free ssh { **user-ip** { *ip-address* | **ipv6** *ipv6-address* } [**port** *port-number*] | **user-pid** *pid-number* | **username** *username* }

Views

User view

Predefined user roles

network-admin

Parameters

user-ip: Specifies the user IP address of the SSH sessions to be disconnected.

ip-address: Specifies the user IPv4 address of the SSH sessions to be disconnected.

ipv6 *ipv6-address:* Specifies the user IPv6 address of the SSH sessions to be disconnected.

port *port-number*: Specifies the source port of the SSH session to be disconnected, in the range of 1 to 65535. If you do not specify a source port, this command disconnects all SSH sessions using the specified IP address.

user-pid *pid-number*: Specifies the user process ID of the SSH session to be disconnected, in the range of 1 to 2147483647. To view the user process ID of an SSH session, use the **display ssh server session** command.

username *username*: Specifies the username of the SSH session to be disconnected. To view the username of an SSH session, use the **display ssh server session** command.

Examples

Disconnect the SSH sessions with user IPv4 address 192.168.15.45.

```
<Sysname> free ssh user-ip 192.168.15.45
Releasing SSH connection. Continue? [Y/N]:y
```

Disconnect the SSH sessions with user IPv6 address 2000::11.

```
<Sysname> free ssh user-ip ipv6 2000::11
Releasing SSH connection. Continue? [Y/N]:y
```

Disconnect the SSH session with user process ID 417.

```
<Sysname> free ssh user-pid 417
Releasing SSH connection. Continue? [Y/N]:y
```

Disconnect the SSH session with username **sshuser**.

```
<Sysname> free ssh username sshuser
Releasing SSH connection. Continue? [Y/N]:y
```

Related commands

display ssh server session

scp server enable

Use **scp server enable** to enable the SCP server.

Use **undo scp server enable** to disable the SCP server.

Syntax

scp server enable

undo scp server enable

Default

The SCP server is disabled.

Examples

Enable the SFTP server.

```
<Sysname> system-view
[Sysname] sftp server enable
```

Related commands

display ssh server

sftp server idle-timeout

Use **sftp server idle-timeout** to set the idle timeout timer for SFTP connections on an SFTP server.

Use **undo sftp server idle-timeout** to restore the default.

Syntax

sftp server idle-timeout *time-out-value*

undo sftp server idle-timeout

Default

The idle timeout timer is 10 minutes for SFTP connections.

Views

System view

Predefined user roles

network-admin

Parameters

time-out-value: Specifies an idle timeout timer in the range of 1 to 35791 minutes.

Usage guidelines

If an SFTP connection is idle when the idle timeout timer expires, the system automatically terminates the connection. To promptly release connection resources, set the idle timeout timer to a small value when many SFTP connections concurrently exist.

Examples

Set the idle timeout timer to 500 minutes for SFTP connections.

```
<Sysname> system-view
[Sysname] sftp server idle-timeout 500
```

Related commands

display ssh server

ssh server acl

Use **ssh server acl** to specify an ACL to control IPv4 SSH connections to the server.

Use **undo ssh server acl** to restore the default.

Syntax

ssh server acl { *advanced-acl-number* | *basic-acl-number* | **mac** *mac-acl-number* }

undo ssh server acl

Default

No ACLs are specified and all IPv4 SSH clients can initiate SSH connections to the server.

Views

System view

Predefined user roles

network-admin

Parameters

advanced-acl-number: Specifies an IPv4 advanced ACL number in the range of 3000 to 3999.

basic-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999.

mac *mac-acl-number:* Specifies a Layer 2 ACL by its number in the range of 4000 to 4999.

Usage guidelines

The ACL specified in this command filters IPv4 SSH clients' connection requests. Only the IPv4 SSH clients that the ACL permits can access the device. If the specified ACL does not exist or contains no rules, all IPv4 SSH clients can access the device.

The ACL takes effect only on SSH connections that are initiated after the ACL configuration.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure ACL 2001 and permit only the users at 1.1.1.1 to initiate SSH connections to the server.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] ssh server acl 2001
```

Related commands

display ssh server

ssh server acl-deny-log enable

Use **ssh server acl-deny-log enable** to enable logging for SSH login attempts that are denied by the SSH login control ACL.

Use **undo ssh server acl-deny-log enable** to disable logging for SSH login attempts that are denied by the SSH login control ACL.

Syntax

ssh server acl-deny-log enable

undo ssh server acl-deny-log enable

Default

Logging is disabled for SSH login attempts that are denied by the SSH login control ACL.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Only SSH clients permitted by the SSH login control ACL can access the SSH server. The logging feature generates log messages for SSH login attempts that are denied by the SSH login control ACL, and sends the messages to the information center.

For information about log message output, see the information center in *Network Management and Monitoring Configuration Guide*. For information about configuring an SSH login control ACL, see the **ssh server acl** or **ssh server ipv6 acl** command.

Examples

Enable logging for SSH login attempts that are denied by the SSH login control ACL.

```
<Sysname> system-view
[Sysname] ssh server acl-deny-log enable
```

Related commands

ssh server acl

ssh server ipv6 acl

ssh server authentication-retries

Use **ssh server authentication-retries** to set the maximum number of authentication attempts for SSH users.

Use **undo ssh server authentication-retries** to restore the default.

Syntax

ssh server authentication-retries *retries*

undo ssh server authentication-retries

Default

The maximum number of authentication attempts is 3 for SSH users.

Views

System view

Predefined user roles

network-admin

Parameters

retries: Specifies the maximum number of authentication attempts for SSH users, in the range of 1 to 5.

Usage guidelines

Setting the maximum number of authentication attempts prevents malicious hacking of usernames and passwords.

If the total number of authentication attempts exceeds the upper limit specified in this command, further authentication is not allowed.

- For **any** authentication, an authentication attempt is a publickey or password authentication process.
- For **password-publickey** authentication, an authentication attempt contains both a publickey authentication process and a password authentication process. The server first uses publickey authentication, and then uses password authentication to authenticate the SSH user.

This configuration does not affect logged-in users. It affects only users that attempt to log in after the configuration.

Examples

Set the maximum number of authentication attempts to 4 for SSH users.

```
<Sysname> system-view
[Sysname] ssh server authentication-retries 4
```

Related commands

display ssh server

ssh server authentication-timeout

Use **ssh server authentication-timeout** to set the SSH user authentication timeout timer on the SSH server.

Use **undo ssh server authentication-timeout** to restore the default.

Syntax

ssh server authentication-timeout *time-out-value*

undo ssh server authentication-timeout

Default

The SSH user authentication timeout timer is 60 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time-out-value: Specifies an authentication timeout timer in the range of 1 to 120 seconds.

Usage guidelines

If a user does not finish the authentication when the timeout timer expires, the connection cannot be established.

To prevent malicious occupation of TCP connections, set the authentication timeout timer to a small value.

Examples

Set the authentication timeout timer to 10 seconds for SSH users.

```
<Sysname> system-view
[Sysname] ssh server authentication-timeout 10
```

Related commands

display ssh server

ssh server compatible-ssh1x enable

Use **ssh server compatible-ssh1x enable** to enable the SSH server to support SSH1 clients.

Use **undo ssh server compatible-ssh1x** [**enable**] to restore the default.

Syntax

ssh server compatible-ssh1x enable

undo ssh server compatible-ssh1x [**enable**]

Default

The SSH server does not support SSH1 clients.

Views

System view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command is not available in FIPS mode.

The **undo** form of this command restores the default setting whether you specify the **enable** keyword or not.

This configuration does not affect logged-in users. It affects only users that attempt to log in after the configuration.

Examples

Enable the SSH server to support SSH1 clients.

```
<Sysname> system-view
[Sysname] ssh server compatible-ssh1x enable
```

Related commands

display ssh server

ssh server dscp

Use **ssh server dscp** to set the DSCP value in the IPv4 SSH packets that the SSH server sends to SSH clients.

Use **undo ssh server dscp** to restore the default.

Syntax

ssh server dscp *dscp-value*

undo ssh server dscp

Default

The DSCP value is 48 in IPv4 SSH packets.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the IPv4 SSH packets, in the range of 0 to 63. A bigger DSCP value represents a higher priority.

Usage guidelines

The DSCP value of a packet specifies the priority of the packet and affects the transmission priority of the packet.

Examples

Set the DSCP value to 30 for IPv4 SSH packets.

```
<Sysname> system-view
[Sysname] ssh server dscp 30
```

ssh server enable

Use **ssh server enable** to enable the Stelnet server.

Use **undo ssh server enable** to disable the Stelnet server.

Syntax

ssh server enable

undo ssh server enable

Default

The Stelnet server is disabled.

Views

System view

Predefined user roles

Examples

Enable the Stelnet server.

```
<Sysname> system-view
[Sysname] ssh server enable
```

Related commands

display ssh server

ssh server ipv6 acl

Use **ssh server ipv6 acl** to specify an ACL to control IPv6 SSH connections to the server.

Use **undo ssh server ipv6 acl** to restore the default.

Syntax

ssh server ipv6 acl { **ipv6** { *advanced-acl-number* | *basic-acl-number* } | **mac** *mac-acl-number* }

undo ssh server ipv6 acl

Default

No ACLs are specified and all IPv6 SSH clients can initiate SSH connections to the server.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

advanced-acl-number: Specifies an IPv6 advanced ACL number in the range of 3000 to 3999.

basic-acl-number: Specifies an IPv6 basic ACL number in the range of 2000 to 2999.

mac *mac-acl-number:* Specifies a Layer 2 ACL by its number in the range of 4000 to 4999.

Usage guidelines

The ACL specified in this command filters IPv6 SSH clients' connection requests. Only the IPv6 SSH clients that the ACL permits can access the device. If the specified ACL does not exist or contains no rules, all IPv6 SSH clients can access the device.

The ACL takes effect only on SSH connections that are initiated after the ACL configuration.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure ACL 2001 and permit only the users on the subnet 1::1/64 to initiate SSH connections to the server.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2001
[Sysname-acl6-ipv6-basic-2001] rule permit source 1::1 64
[Sysname-acl6-ipv6-basic-2001] quit
[Sysname] ssh server ipv6 acl ipv6 2001
```

Related commands

display ssh server

ssh server ipv6 dscp

Use **ssh server ipv6 dscp** to set the DSCP value in the IPv6 SSH packets that the SSH server sends to SSH clients.

Use **undo ssh server ipv6 dscp** to restore the default.

Syntax

ssh server ipv6 dscp *dscp-value*

undo ssh server ipv6 dscp

Default

The DSCP value is 48 in IPv6 SSH packets.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the IPv6 SSH packets, in the range of 0 to 63. A bigger DSCP value represents a higher priority.

Usage guidelines

The DSCP value of an IPv6 packet specifies the priority of the packet and affects the transmission priority of the packet.

Examples

Set the DSCP value to 30 for IPv6 SSH packets.

```
<Sysname> system-view
[Sysname] ssh server ipv6 dscp 30
```

ssh server key-re-exchange enable

Use **ssh server key-re-exchange enable** to enable SSH algorithm renegotiation and key re-exchange.

Use **undo ssh server key-re-exchange enable** to disable SSH algorithm renegotiation and key re-exchange.

Syntax

ssh server key-re-exchange enable [**interval** *interval*]

undo ssh server key-re-exchange enable

Default

SSH algorithm renegotiation and key re-exchange are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies an interval for SSH algorithm renegotiation and key re-exchange, in the range of 1 to 24 hours. If you do not specify this option, the SSH server initiates SSH algorithm renegotiation and key re-exchange at intervals of 1 hour.

Usage guidelines

This command is not available in FIPS mode.

This command enables the SSH server to renegotiate algorithms and re-exchange keys at regular intervals after the first algorithm negotiation and key exchange with SSH clients.

This command takes effect only on new SSH connections that are established after the command is configured, and it does not affect existing SSH connections.

Examples

Enable SSH algorithm renegotiation and key re-exchange.

```
<Sysname> sysname
[Sysname] ssh server key-re-exchange enable
```

ssh server pki-domain

Use **ssh server pki-domain** to specify a PKI domain for an SSH server.

Use **undo ssh server pki-domain** to restore the default.

Syntax

ssh server pki-domain *domain-name*

undo ssh server pki-domain

Default

No PKI domain is specified for an SSH server.

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the name of the PKI domain used to verify the SSH server. The PKI domain name is a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

Examples

Specify PKI domain **serverpkidomain** for the SSH server.

```
<Sysname> system-view
```

```
[Sysname] ssh server pki-domain serverpkidomain
```

ssh server port

Use **ssh server port** to specify the SSH service port.

Use **undo ssh server port** to restore the default.

Syntax

ssh server port *port-number*

undo ssh server port

Default

The SSH service port is 22.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies a port number in the range of 1 to 65535.

Usage guidelines

CAUTION:

- If you modify the SSH port number when the SSH server is enabled, the SSH service is restarted and all SSH connections are terminated after the modification. SSH users must reconnect to the SSH server to access the server.
- If you set the SSH port to a well-known port number, the service that uses the well-known port number might fail to start. Well-known port numbers are in the range of 1 to 1024.

Examples

Set the SSH service port to 1025.

```
<Sysname> system-view
[Sysname] ssh server port 1025
```

ssh server rekey-interval

Use **ssh server rekey-interval** to set the minimum interval for updating the RSA server key pair.

Use **undo ssh server rekey-interval** to restore the default.

Syntax

ssh server rekey-interval *interval*

undo ssh server rekey-interval

Default

The minimum interval for updating the RSA server key pair is 0 hours. The system does not update the RSA server key pair.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum interval for updating the RSA server key pair, in the range of 1 to 24 hours.

Usage guidelines

This command is not available in FIPS mode.

Periodically updating the RSA server key pair prevents malicious hacking to the key pair and enhances security of the SSH connections.

The system starts to count down the configured minimum update interval after the first SSH1 user logs in to the server. If a new SSH1 user logs in to the server after the interval, the system performs the following operations:

1. Updates the RSA server key pair.
2. Uses the updated RSA server key pair for key pair negotiation with the new user.
3. Resets the interval and starts to count down the interval again.

This command takes effect only on SSH1 clients.

Examples

Set the minimum interval to 3 hours for updating the RSA server key pair.

```
<Sysname> system-view
[Sysname] ssh server rekey-interval 3
```

Related commands

display ssh server

ssh user

Use **ssh user** to create an SSH user and specify the service type and authentication method.

Use **undo ssh user** to delete an SSH user.

Syntax

In non-FIPS mode:

ssh user *username* **service-type** { **all** | **netconf** | **scp** | **sftp** | **stelnet** } **authentication-type** { **keyboard-interactive** | **password** | { **any** | **password-publickey** | **publickey** } [**assign** { **pki-domain** *domain-name* | **publickey** *keyname*&<1-6> }] }

undo ssh user *username*

In FIPS mode:

ssh user *username* **service-type** { **all** | **netconf** | **scp** | **sftp** | **stelnet** } **authentication-type** { **keyboard-interactive** | **password** | **password-publickey** [**assign** { **pki-domain** *domain-name* | **publickey** *keyname*&<1-6> }] }

undo ssh user *username*

Default

No SSH users exist.

Views

System view

Predefined user roles

network-admin

Parameters

username: Specifies an SSH username, a case-sensitive string of 1 to 80 characters. The username cannot be **a**, **al**, or **all**. In addition, the username cannot include vertical bars (|), colons (:), asterisks (*), question marks (?), or angle brackets (< >). The at sign (@), slash (/), and backslash (\) can only be used to append ISP domain names to usernames in the *pureusername@domain*, *pureusername*/*domain*, and *domain**pureusername* format. Do not include hyphens (-) in the username of an SCP user. Otherwise, SCP logins using that username will fail.

service-type: Specifies a service type for the SSH user.

- **all**: Specifies service types Stelnet, SFTP, SCP, and NETCONF.
- **scp**: Specifies the service type SCP.
- **sftp**: Specifies the service type SFTP.
- **stelnet**: Specifies the service type Stelnet.
- **netconf**: Specifies the service type NETCONF.

authentication-type: Specifies an authentication method for the SSH user.

- **keyboard-interactive**: Specifies keyboard-interactive authentication. This authentication method supports multiple rounds of interactive exchanges of information. To pass authentication, the user must provide all interactive information required by the remote authentication server. If the remote authentication server does not require interactive information, the keyboard-interactive authentication process is the same as the password authentication.
- **password**: Specifies password authentication. This authentication method provides easy and fast encryption, but it is vulnerable. It can work with AAA to implement user authentication, authorization, and accounting.
- **any**: Specifies keyboard-interactive authentication, password authentication, or publickey authentication.
- **password-publickey**: Specifies both password authentication and publickey authentication for SSH2 clients. In SSH2, the password-publickey authentication method provides higher security. If the client runs SSH1, this keyword specifies either password authentication or publickey authentication.
- **publickey**: Specifies publickey authentication. This authentication method has complicated and slow encryption, but it provides strong authentication that can defend against brute-force attacks. This authentication method is easy to use. If this method is configured, the authentication process completes automatically without entering any password.

assign: Specifies parameters used for client verification.

- **pki-domain** *domain-name*: Specifies the PKI domain that verifies the client's digital certificate. The *domain-name* argument is a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes ('). The server uses the CA certificate that is saved in the PKI domain to verify the client's digital certificate. In this scenario, the server does not need to save clients' public keys in advance.

- **publickey** *keyname*&<1-6>: Specifies a space-separated list of up to six SSH client public keys. The *keyname* argument represents the SSH client's public key configured on the server. It is a case-sensitive string of 1 to 64 characters. The server uses the client's public key to check the validity of the client. If the public key file of the client is changed, you must update the client's public key on the server promptly. If you specify multiple client public keys, the device verifies the user identity by using the public keys in the order they are specified. The user is valid if the user passes one public key check.

Usage guidelines

Use this command to configure an SSH user depending on the authentication method.

- If the authentication method is **publickey**, you must create an SSH user and a local user on the SSH server. The two users must have the same username, so that the SSH user can be assigned the correct working directory and user role.
- If the authentication method is **password**, you must perform one of the following tasks:
  - For local authentication, configure a local user on the SSH server.
  - For remote authentication, configure an SSH user on a remote authentication server, for example, a RADIUS server.

  You do not need to create an SSH user by using the **ssh user** command. However, if you want to display all SSH users, including the password-only SSH users, for centralized management, you can use this command to create them. If such an SSH user has been created, make sure you have specified the correct service type and authentication method.
- If the authentication method is **keyboard-interactive**, **password-publickey** or **any**, you must create an SSH user on the SSH server and perform one of the following tasks:
  - For local authentication, configure a local user on the SSH server.
  - For remote authentication, configure an SSH user on a remote authentication server, for example, a RADIUS server.

  In either case, the local user or the SSH user configured on the remote authentication server must have the same username as the SSH user.

For an SFTP or SCP user, the working directory depends on the authentication method.

- If the authentication method is **publickey** or **password-publickey**, the working directory is specified by the **authorization-attribute** command in the associated local user view.
- If the authentication method is **keyboard-interactive** or **password**, the working directory is authorized by AAA.

For an SSH user, the user role also depends on the authentication method.

- If the authentication method is **publickey** or **password-publickey**, the user role is specified by the **authorization-attribute** command in the associated local user view.
- If the authentication method is **keyboard-interactive** or **password**, the user role is authorized by AAA.

If you use this command to specify a host public key or a PKI domain for a user multiple times, the most recent configuration takes effect. If neither a host public key nor a PKI domain is specified for the user, the user uses certificate authentication for login. The server uses the PKI domain of its own certificate to verify the client's certificate.

The command configuration does not affect logged-in users. It affects only users that attempt to log in after the configuration.

Examples

Create an SSH user named **user1**. Specify the service type as **sftp** and the authentication method as **password-publickey** for the user. Assign the host public key **key1** to the user.

```
<Sysname> system-view
[Sysname] ssh user user1 service-type sftp authentication-type password-publickey assign
publickey key1
```

Create a local device management user named **user1**. Specify the password as **123456TESTplat&!** in plain text and the service type as **ssh** for the user. Assign the working directory **flash:** and the **network-admin** user role to the user.

```
[Sysname] local-user user1 class manage
[Sysname-luser-manage-user1] password simple 123456TESTplat&!
[Sysname-luser-manage-user1] service-type ssh
[Sysname-luser-manage-user1] authorization-attribute work-directory flash: user-role
network-admin
```

Usage guidelines

This command has the same function as the **exit** and **quit** commands.

Examples

Terminate the connection with the SFTP server.

```
sftp> bye
<Sysname>
```

cd

Use **cd** to change the working directory on the SFTP server.

Syntax

cd [*remote-path*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-path: Specifies the name of a directory on the server.

Usage guidelines

You can use the **cd ..** command to return to the upper-level directory.

You can use the **cd /** command to return to the root directory of the system.

Examples

Change the working directory to **new1**.

```
sftp> cd new1
Current Directory is:/new1
sftp> pwd
Remote working directory: /new1
sftp>
```

cdup

Use **cdup** to return to the upper-level directory.

Syntax

cdup

Views

SFTP client view

Predefined user roles

Example

Return to the upper-level directory from the current working directory **/test1**.

```
sftp> cd test1
Current Directory is:/test1
sftp> pwd
Remote working directory: /test1
sftp> cdup
Current Directory is:/
sftp> pwd
Remote working directory: /
sftp>
```

delete

Use **delete** to delete a file from the SFTP server.

Syntax

delete *remote-file*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-file: Specifies a file by its name.

Usage guidelines

This command has the same function as the **remove** command.

Examples

Delete file **temp.c** from the SFTP server.

```
sftp> delete temp.c
Removing /temp.c
```

delete ssh client server-public-key

Use **delete ssh client server-public-key** to delete server public key information saved in the public key file of the SSH client.

Syntax

delete ssh client server-public-key [**server-ip** *ip-address*]

Views

System view

Predefined user roles

network-admin

Parameters

server-ip *ip-address*: Specifies the IP address of the server whose public key information will be deleted. If you do not specify a server IP address, this command deletes the public keys of all servers from the client's public key file.

Examples

Delete all server public keys saved in the public key file of the SSH client.

```
<Sysname> system-view
[Sysname] delete ssh client server-public-key
Public keys of all SSH servers will be deleted. Continue? [Y/N]:y
```

Delete the public key of server 2.2.2.1 saved in the public key file of the SSH client.

```
<Sysname> system-view
[Sysname] delete ssh client server-public-key server-ip 2.2.2.1
```

dir

Use **dir** to display information about the files and subdirectories under a directory.

Syntax

dir [**-a** | **-l**] [*remote-path*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

-a: Displays detailed information about files and subdirectories under a directory in a list, including the files and subdirectories with names starting with dots (.).

-l: Displays detailed information about the files and subdirectories under a directory in a list, excluding the files and subdirectories with names starting with dots (.).

remote-path: Specifies the name of the directory to be queried. If you do not specify this argument, the command displays information about the files and subdirectories under the current working directory.

Usage guidelines

If you do not specify both of the **-a** and **-l** keywords, this command displays the names of the files and subdirectories under a directory.

This command has the same function as the **ls** command.

Examples

Display detailed information about the files and subdirectories under the current directory, including the files and subdirectories with names starting with dots (.).

```
sftp> dir -a
drwxrwxrwx    2 1        1               512 Dec 18 14:12 .

-rwxrwxrwx    1 1        1               301 Dec 18 14:11 010.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 011.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 012.pub
```

Display detailed information about the files and subdirectories under the current directory, excluding the files and subdirectories with names starting with dots (.).

```
sftp> dir -l
-rwxrwxrwx    1 1        1               301 Dec 18 14:11 010.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 011.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 012.pub
```

display scp client source

Use **display scp client source** to display the source IP address configuration of the SCP client.

Syntax

display scp client source

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the source IP address configuration of the SCP client.

```
<Sysname> display scp client source
The source IP address of the SCP client is 192.168.0.1.
The source IPv6 address of the SCP client is 2:2::2:2.
```

Related commands

scp client ipv6 source
scp client source

display sftp client source

Use **display sftp client source** to display the source IP address configuration of the SFTP client.

Syntax

display sftp client source

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the source IP address configuration of the SFTP client.

```
<Sysname> display sftp client source
The source IP address of the SFTP client is 192.168.0.1
The source IPv6 address of the SFTP client is 2:2::2:2.
```

Related commands

sftp client ipv6 source

sftp client source

display ssh client server-public-key

Use **display ssh client server-public-key** to display server public key information saved in the public key file of the SSH client.

Syntax

display ssh client server-public-key [**server-ip** *ip-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

server-ip *ip-address*: Specifies the IP address of the server whose public key information will be displayed. If you do not specify a server IP address, this command displays the public keys of all servers saved in the client's public key file.

Usage guidelines

When a user connects to an unauthenticated server and selects to save the server's public key, the server public key will be saved to the public key file. Server public key information saved in the public

key file is not available in the configuration file. To display such server public key information on the SSH client, you must use this command.

Examples

Display all server public keys saved in the public key file of the SSH client.

```
<Sysname> display ssh client server-public-key
 Server address: 10.153.124.209
 Key type: ecdsa-sha2-nistp256
 Key length: 256
 Key code:
   AAAAE2VjZHNhLXNoYTItbmlzdHAyNTYAAAAIbmlzdHAyNTYAAABBBAOGpJfwJExK
   eYb53KKqmrZ0V/XnYZKZEchyN9ax1IBt+toIXHeW5NfBE5ymeklPSNgQNhcndkU/
   422fT15UmgM=

 Server address: 2.2.2.1
 Key type: rsa
 Key length: 1024
 Key code:
   AAAAB3NzaC1yc2EAAAADAQABAAAAgQDIUrHbeLx/W7xElB1Ny3zeA8/uV9K6sj1p
   dSlhx5XcOatdNMoD/sioYgSsy9IxKZPqBs+vadqx/wCCB5+T2GLLu2qgaT0P9J+v
   RR/9Y8fI2b4tS7PoNf/QKDVD7XnoiZ+dqd0tnnRf6GV+74cp8ZEUQdAoTeDzzaAh
   7t6FbxrNrQ==
```

Display the public key of server 2.2.2.1 saved in the public key file of the SSH client.

```
<Sysname> display ssh client server-public-key server-ip 2.2.2.1
 Server address: 2.2.2.1
 Key type: rsa
 Key length: 1024
 Key code:
   AAAAB3NzaC1yc2EAAAADAQABAAAAgQDIUrHbeLx/W7xElB1Ny3zeA8/uV9K6sj1p
   dSlhx5XcOatdNMoD/sioYgSsy9IxKZPqBs+vadqx/wCCB5+T2GLLu2qgaT0P9J+v
   RR/9Y8fI2b4tS7PoNf/QKDVD7XnoiZ+dqd0tnnRf6GV+74cp8ZEUQdAoTeDzzaAh
   7t6FbxrNrQ==
```

Table 4 Command output

Field	Description
Server address	IP address of the SSH server.
Key type	Type of the public key: • **dsa**—DSA public key. • **ecdsa-sha2-nistp256**—256-bit ECDSA public key created by using the secp256r1 curve. • **ecdsa-sha2-nistp384**—384-bit ECDSA public key created by using the secp384r1 curve. • **rsa**—RSA public key.
Key length	Length of the public key, in bits.
Key code	Content of the public key.

display ssh client source

Use **display ssh client source** to display the source IP address configuration of the Stelnet client.

Syntax

display ssh client source

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the source IP address configuration of the Stelnet client.

```
<Sysname> display ssh client source
The source IP address of the SSH client is 192.168.0.1
The source IPv6 address of the SSH client is 2:2::2:2.
```

ssh client ipv6 source

ssh client source

exit

Use **exit** to terminate the SFTP connection and return to user view.

Syntax

exit

Views

SFTP client view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command has the same function as the **bye** and **quit** commands.

Examples

Terminate the SFTP connection.

```
sftp> exit
<Sysname>
```

get

Use **get** to download a file from the SFTP server and save it locally.

Syntax

get *remote-file* [*local-file*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-file: Specifies the name of a file on the SFTP server.

local-file: Specifies the name for the local file. If you do not specify this argument, the file will be saved locally with the same name as the file on the SFTP server.

Examples

Download file **temp1.c** and save it as **temp.c** locally.

```
sftp> get temp1.c temp.c
Fetching /temp1.c to temp.c
/temp.c                                                100% 1424     1.4KB/s   00:00
```

help

Use **help** to display help information on the SFTP client.

Syntax

help

Views

SFTP client view

Predefined user roles

Usage guidelines

This command has the same function as entering the question mark (?).

Examples

Display help information on the SFTP client.

```
sftp> help
Available commands:
  bye                          Quit sftp
  cd [path]                    Change remote directory to 'path'
  cdup                         Change remote directory to the parent directory
  delete path                  Delete remote file
  dir [-a|-l][path]            Display remote directory listing
       -a                        List all filenames
       -l                        List filename including the specific
                                 information of the file
  exit                         Quit sftp
  get remote-path [local-path] Download file
  help                         Display this help text
```

```
ls [-a|-l][path]             Display remote directory
     -a                         List all filenames
     -l                         List filename including the specific
                                information of the file
mkdir path                   Create remote directory
put local-path [remote-path] Upload file
pwd                          Display remote working directory
quit                         Quit sftp
rename oldpath newpath       Rename remote file
remove path                  Delete remote file
rmdir path                   Delete remote empty directory
?                            Synonym for help
```

ls

Use **ls** to display information about the files and subdirectories under a directory.

Syntax

ls [**-a** | **-l**] [*remote-path*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

-a: Displays detailed information about files and subdirectories under a directory in a list, including the files and subdirectories with names starting with dots (.).

-l: Displays detailed information about the files and subdirectories under a directory in a list, excluding the files and subdirectories with names starting with dots (.).

remote-path: Specifies the name of the directory to be queried. If you do not specify this argument, the command displays information about the files and subdirectories under the current working directory.

Usage guidelines

If you do not specify both of the **-a** and **-l** keywords, this command displays the names of the files and subdirectories under a directory.

This command has the same function as the **dir** command.

Examples

Display detailed information about the files and subdirectories under the current directory, including the files and subdirectories with names starting with dots (.).

```
sftp> ls -a
drwxrwxrwx    2 1        1               512 Dec 18 14:12 .
drwxrwxrwx    2 1        1               512 Dec 18 14:12 ..
-rwxrwxrwx    1 1        1               301 Dec 18 14:11 010.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 011.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 012.pub
```

Display detailed information about the files and subdirectories under the current working directory, excluding the files and subdirectories with names starting with dots (.).

```
sftp> ls -l
-rwxrwxrwx    1 1        1               301 Dec 18 14:11 010.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 011.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 012.pub
```

mkdir

Use **mkdir** to create a directory on the SFTP server.

Syntax

mkdir *remote-path*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-path: Specifies the name of a directory.

Examples

Create a directory named **test** on the SFTP server.

```
sftp> mkdir test
```

put

Use **put** to upload a local file to the SFTP server.

Syntax

put *local-file* [*remote-file*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

local-file: Specifies the name of a local file.

remote-file: Specifies the name of a file on an SFTP server. If you do not specify this argument, the file will be remotely saved with the same name as the local file.

Examples

Upload the local file **startup.bak** to the SFTP server and save it as **startup01.bak**.

```
sftp> put startup.bak startup01.bak
Uploading startup.bak to /startup01.bak
startup01.bak                                 100% 1424     1.4KB/s   00:00
```

pwd

Use **pwd** to display the current working directory of the SFTP server.

Syntax

pwd

Views

SFTP client view

Predefined user roles

network-admin

Examples

Display the current working directory of the SFTP server.

```
sftp> pwd
Remote working directory: /
```

The output shows that the current working directory is the root directory.

quit

Use **quit** to terminate the SFTP connection and return to user view.

Syntax

quit

Views

SFTP client view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command has the same function as the **bye** and **exit** commands.

Examples

Terminate the SFTP connection.

```
sftp> quit
<Sysname>
```

remove

Use **remove** to delete a file from the SFTP server.

Syntax

remove *remote-file*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-file: Specifies a file by its name.

Usage guidelines

This command has the same function as the **delete** command.

Examples

Delete file **temp.c** from the SFTP server.

```
sftp> remove temp.c
Removing /temp.c
```

rename

Use **rename** to change the name of a file or directory on the SFTP server.

Syntax

rename *old-name new-name*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

oldname: Specifies the name of an existing file or directory.

newname: Specifies a new name for the existing file or directory.

Examples

Change the name of a file on the SFTP server from **temp1.c** to **temp2.c**.

```
sftp> dir
aa.pub  temp1.c
sftp> rename temp1.c temp2.c
sftp> dir
aa.pub  temp2.c
```

rmdir

Use **rmdir** to delete a directory from the SFTP server.

Syntax

rmdir *remote-path*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-path: Specifies a directory.

Examples

Delete subdirectory **temp1** under the current directory on the SFTP server.

```
sftp> rmdir temp1
```

scp

Use **scp** to establish a connection to an IPv4 SCP server and transfer files with the server.

Syntax

In non-FIPS mode:

scp *server* [*port-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] * [**user** *username* [**password** *password*]]

In FIPS mode:

scp *server* [*port-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] * [**user** *username* [**password** *password*]]

Views

User view

Predefined user roles

network-admin

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

get: Downloads the file.

put: Uploads the file.

source-file-name: Specifies the name of the source file, a case-sensitive string of 1 to 255 characters.

destination-file-name: Specifies the name of the target file, a case-sensitive string of 1 to 255 characters. If you do not specify this argument, the target file uses the same file name as the source file.

identity-key: Specifies a public key algorithm for publickey authentication of the client. The default is DSA in non-FIPS mode and is RSA in FIPS mode. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **ecdsa-sha2-nistp256**: Specifies public key algorithm ecdsa-sha2-nistp256.
- **ecdsa-sha2-nistp384**: Specifies public key algorithm ecdsa-sha2-nistp384.
- **rsa**: Specifies public key algorithm RSA.
- **x509v3-ecdsa-sha2-nistp256**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp256.
- **x509v3-ecdsa-sha2-nistp384**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp384.
- **pki-domain** *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument is a case-insensitive string of 1 to 31 characters. When the x509v3 public key algorithm is used, you must specify this option for the client to get the correct local certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. The default is AES128-CTR. Supported algorithms are DES-CBC, 3DES-CBC, AES128-CBC, AES128-CTR, AES128-GCM, AES192-CTR, AES256-CBC, AES256-CTR, and AES256-GCM in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **aes128-ctr**: Specifies encryption algorithm AES128-CTR.
- **aes128-gcm**: Specifies encryption algorithm AES128-GCM.
- **aes192-ctr**: Specifies encryption algorithm AES192-CTR.
- **aes256-cbc**: Specifies encryption algorithm AES256-CBC.
- **aes256-ctr**: Specifies encryption algorithm AES256-CTR.
- **aes256-gcm**: Specifies encryption algorithm AES256-GCM.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. The default is SHA2-256.Supported algorithms are MD5, MD5-96, SHA1, SHA1-96, SHA2-256, and SHA2-512 in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.
- **sha2-256**: Specifies HMAC algorithm HMAC-SHA2-256.
- **sha2-512**: Specifies HMAC algorithm HMAC-SHA2-512.

prefer-kex: Specifies the preferred key exchange algorithm. The default is ecdh-sha2-nistp256. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, diffie-hellman-group14-sha1, ecdh-sha2-nistp256, and ecdh-sha2-nistp384, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.
- **ecdh-sha2-nistp256**: Specifies key exchange algorithm ecdh-sha2-nistp256.
- **ecdh-sha2-nistp384**: Specifies key exchange algorithm ecdh-sha2-nistp384.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. The default is AES128-CTR. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. The default is SHA2-256. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

public-key *keyname*: Specifies the server's host public key that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

source: Specifies a source IPv4 address or source interface for SCP packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SCP packets. As a best practice to ensure successful SCP connections, specify a loopback interface as the source interface or specify the IPv4 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv4 address of this interface is the source IPv4 address of the SCP packets.
- **ip** *ip-address*: Specifies a source IPv4 address.

user *username*: Specifies an SCP username, a case-sensitive string of 1 to 80 characters. If the username contains an ISP domain name, use the *pureusername@domain*, *pureusername*/*domain*, or *domain**pureusername* format.

password *password*: Specifies a password in plaintext form, a case-sensitive string of 1 to 63 characters.

Usage guidelines

If the client and the server have negotiated to use certificate authentication, the client must verify the server's certificate. For the client to correctly get the server's certificate, you must specify the server's PKI domain on the client by using the **server-pki-domain** *domain-name* option. The client uses the CA certificate stored in the specified PKI domain to verify the server's certificate and does not need to save the server's public key before authentication. If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

If you do not specify a username and password in the command, you must provide the username and password in an interactive way.

If the SCP server uses publickey authentication, the password specified by this command is ignored.

Examples

Connect the SCP client to SCP server **200.1.1.1**. Specify the public key of the server as **svkey**, and download file **abc.txt** from the server. The SCP client uses publickey authentication. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.

- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Sysname> scp 200.1.1.1 get abc.txt prefer-kex dh-group14-sha1 prefer-stoc-cipher
aes128-cbc prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key
svkey
Username:
```

scp client ipv6 source

Use **scp client ipv6 source** to configure the source IPv6 address for SCP packets that are sent by the SCP client.

Use **undo scp client ipv6 source** to restore the default.

Syntax

scp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

undo scp client ipv6 source

Default

The source IPv6 address for outgoing SCP packets is not configured. The SCP client automatically selects an IPv6 address for outgoing SCP packets in compliance with RFC 3484.

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The SCP client selects the interface's address that most specifically matches the destination address of outgoing SCP packets as the source address of the SCP packets.

ipv6 *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

This command takes effect on all IPv6 SCP connections. The source IPv6 address specified in the **scp ipv6** command takes effect only on the current IPv6 SCP connection. If you specify the source IPv6 address in both this command and the **scp ipv6** command, the source IPv6 address specified in the **scp ipv6** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **2:2::2:2** as the source IPv6 address for SCP packets.

```
<Sysname> system-view
[Sysname] scp client ipv6 source ipv6 2:2::2:2
```

Related commands

display scp client source

scp client source

Use **scp client source** to configure the source IPv4 address for SCP packets that are sent by the SCP client.

Use **undo scp client source** to restore the default.

Syntax

scp client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

undo scp client source

Default

The source IPv4 address for outgoing SCP packets is not configured. The SCP client uses the primary IPv4 address of the output interface in the matching route as the source IPv4 address for outgoing SCP packets.

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The SCP client uses the primary IPv4 address of the interface as the source address of outgoing SCP packets.

ip *ip-address*: Specifies a source IPv4 address.

Usage guidelines

This command takes effect on all SCP connections. The source IPv4 address specified in the **scp** command takes effect only on the current SCP connection. If you specify the source IPv4 address in both this command and the **scp** command, the source IPv4 address specified in the **scp** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **192.168.0.1** as the source IPv4 address for SCP packets.

```
<Sysname> system-view
[Sysname] scp client source ip 192.168.0.1
```

Related commands

display scp client source

scp ipv6

Use **scp ipv6** to establish a connection to an IPv6 SCP server and transfer files with the server.

Syntax

In non-FIPS mode:

scp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** |

{ **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] * [**user** *username* [**password** *password*]]

In FIPS mode:

scp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] * [**user** *username* [**password** *password*]]

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

-i *interface-type interface-number:* Specifies an output interface by its type and number for SCP packets. This option is used only when the server uses a link-local address to provide the SCP service for the client. The specified output interface on the SCP client must have a link-local address.

get: Downloads the file.

put: Uploads the file.

source-file-name: Specifies the name of the source file, a case-sensitive string of 1 to 255 characters.

destination-file-name: Specifies the name of the target file, a case-sensitive string of 1 to 255 characters. If you do not specify this argument, the target file uses the same file name as the source file.

identity-key: Specifies a public key algorithm for publickey authentication of the client. The default is DSA in non-FIPS mode and is RSA in FIPS mode. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **ecdsa-sha2-nistp256**: Specifies public key algorithm ecdsa-sha2-nistp256.
- **ecdsa-sha2-nistp384**: Specifies public key algorithm ecdsa-sha2-nistp384.
- **rsa**: Specifies public key algorithm RSA.
- **x509v3-ecdsa-sha2-nistp256**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp256.

  x509v3-ecdsa-sha2-nistp384: Specifies public key algorithm x509v3-ecdsa-sha2-nistp384.
- **pki-domain** *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument is a case-insensitive string of 1 to 31 characters. When the x509v3 public key algorithm is used, you must specify this option for the client to get the correct local certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. The default is AES128-CTR. Supported algorithms are DES-CBC, 3DES-CBC, AES128-CBC, AES128-CTR, AES128-GCM, AES192-CTR, AES256-CBC, AES256-CTR, and AES256-GCM in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **aes128-ctr**: Specifies encryption algorithm AES128-CTR.
- **aes128-gcm**: Specifies encryption algorithm AES128-GCM.
- **aes192-ctr**: Specifies encryption algorithm AES192-CTR.
- **aes256-cbc**: Specifies encryption algorithm AES256-CBC.
- **aes256-ctr**: Specifies encryption algorithm AES256-CTR.
- **aes256-gcm**: Specifies encryption algorithm AES256-GCM.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. The default is SHA2-256. Supported algorithms are MD5, MD5-96, SHA1, SHA1-96, SHA2-256, and SHA2-512 in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.
- **sha2-256**: Specifies HMAC algorithm HMAC-SHA2-256.
- **sha2-512**: Specifies HMAC algorithm HMAC-SHA2-512.

prefer-kex: Specifies the preferred key exchange algorithm. The default is ecdh-sha2-nistp256. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, diffie-hellman-group14-sha1, ecdh-sha2-nistp256, and ecdh-sha2-nistp384, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.

- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.
- **ecdh-sha2-nistp256**: Specifies key exchange algorithm ecdh-sha2-nistp256.
- **ecdh-sha2-nistp384**: Specifies key exchange algorithm ecdh-sha2-nistp384.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. The default is AES128-CTR. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. The default is SHA2-256. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

public-key *keyname*: Specifies the server's host public key that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

source: Specifies a source IPv6 address or source interface for IPv6 SCP packets. By default, the device automatically selects a source address for IPv6 SCP packets in compliance with RFC 3484. As a best practice to ensure successful SCP connections, specify a loopback interface as the source interface or specify the IPv6 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IPv6 address of the IPv6 SCP packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

user *username*: Specifies an SCP username, a case-sensitive string of 1 to 80 characters. If the username contains an ISP domain name, use the *pureusername@domain*, *pureusername*/*domain*, or *domain**pureusername* format.

password *password*: Specifies a password in plaintext form, a case-sensitive string of 1 to 63 characters.

Usage guidelines

If the client and the server have negotiated to use certificate authentication, the client must verify the server's certificate. For the client to correctly get the server's certificate, you must specify the server's PKI domain on the client by using the **server-pki-domain** *domain-name* option. The client uses the CA certificate stored in the specified PKI domain to verify the server's certificate and does not need to save the server's public key before authentication. If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

If you do not specify a username and password in the command, you must provide the username and password in an interactive way.

If the SCP server uses publickey authentication, the password specified by this command is ignored.

Examples

Connect an SCP client to SCP server **2000::1**. Specify the public key of the server as **svkey**, and download file **abc.txt** from the server. The SCP client uses publickey authentication. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Sysname> scp ipv6 2000::1 get abc.txt prefer-kex dh-group14-sha1 prefer-stoc-cipher
aes128-cbc prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key
svkey
Username:
```

scp ipv6 suite-b

Use **scp ipv6 suite-b** to establish a connection to an IPv6 SCP server based on Suite B algorithms and transfer files with the server.

Syntax

scp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] * [**user** *username* [**password** *password*]]

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

-i *interface-type interface-number:* Specifies an output interface by its type and number for SCP packets. Specify this option when the server uses a link-local address to provide the SCP service for the client. The specified output interface on the SCP client must have a link-local address.

get: Downloads the file.

put: Uploads the file.

source-file-name: Specifies the name of the source file, a case-sensitive string of 1 to 255 characters.

destination-file-name: Specifies the name of the target file, a case-sensitive string of 1 to 255 characters. If you do not specify this argument, the target file uses the same file name as the source file.

suite-b: Specifies the Suite B algorithms. If neither the 128-bit keyword nor the 192-bit keyword is specified, all algorithms in Suite B are used. For more information about the Suite B algorithms, see Table 5.

128-bit: Specifies the 128-bit Suite B security level.

192-bit: Specifies the 192-bit Suite B security level.

pki-domain *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string

of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes ('). If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

source: Specifies a source IPv6 address or source interface for IPv6 SCP packets. By default, the device automatically selects a source address for IPv6 SCP packets in compliance with RFC 3484. As a best practice to ensure successful SCP connections, specify a loopback interface as the source interface or specify the IPv6 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IPv6 address of the IPv6 SCP packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

user *username*: Specifies an SCP username, a case-sensitive string of 1 to 80 characters. If the username contains an ISP domain name, use the *pureusername@domain*, *pureusername*/*domain*, or *domain**pureusername* format.

password *password*: Specifies a password in plaintext form, a case-sensitive string of 1 to 63 characters.

Usage guidelines

Table 5 Suite B algorithms

Security level	Key exchange algorithm	Encryption algorithm and HMAC algorithm	Public key algorithm
128-bit	ecdh-sha2-nistp256	AES128-GCM	x509v3-ecdsa-sha2-nistp256
192-bit	ecdh-sha2-nistp384	AES256-GCM	x509v3-ecdsa-sha2-nistp384
Both	ecdh-sha2-nistp256 ecdh-sha2-nistp384	AES128-GCM AES256-GCM	x509v3-ecdsa-sha2-nistp256 x509v3-ecdsa-sha2-nistp384

If you do not specify a username and password in the command, you must provide the username and password in an interactive way.

If the SCP server uses publickey authentication, the password specified by this command is ignored.

Examples

Use the 192-bit Suite B algorithms to establish a connection to SCP server **2000::1** and download the file **abc.txt** from the server. Specify the client's PKI domain and the server's PKI domain as **clientpkidomain** and **serverpkidomain**, respectively.

```
<Sysname> scp ipv6 2000::1 get abc.txt suite-b 192-bit pki-domain clientpkidomain
server-pki-domain serverpkidomain
Username:
```

scp suite-b

Use **scp suite-b** to establish a connection to an SCP server based on Suite B algorithms and transfer files with the server.

Syntax

scp *server* [*port-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] * [**user** *username* [**password** *password*]]

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

get: Downloads the file.

put: Uploads the file.

source-file-name: Specifies the name of the source file, a case-sensitive string of 1 to 255 characters.

destination-file-name: Specifies the name of the target file, a case-sensitive string of 1 to 255 characters. If you do not specify this argument, the target file uses the same file name as the source file.

suite-b: Specifies the Suite B algorithms. If neither the 128-bit keyword nor the 192-bit keyword is specified, all algorithms in Suite B are used. For more information about the Suite B algorithms, see Table 6.

128-bit: Specifies the 128-bit Suite B security level.

192-bit: Specifies the 192-bit Suite B security level.

pki-domain *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes ('). If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

source: Specifies a source IP address or source interface for SCP packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SCP packets. As a best practice to ensure successful SCP connections, specify a loopback interface as the source interface or specify the IPv4 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv4 address of this interface is the source IPv4 address of the SCP packets.

- **ip** *ip-address*: Specifies a source IPv4 address.

user *username*: Specifies an SCP username, a case-sensitive string of 1 to 80 characters. If the username contains an ISP domain name, use the *pureusername@domain*, *pureusername*/*domain*, or *domain**pureusername* format.

password *password*: Specifies a password in plaintext form, a case-sensitive string of 1 to 63 characters.

Usage guidelines

Table 6 Suite B algorithms

Security level	Key exchange algorithm	Encryption algorithm and HMAC algorithm	Public key algorithm
128-bit	ecdh-sha2-nistp256	AES128-GCM	x509v3-ecdsa-sha2-nistp256
192-bit	ecdh-sha2-nistp384	AES256-GCM	x509v3-ecdsa-sha2-nistp384
Both	ecdh-sha2-nistp256 ecdh-sha2-nistp384	AES128-GCM AES256-GCM	x509v3-ecdsa-sha2-nistp256 x509v3-ecdsa-sha2-nistp384

If you do not specify a username and password in the command, you must provide the username and password in an interactive way.

If the SCP server uses publickey authentication, the password specified by this command is ignored.

Examples

Use the 128-bit Suite B algorithms to establish a connection to SCP server **200.1.1.1** and download the file **abc.txt** from the server. Specify the client's PKI domain and the server's PKI domain as **clientpkidomain** and **serverpkidomain**, respectively.

```
<Sysname> scp 200.1.1.1 get abc.txt suite-b 128-bit pki-domain clientpkidomain
server-pki-domain serverpkidomain
Username
```

sftp

Use **sftp** to establish a connection to an IPv4 SFTP server and enter SFTP client view.

Syntax

In non-FIPS mode:

sftp *server* [*port-number*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**dscp** *dscp-value* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

In FIPS mode:

sftp *server* [*port-number*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress** **zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

identity-key: Specifies a public key algorithm for publickey authentication of the client. The default is DSA in non-FIPS mode and is RSA in FIPS mode. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **ecdsa-sha2-nistp256**: Specifies public key algorithm ecdsa-sha2-nistp256.
- **ecdsa-sha2-nistp384**: Specifies public key algorithm ecdsa-sha2-nistp384.
- **rsa**: Specifies public key algorithm RSA.
- **x509v3-ecdsa-sha2-nistp256**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp256.
- **x509v3-ecdsa-sha2-nistp384**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp384.
- **pki-domain** *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument is a case-insensitive string of 1 to 31 characters. When the x509v3 public key algorithm is used, you must specify this option for the client to get the correct local certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. The default is AES128-CTR. Supported algorithms are DES-CBC, 3DES-CBC, AES128-CBC, AES128-CTR, AES128-GCM, AES192-CTR, AES256-CBC, AES256-CTR, and AES256-GCM in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **aes128-ctr**: Specifies encryption algorithm AES128-CTR.
- **aes128-gcm**: Specifies encryption algorithm AES128-GCM.

- **aes192-ctr**: Specifies encryption algorithm AES192-CTR.
- **aes256-cbc**: Specifies encryption algorithm AES256-CBC.
- **aes256-ctr**: Specifies encryption algorithm AES256-CTR.
- **aes256-gcm**: Specifies encryption algorithm AES256-GCM.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. The default is SHA2-256. Supported algorithms are MD5, MD5-96, SHA1, SHA1-96, SHA2-256, and SHA2-512 in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.
- **sha2-256**: Specifies HMAC algorithm HMAC-SHA2-256.
- **sha2-512**: Specifies HMAC algorithm HMAC-SHA2-512.

prefer-kex: Specifies the preferred key exchange algorithm. The default is ecdh-sha2-nistp256. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, diffie-hellman-group14-sha1, ecdh-sha2-nistp256, and ecdh-sha2-nistp384, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.
- **ecdh-sha2-nistp256**: Specifies key exchange algorithm ecdh-sha2-nistp256.
- **ecdh-sha2-nistp384**: Specifies key exchange algorithm ecdh-sha2-nistp384.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. The default is AES128-CTR. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. The default is SHA2-256. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

dscp *dscp-value*: Specifies the DSCP value in the IPv4 SFTP packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

public-key *keyname*: Specifies the server's host public key that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

source: Specifies a source IPv4 address or source interface for the SFTP packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SFTP packets. As a best practice to ensure successful SFTP connections, specify a loopback interface as the source interface or specify the IPv4 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The primary IPv4 address of this interface is the source IPv4 address of the SFTP packets.
- **ip** *ip-address*: Specifies a source IPv4 address.

Usage guidelines

If the client and the server have negotiated to use certificate authentication, the client must verify the server's certificate. For the client to correctly get the server's certificate, you must specify the server's PKI domain on the client by using the **server-pki-domain** *domain-name* option. The client uses the CA certificate stored in the specified PKI domain to verify the server's certificate and does not need to save the server's public key before authentication. If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

Examples

Connect an SFTP client to SFTP server **10.1.1.2** and specify the public key of the server as **svkey**. The SFTP client uses publickey authentication. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Sysname> sftp 10.1.1.2 prefer-kex dh-group14-sha1 prefer-stoc-cipher aes128-cbc
prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key svkey
```

sftp client ipv6 source

Use **sftp client ipv6 source** to configure the source IPv6 address for SFTP packets that are sent by the SFTP client.

Use **undo sftp client ipv6 source** to restore the default.

Syntax

sftp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

undo sftp client ipv6 source

Default

The source IPv6 address for outgoing SFTP packets is not configured. The SFTP client automatically selects an IPv6 address for outgoing SFTP packets in compliance with RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The SFTP client selects the interface's address that most specifically matches the destination address of outgoing SFTP packets as the source address of the SFTP packets.

ipv6 *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

This command takes effect on all IPv6 SFTP connections. The source IPv6 address specified in the **sftp ipv6** command takes effect only on the current IPv6 SFTP connection. If you specify the source IPv6 address both in this command and the **sftp ipv6** command, the source IPv6 address specified in the **sftp ipv6** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **2:2::2:2** as the source IPv6 address for SFTP packets.

```
<Sysname> system-view
[Sysname] sftp client ipv6 source ipv6 2:2::2:2
```

Related commands

display sftp client source

sftp client source

Use **sftp client source** to configure the source IPv4 address for SFTP packets that are sent by the SFTP client.

Use **undo sftp client source** to restore the default.

Syntax

sftp client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

undo sftp client source

Default

The source IPv4 address for outgoing SFTP packets is not configured. The SFTP client uses the primary IPv4 address of the output interface in the matching route as the source IPv4 address of outgoing SFTP packets.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The SFTP client uses the primary IPv4 address of the interface as the source address of outgoing SFTP packets.

ip *ip-address*: Specifies a source IPv4 address.

Usage guidelines

This command takes effect on all SFTP connections. The source IPv4 address specified in the **sftp** command takes effect only on the current SFTP connection. If you specify the source IPv4 address both in this command and the **sftp** command, the source IPv4 address specified in the **sftp** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **192.168.0.1** as the source IPv4 address for SFTP packets.

```
<Sysname> system-view
[Sysname] sftp client source ip 192.168.0.1
```

Related commands

display sftp client source

sftp ipv6

Use **sftp ipv6** to connect an SFTP client to an IPv6 SFTP server and enter SFTP client view.

Syntax

In non-FIPS mode:

sftp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**dscp** *dscp-value* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

In FIPS mode:

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

-i *interface-type interface-number:* Specifies an output interface by its type and number for IPv6 SFTP packets. This option is used only when the server uses a link-local address to

provide the SFTP service for the client. The specified output interface on the SFTP client must have a link-local address.

identity-key: Specifies a public key algorithm for publickey authentication of the client. The default is DSA in non-FIPS mode and is RSA in FIPS mode. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **ecdsa-sha2-nistp256**: Specifies public key algorithm ecdsa-sha2-nistp256.
- **ecdsa-sha2-nistp384**: Specifies public key algorithm ecdsa-sha2-nistp384.
- **rsa**: Specifies public key algorithm RSA.
- **x509v3-ecdsa-sha2-nistp256**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp256.
- **x509v3-ecdsa-sha2-nistp384**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp384.
- **pki-domain** *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument is a case-insensitive string of 1 to 31 characters. When the x509v3 public key algorithm is used, you must specify this option for the client to get the correct local certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. The default is AES128-CTR. Supported algorithms are DES-CBC, 3DES-CBC, AES128-CBC, AES128-CTR, AES128-GCM, AES192-CTR, AES256-CBC, AES256-CTR, and AES256-GCM in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **aes128-ctr**: Specifies encryption algorithm AES128-CTR.
- **aes128-gcm**: Specifies encryption algorithm AES128-GCM.
- **aes192-ctr**: Specifies encryption algorithm AES192-CTR.
- **aes256-cbc**: Specifies encryption algorithm AES256-CBC.
- **aes256-ctr**: Specifies encryption algorithm AES256-CTR.
- **aes256-gcm**: Specifies encryption algorithm AES256-GCM.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. The default is SHA2-256. Supported algorithms are MD5, MD5-96, SHA1, SHA1-96, SHA2-256, and SHA2-512 in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.
- **sha2-256**: Specifies HMAC algorithm HMAC-SHA2-256.
- **sha2-512**: Specifies HMAC algorithm HMAC-SHA2-512.

prefer-kex: Specifies the preferred key exchange algorithm. The default is ecdh-sha2-nistp256. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, diffie-hellman-group14-sha1, ecdh-sha2-nistp256, and ecdh-sha2-nistp384, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.
- **ecdh-sha2-nistp256**: Specifies key exchange algorithm ecdh-sha2-nistp256.
- **ecdh-sha2-nistp384**: Specifies key exchange algorithm ecdh-sha2-nistp384.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. The default is AES128-CTR. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. The default is SHA2-256. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

dscp *dscp-value*: Specifies the DSCP value in the IPv6 SFTP packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

public-key *keyname*: Specifies the host public key of the server that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

source: Specifies a source IPv6 address or source interface for IPv6 SFTP packets. By default, the device automatically selects a source address for IPv6 SFTP packets in compliance with RFC 3484. As a best practice to ensure successful SFTP connections, specify a loopback interface as the source interface or specify the IPv6 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IPv6 address of the IPv6 SFTP packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

If the client and the server have negotiated to use certificate authentication, the client must verify the server's certificate. For the client to correctly get the server's certificate, you must specify the server's PKI domain on the client by using the **server-pki-domain** *domain-name* option. The client uses the CA certificate stored in the specified PKI domain to verify the server's certificate and does not need to save the server's public key before authentication. If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

Examples

Connect an SFTP client to SFTP server **2000::1** and specify the public key of the server as **svkey**. The SFTP client uses publickey authentication. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.

- Preferred compression algorithm: **zlib**.

```
<Sysname> sftp ipv6 2000::1 prefer-kex dh-group14-sha1 prefer-stoc-cipher aes128-cbc
prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key svkey
Username:
```

sftp ipv6 suite-b

Use **sftp ipv6 suite-b** to establish a connection to an IPv6 SFTP server based on Suite B algorithms and enter SFTP client view.

Syntax

sftp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

-i *interface-type interface-number:* Specifies an output interface by its type and number for IPv6 SFTP packets. The specified outgoing interface must have a link-local address. This option is used only when the server uses a link-local address to provide the SFTP service for the client.

suite-b: Specifies the Suite B algorithms. If neither the 128-bit keyword nor the 192-bit keyword is specified, all algorithms in Suite B are used. For more information about the Suite B algorithms, see Table 7.

128-bit: Specifies the 128-bit Suite B security level.

192-bit: Specifies the 192-bit Suite B security level.

pki-domain *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes ('). If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

dscp *dscp-value*: Specifies the DSCP value in the IPv6 SFTP packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

source: Specifies a source IP address or source interface for IPv6 SFTP packets. By default, the device automatically selects a source address for IPv6 SFTP packets in compliance with RFC 3484. As a best practice to ensure successful SFTP connections, specify a loopback interface as the source interface or specify the IPv6 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IP address of the IPv6 SFTP packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

Table 7 Suite B algorithms

Security level	Key exchange algorithm	Encryption algorithm and HMAC algorithm	Public key algorithm
128-bit	ecdh-sha2-nistp256	AES128-GCM	x509v3-ecdsa-sha2-nistp256
192-bit	ecdh-sha2-nistp384	AES256-GCM	x509v3-ecdsa-sha2-nistp384
Both	ecdh-sha2-nistp256 ecdh-sha2-nistp384	AES128-GCM AES256-GCM	x509v3-ecdsa-sha2-nistp256 x509v3-ecdsa-sha2-nistp384

Examples

Use the 192-bit Suite B algorithms to establish a connection to SFTP server **2000::1**. Specify the client's PKI domain and the server's PKI domain as **clientpkidomain** and **serverpkidomain**, respectively.

```
<Sysname> sftp ipv6 2000::1 suite-b 192-bit pki-domain clientpkidomain server-pki-domain
serverpkidomain
Username:
```

sftp suite-b

Use **sftp suite-b** to establish a connection to an IPv4 SFTP server based on Suite B algorithms and enter SFTP client view.

Syntax

sftp *server* [*port-number*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

suite-b: Specifies the Suite B algorithms. If neither the 128-bit keyword nor the 192-bit keyword is specified, all algorithms in Suite B are used. For more information about the Suite B algorithms, see Table 8.

128-bit: Specifies the 128-bit Suite B security level.

192-bit: Specifies the 192-bit Suite B security level.

pki-domain *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes ('). If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

dscp *dscp-value*: Specifies the DSCP value in the IPv4 SFTP packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

source: Specifies a source IP address or source interface for the SFTP packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SFTP packets. As a best practice to ensure successful SFTP connections, specify a loopback interface as the source interface or specify the IPv4 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The primary IPv4 address of this interface is the source IPv4 address of the SFTP packets.
- **ip** *ip-address*: Specifies a source IPv4 address.

Usage guidelines

Table 8 Suite B algorithms

Security level	Key exchange algorithm	Encryption algorithm and HMAC algorithm	Public key algorithm
128-bit	ecdh-sha2-nistp256	AES128-GCM	x509v3-ecdsa-sha2-nistp256
192-bit	ecdh-sha2-nistp384	AES256-GCM	x509v3-ecdsa-sha2-nistp384
Both	ecdh-sha2-nistp256 ecdh-sha2-nistp384	AES128-GCM AES256-GCM	x509v3-ecdsa-sha2-nistp256 x509v3-ecdsa-sha2-nistp384

Examples

Use the 128-bit Suite B algorithms to establish a connection to SFTP server **10.1.1.2**. Specify the client's PKI domain and the server's PKI domain as **clientpkidomain** and **serverpkidomain**, respectively.

```
<Sysname> sftp 10.1.1.2 suite-b 128-bit pki-domain clientpkidomain server-pki-domain
serverpkidomain
```

Username

ssh client ipv6 source

Use **ssh client ipv6 source** to configure the source IPv6 address for SSH packets that are sent by the Stelnet client.

Use **undo ssh client ipv6 source** to restore the default.

Syntax

ssh client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

undo ssh client ipv6 source

Default

The source IPv6 address for outgoing SSH packets is not configured. The Stelnet client automatically selects an IPv6 address for outgoing SSH packets in compliance with RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The Stelnet client selects the interface's address that most specifically matches the destination address of outgoing SSH packets as the source address of the SSH packets.

ipv6 *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

This command takes effect on all IPv6 Stelnet connections. The source IPv6 address specified in the **ssh2 ipv6** command takes effect only on the current IPv6 Stelnet connection. If you specify the source IPv6 address both in this command and the **ssh2 ipv6** command, the source IPv6 address specified in the **ssh2 ipv6** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **2:2::2:2** as the source IPv6 address for SSH packets that are sent by the Stelnet client.

```
<Sysname> system-view
[Sysname] ssh client ipv6 source ipv6 2:2::2:2
```

Related commands

display ssh client source

ssh client source

Use **ssh client source** to configure the source IPv4 address for SSH packets that are sent by the Stelnet client.

Use **undo ssh client source** to restore the default.

Syntax

ssh client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

undo ssh client source

Default

The source IPv4 address for outgoing SSH packets is not configured. The Stelnet client uses the primary IPv4 address of the output interface in the matching route as the source address of outgoing SSH packets.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The Stelnet client uses the primary IPv4 address of the interface as the source address of outgoing SSH packets.

ip *ip-address*: Specifies a source IPv4 address.

Usage guidelines

This command takes effect on all Stelnet connections. The source IPv4 address specified in the **ssh2** command takes effect only on the current Stelnet connection. If you specify the source IPv4 address both in this command and the **ssh2** command, the source IPv4 address specified in the **ssh2** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **192.168.0.1** as the source IPv4 address for SSH packets.

```
<Sysname> system-view
[Sysname] ssh client source ip 192.168.0.1
```

Related commands

display ssh client source

ssh2

Use **ssh2** to establish a connection to an IPv4 Stelnet server.

Syntax

In non-FIPS mode:

ssh2 *server* [*port-number*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1**

| **sha1-96** | **sha2-256** | **sha2-512** }] * [**dscp** *dscp-value* | **escape** *character* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

In FIPS mode:

ssh2 *server* [*port-number*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress** **zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**escape** *character* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Predefined user roles

network-admin

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range 1 to 65535. The default is 22.

identity-key: Specifies a public key algorithm for publickey authentication of the client. The default is DSA in non-FIPS mode and is RSA in FIPS mode. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **ecdsa-sha2-nistp256**: Specifies public key algorithm ecdsa-sha2-nistp256.
- **ecdsa-sha2-nistp384**: Specifies public key algorithm ecdsa-sha2-nistp384.
- **rsa**: Specifies public key algorithm RSA.
- **x509v3-ecdsa-sha2-nistp256**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp256.
- **x509v3-ecdsa-sha2-nistp384**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp384.
- **pki-domain** *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument is a case-insensitive string of 1 to 31 characters. When the x509v3 public key algorithm is used, you must specify this option for the client to get the correct local certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. The default is AES128-CTR. Supported algorithms are DES-CBC, 3DES-CBC, AES128-CBC, AES128-CTR, AES128-GCM, AES192-CTR, AES256-CBC, AES256-CTR, and AES256-GCM in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **aes128-ctr**: Specifies encryption algorithm AES128-CTR.
- **aes128-gcm**: Specifies encryption algorithm AES128-GCM.
- **aes192-ctr**: Specifies encryption algorithm AES192-CTR.
- **aes256-cbc**: Specifies encryption algorithm AES256-CBC.
- **aes256-ctr**: Specifies encryption algorithm AES256-CTR.
- **aes256-gcm**: Specifies encryption algorithm AES256-GCM.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. The default is SHA2-256. Supported algorithms are MD5, MD5-96, SHA1, SHA1-96, SHA2-256, and SHA2-512 in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.
- **sha2-256**: Specifies HMAC algorithm HMAC-SHA2-256.
- **sha2-512**: Specifies HMAC algorithm HMAC-SHA2-512.

prefer-kex: Specifies the preferred key exchange algorithm. The default is ecdh-sha2-nistp256. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, diffie-hellman-group14-sha1, ecdh-sha2-nistp256, and ecdh-sha2-nistp384, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.
- **ecdh-sha2-nistp256**: Specifies key exchange algorithm ecdh-sha2-nistp256.
- **ecdh-sha2-nistp384**: Specifies key exchange algorithm ecdh-sha2-nistp384.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. The default is AES128-CTR. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. The default is SHA2-256. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

dscp *dscp-value*: Specifies the DSCP value in the IPv4 SSH packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

escape *character*: Specifies a case-sensitive escape character. By default, the escape character is a tilde (~).

public-key *keyname*: Specifies the host public key of the server that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive

string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

source: Specifies a source IPv4 address or source interface for SSH packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SSH packets. As a best practice to ensure successful Stelnet connections, specify a loopback interface as the source interface or specify the IPv4 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The primary IPv4 address of this interface is the source IPv4 address of the SSH packets.
- **ip** *ip-address*: Specifies a source IPv4 address.

Usage guidelines

The combination of an escape character and a dot (.) works as an escape sequence. This escape sequence is typically used to quickly terminate an SSH connection when the server reboots or malfunctions.

For the escape sequence to take effect, you must enter it at the very beginning of a line. If you have entered other characters or performed operations in a line, enter the escape sequence in the next line.

As a best practice, use the default escape character (~). Do not use any character in SSH usernames as the escape character.

If the client and the server have negotiated to use certificate authentication, the client must verify the server's certificate. For the client to correctly get the server's certificate, you must specify the server's PKI domain on the client by using the **server-pki-domain** *domain-name* option. The client uses the CA certificate stored in the specified PKI domain to verify the server's certificate and does not need to save the server's public key before authentication. If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

Examples

Establish a connection to Stelnet server **3.3.3.3** and specify the public key of the server as **svkey**. The Stelnet client uses publickey authentication. Specify the dollar sign ($) as the escape character. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Sysname> ssh2 3.3.3.3 prefer-kex dh-group14-sha1 prefer-stoc-cipher aes128-cbc
prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key svkey
escape $
```

ssh2 ipv6

Use **ssh2 ipv6** to establish a connection to an IPv6 Stelnet server.

Syntax

In non-FIPS mode:

ssh2 ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** |

aes128-cbc | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**dscp** *dscp-value* | **escape** *character* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

In FIPS mode:

ssh2 ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**escape** *character* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range 1 to 65535. The default is 22.

-i *interface-type interface-number:* Specifies an output interface by its type and number for IPv6 SSH packets. This option is used only when the server uses a link-local address to provide the Stelnet service for the client. The specified output interface on the Stelnet client must have a link-local address.

identity-key: Specifies a public key algorithm for publickey authentication of the client. The default is DSA in non-FIPS mode and is RSA in FIPS mode. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **ecdsa-sha2-nistp256**: Specifies public key algorithm ecdsa-sha2-nistp256.
- **ecdsa-sha2-nistp384**: Specifies public key algorithm ecdsa-sha2-nistp384.
- **rsa**: Specifies public key algorithm RSA.
- **x509v3-ecdsa-sha2-nistp256**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp256.
- **x509v3-ecdsa-sha2-nistp384**: Specifies public key algorithm x509v3-ecdsa-sha2-nistp384.

- **pki-domain** *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument is a case-insensitive string of 1 to 31 characters. When the x509v3 public key algorithm is used, you must specify this option for the client to get the correct local certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. The default is AES128-CTR. Supported algorithms are DES-CBC, 3DES-CBC, AES128-CBC, AES128-CTR, AES128-GCM, AES192-CTR, AES256-CBC, AES256-CTR, and AES256-GCM in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **aes128-ctr**: Specifies encryption algorithm AES128-CTR.
- **aes128-gcm**: Specifies encryption algorithm AES128-GCM.
- **aes192-ctr**: Specifies encryption algorithm AES192-CTR.
- **aes256-cbc**: Specifies encryption algorithm AES256-CBC.
- **aes256-ctr**: Specifies encryption algorithm AES256-CTR.
- **aes256-gcm**: Specifies encryption algorithm AES256-GCM.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. The default is SHA2-256. Supported algorithms are MD5, MD5-96, SHA1, SHA1-96, SHA2-256, and SHA2-512 in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.
- **sha2-256**: Specifies HMAC algorithm HMAC-SHA2-256.
- **sha2-512**: Specifies HMAC algorithm HMAC-SHA2-512.

prefer-kex: Specifies the preferred key exchange algorithm. The default is ecdh-sha2-nistp256. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, diffie-hellman-group14-sha1, ecdh-sha2-nistp256, and ecdh-sha2-nistp384, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.
- **ecdh-sha2-nistp256**: Specifies key exchange algorithm ecdh-sha2-nistp256.
- **ecdh-sha2-nistp384**: Specifies key exchange algorithm ecdh-sha2-nistp384.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. The default is AES128-CTR. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. The default is SHA2-256. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

dscp *dscp-value*: Specifies the DSCP value in the IPv6 SSH packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

escape *character*: Specifies a case-sensitive escape character. By default, the escape character is a tilde (~).

public-key *keyname*: Specifies the server by its host public key that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

source: Specifies a source IPv6 address or source interface for IPv6 SSH packets. By default, the device automatically selects a source address for IPv6 SSH packets in compliance with RFC 3484. As a best practice to ensure successful Stelnet connections, specify a loopback interface as the source interface or specify the IPv6 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IPv6 address of the IPv6 SSH packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

The combination of an escape character and a dot (.) works as an escape sequence. This escape sequence is typically used to quickly terminate an SSH connection when the server reboots or malfunctions.

For the escape sequence to take effect, you must enter it at the very beginning of a line. If you have entered other characters or performed operations in a line, enter the escape sequence in the next line.

As a best practice, use the default escape character (~). Do not use any characters in SSH usernames as the escape character.

If the client and the server have negotiated to use certificate authentication, the client must verify the server's certificate. For the client to correctly get the server's certificate, you must specify the server's PKI domain on the client by using the **server-pki-domain** *domain-name* option. The client uses the CA certificate stored in the specified PKI domain to verify the server's certificate and does not need to save the server's public key before authentication. If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

Examples

Establish a connection to Stelnet server **2000::1** and specify the public key of the server as **svkey**. The SSH client uses publickey authentication. Specify the dollar sign ($) as the escape character. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Sysname> ssh2 ipv6 2000::1 prefer-kex dh-group14-sha1 prefer-stoc-cipher aes128-cbc
prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key svkey
escape $
```

ssh2 ipv6 suite-b

Use **ssh2 ipv6 suite-b** to establish a connection to an IPv6 Stelnet server based on Suite B algorithms.

Syntax

ssh2 ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**dscp** *dscp-value* | **escape** *character* | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range 1 to 65535. The default is 22.

-i *interface-type interface-number:* Specifies an output interface by its type and number for IPv6 SSH packets. Specify this option when the server uses a link-local address to provide the Stelnet service for the client. The specified output interface on the Stelnet client must have a link-local address.

suite-b: Specifies the Suite B algorithms. If neither the 128-bit keyword nor the 192-bit keyword is specified, all algorithms in Suite B are used. For more information about the Suite B algorithms, see Table 9.

128-bit: Specifies the 128-bit Suite B security level.

192-bit: Specifies the 192-bit Suite B security level.

pki-domain *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes ('). If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

dscp *dscp-value*: Specifies the DSCP value in the IPv6 SSH packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

escape *character*: Specifies a case-sensitive escape character. By default, the escape character is a tilde (~).

source: Specifies a source IP address or source interface for IPv6 SSH packets. By default, the device automatically selects a source address for IPv6 SSH packets in compliance with RFC 3484. As a best practice to ensure successful Stelnet connections, specify a loopback interface as the source interface or specify the IPv6 address of a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IP address of the IPv6 SSH packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

Table 9 Suite B algorithms

Security level	Key exchange algorithm	Encryption algorithm and HMAC algorithm	Public key algorithm
128-bit	ecdh-sha2-nistp256	AES128-GCM	x509v3-ecdsa-sha2-nistp256
192-bit	ecdh-sha2-nistp384	AES256-GCM	x509v3-ecdsa-sha2-nistp384
Both	ecdh-sha2-nistp256 ecdh-sha2-nistp384	AES128-GCM AES256-GCM	x509v3-ecdsa-sha2-nistp256 x509v3-ecdsa-sha2-nistp384

The combination of an escape character and a dot (.) works as an escape sequence. This escape sequence is typically used to quickly terminate an SSH connection when the server reboots or malfunctions.

For the escape sequence to take effect, you must enter it at the very beginning of a line. If you have entered other characters or performed operations in a line, enter the escape sequence in the next line. As a best practice, use the default escape character (~). Do not use any character in SSH usernames as the escape character.

Examples

Use the 192-bit Suite B algorithms to establish a connection to Stelnet server **2000::1**. Specify the client's PKI domain and the server's PKI domain as **clientpkidomain** and **serverpkidomain**, respectively.

```
<Sysname> ssh2 ipv6 2000::1 suite-b 192-bit pki-domain clientpkidomain server-pki-domain
serverpkidomain
Username
```

ssh2 suite-b

Use **ssh2 suite-b** to establish a connection to an IPv4 Stelnet server based on Suite B algorithms.

Syntax

ssh2 *server* [*port-number*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**dscp** *dscp-value* | **escape** *character* | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Views

User view

Predefined user roles

network-admin

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range 1 to 65535. The default is 22.

suite-b: Specifies the Suite B algorithms. If neither the 128-bit keyword nor the 192-bit keyword is specified, all algorithms in Suite B are used. For more information about the Suite B algorithms, see Table 10.

128-bit: Specifies the 128-bit Suite B security level.

192-bit: Specifies the 192-bit Suite B security level.

pki-domain *domain-name*: Specifies the PKI domain of the client's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes (').

server-pki-domain *domain-name*: Specifies the PKI domain for verifying the server's certificate. The *domain-name* argument represents the PKI domain name, a case-insensitive string of 1 to 31 characters. Invalid characters are tildes (~), asterisks (*), backslashes (\), vertical bars (|), colons (:), dots (.), angle brackets (< >), quotation marks ("), and apostrophes ('). If you do not specify the server's PKI domain, the client uses the PKI domain of its own certificate to verify the server's certificate.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

dscp *dscp-value*: Specifies the DSCP value in the IPv4 SSH packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

escape *character*: Specifies a case-sensitive escape character. By default, the escape character is a tilde (~).

source: Specifies a source IP address or source interface for SSH packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SSH packets. As a best practice to ensure successful Stelnet connections, specify a loopback interface as the source interface or specify the IPv4 address a loopback interface as the source address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The primary IPv4 address of this interface is the source IPv4 address of the SSH packets.
- **ip** *ip-address*: Specifies a source IPv4 address.

Usage guidelines

Table 10 Suite B algorithms

Security level	Key exchange algorithm	Encryption algorithm and HMAC algorithm	Public key algorithm
128-bit	ecdh-sha2-nistp256	AES128-GCM	x509v3-ecdsa-sha2-nistp256
192-bit	ecdh-sha2-nistp384	AES256-GCM	x509v3-ecdsa-sha2-nistp384
Both	ecdh-sha2-nistp256	AES128-GCM	x509v3-ecdsa-sha2-nistp256

Security level	Key exchange algorithm	Encryption algorithm and HMAC algorithm	Public key algorithm
	ecdh-sha2-nistp384	AES256-GCM	x509v3-ecdsa-sha2-nistp384

The combination of an escape character and a dot (.) works as an escape sequence. This escape sequence is typically used to quickly terminate an SSH connection when the server reboots or malfunctions.

For the escape sequence to take effect, you must enter it at the very beginning of a line. If you have entered other characters or performed operations in a line, enter the escape sequence in the next line. As a best practice, use the default escape character (~). Do not use any character in SSH usernames as the escape character.

Examples

Use the 128-bit Suite B algorithms to establish a connection to Stelnet server **3.3.3.3**. Specify the client's PKI domain and the server's PKI domain as **clientpkidomain** and **serverpkidomain**, respectively.

```
<Sysname> ssh2 3.3.3.3 suite-b 128-bit pki-domain clientpkidomain server-pki-domain
serverpkidomain
Username
```

ssh2 algorithm mac

ssh2 algorithm public-key

ssh2 algorithm cipher

Use **ssh2 algorithm cipher** to specify encryption algorithms for SSH2.

Use **undo ssh2 algorithm cipher** to restore the default.

Syntax

In non-FIPS mode:

ssh2 algorithm cipher { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } *

undo ssh2 algorithm cipher

In FIPS mode:

ssh2 algorithm cipher { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } *

undo ssh2 algorithm cipher

Default

SSH2 uses encryption algorithms AES128-CTR, AES192-CTR, AES256-CTR, AES128-GCM, AES256-GCM, AES128-CBC, 3DES-CBC, AES256-CBC, and DES-CBC in descending order of priority for algorithm negotiation.

Views

System view

Predefined user roles

network-admin

Parameters

3des-cbc: Specifies encryption algorithm 3DES-CBC.

aes128-cbc: Specifies encryption algorithm AES128-CBC.

aes128-ctr: Specifies encryption algorithm AES128-CTR.

aes128-gcm: Specifies encryption algorithm AES128-GCM.

aes192-ctr: Specifies encryption algorithm AES192-CTR.

aes256-cbc: Specifies encryption algorithm AES256-CBC.

aes256-ctr: Specifies encryption algorithm AES256-CTR.

aes256-gcm: Specifies encryption algorithm AES256-GCM.

des-cbc: Specifies encryption algorithm DES-CBC.

Usage guidelines

If you specify the encryption algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The algorithm specified earlier has a higher priority during negotiation.

Examples

Specify algorithm **aes256-cbc** as the encryption algorithm for SSH2.

```
<Sysname> system-view
[Sysname] ssh2 algorithm cipher aes256-cbc
```

ssh2 algorithm mac

ssh2 algorithm public-key

ssh2 algorithm key-exchange

Use **ssh2 algorithm key-exchange** to specify key exchange algorithms for SSH2.

Use **undo ssh2 algorithm key-exchange** to restore the default.

Syntax

In non-FIPS mode:

ssh2 algorithm key-exchange { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } *

undo ssh2 algorithm key-exchange

In FIPS mode:

ssh2 algorithm key-exchange { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } *

undo ssh2 algorithm key-exchange

Default

SSH2 uses key exchange algorithms ecdh-sha2-nistp256, ecdh-sha2-nistp384, diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1, and diffie-hellman-group1-sha1 in descending order of priority for algorithm negotiation.

Views

System view

Predefined user roles

network-admin

Parameters

dh-group-exchange-sha1: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.

dh-group1-sha1: Specifies key exchange algorithm diffie-hellman-group1-sha1.

dh-group14-sha1: Specifies key exchange algorithm diffie-hellman-group14-sha1.

ecdh-sha2-nistp256: Specifies key exchange algorithm ecdh-sha2-nistp256.

ecdh-sha2-nistp384: Specifies key exchange algorithm ecdh-sha2-nistp384.

Usage guidelines

If you specify the key exchange algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The algorithm specified earlier has a higher priority during negotiation.

Examples

Specify algorithm **dh-group1-sha1** as the key exchange algorithm for SSH2.

```
<Sysname> system-view
[Sysname] ssh2 algorithm key-exchange dh-group1-sha1
```

Related commands

display ssh2 algorithm

ssh2 algorithm cipher

ssh2 algorithm mac

ssh2 algorithm public-key

ssh2 algorithm mac

Use **ssh2 algorithm mac** to specify HMAC algorithms for SSH2.

Use **undo ssh2 algorithm mac** to restore the default.

Syntax

In non-FIPS mode:

ssh2 algorithm mac { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } *

undo ssh2 algorithm mac

In FIPS mode:

ssh2 algorithm mac { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } *

undo ssh2 algorithm mac

Default

SSH2 uses HMAC algorithms SHA2-256, SHA2-512, SHA1, MD5, SHA1-96, and MD5-96 in descending order of priority for algorithm negotiation.

Views

System view

Predefined user roles

network-admin

Parameters

md5: Specifies HMAC algorithm HMAC-MD5.

md5-96: Specifies HMAC algorithm HMAC-MD5-96.

sha1: Specifies HMAC algorithm HMAC-SHA1.

sha1-96: Specifies HMAC algorithm HMAC-SHA1-96.

sha2-256: Specifies HMAC algorithm HMAC-SHA2-256.

sha2-512: Specifies HMAC algorithm HMAC-SHA2-512.

Usage guidelines

If you specify the HMAC algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The algorithm specified earlier has a higher priority during negotiation.

Examples

Specify algorithm **md5** as the HMAC algorithm for SSH2.

```
<Sysname> system-view
[Sysname] ssh2 algorithm mac md5
```

display ssh2 algorithm

ssh2 algorithm cipher

ssh2 algorithm key-exchange

ssh2 algorithm public-key

ssh2 algorithm public-key

Use **ssh2 algorithm public-key** to specify public key algorithms for SSH2.

Use **undo ssh2 algorithm public-key** to restore the default.

Syntax

In non-FIPS mode:

ssh2 algorithm public-key { dsa | ecdsa-sha2-nistp256 | ecdsa-sha2-nistp384 | rsa | x509v3-ecdsa-sha2-nistp256 | x509v3-ecdsa-sha2-nistp384 } *

undo ssh2 algorithm public-key

In FIPS mode:

ssh2 algorithm public-key { ecdsa-sha2-nistp256 | ecdsa-sha2-nistp384 | rsa | x509v3-ecdsa-sha2-nistp256 | x509v3-ecdsa-sha2-nistp384 } *

undo ssh2 algorithm public-key

Default

SSH2 uses public key algorithms x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384, ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, RSA, and DSA in descending order of priority for algorithm negotiation.

Views

System view

Predefined user roles

network-admin

Parameters

dsa: Specifies public key algorithm DSA.

ecdsa-sha2-nistp256: Specifies public key algorithm ecdsa-sha2-nistp256.

ecdsa-sha2-nistp384: Specifies public key algorithm ecdsa-sha2-nistp384.

rsa: Specifies public key algorithm RSA.

x509v3-ecdsa-sha2-nistp256: Specifies public key algorithm x509v3-ecdsa-sha2-nistp256.

x509v3-ecdsa-sha2-nistp384: Specifies public key algorithm x509v3-ecdsa-sha2-nistp384.

Usage guidelines

If you specify the public key algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The algorithm specified earlier has a higher priority during negotiation.

Examples

Specify algorithm **dsa** as the public key algorithm for SSH2.

```
<Sysname> system-view
[Sysname] ssh2 algorithm public-key dsa
```

Contents

SSL commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

certificate-chain-sending enable

Use **certificate-chain-sending enable** to enable the SSL server to send the complete certificate chain to the client during SSL negotiation.

Use **undo certificate-chain-sending enable** to restore the default.

Syntax

certificate-chain-sending enable

undo certificate-chain-sending enable

Default

During SSL negotiation, the SSL server sends the server certificate rather than the complete certificate chain to the client.

Views

SSL server policy view

Predefined user roles

network-admin

Usage guidelines

This feature causes additional overheads in the SSL negotiation process. Enable it only when the SSL client does not have the complete certificate chain to verify the server certificate.

Examples

Enable the SSL server to send the complete certificate chain to the client during SSL negotiation.

```
<Sysname> system-view
[Sysname] ssl server-policy policy1
[Sysname-ssl-server-policy-policy1] certificate-chain-sending enable
```

Related commands

display ssl server-policy

ciphersuite

Use **ciphersuite** to specify the cipher suites supported by an SSL server policy.

Use **undo ciphersuite** to restore the default.

Syntax

In non-FIPS mode:

ciphersuite { dhe_rsa_aes_128_cbc_sha | dhe_rsa_aes_128_cbc_sha256 | dhe_rsa_aes_256_cbc_sha | dhe_rsa_aes_256_cbc_sha256 | ecdhe_ecdsa_aes_128_cbc_sha256 | ecdhe_ecdsa_aes_128_gcm_sha256 | ecdhe_ecdsa_aes_256_cbc_sha384 | ecdhe_ecdsa_aes_256_gcm_sha384 | ecdhe_rsa_aes_128_cbc_sha256 | ecdhe_rsa_aes_128_gcm_sha256 |

ecdhe_rsa_aes_256_cbc_sha384 | **ecdhe_rsa_aes_256_gcm_sha384** | **exp_rsa_des_cbc_sha** | **exp_rsa_rc2_md5** | **exp_rsa_rc4_md5** | **rsa_3des_ede_cbc_sha** | **rsa_aes_128_cbc_sha** | **rsa_aes_128_cbc_sha256** | **rsa_aes_256_cbc_sha** | **rsa_aes_256_cbc_sha256** | **rsa_des_cbc_sha** | **rsa_rc4_128_md5** | **rsa_rc4_128_sha** } *

undo ciphersuite

In FIPS mode:

ciphersuite { **ecdhe_ecdsa_aes_128_cbc_sha256** | **ecdhe_ecdsa_aes_256_cbc_sha384** | **ecdhe_ecdsa_aes_128_gcm_sha256** | **ecdhe_ecdsa_aes_256_gcm_sha384** | **ecdhe_rsa_aes_128_cbc_sha256** | **ecdhe_rsa_aes_128_gcm_sha256** | **ecdhe_rsa_aes_256_cbc_sha384** | **ecdhe_rsa_aes_256_gcm_sha384** | **rsa_aes_128_cbc_sha** | **rsa_aes_128_cbc_sha256** | **rsa_aes_256_cbc_sha** | **rsa_aes_256_cbc_sha256** } *

undo ciphersuite

Default

An SSL server policy supports all cipher suites.

Views

Parameters

dhe_rsa_aes_128_cbc_sha: Specifies the cipher suite that uses key exchange algorithm DHE RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA.

dhe_rsa_aes_128_cbc_sha256: Specifies the cipher suite that uses key exchange algorithm DHE RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA256.

dhe_rsa_aes_256_cbc_sha: Specifies the cipher suite that uses key exchange algorithm DHE RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA.

dhe_rsa_aes_256_cbc_sha256: Specifies the cipher suite that uses key exchange algorithm DHE RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA256.

ecdhe_ecdsa_aes_128_cbc_sha256: Specifies the cipher suite that uses key exchange algorithm ECDHE ECDSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA256.

ecdhe_ecdsa_aes_128_gcm_sha256: Specifies the cipher suite that uses key exchange algorithm ECDHE ECDSA, data encryption algorithm 128-bit AES_GCM, and MAC algorithm SHA256.

ecdhe_ecdsa_aes_256_cbc_sha384: Specifies the cipher suite that uses key exchange algorithm ECDHE ECDSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA384.

ecdhe_ecdsa_aes_256_gcm_sha384: Specifies the cipher suite that uses key exchange algorithm ECDHE ECDSA, data encryption algorithm 256-bit AES_GCM, and MAC algorithm SHA384.

ecdhe_rsa_aes_128_cbc_sha256: Specifies the cipher suite that uses key exchange algorithm ECDHE RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA256.

ecdhe_rsa_aes_128_gcm_sha256: Specifies the cipher suite that uses key exchange algorithm ECDHE RSA, data encryption algorithm 128-bit AES_GCM, and MAC algorithm SHA256.

ecdhe_rsa_aes_256_cbc_sha384: Specifies the cipher suite that uses key exchange algorithm ECDHE RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA384.

ecdhe_rsa_aes_256_gcm_sha384: Specifies the cipher suite that uses key exchange algorithm ECDHE RSA, data encryption algorithm 256-bit AES_GCM, and MAC algorithm SHA384.

exp_rsa_des_cbc_sha: Specifies the export cipher suite that uses key exchange algorithm RSA, data encryption algorithm DES_CBC, and MAC algorithm SHA.

exp_rsa_rc2_md5: Specifies the export cipher suite that uses key exchange algorithm RSA, data encryption algorithm RC2, and MAC algorithm MD5.

exp_rsa_rc4_md5: Specifies the export cipher suite that uses key exchange algorithm RSA, data encryption algorithm RC4, and MAC algorithm MD5.

rsa_3des_ede_cbc_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 3DES_EDE_CBC, and MAC algorithm SHA.

rsa_aes_128_cbc_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA.

rsa_aes_128_cbc_ sha256: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA256.

rsa_aes_256_cbc_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA.

rsa_aes_256_cbc_ sha256: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA256.

rsa_des_cbc_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm DES_CBC, and MAC algorithm SHA.

rsa_rc4_128_md5: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 128-bit RC4, and MAC algorithm MD5.

rsa_rc4_128_sha: Specifies key exchange algorithm RSA, data encryption algorithm 128-bit RC4, and MAC algorithm SHA.

Usage guidelines

SSL employs the following algorithms:

- **Data encryption algorithms**—Encrypt data to ensure privacy. Commonly used data encryption algorithms are symmetric key algorithms. When a symmetric key algorithm is used, the SSL server and the SSL client must use the same key.
- **Message Authentication Code (MAC) algorithms**—Calculate the MAC value for data to ensure integrity. Commonly used MAC algorithms include MD5 and SHA. When a MAC algorithm is used, the SSL server and the SSL client must use the same key.
- **Key exchange algorithms**—Implement secure exchange of the keys used by the symmetric key algorithm and the MAC algorithm. Commonly used key exchange algorithms are usually asymmetric key algorithms, such as RSA.

After the SSL server receives a cipher suite from a client, the server matches the received cipher suite against the cipher suits it supports. If a match is found, the cipher suite negotiation succeeds. Otherwise, the negotiation fails.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure SSL server policy **policy1** to support the following cipher suites:

- Key exchange algorithm DHE RSA, data encryption algorithm 128-bit AES, and MAC algorithm SHA.
- Key exchange algorithm RSA, data encryption algorithm 128-bit AES, and MAC algorithm SHA.

```
<Sysname> system-view
[Sysname] ssl server-policy policy1
[Sysname-ssl-server-policy-policy1] ciphersuite dhe_rsa_aes_128_cbc_sha
rsa_aes_128_cbc_sha
```

Related commands

display ssl server-policy

prefer-cipher

client-verify

Use **client-verify** to enable mandatory or optional SSL client authentication.

Use **undo client-verify** to restore the default.

Syntax

client-verify { **enable** | **optional** }

undo client-verify [**enable**]

Default

SSL client authentication is disabled. The SSL server does not authenticate SSL clients based on digital certificates.

Views

SSL server policy view

Predefined user roles

network-admin

Parameters

enable: Enables mandatory SSL client authentication.

optional: Enables optional SSL client authentication.

Usage guidelines

SSL uses digital certificates to authenticate communicating parties. For more information about digital certificates, see *Security Configuration Guide*.

Mandatory SSL client authentication—The SSL server requires an SSL client to submit its digital certificate for identity authentication. The SSL client can access the SSL server only after it passes identity authentication.

Optional SSL client authentication—The SSL server does not require an SSL client to submit its digital certificate for identity authentication.

- If an SSL client submits its certificate to the SSL server, the server authenticates the client identity. The client must pass authentication to access the server.
- If an SSL client does not submit its certificate to the SSL server, the server does not authenticate the client identity. The client can access the SSL server without authentication.

If SSL client authentication is disabled, the SSL server does not authenticate SSL clients regardless of whether the clients submit digital certificates or not. SSL clients can access the SSL server without authentication.

When authenticating a client by using the digital certificate, the SSL server performs the following operations:

- Verifies the certificate chain presented by the client.

- Checks that the certificates in the certificate chain (except the root CA certificate) are not revoked.

Examples

Enable mandatory SSL client authentication.

```
<Sysname> system-view
[Sysname] ssl server-policy policy1
[Sysname-ssl-server-policy-policy1] client-verify enable
```

Enable optional SSL client authentication.

```
<Sysname> system-view
[Sysname] ssl server-policy policy1
[Sysname-ssl-server-policy-policy1] client-verify optional
```

Disable SSL client authentication.

```
<Sysname> system-view
[Sysname] ssl server-policy policy1
[Sysname-ssl-server-policy-policy1] undo client-verify
```

Related commands

display ssl server-policy

display ssl client-policy

Use **display ssl client-policy** to display SSL client policy information.

Syntax

display ssl client-policy [*policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

policy-name: Specifies an SSL client policy by its name, a case-insensitive string of 1 to 31 characters. If you do not specify a policy name, this command displays information about all SSL client policies.

Examples

Display information about the SSL client policy **policy1**.

```
<Sysname> display ssl client-policy policy1
 SSL client policy: policy1
     SSL version: SSL 3.0
     PKI domain: client-domain
     Preferred ciphersuite:
         RSA_AES_128_CBC_SHA
     Server-verify: enabled
```

Table 1 Command output

Field	Description
Server-verify	Indicates whether the client is enabled to use digital certificates to authenticate servers.

display ssl server-policy

Use **display ssl server-policy** to display SSL server policy information.

Syntax

display ssl server-policy [*policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

policy-name: Specifies an SSL server policy by its name, a case-insensitive string of 1 to 31 characters. If you do not specify a policy name, this command displays information about all SSL server policies.

Examples

Display information about the SSL server policy **policy1**.

```
<Sysname> display ssl server-policy policy1
 SSL server policy: policy1
     PKI domain: server-domain
     Ciphersuites:
         DHE_RSA_AES_128_CBC_SHA
         RSA_AES_128_CBC_SHA
     Session cache size: 600
     Caching timeout: 3600 seconds
     Client-verify: Enabled
     Certificate chain sending: Enabled
```

Table 2 Command output

Field	Description
Caching timeout	Session cache timeout time in seconds.
Client-verify	SSL client authentication mode, including: • **Disabled**—SSL client authentication is disabled. • **Enabled**—SSL client authentication is mandatory. • **Optional**—SSL client authentication is optional.
Certificate chain sending	Whether the SSL server is enabled to send the complete certificate chain to the client during SSL negotiation.

pki-domain (SSL client policy view)

Use **pki-domain** to specify a PKI domain for an SSL client policy.

Use **undo pki-domain** to restore the default.

Syntax

pki-domain *domain-name*

undo pki-domain

Default

No PKI domain is specified for an SSL client policy.

Views

SSL client policy view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you specify a PKI domain for an SSL client policy, the SSL client that uses the SSL client policy will obtain its digital certificate through the specified PKI domain.

Examples

Specify PKI domain **client-domain** for SSL client policy **policy1**.

```
<Sysname> system-view
[Sysname] ssl client-policy policy1
[Sysname-ssl-client-policy-policy1] pki-domain client-domain
```

Related commands

display ssl client-policy

pki domain

pki-domain (SSL server policy view)

Use **pki-domain** to specify a PKI domain for an SSL server policy.

Use **undo pki-domain** to restore the default.

Syntax

pki-domain *domain-name*

undo pki-domain

Default

No PKI domain is specified for an SSL server policy.

Views

SSL server policy view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you specify a PKI domain for an SSL server policy, the SSL server that uses the SSL server policy will obtain its digital certificate through the specified PKI domain.

Examples

Specify PKI domain **server-domain** for SSL server policy **policy1**.

```
<Sysname> system-view
[Sysname] ssl server-policy policy1
[Sysname-ssl-server-policy-policy1] pki-domain server-domain
```

pki domain

prefer-cipher

Use **prefer-cipher** to specify a preferred cipher suite for an SSL client policy.

Use **undo prefer-cipher** to restore the default.

Syntax

In non-FIPS mode:

prefer-cipher { **dhe_rsa_aes_128_cbc_sha** | **dhe_rsa_aes_128_cbc_sha256** | **dhe_rsa_aes_256_cbc_sha** | **dhe_rsa_aes_256_cbc_sha256** | **ecdhe_ecdsa_aes_128_cbc_sha256** | **ecdhe_ecdsa_aes_128_gcm_sha256** | **ecdhe_ecdsa_aes_256_cbc_sha384** | **ecdhe_ecdsa_aes_256_gcm_sha384** | **ecdhe_rsa_aes_128_cbc_sha256** | **ecdhe_rsa_aes_128_gcm_sha256** | **ecdhe_rsa_aes_256_cbc_sha384** | **ecdhe_rsa_aes_256_gcm_sha384** | **exp_rsa_des_cbc_sha** | **exp_rsa_rc2_md5** | **exp_rsa_rc4_md5** | **rsa_3des_ede_cbc_sha** | **rsa_aes_128_cbc_sha** | **rsa_aes_128_cbc_sha256** | **rsa_aes_256_cbc_sha** | **rsa_aes_256_cbc_sha256** | **rsa_des_cbc_sha** | **rsa_rc4_128_md5** | **rsa_rc4_128_sha** }

undo prefer-cipher

In FIPS mode:

prefer-cipher { **ecdhe_ecdsa_aes_128_cbc_sha256** | **ecdhe_ecdsa_aes_128_gcm_sha256** | **ecdhe_ecdsa_aes_256_cbc_sha384** | **ecdhe_ecdsa_aes_256_gcm_sha384** | **ecdhe_rsa_aes_128_cbc_sha256** | **ecdhe_rsa_aes_128_gcm_sha256** | **ecdhe_rsa_aes_256_cbc_sha384** | **ecdhe_rsa_aes_256_gcm_sha384** | **rsa_aes_128_cbc_sha** | **rsa_aes_128_cbc_sha256** | **rsa_aes_256_cbc_sha** | **rsa_aes_256_cbc_sha256** }

undo prefer-cipher

Default

In non-FIPS mode:

The preferred cipher suite of an SSL client policy is **rsa_rc4_128_md5**.

In FIPS mode:

The preferred cipher suite of an SSL client policy is **rsa_aes_128_cbc_sha**.

Views

SSL client policy view

Predefined user roles

network-admin

Parameters

dhe_rsa_aes_128_cbc_sha: Specifies the cipher suite that uses key exchange algorithm DHE RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA.

dhe_rsa_aes_128_cbc_sha256: Specifies the cipher suite that uses key exchange algorithm DHE RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA256.

dhe_rsa_aes_256_cbc_sha: Specifies the cipher suite that uses key exchange algorithm DHE RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA.

dhe_rsa_aes_256_cbc_sha256: Specifies the cipher suite that uses key exchange algorithm DHE RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA256.

ecdhe_ecdsa_aes_128_cbc_sha256: Specifies the cipher suite that uses key exchange algorithm ECDHE ECDSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA256.

ecdhe_ecdsa_aes_128_gcm_sha256: Specifies the cipher suite that uses key exchange algorithm ECDHE ECDSA, data encryption algorithm 128-bit AES_GCM, and MAC algorithm SHA256.

ecdhe_ecdsa_aes_256_cbc_sha384: Specifies the cipher suite that uses key exchange algorithm ECDHE ECDSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA384.

ecdhe_ecdsa_aes_256_gcm_sha384: Specifies the cipher suite that uses key exchange algorithm ECDHE ECDSA, data encryption algorithm 256-bit AES_GCM, and MAC algorithm SHA384.

ecdhe_rsa_aes_128_cbc_sha256: Specifies the cipher suite that uses key exchange algorithm ECDHE RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA256.

ecdhe_rsa_aes_128_gcm_sha256: Specifies the cipher suite that uses key exchange algorithm ECDHE RSA, data encryption algorithm 128-bit AES_GCM, and MAC algorithm SHA256.

ecdhe_rsa_aes_256_cbc_sha384: Specifies the cipher suite that uses key exchange algorithm ECDHE RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA384.

ecdhe_rsa_aes_256_gcm_sha384: Specifies the cipher suite that uses key exchange algorithm ECDHE RSA, data encryption algorithm 256-bit AES_GCM, and MAC algorithm SHA384.

exp_rsa_des_cbc_sha: Specifies the export cipher suite that uses key exchange algorithm RSA, data encryption algorithm DES_CBC, and MAC algorithm SHA.

exp_rsa_rc2_md5: Specifies the export cipher suite that uses key exchange algorithm RSA, data encryption algorithm RC2, and MAC algorithm MD5.

exp_rsa_rc4_md5: Specifies the export cipher suite that uses key exchange algorithm RSA, data encryption algorithm RC4, and MAC algorithm MD5.

rsa_3des_ede_cbc_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 3DES_EDE_CBC, and MAC algorithm SHA.

rsa_aes_128_cbc_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA.

rsa_aes_128_cbc_ sha256: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA256.

rsa_aes_256_cbc_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA.

rsa_aes_256_cbc_ sha256: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 256-bit AES_CBC, and MAC algorithm SHA256.

rsa_des_cbc_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm DES_CBC, and MAC algorithm SHA.

rsa_rc4_128_md5: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 128-bit RC4, and MAC algorithm MD5.

rsa_rc4_128_sha: Specifies the cipher suite that uses key exchange algorithm RSA, data encryption algorithm 128-bit RC4, and MAC algorithm SHA.

Usage guidelines

SSL employs the following algorithms:

- **Data encryption algorithms**—Encrypt data to ensure privacy. Commonly used data encryption algorithms are usually symmetric key algorithms. When using a symmetric key algorithm, the SSL server and the SSL client must use the same key.
- **Message Authentication Code (MAC) algorithms**—Calculate the MAC value for data to ensure integrity. Commonly used MAC algorithms include MD5 and SHA. When using a MAC algorithm, the SSL server and the SSL client must use the same key.
- **Key exchange algorithms**—Implement secure exchange of the keys used by the symmetric key algorithm and MAC algorithm. Commonly used key exchange algorithms are asymmetric key algorithms, such as RSA.

The SSL client sends the preferred cipher suite to the SSL server. The server compares the received cipher suite with the cipher suits it supports. If a match is found, the cipher suite negotiation succeeds. If no match is found, the negotiation fails.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure SSL client policy **policy1** to support the key exchange algorithm RSA, data encryption algorithm 128-bit AES_CBC, and MAC algorithm SHA.

```
<Sysname> system-view
[Sysname] ssl client-policy policy1
[Sysname-ssl-client-policy-policy1] prefer-cipher rsa_aes_128_cbc_sha
```

Related commands

ciphersuite

display ssl client-policy

server-verify enable

Use **server-verify enable** to enable the SSL client to use digital certificates to authenticate the SSL server.

Use **undo server-verify enable** to disable SSL server authentication. The SSL client does not authenticate the SSL server.

Syntax

server-verify enable

undo server-verify enable

Default

The SSL client uses digital certificates to authenticate the SSL server.

Views

SSL client policy view

Predefined user roles

network-admin

Usage guidelines

SSL uses digital certificates to authenticate communicating parties. For more information about digital certificates, see *Security Configuration Guide*.

If you execute the **server-verify enable** command, the SSL server must send its digital certificate to the SSL client for authentication. The client can access the SSL server only after the server passes the authentication.

Examples

Enable the SSL client to use digital certificates to authenticate the SSL server.

```
<Sysname> system-view
[Sysname] ssl client-policy policy1
[Sysname-ssl-client-policy-policy1] server-verify enable
```

Related commands

display ssl client-policy

session

Use **session** to set the maximum number of sessions that the SSL server can cache and the timeout time for cached sessions.

Use **undo session** to restore the default.

Syntax

session { **cachesize** *size* | **timeout** *time* } *

undo session { **cachesize** | **timeout** } *

Default

The SSL server can cache a maximum of 500 sessions, and the timeout time for cached sessions is 3600 seconds.

Views

SSL server policy view

Predefined user roles

network-admin

Parameters

cachesize *size*: Sets the maximum number of cached sessions, in the range of 100 to 20480.

timeout *time*: Sets the session cache timeout in the range of 1 to 4294967295 seconds.

Usage guidelines

The SSL server caches SSL sessions to reuse negotiated session parameters to simplify SSL handshake. Use this command to limit the maximum number and timeout time for cached sessions.

When the number of cached sessions reaches the maximum, SSL does not cache new sessions. When the timeout timer for a cached session expires, SSL deletes the session.

Examples

Set the maximum number of cached sessions to 600, and the timeout time for cached sessions to 1800 seconds.

```
<Sysname> system-view
[Sysname] ssl server-policy policy1
[Sysname-ssl-server-policy-policy1] session cachesize 600 timeout 1800
```

Related commands

display ssl server-policy

ssl client-policy

Use **ssl client-policy** to create an SSL client policy and enter its view, or enter the view of an existing SSL client policy.

Use **undo ssl client-policy** to delete an SSL client policy.

Syntax

ssl client-policy *policy-name*

undo ssl client-policy *policy-name*

Default

No SSL client policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies an SSL client policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

This command creates an SSL client policy for which you can configure SSL parameters that the client uses to establish a connection to the server. The parameters include a PKI domain and a preferred cipher suite. An SSL client policy takes effect only after it is associated with an application.

Examples

Create an SSL client policy named **policy1** and enter its view.

```
<Sysname> system-view
[Sysname] ssl client-policy policy1
[Sysname-ssl-client-policy-policy1]
```

Related commands

display ssl client-policy

ssl renegotiation disable

Use **ssl renegotiation disable** to disable SSL session renegotiation.

Use **undo ssl renegotiation disable** to restore the default.

Syntax

ssl renegotiation disable

undo ssl renegotiation disable

Default

SSL session renegotiation is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The SSL session renegotiation feature enables the SSL client and server to reuse a previously negotiated SSL session for an abbreviated handshake.

Disabling session renegotiation causes more computational overhead to the system but it can avoid potential risks. Disable SSL session renegotiation only when explicitly required.

Examples

#Disable SSL session renegotiation.

```
<Sysname> system-view
[Sysname] ssl renegotiation disable
```

ssl server-policy

Use **ssl server-policy** to create an SSL server policy and enter its view, or enter the view of an existing SSL server policy.

Use **undo ssl server-policy** to delete an SSL server policy.

Syntax

ssl server-policy *policy-name*

undo ssl server-policy *policy-name*

Default

No SSL server policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a name for the SSL server policy, a case-insensitive string of 1 to 31 characters.

Usage guidelines

This command creates an SSL server policy for which you can configure SSL parameters such as a PKI domain and supported cipher suits. An SSL server policy takes effect only after it is associated with an application such as HTTPS.

Examples

Create an SSL server policy named **policy1** and enter its view.

```
<Sysname> system-view
[Sysname] ssl server-policy policy1
[Sysname-ssl-server-policy-policy1]
```

Related commands

display ssl server-policy

ssl version disable

Use **ssl version disable** to disable the SSL server from using specific SSL protocol versions for session negotiation.

Use **undo ssl version disable** restore the default.

Syntax

In non-FIPS mode:

ssl version { **ssl3.0** | **tls1.0** | **tls1.1** } * **disable**

undo ssl version { **ssl3.0** | **tls1.0** | **tls1.1** } * **disable**

In FIPS mode:

ssl version { **tls1.0** | **tls1.1** } * **disable**

undo ssl version { **tls1.0** | **tls1.1** } * **disable**

Default

In non-FIPS mode:

The SSL server supports SSL 3.0, TLS 1.0, TLS 1.1, and TLS 1.2.

In FIPS mode:

The SSL server supports TLS 1.0, TLS 1.1, and TLS 1.2.

Views

System view

Predefined user roles

network-admin

Parameters

ssl3.0: Specifies SSL 3.0.

tls1.0: Specifies TLS 1.0.

tls1.1: Specifies TLS 1.1.

Usage guidelines

To enhance system security, you can disable the SSL server from using specific SSL protocol versions (SSL 3.0, TLS 1.0, and TLS 1.1) for session negotiation.

Disabling an SSL protocol version does not affect the availability of earlier SSL protocol versions. For example, if you execute the **ssl version tls1.1 disable** command, TLS 1.1 is disabled but TLS 1.0 is still available for the SSL server.

Examples

Disable SSL 3.0 for the SSL server.

```
<Sysname> system-view
[Sysname] ssl version ssl3.0 disable
```

version

Use **version** to specify an SSL protocol version for an SSL client policy.

Use **undo version** to restore the default.

Syntax

In non-FIPS mode:

version { **ssl3.0** | **tls1.0** | **tls1.1** | **tls1.2** }

undo version

In FIPS mode:

version { **tls1.0** | **tls1.1** | **tls1.2** }

undo version

Default

An SSL client policy uses SSL protocol version TLS 1.0.

Views

SSL client policy view

Predefined user roles

network-admin

Parameters

ssl3.0: Specifies SSL 3.0.

tls1.0: Specifies TLS 1.0.

tls1.1: Specifies TLS 1.1.

tls1.2: Specifies TLS 1.2.

Usage guidelines

To ensure security, do not specify SSL 3.0 for an SSL client policy.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the SSL protocol version to TLS 1.0 for SSL client policy **policy1**.

```
<Sysname> system-view
[Sysname] ssl client-policy policy1
[Sysname-ssl-client-policy-policy1] version tls1.0
```

Related commands

display ssl client-policy

Contents

Attack detection and prevention commands

attack-defense login reauthentication-delay

Use **attack-defense login reauthentication-delay** to enable the login delay feature.

Use **undo attack-defense login reauthentication-delay** to restore the default.

Syntax

attack-defense login reauthentication-delay *seconds*

undo attack-defense login reauthentication-delay

Default

The login delay feature is disabled. The device does not delay accepting a login request from a user who has failed a login attempt.

Views

System view

Predefined user roles

network-admin

Parameters

seconds: Specifies the delay period in the range of 4 to 60 seconds.

Usage guidelines

The login delay feature delays the device to accept a login request from a user after the user fails a login attempt. This feature can slow down login dictionary attacks.

The login delay feature is independent of the login attack prevention feature.

Examples

Enable the login delay feature and set the delay period to 5 seconds.

```
<Sysname> system-view
[Sysname] attack-defense login reauthentication-delay 5
```

attack-defense tcp fragment enable

Use **attack-defense tcp fragment enable** to enable TCP fragment attack prevention.

Use **undo attack-defense tcp fragment enable** to disable TCP fragment attack prevention.

Syntax

attack-defense tcp fragment enable

undo attack-defense tcp fragment enable

Default

TCP fragment attack prevention is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to drop attack TCP fragments to prevent TCP fragment attacks that the packet filter cannot detect. As defined in RFC 1858, attack TCP fragments refer to the following TCP fragments:

- First fragments in which the TCP header is smaller than 20 bytes.
- Non-first fragments with a fragment offset of 8 bytes (FO=1).

TCP fragment attack prevention takes precedence over single-packet attack prevention. When both are used, incoming TCP packets are processed first by TCP fragment attack prevention and then by the single-packet attack defense policy.

Examples

Enable TCP fragment attack prevention.

```
<Sysname> System-view
[Sysname] attack-defense tcp fragment enable
```

Contents

TCP attack prevention commands

tcp anti-naptha enable

Use **tcp anti-naptha enable** to enable Naptha attack prevention.

Use **undo tcp anti-naptha enable** to disable Naptha attack prevention.

Syntax

tcp anti-naptha enable

undo tcp anti-naptha enable

Default

Naptha attack prevention is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After you enable Naptha attack prevention, the device periodically checks the number of TCP connections in each state. If the number of TCP connections in a state exceeds the limit, the device will accelerate the aging of the TCP connections in that state. The check interval is set by the **tcp check-state interval** command. The TCP connection limits are set by the **tcp state** command.

Examples

Enable Naptha attack prevention.

```
<Sysname> system-view
[Sysname] tcp anti-naptha enable
```

Related commands

tcp state

tcp check-state interval

tcp check-state interval

Use **tcp check-state interval** to set the interval for checking the number of TCP connections in each state.

Use **undo tcp check-state interval** to restore the default.

Syntax

tcp check-state interval *interval*

undo tcp check-state interval

Default

The interval for checking the number of TCP connections in each state is 30 seconds.

Views

System

Predefined user roles

network-admin

Parameter

interval: Specifies the check interval in the range of 1 to 60 seconds.

Usage guidelines

This command takes effect after you enable Naptha attack prevention.

After you enable Naptha attack prevention, the device checks the number of TCP connections in each state at intervals. If the number of TCP connections in a state exceeds the limit, the device will accelerate the aging of the TCP connections in that state.

Examples

Set the interval to 40 seconds for checking the number of TCP connections in each state.

```
<Sysname> system-view
[Sysname] tcp check-state interval 40
```

Related commands

tcp anti-naptha enable

tcp state

tcp state

Use **tcp state** to set the maximum number of TCP connections in a state.

Use **undo tcp state** to restore the default.

Syntax

tcp state { **closing** | **established** | **fin-wait-1** | **fin-wait-2** | **last-ack** } **connection-limit** *number*

undo tcp state { **closing** | **established** | **fin-wait-1** | **fin-wait-2** | **last-ack** } **connection-limit**

Default

The maximum number of TCP connections in each state (CLOSING, ESTABLISHED, FIN_WAIT_1, FIN_WAIT_2, and LAST_ACK) is 50.

Views

System view

Predefined user roles

network-admin

Parameters

closing: Specifies the CLOSING state.

established: Specifies the ESTABLISHED state.

fin-wait-1: Specifies the FIN_WAIT_1 state.

fin-wait-2: Specifies the FIN_WAIT_2 state.

last-ack: Specifies the LAST_ACK state.

connection-limit *number*: Specifies the maximum number of TCP connections, in the range of 0 to 500. The value of 0 represents that the device does not accelerate the aging of the TCP connections in a state.

Usage guidelines

This command takes effect after you enable Naptha attack prevention. If the number of TCP connections in a state exceeds the limit, the device will accelerate the aging of the TCP connections in the state.

Examples

Set the maximum number of TCP connections in the ESTABLISHED state to 100.

```
<Sysname> system-view
[Sysname] tcp state established connection-limit 100
```

IP source guard commands

display ip source binding

Use **display ip source binding** to display IPv4SG bindings.

Syntax

display ip source binding [**static** | [**arp-snooping-vlan** | **dhcp-relay** | **dhcp-server** | **dhcp-snooping** | **dot1x**]] [**ip-address** *ip-address*] [**mac-address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

static: Displays static IPv4SG bindings.

arp-snooping-vlan: Specifies IPv4SG bindings generated based on ARP snooping for VLANs.

dhcp-relay: Specifies IPv4SG bindings generated based on DHCP relay agent.

dhcp-server: Specifies IPv4SG bindings generated based on DHCP server.

dhcp-snooping: Specifies IPv4SG bindings generated based on DHCP snooping.

dot1x: Specifies IPv4SG bindings generated based on 802.1X. To display dynamic IPv4SG bindings generated based on the 802.1X module, you must also specify the slot through which 802.1X users access the network.

ip-address *ip-address*: Specifies an IPv4 address.

mac-address *mac-address*: Specifies a MAC address in H-H-H format.

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094.

interface *interface-type interface-number*: Specifies an interface by its type and number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv4SG bindings for the master device.

Examples

Display all IPSG bindings on the public network.

```
<Sysname> display ip source binding
Total entries found: 5
IP Address      MAC Address    Interface               VLAN Type
10.1.0.5        040a-0000-4000 GE1/0/1                 1    DHCP snooping
10.1.0.6        040a-0000-3000 GE1/0/1                 1    DHCP snooping
10.1.0.7        040a-0000-2000 GE1/0/1                 1    DHCP snooping
10.1.0.8        040a-0000-1000 GE1/0/2                 N/A  DHCP relay
10.1.0.9        040a-0000-2000 GE1/0/2                 N/A  Static
```

Table 1 Command output

Field	Description
Total entries found	Total number of IPv4SG bindings.
IP Address	IPv4 address in the IPv4SG binding. If no IP address is bound in the binding, this field displays **N/A**.
MAC Address	MAC address in the IPv4SG binding. If no MAC address is bound in the binding, this field displays **N/A**.
Interface	Interface of the binding. This field displays **N/A** for a global IPv4SG binding.
VLAN	VLAN information in the IPv4SG binding. If the binding contains no VLAN information, this field displays **N/A**.
Type	IPSG binding type: • **Static**—Manually configured by using the **ip source binding** command. Static bindings are for packet filtering in IPSG or used by other modules to provide security services. • **ARP snooping vlan**—Dynamically generated based on ARP snooping for the VLAN. The binding is for packet filtering in IPSG. • **802.1X**—Dynamically generated based on 802.1X. The binding is for packet filtering in IPSG. • **DHCP relay**—Dynamically generated based on DHCP relay agent. The binding is for packet filtering in IPSG. • **DHCP server**—Dynamically generated based on DHCP server. The binding is used by other modules to provide security services. • **DHCP snooping**—Dynamically generated based on DHCP snooping. The binding is for packet filtering in IPSG.

Related commands

ip source binding

ip verify source

display ip verify source excluded

Use **display ip verify source excluded** to display source items that have been configured to be excluded from IPSG filtering.

Syntax

display ip verify source excluded [**vlan** *start-vlan-id* [**to** *end-vlan-id*]] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *start-vlan-id* [**to** *end-vlan-id*]: Specifies VLANs that have been configured to be excluded from IPSG filtering. Value ranges for both the *start-vlan-id* and *end-vlan-id* arguments are 1 to 4094. The value for the *end-vlan-id* argument must be equal to or greater than the value for the *start-vlan-id* argument.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Examples

Display all source items that have been configured to be excluded from IPSG filtering.

```
<Sysname> display ip verify source excluded
Slot:
  Start VLAN ID        End VLAN ID    Status
  1                    20             Active
  24                   50             Active
  200                  300            Inactive
```

Display VLANs (VLAN 3 and VLAN 5 through VLAN 10) that have been configured to be excluded from IPSG filtering.

```
<Sysname> display ip verify source excluded vlan 3
Slot:
  VLAN ID: 3
  Status: Active

<Sysname> display ip verify source excluded vlan 5 to 10
Slot:
  Start VLAN ID        End VLAN ID    Status
  5                    10             Active
```

Table 2 Command output

Field	Description
Start VLAN ID	Start VLAN ID of the VLAN range that has been configured to be excluded from IPSG filtering.
End VLAN ID	End VLAN ID of the VLAN range that has been configured to be excluded from IPSG filtering.
Status	Whether the excluded VLAN configuration takes effect: • **Active**—The configuration takes effect. • **Inactive**—The configuration does not take effect.

Related commands

ip verify source exclude

display ipv6 source binding

Use **display ipv6 source binding** to display IPv6SG address bindings.

Syntax

display ipv6 source binding [**static** | [**dhcpv6-server** | **dhcpv6-snooping** | **dot1x**]] [**ip-address** *ipv6-address*] [**mac-address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`static`: Displays static IPv6SG address bindings.

`dhcpv6-server`: Specifies IPv6SG bindings generated based on DHCPv6 server.

`dhcpv6-snooping`: Specifies IPv6SG bindings generated based on DHCPv6 snooping.

`dot1x`: Specifies IPv6SG bindings generated based on 802.1X. To display dynamic IPv6SG address bindings generated based on the 802.1X module, you must also specify the slot through which 802.1X users access the network.

`ip-address` *`ipv6-address`*: Specifies an IPv6 address.

`mac-address` *`mac-address`*: Specifies a MAC address in H-H-H format.

`vlan` *`vlan-id`*: Specifies a VLAN ID in the range of 1 to 4094.

`interface` *`interface-type interface-number`*: Specifies an interface by its type and number.

`slot` *`slot-number`*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6SG address bindings for the master device.

Examples

Display all IPv6SG address bindings on the public network.

```
<Sysname> display ipv6 source binding
Total entries found: 2
IPv6 Address         MAC Address    Interface              VLAN Type
2012:1222:2012:1222: 000f-2202-0435 GE1/0/1                1    DHCPv6 snooping
2012:1222:2012:1222
2012:1222:2012:1222: 000f-2202-0436 GE1/0/1                N/A  Static
2012:1222:2012:1223
```

Table 3 Command output

Field	Description
Total entries found	Total number of IPv6SG address bindings.
IPv6 Address	IPv6 address in the IPv6SG address binding. If no IPv6 address is bound in the binding, this field displays **N/A**.
MAC Address	MAC address in the IPv6SG address binding. If no MAC address is bound in the binding, this field displays **N/A**.
Interface	Interface of the IPv6SG address binding. This field displays **N/A** for a global IPv6SG binding.
VLAN	VLAN information in the IPv6SG address binding. If the binding contains no VLAN information, this field displays **N/A**.

Field	Description
Type	Type of the IPv6SG address binding: • **Static**—Manually configured by using the **ipv6 source binding** command. Static bindings are for packet filtering in IPv6SG or used by other modules to provide security services. • **DHCPv6 sever**—Dynamically generated based on DHCPv6 server. The binding is reported to the controller for the controller to understand the information about online and offline users. The binding is not for packet filtering. • **DHCPv6 snooping**—Dynamically generated based on DHCPv6 snooping. The binding is for packet filtering in IPv6SG. • **802.1X**—Dynamically generated based on 802.1X. The binding is for packet filtering in IPv6SG.

Related commands

ipv6 source binding

ipv6 verify source

display ipv6 source binding pd

Use **display ipv6 source binding pd** to display IPv6SG prefix bindings.

Syntax

display ipv6 source binding pd [**prefix** *prefix/prefix-length*] [**mac-address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*] [**slot** *slot-number*]

Views

Any views

Predefined user roles

network-admin

network-operator

Parameters

prefix *prefix/prefix-length*: Specifies an IPv6 prefix. The value range for the *prefix-length* argument is 1 to 128. If you do not specify an IPv6 prefix, this command displays all IPv6SG prefix bindings.

mac-address *mac-address*: Specifies a MAC address in H-H-H format. If you do not specify a MAC address, this command displays IPv6SG prefix bindings for all MAC addresses.

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays IPv6SG prefix bindings for all VLANs.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays IPv6SG prefix bindings for all interfaces.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6SG prefix bindings for the master device.

Usage guidelines

IPv6SG prefix bindings are dynamically obtained from the DHCPv6 snooping module.

Examples

Display all IPv6SG prefix bindings.

```
<Sysname> display ipv6 source binding pd
Total entries found: 3
IPv6 prefix          MAC address     Interface      VLAN  Type
2012:1111::/64       000f-2202-0435  GE1/0/1        1     DHCPv6 snooping
2012:2222::/64       000f-2202-0436  GE2/0/1        2     DHCPv6 snooping
```

Table 4 Command output

Field	Description
Total entries found	Total number of IPv6SG prefix bindings.
IPv6 prefix	IPv6 prefix and prefix length in the IPv6SG prefix binding.
MAC address	MAC address in the IPv6SG prefix binding. This field displays **N/A** if the MAC address is invalid.
Interface	Interface to which the IPv6SG prefix binding belongs. This field displays **N/A** for a global IPv6SG prefix binding or an IPv6SG prefix binding generated based on an ND RA prefix entry.
VLAN	VLAN information in the IPv6SG prefix binding. This field displays **N/A** if the IPv6SG prefix binding does not contain the VLAN information.
Type	Type of the IPv6SG prefix binding: **DHCPv6 snooping**—The binding is generated based on a DHCPv6 snooping entry.

Related commands

ipv6 source binding

ipv6 verify source

ip source binding (interface view)

Use **ip source binding** to configure a static IPv4SG binding on an interface.

Use **undo ip source binding** to delete the static IPv4SG bindings configured on an interface.

Syntax

ip source binding { **ip-address** *ip-address* | **ip-address** *ip-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]

undo ip source binding { **all** | **ip-address** *ip-address* | **ip-address** *ip-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]

Default

No static IPv4SG bindings exist on an interface.

Views

Layer 2 Ethernet interface view

VLAN interface view

Predefined user roles

network-admin

Parameters

all: Removes all static IPv4SG bindings on the interface.

ip-address *ip-address*: Specifies an IPv4 address for the static binding. The IPv4 address must be a class A, B, or C address, and cannot be 127.x.x.x or 0.0.0.0.

mac-address *mac-address*: Specifies a MAC address for the static binding. The MAC address must be in H-H-H format, and cannot be all 0s, all Fs (a broadcast MAC address), or a multicast MAC address.

vlan *vlan-id*: Specifies a VLAN ID for the static binding. The value range is 1 to 4094. This option is supported only in Layer 2 Ethernet interface view.

Usage guidelines

Static IPv4SG bindings on an interface implement the following functions:

- Filter incoming IPv4 packets on the interface.
- Check user validity by cooperating with the ARP attack detection feature.

Examples

Configure a static IPv4SG binding on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ip source binding ip-address 192.168.0.1 mac-address
0001-0001-0001
```

Related commands

display ip source binding

ip source binding (system view)

Use **ip source binding** to configure a global static IPv4SG binding.

Use **undo ip source binding** to delete one or all global static IPv4SG bindings.

Syntax

ip source binding ip-address *ip-address* **mac-address** *mac-address*

undo ip source binding { **all** | **ip-address** *ip-address* **mac-address** *mac-address* }

Default

No global static IPv4SG bindings exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address *ip-address*: Specifies the IPv4 address for the static binding. The IPv4 address must be a class A, B, or C address, and cannot be 127.x.x.x or 0.0.0.0.

mac-address *mac-address*: Specifies the MAC address for the static binding. The MAC address is in the format H-H-H but cannot be all 0s, all Fs (a broadcast MAC address), or a multicast MAC address.

all: Removes all global static IPv4SG bindings.

Usage guidelines

A global static IPv4SG binding takes effect on all interfaces.

Examples

Configure a global static IPv4SG binding.

```
<Sysname> system-view
[Sysname] ip source binding ip-address 192.168.0.1 mac-address 0001-0001-0001
```

Related commands

display ip source binding

ip source binding (interface view)

ip verify source

Use **ip verify source** to enable IPv4SG on an interface.

Use **undo ip verify source** to disable IPv4SG on an interface.

Syntax

ip verify source { **ip-address** | **ip-address mac-address** | **mac-address** }

undo ip verify source

Default

The IPv4SG feature is disabled on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 aggregate subinterface view

VLAN interface view

Predefined user roles

network-admin

Parameters

ip-address: Filters incoming packets by source IPv4 addresses.

ip-address mac-address: Filters incoming packets by source IPv4 addresses and source MAC addresses.

mac-address: Filters incoming packets by source MAC addresses.

Usage guidelines

After you enable IPv4SG on an interface, this feature uses static and dynamic IPv4SG bindings to match incoming packets on the interface. Packets that match an IPv4SG binding are forwarded and packets that do not match any IPv4SG binding are discarded.

The matching criterion specified by this command applies only to dynamic IPSG. Static IPv4SG uses static bindings configured by using the **ip source binding** command.

If you re-execute this command to modify the matching criterion, the new criterion applies only to packets of the access users that come online after the command execution.

You can configure IPv4SG on an interface multiple times, the most recent configuration takes effect.

Examples

Enable IPv4SG on Layer 2 Ethernet interface GigabitEthernet 1/0/1 and verify the source IPv4 address and MAC address for dynamic IPSG.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ip verify source ip-address mac-address
```

Enable IPv4SG on VLAN-interface 100 and verify the source IPv4 address and MAC address for dynamic IPSG.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ip verify source ip-address mac-address
```

Related commands

display ip source binding

ip verify source exclude

Use **ip verify source exclude** to exclude IPv4 packets with the specified source items from IPSG filtering.

Use **undo ip verify source exclude** to remove the specified excluded source items.

Syntax

ip verify source exclude vlan *start-vlan-id* [**to** *end-vlan-id*]

undo ip verify source exclude vlan *start-vlan-id* [**to** *end-vlan-id*]

Default

No excluded source items are configured.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *start-vlan-id* [**to** *end-vlan-id*]: Specifies excluded VLANs. Value ranges for both the *start-vlan-id* and *end-vlan-id* arguments are 1 to 4094. The value for the *end-vlan-id* argument must be equal to or greater than the value for the *start-vlan-id* argument. A single excluded VLAN is specified if you specify only the *start-vlan-id* argument or specify the same VLAN ID for the *start-vlan-id* and *end-vlan-id* arguments.

Usage guidelines

This command allows all IPv4 packets with the specified source items to be forwarded without being processed by IPSG.

You can execute this command multiple times to specify multiple excluded VLANs. The specified excluded VLANs cannot overlap.

To successfully delete excluded VLANs, make sure the VLANs specified in the **undo** form of this command are the same as the VLANs specified when you configure excluded VLANs.

Examples

Exclude IPv4 packets from VLAN 3 and VLAN 5 through VLAN 10 from IPSG filtering.

```
<Sysname> system-view
[Sysname] ip verify source exclude vlan 3
[Sysname] ip verify source exclude vlan 5 to 10
```

Related commands

display ip verify source excluded

undo ipv6 source binding { **all** | **ip-address** *ipv6-address* | **ip-address** *ipv6-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]

Default

No static IPv6SG bindings exist on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 aggregate subinterface view

VLAN interface view

Predefined user roles

network-admin

Parameters

all: Removes all the static IPv6SG bindings on the interface.

ip-address *ipv6-address*: Specifies an IPv6 address for the static binding. The IPv6 address cannot be an all-zero address, a multicast address, or a loopback address.

mac-address *mac-address*: Specifies a MAC address for the static binding. The MAC address must be in H-H-H format, and cannot be all 0s, all Fs (a broadcast MAC address), or a multicast MAC address.

vlan *vlan-id*: Specifies a VLAN ID for the static binding. The value range is 1 to 4094. This option is supported only in Layer 2 Ethernet interface view.

Usage guidelines

Static IPv6SG bindings on an interface filter incoming IPv6 packets.

Examples

Configure a static IPv6SG binding on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 source binding ip-address 2001::1 mac-address
0002-0002-0002
```

arp source-suppression limit

Use **arp source-suppression limit** to set the maximum number of unresolvable packets that can be processed per source IP address within 5 seconds.

Use **undo arp source-suppression limit** to restore the default.

Syntax

arp source-suppression limit *limit-value*

undo arp source-suppression limit

Default

The device can process a maximum of 10 unresolvable packets per source IP address within 5 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

limit-value: Specifies the limit in the range of 2 to 1024.

Usage guidelines

If unresolvable packets received from an IP address within 5 seconds exceed the limit, the device stops processing the packets from that IP address until the 5 seconds elapse.

Examples

Configure the device to process a maximum of 100 unresolvable packets per source IP address within 5 seconds.

```
<Sysname> system-view
[Sysname] arp source-suppression limit 100
```

Display information about the current ARP source suppression configuration.

```
<Sysname> display arp source-suppression
 ARP source suppression is enabled
 Current suppression limit: 100
```

Table 1 Command output

Field	Description
Current suppression limit	Maximum number of unresolvable packets that can be processed per source IP address within 5 seconds.

ARP packet rate limit commands

arp rate-limit

Use **arp rate-limit** to enable the ARP packet rate limit feature on an interface.

Use **undo arp rate-limit** to disable the ARP packet rate limit feature on an interface.

Syntax

arp rate-limit [*pps*]

undo arp rate-limit

Default

The ARP packet rate limit feature is enabled on an interface.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

pps: Specifies the upper limit for ARP packet rate in pps. The value range for this argument is 5 to 200.

Usage guidelines

If you do not specify a value for the *pps* argument in the **arp rate-limit** command, the default rate limit value applies. Packets that exceed the rate limit are discarded.

Examples

Enable the ARP packet rate limit feature on GigabitEthernet 1/0/1, and set the maximum ARP packet rate to 50 pps.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] arp rate-limit 50
```

arp rate-limit log enable

Use **arp rate-limit log enable** to enable logging for ARP packet rate limit.

Use **undo arp rate-limit log enable** to disable logging for ARP packet rate limit.

Syntax

arp rate-limit log enable

undo arp rate-limit log enable

Default

Logging for ARP packet rate limit is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When logging for ARP packet rate limit is enabled, the device sends the highest threshold-crossed ARP packet rate within the sending interval in a log message to the information center. You can configure the information center module to set the log output rules. For more information about information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable logging for ARP packet rate limit.

```
<Sysname> system-view
[Sysname] arp rate-limit log enable
```

arp rate-limit log interval

Use **arp rate-limit log interval** to set the notification and log message sending interval for ARP packet rate limit.

Use **undo arp rate-limit log interval** to restore the default.

Syntax

arp rate-limit log interval *interval*

undo arp rate-limit log interval

Default

The device sends notifications or log messages every 60 seconds when the rate of ARP packets received on an interface exceeds the limit.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies an interval in the range of 1 to 86400 seconds.

Usage guidelines

To change the default interval and activate it, you must enable ARP packet rate limit and enable sending notifications or log messages for ARP packet rate limit.

Examples

Set the device to send notifications and log messages every 120 seconds when the rate of ARP packets received on an interface exceeds the limit.

```
<Sysname> system-view
[Sysname] arp rate-limit log interval 120
```

Related commands

arp rate-limit

arp rate-limit log enable

snmp-agent trap enable arp

snmp-agent trap enable arp

Use **snmp-agent trap enable arp** to enable SNMP notifications for ARP.

Use **undo snmp-agent trap enable arp** to disable SNMP notifications for ARP.

Syntax

snmp-agent trap enable arp [**rate-limit**]

undo snmp-agent trap enable arp [**rate-limit**]

Default

SNMP notifications for ARP is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

rate-limit: Specifies the ARP packet rate limit feature.

Usage guidelines

After you enable SNMP notifications for ARP, the device generates a notification that includes the highest threshold-crossed ARP packet rate within the sending interval.

For ARP event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Examples

Enable SNMP notifications for ARP packet rate limit.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable arp rate-limit
```

Source MAC-based ARP attack detection commands

arp source-mac

Use **arp source-mac** to enable the source MAC-based ARP attack detection feature and specify a handling method.

Use **undo arp source-mac** to disable the source MAC-based ARP attack detection feature.

Syntax

arp source-mac { **filter** | **monitor** }

undo arp source-mac [**filter** | **monitor**]

Default

The source MAC-based ARP attack detection feature is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

filter: Specifies the filter handling method.

monitor: Specifies the monitor handling method.

Usage guidelines

Configure this feature on the gateways.

This feature checks the number of ARP packets delivered to the CPU. If the number of packets from the same MAC address within 5 seconds exceeds a threshold, the device generates an ARP attack entry for the MAC address. Before the entry ages out, the device handles the attack by using either of the following methods:

- **Monitor**—Only generates log messages.
- **Filter**—Generates log messages and filters out subsequent ARP packets from the MAC address and data packets sources from or destined for the MAC address.

Make sure you have enabled the ARP logging feature before enabling the source MAC-based ARP attack detection feature. For information about the ARP logging feature, see *Layer 3—IP Services Configuration Guide*.

If you do not specify any handling method in the **undo arp source-mac** command, the command disables this feature.

Examples

Enable the source MAC-based ARP attack detection feature and specify the filter handling method.

```
<Sysname> system-view
[Sysname] arp source-mac filter
```

arp source-mac aging-time

Use **arp source-mac aging-time** to set the aging time for ARP attack entries.

Use **undo arp source-mac aging-time** to restore the default.

Syntax

network-admin

Parameters

mac-address&<1-10>: Specifies a MAC address list. The *mac-address* argument indicates an excluded MAC address in the format of H-H-H. &<1-10> indicates that you can specify a maximum of 10 excluded MAC addresses each time.

Usage guidelines

If you do not specify a MAC address, the **undo arp source-mac exclude-mac** command removes all excluded MAC addresses.

You can repeat this command to configure a maximum of 64 MAC addresses excluded from source MAC-based ARP attack detection.

Examples

Exclude a MAC address from source MAC-based ARP attack detection.

```
<Sysname> system-view
[Sysname] arp source-mac exclude-mac 001e-1200-0213
```

arp source-mac log enable

Use **arp source-mac log enable** to enable logging for source MAC-based ARP attack detection.

Use **undo arp source-mac log enable** to disable logging for source MAC-based ARP attack detection.

Syntax

arp source-mac log enable

undo arp source-mac log enable

Default

Logging for source MAC-based ARP attack detection is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When the device detects a source MAC-based ARP attack, it generates a log message and sends it to the information center. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

The log messages help administrators to locate and solve problems.

Examples

Enable logging for source MAC-based ARP attack detection.

```
<Sysname> system-view
[Sysname] arp source-mac log enable
```

arp source-mac threshold

Use **arp source-mac threshold** to set the threshold for source MAC-based ARP attack detection. If the number of ARP packets sent from a MAC address within 5 seconds exceeds this threshold, the device recognizes this as an attack.

Use **undo arp source-mac threshold** to restore the default.

Syntax

arp source-mac threshold *threshold-value*

undo arp source-mac threshold

Default

The threshold for source MAC-based ARP attack detection is 30.

Views

System view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the threshold for source MAC-based ARP attack detection. The value range for this argument is 1 to 5000.

Examples

Set the threshold for source MAC-based ARP attack detection to 30.

```
<Sysname> system-view
[Sysname] arp source-mac threshold 30
```

display arp source-mac

Use **display arp source-mac** to display ARP attack entries detected by source MAC-based ARP attack detection.

Syntax

display arp source-mac { **interface** *interface-type interface-number* [**slot** *slot-number*] | **slot** *slot-number* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

slot *slot-number*: Displays the ARP attack entries detected by the physical interfaces that reside on the specified member device and belong to the virtual interface. If you do not specify a member device, this command displays entries detected by the physical interfaces that reside on the master device and belong to the specified virtual interface.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify a member device, this command displays ARP attack entries for the master device.

Usage guidelines

The **slot** *slot-number* option is supported only when the **interface** *interface-type interface-number* option specifies a virtual interface.

Virtual interfaces can be only Layer 2 aggregate interfaces.

Examples

Display the ARP attack entries detected by source MAC-based ARP attack detection on GigabitEthernet 1/0/1.

```
<Sysname> display arp source-mac interface gigabitethernet 1/0/1
Source-MAC       VLAN/VSI name     Interface               Aging-time (sec)
23f3-1122-3344   4094              GE1/0/1                 10
```

Table 2 Command output

Field	Description
Source-MAC	Source MAC address of the attack.
VLAN ID/VSI name	This field is not supported in the current software version. ID of the VLAN or name of the name of the VSI in which the attack was detected. If the detected attack does not belong to any VLAN or VSI, this field displays **N/A**.
Interface	Interface on which the attack was detected.
Aging-time (sec)	Aging time for the ARP attack entry, in seconds.

ARP packet source MAC consistency check commands

arp valid-check enable

Use **arp valid-check enable** to enable ARP packet source MAC address consistency check.

Use **undo arp valid-check enable** to disable ARP packet source MAC address consistency check.

Syntax

arp valid-check enable

undo arp valid-check enable

Default

ARP packet source MAC address consistency check is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Configure this feature on gateways. The gateways can filter out ARP packets whose source MAC address in the Ethernet header is different from the sender MAC address in the message body.

Examples

Enable ARP packet source MAC address consistency check.

```
<Sysname> system-view
[Sysname] arp valid-check enable
```

ARP active acknowledgement commands

arp active-ack enable

Use **arp active-ack enable** to enable the ARP active acknowledgement feature.

Use **undo arp active-ack enable** to disable the ARP active acknowledgement feature.

Syntax

arp active-ack [**strict**] **enable**

undo arp active-ack [**strict**] **enable**

Default

The ARP active acknowledgement feature is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

strict: Enables strict mode for ARP active acknowledgement.

Usage guidelines

Configure this feature on gateways to prevent user spoofing.

In strict mode, a gateway learns an entry only when ARP active acknowledgement is successful based on the correct ARP resolution.

Examples

Enable the ARP active acknowledgement feature.

```
<Sysname> system-view
[Sysname] arp active-ack enable
```

Authorized ARP commands

arp authorized enable

Use **arp authorized enable** to enable authorized ARP on an interface.

Use **undo arp authorized enable** to disable authorized ARP on an interface.

Syntax

arp authorized enable

undo arp authorized enable

Default

Authorized ARP is disabled on the interface.

Views

VLAN interface view

Predefined user roles

network-admin

Examples

Enable authorized ARP on VLAN-interface 200.

```
<Sysname> system-view
[Sysname] interface vlan-interface 200
[Sysname-Vlan-interface200] arp authorized enable
```

ARP attack detection commands

arp detection enable

Use **arp detection enable** to enable ARP attack detection.

Use **undo arp detection enable** to disable ARP attack detection.

Syntax

arp detection enable

undo arp detection enable

Default

ARP attack detection is disabled.

Views

VLAN view

Predefined user roles

network-admin

Examples

Enable ARP attack detection for VLAN 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] arp detection enable
```

Related commands

arp detection rule

display arp detection

display arp detection statistics attack-source

reset arp detection statistics attack-source

arp detection log enable

Use **arp detection log enable** to enable ARP attack detection logging.

Use **undo arp detection log enable** to disable ARP attack detection logging.

Syntax

arp detection log enable [**interval** *interval* | **number** *number*]

undo arp detection log enable

Default

ARP attack detection logging is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the interval for sending ARP attack detection logs to the information center, in seconds. The value for this argument can be 0 or a value in the range of 10 to 3600. The default value is 60. If you set the interval to 0 seconds, the device sends ARP detection logs to the information center immediately.

number *number*: Specifies the maximum number of ARP attack detection logs for each log output. The value range for the *number* argument is 1 to 128, and the default value is 128.

Usage guidelines

This feature enables the device to generate ARP detection logs and send them to the information center. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

As a best practice, disable this feature if the log generation affects the device performance.

Excessive number of logs not only affects the device performance, but also makes it difficult for you to locate logs for specific events. To resolve the issue, you can adjust the maximum number of ARP attack detection logs for each log output. The logs that exceed the number limit will not be output and displayed.

An IRF member device can send a maximum of 128 ARP attack detection logs each time.

Examples

Enable ARP attack detection logging.

```
<Sysname> system-view
[Sysname] arp detection log enable
```

arp detection port-match-ignore

Use **arp detection port-match-ignore** to ignore ingress ports of ARP packets during user validity check.

Use **undo arp detection port-match-ignore** to remove the configuration.

Syntax

arp detection port-match-ignore

undo arp detection port-match-ignore

Default

Ingress ports of ARP packets are checked for user invalidity.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command configures ARP attack detection to ignore the ingress port information of ARP packets when the packets are compared with the entries used for user validity check.

Examples

Ignore ingress ports of ARP packets during user validity check.

```
<Sysname> system-view
[Sysname] arp detection port-match-ignore
```

Related commands

arp detection enable

arp detection rule

Use **arp detection rule** to configure a user validity check rule.

Use **undo arp detection rule** to delete a user validity check rule.

Syntax

arp detection rule *rule-id* { **deny** | **permit** } **ip** { *ip-address* [*mask*] | **any** } **mac** { *mac-address* [*mask*] | **any** } [**vlan** *vlan-id*]

undo arp detection rule [*rule-id*]

Default

No user validity check rule is configured.

Views

System view

Predefined user roles

network-admin

Parameters

rule-id: Assigns an ID to the user validity check rule. The ID value range is 0 to 511. A smaller value represents a higher priority.

deny: Denies matching ARP packets.

permit: Permits matching ARP packets.

ip { *ip-address* [*mask*] | **any** }: Specifies the sender IP address as the match criterion.

- *ip-address*: Specifies an IP address in dotted decimal notation.
- *mask*: Specifies the address mask in dotted decimal notation. If you do not specify the mask, the *ip-address* argument specifies a host IP address.
- **any**: Matches any IP address.

mac { *mac-address* [*mask*] | **any** }: Specifies the sender MAC address as the match criterion.

- *mac-address*: Specifies a MAC address in the H-H-H format.
- *mask*: Specifies the MAC address mask in the H-H-H format. If you do not specify the mask, the argument specifies the host MAC address.
- **any**: Matches any MAC address.

vlan *vlan-id*: Specifies the ID of a VLAN in the specified rule. The value range for the *vlan-id* argument is 1 to 4094. If you do not specify a VLAN, the packets' VLAN information is not checked.

Usage guidelines

A user validity check rule takes effect only when ARP attack detection is enabled.

If you do not specify a rule ID, the **undo arp detection rule** command deletes all user validity check rules.

Examples

Configure a user validity check rule and enable ARP detection for VLAN 2.

```
<Sysname> system-view
[Sysname] arp detection rule 0 permit ip 10.1.1.1 255.255.0.0 mac 0001-0203-0405
ffff-ffff-0000
[Sysname] vlan 2
[Sysname-vlan2] arp detection enable
```

Related commands

arp detection enable

arp detection trust

Use **arp detection trust** to configure an interface as an ARP trusted interface.

Use **undo arp detection trust** to restore the default.

Syntax

arp detection trust

undo arp detection trust

Default

An interface is an ARP untrusted interface.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Examples

Configure GigabitEthernet 1/0/1 as an ARP trusted interface.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] arp detection trust
```

arp detection validate

Use **arp detection validate** to enable ARP packet validity check.

Use **undo arp detection validate** to disable ARP packet validity check.

Syntax

arp detection validate { **dst-mac** | **ip** | **src-mac** } *

undo arp detection validate [**dst-mac** | **ip** | **src-mac**] *

Default

ARP packet validity check is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

dst-mac: Checks the target MAC address of ARP responses. If the target MAC address is all-zero, all-one, or inconsistent with the destination MAC address in the Ethernet header, the packet is considered invalid and discarded.

ip: Checks the sender and target IP addresses of ARP replies, and the sender IP address of ARP requests. All-one or multicast IP addresses are considered invalid and the corresponding packets are discarded.

src-mac: Checks whether the sender MAC address in the message body is identical to the source MAC address in the Ethernet header. If they are identical, the packet is forwarded. Otherwise, the packet is discarded.

Usage guidelines

You can specify more than one object to be checked in one command line.

If no keyword is specified, the **undo arp detection validate** command disables ARP packet validity check for all objects.

Examples

Enable ARP packet validity check by checking the MAC addresses and IP addresses of ARP packets.

```
<Sysname> system-view
[Sysname] arp detection validate dst-mac ip src-mac
```

arp restricted-forwarding enable

Use **arp restricted-forwarding enable** to enable ARP restricted forwarding.

Use **undo arp restricted-forwarding enable** to disable ARP restricted forwarding.

Syntax

arp restricted-forwarding enable

undo arp restricted-forwarding enable

Default

ARP restricted forwarding is disabled.

Views

Display the VLANs that are enabled with ARP attack detection.

```
<Sysname> display arp detection
ARP detection is enabled in the following VLANs:
1-2, 4-5
```

Table 3 Command output

Field	Description
ARP detection is enabled in the following VLANs:	VLANs enabled with ARP attack detection. If no VLANs are enabled with ARP attack detection, this field displays **ARP detection is not enabled in any VLANs.**.

Related commands

arp detection enable

display arp detection statistics attack-source

Use **display arp detection statistics attack-source** to display statistics for ARP attack sources.

Syntax

display arp detection statistics attack-source slot *slot-number*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify a member device, this command displays ARP attack source statistics for the master device.

Examples

Display statistics for ARP attack sources on slot 1.

```
<Sysname> display arp detection statistics attack-source slot 1
Interface              VLAN  MAC address    IP address      Number     Time
GE1/0/1                1     0005-0001-0001 10.1.1.14       24         17:09:56
03-27-2017
```

Table 4 Command output

Field	Description
Interface	Receiving interface of ARP attack packets.
VLAN	VLAN to which ARP attack packets belong.
MAC address	Sender MAC address in ARP attack packets.
IP address	Sender IP address in ARP attack packets.
Number	Number of ARP attack packets dropped by ARP attack detection.
Time	The most recent time when ARP attack detection dropped an ARP attack packet.

Related commands

arp detection enable

display arp detection statistics packet-drop

Use **display arp detection statistics packet-drop** to display statistics for packets dropped by ARP attack detection.

Syntax

display arp detection statistics packet-drop [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays dropped packet statistics for all interfaces.

Usage guidelines

This command displays numbers of packets discarded by user validity check and ARP packet validity check on interfaces.

Examples

Display statistics for packets dropped by ARP attack detection.

```
<Sysname> display arp detection statistics packet-drop
State: U-Untrusted  T-Trusted
```

```
ARP packets dropped by ARP inspect checking:
Interface(State)            IP        Src-MAC   Dst-MAC   Inspect
GE1/0/1(U)                  40        0         0         78
GE1/0/2(U)                  0         0         0         0
GE1/0/3(T)                  0         0         0         0
GE1/0/4(U)                  0         0         30        0
```

Table 5 Command output

Field	Description
State	State of an interface: • **U**—ARP untrusted interface. • **T**—ARP trusted interface.
Interface(State)	Inbound interface of ARP packets. State specifies the port state, **trusted** or **untrusted**.
IP	Number of ARP packets discarded due to invalid sender and target IP addresses.
Src-MAC	Number of ARP packets discarded due to invalid source MAC address.
Dst-MAC	Number of ARP packets discarded due to invalid destination MAC address.
Inspect	Number of ARP packets that failed to pass user validity check.

ARP scanning and fixed ARP commands

arp fixup

Use **arp fixup** to convert existing dynamic ARP entries to static ARP entries.

Use **undo arp fixup** to convert valid static ARP entries to dynamic ARP entries and delete invalid static ARP entries.

Syntax

arp fixup

undo arp fixup

Views

System view

Predefined user roles

network-admin

Usage guidelines

The ARP conversion is a one-time operation. You can use this command again to convert the dynamic ARP entries learned later to static.

The static ARP entries converted from dynamic ARP entries have the same attributes as the manually configured static ARP entries. Due to the device's limit on the total number of static ARP entries, some dynamic ARP entries might fail the conversion.

The static ARP entries after conversion can include the following entries:

- Existing dynamic and static ARP entries before conversion.
- New dynamic ARP entries learned during the conversion.

Dynamic ARP entries that are aged out during the conversion are not converted to static ARP entries.

To delete a static ARP entry changed from a dynamic one, use the **undo arp** *ip-address* command. To delete all such static ARP entries, use the **reset arp all** or **reset arp static** command.

Examples

Convert existing dynamic ARP entries to static ARP entries.

```
<Sysname> system-view
[Sysname] arp fixup
```

arp scan

Use **arp scan** to trigger an ARP scanning in an address range.

Syntax

arp scan [*start-ip-address* **to** *end-ip-address*] [**send-rate** *pps*]

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

start-ip-address: Specifies the start IP address of the scanning range.

end-ip-address: Specifies the end IP address of the scanning range. The end IP address must be higher than or equal to the start IP address.

send-rate *pps*: Specifies the rate at which the device sends ARP requests for ARP scanning, in pps. The value range for the *pps* argument is 10 to 1000, and the value must be a multiple of 10. If you do not set the rate, the device sends ARP requests to all IP addresses in the specified scanning range simultaneously.

Usage guidelines

CAUTION:

ARP scanning will take some time. To stop an ongoing scan, press **Ctrl** + **C**. Dynamic ARP entries are created based on ARP replies received before the scan is terminated.

ARP scanning automatically creates ARP entries for devices in the specified address range. IP addresses already in existing ARP entries are not scanned.

If the interface's primary and secondary IP addresses are in the address range, the sender IP address in the ARP request is the address on the smallest network segment.

If no address range is specified, the device learns ARP entries for devices on the subnet where the primary IP address of the interface resides. The sender IP address in the ARP requests is the primary IP address of the interface.

The start and end IP addresses must be on the same subnet as the primary IP address or secondary IP addresses of the interface.

You can set the ARP packet sending rate if the scanning range has a large number of IP addresses. This setting can avoid high CPU usage and heavy network load caused by a burst of ARP traffic.

When you set the sending rate to a large value, the device might use a rate lower than the specified rate to ensure the device performance.

Examples

Configure the device to scan the neighbors on the network where the primary IP address of VLAN-interface 2 resides.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] arp scan
```

Configure the device to scan neighbors in an address range.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] arp scan 1.1.1.1 to 1.1.1.20
```

Configure the device to scan neighbors in an address range on VLAN-interface 2 and set the ARP packet sending rate to 10 pps.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] arp scan 1.1.1.1 to 1.1.1.20 send-rate 10
```

ARP gateway protection commands

arp filter source

Use **arp filter source** to enable ARP gateway protection for a gateway.

Use **undo arp filter source** to disable ARP gateway protection for a gateway.

Syntax

arp filter source *ip-address*

undo arp filter source *ip-address*

Default

ARP gateway protection is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a protected gateway.

Usage guidelines

You can enable ARP gateway protection for a maximum of eight gateways on an interface.

You cannot configure both the **arp filter source** and **arp filter binding** commands on the same interface.

Examples

Enable ARP gateway protection for the gateway with IP address 1.1.1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] arp filter source 1.1.1.1
```

ARP filtering commands

arp filter binding

Use **arp filter binding** to enable ARP filtering and configure an ARP permitted entry.

Use **undo arp filter binding** to remove an ARP permitted entry.

Syntax

arp filter binding *ip-address mac-address*

undo arp filter binding *ip-address*

Default

ARP filtering is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a permitted sender IP address.

mac-address: Specifies a permitted sender MAC address.

Usage guidelines

If the sender IP and MAC addresses of an ARP packet match an ARP permitted entry, the ARP packet is permitted. If the sender IP and MAC addresses of an ARP packet do not match an ARP permitted entry, the ARP packet is discarded.

You can configure a maximum of eight ARP permitted entries on an interface.

You cannot configure both the **arp filter source** and **arp filter binding** commands on the same interface.

Examples

Enable ARP filtering and configure an ARP permitted entry.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] arp filter binding 1.1.1.1 0e10-0213-1023
```

Contents

ND attack defense commands

Source MAC consistency check commands

ipv6 nd check log enable

Use **ipv6 nd check log enable** to enable the ND logging feature.

Use **undo ipv6 nd check log enable** to restore the default.

Syntax

ipv6 nd check log enable

undo ipv6 nd check log enable

Default

The ND logging feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The ND logging feature logs source MAC inconsistency events, and sends the log messages to the information center. The information center can then output log messages from different source modules to different destinations. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

As a best practice, disable the ND logging feature to avoid excessive ND logs.

Examples

Enable the ND logging feature.

```
<Sysname> system-view
[Sysname] ipv6 nd check log enable
```

Related commands

ipv6 nd mac-check enable

ipv6 nd mac-check enable

Use **ipv6 nd mac-check enable** to enable source MAC consistency check for ND messages.

Use **undo ipv6 nd mac-check enable** to disable source MAC consistency check for ND messages.

Syntax

ipv6 nd mac-check enable

undo ipv6 nd mac-check enable

Default

Source MAC consistency check for ND messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use this command to enable source MAC consistency check on a gateway. The gateway checks the source MAC address and the source link-layer address for consistency for each ND message. If an inconsistency is found, the gateway drops the ND message.

Examples

Enable source MAC consistency check for ND messages.

```
<Sysname> system-view
[Sysname] ipv6 nd mac-check enable
```

ND attack detection commands

display ipv6 nd detection statistics

Use **display ipv6 nd detection statistics** to display statistics for ND messages dropped by ND attack detection.

Syntax

display ipv6 nd detection statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays statistics for ND messages dropped by ND attack detection on all interfaces.

Examples

Display statistics for all ND messages dropped by ND attack detection.

```
<Sysname> display ipv6 nd detection statistics
ND packets dropped by ND detection:
Interface/AC         Packets dropped
GE1/0/1              78
GE1/0/2              0
GE1/0/3              0
GE1/0/4              0
```

Table 1 Command output

Field	Description
Interface/AC	Input interface of the ND messages.
Packets dropped	Number of ND messages dropped by ND attack detection.

ipv6 nd detection enable

Use **ipv6 nd detection enable** to enable ND attack detection. This feature checks the ND message validity.

Use **undo ipv6 nd detection enable** to disable ND attack detection.

Syntax

ipv6 nd detection enable

undo ipv6 nd detection enable

Default

ND attack detection is disabled.

Views

<Sysname> system-view
[Sysname] vlan 10
[Sysname-vlan10] ipv6 nd detection enable
```

ipv6 nd detection log enable

Use **ipv6 nd detection log enable** to enable ND attack detection logging.

Use **undo ipv6 nd detection log enable** to disable ND attack detection logging.

Syntax

ipv6 nd detection log enable

undo ipv6 nd detection log enable

Default

ND attack detection logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command allows a device to generate logs when it detects ND attacks. The log information helps administrators locate and solve problems. The ND attack detection logging feature sends the log message to the information center. The information center can then output log messages from different source modules to different destinations. For more information about information center, see *Network Management and Monitoring Configuration Guide*.

The device performance is degraded when the device outputs a large number of ND attack detection logs. You can disable ND attack detection logging to ensure the device performance.

Examples

Enable ND attack detection logging.

```
<Sysname> system-view
[Sysname] ipv6 nd detection log enable
```

ipv6 nd detection trust

Use **ipv6 nd detection trust** to configure an interface as an ND trusted interface.

Use **undo ipv6 nd detection trust** to restore the default.

Syntax

ipv6 nd detection trust

undo ipv6 nd detection trust

Default

All interfaces are ND untrusted interfaces.

Examples

Configure GigabitEthernet 1/0/1 as an ND trusted interface.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 nd detection trust
```

Configure Bridge-Aggregation 1 as an ND trusted interface.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] ipv6 nd detection trust
```

reset ipv6 nd detection statistics

Use **reset ipv6 nd detection statistics** to clear ND attack detection statistics.

Syntax

reset ipv6 nd detection statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears ND attack detection statistics for all interfaces.

Examples

Clear all ND attack detection statistics.

```
<Sysname> reset ipv6 nd detection statistics
```

RA guard commands

display ipv6 nd raguard policy

Use **display ipv6 nd raguard policy** to display the RA guard policy configuration.

Syntax

display ipv6 nd raguard policy [*policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

policy-name: Specifies an RA guard policy by its name. The policy name is a case-sensitive string of 1 to 31 characters. If you do not specify a policy, this command displays the configuration of all RA guard policies.

Examples

Display the configuration of all RA guard policies.

```
<Sysname> display ipv6 nd raguard policy
Total number of policies: 2
RA Guard policy: policy1
  if-match ACL 2001
  if-match autoconfig managed-address-flag on
  if-match autoconfig other-flag off
  if-match hop-limit maximum 128
  if-match hop-limit minimum 100
  if-match prefix ACL name aa
  if-match router-preference medium
  applied to VLAN 1-3 7
RA Guard policy: policy2
  if-match ACL name zdd
```

```
if-match prefix ACL 2200
```

Table 2 Command output

Field	Description
RA Guard policy	Name of the RA guard policy.
if-match ACL	Number of the ACL in the ACL match criterion.
if-match ACL name	Name of the ACL in ACL match criterion.
if-match autoconfig managed-address-flag	Match criterion of the advertised M flag: • **on**—The value of the advertised M flag is 1. • **off**—The value of the advertised M flag is 0.
if-match autoconfig other-flag	Match criterion of the advertised O flag: • **on**—The value of the advertised O flag is 1. • **off**—The value of the advertised O flag is 0.
if-match hop-limit maximum	The maximum advertised hop limit match criterion.
if-match hop-limit minimum	The minimum advertised hop limit match criterion.
if-match prefix ACL	Number of the ACL used to identify the prefix match criterion.
if-match prefix ACL name	Name of the ACL used to identify the prefix match criterion.
applied to VLAN	ID of the VLAN to which the RA guard policy is applied.

Related commands

ipv6 nd raguard policy

display ipv6 nd raguard statistics

Use **display ipv6 nd raguard statistics** to display RA guard statistics.

Syntax

display ipv6 nd raguard statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays RA guard statistics for all interfaces.

Examples

Display RA guard statistics.

```
<Sysname> display ipv6 nd raguard statistics
RA messages dropped by RA guard:
Interface    Dropped
GE1/0/1      78
```

```
GE1/0/2      0
GE1/0/3      32
GE1/0/4      0
```

Table 3 Command output

Field	Description
Interface	Interface that received the dropped RA messages.
Dropped	Number of RA messages dropped on the interface.

Related commands

ipv6 nd raguard log enable

reset ipv6 nd raguard statistics

if-match acl

Use **if-match acl** to specify an ACL match criterion.

Use **undo if-match acl** to delete the ACL match criterion.

Syntax

if-match acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }

undo if-match acl

Default

No ACL match criterion exists.

Views

RA guard policy view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999.

name *ipv6-acl-name*: Specifies an IPv6 basic ACL by its name, a case-insensitive string of 1 to 63 characters. The name must start with an English letter. To avoid confusion, the name cannot be **all**.

Usage guidelines

RA guard uses the ACL match criterion to match the IP address of the RA message sender. If the sender IP address matches a permit rule, the message passes the check.

If the specified ACL does not exist or does not contain a rule, the ACL match criterion does not take effect.

Examples

Use IPv6 basic ACL 2001 as the ACL match criterion for RA guard policy **policy1**.

```
<Sysname> system-view
[Sysname] ipv6 nd raguard policy policy1
[Sysname-raguard-policy-policy1] if-match acl 2001
```

if-match autoconfig managed-address-flag

Use **if-match autoconfig managed-address-flag** to specify an M flag match criterion.

Use **undo if-match autoconfig managed-address-flag** to delete the M flag match criterion.

Syntax

if-match autoconfig managed-address-flag { **off** | **on** }

undo if-match autoconfig managed-address-flag

Default

No M flag match criterion exists.

Views

RA guard policy view

Predefined user roles

network-admin

Parameters

off: Specifies the advertised M flag as 0

on: Specifies the advertised M flag as 1.

Usage guidelines

The M flag in an RA message determines whether a receiving host uses stateful autoconfiguration to obtain an IPv6 address.

- If the M flag is set to 1, the host uses stateful autoconfiguration, for example, uses a DHCPv6 server.
- If the M flag is set to 0, the host uses stateless autoconfiguration. In stateless autoconfiguration, the host generates an IPv6 address according to its link-layer address and the prefix information in the RA message.

Examples

Specify **on** as the M flag match criterion for RA guard policy **policy1**.

```
<Sysname> system-view
[Sysname] ipv6 nd raguard policy policy1
[Sysname-raguard-policy-policy1] if-match autoconfig managed-address-flag on
```

if-match autoconfig other-flag

Use **if-match autoconfig other-flag** to specify an O flag match criterion.

Use **undo if-match autoconfig other-flag** to delete the O flag match criterion.

Syntax

if-match autoconfig other-flag { **off** | **on** }

undo if-match autoconfig other-flag

Default

No O flag match criterion exists.

Views

RA guard policy view

Predefined user roles

network-admin

Parameters

off: Specifies the advertised O flag as 0.

on: Specifies the advertised O flag as 1.

Usage guidelines

The O flag in an RA message determines whether a receiving host uses stateful autoconfiguration to obtain configuration information other than IPv6 address.

- If the O flag is set to 1, the host uses stateful autoconfiguration, for example, uses a DHCPv6 server.
- If the O flag is set to 0, the host uses stateless autoconfiguration.

Examples

Specify **on** as the M flag match criterion for RA guard policy **policy1**.

```
<Sysname> system-view
[Sysname] ipv6 nd raguard policy policy1
[Sysname-raguard-policy-policy1] if-match autoconfig other-flag on
```

if-match hop-limit

Use **if-match hop-limit** to specify a maximum or minimum hop limit match criterion.

Use **undo if-match hop-limit** to delete the maximum or minimum hop limit match criterion.

Syntax

if-match hop-limit { **maximum** | **minimum** } *limit*

undo if-match hop-limit { **maximum** | **minimum** }

Default

No maximum or minimum hop limit match criterion exists.

Views

RA guard policy view

Predefined user roles

network-admin

Parameters

maximum: Specifies the maximum advertised hop limit. An RA message passes the check if its current hop limit is not higher than the maximum advertised hop limit.

minimum: Specifies the minimum advertised hop limit. An RA message passes the check if its current hop limit is not less than the minimum advertised hop limit.

limit: Specifies the advertised hop limit in the range of 1 to 255.

Usage guidelines

If a hop limit match criterion is set, and the RA message's current hop limit is 0, the message will be dropped.

Examples

Set the maximum hop limit match criterion to 128 for RA guard policy **policy1**.

```
<Sysname> system-view
```

```
[Sysname] ipv6 nd raguard policy policy1
[Sysname-raguard-policy-policy1] if-match hop-limit maximum 128
```

if-match prefix

Use **if-match prefix** to specify a prefix match criterion.

Use **undo if-match prefix** to delete the prefix match criterion.

Syntax

if-match prefix acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }

undo if-match prefix acl

Default

No prefix match criterion exists.

Views

RA guard policy view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999.

name *ipv6-acl-name*: Specifies an IPv6 basic ACL by its name, a case-insensitive string of 1 to 63 characters. The name must start with an English letter. To avoid confusion, the name cannot be **all**.

Usage guidelines

An RA message passes the check if the advertised prefixes in the message match the prefixes set by the ACL.

If the specified ACL does not exist or does not contain a rule, the prefix match criterion does not take effect.

Examples

Use IPv6 basic ACL 2000 as the prefix match criterion for RA guard policy **policy1**.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2000
[Sysname-acl-ipv6-basic-2000] rule permit source 1001:: 64
[Sysname-acl-ipv6-basic-2000] rule permit source 3124:1123:: 64
[Sysname-acl-ipv6-basic-2000] rule deny source any
[Sysname-acl-ipv6-basic-2000] quit
[Sysname] ipv6 nd raguard policy policy1
[Sysname-raguard-policy-policy1] if-match prefix acl 2000
```

if-match router-preference

Use **if-match router-preference maximum** to specify a router preference match criterion.

Use **undo if-match router-preference maximum** to delete the router preference match criterion.

Syntax

if-match router-preference maximum { **high** | **low** | **medium** }

undo if-match router-preference maximum

Default

No router preference match criterion exists.

Views

RA guard policy view

Predefined user roles

network-admin

Parameters

high: Sets the maximum router preference to **high**. An RA message passes the check if its router preference is not higher than **high**.

low: Sets the maximum router preference to **low**. An RA message passes the check if its router preference is not higher than **low**.

medium: Sets the maximum router preference to **medium**. An RA message passes the check if its router preference is not higher than **medium**.

Usage guidelines

A host selects a router as the default gateway according to the router preference in received RA messages. If router preferences are the same, the host selects the default router from which the first RA message is received.

An RA message will not pass the router preference check if the message does not have a preference value. This RA message will be dropped.

Examples

Specify **medium** as the router preference match criterion for RA guard policy **policy1**.

```
<Sysname> system-view
[Sysname] ipv6 nd raguard policy policy1
[Sysname-raguard-policy-policy1] if-match router-preference maximum medium
```

ipv6 nd raguard apply policy

Use **ipv6 nd raguard apply policy** to apply an RA guard policy to a VLAN.

Use **undo ipv6 nd raguard apply policy** to remove the RA guard policy from a VLAN.

Syntax

ipv6 nd raguard apply policy [*policy-name*]

undo ipv6 nd raguard apply policy

Default

No RA guard policy is applied to a VLAN.

Views

VLAN view

Predefined user roles

network-admin

Parameters

policy-name: Specifies an RA guard policy by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a policy, RA guard blocks RA messages on all interfaces in the VLAN except interfaces that are defined to be connected to routers.

Usage guidelines

If an RA message has multiple VLAN tags, RA guard uses the outermost VLAN tag to select the applied RA guard policy.

If the specified RA guard policy does not exist, the command does not take effect.

Examples

Apply RA guard policy **policy1** to VLAN 100.

```
<Sysname> system-view
[Sysname] vlan 100
[Sysname-vlan100] ipv6 nd raguard apply policy policy1
```

Related commands

ipv6 nd raguard policy

ipv6 nd raguard log enable

Use **ipv6 nd raguard log enable** to enable the RA guard logging feature.

Use **undo ipv6 nd raguard log enable** to disable the RA guard logging feature.

Syntax

ipv6 nd raguard log enable

undo ipv6 nd raguard log enable

Default

The RA guard logging feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command allows a device to generate logs when it detects forged RA messages. The log information helps administrators locate and solve problems. Each log records the following information:

- Name of the interface that received the forged RA message.
- Source IP address of the forged RA message.
- Number of RA messages dropped on the interface.

The RA guard logging feature sends the log messages to the information center. The information center can then output log messages from different source modules to different destinations. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable the RA guard logging feature.

```
<Sysname> system-view
```

```
[Sysname] ipv6 nd raguard log enable
```

Related commands

display ipv6 nd raguard statistics

reset ipv6 nd raguard statistics

ipv6 nd raguard policy

Use **ipv6 nd raguard policy** to create an RA guard policy and enter its view, or enter the view of an existing RA guard policy.

Use **undo ipv6 nd raguard policy** to delete an RA guard policy.

Syntax

ipv6 nd raguard policy *policy-name*

undo ipv6 nd raguard policy *policy-name*

Default

No RA guard policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Assigns a name to the RA guard policy. The name is a case-sensitive string of 1 to 31 characters.

Examples

Create RA guard policy **policy1** and enter its view.

```
<Sysname> system-view
[Sysname] ipv6 nd raguard policy policy1
[Sysname-raguard-policy-policy1]
```

Related commands

display ipv6 nd raguard policy

ipv6 nd raguard apply policy

ipv6 nd raguard role

Use **ipv6 nd raguard role** to specify the role of the device attached to the interface.

Use **undo ipv6 nd raguard role** to remove the role of the device attached to the interface.

Syntax

ipv6 nd raguard role { **host** | **router** }

undo ipv6 nd raguard role

Default

No role is specified for the device attached to the interface.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

host: Specifies the host role. The interface attached to a host drops all received RA messages.

router: Specifies the router role. The interface attached to a router forwards all received RA messages.

Usage guidelines

Make sure your setting is consistent with the device type. If you are not aware of the attached device type, do not specify a role for the device.

Examples

Specify **host** as the role for the device attached to GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 nd raguard role host
```

reset ipv6 nd raguard statistics

Use **reset ipv6 nd raguard statistics** to clear RA guard statistics.

Syntax

reset ipv6 nd raguard statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears RA guard statistics for all interfaces.

Examples

Clear RA guard statistics.

```
<Sysname> reset ipv6 nd raguard statistics
```

Related commands

display ipv6 nd raguard statistics

SAVI commands

ipv6 savi down-delay

Use **ipv6 savi down-delay** to set the entry deletion delay.

Use **undo ipv6 savi down-delay** to restore the default.

Syntax

ipv6 savi down-delay *delay-time*

undo ipv6 savi down-delay

Default

The entry deletion delay is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

delay-time: Specifies the entry deletion delay in the range of 0 to 21474836 seconds.

Usage guidelines

The entry deletion delay is the period of time that the device waits before deleting the DHCPv6 snooping entries and ND snooping entries for a down port.

Examples

Set the entry deletion delay to 100 seconds.

```
<Sysname> system-view
[Sysname] ipv6 savi down-delay 100
```

ipv6 savi log enable

Use **ipv6 savi log enable** to enable packet spoofing logging or filtering entry logging.

undo ipv6 savi log enable to disable packet spoofing logging or filtering entry logging.

NOTE:

This command is supported only in Release 6328 and later.

Syntax

ipv6 savi log enable { **spoofing-packet** [**interval** *interval* | **total-number** *number*] * | **filter-entry** }

undo ipv6 savi log enable { **spoofing-packet** | **filter-entry** }

Default

Packet spoofing logging and filtering entry logging are disabled.

Views

System view

Predefined user roles

network-admin

network-operator

Parameters

spoofing-packet [**interval** *interval* | **total-number** *number*]: Enables packet spoofing logging.

- **interval** *interval*: Sets the log output interval in seconds. The value of the *interval* argument can be 0 or in the range of 5 to 3600. The default value is 60 seconds. If you set this parameter to 0, the device outputs a log message immediately after it is generated.
- **total-number** *number*: Sets the maximum number of log messages that can be output per interval. The value range for the *number* argument is 1 to 128, and the default value is 128.

filter-entry: Enables filtering entry logging.

Usage guidelines

Packet spoofing logging enables the device to generate log messages for the spoofed packets detected by SAVI.

Filtering entries are effective bindings used for filtering IPv6 packets by the source IPv6 address. Filtering entry logging enables the device to generate log messages for filtering entries. A log message contains the IPv6 address, MAC address, VLAN, and interface of a filtering entry.

The device sends packet spoofing and filtering entry log messages to the information center. With the information center, you can set log message filtering and output rules, including output destinations. For more information about using the information center, see *Network Management and Monitoring Configuration Guide*.

The device can output a maximum of 128 packet spoofing log messages. If this limit is crossed, the device drops excess log messages. To ensure device performance, set the log output interval and maximum number of log messages output per interval appropriately.

Examples

Enable packet spoofing logging.

```
<Sysname> system-view
[Sysname] ipv6 savi log enable spoofing-packet
```

ipv6 savi strict

Use **ipv6 savi strict** to enable Source Address Validation Improvement (SAVI).

Use **undo ipv6 savi strict** to disable SAVI.

Syntax

ipv6 savi strict

undo ipv6 savi strict

Default

SAVI is disabled.

Views

System view

Predefined user roles

network-admin

network-operator

Examples

Display MFF port configuration.

```
<Sysname> display mac-forced-forwarding interface
Network Port:
GE1/0/1                 GE1/0/2
User Port:
GE1/0/3                 GE1/0/4                 GE1/0/5
...
```

Table 1 Command output

Field	Description
Network Port	List of network ports.
User Port	List of user ports.

Related commands

mac-forced-forwarding network-port

display mac-forced-forwarding vlan

Use **display mac-forced-forwarding vlan** to display the MFF configuration for a VLAN.

Syntax

display mac-forced-forwarding vlan *vlan-id*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-id: Specifies a VLAN by its ID.

Examples

Display the MFF configuration for VLAN 2.

```
<Sysname> display mac-forced-forwarding vlan 2
VLAN 2
Gateway:
------------------------------------------------------------------------
192.168.1.42         000f-e200-8046
Server:
------------------------------------------------------------------------
192.168.1.48         192.168.1.49
```

Table 2 Command output

Field	Description
VLAN 2	ID of the VLAN to which the gateways belong.
Gateway	IP and MAC addresses of gateways. If no address is learned, this field displays **N/A**.
Server	Server IP addresses.

Related commands

mac-forced-forwarding

mac-forced-forwarding server

mac-forced-forwarding

Use **mac-forced-forwarding** to enable MFF and specify the default gateway.

Use **undo mac-forced-forwarding** to disable MFF.

Syntax

mac-forced-forwarding default-gateway *gateway-ip*

undo mac-forced-forwarding

Default

MFF is disabled.

Views

VLAN view

Predefined user roles

network-admin

Parameters

default-gateway *gateway-ip*: Specifies the IP address of the default gateway.

Usage guidelines

For MFF to take effect, make sure ARP snooping is enabled on the VLAN where MFF is enabled.

For a network (or VLAN) with IP addresses manually configured, the gateway IP address must be manually configured. MFF checks for and denies only all-zero and all-one gateway IP addresses.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Enable MFF for VLAN 2 and specify the IP address of the default gateway.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] mac-forced-forwarding default-gateway 1.1.1.1
```

Related commands

Use **undo mac-forced-forwarding network-port** to restore the default.

Syntax

mac-forced-forwarding network-port

undo mac-forced-forwarding network-port

Default

The Ethernet port is a user port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

You should configure the following ports as network ports:

- Upstream ports connected to a gateway.
- Ports connected to the MFF devices in a cascaded network (a network with multiple MFF devices connected to one another).
- Ports between devices in a ring network.

You can configure multiple ports as network ports.

You can configure a port as a network port regardless of whether MFF is enabled for the VLAN of the port. However, the configuration takes effect only after MFF is enabled.

Link aggregation is supported by network ports in an MFF-enabled VLAN, but is not supported by user ports in the VLAN. To cancel the network port configuration of a link aggregation member port in a MFF-enabled VLAN, remove the network port from the link aggregation group first. For more information about link aggregation, see *Layer 2—LAN Switching Configuration Guide*.

Examples

Configure GigabitEthernet 1/0/1 as a network port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-forced-forwarding network-port
```

Related commands

mac-forced-forwarding

mac-forced-forwarding server

Use **mac-forced-forwarding server** to specify the IP addresses of servers.

Use **undo mac-forced-forwarding server** to remove server IP addresses.

Syntax

mac-forced-forwarding server *server-ip*&<1-10>

undo mac-forced-forwarding server *server-ip*&<1-10>

Default

No server IP address is specified.

Views

VLAN view

Predefined user roles

network-admin

Parameters

server-ip&<1-10>: Specifies a space-separated list of up to 10 server IP addresses.

Usage guidelines

You need to maintain a server list on the MFF device to ensure communication between the servers and clients.

Server IP addresses can be those of the servers collaborating with MFF, such as a RADIUS server.

When the MFF device receives an ARP request from a server, it searches the IP-to-MAC address entries it has stored. Then the device replies with the requested MAC address to the server.

In this way, packets from the server to a host are not forwarded by the gateway. However, packets from a host to the server are forwarded by the gateway.

MFF does not check whether the IP address of a server is on the same network segment as that of a gateway. Instead, it checks whether the IP address of a server is all-zero or all-one. An all-zero or all-one server IP address is invalid.

Make sure MFF is enabled before you execute the **mac-forced-forwarding server** command.

Examples

Specify the server at 192.168.1.100.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] mac-forced-forwarding server 192.168.1.100
```

  Random number generation function: Supported
```

Table 1 Command output

Field	Description
Crypto engine state	This field always displays **Enabled** for software crypto engines.
Crypto engine type	The value is **Software** for this field.
CPU ID	ID of the CPU on the device.
Symmetric algorithms	Supported symmetric algorithms.
Asymmetric algorithms	Supported asymmetric algorithms.
Random number generation function	Whether random number generation function is supported: • Supported. • Not supported.

display crypto-engine statistics

Use **display crypto-engine statistics** to display crypto engine statistics.

Syntax

display crypto-engine statistics [**engine-id** *engine-id* **slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

engine-id *engine-id*: Specifies a crypto engine by its ID. The switch supports only one software crypto engine, and the engine ID can only be 0.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

If you do not specify any parameters, this command displays crypto engine statistics for all member devices.

Examples

Display all crypto engine statistics.

```
<Sysname> display crypto-engine statistics
  Slot ID: 1
  CPU ID: 0
  Crypto engine ID: 0
  Submitted sessions: 0
  Failed sessions: 0
  Symmetric operations: 0
  Symmetric errors: 0
  Asymmetric operations: 0
  Asymmetric errors: 0
  Get-random operations: 0
  Get-random errors: 0
```

Table 2 Command output

Field	Description
Submitted sessions	Number of established sessions.
Failed sessions	Number of failed sessions.
Symmetric operations	Number of operations using symmetric algorithms.
Symmetric errors	Number of failed operations using symmetric algorithms.
Asymmetric operations	Number of operations using asymmetric algorithms.
Asymmetric errors	Number of failed operations using asymmetric algorithms.
Get-random operations	Number of operations for obtaining random numbers.
Get-random errors	Number of failed operations for obtaining random numbers.

Related commands

reset crypto-engine statistics

reset crypto-engine statistics

Use **reset crypto-engine statistics** to clear crypto engine statistics.

Syntax

reset crypto-engine statistics [**engine-id** *engine-id* **slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

engine-id *engine-id*: Specifies a crypto engine by its ID. The switch supports only one software crypto engine, and the engine ID can only be 0.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

If you do not specify any parameters, this command clears crypto engine statistics for all member devices.

Examples

Clear statistics for all crypto engines.

```
<Sysname> reset crypto-engine statistics
```

Related commands

display crypto-engine statistics

Contents

FIPS commands

display crypto version

Use **display crypto version** to display the version number of the device algorithm base.

Syntax

display crypto version

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Each algorithm base version number represents a set of cryptographic algorithms.

Examples

Display the version number of the current device algorithm base.

```
<Sysname> display crypto version
7.1.1.1.1.72
```

Table 1 Command output

Field	Description
7.1.1.1.1.72	Version number in the **7.1.***X* format. • **7.1**—Comware V700R001. • **X**—Version number of the device algorithm base.

display fips status

Use **display fips status** to display the FIPS mode state.

Syntax

display fips status

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the FIPS mode state.

```
<Sysname> display fips status
FIPS mode is enabled.
```

Related commands

fips mode enable

fips mode enable

Use **fips mode enable** to enable FIPS mode.

Use **undo fips mode enable** to disable FIPS mode.

Syntax

fips mode enable

undo fips mode enable

Default

FIPS mode is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

- When you enable or disable FIPS mode, the system prompts you to select the reboot method before it reboots. System reboot might interrupt ongoing services. Perform this operation with caution.
- If you select the manual reboot method to enable FIPS mode, you must manually complete the configurations for entering FIPS mode. If you fail to do so, the system enters FIPS mode after reboot but you cannot log in to the system correctly.

After you enable FIPS mode and reboot the device, the device operates in FIPS mode. The FIPS device has strict security requirements, and performs self-tests on cryptography modules to verify that they are operating correctly.

After you execute the **fips mode enable** command, the system provides the following methods to enter FIPS mode:

- Automatic reboot

  Select the automatic reboot method. The system automatically performs the following operations:

  a. Create a default FIPS configuration file named **fips-startup.cfg**.

  b. Specify the default file as the startup configuration file.

  c. Require you to configure the username and password for next login.

  After you configure the username and password at prompt, the system automatically uses the specified startup configuration file to reboot the device.

  During the interactive configuration process, you can press **Ctrl+C** to abort the configuration process and the **fips mode enable** command.

- Manual reboot

  This method requires that you manually complete the configurations for entering FIPS mode, and then reboot the device.

  To use manual reboot to enter FIPS mode:

  a. Enable the password control feature globally.

b. Set the number of character types a password must contain to 4, and set the minimum number of characters for each type to one character.

c. Set the minimum length of user passwords to 15 characters.

d. Add a local user account for device management, including the following items:

- A username.
- A password that must comply with the password control policies.
- A user role of **network-admin**.
- A service type of **terminal**.

e. Delete the FIPS-incompliant local user service types Telnet, HTTP, and FTP.

f. Save the configuration file and specify it as the startup configuration file.

g. Delete the original startup configuration file in binary format.

h. Reboot the device.

After executing the **`fips mode enable`** command, the system prompts you to choose a reboot method. If you do not make a choice within 30 seconds, the system uses the manual reboot method by default.

After executing the **`undo fips mode enable`** command, the system provides the following methods to exit FIPS mode:

- Automatic reboot

  Select the automatic reboot method. The system automatically creates a default non-FIPS configuration file named **non-fips-startup.cfg**, and specifies the file as the startup configuration file. The system reboots the device by using the default non-FIPS configuration file. After the reboot, you are directly logged into the device.

- Manual reboot

  This method requires that you manually complete the configurations for entering non-FIPS mode, and then reboot the device. After the device reboots, you must enter user information according to the authentication mode to log in to the device.

Examples

Enable FIPS mode, and choose the automatic reboot method to enter FIPS mode.

```
<Sysname> system-view
[Sysname] fips mode enable
FIPS mode change requires a device reboot. Continue? [Y/N]:y
Reboot the device automatically? [Y/N]:y
The system will create a new startup configuration file for FIPS mode. After you set the login username and password for FIPS mode, the device will reboot automatically.
Enter username(1-55 characters): root
Enter password(15-63 characters):
Confirm password:
Waiting for reboot... After reboot, the device will enter FIPS mode.
```

Enable FIPS mode, and choose the manual reboot method to enter FIPS mode.

```
<Sysname> system-view
[Sysname] fips mode enable
FIPS mode change requires a device reboot. Continue? [Y/N]:y
Reboot the device automatically? [Y/N]:n
Change the configuration to meet FIPS mode requirements, save the configuration to the next-startup configuration file, and then reboot to enter FIPS mode.
```

Disable FIPS mode, and choose the automatic reboot method to enter non-FIPS mode.

```
[Sysname] undo fips mode enable
```

```
FIPS mode change requires a device reboot. Continue? [Y/N]:y
The system will create a new startup configuration file for non-FIPS mode and then reboot automatically. Continue? [Y/N]:y
Waiting for reboot... After reboot, the device will enter non-FIPS mode.
```

Disable FIPS mode, and choose the manual reboot method to enter non-FIPS mode.

```
[Sysname] undo fips mode enable
FIPS mode change requires a device reboot. Continue? [Y/N]:y
The system will create a new startup configuration file for non-FIPS mode, and then reboot automatically. Continue? [Y/N]:n
Change the configuration to meet non-FIPS mode requirements, save the configuration to the next-startup configuration file, and then reboot to enter non-FIPS mode.
```

Related commands

`display fips status`

fips self-test

Use **`fips self-test`** to trigger a self-test on the cryptographic algorithms.

Syntax

`fips self-test`

Views

System view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

A successful self-test requires that all cryptographic algorithms pass the self-test. If the self-test fails, the device where the self-test process exists reboots.

This command is supported only in FIPS mode. To examine whether the cryptography modules operate correctly, you can use this command to trigger a self-test on the cryptographic algorithms. The triggered self-test is the same as the power-up self-test.

Examples

Trigger a self-test on the cryptographic algorithms.

```
<Sysname> system-view
[Sysname] fips self-test
Cryptographic Algorithms Known-Answer Tests are running ...

802.1X client commands

display dot1x supplicant

Use **display dot1x supplicant** to display 802.1X authentication information about 802.1X clients.

Syntax

display dot1x supplicant [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays 802.1X authentication information about 802.1X clients on all interfaces.

Examples

Display 802.1X authentication information about 802.1X clients on GigabitEthernet 1/0/1.

```
<Sysname> display dot1x supplicant interface gigabitethernet 1/0/1
GigabitEthernet1/0/1
  Username             : aaa
  EAP method           : PEAP-MSCHAPv2
  Dot1x supplicant     : Enabled
  Anonymous identifier : bbb
  SSL client policy    : policy_1
  FSM state            : Init
  EAPOL-Start packets  : 0
```

Table 1 Command output

Field	Description
Username	802.1X client username.
EAP method	802.1X client EAP authentication method: • MD5. • PEAP-GTC. • PEAP-MSCHAPv2. • TTLS-GTC. • TTLS-MSCHAPv2.
Dot1x supplicant	Status of the 802.1X client feature: • Enabled. • Disabled.
Anonymous identifier	802.1X client anonymous identifier.

Field	Description
SSL client policy	SSL client policy used by the 802.1X client feature.
FSM state	802.1X client authentication state: • **Init**—The authentication process starts. • **Connecting**—The 802.1X client is connecting to the authenticator. • **Authenticating**—The 802.1X client is being authenticated. • **Authenticated**—The 802.1X client has been authenticated. • **Held**—The 802.1X client is waiting for authentication.
EAPOL-Start packets	Number of sent EAPOL-Start packets.

dot1x supplicant anonymous identify

Use **dot1x supplicant anonymous identify** to configure an 802.1X client anonymous identifier.

Use **undo dot1x supplicant anonymous identify** to restore the default.

Syntax

dot1x supplicant anonymous identify *identifier*

undo dot1x supplicant anonymous identify

Default

No 802.1X client anonymous identifier exists.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

identifier: Specifies an 802.1X client anonymous identifier, a case-sensitive string of 1 to 253 characters.

Usage guidelines

At the first authentication phase, packets sent to the authenticator are not encrypted. The use of an 802.1X client anonymous identifier prevents the 802.1X client username from being disclosed at the first phase. The 802.1X client-enabled device sends the anonymous identifier to the authenticator instead of the 802.1X client username. The 802.1X client username will be sent to the authenticator in encrypted packets at the second phase.

If no 802.1X client anonymous identifier is configured, the device sends the 802.1X client username in the first phase.

The configured 802.1X client anonymous identifier takes effect only if one of the following EAP authentication methods is used:

- PEAP-MSCHAPv2.
- PEAP-GTC.
- TTLS-MSCHAPv2.
- TTLS-GTC.

If the MD5-Challenge EAP authentication is used, the configured 802.1X client anonymous identifier does not take effect. The device uses the 802.1X client username at the first authentication phase.

Do not configure the 802.1X client anonymous identifier if the vendor-specific authentication server cannot identify anonymous identifiers.

Examples

Configure the 802.1X client anonymous identifier as **bbb** on a port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dot1x supplicant anonymous identify bbb
```

Related commands

display dot1x supplicant

dot1x supplicant enable

dot1x supplicant username

dot1x supplicant eap-method

Use **dot1x supplicant eap-method** to specify an 802.1X client EAP authentication method.

Use **undo dot1x supplicant eap-method** to restore the default.

Syntax

dot1x supplicant eap-method { **md5** | **peap-gtc** | **peap-mschapv2** | **ttls-gtc** | **ttls-mschapv2** }

undo dot1x supplicant eap-method

Default

The MD5-Challenge authentication is used as the 802.1X client EAP authentication method.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

md5: Specifies the MD5-challenge EAP authentication method.

peap-gtc: Specifies the PEAP-GTC EAP authentication method.

peap-mschapv2: Specifies the PEAP-MSCHAPv2 EAP authentication method

ttls-gtc: Specifies the TTLS-GTC EAP authentication method.

ttls-mschapv2: Specifies the TTLS-MSCHAPv2 EAP authentication method.

Usage guidelines

Make sure the specified 802.1X client EAP authentication method is supported by the authentication server.

Examples

Specify PEAP-GTC as the 802.1X client EAP authentication method on a port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
```

```
[Sysname-GigabitEthernet1/0/1] dot1x supplicant eap-method peap-gtc
```

Related commands

display dot1x supplicant

dot1x supplicant enable

dot1x supplicant enable

Use **dot1x supplicant enable** to enable the 802.1X client feature.

Use **undo dot1x supplicant enable** to disable the 802.1X client feature.

Syntax

dot1x supplicant enable

undo dot1x supplicant enable

Default

The 802.1X client feature is disabled.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Make sure you have configured 802.1X authentication on the authenticator before you use this command.

Examples

Enable the 802.1X client feature on a port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dot1x supplicant enable
```

Related commands

display dot1x supplicant

dot1x supplicant mac-address

Use **dot1x supplicant mac-address** to configure an 802.1X client MAC address on an interface.

Use **undo dot1x supplicant mac-address** to restore the default.

Syntax

dot1x supplicant mac-address *mac-address*

undo dot1x supplicant mac-address

Default

The 802.1X client on an Ethernet interface uses the interface's MAC address for 802.1X authentication. If the interface's MAC address is unavailable, the 802.1X client uses the device's MAC address for 802.1X authentication.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a MAC address in the format of H-H-H, excluding multicast, all-zero, and all-F MAC addresses. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

Usage guidelines

If multiple Ethernet interfaces on the device act as 802.1X clients, configure a unique MAC address for each interface to ensure that they can pass 802.1X authentication.

You can use either of the following methods to configure a unique MAC address for each 802.1X client-enabled interface:

- Execute the **mac-address** command in Ethernet interface view.
- Execute the **dot1x supplicant mac-address** command.

Examples

Configure the 802.1X client MAC address as 0001-0001-0001 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dot1x supplicant mac-address 1-1-1
```

dot1x supplicant password

Use **dot1x supplicant password** to set an 802.1X client password.

Use **undo dot1x supplicant password** to restore the default.

Syntax

dot1x supplicant password { **cipher** | **simple** } *string*

undo dot1x supplicant password

Default

No 802.1X client password exists.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 127 characters. Its encrypted form is a case-sensitive string of 1 to 201 characters.

Examples

Set the 802.1X client password to **123456** in plaintext form on a port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dot1x supplicant password simple 123456
```

Related commands

display dot1x supplicant

dot1x supplicant enable

dot1x supplicant ssl-client-policy

Use **dot1x supplicant ssl-client-policy** to specify an SSL client policy for an 802.1X client-enabled device.

Use **undo dot1x supplicant ssl-client-policy** to restore the default.

Syntax

dot1x supplicant ssl-client-policy *policy-name*

undo dot1x supplicant ssl-client-policy *policy-name*

Default

An 802.1X client-enabled device uses the default SSL client policy.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

policy-name: Specifies an SSL client policy by its name, a case-insensitive string of 1 to 31 characters. Make sure the specified SSL client policy already exists.

Usage guidelines

If the PEAP-MSCHAPv2, PEAP-GTC, TTLS-MSCHAPv2, or TTLS-GTC authentication is used, the 802.1X authentication process is as follows:

- **The first phase**—The device acts as an SSL client to negotiate with the SSL server.

  The SSL client uses the SSL parameters specified in the specified SSL client policy to establish a connection to the SSL server for negotiation. The SSL parameters include a PKI domain, supported cipher suites, and the SSL version. For information about SSL client policies, see *Security Configuration Guide*.
- **The second phase**—The device uses the negotiated result to encrypt and transmit the interchanged authentication packets.

If the MD5-Challenge authentication is used, the device does not use an SSL client policy during the authentication process.

Examples

Specify SSL client policy **policy_1** to be used by an 802.1X client-enabled device on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dot1x supplicant ssl-client-policy policy_1
```

Related commands

display dot1x supplicant

dot1x supplicant enable

ssl client-policy

dot1x supplicant transmit-mode

Use **dot1x supplicant transmit-mode** to specify a mode used by 802.1X authentication for sending EAP-Response and EAPOL-Logoff packets.

Use undo dot1x supplicant transmit-mode to restore the default.

Syntax

dot1x supplicant transmit-mode { **multicast** | **unicast** }

undo dot1x supplicant transmit-mode

Default

802.1X authentication uses unicast mode to send EAP-Response and EAPOL-Logoff packets.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

multicast: Specifies multicast mode for sending EAP-Response and EAPOL-Logoff packets, of which the destination addresses are multicast MAC address 01-80-C2-00-00-03.

unicast: Specifies unicast mode for sending EAP-Response and EAPOL-Logoff packets.

Usage guidelines

When the device acts as an 802.1X client, use the multicast mode to avoid 802.1X authentication failures if the NAS device does not support receiving unicast EAP-Response or EAPOL-Logoff packets.

Examples

Configure 802.1X authentication to use multicast mode for sending EAP-Response and EAPOL-Logoff packets on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dot1x supplicant transmit-mode multicast
```

dot1x supplicant username

Use **dot1x supplicant username** to configure an 802.1X client username.

Use **undo dot1x supplicant username** to restore the default.

Syntax

dot1x supplicant username *username*

undo dot1x supplicant username

Default

No 802.1X client username exists.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

username: Specifies the 802.1X client username, a case-sensitive string of 1 to 253 characters.

Usage guidelines

802.1X client usernames can include domain names. The supported domain name delimiters include the at sign (@), backslash (\), dot (.), and forward slash (/). Usernames that include domain names can use the format of *username*@*domain-name*, *domain-name**username*, *username*.*domain-name*, or *username*/*domain-name*.

If you want to use backslash (\) as the domain name delimiter, you must enter the escape character (\) along with the backslash (\) sign.

If a username string includes multiple configured delimiters, the device takes the rightmost delimiter in the username string as the domain name delimiter. For more information about the domain name delimiters, see the **dot1x domain-delimiter** command.

Examples

Configure the 802.1X client username as **aaa** on a port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dot1x supplicant username aaa
```

Preface

This command reference describes fault detection and fast failover configuration commands. With these commands, you can detect and diagnose your network, and rapidly recover your network when failures occur.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** >

Convention	Description
	Folder.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
ⓘ **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Ethernet OAM commands

display oam

Use **display oam** to display Ethernet OAM connection information.

Syntax

display oam { **local** | **remote** } [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

local: Specifies the local end.

remote: Specifies the remote end.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays Ethernet OAM connection information for all interfaces.

Examples

Display Ethernet OAM connection information for all local interfaces.

```
<Sysname> display oam local
----------- [GigabitEthernet1/0/1] -----------
 Enable status    : Enable
 Loopback status  : No loopback
 Link status      : UP
 OAM mode         : Active

Table 1 Command output

Field	Description
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
Enable status	Ethernet OAM state: • **Enable**. • **Disable**.
Loopback status	Ethernet OAM loopback state: • **No loopback**—**Remote loopback is disabled**. • **Remote loopback**—**Controlling end of remote loopback**. • **Local loopback**—**Controlled end of remote loopback**.
Link status	Link physical state: • **UP** • **DOWN**.
OAM mode	Local Ethernet OAM mode: • **Active**—The interface operates in active Ethernet OAM mode. • **Passive**—The interface operates in passive Ethernet OAM mode.
PDU	The way in which the local end processes Ethernet OAMPDUs: • **RX_INFO**—The interface receives only Information OAMPDUs and does not send any Ethernet OAMPDUs. • **LF_INFO**—The interface sends only Information OAMPDUs without Information TLV triplets and with their link error flag bits being set. • **INFO**—The interface sends and receives only Information OAMPDUs. • **ANY**—The interface sends and receives Ethernet OAMPDUs of any type.
Mux action	Operating mode of the local transmitter: • **FWD**—The interface can send any packets. • **DISCARD**—The interface only sends Ethernet OAMPDUs.
Par action	Operating mode of the local receiver: • **FWD**—The interface can receive any packets. • **DISCARD**—The interface only receives Ethernet OAMPDUs. • **LB**—The local receiver is in loopback state. All the packets, other than Ethernet OAMPDUs, received on the local receiver are returned to their sources along their original routes.
Flags	Local flags inserted in the local flag fields of the sent Ethernet OAMPDUs.

Field	Description
Link fault	Indicates whether an Ethernet OAM link error is present.
Dying gasp	Indicates whether a fatal error is present.
Critical event	Indicates whether a critical error is present.
Local evaluating	Indicates whether the local-to-remote configuration negotiation is complete: • **COMPLETE**—The negotiation is completed. • **NOTCOMPLETE**—The negotiation is uncompleted.
Remote evaluating	Indicates whether the remote-to-local configuration negotiation is complete: • **COMPLETE**—The negotiation is completed. • **NOTCOMPLETE**—The negotiation is uncompleted. • **RESERVED**—The field is reserved and the negotiation is uncompleted. • **UNSATISFIED**—The remote end is not satisfied with the local configuration and the negotiation is uncompleted.
Packets statistics	Statistics about Ethernet OAMPDUs.
OAMPDU	Total number of sent or received Ethernet OAMPDUs.
OAMInformation	Number of sent or received Information OAMPDUs.
OAMEventNotification	Number of sent or received Event notification OAMPDUs.
OAMUniqueEventNotification	Number of unduplicated sent or received Event notification OAMPDUs.
OAMDuplicateEventNotification	Number of duplicate sent or received Event notification OAMPDUs.

Display Ethernet OAM connection information for all remote interfaces.

```
<Sysname> display oam remote
----------- [GigabitEthernet1/0/1] -----------
 OAM mode         : Active
 MAC address      : 3822-d6a2-a800
 MTU size         : 1500
 Mux action       : FWD
 Par action       : FWD
```

Display Ethernet OAM connection information for the peer interface GigabitEthernet 1/0/1.

```
<Sysname> display oam remote interface gigabitethernet 1/0/1
 OAM mode         : Active
 MAC address      : 3822-d6a2-a800

Local evaluating  : COMPLETE
Remote evaluating : COMPLETE
```

Table 2 Command output

Field	Description
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
OAM mode	Ethernet OAM mode on the remote end: • **Active**—The interface operates in active Ethernet OAM mode. • **Passive**—The interface operates in passive Ethernet OAM mode.
MAC address	MAC address of the remote end.
MTU size	MTU size, in bytes.
Mux action	Operating mode of the remote transmitter: • **FWD**—The interface can send any packets. • **DISCARD**—The interface only sends Ethernet OAMPDUs.
Par action	Operating mode of the remote receiver: • **FWD**—The interface can receive any packets. • **DISCARD**—The interface only receives Ethernet OAMPDUs. • **LB**—The local receiver is in loopback state. All the packets, other than Ethernet OAMPDUs, received on the local receiver are returned to their sources along their original routes.
Configuration	Configuration of the remote Ethernet OAM entity.
Unidirectional	Indicates whether unidirectional transmission is supported.
Remote loopback	Indicates whether Ethernet OAM remote loopback is supported.
Link events	Indicates whether Ethernet OAM link error events are supported.
MIB retrieval	Indicates whether MIB variable retrieval is supported.
Flags	Values of the peer Ethernet OAM flag fields in OAM packets.
Link fault	Indicates whether an Ethernet OAM link error is present.
Dying gasp	Indicates whether a fatal error is present.
Critical event	Indicates whether a critical error is present.
Local evaluating	Indicates whether the local-to-remote configuration negotiation is complete: • **COMPLETE**—The negotiation is completed. • **NOTCOMPLETE**—The negotiation is uncompleted. • **RESERVED**—The field is reserved and the negotiation is uncompleted. • **UNSATISFIED**—The remote end is not satisfied with the local configuration and the negotiation is uncompleted.
Remote evaluating	Indicates whether the remote-to-local configuration negotiation is complete: • **COMPLETE**—The negotiation is completed. • **NOTCOMPLETE**—The negotiation is uncompleted. • **UNSATISFIED**—The remote end is not satisfied with the local configuration and the negotiation is uncompleted.

Related commands

reset oam

display oam configuration

Use **display oam configuration** to display Ethernet OAM configuration information.

Syntax

display oam configuration [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays Ethernet OAM configuration globally and for interfaces that do not use the default configuration.

Examples

Display Ethernet OAM configuration globally and for interfaces that do not use the default configuration.

```
<Sysname> display oam configuration
---------------- [Global] ----------------
 OAM timers
   Hello timer       : 1000 milliseconds
   Keepalive timer    : 5000 milliseconds
 Link monitoring
   Errored symbol period
     Window          : 100 x 1000000 symbols
     Threshold       : 1 error symbols
   Errored frame
     Window          : 10 x 100 milliseconds
     Threshold       : 1 error frames
   Errored frame period
     Window          : 1000 x 10000 frames
     Threshold       : 1 error frames
   Errored frame seconds
     Window          : 600 x 100 milliseconds
     Threshold       : 1 error seconds

----------- [GigabitEthernet1/0/1] -----------
 OAM timers
   Hello timer       : 500 milliseconds
   Keepalive timer    : 5000 milliseconds
 Link monitoring
   Errored symbol period
     Window          : 100 x 1000000 symbols
```

```
    Threshold       : 1 error symbols
  Errored frame
    Window          : 10 x 100 milliseconds
    Threshold       : 1 error frames
  Errored frame period
    Window          : 1000 x 10000 frames
    Threshold       : 1 error frames
  Errored frame seconds
    Window          : 600 x 100 milliseconds
    Threshold       : 1 error seconds
```

Table 3 Command output

Field	Description
Global	Global information.
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
OAM timers	Ethernet OAM connection detection timers.
Hello timer	Ethernet OAM handshake packet transmission interval.
Keepalive timer	Ethernet OAM connection timeout timer.
Link monitoring	Link event detection window and threshold.
Errored symbol period	Errored symbol event.
Errored frame	Errored frame event.
Errored frame period	Errored frame period event.
Errored frame seconds	Errored frame seconds event.
Window	Detection window configured for link events.
Threshold	Triggering threshold configured for link events.

display oam critical-event

Use **display oam critical-event** to display statistics for critical Ethernet OAM link events.

Syntax

display oam critical-event [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays statistics for the critical Ethernet OAM link events for all interfaces.

Examples

Display statistics for critical Ethernet OAM link events on all interfaces.

```
<Sysname> display oam critical-event
----------- [GigabitEthernet1/0/1] -----------
 Local link status   : UP
 Event statistics
   Link fault       : Not occurred
   Dying gasp       : Not occurred
   Critical event    : Not occurred
```

Table 4 Command output

Field	Description
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
Local link status	Local link status, up or down.
Event statistics	Statistics for critical Ethernet OAM link events.
Link fault	Indicates whether a link fault is present.
Dying Gasp	Indicates whether a fatal fault is present.
Critical Event	Indicates whether a critical fault is present.

display oam link-event

Use **display oam link-event** to display statistics for Ethernet OAM link error events for local or peer interfaces.

Syntax

display oam link-event { **local** | **remote** } [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

local: Specifies the local end.

remote: Specifies the peer end.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays statistics for Ethernet OAM link error events for all local or peer interfaces.

Usage guidelines

Ethernet OAM link error events include errored symbol events, errored frame events, errored frame period events, and errored frame seconds events.

Examples

Display statistics for Ethernet OAM link error events for all local interfaces.

```
<Sysname> display oam link-event local
----------- [GigabitEthernet1/0/1] -----------
```

```
 Link status: UP
 OAM local errored symbol event
   Event time stamp       : 35498 x 100 milliseconds
   Errored symbol window    : 100000000 symbols
   Errored symbol threshold : 1 error symbols
   Errored symbol         : 1 error symbols
   Error running total     : 4 error symbols
   Event running total     : 4 events
 OAM local errored frame event
   Event time stamp       : 49582 x 100 milliseconds
   Errored frame window    : 10 x 100 milliseconds
   Errored frame threshold : 1 error frames
   Errored frame         : 1 error frames
   Error running total    : 6 error frames
   Event running total    : 6 events
 OAM local errored frame period event
   Event time stamp             : 16382 x 100 milliseconds
   Errored frame period window    : 10000000 frames
   Errored frame period threshold  : 1 error frames
   Errored frame period          : 1 error frames
   Error running total           : 5 error frames
   Event running total           : 5 events
 OAM local errored frame seconds summary event
   Event time stamp             : 50022 x 100 milliseconds
   Errored frame seconds window    : 600 x 100 milliseconds
   Errored frame seconds threshold : 1 error seconds
   Errored frame seconds         : 1 error seconds
   Error running total           : 1 error seconds
   Event running total           : 1 events
```

Display statistics for Ethernet OAM link error events for all peer interfaces.

```
<Sysname> display oam link-event remote
------------ [GigabitEthernet1/0/1] ------------
 Link status: UP
 OAM remote errored symbol event
   Event time stamp       : 35498 x 100 milliseconds
   Errored symbol window    : 100000000  symbols
   Errored symbol threshold : 1 error symbols
   Errored symbol         : 1 error symbols
   Error running total     : 4 error symbols
   Event running total     : 4 events
 OAM remote errored frame event
   Event time stamp       : 49582 x 100 milliseconds
   Errored frame window    : 10 x 100 milliseconds
   Errored frame threshold : 1 error frames
   Errored frame         : 1 error frames
   Error running total    : 6 error frames
   Event running total    : 6 events
 OAM remote errored frame period event
```

```
  Event time stamp             : 16382 x 100 milliseconds
  Errored frame period window    : 10000000 frames
  Errored frame period threshold  : 1 error frames
  Errored frame period          : 1 error frames
  Error running total           : 5 error frames
  Event running total           : 5 events
OAM remote errored frame seconds summary event
  Event time stamp             : 50022 x 100 milliseconds
  Errored frame seconds window   : 600 x 100 milliseconds
  Errored frame seconds threshold : 1 error seconds
  Errored frame seconds         : 1 error seconds
  Error running total           : 1 error seconds
  Event running total           : 1 events
```

Table 5 Command output

Field	Description
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
Link status	Link status, up or down.
OAM local/remote errored symbol event	Information about local/remote errored symbol events (available only when remote errored symbol events occur): • **Event time stamp**—Time when an errored symbol event occurred. • **Errored symbol window**—Errored symbol detection interval. • **Errored symbol threshold**—Errored threshold that triggers an errored symbol event. • **Errored symbol**—Number of detected errored symbols in the most recent errored symbol event. • **Error running total**—Total number of errored symbols. • **Event running total**—Total number of errored symbol events that have occurred.
OAM local/remote errored frame event	Information about local/remote end errored frame events (available only when local/remote end errored frame events occur): • **Event time stamp**—Time when an errored frame event occurred. • **Errored frame window**—Errored frame detection interval. • **Errored frame threshold**—Errored threshold that triggers an errored frame event. • **Errored frame**—Number of detected errored frames in the most recent errored frame event. • **Error running total**—Total number of errored frames. • **Event running total**—Total number of errored frame events that have occurred.
OAM local/remote errored frame period event	Information about local or remote errored frame period events (available only when local/remote errored frame period events occur): • **Event time stamp**—Time when an errored frame period event occurred. • **Errored frame period window**—Errored frame period detection interval. • **Errored frame period threshold**—Errored threshold that triggers an errored frame period event. • **Errored frame period**—Number of detected errored frames in the most recent errored frame period event. • **Error running total**—Total number of errored frames that have detected. • **Event running total**—Total number of errored frame period events.

Field	Description
OAM local/remote errored frame seconds summary event	Information about local/remote end errored frame seconds events (available only when local/remote end errored frame seconds events occur): • **Event time stamp**—Time when an errored frame seconds event occurred. • **Errored frame second window**—Errored frame second detection interval. • **Errored Frame seconds threshold**—Errored threshold that triggers an errored frame seconds event. • **Errored frame seconds**—Number of detected errored frame seconds in the most recent errored frame seconds event. • **Error running total**—Total number of errored frame seconds. • **Event running total**—Total number of errored frame seconds events that have occurred.

Related commands

reset oam

oam enable

Use **oam enable** to enable Ethernet OAM.

Use **undo oam enable** to disable Ethernet OAM.

Syntax

oam enable

undo oam enable

Default

Ethernet OAM is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable OAM on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam enable
```

oam errored-frame threshold

Use **oam errored-frame threshold** to set the errored frame event triggering threshold for an interface.

Use **undo oam errored-frame threshold** to restore the default.

Syntax

oam errored-frame threshold *threshold-value*

undo oam errored-frame threshold

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame event triggering threshold in number of errored frame events, in the range of 0 to 4294967295.

Usage guidelines

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame event triggering threshold to 100 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam errored-frame threshold 100
```

Related commands

display oam configuration

display oam link-event

oam global errored-frame threshold

oam errored-frame window

Use **oam errored-frame window** to set the errored frame event detection window.

Use **undo oam errored-frame window** to restore the default.

Syntax

oam errored-frame window *window-value*

undo oam errored-frame window

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

window-value: Specifies the errored frame event detection window in the range of 10 to 600, in steps of 10, in 100 milliseconds.

Usage guidelines

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame event detection window to 2000 milliseconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam errored-frame window 20
```

Related commands

display oam configuration

oam global errored-frame window

oam errored-frame-period threshold

Use **oam errored-frame-period threshold** to set the errored frame period event triggering threshold on an interface.

Use **undo oam errored-frame-period threshold** to restore the default.

Syntax

oam errored-frame-period threshold *threshold-value*

undo oam errored-frame-period threshold

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame period event triggering threshold in the range of 0 to 4294967295.

Usage guidelines

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame period event triggering threshold to 100 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam errored-frame-period threshold 100
```

Related commands

display oam configuration

display oam link-event

oam global errored-frame-period threshold

oam errored-frame-period window

Use **oam errored-frame-period window** to set the errored frame period event detection window.

Use **undo oam errored-frame-period window** to restore the default.

Syntax

oam errored-frame-period window *window-value*

undo oam errored-frame-period window

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

window-value: Specifies the errored frame period event detection window in the range of 1 to 65535. The value of this argument must be a multiple of 10000.

Usage guidelines

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame period event detection window to 20000000 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam errored-frame-period window 2000
```

Related commands

display oam configuration

display oam link-event

oam global errored-frame-period window

oam errored-frame-seconds threshold

Use **oam errored-frame-seconds threshold** to set the errored frame seconds event triggering threshold on an interface.

Use **undo oam errored-frame-seconds threshold** to restore the default.

Syntax

oam errored-frame-seconds threshold *threshold-value*

undo oam errored-frame-seconds threshold

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame seconds event triggering threshold in the range of 0 to 900.

Usage guidelines

The value of the errored frame seconds event triggering threshold cannot be greater than the value of the errored frame seconds event detection window (in seconds). Otherwise, errored frame seconds events cannot be generated.

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame seconds event triggering threshold to 100 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam errored-frame-seconds threshold 100
```

Use **undo oam global errored-frame threshold** to restore the default.

Syntax

oam global errored-frame threshold *threshold-value*

undo oam global errored-frame threshold

Default

The errored frame event triggering threshold is 1.

Views

System view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame event triggering threshold in the range of 0 to 4294967295.

Usage guidelines

The configuration in system view takes effect on all interfaces, but has a lower precedence than the configuration in interface view.

Examples

Set the errored frame event triggering threshold to 100.

```
<Sysname> system-view
[Sysname] oam global errored-frame threshold 100
```

Related commands

oam errored-frame threshold

oam global errored-frame window

Use **oam global errored-frame window** to set the global errored frame event detection window.

Use **undo oam global errored-frame window** to restore the default.

Syntax

oam global errored-frame window *window-value*

undo oam global errored-frame window

Default

The global errored frame event detection window is 1000 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

window-value: Specifies the errored frame event detection window in the range of 10 to 600, in steps of 10, in 100 milliseconds.

Usage guidelines

The configuration in system view takes effect on all interfaces, but has a lower precedence than the configuration in interface view.

Examples

Set the errored frame event detection window to 2000 milliseconds.

```
<Sysname> system-view
[Sysname] oam global errored-frame window 20
```

oam global timer hello

Use **oam global timer hello** to configure the global Ethernet OAM handshake packet transmission interval.

Use **undo oam global timer hello** to restore the default.

Syntax

oam global timer hello *interval*

undo oam global timer hello

Default

The global Ethernet OAM handshake packet transmission interval is 1000 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the Ethernet OAM handshake packet transmission interval, in steps of 100, in milliseconds. The value range for the *interval* argument is 500 to 5000.

Usage guidelines

After the timeout timer of an Ethernet OAM connection expires, the local OAM entity ages out and terminates its connection with the peer OAM entity. To keep the Ethernet OAM connections stable, set the connection timeout timer to be a minimum of five times the handshake packet transmission interval.

The configuration in system view takes effect on all interfaces, but has a lower precedence than the configuration in interface view.

Examples

Set the Ethernet OAM handshake packet transmission interval to 600 milliseconds.

```
<Sysname> system-view
[Sysname] oam global timer hello 600
```

Related commands

oam global timer keepalive

Use **oam global timer keepalive** to configure the global Ethernet OAM connection timeout timer.

Use **undo oam global timer keepalive** to restore the default.

Syntax

oam global timer keepalive *interval*

undo oam global timer keepalive

Default

The global Ethernet OAM connection timeout timer is 5000 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the Ethernet OAM connection timeout timer, in steps of 100, in milliseconds. The value range for the *interval* argument is 1000 to 25000.

Usage guidelines

After the timeout timer of an Ethernet OAM connection expires, the local OAM entity ages out and terminates its connection with the peer OAM entity. To keep the Ethernet OAM connections stable, set the connection timeout timer to be a minimum of five times the handshake packet transmission interval.

The configuration in system view takes effect on all interfaces, but has a lower precedence than the configuration in interface view.

Examples

Set the Ethernet OAM connection timeout timer to 6000 milliseconds.

```
<Sysname> system-view
[Sysname] oam global timer keepalive 6000
```

Related commands

display oam configuration

oam mode

Use **oam mode** to set the Ethernet OAM mode.

Use **undo oam mode** to restore the default.

Syntax

oam mode { **active** | **passive** }

undo oam mode

Default

An Ethernet OAM-enabled Ethernet interface operates in active Ethernet OAM mode.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

active: Specifies the active Ethernet OAM mode.

passive: Specifies the passive Ethernet OAM mode.

Usage guidelines

To change the Ethernet OAM mode of an Ethernet OAM-enabled Ethernet interface, first disable Ethernet OAM on the interface.

Examples

Disable Ethernet OAM on GigabitEthernet 1/0/1, and then configure GigabitEthernet 1/0/1 to operate in passive Ethernet OAM mode.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo oam enable
[Sysname-GigabitEthernet1/0/1] oam mode passive
```

Related commands

oam enable

oam remote-failure action

Use **oam remote-failure action** to configure the action an interface takes after it receives an Ethernet OAM event from the remote end.

Use **undo oam remote-failure action** to remove the configuration.

Syntax

oam remote-failure { **connection-expired** | **critical-event** | **dying-gasp** | **link-fault** } **action error-link-down**

undo oam remote-failure { **connection-expired** | **critical-event** | **dying-gasp** | **link-fault** } **action error-link-down**

Default

An interface only logs the Ethernet OAM event it receives from the remote end.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

connection-expired: Specifies a connection timeout event.

critical-event: Specifies a critical event.

dying-gasp: Specifies a fatal event.

link-fault: Specifies a link fault event.

error-link-down: Terminates the OAM connection, and sets the link state of the interface to down.

Examples

Configure GigabitEthernet 1/0/1 to terminate the OAM connection after it receives a critical event from the remote end, and set the link state of the interface to down.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam remote-failure critical-event action error-link-down
```

oam remote-loopback

Use **oam remote-loopback start** to enable Ethernet OAM remote loopback on an interface.

Use **oam remote-loopback stop** to disable Ethernet OAM remote loopback on an interface.

Syntax

oam remote-loopback start

oam remote-loopback stop

Default

Ethernet OAM remote loopback is disabled on an interface.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Ethernet OAM remote loopback is available only after the Ethernet OAM connection is established. It can be performed only by the Ethernet OAM entities operating in active Ethernet OAM mode.

You can enable Ethernet OAM remote loopback on a specified interface in user view or system view. You can also enable it on the current interface in interface view. The configurations have the same effect.

Examples

Configure active Ethernet OAM mode and enable Ethernet OAM on GigabitEthernet 1/0/1. Enable Ethernet OAM remote loopback on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam mode active
[Sysname-GigabitEthernet1/0/1] oam enable
[Sysname-GigabitEthernet1/0/1] oam remote-loopback start
```

Related commands

oam remote-loopback interface

oam remote-loopback interface

Use **oam remote-loopback start interface** to enable Ethernet OAM remote loopback on an interface.

Use **oam remote-loopback stop interface** to disable Ethernet OAM remote loopback on an interface.

Syntax

oam remote-loopback start interface *interface-type interface-number*

oam remote-loopback stop interface *interface-type interface-number*

Default

Ethernet OAM remote loopback is disabled on an interface.

Views

User view

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

Ethernet OAM remote loopback is available only after the Ethernet OAM connection is established. It can be performed only by the Ethernet OAM entities operating in active Ethernet OAM mode.

You can enable Ethernet OAM remote loopback on a specified interface in user view or system view. You can also enable it on the current interface in interface view. The configurations have the same effect.

Examples

Configure the active Ethernet OAM mode and enable Ethernet OAM on GigabitEthernet 1/0/1. Enable Ethernet OAM remote loopback on GigabitEthernet 1/0/1 in system view.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam mode active
[Sysname-GigabitEthernet1/0/1] oam enable
[Sysname-GigabitEthernet1/0/1] quit

```

Related commands

oam enable

oam mode

oam remote-loopback

oam remote-loopback reject-request

Use **oam remote-loopback reject-request** to configure an interface to reject the Ethernet OAM remote loopback request from a remote interface.

Use **undo oam remote-loopback reject-request** to restore the default.

Syntax

oam remote-loopback reject-request

undo oam remote-loopback reject-request

Default

An interface does not reject the Ethernet OAM remote loopback request from a remote interface.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

If an interface is in loopback state when you execute the **oam remote-loopback reject-request** command, the configuration takes effect when the next loopback starts.

Examples

Configure GigabitEthernet 1/0/1 to reject the Ethernet OAM remote loopback request from a remote interface.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam remote-loopback reject-request
```

oam timer hello

Use **oam timer hello** to configure the Ethernet OAM handshake packet transmission interval.

Use **undo oam timer hello** to restore the default.

Syntax

oam timer hello *interval*

undo oam timer hello

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the Ethernet OAM handshake packet transmission interval, in steps of 100, in milliseconds. The value range for the *interval* argument is 500 to 5000.

Usage guidelines

After the timeout timer of an Ethernet OAM connection expires, the local OAM entity ages out and terminates its connection with the peer OAM entity. To keep the Ethernet OAM connections stable, set the connection timeout timer to be at least five times the handshake packet transmission interval.

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the Ethernet OAM handshake packet transmission interval to 600 milliseconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] oam timer hello 600
```

Use **undo cfd ais-track link-status level** to restore the default.

Syntax

cfd ais-track link-status level *level-value*

undo cfd ais-track link-status level

Default

The EAIS frame transmission level is not configured.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

level *level-value*: Specifies the EAIS frame transmission level in the range of 0 to 7.

Usage guidelines

If no EAIS frame transmission level is configured on a port, the port cannot send EAIS frames.

Follow these guidelines when you use the command:

- Configurations in Ethernet interface view take effect only on the current interface.
- Configurations in aggregate interface view take effect only on the current aggregate interface.
- Configurations on a member port take effect only when the member port leaves the aggregation group.

Examples

Configure the EAIS frame transmission level as 3 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] cfd ais-track link-status level 3
```

Default

The EAIS frame transmission period is not configured.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

period *period-value*: Specifies the EAIS frame transmission period in the range of 1 to 60 seconds.

Usage guidelines

If no EAIS frame transmission period is configured on a port, the port cannot send EAIS frames.

Follow these guidelines when you use the command:

- Configurations in Ethernet interface view take effect only on the current interface.
- Configurations in aggregate interface view take effect only on the current aggregate interface.
- Configurations on a member port take effect only when the member port leaves the aggregation group.

Examples

Configure the EAIS frame transmission period as 60 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] cfd ais-track link-status period 60
```

Related commands

cfd ais-track link-status global

cfd ais-track link-status level

cfd ais-track link-status vlan

cfd ais-track link-status vlan

Use **cfd ais-track link-status vlan** to specify the VLANs where the EAIS frames can be transmitted.

Use **undo cfd ais-track link-status vlan** to remove the VLANs where the EAIS frames can be transmitted.

Syntax

cfd ais-track link-status vlan *vlan-list*

undo cfd ais-track link-status vlan *vlan-list*

Default

The EAIS frames can be transmitted only within the default VLAN of the port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies the VLANs where the EAIS frames can be transmitted. The *vlan-list* argument specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id* [**to** *vlan-id*]. The value range for VLAN IDs is 1 to 4094.

Usage guidelines

The EAIS frames are transmitted within the intersection of the VLANs specified with this command and the existing VLANs on the device.

If the command is executed multiple times, the combination of the VLANs specified in each command takes effect.

Follow these guidelines when you use the command:

- Configurations in Ethernet interface view take effect only on the current interface.
- Configurations in aggregate interface view take effect only on the current aggregate interface.
- Configurations on a member port take effect only when the member port leaves the aggregation group.

Examples

On port GigabitEthernet 1/0/1, specify VLANs 100 through 200 as the VLANs where the EAIS frames can be transmitted.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] cfd ais-track link-status vlan 100 to 200
```

Syntax

cfd cc service-instance *instance-id* **mep** *mep-id* **enable**

undo cfd cc service-instance *instance-id* **mep** *mep-id* **enable**

Default

The CCM sending feature is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191.

Usage guidelines

Follow these guidelines when you use the command:

- Configurations in Ethernet interface view take effect only on the current interface.
- Configurations in aggregate interface view take effect only on the current aggregate interface.
- If the MEP belongs to an MA that does not carry the VLAN attribute, configurations on a member port of an aggregation group view take effect only on the current member port.
- If the MEP belongs to an MA that carries the VLAN attribute, configurations on a member port of an aggregation group take effect only when the member port leaves the aggregation group.

Examples

On port GigabitEthernet 1/0/1, enable CCM sending on MEP 3 in service instance 5.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1

network-admin

Parameters

interval *interval-value*: Specifies the value of the interval field in CCM messages. The value range for the interval field is 1 to 7. If you set the value to 1 or 2, the continuity check might work incorrectly due to hardware restrictions.

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

Usage guidelines

When setting the CCM interval, use the settings described in Table 1.

Table 1 CCM interval field encoding

CCM interval field	Transmission interval	Maximum CCM lifetime
1	10/3 milliseconds	35/3 milliseconds
2	10 milliseconds	35 milliseconds
3	100 milliseconds	350 milliseconds
4	1 second	3.5 seconds
5	10 seconds	35 seconds
6	60 seconds	210 seconds
7	600 seconds	2100 seconds

Examples

Set the value of the interval field to 3 in CCM messages sent by MEPs in service instance 2.

```
<Sysname> system-view
[Sysname] cfd cc interval 3 service-instance 2
```

Related commands

cfd cc enable

cfd dm one-way

Use **cfd dm one-way** to enable one-way delay measurement (DM).

Syntax

cfd dm one-way service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**number** *number*]

Views

Any view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies the source MEP by its ID in the range of 1 to 8191.

target-mac *mac-address*: Specifies the target MEP by its MAC address in the format of H-H-H.

target-mep *target-mep-id*: Specifies the target MEP by its ID in the range of 1 to 8191.

number *number*: Specifies the number of 1DM frames sent. The value range for the *number* argument is 2 to 10, and the default is 5.

Usage guidelines

The one-way DM function measures the one-way frame delay between the source and target MEPs by using 1DM frames.

To view the one-way delay test result, use the **display cfd dm one-way history** command on the target MEP.

Examples

Enable the one-way DM function to test the one-way frame delay from source MEP 1101 to target MEP 1003 in service instance 1.

```
<Sysname> cfd dm one-way service-instance 1 mep 1101 target-mep 1003
5 1DMs have been sent. Please check the result on the remote device.
```

Related commands

display cfd dm one-way history

reset cfd dm one-way history

cfd dm two-way

Use **cfd dm two-way** to enable two-way DM.

Syntax

cfd dm two-way service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**dot1p** *dot1p-value*] [**number** *number*] [**interval** *interval*]

Views

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies the source MEP by its ID in the range of 1 to 8191.

target-mac *mac-address*: Specifies the target MEP by its MAC address, which is in the format of H-H-H.

target-mep *target-mep-id*: Specifies the target MEP by its ID in the range of 1 to 8191.

dot1p *dot1p-value*: Specifies an 802.1p priority for DMM frames. The value range for the *dot1p-value* argument is 0 to 7. The default value is 7.

number *number*: Specifies the number of DMM frames to be sent. The value range for the *number* argument is 2 to 10, and the default is 5.

interval*interval*: Specifies the DMM frame sending interval, in seconds. The value takes 1 or 10. The default value is 1.

Usage guidelines

The two-way DM function measures the two-way frame delay between the source and target MEPs by using DMM frames and DMR frames.

Examples

Enable the two-way DM function to test the two-way frame delay between source MEP 1101 and target MEP 2001 in service instance 1.

```
<Sysname> cfd dm two-way service-instance 1 mep 1101 target-mep 2001
Frame delay:
Reply from 0010-fc00-6512: 2406us
Reply from 0010-fc00-6512: 2215us
Reply from 0010-fc00-6512: 2112us
Reply from 0010-fc00-6512: 1812us
Reply from 0010-fc00-6512: 2249us
Average: 2158us
Sent DMMs: 5        Received: 5        Lost: 0

Frame delay variation: 191us 103us 300us 437us
Average: 257us
```

Table 2 Command output

Field	Description
Reply from 0010-fc00-6512	Delay of the DMR frames returned from the MEP with MAC address 0010-FC00-6512.
Average	Average frame delay or average frame delay variation.
Sent DMMs	Number of sent DMM frames .
Received	Number of received DMR frames.
Lost	Number of lost DMM frames.

cfd enable

Use **cfd enable** to enable CFD.

Use **undo cfd enable** to disable CFD.

Syntax

cfd enable

undo cfd enable

Default

CFD is disabled.

```

cfd linktrace

Use **cfd linktrace** to identify the path between the source MEP and target MP.

Syntax

cfd linktrace service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**ttl** *ttl-value*] [**hw-only**]

Views

Any view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies the source MEP by its ID in the range of 1 to 8191.

target-mac *mac-address*: Specifies the destination MAC address, in the format of H-H-H.

target-map *target-mep-id*: Specifies the destination MEP by its ID in the range of 1 to 8191.

ttl *ttl-value*: Specifies the TTL value in the range of 1 to 255. The default value is 64.

hw-only: Sets the hw-only bits of the LTMs sent. If you specify this keyword, the MIP does not flood LTMs that have an unknown destination MAC address.

Usage guidelines

This command identifies the path between the source MEP and target MP by using LTMs and LTRs.

Examples

Identify the path between source MEP 1101 and target MEP 2001 in service instance 1.

```
<Sysname> cfd linktrace service-instance 1 mep 1101 target-mep 2001
Linktrace to MEP 2001 with the sequence number 1101-43361:
MAC address               TTL     Last MAC         Relay action
0010-fc00-6512            63      0010-fc00-6500   Hit
```

Table 3 Command output

Field	Description
Linktrace to MEP 2001 with the sequence number 1101-43361	Linktrace to target MEP 2001 with the sequence number 1101-43361.
MAC address	Source MAC address in the LTRs.
TTL	TTL of the LTM when it passes the device.
Last MAC	MAC address of the last-hop device the LTM passes.
Relay action	Indicates whether the forwarding device found the destination MAC address in its MAC address table. When the standard version (IEEE 802.1ag) of CFD is used: • **Hit**—The current device is the destination device. • **FDB**—The forwarding device found the destination MAC address. • **MPDB**—The destination MAC address is not found, or the destination MAC address is found in the MEP or MIP database.

Related commands

cfd linktrace auto-detection

display cfd linktrace-reply

cfd linktrace auto-detection

Use **cfd linktrace auto-detection** to enable automatic sending of LTMs.

Use **undo cfd linktrace auto-detection** to disable automatic sending of LTMs.

Syntax

cfd linktrace auto-detection [**size** *size-value*]

undo cfd linktrace auto-detection

Default

Automatic sending of LTMs is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

size *size-value*: Specifies the size of the buffer used to store the auto-detection result, in the range of 1 to 100 (in terms of auto-detection times). The default value is 5, which means the buffer stores the results of the recent five auto-detections.

Usage guidelines

This command enables the source MEP to send LTMs when it fails to receive CCMs from the target MEP within 3.5 times the sending interval. The destination of the LTMs is the target MEP, and the TTL field value is 255. Based on the returned LTRs, the fault source can be located on the faulty link.

If you disable automatic LTM sending, the content stored in the buffer will be removed.

Examples

Enable automatic LTM sending, and set the size of the buffer used to store the auto-detection result to 100 (in terms of auto-detection times).

```
<Sysname> system-view
[Sysname] cfd linktrace auto-detection size 100
```

Related commands

cfd loopback

Use **cfd loopback** to enable loopback (LB).

Syntax

cfd loopback service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**number** *number*]

Views

Any view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies the source MEP by its ID in the range of 1 to 8191.

target-mac *mac-address*: Specifies the destination MAC address of the MP, in the format of H-H-H.

target-mep *target-mep-id*: Specifies the target MEP by its ID in the range of 1 to 8191.

number *number*: Specifies the number of the sent LBMs packets. The value is in the range of 1 to 10. The default value is 5.

Usage guidelines

The LB function verifies link connectivity between the source MEP and the target MP by using LBMs and LBRs.

Examples

Enable LB for the link between MEP 1101 and MEP 2001 in service instance 1 (assume that the link status is normal).

```
<Sysname> cfd loopback service-instance 1 mep 1101 target-mep 2001
Loopback to MEP 2001 with the sequence number start from 1101-43404:
Reply from 0010-fc00-6512: sequence number=1101-43404 Time=5ms
Reply from 0010-fc00-6512: sequence number=1101-43405 Time=5ms
```

```
Reply from 0010-fc00-6512: sequence number=1101-43406 Time=5ms
Reply from 0010-fc00-6512: sequence number=1101-43407 Time=5ms
Reply from 0010-fc00-6512: sequence number=1101-43408 Time=5ms
Sent: 5        Received: 5        Lost: 0
```

Enable LB for the link between MEP 1101 and MEP 2001 in service instance 1 (assume that the link status is abnormal).

```
<Sysname> cfd loopback service-instance 1 mep 1101 target-mep 2001
Loopback to MEP 2001 with the sequence number start from 1101-43404:
Sent: 5        Received: 0        Lost: 5
```

Table 4 Command output

Field	Description
Loopback to MEP 2001 with the sequence number start from 1101-43404	Sends LBMs to remote MEP 2001 with the sequence number starting with 1101-43404.
Reply from 0010-fc00-6512	Reply from the MP with the MAC address 0010-FC00-6512.
sequence number	Sequence number in the LBR messages.
Time=5ms	The interval between the sending of LBMs and receiving of LBRs is 5 milliseconds.
Sent	Number of sent LBMs.
Received	Number of received LBRs.
Lost	Number of lost LBRs.

cfd md

Use **cfd md** to create an MD.

Use **undo cfd md** to delete an MD.

Syntax

cfd md *md-name* [**index** *index-value*] **level** *level-value* [**md-id** { **dns** *dns-name* | **mac** *mac-address subnumber* | **none** }]

undo cfd md *md-name*

Default

No MDs exist.

Views

System view

Predefined user roles

network-admin

Parameters

md *md-name*: Specifies the name of an MD, which is a string of 1 to 43 characters that can contain letters, numbers, and special characters such as grave accent (`), tilde (~), exclamation mark (!), at sign (@), number sign (#), dollar sign ($), percent (%), caret (^), ampersand (&), asterisk (*), brackets ({ }, ( ), [ ], < >), hyphen (-), underscore (_), plus (+), equal sign (=), vertical bar (|), colon (:), semicolon (;), quotation mark ('), comma (,), period (.), and slash (/).

index *index-value*: Specifies an MD index in the range of 1 to 4294967295. If you do not specify this option, the system automatically assigns the smallest index number that is not in use. As a best practice, use the index automatically assigned by the system.

level *level-value*: Specifies an MD level in the range of 0 to 7.

md-id: Specifies the MD name carried by packets sent by the MEP. If you do not provide this keyword, the MD name is represented by *md-name*.

dns *dns-name*: Specifies an MD name in the format of DNS name, where *dns-name* represents the DNS name.

mac *mac-address subnumber*: Specifies an MD name containing the MAC address and an integer. The *mac-address* argument represents the MAC address of the MD, and the *subnumber* argument is in the range of 0 to 65535.

none: Specifies that no MD name is carried in the packets sent by the MEP.

Usage guidelines

An MD name must be in compliant with the specifications in IEEE802.1ag-2007.

You can create only one MD with a specific level. MD cannot be created if you enter an invalid MD name or an existing MD name or the MD index is in use.

When deleting an MD, you will also delete the configurations related to that MD.

Examples

Create an MD named **test_md1**, with its level being 3.

```
<Sysname> system-view
[Sysname] cfd md test_md1 level 3
```

Create an MD named **test_md2**, and the MD name carried in the packet sent by the MEP comprises the MAC address 1-1-1 and integer 1.

```
<Sysname> system-view
[Sysname] cfd md test_md2 level 5 md-id mac 1-1-1 1
```

cfd mep

Use **cfd mep** to create a MEP.

Use **undo cfd mep** to delete a MEP.

Syntax

cfd mep *mep-id* **service-instance** *instance-id* { **inbound** | **outbound** }

undo cfd mep *mep-id* **service-instance** *instance-id*

Default

No MEPs exist.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

mep *mep-id*: Specifies the MEP ID, in the range of 1 to 8191.

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

inbound: Creates an inward-facing MEP.

outbound: Creates an outward-facing MEP.

Usage guidelines

In creating a MEP, the service instance you specified defines the MD and MA to which the MEP belongs.

You cannot create a MEP if the MEP ID is not included in the MEP list of the relevant service instance.

Follow these guidelines when you use the command:

- Configurations in Ethernet interface view take effect only on the current interface.
- Configurations in aggregate interface view take effect only on the current aggregate interface.
- If the MEP belongs to an MA that does not carry the VLAN attribute, configurations on a member port of an aggregation group take effect only on the current member port.
- If the MEP belongs to an MA that carries the VLAN attribute, configurations on a member port of an aggregation group take effect only when the member port leaves the aggregation group.

Examples

Configure a MEP list in service instance 5, and create inward-facing MEP 3 in service instance 5 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] cfd md test_md level 3
[Sysname] cfd service-instance 5 ma-id vlan-based md test_md vlan 100
[Sysname] cfd meplist 3 service-instance 5
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] cfd mep 3 service-instance 5 outbound
```

Related commands

cfd meplist

cfd meplist

Use **cfd meplist** to create a MEP list.

Use **undo cfd meplist** to delete a MEP list.

Syntax

cfd meplist *mep-list* **service-instance** *instance-id*

undo cfd meplist *mep-list* **service-instance** *instance-id*

Default

No MEP list is created.

Views

System view

Predefined user roles

network-admin

Parameters

meplist *mep-list*: Specifies a space-separated list of up to 10 MEP items. Each item specifies a MEP ID or a range of MEP IDs in the form of *mep-id 1* **to** *mep-id 2*. The value range for the MEP ID is 1 to 8191. The *mep-id 2* must be equal to or greater than *mep-id 1*.

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

Usage guidelines

A MEP list is a collection of local MEPs allowed to be configured and the remote MEPs to be monitored in the same MA.

Before creating a MEP list, create the relevant MD and service instance.

After you delete a MEP list, all local MEP configurations based on this list are deleted.

Examples

Create a MEP list that includes MEP 9 through MEP 15 in service instance 5.

```
<Sysname> system-view
[Sysname] cfd md test_md level 3
[Sysname] cfd service-instance 5 ma-id vlan-based md test_md vlan 100
[Sysname] cfd meplist 9 to 15 service-instance 5
```

Related commands

cfd md

cfd service-instance

cfd mip-rule

Use **cfd mip-rule** to configure the rules for generating MIPs.

Use **undo cfd mip-rule** to remove the rules for generating MIPs and the MIPs created in a service instance.

Syntax

cfd mip-rule { **default** | **explicit** } **service-instance** *instance-id*

undo cfd mip-rule [**default** | **explicit**] **service-instance** *instance-id*

Default

No rules for generating MIPs are configured and the system does not automatically generate any MIPs.

Views

System view

Predefined user roles

network-admin

Parameters

default: Specifies the default rule. If no lower-level MIP exists on an interface, a MIP is created on the current level. A MIP can be created even if no MEP is configured on the interface.

explicit: Specifies the explicit rule. If no lower-level MIP exists and a lower-level MEP exists on an interface, a MIP is created at the current level. A MIP can be created only when a lower-level MEP is created on the interface.

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

Usage guidelines

The system automatically generates MIPs on each port according to the rules configured.

Examples

Configure the MIP generation rule as default in service instance 5.

```
<Sysname> system-view
[Sysname] cfd mip-rule default service-instance 5
```

cfd service-instance

Use **cfd service-instance** to create a service instance.

Use **undo cfd service-instance** to remove a service instance.

Syntax

cfd service-instance *instance-id* **ma-id** { **icc-based** *ma-name* | **integer** *ma-num* | **string** *ma-name* | **vlan-based** [*vlan-id*] } [**ma-index** *index-value*] **md** *md-name* **vlan** *vlan-id*

undo cfd service-instance *instance-id*

Default

No service instances exist.

Views

System view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies the service instance ID in the range of 1 to 32767.

ma-id: Creates an MA.

icc-based *ma-name*: Specifies that an MA is identified by an ICC. The *ma-name* argument is a string of 1 to 13 characters.

integer *ma-num*: Specifies that an MA is identified by an integer, where the *ma-num* argument is in the range of 0 to 65535.

string *ma-name*: Specifies that an MA is identified by a string, where the *ma-name* argument is string of 1 to 45 characters that can contain letters, numbers, and special characters such as grave accent (`), tilde (~), exclamation mark (!), at sign (@), number sign (#), dollar sign ($), percent (%), caret (^), ampersand (&), asterisk (*), brackets ({ }, ( ), [ ], < >), hyphen (-), underscore (_), plus (+), equal sign (=), vertical bar (|), colon (:), semicolon (;), quotation mark ('), comma (,), period (.), and slash (/).

vlan-based [*vlan-id*]: Specifies that an MA is identified by a VLAN ID, where the *vlan-id* argument is in the range of 1 to 4094. If you do not provide the *vlan-id* argument, the VLAN ID specified by **vlan** *vlan-id* is used. If the **vlan** *vlan-id* option is not provided, you must specify the *vlan-id* argument for the **vlan-based** [*vlan-id*] option.

ma-index *index-value*: Specifies an MA index in the range of 1 to 4294967295. If you do not specify this option, the system automatically assigns the smallest index number that is not in use. As a best practice, use the index automatically assigned by the system.

md *md-name*: Specifies the name of an MD. The *md-name* argument is a string of 1 to 43 characters that can contain letters, numbers, and special characters such as grave accent (`), tilde (~), exclamation mark (!), at sign (@), number sign (#), dollar sign ($), percent (%), caret (^), ampersand (&), asterisk (*), brackets ({ }, ( ),[ ], < >), hyphen (-), underscore (_), plus (+), equal sign (=), vertical bar (|), colon (:), semicolon (;), quotation mark ('), comma (,), period (.), and slash (/).

vlan *vlan-id*: Specifies the VLAN that the MA serves. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

A service instance is indicated by an integer to represent an MA in an MD. An MA index uniquely identifies a specific MA in an MD. An MA index can be used in different MDs.

An MD name must be in compliant with the specifications in IEEE802.1ag-2007.

With the **vlan-based** [*vlan-id*] or **vlan** *vlan-id* option, the command creates an MA carrying the VLAN attribute. If you do not specify the option, the command creates an MA carrying no VLAN attribute.

You must create the relevant MD before creating a service instance with the MD name.

Deleting a service instance also deletes the configurations related to that service instance.

Deleting a service instance not only removes the connection between the service instance and the relevant MA, but also deletes the MA.

Examples

Create a level-3 MD named **test_md** and create service instance 5, in which the MA is identified by a VLAN and serves VLAN 100.

```
<Sysname> system-view
[Sysname] cfd md test_md level 3
[Sysname] cfd service-instance 5 ma-id vlan-based md test_md vlan 100
```

Related commands

cfd md

cfd slm

Use **cfd slm** to enable loss measurement (LM).

Syntax

cfd slm service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**dot1p** *dot1p-value*] [**number** *number*] [**interval** *interval*]

Views

Any view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies the source MEP by its ID in the range of 1 to 8191.

target-mac *mac-address*: Specifies the target MEP by its MAC address, which is in the format of H-H-H.

target-mep *target-mep-id*: Specifies the target MEP by its ID in the range of 1 to 8191.

dot1p *dot1p-value*: Specifies an 802.1p priority for LMM frames. The value range for the *dot1p-value* argument is 0 to 7. The default value is 7.

number *number*: Specifies the number of LMM frames to be sent. The value range for the *number* argument is 2 to 10, and the default is 5.

interval *interval*: Specifies the LMM frame sending interval, in seconds. The value takes 1 or 10. The default value is 1.

Usage guidelines

The LM function measures the frame loss between the source and target MEPs by using LMM frames and LMR frames.

Examples

Enable the LM function to measure the frame loss between source MEP 1101 and target MEP 2001 in service instance 1.

```
<Sysname> cfd slm service-instance 1 mep 1101 target-mep 2001
Reply from 0010-fc00-6512
Far-end frame loss: 10    Near-end frame loss: 20
Reply from 0010-fc00-6512
Far-end frame loss: 40    Near-end frame loss: 40
Reply from 0010-fc00-6512
Far-end frame loss: 0     Near-end frame loss: 10
Reply from 0010-fc00-6512
Far-end frame loss: 30    Near-end frame loss: 30

Average
Far-end frame loss: 20    Near-end frame loss: 25
Far-end frame loss rate: 25.00%      Near-end frame loss rate: 32.00%
Sent LMMs: 5    Received: 5    Lost: 0
```

Table 5 Command output

Field	Description
Reply from 0010-fc00-6512	LMR frames returned from the target MEP with MAC address 0010-FC00-6512.
Far-end frame loss	Number of lost frames on the target MEP.
Near-end frame loss	Number of lost frames on the source MEP.
Far-end frame loss rate	Frame loss ratio on the target MEP.
Near-end frame loss rate	Frame loss ratio on the source MEP.
Average	Average number of lost frames.
Sent LMMs	Number of sent LMM frames.
Received	Number of received LMR frames.
Lost	Number of lost LMR frames.

cfd tst

Use **cfd tst** to enable test (TST).

Syntax

cfd tst service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**number** *number*] [**length-of-test** *length*] [**pattern-of-test** { **all-zero** | **prbs** } [**with-crc**]]

Views

Any view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies the source MEP by its ID in the range of 1 to 8191.

target-mac *mac-address*: Specifies the target MEP by its MAC address, which is in the format of H-H-H.

target-mep *target-mep-id*: Specifies the target MEP by its ID in the range of 1 to 8191.

number *number*: Specifies the number of sent TST frames. The value range for the *number* argument is 1 to 10, and the default is 5.

length-of-test *length*: Specifies the length of the Test TLV (Type/Length/Value) in the TST frame. The value range for the *length* argument is 4 to 1400, in bytes. The default value is 64.

pattern-of-test { **all-zero** | **prbs** } [**with-crc**]: Specifies the pattern of the Test TLV in the TST frame:

- **all-zero** (all-zero value without CRC-32), which is the default pattern.
- **prbs** (pseudo random bit sequence without CRC-32).
- **all-zero with-crc** (all-zero value with CRC-32).
- **prbs with-crc** (pseudo random bit sequence with CRC-32).

Usage guidelines

The TST function detects bit errors between the source and target MEPs by using TST frames.

To view the TST test result, use the **display cfd tst** command on the target MEP.

Examples

Enable the TST function to test the bit errors between source MEP 1101 and target MEP 1003 in service instance 1.

```
<Sysname> cfd tst service-instance 1 mep 1101 target-mep 1003
5 TSTs have been sent. Please check the result on the remote device.
```

Related commands

display cfd tst

reset cfd tst

display cfd ais

Use **display cfd ais** to display the AIS configuration and information on the specified MEP or all MEPs.

Syntax

display cfd ais [**service-instance** *instance-id* [**mep** *mep-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767. If you do not specify this option, the command displays the AIS configuration and information for all service instances.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191. If you do not specify this option, the command displays the AIS configuration and information for all MEPs.

Examples

Display the AIS configuration and information for all the MEPs in all service instances.

```
<Sysname> display cfd ais
Service instance: 5
AIS level: 4    AIS period: 1s
MEP ID: 1
AIS condition: yes   Time to enter the condition: 2013/01/22 10:43:57
AIS state machine: Previous state: NO_RECEIVE
                   Current state: RECEIVE
MEP ID: 2
AIS condition: yes   Time to enter the condition: 2013/01/22 10:43:57
AIS state machine: Previous state: NO_RECEIVE
                   Current state: RECEIVE

Service instance: 20
AIS level: 3    AIS period: 60s
MEP ID: 10
AIS condition: yes   Time to enter the condition: 2013/01/22 10:43:57
AIS state machine: Previous state: NO_RECEIVE
                   Current state: RECEIVE

Service instance: 100
AIS level: 6    AIS period: 1s
MEP ID: 20
AIS condition: no    Time to enter the condition: 2013/01/22 11:40:01
AIS state machine: Previous state: IDLE
                   Current state: NO_RECEIVE

MEP ID: 50
AIS condition: no    Time to enter the condition: -
AIS state machine: Previous state: IDLE
                   Current state: NO_RECEIVE
```

Table 6 Command output

Field	Description
Service instance	Service instance of the MEP.
AIS level	AIS frame transmission level.
AIS period	AIS frame transmission period.
AIS condition	AIS status: • **yes**—AIS is running. • **no**—AIS is not running.
Time to enter the condition	Time when the AIS status began. (**-** means AIS is enabled but the MEP does not receive any AIS frame.)
AIS state machine	AIS frame receiving state machine.
Previous state	Previous state: • **IDLE**—Not activated. • **NO_RECEIVE**—Activated. • **RECEIVE**—AIS frames are received.
Current state	Current state: • **IDLE**—Not activated. • **NO_RECEIVE**—Activated. • **RECEIVE**—AIS frames are received.

display cfd ais-track link-status

Use **display cfd ais-track link-status** to display the configuration and information of the AIS associated with the port status.

Syntax

display cfd ais-track link-status [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the configuration and information of the AIS associated with the status of all ports.

Examples

Display the configuration and information of the AIS associated with the status of all ports.

```
<Sysname> display cfd ais-track link-status
AIS tracking link-status is enabled.

Interface GigabitEthernet1/0/1:
AIS level: 5          AIS period: 1s
```

```
Configured VLANs: 1, 10-100, 103
Send VLANs: 1, 10-100, 103
AIS condition: yes     Time to enter the condition: 2013/02/26 10:43:57

Interface GigabitEthernet1/0/2:
AIS level: 5          AIS period: 1s
Configured VLANs: 1-4094
Send VLANs: 1-2000
AIS condition: yes     Time to enter the condition: 2013/02/26 10:44:57
```

Table 7 Command output

Field	Description
AIS tracking link-status is enabled	Port status-AIS collaboration is enabled.
AIS tracking link-status is disabled	Port status-AIS collaboration is disabled.
Interface	Port that collaborates with AIS.
AIS level	EAIS frame transmission level on the port.
AIS period	EAIS frame transmission period on the port.
Configured VLANs	VLANs where the EAIS frames can be transmitted.
Send VLANs	Actual VLANs where the EAIS frames can be transmitted.
AIS condition	EAIS frame sending status: • **yes**—EAIS frames are being sent. • **no**—No EAIS frame is being sent.
Time to enter the condition	Time when the EAIS frame sending started.

display cfd dm one-way history

Use **display cfd dm one-way history** to display the one-way DM result.

Syntax

display cfd dm one-way history [**service-instance** *instance-id* [**mep** *mep-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767. If you do not specify this option, the command displays the one-way DM results for all service instances.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191. If you do not specify this option, the command displays the one-way DM results for all MEPs.

Usage guidelines

The one-way DM results for all inward-facing MEPs in a service instance are the same.

Examples

Display the one-way DM results for all the MEPs in all service instances.

```
<Sysname> display cfd dm one-way history
Service instance: 1
MEP ID: 1003
Sent 1DM total number: 0
Received 1DM total number: 5
Frame delay: 10ms 9ms 11ms 5ms 5ms
Delay average: 8ms
Frame delay variation: 5ms 4ms 6ms 0ms 0ms
Variation average: 3ms
MEP ID: 1004
Sent 1DM total number: 0
Received 1DM total number: 5
Frame delay: 10ms 9ms 11ms 5ms 5ms
Delay average: 8ms
Delay variation: 5ms 4ms 6ms 0ms 0ms
Variation average: 3ms

Service instance: 2
No MEP exists in the service instance.

Service instance: 3
MEP ID: 1023
Sent 1DM total number: 5
Received 1DM total number: 10
Frame delay: 20ms 9ms 8ms 7ms 1ms 5ms 13ms 17ms 9ms 10ms
Delay average: 9ms
Delay variation: 19ms 8ms 7ms 6ms 0ms 4ms 12ms 16ms 8ms 9ms
Variation average: 8ms

Service instance: 4
MEP ID: 1023
Sent 1DM total number: 77
Received 1DM total number: 0
```

Table 8 Command output

Field	Description
Service instance	Service instance of the MEP.
Sent 1DM total number	Number of sent 1DM frames.
Received 1DM total number	Number of received 1DM frames.
Delay average	Average frame delay.
Delay variation	Frame delay variation.
Variation average	Average frame delay variation.

Related commands

cfd dm one-way

reset cfd dm one-way history

display cfd linktrace-reply

Use **display cfd linktrace-reply** to display information about the LTRs received by a MEP.

Syntax

display cfd linktrace-reply [**service-instance** *instance-id* [**mep** *mep-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767. If you do not specify this option, the command displays the LTR information for all service instances.

mep *mep-id*: Specifies the ID of a MEP, in the range of 1 to 8191. If you do not specify this option, the command displays the LTR information for all MEPs.

Usage guidelines

This command displays only information about LTRs received by execution of the **cfd linktrace** command.

Examples

Display the LTR information saved on all the MEPs in every service instance.

```
[Sysname] display cfd linktrace-reply
Service instance: 1       MEP ID: 1003
MAC address               TTL     Last MAC          Relay action
0000-fc00-6505            63      0000-fc00-6504    MPDB
000f-e269-a852            62      0000-fc00-6505    FDB
0000-fc00-6508            61      000f-e269-a852    Hit
Service instance: 2       MEP ID: 1023
MAC address               TTL     Last MAC          Relay action
0000-fc00-6508            61      000f-e269-a852    Hit
```

Table 9 Command output

Field	Description
Service instance	Service instance to which the MEPs that send LTMs belong.
MEP ID	ID of the MEP that sends LTMs.
MAC address	Source MAC address in the LTR.
TTL	TTL of the LTM when it passes the device.
Last MAC	MAC address of the last-hop device the LTM passes.

Field	Description
Relay action	Indicates whether the forwarding device found the destination MAC address in its MAC address table. When the standard version (IEEE 802.1ag) of CFD is used: • **Hit**—The current device is the destination device. • **FDB**—The forwarding device found the destination MAC address. • **MPDB**—The destination MAC address is not found, or the destination MAC address is found in the MEP or MIP database.

Related commands

cfd linktrace

display cfd linktrace-reply auto-detection

Use **display cfd linktrace-reply auto-detection** to display information about the LTRs received as responses to the automatically sent LTMs.

Syntax

display cfd linktrace-reply auto-detection [**size** *size-value*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

size *size-value*: Specifies the times of recent auto-detections, in the range of 1 to 100. If you do not specify this option, the command displays all information in the buffer.

Usage guidelines

This command displays only information about LTRs received by execution of the **cfd linktrace auto-detection** command.

Examples

Display the contents of the LTRs received as responses to the LTMs automatically sent.

```
<Sysname> display cfd linktrace-reply auto-detection
Service instance: 1       MEP ID: 1003    Time: 2013/05/22 10:43:57
Target MEP ID: 2005       TTL: 64
MAC address               TTL     Last MAC          Relay action
0000-fc00-6505            63      0000-fc00-6504    MPDB
000f-e269-a852            62      0000-fc00-6505    FDB
0000-fc00-6508            61      000f-e269-a852    Hit
Service instance: 2       MEP ID: 1023    Time: 2013/05/22 10:44:06
Target MEP ID: 2025       TTL: 64
MAC address               TTL     Last MAC          Relay action
0000-fc00-6508            61      000f-e269-a852    Hit
```

Table 10 Command output

Field	Description
Service instance	Service instance to which the MEPs that sent LTMs belong.
MEP ID	ID of the MEP that sends LTMs.
Time	Time of the LTMs automatically sent.
Target MEP ID	ID of the target MEP.
TTL	Initial TTL of the automatically sent LTMs.
MAC address	Source MAC address in the LTRs.
TTL	TTL of the LTM when it passes the device.
Last MAC	MAC address of the last-hop device the LTM passes.
Relay action	Indicates whether the forwarding device found the destination MAC address in its MAC address table. When the standard version (IEEE 802.1ag) of CFD is used: • **Hit**—The current device is the destination device. • **FDB**—The forwarding device found the destination MAC address. • **MPDB**—The destination MAC address is not found, or the destination MAC address is found in the MEP or MIP database.

display cfd md

Use **`display cfd md`** to display the MD configuration information.

Syntax

`display cfd md`

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the MD configuration information.

```
<Sysname> display cfd md
CFD is enabled.
Maintenance domains configured: 4 in total
Level  Index      Maintenance domain                          MD format  MD ID
0      1          md_0                                        CHARSTRING md_0
1      2          md_1                                        DNS        dns1
2      3          md_2                                        MAC        0001-00
01-0001-1
3      4          md_3                                        NONE       Without
 ID
```

Table 11 Command output

Field	Description
Maintenance domains configured	Number of MDs configured.
Level	Level of MD.
Index	MD index.
Maintenance domain	Name of MD.
MD format	MD name format: • **CHARSTRING**—Character string. • **DNS**—DNS name. • **MAC**—MAC address and an integer. • **NONE**—No MD name is carried.
MD ID	MD ID value: • A character string if the MD format is **CHARSTRING**. • A DNS name if the MD format is **DNS**. • A MAC address-subnumber if the MD format is **MAC**. • No ID if the MD format is **NONE**.

display cfd mep

Use **display cfd mep** to display the attribute and operating information for a MEP.

Syntax

display cfd mep *mep-id* **service-instance** *instance-id*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191.

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

Examples

Display the attribute and operating information for MEP 50 in service instance 1.

```
<Sysname> display cfd mep 50 service-instance 1
Interface: GigabitEthernet1/0/2
Maintenance domain: md_0
Maintenance domain index: 1
Maintenance association: ma_0
Maintenance association index: 1
Level: 0        VLAN: 1         Direction: Outbound
Current state: Active          CCM send: Enabled
FNG state: FNG_DEFECT_REPORTED
```

```
CCM:
Current state: CCI_WAITING
Interval: 1s        SendCCM: 12018

Loopback:
NextSeqNumber: 8877
SendLBR: 0          ReceiveInOrderLBR: 0          ReceiveOutOrderLBR: 0

Linktrace:
NextSeqNumber: 8877
SendLTR: 0          ReceiveLTM: 0

No CCM received from some remote MEPs.

One or more streams of error CCMs is received. The last received CCM:
Maintenance domain: (Without ID)
Maintenance association: matest1
MEP ID: 5      Sequence Number:0x50A
MAC Address: 0011-2233-4402
Received Time: 2013/03/06 13:01:34

One or more streams of cross-connect CCMs is received. The last received CCM:
Maintenance domain: mdtest1
Maintenance association:matest1
MEP ID: 6      Sequence Number:0x63A
MAC Address: 0011-2233-4401
Received Time: 2013/03/06 13:01:34

Some other MEPs are transmitting the RDI bit.
```

Table 12 Command output

Field	Description
Interface	Interface on which the MEP is configured.
Maintenance domain	MD to which the MEP belongs. (If the MD does not have a name, this field is displayed as **Without ID**.)
Maintenance domain index	Index of the MD to which the MEP belongs..
Maintenance association	MA to which the MEP belongs.
Maintenance association index	Index of the MA to which the MEP belongs.
Level	Level of the MD.
VLAN	VLAN to which the MA belongs.
Direction	Direction of the MEPs.
Current state	State of MEP: • **Active**. • **Inactive**.
CCM send	Whether the MEP sends CCM.

Field	Description
FNG state	State of FNG (Fault Notification Generator): • **FNG_RESET**—A fault has been cleared. • **FNG_DEFECT**—A fault has been detected. • **FNG_REPORT_DEFECT**—Report a fault. • **FNG_DEFECT_REPORTED**—A fault has been reported. • **FNG_DEFECT_CLEARING**—A fault is being cleared. If this field is not supported, a hyphen (-) is displayed.
CCM	Information related to CCM.
Current state	State of CCMs sent: • **CCI_IDLE**—Initial state. • **CCI_WAITING**—Sending state. If this field is not supported, a hyphen (-) is displayed.
Interval	Interval to send CCM. **Not supported** means the MEP does not support CCM sending.
SendCCM	Number of CCMs that have been sent by the MEPs. If this field is not supported, a hyphen (-) is displayed.
Loopback	Information related to Loopback.
NextSeqNumber	Sequence number of the next LBM to be sent.
SendLBR	Number of LBRs that have been sent. If the MEP is inward-facing, the number of LBRs will not be counted.
ReceiveInOrderLBR	Number of LBRs received in correct sequence.
ReceiveOutOrderLBR	Number of LBRs received out of order.
Linktrace	Information related to linktrace.
NextSeqNumber	Sequence number of the next LTM to be sent.
SendLTR	Number of LTRs sent. If the MEP is inward-facing, the number of LTRs will not be counted.
ReceiveLTM	Number of LTMs received.
No CCM received from some remote MEPs.	Failure to receive CCMs from some remote MEPs. (This information is displayed only when some CCMs are lost.)
One or more streams of error CCMs is received. The last received CCM:	Display the content of the last error CCM when one or more error CCMs are received. (This information is displayed only when error CCMs are received.)
Maintenance domain	MD of the last error CCM. If this field is not supported, a hyphen (-) is displayed.
Maintenance association	MA of the last error CCM. If this field is not supported, a hyphen (-) is displayed.
MEP	ID of the MEP that sent the last error CCM. If this field is not supported, a hyphen (-) is displayed.
Sequence Number	Sequence number of the last error CCM. If this field is not supported, a hyphen (-) is displayed.
Received Time	Time when the last error CCM is received. If this field is not supported, a hyphen (-) is displayed.

Field	Description
One or more streams of cross-connect CCMs is received. The last received CCM:	Cross-connect CCMs are received, and the content of the last cross-connect CCM is displayed. (This information is displayed only when cross-connect CCMs are received.)
Some other MEPs are transmitting the RDI bit.	CCMs with the RDI flag bits set are received from other MEPs. (This information is displayed only when this type of CCMs are received.)

display cfd meplist

Use **display cfd meplist** to display the MEP list in a service instance.

Syntax

display cfd meplist [**service-instance** *instance-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767. If you do not specify this option, the command displays MEP lists in all service instances.

Examples

Display the MEP list in service instance 5.

```
<Sysname> display cfd meplist service-instance 5
Service instance: 5
MEP list: 1 to 20, 30, 50.
```

display cfd mp

Use **display cfd mp** to display the MP information.

Syntax

display cfd mp [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays MP information for all ports.

Usage guidelines

The output is arranged by port name. On a port, the output shows MPs that serve VLANs, and then shows MPs that do not serve any VLANs. The MPs that serve VLANs are displayed in the ascending VLAN ID order. Within the same VLAN, the output is in the order of MIPs and MEPs (from high to low level). The MEPs that do not serve any VLANs are displayed by level (from high to low).

Examples

Display the MP information on all ports.

```
<Sysname> display cfd mp
Interface GigabitEthernet1/0/1   VLAN 100
MIP              Level: 2    Service instance: 102
Maintenance domain: md_2
Maintenance domain index: 3
Maintenance association: ma_2
Maintenance association index: 3

MEP ID: 101      Level: 1    Service instance: 101    Direction: Inbound
Maintenance domain: md_1
Maintenance domain index: 2
Maintenance association: ma_1
Maintenance association index: 2

MEP ID: 100      Level: 0    Service instance: 100    Direction: Outbound
Maintenance domain: md_0
Maintenance domain index: 1
Maintenance association: ma_0
Maintenance association index: 1
```

Table 13 Command output

Field	Description
Interface GigabitEthernet1/0/1 VLAN 100	MP configuration of VLAN 100 on GigabitEthernet 1/0/1.
MIP	A MIP in the MP.
Level	MD level to which the MP belongs.
Service instance	Service instance to which the MP belongs.
Maintenance domain	MD to which the MP belongs.
Maintenance domain index	Index of the MD to which the MP belongs.
Maintenance association	MA to which the MP belongs.
Maintenance association index	Index of the MA to which the MP belongs.
Direction	Direction of the MEP, inbound or outbound.

display cfd remote-mep

Use **display cfd remote-mep** to display information about a remote MEP.

Syntax

display cfd remote-mep service-instance *instance-id* **mep** *mep-id*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191.

Examples

Display remote MEP information for MEP 10 in service instance 4.

```
<Sysname> display cfd remote-mep service-instance 4 mep 10
MEP ID   MAC address      State        Time                 MAC status
20       00e0-fc00-6565   OK           2013/03/06 02:36:38  UP
30       00e0-fc27-6502   OK           2013/03/06 02:36:38  DOWN
40       00e0-fc00-6510   FAILED       2013/03/06 02:36:39  DOWN
50       00e0-fc52-baa0   OK           2013/03/06 02:36:44  DOWN
60       0010-fc00-6502   OK           2013/03/06 02:36:42  DOWN
```

Table 14 Command output

Field	Description
MEP ID	ID of the remote MED.
MAC address	MAC address of the remote MEP device. If this field is not supported, a hyphen (-) is displayed.
State	Running state of the remote MEP: • **OK**. • **FAILED**.
Time	Time when the remote MEP entered the **FAILED** or **OK** state for the last time. If this field is not supported, a hyphen (-) is displayed.
MAC status	State of the interface indicated by the last CCM received from the remote MEP: • **UP**—The interface is ready to pass packets. • **DOWN**—The interface cannot pass packets. • **TESTING**—The interface is in some test mode. • **UNKNOWN**—The interface status cannot be determined. • **DORMANT**—The interface is not in a state to pass packets. Instead, it is in a pending state, waiting for some external event. • **NOT-PRESENT**—Some component of the interface is missing. • **LLD**—The interface is down due to state of the lower layer interfaces. If this field is not supported, a hyphen (-) is displayed.

display cfd service-instance

Use **display cfd service-instance** to display the configuration information of service instances.

Syntax

display cfd service-instance [*instance-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-id: Specifies a service instance ID in the range of 1 to 32767. If you do not specify this argument, the command displays configuration information for all service instances.

Examples

Display the configuration information of all service instances.

```
<Sysname> display cfd service-instance
Service instances configured (2 in total):
Service instance 5:
Maintenance domain: md_5
Maintenance domain index: 5
Maintenance association: ma_5
Maintenance association index: 5
Level: 5  VLAN: 5   MIP rule: NONE   CCM interval: 1s   Direction: Inbound
MEP ID: 730  Interface: GigabitEthernet1/0/1

Service instance 6:
Maintenance domain: (Without ID)
Maintenance domain index: 6
Maintenance association: ma_6
Maintenance association index: 6
Level: 6  VLAN: 6   MIP rule: NONE   CCM interval: 1s   Direction: Outbound
MEP ID: 731  Interface: GigabitEthernet1/0/2
```

Table 15 Command output

Field	Description
Service instances are configured.	Number of service instances configured.
Service instance	Service instance ID.
Maintenance domain	MD of the service instance. (If the MD does not have a name, this field displays **Without ID**.)
Maintenance domain index	Index of the MD to which the service instance belongs.
Maintenance association:	MA of the service instance.
Maintenance association index	Index of the MA to which the service instance belongs.
Level	MD level.
VLAN	VLAN to which the MA belongs.
MIP rule	MIP generation rules configured on the service instance.
CCM interval	Interval to send CCMs.

Field	Description
Direction	Direction of the MEPs configured on the service instance.
MEP ID	ID of MEPs configured on the service instance.
Interface	Interface of the MEP configured on the service instance.

display cfd status

Use **display cfd status** to display the CFD and AIS status.

Syntax

display cfd status

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the CFD and AIS status.

```
<Sysname> display cfd status
CFD is enabled.
AIS is disabled.
```

display cfd tst

Use **display cfd tst** to display the TST result.

Syntax

display cfd tst [**service-instance** *instance-id* [**mep** *mep-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767. If you do not specify this option, the command displays the TST results for all service instances.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191. If you do not specify this option, the command displays the TST results for all MEPs.

Usage guidelines

The TST DM results for all inward-facing MEPs in a service instance are the same.

Examples

Display the TST results for all the MEPs in all service instances.

```
<Sysname> display cfd tst
Service instance: 1
MEP ID: 1003
Sent TST total number: 0
Received TST total number: 5
Received from 0010-fc00-6510, Bit True,  sequence number 0
Received from 0010-fc00-6510, Bit True,  sequence number 1
Received from 0010-fc00-6510, Bit True,  sequence number 2
Received from 0010-fc00-6510, Bit True,  sequence number 3
Received from 0010-fc00-6510, Bit True,  sequence number 4
MEP ID: 1004
Sent TST total number: 5
Received TST total number: 0

Service instance: 2
No MEP exists in the service instance.

Service instance: 3
MEP ID: 1023
Sent TST total number: 5
Received TST total number: 0
```

Table 16 Command output

Field	Description
Service instance	Service instance of the MEP.
Sent TST total number	Number of sent TST frames.
Received TST total number	Number of received TST frames.
Received from 0010-fc00-6510, Bit True, sequence number 0	TST frame with sequence number 0 was received from the MEP with MAC address 0010-FC00-6510: • **Bit True**—No bit error occurred. • **Bit False**—Bit errors occurred.

Related commands

cfd tst

reset cfd tst

reset cfd dm one-way history

Use **reset cfd dm one-way history** to clear the one-way DM result.

Syntax

reset cfd dm one-way history [**service-instance** *instance-id* [**mep** *mep-id*]]

Views

User view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767. If you do not specify this option, the command clears the one-way DM results for all service instances.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191. If you do not specify this option, the command clears the one-way DM results for all MEPs.

Usage guidelines

Clearing the one-way DM result for an inward-facing MEP clears all one-way DM results for the service instance where the inward-facing MEP resides.

Examples

Clear the one-way DM results for all MEPs in all service instances.

```
<Sysname> reset cfd dm one-way history
```

Related commands

cfd dm one-way

display cfd dm one-way history

reset cfd tst

Use **reset cfd tst** to clear the TST result.

Syntax

reset cfd tst [**service-instance** *instance-id* [**mep** *mep-id*]]

Views

User view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767. If you do not specify this option, the command clears the TST results for all service instances.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191. If you do not specify this option, the command clears the TST results for all MEPs.

Usage guidelines

Clearing the TST result for an inward-facing MEP clears all TST results for the service instance where the inward-facing MEP resides.

Examples

Clear the TST results for all MEPs in all service instances.

```
<Sysname> reset cfd tst
```

DLDP commands

display dldp

Use **display dldp** to display DLDP configuration.

Syntax

display dldp [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command displays global and port-specific DLDP configuration.

Examples

Display global and port-specific DLDP configuration.

```
<Sysname> display dldp
 DLDP global status: Enabled
 DLDP advertisement interval: 5s
 DLDP authentication-mode: Simple
 DLDP authentication-password: ******
 DLDP unidirectional-shutdown mode: Auto
 DLDP delaydown-timer value: 1s
 Number of enabled ports: 2

Interface GigabitEthernet1/0/1
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 100s
 Number of the port’s neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 79
  Neighbor state: Confirmed
  Neighbor aged time: 13s
  Neighbor echo time: -

Interface GigabitEthernet1/0/2
 DLDP port state: Inactive
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 100s
 Number of the port’s neighbors: 0 (Maximum number ever detected: 1)
```

Display the DLDP configuration of GigabitEthernet 1/0/1.

```
<Sysname> display dldp interface gigabitethernet 1/0/1
Interface GigabitEthernet1/0/1
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 100s
 Number of the port’s neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 79
  Neighbor state: Confirmed
  Neighbor aged time: 13s
  Neighbor echo time: -
```

Table 1 Command output

Field	Description
DLDP global status	Global DLDP state (Enabled or Disabled).
DLDP advertisement interval	Interval for sending Advertisement packets (in seconds) to maintain neighbor relations.
DLDP authentication-mode	DLDP authentication mode (None, Simple, or MD5).
DLDP authentication-password	Password for DLDP authentication: • **********—The password has been configured. • **Not configured**—The authentication mode has been configured but no password is configured.
DLDP unidirectional-shutdown mode	Global port shutdown mode (auto, manual, or hybrid) after unidirectional links are detected.
DLDP port unidirectional-shutdown mode	Port shutdown mode for the interface (auto, manual, or hybrid) after unidirectional links are detected. If no port shutdown mode is configured for an interface, this field displays **None**.
DLDP delaydown-timer value	Setting of the DelayDown timer, in seconds.
Number of enabled ports	Number of the DLDP-enabled ports.
Interface	Index of a DLDP-enabled port.
DLDP port state	DLDP state on a port: • **Bidirectional**. • **Inactive**. • **Initial**. • **Unidirectional**.
DLDP initial-unidirectional-delay	Delay time in seconds for DLDP to block the interface upon an Initial-to-Unidirectional state transition.
Number of the port’s neighbors	Current number of neighbors.
Maximum number ever detected	Maximum number of neighbors once detected on the port. This field appears only when the current number of neighbors is different from the maximum number of neighbors once detected.
Neighbor MAC address	Bridge MAC address of the device where the neighbor resides.
Neighbor port index	Neighbor port index.
Neighbor state	Neighbor state (Confirmed or Unconfirmed).
Neighbor aged time	Neighbor aging time.

Field	Description
Neighbor echo time	Number of seconds remaining before the Echo timer expires. The Echo timer starts when the Entry timer expires. The neighbor information is deleted when the Echo timer expires. A hyphen (-) indicates that the Echo timer has not started.

display dldp statistics

Use **display dldp statistics** to display DLDP packet statistics.

Syntax

display dldp statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command displays DLDP packet statistics for all interfaces.

Examples

Display DLDP packet statistics for all interfaces.

```
<Sysname> display dldp statistics
Interface GigabitEthernet1/0/1
 Packets sent: 6
 Packets received: 5
 Invalid packets received: 2
 Loopback packets received: 0
 Authentication-failed packets received: 0
 Valid packets received: 3

Interface GigabitEthernet1/0/2
 Packets sent: 7
 Packets received: 7
 Invalid packets received: 3
 Loopback packets received: 0
 Authentication-failed packets received: 0
 Valid packets received: 4
```

Table 2 Command output

Field	Description
Interface	Port index.
Packets sent	Total number of DLDP packets sent.

Field	Description
Packets received	Total number of DLDP packets received.
Invalid packets received	Number of the invalid packets received.
Loop packets received	Number of the loopback packets received.
Authentication failed packets received	Number of the received packets that failed to pass the authentication.
Valid packets received	Number of the valid packets received.

Related commands

`reset dldp statistics`

dldp authentication-mode

Use **`dldp authentication-mode`** to configure DLDP authentication.

Use **`undo dldp authentication-mode`** to restore the default.

Syntax

`dldp authentication-mode` { **`md5`** | **`none`** | **`simple`** }

`undo dldp authentication-mode`

Default

DLDP authentication mode is **none**.

Views

System view

Predefined user roles

network-admin

Parameters

`md5`: Specifies the MD5 authentication mode.

none: Specifies not to perform authentication.

`simple`: Specifies the plaintext authentication mode.

Usage guidelines

To enable DLDP to operate correctly, make sure the DLDP authentication modes and the passwords configured on the two ends of a link are the same.

If you do not configure the authentication password after you configure the authentication mode, the authentication mode is **none** no matter which authentication mode you configure.

Examples

Configure to perform plaintext authentication and set the password to **abc** (assuming that Device A and Device B are connected by a DLDP link).

- Configure Device A:

```
<DeviceA> system-view
[DeviceA] dldp authentication-mode simple
[DeviceA] dldp authentication-password simple abc
```

- Configure Device B:

```
<DeviceB> system-view
[DeviceB] dldp authentication-mode simple
[DeviceB] dldp authentication-password simple abc
```

Related commands

display dldp

dldp authentication-password

dldp authentication-password

Use **dldp authentication-password** to configure the password for DLDP authentication.

Use **undo dldp authentication-password** to restore the default.

Syntax

dldp authentication-password { **cipher** | **simple** } *string*

undo dldp authentication-password

Default

No DLDP authentication password is configured.

Views

System view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 1 to 53 characters.

Usage guidelines

To enable DLDP to operate correctly, make sure the DLDP authentication modes and the passwords configured on the two ends of a link are the same.

If you do not configure the authentication password after you configure the authentication mode, the authentication mode is **none** no matter which authentication mode you configure.

Examples

Configure to perform plaintext authentication and set the password to **abc** (assuming that Device A and Device B are connected by a DLDP link).

- Configure Device A:

```
<DeviceA> system-view
[DeviceA] dldp authentication-mode simple
[DeviceA] dldp authentication-password simple abc
```

- Configure Device B:

```
<DeviceB> system-view
[DeviceB] dldp authentication-mode simple
[DeviceB] dldp authentication-password simple abc
```

Related commands

display dldp

dldp authentication-mode

dldp delaydown-timer

Use **dldp delaydown-timer** to set the DelayDown timer.

Use **undo dldp delaydown-timer** to restore the default.

Syntax

dldp delaydown-timer *time*

undo dldp delaydown-timer

Default

The setting of the DelayDown timer is 1 second.

Views

System view

Predefined user roles

network-admin

Parameters

time: Specifies the DelayDown timer in the range of 1 to 5 seconds.

Usage guidelines

The DelayDown timer configured by using this command applies to all DLDP-enabled ports.

Examples

Set the DelayDown timer to 2 seconds.

```
<Sysname> system-view
[Sysname] dldp delaydown-timer 2
```

Related commands

display dldp

dldp enable

Use **dldp enable** to enable DLDP on a port.

Use **undo dldp enable** to restore the default.

Syntax

dldp enable [**initial-unidirectional-delay** *time*]

undo dldp enable

Default

DLDP is disabled on a port, and when DLDP is enabled, a port is blocked immediately upon an Initial-to-Unidirectional state transition.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

initial-unidirectional-delay *time*: Specifies the delay time for DLDP to block a port upon an Initial-to-Unidirectional state transition. The value range for the *time* argument is 60 to 300 seconds. If you do not specify this option, DLDP blocks the port immediately upon an Initial-to-Unidirectional state transition.

Usage guidelines

DLDP can take effect only after you enable it globally and on a port.

When enabling DLDP on a port, you can set the delay time for DLDP to block the port upon an Initial-to-Unidirectional state transition. If the port does not enter Bidirectional state when the delay time expires, DLDP blocks the port.

Examples

Enable DLDP globally, and enable DLDP on GigabitEthernet 1/0/1 and set a delay time of 100 seconds for DLDP to block the port upon an Initial-to-Unidirectional state transition.

```
<Sysname> system-view
[Sysname] dldp global enable
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dldp enable initial-unidirectional-delay 100
```

Related commands

display dldp

dldp global enable

dldp global enable

Use **dldp global enable** to enable DLDP globally.

Use **undo dldp global enable** to disable DLDP globally.

Syntax

dldp global enable

undo dldp global enable

Default

DLDP is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

DLDP can take effect only after you enable it globally and on a port.

Examples

Enable DLDP globally.

```
<Sysname> system-view
[Sysname] dldp global enable
```

Related commands

display dldp

dldp enable

dldp interval

Use **dldp interval** to set the interval for sending Advertisement packets.

Use **undo dldp interval** to restore the default.

Syntax

dldp interval *interval*

undo dldp interval

Default

The interval for sending Advertisement packets is 5 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies Advertisement packets sending interval in the range of 1 to 100 seconds.

Usage guidelines

This command applies to all DLDP-enabled ports.

To enable DLDP to operate correctly, make sure the intervals for sending Advertisement packets configured on the two ends of a link are the same.

Examples

Set the interval for sending Advertisement packets to 20 seconds.

```
<Sysname> system-view
[Sysname] dldp interval 20
```

Related commands

display dldp

dldp port unidirectional-shutdown

Use **dldp port unidirectional-shutdown** to set the port shutdown mode for an interface.

Use **undo dldp port unidirectional-shutdown** to restore the default.

Syntax

dldp port unidirectional-shutdown { **auto** | **hybrid** | **manual** }

undo dldp port unidirectional-shutdown

Default

The global setting is used.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

auto: Specifies the auto mode. In this mode, when DLDP detects a unidirectional link, it shuts down the unidirectional port. When the link becomes bidirectional, DLDP brings up the port that was shut down.

hybrid: Specifies the hybrid mode. In this mode, when DLDP detects a unidirectional link, it shuts down the unidirectional port and stops link detection. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional.

manual: Specifies the manual mode. In this mode, when DLDP detects a unidirectional link, it does not shut down the involved port. You must manually shut it down. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional.

Usage guidelines

If DLDP detects a unidirectional link, you must troubleshoot the interface and cabling faults.

The port shutdown mode setting for an interface takes effect only on the current interface and has priority over the global port shutdown mode setting.

Examples

Set the port shutdown mode to **manual** for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dldp port unidirectional-shutdown manual
```

Related commands

display dldp

dldp unidirectional-shutdown

dldp unidirectional-shutdown

Use **dldp unidirectional-shutdown** to set the global port shutdown mode.

Use **undo dldp unidirectional-shutdown** to restore the default.

Syntax

dldp unidirectional-shutdown { **auto** | **hybrid** | **manual** }

undo dldp unidirectional-shutdown

Default

The global port shutdown mode is auto mode.

Views

System view

Predefined user roles

network-admin

Parameters

auto: Specifies the auto mode. In this mode, when DLDP detects a unidirectional link, it shuts down the unidirectional port. When the link becomes bidirectional, DLDP brings up the port that was shut down.

hybrid: Specifies the hybrid mode. In this mode, when DLDP detects a unidirectional link, it shuts down the unidirectional port and stops link detection. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional.

manual: Specifies the manual mode. In this mode, when DLDP detects a unidirectional link, it does not shut down the involved port. You must manually shut it down. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional.

Usage guidelines

If DLDP detects a unidirectional link, you must troubleshoot the interface and cabling faults.

The global port shutdown mode setting takes effect on all interfaces and has lower priority than the port shutdown mode setting for an interface.

Examples

Set the global port shutdown mode to manual mode.

```
<Sysname> system-view
[Sysname] dldp unidirectional-shutdown manual
```

Related commands

display dldp

dldp port unidirectional-shutdown

reset dldp statistics

Use **reset dldp statistics** to clear DLDP packet statistics.

Syntax

reset dldp statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command clears DLDP packet statistics for all interfaces.

Examples

Clear DLDP packet statistics for all interfaces.

```
<Sysname> reset dldp statistics
```

Related commands

display dldp statistics

Contents

RRPP commands

The following switch series do not support RRPP:

- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000E-X.
- S5000X-EI.
- WAS6000.

control-vlan

Use **control-vlan** to configure the primary control VLAN for an RRPP domain.

Use **undo control-vlan** to restore the default.

Syntax

control-vlan *vlan-id*

undo control-vlan

Default

No control VLANs exist in an RRPP domain.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies the primary control VLAN by its ID in the range of 2 to 4093.

Usage guidelines

When you configure control VLANs for an RRPP domain, you only need to configure the primary control VLAN. The system automatically configures the secondary control VLAN. It uses the primary control VLAN ID plus 1 as the secondary control VLAN ID. For the control VLAN configuration to succeed, make sure the IDs of the two control VLANs are consecutive and have not been assigned yet.

Do not configure the default VLAN of a port accessing an RRPP ring as the control VLAN.

To ensure correct forwarding of RRPPDUs, do not enable QinQ or VLAN mapping on the control VLANs.

After you configure RRPP rings for an RRPP domain, you cannot delete or modify the primary control VLAN of the domain. To do so, use the **undo control-vlan** command.

Examples

Configure VLAN 100 as the primary control VLAN of RRPP domain 1 (assume that VLAN 100 and VLAN 101 have not been created yet).

```
<Sysname> system-view
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1] control-vlan 100
```

display rrpp brief

Use **display rrpp brief** to display brief RRPP information.

Syntax

display rrpp brief

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display brief RRPP information.

```
<Sysname> display rrpp brief

  2     1      E     GE1/0/3                   GE1/0/5                   Yes
                     GE1/0/4
```

Table 1 Command output

Field	Description
Flags for node mode	RRPP node mode: • **M**—Master node. • **T**—Transit node. • **E**—Edge node. • **A**—Assistant edge node.

Field	Description
RRPP protocol status	RRPP status: • **Enabled**—Globally enabled. • **Disabled**—Globally disabled.
Domain ID	RRPP domain ID.
Control VLAN	Primary and secondary control VLANs of the RRPP domain.
Protected VLAN	MSTIs corresponding to the VLANs protected by the RRPP domain. To view the VLAN-to-instance mappings, use the **display stp region-configuration** command (see *Layer 2—LAN Switching Command Reference*).
Hello timer	Hello timer value in seconds.
Fail timer	Fail timer value in seconds.
Linkup-Delay timer	Link-up delay timer value in seconds.
Ring ID	RRPP ring ID.
Ring level	RRPP ring level: • **0**—Primary ring. • **1**—Subring.
Primary/Common port	This field displays primary ports when the node mode is master node or transit node. This field displays common ports when the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Secondary/Edge port	This field displays secondary ports when the node mode is master node or transit node. This field displays edge ports when the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Enable status	RRPP ring status: • **Yes**—Enabled. • **No**—Disabled.

display rrpp ring-group

Use **display rrpp ring-group** to display the RRPP ring group configuration.

Syntax

display rrpp ring-group [*ring-group-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ring-group-id: Specifies an RRPP ring group by its ID in the range of 1 to 64 If you do not specify this argument, the command displays the configuration of all ring groups.

Usage guidelines

For an edge node RRPP ring group, this command also displays the subring sending Edge-Hello packets.

Examples

Display the configuration of all RRPP ring groups.

```
<Sysname> display rrpp ring-group
 Ring group 1:
  Domain 1 ring 1 to 3, 5
  Domain 2 ring 1 to 3, 5
  Domain 1 ring 1 is the sending ring

 Ring group 2:
  Domain 1 ring 4, 6 to 7
  Domain 2 ring 4, 6 to 7
```

Table 2 Command output

Field	Description
Ring group 1	RRPP ring group 1.
Domain 1 ring 1 to 3, 5	Subrings in the ring group, including rings 1, 2, 3, and 5 in RRPP domain 1.
Domain 1 ring 1 is the sending ring	The sending ring of the ring group is ring 1 in RRPP domain 1.

display rrpp statistics

Use **display rrpp statistics** to display RRPPDU statistics.

Syntax

display rrpp statistics domain *domain-id* [**ring** *ring-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

domain *domain-id*: Specifies an RRPP domain by its ID in the range of 1 to 128.

ring *ring-id*: Specifies an RRPP ring by its ID in the range of 1 to 128. If you do not specify this option, the command displays the RRPPDU statistics for all rings in the specified RRPP domain.

Usage guidelines

If a port belongs to more than one ring, this command collects and displays RRPPDU statistics of the port by ring.

When a ring transits from inactive status to active status, packet counting for the ring restarts.

Examples

Display RRPPDU statistics for all rings in RRPP domain 2.

```
<Sysname> display rrpp statistics domain 2
 Ring ID       : 1
 Ring level    : 0
 Node mode     : Master
 Active status : Yes
 Primary port  : GE1/0/3
  Direct Hello     Link     Common     Complete   Edge      Major     Total

```

Table 3 Command output

Field	Description
Ring ID	RRPP ring ID.
Ring level	RRPP ring level: • **0**—Primary ring. • **1**—Subring.
Node mode	Node mode: • Master node. • Transit node. • Edge node. • Assistant edge node.
Active status	RRPP ring status: • **Yes**—Active. • **No**—Inactive.
Primary port	The primary port field means the node mode is master node or transit node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Secondary port	The secondary port field means the node mode is master node or transit node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Common port	The common port field means the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Edge port	The edge port field means the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Packet direct	Packet transmission direction on the port: • **Out**—Packet sending direction. • **In**—Packet receiving direction.
Hello	Statistics of Hello packets received/sent on the port.
Link down	Statistics of Link-Down packets received/sent on the port.
Common flush FDB	Statistics of Common-Flush-FDB packets received/sent on the port.
Complete flush FDB	Statistics of Complete-Flush-FDB packets received/sent on the port.
Edge hello	Statistics of Edge-Hello packets received/sent on the port.
Major fault	Statistics of Major-Fault packets received/sent on the port.
Total	Total number of packets received/sent on the port. Only Hello, Link-Down, Common-Flush-FDB, Complete-Flush-FDB, Edge-Hello, and Major-Fault packets of RRPP are counted.

Related commands

reset rrpp statistics

display rrpp verbose

Use **display rrpp verbose** to display detailed RRPP information.

Syntax

display rrpp verbose domain *domain-id* [**ring** *ring-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

domain *domain-id*: Specifies an RRPP domain by its ID in the range of 1 to 128.

ring *ring-id*: Specifies an RRPP ring by its ID in the range of 1 to 128. If you do not specify this option, the command displays detailed information for all rings in the specified RRPP domain.

Examples

Display detailed information for all rings in RRPP domain 2.

```
<Sysname> display rrpp verbose domain 2
 Domain ID     : 2
 Control VLAN  : Primary 10, Secondary 11
 Protected VLAN: Reference instance 3, 5 to 7
 Hello timer   : 1 sec, Fail timer: 3 sec
 Linkup-Delay timer: 1 sec

 Ring ID       : 1
 Ring level    : 0
 Node mode     : Master
 Ring state    : Completed
 Enable status : Yes, Active status: Yes
 Primary port  : GE1/0/4                   Port status: UP
 Secondary port: GE1/0/5                   Port status: BLOCKED

 Ring ID       : 2
 Ring level    : 1
 Node mode     : Edge
 Ring state    : Unknown
 Enable status : No, Active status: No
 Common port   : GE1/0/4                   Port status: -
                 GE1/0/5                   Port status: -
 Edge port     : GE1/0/3                   Port status: -
```

Table 4 Command output

Field	Description
Domain ID	RRPP domain ID.
Control VLAN	Control VLANs of the RRPP domain: • **Primary**—Primary control VLAN. • **Secondary**—Secondary control VLAN.
Protected VLAN	MSTIs corresponding to the VLANs protected by the RRPP domain. To view the VLAN-to-instance mappings, use the **`display stp region-configuration`** command (see *Layer 2—LAN Switching Command Reference*).
Hello timer	Hello timer value in seconds.
Fail timer	Fail timer value in seconds.
Linkup-Delay timer	Link-up delay timer value in seconds.
Ring ID	RRPP ring ID.
Ring level	RRPP ring level: • **0**—Primary ring. • **1**—Subring.
Node mode	Node mode: • Master node. • Transit node. • Edge node. • Assistant edge node.

Ring state	RRPP ring state:
	• Possible states on the master node:
	  ○ **Completed**—The ring is healthy.
	  ○ **Failed**—The ring is not closed.
	  ○ **Unknown**—The RRPP domain is disabled.
	• Possible states on a transit node or edge node:
	  ○ **LinkUp**—All ports on the node are up.
	  ○ **LinkDown**—At least one port on the node is down.
	  ○ **PreForward**—A port on the node is blocked.
	  ○ **Unknown**—The RRPP domain is disabled.
	• Possible states on an assistant edge node:
	  ○ **LinkUp**—All ports on the node are up.
	  ○ **LinkDown**—At least one port on the node is down.
	  ○ **PreForward**—A port on the node is blocked.
	  ○ **LinkUpNotify**—The node does not receive Edge-Hello packets in LinkUp state.
	  ○ **LinkDnNotify**—The node does not receive Edge-Hello packets in LinkDown state.
	  ○ **PreForwardNotify**—The port on the directly connected edge node comes up, or the assistant edge node does not receive Edge-Hello packets in PreForward state.
	  ○ **Unknown**—The RRPP domain is disabled.
	If the ring is not enabled on the device operating as the master node or the device is not the master node of the ring, a hyphen (-) is displayed.

Enable status	RRPP ring status: • **Yes**—Enabled. • **No**—Disabled.

Field	Description
Active status	RRPP ring status: • **Yes**—Active. • **No**—Inactive. An RRPP ring can be active only when RRPP and the RRPP ring are both enabled. This field also helps you identify whether RRPP is enabled.
Primary port	The primary port field means the node mode is master node or transit node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Secondary port	The secondary port field means the node mode is master node or transit node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Common port	The common port field means the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Edge port	The edge port field means the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The port is a member of a link aggregation group.
Port status	Port status: Down, up, or blocked. A hyphen (-) appears when one of the following cases occurs: • The ring is inactive. • The port is not configured on the ring. • The port is a member of a link aggregation group.

domain ring

Use **domain ring** to configure subrings for an RRPP ring group.

Use **undo domain ring** to remove subrings from the RRPP ring group.

Syntax

domain *domain-id* **ring** *ring-id-list*

undo domain *domain-id* [**ring** *ring-id-list*]

Default

No subrings exist in an RRPP ring group.

Views

RRPP ring group view

Predefined user roles

network-admin

Parameters

domain-id: Specifies an RRPP domain by its ID in the range of 1 to 128.

ring *ring-id-list*: Specifies a space-separated list of up to 10 RRPP subring ID items. Each item specifies an RRPP subring ID or a range of RRPP subring IDs. The value range for RRPP subring IDs is 1 to 128. If you do not specify this option, the command removes all subrings from the ring group in the specified domain.

Usage guidelines

Follow these guidelines when you configure an RRPP ring group on the edge node and the assistant edge node:

- When you assign an active ring to a ring group, assign it on the assistant edge node first and then on the edge node.
- To remove an active ring from a ring group, remove it on the edge node first and then on the assistant edge node.
- To remove a ring group, remove it on the edge node first and then on the assistant edge node.
- When you activate rings in a ring group, activate them on the edge node first and then on the assistant edge node.
- When you deactivate rings in a ring group, deactivate them on the assistant edge node first and then on the edge node.

If you do not follow these guidelines, the assistant edge node might fail to receive Edge-Hello packets and consider the primary ring failed even if it did not.

Examples

Create RRPP ring group 1, and add subrings 1, 2, 3, and 5 to domain 1 and domain 2.

```
<Sysname> system-view
[Sysname] rrpp ring-group 1
[Sysname-ring-group1] domain 1 ring 1 to 3 5
[Sysname-ring-group1] domain 2 ring 1 to 3 5
```

Related commands

display rrpp ring-group

rrpp ring-group

linkup-delay-timer

Use **linkup-delay-timer** to set the link-up delay timer.

Use **undo linkup-delay-timer** to restore the default.

Syntax

linkup-delay-timer *delay-time* [**distribute**]

undo linkup-delay-timer

Default

The link-up delay timer is 0 seconds, and the **distribute** keyword is not specified.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

delay-time: Specifies the link-up delay timer in the range of 0 to 30 seconds.

distribute: Enables all nodes in the RRPP domain to learn the link-up delay timer value.

Usage guidelines

The link-up delay timer prevents frequent switchover of RRPP traffic forwarding paths caused by unstable RRPP port states.

You can configure this command on any node in an RRPP domain, but this command can take effect only on the master node.

If you specify the **distribute** keyword in an RRPP network implementing load balancing, you must configure the link-up delay timer for each RRPP domain for the timer to take effect. If you set different timer values for different RRPP domains, the smallest timer value takes effect.

If the **distribute** keyword is not specified, the link-up delay timer value cannot be greater than the Fail timer value minus twice the Hello timer value.

Examples

Set the link-up delay timer to 10 seconds for RRPP domain 1.

```
<Sysname> system-view
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1] linkup-delay-timer 10
```

Related commands

timer

protected-vlan

Use **protected-vlan** to configure the protected VLANs for an RRPP domain.

Use **undo protected-vlan** to remove the protected VLANs from an RRPP domain.

Syntax

protected-vlan reference-instance *instance-id-list*

undo protected-vlan [**reference-instance** *instance-id-list*]

Default

No protected VLANs exist in an RRPP domain.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

reference-instance *instance-id-list*: Specifies the Multiple Spanning Tree Instances (MSTIs) you want to reference in the form of *instance-id-list* = { *instance-id* [**to** *instance-id*] }&<1-10>. The *instance-id* argument is an MSTI ID in the range of 0 to 4094. You can specify up to 10 MSTI IDs or ID ranges. You can use the **display stp region-configuration** command to display the VLAN-to-instance mappings. If you do not specify this option, the command removes all MSTIs referenced by the RRPP domain.

Usage guidelines

You can delete or modify the protected VLANs configured for an RRPP domain before and after you configure rings for the domain. However, after you configure rings for the RRPP domain, you cannot delete configurations of all the protected VLANs configured for the domain.

When the VLAN-to-instance mappings change, the protected VLANs of an RRPP domain also change.

Examples

Map VLANs 1 through 30 to MSTI 1, and activate the MST region configuration. Configure VLAN 100 as the control VLAN of RRPP domain 1. Configure VLANs mapped to MSTI 1 as the primary control VLANs of RRPP domain 1.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] instance 1 vlan 1 to 30
[Sysname-mst-region] active region-configuration
[Sysname-mst-region] quit
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1] control-vlan 100
[Sysname-rrpp-domain1] protected-vlan reference-instance 1
```

Related commands

display stp region-configuration (*Layer 2—LAN Switching Command Reference*)

rrpp domain

reset rrpp statistics

Use **reset rrpp statistics** to clear RRPPDU statistics.

Syntax

reset rrpp statistics domain *domain-id* [**ring** *ring-id*]

Views

User view

Predefined user roles

network-admin

Parameters

domain *domain-id*: Specifies an RRPP domain by its ID in the range of 1 to 128.

ring *ring-id*: Specifies an RRPP ring by its ID in the range of 1 to 128. If you do not specify this option, the command clears RRPPDU statistics of all RRPP rings in the specified RRPP domain.

Examples

Clear the RRPPDU statistics of ring 10 in RRPP domain 1.

```
<Sysname> reset rrpp statistics domain 1 ring 10
```

Related commands

display rrpp statistics

ring

Use **ring** to configure the node mode of the device, the role of the specified RRPP port, and the level of the RRPP ring.

Use **undo ring** to delete the RRPP ring.

Syntax

ring *ring-id* **node-mode** { { **master** | **transit** } [**primary-port** *interface-type interface-number*] [**secondary-port** *interface-type interface-number*] **level** *level-value* | { **assistant-edge** | **edge** } [**edge-port** *interface-type interface-number*] }

undo ring *ring-id*

Default

The device is not a node of the RRPP ring.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

ring-id: Specifies an RRPP ring by its ID in the range of 1 to 128.

master: Specifies the device as the master node of the RRPP ring.

transit: Specifies the device as the transit node of the RRPP ring.

primary-port: Specifies the port as a primary port.

interface-type interface-number: Specifies a port by its type and number.

secondary-port: Specifies the port as a secondary port.

level *level-value*: Specifies an RRPP ring level, 0 for the primary ring and 1 for the subring.

assistant-edge: Specifies the device as the assistant edge node of the RRPP ring.

edge: Specifies the device as the edge node of the RRPP ring.

edge-port: Specifies the edge port for the node.

Usage guidelines

The ID of an RRPP ring in a domain must be unique.

When an RRPP ring is activated, you cannot configure its RRPP ports.

When you configure the edge node and the assistant edge node, first configure the primary ring, and then the subrings.

The node mode, RRPP port role, and ring level settings of an RRPP ring cannot be modified after they are configured. To modify the settings, first remove the current settings.

Remove all subring configurations before you delete the primary ring configuration of the edge node or the assistant edge node. However, an active RRPP ring cannot be deleted.

When RRPP is enabled on a device, you must disable the RRPP ring before you can delete it. When RRPP is disabled on the device, you can directly delete the RRPP ring, as well as the setting of the **ring enable** command.

Do not assign a port to both an aggregation group and an RRPP ring. If you do so, the port does not take effect on the RRPP ring.

Examples

Specify the device as the master node of primary ring 10 in RRPP domain 1. Specify GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port.

```
<Sysname> system-view
[Sysname] rrpp domain 1
```

```
[Sysname-rrpp-domain1] control-vlan 100
[Sysname-rrpp-domain1] protected-vlan reference-instance 0 1 2
[Sysname-rrpp-domain1] ring 10 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
```

Specify the device as the transit node of primary ring 10 in RRPP domain 1. Specify GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Specify the device as the edge node of subring 20 in RRPP domain 1, and specify GigabitEthernet 1/0/3 as the edge port.

```
<Sysname> system-view
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1] control-vlan 100
[Sysname-rrpp-domain1] protected-vlan reference-instance 0 1 2
[Sysname-rrpp-domain1] ring 10 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[Sysname-rrpp-domain1] ring 20 node-mode edge edge-port gigabitethernet 1/0/3
```

Related commands

ring enable

ring enable

Use **ring enable** to enable an RRPP ring.

Use **undo ring enable** to disable the RRPP ring.

Syntax

ring *ring-id* **enable**

undo ring *ring-id* **enable**

Default

An RRPP ring is disabled.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

ring-id: Specifies an RRPP ring by its ID in the range of 1 to 128.

Usage guidelines

To activate an RRPP ring, you must enable RRPP and the RRPP ring.

Before you enable subrings on a device, you must enable the primary ring. Before you disable the primary ring on the device, you must disable all subrings. Otherwise, the system displays error prompts.

Examples

Enable RRPP ring 10 in RRPP domain 1.

```
<Sysname> system-view
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1] control-vlan 100
[Sysname-rrpp-domain1] protected-vlan reference-instance 0 1 2
```

```
[Sysname-rrpp-domain1] ring 10 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[Sysname-rrpp-domain1] ring 10 enable
```

Related commands

rrpp enable

rrpp domain

Use **rrpp domain** to create an RRPP domain and enter its view, or enter the view of an existing RRPP domain.

Use **undo rrpp domain** to remove an RRPP domain.

Syntax

rrpp domain *domain-id*

undo rrpp domain *domain-id*

Default

No RRPP domains exist.

Views

System view

Predefined user roles

network-admin

Parameters

domain-id: Specifies an RRPP domain by its ID in the range of 1 to 128.

Usage guidelines

When you delete an RRPP domain, configurations of the control VLANs and protected VLANs are deleted at the same time.

To delete an RRPP domain successfully, make sure it has no RRPP rings.

Examples

Create RRPP domain 1, and enter RRPP domain 1 view.

```
<Sysname> system-view
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1]
```

Related commands

control-vlan

protected-vlan

rrpp enable

Use **rrpp enable** to enable RRPP.

Use **undo rrpp enable** to disable RRPP.

Syntax

rrpp enable

undo rrpp enable

Default

RRPP is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

To activate an RRPP domain, enable RRPP and the RRPP rings for the RRPP domain.

Examples

Enable RRPP.

```
<Sysname> system-view
[Sysname] rrpp enable
```

Related commands

ring enable

rrpp ring-group

Use **rrpp ring-group** to create an RRPP ring group and enter its view, or enter the view of an existing RRPP ring group.

Use **undo rrpp ring-group** to remove an RRPP ring group.

Syntax

rrpp ring-group *ring-group-id*

undo rrpp ring-group *ring-group-id*

Default

No RRPP ring groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

ring-group-id: Specifies an RRPP ring group ID in the range of 1 to 64.

Usage guidelines

When you remove a ring group, remove it on the edge node first and then on the assistant edge node. Otherwise, the assistant edge node might fail to receive Edge-Hello packets and consider the primary ring failed even if it is not.

After a ring group is removed, all subrings in the ring group do not belong to any ring group.

Examples

Create RRPP ring group 1 and enter its view.

```
<Sysname> system-view
[Sysname] rrpp ring-group 1
```

```
[Sysname-ring-group1]
```

Related commands

display rrpp ring-group

domain ring

snmp-agent trap enable rrpp

Use **snmp-agent trap enable rrpp** to enable SNMP notifications for RRPP.

Use **undo snmp-agent trap enable rrpp** to disable SNMP notifications for RRPP.

Syntax

snmp-agent trap enable rrpp [**major-fault** | **multi-master** | **ring-fail** | **ring-recover**] *

undo snmp-agent trap enable rrpp [**major-fault** | **multi-master** | **ring-fail** | **ring-recover**] *

Default

SNMP notifications for RRPP are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

major-fault: Generates notifications when an SRPT between the assistant edge node and edge node is disconnected.

multi-master: Generates notifications when multiple master nodes are configured for the RRPP ring.

ring-fail: Generates notifications when the state of the RRPP ring changes from Health to Disconnect.

ring-recover: Generates notifications when the state of the RRPP ring changes from Disconnect to Health.

Usage guidelines

To report critical RRPP events to an NMS, enable SNMP notifications for RRPP. For RRPP event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

If you do not specify any keyword, this command enables or disables all SNMP notifications for RRPP.

Examples

Generate notifications when the state of the RRPP ring changes from Disconnect to Health.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable rrpp ring-recover
```

timer

Use **timer** to set the Hello timer and the Fail timer.

Use **undo timer** to restore the default.

Syntax

timer hello-timer *hello-value* **fail-timer** *fail-value*

undo timer

Default

The Hello timer is 1 second and the Fail timer is 3 seconds.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

hello-timer *hello-value*: Specifies the Hello timer in the range of 1 to 10 seconds.

fail-timer *fail-value*: Specifies the Fail timer in the range of 3 to 30 seconds.

Usage guidelines

The Fail timer must be greater than or equal to three times the Hello timer.

Examples

Set the Hello timer to 2 seconds and the Fail timer to 7 seconds for RRPP domain 1.

```
<Sysname> system-view
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1] timer hello-timer 2 fail-timer 7
```

Contents

ERPS commands

control-vlan

Use **control-vlan** to configure the control VLAN for an ERPS instance.

Use **undo control-vlan** to restore the default.

Syntax

control-vlan *vlan-id*

undo control-vlan

Default

An ERPS instance does not have control VLANs.

Views

ERPS instance view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies the control VLAN by its ID in the range of 2 to 4094.

Usage guidelines

The control VLAN must be a VLAN that has not been created on the device.

Examples

Configure VLAN 100 as the control VLAN for instance 1 of ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] control-vlan 100
```

Related commands

--------------------------------------------------------------------------
1      1          Owner      Idle         R,B               Enabled
1      2          Normal     Idle                           Disabled
2      1          Owner      Idle         R,B               Enabled
2      2          Normal     Idle                           Disabled
```

Table 1 Command output

Field	Description
ERPS protocol status	ERPS state: • **Enabled**—Globally enabled. • **Disabled**—Globally disabled.
ERPS tcn-propagation	State of the flush packet transparent transmission feature: • **Enabled**—Globally enabled. • **Disabled**—Globally disabled.
Ring	ERPS ring ID.
Instance	ERPS instance ID.
NodeRole	Node type: • Owner. • Neighbor. • Interconnection. • Normal.
NodeState	Node state: • **Idle**—The ERPS ring enters the idle state after initialization. • **Protection**—The ERPS ring enters the protection state when a link fails. • **MS**—Manual switching mode. • **FS**—Forced switching mode. • **Pending**—Transient mode between any two states. • **-**—ERPS is disabled for the ERPS instance or disabled globally.
Port0	State of port 0: • **R**—The port is an RPL port. • **B**—The port is blocked. • **F**—The port is unavailable and the link for the port is faulty. • **FS**—The port is in FS mode. • **MS**—The port is in MS mode. • **-**—The port is not an ERPS ring member port. If this field is blank, the port is not in any of the previous states.

Field	Description
Port1	State of port 1: • **R**—The port is an RPL port. • **B**—The port is blocked. • **F**—The port is unavailable and the link for the port is faulty. • **FS**—The port is in FS mode. • **MS**—The port is in MS mode. • **-**—The port is not an ERPS ring member port. If this field is blank, the port is not in any of the previous states.
Status	State of the ERPS instance: • Enabled. • Disabled.

display erps detail

Use **display erps detail** to display detailed ERPS ring information.

Syntax

display erps detail ring *ring-id* [**instance** *instance-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ring *ring-id*: Specifies an ERPS ring by its ID in the range of 1 to 255.

instance *instance-id*: Specifies an ERPS instance by its ID in the range of 1 to 64. If you do not specify this option, this command displays detailed information about all instances for the ERPS ring.

Examples

Display detailed information about instance 1 of ERPS ring 1.

```
<Sysname> display erps detail ring 1 instance 1
Ring ID                : 1
Port0                  : GigabitEthernet1/0/1
Port1                  : GigabitEthernet1/0/2
Subring                : Yes
Default MAC            : Yes

Instance ID            : 1
Node role              : Owner
Node state             : Idle
Connect (ring/instance): (1/2), (2/3)
Control VLAN           : 100
Protected VLAN         : Reference-instance 0 to 2
Guard timer            : 500 ms
```

```
Hold-off timer         : 1 sec
WTR timer              : 5 min
Revertive operation    : Non-revertive
Enable status          : Yes, Active Status : Yes
R-APS level            : 1
Port                   PortRole              PortStatus
--------------------------------------------------------------------
Port0                  RPL                   Block
Port1                  Non-RPL               Up
```

Display detailed information about all instances of ERPS ring 1.

```
<Sysname> display erps detail ring 1
Ring ID               : 1
Port0                 : GigabitEthernet1/0/1
Port1                 : GigabitEthernet1/0/2
Subring               : Yes
Default MAC           : Yes

Instance ID           : 1
Node role             : Owner
Node state            : Idle
Connect(ring/instance): (1/2), (2/3)

Enable status         : Yes, Active Status : Yes
R-APS level           : 1
Port                  PortRole              PortStatus
--------------------------------------------------------------------
```

```
Port0                RPL                  Block
Port1                Non-RPL              Up
```

Table 2 Command output

Field	Description
Port0	ERPS ring member port 0.
Port1	ERPS ring member port 1.
Subring	ERPS subring status: • **Yes**—The ring is a subring. • **No**—The ring is not a subring.
Default MAC	Default MAC address status: • **Yes**—The last byte is 1 in the destination MAC address of R-APS packets. • **No**—The last byte is the ring ID in the destination MAC address of R-APS packets.
Node role	Node type: • Owner. • Neighbor. • Interconnection. • Normal.
Node state	Node state: • **Idle**—The ERPS ring enters the idle status after initialization. • **Protection**—The ERPS ring enters the protection state when a link fails. • **MS**—Manual switching mode. • **FS**—Forced switching mode. • **Pending**—Transient mode between any two states. • **-**—ERPS is disabled for the ERPS instance or disabled globally.
Connect(ring/instance)	Ring or instance associated with the ERPS instance.
Control VLAN	Control VLAN of the ERPS instance.
Protected VLAN	List of VLANs protected by the ERPS instance, which are represented by MSTIs. To view the mapping between MSTIs and VLANs, use the **`display stp region-configuration`** command.
Guard timer	Guard timer in milliseconds.
Hold-off timer	Hold-off timer in milliseconds.
WTR timer	WTR timer in minutes.
Revertive operation	Revertive mode: • Non-revertive. • Revertive.
Enable status	ERPS status for the instance: • **Yes**—Enabled. • **No**—Disabled.
Active Status	Global ERPS status and ERPS status for the instance: • **Yes**—Enabled. • **No**—Disabled.
R-APS level	Level of the R-APS packets.

Field	Description
Port	ERPS ring member port.
PortRole	Port role: • **RPL**—The port is an RPL port. • **Non-RPL**—The port is not an RPL port.
Port Status	Port status: • **Block**—The port is blocked. • **Up**—The link is up. • **Down**—The link is down.

display erps statistics

Use **display erps statistics** to display ERPS packet statistics.

Syntax

display erps statistics *ring-id* [**instance** *instance-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ring *ring-id*: Specifies an ERPS ring by its ID in the range of 1 to 255.

instance *instance-id*: Specifies an ERPS instance by its ID in the range of 1 to 64. If you do not specify this option, this command displays packet statistics for all instances of the ERPS ring.

Examples

Display packet statistics for all instances of ERPS ring 1.

```
<Sysname> display erps statistics ring 1
  Statistics for ERPS ring 1 instance 1:
  R-APS      Port0(Tx/Rx)             Port1(Tx/Rx)
  --------------------------------------------------
  NR         1/1                      1/1
  NR,RB      0/1                      0/1
  SF         1/0                      1/0
  MS         0/0                      0/0
  FS         0/0                      0/0
  Total      2/2                      2/2

  Statistics for ERPS ring 1 instance 2:
  R-APS      Port0(Tx/Rx)             Port1(Tx/Rx)
  --------------------------------------------------
  NR         1/1                      1/1
  NR,RB      0/1                      0/1
  SF         1/0                      1/0
  MS         0/0                      0/0
```

```
FS          0/0                     0/0
Total       2/2                     2/2
```

Table 3 Command output

Field	Description
R-APS	Packet type.
Port0(Tx/Rx)	Packet statistics for port 0: • **Tx**—Transmitted packets. • **Rx**—Received packets.
Port1(Tx/Rx)	Packet statistics for port 1: • **Tx**—Transmitted packets. • **Rx**—Received packets.

erps clear

Use **erps clear** to remove the MS mode and FS mode settings for an ERPS ring.

Syntax

erps clear *ring-id* **instance** *instance-id*

Views

System view

Predefined user roles

network-admin

Parameters

ring *ring-id*: Specifies an ERPS ring by its ID in the range of 1 to 255.

instance *instance-id*: Specifies an ERPS instance by its ID in the range of 1 to 64.

Usage guidelines

After you configure this command, the owner node can ignore the WTR timer and immediately switch traffic to the recovered link upon link recovery.

This command also switches an ERPS ring in non-revertive mode to revertive mode.

Examples

Remove the MS mode and FS mode settings for instance 1 on ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps clear ring 1 instance 1
```

erps enable

Use **erps enable** to enable ERPS globally.

Use **undo erps enable** to restore the default.

Syntax

erps enable

undo erps enable

Default

ERPS is disabled globally.

Views

System view

Predefined user roles

network-admin

Examples

Enable ERPS.

```
<Sysname> system-view
[Sysname] erps enable
```

erps ring

Use **erps ring** to create an ERPS ring.

Use **undo erps ring** to delete an ERPS ring.

Syntax

erps ring *ring-id*

undo erps ring *ring-id*

Default

No ERPS rings exist.

Views

System view

Predefined user roles

network-admin

Parameters

ring *ring-id*: Specifies an ERPS ring by its ID in the range of 1 to 255.

Usage guideline

To delete an ERPS ring successfully, delete all ERPS instances on the ring first.

Examples

Create ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1]
```

Related commands

instance

erps switch

Use **erps switch** to configure the switching mode for an ERPS ring.

Syntax

erps switch { **force** | **manual** } **ring** *ring-id* **instance** *instance-id* { **port0** | **port1** }

Views

System view

Predefined user roles

network-admin

Parameters

force: Configures the forced switching mode.

manual: Configures the manual switching mode.

port0: Specifies the ERPS ring member port 0.

port1: Specifies the ERPS ring member port 1.

ring *ring-id*: Specifies an ERPS ring by its ID in the range of 1 to 255.

instance *instance-id*: Specifies an ERPS instance by its ID in the range of 1 to 64.

Examples

Configure the forced switching mode for port 1 of instance 1 on ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps switch force ring 1 instance 1 port0
```

erps tcn-propagation

Use **erps tcn-propagation** to enable flush packet transparent transmission for an interconnection node.

Use **undo erps tcn-propagation** to restore the default.

Syntax

erps tcn-propagation

undo erps tcn-propagation

Default

Flush packet transparent transmission is disabled for an interconnection node.

Views

System view

Predefined user roles

network-admin

Usage guideline

This command must be used together with the **sub-ring connect** command.

Examples

Enable flush packet transparent transmission for the interconnection node.

```
<Sysname> system-view
[Sysname] erps tcn-propagation
```

Related commands

sub-ring connect

instance

Use **instance** to create an instance for an ERPS ring.

Use **undo instance** to delete an instance from an ERPS ring.

Syntax

instance *instance-id*

undo instance *instance-id*

Default

An ERPS ring does not have instances.

Views

ERPS ring view

Predefined user roles

network-admin

Parameters

instance *instance-id*: Specifies an ERPS instance by its ID in the range of 1 to 64.

Usage guidelines

You can create multiple instances for an ERPS ring. Each instance has its own protected VLAN, control VLAN, and RPL owner. Each instance maintains its own state machine and data. You can locate an ERPS instance by its ring ID and VLAN ID.

Examples

Create instance 1 for ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1]
```

Related commands

erps ring

instance enable

Use **instance enable** to enable ERPS for an ERPS instance.

Use **undo instance enable** to disable ERPS for an ERPS instance.

Syntax

instance enable

undo instance enable

Default

ERPS is disabled for ERPS instances.

Views

ERPS instance view

Predefined user roles

network-admin

Examples

Create ERPS instance 1 and enable ERPS for the instance.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] control-vlan 100
[Sysname-erps-ring1-inst1] protected-vlan reference-instance 0 1 2
[Sysname-erps-ring1-inst1] instance enable
```

Related commands

instance

node-role

Use **node-role** to configure the role for an ERPS node.

Use **undo node-role** to restore the default.

Syntax

node-role { { **owner** | **neighbor** } **rpl** | **interconnection** } { **port0** | **port1** }

undo node-role

Default

An ERPS node is a normal node.

Views

ERPS instance view

Predefined user roles

network-admin

Parameters

owner: Configures the owner node.

neighbor: Configures the neighbor node.

interconnection: Configures the interconnection node for connecting the major ring and subring.

Usage guidelines

For the owner node to work correctly, you must configure only one owner node for an ERPS ring.

You can configure an interconnection node only for a subring.

Examples

Configure instance 1 of ERPS ring 1 as an RPL owner node and configure port 0 as an RPL port.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
```

```
[Sysname-erps-ring1-inst1] node-role owner rpl port0
```

port erps track

Use **port erps track** to associate an ERPS ring member port with a track entry.

Use **undo port erps track** to remove the association between an ERPS ring member port and a track entry.

Syntax

port erps ring *ring-id* **instance** *instance-id* **track** *track-entry-index*

undo port erps ring *ring-id* **instance** *instance-id* **track**

Default

An ERPS ring member port is not associated with track entries.

Views

Interface view

Predefined user roles

network-admin

Parameters

ring *ring-id*: Specifies an ERPS ring by its ID in the range of 1 to 255.

instance *instance-id*: Specifies an ERPS instance by its ID in the range of 1 to 64.

track-entry-index: Specifies a track entry by its ID in the range of 1 to 1024. For more information about specifying the track entry ID, see the **track cfd** command in "Track commands."

Usage guidelines

An ERPS ring member port collaborates with link detection protocols through track entries. ERPS supports only the CC feature of CFD to implement link detection.

Examples

Associate a track entry with GigabitEthernet 1/0/1 on the RPL owner node in instance 1 of ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] port0 interface gigabitethernet 1/0/1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] node-role owner rpl port0
[Sysname-erps-ring1-inst1] quit
[Sysname-erps-ring1] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 3
```

Related commands

track cfd

port0

Use **port0** to specify the first member port for an ERPS ring.

Use **undo port0** to restore the default.

Syntax

port0 interface *interface-type interface-number*

undo port0

Default

No member ports exist in an ERPS ring.

Views

ERPS ring view

Predefined user roles

network-admin

Usage guidelines

Do not assign an interface to both an aggregation group and an ERPS ring. If you do so, the interface does not take effect on the ERPS ring and cannot be displayed by using the **display erps detail** command.

Parameters

interface *interface-type interface-number*: Specifies a Layer 2 Ethernet interface or a Layer 2 aggregate interface by its type and number.

Examples

Specify GigabitEthernet 1/0/1 as the first member port for ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] port0 interface gigabitethernet 1/0/1
```

port1

Use **port1** to specify the second member port for an ERPS ring.

Use **undo port1** to restore the default.

Syntax

port1 interface *interface-type interface-number*

undo port1

Default

No member ports exist in an ERPS ring.

Views

ERPS ring view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a Layer 2 Ethernet interface or a Layer 2 aggregate interface by its type and number.

Usage guidelines

Do not assign an interface to both an aggregation group and an ERPS ring. If you do so, the interface does not take effect on the ERPS ring and cannot be displayed by using the **display erps detail** command.

Examples

Specify GigabitEthernet 1/0/2 as the second member port for ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] port1 interface gigabitethernet 1/0/2
```

protected-vlan

Use **protected-vlan** to configure protected VLANs for an ERPS instance.

Use **undo protected-vlan** to delete protected VLANs for an ERPS instance.

Syntax

protected-vlan reference-instance *instance-id-list*

undo protected-vlan [**reference-instance** *instance-id-list*]

Default

No protected VLANs exist in an ERPS instance.

Views

ERPS instance view

Predefined user roles

network-admin

Parameters

instance-id-list: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* **to** *instance-id2*. The value for *instance-id2* must be greater than or equal to the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094. The value 0 indicates CIST. You can use the **display stp region-configuration** command to display the VLAN-to-instance mappings. In PVST mode, the system automatically maps VLANs to MSTIs.

Usage guidelines

If you do not specify the **reference-instance** *instance-id-list* option, the **undo protected-vlan** command deletes all mappings between MSTIs and VLANs in the ERPS instance. The protected VLANs change if the mappings between the MSTIs and VLANs change.

Examples

Configure the protected VLANs for instance 1 of ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] protected-vlan reference-instance 0 1 2
```

Related commands

display stp region-configuration

r-aps level

Use **r-aps level** to configure the level for R-APS packets.

Use **undo r-aps level** to restore the default.

Syntax

r-aps level *level-value*

undo r-aps level

Default

The R-APS packet level is 7.

Views

ERPS instance view

Predefined user roles

network-admin

Parameters

level-value: Specifies the R-APS packet level in the range of 0 to 7.

Usage guidelines

The R-APS packet level must be the same for all nodes in an instance of an ERPS ring.

Examples

Configure the R-APS packet level as 1 for instance 1 of ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] r-aps level 1
```

r-aps ring-mac

Use **r-aps ring-mac** to configure the ring ID as the last byte of the destination MAC address for R-APS packets.

Use **undo r-aps ring-mac** to restore the default.

Syntax

r-aps ring-mac

undo r-aps ring-mac

Default

The last byte of the destination MAC address is 1 for the R-APS packets.

Views

ERPS ring view

Predefined user roles

network-admin

Examples

Configure the ID of ERPS ring 2 as the last byte of the destination MAC address for R-APS packets.

```
<Sysname> system-view
[Sysname] erps ring 2
[Sysname-erps-ring2] r-aps ring-mac
```

reset erps statistics

Use **reset erps statistics** to clear ERPS packet statistics.

Syntax

reset erps statistics ring *ring-id* [**instance** *instance-id*]

Views

User view

Predefined user roles

network-admin

Parameters

ring *ring-id*: Specifies an ERPS ring by its ID in the range of 1 to 255.

instance *instance-id*: Specifies an ERPS instance by its ID in the range of 1 to 64. If you do not specify this option, this command clears packet statistics for all instances of the ERPS ring.

Examples

Clear packet statistics for instance 1 of ERPS ring 1.

```
<Sysname> reset erps statistics ring 1 instance 1
```

Related commands

display erps statistics

revertive-operation

Use **revertive-operation non-revertive** to set the non-revertive mode for an ERPS ring.

Use **undo revertive-operation** to restore the default.

Syntax

revertive-operation non-revertive

undo revertive-operation

Default

An ERPS ring operates in revertive mode.

Views

ERPS instance view

Predefined user roles

network-admin

Usage guidelines

In non-revertive mode, an owner node does not perform any operations when receiving NR packets. You can use the **erps clear** command to restore the revertive mode.

Examples

Set the non-revertive mode for instance 1 of ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] revertive-operation non-revertive
```

ring-type sub-ring

Use **ring-type sub-ring** to configure the ERPS ring as a subring.

Use **undo ring-type sub-ring** to restore the default.

Syntax

ring-type sub-ring

undo ring-type

Default

An ERPS ring is a major ring.

Views

ERPS ring view

Predefined user roles

network-admin

Examples

Configure ERPS ring 1 as a subring.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] ring-type sub-ring
```

sub-ring connect

Use **sub-ring connect** to associate the subring with an ERPS ring.

Use **undo sub-ring connect** to remove the association.

Syntax

sub-ring connect ring *ring-id* **instance** *instance-id*

undo sub-ring connect ring *ring-id* **instance** *instance-id*

Default

A subring is not associated with ERPS rings.

Views

ERPS instance view

Predefined user roles

network-admin

Parameters

ring *ring-id*: Specifies an ERPS ring by its ID in the range of 1 to 255.

instance *instance-id*: Specifies an ERPS instance by its ID in the range of 1 to 64.

Examples

Configure ERPS ring 1 as a subring for instance 1, and associate the subring with ERPS ring 2.

```
<Sysname> system-view
[Sysname] erps ring 2
[Sysname-erps-ring2] instance 1
[Sysname-erps-ring2] quit
[Sysname] erps ring 1
[Sysname-erps-ring1] ring-type sub-ring
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] sub-ring connect ring 2 instance 1
```

Related commands

ring-type sub-ring

timer guard

Use **timer guard** to set the guard timer for an ERPS instance.

Use **undo timer guard** to restore the default.

Syntax

timer guard *guard-value*

undo timer guard

Default

The guard timer is 500 milliseconds for an ERPS instance.

Views

ERPS instance view

Predefined user roles

network-admin

Parameters

guard-value: Specifies the guard timer in the range of 0 to 2000 milliseconds and in step of 10.

Usage guidelines

The guard timer starts when the link recovers. The system processes only the flush packets before the guard timer expires. The guard timer prevents SF messages from impacting the network.

Examples

Set the guard timer to 30 milliseconds for instance 1 of ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] timer guard 30
```

timer hold-off

Use **timer hold-off** to set the hold-off timer for an ERPS instance.

Use **undo timer hold-off** to restore the default.

Syntax

timer hold-off *hold-off-value*

undo timer hold-off

Default

The hold-off timer is 0 milliseconds for an ERPS instance.

Views

ERPS instance view

Predefined user roles

network-admin

Parameters

hold-off-value: Specifies the hold-off timer in the range of 0 to 10000 milliseconds and in step of 100.

Usage guidelines

The hold-off timer starts when the port detects a link fault. If the link fault persists when the hold-off timer expires, the port reports the link fault. The hold-off timer delays the fault report time and might impact the link recovery performance.

Examples

Set the hold-off timer to 300 milliseconds for instance 1 of ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] timer hold-off 300
```

timer wtr

Use **timer wtr** to set the WTR timer for an ERPS instance.

Use **undo timer wtr** to restore the default.

Syntax

timer wtr *wtr-value*

undo timer wtr

Default

The WTR timer is 5 minutes for an ERPS instance.

Views

ERPS instance view

Predefined user roles

network-admin

Parameters

wtr-value: Specifies the WTR timer in the range of 1 to 12 minutes and in step of 1.

Usage guidelines

This timer prevents intermittent link failures from impacting the network.

Examples

Set the WTR timer to 3 minutes for instance 1 of ERPS ring 1.

```
<Sysname> system-view
[Sysname] erps ring 1
[Sysname-erps-ring1] instance 1
[Sysname-erps-ring1-inst1] timer wtr 3
```

display smart-link flush

Use **display smart-link flush** to display information about the received flush messages.

Syntax

display smart-link flush

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information about the received flush messages.

```
<Sysname> display smart-link flush
 Received flush packets                            : 10
 Receiving interface of the last flush packet      : GigabitEthernet1/0/1
 Receiving time of the last flush packet           : 19:19:03 2012/04/21
 Device ID of the last flush packet                : 000f-e200-8500
 Control VLAN of the last flush packet             : 1
```

Table 1 Command output

Field	Description
Received flush packets	Total number of received flush messages.
Receiving interface of the last flush packet	Port that received the last flush message.
Receiving time of the last flush packet	Time when the last flush message was received.
Device ID of the last flush packet	Device ID carried in the last flush message.
Control VLAN of the last flush packet	Control VLAN ID carried in the last flush message.

Related commands

reset smart-link statistics

display smart-link group

Use **display smart-link group** to display information about the specified or all smart link groups.

Syntax

display smart-link group { *group-id* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-id: Specifies a smart link group by its ID. The value range for this argument is 1 to 48.

all: Displays information about all smart link groups.

Examples

Display information about smart link group 1.

```
<Sysname> display smart-link group 1
Smart link group 1 information:
  Device ID       : 0011-2200-0001
  Preemption mode : None
  Preemption delay: 1(s)
  Control VLAN    : 1
  Protected VLAN  : Reference Instance 2, 4

  Member                  Role      State   Flush-count     Last-flush-time
  ------------------------------------------------------------------------------
  GE1/0/1                 PRIMARY   ACTIVE  1               16:45:20 2012/04/21
  GE1/0/2                 SECONDARY STANDBY 2               16:37:20 2012/04/21
```

Table 2 Command output

Field	Description
Preemption mode	Preemption mode: • **None**—Preemption disabled. • **Role**—Role preemption mode. • **Speed**—Speed preemption mode.
Preemption delay	Preemption delay time, in seconds.
Control-VLAN	Control VLAN ID.
Protected VLAN	Protected VLANs of the smart link group. Referenced Multiple Spanning Tree Instances (MSTIs) are displayed. To view the VLANs mapped to the referenced MSTIs, use the **display stp region-configuration** command.
Member	Member port of the smart link group.
Role	Port role: primary or secondary.

Field	Description
State	Port state: active, down, or standby.
Flush-count	Number of transmitted flush messages.
Last-flush-time	Time when the last flush message was transmitted (NA indicates that no flush message has been transmitted).

flush enable

Use **flush enable** to enable flush update.

Use **undo flush enable** to disable flush update.

Syntax

flush enable [**control-vlan** *vlan-id*]

undo flush enable

Default

Flush update is enabled for smart link groups, and VLAN 1 is used for flush message transmission.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

control-vlan *vlan-id*: Specifies the control VLAN used for transmitting flush messages. The *vlan-id* argument represents the control VLAN ID and is in the range of 1 to 4094.

Usage guidelines

You must configure different control VLANs for different smart link groups.

- Make sure the configured control VLAN already exists, and assign the smart link group member ports to the control VLAN.
- The control VLAN of a smart link group must also be one of its protected VLANs. Do not remove the control VLAN. Otherwise, flush messages cannot be sent correctly.

Examples

Disable flush update for smart link group 1.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] undo flush enable
```

Related commands

smart-link flush enable

port

Use **port** to assign a port to a smart link group and specify the port role.

Use **undo port** to remove a port from a smart link group.

Syntax

port *interface-type interface-number* { **primary** | **secondary** }

undo port *interface-type interface-number*

Default

No member ports exist in a smart link group.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies a port by its type and number, which can be a Layer 2 Ethernet interface or Layer 2 aggregate interface.

primary: Specifies a port as the primary port.

secondary: Specifies a port as the secondary port.

Usage guidelines

Before configuring member ports for a smart link group, you must configure protected VLANs for the smart link group.

Disable the spanning tree feature, RRPP, and ERPS on the ports you want to add to the smart link group. You cannot enable the spanning tree feature, RRPP, or ERPS on a smart link group member port.

If you configure a port as both an aggregation group member and a smart link group member, only the aggregation group member configuration takes effect. The port is not shown in the output from the **display smart-link group** command. The smart link group member configuration takes effect after the port leaves the aggregation group.

You can also assign a port to a smart link group by using the **port smart-link group** command in interface view.

Examples

Configure GigabitEthernet 1/0/1 as the secondary port of smart link group 1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo stp enable
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 0
[Sysname-smlk-group1] port gigabitethernet 1/0/1 secondary
```

Related commands

port smart-link group

port smart-link group

Use **port smart-link group** to assign a port to a smart link group and specify the port role.

Use **undo port smart-link group** to remove a port from a smart link group.

Syntax

port smart-link group *group-id* { **primary** | **secondary** }

undo port smart-link group *group-id*

Default

A port is not a smart link group member.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a smart link group by its ID. The value range for this argument is 1 to 48.

primary: Specifies the port as the primary port.

secondary: Specifies the port as the secondary port.

Usage guidelines

Before configuring member ports for a smart link group, you must configure protected VLANs for the smart link group.

Disable the spanning tree feature, RRPP, and ERPS on the ports you want to add to the smart link group. You cannot enable the spanning tree feature, RRPP, or ERPS on a smart link group member port.

If you configure a port as both an aggregation group member and a smart link group member, only the aggregation group member configuration takes effect. The port is not shown in the output from the **display smart-link group** command. The smart link group member configuration takes effect after the port leaves the aggregation group.

You can assign a port to a smart link group by using the **port** command in smart link group view.

Examples

Configure GigabitEthernet 1/0/1 as the primary port of smart link group 1.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 0
[Sysname-smlk-group1] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo stp enable
[Sysname-GigabitEthernet1/0/1] port smart-link group 1 primary
```

Configure Layer 2 aggregate interface 1 as the primary port of smart link group 1.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 0
[Sysname-smlk-group1] quit
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] undo stp enable
[Sysname-Bridge-Aggregation1] port smart-link group 1 primary
```

Related commands

port

port smart-link group track

Use **port smart-link group track** to configure the collaboration between a smart link group member port and a track entry.

Use **undo port smart-link group track** to remove the collaboration between a smart link group member port and a track entry.

Syntax

port smart-link group *group-id* **track** *track-entry-number*

undo port smart-link group *group-id* **track** *track-entry-number*

Default

Smart link group member ports do not collaborate with track entries.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a smart link group by its ID. The value range for this argument is 1 to 48.

track-entry-number: Specifies the ID of a track entry that has been associated with the CC function of CFD.

Usage guidelines

Smart Link collaborates with link detection protocols through track entries. It supports only the CC function of CFD to implement link detection. To associate the CC function of CFD with a track entry, use the **track cfd** command.

Before configuring the collaboration between Smart Link and Track on a port, make sure the port has been added to the specified smart link group.

Examples

Configure the collaboration between GigabitEthernet 1/0/1, the primary port of smart link group 1, and the CC function of CFD through track entry 1 to detect the link status.

```
<Sysname> system-view
[Sysname] track 1 cfd cc service-instance 100 mep 2
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 0
[Sysname-smlk-group1] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo stp enable
[Sysname-GigabitEthernet1/0/1] port smart-link group 1 primary
[Sysname-GigabitEthernet1/0/1] port smart-link group 1 track 1
```

Configure the collaboration between bridge-aggregation 1, the primary port of smart link group 1, and the CC function of CFD through track entry 1 to detect the link status.

```
<Sysname> system-view
```

```
[Sysname] track 1 cfd cc service-instance 100 mep 2
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 0
[Sysname-smlk-group1] quit
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] undo stp enable
[Sysname-Bridge-Aggregation1] port smart-link group 1 primary
[Sysname-Bridge-Aggregation1] port smart-link group 1 track 1
```

Related commands

track cfd

preemption delay

Use **preemption delay** to set the preemption delay.

Use **undo preemption delay** to restore the default.

Syntax

preemption delay *delay*

undo preemption delay

Default

The preemption delay is 1 second.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

delay: Specifies the preemption delay in the range of 0 to 300 seconds.

Usage guidelines

Preemption delay is the period of time that the primary port waits before taking over to collaborate with the switchover of upstream devices.

The preemption delay configuration takes effect only after a preemption mode is configured.

Examples

Enable role preemption and set the preemption delay to 10 seconds.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] preemption mode role
[Sysname-smlk-group1] preemption delay 10
```

Related commands

preemption mode

preemption mode

Use **preemption mode** to configure a preemption mode for a smart link group.

Use **undo preemption mode** to restore the default.

Syntax

preemption mode { **role** | **speed** [**threshold** *threshold-value*] }

undo preemption mode

Default

No preemption mode is configured for a smart link group.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

role: Specifies the role preemption mode, which enables the primary port to transition to forwarding state after the primary link recovers.

speed: Specifies the speed preemption mode.

threshold *threshold-value*: Specifies the speed preemption threshold in percentage. The value range for the *threshold-value* argument is 1 to 10000.

Usage guidelines

If you specify the speed preemption mode, the following conditions occur when the primary link recovers:

- If you specify the **threshold** *threshold-value* option, the primary port transitions to forwarding state when the following condition is met:

  The difference between the primary port speed and the secondary port speed equals or exceeds the threshold value (in percentage) of the secondary port speed.
- If you do not specify the **threshold** *threshold-value* option, the primary port transitions to forwarding state when the primary port speed exceeds the secondary port speed.

Examples

Configure the role preemption mode.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] preemption mode role
```

Configure the speed preemption mode and specify the speed preemption threshold as 1000.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] preemption mode speed threshold 1000
```

protected-vlan

Use **protected-vlan** to configure protected VLANs for a smart link group.

Use **undo protected-vlan** to remove the protected VLAN of a smart link group.

Syntax

protected-vlan reference-instance *instance-id-list*

undo protected-vlan [**reference-instance** *instance-id-list*]

Default

A smart link group does not have protected VLANs.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

reference-instance *instance-id-list*: Specifies protected VLANs.

- When the spanning tree mode is MSTP, the *instance-id-list* argument is a space-separated list of up to 10 MSTI items. Each item specifies an MSTI ID or a range of MSTI IDs in the form of *instance-id 1* **to** *instance-id 2*. The value range for MSTI IDs is 0 to 4094. 0 represents the common internal spanning tree (CIST). The *instance-id 2* must be equal to or greater than *instance-id 1*. You can use the **display stp region-configuration** command to display instance-to-VLAN mappings.
- When the spanning tree mode is PVST, the *instance-id-list* argument is a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *instance-id 1* **to** *instance-id 2*. The value range for VLAN IDs is 1 to 4094. The *instance-id 2* must be equal to or greater than *instance-id 1*.

Usage guidelines

You must configure all VLANs to which the member ports of a smart link group belongs as protected VLANs.

If the VLAN-to-MSTI mappings change, the protected VLANs change.

To remove protected VLAN configuration, follow these restrictions and guidelines:

- In MSTP mode, if you specify the **reference-instance** *instance-id-list* option, the **undo protected-vlan** command removes configuration of VLANs mapped to the specified MSTIs. If you do not specify the **reference-instance** *instance-id-list* option, the command removes configuration of all protected VLANs.
- In PVST mode, if you specify the **reference-instance** *instance-id-list* option, the **undo protected-vlan** command removes configuration of the specified VLANs. If you do not specify the **reference-instance** *instance-id-list* option, the command removes configuration of all protected VLANs.
- If a smart link group has member ports, you cannot remove protected VLAN configuration. If a smart link group does not have member ports, you can remove protected VLAN configuration.

Examples

Map VLANs 1 through 30 to MSTI 1, and activate the MST region configuration. Configure the VLANs mapped to MSTI 1 as the protected VLANs of smart link group 1.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] instance 1 vlan 1 to 30
[Sysname-mst-region] active region-configuration
[Sysname-mst-region] quit
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 1
```

Related commands

display stp region-configuration (*Layer 2—LAN Switching Command Reference*)

smart-link group

reset smart-link statistics

Use **reset smart-link statistics** to clear statistics about flush messages.

Syntax

reset smart-link statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear statistics about flush messages.

```
<Sysname> reset smart-link statistics
```

Related commands

display smart-link flush

smart-link flush enable

Use **smart-link flush enable** to enable flush message receiving.

Use **undo smart-link flush enable** to disable flush message receiving.

Syntax

smart-link flush enable [**control-vlan** *vlan-id-list*]

undo smart-link flush enable [**control-vlan** *vlan-id-list*]

Default

Flush message receiving is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

control-vlan *vlan-id-list*: Specifies a space-separated list of up to 10 control VLAN items. Each item specifies a control VLAN ID or a range of control VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for the *vlan-id* argument is 1 to 4094. The *vlan-id2* must be greater than or equal to *vlan-id1*. The default value for the *vlan-id-list* argument is 1.

Examples

Enable GigabitEthernet 1/0/1 to receive flush messages.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] smart-link flush enable
```

Enable Layer 2 aggregate interface 1 to receive flush messages.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] smart-link flush enable
```

Related commands

flush enable

smart-link group

Use **smart-link group** to create a smart link group and enter its view, or enter the view of an existing smart link group.

Use **undo smart-link group** to remove a smart link group.

Syntax

smart-link group *group-id*

undo smart-link group *group-id*

Default

No smart link groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a smart link group ID. The value range for this argument is 1 to 48.

Usage guidelines

You cannot remove a smart link group with member ports.

Examples

Create smart link group 1 and enter its view.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1]
```

Contents

Monitor Link commands

display monitor-link group

Use **display monitor-link group** to display information about monitor link groups.

Syntax

display monitor-link group { *group-id* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-id: Specifies a monitor link group by its ID. The value range for the *group-id* argument is 1 to 16.

all: Specifies all monitor link groups.

Usage guidelines

This command does not display information about ports that belong to a link aggregation group.

Examples

Display information about all monitor link groups.

```
<Sysname> display monitor-link group all
Monitor link protocol status: Disabled
Monitor link group 1 information:
  Group status     : N/A
  Downlink up-delay: 0(s)
  Last-up-time     : -
  Last-down-time   : -
  Up-port-threshold: 1

  Member                    Role       Status
  ------------------------------------------------
  GE1/0/1                   UPLINK     UP
  GE1/0/2                   DOWNLINK   UP
```

Table 1 Command output

Field	Description
Monitor link protocol status	Whether Monitor Link is enabled: • Enabled. • Disabled.

Field	Description
Group status	Monitor link group status: • **DOWN**. • **UP**. • **N/A**—Monitor Link is disabled globally. The monitor link group does not operate.
Downlink up-delay	Switchover delay of the downlink interfaces in the monitor link group, in seconds.
Last-up-time	Last time when the monitor link group came up.
Last-down-time	Last time when the monitor link group went down.
Up-port-threshold	Uplink interface threshold for triggering monitor link group state switchover.
Member	Member interfaces of the monitor link group.
Role	Interface role, which can be uplink interface or downlink interface.
Status	Member interface state: • **DOWN**. • **DOWN (Monitor Link)**—The member interface is shut down by Monitor Link. • **UP**.

downlink up-delay

Use **`downlink up-delay`** to set the switchover delay for the downlink interfaces in a monitor link group.

Use **`undo downlink up-delay`** to restore the default.

Syntax

`downlink up-delay` *`delay`*

`undo downlink up-delay`

Default

The switchover delay is 0 seconds. The downlink interfaces come up as soon as an uplink interface in the monitor link group comes up.

Views

Monitor link group view

Predefined user roles

network-admin

Parameters

`delay`: Sets the switchover delay in the range of 1 to 300 seconds.

Usage guidelines

To avoid frequent state changes of downlink interfaces in the event that the uplink interfaces in the monitor link group flap, you can configure a switchover delay. The switchover delay is the time that the downlink interfaces wait before they come up following an uplink interface.

Examples

Set the switchover delay to 50 seconds for the downlink interfaces in monitor link group 1.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1] downlink up-delay 50
```

monitor-link disable

Use **monitor-link disable** to disable Monitor Link globally.

Use **undo monitor-link disable** to enable Monitor Link globally.

Syntax

monitor-link disable

undo monitor-link disable

Default

Monitor Link is enabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

All monitor link groups can operate only after you enable Monitor Link globally. When you disable Monitor Link globally, all monitor link groups cannot operate and the downlink interfaces brought down by the monitor link groups resume their original states.

Examples

Disable Monitor Link globally.

```
<Sysname> system-view
[Sysname] monitor-link disable
```

monitor-link group

Use **monitor-link group** to create a monitor link group and enter its view, or enter the view of an existing monitor link group.

Use **undo monitor-link group** to remove a monitor link group.

Syntax

monitor-link group *group-id*

undo monitor-link group *group-id*

Default

No monitor link groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a monitor link group ID. The value range for the *group-id* argument is 1 to 16.

Examples

Create monitor link group 1 and enter its view.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1]
```

port

Use **port** to assign an interface to a monitor link group.

Use **undo port** to remove an interface from a monitor link group.

Syntax

port *interface-type interface-number* { **downlink** | **uplink** }

undo port *interface-type interface-number*

Default

No member interfaces exist in a monitor link group.

Views

Monitor link group view

Predefined user roles

network-admin

Parameters

interface-type: Specifies an interface by its type.

interface-number: Specifies an interface by its number.

downlink: Specifies a downlink interface.

uplink: Specifies an uplink interface.

Usage guidelines

You can assign an interface to only one monitor link group.

You can also assign an interface to a monitor link group by using the **port monitor-link group** command in interface view.

If you have configured a Selected port of an aggregation group as the downlink interface of a monitor link group, do not configure an Unselected port of the aggregation group as the uplink interface of the monitor link group.

Do not assign an aggregate interface and member ports of the aggregate group to the same monitor link group.

Examples

Configure GigabitEthernet 1/0/1 as an uplink interface and GigabitEthernet 1/0/2 as a downlink interface for monitor link group 1.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1] port gigabitethernet 1/0/1 uplink
```

```
[Sysname-mtlk-group1] port gigabitethernet 1/0/2 downlink
```

Related commands

port monitor-link group

port monitor-link group

Use **port monitor-link group** to assign an interface to a monitor link group.

Use **undo port monitor-link group** to remove an interface from a monitor link group.

Syntax

port monitor-link group *group-id* { **downlink** | **uplink** }

undo port monitor-link group *group-id*

Default

An interface is not a monitor link group member.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Loopback interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a monitor link group by its ID. The value range for the *group-id* argument is 1 to 16.

downlink: Specifies a downlink interface.

uplink: Specifies an uplink interface.

Usage guidelines

You can assign an interface to only one monitor link group.

You can also assign an interface to a monitor link group by using the **port** command in monitor link group view.

If you have configured a Selected port of an aggregation group as the downlink interface of a monitor link group, do not configure an Unselected port of the aggregation group as the uplink interface of the monitor link group.

Do not assign an aggregate interface and member ports of the aggregate group to the same monitor link group.

Examples

Configure GigabitEthernet 1/0/1 as an uplink interface and GigabitEthernet 1/0/2 as a downlink interface for monitor link group 1.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port monitor-link group 1 uplink
[Sysname-GigabitEthernet1/0/1] quit
```

```
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] port monitor-link group 1 downlink
```

Related commands

port

uplink up-port-threshold

Use **uplink up-port-threshold** to configure the uplink interface threshold for triggering monitor link group state switchover.

Use **undo uplink up-port-threshold** to restore the default.

Syntax

uplink up-port-threshold *number-of-port*

undo uplink up-port-threshold

Default

The uplink interface threshold for triggering monitor link group state switchover is 1.

Views

Monitor link group view

Predefined user roles

network-admin

Parameters

number-of-port: Specifies the uplink interface threshold for triggering monitor link group state switchover, in the range of 1 to 1024.

Usage guidelines

When the number of uplink interfaces in up state in a monitor link group is less than the specified threshold, the monitor link group goes down and shuts down its downlink interfaces. When the number of uplink interfaces in up state reaches the threshold, the monitor link group comes up and brings up all its downlink interfaces.

As a best practice, use the **display monitor-link group** command to display the total number of uplink interfaces before executing the **uplink up-port-threshold** command. If you set the threshold to be greater than the total number of uplink interfaces, the monitor link group cannot come up and data will be lost.

Examples

Set the uplink interface threshold for triggering monitor link group state switchover to 5.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1] uplink up-port-threshold 5
```

Contents

VRRP commands

The S5110V2, S5110V2-SI, S5120V3-LI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, WS5810-WiNet, and WAS6000 switch series do not support VRRP.

VRRP does not take effect on member ports of aggregation groups.

IPv4 VRRP commands

display vrrp

Use **display vrrp** to display the states of IPv4 VRRP groups.

Syntax

display vrrp [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

verbose: Displays detailed IPv4 VRRP group information. If you do not specify the **verbose** keyword, the command displays brief IPv4 VRRP group information.

Usage guidelines

If no interface or VRRP group is specified, this command displays the states of all IPv4 VRRP groups.

If only an interface is specified, this command displays the states of all IPv4 VRRP groups on the specified interface.

If both an interface and an IPv4 VRRP group are specified, this command displays the states of the specified IPv4 VRRP group on the specified interface.

Examples

Display brief information about all IPv4 VRRP groups on the device when VRRP operates in standard mode.

```
<Sysname> display vrrp
IPv4 Virtual Router Information:
 Running Mode      : Standard
 Gratuitous ARP sending interval : 120 sec
 Total number of virtual routers : 1
 Interface          VRID  State        Running Adver   Auth     Virtual
                                        Pri     Timer   Type        IP
```

```
--------------------------------------------------------------------------
Vlan2              1     Master       150     100     Simple   1.1.1.1
```

Table 1 Command output (in standard mode)

Field	Description
Running Mode	VRRP operating mode (standard mode).
Gratuitous ARP sending interval	Sending interval for gratuitous ARP packets. This field is displayed only after you configure the **vrrp send-gratuitous-arp** command.
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Adver Timer	VRRP advertisement sending interval in centiseconds.
Auth Type	Authentication type: • **None**—No authentication. • **Simple**—Simple text authentication. • **MD5**—MD5 authentication.
Virtual IP	Virtual IP address of the VRRP group.

Display detailed information about all IPv4 VRRP groups on the device when VRRP operates in standard mode.

Table 2 Command output (in standard mode)

Field	Description
Running Mode	VRRP operating mode (standard mode).
Gratuitous ARP sending interval	Sending interval for gratuitous ARP packets. This field is displayed only after you configure the **vrrp send-gratuitous-arp** command.
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
Adver Timer	VRRP advertisement sending interval in centiseconds.
Admin Status	Administrative status: **Up** or **Down**.
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Config Pri	Configured priority of the router, which is configured by using the **vrrp vrid priority** command.

Field	Description
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Preempt Mode	Preemptive mode: • **Yes**. • **No**.
Delay Time	Preemption delay in centiseconds.
Become Master	Time (in milliseconds) that a backup router has to wait before it becomes the master. This field is displayed only when the router is a backup.
Auth Type	Authentication type: • **None**—No authentication. • **Simple**—Simple text authentication. • **MD5**—MD5 authentication.
Key	Authentication key, which is not displayed if no authentication is required.
Virtual IP	Virtual IP address of the VRRP group.
Virtual MAC	Virtual MAC address of the VRRP group's virtual IP address, which is displayed when the router is the master.
Master IP	Primary IP address of the interface where the master resides.
Config Role	The configured role of the VRRP group to which the router belongs. • **Master**. • **Subordinate**.
Name	Master group name assigned to the VRRP group. This field is displayed only after you configure the **vrrp vrid name** command.
Follow Name	Name of the master VRRP group that the VRRP group follows. This field is displayed only after you configure the **vrrp vrid follow** command.
VRRP Track Information	Track entry information. This field is displayed only after you configure the **vrrp vrid track** command.
Track Object	Track entry which is associated with the VRRP group.
State	Track entry state: • **Negative**. • **Positive**. • **NotReady**.
Pri Reduced	Value by which the priority decreases when the status of the associated track entry changes to the Negative state.
Switchover	Switchover mode. When the status of the associated track entry changes to the Negative state, the backup immediately becomes the master.

Display brief information about all IPv4 VRRP groups on the device when VRRP operates in load balancing mode.

```
<Sysname> display vrrp
IPv4 Virtual Router Information:
 Running Mode      : Load Balance
 Total number of virtual routers : 1
 Interface          VRID  State        Running Address            Active
```

```
                                    Pri
------------------------------------------------------------------------
Vlan2               1     Master       150     1.1.1.1             Local
-----               VF1   Active       255     000f-e2ff-0011      Local
```

Table 3 Command output (in load balancing mode)

Field	Description
Running Mode	VRRP operating mode (load balancing mode).
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number) or virtual forwarder (VF) ID.

State	• For a VRRP group, this field indicates the state of the router in the VRRP group:
	  ◦ **Master**—The router is the master in the VRRP group.
	  ◦ **Backup**—The router is the backup in the VRRP group.
	  ◦ **Initialize**—The router is in **Initialize** state.
	  ◦ **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
	• For a VF, this field indicates the state of the VF in the VRRP group:
	  ◦ **Active**—The VF is created on the device.
	  ◦ **Listening**—The VF is learned from another device.
	  ◦ **Initialize**—The VF is in **Initialize** state.

Running Pri	• For a VRRP group, this field indicates the running priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes. • For a VF, this field indicates the running priority of the VF. When a track entry is associated with a VF, the priority of the VF changes if the track entry's status changes.
Address	• For a VRRP group, this field indicates the virtual IP address of the VRRP group. • For a VF, this field indicates the virtual MAC address of the VF.
Active	• For a VRRP group, this field indicates the IP address of the interface where the master resides. If the current router is the master, this field displays **local**. • For a VF, this field indicates the IP address of the interface where the active virtual forwarder (AVF) resides. If the current VF is the AVF, this field displays **local**.

Display detailed information about all IPv4 VRRP groups on the device when VRRP operates in load balancing mode.

```
<Sysname> display vrrp verbose

Table 4 Command output (in load balancing mode)

Field	Description
Running Mode	VRRP operating mode (load balancing mode).
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
Adver Timer	VRRP advertisement sending interval in centiseconds.
Admin Status	Administrative status: **Up** or **Down**.
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Config Pri	Configured priority of the router, which is configured by using the **vrrp vrid priority** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Preempt Mode	Preemptive mode: • **Yes**. • **No**.
Delay Time	Preemption delay in centiseconds.
Become Master	Time (in milliseconds) that a backup router has to wait before it becomes the master. This field is displayed only when the router is a backup.
Auth Type	Authentication type: • **None**—No authentication. • **Simple**—Simple text authentication. • **MD5**—MD5 authentication.
Key	Authentication key, which is not displayed if no authentication is required.
Virtual IP	Virtual IP address list of the VRRP group.
Member IP List	IP addresses of the member devices in the VRRP group: • **Local**—IP address of the local router. • **Master**—IP address of the master. • **Backup**—IP address of the backup.
VRRP Track Information	Track entry which is associated with the VRRP group. This field is displayed only after you configure the **vrrp vrid track** command.
Track Object	Track entry to be monitored.

Field	Description
State	Track entry state: • **Negative**. • **Positive**. • **NotReady**.
Pri Reduced	Value by which the priority decreases when the status of the associated track entry changes to the Negative state. This field is displayed only after you configure the **vrrp vrid track** command.
Switchover	Switchover mode. When the status of the associated track entry changes to the Negative state, the backup immediately becomes the master.
Forwarder Information: 2 Forwarders 1 Active	VF information: Two VFs exist, and one is the AVF.
Config Weight	Configured weight of the VF: 255.
Running Weight	Current weight of the VF. When a track entry is associated with the VFs of a VRRP group, the VFs' weights change when the track entry's status changes.
Forwarder 01	Information about VF 01.
State	VF state: • **Active**—The VF is created on the device. • **Listening**—The VF is learned from another device. • **Initialize**—The VF is in **Initialize** state.
Virtual MAC	Virtual MAC address of the VF.
Owner ID	Real MAC address of the VF owner.
Priority	VF priority in the range of 1 to 255.
Active	IP address of the interface where the AVF resides. If the current VF is the AVF, this field displays **local**.
Forwarder Weight Track Configuration	VF weight Track configuration. The field is displayed only after you configure the **vrrp vrid track** command.
Track Object	Track entry that is associated with the VFs. The field is displayed only after you configure the **vrrp vrid track** command.
State	Track entry state: • **Negative**. • **Positive**. • **NotReady**.
Weight Reduced	Value by which the weights of the VFs decrease when the state of the associated track entry changes to Negative. The field is displayed only after you configure the **vrrp vrid track** command.
Forwarder Switchover Track Information:	VF switchover Track configuration. The field is displayed only after you configure the **vrrp vrid track** command.
Member IP	IP address of a member device. The field is displayed only after you configure the **vrrp vrid track** command.

display vrrp binding

Use **display vrrp binding** to display master-to-subordinate IPv4 VRRP group bindings.

Syntax

display vrrp binding [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*] | **name** *name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The interface must be an interface to which master IPv4 VRRP groups belong.

vrid *virtual-router-id*: Specifies a master IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

name *name*: Specifies a master IPv4 VRRP group by its name, a case-sensitive string of 1 to 20 characters.

Usage guidelines

If you do not specify any parameters, this command displays all master-to-subordinate IPv4 VRRP group bindings.

If you specify an interface but do not specify the virtual router ID of a master VRRP group, this command displays all master-to-subordinate VRRP group bindings on the specified interface.

If you specify an interface and the virtual router ID of a master VRRP group, this command displays the binding information about the specified master VRRP group on the specified interface.

Examples

Display master-to-subordinate IPv4 VRRP group bindings.

```
<Sysname> display vrrp binding
IPv4 virtual router binding information:
  Total number of master virtual routers           : 1
  Total number of subordinate virtual routers      : 2
  Interface : Vlan2                    Master VRID : 1
  Name      : a                        Status      : Backup
  Subordinate virtual routers : 1
    Interface : Vlan2                  VRID        : 4

  Interface : --                       Master VRID : --
  Name      : c                        Status      : --
  Subordinate virtual routers : 1
    Interface : Vlan2                  VRID        : 5
```

Table 5 Command output

Field	Description
Total number of master virtual routers	Total number of master VRRP groups.
Total number of subordinate virtual routers	Total number of subordinate VRRP groups.
Interface	Interface to which the master VRRP group belongs. If the master VRRP group does not exist, this field displays two hyphens (**--**).
Master VRID	Virtual router ID of the master VRRP group. If the master VRRP group does not exist, this field displays two hyphens (**--**).
Name	Name of the master VRRP group.
Status	Status of the router in the master VRRP group: • **Master**. • **Backup**. • **Initialize**. • **Inactive**. If the master VRRP group does not exist, this field displays two hyphens (**--**).
Subordinate virtual routers	Number of subordinate VRRP groups.
Interface	Interface to which the subordinate VRRP group belongs.
VRID	Virtual router ID of the subordinate VRRP group.

Related commands

`vrrp vrid follow`

`vrrp vrid name`

display vrrp statistics

Use **`display vrrp statistics`** to display statistics for IPv4 VRRP groups.

Syntax

`display vrrp statistics` [**`interface`** *`interface-type interface-number`* [**`vrid`** *`virtual-router-id`*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`interface` *`interface-type interface-number`*: Specifies an interface by its type and number.

`vrid` *`virtual-router-id`*: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *`virtual-router-id`* argument is 1 to 255.

Usage guidelines

If no interface or VRRP group is specified, this command displays statistics for all IPv4 VRRP groups.

If only an interface is specified, this command displays statistics for all IPv4 VRRP groups on the specified interface.

If both an interface and an IPv4 VRRP group are specified, this command displays statistics for the specified IPv4 VRRP group on the specified interface.

Examples

Display statistics for all IPv4 VRRP groups when VRRP operates in standard mode.

```
<Sysname> display vrrp statistics
 Interface              : Vlan-interface2
 VRID                   : 1
 CheckSum Errors        : 0          Version Errors               : 0
 Invalid Pkts Rcvd  :     0          Unexpected Pkts Rcvd         : 0
 IP TTL Errors          : 0          Advertisement Interval Errors : 0
 Invalid Auth Type      : 0          Auth Failures                : 0
 Packet Length Errors   : 0          Auth Type Mismatch           : 0
 Become Master          : 1          Address List Errors          : 0

Table 6 Command output (in standard mode)

Field	Description
Interface	Interface where the VRRP group is configured.
VRID	VRRP group number.
CheckSum Errors	Number of packets with checksum errors.
Version Errors	Number of packets with version errors.
Invalid Pkts Rcvd	Number of received packets of invalid packet types.
Unexpected Pkts Rcvd	Number of received unexpected packets.
Advertisement Interval Errors	Number of packets with advertisement interval errors.
IP TTL Errors	Number of packets with TTL errors.
Auth Failures	Number of packets with authentication failures.
Invalid Auth Type	Number of packets with authentication failures because of invalid authentication types.
Auth Type Mismatch	Number of packets with authentication failures because of mismatching authentication types.
Packet Length Errors	Number of packets with VRRP packet length errors.
Address List Errors	Number of packets with virtual IP address list errors.
Become Master	Number of times that the router has been elected as the master.
Priority Zero Pkts Rcvd	Number of received advertisements with the router priority of 0.
Adver Rcvd	Number of received advertisements.
Priority Zero Pkts Sent	Number of sent advertisements with the router priority of 0.
Adver Sent	Number of sent advertisements.
IP Owner Conflicts	Number of VRRP packets that the local router (IP address owner) has received from conflicting IP address owners.
Global statistics	Global statistics for all VRRP groups.
CheckSum Errors	Total number of packets with checksum errors.
Version Errors	Total number of packets with version errors.
VRID Errors	Total number of packets with VRID errors.

Table 7 Command output (in load balancing mode)

Field	Description
Interface	Interface where the VRRP group is configured.
VRID	VRRP group number.
CheckSum Errors	Number of packets with checksum errors.
Version Errors	Number of packets with version errors.
Invalid Pkts Rcvd	Number of received packets of invalid packet types.

Field	Description
Unexpected Pkts Rcvd	Number of received unexpected packets.
Advertisement Interval Errors	Number of packets with advertisement interval errors.
IP TTL Errors	Number of packets with TTL errors.
Auth Failures	Number of packets with authentication failures.
Invalid Auth Type	Number of packets with authentication failures because of invalid authentication types.
Auth Type Mismatch	Number of packets with authentication failures because of mismatching authentication types.
Packet Length Errors	Number of packets with VRRP packet length errors.
Address List Errors	Number of packets with virtual IP address list errors.
Become Master	Number of times that the router has been elected as the master.
Redirect Timer Expires	Number of times that the redirect timer expired.
Become AVF	Number of times that the VF has been elected as the AVF.
Time-out Timer Expires	Number of times that the time-out timer expired.
Adver Rcvd	Number of received advertisements.
Request Rcvd	Number of received requests.
Adver Sent	Number of sent advertisements.
Request Sent	Number of sent requests.
Reply Rcvd	Number of received replies.
Release Rcvd	Number of received release packets.
Reply Sent	Number of sent replies.
Release Sent	Number of sent release packets.
Priority Zero Pkts Rcvd	Number of received advertisements with the router priority of 0.
VF Priority Zero Pkts Rcvd	Number of received advertisements with the VF priority of 0.
Priority Zero Pkts Sent	Number of sent advertisements with the router priority of 0.
VF Priority Zero Pkts Sent	Number of sent advertisements with the VF priority of 0.
Packet Option Errors	Number of packet option errors.
Global statistics	Global statistics for all IPv4 VRRP groups.
CheckSum Errors	Total number of packets with checksum errors.
Version Errors	Total number of packets with version errors.
VRID Errors	Total number of packets with VRID errors.

Related commands

`reset vrrp statistics`

reset vrrp statistics

Use **`reset vrrp statistics`** to clear statistics for IPv4 VRRP groups.

Syntax

reset vrrp statistics [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

Usage guidelines

If no interface or VRRP group is specified, this command clears statistics for all IPv4 VRRP groups.

If only an interface is specified, this command clears statistics for all IPv4 VRRP groups on the specified interface.

If both an interface and an IPv4 VRRP group are specified, this command clears statistics for the specified IPv4 VRRP group on the specified interface.

Examples

Clear statistics for all IPv4 VRRP groups on all interfaces.

```
<Sysname> reset vrrp statistics
```

Related commands

display vrrp statistics

snmp-agent trap enable vrrp

Use **snmp-agent trap enable vrrp** to enable SNMP notifications for VRRP.

Use **undo snmp-agent trap enable vrrp** to disable SNMP notifications for VRRP.

Syntax

snmp-agent trap enable vrrp [**auth-failure** | **new-master**]

undo snmp-agent trap enable vrrp [**auth-failure** | **new-master**]

Default

SNMP notifications for VRRP are enabled.

Views

System view

Predefined user roles

network-admin

Parameters

auth-failure: Generates notifications as defined in RFC 2787 when the device in a VRRP group receives a VRRP advertisement with the authentication type or key not matching the local configuration.

new-master: Generates notifications as defined in RFC 2787 when the state of a device in a VRRP group changes from Initialize or Backup to Master.

Usage guidelines

To report critical VRRP events to an NMS, enable SNMP notifications for VRRP. For VRRP event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Examples

Generate notifications as defined in RFC 2787 when the device in a VRRP group receives a VRRP advertisement with the authentication type or key not matching the local configuration.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable vrrp auth-failure
```

vrrp check-ttl enable

Use **vrrp check-ttl enable** to enable TTL check for IPv4 VRRP packets.

Use **undo vrrp check-ttl enable** to disable TTL check for IPv4 VRRP packets.

Syntax

vrrp check-ttl enable

undo vrrp check-ttl enable

Default

TTL check for IPv4 VRRP packets is enabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The master in an IPv4 VRRP group periodically sends VRRP advertisements to declare its presence. The VRRP advertisements are multicast in the local subnet and cannot be forwarded by routers, so the TTL value is not changed. When the master sends VRRP advertisements, it sets the TTL value to 255. If you enable TTL check, the backups drop the VRRP advertisements with TTL other than 255, preventing attacks from other subnets.

Devices from different vendors might implement VRRP differently. When the device is interoperating with devices of other vendors, TTL check on VRRP packets might result in unexpected dropping of packets. In this scenario, use the **undo vrrp check-ttl enable** command to disable TTL check on VRRP packets.

Examples

Disable TTL check for IPv4 VRRP packets.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] undo vrrp check-ttl enable
```

vrrp dscp

Use **vrrp dscp** to set a DSCP value for VRRP packets.

Use **undo vrrp dscp** to restore the default.

Syntax

vrrp dscp *dscp-value*

undo vrrp dscp

Default

The DSCP value for VRRP packets is 48.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value for VRRP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value identifies the packet priority during transmission. A greater DSCP value means a higher packet priority.

Examples

Set the DSCP value to 30 for VRRP packets.

```
<Sysname> system-view
[Sysname] vrrp dscp 30
```

vrrp mode

Use **vrrp mode** to specify the operating mode for IPv4 VRRP.

Use **undo vrrp mode** to restore the default.

Syntax

vrrp mode load-balance [**version-8**]

undo vrrp mode

Default

IPv4 VRRP operates in standard mode.

Views

System view

Predefined user roles

network-admin

Parameters

load-balance: Specifies the load balancing mode.

version-8: Specifies the version carried in VRRP packets as 8.

Usage guidelines

After you create IPv4 VRRP groups on the router, you can use this command to modify their operating mode. All IPv4 VRRP groups on the router operate in the specified mode.

The **version-8** keyword takes effect only when the version of IPv4 VRRP configured on the interface is VRRPv2. The **version-8** keyword is required in the following conditions:

- A router running Comware 5 software exists in the VRRP group.

  To display the software version, use the **display version** command.
- All routers in the IPv4 VRRP group are operating in load balancing mode.
- All routers in the IPv4 VRRP group are configured with the version of VRRPv2.

Examples

Specify the load balancing mode for IPv4 VRRP.

```
<Sysname> system-view
[Sysname] vrrp mode load-balance
```

Related commands

display vrrp

vrrp send-gratuitous-arp

Use **vrrp send-gratuitous-arp** to enable periodic sending of gratuitous ARP packets for IPv4 VRRP.

Use **undo vrrp send-gratuitous-arp** to disable periodic sending of gratuitous ARP packets for IPv4 VRRP.

Syntax

vrrp send-gratuitous-arp [**interval** *interval*]

undo vrrp send-gratuitous-arp

Default

Periodic sending of gratuitous ARP packets is disabled for IPv4 VRRP.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the sending interval in the range of 30 to 1200 seconds. The default value is 120 seconds.

Usage guidelines

This command ensures that the MAC address entry for the virtual MAC address of a VRRP group can be updated on downstream devices in a timely manner.

This command takes effect only in VRRP standard mode.

If you change the sending interval for gratuitous ARP packets, the configuration takes effect at the next sending interval.

The master sends the first gratuitous ARP packet at a random time in the second half of the set interval after you execute the **vrrp send-gratuitous-arp** command. This prevents too many gratuitous ARP packets from being sent at the same time.

The sending interval for gratuitous ARP packets might be much longer than the set interval when the following conditions are met:

- Multiple VRRP groups exist on the device.

- A short sending interval is set.

Examples

Enable periodic sending of gratuitous ARP packets for IPv4 VRRP and set the sending interval to 200 seconds.

```
<Sysname> system-view
[Sysname] vrrp send-gratuitous-arp interval 200
```

vrrp version

Use **vrrp version** to specify the version of IPv4 VRRP on an interface.

Use **undo vrrp version** to restore the default.

Syntax

vrrp version *version-number*

undo vrrp version

Default

VRRPv3 is used.

Views

Interface view

Predefined user roles

network-admin

Parameters

version-number: Specifies a VRRP version. The version number is 2 or 3, where 2 indicates VRRPv2 (described in RFC 3768), and 3 indicates VRRPv3 (described in RFC 5798).

Usage guidelines

The version of VRRP on all routers in an IPv4 VRRP group must be the same.

Examples

Specify VRRPv2 to run on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] vrrp version 2
```

vrrp vrid

Use **vrrp vrid** to create an IPv4 VRRP group and assign a virtual IP address to it, or to assign a virtual IP address to an existing IPv4 VRRP group.

Use **undo vrrp vrid** to remove all configurations of an IPv4 VRRP group, or to remove a virtual IP address from an IPv4 VRRP group.

Syntax

vrrp vrid *virtual-router-id* **virtual-ip** *virtual-address*

undo vrrp vrid *virtual-router-id* [**virtual-ip** [*virtual-address*]]

Default

No IPv4 VRRP groups exist.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

virtual-ip *virtual-address*: Specifies a virtual IP address. You cannot specify the virtual IP address as any of the following IP addresses:

- All-zero address (0.0.0.0).
- Broadcast address (255.255.255.255).
- Loopback address.
- IP address of other than Class A, Class B, and Class C.
- Invalid IP address (for example, 0.0.0.1).

If you do not specify the *virtual-address* argument, the **undo vrrp vrid** command removes all virtual IP addresses from the specified IPv4 VRRP group.

Usage guidelines

You can execute this command multiple times to assign multiple virtual IP addresses to an IPv4 VRRP group. An IPv4 VRRP group can have a maximum of 16 virtual IP addresses.

An IPv4 VRRP group without virtual IP addresses configured can exist on a device provided that other settings (for example, priority and preemption mode) are available. Such a VRRP group stays in inactive state and does not function.

The virtual IP address of an IPv4 VRRP group and the downlink interface IP addresses of the VRRP group members must be in the same subnet. Otherwise, the hosts in the subnet might fail to access external networks.

For VRRP to operate correctly in load balancing mode, make sure the virtual IP address of an IPv4 VRRP group is not the IP address of any interfaces in the VRRP group.

Examples

Create IPv4 VRRP group 1 and assign virtual IP address 10.10.10.10 to the VRRP group. Then assign virtual IP address 10.10.10.11 to the VRRP group.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 virtual-ip 10.10.10.10
[Sysname-Vlan-interface2] vrrp vrid 1 virtual-ip 10.10.10.11
```

Related commands

display vrrp

vrrp vrid authentication-mode

Use **vrrp vrid authentication-mode** to configure the authentication mode and the authentication key for an IPv4 VRRP group to send and receive VRRP packets.

Use **undo vrrp vrid authentication-mode** to restore the default.

Syntax

vrrp vrid *virtual-router-id* **authentication-mode** { **md5** | **simple** } { **cipher** | **plain** } *string*

undo vrrp vrid *virtual-router-id* **authentication-mode**

Default

Authentication is disabled when a VRRP group sends and receives VRRP packets.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

md5: Specifies the MD5 authentication mode.

simple: Specifies the simple authentication mode.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 8 characters. Its encrypted form is a case-sensitive string of 1 to 41 characters.

Usage guidelines

To avoid attacks from unauthorized users, VRRP member routers add authentication keys in VRRP packets to authenticate one another. VRRP provides the following authentication modes:

- **simple**—Simple text authentication.

  The sender fills an authentication key into the VRRP packet, and the receiver compares the received authentication key with its local authentication key. If the two authentication keys are the same, the received VRRP packet is legitimate. Otherwise, the received packet is illegitimate.

- **md5**—MD5 authentication.

  The sender computes a digest for the VRRP packet by using the authentication key and MD5 algorithm, and saves the result to the authentication header. The receiver performs the same operation by using the authentication key and MD5 algorithm, and it compares the result with the content in the authentication header. If the results are the same, the received VRRP packet is legitimate. Otherwise, the received packet is illegitimate.

The MD5 authentication is more secure than the simple text authentication, but it costs more resources.

IMPORTANT:

- You can configure different authentication modes and authentication keys for the VRRP groups on an interface. However, members of the same VRRP group must use the same authentication mode and authentication key.
- For VRRPv3, this command does not take effect because VRRPv3 does not support authentication.

Examples

Set the authentication mode to **simple** and the authentication key to **Sysname** for VRRP group 1 on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 authentication-mode simple plain Sysname
```

Related commands

display vrrp

vrrp version

vrrp vrid follow

Use **vrrp vrid follow** to configure an IPv4 VRRP group to follow a master group.

Use **undo vrrp vrid follow** to remove the configuration.

Syntax

vrrp vrid *virtual-router-id* **follow** *name*

undo vrrp vrid *virtual-router-id* **follow**

Default

An IPv4 VRRP group does not follow a master group.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

name: Specifies a master IPv4 VRRP group by its name, a case-sensitive string of 1 to 20 characters.

Usage guidelines

This command configures an IPv4 VRRP group as a subordinate VRRP group to follow a master group. A subordinate VRRP group can forward service traffic.

An IPv4 VRRP group cannot be both a master group and a subordinate group.

An IPv4 VRRP group stays in **Inactive** state if it is configured to follow a nonexistent master VRRP group.

If an IPv4 VRRP group in **Inactive** or **Initialize** state follows a master group that is not in **Inactive** state, the state of the VRRP group does not change.

Examples

Configure IPv4 VRRP group 1 to follow master group **abc**.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 follow abc
```

Related commands

display vrrp binding

vrrp vrid name

vrrp vrid name

Use **vrrp vrid name** to configure an IPv4 VRRP group as a master group and assign a name to it.

Use **undo vrrp vrid name** to remove the configuration.

Syntax

vrrp vrid *virtual-router-id* **name** *name*

undo vrrp vrid *virtual-router-id* **name**

Default

An IPv4 VRRP group does not act as a master group.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

name: Specifies a master IPv4 VRRP group name, a case-sensitive string of 1 to 20 characters.

Usage guidelines

This command configures an IPv4 VRRP group as a master group by assigning a master group name to it. A VRRP group that follows the master group is a subordinate VRRP group. The master VRRP group exchanges VRRP packets among member devices. The subordinate VRRP group does not exchange VRRP packets and follows the state of the master group. Both the master and subordinate VRRP groups can forward service traffic.

You cannot assign the same master VRRP group name to different VRRP groups on a device.

Examples

Configure IPv4 VRRP group 1 as a master group and assign master group name **abc** to it.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 name abc
```

Related commands

display vrrp binding

vrrp vrid follow

vrrp vrid preempt-mode

Use **vrrp vrid preempt-mode** to enable the preemptive mode for the device in an IPv4 VRRP group and set the preemption delay.

Use **undo vrrp vrid preempt-mode** to disable the preemptive mode for the device in an IPv4 VRRP group.

Use **undo vrrp vrid preempt-mode delay** to restore the default preemption delay.

Syntax

vrrp vrid *virtual-router-id* **preempt-mode** [**delay** *delay-value*]

undo vrrp vrid *virtual-router-id* **preempt-mode** [**delay**]

Default

The device operates in preemptive mode and the preemption delay is 0 centiseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

delay *delay-value*: Specifies the preemption delay in the range of 0 to 180000 in centiseconds.

Usage guidelines

In non-preemptive mode, the master router acts as the master as long as it operates correctly, even if a backup is assigned a higher priority later. The non-preemptive mode helps avoid frequent switchover between the master and backups.

In preemptive mode, a backup sends VRRP advertisements when it detects that it has a higher priority than the master. Then the backup takes over as the master and the previous master becomes a backup. This mechanism ensures that the master is always the device with the highest priority.

You can configure the VRRP preemption delay for the following purposes:

- Avoid frequent state changes among members in a VRRP group.
- Provide the backups with enough time to collect information (such as routing information).

A backup does not immediately become the master after it receives an advertisement with a lower priority than the local priority. Instead, it waits for a period of time before taking over as the master.

Examples

Enable the preemptive mode for the device in VRRP group 1, and set the preemption delay to 5000 centiseconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 preempt-mode delay 5000
```

Related commands

display vrrp

vrrp vrid priority

Use **vrrp vrid priority** to set the priority of the device in an IPv4 VRRP group.

Use **undo vrrp vrid priority** to restore the default.

Syntax

vrrp vrid *virtual-router-id* **priority** *priority-value*

undo vrrp vrid *virtual-router-id* **priority**

Default

The priority of a device in an IPv4 VRRP group is 100.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

priority-value: Specifies a priority value in the range of 1 to 254. A higher value indicates a higher priority.

Usage guidelines

VRRP determines the role (master or backup) of each device in a VRRP group by priority. A device with a higher priority is more likely to become the master.

Priorities 1 to 254 are configurable. Priority 0 is reserved for special uses, and priority 255 is for the IP address owner. The IP address owner in a VRRP group always has a running priority of 255 and acts as the master as long as it operates correctly.

Examples

Set the priority of the switch to 150 in VRRP group 1 on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 priority 150
```

Related commands

display vrrp

vrrp vrid track

vrrp vrid shutdown

Use **vrrp vrid shutdown** to disable an IPv4 VRRP group.

Use **undo vrrp vrid shutdown** to enable an IPv4 VRRP group.

Syntax

vrrp vrid *virtual-router-id* **shutdown**

undo vrrp vrid *virtual-router-id* **shutdown**

Default

An IPv4 VRRP group is enabled.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

Usage guidelines

You can use this command to temporarily disable an IPv4 VRRP group. After this command is configured, the VRRP group stays in **Initialize** state, and its configurations remain unchanged. You can change the configuration of the VRRP group, and your changes take effect when you enable the VRRP group again.

Examples

Disable IPv4 VRRP group 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 shutdown
```

vrrp vrid source-interface

Use **vrrp vrid source-interface** to specify the source interface for an IPv4 VRRP group, instead of the interface where the VRRP group resides, to send and receive VRRP packets.

Use **undo vrrp source-interface** to cancel the specified source interface.

Syntax

vrrp vrid *virtual-router-id* **source-interface** *interface-type interface-number*

undo vrrp vrid *virtual-router-id* **source-interface**

Default

No source interface is specified for a VRRP group. The interface where the VRRP group resides sends and receives VRRP packets.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

If VRRP group members cannot exchange VRRP packets through the interfaces where the VRRP group resides, use this command to specify interfaces for VRRP packet exchange.

Examples

Specify VLAN-interface 20 as the source interface for VRRP packet exchange in IPv4 VRRP group 10.

```
<Sysname> system-view
```

```
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] vrrp vrid 10 source-interface vlan-interface 20
```

vrrp vrid timer advertise

Use **vrrp vrid timer advertise** to set the interval at which the master in an IPv4 VRRP group sends VRRP advertisements.

Use **undo vrrp vrid timer advertise** to restore the default.

Syntax

vrrp vrid *virtual-router-id* **timer advertise** *adver-interval*

undo vrrp vrid *virtual-router-id* **timer advertise**

Default

The master in an IPv4 VRRP group sends VRRP advertisements at an interval of 100 centiseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

adver-interval: Specifies an interval for the master in the specified IPv4 VRRP group to send VRRP advertisements. The value range for this argument is 10 to 4095 centiseconds. For VRRPv2, the value of the *adver-interval* argument can only be a multiple of 100. For example, if you configure values in the range of 10 to 100, 101 to 200, and 4001 to 4095, the actual values are 100, 200, and 4100, respectively. For VRRPv3, the configured value for the *adver-interval* argument takes effect.

Usage guidelines

The master in an IPv4 VRRP group periodically sends VRRP advertisements to declare its presence. You can use this command to configure the interval at which the master sends VRRP advertisements.

As a best practice to maintain system stability, set the VRRP advertisement interval to be greater than 100 centiseconds.

In VRRPv2, all routers in an IPv4 VRRP group must have the same interval for sending VRRP advertisements.

In VRRPv3, the routers in an IPv4 VRRP group can have different intervals for sending VRRP advertisements. The master in the VRRP group sends VRRP advertisements at the specified interval and carries the interval attribute in the advertisements. After a backup receives the advertisement, it records the interval in the advertisement. If the backup does not receive any VRRP advertisement when the timer (3 × recorded interval + Skew_Time) expires, it regards the master as failed and takes over.

Large network traffic might disable a backup from receiving VRRP advertisements from the master within the specified timer and trigger an unexpected master switchover. To solve this problem, you can use this command to set a larger interval.

Examples

Configure the master in IPv4 VRRP group 1 to send VRRP advertisements at an interval of 500 centiseconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 timer advertise 500
```

Related commands

display vrrp

vrrp vrid track

Use **vrrp vrid track** to associate a VRRP group or the VFs in a VRRP group with a track entry.

Use **undo vrrp vrid track** to remove the association between a VRRP group or the VFs in a VRRP group and a track entry.

Syntax

vrrp vrid *virtual-router-id* **track** *track-entry-number* { **forwarder-switchover member-ip** *ip-address* | **priority reduced** [*priority-reduced*] | **switchover** | **weight reduced** [*weight-reduced*] }

undo vrrp vrid *virtual-router-id* **track** [*track-entry-number*] [**forwarder-switchover** | **priority reduced** | **switchover** | **weight reduced**]

Default

A VRRP group and the VFs in a VRRP group are not associated with any track entries.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group number. The value range for the *virtual-router-id* argument is 1 to 255.

track-entry-number: Specifies a track entry by its number in the range of 1 to 1024.

forwarder-switchover member-ip *ip-address*: Enables the LVF on the router to take over the role of the AVF at the specified IP address immediately after the specified track entry changes to the Negative state. The *ip-address* argument specifies the IP address of a member router. You can use the **display vrrp verbose** command to view the IP addresses of the members.

priority reduced [*priority-reduced*]: Reduces the priority of the router in the VRRP group by the specified value when the state of the specified track entry changes to Negative. The value range for the *priority-reduced* argument is 1 to 255, and the default value is 10.

switchover: Enables the router in backup state to take over as the master immediately after the specified track entry changes to the Negative state.

weight reduced [*weight-reduced*]: Reduces the weight of all VFs on the router in the VRRP group by the specified value when the state of the specified track entry changes to Negative. The value range for the *weight-reduced* argument is 1 to 255, and the default value is 30.

Usage guidelines

When the associated track entry changes to the Negative state, one of the following events occurs depending on your configuration:

- The priority of the router in the VRRP group decreases by a specified value.
- The weight of VFs decreases by a specified value.

- The router immediately takes over as the master if it is a backup.
- The LVF on the router immediately takes over the role of the AVF at the specified IP address.

When the track entry changes from Negative to Positive or NotReady, one of the following events occurs:

- The router automatically restores its priority or VF weight.
- The failed master router becomes the master again.
- The failed AVF becomes active again.

Before executing this command, create a VRRP group on the interface and assign a virtual IP address to the VRRP group.

You can create a track entry by using the **track** command before or after you associate it with a VRRP group or the VFs in a VRRP group. For more information about configuring track entries, see *High Availability Configuration Guide*.

If no track entry is specified, the **undo vrrp vrid track** command removes all associations between track entries and the VRRP group or VFs in the VRRP group.

The **vrrp vrid track priority reduced** command and the **vrrp vrid track switchover** command do not take effect on an IP address owner. If you configure the command on an IP address owner, the configuration takes effect after the router changes to be a non-IP address owner.

The following parameters take effect only when the IPv4 VRRP group is operating in load balancing mode:

- The **forwarder-switchover member-ip** *ip-address* option.
- The **weight reduced** *weight-reduced* option.
- The **weight reduced** keyword.

The weight of a VF is 255, and its lower limit of failure is 10.

When the weight of a VF owner is higher than or equal to the lower limit of failure, its priority is always 255. The priority does not change with the weight. When the upstream link of the VF owner fails, an LVF must take over as the AVF. The switchover occurs when the weight of the VF owner drops below the lower limit of failure. This requires that the reduced weight for the VF owner be higher than 245.

Examples

Associate VRRP group 1 on VLAN-interface 2 with track entry 1 and decrease the router priority by 50 when the state of track entry 1 changes to Negative.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 track 1 priority reduced 50
```

Associate the VFs of IPv4 VRRP group 1 on VLAN-interface 2 with track entry 1. Enable the LVF to take over the role of the AVF at the IP address of 10.1.1.3 immediately when the state of track entry 1 changes to Negative.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 track 1 forwarder-switchover member-ip 10.1.1.3
```

Associate the VFs of IPv4 VRRP group 1 on VLAN-interface 2 with track entry 1. Decrease the weight of all VFs on the router in the VRRP group by 50 when the state of track entry 1 changes to Negative.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 track 1 weight reduced 50
```

Related commands

display vrrp

vrrp vrid vrrpv3-send-packet

Use **vrrp vrid vrrpv3-send-packet** to set the packet sending mode for IPv4 VRRPv3.

Use **undo vrrp vrid vrrpv3-send-packet** to restore the default.

Syntax

vrrp vrid *virtual-router-id* **vrrpv3-send-packet** { **v2-only** | **v2v3-both** }

undo vrrp vrid *virtual-router-id* **vrrpv3-send-packet**

Default

A router configured with IPv4 VRRPv3 sends only VRRPv3 packets.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

v2-only: Sends VRRPv2 packets only.

v2v3-both: Sends both VRRPv2 and VRRPv3 packets.

Usage guidelines

This command takes effect only on IPv4 VRRPv3.

The packet sending mode for IPv4 VRRPv3 takes effect only on outgoing VRRP packets. A router configured with VRRPv3 can process incoming VRRPv2 and VRRPv3 packets.

If you set the packet sending mode for IPv4 VRRPv3 and configure VRRP packet authentication, authentication information will be carried in outgoing VRRPv2 packets but not in outgoing VRRPv3 packets.

The VRRP advertisement interval is set in centiseconds by using the **vrrp vrid timer advertise** command. The VRRP advertisement interval carried in VRRPv2 packets sent from routers configured with VRRPv3 might be different from the configured value. For information about the VRRP advertisement interval, see the **vrrp vrid timer advertise** command.

Examples

Configure VRRP group 1 to send both VRRPv2 and VRRPv3 packets.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp vrid 1 vrrpv3-send-packet v2v3-both
```

Related commands

display vrrp

vrrp vrid timer advertise

IPv6 VRRP commands

display vrrp ipv6

Use **display vrrp ipv6** to display the states of IPv6 VRRP groups.

Syntax

display vrrp ipv6 [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

verbose: Displays detailed IPv6 VRRP group information. If you do not specify the **verbose** keyword, the command displays brief IPv6 VRRP group information.

Usage guidelines

If no interface or VRRP group is specified, this command displays the states of all IPv6 VRRP groups.

If only an interface is specified, this command displays the states of all IPv6 VRRP groups on the specified interface.

If both an interface and an IPv6 VRRP group are specified, this command displays the states of the specified IPv6 VRRP group on the specified interface.

Examples

Display brief information about all IPv6 VRRP groups on the device when VRRP operates in standard mode.

```
<Sysname> display vrrp ipv6
IPv6 Virtual Router Information:
 Running Mode      : Standard
 ND sending interval : 120 sec
 Total number of virtual routers : 1
 Interface          VRID  State        Running Adver   Auth     Virtual
                                       Pri     Timer   Type        IP
 ------------------------------------------------------------------------
 Vlan2              1     Master       150     100     None     FE80::1
```

Table 8 Command output (in standard mode)

Field	Description
Running Mode	VRRP operating mode (standard mode).

Field	Description
ND sending interval	Sending interval for ND packets. This field is displayed only after you configure the **vrrp ipv6 send-nd** command.
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Adver Timer	VRRP advertisement sending interval in centiseconds.
Auth Type	Authentication type. Only **none** is available, which means no authentication is required.
Virtual IP	Virtual IP address of the VRRP group.

Display detailed information about all IPv6 VRRP groups on the device when VRRP operates in standard mode.

Table 9 Command output (in standard mode)

Field	Description
Running Mode	VRRP operating mode (standard mode).
ND sending interval	Sending interval for ND packets. This field is displayed only after you configure the **vrrp ipv6 send-nd** command.
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
Adver Timer	VRRP advertisement sending interval in centiseconds.
Admin Status	Administrative status: **Up** or **Down**.
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Config Pri	Configured priority of the router, which is configured by using the **vrrp ipv6 vrid priority** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Preempt Mode	Preemptive mode: • **Yes**. • **No**.
Delay Time	Preemption delay in centiseconds.
Become Master	Time (in milliseconds) that a backup router has to wait before it becomes the master. This field is displayed only when the router is a backup.

Field	Description
Auth Type	Authentication type. Only **none** is available, which means no authentication is required.
Virtual IP	Virtual IP address of the VRRP group.
Virtual MAC	Virtual MAC address of the VRRP group's virtual IP address, which is displayed when the router is the master.
Master IP	Link-local address of the interface where the master resides.
Config Role	The configured role of the IPv6 VRRP group to which the router belongs. • **Master**. • **Subordinate**.
Name	Master group name assigned to the IPv6 VRRP group. This field is displayed only after you configure the **vrrp ipv6 vrid name** command.
Follow Name	Name of the master VRRP group that the IPv6 VRRP group follows. This field is displayed only after you configure the **vrrp ipv6 vrid follow** command.
VRRP Track Information	Track entry information. This field is displayed only after you configure the **vrrp ipv6 vrid track** command.
Track Object	Track entry which is associated with the VRRP group.
State	Track entry state: • **Negative**. • **Positive**. • **NotReady**.
Pri Reduced	Value by which the priority decreases when the state of the associated track entry becomes Negative.
Switchover	Switchover mode. When the state of the associated track entry becomes Negative, the backup immediately becomes the master.

Display brief information about all IPv6 VRRP groups on the device when VRRP operates in load balancing mode.

```
<Sysname> display vrrp ipv6
IPv6 Virtual Router Information:
 Running Mode      : Load Balance
 Total number of virtual routers : 1
 Interface          VRID  State        Running Address             Active

```

Table 10 Command output (in load balancing mode)

Field	Description
Running Mode	VRRP operating mode (load balancing mode).
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number) or VF ID.

Field	Description

State	• For a VRRP group, this field indicates the state of the router in the VRRP group:
	  ○ **Master**—The router is the master in the VRRP group.
	  ○ **Backup**—The router is the backup in the VRRP group.
	  ○ **Initialize**—The router is in **Initialize** state.
	  ○ **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
	• For a VF, this field indicates the state of the VF in the VRRP group:
	  ○ **Active**—The VF is created on the device.
	  ○ **Listening**—The VF is learned from another device.
	  ○ **Initialize**—The VF is in **Initialize** state.

Running Pri	• For a VRRP group, this field indicates the running priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes. • For a VF, this field indicates the running priority of the VF. When a track entry is associated with a VF, the priority of the VF changes if the state of the track entry changes.
Address	• For a VRRP group, this field indicates the virtual IP address of the VRRP group. • For a VF, this field indicates the virtual MAC address of the VF.
Active	• For a VRRP group, this field indicates the link-local address of the interface where the master resides. If the current router is the master, this field displays **local**. • For a VF, this field indicates the link-local address of the interface where the AVF resides. If the current VF is the AVF, this field displays **local**.

Display detailed information about all IPv6 VRRP groups on the device when VRRP operates in load balancing mode.

```
<Sysname> display vrrp ipv6 verbose

Table 11 Command output (in load balancing mode)

Field	Description
Running Mode	VRRP operating mode (load balancing mode).
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
Adver Timer	VRRP advertisement sending interval in centiseconds.

Field	Description
Admin Status	Administrative status: **Up** or **Down**.
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Config Pri	Configured priority of the router, which is configured by using the **vrrp ipv6 vrid priority** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Preempt Mode	Preemptive mode: • **Yes**. • **No**.
Delay Time	Preemption delay in centiseconds.
Become Master	Time (in milliseconds) that a backup router has to wait before it becomes the master. This field is displayed only when the router is a backup.
Auth Type	Authentication type. Only **none** is available, which means no authentication is required.
Virtual IP	Virtual IP address list of the VRRP group.
Member IP List	IP addresses of the member devices in the VRRP group: • **Local**—IP address of the local router. • **Master**—IP address of the master. • **Backup**—IP address of the backup.
VRRP Track Information	Track entry that is associated with the VRRP group. This field is displayed only after you configure the **vrrp ipv6 vrid track** command.
Track Object	Track entry to be monitored. This field is displayed only after you configure the **vrrp ipv6 vrid track** command.
State	Track entry state: • **Negative**. • **Positive**. • **NotReady**.
Pri Reduced	Value by which the priority decreases when the status of the associated track entry becomes Negative. This field is displayed only after you configure the **vrrp ipv6 vrid track** command.
Switchover	Switchover mode. When the status of the associated track entry becomes Negative, the backup immediately becomes the master.
Forwarder Information: 2 Forwarders 1 Active	VF information: Two VFs exist and one is the AVF.
Config Weight	Configured weight of the VF: 255.
Running Weight	Current weight of the VF. When a track entry is associated with the VFs of a VRRP group, the VFs' weights change when the track entry's status changes.

Field	Description
Forwarder 01	Information about VF 01.
State	VF state: • **Active**—The VF is created on the device. • **Listening**—The VF is learned from another device. • **Initialize**—The VF is in **Initialize** state.
Virtual MAC	Virtual MAC address of the VF.
Owner ID	Real MAC address of the VF owner.
Priority	VF priority in the range of 1 to 255.
Active	Link-local address of the interface where the AVF resides. If the current VF is the AVF, this field displays **local**.
Forwarder Weight Track Configuration	VF weight Track configuration. The field is displayed only after you configure the **vrrp ipv6 vrid track** command.
Track Object	Track entry which is associated with the VFs. The field is displayed only after you configure the **vrrp ipv6 vrid track** command.
State	Track entry state: • **Negative**. • **Positive**. • **NotReady**.
Weight Reduced	Value by which the weights of the VFs decrease when the state of the associated track entry changes to Negative. The field is displayed only after you configure the **vrrp ipv6 vrid track** command.
Forwarder Switchover Track Information:	VF switchover Track configuration. The field is displayed only after you configure the **vrrp ipv6 vrid track** command.
Member IP	IPv6 address of a member device. The field is displayed only after you configure the **vrrp ipv6 vrid track** command.

display vrrp ipv6 binding

Use **display vrrp ipv6 binding** to display master-to-subordinate IPv6 VRRP group bindings.

Syntax

display vrrp ipv6 binding [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*] | **name** *name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The interface must be an interface to which master IPv6 VRRP groups belong.

vrid *virtual-router-id*: Specifies a master IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

name *name*: Specifies a master IPv6 VRRP group by its name, a case-sensitive string of 1 to 20 characters.

Usage guidelines

If you do not specify any parameters, this command displays all master-to-subordinate IPv6 VRRP group bindings.

If you specify an interface but do not specify the virtual router ID of a master IPv6 VRRP group, this command displays all master-to-subordinate IPv6 VRRP group bindings on the specified interface.

If you specify an interface and the virtual router ID of a master IPv6 VRRP group, this command displays the binding information about the specified master VRRP group on the specified interface.

Examples

Display master-to-subordinate IPv6 VRRP group bindings.

```
<Sysname> display vrrp ipv6 binding
IPv6 virtual router binding information:
  Total number of master virtual routers            : 1
  Total number of subordinate virtual routers       : 2
  Interface : Vlan2                    Master VRID : 1
  Name      : a                        Status      : Backup
  Subordinate virtual routers : 1
    Interface : Vlan2                  VRID        : 4

  Interface : --                       Master VRID : --
  Name      : c                        Status      : --
  Subordinate virtual routers : 1
    Interface : Vlan2                  VRID        : 5
```

Table 12 Command output

Field	Description
Total number of master virtual routers	Total number of master IPv6 VRRP groups.
Total number of subordinate virtual routers	Total number of subordinate IPv6 VRRP groups.
Interface	Interface to which the master IPv6 VRRP group belongs. If the master IPv6 VRRP group does not exist, this field displays two hyphens (**--**).
Master VRID	Virtual router ID of the master IPv6 VRRP group. If the master IPv6 VRRP group does not exist, this field displays two hyphens (**--**).
Name	Name of the master IPv6 VRRP group.
Status	Status of the router in the master IPv6 VRRP group: • **Master**. • **Backup**. • **Initialize**. • **Inactive**.

Field	Description
	If the master IPv6 VRRP group does not exist, this field displays two hyphens (**--**).
Subordinate virtual routers	Number of subordinate IPv6 VRRP groups.
Interface	Interface to which the subordinate IPv6 VRRP group belongs.
VRID	Virtual router ID of the subordinate IPv6 VRRP group.

Related commands

vrrp ipv6 vrid follow

vrrp ipv6 vrid name

display vrrp ipv6 statistics

Use **display vrrp ipv6 statistics** to display statistics for IPv6 VRRP groups.

Syntax

display vrrp ipv6 statistics [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

Usage guidelines

If no interface or VRRP group is specified, this command displays statistics for all IPv6 VRRP groups.

If only an interface is specified, this command displays statistics for all IPv6 VRRP groups on the specified interface.

If both an interface and an IPv6 VRRP group are specified, this command displays statistics for the specified IPv6 VRRP group on the specified interface.

Examples

Display statistics for all IPv6 VRRP groups when VRRP operates in standard mode.

```
<Sysname> display vrrp ipv6 statistics
 Interface              : Vlan-interface2
 VRID                   : 1
 CheckSum Errors        : 0          Version Errors               : 0
 Invalid Pkts Rcvd      : 0          Unexpected Pkts Rcvd         : 0
 Hop Limit Errors       : 0          Advertisement Interval Errors : 0
 Invalid Auth Type      : 0          Auth Failures                : 0
```

```

Table 13 Command output (in standard mode)

Field	Description
Interface	Interface where the VRRP group is configured.
VRID	VRRP group number.
CheckSum Errors	Number of packets with checksum errors.
Version Errors	Number of packets with version errors.
Invalid Pkts Rcvd	Number of received packets of invalid packet types.
Unexpected Pkts Rcvd	Number of received unexpected packets.
Advertisement Interval Errors	Number of packets with advertisement interval errors.
Hop Limit Errors	Number of packets with hop limit errors.
Auth Failures	Number of packets with authentication failures.

Field	Description
Invalid Auth Type	Number of packets with authentication failures because of invalid authentication types.
Auth Type Mismatch	Number of packets with authentication failures because of mismatching authentication types.
Packet Length Errors	Number of packets with VRRP packet length errors.
Address List Errors	Number of packets with virtual IP address list errors.
Become Master	Number of times that the router has been elected as the master.
Priority Zero Pkts Rcvd	Number of received advertisements with the router priority of 0.
Adver Rcvd	Number of received advertisements.
Priority Zero Pkts Sent	Number of sent advertisements with the router priority of 0.
Adver Sent	Number of sent advertisements.
IP Owner Conflicts	Number of VRRP packets that the local router (IP address owner) has received from conflicting IP address owners.
Global statistics	Global statistics for all IPv6 VRRP groups.
CheckSum Errors	Total number of packets with checksum errors.
Version Errors	Total number of packets with version errors.
VRID Errors	Total number of packets with VRID errors.

Table 14 Command output (in load balancing mode)

Field	Description
Interface	Interface where the VRRP group is configured.
VRID	VRRP group number.
CheckSum Errors	Number of packets with checksum errors.
Version Errors	Number of packets with version errors.
Invalid Pkts Rcvd	Number of received packets of invalid packet types.
Unexpected Pkts Rcvd	Number of received unexpected packets.
Advertisement Interval Errors	Number of packets with advertisement interval errors.
Hop Limit Errors	Number of packets with hop limit errors.
Auth Failures	Number of packets with authentication failures.
Invalid Auth Type	Number of packets with authentication failures because of invalid authentication types.
Auth Type Mismatch	Number of packets with authentication failures because of mismatching authentication types.
Packet Length Errors	Number of packets with VRRP packet length errors.
Address List Errors	Number of packets with virtual IP address list errors.
Become Master	Number of times that the router has been elected as the master.
Redirect Timer Expires	Number of times that the redirect timer expired.

Field	Description
Become AVF	Number of times that the VF has been elected as the AVF.
Time-out Timer Expires	Number of times that the time-out timer expired.
Adver Rcvd	Number of received advertisements.
Request Rcvd	Number of received requests.
Adver Sent	Number of sent advertisements.
Request Sent	Number of sent requests.
Reply Rcvd	Number of received replies.
Release Rcvd	Number of received release packets.
Reply Sent	Number of sent replies.
Release Sent	Number of sent release packets.
Priority Zero Pkts Rcvd	Number of received advertisements with the router priority of 0.
VF Priority Zero Pkts Rcvd	Number of received advertisements with the VF priority of 0.
Priority Zero Pkts Sent	Number of sent advertisements with the router priority of 0.
VF Priority Zero Pkts Sent	Number of sent advertisements with the VF priority of 0.
Packet Option Errors	Number of packet option errors.
Global statistics	Global statistics for all IPv6 VRRP groups.
CheckSum Errors	Total number of packets with checksum errors.
Version Errors	Total number of packets with version errors.
VRID Errors	Total number of packets with VRID errors.

Related commands

`reset vrrp ipv6 statistics`

reset vrrp ipv6 statistics

Use **`reset vrrp ipv6 statistics`** to clear statistics for IPv6 VRRP groups.

Syntax

`reset vrrp ipv6 statistics` [**`interface`** *`interface-type interface-number`* [**`vrid`** *`virtual-router-id`*]]

Views

User view

Predefined user roles

network-admin

Parameters

`interface` *`interface-type interface-number`*: Specifies an interface by its type and number.

`vrid` *`virtual-router-id`*: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *`virtual-router-id`* argument is 1 to 255.

Usage guidelines

If no interface or VRRP group is specified, this command clears statistics for all IPv6 VRRP groups.

If only an interface is specified, this command clears statistics for all IPv6 VRRP groups on the specified interface.

If both an interface and an IPv6 VRRP group are specified, this command clears statistics for the specified IPv6 VRRP group on the specified interface.

Examples

Clear statistics for all IPv6 VRRP groups on all interfaces.

```
<Sysname> reset vrrp ipv6 statistics
```

Related commands

display vrrp ipv6 statistics

vrrp ipv6 dscp

Use **vrrp ipv6 dscp** to set a DSCP value for IPv6 VRRP packets.

Use **undo vrrp ipv6 dscp** to restore the default.

Syntax

vrrp ipv6 dscp *dscp-value*

undo vrrp ipv6 dscp

Default

The DSCP value for IPv6 VRRP packets is 56.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value for IPv6 VRRP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value identifies the packet priority during transmission. A greater DSCP value means a higher packet priority.

Examples

Set the DSCP value to 30 for IPv6 VRRP packets.

```
<Sysname> system-view
[Sysname] vrrp ipv6 dscp 30
```

vrrp ipv6 mode

Use **vrrp ipv6 mode** to specify the operating mode for IPv6 VRRP.

Use **undo vrrp ipv6 mode** to restore the default.

Syntax

vrrp ipv6 mode load-balance

undo vrrp ipv6 mode

Default

IPv6 VRRP operates in standard mode.

Views

System view

Predefined user roles

network-admin

Parameters

load-balance: Specifies the load balancing mode.

Usage guidelines

For IPv6 VRRP to operate correctly in load balancing mode, make sure the virtual IPv6 address of an IPv6 VRRP group is not the IPv6 address of any interfaces in the VRRP group.

After you create IPv6 VRRP groups on the router, you can use this command to modify their operating mode. All IPv6 VRRP groups on the router operate in the specified mode.

Examples

Specify the load balancing mode for IPv6 VRRP.

```
<Sysname> system-view
[Sysname] vrrp ipv6 mode load-balance
```

Related commands

display vrrp ipv6

vrrp ipv6 send-nd

Use **vrrp ipv6 send-nd** to enable periodic sending of ND packets for IPv6 VRRP.

Use **undo vrrp ipv6 send-nd** to disable periodic sending of ND packets for IPv6 VRRP.

Syntax

vrrp ipv6 send-nd [**interval** *interval*]

undo vrrp ipv6 send-nd

Default

Periodic sending of ND packets is disabled for IPv6 VRRP.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the sending interval in the range of 30 to 1200 seconds. The default value is 120 seconds.

Usage guidelines

This command ensures that the MAC address entry for the virtual MAC address of an IPv6 VRRP group can be updated on downstream devices in a timely manner.

This command takes effect only in VRRP standard mode.

If you change the sending interval for ND packets, the configuration takes effect at the next sending interval.

The master sends the first ND packet at a random time in the second half of the set interval after you execute the **vrrp ipv6 send-nd** command. This prevents too many ND packets from being sent at the same time.

The sending interval for ND packets might be much longer than the set interval when the following conditions are met:

- Multiple IPv6 VRRP groups exist on the device.
- A short sending interval is set.

Examples

Enable periodic sending of ND packets for IPv6 VRRP and set the sending interval to 200 seconds.

```
<Sysname> system-view
[Sysname] vrrp ipv6 send-nd interval 200
```

vrrp ipv6 vrid

Use **vrrp ipv6 vrid** to create an IPv6 VRRP group and assign a virtual IPv6 address to it, or to assign a virtual IPv6 address to an existing IPv6 VRRP group.

Use **undo vrrp ipv6 vrid** to remove all configurations of an IPv6 VRRP group, or to remove a virtual IPv6 address from an IPv6 VRRP group.

Syntax

vrrp ipv6 vrid *virtual-router-id* **virtual-ip** *virtual-address* [**link-local**]

undo vrrp ipv6 vrid *virtual-router-id* [**virtual-ip** [*virtual-address* [**link-local**]]]

Default

No IPv6 VRRP groups exist.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

virtual-ip *virtual-address*: Specifies a virtual IPv6 address. If you do not specify this option, the **undo vrrp ipv6 vrid** command removes all virtual IPv6 addresses from the specified IPv6 VRRP group.

link-local: Specifies a link-local address as the virtual IPv6 address.

Usage guidelines

You can execute this command multiple times to assign multiple virtual IPv6 addresses to an IPv6 VRRP group. An IPv6 VRRP group can have a maximum of 16 virtual IPv6 addresses.

The first virtual IPv6 address that you assign to an IPv6 VRRP group must be a link-local address, and it must be removed last.

An IPv6 VRRP group can have only one link-local address as its virtual IPv6 address.

An IPv6 VRRP group without virtual IPv6 addresses configured can exist on a device provided that other settings (for example, priority and preemption mode) are available. Such a VRRP group stays in inactive state and does not function.

The virtual IPv6 address of an IPv6 VRRP group and the downlink interface IPv6 address of the VRRP group members must be in the same subnet. Otherwise, the hosts in the subnet might fail to access external networks.

Examples

Create IPv6 VRRP group 1 and assign virtual IPv6 address fe80::10 to the VRRP group. Then assign virtual IPv6 address 1::10 to the VRRP group.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 virtual-ip fe80::10 link-local
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 virtual-ip 1::10
```

Related commands

display vrrp ipv6

vrrp ipv6 vrid follow

Use **vrrp ipv6 vrid follow** to configure an IPv6 VRRP group to follow a master group.

Use **undo vrrp ipv6 vrid follow** to remove the configuration.

Syntax

vrrp ipv6 vrid *virtual-router-id* **follow** *name*

undo vrrp ipv6 vrid *virtual-router-id* **follow**

Default

An IPv6 VRRP group does not follow a master group.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

name: Specifies a master IPv6 VRRP group by its name, a case-sensitive string of 1 to 20 characters.

Usage guidelines

This command configures an IPv6 VRRP group as a subordinate VRRP group to follow a master group. A subordinate IPv6 VRRP group can forward service traffic.

An IPv6 VRRP group cannot be both a master group and a subordinate group.

An IPv6 VRRP group stays in **Inactive** state if it is configured to follow a nonexistent master VRRP group.

If an IPv6 VRRP group in **Inactive** or **Initialize** state follows a master group that is not in **Inactive** state, the state of the VRRP group does not change.

Examples

Configure IPv6 VRRP group 1 to follow master group **abc**.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 follow abc
```

Related commands

display vrrp ipv6 binding

vrrp ipv6 vrid name

vrrp ipv6 vrid name

Use **vrrp ipv6 vrid name** to configure an IPv6 VRRP group as a master group and assign a name to it.

Use **undo vrrp ipv6 vrid name** to remove the configuration.

Syntax

vrrp ipv6 vrid *virtual-router-id* **name** *name*

undo vrrp ipv6 vrid *virtual-router-id* **name**

Default

An IPv6 VRRP group does not act as a master group.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

name: Specifies a master IPv6 VRRP group name, a case-sensitive string of 1 to 20 characters.

Usage guidelines

This command configures an IPv6 VRRP group as a master group through assigning a master group name to it. An IPv6 VRRP group that follows the master group is a subordinate VRRP group. The master VRRP group exchanges VRRP packets among member devices. The subordinate group does not exchange VRRP packets and follows the state of the master group. Both the master and subordinate VRRP groups can forward service traffic.

You cannot assign the same master VRRP group name to different IPv6 VRRP groups on a device.

Examples

Configure IPv6 VRRP group 1 as a master VRRP group and assign master group name **abc** to it.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 name abc
```

Related commands

display vrrp ipv6 binding

vrrp ipv6 vrid follow

vrrp ipv6 vrid preempt-mode

Use **vrrp ipv6 vrid preempt-mode** to enable the preemptive mode for the router in an IPv6 VRRP group and set the preemption delay.

Use **undo vrrp ipv6 vrid preempt-mode** to disable the preemptive mode for the router in an IPv6 VRRP group.

Use **undo vrrp ipv6 vrid preempt-mode delay** to restore the default preemption delay.

Syntax

vrrp ipv6 vrid *virtual-router-id* **preempt-mode** [**delay** *delay-value*]

undo vrrp ipv6 vrid *virtual-router-id* **preempt-mode** [**delay**]

Default

The router operates in preemptive mode and the preemption delay is 0 centiseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

delay *delay-value*: Specifies the preemption delay in the range of 0 to 180000 in centiseconds.

Usage guidelines

In non-preemptive mode, the master router acts as the master as long as it operates correctly, even if a backup is assigned a higher priority later. The non-preemptive mode helps avoid frequent switchover between the master and backups.

In preemptive mode, a backup sends VRRP advertisements when it detects that it has a higher priority than the master. Then the backup takes over as the master and the previous master becomes a backup. This mechanism ensures that the master is always the router with the highest priority.

You can configure the VRRP preemption delay for the following purposes:

- Avoid frequent state changes among members in a VRRP group.
- Provide the backups with enough time to collect information (such as routing information).

A backup does not immediately become the master after it receives an advertisement with a lower priority than the local priority. Instead, it waits for a period of time before taking over.

Examples

Enable the preemptive mode for VRRP group 1, and set the preemption delay to 5000 centiseconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 10 preempt-mode delay 5000
```

Related commands

display vrrp ipv6

vrrp ipv6 vrid priority

Use **vrrp ipv6 vrid priority** to set the priority of the router in an IPv6 VRRP group.

Use **undo vrrp ipv6 vrid priority** to restore the default.

Syntax

vrrp ipv6 vrid *virtual-router-id* **priority** *priority-value*

undo vrrp ipv6 vrid *virtual-router-id* **priority**

Default

The priority of a router in an IPv6 VRRP group is 100.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

priority-value: Specifies a priority value in the range of 1 to 254. A higher value indicates a higher priority.

Usage guidelines

VRRP determines the role (master or backup) of each router in a VRRP group by priority. A router with a higher priority is more likely to become the master.

Priorities 1 to 254 are configurable. Priority 0 is reserved for special uses, and priority 255 is for the IP address owner. The IP address owner in a VRRP group always has a running priority of 255 and acts as the master as long as it operates correctly.

Examples

Set the priority of the switch to 150 in VRRP group 1 on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 priority 150
```

Related commands

display vrrp ipv6

vrrp ipv6 vrid shutdown

Use **vrrp ipv6 vrid shutdown** to disable an IPv6 VRRP group.

Use **undo vrrp ipv6 vrid shutdown** to enable an IPv6 VRRP group.

Syntax

vrrp ipv6 vrid *virtual-router-id* **shutdown**

undo vrrp ipv6 vrid *virtual-router-id* **shutdown**

Default

An IPv6 VRRP group is enabled.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

Usage guidelines

You can use this command to temporarily disable an IPv6 VRRP group. After this command is configured, the VRRP group stays in **Initialize** state, and its configurations remain unchanged. You can change the configuration of the VRRP group, and your changes take effect when you enable the VRRP group again.

Examples

Disable IPv6 VRRP group 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 shutdown
```

vrrp ipv6 vrid timer advertise

Use **vrrp ipv6 vrid timer advertise** to set the interval at which the master in an IPv6 VRRP group sends VRRP advertisements.

Use **undo vrrp ipv6 vrid timer advertise** to restore the default.

Syntax

vrrp ipv6 vrid *virtual-router-id* **timer advertise** *adver-interval*

undo vrrp ipv6 vrid *virtual-router-id* **timer advertise**

Default

The master in an IPv6 VRRP group sends VRRP advertisements at an interval of 100 centiseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID. The value range for the *virtual-router-id* argument is 1 to 255.

adver-interval: Specifies an interval for the master in the specified IPv6 VRRP group to send VRRP advertisements, in the range of 100 to 4095 centiseconds.

Usage guidelines

The master in an IPv6 VRRP group periodically sends VRRP advertisements to declare its presence. You can use this command to set the interval at which the master sends VRRP advertisements.

As a best practice to maintain system stability, set the VRRP advertisement interval to be greater than 100 centiseconds.

The routers in an IPv6 VRRP group can have different intervals for sending VRRP advertisements. The master in the VRRP group sends VRRP advertisements at the specified interval and carries the interval attribute in the advertisements. After a backup receives the advertisement, it records the interval in the advertisement. If the backup does not receive any VRRP advertisement when the timer (3 × VRRP advertisement sending interval + Skew_Time) expires, it regards the master as failed and takes over.

Large network traffic might disable a backup from receiving VRRP advertisements from the master within the specified timer and trigger an unexpected master switchover. To solve this problem, you can use this command to configure a larger interval.

Examples

Configure the master in IPv6 VRRP group 1 to send VRRP advertisements at an interval of 500 centiseconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 timer advertise 500
```

Related commands

display vrrp ipv6

vrrp ipv6 vrid track

Use **vrrp ipv6 vrid track** to associate an IPv6 VRRP group or the VFs in an IPv6 VRRP group with a track entry.

Use **undo vrrp ipv6 vrid track** to remove the association between an IPv6 VRRP group or the VFs in an IPv6 VRRP group and a track entry.

Syntax

vrrp ipv6 vrid *virtual-router-id* **track** *track-entry-number* { **forwarder-switchover member-ip** *ipv6-address* | **priority reduced** [*priority-reduced*] | **switchover** | **weight reduced** [*weight-reduced*] }

undo vrrp ipv6 vrid *virtual-router-id* **track** [*track-entry-number*] [**forwarder-switchover** | **priority reduced** | **switchover** | **weight reduced**]]

Default

An IPv6 VRRP group and the VFs in an IPv6 VRRP group are not associated with any track entries.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group number. The value range for the *virtual-router-id* argument is 1 to 255.

track-entry-number: Specifies a track entry by its number in the range of 1 to 1024.

forwarder-switchover member-ip *ipv6-address*: Enables the LVF on the router to take over the role of the AVF at the specified IPv6 address immediately after the specified track entry changes to the Negative state. The *ipv6-address* argument specifies the IPv6 address of a member router. You can use the **display vrrp ipv6 verbose** command to view the IPv6 addresses of the members.

priority reduced [*priority-reduced*]: Reduces the priority of the router in the VRRP group by the specified value when the state of the specified track entry changes to Negative. The value range for the *priority-reduced* argument is 1 to 255, and the default value is 10.

switchover: Enables the router in backup state to take over as the master immediately after the specified track entry changes to the Negative state.

weight reduced [*weight-reduced*]: Reduces the weight of all VFs on the router in the VRRP group by the specified value when the state of the specified track entry changes to Negative. The value range for the *weight-reduced* argument is 1 to 255, and the default value is 30.

Usage guidelines

When the associated track entry changes to the Negative state, one of the following events occurs depending on your configuration:

- The priority of the router in the VRRP group decreases by a specified value.
- The weight of VFs decreases by a specified value.
- The router immediately takes over as the master if it is a backup.
- The LVF on the router immediately takes over the role of the AVF at the specified IPv6 address.

When the track entry changes from Negative to Positive or NotReady, one of the following events occurs:

- The router automatically restores its priority or VF weight.
- The failed master router becomes the master again.
- The failed AVF becomes active again.

Before executing this command, create an IPv6 VRRP group on the interface and assign a virtual IPv6 address to the IPv6 VRRP group.

You can create a track entry by using the **track** command before or after you associate it with an IPv6 VRRP group or the VFs in an IPv6 VRRP group. For more information about configuring track entries, see *High Availability Configuration Guide*.

If no track entry is specified, the **undo vrrp ipv6 vrid track** command removes all associations between track entries and the IPv6 VRRP group or VFs in the IPv6 VRRP group.

The **vrrp ipv6 vrid track priority reduced** command and the **vrrp ipv6 vrid track switchover** command do not take effect on an IP address owner. If you configure the command on an IP address owner, the configuration takes effect after the router changes to be a non-IP address owner.

The following parameters take effect only when the IPv6 VRRP group is operating in load balancing mode:

- The **forwarder-switchover member-ip** *ip-address* option.
- The **weight reduced** *weight-reduced* option.
- The **weight reduced** keyword.

The weight of a VF is 255, and its lower limit of failure is 10.

When the weight of a VF owner is higher than or equal to the lower limit of failure, its priority is always 255. The priority does not change with the weight. When the upstream link of the VF owner fails, an LVF must take over as the AVF. The switchover happens when the weight of the VF owner drops below the lower limit of failure. This requires that the reduced weight for the VF owner be higher than 245.

Examples

Associate IPv6 VRRP group 1 on VLAN-interface 2 with track entry 1 and decrease the router priority by 50 when the state of track entry 1 changes to Negative.

```
<Sysname> system-view
```

```
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 track 1 priority reduced 50
```

Associate the VFs of IPv6 VRRP group 1 on VLAN-interface 2 with track entry 1. Enable the LVF to take over the role of the AVF at the IPv6 address of 1::3 immediately when the state of track entry 1 changes to Negative.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 track 1 forwarder-switchover member-ip 1::3
```

Associate the VFs of IPv6 VRRP group 1 on VLAN-interface 2 with track entry 1. Decrease the weight of all VFs on the router in the VRRP group by 50 when the state of track entry 1 changes to Negative.

```
<Sysname> system-view
[Sysname] interface vlan-interface2
[Sysname-Vlan-interface2] vrrp ipv6 vrid 1 track 1 weight reduced 50
```

Contents

BFD commands

Basic BFD commands

bfd authentication-mode

Use **bfd authentication-mode** to configure the BFD authentication mode for single-hop BFD control packets.

Use **undo bfd authentication-mode** to restore the default.

Syntax

bfd authentication-mode { **hmac-md5** | **hmac-mmd5** | **hmac-msha1** | **hmac-sha1** | **m-md5** | **m-sha1** | **md5** | **sha1** | **simple** } *key-id* { **cipher** | **plain** } *string*

undo bfd authentication-mode

Default

Single-hop BFD control packets are not authenticated.

Views

Interface view

BFD template view

Predefined user roles

network-admin

Parameters

hmac-md5: Specifies the HMAC MD5 algorithm.

hmac-mmd5: Specifies the HMAC Meticulous MD5 algorithm.

hmac-msha1: Specifies the HMAC Meticulous SHA1 algorithm.

hmac-sha1: Specifies the HMAC SHA1 algorithm.

m-md5: Specifies the Meticulous MD5 algorithm.

m-sha1: Specifies the Meticulous SHA1 algorithm.

md5: Specifies the MD5 algorithm.

sha1: Specifies the SHA1 algorithm.

simple: Specifies the simple authentication mode.

key-id: Sets the authentication key ID in the range of 1 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 33 to 53 characters.

Usage guidelines

Use this command to enhance BFD session security.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure VLAN-interface 11 to perform simple authentication for single-hop BFD control packets, setting the authentication key ID to **1** and plaintext key to **123456**.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] bfd authentication-mode simple 1 plain 123456
```

bfd demand enable

Use **bfd demand enable** to enable the Demand BFD session mode.

Use **undo bfd demand enable** to restore the default.

Syntax

bfd demand enable

undo bfd demand enable

Default

The BFD session is in Asynchronous mode.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

In Demand mode, the device periodically sends BFD control packets. If the peer end is operating in Asynchronous mode (default), the peer end stops sending BFD control packets. If the peer end is operating in Demand mode, both ends stop sending BFD control packets. When the connectivity to another system needs to be verified explicitly, a system sends several BFD control packets with the Poll (P) bit set at the negotiated transmit interval. If no response is received within the detection interval, the session is considered down. If the connectivity is found to be up, no more BFD control packets are sent until the next command is issued.

In Asynchronous mode, the device periodically sends BFD control packets. The device considers that the session is down if it does not receive any BFD control packets within a specific interval.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Enable the Demand BFD session mode on VLAN-interface 11.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] bfd demand enable
```

bfd detect-interface

Use **bfd detect-interface source-ip** to create a BFD session for detecting the local interface state.

Use **undo bfd detect-interface** to remove the BFD session.

Syntax

bfd detect-interface source-ip *ip-address* [**discriminator local** *local-value* **remote** *remote-value*] [**template** *template-name*]

undo bfd detect-interface

Default

No BFD session is created for detecting the local interface state.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address for BFD control packets.

discriminator: Specifies BFD session discriminators. If you do not specify discriminators, the device obtains BFD session discriminators through autonegotiation.

local *local-value*: Specifies the local discriminator. The value range for the *local-value* argument is 97 to 128.

remote *remote-value*: Specifies the remote discriminator in the range of 1 to 4294967295.

template *template-name*: Specifies a template by its name, a case-sensitive string of 1 to 63 characters. If you do not specify a template, the BFD session uses the BFD parameters configured in interface view.

Usage guidelines

This command implements fast collaboration between interface state and BFD session state. When BFD detects a link fault, it sets the link layer protocol state to DOWN(BFD). This behavior helps applications relying on the link layer protocol state achieve fast convergence.

The source IP address of control packets is specified manually, and the destination IP address is fixed at 224.0.0.184. As a best practice, specify the IP address of the interface as the source IP address. If the interface does not have an IP address, specify a unicast IP address other than 0.0.0.0 as the source IP address.

You can associate the state of the following interfaces with BFD:

- Layer 2 Ethernet interfaces.
- Member ports in a Layer 2 aggregation group.
- VLAN interfaces.
- Layer 2 aggregate interfaces.

This command must be executed on both ends of the link for a BFD session to be established.

If you execute both the **bfd detect-interface** and **bfd echo enable** commands for an interface, only the **bfd detect-interface** command takes effect.

For BFD detection to take effect, do not execute this command on both a Layer 2 Ethernet interface and the VLAN interface created for the VLAN to which the Layer 2 Ethernet interface is assigned.

For BFD detection to take effect, do not execute this command on the following interfaces at the same time:

- A Layer 2 aggregate interface.
- A member port of the Layer 2 aggregate interface.
- The VLAN interface to which the Layer 2 aggregate interface belongs.

If the peer device does not support obtaining BFD session discriminators through autonegotiation, you must specify the discriminators on both the local and peer devices. Without the discriminators, the BFD session cannot come up.

The BFD session discriminators must match on the local and peer devices. For example, if you configure **bfd detect-interface source-ip** 20.1.1.1 **discriminator local** 513 **remote** 514 on the local device, you must configure **bfd detect-interface source-ip** 20.1.1.2 **discriminator local** 514 **remote** 513 on the peer device.

The local discriminators of BFD sessions for interfaces on the same device must be different.

Examples

Create a BFD session to detect the state of VLAN-interface 10, and specify the source IP address as 20.1.1.1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] bfd detect-interface source-ip 20.1.1.1
```

bfd detect-interface first-fail-timer

Use **bfd detect-interface first-fail-timer** to configure the timer that delays reporting the first BFD session establishment failure to the data link layer.

Use **undo bfd detect-interface first-fail-timer** to restore the default.

Syntax

bfd detect-interface first-fail-timer *seconds*

undo bfd detect-interface first-fail-timer

Default

The first BFD session establishment failure is not reported to the data link layer.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the timeout time that reports the first BFD session establishment failure to the data link layer. The value range for this argument is 1 to 10000 seconds.

Usage guidelines

If the BFD session fails to be established when the timer expires, BFD reports the failure to the data link layer and sets the data link layer state of the interface to DOWN(BFD). This behavior rapidly identifies the interfaces for which BFD sessions fail to be established. In this case, the BFD session state is displayed as Down in the **display bfd session** command output. The line protocol state of the interface is displayed as DOWN(BFD) in the **display interface** command output.

If the local end is configured with the **bfd detect-interface** command, the BFD session for detecting the local interface state fails to be established when the following conditions exist:

- The remote end is not configured with the **bfd detect-interface** command.
- The local and remote ends have mismatching BFD authentication settings.

Examples

Configure the timer that delays reporting the first BFD session establishment failure as 10 seconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] bfd detect-interface first-fail-timer 10
```

Related commands

bfd detect-interface

display interface (*Interface Command Reference*)

bfd detect-interface special-processing

Use **bfd detect-interface special-processing** to enable special processing for BFD sessions.

Use **undo bfd detect-interface special-processing** to disable special processing for BFD sessions.

Syntax

bfd detect-interface special-processing [**admin-down** | **authentication-change** | **session-up**] *

undo bfd detect-interface special-processing [**admin-down** | **authentication-change** | **session-up**] *

Default

All types of special processing for BFD sessions are disabled.

Views

Interface view

Predefined user roles

network-admin

Parameters

admin-down: Notifies a session down event to the data link layer upon receipt of a BFD packet with the State field as AdminDown. This keyword helps rapidly discover interfaces that BFD sessions are manually shut down. If you do not specify this keyword, the device sets the BFD session state to Down, but does not notify the session down event to the data link layer.

authentication-change: Immediately sets the session to down state upon a local authentication information change. This keyword helps rapidly discover interfaces with authentication information changes. If you do not specify this keyword, the device sets the session to down state if authentication information inconsistency still persists after a period of time.

session-up: Ignores authentication information inconsistency when the local session is up. If there is a large number of BFD sessions, examining authentication information consistency affects device performance. If you do not specify this keyword, the device examines authentication information in incoming BFD packets when the local session state is up. If the authentication information does not match on the two ends, the BFD session is declared down.

Usage guidelines

If you do not specify any parameters, this command enables or disables all types of special processing.

Examples

Enable all types of special processing for BFD sessions on VLAN-interface 11.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
```

```
[Sysname-Vlan-interface11] bfd detect-interface special-processing admin-down
authentication-change session-up
```

bfd detect-multiplier

Use **bfd detect-multiplier** to set the single-hop detection time multiplier for control packet mode and the detection time multiplier for echo packet mode.

Use **undo bfd detect-multiplier** to restore the default.

Syntax

bfd detect-multiplier *value*

undo bfd detect-multiplier

Default

The single-hop detection time multiplier for control packet mode and the detection time multiplier for echo packet mode are both 5.

Views

Interface view

BFD template view

Predefined user roles

network-admin

Parameters

value: Specifies a detection time multiplier. The value range for this argument is 3 to 50.

Usage guidelines

The detection time multiplier determines the maximum number of concurrent BFD packets (including control packets and echo packets) that can be discarded.

Table 1 Actual detection interval calculation method

Mode	Actual detection interval of the sender
Echo packet mode	Detection time multiplier of the sender × actual packet sending interval of the sender
Control packet mode BFD session in asynchronous mode	Detection time multiplier of the receiver × MAX (minimum receiving interval supported by the sender, minimum sending interval supported by the receiver)
Control packet mode BFD session in demand mode	Detection time multiplier of the sender × MAX (minimum sending interval supported by the sender, minimum receiving interval supported by the receiver)

Examples

Set the single-hop detection time multiplier for control packet mode and the detection time multiplier for echo packet mode to 6 on VLAN-interface 11.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] bfd detect-multiplier 6
```

bfd echo enable

Use **bfd echo enable** to enable the echo packet mode.

Use **undo bfd echo enable** to disable the echo packet mode.

Syntax

bfd echo [**receive** | **send**] **enable**

undo bfd echo [**receive** | **send**] **enable**

Default

The echo packet mode is disabled.

Views

Interface view

Predefined user roles

network-admin

Parameters

receive: Specifies the echo packet receiving capability.

send: Specifies the echo packet sending capability.

Usage guidelines

If you enable the echo packet mode for a BFD session in which control packets are sent and the session comes up, BFD performs the following operations:

- Periodically sends echo packets to detect link connectivity.
- Decreases the control packet receiving rate at the same time.

To enable only the echo packet receiving capability, use the **bfd echo receive enable** command.

To enable only the echo packet sending capability, use the **bfd echo send enable** command.

If you do not specify the **receive** or **send** keyword, the command enables both the echo packet receiving and sending capabilities.

If you configure both the **bfd detect-interface** and **bfd echo enable** commands for an interface, only the **bfd detect-interface** command takes effect.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Enable the echo packet mode on VLAN-interface 11.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] bfd echo enable
```

bfd echo-source-ip

Use **bfd echo-source-ip** to configure the source IP address of BFD echo packets.

Use **undo bfd echo-source-ip** to remove the configured source IP address of BFD echo packets.

Syntax

bfd echo-source-ip *ip-address*

undo bfd echo-source-ip

Default

No source IP address is configured for BFD echo packets.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address of BFD echo packets.

Usage guidelines

The source IP address cannot be on the same network segment as any local interface's IP address. Otherwise, a large number of ICMP redirect packets might be sent from the peer, resulting in link congestion.

Examples

Configure the source IP address of BFD echo packets as 8.8.8.8.

```
<Sysname> system-view
[Sysname] bfd echo-source-ip 8.8.8.8
```

bfd echo-source-ipv6

Use **bfd echo-source-ipv6** to configure the source IPv6 address of BFD echo packets.

Use **undo bfd echo-source-ipv6** to remove the configured source IPv6 address of BFD echo packets.

Syntax

bfd echo-source-ipv6 *ipv6-address*

undo bfd echo-source-ipv6

Default

No source IPv6 address is configured for BFD echo packets.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the source IPv6 address for BFD echo packets.

Usage guidelines

The source IPv6 address of echo packets can only be a global unicast address.

The source IPv6 address cannot be on the same network segment as any local interface's IP address. Otherwise, a large number of ICMP redirect packets might be sent from the peer, resulting in link congestion.

Examples

Configure the source IPv6 address of BFD echo packets as 80::2.

```
<Sysname> system-view
[Sysname] bfd echo-source-ipv6 80::2
```

bfd min-echo-receive-interval

Use **bfd min-echo-receive-interval** to set the minimum interval for receiving BFD echo packets.

Use **undo bfd min-echo-receive-interval** to restore the default.

Syntax

bfd min-echo-receive-interval *interval*

undo bfd min-echo-receive-interval

Default

The minimum interval for receiving BFD echo packets is 400 milliseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum interval for receiving BFD echo packets, in milliseconds. The value takes 0 or is in the range of 100 to 1000.

Usage guidelines

This command sets the BFD echo packet receiving interval, which is the actual BFD echo packet sending interval.

The local end stops sending echo packets after autonegotiation with the remote end if the following conditions are met:

- The echo packet mode is enabled on the local end.
- The minimum interval for receiving BFD echo packets is set to 0 milliseconds on the remote end.

Examples

Set the minimum interval for receiving BFD echo packets to 500 milliseconds on VLAN-interface 11.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] bfd min-echo-receive-interval 500
```

bfd min-receive-interval

Use **bfd min-receive-interval** to set the minimum interval for receiving single-hop BFD control packets.

Use **undo bfd min-receive-interval** to restore the default.

Syntax

bfd min-receive-interval *interval*

undo bfd min-receive-interval

Default

The minimum interval for receiving single-hop BFD control packets is 400 milliseconds.

Views

Interface view

BFD template view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum interval for receiving single-hop BFD control packets, in milliseconds. The value range is 100 to 1000.

Usage guidelines

Use this command to prevent the control packet sending rate of the peer end from exceeding the control packet receiving rate of the local end.

The actual control packet sending interval of the peer end takes the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the peer end.
- Minimum interval for receiving BFD control packets on the local end.

Examples

Set the minimum interval for receiving single-hop BFD control packets to 500 milliseconds on VLAN-interface 11.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] bfd min-receive-interval 500
```

bfd min-transmit-interval

Use **bfd min-transmit-interval** to set the minimum interval for transmitting single-hop BFD control packets.

Use **undo bfd min-transmit-interval** to restore the default.

Syntax

bfd min-transmit-interval *interval*

undo bfd min-transmit-interval

Default

The minimum interval for transmitting single-hop BFD control packets is 400 milliseconds.

Views

Interface view

network-admin

Parameters

interval: Specifies the minimum interval for transmitting single-hop BFD control packets, in milliseconds. The value range is 100 to 1000.

Usage guidelines

Use this command to prevent the BFD packet sending rate from exceeding the device capability.

The actual BFD control packet transmitting interval on the local end is the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the local end.
- Minimum interval for receiving BFD control packets on the peer end.

Examples

Set the minimum interval for transmitting single-hop BFD control packets to 500 milliseconds on VLAN-interface 11.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] bfd min-transmit-interval 500
```

bfd multi-hop authentication-mode

Use **bfd multi-hop authentication-mode** to configure the authentication mode for multihop BFD control packets.

Use **undo bfd multi-hop authentication-mode** to restore the default.

Syntax

bfd multi-hop authentication-mode { **hmac-md5** | **hmac-mmd5** | **hmac-msha1** | **hmac-sha1** | **m-md5** | **m-sha1** | **md5** | **sha1** | **simple** } *key-id* { **cipher** | **plain** } *string*

undo bfd multi-hop authentication-mode

Default

No authentication is performed.

Views

System view

Predefined user roles

network-admin

Parameters

hmac-md5: Specifies the HMAC MD5 algorithm.

hmac-mmd5: Specifies the HMAC Meticulous MD5 algorithm.

hmac-msha1: Specifies the HMAC Meticulous SHA1 algorithm.

hmac-sha1: Specifies the HMAC SHA1 algorithm.

m-md5: Specifies the Meticulous MD5 algorithm.

m-sha1: Specifies the Meticulous SHA1 algorithm.

md5: Specifies the MD5 algorithm.

sha1: Specifies the SHA1 algorithm.

simple: Specifies the simple authentication mode.

key-id: Sets the authentication key ID in the range of 1 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 33 to 53 characters.

Usage guidelines

Use this command to enhance BFD session security.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure the simple authentication mode for multihop BFD control packets, setting the authentication key ID to 1 and key to **123456**.

```
<Sysname> system-view
[Sysname] bfd multi-hop authentication-mode simple 1 plain 123456
```

bfd multi-hop destination-port

Use **bfd multi-hop destination-port** to configure the destination port number for multihop BFD control packets.

Use **undo bfd multi-hop destination-port** to restore the default.

Syntax

bfd multi-hop destination-port *port-number*

undo bfd multi-hop destination-port

Default

The destination port number for multihop BFD control packets is 4784.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies the destination port number of multihop BFD control packets, 3784 or 4784.

Examples

Specify the destination port number for multihop BFD control packets as 3784.

```
<Sysname> system-view
[Sysname] bfd multi-hop destination-port 3784
```

bfd multi-hop detect-multiplier

Use **bfd multi-hop detect-multiplier** to set the multihop detection time multiplier for control packet mode.

Use **undo bfd multi-hop detect-multiplier** to restore the default.

Syntax

bfd multi-hop detect-multiplier *value*

undo bfd multi-hop detect-multiplier

Default

The multihop detection time multiplier for control packet mode is 5.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the multihop detection time multiplier in the range of 3 to 50.

Usage guidelines

The detection time multiplier determines the maximum number of concurrent BFD control packets that can be discarded.

Table 2 Actual detection interval calculation method

Mode	Actual detection interval of the sender
Control packet mode BFD session in asynchronous mode	Detection time multiplier of the receiver × MAX (minimum receiving interval supported by the sender, minimum sending interval supported by the receiver)
Control packet mode BFD session in demand mode	Detection time multiplier of the sender × MAX (minimum sending interval supported by the sender, minimum receiving interval supported by the receiver)

Examples

Set the multihop detection time multiplier to 6.

```
<Sysname> system-view
[Sysname] bfd multi-hop detect-multiplier 6
```

bfd multi-hop min-receive-interval

Use **bfd multi-hop min-receive-interval** to set the minimum interval for receiving multihop BFD control packets.

Use **undo bfd multi-hop min-receive-interval** to restore the default.

Syntax

bfd multi-hop min-receive-interval *interval*

undo bfd multi-hop min-receive-interval

Default

The minimum interval for receiving multihop BFD control packets is 400 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum interval for receiving multihop BFD control packets, in milliseconds. The value range is 100 to 1000.

Usage guidelines

Use this command to prevent the packet sending rate of the peer end from exceeding the packet receiving capability (minimum control packet receiving interval) of the local end. If the receiving capability is exceeded, the peer end dynamically adjusts the BFD control packet sending interval to the minimum control packet receiving interval of the local end.

Examples

Set the minimum interval for receiving multihop BFD control packets to 500 milliseconds.

```
<Sysname> system-view
[Sysname] bfd multi-hop min-receive-interval 500
```

bfd multi-hop min-transmit-interval

Use **bfd multi-hop min-transmit-interval** to set the minimum interval for transmitting multihop BFD control packets.

Use **undo bfd multi-hop min-transmit-interval** to restore the default.

Syntax

bfd multi-hop min-transmit-interval *interval*

undo bfd multi-hop min-transmit-interval

Default

The minimum interval for transmitting multihop BFD control packets is 400 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum interval for transmitting multihop BFD control packets, in milliseconds. The value range is 100 to 1000.

Usage guidelines

Use this command to prevent the BFD packet sending rate from exceeding the device capability.

The actual BFD control packet transmitting interval on the local end is the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the local end.
- Minimum interval for receiving BFD control packets on the peer end.

Examples

Set the minimum interval for transmitting multihop BFD control packets to 500 milliseconds.

```
<Sysname> system-view
[Sysname] bfd multi-hop min-transmit-interval 500
```

bfd session init-mode

Use **bfd session init-mode** to configure the mode for establishing a BFD session.

Use **undo bfd session init-mode** to restore the default.

Syntax

bfd session init-mode { **active** | **passive** }

undo bfd session init-mode

Default

BFD uses the **active** mode.

Views

System view

Predefined user roles

network-admin

Parameters

active: Specifies the active mode. In active mode, BFD actively transmits BFD control packets to the remote device, regardless of whether it receives a BFD control packet from the remote device.

passive: Specifies the passive mode. In passive mode, BFD does not actively transmit a BFD control packet to the remote end; it transmits a BFD control packet only after receiving a BFD control packet from the remote end.

Usage guidelines

A minimum of one end must operate in active mode for a BFD session to be established.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure the session establishment mode as **passive**.

```
<Sysname> system-view
[Sysname] bfd session init-mode passive
```

bfd template

Use **bfd template** to create a BFD template and enter its view, or enter the view of an existing BFD template.

Use **undo bfd template** to delete the BFD template.

Syntax

bfd template *template-name*

undo bfd template *template-name*

Default

No BFD templates exist.

Views

System view

Predefined user roles

network-admin

Parameters

template-name: Specifies the template name, a case-sensitive string of 1 to 63 characters.

Examples

Create BFD template **bfd1** and enter BFD template view.

```
<Sysname> system-view
[Sysname] bfd template bfd1
[Sysname-bfd-template-bfd1]
```

display bfd session

Use **display bfd session** to display BFD session information.

Syntax

display bfd session [**discriminator** *value* | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

discriminator *value*: Specifies a local ID in the range of 1 to 4294967295. If this option is not specified, the command displays brief information about all BFD sessions.

verbose: Displays detailed BFD session information. If this keyword is not specified, the command displays brief BFD session information.

Examples

Display brief information about all IPv4 BFD sessions.

```
<Sysname> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 session working in control packet mode:

 LD/RD          SourceAddr      DestAddr        State    Holdtime    Interface
 513/513        1.1.1.1         1.1.1.2         Up       2297ms      Vlan100
```

Display detailed IPv4 BFD session information.

```
<Sysname> display bfd session verbose

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 session working in control packet mode:

      Local Discr: 513                Remote Discr: 513
        Source IP: 1.1.1.1           Destination IP: 1.1.1.2
    Session State: Up                     Interface: Vlan-interface100
     Min Tx Inter: 500ms                Act Tx Inter: 500ms
```

```
      Min Rx Inter: 500ms               Detect Inter: 2500ms
          Rx Count: 42                      Tx Count: 43
      Connect Type: Direct             Running Up for: 00:00:20
         Hold Time: 2078ms                 Auth mode: None
       Detect Mode: Async                       Slot: 0
          Protocol: OSPF
          Version:1
         Diag Info: No Diagnostic
```

Display brief information about all IPv6 BFD sessions.

```
<Sysname> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv6 session working in control packet mode:

       Local Discr: 513                 Remote Discr: 513
         Source IP: FE80::20C:29FF:FED4:7171
    Destination IP: FE80::20C:29FF:FE72:AC4D
     Session State: Up                     Interface: Vlan100
         Hold Time: 2142ms
```

Display detailed IPv6 BFD session information.

```
<Sysname> display bfd session verbose

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv6 session working in control packet mode:

       Local Discr: 513                 Remote Discr: 513
         Source IP: FE80::20C:29FF:FED4:7171
    Destination IP: FE80::20C:29FF:FE72:AC4D
     Session State: Up                     Interface: Vlan-interface100
      Min Tx Inter: 500ms               Act Tx Inter: 500ms
      Min Rx Inter: 500ms               Detect Inter: 2500ms
          Rx Count: 38                      Tx Count: 38
      Connect Type: Direct             Running Up for: 00:00:15
         Hold Time: 2211ms                 Auth mode: None
       Detect Mode: Async                       Slot: 0
          Protocol: OSPFv3
          Version:1
         Diag Info: No Diagnostic
```

Table 3 Command output

Field	Description
Total Session Num	Total number of BFD sessions.
Up Session Num	Total number of active BFD sessions.
Init Mode	BFD operating mode: Active or passive.

Field	Description
IPv4 session working in control packet mode	BFD session type and operating mode: • **IPv4 session working in control packet mode**. • **IPv4 session working in echo mode**. • **IPv6 session working in control packet mode**. • **IPv6 session working in echo mode**.
Local Discr/LD	Local discriminator of the session.
Remote Discr/RD	Remote discriminator of the session.
Source IP/SourceAddr	Source IP address of the session.
Destination IP/DestAddr	Destination IP address of the session.
Session State/State	Session state: **Down**, **Init**, or **Up**.
Interface	Name of the interface of the session.
Min Tx Inter	Minimum BFD packet transmission interval.
Min Rx Inter	Minimum BFD packet receiving interval.
Act Tx Inter	Actual BFD packet transmission interval.
Detect Inter	Actual session detection timer.
Rx Count	Number of packets received.
Tx Count	Number of packets sent.
Hold Time/Holdtime	Length of time before the session detection timer expires, in milliseconds. For a BFD session in **Down** state, this field displays **0ms**.
Auth mode	Session authentication mode.
Connect Type	Connection type of the interface: Direct or indirect.
Running up for	Time period for which the session has been up.
Detect Mode	Detection mode: • **Async**—Asynchronous mode. • **Demand**—Demand mode. • **Async/Echo**—Asynchronous mode with echo detection enabled. • **Demand/Echo**—Demand mode with echo detection enabled.
Slot	Slot number.
Diag Info	Diagnostic information about the session: • **No Diagnostic**. • **Control Detection Time Expired**—A control packet mode BFD session goes down because local detection times out. • **Echo Function Failed**—An echo packet mode BFD session goes down, because local detection times out or the source IP address of echo packets is deleted. • **Neighbor Signaled Session Down**—The remote end notifies the local end of BFD session down. • **Administratively Down**—The local system prevents a BFD session from being established.

reset bfd session statistics

Use **reset bfd session statistics** to clear the BFD session statistics.

Syntax

reset bfd session statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear the BFD session statistics.

```
<Sysname> reset bfd session statistics
```

snmp-agent trap enable bfd

Use **snmp-agent trap enable bfd** to enable SNMP notifications for BFD.

Use **undo snmp-agent trap enable bfd** to disable SNMP notifications for BFD.

Syntax

snmp-agent trap enable bfd

undo snmp-agent trap enable bfd

Default

All SNMP notifications are enabled for BFD.

Views

System view

Predefined user roles

network-admin

Usage guidelines

To report critical BFD events to an NMS, enable SNMP notifications for BFD. For BFD event notifications to be sent correctly, you must also configure SNMP as described in the network management and monitoring configuration guide for the device.

Examples

Disable SNMP notifications for BFD.

```
<Sysname> system-view
[Sysname] undo snmp-agent trap enable bfd
```

Contents

Track commands

delay

Use **delay** to set the period of time that the Track module must wait before notifying the application module of track entry state changes.

Use **undo delay** to remove the notification delay configuration.

Syntax

delay { **negative** *negative-time* | **positive** *positive-time* } *

undo delay

Default

The Track module notifies the application module immediately when the track entry state changes.

Views

Track view

Predefined user roles

network-admin

Parameters

negative *negative-time*: Specifies the delay for notifying the application module that the track entry state has changed to Negative. The *negative-time* argument represents the negative state notification delay in the range of 1 to 300 seconds.

positive *positive-time*: Specifies the delay for notifying the application module that the track entry state has changed to Positive. The *positive-time* argument represents the positive state notification delay in the range of 1 to 300 seconds.

Usage guidelines

If the Track module immediately notifies the application module of a track entry state change but route convergence is not complete, a communication failure might occur. To address this issue, you can set a notification delay to avoid immediate notification of track entry state changes.

The notification delay settings do not take effect if the track entry is not associated with an application module.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the negative state notification delay to 50 seconds and the positive state notification delay to 120 seconds for track entry 101 associated with a Boolean OR list.

```
<Sysname> system-view
[Sysname] track 101 list boolean or
[Sysname-track-101] delay negative 50 positive 120
```

Related commands

track bfd

track cfd

track nqa

display track

Use **display track** to display track entry information.

Syntax

display track { *track-entry-number* | **all** [**negative** | **positive**] } [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

all: Specifies all track entries.

negative: Specifies track entries in Negative state.

positive: Specifies track entries in Positive state.

brief: Displays brief information about track entries.

Examples

Display information about all track entries.

```
<Sysname> display track all
Track ID: 1
  State: Positive
  Duration: 0 days 0 hours 0 minutes 7 seconds
  Tracked object type: NQA
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    NQA entry: admin test
    Reaction: 10
    Remote IP/URL: 2.2.2.2
    Local IP: 1.1.1.1
    Interface: Vlan-interface1
Track ID: 2
  State: NotReady
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: BFD ctrl
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    BFD session mode: Echo
    Outgoing interface: Vlan-interface2
```

```
    VPN instance name: --
    Remote IP: 192.168.40.1
    Local IP: 192.168.40.2
Track ID: 3
  State: Negative
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: Interface
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    Interface:  Vlan-interface3
    Protocol: IPv4
Track ID: 4
  State: Negative
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: CFD
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    CFD service instance: MEP 2 in Ethernet service instance 1
Track ID: 6
  State: Positive
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: Failover group
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    LLDP interface: Vlan-interface4
```

Display information about track entries in Negative state.

```
<Sysname> display track all negative brief
ID   Status   Type      Remote IP/URL   Local IP        Interface
1    Negative Interface --              --              Vlan2
10   Negative Interface --              --              Vlan3
```

Table 1 Command output

Field	Description
Track ID	ID of a track entry.
State	States of a track entry: • **Positive**—The tracked object operates correctly. • **NotReady**—The tracked object is invalid. • **Negative**—The tracked object is abnormal.
Duration	Time period during which the track entry stays in the state.

Field	Description
Type	Tracked object type: • **BFD ctrl**—Control-mode BFD session. • **BFD echo**—Echo-mode BFD session. • **CFD**. • **Interface**. • **Route**. • **NQA**. • **LLDP**. This field is displayed only when the **`display track brief`** command is executed.
Tracked object type	Tracked object type: • **BFD ctrl**—Control-mode BFD session. • **BFD echo**—Echo-mode BFD session. • **CFD echo**. • **Interface**. • **Route**. • **LLDP**. • **NQA**.
Notification delay: Positive 20, Negative 30 (in seconds)	• The Track module notifies the application modules that the status of the track entry changes to Positive after a delay time of 20 seconds. • The Track module notifies the application modules that the status of the track entry changes to Negative after a delay time of 30 seconds.
Tracked object	Tracked object associated with the track entry.
NQA entry	NQA operation associated with the track entry.
Reaction	Reaction entry associated with the track entry.
BFD session mode	BFD session mode.
Outgoing interface	Outgoing interface of BFD echo packets.
VPN instance name	This field is not supported in the current software version. Name of the VPN instance to which BFD session packets belong. If the packets belong to the public network, two consecutive hyphens (--) are displayed.
Remote IP/URL	Remote IP address or URL. If no remote IP address or URL exists, two consecutive hyphens (--) are displayed.
Local IP	Local IP address. If no local IP address exists, two consecutive hyphens (--) are displayed.
Interface	Interface to be monitored. If no interface is to be monitored, two consecutive hyphens (--) are displayed.
Protocol	Link states or Layer 3 protocol states of the monitored interface: • **None**—Link status of the monitored interface. • **IPv4**—IPv4 protocol status of the monitored Layer 3 interface. • **IPv6**—IPv6 protocol status of the monitored Layer 3 interface.
IP route	Route associated with the track entry.

Field	Description
VPN instance name	This field is not supported in the current software version. Name of the VPN instance to which the route belongs. If the route belongs to the public network, two consecutive hyphens (--) are displayed.
Protocol	Protocol type of the route. If the route does not exist, **N/A** is displayed.
Nexthop interface	Next hop of the route. If the route does not exist, **N/A** is displayed.
LLDP interface	Monitored LLDP interface.

Related commands

track lldp neighbor

track nqa

track bfd ctrl

Use **track bfd ctrl** to create a track entry associated with a control-mode BFD session and enter Track view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all its settings.

Syntax

track *track-entry-number* **bfd ctrl** [**interface** *interface-type interface-number*] **remote ip** *remote-ip-address* **local ip** *local-ip-address*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface *interface-type interface-number*: Specifies the outgoing interface by its type and number of BFD control packets. If you do not specify an outgoing interface, the outgoing interface found through FIB table lookup is used.

remote ip *remote-ip-address*: Specifies the destination IP address of the BFD control packets. The specified IP address must be the IP address of a directly connected interface.

local ip *local-ip-address*: Specifies the source IP address of the BFD control packets. The specified IP address must be the IP address of a directly connected interface.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **bfd ctrl** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then execute the **track bfd ctrl** command again.

When you associate Track with a BFD session, do not use the virtual IP address of a VRRP group as the local or remote IP address of the BFD session.

Examples

Associate track entry 1 with a control-mode BFD session. The BFD control packets use destination IP address 192.168.1.1, source IP address 192.168.1.2, and outgoing interface VLAN-interface 2.

```
<Sysname> system-view
[Sysname] track 1 bfd ctrl interface vlan-interface 2 remote ip 192.168.1.1 local ip
192.168.1.2
[Sysname-track-1]
```

Related commands

delay

display track

track bfd echo

Use **track bfd echo** to create a track entry associated with an echo-mode BFD session and enter Track view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all its settings.

Syntax

track *track-entry-number* **bfd echo interface** *interface-type interface-number* **remote ip** *remote-ip-address* **local ip** *local-ip-address*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface *interface-type interface-number*: Specifies the outgoing interface by its type and number of the BFD echo packets.

remote ip *remote-ip-address*: Specifies the destination IP address of the BFD echo packets. The specified IP address must be the IP address of a directly connected interface.

local ip *local-ip-address*: Specifies the source IP address of the BFD echo packets. The specified IP address must be the IP address of a directly connected interface.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **bfd echo** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then execute the **track bfd echo** command again.

When you associate Track with BFD, the virtual IP address of a VRRP group cannot be the local or remote address of a BFD session.

Examples

Associate track entry 1 with an echo-mode BFD session. The BFD echo packets use destination IP address 1.1.1.1, source IP address 1.1.1.2, and outgoing interface VLAN-interface 2.

```
<Sysname> system-view
[Sysname] track 1 bfd echo interface vlan-interface 2 remote ip 1.1.1.1 local ip 1.1.1.2
[Sysname-track-1]
```

Related commands

display track

track cfd

Use **track cfd** to create a track entry associated with CFD and enter Track view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all its settings.

Syntax

track *track-entry-number* **cfd cc service-instance** *instance-id* **mep** *mep-id*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

service-instance *instance-id*: Specifies a service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **cfd** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then execute the **track cfd** command again.

Examples

Create track entry 1 and specify the CFD service instance ID as 2 and MEP ID as 3.

```
<Sysname> system-view
[Sysname] track 1 cfd cc service-instance 2 mep 3
[Sysname-track-1]
```

track interface

Use **track interface** to create a track entry associated with the link state of an interface and enter Track view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all its settings.

Syntax

track *track-entry-number* **interface** *interface-type interface-number*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **interface** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

When you associate Track with interface management to monitor the link status of an interface, the track entry state changes as follows:

- The track entry state is Positive if the link state of the interface is up.
- The track entry state is Negative if the link state of the interface is down.

To display the link state of an interface, use the **display ip interface brief** command.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then execute the **track interface** command again.

Examples

Create track entry 1 and associate it with the link state of interface VLAN-interface 10.

```
<Sysname> system-view
[Sysname] track 1 interface vlan-interface 10
[Sysname-track-1]
```

display ip interface brief (*Layer 3—IP Services Command Reference*)

display track

track interface protocol

Use **track interface protocol** to create a track entry associated with the protocol state of an interface and enter Track view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all its settings.

Syntax

track *track-entry-number* **interface** *interface-type interface-number* **protocol** { **ipv4** | **ipv6** }

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface-type interface-number: Specifies an interface by its type and number.

ipv4: Monitors the IPv4 protocol state. When the IPv4 protocol state of an interface is up, the state of the track object is Positive. When the IPv4 protocol state of an interface is down, the state of the track object is Negative. To display the IPv4 protocol state of an interface, use the **display ip interface brief** command.

ipv6: Monitors the IPv6 protocol state. When the IPv6 protocol state of an interface is up, the state of the track object is Positive. When the IPv6 protocol state of an interface is down, the state of the track object is Negative. To display the IPv6 protocol state of an interface, use the **display ipv6 interface brief** command.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **interface protocol** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then execute the **track interface protocol** command again.

Examples

Create track entry 1 and associate it with the IPv4 protocol state of interface VLAN-interface 2.

```
<Sysname> system-view
[Sysname] track 1 interface vlan-interface 2 protocol ipv4
[Sysname-track-1]
```

Related commands

display track

track ip route reachability

Use **track ip route reachability** to create a track entry associated with a route entry and enter Track view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all its settings.

Syntax

track *track-entry-number* **ip route** *ip-address* { *mask-length* | *mask* } **reachability**

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

ip-address: Specifies the IP address of the route entry associated with the track entry in dotted decimal notation.

mask-length: Specifies the mask length in the range of 0 to 32.

mask: Specifies the mask of the IP address, in dotted decimal notation.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **ip route reachability** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then execute the **track ip route reachability** command again.

Route management does not immediately notify the Track module of the route status changes when the following conditions are met:

- An active/standby device switchover or a RIB process switchover has occurred.

- The status of the monitored route entry is changed before the routing protocol completes the graceful restart.

You can resolve the problem by configuring the nonstop routing feature.

Examples

Create track entry 1 to monitor the status of the route entry 10.1.1.0/24.

```
<Sysname> system-view
[Sysname] track 1 ip route 10.1.1.0 24 reachability
[Sysname-track-1]
```

display track

track lldp neighbor

Use **track lldp neighbor** to create a track entry associated with the neighbor availability status of an LLDP interface and enter Track view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all its settings.

Syntax

track *track-entry-number* **lldp neighbor interface** *interface-type interface-number*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface *interface-type interface-number*: Specifies an LLDP interface by its type and number.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **lldp neighbor** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings for a track entry, execute the **undo track** command to remove the track entry, and then execute the **track lldp neighbor** command again.

Examples

Create track entry 1 to monitor the neighbor availability status of GigabitEthernet 1/0/1.

```
<Sysname> system-view
```

```
[Sysname] track 1 lldp neighbor interface gigabitethernet 1/0/1
[Sysname-track-1]
```

track nqa

Use **track nqa** to create a track entry associated with the reaction entry of an NQA operation and enter Track view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all its settings.

Syntax

track *track-entry-number* **nqa entry** *admin-name operation-tag* **reaction** *item-number*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

entry *admin-name operation-tag*: Specifies the NQA operation to be associated with the track entry. The *admin-name* argument specifies the name of the NQA operation administrator who creates the NQA operation, and is a case-insensitive string of 1 to 32 characters. The *operation-tag* argument specifies the NQA operation tag, and is a case-insensitive string of 1 to 32 characters.

reaction *item-number*: Specifies the reaction entry to be associated with the track entry. The *item-number* argument is the reaction entry ID in the range of 1 to 10.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **nqa** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings for a track entry, execute the **undo track** command to remove the track entry, and then execute the **track nqa** command again.

Examples

Create track entry 1 and associate it with reaction entry 3 of the NQA operation **admin-test**.

```
<Sysname> system-view
[Sysname] track 1 nqa entry admin test reaction 3
[Sysname-track-1]
```

Loopback MAC swap commands

Loopback MAC swap is supported only in R6348P01 and later.

display loopback swap-mac information

Use **display loopback swap-mac information** to display loopback MAC swap test information.

Syntax

display loopback swap-mac information

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display local loopback MAC swap test information.

```
<Sysname> display loopback swap-mac information
  Loopback type             : local
  Loopback state            : running
  Loopback test times(s)    : 60
  Loopback interface        : GigabitEthernet1/0/1
  Loopback output interface : GigabitEthernet1/0/2
  Loopback source MAC       : 0001-0001-0001
  Loopback destination MAC  : 0002-0002-0002
  Loopback vlan             : 10
  Loopback inner vlan       : 0
  Loopback packets          : 0
  Drop packets              : 0
```

Table 1 Command output

Field	Description
Loopback type	Loopback MAC swap test type: • **local**—Local loopback MAC swap. • **remote**—Remote loopback MAC swap.
Loopback state	Loopback MAC swap test status: • **running**—The loopback MAC swap test is started. • **stop**—The loopback MAC swap test is stopped.
Loopback test time(s)	Timeout timer for the test. If the value for this field is none, you need to manually stop the test with the relevant command.
Loopback interface	Interface that swaps the source and destination MAC addresses in the test packets.

Field	Description
Loopback output interface	Interface that loops back the test packets.
Loopback source MAC	Source MAC address that the test packets are required to match.
Loopback destination MAC	Destination MAC address that the test packets are required to match.
Loopback vlan	VLAN ID that the test packets are required to match.
Loopbck inner vlan	Inner VLAN ID that the test packets are required to match.
Loopback packets	Number of received packets that match the specified test parameters.
Drop packets	This field is not supported in the current software version. Number of dropped packets that do not match the specified test parameters.

Related commands

loopback local swap-mac

loopback remote swap-mac

loopback local swap-mac

Use **loopback local swap-mac** to configure local loopback MAC swap parameters.

Use **undo loopback local swap-mac** to delete local loopback MAC swap parameters.

Syntax

loopback local swap-mac source-mac *source-mac-address* **dest-mac** *dest-mac-address* **vlan** *vlan-id* [**inner-vlan** *inner-vlan-id*] *interface interface-type interface-number* [**timeout** { *time-value* | **none** }]

undo loopback local swap-mac

Default

Local loopback MAC swap parameters are not configured.

Views

Ethernet interface view

Predefined user roles

network-admin

network-operator

Parameters

source-mac *source-mac-address*: Specifies the source MAC address that the test packets are required to match. The MAC address must be a unicast MAC address.

dest-mac *dest-mac-address*: Specifies the destination MAC address that the test packets are required to match. The MAC address must be a unicast MAC address.

vlan *vlan-id*: Specifies the VLAN ID that the test packets are required to match, in the range of 1 to 4094.

inner-vlan *inner-vlan-id*: Specifies the inner VLAN ID that the test packets are required to match, in the range of 1 to 4094. If you do not specify this option, the device does not match the inner

VLAN ID of packets. **interface** *interface-type interface-number*: Specifies an interface by its type and number for looping back the test packets.

timeout { *time-value* | **none** }: Specifies the timeout timer for the test. After you start the loopback MAC swap test, the test automatically stops upon expiration of the timeout timer. The value range for the *time-value* argument is 5 to 300 seconds. If you specify the **none** keyword, the loopback MAC swap test does not automatically stop. You can only use the **loopback swap-mac stop** command to manually stop the test. By default, the timeout timer for the loopback MAC swap test is 60 seconds.

Usage guidelines

The device takes a packet as a test packet if its source MAC address, destination MAC address, VLAN ID, and inner VLAN ID match the settings configured in this command.

After configuring local loopback MAC swap parameters, you need to execute the **loopback swap-mac start** command to start the test. After starting the test, the tester sends test packets to the downlink interface on the tested device. The tested device swaps the source and destination MAC addresses in the test packets on the downlink interface, and then loops back the test packets to the tester through the specified interface. In this way, the network connectivity and quality information are obtained.

The test scope for local loopback MAC swap is the network from the tester to the downlink interface on the tested device (including the tested device).

Examples

Configure local loopback MAC swap parameters.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] loopback local swap-mac source-mac 00e0-fc00-0085
dest-mac 00e0-fc00-1004 vlan 100 interface gigabitethernet 1/0/2
```

loopback remote swap-mac

Use **loopback remote swap-mac** to configure remote loopback MAC swap parameters.

Use **undo loopback remote swap-mac** to delete remote loopback MAC swap parameters.

Syntax

loopback remote swap-mac source-mac *source-mac-address* **dest-mac** *dest-mac-address* **vlan** *vlan-id* [**inner-vlan** *inner-vlan-id*] [**timeout** { *time-value* | **none** }]

undo loopback remote swap-mac

Default

Remote loopback MAC swap parameters are not configured.

Views

Ethernet interface view

Predefined user roles

network-admin

network-operator

Parameters

source-mac *source-mac-address*: Specifies the source MAC address that the test packets are required to match. The MAC address must be a unicast MAC address.

dest-mac *dest-mac-address*: Specifies the destination MAC address that the test packets are required to match. The MAC address must be a unicast MAC address.

vlan *vlan-id*: Specifies the VLAN ID that the test packets are required to match, in the range of 1 to 4094.

inner-vlan *inner-vlan-id*: Specifies the inner VLAN ID that the test packets are required to match, in the range of 1 to 4094. If you do not specify this option, the device does not match the inner VLAN ID of packets.

timeout { *time-value* | **none** }: Specifies the timeout timer for the test. After you start the loopback MAC swap test, the test automatically stops upon expiration of the timeout timer. The value range for the *time-value* argument is 5 to 300 seconds. If you specify the **none** keyword, the loopback MAC swap test does not automatically stop. You can only use the **loopback swap-mac stop** command to manually stop the test. By default, the timeout timer for the loopback MAC swap test is 60 seconds.

Usage guidelines

The device takes a packet as a test packet if its source MAC address, destination MAC address, VLAN ID, and inner VLAN ID match the settings configured in this command.

After configuring remote loopback MAC swap parameters, you need to execute the **loopback swap-mac start** command to start the test. After starting the test, the tester sends test packets to the uplink interface on the tested device. The tested device swaps the source and destination MAC addresses in the test packets on the uplink interface, and then loops back the test packets to the tester through the uplink interface. In this way, the network connectivity and quality information are obtained.

The test scope for remote loopback MAC swap is the network from the tester to the uplink interface on the tested device (excluding the tested device).

Examples

Configure remote loopback MAC swap parameters.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] loopback local swap-mac source-mac 00e0-fc00-0085
dest-mac 00e0-fc00-1004 vlan 100
```

loopback swap-mac start

Use **loopback swap-mac start** to start the loopback MAC swap test.

Syntax

loopback swap-mac start

Views

Ethernet interface view

Predefined user roles

network-admin

network-operator

Usage guidelines

After configuring local or remote loopback MAC swap parameters, you need to execute the **loopback swap-mac start** command to start the test.

Both local and remote loopback MAC swap tests will affect normal operation of the network. As a best practice to minimize impact on the network, execute the **loopback swap-mac stop** command immediately to stop the test after it is completed.

Execute the **loopback swap-mac start** command again to start a new test if the previous test automatically stops upon expiration of the timeout timer or is manually stopped with the **loopback swap-mac stop** command.

Examples

Start the loopback MAC swap test.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] loopback swap-mac start
```

loopback swap-mac stop

Use **loopback swap-mac stop** to stop the loopback MAC swap test.

Syntax

loopback swap-mac stop

Views

Ethernet interface view

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This command reference describes the network management and monitoring configuration commands. It covers the commands for viewing system information, collecting traffic statistics, assessing the network performance, synchronizing time for all devices with clocks in your network, and checking and debugging the current network connectivity with the ping, tracert, and debug commands.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.

Convention	Description
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

Ping, tracert, and system debugging commands

debugging

Use **debugging** to enable debugging for a module.

Use **undo debugging** to disable debugging for a module or for all modules.

Syntax

debugging *module-name* [*option*]

undo debugging { **all** | *module-name* [*option*] }

Default

Debugging is disabled for all modules.

Views

User view

Predefined user roles

network-admin

Parameters

module-name: Specifies a module by its name, such as **arp** or **device**. For a list of supported modules, use the **debugging ?** command.

option: Specifies the debugging option for a module. Available options vary by module. To display the debugging options supported by a module, use the **debugging** *module-name* **?** command.

all: Specifies all modules.

Usage guidelines

CAUTION:

Output of excessive debugging messages increases the CPU usage and downgrades the system performance. To guarantee system performance, enable debugging only for modules that are in an exceptional condition.

The system sends generated debug messages to the device information center, which then sends the messages to appropriate destinations based on the log output configuration. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable debugging for the device management module.

```
<Sysname> debugging dev
```

Related commands

display debugging

display debugging

Use **display debugging** to display the enabled debugging features for a module or for all modules.

Syntax

display debugging [*module-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

module-name: Specifies a module by its name. For a list of supported modules, use the **display debugging ?** command. If you do not specify a module name, this command displays the enabled debugging features for all modules.

Examples

Display all enabled debugging features.

```
<Sysname> display debugging
DEV debugging switch is on
```

Related commands

debugging

ping

Use **ping** to test the reachability of the destination IP address and display ping statistics.

Syntax

ping [**ip**] [**-a** *source-ip* | **-c** *count* | **-f** | **-h** *ttl* | **-i** *interface-type interface-number* | **-m** *interval* | **-n** | **-p** *pad* | **-q** | **-r** | **-s** *packet-size* | **-t** *timeout* | **-tos** *tos* | **-v**] * *host*

Views

Any view

Predefined user roles

network-admin

Parameters

ip: Distinguishes between a destination host name and the **ping** command keywords if the name of the destination host is **i**, **ip**, **ipv**, **ipv6**, **l**, **ls**, or **lsp**. For example, you must use the command in the form of **ping ip ip** instead of **ping ip** if the destination host name is **ip**.

-a *source-ip*: Specifies an IP address of the device as the source IP address of ICMP echo requests. If this option is not specified, the source IP address of ICMP echo requests is the primary IP address of the outbound interface.

-c *count*: Specifies the number of ICMP echo requests that are sent to the destination. The value range is 1 to 4294967295, and the default is 5.

-f: Sets the "Don't Fragment" bit in the IP header.

-h *ttl*: Specifies the TTL value of ICMP echo requests. The value range is 1 to 255, and the default is 255.

-i *interface-type interface-number*: Specifies the source interface for ICMP echo requests. If you do not specify this option, the system uses the primary IP address of the matching route's egress interface as the source interface for ICMP echo requests.

-m *interval*: Specifies the interval (in milliseconds) to send ICMP echo requests. The value range is 1 to 65535, and the default is 200.

-n: Disables domain name resolution for the *host* argument. If the *host* argument represents the host name of the destination, and if this keyword is not specified, the device translates *host* into an address.

-p *pad*: Specifies the value of the **pad** field in an ICMP echo request, in hexadecimal format, 1 to 8 bits. The *pad* argument is in the range of 0 to ffffffff. If the specified value is less than 8 bits, 0s are added in front of the value to extend it to 8 bits. For example, if *pad* is configured as 0x2f, then the packets are padded with 0x0000002f to make the total length of the packet meet the requirements of the device. By default, the padded value starts from 0x01 up to 0xff, where another round starts again if necessary, such as 0x010203…feff01….

-q: Displays only the summary statistics. If this keyword is not specified, the system displays all the ping statistics.

-r: Records the addresses of the hops (up to 9) the ICMP echo requests passed. If this keyword is not specified, the addresses of the hops that the ICMP echo requests passed are not recorded.

-s *packet-size*: Specifies the length (in bytes) of ICMP echo requests (excluding the IP packet header and the ICMP packet header). The value range is 20 to 9600, and the default is 56.

-t *timeout*: Specifies the timeout time (in milliseconds) of an ICMP echo reply. The value range is 0 to 65535, and the default is 2000. If the source does not receive an ICMP echo reply within the timeout, it considers the ICMP echo reply timed out.

-tos *tos*: Specifies the ToS value of ICMP echo requests. The value range is 0 to 255, and the default is 0.

-v: Displays non-ICMP echo reply packets. If this keyword is not specified, the system does not display non-ICMP echo reply packets.

host: Specifies the IP address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

To ping a device identified by its host name, configure the DNS settings on the device first. If the DNS settings are not configured, the ping operation fails.

To abort the ping operation during the execution of the command, press **Ctrl+C**.

Examples

Test whether the device with an IP address of 1.1.2.2 is reachable.

```
<Sysname> ping 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL_C to break
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=2.137 ms
56 bytes from 1.1.2.2: icmp_seq=1 ttl=254 time=2.051 ms
56 bytes from 1.1.2.2: icmp_seq=2 ttl=254 time=1.996 ms
56 bytes from 1.1.2.2: icmp_seq=3 ttl=254 time=1.963 ms
56 bytes from 1.1.2.2: icmp_seq=4 ttl=254 time=1.991 ms

--- Ping statistics for 1.1.2.2 ---
```

```
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.963/2.028/2.137/0.062 ms
```

Test whether the device with an IP address of 1.1.2.2 is reachable. Only results are displayed.

```
<Sysname> ping -q 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL_C to break

--- Ping statistics for 1.1.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.962/2.196/2.665/0.244 ms
```

Test whether the device with an IP address of 1.1.2.2 is reachable. The IP addresses of the hops that the ICMP packets passed in the path are displayed.

```
<Sysname> ping -r 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL_C to break
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=4.685 ms
RR:      1.1.2.1
         1.1.2.2
         1.1.1.2
         1.1.1.1
56 bytes from 1.1.2.2: icmp_seq=1 ttl=254 time=4.834 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=2 ttl=254 time=4.770 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=3 ttl=254 time=4.812 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=4 ttl=254 time=4.704 ms  (same route)

--- Ping statistics for 1.1.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.685/4.761/4.834/0.058 ms
```

The output shows the following information:

- The destination is reachable.
- The route is 1.1.1.1 <-> {1.1.1.2; 1.1.2.1} <-> 1.1.2.2.

Table 1 Command output

Field	Description
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL_C to break	Test whether the device with IP address 1.1.2.2 is reachable. There are 56 bytes in each ICMP echo request. Press **Ctrl+C** to abort the ping operation.
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=4.685 ms	Received ICMP echo replies from the device whose IP address is 1.1.2.2. If no echo reply is received within the timeout period, no information is displayed. • **bytes**—Number of bytes in the ICMP echo reply. • **icmp_seq**—Packet sequence, used to determine whether a segment is lost, disordered or repeated. • **ttl**—TTL value in the ICMP echo reply. • **time**—Response time.
RR:	Routers through which the ICMP echo request passed. They are displayed in inversed order, which means the router with a smaller distance to the destination is displayed first.
--- Ping statistics for 1.1.2.2 ---	Statistics on data received and sent in the ping operation.
5 packet(s) transmitted	Number of ICMP echo requests sent.

Field	Description
5 packet(s) received	Number of ICMP echo replies received.
0.0% packet loss	Percentage of unacknowledged packets to the total packets sent.
round-trip min/avg/max/std-dev = 4.685/4.761/4.834/0.058 ms	Minimum/average/maximum/standard deviation response time, in milliseconds.

ping ipv6

Use **ping ipv6** to test the reachability of the destination IPv6 address and display IPv6 ping statistics.

Syntax

ping ipv6 [**-a** *source-ipv6* | **-c** *count* | **-i** *interface-type interface-number* | **-m** *interval* | **-q** | **-s** *packet-size* | **-t** *timeout* | **-tc** *traffic-class*| **-v**] * *host*

network-admin

Parameters

-a *source-ipv6*: Specifies an IPv6 address of the device as the source IP address of ICMP echo requests. If this option is not specified, the source IPv6 address of ICMP echo requests is the IPv6 address of the outbound interface. See RFC 3484 for information about the address selection rule.

-c *count*: Specifies the number of ICMPv6 echo requests that are sent to the destination. The value range is 1 to 4294967295, and the default is 5.

-i *interface-type interface-number*: Specifies the source interface for ICMPv6 echo requests. This option must be specified when the destination address is a multicast address or a link local address. If you do not specify this option, the system uses the primary IP address of the matching route's egress interface as the source interface for ICMPv6 echo requests.

-m *interval*: Specifies the interval (in milliseconds) to send an ICMPv6 echo reply. The value range is 1 to 65535, and the default is 1000.

-q: Displays only the summary statistics. If you do not specify this keyword, the system displays all the ping statistics.

-s *packet-size*: Specifies the length (in bytes) of ICMPv6 echo requests (excluding the IPv6 packet header and the ICMPv6 packet header). The value range is 20 to 9600, and the default is 56.

-t *timeout*: Specifies the timeout time (in milliseconds) of an ICMPv6 echo reply. The value range is 0 to 65535, and the default is 2000.

-tc *traffic-class*: Specifies the traffic class value in an ICMPv6 packet. The value range is 0 to 255 and the default is 0.

-v: Displays detailed information (including the **dst** field and the **idx** field) about ICMPv6 echo replies. If this keyword is not specified, the system only displays brief information (not including the **dst** field and the **idx** field) about ICMPv6 echo replies.

host: Specifies the IPv6 address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

To ping a device identified by its host name, configure the DNS settings on the device first. If the DNS settings are not configured, the IPv6 ping operation fails.

To abort the IPv6 ping operation during the execution of the command, press **Ctrl+C**.

Examples

Test whether the IPv6 address (2001::2) is reachable.

```
<Sysname> ping ipv6 2001::2
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL_C to break
56 bytes from 2001::2, icmp_seq=0 hlim=64 time=62.000 ms
56 bytes from 2001::2, icmp_seq=1 hlim=64 time=23.000 ms
56 bytes from 2001::2, icmp_seq=2 hlim=64 time=20.000 ms
56 bytes from 2001::2, icmp_seq=3 hlim=64 time=4.000 ms
56 bytes from 2001::2, icmp_seq=4 hlim=64 time=16.000 ms

--- Ping6 statistics for 2001::2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Test whether the IPv6 address (2001::2) is reachable. Only the statistics are displayed.

```
<Sysname> ping ipv6 –q 2001::2
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL_C to break

--- Ping6 statistics for 2001::2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Test whether the IPv6 address (2001::2) is reachable. Detailed ping information is displayed.

```
<Sysname> ping ipv6 –v 2001::2
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL_C to break
56 bytes from 2001::2, icmp_seq=0 hlim=64 dst=2001::1 idx=3 time=62.000 ms
56 bytes from 2001::2, icmp_seq=1 hlim=64 dst=2001::1 idx=3 time=23.000 ms
56 bytes from 2001::2, icmp_seq=2 hlim=64 dst=2001::1 idx=3 time=20.000 ms
56 bytes from 2001::2, icmp_seq=3 hlim=64 dst=2001::1 idx=3 time=4.000 ms
56 bytes from 2001::2, icmp_seq=4 hlim=64 dst=2001::1 idx=3 time=16.000 ms

--- Ping6 statistics for 2001::2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Table 2 Command output

Field	Description
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL_C to break	An ICMPv6 echo reply with a data length of 56 bytes is sent from 2001::1 to 2001::2. Press **Ctrl+C** to abort the IPv6 ping operation.

Field	Description
56 bytes from 2001::2, icmp_seq=1 hlim=64 dst=2001::1 idx=3 time=62.000 ms	Received ICMPv6 echo replies from the device whose IPv6 address is 2001::2. • The number of data bytes is 56. • The packet sequence is 1. • The hop limit value is 64. • The destination address is 2001::1. Specify the **-v** keyword to display this field. • The index for the packet inbound interface is 3. Specify the **-v** keyword to display this field. • The response time is 62 milliseconds.
--- Ping6 statistics for 2001::2 ------	Statistics on data received and sent in an IPv6 ping operation.
5 packet(s) transmitted	Number of ICMPv6 echo requests sent.
5 packet(s) received	Number of ICMPv6 echo replies received.
0.0% packet loss	Percentage of unacknowledged packets to the total packets sent.
round-trip min/avg/max/ std-dev =4.000/25.000/62.000/20.000 ms	Minimum/average/maximum/standard deviation response time, in milliseconds.

tracert

Use **tracert** to trace the path that the packets traverse from source to destination.

Syntax

tracert [**-a** *source-ip* | **-f** *first-ttl* | **-m** *max-ttl* | **-p** *port* | **-q** *packet-number* | **-t** *tos* | **-w** *timeout*] * *host*

Views

Any view

Predefined user roles

network-admin

Parameters

-a *source-ip*: Specifies an IP address of the device as the source IP address of probe packets. If this option is not specified, the source IP address of probe packets is the primary IP address of the outbound interface.

-f *first-ttl*: Specifies the TTL of the first packet sent to the destination. The value range is 1 to 255, and the default is 1. It must be no greater than the value of the *max-ttl* argument.

-m *max-ttl*: Specifies the maximum number of hops allowed for a probe packet. The value range is 1 to 255, and the default is 30. It must be no smaller than the value of the *first-ttl* argument.

-p *port*: Specifies an invalid UDP port of the destination. The value range is 1 to 65535, and the default is 33434.

-q *packet-number*: Specifies the number of probe packets to send per hop. The value range is 1 to 65535, and the default is 3.

-t *tos*: Specifies the ToS value of probe packets. The value range is 0 to 255, and the default is 0.

-w *timeout*: Specifies the timeout time in milliseconds of the reply packet for a probe packet. The value range is 1 to 65535, and the default is 5000.

host: Specifies the IP address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

After identifying network failure with the **ping** command, use the **tracert** command to locate failed nodes.

The output from the **tracert** command includes IP addresses of all the Layer 3 devices that the packets traverse from source to destination. Asterisks (* * *) are displayed if the device cannot reply with an ICMP error message. The reason might be the destination is unreachable or sending ICMP timeout/destination unreachable packets is disabled.

Before starting a tracert operation, you must enable sending of ICMP destination unreachable messages on the intermediate devices between the source and destination. The tracert operation stops if any one of the following ICMP destination unreachable messages is received:

- **!N**—Network unreachable.
- **!H**—Destination host unreachable.
- !**P**—Protocol unreachable. The protocol number is unknown.
- **!F**—Fragmentation needed. This message indicates that packet fragmentation is needed but the "Don't Fragment" bit is set on an immediate device.
- **!W**—Destination host unknown.
- **!Q**—Network unreachable for ToS.
- **!T**—Host unreachable for ToS.
- **!X**—Communication administratively prohibited by filtering policies.
- **!V**—Host precedence violation.
- **!C**—Precedence cutoff in effect.

To abort the tracert operation during the execution of the command, press **Ctrl+C**.

Examples

Display the path that the packets traverse from source to destination (1.1.2.2).

```
<Sysname> tracert 1.1.2.2
traceroute to 1.1.2.2 (1.1.2.2), 30 hops at most, 40 bytes each packet, press CTRL_C to break
 1  1.1.1.2 (1.1.1.2) 673 ms 425 ms 30 ms
 2  1.1.2.2 (1.1.2.2) [AS 100] 580 ms 470 ms 80 ms
```

Table 3 Command output

Field	Description
traceroute to 1.1.2.2 (1.1.2.2)	Display the route that the IP packets traverse from the current device to the device whose IP address is 1.1.2.2.
hops at most	Maximum number of hops of the probe packets, which can be set by the **-m** keyword.
bytes each packet	Number of bytes of a probe packet.
press CTRL_C to break	During the execution of the command, press **Ctrl+C** to abort the tracert operation.

Field	Description
2 1.1.2.2 (1.1.2.2) [AS 100] 580 ms 470 ms 80 ms	Probe result of the probe packets that contain a TTL value of 2, including the following information about the second hop: • Domain name of the hop. If no domain name is configured, the IP address is displayed as the domain name. • IP address of the hop. The IP address is displayed in parentheses. • Number of the AS that the hop belongs to. The AS number appears only when it is found for the hop in the specified routing table. • The round-trip time of the probe packets. The number of packets that can be sent in each probe can be set by using the **-q** keyword.

tracert ipv6

Use **tracert ipv6** to display the path that the IPv6 packets traverse from source to destination.

Syntax

tracert ipv6 [**-f** *first-hop* | **-m** *max-hops* | **-p** *port* | **-q** *packet-number* | **-t** *traffic-class* | **-w** *timeout*] * *host*

Views

Any view

Predefined user roles

network-admin

Parameters

-f *first-hop*: Specifies the TTL value of the first packet. The value range is 1 to 255, and the default is 1. The value must be no greater than the value of the *max-hops* argument.

-m *max-hops*: Specifies the maximum number of hops allowed for a packet. The value range is 1 to 255, and the default is 30. The value must be no smaller than the value of the *first-hop* argument.

-p *port*: Specifies an invalid UDP port of the destination. The value range is 1 to 65535, and the default is 33434.

-q *packet-number*: Specifies the number of probe packets sent each time. The value range is 1 to 65535, and the default is 3.

-t *traffic-class*: Specifies the traffic class value in an IPv6 probe packet. The value range is 0 to 255, and the default is 0.

-w *timeout*: Specifies the timeout time (in milliseconds) of the reply packet of a probe packet. The value range is 1 to 65535, and the default is 5000.

host: Specifies the IPv6 address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

After identifying network failure with the **ping ipv6** command, you can use the **tracert ipv6** command to locate failed nodes.

The output from the **tracert ipv6** command includes IPv6 addresses of all the Layer 3 devices that the packets traverse from source to destination. Asterisks (* * *) are displayed if the device

cannot reply with an ICMP error message. The reason might be the destination is unreachable or sending ICMP timeout/destination unreachable packets is disabled.

Before starting an IPv6 tracert operation, you must enable sending of ICMPv6 destination unreachable messages on the intermediate devices between the source and destination. The IPv6 tracert operation stops if any one of the following ICMPv6 destination unreachable messages is received:

- **!N**—No route to destination.
- **!P**—Communication with destination administratively prohibited by filtering policies.
- **!A**—Address unreachable. The unreachable reason is unknown.
- **!S**—Beyond scope of source address. This message is displayed if the probe packet has a link-local source address and a non-link-local destination address. Such a packet cannot be delivered to the destination without leaving the scope of the source address.

To abort the tracert operation during the execution of the command, press **Ctrl+C**.

Examples

Display the path that the packets traverse from source to destination (2001:3::2).

```
<Sysname> tracert ipv6 2001:3::2
traceroute to 2001:3::2(2001:3::2), 30 hops at most, 60 byte packets, press CTRL_C to break
 1  2001:1::2  0.661 ms  0.618 ms  0.579 ms
 2  2001:2::2 [AS 100]  0.861 ms  0.718 ms  0.679 ms
 3  2001:3::2 [AS 200]  0.822 ms  0.731 ms  0.708 ms
```

Table 4 Command output

Field	Description
traceroute to 2001:3::2	Display the route that the IPv6 packets traverse from the current device to the device whose IP address is 2001:3:2.
hops at most	Maximum number of hops of the probe packets, which can be set by the **-m** keyword.
byte packets	Number of bytes of a probe packet.
2 2001:2::2 [AS 100] 0.861 ms 0.718 ms 0.679 ms	Probe result of the probe packets that contain a hoplimit value of 2, including the following information about the second hop: • IPv6 address of the hop. • Number of the AS the hop belongs to. The AS number appears only when it is found for the hop in the specified routing table. • The round-trip time of the probe packets. The number of packets that can be sent in each probe can be set by using the **-q** keyword.

Contents

NQA commands

NQA client commands

advantage-factor

Use **advantage-factor** to set the advantage factor to be used for calculating Mean Opinion Scores (MOS) and Calculated Planning Impairment Factor (ICPIF) values.

Use **undo advantage-factor** to restore the default.

Syntax

advantage-factor *factor*

undo advantage-factor

Default

The advantage factor is 0.

Views

Voice operation view

Predefined user roles

network-admin

Parameters

factor: Specifies the advantage factor in the range of 0 to 20.

Usage guidelines

The evaluation of voice quality depends on users' tolerance for voice quality. For users with higher tolerance for voice quality, use the **advantage-factor** command to set an advantage factor. When the system calculates the ICPIF value, it subtracts the advantage factor to modify ICPIF and MOS values for voice quality evaluation.

Examples

Set the advantage factor to 10 for the voice operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type voice
[Sysname-nqa-admin-test-voice] advantage-factor 10
```

codec-type

Use **codec-type** to configure the codec type for the voice operation.

Use **undo codec-type** to restore the default.

Syntax

codec-type { **g711a** | **g711u** | **g729a** }

undo codec-type

Default

The codec type for the voice operation is G.711 A-law.

Views

Voice operation view

Predefined user roles

network-admin

Parameters

g711a: Specifies G.711 A-law codec type.

g711u: Specifies G.711 μ-law codec type

g729a: Specifies G.729 A-law codec type.

Examples

Set the codec type to **g729a** for the voice operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type voice
[Sysname-nqa-admin-test-voice] codec-type g729a
```

community read

Use **community read** to specify the community name for the SNMP operation.

Use **undo community read** to restore the default.

Syntax

community read { **cipher** | **simple** } *community-name*

undo community read

Default

The SNMP operation uses the community name **public**.

Views

SNMP operation view

Predefined user roles

network-admin

Parameters

cipher: Specifies a community name in encrypted form.

simple: Specifies a community name in plaintext form. For security purposes, the community name specified in plaintext form will be stored in encrypted form.

community-name: Specifies the community name. Its plaintext form is a case-sensitive string of 1 to 32 characters. Its encrypted form is a case-sensitive string of 33 to 73 characters.

Usage guidelines

You must specify the community name for the SNMP operation when both of the following conditions exist:

- The SNMP operation uses the SNMPv1 or SNMPv2c agent.
- The SNMPv1 or SNMPv2c agent is configured with a read-only or read-write community name.

The specified community name must be the same as the community name configured on the SNMP agent.

The community name configuration is not required if the SNMP operation uses the SNMPv3 agent.

For more information about SNMP, see "Configuring SNMP."

Examples

Specify **readaccess** as the community name for the SNMP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type snmp
[Sysname-nqa-admin-test-snmp] community read simple readaccess
```

data-fill

Use **data-fill** to configure the payload fill string for probe packets.

Use **undo data-fill** to restore the default.

Syntax

data-fill *string*

undo data-fill

Default

The default payload fill string is the hexadecimal string 00010203040506070809.

Views

ICMP/UDP echo operation view

Path jitter/UDP jitter/voice operation view

ICMP/TCP/UDP template view

Predefined user roles

network-admin

Parameters

string: Specifies a case-sensitive string of 1 to 200 characters.

Usage guidelines

If the payload length is smaller than the string length, only the first part of the string is filled. For example, if you configure the string as **abcd** and set the payload size to 3 bytes, **abc** is filled.

If the payload length is greater than the string length, the system fills the payload with the string cyclically until the payload is full. For example, if you configure the string as **abcd** and the payload size as 6 bytes, **abcdab** is filled.

How the string is filled depends on the operation type.

- For the ICMP echo operation, the string fills the whole payload of an ICMP echo request.
- For the UDP echo operation, the first five bytes of the payload of a UDP packet are for special purpose. The string fills the remaining part of payload.
- For the UDP jitter operation, the first 68 bytes of the payload of a UDP packet are for special purpose. The string fills the remaining part of the payload.
- For the voice operation, the first 16 bytes of the payload of a UDP packet are for special purpose. The string fills the remaining part of the payload.

- For the path jitter operation, the first four bytes of the payload of an ICMP echo request are for special purpose. The string fills the remaining part of payload.

Examples

Specify **abcd** as the payload fill string for ICMP echo requests.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] data-fill abcd
```

In TCP template view, specify **abcd** as the payload fill string for probe packets.

```
<Sysname> system-view
[Sysname] nqa template tcp tcptplt
[Sysname-nqatplt-tcp-tcptplt] data-fill abcd
```

data-size

Use **data-size** to set the payload size for each probe packet.

Use **undo data-size** to restore the default.

Syntax

data-size *size*

undo data-size

Default

The default payload size of a probe packet for different operations is described in Table 1.

Table 1 Default payload size of a probe packet

Operation type	Codec type	Default size (bytes)
ICMP echo	N/A	100
UDP echo	N/A	100
UDP jitter	N/A	100
UDP tracert	N/A	100
Path jitter	N/A	100
Voice	G.711 A-law	172
Voice	G.711 μ-law	172
Voice	G.729 A-law	32

Views

ICMP/UDP echo operation view

UDP tracert operation view

Path jitter/UDP jitter/voice operation view

ICMP/UDP template view

Predefined user roles

network-admin

Parameters

size: Specifies the payload size. Available value ranges include:

- 20 to 65507 bytes for the ICMP echo, UDP echo, or UDP tracert operation.
- 68 to 65507 bytes for the UDP jitter or path jitter operation.
- 16 to 65507 bytes for the voice operation.

Usage guidelines

In ICMP echo and path jitter operations, the command sets the payload size for each ICMP echo request.

In UDP echo, UDP jitter, UDP tracert, and voice operations, the command sets the payload size for each UDP packet.

Examples

Set the payload size to 80 bytes for each ICMP echo request.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] data-size 80
```

In ICMP template view, set the payload size to 80 bytes for each probe packet.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] data-size 80
```

description

Use **description** to configure a description for an NQA operation, such as the operation type or purpose.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for an NQA operation.

Views

Any NQA operation view

Any NQA template view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 200 characters.

Examples

Configure the description as **icmp-probe** for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
```

```
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] description icmp-probe
```

In ICMP template view, configure the description as **icmp-probe** for the NQA operation.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] description icmp-probe
```

destination host

Use **destination host** to configure the destination host name for the operation.

Use **undo destination host** to restore the default.

Syntax

destination host *host-name*

undo destination host

Default

No destination host name is configured for the operation.

Views

UDP tracert operation view

Predefined user roles

network-admin

Parameters

host-name: Specifies the destination host name, a case-sensitive string of 1 to 254 characters. The host name can contain letters, digits, hyphens (-), underscores (_), and dots (.), but consecutive dots (.) are not allowed. If the host name is a series of dot-separated labels, each label can contain a maximum of 63 characters.

Examples

Specify **www.test.com** as the destination host name for the UDP tracert operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-tracert
[Sysname-nqa-admin-test-udp-tracert] destination host www.test.com
```

destination ip

Use **destination ip** to configure the destination IPv4 address for the operation.

Use **undo destination ip** to restore the default.

Syntax

destination ip *ip-address*

undo destination ip

Default

No destination IPv4 address is configured for an operation.

Views

Predefined user roles

network-admin

Parameters

ip-address: Specifies the destination IPv4 address for the operation.

Examples

Specify 10.1.1.1 as the destination IPv4 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] destination ip 10.1.1.1
```

In ICMP template view, specify 10.1.1.1 as the destination IPv4 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] destination ip 10.1.1.1
```

destination ipv6

Use **destination ipv6** to configure the destination IPv6 address for the operation.

Use **undo destination ipv6** to restore the default.

Syntax

destination ipv6 *ipv6-address*

undo destination ipv6

Default

No destination IPv6 address is configured for an operation.

Views

ICMP echo operation view

DNS/ICMP/RADIUS/SSL/TCP/TCP half open/UDP template view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the destination IPv6 address for the operation. IPv6 link-local addresses are not supported.

Examples

Specify 1::1 as the destination IPv6 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] destination ipv6 1::1
```

In ICMP template view, specify 1::1 as the destination IPv6 address for the operation.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] destination ipv6 1::1
```

destination port

Use **destination port** to configure the destination port number for the operation.

Use **undo destination port** to restore the default.

Syntax

destination port *port-number*

undo destination port

Default

The destination port number is 33434 for the UDP tracert operation and 161 for the SNMP operation.

No destination port number is configured for other types of operations.

The destination port numbers for the operations that use the following NQA templates are:

- 53 for the DNS template.
- 1812 for the RADIUS template.

No destination port number is configured for other types of NQA templates.

Views

TCP/UDP echo operation view

UDP tracert operation view

UDP jitter/voice operation view

DNS/RADIUS/SSL/TCP/UDP template view

Predefined user roles

network-admin

Parameters

port-number: Specifies the destination port number for the operation, in the range of 1 to 65535.

Examples

Set the destination port number to 9000 for the UDP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-echo
[Sysname-nqa-admin-test-udp-echo] destination port 9000
```

In TCP template view, set the destination port number to 9000 for the NQA operation.

```
<Sysname> system-view
[Sysname] nqa template tcp tcptplt
[Sysname-nqatplt-tcp-tcptplt] destination port 9000
```

display nqa history

Use **display nqa history** to display the history records of NQA operations.

Syntax

display nqa history [*admin-name operation-tag*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays the history records of all NQA operations.

Usage guidelines

The **display nqa history** command does not display the results or statistics of the following operations:

- ICMP jitter.
- Path jitter.
- UDP jitter.
- Voice.

To view the results or statistics of the ICMP jitter, path jitter, UDP jitter, and voice operations, use the **display nqa result** or **display nqa statistics** command.

Examples

Display the history records of the UDP tracert operation with administrator name **administrator** and operation tag **tracert**.

```
<Sysname> display nqa history administrator tracert
NQA entry (admin administrator, tag tracert) history records:
Index      TTL  Response  Hop IP          Status          Time
1          2    328       4.1.1.1         Succeeded       2013-09-09 14:46:06.2
1          2    328       4.1.1.1         Succeeded       2013-09-09 14:46:05.2
1          2    328       4.1.1.1         Succeeded       2013-09-09 14:46:04.2
1          1    328       3.1.1.2         Succeeded       2013-09-09 14:46:03.2
1          1    328       3.1.1.1         Succeeded       2013-09-09 14:46:02.2
1          1    328       3.1.1.1         Succeeded       2013-09-09 14:46:01.2
```

Display the history records of the NQA operation with administrator name **administrator** and operation tag **test**.

```
<Sysname> display nqa history administrator test
NQA entry (admin administrator, tag test) history records:
  Index      Response     Status           Time
  10         329          Succeeded        2011-04-29 20:54:26.5
  9          344          Succeeded        2011-04-29 20:54:26.2
  8          328          Succeeded        2011-04-29 20:54:25.8
```

```
7           328           Succeeded        2011-04-29 20:54:25.5
6           328           Succeeded        2011-04-29 20:54:25.1
5           328           Succeeded        2011-04-29 20:54:24.8
4           328           Succeeded        2011-04-29 20:54:24.5
3           328           Succeeded        2011-04-29 20:54:24.1
2           328           Succeeded        2011-04-29 20:54:23.8
1           328           Succeeded        2011-04-29 20:54:23.4
```

Table 2 Command output

Field	Description
Index	History record ID. The history records in one UDP tracert operation have the same ID.
TTL	If the routing table bypass feature is not enabled in the operation, this field displays the TTL value in the probe packet. If the routing table bypass feature is enabled, this field value varies by the **init-ttl** command. However, the actual TTL value in the probe packet is fixed at 1.
Response	Round-trip time if the operation succeeds, timeout time upon timeout, or 0 if the operation cannot be completed, in milliseconds.
Hop IP	IP address of the node that sent the reply packet.
Status	Status of the operation result: • Succeeded. • Unknown error. • Internal error. • Timeout.
Time	Time when the operation was completed.

display nqa reaction counters

Use **display nqa reaction counters** to display the current monitoring results of reaction entries.

Syntax

display nqa reaction counters [*admin-name operation-tag* [*item-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays the current monitoring results of reaction entries for all NQA operations.

item-number: Specifies a reaction entry by its ID in the range of 1 to 10. If you do not specify a reaction entry, the command displays the results of all reaction entries.

Usage guidelines

The result fields display hyphens (-) in one of the following conditions:

- The threshold type is the average value.
- The monitored performance metric is ICPIF or MOS of the voice operation.

The monitoring results of an operation are accumulated, and are not cleared after the operation completes.

Examples

Display the monitoring results of all reaction entries of the ICMP echo operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa reaction counters admin test
NQA entry (admin admin, tag test) reaction counters:
  Index  Checked Element  Threshold Type  Checked Num  Over-threshold Num
  1      probe-duration   accumulate      12           4
  2      probe-duration   average         -            -
  3      probe-duration   consecutive     160          56
  4      probe-fail       accumulate      12           0
  5      probe-fail       consecutive     162          2
```

Table 3 Command output

Field	Description
Index	ID of a reaction entry.
Checked Element	Monitored performance metric. The available performance metrics vary by NQA operation type. For more information, see Table 4 and Table 5.
Threshold Type	Threshold type.
Checked Num	Number of targets that have been monitored for data collection.
Over-threshold Num	Number of threshold violations.

Table 4 Monitored performance metrics for DHCP/DLSw/DNS/FTP/HTTP/ICMP echo/SNMP/TCP/UDP echo operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
probe-duration	accumulate	Probes after the operation starts.	Number of completed probes.	Number of probes with duration exceeding the threshold.
	average	N/A	N/A	N/A
	consecutive	Probes after the operation starts.	Number of completed probes.	Number of probes with duration exceeding the threshold.
probe-fail	accumulate	Probes after the operation starts.	Number of completed probes.	Number of probe failures.

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
	consecutive	Probes after the operation starts.	Number of completed probes.	Number of probe failures.

Table 5 Monitored performance metrics for ICMP jitter/UDP jitter/voice operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
RTT	accumulate	Packets sent after the operation starts.	Number of sent packets.	Number of packets with round-trip time exceeding threshold.
	average	N/A	N/A	N/A
jitter-DS/jitter-SD	accumulate	Packets sent after the operation starts.	Number of sent packets.	Number of packets with the one-way jitter exceeding the threshold.
	average	N/A	N/A	N/A
OWD-DS/OWD-SD	N/A	Packets sent after the operation starts.	Number of sent packets.	Number of packets with the one-way delay exceeding the threshold.
packet-loss	accumulate	Packets sent after the operation starts.	Number of sent packets.	Total packet loss.
ICPIF/MOS (available only for the voice operation)	N/A	N/A	N/A	N/A

display nqa result

Use **`display nqa result`** to display the most recent result of an NQA operation.

Syntax

`display nqa result` [*`admin-name operation-tag`*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`admin-name operation-tag`: Specifies an NQA operation by its administrator name and operation tag. The *`admin-name`* argument represents the name of the administrator who creates the NQA operation. The *`operation-tag`* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays the most recent results of all NQA operations.

Examples

Display the most recent result of the TCP operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 1              Receive response times: 1
    Min/Max/Average round trip time: 35/35/35
    Square-Sum of round trip time: 1225
    Last succeeded probe time: 2011-05-29 10:50:33.2
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to disconnect: 0
    Failures due to no connection: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

Display the most recent result of the ICMP jitter operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 10             Receive response times: 10
    Min/Max/Average round trip time: 1/2/1
    Square-Sum of round trip time: 13
    Last packet received time: 2015-03-09 17:40:29.8
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
    Packets out of sequence: 0
    Packets arrived late: 0
  ICMP-jitter results:
   RTT number: 10
    Min positive SD: 0                   Min positive DS: 0
    Max positive SD: 0                   Max positive DS: 0
    Positive SD number: 0                Positive DS number: 0
    Positive SD sum: 0                   Positive DS sum: 0
    Positive SD average: 0               Positive DS average: 0
    Positive SD square-sum: 0            Positive DS square-sum: 0
    Min negative SD: 1                   Min negative DS: 2
    Max negative SD: 1                   Max negative DS: 2
    Negative SD number: 1                Negative DS number: 1
    Negative SD sum: 1                   Negative DS sum: 2
    Negative SD average: 1               Negative DS average: 2
    Negative SD square-sum: 1            Negative DS square-sum: 4
    SD average: 1                        DS average: 2
  One way results:
    Max SD delay: 1                      Max DS delay: 2
```

```
    Min SD delay: 1                         Min DS delay: 2
    Number of SD delay: 1                   Number of DS delay: 1
    Sum of SD delay: 1                      Sum of DS delay: 2
    Square-Sum of SD delay: 1               Square-Sum of DS delay: 4
    Lost packets for unknown reason: 0
```

Display the most recent result of the UDP jitter operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 10             Receive response times: 10
    Min/Max/Average round trip time: 15/46/26
    Square-Sum of round trip time: 8103
    Last packet received time: 2011-05-29 10:56:38.7
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
    Packets out of sequence: 0
    Packets arrived late: 0
  UDP-jitter results:
   RTT number: 10
    Min positive SD: 8                      Min positive DS: 8
    Max positive SD: 18                     Max positive DS: 8
    Positive SD number: 5                   Positive DS number: 2
    Positive SD sum: 75                     Positive DS sum: 32
    Positive SD average: 15                 Positive DS average: 16
    Positive SD square-sum: 1189            Positive DS square-sum: 640
    Min negative SD: 8                      Min negative DS: 1
    Max negative SD: 24                     Max negative DS: 30
    Negative SD number: 4                   Negative DS number: 7
    Negative SD sum: 56                     Negative DS sum: 99
    Negative SD average: 14                 Negative DS average: 14
    Negative SD square-sum: 946             Negative DS square-sum: 1495
    SD average: 14                          DS average: 14
  One way results:
    Max SD delay: 22                        Max DS delay: 23
    Min SD delay: 7                         Min DS delay: 7
    Number of SD delay: 10                  Number of DS delay: 10
    Sum of SD delay: 125                    Sum of DS delay: 132
    Square-Sum of SD delay: 1805            Square-Sum of DS delay: 1988
    SD lost packets: 0                      DS lost packets: 0
    Lost packets for unknown reason: 0
```

Display the most recent result of the voice operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 1000           Receive response times: 0
```

```
    Min/Max/Average round trip time: 0/0/0
    Square-Sum of round trip time: 0
    Last packet received time: 0-00-00 00:00:00.0
  Extended results:
    Packet loss ratio: 100%
    Failures due to timeout: 1000
    Failures due to internal error: 0
    Failures due to other errors: 0
    Packets out of sequence: 0
    Packets arrived late: 0
  Voice results:
   RTT number: 0

```

Display the most recent result of the UDP tracert operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 6              Receive response times: 6
    Min/Max/Average round trip time: 35/35/35
    Square-Sum of round trip time: 1225
    Last succeeded probe time: 2013-09-09 14:23:24.5
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

```
UDP-tracert results:
  TTL     Hop IP              Time
  1       3.1.1.1             2013-09-09 14:23:24.5
  2       4.1.1.1             2013-09-09 14:23:24.5
```

Table 6 Command output

Field	Description
Data collecting in progress	The operation is in progress.
Send operation times	Number of operations.
Receive response times	Number of response packets received.
Min/Max/Average round trip time	Minimum/maximum/average round-trip time in milliseconds.
Square-Sum of round trip time	Square sum of round-trip time.
Last succeeded probe time	Time when the last successful probe was completed. If no probes are successful in an operation, the field displays **0**. This field is not available for UDP jitter, path jitter, and voice operations.
Last packet received time	Time when the last response packet was received. If no response packets in a probe were received, the field displays **0**. This field is available only for UDP jitter and voice operations.
Packet loss ratio	Average packet loss ratio.
Failures due to timeout	Number of timeout occurrences in an operation.
Failures due to disconnect	Number of disconnections by the peer.
Failures due to no connection	Number of failures to connect with the peer.
Failures due to internal error	Number of failures due to internal errors.
Failures due to other errors	Failures due to other errors.
Packets out of sequence	Number of failures due to out-of-sequence packets.
ICMP-jitter results	ICMP jitter operation results. This field is available only for the ICMP jitter operation.
Packets arrived late	Number of response packets received after a probe times out.
UDP-jitter results	UDP jitter operation results. This field is available only for the UDP jitter operation.
Voice results	Voice operation results. This field is available only for the voice operation.
RTT number	Number of response packets received.
Min positive SD	Minimum positive jitter from source to destination.
Min positive DS	Minimum positive jitter from destination to source.
Max positive SD	Maximum positive jitter from source to destination.
Max positive DS	Maximum positive jitter from destination to source.
Positive SD number	Number of positive jitters from source to destination.

Field	Description
Positive DS number	Number of positive jitters from destination to source.
Positive SD sum	Sum of positive jitters from source to destination.
Positive DS sum	Sum of positive jitters from destination to source.
Positive SD average	Average positive jitters from source to destination.
Positive DS average	Average positive jitters from destination to source.
Positive SD square-sum	Square sum of positive jitters from source to destination.
Positive DS square-sum	Square sum of positive jitters from destination to source.
Min negative SD	Minimum absolute value among negative jitters from source to destination.
Min negative DS	Minimum absolute value among negative jitters from destination to source.
Max negative SD	Maximum absolute value among negative jitters from source to destination.
Max negative DS	Maximum absolute value among negative jitters from destination to source.
Negative SD number	Number of negative jitters from source to destination.
Negative DS number	Number of negative jitters from destination to source.
Negative SD sum	Sum of absolute values of negative jitters from source to destination.
Negative DS sum	Sum of absolute values of negative jitters from destination to source.
Negative SD average	Average absolute value of negative jitters from source to destination.
Negative DS average	Average absolute value of negative jitters from destination to source.
Negative SD square-sum	Square sum of negative jitters from source to destination.
Negative DS square-sum	Square sum of negative jitters from destination to source.
SD average	Average value of jitters from source to destination.
DS average	Average value of jitters from destination to source.
One way results	Unidirectional delay. This field is available only for the ICMP jitter, UDP jitter, and voice operations.
Max SD delay	Maximum delay from source to destination.
Max DS delay	Maximum delay from destination to source.
Min SD delay	Minimum delay from source to destination.
Min DS delay	Minimum delay from destination to source.
Number of SD delay	Number of delays from source to destination.
Number of DS delay	Number of delays from destination to source.

Field	Description
Sum of SD delay	Sum of delays from source to destination.
Sum of DS delay	Sum of delays from destination to source.
Square-Sum of SD delay	Square sum of delays from source to destination.
Square-Sum of DS delay	Square sum of delays from destination to source.
SD lost packets	Number of lost packets from the source to the destination.
DS lost packets	Number of lost packets from the destination to the source.
Lost packets for unknown reason	Number of lost packets for unknown reasons.
Voice scores	Voice parameters. This field is available only for the voice operation.
MOS value	MOS value calculated for the voice operation.
ICPIF value	ICPIF value calculated for the voice operation.
Hop IP	IP address of the hop. This field is available only for the path jitter operation.
Path-jitter results	Path jitter operation results. This field is available only for the path jitter operation.
Jitter number	Number of jitters. This field is available only for the path jitter operation.
Min/Max/Average jitter	Minimum/maximum/average jitter in milliseconds. This field is available only for the path jitter operation.
Positive jitter number	Number of positive jitter. This field is available only for the path jitter operation.
Min/Max/Average positive jitter	Minimum/maximum/average positive jitter in milliseconds. This field is available only for the path jitter operation.
Sum/Square-Sum positive jitter	Sum/square sum of the positive jitter. This field is available only for the path jitter operation.
Negative jitter number	Number of negative jitter. This field is available only for the path jitter operation.
Min/Max/Average negative jitter	Minimum/maximum/average negative jitter in milliseconds. This field is available only for the path jitter operation.
Sum/Square-Sum negative jitter	Sum/square sum of the negative jitter. This field is available only for the path jitter operation.
TTL	If the routing table bypass feature is not enabled in the operation, this field displays the TTL value in the probe packet. If the routing table bypass feature is enabled, this field value varies by the **`init-ttl`** command. However, the actual TTL value in the probe packet is fixed at 1.
Hop IP	IP address of the node that sent the reply packet.
Time	Time when the NQA client received the reply packet.

display nqa statistics

Use **display nqa statistics** to display NQA operation statistics.

Syntax

display nqa statistics [*admin-name operation-tag*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays statistics for all NQA operations.

Usage guidelines

The statistics are generated after the NQA operation completes. If you execute the **display nqa statistics** command before the operation completes, the statistics are displayed as all 0s.

If a reaction entry is configured, the command displays the monitoring results of the reaction entry in the period specified by the **statistics internal** command. The result fields display hyphens (-) in one of the following conditions:

- The threshold type is average value.
- The monitored performance metric is ICPIF or MOS for the voice operation.

Examples

Display the statistics for the TCP operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
  NO. : 1
    Start time: 2007-01-01 09:30:20.0
    Life time: 2 seconds
    Send operation times: 1              Receive response times: 1
    Min/Max/Average round trip time: 13/13/13
    Square-Sum of round trip time: 169
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to disconnect: 0
    Failures due to no connection: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

Display the statistics for the ICMP jitter operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
```

```
  NO. : 1
    Start time: 2015-03-09 17:42:10.7
    Life time: 156 seconds
    Send operation times: 1560           Receive response times: 1560
    Min/Max/Average round trip time: 1/2/1
    Square-Sum of round trip time: 1563
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
    Packets out of sequence: 0
    Packets arrived late: 0
  ICMP-jitter results:
   RTT number: 1560
    Min positive SD: 1                   Min positive DS: 1
    Max positive SD: 1                   Max positive DS: 2
    Positive SD number: 18               Positive DS number: 46
    Positive SD sum: 18                  Positive DS sum: 49
    Positive SD average: 1               Positive DS average: 1
    Positive SD square-sum: 18           Positive DS square-sum: 55
    Min negative SD: 1                   Min negative DS: 1
    Max negative SD: 1                   Max negative DS: 2
    Negative SD number: 24               Negative DS number: 57
    Negative SD sum: 24                  Negative DS sum: 58
    Negative SD average: 1               Negative DS average: 1
    Negative SD square-sum: 24           Negative DS square-sum: 60
    SD average: 1                        DS average: 1
  One way results:
    Max SD delay: 1                      Max DS delay: 2
    Min SD delay: 1                      Min DS delay: 1
    Number of SD delay: 4                Number of DS delay: 4
    Sum of SD delay: 4                   Sum of DS delay: 5
    Square-Sum of SD delay: 4            Square-Sum of DS delay: 7
    Lost packets for unknown reason: 0
  Reaction statistics:
    Index  Checked Element  Threshold Type  Checked Num  Over-threshold Num
    1      jitter-DS        accumulate      1500         10
    2      jitter-SD        average         -            -
    3      OWD-DS           -               1560         2
    4      OWD-SD           -               1560         0
    5      packet-loss      accumulate      0            0
    6      RTT              accumulate      1560         0
```

Display the statistics for the UDP jitter operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
  NO. : 1
```

```

```

Table 7 Command output

Field	Description
No.	Statistics group ID.
Start time	Time when the operation started.

Field	Description
Life time	Duration of the operation in seconds.
Send operation times	Number of probe packets sent.
Receive response times	Number of response packets received.
Min/Max/Average round trip time	Minimum/maximum/average round-trip time in milliseconds.
Square-Sum of round trip time	Square sum of round-trip time.
Packet loss ratio	Average packet loss ratio.
Failures due to timeout	Number of timeout occurrences in an operation.
Failures due to disconnect	Number of disconnections by the peer.
Failures due to no connection	Number of failures to connect with the peer.
Failures due to internal error	Number of failures due to internal errors.
Failures due to other errors	Failures due to other errors.
Packets out of sequence	Number of failures due to out-of-sequence packets.
Packets arrived late	Number of response packets received after a probe times out.
ICMP-jitter results	ICMP jitter operation results. This field is available only for the ICMP jitter operation.
UDP-jitter results	UDP jitter operation results. This field is available only for the UDP jitter operation.
Voice results	Voice operation results. This field is available only for the voice operation.
RTT number	Number of response packets received.
Min positive SD	Minimum positive jitter from source to destination.
Min positive DS	Minimum positive jitter from destination to source.
Max positive SD	Maximum positive jitter from source to destination.
Max positive DS	Maximum positive jitter from destination to source.
Positive SD number	Number of positive jitters from source to destination.
Positive DS number	Number of positive jitters from destination to source.
Positive SD sum	Sum of positive jitters from source to destination.
Positive DS sum	Sum of positive jitters from destination to source.
Positive SD average	Average positive jitters from source to destination.
Positive DS average	Average positive jitters from destination to source.
Positive SD square-sum	Square sum of positive jitters from source to destination.
Positive DS square-sum	Square sum of positive jitters from destination to source.
Min negative SD	Minimum absolute value among negative jitters from source to destination.

Field	Description
Min negative DS	Minimum absolute value among negative jitters from destination to source.
Max negative SD	Maximum absolute value among negative jitters from source to destination.
Max negative DS	Maximum absolute value among negative jitters from destination to source.
Negative SD number	Number of negative jitters from source to destination.
Negative DS number	Number of negative jitters from destination to source.
Negative SD sum	Sum of absolute values of negative jitters from source to destination.
Negative DS sum	Sum of absolute values of negative jitters from destination to source.
Negative SD average	Average absolute value of negative jitters from source to destination.
Negative DS average	Average absolute value of negative jitters from destination to source.
Negative SD square-sum	Square sum of negative jitters from source to destination.
Negative DS square-sum	Square sum of negative jitters from destination to source.
SD average	Average value of jitters from source to destination.
DS average	Average value of jitters from destination to source.
One way results	Unidirectional delay result. This field is available only for the ICMP jitter, UDP jitter, and voice operations.
Max SD delay	Maximum delay from source to destination.
Max DS delay	Maximum delay from destination to source.
Min SD delay	Minimum delay from source to destination.
Min DS delay	Minimum delay from destination to source.
Number of SD delay	Number of delays from source to destination.
Number of DS delay	Number of delays from destination to source.
Sum of SD delay	Sum of delays from source to destination.
Sum of DS delay	Sum of delays from destination to source.
Square-Sum of SD delay	Square sum of delays from source to destination.
Square-Sum of DS delay	Square sum of delays from destination to source.
SD lost packets	Number of lost packets from the source to the destination.
DS lost packets	Number of lost packets from the destination to the source.
Lost packets for unknown reason	Number of lost packets for unknown reasons.

Field	Description
Voice scores	Voice parameters. This field is available only for the voice operation.
Max MOS value	Maximum MOS value.
Min MOS value	Minimum MOS value.
Max ICPIF value	Maximum ICPIF value.
Min ICPIF value	Minimum ICPIF value.
Reaction statistics	Statistics about the reaction entry in the counting interval.
Index	ID of a reaction entry.
Checked Element	Monitored element.
Threshold Type	Threshold type.
Checked Num	Number of targets that have been monitored for data collection.
Over-threshold Num	Number of threshold violations.
Path	Serial number for the path in the path jitter operation. This field is available only for the path jitter operation.
Hop IP	IP address of the hop. This field is available only for the path jitter operation.
Path-jitter results	Path jitter operation results. This field is available only for the path jitter operation.
Jitter number	Number of jitters. This field is available only for the path jitter operation.
Min/Max/Average jitter	Minimum/maximum/average positive jitter in milliseconds. This field is available only for the path jitter operation.
Positive jitter number	Number of positive jitters. This field is available only for the path jitter operation.
Min/Max/Average positive jitter	Minimum/maximum/average positive jitter in milliseconds. This field is available only for the path jitter operation.
Sum/Square-Sum positive jitter	Sum/square sum of positive jitters. This field is available only for the path jitter operation.
Negative jitter number	Number of negative jitters. This field is available only for the path jitter operation.
Min/Max/Average negative jitter	Minimum/maximum/average negative jitter in milliseconds. This field is available only for the path jitter operation.
Sum/Square-Sum negative jitter	Sum/square sum of negative jitters. This field is available only for the path jitter operation.

Table 8 Monitored performance metrics for DHCP/DLSw/DNS/FTP/HTTP/ICMP echo/SNMP/TCP/UDP echo operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
probe-duration	accumulate	Probes in the counting interval.	Number of completed probes.	Number of probes of which the duration exceeds the threshold.
	average	N/A	N/A	N/A
	consecutive	Probes in the counting interval.	Number of completed probes.	Number of probes of which the duration exceeds the threshold.
probe-fail	accumulate	Probes in the counting interval.	Number of completed probes.	Number of probe failures.
	consecutive	Probes in the counting interval.	Number of completed probes.	Number of probe failures.

Table 9 Monitored performance metrics for ICMP jitter/UDP jitter/voice operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
RTT	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the round-trip time exceeds the threshold.
	average	N/A	N/A	N/A
jitter-DS/jitter-SD	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the one-way jitter exceeds the threshold.
	average	N/A	N/A	N/A
OWD-DS/OWD-SD	N/A	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the one-way delay exceeds the threshold.
packet-loss	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packet loss.
ICPIF/MOS (available only for the voice operation)	N/A	N/A	N/A	N/A

Related commands

`statistics interval`

expect data

Use **`expect data`** to configure the expected data.

Use **`undo expect data`** to restore the default.

Syntax

expect data *expression* [**offset** *number*]

undo expect data

Default

No expected data is configured.

Views

HTTP/HTTPS/TCP/UDP template view

Predefined user roles

network-admin

Parameters

expression: Specifies the expected data, a case-sensitive string of 1 to 200 characters.

offset *number*: Specifies the offset in bytes after which the first match operation starts. The value range for the *number* argument is 0 to 1000, and the default value is 0. If you do not specify an offset, the match operation starts from the beginning byte of the payload.

Usage guidelines

Upon receiving a response packet, the NQA client examines the target payload for the expected data.

- If a match is found, the NQA client verifies the NQA destination device as legal.
- If no match is found, the NQA client looks up the entire payload for a match. If no match is found again, the NQA destination device is verified as illegal. The NQA client does not perform the second round if no offset is specified. It verifies the NQA destination as illegal directly if no match is found for the first round.

Expected data check takes place in the following conditions:

- For features that use the HTTP or HTTPS template, the NQA client checks for the expected data if the response contains the Content-Length header.
- For features that use the TCP or UDP template, the NQA client checks for the expected data if the **data-fill** command is configured.

  The first five bytes of the UDP packet payload identify the probe packet type. The start byte of the offset is the sixth byte of the UDP payload.

Examples

In HTTP template view, set the expected data to **welcome!**.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] expect data welcome!
```

expect ip

Use **expect ip** to specify the expected IPv4 address.

Use **undo expect ip** to restore the default.

Syntax

expect ip *ip-address*

undo expect ip

Default

No expected IPv4 address is specified.

Views

DNS template view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the expected IPv4 address for a DNS echo request.

Usage guidelines

During a DNS operation, the NQA client compares the expected IPv4 address with the IPv4 address resolved by the DNS server. If they are the same, it considers the DNS server legal.

Examples

In DNS template view, specify 1.1.1.1 as the expected IPv4 address.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] expect ip 1.1.1.1
```

expect ipv6

Use **expect ipv6** to specify the expected IPv6 address.

Use **undo expect ipv6** to restore the default.

Syntax

expect ipv6 *ipv6-address*

undo expect ipv6

Default

No expected IPv6 address is specified.

Views

DNS template view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the expected IPv6 address for a DNS echo request.

Usage guidelines

During a DNS operation, the NQA client compares the expected IPv6 address with the IPv6 address resolved by the DNS server. If they are the same, it considers the DNS server legal.

Examples

In DNS template view, specify 1::1 as the expected IPv6 address.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] expect ipv6 1::1
```

expect status

Use **expect status** to configure the expected status code.

Use **undo expect status** to restore the default.

Syntax

expect status *status-list*

undo expect status [*status-list*]

Default

No expected status code is configured.

Views

HTTP template view

HTTPS template view

Predefined user roles

network-admin

Parameters

status-list: Specifies a space-separated list of up to 10 status code items. Each item specifies a status code or a range of status codes in the form of *status-num* 1 **to** *status-num 2*. The value ranges for both the *status-num* 1 and *status-num 2* arguments are 0 to 999. The value for the *status-num* 2 argument must be equal to or greater than the value for the *status-num* 1 argument.

Usage guidelines

The status code of the HTTP or HTTPS packet is a three-digit field in decimal notation, and the code includes the server status information. The first digit defines the class of response.

Examples

In HTTP template view, set the expected status codes to 200, 300, and 400 to 500.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] expect status 200 300 400 to 500
```

filename

Use **filename** to specify a file to be transferred between the FTP server and the FTP client.

Use **undo filename** to restore the default.

Syntax

filename *filename*

undo filename

Default

No file is specified.

Views

FTP operation view

FTP template view

Predefined user roles

network-admin

Parameters

filename: Specifies the name of a file, a case-sensitive string of 1 to 200 characters that cannot contain slashes (/).

Examples

Specify **config.txt** as the file to be transferred between the FTP server and the FTP client for the FTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] filename config.txt
```

In FTP template view, specify **config.txt** as the file to be transferred between the FTP server and the FTP client.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] filename config.txt
```

frequency

Use **frequency** to specify the interval at which the NQA operation repeats.

Use **undo frequency** to restore the default.

Syntax

frequency *interval*

undo frequency

Default

In NQA operation view, the interval between two consecutive voice or path jitter operations is 60000 milliseconds. The interval between two consecutive operations of other types is 0 milliseconds.

In NQA template view, the interval between two consecutive operations is 5000 milliseconds.

Views

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Any NQA template view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval between two consecutive operations, in the range of 0 to 604800000 milliseconds. An interval of 0 milliseconds configures NQA to perform the operation only once, and not to generate any statistics.

Usage guidelines

After an NQA operation starts, it repeats at the specified interval. However, when the interval is reached, but the current operation is not completed or not timed out, the next operation does not start.

Examples

Configure the ICMP echo operation to repeat every 1000 milliseconds.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] frequency 1000
```

In DNS template view, configure the DNS operation to repeat every 1000 milliseconds.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] frequency 1000
```

Related commands

probe timeout

history-record enable

Use **history-record enable** to enable the saving of history records for the NQA operation.

Use **undo history-record enable** to disable the saving of history records.

Syntax

history-record enable

undo history-record enable

Default

The saving of history records is enabled only for the UDP tracert operation.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

Predefined user roles

network-admin

Usage guidelines

To display the history records of the NQA operation, use the **display nqa history** command.

The **undo** form of the command also removes existing history records of an NQA operation.

Examples

Enable the saving of history records for the NQA operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] history-record enable
```

Related commands

display nqa history

history-record keep-time

Use **history-record keep-time** to set the lifetime of history records for an NQA operation.

Use **undo history-record keep-time** to restore the default.

Syntax

history-record keep-time *keep-time*

undo history-record keep-time

Default

The history records of an NQA operation are kept for 120 minutes.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

Predefined user roles

network-admin

Parameters

keep-time: Specifies how long the history records can be saved. The value range is 1 to 1440 minutes.

Usage guidelines

When an NQA operation completes, the timer starts. All records are removed when the lifetime is reached.

Examples

Set the lifetime of the history records to 100 minutes for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] history-record keep-time 100
```

history-record number

Use **history-record number** to set the maximum number of history records that can be saved for an NQA operation.

Use **undo history-record number** to restore the default.

Syntax

history-record number *number*

undo history-record number

Default

A maximum of 50 history records can be saved for an NQA operation.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of history records that can be saved for an NQA operation. The value range is 0 to 50.

Usage guidelines

If the number of history records for an NQA operation exceeds the maximum number, earliest history records are removed.

Examples

Set the maximum number of history records to 10 for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] history-record number 10
```

init-ttl

Use **init-ttl** to set the TTL value for UDP packets in the start round of the UDP tracert operation.

Use **undo init-ttl** to restore the default.

Syntax

init-ttl *value*

undo init-ttl

Default

The NQA client sends a UDP packet with the TTL value 1 to start the UDP tracert operation.

Views

UDP tracert operation view

Predefined user roles

network-admin

Parameters

value: Specifies the TTL value in the range of 1 to 255.

Examples

Set the TTL value to 5 for the UDP packets in the start round.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-tracert
[Sysname-nqa-admin-test-udp-tracert] init-ttl 5
```

key

Use **key** to set the shared key for secure RADIUS authentication.

Use **undo key** to restore the default.

Syntax

key { **cipher** | **simple** } *string*

undo key

Default

No shared key is configured for secure RADIUS authentication.

Views

RADIUS template view

Predefined user roles

network-admin

Parameters

cipher: Specifies a key in encrypted form.

simple: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the shared key string. Its plaintext form is a case-sensitive string of 1 to 64 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

Make sure the NQA client and the RADIUS server have the same shared key.

Examples

In RADIUS template view, set the shared key to **abc** in plain text for secure RADIUS authentication.

```
<Sysname> system-view
[Sysname] nqa template radius radiustplt
[Sysname-nqatplt-radius-radiustplt] key simple abc
```

lsr-path

Use **lsr-path** to specify a loose source routing (LSR) path.

Use **undo lsr-path** to restore the default.

Syntax

lsr-path *ip-address*&<1-8>

undo lsr-path

Default

No LSR path is configured.

Views

Path jitter operation view

Predefined user roles

network-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight IP addresses. Each IP address represents a hop on the path.

Usage guidelines

The path jitter operation first uses tracert to detect each hop to the destination. It then sends ICMP echo requests to measure the delay and jitters from the source to each node. If multiple routes exist between the source and destination, the operation uses the path specified by using **lsr-path** command.

Examples

Specify 10.1.1.20 and 10.1.2.10 as the hops on the LSR path for the path jitter operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type path-jitter
[Sysname-nqa-admin-test- path-jitter] lsr-path 10.1.1.20 10.1.2.10
```

max-failure

Use **max-failure** to set the maximum number of consecutive probe failures in a UDP tracert operation.

Use **undo max-failure** to restore the default.

Syntax

max-failure *times*

undo max-failure

Default

A UDP tracert operation stops and fails when it detects five consecutive probe failures.

Views

UDP tracert operation view

Predefined user roles

network-admin

Parameters

times: Specifies the maximum number in the range of 0 to 255. When this argument is set to 0 or 255, the UDP tracert operation does not stop when consecutive probe failures occur.

Usage guidelines

When a UDP tracert operation detects the maximum number of consecutive probe failures, the operation fails and stops probing the path.

Examples

Set the maximum number of consecutive probe failures to 20 in a UDP tracert operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-tracert
[Sysname-nqa-admin-test-udp-tracert] max-failure 20
```

mode

Use **mode** to set the data transmission mode for the FTP operation.

Use **undo mode** to restore the default.

Syntax

mode { **active** | **passive** }

undo mode

Default

The FTP operation uses the data transmission mode **active**.

Views

FTP operation view

FTP template view

Predefined user roles

network-admin

Parameters

active: Sets the data transmission mode to active. The FTP server initiates a connection request.

passive: Sets the data transmission mode to passive. The FTP client initiates a connection request.

Examples

Set the data transmission mode to **passive** for the FTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] mode passive
```

In FTP template view, set the data transmission mode to **passive** for the FTP operation.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] mode passive
```

next-hop ip

Use **next-hop ip** to specify the next hop IPv4 address for probe packets.

Use **undo next-hop ip** to restore the default.

Syntax

next-hop ip *ip-address*

undo next-hop ip

Default

No next hop IPv4 address is specified for probe packets.

Views

ICMP echo operation view

ICMP/TCP half open template view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IPv4 address of the next hop.

Usage guidelines

If the next hop IPv4 address is not configured, the device searches the routing table to determine the next hop IPv4 address for the probe packets.

Examples

Specify 10.1.1.1 as the next hop IPv4 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] next-hop ip 10.1.1.1
```

next-hop ipv6

Use **next-hop ipv6** to specify the next hop IPv6 address for probe packets.

Use **undo next-hop ipv6** to restore the default.

Syntax

next-hop ipv6 *ipv6-address*

undo next-hop ipv6

Default

No next hop IPv6 address is specified for probe packets.

Views

ICMP echo operation view

ICMP/TCP half open template view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of the next hop. IPv6 link-local addresses are not supported.

Usage guidelines

If the next hop IPv6 address is not configured, the device searches the routing table to determine the next hop IPv6 address for the probe packets.

Examples

Specify 10::1 as the next hop IPv6 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] next-hop ipv6 10::1
```

no-fragment enable

Use **no-fragment enable** to enable the no-fragmentation feature.

Use **undo no-fragment enable** to disable the no-fragmentation feature.

Syntax

no-fragment enable

undo no-fragment enable

Default

The no-fragmentation feature is disabled.

Views

UDP tracert operation view

Predefined user roles

network-admin

Usage guidelines

The no-fragmentation feature sets the DF field to 1. Packets with the DF field set cannot be fragmented during the forwarding process.

You can use this command to test the path MTU of a link.

Examples

Enable the no-fragmentation feature for the UDP tracert operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-tracert
[Sysname-nqa-admin-test-udp-tracert] no-fragment enable
```

nqa

Use **nqa** to create an NQA operation and enter its view, or enter the view of an existing NQA operation.

Use **undo nqa** to remove the operation.

Syntax

nqa entry *admin-name operation-tag*

undo nqa { **all** | **entry** *admin-name operation-tag* }

Default

No NQA operations exist.

Views

System view

Predefined user roles

network-admin

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates

the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-).

all: Removes all NQA operations.

Examples

Create an NQA operation with administrator name **admin** and operation tag **test**, and enter NQA operation view.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test]
```

nqa agent enable

Use **nqa agent enable** to enable the NQA client.

Use **undo nqa agent enable** to disable the NQA client and stop all operations being performed.

Syntax

nqa agent enable

undo nqa agent enable

Default

The NQA client is enabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the NQA client.

```
<Sysname> system-view
[Sysname] nqa agent enable
```

Related commands

nqa server enable

nqa schedule

Use **nqa schedule** to configure scheduling parameters for an NQA operation.

Use **undo nqa schedule** to stop the operation.

Syntax

nqa schedule *admin-name operation-tag* **start-time** { *hh*:*mm*:*ss* [*yyyy/mm/dd* | *mm/dd/yyyy*] | **now** } **lifetime** { *lifetime* | **forever** } [**recurring**]

undo nqa schedule *admin-name operation-tag*

Default

No schedule is configured for an NQA operation.

Views

System view

Predefined user roles

network-admin

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-).

start-time: Specifies the start time and date of the NQA operation.

hh:*mm*:*ss*: Specifies the start time of an NQA operation.

yyyy/mm/dd: Specifies the start date of an NQA operation. The default value is the current system time, and the value for the *yyyy* argument is in the range of 2000 to 2035.

mm/dd/yyyy: Specifies the start date of an NQA operation. The default value is the current system time, and the value for the *yyyy* argument is in the range of 2000 to 2035.

now: Starts the operation immediately.

lifetime: Specifies the duration of an operation.

lifetime: Specifies the duration of an operation in seconds. The value range is 1 to 2147483647.

forever: Performs the operation until you stop it by using the **undo nqa schedule** command.

recurring: Runs the operation automatically at the start time and for the specified duration. If you do not specify this keyword, the NQA operation is performed only once at the specified date and time.

Usage guidelines

The NQA operation works between the specified start time and the end time (the start time plus operation duration). If the specified start time is ahead of the system time, the operation starts immediately. If both the specified start time and end time are ahead of the system time, the operation does not start. To display the current system time, use the **display clock** command.

You cannot enter the view of a scheduled NQA operation. If you want to enter such view, use the **undo nqa schedule** command to stop the NQA operation first.

Examples

Schedule the operation with administrator name **admin** and operation tag **test** to start on 08:08:08 2008/08/08 and last 1000 seconds.

```
<Sysname> system-view
[Sysname] nqa schedule admin test start-time 08:08:08 2008/08/08 lifetime 1000 recurring
```

Related commands

destination ip

display clock (*Fundamentals Command Reference*)

nqa entry

type

nqa template

Use **nqa template** to create an NQA template and enter its view, or enter the view of an existing NQA template.

Use **undo nqa template** to remove an NQA template.

Syntax

nqa template { **dns** | **ftp** | **http** | **https** | **icmp** | **radius** | **ssl** | **tcp** | **tcphalfopen** | **udp** } *name*

undo nqa template { **dns** | **ftp** | **http** | **https** | **icmp** | **radius** | **ssl** | **tcp** | **tcphalfopen** | **udp** } *name*

Default

No NQA templates exist.

Views

System view

Predefined user roles

network-admin

Parameters

dns: Specifies the DNS template.

ftp: Specifies the FTP template.

http: Specifies the HTTP template.

https: Specifies the HTTPS template.

icmp: Specifies the ICMP template.

radius: Specifies the RADIUS template.

ssl: Specifies the SSL template.

tcp: Specifies the TCP template.

tcphalfopen: Specifies the TCP half open template.

udp: Specifies the UDP template.

name: Specifies the name of the NQA template, a case-insensitive string of 1 to 32 characters.

Examples

Create an ICMP template named **icmptplt**, and enter its view.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt]
```

operation (FTP operation view)

Use **operation** to specify the operation type for the FTP operation.

Use **undo operation** to restore the default.

Syntax

operation { **get** | **put** }

undo operation

Default

The FTP operation type is **get**.

Views

FTP operation view

FTP template view

Predefined user roles

network-admin

Parameters

get: Gets a file from the FTP server.

put: Transfers a file to the FTP server.

Usage guidelines

When you perform the **put** operation with the **filename** command configured, make sure the file exists on the NQA client.

If you get a file from the FTP server, make sure the file specified in the URL exists on the FTP server. The NQA client does not save the file obtained from the FTP server.

Use a small file for the FTP operation. A big file might result in transfer failure because of timeout, or might affect other services for occupying much network bandwidth.

Examples

Set the operation type to **put** for the FTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] operation put
```

In FTP template view, set the operation type to **put** for the FTP operation.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] operation put
```

operation (HTTP/HTTPS operation view)

Use **operation** to specify the operation type for the HTTP or HTTPS operation.

Use **undo operation** to restore the default.

Syntax

operation { **get** | **post** | **raw** }

undo operation

Default

The HTTP or HTTPS operation type is **get**.

Views

HTTP operation view

HTTP/HTTPS template view

Predefined user roles

network-admin

Parameters

get: Gets data from the HTTP or HTTPS server.

post: Transfers data to the HTTP or HTTPS server.

raw: Sends the RAW request to the HTTP or HTTPS server.

Usage guidelines

The HTTP and HTTPS operations use HTTP and HTTPS requests as probe packets.

For the **get** or **post** operation, the content in the request is obtained from the URL specified by the **url** command.

For the **raw** operation, the content in the request is configured in raw request view. You can use the **raw-request** command to enter the raw request view.

Examples

Set the operation type to **raw** for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type http
[Sysname-nqa-admin-test-http] operation raw
```

In HTTP template view, set the operation type to **raw** for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] operation raw
```

Related commands

out interface

Use **out interface** to specify the output interface for probe packets.

Use **undo out interface** to restore the default.

Syntax

out interface *interface-type interface-number*

undo out interface

Default

The output interface for probe packets is not specified. The NQA client determines the output interface based on the routing table lookup.

Views

ICMP echo operation view

DHCP operation view

UDP tracert operation view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

For successful operation, the specified output interface must be up.

If both the **next-hop** and **out interface** commands are configured for the ICMP echo operation, the **out interface** command does not take effect.

Examples

Specify VLAN-interface 1 as the output interface for probe packets in the UDP tracert operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-tracert
[Sysname-nqa-admin-test-udp-tracert] out interface vlan-interface 1
```

password

Use **password** to specify a password.

Use **undo password** to restore the default.

Syntax

password { **cipher** | **simple** } *string*

undo password

Default

No password is specified.

Views

FTP/HTTP operation view

FTP/HTTP/HTTPS/RADIUS template view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. The value of the argument varies as follows:

- For FTP, HTTP, and HTTPS operations, the plaintext form of the password is a case-sensitive string of 1 to 32 characters. The encrypted form of the password is a case-sensitive string of 1 to 73 characters.
- For RADIUS templates, the plaintext form of the password is a case-sensitive string of 1 to 64 characters. The encrypted form of the password is a case-sensitive string of 1 to 117 characters.

Examples

Set the FTP login password to **ftpuser**.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
```

```
[Sysname-nqa-admin-test-ftp] password simple ftpuser
```

Set the FTP login password to **ftpuser** in FTP template view.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] password simple ftpuser
```

probe count

Use **probe count** to specify the probe times.

Use **undo probe count** to restore the default.

Syntax

probe count *times*

undo probe count

Default

In an UDP tracert operation, the NQA client sends three probe packets to each hop along the path.

In other types of operations, the NQA client performs one probe to the destination per operation.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/UDP jitter operation view

Predefined user roles

network-admin

Parameters

times: Specifies the probe times.

- For the UDP tracert operation, this argument specifies the times of probes to each hop along the path. The value range for this argument is 1 to 10.
- For other types of operations, this argument specifies the times of probes to the destination per operation. The value range for this argument is 1 to 15.

Usage guidelines

The following describes how NQA performs different types of operations:

- A TCP or DLSw operation sets up a connection.
- An ICMP jitter or UDP jitter operation sends a number of probe packets. The number of probe packets is set by using the **probe packet-number** command.
- An FTP operation uploads or downloads a file.
- An HTTP operation gets a Web page.
- A DHCP operation gets an IP address through DHCP.
- A DNS operation translates a domain name to an IP address.

- An ICMP echo sends an ICMP echo request.
- A UDP echo operation sends a UDP packet.
- An SNMP operation sends one SNMPv1 packet, one SNMPv2c packet, and one SNMPv3 packet.
- A UDP tracert operation determines the routing path from the source to the destination. The number of probe packets sent to each hop is set by using the **probe count** command.
- A frame loss, latency, or throughput operation sends probe frames to the destination device to test the frame loss ratio, latency, or throughput of the network.

If an operation is to perform multiple probes, the NQA client starts a new probe in one of the following conditions:

- The NQA client receives responses to packets sent in the last probe.
- The probe timeout time expires.

This command is not available for the voice or path jitter operations. Each of these operations performs only one probe.

Examples

Configure the ICMP echo operation to perform 10 probes.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] probe count 10
```

probe packet-interval

Use **probe packet-interval** to configure the packet sending interval in the probe.

Use **undo probe packet-interval** to restore the default.

Syntax

probe packet-interval *interval*

undo probe packet-interval

Default

The packet sending interval is 20 milliseconds.

Views

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

interval: Specifies the sending interval in the range of 10 to 60000 milliseconds.

Examples

Configure the UDP jitter operation to send packets every 100 milliseconds.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] probe packet-interval 100
```

probe packet-number

Use **probe packet-number** to set the number of packets to be sent in a UDP jitter, path jitter, or voice probe.

Use **undo probe packet-number** to restore the default.

Syntax

probe packet-number *packet-number*

undo probe packet-number

Default

An ICMP jitter, UDP jitter, or path jitter probe sends 10 packets and a voice probe sends 1000 packets.

Views

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

packet-number: Specifies the number of packets to be sent per probe. Available value ranges include:

- 10 to 1000 for the ICMP jitter, UDP jitter, and path jitter operations.
- 10 to 60000 for the voice operation.

Examples

Configure the UDP jitter probe to send 100 packets.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] probe packet-number 100
```

probe packet-timeout

Use **probe packet-timeout** to set the timeout time for waiting for a response in the UDP jitter, path jitter, or voice operation.

Use **undo probe packet-timeout** to restore the default.

Syntax

probe packet-timeout *timeout*

undo probe packet-timeout

Default

The response timeout time in the UDP jitter or path jitter operation is 3000 milliseconds.

The response timeout time in the voice operation is 5000 milliseconds.

Views

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

timeout: Specifies the timeout time in milliseconds. The value range is 10 to 3600000.

Examples

Set the response timeout time to 100 milliseconds in the UDP jitter operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] probe packet-timeout 100
```

probe timeout

Use **probe timeout** to set the probe timeout time.

Use **undo probe timeout** to restore the default.

Syntax

probe timeout *timeout*

undo probe timeout

Default

The timeout time of a probe is 3000 milliseconds.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

Any NQA template view

Predefined user roles

network-admin

Parameters

timeout: Specifies the probe timeout time in milliseconds. The value range for this argument varies as follows:

- For FTP and HTTP operations, the value range is 10 to 86400000.
- For DHCP, DNS, DLSw, ICMP echo, SNMP, TCP, UDP echo, and UDP tracert operations, the value range is 10 to 3600000.
- For FTP, HTTP, and HTTPS templates, the value range is 10 to 86400000.
- For other types of NQA templates, the value range is 10 to 3600000.

Usage guidelines

If a probe does not complete within the period, the probe is timed out.

Examples

Set the probe timeout time to 10000 milliseconds for the DHCP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
```

```
[Sysname-nqa-admin-test] type dhcp
[Sysname-nqa-admin-test-dhcp] probe timeout 10000
```

In HTTP template view, set the probe timeout time to 10000 milliseconds for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] probe timeout 10000
```

raw-request

Use **raw-request** to enter raw request view and specify the content of an HTTP or HTTPS request.

Use **undo raw-request** to restore the default.

Syntax

raw-request

undo raw-request

Default

The contents of an HTTP or HTTPS raw request are not specified.

Views

HTTP operation view

HTTP/HTTPS template view

Predefined user roles

network-admin

Usage guidelines

This command places you in raw request view and deletes the previously configured request content.

If the HTTP or HTTPS operation type is set to **raw**, you must enter raw request view and configure the request content to be sent to the HTTP or HTTPS server. To ensure successful operations, make sure the request content does not contain command aliases configured by using the **alias** command. For more information about the **alias** command, see CLI commands in *Fundamentals Command Reference*.

Examples

Enter raw request view and specify the content of a GET request for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type http
[Sysname-nqa-admin-test-http] raw-request
[Sysname-nqa-admin-test-http-raw-request] GET /sdn/ui/app/index HTTP/1.0\r\nHost:
172.0.0.2\r\n\r\n
```

In HTTP template view, enter raw request view and specify the content of a POST request for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] raw-request
[Sysname-nqatplt-http-httptplt-raw-request] POST /sdn/ui/app/index HTTP/1.0\r\nHost:
 172.0.0.2\r\nAuthorization: Basic cm9vdDoxMjM0NTY=\r\n\r\n
```

reaction checked-element { jitter-ds | jitter-sd }

Use **reaction checked-element** { **jitter-ds** | **jitter-sd** } to configure a reaction entry for monitoring one-way jitter in the NQA operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element** { **jitter-ds** | **jitter-sd** } **threshold-type** { **accumulate** *accumulate-occurrences* | **average** } **threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring one-way jitter exist.

Views

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

jitter-ds: Specifies the destination-to-source jitter of each probe packet as the monitored element (or performance metric).

jitter-sd: Specifies source-to-destination jitter of each probe packet as the monitored element.

threshold-type: Specifies a threshold type.

accumulate *accumulate-occurrences*: Checks the total number of threshold violations in the operation. The value range is 1 to 14999 for the ICMP jitter and UDP jitter operations, and 1 to 59999 for the voice operation.

average: Checks the average one-way jitter.

threshold-value: Specifies threshold range in milliseconds.

upper-threshold: Specifies the upper limit in the range of 0 to 3600000.

lower-threshold: Specifies the lower limit in the range of 0 to 3600000. It must not be greater than the upper limit.

action-type: Specifies the action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Only successful probe packets are monitored. Statistics about failed probe packets are not collected.

Examples

Create reaction entry 1 for monitoring the average destination-to-source jitter of UDP jitter packets, and set the upper limit to 50 milliseconds and the lower limit to 5 milliseconds. Before the NQA

operation starts, the initial state of the reaction entry is invalid. After the operation, the average destination-to-source jitter is checked against the threshold range. If it exceeds the upper limit, the state of the reaction entry is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element jitter-ds threshold-type average threshold-value 50 5 action-type trap-only
```

Create reaction entry 2 for monitoring the destination-to-source jitter of UDP jitter probe packets, and set the upper limit to 50 milliseconds, and the lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the destination-to-source jitter is checked against the threshold range. If the total number of threshold violations reaches or exceeds 100, the state of the entry is set to over-threshold. Otherwise, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 2 checked-element jitter-ds threshold-type accumulate 100 threshold-value 50 5 action-type trap-only
```

reaction checked-element { owd-ds | owd-sd }

Use **reaction checked-element** { **owd-ds** | **owd-sd** } to configure a reaction entry for monitoring the one-way delay.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element** { **owd-ds** | **owd-sd** } **threshold-value** *upper-threshold lower-threshold*

undo reaction *item-number*

Default

No reaction entries for monitoring the one-way delay exist.

Views

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

owd-ds: Specifies the destination-to-source delay of each probe packet as the monitored element.

owd-sd: Specifies the source-to-destination delay of each probe packet as the monitored element.

threshold-value: Specifies threshold range in milliseconds.

upper-threshold: Specifies the upper limit in the range of 0 to 3600000.

lower-threshold: Specifies the lower limit in the range of 0 to 3600000. It must not be greater than the upper limit.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Only successful probe packets are monitored. Statistics about failed probe packets are not collected.

No actions can be configured for a reaction entry of monitoring one-way delays. To display the monitoring results and statistics, use the **display nqa reaction counters** and **display nqa statistics** commands.

Examples

Create reaction entry 1 for monitoring the destination-to-source delay of every UDP jitter packet, and set the upper limit to 50 milliseconds and lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. The destination-to-source delay is calculated after the response to the probe packet arrives. If the delay exceeds the upper limit, the state of the reaction entry is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element owd-ds threshold-value 50
5
```

reaction checked-element icpif

Use **reaction checked-element icpif** to configure a reaction entry for monitoring the ICPIF value in the voice operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element icpif threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring ICPIF values exist.

Views

Voice operation view

Predefined user roles

network-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-value: Specifies threshold range.

upper-threshold: Specifies the upper limit in the range of 1 to 100.

lower-threshold: Specifies the lower limit in the range of 1 to 100. It must not be greater than the upper limit.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Examples

Create reaction entry 1 for monitoring the ICPIF value in the voice operation, and set the upper limit to 50 and lower limit to 5. Before the voice operation starts, the initial state of the reaction entry is invalid. After the operation, the ICPIF value is checked against the threshold range. If it exceeds the upper limit, the state of the reaction entry is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type voice
[Sysname-nqa-admin-test-voice] reaction 1 checked-element icpif threshold-value 50 5
action-type trap-only
```

reaction checked-element mos

Use **reaction checked-element mos** to configure a reaction entry for monitoring the MOS value in the voice operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element mos threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring the MOS value exist.

Views

Voice operation view

Predefined user roles

network-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-value: Specifies threshold range.

upper-threshold: Specifies the upper limit in the range of 1 to 500.

lower-threshold: Specifies the lower limit in the range of 1 to 500. It must not be greater than the upper limit.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

For the MOS threshold, the number is expressed in three digits representing ones, tenths, and hundredths. For example, to express a MOS threshold of 1, enter 100.

Examples

Create reaction entry 1 for monitoring the MOS value of the voice operation, and set the upper limit to 2 and lower limit to 1. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the MOS value is checked against the threshold range. If it exceeds the upper limit, the state of the reaction entry is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type voice
[Sysname-nqa-admin-test-voice] reaction 1 checked-element mos threshold-value 200 100
action-type trap-only
```

reaction checked-element packet-loss

Use **reaction checked-element packet-loss** to configure a reaction entry for monitoring packet loss in UDP jitter or voice operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element packet-loss threshold-type accumulate** *accumulate-occurrences* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring packet loss exist.

Views

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-type: Specifies a threshold type.

accumulate *accumulate-occurrences*: Specifies the total number of lost packets in the operation. The value range is 1 to 15000 for the ICMP jitter and UDP jitter operations and 1 to 60000 for the voice operation.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Examples

Create reaction entry 1 for monitoring packet loss in the UDP jitter operation. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the total number of the lost packets is checked against the threshold. If the number reaches or exceeds 100, the state of the reaction entry is set to over-threshold. Otherwise, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element packet-loss
threshold-type accumulate 100 action-type trap-only
```

reaction checked-element probe-duration

Use **reaction checked-element probe-duration** to configure a reaction entry for monitoring the probe duration.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element probe-duration threshold-type** { **accumulate** *accumulate-occurrences* | **average** | **consecutive** *consecutive-occurrences* } **threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring the probe duration exist.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

Predefined user roles

network-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-type: Specifies a threshold type.

accumulate *accumulate-occurrences*: Checks the total number of threshold violations. The value range is 1 to 15.

average: Checks the average probe duration.

consecutive *consecutive-occurrences*: Specifies the number of consecutive threshold violations after the NQA operation starts. The value range is 1 to 16.

threshold-value: Specifies threshold range in milliseconds.

upper-threshold: Specifies the upper limit in the range of 0 to 3600000.

lower-threshold: Specifies the lower limit in the range of 0 to 3600000. It must not be greater than the upper threshold.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS. This keyword is not available for the DNS operation.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Only successful probe packets are monitored. Statistics about failed probe packets are not collected.

Examples

Create reaction entry 1 for monitoring the average probe duration of ICMP echo operation, and set the upper limit to 50 milliseconds and lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the average probe duration is checked. If it exceeds the upper limit, the state is set to over-threshold. If it is below the lower limit, the state of the reaction entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reaction 1 checked-element probe-duration
threshold-type average threshold-value 50 5 action-type trap-only
```

Create reaction entry 2 for monitoring the probe duration of ICMP echo operation, and set the upper limit to 50 milliseconds and the lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the accumulated probe duration is checked against the threshold range. If the total number of threshold violations reaches or exceeds 10, the state of the entry is set to over-threshold. If it is below the lower threshold, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reaction 2 checked-element probe-duration
threshold-type accumulate 10 threshold-value 50 5 action-type trap-only
```

Create reaction entry 3 for monitoring the probe duration time of ICMP echo operation, and set the upper limit to 50 milliseconds and the lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the consecutive probe duration is checked against the threshold range. If the total number of consecutive threshold violations reaches or exceeds 10, the state of the entry is set to over-threshold. If it is below the lower threshold, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reaction 3 checked-element probe-duration
threshold-type consecutive 10 threshold-value 50 5 action-type trap-only
```

reaction checked-element probe-fail (for trap)

Use **reaction checked-element probe-fail** to configure a reaction entry for monitoring the probe failures of the operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element probe-fail threshold-type** { **accumulate** *accumulate-occurrences* | **consecutive** *consecutive-occurrences* } [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring probe failures exist.

[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element rtt threshold-type
average threshold-value 50 5 action-type trap-only
```

Create reaction entry 2 for monitoring the round-trip time of UDP jitter probe packets, and set the upper limit to 50 milliseconds and lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the packet round-trip time is checked. If the total number of threshold violations reaches or exceeds 100, the state of the entry is set to over-threshold. Otherwise, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element rtt threshold-type
accumulate 100 threshold-value 50 5 action-type trap-only
```

reaction trap

Use **reaction trap** to configure the sending of traps to the NMS under specific conditions.

Use **undo reaction trap** to restore the default.

Syntax

reaction trap { **path-change** | **probe-failure** *consecutive-probe-failures* | **test-complete** | **test-failure** [*accumulate-probe-failures*] }

undo reaction trap { **path-change** | **probe-failure** | **test-complete** | **test-failure** }

Default

No traps are sent to the NMS.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

path-change: Sends a trap when the UDP tracert operation detects a different path to the destination.

probe-failure *consecutive-probe-failures*: Sends a trap to the NMS if the number of consecutive probe failures in an operation is greater than or equal to *consecutive-probe-failures.* The value range for the *consecutive-probe-failures* argument is 1 to 15. The system counts the number of consecutive probe failures for each operation, so multiple traps might be sent.

test-complete: Sends a trap to indicate that the operation is completed.

test-failure: Sends a trap when an operation fails. For operations other than UDP tracert operation, the system counts the total number of probe failures in an operation. If the number reaches or exceeds the value for the *accumulate-probe-failures* argument, a trap is sent for the operation failure.

accumulate-probe-failures: Specifies the total number of probe failures in an operation. The value range is 1 to 15. This argument is not supported by the UDP tracert operation.

Usage guidelines

The ICMP jitter, UDP jitter, and voice operations support only the **test-complete** keyword.

The following parameters are not available for the UDP tracert operation:

- The **probe-failure** *consecutive-probe-failures* option.
- The *accumulate-probe-failures* argument.

Examples

Configure the system to send a trap if five or more consecutive probe failures occur in an ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reaction trap probe-failure 5
```

reaction trigger per-probe

Use **reaction trigger per-probe** to configure the probe result sending on a per-probe basis.

Use **undo reaction trigger per-probe** to restore the default.

Syntax

reaction trigger per-probe

undo reaction trigger per-probe

Default

The probe result is sent to the feature that uses the template after three consecutive failed or successful probes.

Views

ICMP/TCP half open template view

Predefined user roles

network-admin

Usage guidelines

The feature enables the NQA client to send the probe result to the feature that uses the NQA template every time a probe is completed.

If you execute this command and the **reaction trigger probe-fail** command multiple times, the most recent configuration takes effect.

If you execute this command and the **reaction trigger probe-pass** command multiple times, the most recent configuration takes effect.

Examples

In ICMP template view, configure the probe result sending on a per-probe basis.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] reaction trigger per-probe
```

Related commands

reaction trigger probe-fail

reaction trigger probe-pass

reaction trigger probe-fail

Use **reaction trigger probe-fail** to set the number of consecutive probe failures to determine an operation failure.

Use **undo reaction trigger probe-fail** to restore the default.

Syntax

reaction trigger probe-fail *count*

undo reaction trigger probe-fail

Default

The NQA client notifies the feature of the operation failure when the number of consecutive probe failures reaches 3.

Views

Any NQA template view

Predefined user roles

network-admin

Parameters

count: Specifies the number of consecutive probe failures, in the range of 1 to 15.

Usage guidelines

If the number of consecutive probe failures is reached, the NQA client notifies the feature that uses the NQA template of the operation failure.

If you execute this command and the **reaction trigger per-probe** command multiple times, the most recent configuration takes effect.

Examples

In HTTP template view, configure the NQA client to notify the feature of the operation failure when the number of consecutive probe failures reaches 5.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] reaction trigger probe-fail 5
```

Related commands

reaction trigger per-probe

reaction trigger probe-pass

reaction trigger probe-pass

Use **reaction trigger probe-pass** to set the number of consecutive successful probes to determine a successful operation event.

Use **undo reaction trigger probe-pass** to restore the default.

Syntax

reaction trigger probe-pass *count*

undo reaction trigger probe-pass

Default

The NQA client notifies the feature of the successful operation event if the number of consecutive successful probes reaches 3.

Views

Any NQA template view

Predefined user roles

network-admin

Parameters

count: Specifies the number of consecutive successful probes, in the range of 1 to 15.

Usage guidelines

If number of consecutive successful probes is reached, the NQA client notifies the feature that uses the template of the successful operation event.

If you execute this command and the **reaction trigger per-probe** command multiple times, the most configuration takes effect.

Examples

In HTTP template view, configure the NQA client to notify the feature of the successful operation event if the number of consecutive successful probes reaches 5.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] reaction trigger probe-pass 5
```

Related commands

reaction trigger per-probe

reaction trigger probe-fail

resolve-target

Use **resolve-target** to specify the domain name to be resolved in the DNS operation.

Use **undo resolve-target** to restore the default.

Syntax

resolve-target *domain-name*

undo resolve-target

Default

The domain name to be resolved in the DNS operation is not specified.

Views

DNS operation view

DNS template view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the domain name to be resolved. It is a dot-separated case-sensitive string of 1 to 255 characters including letters, digits, hyphens (-), and underscores (_) (for example, aabbcc.com). Each part consists of 1 to 63 characters, and consecutive dots (.) are not allowed.

Examples

Specify **domain1** as the domain name to be resolved.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type dns
[Sysname-nqa-admin-test-dns] resolve-target domain1
```

In DNS template view, specify **domain1** as the domain name to be resolved.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] resolve-target domain1
```

resolve-type

Use **resolve-type** to configure the domain name resolution type.

Use **undo resolve-type** to restore the default.

Syntax

resolve-type { **A** | **AAAA** }

undo resolve-type

Default

The domain name resolution type is type A.

Views

DNS template view

Predefined user roles

network-admin

Parameters

A: Specifies the type A queries. A type A query resolves a domain name to a mapped IPv4 address.

AAAA: Specifies the type AAAA queries. A type AAAA query resolves a domain name to a mapped IPv6 address.

Examples

In DNS template view, set the domain name resolution type to **A**.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] resolve-type A
```

route-option bypass-route

Use **route-option bypass-route** to enable the routing table bypass feature to test the connectivity to the direct destination.

Use **undo route-option bypass-route** to disable the routing table bypass feature.

Syntax

route-option bypass-route

undo route-option bypass-route

Default

The routing table bypass feature is disabled.

Views

ICMP echo/TCP/UDP echo operation view

DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Usage guidelines

When the routing table bypass feature is enabled, the following events occur:

- The routing table is not searched. Packets are sent to the destination on a directly connected network.
- The TTL value in the probe packet is set to 1. The TTL set in the **ttl** command does not take effect.

This command does not take effect if the destination address of the NQA operation is an IPv6 address.

Examples

Enable the routing table bypass feature.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] route-option bypass-route
```

source interface (ICMP echo/UDP tracert operation view)

Use **source interface** to specify the IP address of an interface as the source IP address of probe packets.

Use **undo source interface** to restore the default.

Syntax

source interface *interface-type interface-number*

undo source interface

Default

The probe packets take the primary IP address of the outgoing interface as their source IP address.

Views

ICMP echo operation view

UDP tracert operation view

ICMP template view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The specified interface must be up. If the interface is down, no probe requests can be sent out.

If you execute this command and the **source ip** or **source ipv6** command for an ICMP echo operation or ICMP template multiple times, the most recent configuration takes effect.

If you execute this command and the **source ip** command for a UDP tracert operation multiple times, the most recent configuration takes effect.

Examples

Specify the IP address of the interface VLAN-interface 1 as the source IP address of ICMP echo request packets.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] source interface vlan-interface 1
```

In ICMP template view, specify the IP address of the interface VLAN-interface 1 as the source IP address of ICMP echo request packets.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] source interface vlan-interface 1
```

Related commands

source ip

source ipv6

source ip

Use **source ip** to configure the source IPv4 address for probe packets.

Use **undo source ip** to restore the default.

Syntax

source ip *ip-address*

undo source ip

Default

The probe packets takes the primary IP address of their output interface as the source IPv4 address.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Any NQA template view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IPv4 address for probe packets.

Usage guidelines

The specified source IP address must be the IPv4 address of a local interface, and the local interface must be up. Otherwise, no probe packets can be sent out.

For an NQA template, if the source and destination addresses have different IP versions, the source address does not take effect.

If you execute the **source interface** and **source ip** commands multiple times for an ICMP echo operation, ICMP template, or UDP tracert operation, the most recent configuration takes effect.

Examples

Specify 10.1.1.1 as the source IPv4 address for ICMP echo requests.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] source ip 10.1.1.1
```

In ICMP template view, specify 10.1.1.1 as the source IPv4 address for ICMP echo requests.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] source ip 10.1.1.1
```

Related commands

source interface

source ipv6

Use **source ipv6** to configure the source IPv6 address for probe packets.

Use **undo source ipv6** to restore the default.

Syntax

source ipv6 *ipv6-address*

undo source ipv6

Default

The probe packets takes the IPv6 address of their output interface as the source IPv6 address.

Views

ICMP echo operation view

Any NQA template view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the source IPv6 address for probe packets. IPv6 link-local addresses are not supported.

Usage guidelines

The specified source IPv6 address must be the IPv6 address of a local interface. The local interface must be up. Otherwise, no probe packets can be sent out.

For an NQA template, if the source and destination addresses have different IP versions, the source address does not take effect.

If you execute the **source interface** and **source ipv6** commands multiple times for an ICMP echo operation or ICMP template, the most recent configuration takes effect.

Examples

Specify 1::1 as the source IPv6 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] source ipv6 1::1
```

In ICMP template view, specify 1::1 as the source IPv6 address for ICMP echo requests.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] source ipv6 1::1
```

Related commands

source interface

source port

Use **source port** to configure the source port number for probe packets.

Use **undo source port** to restore the default.

Syntax

source port *port-number*

undo source port

Default

The source port number is not specified.

Views

UDP echo operation view

SNMP operation view

UDP tracert operation view

UDP jitter/voice operation view

DNS template view

Predefined user roles

network-admin

Parameters

port-number: Specifies the source port number in the range of 1 to 65535.

Examples

Set the source port number to 8000 for probe packets in the UDP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-echo
[Sysname-nqa-admin-test-udp-echo] source port 8000
```

In DNS template view, set the source port number to 8000 for probe packets in the DNS operation.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] source port 8000
```

ssl-client-policy

Use **ssl-client-policy** to specify an SSL client policy for an HTTPS or SSL template.

Use **undo ssl-client-policy** to restore the default.

Syntax

ssl-client-policy *policy-name*

undo ssl-client-policy

Default

No SSL client policy is specified for an HTTPS or SSL template.

Views

HTTPS/SSL template view

Predefined user roles

network-admin

Parameters

policy-name: Specifies an SSL client policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

In the HTTPS or SSL operation, the NQA client uses the specified SSL client policy to establish an SSL connection to the server.

Examples

Specify SSL client policy **policy** for SSL template **ssltplt**.

```
<Sysname> system-view
[Sysname] nqa template ssl ssltplt
[Sysname-nqatplt-ssl-ssltplt] ssl-client-policy policy
```

statistics hold-time

Use **statistics hold-time** to set the hold time of statistics groups for an NQA operation.

Use **undo statistics hold-time** to restore the default.

Syntax

statistics hold-time *hold-time*

undo statistics hold-time

Default

The hold time of statistics groups for an NQA operation is 120 minutes.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

hold-time: Specifies the hold time in minutes, in the range of 1 to 1440.

Usage guidelines

A statistics group is deleted when its hold time expires.

Examples

Set the hold time to 3 minutes for statistics groups of the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] statistics hold-time 3
```

statistics interval

Use **statistics interval** to set the statistics collection interval for an NQA operation.

Use **undo statistics interval** to restore the default.

Syntax

statistics interval *interval*

undo statistics interval

Default

The statistics collection interval is 60 minutes.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval in minutes, in the range of 1 to 35791394.

Usage guidelines

NQA forms statistics within the same collection interval as a statistics group. To display information about the statistics groups, use the **display nqa statistics** command.

Examples

Configure NQA to collect the ICMP echo operation statistics every 2 minutes.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] statistics interval 2
```

statistics max-group

Use **statistics max-group** to set the maximum number of statistics groups that can be saved.

Use **undo statistics max-group** to restore the default.

Syntax

statistics max-group *number*

undo statistics max-group

Default

A maximum of two statistics groups can be saved.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of statistics groups, in the range of 0 to 100. To disable statistics collection, set the value to 0.

Usage guidelines

When the maximum number of statistics groups is reached and a new statistics group is to be saved, the earliest statistics group is deleted.

Examples

Configure NQA to save a maximum of five statistics groups for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] statistics max-group 5
```

target-only

Use **target-only** to perform the path jitter operation only on the destination address.

Use **undo target-only** to restore the default.

Syntax

target-only

undo target-only

Default

NQA performs the path jitter operation to the destination hop by hop.

Views

Path jitter operation view

Predefined user roles

network-admin

Examples

Perform the path jitter operation only on the destination address.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type path-jitter
[Sysname-nqa-admin-test-path-jitter] target-only
```

tos

Use **tos** to set the ToS value in the IP header for probe packets.

Use **undo tos** to restore the default.

Syntax

tos *value*

undo tos

Default

The ToS value in the IP header of probe packets is 0.

Views

Any operation view

Any NQA template view

Predefined user roles

network-admin

Parameters

value: Specifies the ToS value in the range of 0 to 255.

Examples

In ICMP echo operation view, set the ToS value to 1 in the IP header for probe packets.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] tos 1
```

In ICMP template view, set the ToS value to 1 in the IP header for probe packets.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] tos 1
```

ttl

Use **ttl** to set the maximum number of hops that the probe packets can traverse.

Use **undo ttl** to restore the default.

Syntax

ttl *value*

undo ttl

Default

The maximum number of hops is 30 for probe packets of the UDP tracert operation, and is 20 for probe packets of other types of operations.

Views

ICMP echo/TCP/UDP echo operation view

DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/UDP jitter/voice operation view

Any NQA template view

Predefined user roles

network-admin

Parameters

value: Specifies the maximum number of hops that the probe packets can traverse, in the range of 1 to 255.

Usage guidelines

The **route-option bypass-route** command sets the TTL to 1 for probe packets. If you configure both the **route-option bypass-route** and **ttl** commands for an operation, the **ttl** command does not take effect.

For a successful UDP tracert operation, make sure the maximum number of hops is not smaller than the value set in the **init-ttl** command.

Examples

Set the maximum number of hops to 16 for probe packets in the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] ttl 16
```

In ICMP template view, set the maximum number of hops to 16 for probe packets.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] ttl 16
```

type

Use **type** to specify an NQA operation type and enter its view.

Syntax

type { **dhcp** | **dlsw** | **dns** | **ftp** | **http** | **icmp-echo** | **icmp-jitter** | **path-jitter** | **snmp** | **tcp** | **udp-echo** | **udp-jitter** | **udp-tracert** | **voice** }

Default

No operation type is specified.

Views

NQA operation view

Predefined user roles

network-admin

Parameters

dhcp: Specifies the DHCP operation type.

dlsw: Specifies the DLSw operation type.

dns: Specifies the DNS operation type.

ftp: Specifies the FTP operation type.

http: Specifies the HTTP operation type.

icmp-echo: Specifies the ICMP echo operation type.

icmp-jitter: Specifies the ICMP jitter operation type.

path-jitter: Specifies the path jitter operation type.

snmp: Specifies the SNMP operation type.

tcp: Specifies the TCP operation type.

udp-echo: Specifies the UDP echo operation type.

udp-jitter: Specifies the UDP jitter operation type.

udp-tracert: Specifies the UDP tracert operation type.

voice: Specifies the voice operation type.

Usage guidelines

You can specify only one type for an NQA operation. After that, you can configure the operation type-related settings for the NQA operation. To change the type of the NQA operation, remove the NQA operation in system view, and then re-create the NQA operation.

Examples

Specify FTP as the NQA operation type and enter FTP operation view.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp]
```

url

Use **url** to specify the URL of the destination.

Use **undo url** to restore the default.

Syntax

url *url*

undo url

Default

The destination URL is not specified.

Views

FTP/HTTP operation view

FTP/HTTP/HTTPS template view

Predefined user roles

network-admin

Parameters

url: Specifies the URL of the destination server, a case-sensitive string of 1 to 255 characters. The following table describes the URL format and parameters for different operations.

Operation	URL format	Parameter description
HTTP operation	http://*host*/*resource* http://*host*:*port*/*resource*	The *host* parameter represents the host name of the destination server. The host name is a dot-separated case-sensitive string including letters, digits, hyphens (-), and underscores (_). Host names are composed of series of labels, aabbcc.com for example. Each label consists of 1 to 63 characters. Consecutive dots (.) and question marks are not allowed. For description about the filename parameter, see *Fundamentals Configuration Guide*.
HTTPS operation	https://host/resource https://*host*:*port*/*resource*	
FTP operation	ftp://*host/filename* ftp://*host*:*port*/*filename*	

Examples

Configure the URL that the HTTP operation visits as **http://www.company.com/index.htm**.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type http
[Sysname-nqa-admin-test-http] url http://www.company.com/index.html
```

In HTTP template view, configure the URL that the HTTP operation visits as **http://www.company.com/index.htm**.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] url http://www.company.com/index.html
```

username

Use **username** to specify a username.

Use **undo username** to restore the default.

Syntax

username *username*

undo username

Default

No username is configured.

Views

FTP/HTTP operation view

FTP/HTTP/HTTPS/RADIUS template view

Predefined user roles

network-admin

Parameters

username: Specifies the username. This argument is case sensitive. It is a string of 1 to 32 characters for an FTP, HTTP, or HTTPS username, and a string of 1 to 253 characters for a RADIUS authentication username.

Examples

Set the FTP login username to **administrator**.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] username administrator
```

Set the FTP login username to **administrator** in FTP template view.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] username administrator
```

Related commands

operation

password

version

Use **version** to specify the version used in the HTTP or HTTPS operation.

Use **undo version** to restore the default.

Syntax

version { **v1.0** | **v1.1** }

undo version

Default

Version 1.0 is used in the HTTP operation or HTTPS operation.

Views

HTTP operation view

HTTP/HTTPS template view

Predefined user roles

network-admin

Parameters

v1.0: Uses version 1.0.

v1.1: Uses version 1.1.

Examples

Configure the HTTP operation to use the HTTP version 1.1.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type http
[Sysname-nqa-admin-test-http] version v1.1
```

NQA server commands

IMPORTANT:

Configure the NQA server only for UDP jitter, TCP, UDP echo, and voice operations.

display nqa server

Use **display nqa server status** to display NQA server status.

Syntax

display nqa server

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display NQA server status.

```
<Sysname> display nqa server
NQA server status: Enabled
TCP connect:
   IP address          Port      Tos    VPN instance
   2.2.2.2             2000      200    -
UDP echo:
   IP address          Port      Tos    VPN instance
   3.3.3.3             3000      255    -
```

Table 10 Command output

Field	Description
NQA server status	Whether the NQA server is enabled.
TCP connect	Information about the TCP listening service on the NQA server.
UDP echo	Information about the UDP listening service on the NQA server.

Field	Description
IP address	IP address specified for the TCP/UDP listening service on the NQA server.
Port	Port number specified for the TCP/UDP listening service on the NQA server.
Tos	ToS value in the reply packets sent by the NQA server. The ToS value can be specified when you configure a TCP or UDP listening service on the NQA server. If no ToS value is specified, the following rules apply: • This field displays a hyphen (-). • The ToS value in the reply packets of a TCP listening service is 0. • The ToS value in the reply packets of a UDP listening service is obtained from the request packets.
VPN instance	This field is not supported in the current software version. Name of the VPN instance to which the IP address that the NQA server listens on belongs. This field displays a hyphen (-) if the NQA server listens on a public IP address.

`nqa server udp-echo`

nqa server tcp-connect

Use **nqa server tcp-connect** to configure a TCP listening service to enable the NQA server to listen to a port on an IP address.

Use **undo nqa server tcp-connect** to remove a TCP listening service.

Syntax

nqa server tcp-connect *ip-address port-number* [**tos** *tos*]

undo nqa server tcp-connect *ip-address port-number*

Default

No TCP listening services exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address for the TCP listening service.

port-number: Specifies the port number for the TCP listening service, in the range of 1 to 65535.

tos *tos*: Specifies the ToS value in the IP header for reply packets. The value range is 0 to 255, and the default value is 0.

Usage guidelines

Use this command on the NQA server only for the TCP operation.

When you configure the IP address and port number for a TCP listening service on the NQA server, follow these restrictions and guidelines:

- The IP address and port number must be unique on the NQA server and match the configuration on the NQA client.
- The IP address must be the address of an interface on the NQA server.
- To ensure successful NQA operations and avoid affecting existing services, do not configure the TCP listening service on well-known ports from 1 to 1023.

Examples

Configure a TCP listening service to enable the NQA server to listen to port 9000 on the IP address 169.254.10.2.

```
<Sysname> system-view
[Sysname] nqa server tcp-connect 169.254.10.2 9000
```

Related commands

display nqa server

nqa server enable

nqa server udp-echo

Use **nqa server udp-echo** to configure a UDP listening service to enable the NQA server to listen to a port on an IP address.

Use **undo nqa server udp-echo** to remove the UDP listening service created.

Syntax

nqa server udp-echo *ip-address port-number* [**tos** *tos*]

undo nqa server udp-echo *ip-address port-number*

Default

No UDP listening services exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address for the UDP listening service.

port-number: Specifies the port number for the UDP listening service, in the range of 1 to 65535.

tos *tos*: Specifies the ToS value in the IP header for reply packets. The value range is 0 to 255. If you do not specify a ToS value, the ToS value in the request packet is used.

Usage guidelines

Use this command on the NQA server only for the UDP jitter, UDP echo, and voice operations.

When you configure the IP address and port number for a UDP listening service on the NQA server, follow these restrictions and guidelines:

- The IP address and port number must be unique on the NQA server and match the configuration on the NQA client.
- The IP address must be the address of an interface on the NQA server.
- To ensure successful NQA operations and avoid affecting existing services, do not configure the UDP listening service on well-known ports from 1 to 1023.

Examples

Configure a UDP listening service to enable the NQA server to listen to port 9000 on the IP address 169.254.10.2.

```
<Sysname> system-view
[Sysname] nqa server udp-echo 169.254.10.2 9000
```

Related commands

NTP commands

NTP is supported only on Layer 3 interfaces.

display ntp-service ipv6 sessions

Use **display ntp-service ipv6 sessions** to display information about all IPv6 NTP associations.

Syntax

display ntp-service ipv6 sessions [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

verbose: Displays detailed information about all IPv6 NTP associations. If you do not specify this keyword, the command displays only brief information about the IPv6 NTP associations.

Examples

Display brief information about all IPv6 NTP associations.

```
<Sysname> display ntp-service ipv6 sessions
Notes: 1 source(master), 2 source(peer), 3 selected, 4 candidate, 5 configured.

 Source:   [125]3000::32
 Reference: 127.127.1.0          Clock stratum: 2
 Reachabilities: 1               Poll interval: 64
 Last receive time: 6            Offset: -0.0
 Roundtrip delay: 0.0            Dispersion: 0.0

 Total sessions : 1
```

Table 1 Command output

Field	Description
[12345]	• **1**—Clock source selected by the system (the current reference source). • **2**—The stratum level of the clock source is less than or equal to 15. • **3**—The clock source has survived the clock selection algorithm. • **4**—The clock source is a candidate clock source. • **5**—The clock source was created by a command.
Source	IPv6 address of the NTP server. If this field displays **::**, the IPv6 address of the NTP server has not been resolved successfully.

Field	Description

Reference	Reference clock ID of the NTP server:
	• If the reference clock is the local clock, the value of this field is related to the value of the **Clock stratum** field:
	  ○ When the value of the **Clock stratum** field is 0 or 1, this field displays **LOCL**.
	  ○ When the **Clock stratum** field has another value, this field displays the MD5 digest value of the first 32 bits of the IPv6 address. The MD5 digest value is in dotted decimal format.
	• If the reference clock is the clock of another device on the network, this field displays the MD5 digest value of the first 32 bits of the IPv6 address. The MD5 digest value is in dotted decimal format. If this field displays **INIT**, the local device has not established a connection with the NTP server.

Clock stratum	Stratum level of the NTP server, which determines the clock accuracy. The value is in the range of 1 to 16. A lower stratum level represents higher clock accuracy. A stratum 16 clock is not synchronized.
Reachabilities	Reachability count of the NTP server. 0 indicates that the NTP server is unreachable.
Poll interval	Polling interval in seconds. It is the maximum interval between successive NTP messages.
Last receive time	Length of time from when the last NTP message was received or when the local clock was last updated to the current time. Time is in seconds by default. • If the time length is greater than 2048 seconds, it is displayed in minutes (m). • If the time length is greater than 300 minutes, it is displayed in hours (h). • If the time length is greater than 96 hours, it is displayed in days (d). • If the time length is greater than 999 days, it is displayed in years (y). If the time when the most recent NTP message was received or when the local clock was updated most recently is behind the current time, this field displays a hyphen (-).
Offset	Offset of the system clock relative to the reference clock, in milliseconds.
Roundtrip delay	Roundtrip delay from the local device to the clock source, in milliseconds.
Dispersion	Maximum error of the system clock relative to the reference source.
Total sessions	Total number of associations.

Display detailed information about all IPv6 NTP associations.

```

Table 2 Command output

Field	Description
Clock source	IPv6 address of the clock source. If this field displays **::**, the IPv6 address of the NTP server has not been resolved successfully.
Clock stratum	Stratum level of the NTP server, which determines the clock precision. The value is in the range of 1 to 16. A lower stratum level represents higher clock accuracy. A stratum 16 clock is not synchronized.

Clock status	Status of the clock source corresponding to this association:
	• **configured**—The association was created at the CLI.
	• **dynamic**—The association is established dynamically.
	• **master**—The clock source is the primary NTP server of the current system.
	• **selected**—The clock source has survived the clock selection algorithm.
	• **candidate**—The clock source is the candidate reference source.
	• **sane**—The clock source has passed authentication and its clock will be used as the reference clock.
	• **insane**—The clock source has not passed authentication, or it has passed authentication but its clock will not be used as the reference clock.
	• **valid**—The clock source is valid, which means the clock source meets the following requirements:
	  ○ It has been authenticated and synchronized.
	  ○ Its stratum level is valid.
	  ○ Its root delay and root dispersion values are within their ranges.
	• **invalid**—The clock source is invalid.
	• **unsynced**—The clock source has not been synchronized or the value of the stratum level is invalid.

Reference clock ID	• If the reference clock is the local clock, the value of this field is related to the value of the Clock stratum field:
	  ○ When the value of the Clock stratum field is 0 or 1, this field displays **LOCL**.
	  ○ When the Clock stratum field has another value, this field displays the MD5 digest value of the first 32 bits of the IPv6 address. The MD5 digest value is in dotted decimal format.
	• If the reference clock is the clock of another device on the network, this field displays the MD5 digest value of the first 32 bits of the IPv6 address. The MD5 digest value is in dotted decimal format. If this field displays **INIT**, the local device has not established a connection with the NTP server.

Field	Description
Local mode	Operation mode of the local device: • **unspec**—The mode is unspecified. • **sym_active**—Active mode. • **sym_passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
local poll interval	Polling interval for the local device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the poll interval of the local device is 2^6, or 64 seconds.
peer mode	Operation mode of the peer device: • **unspec**—The mode is unspecified. • **sym_active**—Active mode. • **sym_passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
peer poll interval	Polling interval for the peer device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the polling interval of the local device is 2^6, or 64 seconds.
Offset	Offset of the system clock relative to the reference clock, in milliseconds.
roundtrip delay	Roundtrip delay from the local device to the clock source, in milliseconds.
dispersion	Maximum error of the system clock relative to the reference clock.
Root roundtrip delay	Roundtrip delay from the local device to the primary NTP server, in milliseconds.
root dispersion	Maximum error of the system clock relative to the primary NTP server, in milliseconds.
Reachabilities	Reachability count of the clock source. 0 indicates that the clock source is unreachable.
sync distance	Synchronization distance relative to the upper-level clock, in seconds, and calculated from dispersion and roundtrip delay values.
Precision	Accuracy of the system clock.
version	NTP version in the range of 1 to 4.
source interface	Source interface. If the source interface is not specified, this field displays **Not specified**.
Reftime	Reference timestamp in the NTP message.
Orgtime	Originate timestamp in the NTP message.
Rcvtime	Receive timestamp in the NTP message.
Xmttime	Transmit timestamp in the NTP message.
Filter order	Dispersion information.

Field	Description
Reference clock status	Status of the local clock. The field is displayed only when you use the **ntp-service refclock-master** command to set the local clock as the reference clock. When the reach field of the local clock is 255, the field is displayed as **working normally**. Otherwise, the field is displayed as **working abnormally**.
Total sessions	Total number of associations.

display ntp-service sessions

Use **display ntp-service sessions** to display information about all IPv4 NTP associations.

Syntax

display ntp-service sessions [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

verbose: Displays detailed information about all IPv4 NTP associations. If you do not specify this keyword, the command displays only brief information about the NTP associations.

Usage guidelines

When a device is operating in NTP broadcast or multicast server mode, the **display ntp-service sessions** command does not display the IPv4 NTP association information corresponding to the broadcast or multicast server. However, the associations are counted in the total number of associations.

Examples

Display brief information about all IPv4 NTP associations.

```
<Sysname> display ntp-service sessions
       source          reference       stra reach poll  now offset  delay disper
**********************************************************************************
[12345]LOCAL(0)        LOCL               0     1   64    - 0.0000 0.0000 7937.9
    [5]0.0.0.0         INIT              16     0   64    - 0.0000 0.0000 0.0000
Notes: 1 source(master), 2 source(peer), 3 selected, 4 candidate, 5 configured.
 Total sessions: 1
```

Table 3 Command output

Field	Description
source	• When the reference clock is the local clock, the field displays **LOCAL** (*number*). It indicates that the IP address of the local clock is 127.127.1.*number*, where *number* represents the NTP process number in the range of 0 to 3. • When the reference clock is the clock of another device, the field displays the IP address of the NTP server. If this field displays **0.0.0.0**, the IP address of the NTP server has not been resolved successfully.

Field	Description

reference	Reference clock ID of the NTP server:
	• If the reference clock is the local clock, the value of this field is related to the value of the **stra** field:
	  ○ When the value of the **stra** field is 0 or 1, this field displays **LOCL**.
	  ○ When the **stra** field has another value, this field displays the IP address of the local clock.
	• If the reference clock is the clock of another device on the network, this field displays the IP address of the device. If the device supports IPv6, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the device. If this field displays **INIT**, the local device has not established a connection with the NTP server.

stra	Stratum level of the clock source, which determines the clock accuracy. The value is in the range of 1 to 16. The clock accuracy decreases from stratum 1 to stratum 16. A stratum 1 clock has the highest precision, and a stratum 16 clock is not synchronized.
reach	Reachability count of the clock source. 0 indicates that the clock source is unreachable.
poll	Polling interval in seconds. It is the maximum interval between successive NTP messages.
now	Length of time from when the last NTP message was received or when the local clock was last updated to the current time. Time is in seconds by default. • If the time length is greater than 2048 seconds, it is displayed in minutes (m). • If the time length is greater than 300 minutes, it is displayed in hours (h). • If the time length is greater than 96 hours, it is displayed in days (d). • If the time length is greater than 999 days, it is displayed in years (y). If the time when the most recent NTP message was received or when the local clock was updated most recently is behind the current time, this field displays a hyphen (-).
offset	Offset of the system clock relative to the reference clock, in milliseconds.
delay	Roundtrip delay from the local device to the NTP server, in milliseconds.
disper	Maximum error of the system clock relative to the reference source, in milliseconds.
[12345]	• **1**—Clock source selected by the system (the current reference source). • **2**—The stratum level of the clock source is less than or equal to 15. • **3**—The clock source has survived the clock selection algorithm. • **4**—The clock source is a candidate clock source. • **5**—The clock source was created by a configuration command.
Total sessions	Total number of associations.

Display detailed information about all IPv4 NTP associations.

Table 4 Command output

Field	Description
Clock source	IP address of the NTP server. If this field displays **0.0.0.0**, the IP address of the NTP server has not been resolved successfully.
Clock stratum	Stratum level of the NTP server, which determines the clock accuracy. The value is in the range of 1 to 16. A lower stratum level represents greater clock accuracy. A stratum 16 clock is not synchronized.

Clock status	Status of the clock source corresponding to this association:
	• **configured**—The association was created by a configuration command.
	• **dynamic**—The association is established dynamically.
	• **master**—The clock source is the primary NTP server of the current system.
	• **selected**—The clock source has survived the clock selection algorithm.
	• **candidate**—The clock source is the candidate reference source.
	• **sane**—The clock source has passed authentication and its clock will be used as the reference clock.
	• **insane**—The clock source has not passed authentication, or it has passed authentication but its clock will not be used as the reference clock.
	• **valid**—The clock source is valid, which means the clock source meets the following requirements:
	  ○ It has been authenticated and synchronized.
	  ○ Its stratum level is valid.
	  ○ Its root delay and root dispersion values are within their ranges.
	• **invalid**—The clock source is invalid.
	• **unsynced**—The clock source has not been synchronized or the value of the stratum level is invalid.

Reference clock ID	Reference clock ID of the NTP server:
	• If the reference clock is the local clock, the value of this field is related to the value of the **Clock** stratum field:
	  ○ When the value of the **Clock** stratum field is 0 or 1, this field displays **LOCL**.
	  ○ When the **Clock** stratum field has another value, this field displays the IP address of the local clock.
	• If the reference clock is the clock of another device on the network, this field displays the IP address of the device. If the device supports IPv6, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the device. If this field displays **INIT**, the local device has not established a connection with the NTP server.

Field	Description
Local mode	Operation mode of the local device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
local poll interval	Polling interval of the local device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the poll interval of the local device is 2^6, or 64 seconds.
Peer mode	Operation mode of the peer device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
peer poll interval	Polling interval of the peer device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the poll interval of the local device is 2^6, or 64 seconds.
Offset	Offset of the system clock relative to the reference clock, in milliseconds.
roundtrip delay	Roundtrip delay from the local device to the NTP server, in milliseconds.
dispersion	Maximum error of the system clock relative to the reference clock.
Root roundtrip delay	Roundtrip delay from the local device to the primary NTP server, in milliseconds.
root dispersion	Maximum error of the system clock relative to the primary reference clock, in milliseconds.
Reachabilities	Reachability count of the clock source. 0 indicates that the clock source is unreachable.
sync distance	Synchronization distance relative to the upper-level clock, in seconds, and calculated from dispersion and roundtrip delay values.
Precision	Accuracy of the system clock.
version	NTP version in the range of 1 to 4.
source interface	Source interface. If the source interface is not specified, this field is **Not specified**.
Reftime	Reference timestamp in the NTP message.
Orgtime	Originate timestamp in the NTP message.
Rcvtime	Receive timestamp in the NTP message.
Xmttime	Transmit timestamp in the NTP message.
Filter order	Sample information order.

Field	Description
Reference clock status	Status of the local clock. The field is displayed only when you use the **ntp-service refclock-master** command to set the local clock as the reference clock. When the reach field of the local clock is 255, the field is displayed as **working normally**. Otherwise, the field is displayed as **working abnormally**.
Total sessions	Total number of associations.

display ntp-service status

Use **display ntp-service status** to display NTP service status.

Syntax

display ntp-service status

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display NTP service status after time synchronization.

```
<Sysname> display ntp-service status
 Clock status: synchronized
 Clock stratum: 2
 System peer: LOCAL(0)
 Local mode: client
 Reference clock ID: 127.127.1.0
 Leap indicator: 00
 Clock jitter: 0.000977 s
 Stability: 0.000 pps
 Clock precision: 2^-19
 Root delay: 0.00000 ms
 Root dispersion: 3.96367 ms
 Reference time: d0c5fc32.92c70b1e  Wed, Dec 29 2010 18:28:02.573
 System poll interval: 256 s
```

Display the NTP service status when time is not synchronized.

```
<Sysname> display ntp-service status
 Clock status: unsynchronized
 Clock stratum: 16
 Reference clock ID: none
 Clock jitter: 0.000000 s
 Stability: 0.000 pps
 Clock precision: 2^-19
 Clock precision:
 Root delay: 0.00000 ms
 Root dispersion: 0.00002 ms
```

```
Reference time: d0c5fc32.92c70b1e  Wed, Dec 29 2010 18:28:02.573
System poll interval: 8 s
```

Table 5 Command output

Field	Description
Clock status	Status of the system clock: • **synchronized**—The system clock has been synchronized. • **unsynchronized**—The system clock has not been synchronized.
Clock stratum	Stratum level of the system clock.
System peer	IP address of the selected NTP server.
Local mode	Operation mode of the local device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
Reference clock ID	For an IPv4 NTP server: The field represents the IP address of the remote server when the local device is synchronized to a remote NTP server. The field represents the local clock when the local device uses the local clock as the reference source. • When the local clock has a stratum level of 1, this field displays **LOCL**. • When the local clock has any other stratum, this field displays the IP address of the local clock. For an IPv6 NTP server: The field represents the MD5 digest of the first 32 bits of the IPv6 address of the remote server when the local device is synchronized to a remote IPv6 NTP server. The field represents the local clock when the local device uses the local clock as the reference source. • When the local clock has a stratum level of 1, this field displays **LOCL**. • When the local clock has any other stratum, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the local clock.
Leap indicator	Alarming status: • **00**—Normal. • **01**—Leap second, indicates that the last minute in a day has 61 seconds. • **10**—Leap second, indicates that the last minute in a day has 59 seconds. • **11**—Time is not synchronized.
Clock jitter	Difference between the system clock and reference clock, in seconds.
Stability	Clock frequency stability. A lower value represents better stability.
Clock precision	Accuracy of the system clock.
Root delay	Roundtrip delay from the local device to the primary NTP server, in milliseconds.
Root dispersion	Maximum error of the system clock relative to the primary NTP server, in milliseconds.
Reference time	Reference timestamp.
System poll interval	System polling interval in seconds.

display ntp-service trace

Use **display ntp-service trace** to display brief information about each NTP server from the local device back to the primary NTP server.

Syntax

display ntp-service trace [**source** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

source *interface-type interface-number*: Specifies the source interface for sending NTP packets to trace each NTP server from the local device back to the primary NTP server. The source IP address of the NTP packets is the IPv4 address/IPv6 address of the specified source interface. If the IP address of an NTP server is a link-local address, the link-local address of the outgoing interface of NTP packets is used as the source IP address of the NTP packets. If you do not specify this option, the interface that sends the tracing NTP packets acts as the source interface.

Usage guidelines

To trace back to the primary NTP server from the source interface, make sure the source interface and the NTP servers from the local device to the primary NTP server are reachable to each other.

Examples

Display brief information about each NTP server from the local device back to the primary NTP server.

```
<Sysname> display ntp-service trace
Server     127.0.0.1
Stratum    3, jitter  0.000, synch distance 0.0000.
Server     3000::32
Stratum    2 , jitter 790.00, synch distance 0.0000.
RefID      127.127.1.0
```

The output shows that server 127.0.0.1 is synchronized to server 3000::32, and server 3000::32 is synchronized to the local clock.

Table 6 Command output

Field	Description
Server	IP address of the NTP server.
Stratum	Stratum level of the NTP server.
jitter	Root mean square (RMS) value of the clock offset relative to the upper-level clock, in seconds.
synch distance	Synchronization distance relative to the upper-level NTP server, in seconds, calculated from dispersion and roundtrip delay values.
RefID	Identifier of the primary NTP server. When the stratum level of the primary reference clock is 0, it is displayed as **LOCL**. Otherwise, it is displayed as the IP address of the primary reference clock.

ntp-service acl

Use **ntp-service acl** to configure the right for peer devices to access the IPv4 NTP services on the local device.

Use **undo ntp-service** to remove the configured IPv4 NTP service access right.

Syntax

ntp-service { **peer** | **query** | **server** | **synchronization** } **acl** *ipv4-acl-number*

undo ntp-service { **peer** | **query** | **server** | **synchronization** } [**acl** *ipv4-acl-number*]

Default

The right for the peer devices to access the IPv4 NTP services on the local device is **peer**.

Views

System view

Predefined user roles

network-admin

Parameters

peer: Allows time requests and NTP control queries (such as alarms, authentication status, and time server information) from a peer device and allows the local device to synchronize itself to a peer device.

query: Allows only NTP control queries from a peer device to the local device.

server: Allows time requests and NTP control queries from a peer device, but does not allow the local device to synchronize itself to a peer device.

synchronization: Allows only time requests from a peer device.

acl *ipv4-acl-number*: Specifies an IPv4 ACL by its number. The peer devices that match the IPv4 ACL have the access right specified in the command. The *ipv4-acl-number* argument represents an IPv4 basic ACL number in the range of 2000 to 2999 or an IPv4 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

When the device receives an IPv4 NTP request, it matches the request against the access rights in order from the least restrictive to the most restrictive: **peer**, **server**, **synchronization**, and **query**.

- If no IPv4 NTP access control is configured, the **peer** access right applies.
- If the IP address of the peer device matches a **permit** statement in an IPv4 ACL, the access right is granted to the peer device. If a **deny** statement or no IPv4 ACL is matched, no access right is granted.

- If no IPv4 ACL is specified for an access right or the IPv4 ACL specified for the access right is not created, the access right is not granted.
- If none of the IPv4 ACLs specified for the access rights is created, the **peer** access right applies.
- If none of the IPv4 ACLs specified for the access rights contains rules, no access right is granted.

The **ntp-service acl** command provides minimal security for a system running NTP. A more secure method is NTP authentication.

Examples

Configure the peer devices on subnet 10.10.0.0/16 to have full access to the local device.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 10.10.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] ntp-service peer acl 2001
```

ntp-service authentication enable

undo ntp-service authentication enable

Default

NTP authentication is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Enable NTP authentication in networks that require time synchronization security to make sure NTP clients are synchronized only to authenticated NTP servers.

To authenticate an NTP server, set an authentication key and specify it as a trusted key.

Examples

Enable NTP authentication.

```
<Sysname> system-view
[Sysname] ntp-service authentication enable
```

Related commands

ntp-service authentication-keyid

ntp-service reliable authentication-keyid

ntp-service authentication-keyid

Use **ntp-service authentication-keyid** to set an NTP authentication key.

Use **undo ntp-service authentication-keyid** to remove an NTP authentication key.

Syntax

ntp-service authentication-keyid *keyid* **authentication-mode** { **hmac-sha-1** | **hmac-sha-256** | **hmac-sha-384** | **hmac-sha-512** | **md5** } { **cipher** | **simple** } *string* [**acl** *ipv4-acl-number* | **ipv6 acl** *ipv6-acl-number*] *

undo ntp-service authentication-keyid *keyid*

Default

No NTP authentication key exists.

Views

System view

Predefined user roles

network-admin

Parameters

keyid: Specifies an authentication key ID in the range of 1 to 4294967295.

authentication-mode: Specifies an authentication algorithm.

- **hmac-sha-1**: Specifies the HMAC-SHA-1 algorithm.
- **hmac-sha-256**: Specifies the HMAC-SHA-256 algorithm.
- **hmac-sha-384**: Specifies the HMAC-SHA-384 algorithm.
- **hmac-sha-512**: Specifies the HMAC-SHA-512 algorithm.
- **md5**: Specifies the MD5 algorithm.

cipher: Specifies an authentication key in encrypted form.

simple: Specifies an authentication key in plaintext form. For security purposes, the authentication key specified in plaintext form will be stored in encrypted form.

string: Specifies a case-sensitive authentication key. Its plaintext form is a string of 1 to 32 characters. Its encrypted form is a string of 1 to 73 characters.

acl *ipv4-acl-number*: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999. Only the devices permitted by the ACL can use the key ID for authentication.

ipv6 acl *ipv6-acl-number*: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999. Only the devices permitted by the ACL can use the key ID for authentication.

Usage guidelines

In a network where there is a high security demand, the NTP authentication feature must be enabled for a system running NTP. This feature enhances the network security by using client-server key authentication, which prohibits a client from synchronizing to a device that has failed the authentication.

The key ID in the message from the peer device identifies the key used for authentication. The **acl** *ipv4-acl-number* or **acl** *ipv6-acl-number* option is used to identify the peer device that can use the key ID.

- The device uses the **acl** *ipv4-acl-number* or **acl** *ipv6-acl-number* option to identify the peer device that can use the key ID only when an NTP session for the peer device is required to be established or after the NTP session has been established.
- If the specified IPv4 or IPv6 ACL does not exist, any device can use the key ID for authentication.
- If the specified IPv4 or IPv6 ACL does not contain any rules, no device can use the key ID for authentication.

To ensure a successful NTP authentication, configure the same key ID, authentication algorithm, and key on the time server and client.

After you specify an NTP authentication key, use the **ntp-service reliable authentication-keyid** command to configure the key as a trusted key. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo ntp-service reliable authentication-keyid** command.

The security strength of the five algorithms, in descending order, is HMAC-SHA-512, HMAC-SHA-384, HMAC-SHA-256, HMAC-SHA-1, and MD5.

You can set a maximum of 128 authentication keys by executing the command.

Examples

Set a plaintext MD5 authentication key, with the key ID of **10** and key value of **BetterKey**.

```
<Sysname> system-view
[Sysname] ntp-service authentication enable
[Sysname] ntp-service authentication-keyid 10 authentication-mode md5 simple BetterKey
```

Related commands

ntp-service authentication enable

ntp-service broadcast-client

Use **ntp-service broadcast-client** to configure the device to operate in NTP broadcast client mode and use the current interface to receive NTP broadcast packets.

Use **undo ntp-service broadcast-client** to remove the configuration.

Syntax

ntp-service broadcast-client

undo ntp-service broadcast-client

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

After you configure the command, the device listens to NTP messages sent by the NTP broadcast server and is synchronized based on the received NTP messages.

If you have configured the device to operate in broadcast client mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in broadcast client mode and receive NTP broadcast messages on VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] ntp-service broadcast-client
```

Related commands

ntp-service broadcast-server

ntp-service broadcast-server

Use **ntp-service broadcast-server** to configure the device to operate in NTP broadcast server mode and use the current interface to send NTP broadcast packets.

Use **undo ntp-service broadcast-server** to remove the configuration.

Syntax

ntp-service broadcast-server [**authentication-keyid** *keyid* | **version** *number*] *

undo ntp-service broadcast-server

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Parameters

authentication-keyid *keyid*: Specifies the key ID to be used for sending broadcast messages to broadcast clients. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device cannot synchronize broadcast clients enabled with NTP authentication.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4, and the default is 4.

Usage guidelines

After you configure the command, the device periodically sends NTP messages to the broadcast address 255.255.255.255.

If you have configured the device to operate in broadcast server mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in broadcast server mode and send NTP broadcast messages on VLAN-interface 1, using key 4 for encryption. Set the NTP version to 4.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] ntp-service broadcast-server authentication-keyid 4 version 4
```

ntp-service inbound enable

Use **ntp-service inbound enable** to enable an interface to receive NTP messages.

Use **undo ntp-service inbound enable** to disable an interface from receiving NTP messages.

Syntax

ntp-service inbound enable

undo ntp-service inbound enable

Default

An interface receives NTP messages.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

Execute the **undo ntp-service inbound enable** command on an interface in the following cases:

- You do not want the interface to synchronize the peer device in the corresponding subnet.
- You do not want the device to be synchronized by the peer device in the subnet corresponding to the interface.

Examples

Disable VLAN-interface 1 from receiving NTP messages.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] undo ntp-service inbound enable
```

ntp-service ipv6 acl

Use **ntp-service ipv6 acl** to configure the right for the peer devices to access the IPv6 NTP services of the local device.

Use **undo ntp-service ipv6** to remove the configured IPv6 NTP service access right.

Syntax

ntp-service ipv6 { **peer** | **query** | **server** | **synchronization** } **acl** *ipv6-acl-number*

undo ntp-service ipv6 { **peer** | **query** | **server** | **synchronization** } [**acl** *ipv6-acl-number*]

Default

The right for the peer devices to access the IPv6 NTP services on the local device is **peer**.

Views

System view

Predefined user roes

network-admin

Parameters

peer: Allows time requests and NTP control queries (such as alarms, authentication status, and time server information) and allows the local device to synchronize itself to a peer device.

query: Allows only NTP control queries from a peer device to the local device.

server: Allows time requests and NTP control queries, but does not allow the local device to synchronize itself to a peer device.

synchronization: Allows only time requests from a system whose address passes the access list criteria.

ipv6-acl-number: Specifies an IPv6 ACL by its number. The peer devices that match the IPv6 ACL have the access right specified in the command. The *ipv6-acl-number argument* represents a basic IPv6 ACL number in the range of 2000 to 2999 or an advanced IPv6 ACL number in the range of 3000 to 3999.

Usage guidelines

When the device receives an IPv6 NTP request, it matches the request against the access rights in order from the least restrictive to the most restrictive: **peer**, **server**, **synchronization**, and **query**.

- If no IPv6 NTP access control is configured, the **peer** access right applies.
- If the IP address of the peer device matches a **permit** statement in an IPv6 ACL, the access right is granted to the peer device. If a **deny** statement or no IPv6 ACL is matched, no access right is granted.
- If no IPv6 ACL is specified for an access right or the IPv6 ACL specified for the access right is not created, the access right is not granted.
- If none of the IPv6 ACLs specified for the access rights is created, the **peer** access right applies.
- If none of the IPv6 ACLs specified for the access rights contains rules, no access right is granted.

The **ntp-service ipv6 acl** command provides a minimum security method. NTP authentication is more secure.

Examples

Configure the peer devices on subnet 2001::1 to have full access to the local device.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2001
[Sysname-acl-ipv6-basic-2001] rule permit source 2001::1 64
[Sysname-acl-ipv6-basic-2001] quit
[Sysname] ntp-service ipv6 peer acl 2001
```

Use **ntp-service ipv6 dscp** to set a DSCP value for IPv6 NTP packets.

Use **undo ntp-service ipv6 dscp** to restore the default.

Syntax

ntp-service ipv6 dscp *dscp-value*

undo ntp-service ipv6 dscp

Default

The DSCP value for IPv6 NTP packets is 56.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63 for IPv6 NTP packets.

Usage guidelines

The DSCP value is included in the Traffic Class field of an IPv6 packet to identify the packet priority.

Examples

Set the DSCP value for IPv6 NTP packets to **30**.

```
<Sysname> system-view
[Sysname] ntp-service ipv6 dscp 30
```

ntp-service ipv6 inbound enable

Use **ntp-service ipv6 inbound enable** to enable an interface to receive IPv6 NTP messages.

Use **undo ntp-service ipv6 inbound enable** to disable an interface from receiving IPv6 NTP messages.

Syntax

ntp-service ipv6 inbound enable

undo ntp-service ipv6 inbound enable

Default

An interface receives IPv6 NTP messages.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

Execute the **undo ntp-service ipv6 inbound enable** command on an interface in the following cases:

- You do not want the interface to synchronize the peer devices in the corresponding subnet.
- You do not want the device to be synchronized by the peer devices in the subnet corresponding to the interface.

Examples

Disable VLAN-interface 1 from receiving IPv6 NTP messages.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] undo ntp-service ipv6 inbound enable
```

ntp-service ipv6 multicast-client

Use **ntp-service ipv6 multicast-client** to configure the device to operate in IPv6 NTP multicast client mode and use the current interface to receive IPv6 NTP multicast packets.

Use **undo ntp-service ipv6 multicast-client** to remove the configuration.

Syntax

ntp-service ipv6 multicast-client *ipv6-address*

undo ntp-service ipv6 multicast-client *ipv6-address*

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 multicast address. An IPv6 broadcast client and an IPv6 broadcast server must be configured with the same multicast address.

Usage guidelines

After you configure the command, the device listens to IPv6 NTP messages using the specified multicast address as the destination address. It is synchronized based on the received IPv6 NTP messages.

If you have configured the device to operate in IPv6 multicast client mode on an interface by using the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in IPv6 multicast client mode and receive IPv6 NTP multicast messages with the destination FF21::1 on VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] ntp-service ipv6 multicast-client ff21::1
```

Related commands

Use **undo ntp-service ipv6 multicast-server** to remove the configuration.

Syntax

ntp-service ipv6 multicast-server *ipv6-address* [**authentication-keyid** *keyid* | **ttl** *ttl-number*] *

undo ntp-service ipv6 multicast-server *ipv6-address*

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 multicast address. An IPv6 multicast client and server must be configured with the same multicast address.

authentication-keyid *keyid*: Specifies the key ID to be used for sending multicast messages to multicast clients. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device cannot synchronize clients enabled with NTP authentication.

ttl *ttl-number*: Specifies the TTL of NTP multicast messages. The value range for the *ttl-number* argument is 1 to 255, and the default is 16.

Usage guidelines

After you configure the command, the device periodically sends NTP messages to the specified IPv6 multicast address.

If you have configured the device to operate in IPv6 multicast server mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in IPv6 multicast server mode and send IPv6 NTP multicast messages on VLAN-interface 1 to the multicast address FF21::1, using key 4 for encryption.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] ntp-service ipv6 multicast-server ff21::1 authentication-keyid
4
```

Related commands

ntp-service ipv6 multicast-client

ntp-service ipv6 source

Use **ntp-service ipv6 source** to specify a source interface for IPv6 NTP messages.

Use **undo ntp-service ipv6 source** to restore the default.

Syntax

ntp-service ipv6 source *interface-type interface-number*

undo ntp-service ipv6 source

Default

No source interface is specified for IPv6 NTP messages. The device automatically selects the source IP address for IPv6 NTP messages. For more information, see *RFC 3484*.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

If you specify a source interface for IPv6 NTP messages, the device uses the IPv6 address of the source interface as the source address to send IPv6 NTP messages. Consequently, the destination address of the IPv6 NTP response messages is the address of the source interface.

When the device responds to an IPv6 NTP request, the source IPv6 address of the NTP response is always the IPv6 address of the interface that has received the IPv6 NTP request.

If you do not want the IPv6 address of an interface on the local device to become the destination address for response messages, use the command to specify another interface as the source interface for IPv6 NTP messages.

The source interface for IPv6 NTP messages can also be specified in the following ways:

- In NTP client/server mode, if you have specified the source interface for IPv6 NTP messages in the **ntp-service ipv6 unicast-server** command, the specified interface acts as the source interface for IPv6 NTP messages.
- In NTP symmetric active/passive mode, if you have specified the source interface for IPv6 NTP messages in the **ntp-service ipv6 unicast-peer** command, the specified interface acts as the source interface for IPv6 NTP messages.
- In NTP multicast mode, if you have configured the **ntp-service ipv6 multicast-server** command on an interface, the interface acts as the source interface for NTP multicast messages.

If the specified source interface is down, the device does not send IPv6 NTP messages.

Examples

Specify the source interface of IPv6 NTP messages as VLAN-interface 1.

```
<Sysname> system-view
[Sysname] ntp-service ipv6 source vlan-interface 1
```

ntp-service ipv6 unicast-peer

Use **ntp-service ipv6 unicast-peer** to specify an IPv6 symmetric-passive peer for the device.

Use **undo ntp-service ipv6 unicast-peer** to remove the IPv6 symmetric-passive peer specified for the device.

Syntax

ntp-service ipv6 unicast-peer { *peer-name* | *ipv6-address* } [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number*] *

undo ntp-service ipv6 unicast-peer { *peer-name* | *ipv6-address* }

Default

No IPv6 symmetric-passive peer is specified.

Views

System view

Predefined user roles

network-admin

Parameters

peer-name: Specifies a symmetric-passive peer by its host name, a case-insensitive string of 1 to 253 characters.

ipv6-address: Specifies a symmetric-passive peer by its IPv6 address. It must be a unicast address, rather than a multicast address.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the peer. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and the peer do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies the peer specified by *ipv6-address* or *peer-name* as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for IPv6 NTP messages. If the specified passive peer address is not a link local address, the source IPv6 address for IPv6 NTP messages sent by the local device is the IPv6 address of the specified source interface. If the specified passive peer address is a link local address, the IPv6 NTP messages are sent from the specified source interface, and the source address of the messages is the link local address of the interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify an interface, the device automatically selects the source IPv6 address of IPv6 NTP messages. For more information, see *RFC 3484*.

Usage guidelines

When you specify an IPv6 passive peer for the device, the device and its IPv6 passive peer can be synchronized to each other. If their clocks are in synchronized state, the clock with a high stratum level is synchronized to the clock with a lower stratum level.

If the specified IPv6 address of the passive peer is a link local address, you must specify the source interface for NTP messages.

After you specify an IPv6 symmetric-passive peer for a device, the device polls and synchronize its time with the peer device at the minimum polling interval. If the time discrepancy between the two remains in the acceptable range, the system gradually increases the polling interval until the

maximum polling interval is reached. If the time discrepancy exceeds the acceptable range repeatedly, the polling interval decreases gradually.

The polling interval configuration takes effect when the next polling starts.

Examples

Specify the device with the IPv6 address of 2001::1 as the symmetric-passive peer of the device, and specify the source interface for IPv6 NTP messages as VLAN-interface 1.

```
<Sysname> system-view
[Sysname] ntp-service ipv6 unicast-peer 2001::1 source vlan-interface 1
```

Related commands

Use **ntp-service ipv6 unicast-server** to specify an IPv6 NTP server for the device.

Use **undo ntp-service ipv6 unicast-server** to remove an IPv6 NTP server specified for the device.

Syntax

ntp-service ipv6 unicast-server { *server-name* | *ipv6-address* } [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number*] *

undo ntp-service ipv6 unicast-server { *server-name* | *ipv6-address* }

Default

No IPv6 NTP server is specified.

Views

System view

Predefined user roles

network-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters.

ipv6-address: Specifies an NTP server by its IPv6 address. It must be a unicast address, rather than a multicast address.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds.

The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies this NTP server as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for IPv6 NTP messages. If the specified IPv6 NTP server address is not a link local address, the source IPv6 address for IPv6 NTP messages sent by the local device to the NTP server is the IPv6 address of the specified source interface. If the specified IPv6 NTP server address is a link local address, the IPv6 NTP messages are sent from the specified source interface, and the source address of the messages is the link local address of the interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify an interface, the device automatically selects the source IPv6 address of IPv6 NTP messages. For more information, see *RFC 3484*.

Usage guidelines

When you specify an IPv6 NTP server for the device, the device is synchronized to the IPv6 NTP server, but the IPv6 NTP server is not synchronized to the device.

If the specified IPv6 address of the NTP server is a link local address, you must specify the source interface for NTP messages.

After you specify an IPv6 NTP server for a device, the device polls and synchronizes its time with the server at the minimum polling interval. If the time discrepancy between the two remains in the acceptable range, the system gradually increases the polling interval until the maximum polling interval is reached. If the time discrepancy exceeds the acceptable range repeatedly, the polling interval decreases gradually.

The polling interval configuration takes effect when the next polling starts.

Examples

Specify the IPv6 NTP server 2001::1 for the device.

```
<Sysname> system-view
[Sysname] ntp-service ipv6 unicast-server 2001::1
```

Related commands

ntp-service authentication enable

ntp-service authentication-keyid

ntp-service reliable authentication-keyid

ntp-service max-dynamic-sessions

Use **ntp-service max-dynamic-sessions** to set the maximum number of dynamic NTP sessions.

Use **undo ntp-service max-dynamic-sessions** to restore the default.

Syntax

ntp-service max-dynamic-sessions *number*

undo ntp-service max-dynamic-sessions

Default

The maximum number of dynamic NTP sessions is 100.

Views

System view

Predefined user roles

network-admin

Parameters

number: Sets the maximum number of dynamic NTP associations, in the range of 0 to 100.

Usage guidelines

A device can have a maximum of 128 concurrent associations, including static associations and dynamic associations. A static association refers to an association that a user has manually created by using an NTP command. A dynamic association is a temporary association created by the system during operation.

This command limits the number of dynamic NTP associations and prevents dynamic NTP associations from occupying too many system resources.

Examples

Set the maximum number of dynamic NTP associations to 50.

```
<Sysname> system-view
[Sysname] ntp-service max-dynamic-sessions 50
```

Related commands

display ntp-service sessions

ntp-service multicast-client

Use **ntp-service multicast-client** to configure the device to operate in NTP multicast client mode and use the current interface to receive NTP multicast packets.

Use **undo ntp-service multicast-client** to remove the NTP multicast client configuration.

Syntax

ntp-service multicast-client [*ip-address*]

undo ntp-service multicast-client [*ip-address*]

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a multicast IP address. The default value is 224.0.1.1. The value for the *ip-address* argument is 224.0.1.0/24.The multicast client and multicast server must be configured with the same multicast IP address.

Usage guidelines

After you configure the command, the device listens to NTP messages using the specified multicast address as the destination address.

If you have configured the device to operate in multicast client mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the NTP multicast client configuration from the interface.

Examples

Configure the device to operate in multicast client mode and receive NTP multicast messages on VLAN-interface 1, and set the multicast address to 224.0.1.1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] ntp-service multicast-client 224.0.1.1
```

Related commands

ntp-service multicast-server

ntp-service multicast-server

Use **ntp-service multicast-server** to configure the device to operate in NTP multicast server mode and use the current interface to send NTP multicast packets.

Use **undo ntp-service multicast-server** to remove the NTP multicast server configuration.

Syntax

ntp-service multicast-server [*ip-address*] [**authentication-keyid** *keyid* | **ttl** *ttl-number* | **version** *number*] *

undo ntp-service multicast-server [*ip-address*]

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a multicast IP address. The default value is 224.0.1.1. The value for the *ip-address* argument is 224.0.1.0/24.The multicast server and client must be configured with the same multicast IP address.

authentication-keyid *keyid*: Specifies the key ID to be used for sending multicast messages to multicast clients. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device cannot synchronize multicast clients enabled with NTP authentication.

ttl *ttl-number*: Specifies the TTL of NTP multicast messages. The value range for the *ttl-number* argument is 1 to 255. The default value is 16.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

After you configure the command, the device periodically sends NTP messages to the specified multicast address.

If you have configured the device to operate in multicast server mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the NTP multicast server configuration from the interface.

Examples

Configure the device to operate in multicast server mode and send NTP multicast messages on VLAN-interface 1 to the multicast address 224.0.1.1, using key 4 for encryption. Set the NTP version to 4.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] ntp-service multicast-server 224.0.1.1 version 4
authentication-keyid 4
```

Related commands

ntp-service multicast-client

ntp-service refclock-master

Use **ntp-service refclock-master** to configure the local clock as the reference source.

Use **undo ntp-service refclock-master** to remove the configuration.

Syntax

ntp-service refclock-master [*ip-address*] [*stratum*]

undo ntp-service refclock-master [*ip-address*]

Default

The device does not use its local clock as the reference clock.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: IP address of the local clock, 127.127.1.*u*, where *u* is the NTP process ID in the range of 0 to 3. The default value is 127.127.1.0.

stratum: Stratum level of the local clock, in the range of 1 to 15. The default value is 8. A lower stratum level represents higher clock accuracy.

Usage guidelines

Typically an NTP server that gets its time from an authoritative time source, such as an atomic clock has stratum 1 and operates as the primary time server to provide time synchronization for other devices in the network. The accuracy of each server is the stratum, with the topmost level (primary servers) assigned as one and each level downwards (secondary servers) in the hierarchy assigned as one greater than the preceding level.

If the devices in a network cannot synchronize to an authoritative time source, you can perform the following tasks:

- Select a device that has a relatively accurate clock from the network.
- Use the local clock of the device as the reference clock to synchronize other devices in the network.

Use the command with caution to avoid time errors. As a best practice, set the local clock time to a correct value before you execute the command.

Examples

Specify the local clock as the reference source, with the stratum level 2.

```
<Sysname> system-view
[Sysname] ntp-service refclock-master 2
```

ntp-service reliable authentication-keyid

Use **ntp-service reliable authentication-keyid** to specify an authentication key as a trusted key.

Use **undo ntp-service reliable authentication-keyid** to remove the configuration.

Syntax

ntp-service reliable authentication-keyid *keyid*

undo ntp-service reliable authentication-keyid *keyid*

Default

No trusted key is specified.

Views

System view

Predefined user roles

network-admin

Parameters

keyid: Specifies an authentication key by its ID in the range of 1 to 4294967295.

Usage guidelines

When NTP authentication is enabled, a client can be synchronized only to a server that can provide a trusted authentication key.

Before you use the command, make sure NTP authentication is enabled and an authentication key is configured. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo ntp-service reliable authentication-keyid** command.

You can set a maximum of 128 keys by executing the command.

Examples

Enable NTP authentication, specify the MD5 algorithm, with the key ID of 37 and key value of **BetterKey**.

```
<Sysname> system-view
[Sysname] ntp-service authentication enable
[Sysname] ntp-service authentication-keyid 37 authentication-mode md5 simple BetterKey
```

Specify this key as a trusted key.

```
[Sysname] ntp-service reliable authentication-keyid 37
```

Related commands

ntp-service authentication enable

ntp-service authentication-keyid

ntp-service source

Use **ntp-service source** to specify a source IPv4 address for NTP messages.

Use **undo ntp-service source** to restore the default.

Syntax

ntp-service source { *interface-type interface-number* | *ipv4-address* }

undo ntp-service source

Default

No source IPv4 address is specified for NTP messages. The device performs the following operations:

- Searches the routing table for the outbound interface of NTP messages.
- Uses the primary IPv4 address of the outbound interface as the source IPv4 address for NTP messages.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you specify a source interface for NTP messages, the device uses the primary IPv4 address of the specified source interface as the source address to send NTP messages. The receiving device uses this address as the destination address of the NTP response message.

ip-address: Specifies the source IPv4 address for NTP messages.

Usage guidelines

When the device responds to an NTP request, the source IP address of the NTP response is always the IP address of the interface that has received the NTP request.

If you have specified the source interface for NTP messages in the **ntp-service unicast-server** or **ntp-service unicast-peer** command, the IPv4 address of the specified interface is used as the source IPv4 address for NTP messages.

If you have configured the **ntp-service broadcast-server** or **ntp-service multicast-server** command in an interface view, the IPv4 address of the interface is used as the source IPv4 address for broadcast or multicast NTP messages.

If the specified source interface is down, the device does not send NTP messages.

Examples

Specify the IP address of VLAN-interface 1 as the source IPv4 address for NTP messages.

```
<Sysname> system-view
[Sysname] ntp-service source vlan-interface 1
```

ntp-service time-offset-threshold

Use **ntp-service time-offset-threshold** to set the NTP time-offset thresholds for log and trap outputs.

Use **undo ntp-service time-offset-threshold** to restore the default.

Syntax

ntp-service time-offset-threshold { **log** *log-threshold* | **trap** *trap-threshold* } *

undo ntp-service time-offset-threshold

Default

No NTP time-offset thresholds are set for log and trap outputs.

Views

System view

Predefined user roles

network-admin

Parameters

log *log-threshold*: Specifies the NTP time-offset threshold for log output. The value range for the *log-threshold* argument is 128 to 60000, in milliseconds.

trap *trap-threshold*: Specifies the NTP time-offset threshold for trap output. The value range for the *trap-threshold* argument is 128 to 60000, in milliseconds.

Usage guidelines

By default, the system synchronizes the NTP client's time to the server and outputs a log and a trap when the time offset exceeds 128 ms for multiple times.

After you set the thresholds, the system synchronizes the client's time to the server when the time offset exceeds 128 ms for multiple times, but outputs logs and traps only when the time offset exceeds the specified thresholds, respectively.

Examples

Set the NTP time-offset thresholds for log and trap outputs to 500 ms and 600 ms, respectively.

```
<Sysname> system-view
[Sysname] ntp-service time-offset-threshold log 500 trap 600
```

ntp-service unicast-peer

Use **ntp-service unicast-peer** to specify a symmetric-passive peer for the device.

Use **undo ntp-service unicast-peer** to remove the symmetric-passive peer specified for the device.

Syntax

ntp-service unicast-peer { *peer-name* | *ip-address* } [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number* | **version** *number*] *

undo ntp-service unicast-peer { *peer-name* | *ip-address* }

Default

No symmetric-passive peer is specified.

Views

System view

Predefined user roles

network-admin

Parameters

peer-name: Specifies a symmetric-passive peer by its host name, a case-insensitive string of 1 to 253 characters.

ip-address: Specifies a symmetric-passive peer by its IP address. It must be a unicast address, rather than a broadcast address, a multicast address, or the IP address of the local clock.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the peer. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and the peer do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies the peer specified by *ip-address* or *peer-name* as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for NTP messages. In an NTP message the local device sends to its peer, the source IP address is the primary IP address of this interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify this option, the device searches the routing table for the outgoing interface and uses the primary IP address of the outgoing interface as the source IP address of the NTP messages.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

When you specify a passive peer for the device, the device and its passive peer can be synchronized to each other. If their clocks are in synchronized state, the clock with a high stratum level is synchronized to the clock with a lower stratum level.

Examples

Specify the device with the IP address of 10.1.1.1 as the symmetric-passive peer of the device, and configure the device to run NTP version 4. Specify the source interface of NTP messages as VLAN-interface 1.

```
<Sysname> system-view
[Sysname] ntp-service unicast-peer 10.1.1.1 version 4 source-interface vlan-interface 1
```

Related commands

Syntax

ntp-service unicast-server { *server-name* | *ip-address* } [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number* | **version** *number*] *

undo ntp-service unicast-server { *server-name* | *ip-address* }

Default

No NTP server is specified.

Views

System view

Predefined user roles

network-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters.

ip-address: Specifies an NTP server by its IP address. It must be a unicast address, rather than a broadcast address, a multicast address, or the IP address of the local clock.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies this NTP server as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for NTP messages. For an NTP message the local device sends to the NTP server, the source IP address is the primary IP address of this interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify this option, the device searches the routing table for the outgoing interface and uses the primary IP address of the outgoing interface as the source IP address of the NTP messages.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

When you specify an NTP server for the device, the device is synchronized to the NTP server, but the NTP server is not synchronized to the device.

Examples

Specify NTP server 10.1.1.1 for the device, and configure the device to run NTP version 4.

```
<Sysname> system-view
[Sysname] ntp-service unicast-server 10.1.1.1 version 4
```

SNTP server     Stratum   Version    Last receive time
1.0.1.11        2         4          Tue, May 17 2011  9:11:20.833 (Synced)
```

Table 8 Command output

Field	Description
SNTP server	SNTP server (NTP server). If this field displays **0.0.0.0**, the IP address of the NTP server has not been resolved successfully.
Stratum	Stratum level of the NTP server, which determines the clock accuracy. It is in the range of 1 to 16. A lower stratum level represents higher clock accuracy. A clock with stratum level 16 is not synchronized.
Version	SNTP version.
Last receive time	Time when the last message was received. Synced means the local clock is synchronized to the NTP server.

sntp authentication enable

Use **sntp authentication enable** to enable SNTP authentication.

Use **undo sntp authentication enable** to disable SNTP authentication.

Syntax

sntp authentication enable

undo sntp authentication enable

Default

SNTP authentication is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

You need to enable SNTP authentication in networks that require time synchronization security to make sure SNTP clients are synchronized only to authenticated NTP servers.

To authenticate an NTP server, set an authentication key and specify it as a trusted key.

Examples

Enable SNTP authentication.

```
<Sysname> system-view
```

```
[Sysname] sntp authentication enable
```

Related commands

sntp authentication-keyid

sntp reliable authentication-keyid

sntp authentication-keyid

Use **sntp authentication-keyid** to set an SNTP authentication key.

Use **undo sntp authentication-keyid** to remove an SNTP authentication key.

Syntax

sntp authentication-keyid *keyid* **authentication-mode** { **hmac-sha-1** | **hmac-sha-256** | **hmac-sha-384** | **hmac-sha-512** | **md5** } { **cipher** | **simple** } *string* [**acl** *ipv4-acl-number* | **ipv6 acl** *ipv6-acl-number*] *

undo sntp authentication-keyid *keyid*

Default

No SNTP authentication key exists.

Views

System view

Predefined user roles

network-admin

Parameters

keyid: Specifies an authentication key ID in the range of 1 to 4294967295.

authentication-mode: Specifies an authentication algorithm.

- **hmac-sha-1**: Specifies the HMAC-SHA-1 algorithm.
- **hmac-sha-256**: Specifies the HMAC-SHA-256 algorithm.
- **hmac-sha-384**: Specifies the HMAC-SHA-384 algorithm.
- **hmac-sha-512**: Specifies the HMAC-SHA-512 algorithm.
- **md5**: Specifies the MD5 algorithm.

cipher: Specifies an authentication key in encrypted form.

simple: Specifies an authentication key in plaintext form. For security purposes, the authentication key specified in plaintext form will be stored in encrypted form.

string: Specifies a case-sensitive authentication key. Its plaintext form is a string of 1 to 32 characters. Its encrypted form is a string of 1 to 73 characters.

acl *ipv4-acl-number*: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999. Only the devices permitted by the ACL can use the key ID for authentication.

ipv6 acl *ipv6-acl-number*: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999. Only the devices permitted by the ACL can use the key ID for authentication.

Usage guidelines

You need to enable SNTP authentication in networks that require time synchronization security to make sure SNTP clients are synchronized only to authenticated NTP servers.

The key ID in the message from the peer device identifies the key used for authentication. The **acl** *ipv4-acl-number* or **acl** *ipv6-acl-number* option is used to identify the peer device that can use the key ID.

- The device uses the **acl** *ipv4-acl-number* or **acl** *ipv6-acl-number* option to identify the peer device that can use the key ID only when an SNTP session for the peer device is required to be established or after the SNTP session has been established.
- If the specified IPv4 or IPv6 ACL does not exist, any device can use the key ID for authentication.
- If the specified IPv4 or IPv6 ACL does not contain any rules, no device can use the key ID for authentication.

To ensure a successful authentication, configure the same key ID, authentication algorithm, and key on the time server and client.

After you configure an SNTP authentication key, use the **sntp reliable authentication-keyid** command to set it as a trusted key. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo sntp-service reliable authentication-keyid** command.

The security strength of the five algorithms, in descending order, is HMAC-SHA-512, HMAC-SHA-384, HMAC-SHA-256, HMAC-SHA-1, and MD5.

You can set a maximum of 128 authentication keys by executing the command.

Examples

Set an MD5 authentication key, with the key ID of **10** and key value of **BetterKey**. Input the key in plain text.

```
<Sysname> system-view
[Sysname] sntp authentication enable
[Sysname] sntp authentication-keyid 10 authentication-mode md5 simple BetterKey
```

Related commands

Enable the SNTP service.

```
<Sysname> system-view
[Sysname] sntp enable
```

sntp ipv6 unicast-server

Use **sntp ipv6 unicast-server** to specify an IPv6 NTP server for the device.

Use **undo sntp ipv6 unicast-server** to remove the IPv6 NTP server specified for the device.

Syntax

sntp ipv6 unicast-server { *server-name* | *ipv6-address* } [**authentication-keyid** *keyid* | **source** *interface-type interface-number*] *

undo sntp ipv6 unicast-server { *server-name* | *ipv6-address* }

Default

No IPv6 NTP server is specified.

Views

System view

Predefined user roles

network-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters.

ipv6-address: Specifies an NTP server by its IPv6 address.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

source *interface-type interface-number*: Specifies the source interface for IPv6 NTP messages. If the specified IPv6 NTP server address is not a link local address, the source IPv6 address for IPv6 NTP messages sent by the local device to the NTP server is the IPv6 address of the specified source interface. If the specified IPv6 NTP server address is a link local address, the IPv6 NTP messages are sent from the specified source interface, and the source address of the messages is the link local address of the interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify an interface, the device automatically selects the source IPv6 address of IPv6 NTP messages. For more information, see *RFC 3484*.

Usage guidelines

When you specify an IPv6 NTP server for the device, the device is synchronized to the NTP server, but the NTP server is not synchronized to the device.

Examples

Specify the IPv6 NTP server 2001::1 for the device.

```
<Sysname> system-view
[Sysname] sntp ipv6 unicast-server 2001::1
```

Use **undo sntp reliable authentication-keyid** to remove the trusted key.

Syntax

sntp reliable authentication-keyid *keyid*

undo sntp reliable authentication-keyid *keyid*

Default

No trusted key is specified.

Views

System view

Predefined user roles

network-admin

Parameters

keyid: Specifies an authentication key by its ID in the range of 1 to 4294967295.

Usage guidelines

If SNTP is enabled, the SNTP client is synchronized only to an NTP server that provides a trusted key.

Before you use the command, make sure SNTP authentication is enabled and an authentication key is configured. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo sntp-service reliable authentication-keyid** command.

Examples

Enable NTP authentication, and specify the MD5 encryption algorithm, with the key ID of 37 and key value of **BetterKey**.

```
<Sysname> system-view
[Sysname] sntp authentication enable
[Sysname] sntp authentication-keyid 37 authentication-mode md5 simple BetterKey
```

Specify this key as a trusted key.

```
[Sysname] sntp reliable authentication-keyid 37
```

sntp authentication-keyid

sntp authentication enable

sntp time-offset-threshold

Use **sntp time-offset-threshold** to specify the SNTP time-offset thresholds for log and trap outputs.

Use **undo sntp time-offset-threshold** to restore the default.

Syntax

sntp time-offset-threshold { **log** *log-threshold* | **trap** *trap-threshold* } *

undo sntp time-offset-threshold

Default

No SNTP time-offset thresholds are set for log and trap outputs.

Views

System view

Predefined user roles

network-admin

Parameters

log *log-threshold*: Specifies the SNTP time-offset threshold for log output. The value range for the *log-threshold* argument is 128 to 60000, in milliseconds.

trap *trap-threshold*: Specifies the SNTP time-offset threshold for trap output. The value range for the *trap-threshold* argument is 128 to 60000, in milliseconds.

Usage guidelines

By default, the system synchronizes the NTP client's time to the server and outputs a log and a trap when the time offset exceeds 128 ms for multiple times.

After you set the NTP time-offset thresholds for log and trap outputs, the system synchronizes the client's time to the server when the time offset exceeds 128 ms for multiple times, but outputs logs and traps only when the time offset exceeds the specified thresholds, respectively.

Examples

Specify the SNTP time-offset thresholds for log and trap outputs as 500 ms and 600 ms, respectively.

```
<Sysname> system-view
[Sysname] sntp time-offset-threshold log 500 trap 600
```

sntp unicast-server

Use **sntp unicast-server** to specify an NTP server for the device.

Use **undo sntp unicast-server** to remove an NTP server specified for the device.

Syntax

sntp unicast-server { *server-name* | *ip-address* } [**authentication-keyid** *keyid* | **source** *interface-type interface-number* | **version** *number*] *

undo sntp unicast-server { *server-name* | *ip-address* }

Default

No NTP server is specified.

Views

System view

Predefined user roles

network-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters.

ip-address: Specifies an NTP server by its IP address. It must be a unicast address, rather than a broadcast address, a multicast address, or the IP address of the local clock.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

source *interface-type interface-number*: Specifies the source interface for NTP messages. In an NTP message the local device sends to the NTP server, the source IP address is the primary IP address of this interface. The *interface-type interface-number* argument represents the interface type and number.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

When you specify an NTP server for the device, the device is synchronized to the NTP server, but the NTP server is not synchronized to the device.

Examples

Specify NTP server 10.1.1.1 for the device, and configure the device to run NTP version 4.

```
<Sysname> system-view
[Sysname] sntp unicast-server 10.1.1.1 version 4
```

Contents

PoE commands

Only the PoE models support the PoE feature.

apply poe-profile

Use **apply poe-profile** to apply a PoE profile to a power interface (PI).

Use **undo apply poe-profile** to restore the default.

Syntax

apply poe-profile { **index** *index* | **name** *profile-name* }

undo apply poe-profile { **index** *index* | **name** *profile-name* }

Default

No PoE profile is applied to PIs.

Views

PI view

Predefined user roles

network-admin

Parameters

index *index*: Specifies a PoE profile by its index number in the range of 1 to 100.

name *profile-name*: Specifies a PoE profile by its name, a case-sensitive string of 1 to 15 characters.

Examples

Apply the PoE profile named **forIPphone** to GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] apply poe-profile name forIPphone
```

Related commands

apply poe-profile interface

display poe-profile

apply poe-profile interface

Use **apply poe-profile interface** to apply a PoE profile to PIs.

Use **undo apply poe-profile interface** to remove the PoE profile application from PIs.

Syntax

apply poe-profile { **index** *index* | **name** *profile-name* } **interface** *interface-range*

undo apply poe-profile { **index** *index* | **name** *profile-name* } **interface** *interface-range*

Default

No PoE profile is applied to a PI.

Views

System view

Predefined user roles

network-admin

Parameters

index *index*: Specifies a PoE profile by its index number in the range of 1 to 100.

name *profile-name*: Specifies a PoE profile by its name, a case-sensitive string of 1 to 15 characters.

interface-range: Specifies a range of Ethernet interfaces in the form of *interface-type interface-number* [**to** *interface-type interface-number*], where *interface-type interface-number* represents the interface type and interface number. The start interface number must be smaller than the end interface number. If an interface in the specified range does not support PoE, it is ignored when the PoE profile is applied.

Examples

Apply the PoE profile named **forIPphone** to GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] apply poe-profile name forIPphone interface gigabitethernet 1/0/1
```

Apply the PoE profile with index number 1 to PIs GigabitEthernet 1/0/2 to GigabitEthernet 1/0/6.

```
<Sysname> system-view
[Sysname] apply poe-profile index 1 interface gigabitethernet 1/0/2 to gigabitethernet
1/0/6
```

Related commands

apply poe-profile

display poe device

Use **display poe device** to display general PSE information.

Syntax

display poe device [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, the command displays general PSE information about all PSEs in the IRF fabric.

Examples

Display general PSE information.

```
<Sysname> display poe device
Slot  1:
 PSE ID    Slot No.  SSlot No. PortNum   MaxPower(W)    State   Model
 4         1         0         48        600.0          Off     LSPPSE48A
```

Table 1 Command output

Field	Description
PSE ID	ID of the PSE.
Slot No.	Slot number of the PSE.
SSlot No.	Sub-slot number of the PSE.
PortNum	Number of PIs on the PSE.
MaxPower(W)	Maximum power of the PSE.
State	PSE status: • **On**—The PSE is supplying power. • **Off**—The PSE is not supplying power. • **Faulty**—The PSE has failed.
Model	PSE model.

display poe interface

Use **display poe interface** to display power supplying information for PIs.

Syntax

display poe interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays power supplying information for all PIs.

Examples

Display power supplying information for GigabitEthernet 1/0/1.

```
<Sysname> display poe interface gigabitethernet 1/0/1

 PoE Status                    : Enabled

Table 2 Command output

Field	Description
PoE Status	PoE status: • Enabled. • Disabled.
Power Priority	Power supply priority: • Critical (highest). • High. • Low.
Oper	Operating status: • **Off**—PoE is disabled. • **On**—Power is being supplied to the PI correctly. • **Power-lack**—Remaining guaranteed power is insufficient for a critical PI. • **Power-deny**—The PSE refuses to supply power. The power required by the PD is higher than the configured power. • **Power-itself**—The PD is using another power supply. • **Power-limit**—The PSE is supplying power to the PD based on the configured power though the PD requires more power than the configured power.
IEEE Class	PD power class by which the PI supplies power to the PD. If the PI does not supplying power to the PD, this field displays a hyphen (-).
Detection Status	Power detection status: • **Disabled**—The PoE function is disabled. • **Searching**—The PI is searching for the PD. • **Delivering power**—The PI is supplying power to the PD. • **Fault**—A fault occurred during the test. • **Test**—The PI is undergoing a test. • **Other fault**—A fault has caused the PSE to enter the idle status. • **PD disconnected**—The PD is disconnected.
Power Mode	Power transmission mode: • **Signal**—Power is transmitted over the signal pairs of a twisted pair cable. • **Spare**—Power is transmitted over the spare pairs of a twisted pair cable.
Current Power	Current power, including PD consumption power and transmission loss.
Average Power	Average power.
Peak Power	Peak power.
Max Power	Maximum power.
Electric Current	Current.

Field	Description
Voltage	Voltage.
PD Description	Type and location description for the PD connected to the PI.

Table 3 Command output

Field	Description
Interface	Interface name.
PoE	PoE status: • **Enabled**. • **Disabled**.
Priority	Power priority: • **Critical** (highest). • **High**. • **Low**.
CurPower	Current power of a PI.

Field	Description
Oper	Operating status: • **Off**—PoE is disabled. • **On**—Power is being supplied to the PI correctly. • **Power-lack**—Remaining guaranteed power is insufficient for a critical PI. • **Power-deny**—The PSE refuses to supply power. The power required by the PD is higher than the configured power. • **Power-itself**—The PD is using another power supply. • **Power-limit**—The PSE is supplying power to the PD based on the configured power though the PD requires more power than the configured power.
IEEE Class	PD power class by which the PI supplies power to the PD. If the PI does not supplying power to the PD, this field displays a hyphen (-).
Detection Status	Power detection status: • **Disabled**—PoE function is disabled. • **Searching**—The PI is searching for the PD. • **Delivering Power**—The PI is supplying power for the PD. • **Fault**—A fault occurred during the test. • **Test**—The PI is undergoing a test. • **Other fault**—A fault has caused the PSE to enter the idle status. • **PD disconnected**—The PD is disconnected.
On State Ports	Number of PIs that are supplying power.
Used	Power consumed by the current PI.
Remaining	(Devices that support dynamic power allocation.) Total remaining power of all PSEs configured with a maximum power. This field displays 0 if no PSE is configured with a maximum power (all PSEs participate in dynamic power allocation). (Devices that do not support dynamic power allocation.) Total remaining power of all PSEs.

display poe interface power

Use **`display poe interface power`** to display power information for PIs.

Syntax

`display poe interface power` [*`interface-type interface-number`*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`interface-type interface-number`: Specifies an interface by its type and number. If you do not specify an interface, this command displays power information for all PIs.

Examples

Display power information for GigabitEthernet 1/0/1.

```
<Sysname> display poe interface power gigabitethernet 1/0/1
Interface    Current   Peak     Max      PD Description
             (W)       (W)      (W)
 GE1/0/1       15.0     15.3     30.0     Access Point on Room 509 for Peter
```

Display power information for all PIs.

```
<Sysname> display poe interface power
 Interface    Current   Peak     Max      PD Description
              (W)       (W)      (W)
 GE1/0/1      0.0       0.0      30.0
 GE1/0/2      0.0       0.0      30.0
 GE1/0/3      0.0       0.0      30.0
 GE1/0/4      0.0       0.0      30.0
 GE1/0/5      0.0       0.0      30.0
 GE1/0/6      0.0       0.0      30.0
 GE1/0/7      0.0       0.0      30.0
 GE1/0/8      0.0       0.0      30.0
 GE1/0/9      0.0       0.0      30.0
 GE1/0/10     0.0       0.0      30.0
 GE1/0/11     0.0       0.0      30.0
 GE1/0/12     0.0       0.0      30.0
 GE1/0/13     0.0       0.0      30.0
 GE1/0/14     0.0       0.0      30.0
 GE1/0/15     0.0       0.0      30.0
 GE1/0/16     0.0       0.0      30.0
 GE1/0/17     0.0       0.0      30.0
 GE1/0/18     0.0       0.0      30.0
 GE1/0/19     0.0       0.0      30.0
 GE1/0/20     0.0       0.0      30.0
 GE1/0/21     0.0       0.0      30.0
 GE1/0/22     0.0       0.0      30.0
 GE1/0/23     0.0       0.0      30.0
 GE1/0/24     0.0       0.0      30.0
   ---  On State Ports: 0; Used: 0.0(W); Remaining: 370.0(W)  ---
```

Table 4 Command output

Field	Description
Interface	Interface name.
CurPower	Current power.
PeakPower	Peak power.
MaxPower	Maximum power.
PD Description	Type and location description for the PD connected to a PI.
Ports On	Number of PIs that are supplying power.
Used	Power consumed by all PIs.

Field	Description
Remaining	(Devices that support dynamic power allocation.) Total remaining power of all PSEs configured with a maximum power. This field displays 0 if no PSE is configured with a maximum power (all PSEs participate in dynamic power allocation). (Devices that do not support dynamic power allocation.) Total remaining power of all PSEs.

display poe pse

Use **display poe pse** to display detailed PSE information.

Syntax

display poe pse [*pse-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pse-id: Specifies a PSE by its ID. If you do not specify a PSE, this command displays detailed information about all PSEs.

Examples

Display detailed PSE information.

```
<Sysname> display poe pse
 PSE ID                        : 4
 Slot No.                      : 1
 SSlot No.                     : 0
 PSE Model                     : LSPPSE48A
 PSE Status                    : Enabled
 Power Priority                : Low
 Current Power                 : 0.0     W
 Average Power                 : 0.0     W
 Peak Power                    : 0.0     W
 Max Power                     : 600.0   W
 Max Allocable Power           : 600.0   W
 Remaining Guaranteed Power    : 600.0   W

 PSE Hardware Version          : 0
 Legacy PD Detection           : Disabled
 Power Utilization Threshold   : 80
 PD Power Policy               : Priority
 PD Disconnect-Detection Mode  : DC
```

Table 5 Command output

Field	Description
PSE ID	ID of the PSE.
SSlot No.	Sublsot number of the PSE.
PSE Status	PoE status of the PSE: • Enabled. • Disabled.
PSE Fast Power Supply	PSE fast power supply enabling status: • Enabled. • Disabled.
Power Priority	Power priority of the PSE.
Current Power	Current power of the PSE.
Average Power	Average power of the PSE.
Peak Power	Peak power of the PSE.
Max Power	Maximum power of the PSE.
Max Allocable Power	Maximum allocable power of the PSE. (This field is supported only in Release 6340 and later.) The value of this field = Maximum power of the PSE – Sum of maximum powers of all PIs with forced PoE power supply enabled.
Remaining Guaranteed Power	Remaining guaranteed power of the PSE = Maximum guaranteed power of the PSE – Total maximum power of all critical PIs of the PSE.
PSE CPLD Version	PSE CPLD version number.
PSE Software Version	PSE software version number.
PSE Hardware Version	PSE hardware version number.
Legacy PD Detection	Nonstandard PD detection status: • Enabled. • Disabled.
Power Utilization Threshold	PSE power alarm threshold.
PD Power Policy	PD power management policy mode.
PD Disconnect-Detection Mode	PD disconnection detection mode.
PD High Inrush	Whether PD high inrush is enabled. • Enabled. • Disabled.

display poe pse interface

Use **display poe pse interface** to display the PoE status of all PIs on a PSE.

Syntax

display poe pse *pse-id* **interface**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pse *pse-id*: Specifies a PSE ID. To display PSE ID and slot mappings, use the **display poe device** command.

Examples

Display the status of all PIs on PSE 4.

```
<Sysname> display poe pse 4 interface
 Interface   PoE      Priority  CurPower  Oper    IEEE  Detection
                                (W)               Class Status
 GE1/0/1     Disabled  Low      0.0       Off     0     Disabled

Table 6 Command output

Field	Description
Interface	Interface name of a PI.
PoE	PoE status of a PI: • **Enabled**. • **Disabled**.

Field	Description
Priority	Priority of a PI: • **Critical** (highest). • **High**. • **Low**.
CurPower	Current power of a PI.
Oper	Operating status of a PI: • **Off**—PoE is disabled. • **On**—Power is being supplied to the PI correctly. • **Power-lack**—Remaining guaranteed power is insufficient for a critical PI. • **Power-deny**—The PSE refuses to supply power. The power required by the PD is higher than the configured power. • **Power-itself**—The PD is using another power supply. • **Power-limit**—The PSE is supplying power to the PD based on the configured power though the PD requires more power than the configured power.
IEEE Class	PD power class by which the PI supplies power to the PD. If the PI does not supplying power to the PD, this field displays a hyphen (-).
Detection Status	Power detection status of a PI: • **Disabled**—PoE function is disabled. • **Searching**—The PI is searching for the PD. • **Delivering Power**—The PI is supplying power to the PD. • **Fault**—A fault occurred during the test. • **Test**—The PI is undergoing a test. • **Other Fault**—A fault has caused the PSE to enter the idle status. • **PD Disconnected**—The PD is disconnected.
On State Ports	Number of PIs that are supplying power.
Used	Power consumed by PIs on the PSE.
Remaining	Remaining power of the PSE. This field displays 0 for a PSE that participates in dynamic power allocation.

display poe pse interface power

Use **`display poe pse interface power`** to display power information for PIs on a PSE.

Syntax

`display poe pse` *`pse-id`* **`interface power`**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pse *pse-id*: Specifies a PSE by its ID. To display PSE ID and slot mappings, use the **display poe device** command.

Examples

Display power information for PIs on PSE 4.

```
<Sysname> display poe pse 4 interface power
 Interface    Current   Peak      Max      PD Description
              (W)       (W)       (W)
 GE1/0/1      0.0       0.0       30.0
 GE1/0/2      0.0       0.0       30.0
 GE1/0/3      0.0       0.0       30.0
 GE1/0/4      0.0       0.0       30.0
 GE1/0/5      0.0       0.0       30.0
 GE1/0/6      0.0       0.0       30.0
 GE1/0/7      0.0       0.0       30.0
 GE1/0/8      0.0       0.0       30.0
 GE1/0/9      0.0       0.0       30.0
 GE1/0/10     0.0       0.0       30.0
 GE1/0/11     0.0       0.0       30.0
 GE1/0/12     0.0       0.0       30.0
 GE1/0/13     0.0       0.0       30.0
 GE1/0/14     0.0       0.0       30.0
 GE1/0/15     0.0       0.0       30.0
 GE1/0/16     0.0       0.0       30.0
 GE1/0/17     0.0       0.0       30.0
 GE1/0/18     0.0       0.0       30.0
 GE1/0/19     0.0       0.0       30.0
 GE1/0/20     0.0       0.0       30.0
 GE1/0/21     0.0       0.0       30.0
 GE1/0/22     0.0       0.0       30.0
 GE1/0/23     0.0       0.0       30.0
 GE1/0/24     0.0       0.0       30.0
   ---  On State Ports: 0; Used: 0.0(W); Remaining: 370.0(W)  ---
```

Table 7 Command output

Field	Description
Interface	Interface name of a PI.
Current	Current power of a PI.
Peak	Peak power of a PI.
Max	Maximum power of a PI.
PD Description	Type and location description for the PD connected with a PI.
Ports On	Number of PIs that are supplying power.
Used	Power consumed by all PIs.
Remaining	Remaining power of the PSE. This field displays 0 for a PSE that participates in dynamic power allocation.

display poe-profile

Use **display poe-profile** to display information about the PoE profile.

Syntax

display poe-profile [**index** *index* | **name** *profile-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

index *index*: Specifies a PoE profile by its index number in the range of 1 to 100.

name *profile-name*: Specifies a PoE profile by its name, a case-sensitive string of 1 to 15 characters.

Usage guidelines

If you do not specify a profile, the command displays information about all PoE profiles.

Examples

Display information about all PoE profiles.

```
<Sysname> display poe-profile
 PoE Profile     Index   ApplyNum  Interfaces    Configuration
 forIPphone      1       4         GE1/0/1       poe enable
                                   GE1/0/2         poe priority critical
                                   GE1/0/3
                                   GE1/0/4
 forAP           2       2         GE1/0/5        poe enable
                                   GE1/0/6        poe max-power 14000
   ---  Total PoE profiles: 2, total ports: 6  ---
```

Display information about the PoE profile with index number 1.

```
<Sysname> display poe-profile index 1
 PoE Profile     Index   ApplyNum  Interfaces   Configuration
 forIPphone      1       6         GE1/0/1       poe enable
                                   GE1/0/2       poe priority critical
                                   GE1/0/3
                                   GE1/0/4
                                   GE1/0/5
                                   GE1/0/6
   ---  Total ports: 6  ---
```

Table 8 Command output

Field	Description
PoE Profile	Name of the PoE profile.
Index	Index number of the PoE profile.
ApplyNum	Number of PIs to which the PoE profile is applied.

Field	Description
Interfaces	Interface name of the PI to which the PoE configuration is applied.
Configuration	Configurations of the PoE profile.
Total PoE profiles	Number of PoE profiles.
Total ports	Number of PIs to which all PoE profiles are applied.

display poe-profile interface

Use **display poe-profile interface** to display information about the PoE profile on a PI.

Syntax

display poe-profile interface *interface-type interface-number*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Examples

Display information about the PoE profile on GigabitEthernet 1/0/1.

```
<Sysname> display poe-profile interface gigabitethernet 1/0/1
 PoEProfile     Index   ApplyNum  Interface   Effective configuration
 forIPphone      1       6        GE1/0/1       poe enable
                                                poe priority critical
```

The **Effective configuration** field displays the configurations that have taken effect. For the descriptions of other fields, see Table 8.

poe ai enable

Use **poe ai enable** to enable AI-driven PoE.

Use **undo ai poe enable** to disable AI-driven PoE.

Syntax

poe ai enable

undo poe ai enable

IMPORTANT:

This command is available only in Release 6318P01 and later.

Default

AI-driven PoE is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

With AI-driven PoE enabled, the device automatically recovers a PI when it fails. If more than one PI fails simultaneously, the device recovers the PIs one by one in ascending order of PI number.

AI-driven PoE automatically adjusts the power supply parameters to fit the power needs. If you disable AI-driven PoE, the system reverts the parameters to the settings before the adjustment.

AI-driven PoE takes effect only on PSEs that run firmware V147 or later.

- **Firmware earlier than V147**—You must use the **poe update** command to upgrade the PSE firmware and then enable AI-driven PoE on the PSE.
- **Firmware V147 or later**—You do not need to re-enable AI-driven PoE after upgrading the firmware if you have enabled the feature before the upgrade.

Examples

Enable AI-driven PoE.

```
<Sysname> system-view
[Sysname] poe ai enable
```

poe detection-mode

Use **poe detection-mode** to configure the PD detection mode.

Use **undo poe detection-mode** to restore the default.

Syntax

poe detection-mode { **none** | **simple** | **strict** }

undo poe detection-mode

Default

The default differs depending on the software version, as shown below:

Versions	Default setting
Versions earlier than Release 6350	The PD detection mode is **strict**.
Release 6350 and later	• If the device starts up with the initial configuration, the PD detection mode is **strict**. • If the device starts up with the factory defaults, the PD detection mode is **simple**.

Views

PI view

Predefined user roles

network-admin

Parameters

none: Enables the device to supply power to PDs that are correctly connected to the device without causing short circuit.

simple: Enables the device to supply power to PDs that comply with basic requirements of 802.3af or 802.3at.

strict: Enables the device to supply power to PDs that comply with all requirements of 802.3af or 802.3at.

Usage guidelines

CAUTION:

A non-PD device might be damaged when power is supplied to it. To avoid device damage, do not specify the **none** keyword when the PI connects to a non-PD device.

This command is available only for a PSE that has a model name ending with a character of **B**, **LSPPSE48B** for example. To obtain the model name of a PSE, execute the **display poe pse** command.

To configure the detection mode for nonstandard PDs, first execute the **poe legacy enable** command to enable detection for nonstandard PDs.

Examples

Configure the simple detection mode for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] poe detection-mode simple
```

Related commands

poe legacy enable

poe enable

Use **poe enable** to enable PoE on a PI.

Use **undo poe enable** to disable PoE on a PI.

Syntax

poe enable

undo poe enable

Default

- S5110V2 switch series:

  The default differs depending on the software version, as shown below:

Versions	Default setting
Versions earlier than Release 6328	PoE is disabled on PIs.
Release 6328 and later	• If the device starts up with the initial configuration, PoE is disabled on PIs. • If the device starts up with the factory defaults, PoE is enabled on PIs.

- S3100V3-SI switch series, S5130S-LI switch series, S5120V2-LI switch series, S5120V3-LI switch series, S5110V2-SI switch series, S5120V3-SI switch series, MS4300V2 switch series, MS4200 switch series, MS4320V2 switch series, MS4320V3 switch series, MS4320 switch series, WS5810-WiNet switch series, WS5820-WiNet switch series, S5000E-X switch series,

S5000X-EI switch series, S5000V3-EI switch series, S5000V5-EI switch series, and WAS6000 switch series:

PoE is enabled on PIs if the device starts up with the factory defaults and is disabled on PIs when the device starts up with the initial configuration.

For more information about the device initial configuration and factory defaults, see configuration file management in *Fundamentals Configuration Guide*.

Views

PI view

PoE profile view

Predefined user roles

network-admin

Usage guidelines

If a PoE profile has been applied to a PI, remove the application before configuring the PI in PoE profile view.

If a PI has been configured, remove the configuration before configuring the PI in PI view.

Examples

Enable PoE on a PI in PI view.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] poe enable
```

Enable PoE on a PI in PoE profile view.

```
<Sysname> system-view
[Sysname] poe-profile abc
[Sysname-poe-profile-abc-1] poe enable
```

Related commands

display poe interface

poe-profile

poe fast-on enable

Use **poe fast-on enable** to enable fast PoE for a PSE.

Use **undo poe fast-on enable** to disable fast PoE for the PSE.

IMPORTANT:
This command is supported only in Release 6328 and later.

Syntax

poe fast-on enable pse *pse-id*

undo poe fast-on enable pse *pse-id*

Default

Fast PoE is disabled on a PSE. PIs on the PSE supply power to PDs only after the PSE has started up.

Views

System view

Predefined user roles

network-admin

Parameters

pse *pse-id*: Specifies a PSE by its ID.

Usage guidelines

Fast PoE enables a PI on a PSE to supply power to PDs immediately after the PSE is powered on.

You must re-configure this command if you modified other PoE settings after configuring this command.

Examples

Enable fast PoE for PSE 4.

```
<Sysname> system-view
[Sysname] poe fast-on enable pse 4
```

Related commands

display poe pse

poe force-power

Use **poe force-power** to enable forced PoE power supply.

Use **undo poe force-power** to disable forced PoE power supply.

NOTE:

This command is supported only in Release 6340 and later.

Syntax

poe force-power

undo poe force-power

Default

Forced PoE power supply is disabled.

Views

PI view

Predefined user roles

network-admin

mdc-admin

Usage guidelines

CAUTION:

This command enables the device to supply power to a PD directly without performing a detection of the PD. To avoid damaging the PD, make sure the power provided by the device meets the PD specifications before executing this command.

Before supplying power to a PD, the device performs a detection of the PD. It supplies power to the PD only after the PD passes the detection. If the PD fails the detection but the power provided by the device meets the PD specifications, you can execute this command to enable forced power supply to the PD.

Examples

Enable forced PoE power supply.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] poe force-power
The PD might be damaged if the prowded by the device does not meet the PD power specifications.
Make sure you are fully aware of the impacts of this command when you use it in a live
network. Continue?[Y/N]: y
```

poe high-inrush enable

Use **poe high-inrush enable** to allow inrush currents drawn by PDs.

Use **undo poe high-inrush enable** to restore the default.

Syntax

poe high-inrush enable pse *pse-id*

undo poe high-inrush enable pse *pse-id*

Default

Inrush currents drawn by PDs are not allowed.

Views

System view

Predefined user roles

network-admin

Parameters

pse *pse-id*: Specifies a PSE by its ID.

Usage guidelines

CAUTION:

Inrush currents might damage the components on the device. Use this command with caution.

This command is available only for a PSE that has a model name ending with a character of **B**, **LSPPSE48B** for example. To obtain the model name of a PSE, execute the **display poe pse** command.

Inrush current might occur at PD startup and trigger PSE self-protection, As a result, the PSE stops supplying power to the PDs. To continue power supply to the PDs, configure this feature to allow inrush currents drawn by PDs.

IEEE 802.3af and IEEE 802.3at define specifications for inrush current. Support for the specifications defined by IEEE 802.3af and/or IEEE 802.3at depends on the device model.

Examples

All high inrush currents drawn by PDs.

```
<Sysname> system-view
[Sysname] poe high-inrush enable pse 4
```

Related commands

display poe interface

display poe pse

poe legacy enable (interface view)

Use **poe legacy enable** to enable nonstandard PD detection for a PI.

Use **undo poe legacy enable** to disable nonstandard PD detection for a PI.

Syntax

poe legacy enable

undo poe legacy enable

Default

Nonstandard PD detection is disabled for a PI.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The device supports PSE-based and PI-based nonstandard PD detection. If you enable nonstandard PD detection both in system view and interface view, the configuration in system view takes effect.

As a best practice for disabling nonstandard PD detection for all PIs successfully in one operation, disable this feature in both system view and interface view.

Examples

Enable nonstandard PD detection for a PI.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] poe legacy enable
```

Related commands

display poe interface

poe legacy enable (system view)

poe legacy enable (system view)

Use **poe legacy enable** to enable the PSE to detect nonstandard PDs.

Use **undo poe legacy enable** to disable the PSE from detecting nonstandard PDs.

Syntax

poe legacy enable pse *pse-id*

undo poe legacy enable pse *pse-id*

Default

Nonstandard PD detection is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

pse *pse-id*: Specifies a PSE by its ID.

Usage guidelines

The device supports PSE-based and PI-based nonstandard PD detection. If you enable nonstandard PD detection both in system view and interface view, the configuration in system view takes effect.

As a best practice for disabling nonstandard PD detection for all PIs successfully in one operation, disable this feature in both system view and interface view.

Examples

Enable PSE 4 to detect nonstandard PDs.

```
<Sysname> system-view
[Sysname] poe legacy enable pse 4
```

Related commands

display poe pse

poe legacy enable (interface view)

poe max-power (interface view)

Use **poe max-power** to set the maximum PI power.

Use **undo poe max-power** to restore the default.

Syntax

poe max-power *max-power*

undo poe max-power

Default

The maximum PI power is 30000 W.

Views

PI view

PoE profile view

Predefined user roles

network-admin

Parameters

max-power: Sets the maximum PI power in milliwatts. The value range is 1000 to 30000.

Examples

Set the maximum PI power to 12000 milliwatts in PI view.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] poe max-power 12000
```

Set the maximum PI power to 12000 milliwatts in PoE profile view.

```
<Sysname> system-view
[Sysname] poe-profile abc
[Sysname-poe-profile-abc-1] poe max-power 12000
```

poe mps

Use **poe mps** to set the TMPDO for Maintain Power Signature (MPS).

Use **undo poe mps** to restore the default.

NOTE:

This command is supported only in R6350 and later.

Syntax

poe mps pse *pse-id* **tmpdo** { *timer* | **long** |**normal** }

undo poe mps pse *pse-id* **tmpdo**

Default

The normal TMPDO mode is used for the MPS. The TMPDO is 324 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

pse-id: Specifies a PSE by its ID.

timer: Sets the TMPDO for the MPS. The value is a multiple of 4 in the range of 300 to 400, in milliseconds.

long: Specify the long TMPDO mode. The TMPDO is 360 milliseconds.

normal: Specifies the normal TMPDO mode. The TMPDO is 324 milliseconds.

Usage guidelines

The MPS is an electronic signature provided by a PD. The PD can use this signature to maintain connection to the PSE in sleep mode. The PD sends a PoE-compliant pulse current to the PSE periodically. If the PSE detects the PoE-compliant pulse current from the PD within the TMPDO, it supplies power to the PD. If the PSE does not detect the PoE-compliant pulse current from the PD within the TMPDO, it will not supply power to the PD.

To send pulse currents at larger intervals for lower standby power, you can use this command to change the TMPDO to be longer.

Only PSE modules that have a model name of LSPPSE**A support this feature. To view the PSE models, execute the **display poe pse** command.

If you execute the command multiple times, the most recent configuration takes effect.

Examples

Set the TMPDO for the MPS to 350 milliseconds.

```
<Sysname> system-view
[Sysname] poe mps pse 1 tmpdo 350
```

poe pd-description

Use **poe pd-description** to configure a description for the PD that connects to a PI.

Use **undo poe pd-description** to restore the default.

Syntax

poe pd-description *text*

undo poe pd-description

Default

No description is configured for the PD that connects to a PI.

Views

PI view

Predefined user roles

network-admin

Parameters

text: Configures a description for the PD connected to the PI, a case-sensitive string of 1 to 80 characters.

Examples

Configure the description for the PD as **IP Phone for Room 101**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] poe pd-description IP Phone For Room 101
```

poe pd-policy priority

Use **poe pd-policy priority** to enable PI power management.

Use **undo poe pd-policy priority** to restore the default.

Syntax

poe pd-policy priority

undo poe pd-policy priority

Default

PI power management is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

If PI power management is disabled, the PSE does not supply power to new PDs when PSE power overload occurs.

If PI power management is enabled, when a PSE is overloaded, the PSE allocates power to PDs based on the priority of their PIs.

Examples

Enable PI power management.

```
<Sysname> system-view
[Sysname] poe pd-policy priority
```

Related commands

poe priority

poe priority (interface view)

Use **poe priority** to set the power supply priority for a PI.

Use **undo poe priority** to restore the default.

Syntax

poe priority { **critical** | **high** | **low** }

undo poe priority

Default

The power supply priority of a PI is **low**.

Views

PI view

PoE profile view

Predefined user roles

network-admin

Parameters

critical: Sets the power supply priority to **critical**. The PI with critical power priority operates in guaranteed mode. Power is first supplied to the PD connected to the critical PI.

high: Sets the power supply priority to **high**.

low: Sets the power supply priority to **low**.

Usage guidelines

When the PoE power is insufficient, power is first supplied to PIs with higher priority.

For PIs with same power supply priority, the PI with the smallest ID is allocated with power first.

If a PoE profile has been applied to a PI, remove the application before configuring the PI in PoE profile view.

If a PI has been configured, remove the configuration before configuring the PI in PI view.

Examples

Set the power supply priority of the PI to **critical** in PI view.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] poe priority critical
```

Set the power supply priority of the PI to **critical** in PoE profile view.

```
<Sysname> system-view
[Sysname] poe-profile abc
[Sysname-poe-profile-abc-1] poe priority critical
[Sysname-poe-profile-abc-1] quit
```

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] apply poe-profile name abc
```

Related commands

poe pd-policy priority

poe reset enable

Use **poe reset enable** to enable PI power cycling upon a system warm reboot.

Use **undo poe pse-policy priority** to disable PI power cycling upon a system warm reboot.

Syntax

poe reset enable

undo poe reset enable

Default

PI power cycling upon a system warm reboot is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

During the system warm reboot process (upon execution of the **reboot** command), the PIs continue supplying power to the PDs but data connections between the PDs and the device are interrupted. After the system reboots, PDs might not re-initiate data connections with the device. Power cycling PIs upon a system warm reboot allows the PDs to re-establish data connections with the device.

Examples

Enable PI power cycling upon a system warm reboot.

```
<Sysname> system-view
[Sysname] poe reset enable
```

poe track

Use **poe track** to associate a PI to a track entry.

Use **undo poe track** to restore the default.

NOTE:

This command is supported only in Release 6348P01 and later.

Syntax

poe track *track-entry-number* **action** { **alarm** | **alarm-reboot-pd** }

undo poe track

Default

A PI is not associated with any track entry.

Views

PI view

Predefined user roles

network-admin

Parameters

track-entry-number: Specify a track entry ID in the range of 1 to 1024.

action: Specifies the action to be taken when the track entry state changes from positive to negative.

alarm: Outputs an SNMP notification and log.

alarm-reboot-pd: Outputs an SNMP notification and log and reboots the PD connected to the PI.

Usage guidelines

This command uses a track entry to monitor the link status between the device and a PD and triggers the specified action when the track entry state changes from positive to negative. For more information about Track, see Track configuration in *High Availability Configuration Guide*.

If you configure this command multiple times in PI view, the most recent configuration takes effect.

Examples

Associate GigabitEthernet 1/0/1 with track entry 1 and enable the system to output an SNMP notification and log when the track entry state changes from positive to negative.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] poe track 1 action alarm
```

poe update

Use **poe update** to upgrade the PSE firmware when the device is operating.

Syntax

poe update { **full** | **refresh** } *filename* [**pse** *pse-id*]

Views

System view

Predefined user roles

network-admin

Parameters

full: Upgrades the PSE firmware in full mode.

refresh: Upgrades the PSE firmware in refresh mode.

filename: Specifies the name of the upgrade file, a case-insensitive string of 1 to 64 characters. The specified file must be in the root directory of the file system of the device.

pse *pse-id*: Specifies a PSE by its ID. If you do not specify a PSE, all PSEs are upgraded.

Usage guidelines

You can upgrade the PSE firmware in service in either of the following modes:

- **Refresh mode**—Updates the PSE firmware without deleting it. You can use the refresh mode in most cases.

- **Full mode**—Deletes the current PSE firmware and reloads a new one. Use the full mode if the PSE firmware is damaged and you cannot execute any PoE commands.

Examples

Upgrade the firmware of PSE 4 in service.

```
<Sysname> system-view
[Sysname] poe update refresh POE-168.bin pse 4
```

poe utilization-threshold

Use **poe utilization-threshold** to configure a power alarm threshold for the PSE.

Use **undo poe utilization-threshold** to restore the default power alarm threshold of the PSE.

Syntax

poe utilization-threshold *value* **pse** *pse-id*

undo poe utilization-threshold pse *pse-id*

Default

The power alarm threshold for the PSE is 80%.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies alarm threshold as a percentage of 1 to 99.

pse *pse-id*: Specifies a PSE by its ID.

Usage guidelines

If PSE power usage crosses the threshold multiple times in succession, the system sends notification messages only for the first crossing. For more information, see "Configuring SNMP."

Examples

Set the power alarm threshold of PSE 4 to 90%.

```
<Sysname> system-view
[Sysname] poe utilization-threshold 90 pse 4
```

poe-profile

Use **poe-profile** to create a PoE profile and enter its view, or enter the view of an existing PoE profile.

Use **undo poe-profile** to delete a PoE profile.

Syntax

poe-profile *profile-name* [*index*]

undo poe-profile { **index** *index* | **name** *profile-name* }

Default

No PoE profiles exist.

Views

System view

Predefined user roles

network-admin

Parameters

profile-name: Specifies a PoE profile name, a case-sensitive string of 1 to 15 characters. A PoE configuration file name begins with a letter and must not contain reserved keywords including **undo**, **all**, **name**, **interface**, **user**, **poe**, **disable**, **max-power**, **mode**, **priority**, or **enable**.

index: Specifies the index number of a PoE profile, in the range of 1 to 100.

Usage guidelines

To configure PIs in batches, use the PoE profile.

If you do not specify a profile index, the system automatically assigns an index (starting from 1) to the PoE profile.

If a PoE profile is applied, use the **undo apply poe-profile** command to remove the application before deleting the PoE profile.

Examples

Create a PoE profile, name it **abc**, and specify the index number as **3**.

```
<Sysname> system-view
[Sysname] poe-profile abc 3
[Sysname-poe-profile-abc-3]
```

Create a PoE profile and name it **def**. Do not specify the index number.

```
<Sysname> system-view
[Sysname] poe-profile def
[Sysname-poe-profile-def-1]
```

SNMP commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

The SNMP agent sends notifications (traps and informs) to inform the NMS of significant events, such as link state changes and user logins or logouts. Unless otherwise stated, the **trap** keyword in the command line includes both traps and informs.

display snmp-agent community

Use **display snmp-agent community** to display information about SNMPv1 or SNMPv2c communities.

Syntax

display snmp-agent community [**read** | **write**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

read: Specifies SNMP read-only communities.

write: Specifies SNMP read and write communities.

Usage guidelines

This command is not available in FIPS mode.

If you do not specify the **read** or **write** keyword, this command displays information about all SNMPv1 and SNMPv2c communities.

SNMPv1 and SNMPv2c communities can be created in the following ways:

- Created by using the **snmp-agent community** command.
- Automatically created by the system for SNMPv1 and SNMPv2c users that have been assigned to an existing SNMP group.

This command displays information only about communities created and saved in plaintext form.

Examples

Display information about all SNMPv1 and SNMPv2c communities.

```
<Sysname> display snmp-agent community
   Community name: aa
       Group name: aa
       ACL:2001
       Storage-type: nonVolatile
       Context name: con1

   Community name: bb
       Role name: bb
```

```
       Storage-type: nonVolatile

   Community name: userv1
       Group name: testv1
       Storage-type: nonvolatile
Community name: cc
       Group name: cc
       ACL name: testacl
       Storage-type: nonVolatile
```

Table 1 Command output

Field	Description
Community name	Community name created by using the **snmp-agent community** command or username created by using the **snmp-agent usm-user { v1 | v2c }** command.
Group name	SNMP group name. • If the community is created by using the **snmp-agent community** command in VACM mode, the group name is the same as the community name. • If the community is created by using the **snmp-agent usm-user { v1 | v2c }** command, the name of the group that has the user is displayed.
Role name	User role name for the community. If the community is created by using the **snmp-agent community** command in RBAC mode, a user role can be bound to the community name.
ACL	Number of the ACL. This field appears only when an ACL is specified for the SNMPv1 or SNMPv2c community.
ACL name	Name of the ACL. This field appears only when an ACL is specified for the SNMPv1 or SNMPv2c community.
IPV6 ACL	Number of the IPv6 ACL. This field appears only when an ACL is specified for the SNMPv1 or SNMPv2c community.
IPV6 ACL name	Name of the IPv6 ACL. This field appears only when an ACL is specified for the SNMPv1 or SNMPv2c community.
Storage-type	Storage type: • **volatile**—Settings are lost when the system reboots. • **nonVolatile**—Settings remain after the system reboots. • **permanent**—Settings remain after the system reboots and can be modified but not deleted. • **readOnly**—Settings remain after the system reboots and cannot be modified or deleted. • **other**—Any other storage type.
Context name	SNMP context: • If a mapping between the SNMP community and an SNMP context is configured, the SNMP context is displayed. • If no mapping between the SNMP community and an SNMP context exists, this field is empty.

Related commands

snmp-agent community

snmp-agent usm-user { **v1** | **v2c** }

display snmp-agent context

Use **display snmp-agent context** to display SNMP contexts.

Syntax

display snmp-agent context [*context-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

context-name: Specifies an SNMP context by its name, a case-sensitive string of 1 to 32 characters. If you do not specify this argument, the command displays all SNMP contexts.

Examples

Display all SNMP contexts.

```
<Sysname> display snmp-agent context
   testcontext
```

Related commands

snmp-agent context

display snmp-agent group

Use **display snmp-agent group** to display information about SNMP groups.

Syntax

display snmp-agent group [*group-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-name: Specifies an SNMPv1, SNMPv2c, or SNMPv3 group name in non-FIPS mode, and an SNMPv3 group name in FIPS mode. It is a case-sensitive string of 1 to 32 characters. If you do not specify a group, this command displays information about all SNMP groups.

Examples

Display information about all SNMP groups.

```
<Sysname> display snmp-agent group
   Group name: groupv3
```

```
Security model: v3 noAuthnoPriv
Readview: ViewDefault
Writeview: <no specified>
Notifyview: <no specified>
Storage-type: nonvolatile
 ACL name: testacl
```

Table 2 Command output

Field	Description
Group name	SNMP group name.
Security model	Security model of the SNMP group: • **authPriv**—Authentication with privacy. • **authNoPriv**—Authentication without privacy. • **noAuthNoPriv**—No authentication, no privacy. Security model of an SNMPv1 or SNMPv2c group can only be noAuthNoPriv.
Readview	Read-only MIB view accessible to the SNMP group.
Writeview	Write MIB view accessible to the SNMP group.
Notifyview	Notify MIB view for the SNMP group. The SNMP users in the group can send notifications only for the nodes in the notify MIB view.
Storage-type	Storage type, including **volatile**, **nonvolatile**, **permanent**, **readOnly**, and **other**. For more information, see Table 1.
ACL	Number of the IPv4 ACL. This field appears only when an IPv4 ACL is specified for the SNMP group.
ACL name	Name of the ACL. This field appears only when an ACL is specified for the SNMP group.
IPv6 ACL	Number of the IPv6 ACL. This field appears only when an IPv6 ACL is specified for the SNMP group.
IPV6 ACL name	Name of the IPv6 ACL. This field appears only when an IPv6 ACL is specified for the SNMP group.

Related commands

snmp-agent group

display snmp-agent local-engineid

Use **display snmp-agent local-engineid** to display the local SNMP engine ID.

Syntax

display snmp-agent local-engineid

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Every SNMP entity has one SNMP engine to provide services for sending and receiving messages, authenticating and encrypting messages, and controlling access to managed objects.

An SNMP engine ID uniquely identifies an SNMP entity in an SNMP domain.

Examples

Display the local SNMP engine ID.

```
<Sysname> display snmp-agent local-engineid
   SNMP local engine ID: 800063A2800084E52BED7900000001
```

Related commands

snmp-agent local-engineid

display snmp-agent mib-node

Use **display snmp-agent mib-node** to display SNMP MIB node information.

Syntax

display snmp-agent mib-node [**details** | **index-node** | **trap-node** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

details: Specifies detailed MIB node information, including node name, last octet of an OID string, and name of the next leaf node.

index-node: Specifies SNMP MIB tables, and node names and OIDs of MIB index nodes.

trap-node: Specifies node names and OIDs of MIB notification nodes, and node names and OIDs of notification objects.

verbose: Specifies detailed information about SNMP MIB nodes, including node names, OIDs, node types, permissions to MIB nodes, data types, MORs, and parent, child, and sibling nodes.

Usage guidelines

If you do not specify any keywords, this command displays information about all SNMP MIB nodes, including node name, OID, and permissions to MIB nodes.

The SNMP software package includes different MIB files. Support for MIBs varies by SNMP software versions.

Examples

Display SNMP MIB node information.

```
<Sysname> display snmp-agent mib-node

iso<1>(NA)
  |-std<1.0>(NA)
   |-iso8802<1.0.8802>(NA)
    |-ieee802dot1<1.0.8802.1>(NA)
     |-ieee802dot1mibs<1.0.8802.1.1>(NA)
```

```
...
```

Table 3 Command output

Field	Description
-std	MIB node name
<1.0>	MIB node OID
(NA)	Access right to the MIB node: • **NA**—Not accessible • **NF**—Notifications • **RO**—Read-only access • **RW**—Read and write access • **RC**—Read-write-create access • **WO**—Write-only access
*	Leaf node or MIB table node

Display detailed MIB node information.

```
<Sysname> display snmp-agent mib-node details

 iso(1)(dot1xPaeSystemAuthControl)
  |-std(0)(dot1xPaeSystemAuthControl)
   |-iso8802(8802)(dot1xPaeSystemAuthControl)
    |-ieee802dot1(1)(dot1xPaeSystemAuthControl)
     |-ieee802dot1mibs(1)(dot1xPaeSystemAuthControl)
      ...
```

Table 4 Command output

Field	Description
-std	MIB node name
(0)	Last bit of the MIB OID string
(lldpMessageTxInterval)	Name of the leaf node
*	Leaf node or MIB table node

Display MIB table names, and node names and OIDs of MIB index nodes.

```
<Sysname> display snmp-agent mib-node index-node

Table          |dot1xPaePortTable
Index          ||dot1xPaePortNumber
OID            |||  1.0.8802.1.1.1.1.1.2.1.1
...
```

Table 5 Command output

Field	Description
Table	MIB table name
Index	MIB index node name

Field	Description
OID	MIB index node OID

Display names and OIDs of MIB notification nodes, and names and OIDs of notification objects.

```
<Sysname> display snmp-agent mib-node trap-node

Name          |lldpRemTablesChange
OID           ||1.0.8802.1.1.2.0.0.1
Trap Object
Name          |||lldpStatsRemTablesInserts
OID           ||||1.0.8802.1.1.2.1.2.2
Name          |||lldpStatsRemTablesDeletes
OID           ||||1.0.8802.1.1.2.1.2.3
Name          |||lldpStatsRemTablesDrops
OID           ||||1.0.8802.1.1.2.1.2.4
Name          |||lldpStatsRemTablesAgeouts
OID           ||||1.0.8802.1.1.2.1.2.5
...
```

Table 6 Command output

Field	Description
Name	MIB notification node name
OID	MIB notification node OID
Trap Object	Name and OID of a notification object

Display detailed information about SNMP MIB nodes, including node names, OIDs, node types, permissions to MIB nodes, data types, MORs, and parent, child, and sibling nodes.

```
<Sysname> display snmp-agent mib-node verbose

Name          |iso
OID           ||1
Properties    ||NodeType:   Other
              ||AccessType: NA
              ||DataType:   NA
              ||MOR:        0x00000000
Parent        ||
First child   ||std
Next leaf     ||dot1xPaeSystemAuthControl
Next sibling  ||
...
```

Table 7 Command output

Field	Description
Name	MIB node name.
OID	MIB node OID.
Properties	MIB node properties.
NodeType	MIB node type: • **Table**—Table node. • **Row**—Row node in a MIB table. • **Column**—Column node in a MIB table. • **Leaf**—Leaf node. • **Group**—Group node (parent node of a leaf node). • **Trapnode**—Notification node. • **Other**—Other node type.
AccessType	Access right to the MIB node: • **NA**—Not accessible. • **NF**—Supports notifications. • **RO**—Supports read-only access. • **RW**—Supports read and write access. • **RC**—Supports read-write-create access. • **WO**—Supports write-only access.
DataType	Data type of the MIB node: • **Integer**—An integer. • **Integer32**—A 32-bit integer. • **Unsigned32**—A 32-bit integer with no mathematical sign. • **Gauge**—A non-negative integer that might increase or decrease. • **Gauge32**—A 32-bit non-negative integer that might increase or decrease. • **Counter**—A non-negative integer that might increase but not decrease. • **Counter32**—A 32-bit non-negative integer that might increase but not decrease. • **Counter64**—A 64-bit non-negative integer that might increase but not decrease. • **Timeticks**—A non-negative integer for time keeping. • **Octstring**—An octal string. • **OID**—Object identifier. • **IPaddress**—A 32-bit IP address. • **Networkaddress**—A network IP address. • **Opaque**—Any data. • **Userdefined**—User-defined data. • **BITS**—Bit enumeration. • **NA**—Other data type.
MOR	MOR for the MIB node.
Parent	Name of the parent node.
First child	Name of the first leaf node.
Next leaf	Name of the next leaf node.
Next sibling	Name of the next sibling node.

Field	Description
Allow	Operation types allowed: • **get/set/getnext**—All operations. • **get**—Get operation. • **set**—Set operation. • **getnext**—GetNext operation.
Value range	Value range of the MIB node.
Index	Table index. This field appears only for a table node.

display snmp-agent mib-view

Use **display snmp-agent mib-view** to display MIB views.

Syntax

display snmp-agent mib-view [**exclude** | **include** | **viewname** *view-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

exclude: Displays the subtrees excluded from any MIB view.

include: Displays the subtrees included in any MIB view.

viewname *view-name*: Displays information about the specified MIB view. The *view-name* argument is a case-sensitive string of 1 to 32 characters.

Usage guidelines

If you do not specify any parameters, this command displays all MIB views.

Examples

Display all MIB views.

```
<Sysname> display snmp-agent mib-view
   View name: ViewDefault
       MIB Subtree: iso
       Subtree mask:
       Storage-type: nonVolatile
       View Type: included
       View status: active

   View name: ViewDefault
       MIB Subtree: snmpUsmMIB
       Subtree mask:
       Storage-type: nonVolatile
       View Type: excluded
```

```
        View status: active

    View name: ViewDefault
        MIB Subtree: snmpVacmMIB
        Subtree mask:
        Storage-type: nonVolatile
        View Type: excluded
        View status: active

    View name: ViewDefault
        MIB Subtree: snmpModules.18
        Subtree mask:
        Storage-type: nonVolatile
        View Type: excluded
        View status: active
```

ViewDefault is the default MIB view. The output shows that except for the MIB objects in the **snmpUsmMIB**, **snmpVacmMIB**, and **snmpModules.18** subtrees, all the MIB objects in the **iso** subtree are accessible.

Table 8 Command output

Field	Description
View name	MIB view name.
MIB Subtree	MIB subtree covered by the MIB view.
Subtree mask	MIB subtree mask.
Storage-type	Type of the medium (see Table 1) where the subtree view is stored.
View Type	Access privilege for the MIB subtree in the MIB view: • **Included**—All objects in the MIB subtree are accessible in the MIB view. • **Excluded**—None of the objects in the MIB subtree is accessible in the MIB view.
View status	Status of the MIB view: • **active**—MIB view is effective. • **inactive**—MIB view is ineffective. The objects in the MIB view are not accessible, but they can send notifications.

Related commands

snmp-agent mib-view

display snmp-agent remote

Use **display snmp-agent remote** to display engine IDs of the remote SNMP entities.

Syntax

display snmp-agent remote [{ *ipv4-address* | **ipv6** *ipv6-address* }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv4-address: Specifies a remote SNMP entity by its IPv4 address.

ipv6 *ipv6-address*: Specifies a remote SNMP entity by its IPv6 address.

Usage guidelines

Every SNMP entity has one SNMP engine to provide services for sending and receiving messages, authenticating and encrypting messages, and controlling access to managed objects.

An SNMP engine ID uniquely identifies an SNMP entity in an SNMP domain.

If you do not specify a remote SNMP entity, this command displays the engine IDs of all remote SNMP entities.

Examples

Display engine IDs of all remote SNMP entities.

```
<Sysname> display snmp-agent remote
   Remote engineID: 800063A28000A0FC00580400000001
       IPv4 address: 1.1.1.1
```

Table 9 Command output

Field	Description
Remote engineID	Remote SNMP engine ID you have configured using the **snmp-agent remote** command.
IPv4 address	IPv4 address of the remote SNMP entity.
IPv6 address	IPv6 address of the remote SNMP entity. This field is displayed if the remote SNMP entity is configured with an IPv6 address.

Related commands

snmp-agent remote

display snmp-agent statistics

Use **display snmp-agent statistics** to display SNMP message statistics.

Syntax

display snmp-agent statistics

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display SNMP message statistics.

```
<Sysname> display snmp-agent statistics
  1684 messages delivered to the SNMP entity.
  5 messages were for an unsupported version.
  0 messages used an unknown SNMP community name.
```

```
0 messages represented an illegal operation for the community supplied.
0 ASN.1 or BER errors in the process of decoding.
1679 messages passed from the SNMP entity.
0 SNMP PDUs had badValue error-status.
0 SNMP PDUs had genErr error-status.
0 SNMP PDUs had noSuchName error-status.
0 SNMP PDUs had tooBig error-status (Maximum packet size 1500).
16544 MIB objects retrieved successfully.
2 MIB objects altered successfully.
7 GetRequest-PDU accepted and processed.
7 GetNextRequest-PDU accepted and processed.
1653 GetBulkRequest-PDU accepted and processed.
1669 GetResponse-PDU accepted and processed.
2 SetRequest-PDU accepted and processed.
0 Trap PDUs accepted and processed.
0 alternate Response Class PDUs dropped silently.
0 forwarded Confirmed Class PDUs dropped silently.
```

Table 10 Command output

Field	Description
messages delivered to the SNMP entity	Number of messages that the SNMP agent has received.
messages were for an unsupported version	Number of messages that are not supported by the SNMP agent version.
messages used an unknown SNMP community name	Number of messages that used an unknown SNMP community name.
messages represented an illegal operation for the community supplied	Number of messages carrying an operation that the community has no right to perform.
ASN.1 or BER errors in the process of decoding	Number of messages that had ASN.1 or BER errors during decoding.
messages passed from the SNMP entity	Number of messages sent by the SNMP agent.
SNMP PDUs had badValue error-status	Number of PDUs with a BadValue error.
SNMP PDUs had genErr error-status	Number of PDUs with a genErr error.
SNMP PDUs had noSuchName error-status	Number of PDUs with a NoSuchName error.
SNMP PDUs had tooBig error-status	Number of PDUs with a TooBig error (the maximum packet size is 1500 bytes).
MIB objects retrieved successfully	Number of MIB objects that have been successfully retrieved.
MIB objects altered successfully	Number of MIB objects that have been successfully modified.
GetRequest-PDU accepted and processed	Number of GetRequest requests that have been received and processed.
GetNextRequest-PDU accepted and processed	Number of getNext requests that have been received and processed.
GetBulkRequest-PDU accepted and processed	Number of getBulk requests that have been received and processed.

Field	Description
GetResponse-PDU accepted and processed	Number of get responses that have been received and processed.
SetRequest-PDU accepted and processed	Number of set requests that have been received and processed.
Trap PDUs accepted and processed	Number of notifications that have been received and processed.
alternate Response Class PDUs dropped silently	Number of dropped response packets.
forwarded Confirmed Class PDUs dropped silently	Number of forwarded packets that have been dropped.

display snmp-agent sys-info

Use **display snmp-agent sys-info** to display SNMP agent system information.

Syntax

display snmp-agent sys-info [**contact** | **location** | **version**] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

contact: Displays the system contact.

location: Displays the physical location of the device.

version: Displays the SNMP agent version.

Usage guidelines

If you do not specify any keywords, this command displays all SNMP agent system information.

Examples

Display all SNMP agent system information.

```
<Sysname> display snmp-agent sys-info
   The contact information of the agent:
       New H3C Technologies Co., Ltd.

   The location information of the agent:
       Hangzhou, China

   The SNMP version of the agent:
       SNMPv3
```

Related commands

snmp-agent sys-info

display snmp-agent trap queue

Use **display snmp-agent trap queue** to display basic information about the trap queue.

Syntax

display snmp-agent trap queue

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the trap queue configuration and usage status.

```
<Sysname> display snmp-agent trap queue
   Queue size: 100
   Message number: 6
```

Related commands

snmp-agent trap life

snmp-agent trap queue-size

display snmp-agent trap-list

Use **display snmp-agent trap-list** to display SNMP notifications enabling status for modules.

Syntax

display snmp-agent trap-list

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

If a module has multiple sub-modules and SNMP notifications are enabled for one of its sub-modules, the command output shows that the module is SNMP notifications-enabled.

To determine whether a module supports SNMP notifications, execute the **snmp-agent trap enable ?** command.

The **display snmp-agent trap-list** command output varies by the **snmp-agent trap enable** command configuration and the module configuration.

Examples

Display SNMP notifications enabling status for modules.

```
<Sysname> display snmp-agent trap-list
   arp notification is disabled.
   configuration notification is enabled.
```

```
mac-address notification is enabled.
radius notification is disabled.
standard notification is enabled.
syslog notification is disabled.
system notification is enabled.

Enabled notifications: 4; Disabled notifications: 3
```

Related commands

snmp-agent trap enable

display snmp-agent usm-user

Use **display snmp-agent usm-user** to display SNMPv3 user information.

Syntax

display snmp-agent usm-user [**engineid** *engineid* | **group** *group-name* | **username** *user-name*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

engineid *engineid*: Specifies an SNMP engine ID. The engine ID is case insensitive. When an SNMPv3 user is created, the system records the local SNMP entity engine ID. The user becomes invalid when the engine ID changes, and it becomes valid again when the recorded engine ID is restored.

group *group-name*: Specifies an SNMP group by its name. The group name is case sensitive.

username *user-name*: Specifies an SNMPv3 user by its name. The username is case sensitive.

Usage guidelines

This command displays only SNMPv3 users that you have created by using the **snmp-agent usm-user v3** command. To display SNMPv1 or SNMPv2c users created by using the **snmp-agent usm-user** { **v1** | **v2c** } command, use the **display snmp-agent community** command.

Examples

Display information about all SNMPv3 users.

```
<Sysname> display snmp-agent usm-user
   Username: userv3
   Group name: mygroupv3
       Engine ID: 800063A203000FE240A1A6
       Storage-type: nonVolatile
       UserStatus: active
       ACL: 2000

   Username: userv3
   Group name: mygroupv3
```

```
    Engine ID: 8000259503000BB3100A508
    Storage-type: nonVolatile
    UserStatus: active
    ACL name: testacl

Username: userv3code
Role name: groupv3code
           network-operator
    Engine ID: 800063A203000FE240A1A6
    Storage-type: nonVolatile
    UserStatus: active

Username: userv3code
Role name: snmprole
           network-operator
    Engine ID: 800063A280000002BB0001
    Storage-type: nonVolatile
    UserStatus: active
```

Table 11 Command output

Field	Description
Username	SNMP username.
Group name	SNMP group name.
Role name	SNMP user role name.
Engine ID	Engine ID that the SNMP agent used when the SNMP user was created.
Storage-type	Storage type: • **volatile**. • **nonvolatile**. • **permanent**. • **readOnly**. • **other**. For more information about these storage types, see Table 1.
UserStatus	SNMP user status: • **active**—The SNMP user is effective. • **notInService**—The SNMP user is correctly configured but not activated. • **notReady**—The SNMP user configuration is incomplete. • **other**—Any other status.
ACL	Number of the ACL. This field appears only when an ACL is specified for the SNMPv3 user.
ACL name	Name of the ACL. This field appears only when an ACL is specified for the SNMPv3 user.
IPV6 ACL	Number of the IPv6 ACL. This field appears only when an ACL is specified for the SNMPv3 user.
IPV6 ACL name	Name of the IPv6 ACL. This field appears only when an ACL is specified for the SNMPv3 user.

Related commands

snmp-agent usm-user v3

enable snmp trap updown

Use **enable snmp trap updown** to enable link state notifications on an interface.

Use **undo enable snmp trap updown** to disable link state notifications on an interface.

Syntax

enable snmp trap updown

undo enable snmp trap updown

Default

Link state notifications are enabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

For an interface to generate linkUp/linkDown notifications when its state changes, you must also enable the linkUp/linkDown notification function globally by using the **snmp-agent trap enable standard** [**linkdown** | **linkup**] * command.

Examples

Enable GigabitEthernet 1/0/1 to send linkUp/linkDown SNMP traps to 10.1.1.1 in the community **public**.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable
[Sysname] snmp-agent target-host trap address udp-domain 10.1.1.1 params securityname
public
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] enable snmp trap updown
```

Related commands

snmp-agent target-host

snmp-agent trap enable

snmp-agent

Use **snmp-agent** to enable the SNMP agent.

Use **undo snmp-agent** to disable the SNMP agent.

Syntax

snmp-agent

undo snmp-agent

Default

On the following switches, the SNMP agent is disabled.

- S5110V2 switch series
- S5110V2-SI switch series
- S5120V2-LI switch series
- S5130S-LI switch series
- S3100V3-SI switch series
- S5120V3-SI switch series
- S5120V3-LI switch series
- MS4320V3 switch series
- MS4320V2 switch series
- MS4320 switch series
- MS4200 switch series
- MS4300V2 switch series

On the following switches, the SNMP agent is enabled when the switch starts up with factory defaults and is disabled when the switch starts up with the initial configuration. For more information about the device initial configuration and factory defaults, see configuration file management in *Fundamentals Configuration Guide*.

- S5000V3-EI switch series
- S5000V5-EI switch series
- WS5810-WiNet switch series
- WS5820-WiNet switch series
- S5000E-X switch series
- S5000X-EI switch series
- WAS6000 switch series

Views

System view

Predefined user roles

network-admin

Usage guidelines

The SNMP agent is automatically enabled when you execute any command that begins with **snmp-agent** except for the **snmp-agent calculate-password** command.

The SNMP agent will fail to be enabled when the port that the agent will listen on is used by another service. You can use the **snmp-agent port** command to specify a listening port. To view the UDP port use information, execute the **display udp verbose** command.

If you disable the SNMP agent, the SNMP settings do not take effect. The **display current-configuration** command does not display the SNMP settings. The SNMP settings will not be saved in the configuration file. For the SNMP settings to take effect, enable the SNMP agent.

Examples

Enable the SNMP agent.

```
<Sysname> system-view
[Sysname] snmp-agent
```

Related commands

display udp verbose (see IP performance optimization commands in *Layer 3—IP Services Configuration Guide*)

snmp-agent port

snmp-agent { inform | trap } source

Use **snmp-agent** { **inform** | **trap** } **source** to specify a source IP address for the informs or traps sent by the SNMP agent.

Use **undo snmp-agent** { **inform** | **trap** } **source** to restore the default.

Syntax

snmp-agent { **inform** | **trap** } **source** *interface-type interface-number*

undo snmp-agent { **inform** | **trap** } **source**

Default

The SNMP agent uses the IP address of the outgoing interface as the source IP address of notifications.

Views

System view

Predefined user roles

network-admin

Parameters

inform: Specifies informs.

trap: Specifies traps.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The **snmp-agent source** command enables the SNMP agent to use the primary IP address of an interface or subinterface as the source IP address in all its SNMP informs or traps, regardless of their outgoing interfaces. An NMS can use this IP address to filter all the informs or traps sent by the SNMP agent.

Make sure the specified interface has been created and assigned a valid IP address. The configuration will fail if the interface has not been created and will take effect only after a valid IP address is assigned to the specified interface.

Examples

Configure the primary IP address of GigabitEthernet 1/0/1 as the source address of SNMP traps.

```
<Sysname> system-view
[Sysname] snmp-agent trap source gigabitethernet 1/0/1
```

Configure the primary IP address of GigabitEthernet 1/0/2 as the source address of SNMP informs.

```
<Sysname> system-view
[Sysname] snmp-agent inform source gigabitethernet 1/0/2
```

Related commands

snmp-agent target-host

snmp-agent trap enable

snmp-agent calculate-password

Use **snmp-agent calculate-password** to calculate the encrypted form for a key in plaintext form.

Syntax

In non-FIPS mode:

snmp-agent calculate-password *plain-password* **mode** { **3desmd5** | **3dessha** | **aes192md5** | **aes192sha** | **aes256md5** | **aes256sha** | **md5** | **sha** } { **local-engineid** | **specified-engineid** *engineid* }

In FIPS mode:

snmp-agent calculate-password *plain-password* **mode** { **aes192sha** | **aes256sha** | **sha** } { **local-engineid** | **specified-engineid** *engineid* }

Views

System view

Predefined user roles

network-admin

Parameters

plain-password: Specifies a key in plaintext form. The *plain-password* argument is a case-sensitive string of 1 to 64 characters.

mode: Specifies an authentication algorithm and encryption algorithm. The device supports the HMAC-MD5 and HMAC-SHA1 authentication algorithms. The HMAC-MD5 algorithm is faster than the HMAC-SHA1 algorithm. The HMAC-SHA1 algorithm provides more security than the HMAC-MD5 algorithm. The AES256, AES192, AES, 3DES, and DES encryption algorithms (in descending order of security strength) are available for the device. A more secure algorithm calculates slower. DES is enough to meet general security requirements.

- **3desmd5**: Calculates the encrypted form for the encryption key by using the 3DES encryption algorithm and HMAC-MD5 authentication algorithm.
- **3dessha**: Calculates the encrypted form for the encryption key by using the 3DES encryption algorithm and HMAC-SHA1 authentication algorithm.
- **aes192md5**: Calculates the encrypted form for the encryption key by using the AES192 encryption algorithm and the HMAC-MD5 authentication algorithm.
- **aes192sha**: Calculates the encrypted form for the encryption key by using the AES192 encryption algorithm and the HMAC-SHA1 authentication algorithm.
- **aes256md5**: Calculates the encrypted form for the encryption key by using the AES256 encryption algorithm and the HMAC-MD5 authentication algorithm.
- **aes256 sha**: Calculates the encrypted form for the encryption key by using the AES256 encryption algorithm and the HMAC-SHA1 authentication algorithm.
- **md5**: Calculates the encrypted form for the authentication key or encryption key by using the HMAC-MD5 authentication algorithm and AES or DES encryption algorithm. When the HMAC-MD5 authentication algorithm is used, you can get the same authentication key or encryption key in encrypted form regardless of whether the AES or DES encryption algorithm is used.
- **sha**: Calculates the encrypted form for the authentication key or encryption key by using HMAC-SHA1 authentication algorithm and AES or DES encryption algorithm. When the HMAC-SHA1 authentication algorithm is used, you can get the same authentication key or encryption key in encrypted form regardless of whether the AES or DES encryption algorithm is used.

local-engineid: Uses the local engine ID to calculate the encrypted form for the key. You can configure the local engine ID by using the **snmp-agent local-engineid** command.

specified-engineid *engineid*: Uses a user-defined engine ID to calculate the encrypted form for the key. The *engineid* argument is an even number of case-insensitive hexadecimal characters. All-zero and all-F strings are invalid. The even number is in the range of 10 to 64.

Usage guidelines

Make sure the SNMP agent is enabled before you execute the **snmp-agent calculate-password** command.

For security purposes, use the encrypted-form key generated by using this command when you create SNMPv3 users by specifying the **cipher** keyword in the **snmp-agent usm-user v3** command.

The encrypted form of the key is valid only under the engine ID specified for key conversion.

Examples

Use the local engine ID and the HMAC-SHA1 algorithm to calculate the encrypted form for key **authkey**.

```
<Sysname> system-view
[Sysname] snmp-agent calculate-password authkey mode sha local-engineid
The encrypted key is: 09659EC5A9AE91BA189E5845E1DDE0CC
```

Related commands

snmp-agent local-engineid

snmp-agent usm-user v3

snmp-agent community

Use **snmp-agent community** to configure an SNMPv1 or SNMPv2c community.

Use **undo snmp-agent community** to delete an SNMPv1 or SNMPv2c community.

Syntax

In VACM mode:

snmp-agent community { **read** | **write** } [**simple** | **cipher**] *community-name* [**mib-view** *view-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent community [**cipher**] *community-name*

In RBAC mode:

snmp-agent community [**simple** | **cipher**] *community-name* **user-role** *role-name* [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent community [**cipher**] *community-name*

Default

No SNMPv1 or SNMPv2c communities exist.

Views

System view

Predefined user roles

network-admin

Parameters

read: Assigns the specified community read-only access to MIB objects. A read-only community can only inquire MIB information.

write: Assigns the specified community read and write access to MIB objects. A read and write community can configure MIB information.

simple: Specifies a community name in plaintext form. For security purposes, the community name specified in plaintext form will be stored in encrypted form.

cipher: Specifies a community name in encrypted form.

community-name: Specifies the community name. The plaintext form is a case-sensitive string of 1 to 32 characters. The encrypted form is a case-sensitive string of 33 to 73 characters. Input a string as escape characters after a backslash (\).

mib-view *view-name*: Specifies the MIB view available for the community. The *view-name* argument represents a MIB view name, a case-sensitive string of 1 to 32 characters. A MIB view represents a set of accessible MIB objects. If you do not specify a view, the specified community can access the MIB objects in the default MIB view **ViewDefault**.

user-role *role-name*: Specifies a user role name for the community, a case-sensitive string of 1 to 63 characters.

acl: Specifies a basic or advanced IPv4 ACL for the community.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the community.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

This command is not available in FIPS mode.

Only users with the network-admin or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

An SNMP community is identified by a community name. It contains a set of NMSs and SNMP agents. Devices in an SNMP community authenticate each other by using the community name. An NMS and an SNMP agent can communicate only when they use the same community name.

Typically, **public** is used as the read-only community name and **private** is used as the read and write community name. To enhance security, you can assign your SNMP communities a name other than **public** and **private**.

The **snmp-agent community** command allows you to use either of the following modes to control SNMP community access to MIB objects:

- **View-based access control model**—The VACM mode controls access to MIB objects by assigning MIB views to SNMP communities.
- **Role based access control**—The RBAC mode controls access to MIB objects by assigning user roles to SNMP communities.

-
- The network-admin and level-15 user roles have the read and write access to all MIB objects.
- The network-operator user role has the read-only access to all MIB objects.

For more information about user roles, see *Fundamentals Configuration Guide*.

RBAC mode controls access on a per MIB object basis, and VACM mode controls access on a MIB view basis. As a best practice to enhance MIB security, use RBAC mode.

You can create a maximum of 10 SNMP communities by using the **snmp-agent community** command.

If you execute the command multiple times to specify the same community name but different other settings each time, the most recent configuration takes effect.

To set and save a community name in plain text, do not specify the **simple** or **cipher** keyword.

The ACL is used to filter illegitimate NMSs.

- If you do not specify an ACL, the specified ACL does not exist, or the specified ACL does not have any rules, all NMSs that use the community name can access the SNMP agent.
- If you specify an ACL and the ACL has rules, only NMSs permitted by the ACL can access the SNMP agent.

For more information about ACL, see *ACL and QoS Configuration Guide*.

You can also create an SNMP community by using the **snmp-agent usm-user** { **v1** | **v2c** } and **snmp-agent group** { **v1** | **v2c** } commands. These two commands create an SNMPv1 or SNMPv2c user and the group to which the user is assigned. The system automatically creates an SNMP community by using the SNMPv1 or SNMPv2c username.

The **display snmp-agent community** command displays information only about communities created and saved in plaintext form.

Examples

Create the read-only community with the plaintext form name **readaccess** so an SNMPv1 or SNMPv2c NMS can use the community name **readaccess** to read the MIB objects in the default view **ViewDefault**.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v1 v2c
[Sysname] snmp-agent community read simple readaccess
```

Create the read and write community with the plaintext form name **writeaccess** so only the SNMPv2c NMS at 1.1.1.1 can use the community name **writeaccess** to read or set the MIB objects in the default view **ViewDefault**.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0.0.0.0
[Sysname-acl-ipv4-basic-2001] rule deny source any
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent community write simple writeaccess acl 2001
```

Create the read and write community with the plaintext form name **writeaccess** so only the SNMPv2c NMS at 1.1.1.2 can use the community name **writeaccess** to read or set the MIB objects in the default view **ViewDefault**.

```
<Sysname> system-view
[Sysname] acl basic name testacl
[Sysname-acl-ipv4-basic-testacl] rule permit source 1.1.1.2 0.0.0.0
```

```
[Sysname-acl-ipv4-basic-testacl] rule deny source any
[Sysname-acl-ipv4-basic-testacl] quit
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent community write simple writeaccess acl name testacl
```

Create the read and write community with the plaintext form name **wr-sys-acc** so an SNMPv1 or SNMPv2c NMS can use the community name **wr-sys-acc** to read or set the MIB objects in the system subtree (OID 1.3.6.1.2.1.1).

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v1 v2c
[Sysname] undo snmp-agent mib-view ViewDefault
[Sysname] snmp-agent mib-view included test system
[Sysname] snmp-agent community write simple wr-sys-acc mib-view test
```

Related commands

display snmp-agent community

snmp-agent mib-view

snmp-agent community-map

Use **snmp-agent community-map** to map an SNMP community to an SNMP context.

Use **undo snmp-agent community-map** to delete the mapping between an SNMP community and an SNMP context.

Syntax

snmp-agent community-map *community-name* **context** *context-name*

undo snmp-agent community-map *community-name* **context** *context-name*

Default

No mapping exists between an SNMP community and an SNMP context.

Views

System view

Predefined user roles

network-admin

Parameters

community-name: Specifies an SNMP community, a case-sensitive string of 1 to 32 characters.

context-name: Specifies an SNMP context, a case-sensitive string of 1 to 32 characters.

Usage guidelines

This command enables a module on an agent to obtain the context mapped to a community name when an NMS accesses the agent by using SNMPv1 or SNMPv2c.

You can configure a maximum of 10 community-context mappings on the device.

Examples

Map SNMP community **private** to SNMP context **trillcontext**.

```
<Sysname> system-view
[Sysname] snmp-agent community-map private context testcontext
```

Related commands

display snmp-agent community

snmp-agent configuration-examine interval

Use **snmp-agent configuration-examine interval** to set the intervals at which the SNMP module examines the system configuration for changes.

Use **undo snmp-agent configuration-examine interval** to restore the default.

NOTE:

This command is supported only in Release 6340 and later.

Syntax

snmp-agent configuration-examine interval *interval*

undo snmp-agent configuration-examine interval

Default

The SNMP module examines the system configuration for changes at intervals of 600 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the intervals at which the SNMP module examines the system configuration for changes, in seconds. The value range for this argument is 1 to 86400.

Usage guidelines

The SNMP module examines the system running configuration, startup configuration, and next-startup configuration file for changes periodically and generates a log if any change is found. If SNMP notification for configuration changes has been enabled, the system generates also an SNMP notification.

You can use this command to modify the examination interval.

Examples

Set the intervals at which the SNMP module examines the system configuration for changes to 600 seconds.

```
<sysname> system-view
[sysname] snmp-agent configuration-examine interval 600
```

Related commands

snmp-agent trap enable

snmp-agent context

Use **snmp-agent context** to create an SNMP context.

Use **undo snmp-agent context** to delete an SNMP context.

Syntax

snmp-agent context *context-name*

undo snmp-agent context *context-name*

Default

No SNMP contexts exist.

Views

System view

Predefined use roles

network-admin

Parameters

context-name: Specifies an SNMP context, a case-sensitive string of 1 to 32 characters.

Usage guidelines

For an NMS and an SNMP agent to communicate, configure the same SNMP context for them or do not configure a context for the NMS.

You can create a maximum of 20 SNMP contexts.

Examples

Create SNMP context **trillcontext**.

```
<Sysname> system-view
[Sysname] snmp-agent context testcontext
```

Related commands

display snmp-agent context

snmp-agent group

Use **snmp-agent group** to create an SNMP group.

Use **undo snmp-agent group** to delete an SNMP group.

Syntax

In non-FIPS mode:

- SNMPv1 and SNMP v2c:

  snmp-agent group { **v1** | **v2c** } *group-name* [**notify-view** *view-name* | **read-view** *view-name* | **write-view** *view-name*] * [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

  undo snmp-agent group { **v1** | **v2c** } *group-name*

- SNMPv3:

  snmp-agent group v3 *group-name* [**authentication** | **privacy**] [**notify-view** *view-name* | **read-view** *view-name* | **write-view** *view-name*] * [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

  undo snmp-agent group v3 *group-name* [**authentication** | **privacy**]

In FIPS mode:

snmp-agent group v3 *group-name* { **authentication** | **privacy** } [**notify-view** *view-name* | **read-view** *view-name* | **write-view** *view-name*] * [**acl**

{ *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent group v3 *group-name* { **authentication** | **privacy** }

Default

No SNMP groups exist.

Views

System view

Predefined use roles

network-admin

Parameters

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

group-name: Specifies an SNMP group name, a case-sensitive string of 1 to 32 characters.

authentication: Specifies the authentication without privacy security model for the SNMPv3 group.

privacy: Specifies the authentication with privacy security model for the SNMPv3 group.

read-view *view-name*: Specifies a read-only MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. If you do not specify a read-only MIB view, the SNMP group has read access to the default view **ViewDefault**.

notify-view *view-name*: Specifies a notify MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. The SNMP agent sends notifications to the users in the specified group only for the MIB objects included in the notify view. If you do not specify a notify view, the SNMP agent does not send any notification to the users in the specified group.

write-view *view-name:* Specifies a read and write MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. If you do not specify a read and write view, the SNMP group cannot set any MIB object on the SNMP agent.

acl: Specifies a basic or advanced IPv4 ACL for the group.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the group.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

SNMPv1 and SNMPv2c settings in this command are not supported in FIPS mode.

Only users with the network-admin or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

All users in an SNMP group share the security model and access rights of the group.

You can create a maximum of 20 SNMP groups, including SNMPv1, SNMPv2c, and SNMPv3 groups.

All SNMPv3 users in a group share the same security model, but can use different authentication and encryption key settings. To implement a security model for a user and avoid SNMP communication failures, make sure the security model configuration for the group and the security key settings for the user are compliant with Table 12 and match the settings on the NMS.

Table 12 Basic security setting requirements for different security models

Security model	Security model keyword for the group	Security key settings for the user	Remarks
Authentication with privacy	**privacy**	Authentication key, encryption key	If the authentication key or the encryption key is not configured, SNMP communication will fail.
Authentication without privacy	**authentication**	Authentication key	If no authentication key is configured, SNMP communication will fail. The encryption key (if any) for the user does not take effect.
No authentication, no privacy	Neither **authentication** nor **privacy**	None	The authentication and encryption keys, if configured, do not take effect.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If you do not specify an ACL, the specified ACL does not exist, or the specified ACL does not have any rules, all NMSs that use the username can access the SNMP agent.
- If you have specified an ACL and the ACL has rules, only the NMSs permitted by the ACL can access the agent.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

Create the SNMPv3 group **group1**.

```
<Sysname> system-view
[Sysname] snmp-agent group v3 group1
```

Related commands

display snmp-agent group

snmp-agent mib-view

snmp-agent usm-user

snmp-agent local-engineid

Use **snmp-agent local-engineid** to set an SNMP engine ID.

Use **undo snmp-agent local-engineid** to restore the default.

Syntax

snmp-agent local-engineid *engineid*

undo snmp-agent local-engineid

Default

The engine ID of a device is the combination of the company ID and the device ID.

Views

System view

Predefined user roles

network-admin

Parameters

engineid: Specifies an SNMP engine ID, a case-insensitive hexadecimal string. Its length is an even number in the range of 10 to 64. All-zero and all-F strings are invalid.

Usage guidelines

An SNMP engine ID uniquely identifies a device in an SNMP managed network. Make sure the local SNMP engine ID is unique within your SNMP managed network to avoid communication problems.

If you have configured SNMPv3 users, change the local SNMP engine ID only when necessary. The change can void the SNMPv3 usernames and encrypted keys you have configured.

You can use the default engine ID or configure an easy-to-remember engine ID based on the network plan. For example, you can set the engine ID for device 1 on the first floor of building A to 000Af0010001 and device 2 to 000Af0010002.

Examples

Set the local SNMP engine ID to **123456789A**.

```
<Sysname> system-view
[Sysname] snmp-agent local-engineid 123456789A
```

Related commands

display snmp-agent local-engineid

snmp-agent usm-user

snmp-agent log

Use **snmp-agent log** to enable SNMP logging.

Use **undo snmp-agent log** to disable SNMP logging.

Syntax

snmp-agent log { **all** | **authfail** | **get-operation** | **set-operation** }

undo snmp-agent log { **all** | **authfail** | **get-operation** | **set-operation** }

Default

SNMP logging operations are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

all: Enables logging SNMP authentication failures, Get operations, and Set operations.

authfail: Enables logging SNMP authentication failures.

get-operation: Enables logging SNMP Get operations.

set-operation: Enables logging SNMP Set operations.

Usage guidelines

Use SNMP logging to record the SNMP operations performed on the SNMP agent or authentication failures from the NMS to the agent for auditing NMS behaviors. The SNMP agent sends log data to the information center. You can configure the information center to output the data to a destination as needed.

Examples

Enable logging SNMP Get operations.

```
<Sysname> system-view
[Sysname] snmp-agent log get-operation
```

Enable logging SNMP Set operations.

```
<Sysname> system-view
[Sysname] snmp-agent log set-operation
```

Enable logging SNMP authentication failures.

```
<Sysname> system-view
[Sysname] snmp-agent log authfail
```

snmp-agent mib-view

Use **snmp-agent mib-view** to create or update a MIB view.

Use **undo snmp-agent mib-view** to delete a MIB view.

Syntax

snmp-agent mib-view { **excluded** | **included** } *view-name oid-tree* [**mask** *mask-value*]

undo snmp-agent mib-view *view-name*

Default

The system creates the **ViewDefault** view when the SNMP agent is enabled. In this default MIB view, all MIB objects in the **iso** subtree but the **snmpUsmMIB**, **snmpVacmMIB**, and **snmpModules.18** subtrees are accessible.

Views

System view

Predefined user roles

network-admin

Parameters

excluded: Denies access to any node in the specified MIB subtree.

included: Permits access to all the nodes in the specified MIB subtree.

view-name: Specifies a view name, a case-sensitive string of 1 to 32 characters.

oid-tree: Specifies a MIB subtree by its root node's OID (for example, **1.3.6.1.2.1.1**) or object name (for example, **system**). The *oid-tree* argument is a case-sensitive string of 1 to 255 characters. An OID is a dotted numeric string that uniquely identifies an object in the MIB tree.

mask *mask-value*: Sets a MIB subtree mask, a case-insensitive hexadecimal string. Its length is an even number in the range of 1 to 32.

Usage guidelines

A MIB view represents a set of MIB objects (or MIB object hierarchies) with certain access privilege. The MIB objects included in the MIB view are accessible while those excluded from the MIB view are inaccessible.

Each *view-name oid-tree* pair represents a view record. If you specify the same record with different MIB subtree masks multiple times, the most recent configuration takes effect.

Be cautious with deleting the default MIB view. The operation blocks the access to any MIB object on the device from NMSs that use the default view.

Examples

Include the **mib-2** (OID 1.3.6.1.2.1) subtree in the **mibtest** view and exclude the **system** subtree from this view.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v1
[Sysname] snmp-agent mib-view included mibtest 1.3.6.1.2.1
[Sysname] snmp-agent mib-view excluded mibtest system
[Sysname] snmp-agent community read public mib-view mibtest
```

An SNMPv1 NMS in the **public** community can query the objects in the **mib-2** subtree but not any object (for example, the **sysDescr or sysObjectID** node) in the **system** subtree.

Related commands

display snmp-agent mib-view

snmp-agent group

snmp-agent packet max-size

Use **snmp-agent packet max-size** to set the maximum size (in bytes) of SNMP packets that an SNMP agent can receive or send.

Use **undo snmp-agent packet max-size** to restore the default.

Syntax

snmp-agent packet max-size *byte-count*

undo snmp-agent packet max-size

Default

An SNMP agent can process SNMP packets with a maximum size of 1500 bytes.

Views

System view

Predefined user roles

network-admin

Parameters

byte-count: Sets the maximum size (in bytes) of SNMP packets that the SNMP agent can receive or send. The value range is 484 to 17940.

Usage guidelines

If any device on the path to the NMS does not support packet fragmentation, limit the SNMP packet size to prevent large-sized packets from being discarded. For most networks, the default value is sufficient.

Examples

Set the maximum SNMP packet size to 1024 bytes.

```
<Sysname> system-view
[Sysname] snmp-agent packet max-size 1024
```

snmp-agent packet response dscp

Use **snmp-agent packet response dscp** to set the DSCP value for SNMP responses.

Use **undo snmp-agent packet response dscp** to restore the default.

Syntax

snmp-agent packet response dscp *dscp-value*

undo snmp-agent packet response dscp

Default

The DSCP value for SNMP responses is 0.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Sets the DSCP value for SNMP responses, in the range of 0 to 63. A greater DSCP value represents a higher priority.

Usage guidelines

The DSCP value is encapsulated in the ToS field of an IP packet. It specifies the priority level of the packet for transmission.

Examples

Set the DSCP value to 40 for SNMP responses.

```
<Sysname> system-view
[Sysname] snmp-agent packet response dscp 40
```

snmp-agent port

Use **snmp-agent port** to specify an SNMP listening port.

Use **undo snmp-agent port** to restore the default.

Syntax

snmp-agent port *port-number*

undo snmp-agent port

Default

The SNMP listening port is UDP port 161.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies an SNMP listening port by its number in the range of 1 to 65535.

Usage guidelines

The SNMP agent will fail to be enabled when the port that the agent will listen on is used by another service. You can use the **snmp-agent port** command to change the SNMP listening port. As a best practice, execute the **display udp verbose** command to view the UDP port use information before specifying a new SNMP listening port.

After changing the SNMP listening port, the NMS can perform SNMP set and get operations on the device only after reconnecting the device by using the new port number.

Examples

Specify **5555** as the SNMP listening port..

```
<Sysname> system-view
[Sysname] snmp-agent port 5555
```

Related commands

display udp verbose (see IP performance optimization commands in *Layer 3—IP Services Configuration Guide*)

snmp-agent remote

Use **snmp-agent remote** to set an SNMP engine ID for a remote SNMP entity.

Use **undo snmp-agent remote** to delete the SNMP engine ID of a remote SNMP entity.

Syntax

snmp-agent remote { *ipv4-address* | **ipv6** *ipv6-address* } **engineid** *engineid*

undo snmp-agent remote *ip-address*

Default

No SNMP engine IDs are configured for remote SNMP entities.

Views

System view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies a remote SNMP entity by its IPv4 address.

ipv6 *ipv6-address*: Specifies a remote SNMP entity by its IPv6 address.

engineid: Specifies the SNMP engine ID of the remote SNMP entity. This argument is a case-insensitive hexadecimal string. Its length is an even number in the range of 10 to 64. All-zero and all-F strings are invalid.

Usage guidelines

To send informs to an NMS, you must configure the SNMP engine ID of the NMS on the SNMP agent.

The NMS accepts the SNMPv3 informs from the SNMP agent only if the engine ID in the informs is the same as its local engine ID.

You can configure a maximum of 20 remote SNMP engine IDs.

Examples

Set the SNMP engine ID to **123456789A** for the remote entity **10.1.1.1**.

```
<Sysname> system-view
[Sysname] snmp-agent remote 10.1.1.1 engineid 123456789A
```

Related commands

display snmp-agent remote

snmp-agent sys-info contact

Use **snmp-agent sys-info contact** to configure the system contact.

Use **undo snmp-agent sys-info contact** to restore the default contact.

Syntax

snmp-agent sys-info contact *sys-contact*

undo snmp-agent sys-info contact

Default

The system contact is **New H3C Technologies Co., Ltd.**.

Views

System view

Predefined user roles

network-admin

Parameters

sys-contact: Specifies the system contact, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure the system contact for system maintenance and management.

Examples

Configure the system contact as **Dial System Operator # 27345**.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info contact Dial System Operator # 27345
```

Related commands

display snmp-agent sys-info

snmp-agent sys-info location

Use **snmp-agent sys-info location** to configure the system location.

Use **undo snmp-agent sys-info location** to restore the default location.

Syntax

snmp-agent sys-info location *sys-location*

undo snmp-agent sys-info location

Default

The system location is **Hangzhou, China**.

Views

System view

Predefined user roles

network-admin

Parameters

sys-location: Specifies the system location, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure the location of the device for system maintenance and management.

Examples

Configure the system location as **Room524-row1-3**.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info location Room524-row1-3
```

Related commands

display snmp-agent sys-info

snmp-agent sys-info version

Use **snmp-agent sys-info version** to enable SNMP versions.

Use **undo snmp-agent sys-info version** to disable SNMP versions.

Syntax

In non-FIPS mode:

snmp-agent sys-info contact version { **all** | { **v1** | **v2c** | **v3** } * }

undo snmp-agent sys-info version { **all** | { **v1** | **v2c** | **v3** } * }

In FIPS mode:

snmp-agent sys-info version v3

undo snmp-agent sys-info version v3

Default

SNMPv3 is enabled.

Views

System view

Predefined user roles

network-admin

Parameters

all: Specifies SNMPv1, SNMPv2c, and SNMPv3.

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

Usage guidelines

SNMPv1 and SNMPv2c settings in this command are not supported in FIPS mode.

Configure the SNMP agent with the same SNMP version as the NMS for successful communications between them.

To use SNMP notifications in IPv6, enable SNMPv2c or SNMPv3.

Examples

Enable SNMPv3.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v3
```

Related commands

display snmp-agent sys-info

snmp-agent target-host

Use **snmp-agent target-host** to configure an SNMP notification target host.

Use **undo snmp-agent target-host** to remove an SNMP notification target host.

Syntax

In non-FIPS mode:

snmp-agent target-host inform address udp-domain { *ipv4-target-host* | **ipv6** *ipv6-target-host* } [**udp-port** *port-number*] **params securityname** *security-string* { **v2c** | **v3** [**authentication** | **privacy**] }

snmp-agent target-host trap address udp-domain { *ipv4-target-host* | **ipv6** *ipv6-target-host* } [**udp-port** *port-number*] [**dscp** *dscp-value*] **params securityname** *security-string* [**v1** | **v2c** | **v3** [**authentication** | **privacy**]]

undo snmp-agent target-host { **trap** | **inform** } **address udp-domain** { *ipv4-target-host* | **ipv6** *ipv6-target-host* } **params securityname** *security-string*

In FIPS mode:

snmp-agent target-host inform address udp-domain { *ipv4-target-host* | **ipv6** *ipv6-target-host* } [**udp-port** *port-number*] **params securityname** *security-string* **v3** { **authentication** | **privacy** }

snmp-agent target-host trap address udp-domain { *ipv4-target-host* | **ipv6** *ipv6-target-host* } [**udp-port** *port-number*] [**dscp** *dscp-value*] **params securityname** *security-string* **v3** { **authentication** | **privacy** }

undo snmp-agent target-host { **trap** | **inform** } **address udp-domain** { *ipv4-target-host* | **ipv6** *ipv6-target-host* } **params securityname** *security-string*

Default

No SNMP notification target hosts exist.

Views

System view

Predefined user roles

network-admin

Parameters

inform: Specifies a host that receives informs.

trap: Specifies a host that receives traps.

address: Specifies the destination address of SNMP notifications.

udp-domain: Specifies UDP as the transport protocol.

ipv4-target-host: Specifies a target host by its IPv4 address or host name. The host name is a case-insensitive string of 1 to 253 characters. The string can only contain letters, numbers, hyphens (-), underscores (_), and dots (.). If you specify a host name, the IPv4 address of the target host can be obtained.

ipv6 *ipv6-target-host*: Specifies a target host by its IPv6 address or host name. The host name is a case-insensitive string of 1 to 253 characters, which only contains letters, numbers, hyphens (-), underscores (_), and dots (.). If you specify a host name, the IPv6 address of the target host can be obtained. If you specify an IPv6 address, the address cannot be a link local address.

udp-port *port-number*: Specifies the UDP port for SNMP notifications. The default port number is 162.

dscp-value: Sets the DSCP value for traps sent to the target host, in the range of 0 to 63. The DSCP value is encapsulated in the ToS field of an IP packet. It specifies the priority level of the packet and affects the transmission priority of the packet. A greater DSCP value represents a higher priority. The default DSCP value for traps is 0.

params securityname *security-string*: Specifies the authentication parameter. The *security-string* argument specifies an SNMPv1 or SNMPv2c community name or an SNMPv3 username, a case-sensitive string of 1 to 32 characters.

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

- **authentication**: Specifies the security model to be authentication without privacy. You must specify the authentication key when you create the SNMPv3 user.
- **privacy**: Specifies the security model to be authentication with privacy. You must specify the authentication key and encryption key when you create the SNMPv3 user.

Usage guidelines

You can specify multiple SNMP notification target hosts.

Make sure the SNMP agent uses the same UDP port for SNMP notifications as the target host. Typically, NMSs, for example, IMC and MIB Browser, use port 162 for SNMP notifications as defined in the SNMP protocols.

If none of the keywords **v1**, **v2c**, or **v3** is specified, SNMPv1 is used. Make sure the SNMP agent uses the same SNMP version as the target host so the host can receive the notification.

If neither **authentication** nor **privacy** is specified, the security model is no authentication, no privacy.

Examples

Configure the SNMP agent to send SNMPv3 traps to 10.1.1.1 by using the username **public**.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable standard
```

```
[Sysname] snmp-agent target-host trap address udp-domain 10.1.1.1 params securityname
public v3
```

Related commands

snmp-agent { **inform** | **trap** } **source**

snmp-agent trap enable

snmp-agent trap life

snmp-agent trap enable

Use **snmp-agent trap enable** to enable SNMP notifications.

Use **undo snmp-agent trap enable** to disable SNMP notifications.

Syntax

snmp-agent trap enable [**configuration** | *protocol* | **standard** [**authentication** | **coldstart** | **linkdown** | **linkup** | **warmstart**] * | **system**]

undo snmp-agent trap enable [**configuration** | *protocol* | **standard** [**authentication** | **coldstart** | **linkdown** | **linkup** | **warmstart**] * | **system**]

Default

SNMP configuration notifications, standard notifications, and system notifications are enabled. Whether other SNMP notifications are enabled varies by module.

Views

System view

Predefined user roles

network-admin

Parameters

configuration: Specifies configuration notifications. If configuration notifications are enabled, the system checks the running configuration and the startup configuration every 10 minutes for any change and generates a notification for the most recent change.

protocol: Specifies protocol module notifications. You can use the **snmp-agent trap enable ?** command to obtain the value of this argument. For more information about this argument, see the command reference for each module.

standard: Specifies SNMP standard notifications.

Table 13 Standard SNMP notifications

Keyword	Definition
authentication	Authentication failure notification sent when an NMS fails to be authenticated by the SNMP agent.
coldstart	Notification sent when the device restarts.
linkdown	Notification sent when the link of a port goes down.
linkup	Notification sent when the link of a port comes up.
warmstart	Notification sent when the SNMP agent restarts.

system: Specifies system notifications sent when the system time is modified, the system reboots, or the main system software image is not available.

Usage guidelines

To report critical protocol events to an NMS, first enable the protocol and then enable SNMP notifications for the protocol.

To use SNMP notifications in IPv6, enable SNMPv2c or SNMPv3.

For SNMP notifications to be sent correctly, you must also configure the notification sending parameters as required.

If no optional parameters are specified, this command or its **undo** form enables or disables all SNMP notifications supported by the device.

Examples

Enable the SNMP agent to send SNMP authentication failure notifications.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable standard authentication
```

Related commands

snmp-agent sys-info version

snmp-agent target-host

snmp-agent trap if-mib link extended

Use **snmp-agent trap if-mib link extended** to configure the SNMP agent to send extended linkUp/linkDown notifications.

Use **undo snmp-agent trap if-mib link extended** to restore the default.

Syntax

snmp-agent trap if-mib link extended

undo snmp-agent trap if-mib link extended

Default

The SNMP agent sends standard linkUp/linkDown notifications.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Extended linkUp and linkDown notifications add interface description and interface type to the standard linkUp/linkDown notifications for fast failure point identification.

When you use this command, make sure the NMS supports the extended linkup and linkDown notifications.

Examples

Enable extended linkUp/linkDown notifications.

```
<Sysname> system-view
[Sysname] snmp-agent trap if-mib link extended
```

snmp-agent trap life

Use **snmp-agent trap life** to set the lifetime of notifications in the SNMP notification queue.

Use **undo snmp-agent trap life** to restore the default notification lifetime.

Syntax

snmp-agent trap life *seconds*

undo snmp-agent trap life

Default

The SNMP notification lifetime is 120 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

seconds: Sets a lifetime in the range of 1 to 2592000, in seconds.

Usage guidelines

When congestion occurs, the SNMP agent buffers notifications in a queue. The notification lifetime sets how long a notification can stay in the queue. A notification is deleted when its lifetime expires.

Examples

Set the SNMP notification lifetime to 60 seconds.

```
<Sysname> system-view
[Sysname] snmp-agent trap life 60
```

Related commands

snmp-agent target-host

snmp-agent trap enable

snmp-agent trap queue-size

snmp-agent trap log

Use **snmp-agent trap log** to enable SNMP notification logging.

Use **undo snmp-agent trap log** to disable SNMP notification logging.

Syntax

snmp-agent trap log

undo snmp-agent trap log

Default

SNMP notification logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use SNMP notification logging to record SNMP notifications sent by the SNMP agent for notification tracking. The SNMP agent sends the logs to the information center. You can configure the information center to output the logs to a destination as needed.

Examples

Enable SNMP notification logging.

```
<Sysname> system-view
[Sysname] snmp-agent trap log
```

snmp-agent trap queue-size

Use **snmp-agent trap queue-size** to set the SNMP notification queue size.

Use **undo snmp-agent trap queue-size** to restore the default queue size.

Syntax

snmp-agent trap queue-size *size*

undo snmp-agent trap queue-size

Default

The SNMP notification queue can store a maximum of 100 notifications.

Views

System view

Predefined user roles

network-admin

Parameters

size: Specifies the maximum number of notifications that the SNMP notification queue can hold. The value range is 1 to 1000.

Usage guidelines

When congestion occurs, the SNMP agent buffers notifications in a queue. SNMP notification queue size sets the maximum number of notifications that this queue can hold.

When the queue size is reached, the system discards the new notification it receives.

If modification of the queue size causes the number of notifications in the queue to exceed the queue size, the oldest notifications are dropped for new notifications.

Examples

Set the SNMP notification queue size to 200.

```
<Sysname> system-view
[Sysname] snmp-agent trap queue-size 200
```

Related commands

snmp-agent target-host

snmp-agent trap enable

snmp-agent usm-user { v1 | v2c }

Use **snmp-agent usm-user { v1 | v2c }** to create an SNMPv1 or SNMPv2c user.

Use **undo snmp-agent usm-user { v1 | v2c }** to delete an SNMPv1 or SNMPv2c user.

Syntax

snmp-agent usm-user { **v1** | **v2c** } *user-name group-name* [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent usm-user { **v1** | **v2c** } *user-name*

Default

No SNMPv1 or SNMPv2c users exist.

Views

System view

Predefined user roles

network-admin

Parameters

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

user-name: Specifies an SNMP username, a case-sensitive string of 1 to 32 characters.

group-name: Specifies an SNMPv1 or SNMPv2c group name, a case-sensitive string of 1 to 32 characters. The group can be one that has been created or not. The user takes effect only after you create the group.

acl: Specifies a basic or advanced IPv4 ACL for the user.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the user.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

This command is not available in FIPS mode.

Only users with the network-admin or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

On an SNMPv1 or SNMPv2c network, NMSs and agents authenticate each other by using the community name. On an SNMPv3 network, NMSs and agents authenticate each other by using the username.

You can create an SNMPv1 or SNMPv2c community by using either of the following ways:

- Execute the **snmp-agent community** command.
- Execute the **snmp-agent usm-user** { **v1** | **v2c** } and **snmp-agent group** { **v1** | **v2c** } commands to create an SNMPv1 or SNMPv2c user and the group that the user is assigned to. The system automatically creates an SNMP community by using the SNMPv1 or SNMPv2c username.

The **display snmp-agent community** command displays information only about communities created and saved in plaintext form.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If you do not specify an ACL, the specified ACL does not exist, or the specified ACL does not have any rules, all NMSs that use the username can access the SNMP agent.
- If you have specified an ACL and the ACL has rules, only the NMSs permitted by the ACL can access the agent.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

Add the user **userv2c** to the SNMPv2c group **readCom** so an NMS can use the protocol SNMPv2c and the read-only community name **userv2c** to access the device.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent group v2c readCom
[Sysname] snmp-agent usm-user v2c userv2c readCom
```

Add the user **userv2c** in the SNMPv2c group **readCom** so only the NMS at 1.1.1.1 can use the protocol SNMPv2c and read-only community name **userv2c** to access the device.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0.0.0.0
[Sysname-acl-ipv4-basic-2001] rule deny source any
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent group v2c readCom
[Sysname] snmp-agent usm-user v2c userv2c readCom acl 2001
```

Add the user **userv2c** in the SNMPv2c group **readCom** so only the NMS at 1.1.1.2 can use the protocol SNMPv2c and read-only community name **userv2c** to access the device.

```
[Sysname] acl basic name testacl
[Sysname-acl-ipv4-basic-testacl] rule permit source 1.1.1.2 0.0.0.0
[Sysname-acl-ipv4-basic-testacl] rule deny source any
[Sysname-acl-ipv4-basic-testacl] quit
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent group v2c readCom
[Sysname] snmp-agent usm-user v2c userv2c readCom acl name testacl
```

  undo snmp-agent usm-user v3 *user-name* { **local** | **engineid** *engineid-string* | **remote** { *ipv4-address* | **ipv6** *ipv6-address* } }

- In RBAC mode:

  snmp-agent usm-user v3 *user-name* **user-role** *role-name* [**remote** { *ipv4-address* | **ipv6** *ipv6-address* }] [{ **cipher** | **simple** } **authentication-mode sha** *auth-password* [**privacy-mode** { **aes128** | **aes192** | **aes256** } *priv-password*]] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

  undo snmp-agent usm-user v3 *user-name* { **local** | **engineid** *engineid-string* | **remote** { *ipv4-address* | **ipv6** *ipv6-address* } }

Default

No SNMPv3 users exist.

Views

System view

Predefined user roles

network-admin

Parameters

user-name: Specifies an SNMPv3 username, a case-sensitive string of 1 to 32 characters.

group-name: Specifies an SNMPv3 group name, a case-sensitive string of 1 to 32 characters. The group can be one that has been created or not. The user takes effect only after you create the group.

user-role *role-name*: Specifies a user role name, a case-sensitive string of 1 to 63 characters.

remote { *ipv4-address* | **ipv6** *ipv6-address* }: Specifies a target host by its IPv4 or IPv6 address, typically the NMS, to receive the notifications. To send SNMPv3 notifications to a target host, you need to specify this option and use the **snmp-agent remote** command to bind the IPv4 or IPv6 address to the remote engine ID.

cipher: Specifies an authentication key and an encryption key in encrypted form. The keys will be converted to a digest in encrypted form and stored in the device.

simple: Specifies an authentication key and an encryption key in plaintext from. The keys will be converted to a digest in encrypted form and stored in the device.

authentication-mode: Specifies an authentication algorithm. If you do not specify the keyword, the system does not perform authentication. For more information about authentication algorithms, see IPSec configuration in *Security Configuration Guide*.

- **md5**: Specifies the HMAC-MD5 authentication algorithm.
- **sha**: Specifies the HMAC-SHA1 authentication algorithm.

auth-password: Specifies an authentication key. This argument is case sensitive.

- The plaintext form of the key in non-FIPS mode is a string of 1 to 64 characters. The plaintext form of the key in FIPS mode is a string of 15 to 64 characters, which must contain numbers, uppercase letters, lowercase letters, and special characters.
- The encrypted form of the key can be calculated by using the **snmp-agent calculate-password** command.

privacy-mode: Specifies an encryption algorithm. If you do not specify this keyword, the system does not perform encryption.

- **3des**: Specifies the 3DES encryption algorithm that uses a 168-bit key.
- **aes128**: Specifies the AES encryption algorithm that uses a 128-bit key.
- **aes192**: Specifies the AES encryption algorithm that uses a 192-bit key.
- **aes256**: Specifies the AES encryption algorithm that uses a 256-bit key.
- **des56**: Specifies the DES encryption algorithm that uses a 56-bit key.

priv-password: Specifies an encryption key. This argument is case sensitive.

- The plaintext form of the key in non-FIPS mode is a string of 1 to 64 characters. The plaintext form of the key in FIPS mode is a string of 15 to 64 characters, which must contain numbers, uppercase letters, lowercase letters, and special characters.
- The encrypted form of the key can be calculated by using the **snmp-agent calculate-password** command.

acl: Specifies a basic or advanced IPv4 ACL for the user.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the user.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

local: Specifies the local SNMP engine. By default, an SNMPv3 user is associated with the local SNMP engine.

engineid *engineid-string*: Specifies an SNMP engine ID. The *engineid-string* argument is an even number of hexadecimal characters. All-zero and all-F strings are invalid. The even number is in the range of 10 to 64. If you change the local engine ID, the existing SNMPv3 users and keys become invalid. To delete an invalid username, specify the engine ID associated with the username in the **undo snmp-agent usm-user v3** command.

Usage guidelines

Only users with the network-admin or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

You can use either of the following modes to control SNMPv3 user access to MIB objects.

- **VACM**—Controls user access to MIB objects by assigning the user to an SNMP group. To make sure the user takes effect, make sure the group has been created. An SNMP group contains one or multiple users and specifies the MIB views and security model for the users. The authentication and encryption algorithms for each user are specified when they are created.
- **RBAC**—Controls user access to MIB objects by assigning user roles to the user. A user role specifies the MIB objects accessible to the user and the operations that the user can perform on the objects. After you create a user in RBAC mode, you can use the **snmp-agent usm-user v3 user-role** command to assign more user roles to the user. You can assign a maximum of 64 user roles to a user.

RBAC mode controls access on a per MIB object basis, and VACM mode controls access on a MIB view basis. As a best practice to enhance MIB security, use RBAC mode.

You can execute the **snmp-agent usm-user v3** command multiple times to create different SNMPv3 users in VACM mode. If you do not change the username each time, the most recent configuration takes effect.

You can execute the **snmp-agent usm-user v3** command in RBAC mode multiple times to assign different user roles to an SNMPv3 user. The following restrictions and guidelines apply:

- If you specify only user roles but do not change any other settings each time, the **snmp-agent usm-user v3** command assigns different user roles to the user. Other settings remain unchanged.
- If you specify user roles and also change other settings each time, the **snmp-agent usm-user v3** command assigns different user roles to the user. The most recent configuration for other settings takes effect.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs from accessing the agent. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If you do not specify an ACL, the specified ACL does not exist, or the specified ACL does not have any rules, all NMSs that use the username can access the SNMP agent.
- If you have specified an ACL and the ACL has rules, only the NMSs permitted by the ACL can access the agent.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

In VACM mode:

Add user **testUser** to SNMPv3 group **testGroup**, and enable authentication for the group. Specify authentication algorithm **HMAC-SHA1** and plaintext-form authentication key **123456TESTplat&!** for the user.

```
<Sysname> system-view
[Sysname] snmp-agent group v3 testGroup authentication
[Sysname] snmp-agent usm-user v3 testUser testGroup simple authentication-mode sha
123456TESTplat&!
```

For an NMS to access the MIB objects in the default view **ViewDefault**, make sure the following configurations on the NMS are the same as the SNMP agent:

- SNMPv3 username.
- SNMP protocol version.
- Authentication algorithm and key.

Add user **testUser** to SNMPv3 group **testGroup**, and enable authentication and encryption for the group. Specify authentication algorithm **HMAC-SHA1**, encryption algorithm **AES**, plaintext-form authentication key **123456TESTauth&!**, and plaintext-form encryption key **123456TESTencr&!** for the user.

```
<Sysname> system-view
[Sysname] snmp-agent group v3 testGroup privacy
[Sysname] snmp-agent usm-user v3 testUser testGroup simple authentication-mode sha
123456TESTauth&! privacy-mode aes128 123456TESTencr&!
```

For an NMS to access the MIB objects in the default view **ViewDefault**, make sure the following configurations on the NMS are the same as the SNMP agent:

- SNMPv3 username.
- SNMP protocol version.
- Authentication algorithm.
- Privacy algorithm.
- Plaintext authentication and encryption keys.

Add user **remoteUser** for the SNMP remote engine at 10.1.1.1 to SNMPv3 group **testGroup**, and enable authentication and encryption for the group. Specify authentication algorithm **HMAC-SHA1**, encryption algorithm **AES**, plaintext-form authentication key **123456TESTauth&!**, and plaintext-form encryption key **123456TESTencr&!** for the user.

```
<Sysname> system-view
[Sysname] snmp-agent remote 10.1.1.1 engineid 123456789A
[Sysname] snmp-agent group v3 testGroup privacy
[Sysname] snmp-agent usm-user v3 remoteUser testGroup remote 10.1.1.1 simple
authentication-mode sha 123456TESTauth&! privacy-mode aes128 123456TESTencr&!
```

In RBAC mode:

Create SNMPv3 user **testUser** with user role **network-operator** and enable authentication for the user. Specify authentication algorithm **HMAC-SHA1** and plaintext-form authentication key **123456TESTplat&!** for the user.

```
<Sysname> system-view
[Sysname] snmp-agent usm-user v3 testUser user-role network-operator simple
authentication-mode sha 123456TESTplat&!
```

For an NMS to have read-only access to all MIB objects, make sure the following configurations on the NMS are the same as the SNMP agent:

- SNMPv3 username.

- SNMP protocol version.
- Authentication algorithm and key.

display snmp-agent usm-user

snmp-agent calculate-password

snmp-agent group

snmp-agent remote

snmp-agent usm-user v3 user-role

snmp-agent usm-user v3 user-role

Use **snmp-agent usm-user v3 user-role** to assign a user role to an SNMPv3 user created in RBAC mode.

Use **undo snmp-agent usm-user user-role** to remove a user role.

Syntax

snmp-agent usm-user v3 *user-name* **user-role** *role-name*

undo snmp-agent usm-user v3 *user-name* **user-role** *role-name*

Default

An SNMPv3 user has the user role assigned to it at its creation.

Views

System view

Predefined user roles

network-admin

Parameters

user-name: Specifies an SNMPv3 username, a case-sensitive string of 1 to 32 characters.

user-role *role-name*: Specifies a user role name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can assign a maximum of 64 user roles to an SNMPv3 user.

An SNMPv3 user must have a minimum of one user role.

Examples

Assign the user role **network-admin** to the SNMPv3 user **testUser**.

```
<Sysname> system-view
[Sysname] snmp-agent usm-user v3 testUser user-role network-admin
```

RMON commands

display rmon alarm

Use **display rmon alarm** to display information about RMON alarm entries.

Syntax

display rmon alarm [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

entry-number: Specifies an alarm entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays all RMON alarm entries.

Examples

Display information about all RMON alarm entries.

```
<Sysname> display rmon alarm
AlarmEntry 1 owned by user1 is VALID.
  Sample type                    : absolute
  Sampled variable               : 1.3.6.1.2.1.16.1.1.1.4.1<etherStatsOctets.1>
  Sampling interval (in seconds) : 10
  Rising threshold               : 50(associated with event 1)
  Falling threshold              : 5(associated with event 2)
  Alarm sent upon entry startup  : risingOrFallingAlarm
  Latest value                   : 0
```

Table 1 Command output

Field	Description

AlarmEntry *entry-number* owned by *owner* is *status*.	Alarm entry owner and status:
	• *entry-number*—Alarm entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default.
	The **display rmon alarm** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Sample type	Sample type: • absolute. • delta.

Field	Description
Sampled variable	Monitored variable.
Sampling interval	Interval (in seconds) at which data is sampled.
Rising threshold	Alarm rising threshold.
associated with event	Event index associated with the alarm..
Falling threshold	Alarm falling threshold.
Alarm sent upon entry startup	Alarm that can be generated at the first sampling: • **risingAlarm**. • **fallingAlarm**. • **risingOrFallingAlarm**. The default is **risingOrFallingAlarm**.
Latest value	Most recent sampled value.

Related commands

rmon alarm

display rmon event

Use **display rmon event** to display information about RMON event entries.

Syntax

display rmon event [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

entry-number: Specifies an event entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays all event entries.

Usage guidelines

An event entry includes the following information:

- Event index.
- Event owner.
- Event description.
- Action triggered by the event (such as logging the event or sending an SNMP notification).
- Last time when the event occurred (seconds that elapsed since the system startup).

Examples

Display information about all RMON event entries.

```
<Sysname> display rmon event
EventEntry 1 owned by user1 is VALID.
  Description: N/A
```

```
Community: Security
Take the action log-trap when triggered, last triggered at 0days 00h:02m:27s uptime.
```

Table 2 Command output

Field	Description

EventEntry *entry-number* owned by *owner* is *status*.	Event entry owner and status:
	• *entry-number*—Event entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default.
	The **display rmon event** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Description	Event description.
Community	SNMP community name for the RMON event.
Take the action *action* when triggered	Actions that the system takes when the event is triggered: • **none**—Takes no action. • **log**—Logs the event. • **trap**—Sends an SNMP notification. • **log-trap**—Logs the event and sends an SNMP notification.
last triggered at *time* uptime	Last time when the event occurred, which is represented as the amount of time that elapsed since the system startup.

Related commands

rmon event

display rmon eventlog

Use **display rmon eventlog** to display information about event log entries.

Syntax

display rmon eventlog [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

entry-number: Specifies an event entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays log entries for all event entries.

Usage guidelines

If the log action is specified for an event, the system adds a record in the event log table each time the event occurs. Each record contains the log entry index, time when the event was logged (the amount of time that elapsed since system startup), and event description.

The system can maintain a maximum of 10 records for an event. The most recent record replaces the oldest record if the number of records reaches 10.

Examples

Display the RMON log for event entry **99**.

```
<Sysname> display rmon eventlog 99
EventEntry 99 owned by ww is VALID.
  LogEntry 99.1 created at 50days 08h:54m:44s uptime.
  Description: The 1.3.6.1.2.1.16.1.1.1.4.5 defined in alarmEntry 77,
     uprise 16760000 with alarm value 16776314. Alarm sample type is absolute.
  LogEntry 99.2 created at 50days 09h:11m:13s uptime.
  Description: The 1.3.6.1.2.1.16.1.1.1.4.5 defined in alarmEntry 77,
     less than(or =) 20000000 with alarm value 16951648. Alarm sample type is absolute.
  LogEntry 99.3 created at 50days 09h:18m:43s uptime.
  Description: The alarm formula defined in prialarmEntry 777,
     less than(or =) 15000000 with alarm value 14026493. Alarm sample type is absolute.
  LogEntry 99.4 created at 50days 09h:23m:28s uptime.
  Description: The alarm formula defined in prialarmEntry 777,
     uprise 17000000 with alarm value 17077846. Alarm sample type is absolute.
```

This example shows that the event log table has four records for event 99:

- Two records were created when event 99 was triggered by alarm entry 77.
- Two records were created when event 99 was triggered by private alarm entry 777.

Table 3 Command output

Field	Description

EventEntry *entry-number* owned by *owner* is *status*.	Event log entry owner and status:
	• *entry-number*—Event log entry index, which is the same as the event entry index for which this log entry is generated.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid (default value).
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All event log entries are valid by default.
	The **display rmon eventlog** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

LogEntry *entry-number* created at *created-time* uptime.	Time when an event record was created: • *entry-number*—Event record index, represented as logEventIndex.logIndex, where logEventIndex and logIndex are MIB objects. A record index uniquely identifies a record among all records for the event. • *created-time*—Time when the event entry was created.
Description	Record description.

Related commands

rmon event

display rmon history

Use **display rmon history** to display RMON history control entries and history samples of Ethernet statistics for Ethernet interfaces.

Syntax

display rmon history [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type i*nterface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays history samples for all interfaces that have an RMON history control entry.

Usage guidelines

RMON uses the etherHistoryTable object to store the history samples of Ethernet statistics for Ethernet interfaces.

To collect history samples for an Ethernet interface, you must first create a history control entry on the interface.

To configure the number of history samples that can be displayed and the history sampling interval, use the **rmon history** command.

Examples

Display the RMON history control entry and history samples for GigabitEthernet 1/0/1.

```
<Sysname> display rmon history gigabitethernet 1/0/1
HistoryControlEntry 6 owned by user1 is VALID.
  Sampled interface     : GigabitEthernet1/0/1<ifIndex.117>
  Sampling interval     : 8(sec) with 3 buckets max
  Sampling record 1 :
    dropevents        : 0         , octets               : 5869
    packets           : 54        , broadcast packets    : 9
    multicast packets : 23        , CRC alignment errors : 0
    undersize packets : 0         , oversize packets     : 0
    fragments         : 0         , jabbers              : 0
    collisions        : 0         , utilization          : 0
```

Table 4 Command output

Field	Description

HistoryControlEntry *entry-number* owned by *owner* is *status*.	Status and owner of the history control entry:
	• *entry-number*—History control entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All history control entries created from the CLI are valid by default.
	The **`display rmon history`** command can display invalid entries, but the **`display current-configuration`** and **`display this`** commands do not display their settings.

Sampled Interface	Sampled interface.
Sampling interval	Sampling interval in seconds.
buckets max	Maximum number of samples that can be saved for the history control entry. If the expected bucket size specified with the **`rmon history`** command exceeds the available history table size, RMON sets the bucket size as closely to the expected bucket size as possible. If the bucket has been full, RMON overwrites the oldest sample with the new sample.
Sampling record	History sample index.
dropevents	Total number of events in which packets were dropped during the sampling interval. **NOTE:** This statistic is the number of times that a drop condition occurred. It is not necessarily the total number of dropped packets.
octets	Total number of octets received during the sampling interval.
packets	Total number of packets (including bad packets) received during the sampling interval.
broadcast packets	Number of broadcast packets received during the sampling interval.
multicast packets	Number of multicast packets received during the sampling interval.
CRC alignment errors	Number of packets received with CRC alignment errors during the sampling interval.
undersize packets	Number of undersize packets received during the sampling interval. Undersize packets are shorter than 64 octets (excluding framing bits but including FCS octets).
oversize packets	Number of oversize packets received during the sampling interval. An oversize packet is a packet that exceeds the maximum frame length (excluding framing bits but including FCS octets) specified by the **jumboframe enable** command. For more information about the **jumboframe enable** command, see Ethernet interfaces in *Interface Command Reference*.
fragments	Number of undersize packets with CRC errors received during the sampling interval.
jabbers	Number of oversize packets with CRC errors received during the sampling interval.
collisions	Number of colliding packets received during the sampling interval.

Field	Description
utilization	Bandwidth utilization (in hundreds of a percent) during the sampling period.

Related commands

rmon history

display rmon prialarm

Use **display rmon prialarm** to display information about RMON private alarm entries.

Syntax

display rmon prialarm [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

entry-number: Specifies an alarm entry index in the range of 1 to 65535. If you do not specify an entry, the command displays all private alarm entries.

Examples

Display information about all RMON private alarm entries.

```
<Sysname> display rmon prialarm
PrialarmEntry 1 owned by user1 is VALID.
  Sample type                    : absolute
  Variable formula          : (.1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1)
  Description                    : ifUtilization.GigabitEthernet1/0/1
  Sampling interval (in seconds) : 10
  Rising threshold               : 80(associated with event 1)
  Falling threshold              : 5(associated with event 2)
  Alarm sent upon entry startup  : risingOrFallingAlarm
  Entry lifetime                 : forever
  Latest value                   : 85
```

Table 5 Command output

Field	Description

PrialarmEntry *entry-number* owned by *owner* is *status*.	Alarm entry owner and status:
	• *entry-number*—Alarm entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default.
	The **display rmon prialarm** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Sample type	Sample type: • absolute. • delta.
Variable formula	Variable formula.
Description	Description of the alarm.
Sampling interval	Interval (in seconds) at which data is sampled.
Rising threshold	Alarm rising threshold.
Falling threshold	Alarm falling threshold.
associated with event	Event index associated with the alarm..
Alarm sent upon entry startup	Alarm that can be generated at the first sampling: • **risingAlarm**. • **fallingAlarm**. • **risingOrFallingAlarm**. The default is **risingOrFallingAlarm**.
Entry lifetime	Lifetime of the entry. • If the lifetime is set to **forever**, the entry never expires. • If the lifetime is set to an amount of time, the entry is removed when the timer expires.
Latest value	Most recent sampled value.

Related commands

rmon prialarm

display rmon statistics

Use **display rmon statistics** to display RMON statistics.

Syntax

display rmon statistics [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, the command displays RMON statistics for all interfaces.

Usage guidelines

This command displays the cumulative interface statistics for the period from the time the statistics entry was created to the time the command was executed. The statistics are cleared when the device reboots.

Examples

Display RMON statistics for GigabitEthernet 1/0/1.

```
<Sysname> display rmon statistics gigabitethernet 1/0/1
EtherStatsEntry 1 owned by user1 is VALID.
  Interface : GigabitEthernet1/0/1<ifIndex.3>
  etherStatsOctets         : 43393306  , etherStatsPkts          : 619825
  etherStatsBroadcastPkts  : 503581    , etherStatsMulticastPkts : 44013
  etherStatsUndersizePkts  : 0         , etherStatsOversizePkts  : 0
  etherStatsFragments      : 0         , etherStatsJabbers       : 0
  etherStatsCRCAlignErrors : 0         , etherStatsCollisions    : 0
  etherStatsDropEvents (insufficient resources): 0
  Incoming packets by size:
  64     : 0         ,  65-127  : 0         ,  128-255  : 0
  256-511: 0         ,  512-1023: 0         ,  1024-1518: 0
```

Table 6 Command output

Field	Description

EtherStatsEntry *entry-number* owned by *owner* is *status*.	Statistics entry owner and status:
	• *entry-number*—Statistics entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default.
	The **display rmon statistics** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Interface	Interface on which statistics are gathered.
etherStatsOctets	Total number of octets received on the interface.
etherStatsPkts	Total number of packets received on the interface.
etherStatsBroadcastPkts	Total number of broadcast packets received on the interface.
etherStatsMulticastPkts	Total number of multicast packets received on the interface.
etherStatsUndersizePkts	Total number of undersize packets received on the interface.

Field	Description
etherStatsOversizePkts	Total number of oversize packets received on the interface. An oversize packet is a packet that exceeds the maximum frame length (excluding framing bits but including FCS octets) specified by the **jumboframe enable** command. For more information about the **jumboframe enable** command, see Ethernet interfaces in *Interface Command Reference*.
etherStatsFragments	Total number of undersize packets received with CRC errors on the interface.
etherStatsJabbers	Total number of oversize packets received with CRC errors on the interface.
etherStatsCRCAlignErrors	Total number of packets received with CRC errors on the interface.
etherStatsCollisions	Total number of colliding packets received on the interface.
etherStatsDropEvents	Total number of events in which packets were dropped. **NOTE:** This statistic is the number of times that a drop condition occurred. It is not necessarily the total number of dropped packets.
Incoming packets by size:	Incoming-packet statistics by packet length: • **64**—Number of packets with a length equal to 64 bytes. • **65-127**—Number of 65- to 127-byte packets. • **128-255**—Number of 128- to 255-byte packets. • **256-511**—Number of 256- to 511-byte packets. • **512-1023**—Number of 512- to 1023-byte packets. • **1024-1518**—Number of 1024- to 1518-byte packets.

Related commands

rmon statistics

rmon alarm

Use **rmon alarm** to create an RMON alarm entry.

Use **undo rmon alarm** to remove an RMON alarm entry.

Syntax

rmon alarm *entry-number alarm-variable sampling-interval* { **absolute** | **delta** } [**startup-alarm** { **falling** | **rising** | **rising-falling** }] **rising-threshold** *threshold-value1 event-entry1* **falling-threshold** *threshold-value2 event-entry2* [**owner** *text*]

undo rmon alarm *entry-number*

Default

No RMON alarm entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

entry-number: Specifies an alarm entry index in the range of 1 to 65535.

alarm-variable: Specifies an alarm variable, a string of 1 to 255 characters. You can only specify variables that can be parsed as an ASN.1 INTEGER value (INTEGER, INTEGER32, Unsigned32, Counter32, Counter64, Gauge, or TimeTicks) for the *alarm-variable* argument. The alarm variables must use one of the formats in Table 7.

Table 7 Alarm variable formats

Format	Examples
Dotted OID format: *entry.integer.instance*	1.3.6.1.2.1.2.1.10.1
Object name.instance	etherStatsOctets.1 etherStatsPkts.1 etherStatsBroadcastPkts.1 ifInOctets.1 ifInUcastPkts.1 ifInNUcastPkts.1

sampling-interval: Sets the sampling interval in the range of 5 to 65535 seconds.

absolute: Specifies absolute sampling. RMON compares the value of the variable with the rising and falling thresholds.

delta: Specifies delta sampling. RMON subtracts the value of the variable at the previous sample from the current sampled value, and then compares the difference with the rising and falling thresholds.

startup-alarm: Specifies alarms that can be generated at the first sampling when a rising or falling threshold is reached or exceeded. By default, a **rising-falling** alarm is generated.

rising: Generates a rising alarm.

falling: Generates a falling alarm.

rising-falling: Generates a rising or falling alarm.

rising-threshold *threshold-value1 event-entry1*: Sets the rising threshold. The *threshold-value1* argument represents the rising threshold in the range of –2147483648 to 2147483647. The *event-entry1* argument represents the index of the event that is triggered when the rising threshold is crossed. The value range for the *event-entry1* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

falling-threshold *threshold-value2 event-entry2*: Sets the falling threshold. The *threshold-value2* argument represents the falling threshold in the range of –2147483648 to 2147483647. The *event-entry2* argument represents the index of the event that is triggered when the falling threshold is crossed. The value range for the *event-entry2* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

You can create a maximum of 60 RMON alarm entries.

Each alarm entry must have a unique alarm variable, sampling interval, sample type, rising threshold, or falling threshold. You cannot create an alarm entry if all these parameters for the entry are the same as an existing entry.

To trigger the event associated with an alarm condition, you must create the event with the **rmon event** command.

RMON samples the monitored alarm variable at the specified sampling interval, compares the sampled value with the predefined thresholds, and performs one of the following operations:

- Triggers the event associated with the rising alarm if the sampled value is equal to or greater than the rising threshold.
- Triggers the event associated with the falling alarm if the sampled value is equal to or less than the falling threshold.

Examples

Create an alarm entry to perform absolute sampling on the number of octets received on GigabitEthernet 1/0/1 (object instance 1.3.6.1.2.1.16.1.1.1.4.1) at 10-seconds intervals. If the sampled value reaches or exceeds 5000, log the rising alarm event. If the sampled value is equal to or less than 5, take no actions.

```
<Sysname> system-view
[Sysname] rmon event 1 log
[Sysname] rmon event 2 none
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] rmon statistics 1
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] rmon alarm 1 1.3.6.1.2.1.16.1.1.1.4.1 10 absolute rising-threshold 5000 1
falling-threshold 5 2 owner user1
```

In this example, you can replace 1.3.6.1.2.1.16.1.1.1.4.1 with etherStatsOctets.1, where 1 is the statistics entry index for the interface. If you execute the **rmon statistics 5** command, you can use etherStatsOctets.5 to replace 1.3.6.1.2.1.16.1.1.1.4.5.

Related commands

display rmon alarm

rmon event

rmon event

Use **rmon event** to create an RMON event entry.

Use **undo rmon event** to remove an RMON event entry.

Syntax

rmon event *entry-number* [**description** *string*] { **log** | **log-trap** *security-string* | **none** | **trap** *security-string* } [**owner** *text*]

undo rmon event *entry-number*

Default

No RMON event entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

entry-number: Specifies an event entry index in the range of 1 to 65535.

description *string*: Configures an event description, a case-sensitive string of 1 to 127 characters.

log: Logs the event .

log-trap: Logs the event and sends an SNMP notification.

security-string: Specifies the SNMP community name carried in the SNMP notifications. The *security-string* argument is a case-sensitive string of 1 to 127 characters and is determined by the SNMP configuration. This argument is supported but does not take effect in the current software version.

none: Performs no action.

trap: Sends an SNMP notification.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

NOTE:

The SNMP community name setting for the *security-string* argument does not take effect even though you can configure it with the command. Instead, the system uses the settings you configure with SNMP when it sends RMON SNMP notifications. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

Usage guidelines

You can create a maximum of 60 event entries.

You can associate an event entry with a standard or private alarm entry to specify the action to take when an alarm condition occurs. Depending on your configuration, the system logs the event, sends an SNMP notification, does both, or does neither.

You can associate an event with multiple alarm entries.

Examples

Create an RMON log event entry. Specify its index as **10** and the entry owner as **user1**.

```
<Sysname> system-view
[Sysname] rmon event 10 log owner user1
```

Related commands

display rmon event

rmon alarm

rmon prialarm

rmon history

Use **rmon history** to create an RMON history control entry.

Use **undo rmon history** to remove an RMON history control entry.

Syntax

rmon history *entry-number* **buckets** *number* **interval** *interval* [**owner** *text*]

undo rmon history *entry-number*

Default

No RMON history control entries exist.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

entry-number: Specifies a history control entry index in the range of 1 to 65535.

buckets *number*: Specifies the expected maximum number of samples to be retained for the entry, in the range of 1 to 65535. RMON can retain a maximum of 50 samples for each history control entry. If the expected bucket size exceeds the available history table size, RMON sets the bucket size as closely to the expected bucket size as is possible. However, the granted bucket size will not exceed 50. For example, the bucket size for a history control entry will be 30 if the expected bucket size is set to 55, but the available bucket size is only 30.

interval *interval*: Specifies the sampling interval in the range of 5 to 3600 seconds.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

The system supports a maximum of 100 history control entries.

If an Ethernet interface has a history control entry, RMON periodically samples packet statistics on the interface and stores the samples to the history table. When the bucket size for the history control entry is reached, RMON overwrites the oldest sample with the most recent sample.

You can create multiple RMON history control entries for an Ethernet interface.

Examples

Create RMON history control entry 1 for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] rmon history 1 buckets 10 interval 5 owner user1
```

Related commands

display rmon history

rmon prialarm

Use **rmon** *prialarm* to create an RMON private alarm entry.

Use **undo rmon** *prialarm* to remove an RMON private alarm entry.

Syntax

rmon prialarm *entry-number prialarm-formula prialarm-des sampling-interval* { **absolute** | **delta** } [**startup-alarm** { **falling** | **rising** | **rising-falling** }] **rising-threshold** *threshold-value1 event-entry1* **falling-threshold** *threshold-value2 event-entry2* **entrytype** { **forever** | **cycle** *cycle-period* } [**owner** *text*]

undo rmon prialarm *entry-number*

Default

No RMON private alarm entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

entry-number: Specifies a private alarm entry index in the range of 1 to 65535.

prialarm-formula: Configures a private alarm variable formula, a string of 1 to 255 characters. The variables in the formula must be represented in OID format that starts with a dot (.), for example, (.1.3.6.1.2.1.2.1.10.1)*8. You can configure a formula to perform the basic math operations of addition, subtraction, multiplication, and division on these variables. To get a correct calculation result, make sure the following conditions are met:

- The values of the variables in the formula are positive integers.
- The result of each calculating step is in the value range for long integers.

prialarm-des: Configures an entry description, a case-sensitive string of 1 to 127 characters.

sampling-interval: Sets the sampling interval in the range of 10 to 65535 seconds.

absolute: Specifies absolute sampling. RMON compares the value of the variable with the rising and falling thresholds.

delta: Specifies delta sampling. RMON subtracts the value of the variable at the previous sample from the current sampled value, and then compares the difference with the rising and falling thresholds.

startup-alarm: Specifies alarms that can be generated at the first sampling when a rising or falling threshold is reached or exceeded. By default, a **rising-falling** alarm is generated.

rising: Generates a rising alarm.

falling: Generates a falling alarm.

rising-falling: Generates a rising or falling alarm.

rising-threshold *threshold-value1 event-entry1*: Sets the rising threshold. The *threshold-value1* argument represents the rising threshold in the range of –2147483648 to 2147483647. The *event-entry1* argument represents the index of the event that is triggered when the rising threshold is crossed. The value range for the *event-entry1* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

falling-threshold *threshold-value2 event-entry2*: Sets the falling threshold. The *threshold-value2* argument represents the falling threshold in the range of –2147483648 to 2147483647. The *event-entry2* argument represents the index of the event that is triggered when the falling threshold is crossed. The value range for the *event-entry2* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

forever: Configures the entry as a permanent entry. RMON retains a permanent private alarm entry until it is manually deleted.

cycle *cycle-period*: Sets the lifetime of the entry, in the range of 0 to 4294967 seconds. RMON deletes the entry when its lifetime expires.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

You can create a maximum of 50 private alarm entries.

Each alarm entry must have a unique alarm variable, sampling interval, sample type, rising threshold, or falling threshold. You cannot create an alarm entry if all these parameters for the entry are the same as an existing entry.

To trigger the event associated with an alarm condition, you must create the event with the **rmon event** command.

The RMON agent samples variables and takes an alarm action based on a private alarm entry as follows:

1. Periodically samples the variables specified in the private alarm formula.
2. Processes the sampled values with the formula.
3. Compares the calculation result with the predefined thresholds, and then takes one of the following actions:
   - Triggers the event associated with the rising alarm event if the result is equal to or greater than the rising threshold.
   - Triggers the event associated with the falling alarm event if the result is equal to or less than the falling threshold.

Examples

Add a permanent private alarm entry to monitor the ratio of incoming broadcasts to the total number of incoming packets on GigabitEthernet 1/0/1. Log the rising alarm event when the ratio exceeds 80%, and take no actions when the ratio drops to 5%. The formula is (1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1), where 1.3.6.1.2.1.16.1.1.1.6.1 is the OID of the object instance etherStatsBroadcastPkts.1, and 1.3.6.1.2.1.16.1.1.1.5.1 is the OID of the object instance etherStatsPkts.1.

```
<Sysname> system-view
[Sysname] rmon event 1 log
[Sysname] rmon event 2 none
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] rmon statistics 1
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] rmon prialarm 1 (.1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1)
BroadcastPktsRatioOfGE1/0/1 10 absolute rising-threshold 80 1 falling-threshold 5 2
entrytype forever owner user1
```

The last number in the OID forms of variables must be the same as the statistics entry index for the interface. For example, if you execute the **rmon statistics 5** command, you must replace 1.3.6.1.2.1.16.1.1.1.6.1 and 1.3.6.1.2.1.16.1.1.1.5.1 with 1.3.6.1.2.1.16.1.1.1.6.5 and 1.3.6.1.2.1.16.1.1.1.5.5, respectively.

Related commands

display rmon prialarm

rmon event

rmon statistics

Use **rmon statistics** to create an RMON statistics entry.

Use **undo rmon statistics** to remove an RMON statistics entry.

Syntax

rmon statistics *entry-number* [**owner** *text*]

undo rmon statistics *entry-number*

Default

No RMON statistics entries exist.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

entry-number: Specifies a statistics entry index in the range of 1 to 65535.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

Each RMON statistics entry provides a set of cumulative traffic statistics collected up to the present time for an interface. Statistics include number of collisions, CRC alignment errors, number of undersize or oversize packets, number of broadcasts, number of multicasts, number of bytes received, and number of packets received. The statistics are cleared at a reboot.

To display the RMON statistics table, use the **display rmon statistics** command.

The index of an RMON statistics entry must be globally unique. If the index has been used by another interface, the creation operation fails.

You can create only one RMON statistics entry for an Ethernet interface.

Examples

Create an RMON statistics entry for GigabitEthernet 1/0/1. The index is 20 and the owner is **user1**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] rmon statistics 20 owner user1
```

Related commands

display rmon statistics

Contents

NETCONF commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

netconf capability specific-namespace

Use **netconf capability specific-namespace** to configure the device to use module-specific namespaces.

Use **undo netconf capability specific-namespace** to restore the default.

Syntax

netconf capability specific-namespace

undo netconf capability specific-namespace

Default

The device uses the common namespace.

Views

System view

Predefined user roles

network-admin

Usage guidelines

NETCONF supports both the common namespace and module-specific namespaces. The common namespace is incompatible with module-specific namespaces. To set up a NETCONF session, the device and the client must use the same type of namespaces. By default, the common namespace is used. If the client does not support the common namespace, use this command to configure the device to use module-specific namespaces.

For this command to take effect, you must reestablish the NETCONF session.

Examples

Configure the device to use module-specific namespaces.

```
<Sysname> system-view
[Sysname] netconf capability specific-namespace
```

netconf idle-timeout

Use **netconf idle-timeout** to set the NETCONF session idle timeout time.

Use **undo netconf idle-timeout** to restore the default.

Syntax

netconf { **soap** | **agent** } **idle-timeout** *minute*

undo netconf { **soap** | **agent** } **idle-timeout**

Default

The NETCONF session idle timeout time is 10 minutes for NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.

The NETCONF session idle timeout time is 0 minutes for NETCONF over SSH sessions, NETCONF over Telnet sessions, and NETCONF over console sessions. The sessions never time out.

Views

System view

Predefined user roles

network-admin

Parameters

soap: Specifies the NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.

agent: Specifies the NETCONF over SSH sessions, NETCONF over Telnet sessions, and NETCONF over console sessions.

minute: Specifies the NETCONF session idle timeout time in minutes. The value range is as follows:

- 1 to 999 for NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.
- 0 to 999 for NETCONF over SSH sessions, NETCONF over Telnet sessions, and NETCONF over console sessions. To disable the timeout feature, set this argument to 0.

Usage guidelines

If no NETCONF packets are exchanged on a NETCONF session within the NETCONF session idle timeout time, the device tears down the session.

Examples

Set the NETCONF session idle timeout time to 20 minutes for NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.

```
<Sysname> system-view
[Sysname] netconf soap idle-timeout 20
```

netconf log

Use **netconf log** to enable NETCONF logging.

Use **undo netconf log** to remove the configuration for the specified NETCONF operation sources and NETCONF operations.

Syntax

netconf log source { **all** | { **agent** | **soap** | **web** } * } { **protocol-operation** { **all** | { **action** | **config** | **get** | **session** | **set** | **syntax** | **others** } * } | **row-operation** | **verbose** }

undo netconf log source { **all** | { **agent** | **soap** | **web** } * } { **protocol-operation** { **all** | { **action** | **config** | **get** | **session** | **set** | **syntax** | **others** } * } | **row-operation** | **verbose** }

Default

NETCONF logging is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

source: Specifies a NETCONF operation source that represents clients that use a protocol.

- **all**: Specifies NETCONF clients that use all protocols.
- **agent**: Specifies clients that use Telnet, SSH, NETCONF over console, or NETCONF over SSH.
- **soap**: Specifies clients that use SOAP over HTTP, or SOAP over HTTPS.
- **web**: Specifies clients that use Web.

protocol-operation: Logs requests and replies for specific types of NETCONF operations.

- **all**: Specifies all types of NETCONF operations.
- **action**: Specifies the <action> operation.
- **config**: Specifies the configuration-related NETCONF operations, including the <CLI>, <save>, <load>, <rollback>, <lock>, <unlock>, and <save-point> operations.
- **get**: Specifies the data retrieval-related NETCONF operations, including the <get>, <get-config>, <get-bulk>, <get-bulk-config>, and <get-sessions> operations.
- **session**: Specifies session-related NETCONF operations, including the <kill-session> and <close-session> operations, and capability exchanges by hello messages.
- **set**: Specifies all <edit-config> operations.
- **syntax**: Specifies the requests that include XML and schema errors.
- **others**: Specifies NETCONF operations except for those specified by keywords **action**, **config**, **get**, **set**, **session**, and **syntax**.

row-operation: Logs row operations for <action> and <edit-config> operations.

verbose: Logs detailed information about requests and replies for types of NETCONF operations, including packet contents of format-correct requests and error information about failed <edit-config> operations.

Usage guidelines

If you specify the **protocol-operation** keyword, the device logs each of the matching operation and the operation result. For example, if you perform a NETCONF operation to create VLANs 3 through 5, the device outputs the following log messages:

```
%Mar 21 17:11:34:479 2017 Sysname XMLSOAP/6/XML_REQUEST: test from 192.168.100.198,
session id 2,message-id 100, receive edit-config request.
%Mar 21 17:11:34:483 2017 Sysname XMLSOAP/6/EDIT-CONFIG: test from 192.168.100.198,
session id 2,message-id 100, execute success.
```

If you specify the **row-operation** keyword, the device logs each row operation and the operation result for an <action> or <edit-config> operation. For example, if you perform a NETCONF operation to create VLANs 3 through 5, the device outputs the following log messages:

```
%Mar 31 17:50:02:608 2017 Sysname XMLSOAP/6/EDIT-CONFIG: User (test, 192.168.100.20,
session ID 1), message ID=100, operation=create VLAN/VLANs (ID=3), result=Succeeded. No
attributes.
%Mar 31 17:50:02:609 2017 Sysname XMLSOAP/6/EDIT-CONFIG: User (test, 192.168.100.20,
session ID 1), message ID=100, operation=create VLAN/VLANs (ID=4), result=Succeeded. No
attributes.
%Mar 31 17:50:02:611 2017 Sysname XMLSOAP/6/EDIT-CONFIG: User (test, 192.168.100.20,
session ID 1), message ID=100, operation=create VLAN/VLANs (ID=5), result=Succeeded. No
attributes.
```

For NETCONF to correctly send the generated logs to the information center, you must also configure the information center. For information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Examples

Configure the device to log NETCONF edit-config information sourced from agent clients.

```
<Sysname> system-view
[Sysname] netconf log source agent protocol-operation set
```

netconf soap acl

Use **netconf soap acl** to apply an IPv4 ACL to control NETCONF over SOAP access.

Use **undo netconf soap acl** to restore the default.

Syntax

In non-FIPS mode:

netconf soap { **http** | **https** } **acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }

undo netconf soap { **http** | **https** } **acl**

In FIPS mode:

netconf soap https acl { *ipv4-acl-number* | **name** *ipv4-acl-name* }

undo netconf soap https acl

Default

No IPv4 ACL is applied to control NETCONF over SOAP access.

Views

System view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 2999.

http: Applies an IPv4 ACL to control NETCONF over SOAP over HTTP access.

https: Applies an IPv4 ACL to control NETCONF over SOAP over HTTPS access.

name *ipv4-acl-name*: Specifies an IPv4 ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter. To avoid confusion, it cannot be **all**.

Usage guidelines

To control NETCONF over SOAP access, specify an ACL that exists and has rules.

- If the specified ACL exists and has rules, only clients permitted by the ACL can establish NETCONF over SOAP sessions.
- If no ACL is applied or the applied ACL does not exist or does not have rules, all NETCONF clients can establish NETCONF over SOAP sessions.

If you execute the **netconf soap http acl** command multiple times, the most recent configuration takes effect. The same is true for the **netconf soap https acl** command.

Examples

Use IPv4 ACL 2001 to allow only NETCONF clients from subnet 10.10.0.0/16 to establish NETCONF over SOAP over HTTP sessions.

```
<Sysname> system-view
[Sysname] acl basic 2001
```

```
[Sysname-acl-ipv4-basic-2001] rule permit source 10.10.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] netconf soap http acl 2001
```

netconf soap domain

Use **netconf soap domain** to specify a mandatory authentication domain for NETCONF users.

Use **undo netconf soap domain** to restore the default.

Syntax

netconf soap domain *domain-name*

undo netconf soap domain

Default

No mandatory authentication domain is specified for NETCONF users.

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies an ISP domain by its name, a case-insensitive string of 1 to 255 characters. For information about ISP domains, see *Security Configuration Guide*.

Usage guidelines

You can use either of the following methods to specify an authentication domain:

- Execute the **netconf soap domain** command to specify a mandatory authentication domain. After this command is executed, all NETCONF users are placed in the domain for authentication.
- Add an authentication domain to the <UserName> parameter of a SOAP request. The authentication domain takes effect only on the current request.

The authentication domain specified by using this command takes precedence over the authentication domain specified by the <UserName> parameter of a SOAP request.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify mandatory authentication domain **my-domain** for NETCONF users.

```
<Sysname> system-view
[Sysname] netconf soap domain my-domain
```

netconf soap dscp

Use **netconf soap dscp** to set the DSCP value for outgoing NETCONF over SOAP packets.

Use **undo netconf soap dscp** to restore the default.

Syntax

In non-FIPS mode:

netconf soap { **http** | **https** } **dscp** *dscp-value*

undo netconf soap { **http** | **https** } **dscp**

In FIPS mode:

netconf soap https dscp *dscp-value*

undo netconf soap https dscp

Default

The DSCP value is 0 for outgoing NETCONF over SOAP packets.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63. A larger DSCP value represents a higher priority.

http: Specifies NETCONF over SOAP over HTTP packets.

https: Specifies NETCONF over SOAP over HTTPS packets.

Usage guidelines

The DSCP value of an IP packet specifies the priority level of the packet and affects the transmission priority of the packet.

Examples

Set the DSCP value to 30 for outgoing NETCONF over SOAP over HTTP packets.

```
<Sysname> system-view
[Sysname] netconf soap http dscp 30
```

netconf soap enable

Use **netconf soap enable** to enable NETCONF over SOAP.

Use **undo netconf soap enable** to disable NETCONF over SOAP.

Syntax

In non-FIPS mode:

netconf soap { **http** | **https** } **enable**

undo netconf soap { **http** | **https** } **enable**

In FIPS mode:

netconf soap https enable

undo netconf soap https enable

Default

If the device starts up with the initial configuration, NETCONF over SOAP is disabled.

If the device starts up with the factory defaults, the enabling state of NETCONF over SOAP varies depending on the hardware platform and software version, as shown in Table 1.

Table 1 Factory defaults for NETCONF over SOAP

Feature	Factory default	Applicable software versions
NETCONF over SOAP over HTTPS	Disabled	All versions
NETCONF over SOAP over HTTP	Disabled	Versions earlier than Release 6348P01
	Enabled	Release 6348P01 or later

For more information about initial configuration, factory defaults, and startup configuration, see configuration file management in *Fundamentals Configuration Guide*.

Views

System view

Predefined user roles

network-admin

Parameters

`http`: Specifies NETCONF over SOAP over HTTP.

`https`: Specifies NETCONF over SOAP over HTTPS.

Usage guidelines

This command enables the device to resolve NETCONF messages that are encapsulated with SOAP in HTTP or HTTPS packets.

Examples

Enable NETCONF over SOAP over HTTP.

```
<Sysname> system-view
[Sysname] netconf soap http enable
```

netconf ssh server enable

Use **`netconf ssh server enable`** to enable NETCONF over SSH.

Use **`undo netconf ssh server enable`** to disable NETCONF over SSH.

Syntax

`netconf ssh server enable`

`undo netconf ssh server enable`

Default

NETCONF over SSH is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature allows you to use an SSH client to invoke NETCONF as an SSH subsystem. Then, you can directly use XML messages to perform NETCONF operations without using the **`xml`** command.

Before you execute this command, configure the authentication mode for users as **scheme** on the device. Then, the NETCONF-over-SSH-enabled user terminals can access the device through NETCONF over SSH.

Only capability set **urn:ietf:params:netconf:base:1.0** is available. It is supported by both the device and user terminals.

Examples

Enable NETCONF over SSH.

```
<Sysname> system-view
[Sysname] netconf ssh server enable
```

netconf ssh server port

Use **netconf ssh server port** to specify a port to listen for NETCONF over SSH session requests.

Use **undo netconf ssh server port** to restore the default.

Syntax

netconf ssh server port *port-number*

undo netconf ssh server port

Default

The device uses port 830 to listen for NETCONF over SSH session requests.

Views

System view

Predefined user roles

network-admin

Parameters

*port-numbe*r: Specifies a port by its number in the range of 1 to 65535.

Usage guidelines

Make sure the specified port is not being used by other services.

Examples

Use port 800 to listen for NETCONF over SSH session requests.

```
<Sysname> system-view
[Sysname] netconf ssh server port 800
```

xml

Use **xml** to enter XML view.

Syntax

xml

Views

User view

Predefined user roles

network-admin

network-operator

Usage guidelines

In XML view, use NETCONF messages to configure the device or obtain data from the device. The NETCONF operations you can perform depend on the user roles you have, as shown in Table 2.

Table 2 NETCONF operations available for the predefined user roles

User role	NETCONF operations
network-admin	All NETCONF operations
network-operator	• Get • Get-bulk • Get-bulk-config • Get-config • Get-sessions • Close-session

To ensure the format correctness of NETCONF messages in XML view, do not enter NETCONF messages manually. Copy and paste the messages.

While the device is performing a NETCONF operation, do not perform any other operations, such as pasting a NETCONF message or pressing **Enter**.

For the device to identify NETCONF messages, you must add end mark **]]>]]>** at the end of each NETCONF message.

After you enter XML view, the device automatically advertises its NETCONF capabilities to the client. In response, you must configure the client to notify the device of its supported NETCONF capabilities. After the capability exchange, you can use the client to configure the device.

NETCONF messages must comply with the XML format requirements and semantic and syntactic requirements in the NETCONF XML API reference for the device. As a best practice, use third-party software to generate NETCONF messages to ensure successful configuration.

To quit XML view, use a NETCONF message instead of the **quit** command.

If you have configured a shortcut key (**Ctrl + C**, by default) by using the **escape-key** command in user line/user line class view, the NETCONF message should not contain the shortcut key string. If the NETCONF message contains the shortcut key string, relevant configurations in XML view might be affected. For example, in user line view, you configured "a" as the shortcut key by using the **escape-key a** command. When a NETCONF message includes the character "a," only the contents after the last "a" in the message can be processed.

Examples

Enter XML view.

```
<Sysname> xml
<?xml version="1.0" encoding="UTF-8"?><hello
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0"><capabilities><capability>urn:ietf:pa
rams:netconf:base:1.1</capability><capability>urn:ietf:params:netconf:writable-runnin
g</capability><capability>urn:ietf:params:netconf:capability:notification:1.0</capabi
lity><capability>urn:ietf:params:netconf:capability:validate:1.1</capability><capabil
ity>urn:ietf:params:netconf:capability:interleave:1.0</capability><capability>urn:h3c
:params:netconf:capability:h3c-netconf-ext:1.0</capability></capabilities><session-id
>1</session-id></hello>]]>]]>
```

Notify the device of the NETCONF capabilities supported on the client.

```
<hello xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <capabilities>
    <capability>
```

```
            urn:ietf:params:netconf:base:1.0
    </capability>
  </capabilities>
</hello>]]>]]>
```

Quit XML view.

```
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <close-session/>
</rpc>]]>]]>
<Sysname>
```

cwmp enable

cwmp acs default password

Use **cwmp acs default password** to configure a password for authentication to the default ACS URL.

Use **undo cwmp acs default password** to restore the default.

Syntax

cwmp acs default password { **cipher** | **simple** } *string*

undo cwmp acs default password

Default

No password is configured for authentication to the default ACS URL.

Views

CWMP view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 255 characters. Its encrypted form is a case-sensitive string of 33 to 373 characters.

Usage guidelines

You can configure only one password for authentication to the default ACS URL. If you execute this command multiple times, the most recent configuration takes effect.

For a successful connection, make sure the CPE has the same username and password settings as the ACS.

Examples

Configure the password used for authentication to the default ACS URL.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp acs default password simple newpsw
```

Related commands

Use **undo cwmp acs default url** to restore the default.

Syntax

cwmp acs default url *url*

undo cwmp acs default url

Default

No default ACS URL is specified.

Views

CWMP view

Predefined user roles

network-admin

Parameters

url: Specifies the default ACS URL, a string of 8 to 255 characters. The URL must use the **http://***host[:port]/path* or **https://***host[:port]/path* format.

Usage guidelines

The CPE attempts to connect to the default ACS URL if no ACS URL has been assigned to it through the **cwmp acs url** command or DHCP.

You can configure only one default ACS URL. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the default ACS URL.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp acs default url http://www.acs.com:9090
```

cwmp acs username

cwmp acs url

Use **cwmp acs url** to specify a preferred ACS URL.

Use **undo cwmp acs url** to restore the default.

Syntax

cwmp acs url *url*

undo cwmp acs url

Default

No preferred ACS URL is specified.

Views

CWMP view

Predefined user roles

network-admin

Parameters

url: Specifies the preferred ACS URL, a string of 8 to 255 characters. The URL must use the **http://***host[:port]/path* or **https://***host[:port]/path* format.

Usage guidelines

The device supports only one preferred ACS URL. If you execute this command multiple times, the most recent configuration takes effect.

The preferred ACS URL is configurable from the CPE's CLI, the DHCP server, and the ACS. The CLI- and ACS-assigned URLs have higher priority than the DHCP-assigned URL. The CLI- and ACS-assigned URLs overwrite each other.

The CPE uses the default ACS attributes for connection establishment only when it is not assigned a preferred ACS URL from the CLI, ACS, or DHCP server.

Examples

Specify the ACS URL.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp acs url http://www.acs.com:9090
```

cwmp acs username

Use **cwmp acs username** to configure the username for authentication to the preferred ACS URL.

Use **undo cwmp acs username** to restore the default.

Syntax

cwmp acs username *username*

undo cwmp acs username

Default

No username is configured for authentication to the preferred ACS URL.

Views

[Sysname-cwmp] cwmp acs username newname
```

Related commands

cwmp acs password

cwmp cpe connect interface

Use **cwmp cpe connect interface** to specify the CWMP connection interface.

Use **undo cwmp cpe connect interface** to restore the default.

Syntax

cwmp cpe connect interface *interface-type interface-number*

undo cwmp cpe connect interface

Default

No CWMP connection interface is specified.

Views

CWMP view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies the type and number of the CWMP connection interface.

Usage guidelines

A CWMP connection interface is the interface that the CPE uses to communicate with the ACS. To establish a CWMP connection, the CPE sends the IP address of this interface in the Inform message, and the ACS replies to this IP address.

Typically, the CPE selects the CWMP connection interface automatically. If the CWMP connection interface is not the interface that connects the CPE to the ACS, the CPE fails to establish a CWMP connection with the ACS. For example, an incorrect CWMP connection interface selection occurs when the following conditions exist:

- The CPE has multiple Layer 3 interfaces.
- The IP addresses of the CWMP connection interface and the ACS are not in the same subnet.

In this case, you need to use this command to manually specify the CWMP connection interface.

Examples

Specify VLAN-interface 2 as the CWMP connection interface.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe connect interface vlan-interface 2
```

cwmp cpe connect retry

Use **cwmp cpe connect retry** to set the maximum number of attempts the CPE can make to retry a failed CWMP connection.

Use **undo cwmp cpe connect retry** to restore the default.

Syntax

cwmp cpe connect retry *retries*

undo cwmp cpe connect retry

Default

The CPE retries a failed connection until the connection is established with the ACS.

Views

CWMP view

Predefined user roles

network-admin

Parameters

retries: Specifies the maximum number of CWMP connection retries. The value range is 0 to 100. To disable the CPE to retry a CWMP connection, set this argument to 0.

Usage guidelines

The CPE retries connecting to the ACS when its initial connection attempt fails or the CWMP session is ended before the CPE receives a session closed message from the ACS. The CPE does not stop its connection retry attempts until the connection is established or the number of connection retries reaches the upper limit.

Examples

Set the maximum number of CWMP connection retries to 5.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe connect retry 5
```

cwmp cpe inform interval

Use **cwmp cpe inform interval** to set the periodic Inform interval.

Use **undo cwmp cpe inform interval** to restore the default.

Syntax

cwmp cpe inform interval *interval*

undo cwmp cpe inform interval

Default

The periodic Inform interval is 600 seconds.

Views

CWMP view

Predefined user roles

network-admin

Parameters

interval: Sets the periodic Inform interval in the range of 10 to 86400 seconds.

Usage guidelines

This command sets the interval for the CPE to send Inform messages automatically to the ACS. For the command to take effect, you must configure the **cwmp cpe inform interval enable** command.

Examples

Set the periodic Inform interval to 3600 seconds.

```
<Sysname> system-view
```

```
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe inform interval enable
[Sysname-cwmp] cwmp cpe inform interval 3600
```

Related commands

cwmp cpe inform interval enable

cwmp cpe inform interval enable

Use **cwmp cpe inform interval enable** to enable the periodic Inform feature.

Use **undo cwmp cpe inform interval enable** to disable the periodic Inform feature.

Syntax

cwmp cpe inform interval enable

undo cwmp cpe inform interval enable

Default

The CPE does not send Inform messages periodically.

Views

CWMP view

Predefined user roles

network-admin

Usage guidelines

If this command is configured, the CPE sends Inform messages regularly to establish a CWMP session with the ACS. To set the periodic Inform interval, use the **cwmp cpe inform interval** command.

Examples

Enable the periodic Inform feature.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe inform interval enable
```

Related commands

cwmp cpe inform interval

cwmp cpe inform time

Use **cwmp cpe inform time** to schedule a connection initiation for the CPE to connect to the ACS.

Use **undo cwmp cpe inform time** to restore the default.

Syntax

cwmp cpe inform time *time*

undo cwmp cpe inform time

Default

No connection initiation has been scheduled.

Views

CWMP view

Predefined user roles

network-admin

Parameters

time: Specifies the time at which the CPE sends an Inform message. The time format is *yyyy-mm-dd*T*hh:mm:ss*, and the value range is 1970-01-01T00:00:00 to 2035-12-31T23:59:59. The specified time must be greater than the current system time.

Examples

Configure the CPE to send an Inform message at 2007-12-01T20:00:00.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe inform time 2012-12-01T20:00:00
```

cwmp cpe password

Use **cwmp cpe password** to configure the password for the CPE to authenticate the ACS.

Use **undo cwmp cpe password** to restore the default.

Syntax

cwmp cpe password { **cipher** | **simple** } *string*

undo cwmp cpe password

Default

No password is configured for authenticating the ACS.

Views

CWMP view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 255 characters. Its encrypted form is a case-sensitive string of 33 to 373 characters.

Usage guidelines

You can configure only one password for the ACS to authenticate to the CPE when it initiates a connection. If you execute this command multiple times, the most recent configuration takes effect.

For a successful connection, make sure the ACS has the same username and password settings as the CPE.

If a password is configured, the ACS must provide the correct password when it initiates a connection to the CPE. If the password is incorrect, the CPE denies the connection request from the ACS.

You do not need to configure this command if you want to authenticate the ACS only based on its username.

Examples

Configure the password used for authenticating the ACS.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe password simple newpsw
```

Related commands

cwmp cpe username

cwmp cpe provision-code

Use **cwmp cpe provision-code** to configure the provision code of the CPE.

Use **undo cwmp cpe provision-code** to restore the default.

Syntax

cwmp cpe provision-code *provision-code*

undo cwmp cpe provision-code

Default

The provision code is **PROVISIONINGCODE**.

Views

CWMP view

Predefined user roles

network-admin

Parameters

provision-code: Specifies a provision code, a string of 1 to 64 characters. The string can contain uppercase letters, digits, and the full stop (.).

Usage guidelines

The ACS can use the provision code to identify services assigned to each CPE. For correct configuration deployment, make sure the same provision code is configured on the CPE and the ACS. For information about the support of your ACS for provision codes, see the ACS documentation.

The CPE can have only one provision code. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the provision code to **ABC20150714**.

```
<Sysname> system
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe provision-code ABC20150714
```

cwmp cpe stun enable

Use **cwmp cpe stun enable** to enable NAT traversal for the connection requests from the ACS to reach the CPE through a NAT gateway.

Use **undo cwmp cpe stun enable** to disable NAT traversal for the connection requests from the ACS to reach the CPE through a NAT gateway.

Syntax

cwmp cpe stun enable

undo cwmp cpe stun enable

Default

NAT traversal is disabled for CWMP.

Views

CWMP view

Predefined user roles

network-admin

Usage guidelines

Connection requests initiated from the CPE can reach the ACS through a NAT gateway without NAT traversal. However, for the connection request initiated from the ACS to reach the CPE, you must enable NAT traversal on the CPE when a NAT gateway resides between the CPE and the ACS.

The NAT traversal feature complies with *Simple Traversal of UDP Through NATs (STUN)*, RFC 3489. The feature enables the CPE to do the following:

- Discovers the NAT gateway.
- Obtains an open NAT binding (a public IP address and port binding) through which the ACS can send unsolicited packets.

The CPE sends the binding to the ACS when it initiates a connection to the ACS. For the connection requests sent by the ACS at any time to reach the CPE, the CPE maintains the open NAT binding.

Examples

Enable NAT traversal for the CPE.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe stun enable
```

cwmp cpe username

Use **cwmp cpe username** to configure the username for the CPE to authenticate the ACS.

Use **undo cwmp cpe username** to restore the default.

Syntax

cwmp cpe username *username*

undo cwmp cpe username

Default

No username is configured for authenticating the ACS.

Views

CWMP view

Predefined user roles

network-admin

Parameters

username: Specifies a username, a case-sensitive string of 1 to 255 characters.

Usage guidelines

You can configure only one username for the ACS to authenticate to the CPE when it initiates a connection. If you execute this command multiple times, the most recent configuration takes effect.

For a successful connection, make sure the ACS has the same username setting as the CPE. If a password is required, you must also make sure the ACS has the same password setting as the CPE.

The ACS must provide the correct username when it initiates a connection to the CPE. If the username is incorrect, the CPE denies the connection request from the ACS.

Examples

Configure the username used for authenticating the ACS.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe username newname
```

Related commands

cwmp cpe password

cwmp cpe wait timeout

Use **cwmp cpe wait timeout** to set the close-wait timer for the CPE to close an idle connection.

Use **undo cwmp cpe wait timeout** to restore the default.

Syntax

cwmp cpe wait timeout *seconds*

undo cwmp cpe wait timeout

Default

The close-wait timer is 30 seconds.

Views

CWMP view

Predefined user roles

network-admin

Parameters

seconds: Sets the close-wait timer, in the range of 30 to 1800 seconds.

Usage guidelines

The close-wait timer has the following functions:

- It specifies the amount of time the connection to the ACS can be idle before it is terminated. The CPE terminates the connection to the ACS if no traffic is transmitted before the timer expires.
- It also specifies the amount of time the CPE waits for the response to a session request. The CPE determines that its session attempt has failed when the timer expires. By default, the CPE retries a failed session until the session is established with the ACS. To limit the number of retries, use the **cwmp cpe connect retry** command.

Examples

Set the close-wait time to 60 seconds.

```
<Sysname> system-view
```

```
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe wait timeout 60
```

Related commands

```

```
CWMP state                    : Enabled
ACS URL                       : http://www.acs.com:9090
ACS username                  : newname
ACS default URL               : Null
ACS default username          : defname
Periodic inform               : Disabled
Inform interval               : 600s
Inform time                   : None
Wait timeout                  : 30s
Connection retries            : Unlimited
Source IP interface           : None
STUN state                    : Disabled
SSL policy name               : Null
```

Table 1 Command output

Field	Description
CWMP state	Status of CWMP: **Enabled** or **Disabled**.
ACS URL	Preferred ACS URL. This field displays **Null** if no preferred ACS URL has been specified.
ACS username	Username for the CPE to authenticate to the ACS. This field displays **Null** if no username has been configured for authentication to the preferred ACS URL.
ACS default URL	Default ACS URL. This field displays **Null** if no default ACS URL has been configured.
ACS default username	Username for the CPE to authenticate to the default ACS URL. This field displays **Null** if no username has been configured for authentication to the default ACS URL.
Periodic inform	Status of the periodic Inform feature: **Enabled** or **Disabled**.
Inform interval	Periodic Inform interval. The default interval is 600 seconds.
Inform time	Date and time at which an Inform message is scheduled to be sent. If you do not schedule an Inform sending, this field displays **None**.
Wait timeout	Close-wait timer. This timer is configurable with the **cwmp cpe wait timeout** command.
Connection retries	Number of attempts the CPE can make to retry a failed CWMP connection. This field displays **Unlimited** if the default setting is used. The CPE retries a failed session until the session is established with the ACS.
Source IP interface	IP address of the specified CWMP connection interface. This field displays **None** if you have not specified a CWMP connection interface.
STUN state	Status of NAT traversal for CWMP: **Enabled** or **Disabled**.
SSL policy name	SSL client policy specified for the CPE to authenticate the ACS for establishing an HTTPS connection. You must specify an SSL client policy when HTTPS is used. This field displays **Null** if you have not specified an SSL client policy.

Table 2 Command output

Field	Description
CWMP state	Status of CWMP: **Enabled** or **Disabled**.
ACS URL of most recent connection	ACS URL used for the most recent connection attempt. This field displays **Null** if no ACS URL was available.
ACS information source	Source from which the CPE obtained the ACS URL: • **User**—ACS URL assigned by using the **cwmp acs url** command or by ACS. • **DHCP**—ACS URL assigned by the DHCP server. • **Default**—ACS URL assigned by using the **cwmp acs default url** command. This field displays **None** if no ACS URL was available.
ACS username of most recent connection	Username used for the most recent connection to the ACS. This field displays **Null** if no ACS username was available.
Connection status	Current CWMP session status: • **Connected**—A CWMP session has been established to the ACS. • **Disconnected**—No CWMP session has been established to the ACS. • **Waiting response**—The CPE is waiting for the connection response from the ACS.
Data transfer status	Data transfer status of the CPE: • **Uploading**—The CPE is uploading data. • **Downloading**—The CPE is downloading data. • **None**—No data is transferred.

Field	Description
Most recent successful connection attempt	Time of the most recent successful CWMP connection. This field displays **None** if no CWMP session was established.
Length of time before next connection attempt	Amount of time (in seconds) that the CPE must wait before it initiates the next connection. This field displays **None** if the CPE does not detect an event that will trigger a connection attempt.

Related commands

display cwmp configuration

ssl client-policy

Use **ssl client-policy** to specify an SSL client policy for CWMP.

Use **undo ssl client-policy** to restore the default.

Syntax

ssl client-policy *policy-name*

undo ssl client-policy

Default

No SSL client policy is specified for CWMP.

Views

CWMP view

Predefined user roles

network-admin

Parameters

policy-name: Specifies the name of an SSL client policy, a string of 1 to 31 characters.

Usage guidelines

CWMP uses HTTP or HTTPS for data transmission. If the ACS uses HTTPS for secure access, its URL begins with **https://**. You must configure an SSL client policy for the CPE to authenticate the ACS for establishing an HTTPS connection. For more information about configuring SSL client policies, see *Security Configuration Guide*.

Examples

Specify the SSL client policy **test** for CWMP.

```
<Sysname> system
[Sysname] cwmp
[Sysname-cwmp] ssl client-policy test
```

Contents

EAA commands

action cli

Use **action cli** to add a CLI action to a monitor policy.

Use **undo action** to remove an action.

Syntax

action *number* **cli** *command-line*

undo action *number*

Default

A monitor policy does not contain any actions.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

number: Specifies an action ID in the range of 0 to 231.

cli *command-line*: Specifies the command line to be executed when the event occurs. You can enter abbreviated forms of command keywords, but you must make sure the forms can uniquely identify the command keywords. For example, you can enter **int loop 1** for the **interface loopback 1** command.

Usage guidelines

You can configure a series of actions to be executed in response to the event specified in a monitor policy. EAA executes the actions in ascending order of action IDs. When you add actions to a policy, you must make sure the execution order is correct. If two actions have the same ID, the most recent one takes effect.

To execute a command in a view other than user view, you must define actions required for accessing the target view before defining the command execution action. In addition, you must number the actions in the order they should be executed, starting with entering system view.

For example, to shut down an interface, you must create the following actions in order:

1. Action to enter system view.
2. Action to enter interface view.
3. Action to shut down the interface.

When you define an action, you can specify a value or specify a variable name for an argument. For more information about using EAA environment variables, see "rtm environment."

Examples

Configure a CLI action for the CLI-defined policy **test** to shut down GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] action 1 cli system-view
[Sysname-rtm-test] action 2 cli interface gigabitethernet 1/0/1
[Sysname-rtm-test] action 3 cli shutdown
```

action reboot

Use **action reboot** to add a reboot action to a monitor policy.

Use **undo action** to remove an action.

Syntax

action *number* **reboot** [**slot** *slot-number*]

undo action *number*

Default

A monitor policy does not contain any actions.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

number: Specifies an action ID in the range of 0 to 231.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, the command reboots the IRF fabric.

Usage guidelines

The reboot action configured with this command reboots devices without saving the running configuration. If you want to save the running configuration, use the **action cli** command to configure reboot actions.

You can configure a series of actions to be executed in response to the event specified in a monitor policy. EAA executes the actions in ascending order of action IDs. When you add actions to a policy, you must make sure the execution order is correct. If two actions have the same ID, the most recent one takes effect.

When you define an action, you can specify a value or specify a variable name for an argument. For more information about using EAA environment variables, see "rtm environment."

Examples

Configure an action for the CLI-defined policy **test** to reboot the specified slot.

<Sysname> system-view

```
[Sysname] rtm cli-policy test
[Sysname-rtm-test] action 3 reboot slot 1
```

action switchover

Use **action switchover** to add an active/standby switchover action to a monitor policy.

Use **undo action** to remove an action.

Syntax

action *number* **switchover**

undo action *number*

Default

A monitor policy does not contain any actions.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

number: Specifies an action ID in the range of 0 to 231.

Usage guidelines

You can configure a series of actions to be executed in response to the event specified in a monitor policy. EAA executes the actions in ascending order of action IDs. When you add actions to a policy, you must make sure the execution order is correct. If two actions have the same ID, the most recent one takes effect.

This command does not trigger a master/subordinate switchover in either of the following situations:

- No subordinate device is configured.
- The subordinate device is not in up state.

Examples

Configure an action for the CLI-defined policy **test** to perform an active/standby switchover.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] action 3 switchover
```

action syslog

Use **action syslog** to add a Syslog action to a monitor policy.

Use **undo action** to remove an action.

Syntax

action *number* **syslog priority** *priority* **facility** *local-number* **msg** *msg-body*

undo action *number*

Default

A monitor policy does not contain any actions.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

number: Specifies an action ID in the range of 0 to 231.

priority *priority*: Specifies the log severity level in the range of 0 to 7. A lower value represents a higher severity level.

facility *local-number*: Specifies a logging facility by its facility number in the range of local0 to local7. Facility numbers are used by a log host to identify log creation facilities for filtering log messages.

msg *msg-body*: Configures the log message body.

Usage guidelines

EAA sends log messages to the information center. You can configure the information center to output these messages to certain destinations. For more information about the information center, see "Configuring the information center."

You can configure a series of actions to be executed in response to the event specified in a monitor policy. EAA executes the actions in ascending order of action IDs. When you add actions to a policy, you must make sure the execution order is correct. If two actions have the same ID, the most recent one takes effect.

When you define an action, you can specify a value or specify a variable name for an argument. For more information about using EAA environment variables, see "rtm environment."

Examples

Configure an action for the CLI-defined policy **test** to send a log message "hello" with a severity of 7 from the facility device **local3**.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] action 3 syslog priority 7 facility local3 msg hello
```

commit

Use **commit** to enable a CLI-defined monitor policy.

Syntax

commit

Default

No CLI-defined monitor policies are enabled.

Views

CLI-defined policy view

Predefined user roles

network-admin

Usage guidelines

You must execute this command for a CLI-defined monitor policy to take effect.

After changing the settings in a policy that has been enabled, you must re-execute this command for the changes to take effect.

Examples

Enable CLI-defined monitor policy **test**.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] commit
```

display rtm environment

Use **display rtm environment** to display user-defined EAA environment variables and their values.

Syntax

display rtm environment [*var-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

var-name: Specifies a user-defined EAA environment variable by its name, a case-sensitive string of 1 to 63 characters. The name can contain digits, letters, and the underscore sign (_), but its leading character cannot be the underscore sign. If you do not specify a variable, this command displays all user-defined EAA environment variables.

Examples

Display all user-defined EAA environment variables.

```
<Sysname> display rtm environment
Name             Value
save_cmd         save main force
show_run_cmd     display current-configuration
```

Table 1 Command output

Field	Description
Name	Name of a user-defined EAA environment variable. This field displays a maximum of 30 characters. To display a user-defined EAA environment variable name of more than 30 characters, use the **display current-configuration** command.
Value	Value of the user-defined EAA environment variable. This field displays a maximum of 30 characters. To display a user-defined EAA environment variable value of more than 30 characters, use the **display current-configuration** command.

display rtm policy

Use **display rtm policy** to display information about EAA monitor policies.

Syntax

display rtm policy { **active** | **registered** [**verbose**] } [*policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

active: Specifies policies that are executing the actions.

registered: Specifies policies that have been created.

verbose: Displays detailed information about monitor policies.

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 63 characters. If you do not specify a policy, the command displays information about all monitor policies.

Usage guidelines

To display the running configuration of CLI-defined monitor policies, execute the **display current-configuration** command in any view or execute the **display this** command in CLI-defined monitor policy view.

Examples

Display monitor policies that are executing the actions.

```
<Sysname> display rtm policy active
JID   Type  Event      TimeActive           PolicyName
507   CLI   INTERFACE  Aug 29 14:55:55 2013 test
```

Table 2 Command output

Field	Description
JID	Job ID, displayed only when you specify the **active** keyword.
Type	Policy creation method: • **TCL**—The policy was configured by using Tcl. • **CLI**—The policy was configured from the CLI.
Event	Event type, including CLI, hotplug, interface, process, SNMP, SNMP-Notification, Syslog, and track.
TimeActive	Time when the monitor policy was triggered.
PolicyName	Name of the monitor policy.

Display brief information about all created monitor policies.

```
<Sysname> display rtm policy registered
Total number: 1
Type  Event      TimeRegistered       PolicyName
CLI              Aug 29 14:54:50 2013 test
```

Table 3 Command output

Field	Description
Total number	Total number of the monitor policies.
Type	Policy creation method: • **TCL**—The policy was configured by using Tcl. • **CLI**—The policy was configured from the CLI.
Event	Event type, including CLI, hotplug, interface, process, SNMP, SNMP-Notification, Syslog, and track.
TimeRegistered	Time when the monitor policy was created.
PolicyName	Name of the monitor policy.

Display detailed information about all monitor policies.

```
<Sysname> display rtm policy registered verbose
  Total number: 1

   Policy Name: test
   Policy Type: CLI
    Event Type:
TimeRegistered: Aug 29 14:54:50 2013
```

```
User-role: network-operator
           network-admin
```

Table 4 Command output

Field	Description
Total number	Total number of the monitor polices.
PolicyName	Name of the monitor policy.
Policy Type	Policy creation method: • **TCL**—The policy was configured by using Tcl. • **CLI**—The policy was configured from the CLI.
Event Type	Event type, including CLI, hotplug, interface, process, SNMP, SNMP-Notification, Syslog, and track.
TimeRegistered	Time when the policy was created.
User-role	User roles for executing the monitor policy. To execute the monitor policy, an administrator must have a minimum of one of the displayed user roles.

event cli

Use **event cli** to configure a CLI event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event cli { **async** [**skip**] | **sync** } **mode** { **execute** | **help** | **tab** } **pattern** *regular-exp*

undo event

Default

No CLI event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

async [**skip**]: Enables or disables the system to execute the command that triggers the policy. If you specify the **skip** keyword, the system executes the actions in the policy without executing the command that triggers the policy. If you do not specify the **skip** keyword, the system executes both the actions in the policy and the command entered at the CLI.

sync: Enables the system to execute the command that triggers the event only if the policy has been executed successfully.

mode { **execute** | **help** | **tab** }: Specifies the CLI operation to monitor:

- **execute**: Triggers the policy when a matching command is entered.
- **help**: Triggers the policy when a question mark (?) is entered at a matching command line.
- **tab**: Triggers the policy when the **Tab** key is pressed to complete a parameter in a matching command line.

pattern *regular-exp*: Specifies a regular expression for matching commands that trigger the policy. For more information about using regular expressions, see CLI in *Fundamentals Configuration Guide*.

Usage guidelines

Use CLI event monitor policies to monitor operations performed at the CLI.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

Examples

Configure a CLI-defined policy to monitor execution of commands that contain the **display interface brief** string. Enable the system to execute the actions in the policy without executing the command that triggers the policy.

```
<Sysname>system-view
[Sysname] rtm cli-policy test
[Sysname-rmt-test] event cli async skip mode execute pattern display interface brief
```

Configure a CLI-defined policy to monitor the use of the **Tab** key at command lines that contain the **display interface brief** string. Enable the system to execute the actions in the policy and display the complete parameter when **Tab** is pressed at a policy-matching command line.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rmt-test] event cli async mode tab pattern display interface brief
```

Configure a CLI-defined policy to monitor the use of the question mark (?) at command lines that contain the **display interface brief** string. Enable the system to execute a policy-matching command line only if the actions in the policy are executed successfully when a question mark is entered at the command line.

```
<Sysname>system-view
[Sysname] rtm cli-policy test
[Sysname-rmt-test] event cli sync mode help pattern display interface brief
```

event hotplug

Use **event hotplug** to configure a hot-swapping event.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event hotplug [**insert** | **remove**] **slot** *slot-number*

undo event

Default

No hotplug event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

insert: Specifies the IRF member device join event.

remove: Specifies the IRF member device leave event.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

After you configure the event, the monitor policy is triggered when the member device joins or leaves the IRF fabric. If you do not specify the **insert** or **remove** keyword, EAA monitors the member device for joining or leaving the IRF fabric.

You can configure only one event entry for a monitor policy. If the monitor policy already contains an event entry, the new event entry replaces the old event entry.

Examples

Configure a CLI-defined policy to monitor the member device for joining or leaving the IRF fabric.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event hotplug slot 1
```

event interface

Use **event interface** to configure an interface event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event interface *interface-list* **monitor-obj** *monitor-obj* **start-op** *start-op* **start-val** *start-val* **restart-op** *restart-op* **restart-val** *restart-val* [**interval** *interval*]

undo event

Default

No interface event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a space-separated list of up to eight interface items. An item specifies an interface or specifies a range of interfaces in the form of *interface-type interface-number* **to** *interface-type interface-number*. The interfaces in an interface range must be same type. The start interface number must be smaller than the end interface number.

monitor-obj *monitor-obj*: Specifies the traffic statistic to be monitored on the interface. For keywords available for the *monitor-obj* argument, see Table 5.

start-op *start-op*: Specifies the operator for comparing the monitored traffic statistic with the start threshold. The start threshold is crossed if the comparison result meets the condition. For keywords available for the *start-op* argument, see Table 6.

start-val *start-val*: Specifies the start threshold to be compared with the monitored traffic statistic. The value range is 0 to 4294967295.

restart-op *restart-op*: Specifies the operator for comparing the monitored traffic statistic with the restart threshold. The restart threshold is crossed if the comparison result meets the condition. For keywords available for the *restart-op* argument, see Table 6.

restart-val *restart-val*: Specifies the restart threshold to be compared with the monitored traffic statistic. The value range is 0 to 4294967295.

interval *interval*: Specifies the interval to sample the monitored traffic statistic for a comparison. The value range is 1 to 4294967295, in seconds. The default value is 300.

Table 5 Monitored objects

Monitored traffic statistic	Description
input-drops	Number of discarded incoming packets during the sampling interval
input-errors	Number of incoming error packets during the sampling interval
output-drops	Number of discarded outgoing packets during the sampling interval
output-errors	Number of outgoing error packets during the sampling interval
rcv-bps	Receive rate, in bps during the sampling interval
rcv-broadcasts	Number of incoming broadcasts during the sampling interval
rcv-kbps	Receive rate, in kilobytes per second
rcv-kpps	Receive rate, in kilopackets per second
rcv-pps	Receive rate, in packets per second
tx-bps	Transmit rate, in bps
tx-kbps	Transmit rate, in kilobytes per second
tx-kpps	Transmit rate, in kilopackets per second
tx-pps	Transmit rate, in packets per second

Table 6 Comparison operators

Comparison operator	Description
eq	Equal to
ge	Greater than or equal to
gt	Greater than
le	Less than or equal to
lt	Less than
ne	Not equal to

Usage guidelines

Use interface event monitor policies to monitor traffic statistics on an interface.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

EAA executes an interface event policy when the monitored interface traffic statistic crosses the start threshold in the following situations:

- The statistic crosses the start threshold for the first time.
- The statistic crosses the start threshold each time after it crosses the restart threshold.

The following is the interface event monitor process of EAA:

1. Compares the traffic statistic sample with the start threshold at sampling intervals until the start threshold is crossed.

2. Executes the policy.
3. Compares the traffic statistic sample with the restart threshold at sampling intervals until the restart threshold is crossed.
4. Compares the traffic statistic sample with the start threshold at sampling intervals until the start threshold is crossed.
5. Executes the policy again.

This process cycles for the monitor policy to be executed and re-executed.

Examples

Configure a CLI-defined policy to monitor the incoming error packet statistic on GigabitEthernet 1/0/1 every 60 seconds. Set the start threshold to 1000 and the restart threshold to 50. Enable EAA to execute the policy when the statistic exceeds 1000 for the first time. Enable EAA to re-execute the policy if the statistic exceeds 1000 each time after the statistic has dropped below 50.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event interface gigabitethernet 1/0/1 monitor-obj input-errors
start-op gt start-val 1000 restart-op lt restart-val 50 interval 60
```

event process

Use **event process** to configure a process event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event process { **exception** | **restart** | **shutdown** | **start** } [**name** *process-name* [**instance** *instance-id*]] [**slot** *slot-number*]

undo event

Default

No process event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

exception: Monitors the specified process for exceptional events. EAA executes the policy when an exception occurs to the monitored process.

restart: Monitors the specified process for restart events. EAA executes the policy when the monitored process restarts.

shutdown: Monitors the specified process for shutdown events. EAA executes the policy when the monitored process is shut down.

start: Monitors the specified process for start events. EAA executes the policy when the monitored process starts.

name *process-name*: Specifies a user-mode process by its name. The process can be one that is running or not running. If you do not specify a name, this command monitors all use-mode processes.

instance *instance-id*: Specifies a process instance ID in the range of 0 to 4294967295. The instance ID can be one that has not been created yet. If you do not specify an instance, EAA monitors all instances of the process.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the IRF fabric.

Usage guidelines

Use process event monitor policies to monitor process state changes. These changes can result from manual operations or automatic system operations.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

Examples

Configure a CLI-defined policy to monitor all instances of the process **snmpd** for restart events.

```
<Sysname>system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event process restart name snmpd
```

event snmp oid

Use **event snmp oid** to configure an SNMP event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event snmp oid *oid* **monitor-obj** { **get** | **next** } **start-op** *start-op* **start-val** *start-val* **restart-op** *restart-op* **restart-val** *restart-val* [**interval** *interval*]

undo event

Default

No SNMP event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

oid *oid*: Specifies the OID of the monitored MIB variable, a string of 1 to 256 characters.

monitor-obj { **get** | **next** }: Specifies the SNMP operation used for sampling variable values. The **get** keyword represents the SNMP get operation, and the **next** keyword represents the SNMP getNext operation.

start-op *start-op*: Specifies the operator for comparing the sampled value with the start threshold. The start threshold is crossed if the comparison result meets the condition. For keywords available for the *start-op* argument, see Table 6.

start-val *start-val*: Specifies the start threshold to be compared with the sampled value. The *start-val* argument can be any data type supported by SNMP, including numerals and character strings. The value range for the *start-val* argument is a string of 1 to 512 characters. If the threshold value contains spaces, you must enclose the value in quotation marks (" ").

restart-op *op*: Specifies the operator for comparing the sampled value with the restart threshold. The restart threshold is crossed if the comparison result meets the condition. For keywords available for the *start-op* argument, see Table 6.

restart-op *restart-val*: Specifies the restart threshold to be compared with the sampled value. The *restart-val* argument can be any data type supported by SNMP, including numerals and character strings. The value range for the *restart-val* argument is a string of 1 to 512 characters. If the threshold value contains spaces, you must enclose the value in quotation marks (" ").

interval *interval*: Specifies the sampling interval in the range of 1 to 4294967295, in seconds. The default value is 300.

Usage guidelines

Use SNMP event monitor policy to monitor value changes of MIB variables.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

EAA executes an SNMP event policy when the monitored MIB variable's value crosses the start threshold in the following situations:

- The monitored variable's value crosses the start threshold for the first time.
- The monitored variable's value crosses the start threshold each time after it crosses the restart threshold.

The following is the SNMP event monitor process of EAA:

1. Compares the variable sample with the start threshold at sampling intervals until the start threshold is crossed.
2. Executes the policy.
3. Compares the variable sample with the restart threshold at sampling intervals until the restart threshold is crossed.
4. Compares the variable sample with the start threshold at sampling intervals until the start threshold is crossed.
5. Executes the policy again.

This process cycles for the monitor policy to be executed and re-executed.

For the command to take effect, enable SNMP before you execute this command.

Examples

Configure a CLI-defined policy to get the value of the MIB variable **1.3.6.4.9.9.42.1.2.1.6.4** every five seconds. Set the start threshold to 1 and the restart threshold to 2. Enable EAA to execute the policy when the value changes to 1 for the first time. Enable EAA to re-execute the policy if the value changes to 1 each time after the value has changed to 2.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event snmp oid 1.3.6.4.9.9.42.1.2.1.6.4 monitor-obj get start-op eq
start-val 1 restart-op eq restart-val 2 interval 5
```

event snmp-notification

Use **event snmp-notification** to configure an SNMP-Notification event for a CLI-defined policy.

Use **undo event** to remove the event in a CLI-defined policy.

Syntax

event snmp-notification oid *oid* **oid-val** *oid-val* **op** *op* [**drop**]

undo event

Default

No SNMP-Notification event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

oid *oid*: Specifies the OID of the monitored MIB variable, a string of 1 to 256 characters.

oid-val *oid-val*: Specifies the threshold to be compared with the sampled value. The *oid-val* argument can be any data type supported by SNMP, including numerals and character strings. The value range for the *oid-val* argument is a string of 1 to 512 characters. If the threshold value contains spaces, you must enclose the value in quotation marks (" ").

op *op*: Specifies the operator for comparing the sampled value with the threshold. The policy is executed if the comparison result meets the condition. For keywords available for the *start-op* argument, see Table 6.

drop: Drops the notification if the comparison result meets the condition. If you do not specify this keyword, the system sends the notification.

Usage guidelines

Use SNMP-Notification event monitor policies to monitor variables in SNMP notifications.

EAA executes an SNMP-Notification event monitor policy when the value of the monitored variable in an SNMP notification meets the specified condition.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

For the command to take effect, enable SNMP before you execute this command.

Examples

Configure a CLI-defined policy to monitor SNMP notifications that contain the use name variable **1.3.6.1.4.1.25506.2.2.1.1.2.1.0**. Enable the system to execute the policy and drop the SNMP notification if the use name variable value is **admin**.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event snmp-notification oid 1.3.6.1.4.1.25506.2.2.1.1.2.1.0 oid-val
admin op eq drop
```

event syslog

Use **event syslog** to configure a Syslog event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event syslog priority { *priority* | **all** } **msg** *msg* **occurs** *times* **period** *period*

undo event

Default

No Syslog event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

priority { *priority* | **all** }: Specifies the severity level for matching log messages.

- *priority*: Specifies the lowest severity level for matching log messages. It is an integer in the range of 0 to 7. A lower number represents higher severity level. For example, specify a severity level of 3 to match log messages from level 3 to level 0.
- **all:** Represents any severity level from 0 to 7.

msg msg: Specifies a regular expression to match the logs. The *msg* argument represents a regular expression, a string of 1 to 255 characters.

occurs *times* **period** *period*: Executes the policy if the number of log matches over an interval exceeds the limit. The *times* argument specifies the maximum number of log matches in the range of 1 to 32. The *period* argument specifies an interval in the range of 1 to 4294967295 seconds.

Usage guidelines

Use Syslog event monitor policies to monitor log messages.

EAA executes a Syslog event monitor policy when the number of matching logs over an interval reaches the limit.

NOTE:

EAA does not count log messages generated by the RTM module when it counts log matches.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

A regular expression can contain the special characters described in Table 7.

Table 7 Special characters supported in a regular expression

Characters	Meaning	Examples
^	Matches the beginning of a line.	"^u" matches all lines beginning with "u". A line beginning with "Au" is not matched.
$	Matches the end of a line.	"u$" matches all lines ending with "u". A line ending with "uA" is not matched.
. (period)	Matches any single character.	".s" matches "as" and "bs".
*	Matches the preceding character or string zero, one, or multiple times.	"zo*" matches "z" and "zoo", and "(zo)*" matches "zo" and "zozo".
+	Matches the preceding character or string one or multiple times.	"zo+" matches "zo" and "zoo", but not "z".
|	Matches the preceding or succeeding string.	"def|int" matches a line containing "def" or "int".
( )	Matches the string in the parentheses, usually used together with the plus sign (+) or asterisk sign (*).	"(123A)" matches "123A". "408(12)+" matches "40812" and "408121212", but not "408".
\N	Matches the preceding strings in	"(string)\1" matches a string containing

Characters	Meaning	Examples
	parentheses, with the *Nth* string repeated once.	"stringstring". "(string1)(string2)\2" matches a string containing "string1string2string2". "(string1)(string2)\1\2" matches a string containing " string1string2string1string2".
[ ]	Matches a single character in the brackets.	"[16A]" matches a string containing 1, 6, or A; "[1-36A]" matches a string containing 1, 2, 3, 6, or A (- is a hyphen). To match the character "]", put it immediately after "[", for example, []abc]. There is no such limit on "[".
[^]	Matches a single character that is not in the brackets.	"[^16A]" matches a string that contains one or more characters except for 1, 6, or A, such as "abc". A match can also contain 1, 6, or A (such as "m16"), but it cannot contain these three characters only (such as 1, 16, or 16A).
{n}	Matches the preceding character *n* times. The number *n* must be a nonnegative integer.	"o{2}" matches "food", but not "Bob".
{n,}	Matches the preceding character *n* times or more. The number *n* must be a nonnegative integer.	"o{2,}" matches "foooood", but not "Bob".
{n,m}	Matches the preceding character *n* to *m* times or more. The numbers *n* and *m* must be nonnegative integers and *n* cannot be greater than *m*.	" o{1,3}" matches "fod", "food", and "foooood", but not "fd".
\<	Matches a string that starts with the pattern following \<. A string that contains the pattern is also a match if the characters preceding the pattern are not digits, letters, or underscores.	"\<do" matches "domain" and "doa".
\>	Matches a string that ends with the pattern preceding \>. A string that contains the pattern is also a match if the characters following the pattern are not digits, letters, or underscores.	"do\>" matches "undo" and "cdo".
\b	Matches a word that starts with the pattern following \b or ends with the pattern preceding \b.	"er\b" matches "never", but not "verb" or "erase". "\ber" matches "erase", but not "verb" or "never".
\B	Matches a word that contains the pattern but does not start or end with the pattern.	"er\B" matches "verb", but not "never" or "erase".
\w	Same as [A-Za-z0-9_], matches a digit, letter, or underscore.	"v\w" matches "vlan" and "service".
\W	Same as [^A-Za-z0-9_], matches a character that is not a digit, letter, or underscore.	"\Wa" matches "-a", but not "2a" or "ba".
\	Escape character. If a special character listed in this table follows \, the specific meaning of the character is removed.	"\\" matches a string containing "\", "\^" matches a string containing "^", and "\\b" matches a string containing "\b".

Examples

Configure a CLI-defined policy to monitor Syslog messages for level 3 to level 0 messages that contain the **down** string. Enable the policy to execute when five log matches are found within 6 seconds.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event syslog priority 3 msg down occurs 5 period 6
```

event track

Use **event track** to configure a track event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event track *track-list* **state** { **negative** | **positive** } [**suppress-time** *suppress-time*]

undo event

Default

A CLI-defined policy does not contain a track event.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

track-list: Specifies a space-separated list of up to 16 track items. Each item specifies a track entry number or a range of track entry numbers in the form of *track-entry-number* **to** *track-entry-number*. The value range for the *track-entry-number* argument is 1 to 1024.

state { **negative** | **positive** }: Monitors state change of the track entries.

- **negative**: Triggers the policy when the states of the track entries change from Positive to Negative.
- **positive**: Triggers the policy when the states of the track entries change from Negative to Positive.

suppress-time *suppress-time*: Sets a suppress time in the range of 1 to 4294967295, in seconds. The default value is 0.

Usage guidelines

Use track event monitor policies to monitor state change of track entries. If you specify one track entry for a policy, EAA triggers the policy when the state of the track entry changes from Positive to Negative or from Negative to Positive. If you specify multiple track entries for a policy, EAA triggers the policy only when the state of all the track entries changes from Positive to Negative or Negative to Positive.

If you set a suppress time for a track event monitor policy, the timer starts when the policy is triggered. The system does not process the messages that report the track entry positive-to-negative or negative-to-positive state change until the timer times out.

You can configure only one event entry for a monitor policy. If the monitor policy already contains an event entry, the new event entry replaces the old event entry.

Examples

Create CLI-defined monitor policy **test**. Configure a track event for the policy that occurs when the states of track entry 1 to track entry 8 change from Positive to Negative. Set the suppress time to 180 seconds for the policy.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event track 1 to 8 state negative suppress-time 180
```

rtm cli-policy

Use **rtm cli-policy** to create a CLI-defined EAA monitor policy and enter its view, or enter the view of an existing CLI-defined EAA monitor policy.

Use **undo rtm cli-policy** to delete a CLI-defined monitor policy.

Syntax

rtm cli-policy *policy-name*

undo rtm cli-policy *policy-name*

Default

No CLI-defined monitor policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies the name of a CLI-defined monitor policy, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You must create a CLI-defined monitor policy before you can use the CLI to configure settings in the policy.

For a CLI-defined monitor policy to take effect, you must execute the **commit** command after you complete configuring the policy.

You can execute this command multiple times to create multiple CLI-defined monitor policies. Make sure the CLI-defined monitor policies that are executed at the same time do not have conflicting actions. If the actions conflict, the system executes the actions randomly.

You can assign the same name to a CLI-defined policy and a Tcl-defined policy.

Examples

Create a CLI-defined policy and enter its view.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
```

Related commands

commit

rtm environment

Use **rtm environment** to configure an EAA environment variable.

Use **undo rtm environment** to delete a user-defined EAA environment variable.

Syntax

rtm environment *var-name var-value*

undo rtm environment *var-name*

Default

No user-defined EAA environment variables exist.

The system provides the variables in Table 8. You cannot create, delete, or modify these system-defined variables.

Table 8 System-defined EAA environment variables by event type

Event	Variable name and description
Any event	_event_id: Event ID _event_type: Event type _event_type_string: Event type description _event_time: Time when the event occurs _event_severity: Severity level of an event
CLI	_cmd: Commands that are matched
Syslog	_syslog_pattern: Log message content
Hotplug	_slot: ID of the member device that joins or leaves the IRF fabric
Interface	_ifname: Interface name
SNMP	_oid: OID of the MIB variable where an SNMP operation is performed _oid_value: Value of the MIB variable
SNMP-Notification	_oid: OID that is included in the SNMP notification.
Process	_process_name: Process name

Views

System view

Predefined user roles

network-admin

Parameters

var-name: Specifies a user-defined EAA environment variable by its name, a case-sensitive string of 1 to 63 characters. The name can contain digits, letters, and the underscore sign (_), but its leading character cannot be the underscore sign.

var-value: Specifies the variable value.

Usage guidelines

When you define an action, you can enter a variable name with a leading dollar sign (**$***variable_name*) instead of entering a value for an argument. EAA will replace the variable name with the variable value when it performs the action.

For an action argument, you can specify a list of variable names in the form of **$***variable_name1***$***variable_name2...***$***variable_nameN.*

Examples

Create an environment variable: set its name to **if** and set its value to **interface**.

```
<Sysname> system-view
```

```
[Sysname] rtm environment if interface
```

rtm event syslog buffer-size

Use **rtm event syslog buffer-size** to set the size for the EAA-monitored log buffer.

Use **undo rtm event syslog buffer-size** to restore the default.

Syntax

rtm event syslog buffer-size *buffer-size*

undo rtm event syslog buffer-size

Default

The size of the EAA-monitored log buffer is 50000.

Views

System view

Predefined user roles

network-admin

Parameters

buffer-size: Specifies the size for the EAA-monitored log buffer, in the range of 1 to 500000.

Usage guidelines

After you execute a Syslog event monitor policy, the system saves a copy of the logs to the EAA-monitored log buffer. When the logs in the buffer match the Syslog event, EAA executes the monitor policy actions.

Typically, the default EAA-monitored log buffer size is sufficient. However, when a feature malfunctions or the user enables multiple debugging functions, a large number of logs are generated. Some logs might be discarded before the matching is performed. You can set the EAA-monitored log buffer to a large size based on the memory usage.

Examples

Set the size of the EAA-monitored log buffer to 1000.

```
<Sysname> system-view
[Sysname] rtm event syslog buffer-size 1000
```

Related commands

event syslog

rtm scheduler suspend

Use **rtm scheduler suspend** to suspend all monitor policies, including CLI monitor policies and Tcl monitor policies.

Use **undo rtm scheduler suspend** to resume monitor policies.

Syntax

rtm scheduler suspend

undo rtm scheduler suspend

Views

System view

Predefined user roles

network-admin

Usage guidelines

You need to suspend the monitor policies under the following circumstances:

- The monitor policies are triggered frequently, affecting the system services and performance.
- The Tcl script of a policy needs to be revised.

After you execute this command, EAA will not execute the policies even if the trigger conditions are met.

This command does not suspend a running monitor policy until all its actions are executed.

Examples

Suspend monitor policies.

```
<Sysname> system-view
[Sysname] rtm scheduler suspend
```

rtm tcl-policy

Use **rtm tcl-policy** to create a Tcl-defined policy and bind it to a Tcl script file.

Use **undo rtm tcl-policy** to delete a Tcl policy.

Syntax

rtm tcl-policy *policy-name tcl-filename*

undo rtm tcl-policy *policy-name*

Default

No Tcl policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a policy name, a case-sensitive string of 1 to 63 characters.

tcl-filename: Specifies a .tcl script file name. The file name is case sensitive. You must ensure that the file is available on a storage medium of the device.

Usage guidelines

When you use this command to create a Tcl-defined policy, follow these guidelines:

Make sure the script file is saved on all IRF member devices. This practice ensures that the policy can run correctly after a master/subordinate switchover occurs or the member device where the script file resides leaves the IRF.

This command both creates and enables the specified Tcl-defined monitor policy. To revise the Tcl script of a Tcl-defined policy, you must suspend all monitor policies first, and then resume the policies after you finish revising the script. The system cannot execute a Tcl-defined policy if you edit its Tcl script without suspending all monitor policies.

To bind a Tcl-defined policy to a different Tcl script file:

1. Execute the **undo rtm tcl-policy** command to delete the Tcl policy.

2. Create the Tcl policy again, and then bind it to the new Tcl script file.

You can assign the same policy name to a CLI-defined policy and a Tcl-defined policy. However, you cannot assign the same name to policies that are the same type.

Examples

Create a Tcl policy and bind it to a Tcl script file.

```
<Sysname> system-view
[Sysname] rtm tcl-policy test test.tcl
```

running-time

Use **running-time** to configure the action runtime of a CLI-defined policy.

Use **undo running-time** to restore the default.

Syntax

running-time *time*

undo running-time

Default

The action runtime of a CLI-defined policy is 20 seconds.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

time: Specifies the action runtime in the range of 0 to 31536000 seconds. If you specify 0, the policy runs its actions forever once the policy is triggered.

Usage guidelines

The action runtime limits the amount of time that the monitor policy runs its actions from the time it is triggered. When the runtime is reached, the system stops executing the actions even if the execution is not finished.

This setting prevents an incorrectly defined policy from running its actions permanently to occupy resources.

Examples

Set the action runtime to **60** seconds for CLI-defined policy **test**.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] running-time 60
```

user-role

Use **user-role** to assign a user role to a CLI-defined policy.

Use **undo user-role** to remove a user role from a CLI-defined policy.

Syntax

user-role *role-name*

undo user-role *role-name*

Default

A monitor policy contains user roles that its creator had at the time of policy creation.

Views

CLI-defined policy view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

For EAA to execute an action in a monitor policy, you must assign the policy the user role that has access to the action-specific commands and resources. If EAA lacks access to an action-specific command or resource, EAA does not perform the action and all the subsequent actions.

For example, a monitor policy has four actions numbered from 1 to 4. The policy has user roles that are required for performing actions 1, 3, and 4, but it does not have the user role required for performing action 2. When the policy is triggered, EAA executes only action 1.

A monitor policy supports a maximum of 64 valid user roles. User roles added after this limit is reached do not take effect.

An EAA policy cannot have both the **security-audit** user role and any other user roles. Any previously assigned user roles are automatically removed when you assign the **security-audit** user role to the policy. The previously assigned **security-audit** user role is automatically removed when you assign any other user roles to the policy.

Examples

Assign user roles to a CLI-defined policy.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] user-role network-admin
[Sysname-rtm-test] user-role admin
```

Contents

Process monitoring and maintenance commands

The **display memory**, **display process**, **display process cpu**, **monitor process** and **monitor thread** commands display information about both user processes and kernel threads. In these commands, "process" refers to both user processes and kernel threads.

display exception context

Use **display exception context** to display context information for process exceptions.

Syntax

display exception context [**count** *value*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

count *value*: Specifies the number of context information entries, in the range of 1 to 20. The default value is 1.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays context information for process exceptions on the IRF master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The system generates a context information entry for each process exception. A context information entry includes the process ID, the crash time, the core dump file directory, stack information, and register information.

Examples

Display the exception context information on the x86-based 32-bit terminal.

```
<Sysname> display exception context

Table 1 Command output

Filed	Description
Crashed PID	ID of the crashed process.
Crash signal	Signals that led to the crash: • **SIGABRT**—Abort. • **SIGBUS**—Bus error. • **SIGFPE**—Erroneous arithmetic operation. • **SIGILL**—Illegal hardware instructions. • **SIGQUIT**—Quit signal sent by the controlling terminal. • **SIGSEGV**—Invalid memory access. • **SIGSYS**—Invalid system call. • **SIGTRAP**—Trap message. • **SIGXCPU**—CPU usage limit exceeded. • **SIGXFSZ**—File size limit exceeded. • **SIGUNKNOW**—Unknown reason.
Crash time	Time when the crash occurred.
Core file path	Directory where the core dump file is saved.
Backtrace stopped	All stack information has been displayed.

Related commands

`reset exception context`

display exception filepath

Use **`display exception filepath`** to display the core dump file directory.

Syntax

`display exception filepath` [**`slot`** *`slot-number`* [**`cpu`** *`cpu-number`*]]

Views

Any view

Predefined user roles

network-admin

Parameters

`slot` *`slot-number`*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays the core dump file directory on the IRF master device.

`cpu` *`cpu-number`*: Specifies a CPU by its number.

Examples

Display the core dump file directory on the specified slot.

```
<Sysname> display exception filepath slot 1
The exception filepath on slot 1 is flash:.
```

display kernel deadloop

Use **display kernel deadloop** to display kernel thread deadloop information.

Syntax

display kernel deadloop *show-number* [*offset*] [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

show-number: Specifies the number of deadloops to display, in the range of 1 to 20.

offset: Specifies the offset between the starting deadloop and the most recent deadloop, in the range of 0 to 19. The default value is 0.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays kernel thread deadloop information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display brief information about the most recent kernel thread deadloop.

```
<Sysname> display kernel deadloop 1
----------------- Deadloop record 1 -----------------

Table 2 Command output

Field	Description
Description	Description for the kernel thread deadloop, including the CPU number, thread running time, thread name, and thread number.
Recorded at	Time when the kernel thread deadloop was recorded, with microsecond precision.
Occurred at	Time when the kernel thread deadloop occurred, with microsecond precision.
Instruction address	Instruction address for the kernel thread deadloop.
Thread	Name and number of the kernel thread deadloop.
Context	Context for the kernel thread deadloop.
Cpu	Number of the CPU where the kernel thread ran.

Field	Description
VCPU ID	Number of the CPU core where the kernel thread ran.
Kernel module info	Information about kernel modules that had been loaded when the kernel thread deadloop was detected, including: • **Module name**—Kernel module name. • **Module address**—Memory address of the module.
Last 5 thread switches	Last five kernel thread switches on the CPU before the kernel thread deadloop was detected, including kernel thread name and kernel thread switching time with microsecond precision.
Register content	Register information: • **Reg**—Name of a register. • **Val**—Value saved in a register.
Dump stack	Stack information.
Call trace	Function call stack information, which shows the instruction address of a called function at each level.
Instruction dump	Instruction code when the kernel thread deadloop was detected. **ffffffff** indicates an illegitimate instruction code.
No information to display	No kernel thread deadloop information.

Related commands

reset kernel deadloop

display kernel deadloop configuration

Use **display kernel deadloop configuration** to display kernel thread deadloop detection configuration.

Syntax

display kernel deadloop configuration [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays kernel thread deadloop detection configuration for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display kernel thread deadloop detection configuration.

```
<Sysname> display kernel deadloop configuration
Thread dead loop detection: Enabled
Dead loop timer (in seconds): 20
Dead loop core list: 0-1
Dead loop action: Record-only
Threads excluded from monitoring: 1
```

```
  TID:     15   Name: co0
```

Table 3 Command output

Field	Description
Dead loop timer (in seconds): *n*	Time interval (in seconds) to identify a kernel thread deadloop. A kernel thread deadloop occurs if a kernel thread runs more than *n* seconds.
Dead loop core list	CPU cores for which kernel thread deadloop detection is performed.
Dead loop action	Action to be taken in response to a kernel thread deadloop: • **Reboot**—Logs the event and reboots the hardware. • **Record-only**—Logs the event.
Threads excluded from monitoring	Kernel threads excluded from kernel thread deadloop detection. This field appears only if the **monitor kernel deadloop exclude-thread** command is configured.
Name	Kernel thread name.
TID	Kernel thread number.
No thread is excluded from monitoring	All kernel threads are monitored by kernel thread deadloop detection.

display kernel exception

Use **display kernel exception** to display kernel thread exception information.

Syntax

display kernel exception *show-number* [*offset*] [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

show-number: Specifies the number of kernel exceptions to display, in the range of 1 to 20.

offset: Specifies the offset between the starting exception and the most recent exception, in the range of 0 to 19. The default value is 0.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays kernel thread exception information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

If an exception occurs to a running kernel thread, the system automatically records the exception information.

Examples

Display brief information about the most recent kernel thread exception.

```
<Sysname> display kernel exception 1
----------------- Exception record 1 -----------------
Description          : Oops[#0]
Recorded at          : 2013-05-01  11:16:00.823018

Related commands

reset kernel exception

display kernel reboot

Use **display kernel reboot** to display reboot information for member devices.

Syntax

display kernel reboot *show-number* [*offset*] [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

show-number: Specifies the number of reboots to display, in the range of 1 to 20.

offset: Specifies the offset between the starting reboot and the most recent reboot, in the range of 0 to 19. The default value is 0.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays reboot information for the master device. Reboot information for member devices is recorded in the memory of the master device. If the master device is powered off, the reboot information is lost.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display brief information about the most recent reboot.

```
<Sysname> display kernel reboot 1

Table 4 Command output

Field	Description
Recorded at	Time when the reboot was recorded, with microsecond precision.
Occurred at	Time when the reboot occurred, with microsecond precision.
Reason	Reboot reason.
Thread	Name and number of the kernel thread that was running when the reboot occurred.
Context	Context where the reboot occurred.
Slot	Number of the slot that triggered the reboot.
Target Slot	Number of the rebooted slot.
Cpu	Number of the CPU that triggered the reboot.
VCPU ID	Number of the CPU core that triggered the reboot.
Kernel module info	Information about kernel modules that had been loaded when the reboot occurred, including the kernel module names and memory addresses.
Last 5 thread switches	Last five kernel thread switches that occurred on the CPU before the reboot, including the kernel thread names and kernel thread switching time points, with microsecond precision.
Dump stack	Stack information for the threads that were running when the reboot occurred.
Call trace	Function call stack information.
No information to display	No reboot information exists.

Related commands

reset kernel reboot

display kernel starvation

Use **display kernel starvation** to display kernel thread starvation information.

Syntax

display kernel starvation *show-number* [*offset*] [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

show-number: Specifies the number of thread starvations to display, in the range of 1 to 20.

offset: Specifies the offset between the starting starvation and the most recent starvation, in the range of 0 to 19. The default value is 0.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays kernel thread starvation information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display brief information about the most recent kernel thread starvation.

```
<Sysname> display kernel starvation 1
---------------- Starvation record 1 ----------------

```

For detailed information about the command output, see Table 2.

Related commands

reset kernel starvation

display kernel starvation configuration

Use **display kernel starvation configuration** to display kernel thread starvation detection configuration.

Syntax

display kernel starvation configuration [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays kernel thread starvation detection configuration for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display kernel thread starvation detection configuration.

```
<Sysname> display kernel starvation configuration
Thread starvation detection: Disabled
Starvation timer (in seconds): 10
Threads excluded from monitoring: 1
  TID:    123   Name: co0
```

Table 5 Command output

Field	Description
Starvation timer (in seconds): *n*	Time interval (in seconds) to identify a kernel thread starvation. A kernel thread starvation occurs if a kernel thread does not run within *n* seconds.
Threads excluded from monitoring	Kernel threads excluded from kernel thread starvation detection.
Name	Kernel thread name.
TID	Kernel thread number.

Related commands

monitor kernel starvation enable

monitor kernel starvation exclude-thread

monitor kernel starvation time

display process

Use **display process** to display process state information.

Syntax

display process [**all** | **job** *job-id* | **name** *process-name*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Specifies all processes. With the **all** keyword or without any parameters, the command displays state information for all processes.

job *job-id*: Specifies a process by its job ID, in the range of 1 to 2147483647. Each process has a fixed job ID.

name *process-name*: Specifies a process by its name, a case-insensitive string of 1 to 15 characters that must not contain question marks or spaces.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays process state information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display state information for the process **scmd**.

```
<Sysname> display process name scmd
                            Job ID: 1
                               PID: 1
                        Parent JID: 0
                        Parent PID: 0
                    Executable path: /sbin/scmd
                           Instance: 0
                            Respawn: OFF
                      Respawn count: 1
             Max. spawns per minute: 0
                       Last started: Wed Jun  1 14:45:46 2013
                      Process state: sleeping
                          Max. core: 0
                               ARGS: -
   TID  LAST_CPU    Stack      PRI    State   HH:MM:SS:MSEC  Name
     1       0          0K      120       S     0:0:5:220      scmd
```

Table 6 Command output

Field	Description
Job ID	Job ID of the process. The job ID never changes.
PID	Number of the process. The number identifies the process, and it might change as the process restarts.
Parent JID	Job ID of the parent process.
Parent PID	Number of the parent process.
Executable path	Executable path of the process. For a kernel thread, this field displays a hyphen (-).
Instance	Instance number of the process. Whether a process can run multiple instances depends on the software implementation.
Respawn	Indicates whether the process restarts when an error occurs: • **ON**—The process automatically restarts. • **OFF**—The process does not automatically restarts.
Respawn count	Times that the process has restarted. The starting value is 1.
Max. spawns per minute	Maximum number of times that the process can restart within one minute. If the threshold is reached, the system automatically shuts down the process.
Last started	Time when the most recent restart occurred.
Process state	State of the process:

	• **running**—Running or waiting in the queue. • **sleeping**—Interruptible sleep. • **traced** or **stopped**—Stopped. • **uninterruptible sleep**—Uninterruptible sleep. • **zombie**—The process has quit, but some resources are not released.
Max. core	Maximum number of core dump files that the process can create. 0 indicates that the process never creates a core dump file. A process creates a core dump file after it abnormally restarts. If the number of core dump files reaches the maximum value, no more core dump files are created. Core dump files are helpful for troubleshooting.
ARGS	Parameters carried by the process during startup. If the process carries no parameters, this field displays a hyphen (-).
TID	Thread ID.
LAST_CPU	Number of the CPU on which the process is last scheduled.
Stack	Stack size.
PRI	Thread priority.
State	Thread state: • **R**—Running. • **S**—Sleeping. • **T**—Traced or stopped. • **D**—Uninterruptible sleep. • **Z**—Zombie.
HH:MM:SS:MSEC	Running time since the most recent start.
Name	Process name.

Display state information for all processes.

Table 7 Command output

Field	Description
JID	Job ID of a process. It never changes.
PID	Number of a process.
%CPU	CPU usage in percentage (%).
%MEM	Memory usage in percentage (%).
STAT	State of a process: • **R**—Running. • **S**—Sleeping. • **T**—Traced or stopped. • **D**—Uninterruptible sleep. • **Z**—Zombie.
PRI	Priority of a process for scheduling.
THIRD	This field is not supported in the current software version. Whether the process is a third party process: • **Y**—The process is a third party process. • **N**—The process is not a third party process.
TTY	TTY used by a process.
HH:MM:SS	Running time since the most recent start. If the running time reaches or exceeds 100 hours, this field displays only the number of hours.
COMMAND	Name and parameters of a process. If square brackets ([ ]) exist in a process name, the process is a kernel thread.

display process cpu

Use **display process cpu** to display CPU usage for all processes.

Syntax

display process cpu [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display CPU usage for all processes.

```
<Sysname> display process cpu
```

```
CPU utilization in 5 secs: 16.8%; 1 min: 4.7%; 5 mins: 4.7%
    JID      5Sec      1Min      5Min    Name
      1      0.0%      0.0%      0.0%    scmd
      2      0.0%      0.0%      0.0%    [kthreadd]
      3      0.1%      0.0%      0.0%    [ksoftirqd/0]
```

...

Table 8 Command output

Field	Description
CPU utilization in 5 secs: 16.8%; 1 min: 4.7%; 5 mins: 4.7%	System CPU usage within the last 5 seconds, 1 minute, and 5 minutes.
JID	Job ID of a process. It never changes.
5Sec	CPU usage of the process within the last 5 seconds.
1Min	CPU usage of the process within the last minute.
5Min	CPU usage of the process within the last 5 minutes.
Name	Name of the process. If square brackets ([ ]) exist in a process name, the process is a kernel thread.

display process log

Use **display process log** to display log information for all user processes.

Syntax

display process log [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display log information for all user processes.

```
<Sysname> display process log

```

Table 9 Command output

Field	Description
Process	Name of a user process.
JobID	Job ID of a user process.
PID	ID of a user process.
Abort	Indicates whether the process exited abnormally: • **Y**—Yes. • **N**—No.
Core	Indicates whether the process can generate core dump files: • **Y**—Yes. • **N**—No.
Exit	Process exit code. This field displays two hyphens (--) if the process was killed by a signal.
Kill	Code of the signal that killed the process. This field displays two hyphens (--) if the process exited instead of being killed.
StartTime	Time when the user process started.
EndTime	Time when the user process ended.

display process memory

Use **display process memory** to display memory usage for all user processes.

Syntax

display process memory [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

When a user process starts, it requests the following types of memory from the system:

- **Text memory**—Stores code for the user process.
- **Data memory**—Stores data for the user process.
- **Stack memory**—Stores temporary data.
- **Dynamic memory**—Heap memory dynamically assigned and released by the system according to the needs of the user process. To view dynamic memory information, execute the **display process memory heap** command.

Examples

Display memory usage for all user processes.

```
<Sysname> display process memory
   JID       Text      Data      Stack    Dynamic    Name
     1        384      1800         16         36    scmd
     2          0         0          0          0    [kthreadd]
     3          0         0          0          0    [ksoftirqd/0]
     4          0         0          0          0    [watchdog/0]
     5          0         0          0          0    [events/0]
     6          0         0          0          0    [khelper]
    29          0         0          0          0    [kblockd/0]
    49          0         0          0          0    [vzmond]
    52          0         0          0          0    [pdflush]
---- More ----
```

Table 10 Command output

Field	Description
JID	Job ID of a process. It never changes.
Text	Text memory used by the user process, in KB. The value for a kernel thread is 0.
Data	Data memory used by the user process, in KB. The value for a kernel thread is 0.
Stack	Stack memory used by the user process, in KB. The value for a kernel thread is 0.
Dynamic	Dynamic memory used by the user process, in KB. The value for a kernel thread is 0.
Name	Name of the user process. If square brackets ([ ]) exist in a process name, the process is a kernel thread.

Related commands

display process memory heap

display process memory heap address

display process memory heap size

display process memory heap

Use **display process memory heap** to display heap memory usage for a user process.

Syntax

display process memory heap job *job-id* [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

job *job-id*: Specifies a user process by its job ID, in the range of 1 to 2147483647.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

Heap memory comprises fixed-sized blocks such as 16-byte or 64-byte blocks. It stores data and variables used by the user process. When a user process starts, the system dynamically allocates heap memory to the process.

Each memory block has an address represented in hexadecimal format, which can be used to access the memory block. You can view memory block addresses by using the **display process memory heap size** command, and view memory block contents by using the **display process memory heap address** command.

Examples

Display brief information about heap memory usage for the process identified by job ID 1.

```
<Sysname> display process memory heap job 1
Total virtual memory heap space(in bytes) :  2228224
Total physical memory heap space(in bytes) :  262144
Total allocated memory(in bytes)          :  161576
```

Display detailed information about heap memory usage for the process identified by job ID 1.

```
<Sysname> display process memory heap job 1 verbose
Heap usage:
Size       Free      Used      Total     Free Ratio
16         8         52        60        13%
64         3         1262      1265      0.2%
128        2         207       209       1%
512        3         55        58        5.1%
4096       3         297       300       1%
8192       1         19        20        5%
81920      0         1         1         0%
Summary:
Total virtual memory heap space (in bytes)  :  2293760
Total physical memory heap space (in bytes) :  58368
Total allocated memory (in bytes)           :  42368
```

Table 11 Command output

Field	Description
Size	Size of each memory block, in bytes.
Free	Number of free memory blocks.
Used	Number of used memory blocks.
Total	Total number of memory blocks.
Free Ratio	Ratio of free memory to total memory. It helps identify fragment information.

Related commands

display process memory

display process memory heap address

display process memory heap size

display process memory heap address

Use **display process memory heap address** to display heap memory content starting from a specified memory block for a process.

Syntax

display process memory heap job *job-id* **address** *starting-address* **length** *memory-length* [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

job *job-id*: Specifies a user process by its job ID, in the range of 1 to 2147483647.

address *starting-address*: Specifies the starting memory block by its address.

length *memory-length*: Specifies the memory block length in the range of 1 to 1024 bytes.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

When a user process runs abnormally, the command helps locate the problem.

Examples

Display 128-byte memory block content starting from the memory block 0xb7e30580 for the process **job 1**.

```
<Sysname> display process memory heap job 1 address b7e30580 length 128
B7E30580:  14 00 EF FF 00 00 00 00 E4 39 E2 B7 7C 05 E3 B7  .........9..|...
B7E30590:  14 00 EF FF 2F 73 62 69 6E 2F 73 6C 62 67 64 00  ..../sbin/slbgd.

B7E305B0:  14 00 EF FF 2F 73 62 69 6E 2F 6F 73 70 66 64 00  ..../sbin/ospfd.
B7E305C0:  14 00 EF FF 00 00 00 00 A4 3C E2 B7 AC 05 E3 B7  .........<......
B7E305D0:  14 00 EF FF 2F 73 62 69 6E 2F 6D 73 74 70 64 00  ..../sbin/mstpd.
B7E305E0:  14 00 EF FF 00 00 00 00 04 3E E2 B7 CC 05 E3 B7  .........>......
B7E305F0:  14 00 EF FF 2F 73 62 69 6E 2F 6E 74 70 64 00 00  ..../sbin/ntpd..
```

Related commands

display process memory heap

display process memory heap size

display process memory heap size

Use **display process memory heap size** to display the addresses of heap memory blocks with a specified size used by a process.

Syntax

display process memory heap job *job-id* **size** *memory-size* [**offset** *offset-size*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

job *job-id*: Specifies a process by its job ID, in the range of 1 to 2147483647.

size *memory-size*: Specifies the memory block size in the range of 1 to 4294967295.

offset *offset-size*: Specifies an offset in the range of 0 to 4294967295. The default value is 128. For example, suppose the system allocates 100 16-byte memory blocks to process job 1, and the process has used 66 blocks. Then if you execute the **display process memory heap job** *1* **size** *16* **offset** *50* command, the output shows the addresses of the 51st through 66th 16-byte blocks used by the process.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The command displays memory block addresses in hexadecimal format. To view memory block content, execute the **display process memory heap address** command.

Examples

Display the addresses of 16-byte memory blocks used by process job 1.

```
<Sysname> display process memory heap job 1 size 16
0xb7e300c0  0xb7e300d0  0xb7e300e0  0xb7e300f0
0xb7e30100  0xb7e30110  0xb7e30120  0xb7e30130
0xb7e30140  0xb7e30150  0xb7e30160  0xb7e30170
0xb7e30180  0xb7e30190  0xb7e301a0  0xb7e301b0
0xb7e301c0  0xb7e301d0  0xb7e301e0  0xb7e301f0
0xb7e30200  0xb7e30210  0xb7e30220  0xb7e30230
```

Display the addresses of 16-byte memory blocks starting from the fifth block used by process job 1.

```
<Sysname> display process memory heap job 1 size 16 offset 4
0xb7e30100  0xb7e30110  0xb7e30120  0xb7e30130
0xb7e30140  0xb7e30150  0xb7e30160  0xb7e30170
0xb7e30180  0xb7e30190  0xb7e301a0  0xb7e301b0
0xb7e301c0  0xb7e301d0  0xb7e301e0  0xb7e301f0
0xb7e30200  0xb7e30210  0xb7e30220  0xb7e30230
```

Related commands

display process memory heap

display process memory heap address

exception filepath

Use **exception filepath** to specify the directory for saving core dump files.

Use **undo exception filepath** to remove the specified directory.

Syntax

exception filepath *directory*

undo exception filepath *directory*

Default

The directory for saving core dump files is the root directory of the default file system. For more information about the default file system, see file system management in *Fundamentals Configuration Guide*.

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies the directory for saving core dump files. The directory must be the root directory of a file system.

Usage guidelines

The system will save core dump files to the **core** folder in the specified directory on the master. If the **core** folder does not exist in the specified directory, the system creates the **core** folder before saving core dump files.

You can use the command to change the directory if there are different types of storage media on the device.

If no directory is specified or the specified directory is not accessible, the system cannot save core dump files.

Examples

Set the directory for saving core dump files to flash:/.

```
<Sysname> exception filepath flash:/
```

Related commands

display exception filepath

process core

monitor kernel deadloop action

Use **monitor kernel deadloop action** to specify the action to be taken in response to a kernel thread deadloop.

Use **undo monitor kernel deadloop action** to restore the default.

Syntax

monitor kernel deadloop action { **reboot** | **record-only** } [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel deadloop action [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The kernel thread deadloop protection action is **reboot**.

Views

System view

Predefined user roles

network-admin

Parameters

reboot: Logs the event and reboots the specified slot or CPU.

record-only: Logs the event.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command specifies the action for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

Use this command only under the guidance of H3C technical support staff. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

Examples

Set the kernel thread deadloop protection action to **reboot** for slot 1.

```
<Sysname> system-view
[Sysname] monitor kernel deadloop action reboot slot 1
```

Related commands

display kernel deadloop configuration

monitor kernel deadloop enable

monitor kernel deadloop enable

Use **monitor kernel deadloop enable** to enable kernel thread deadloop detection.

Use **undo monitor kernel deadloop enable** to disable kernel thread deadloop detection.

Syntax

monitor kernel deadloop enable [**slot** *slot-number* [**cpu** *cpu-number* [**core** *core-number*&<1-64>]]]

undo monitor kernel deadloop enable [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Kernel thread deadloop detection is enabled.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the master device is specified.

cpu *cpu-number*: Specifies a CPU by its number.

core *core-number*&<1-64>]: Specifies a maximum of 64 CPU cores. If you do not specify this option, the command applies to all cores of the specified CPU.

Usage guidelines

CAUTION:

Use this command only under the guidance of H3C technical support staff. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

Kernel threads share resources in kernel space. If a kernel thread monopolizes the CPU for a long time, other threads cannot run, resulting in a deadloop.

This command enables the device to detect deadloops. If a thread occupies the CPU regularly, the device considers that a deadloop has occurred.

Examples

Enable kernel thread deadloop detection.

```
<Sysname> system-view
[Sysname] monitor kernel deadloop enable
```

Related commands

display kernel deadloop

display kernel deadloop configuration

monitor kernel deadloop action

monitor kernel deadloop exclude-thread

monitor kernel deadloop time

monitor kernel deadloop exclude-thread

Use **monitor kernel deadloop exclude-thread** to disable kernel thread deadloop detection for a kernel thread.

Use **undo monitor kernel deadloop exclude-thread** to enable kernel thread deadloop detection for a kernel thread.

Syntax

monitor kernel deadloop exclude-thread *tid* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel deadloop exclude-thread [*tid*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Kernel thread deadloop detection monitors all kernel threads.

Views

System view

Predefined user roles

network-admin

Parameters

tid: Specifies a kernel thread by its ID, in the range of 1 to 2147483647. If no kernel thread is specified for the undo command, the default is restored.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the master device is specified.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

Use this command only under the guidance of H3C technical support staff. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

You can disable kernel thread deadloop detection for up to 128 kernel threads by executing the command.

Examples

Disable kernel thread deadloop detection for kernel thread 15.

```
<Sysname> system-view
[Sysname]monitor kernel deadloop exclude-thread 15
```

Related commands

display kernel deadloop configuration

display kernel deadloop

monitor kernel deadloop enable

monitor kernel deadloop time

Use **monitor kernel deadloop time** to set the interval for identifying a kernel thread deadloop.

Use **undo monitor kernel deadloop time** to restore the default.

Syntax

monitor kernel deadloop time *time* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel deadloop time [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The interval for identifying a kernel thread deadloop is 20 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time *time*: Specifies the interval for identifying a kernel thread deadloop, in the range of 1 to 65535 seconds.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the master device is specified.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

Use this command only under the guidance of H3C technical support staff. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

If a kernel thread runs for the specified interval, kernel thread deadloop detection considers that a deadloop has occurred.

Examples

Set the interval for identifying a kernel thread deadloop to 8 seconds.

```
<Sysname> system-view
[Sysname] monitor kernel deadloop time 8
```

Related commands

display kernel deadloop configuration

display kernel deadloop

Syntax

monitor kernel starvation enable [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel starvation enable [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Kernel thread starvation detection is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the master device is specified.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

CAUTION:

Use this command only under the guidance of H3C technical support staff. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

Starvation occurs when a thread is unable to access shared resources.

The command enables the system to detect and report thread starvation. If a thread is not executed within an interval, the system considers that a starvation has occurred, and outputs a starvation message.

Thread starvation does not impact system operation. A starved thread can automatically run when certain conditions are met.

Examples

Enable kernel thread starvation detection.

```
<Sysname> system-view
[Sysname] monitor kernel starvation enable
```

Related commands

Syntax

monitor kernel starvation time *time* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel starvation time [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The interval for identifying a kernel thread starvation is 120 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time *time*: Specifies the interval for identifying a kernel thread starvation, in the range of 1 to 65535 seconds.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the master device is specified.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

Use this command only under the guidance of H3C technical support staff. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

If a thread is not executed within the specified interval, the system considers that a starvation has occurred, and outputs a starvation message.

Examples

Set the interval for identifying a kernel thread starvation to 120 seconds.

```
<Sysname> system-view
[Sysname] monitor kernel starvation time 120
```

Related commands

display kernel starvation

display kernel starvation configuration

monitor kernel starvation enable

monitor process

Use **monitor process** to display process statistics.

Syntax

monitor process [**dumbtty**] [**iteration** *number*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

dumbtty: Specifies dumbtty mode. In this mode, the command displays process statistics in descending order of CPU usage without refreshing statistics. If you do not specify this keyword, the command displays statistics for the top 10 processes in descending order of CPU usage in an interactive mode, and refreshes statistics every 5 seconds by default.

iteration *number*: Specifies the number of display times, in the range of 1 to 4294967295. If you specify the **dumbtty** keyword, the *number* argument is 1 by default. If neither the **dumbtty** keyword nor the *number* argument is specified, there is no limit to the display times and process statistics are refreshed every 5 seconds.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

If you do not specify the **dumbtty** keyword, the command displays process statistics in an interactive mode. In this mode, the system automatically determines the number of displayed processes according to the screen size, and does not display exceeding processes. You can also input interactive commands as shown in Table 12 to perform relevant operations.

Table 12 Interactive commands

Commands	Description
? or h	Displays help information that includes available interactive commands.
1	Displays state information for physical CPUs. For example, if you enter 1 for the first time, the state of each physical CPU is displayed in a separate row. If you enter 1 again, the average value of all CPU states is displayed. If you enter 1 for the third time, separate states are displayed. By default, the average value of all CPU states is displayed.
c	Sorts processes by CPU usage in descending order, which is the default setting.
d	Sets the interval for refreshing process statistics, in the range of 1 to 2147483647 seconds. The default value is 5 seconds.
f	Sorts processes by the number of open files in descending order. Files are identified by file descriptors (FDs).
k	Kills a process. Because the command can impact system operation, be cautious to use it.
l	Refreshes the screen.
m	Sorts processes by memory usage in descending order.
n	Changes the maximum number of processes displayed within a screen, in the range of 0 to 2147483647. The default value is 10. A value of 0 means no limit. Only processes not exceeding the screen size can be displayed.
q	Quits the interactive mode.

Commands	Description
t	Sorts processes by running time in descending order.
<	Moves sort field to the next left column.
>	Moves sort field to the next right column.

Examples

Display process statistics in dumbtty mode. In this mode, the system displays process statistics once, and then returns to command view.

```
<Sysname> monitor process dumbtty
 76 processes; 103 threads; 687 fds
Thread states: 1 running, 102 sleeping, 0 stopped, 0 zombie

```

The system refreshes process statistics every 5 seconds. You can enter interactive commands to perform operation as follows:

- Enter **h** or a question mark (?) to display help information as follows:

```
Help for interactive commands:
      ?,h    Show the available interactive commands
        1    Toggle SMP view: '1' single/separate states
        c    Sort by the CPU field(default)
        d    Set the delay interval between screen updates
        f    Sort by number of open files
        k    Kill a job
        l    Refresh the screen
        m    Sort by memory used
        n    Set the maximum number of processes to display
        q    Quit the interactive display
        t    Sort by run time of processes since last restart
        <    Move sort field to the next left column
        >    Move sort field to the next right column
Press any key to continue
```

- Enter **d**, and then enter a number to modify the refresh interval. If you enter **3**, statistics are refreshed every 3 seconds.

```
Enter the delay interval between updates(1~2147483647): 3
```

- Enter **n**, and then enter a number to modify the maximum number of displayed processes. If you enter **5**, statistics for five processes are displayed.

```
Enter the max number of processes to display(0 means unlimited): 5
87 processes; 113 threads; 735 fds
Thread states: 2 running, 111 sleeping, 0 stopped, 0 zombie
CPU states: 86.57% idle, 0.83% user, 11.74% kernel, 0.83% interrupt
Memory: 755M total, 414M available, page size 4K
    JID    PID  PRI  State  FDs    MEM  HH:MM:SS    CPU   Name
    864    864  120    S    24  27020K  00:00:43   8.95%  syslogd

   1160   1160  120    S     28  23096K  00:00:01   0.19%  sshd
```

- Enter **q** to quit interactive mode.

Table 13 Command output

Field	Description
84 processes; 107 threads; 683 fds	Numbers of processes, threads, and open files.
JID	Job ID of a process, which never changes.
PID	ID of a process.
PRI	Priority level of a process.
State	State of a process: • **R**—Running. • **S**—Sleeping. • **T**—Traced or stopped. • **D**—Uninterruptible sleep. • **Z**—Zombie.
FDs	Number of open files for a process.
MEM	Memory usage. It displays **0** for a kernel thread.
HH:MM:SS	Running time of a process since last restart.
CPU	CPU usage of a process.
Name	Name of a process. If square brackets ([ ]) exist in a process name, the process is a kernel thread.

monitor thread

Use **monitor thread** to display thread statistics.

Syntax

monitor thread [**dumbtty**] [**iteration** *number*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

dumbtty: Specifies dumbtty mode. In this mode, the command displays all thread statistics in descending order of CPU usage without refreshing statistics. If you do not specify the keyword, the

command displays statistics for top 10 processes in descending order of CPU usage in an interactive mode, and refreshes statistics every 5 seconds by default.

iteration *number*: Specifies the number of display times, in the range of 1 to 4294967295. If you specify the **dumbtty** keyword, the *number* argument is 1 by default. If neither the **dumbtty** keyword nor the *number* argument is specified, there is no limit to the display times.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

If you do not specify the **dumbtty** keyword, the command displays thread statistics in an interactive mode. In this mode, the system automatically determines the number of displayed thread processes according to the screen size and does not display exceeding processes. You can also input interactive keywords as shown in Table 14 to perform relevant operations.

Table 14 Interactive keywords

Keyword	Description
? or h	Displays help information that includes available interactive keywords.
1	Displays one of the following items in turn when you press **1** again and again: • Values of parameters of physical CPUs. • Average values of parameters of all CPUs. By default, the command displays the average values of parameters of all CPUs.
c	Sorts statistics by CPU usage in descending order. By default, the command sorts statistics by CPU usage in descending order.
d	Sets the interval for refreshing statistics. The default interval is 5 seconds.
k	Kills a process. Because the command can impact system operation, be cautious when you use it.
l	Refreshes the screen.
n	Changes the maximum number of threads displayed within a screen, in the range of 0 to 2147483647. The default value is 10. A value of 0 means no limit. Only threads not exceeding the screen size can be displayed.
q	Quits interactive mode.
t	Sorts statistics by the running time since the latest startup.
<	Moves sort field to the next left column.
>	Moves sort field to the next right column.

Examples

Display thread statistics in dumbtty mode.

```
<Sysname> monitor thread dumbtty
84 processes; 107 threads
Thread states: 1 running, 106 sleeping, 0 stopped, 0 zombie

- Enter **h** or a question mark (?) to display help information as follows:

```
Help for interactive commands:
        ?,h      Show the available interactive commands
          1      Toggle SMP view: '1' single/separate states
          c      Sort by the CPU field(default)
          d      Set the delay interval between screen updates
          k      Kill a job
          l      Refresh the screen
          n      Set the maximum number of threads to display
          q      Quit the interactive display
          t      Sort by run time of threads since last restart
          <      Move sort field to the next left column
          >      Move sort field to the next right column
Press any key to continue
```

- Enter **d**, and then enter a number to modify the refresh interval. If you enter **3**, statistics are refreshed every 3 seconds.

```
Enter the delay interval between screen updates (1~2147483647): 3
```

- Enter **n**, and then enter a number to modify the maximum number of displayed threads. If you enter **5**, statistics for five threads are displayed.

```
Enter the max number of threads to display(0 means unlimited): 5
84 processes; 107 threads
```

```
Thread states: 1 running, 106 sleeping, 0 stopped, 0 zombie
CPU states: 93.26% idle, 0.99% user, 4.23% kernel, 1.49% interrupt
Memory: 755M total, 417M available, page size 4K
    JID    TID  LAST_CPU  PRI  State  HH:MM:SS   MAX    CPU    Name

- Enter **q** to quit interactive mode.

Table 15 Command output

Field	Description
84 processes; 107 threads	Numbers of processes and threads.
JID	Job ID of a thread, which never changes.
TID	ID of a thread.
LAST_CPU	Number of the CPU on which the most recent thread scheduling occurs.
PRI	Priority level of a thread.
State	State of a thread: • **R**—Running. • **S**—Sleeping. • **T**—Traced or stopped. • **D**—Uninterruptible sleep. • **Z**—Zombie.
HH:MM:SS	Running time of a thread since last restart.
MAX	Longest time that a single thread scheduling occupies the CPU, in milliseconds.
CPU	CPU usage of a thread.
Name	Name of a thread. If square brackets ([ ]) exist in a thread name, the thread is a kernel thread.

process core

Use **process core** to enable or disable a process to generate core dump files for exceptions and set the maximum number of core dump files.

Syntax

process core { **maxcore** *value* | **off** } { **job** *job-id* | **name** *process-name* } [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

User view

Default

A process generates a core dump file for the first exception and does not generate any core dump files for subsequent exceptions.

Predefined user roles

network-admin

Parameters

off: Disables core dump file generation.

maxcore *value*: Enables core dump file generation and sets the maximum number of core dump files, in the range of 1 to 10.

name *process-name*: Specifies a process by its name, a case-insensitive string of 1 to 15 characters.

job *job-id*: Specifies a process by its job ID, in the range of 1 to 2147483647. The job ID does not change after the process restarts.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The command applies to all instances of a process.

The command enables the system to generate a core dump file each time the specified process crashes until the maximum number of core dump files is reached. A core dump file records the exception information.

Because the core dump files consume system storage resources, you can disable core dump file generation for processes for which you do not need to review exception information.

Examples

Disable core dump file generation for process **routed**.

```
<Sysname> process core off name routed
```

Enable core dump file generation for process **routed** and set the maximum number of core dump files to 5.

```
<Sysname> process core maxcore 5 name routed
```

Related commands

display exception context

exception filepath

reset exception context

Use **reset exception context** to clear context information for process exceptions.

Syntax

reset exception context [**slot** *slot-number* [**cpu** *cpu-number*]]

Port mirroring commands

display mirroring-group

Use **display mirroring-group** to display mirroring group information.

Syntax

display mirroring-group { *group-id* | **all** | **local** | **remote-destination** | **remote-source** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 4.

all: Specifies all mirroring groups.

local: Specifies local mirroring groups.

remote-destination: Specifies remote destination groups.

remote-source: Specifies remote source groups.

Usage guidelines

Mirroring group information includes the type, status, and content of a mirroring group. It is sorted by mirroring group number.

Examples

Display information about all mirroring groups.

```
<Sysname> display mirroring-group all
Mirroring group 1:
    Type: Local
    Status: Active
    Mirroring port:
        GigabitEthernet1/0/1  Inbound
    Monitor port: GigabitEthernet1/0/2
```

Table 1 Command output

Field	Description
Mirroring group	Number of the mirroring group.
Type	Type of the mirroring group: • Local. • Remote source. • Remote destination.

Field	Description
Status	Status of the mirroring group: • **Active**—The mirroring group has taken effect. • **Incomplete**—The mirroring group configuration is not complete and does not take effect.
Mirroring port	Source port.
Monitor port	Destination port.

mirroring-group

Use **mirroring-group** to create a mirroring group.

Use **undo mirroring-group** to delete mirroring groups.

Syntax

mirroring-group *group-id* { **local** | **remote-destination** | **remote-source** }

undo mirroring-group { *group-id* | **all** | **local** | **remote-destination** | **remote-source** }

Default

No mirroring groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group ID. The value range for this argument is 1 to 4.

local: Specifies local mirroring groups.

remote-destination: Specifies remote destination groups.

remote-source: Specifies remote source groups.

all: Specifies all mirroring groups.

Examples

Create local mirroring group 1.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
```

mirroring-group mirroring-port (interface view)

Use **mirroring-group mirroring-port** to configure a port as a source port for a mirroring group.

Use **undo mirroring-group mirroring-port** to restore the default.

Syntax

mirroring-group *group-id* **mirroring-port** { **both** | **inbound** | **outbound** }

undo mirroring-group *group-id* **mirroring-port**

Default

A port does not act as a source port for any mirroring groups.

Views

Interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 4.

both: Mirrors both received and sent packets.

inbound: Mirrors only received packets.

outbound: Mirrors only sent packets.

Usage guidelines

You can configure source ports only for local mirroring groups and remote source groups.

A Layer 2 aggregate interface cannot be configured as a source port for a mirroring group.

Do not assign a source port of a mirroring group to the remote probe VLAN of the mirroring group.

The device supports only one mirroring group for outbound or bidirectional traffic mirroring

A port can act as a source port for only one mirroring group.

A source port cannot be used as a reflector port, monitor port, or egress port.

Examples

Create local mirroring group 1 to monitor the bidirectional traffic of the port GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mirroring-group 1 mirroring-port both
```

Create remote source group 2 to monitor the bidirectional traffic of the port GigabitEthernet 1/0/2.

```
<Sysname> system-view
[Sysname] mirroring-group 2 remote-source
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] mirroring-group 2 mirroring-port both
```

Related commands

mirroring-group

mirroring-group mirroring-port (system view)

Use **mirroring-group mirroring-port** to configure source ports for a mirroring group.

Use **undo mirroring-group mirroring-port** to remove source ports from a mirroring group.

Syntax

mirroring-group *group-id* **mirroring-port** *interface-list* { **both** | **inbound** | **outbound** }

undo mirroring-group *group-id* **mirroring-port** *interface-list*

Default

No source port is configured for a mirroring group.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 4.

interface-list: Specifies a space-separated list of up to eight interface items. Each item specifies an interface by its type and number or specifies a range of interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*. When you specify a range of interfaces, the interfaces must be of the same type and on the same slot. The start interface number must be identical to or lower than the end interface number.

both: Mirrors both received and sent packets.

inbound: Mirrors only received packets.

outbound: Mirrors only sent packets.

Usage guidelines

You can configure source ports only for local mirroring groups and remote source groups.

A Layer 2 aggregate interface cannot be configured as a source port for a mirroring group.

Do not assign a source port of a mirroring group to the remote probe VLAN of the mirroring group.

The device supports only one mirroring group for outbound or bidirectional traffic mirroring.

A port can act as a source port for only one mirroring group.

A source port cannot be used as a reflector port, monitor port, or egress port.

Examples

Create local mirroring group 1 to monitor the bidirectional traffic of GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] mirroring-group 1 mirroring-port gigabitethernet 1/0/1 both
```

Create remote source group 2 to monitor the bidirectional traffic of GigabitEthernet 1/0/2.

```
<Sysname> system-view
[Sysname] mirroring-group 2 remote-source
[Sysname] mirroring-group 2 mirroring-port gigabitethernet 1/0/2 both
```

Related commands

mirroring-group

mirroring-group monitor-egress

Use **mirroring-group monitor-egress** to configure the egress port for a remote source group.

Use **undo mirroring-group monitor-egress** to restore the default.

Syntax

In system view:

mirroring-group *group-id* **monitor-egress** *interface-type interface-number*

undo mirroring-group *group-id* **monitor-egress** *interface-type interface-number*

In interface view:

mirroring-group *group-id* **monitor-egress**

undo mirroring-group *group-id* **monitor-egress**

Default

No egress port is configured for a remote source group.

Views

System view

Interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 4.

interface-type interface-number: Specifies a port by its type and number.

Usage guidelines

You can configure egress ports only for remote source groups.

For port mirroring to work correctly, disable the following features on the egress port of a mirroring group:

- Spanning tree.
- 802.1X.
- IGMP snooping.
- Static ARP.
- MAC address learning.

The member port of an existing mirroring group cannot be configured as an egress port.

The member port of an aggregate interface cannot be configured as an egress port.

Examples

Create remote source group 1. Configure GigabitEthernet 1/0/1 as its egress port in system view.

```
<Sysname> system-view
[Sysname] mirroring-group 1 remote-source
[Sysname] mirroring-group 1 monitor-egress gigabitethernet 1/0/1
```

Create remote source group 2. Configure GigabitEthernet 1/0/2 as its egress port in interface view.

```
<Sysname> system-view
[Sysname] mirroring-group 2 remote-source
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] mirroring-group 2 monitor-egress
```

Related commands

mirroring-group

mirroring-group monitor-port (interface view)

Use **mirroring-group monitor-port** to configure a port as the monitor port for a mirroring group.

Use **undo mirroring-group monitor-port** to restore the default.

Syntax

mirroring-group *group-id* **monitor-port**

undo mirroring-group *group-id* **monitor-port**

Default

A port does not act as the monitor port for any mirroring groups.

Views

Interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 4.

Usage guidelines

You can configure monitor ports only for local mirroring groups and remote destination groups.

Do not enable the spanning tree feature on the monitor port of a mirroring group.

For an aggregate interface configured as the monitor port of a mirroring group, do not configure its member ports as source ports of the mirroring group.

Use a monitor port only for port mirroring, so the data monitoring device receives and analyzes only the mirrored traffic.

The member port of an existing mirroring group cannot be configured as a monitor port.

The member port of an aggregate interface cannot be configured as a monitor port.

Only one monitor port can be configured for a mirroring group.

Examples

Create local mirroring group 1 and configure GigabitEthernet 1/0/1 as its monitor port.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mirroring-group 1 monitor-port
```

Create remote destination group 2 and configure GigabitEthernet 1/0/2 as its monitor port.

```
<Sysname> system-view
[Sysname] mirroring-group 2 remote-destination
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] mirroring-group 2 monitor-port
```

Related commands

mirroring-group

mirroring-group monitor-port (system view)

Use **mirroring-group monitor-port** to configure the monitor ports for a mirroring group.

Use **undo mirroring-group monitor-port** to remove the monitor ports from a mirroring group.

Syntax

mirroring-group *group-id* **monitor-port** *interface-type interface-number*

undo mirroring-group *group-id* **monitor-port** *interface-type interface-number*

Default

No monitor port is configured for a mirroring group.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 4.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

You can configure monitor ports only for local mirroring groups and remote destination groups.

Do not enable the spanning tree feature on the monitor port of a mirroring group.

For an aggregate interface configured as the monitor port of a mirroring group, do not configure its member ports as source ports of the mirroring group.

Use a monitor port only for port mirroring, so the data monitoring device receives only the mirrored traffic.

The member port of an existing mirroring group cannot be configured as a monitor port.

The member port of an aggregate interface cannot be configured as a monitor port.

Only one monitor port can be configured for a mirroring group.

Examples

Create local mirroring group 1 and configure GigabitEthernet 1/0/1 as its monitor port.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] mirroring-group 1 monitor-port gigabitethernet 1/0/1
```

Create remote destination group 2 and configure GigabitEthernet 1/0/2 as its monitor port.

```
<Sysname> system-view
[Sysname] mirroring-group 2 remote-destination
[Sysname] mirroring-group 2 monitor-port gigabitethernet 1/0/2
```

Related commands

mirroring-group

mirroring-group reflector-port

Use **mirroring-group reflector-port** to configure the reflector port for a remote source group.

Use **undo mirroring-group reflector-port** to restore the default.

Syntax

In system view:

mirroring-group *group-id* **reflector-port** *interface-type interface-number*

undo mirroring-group *group-id* **reflector-port** *interface-type interface-number*

In interface view:

mirroring-group *group-id* **reflector-port**

undo mirroring-group *group-id* **reflector-port**

Default

No reflector port is configured for a mirroring group.

Views

System view

Interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 4.

interface-type interface-number: Specifies a port by its type and number.

Usage guidelines

CAUTION:

- The port to be configured as a reflector port must be a port not in use. Do not connect a network cable to a reflector port.
- When a port is configured as a reflector port, the port restores to the factory default settings. You cannot configure other features on a reflector port.
- If an IRF port is bound to only one physical interface, do not configure the physical interface as a reflector port. Otherwise, the IRF might split.

You can configure reflector ports only for remote source groups.

You cannot change the duplex mode, MDI settings, or speed for a reflector port.

The member port of an aggregate interface cannot be configured as a reflector port.

Examples

Create remote source group 1. Configure GigabitEthernet 1/0/1 as its reflector port in system view.

```
<Sysname> system-view
[Sysname] mirroring-group 1 remote-source
[Sysname] mirroring-group 1 reflector-port gigabitethernet 1/0/1
This operation may delete all settings made on the interface. Continue? [Y/N]: y
```

Create remote source group 2. Configure GigabitEthernet 1/0/2 as its reflector port in interface view.

```
<Sysname> system-view
[Sysname] mirroring-group 2 remote-source
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] mirroring-group 2 reflector-port
This operation may delete all settings made on the interface. Continue? [Y/N]: y
```

Related commands

mirroring-group

mirroring-group remote-probe vlan

Use **mirroring-group remote-probe vlan** to specify a VLAN as the remote probe VLAN for a mirroring group.

Use **undo mirroring-group remote-probe vlan** to restore the default.

Syntax

mirroring-group *group-id* **remote-probe vlan** *vlan-id*

undo mirroring-group *group-id* **remote-probe vlan** *vlan-id*

Default

No remote probe VLAN is configured for a mirroring group.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 4.

vlan-id: Specifies a VLAN by its ID.

Usage guidelines

You can configure remote probe VLANs only for remote source groups and remote destination groups.

When a VLAN is configured as a remote probe VLAN, use the VLAN for port mirroring exclusively.

The remote mirroring groups on the source device and destination device must use the same remote probe VLAN.

Only a static VLAN that already exists can be configured as a remote probe VLAN. A VLAN can be configured as the remote probe VLAN for only one mirroring group.

To delete a VLAN that is configured as a remote probe VLAN, remove the remote probe VLAN configuration first.

The device supports only one remote probe VLAN.

Examples

Create remote source group 1 and configure VLAN 10 as its remote probe VLAN.

```
<Sysname> system-view
[Sysname] mirroring-group 1 remote-source
[Sysname] mirroring-group 1 remote-probe vlan 10
```

Create remote destination group 2 and configure VLAN 20 as its remote probe VLAN.

```
<Sysname> system-view
[Sysname] mirroring-group 2 remote-destination
[Sysname] mirroring-group 2 remote-probe vlan 20
```

Related commands

Predefined user roles

network-admin

Examples

Create traffic behavior 1 and configure the action of mirroring traffic to the CPU for the traffic behavior.

```
<Sysname> system-view
[Sysname] traffic behavior 1
[Sysname-behavior-1] mirror-to cpu
```

mirror-to interface

Use **mirror-to interface** to configure a mirroring action that mirrors traffic to an interface.

Use **undo mirror-to interface** to delete a mirroring action that mirrors traffic to an interface.

Syntax

mirror-to interface *interface-type interface-number*

undo mirror-to interface *interface-type interface-number*

Default

No mirroring actions exist to mirror traffic to interfaces.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

*interface-type interface-numbe*r: Specifies an interface by its type and number.

Usage guidelines

You can execute the **mirror-to interface** *interface-type interface-number* command multiple times for a traffic behavior to mirror traffic to different interfaces.

You can configure a maximum of four traffic behaviors that contain mirroring actions. If you configure more than four such traffic behaviors, only the first four traffic behaviors take effect.

You can use the **mirror-to interface** *interface-type interface-number* command to mirror traffic to only one interface in a traffic behavior. If you execute the command for a traffic behavior multiple times, the most recent configuration takes effect.

Examples

Create traffic behavior 1 and configure the action of mirroring traffic to GigabitEthernet 1/0/1 for the traffic behavior.

```
<Sysname> system-view
[Sysname] traffic behavior 1
[Sysname-behavior-1] mirror-to interface gigabitethernet 1/0/1
```

```

Table 1 Command output

Field	Description
sFlow datagram version	sFlow version, which can only take the value of 5. The device can send only sFlow packets whose sFlow version is 5.
Global information	Global sFlow information.
Agent IP	IP address of the sFlow agent: • **CLI**—Manually configured IP address. • **Auto**—Automatically configured IP address.
Source address	Source IP address of sFlow packets.
Collector information	sFlow collector information.
ID	sFlow collector ID.

Field	Description
IP	sFlow collector IP address.
Port	sFlow collector port.
Aging	Remaining lifetime of the sFlow collector. If this field displays **N/A**, the sFlow collector never ages out.
Size	Maximum length of the sFlow data portion in an sFlow packet.
VPN-instance	This field is not supported in the current software version. Name of the VPN instance to which the sFlow collector belongs.
Description	Description of the sFlow collector.
Port counter sampling information	Information about interfaces configured with counter sampling.
Port flow sampling information	Information about interfaces configured with flow sampling.
Interface	Interface configured with sFlow.
Instance	ID of the sFlow instance for sending counter or flow sampled packets.
CID	ID of the sFlow collector for receiving counter sampled packets. If no sFlow collector ID is specified, this field displays **0**.
Interval(s)	Counter sampling interval, in seconds.
FID	ID of the sFlow collector for receiving flow sampled packets. If no sFlow collector ID is specified, this field displays **0**.
MaxHLen	Maximum number of bytes that can be copied in a sampled packet (starting from the packet header).
Rate	Number of packets out of which the interface samples a packet by using flow sampling.
Mode	Flow sampling mode.
Status	sFlow status of the port: • **Suspended**—The sFlow feature is suspended because the port is down. • **Active**—The sFlow feature is active because the port is up.

sflow agent

Use **sflow agent** to configure an IP address for the sFlow agent.

Use **undo sflow agent** to restore the default.

Syntax

sflow agent { **ip** *ipv4-address* | **ipv6** *ipv6-address* }

undo sflow agent { **ip** | **ipv6** }

Default

No IP address is configured for the sFlow agent. The device periodically identifies whether the sFlow agent has an IP address. If the sFlow agent does not have an IP address, the device automatically selects an IPv4 address for the sFlow agent. It does not save the IPv4 address in the configuration file.

Views

System view

Predefined user roles

network-admin

Parameters

ip *ipv4-address*: Specifies an IPv4 address for the sFlow agent.

ipv6 *ipv6-address*: Specifies an IPv6 address for the sFlow agent.

Usage guidelines

As a best practice, manually configure an IP address for the sFlow agent.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify IP address 10.10.10.1 for the sFlow agent.

```
<Sysname> system-view
[Sysname] sflow agent ip 10.10.10.1
```

sflow collector

Use **sflow collector** to configure parameters for an sFlow collector.

Use **undo sflow collector** to remove an sFlow collector.

Syntax

sflow collector *collector-id* { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number* | **datagram-size** *size* | **time-out** *seconds* | **description** *string*] *

undo sflow collector *collector-id*

Default

No sFlow collector information is configured.

Views

System view

Predefined user roles

network-admin

Parameters

collector-id: Specifies an sFlow collector by its ID. The value range for this argument is 1 to 10.

ip *ipv4-address*: Specifies an IPv4 address for the sFlow collector.

ipv6 *ipv6-address*: Specifies an IPv6 address for the sFlow collector.

port *port-number*: Specifies the UDP port number of the sFlow collector, in the range of 1 to 65535. The default is 6343.

datagram-size *size*: Specifies the maximum length of the sFlow data portion in an sFlow packet. The value range for the *size* argument is 200 to 3000 bytes, and the default value is 1400 bytes.

time-out *seconds*: Specifies the aging timer of the sFlow collector, in the range of 1 to 2147483647 seconds. When the aging timer expires, the sFlow collector settings are deleted. The sFlow collector settings do not age out by default.

description *string*: Specifies a description, a case-sensitive string of 1 to 127 characters. The default description is "CLI Collector."

Examples

Configure the following parameters for sFlow collector 2:

- **IP address**—3.3.3.1.
- **Port number**—Default.
- **Description**—netserver.
- **Aging timer**—1200 seconds.
- **Maximum length of the sFlow data portion in the sFlow packet**—1000 bytes.

```
<Sysname> system-view
[Sysname] sflow collector 2 ip 3.3.3.1 description netserver time-out 1200 datagram-size
1000
```

sflow counter collector

Use **sflow counter collector** to specify an sFlow instance and an sFlow collector for counter sampling.

Use **undo sflow counter collector** to restore the default.

Syntax

sflow counter [**instance** *instance-id*] **collector** *collector-id*

undo sflow counter [**instance** *instance-id*] **collector**

Default

No sFlow instance or sFlow collector is specified for counter sampling.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

instance *instance-id*: Specifies an sFlow instance by its ID in the range of 1 to 4. The default ID for an sFlow instance is 1. If you do not specify an sFlow instance, this command specifies sFlow instance 1 for counter sampling.

collector-id: Specifies an sFlow collector by its ID. The value range for this argument is 1 to 10.

Usage guidelines

This command enables the device to send counter sampling information on an interface to the specified sFlow collector.

On an interface, one sFlow instance has only one sFlow collector. To specify multiple sFlow collectors for counter sampling, execute this command multiple times and use different sFlow instances each time. If you execute this command multiple times but use the same sFlow instance and different sFlow collectors each time, the most recent configuration takes effect.

On an interface, counter sampling and flow sampling are separate from each other. They can have the same sFlow instance but different sFlow collectors specified.

Settings of sFlow instances and sFlow collectors for different interfaces do not affect each other. Configure this command based on actual requirement.

Examples

Specify sFlow instance 2 and sFlow collector 2 on GigabitEthernet 1/0/1 for counter sampling.

```
<Sysname> system-view
```

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] sflow counter instance 2 collector 2
```

sflow counter interval

Use **sflow counter interval** to enable counter sampling and set a counter sampling interval.

Use **undo sflow counter interval** to disable counter sampling.

Syntax

sflow counter interval *interval*

undo sflow counter interval

Default

Counter sampling is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the counter sampling interval in the range of 2 to 86400 seconds.

Examples

Enable counter sampling and set the counter sampling interval to 120 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] sflow counter interval 120
```

sflow flow collector

Use **sflow flow collector** to specify an sFlow instance and an sFlow collector for flow sampling.

Use **undo sflow flow collector** to restore the default.

Syntax

sflow flow [**instance** *instance-id*] **collector** *collector-id*

undo sflow flow [**instance** *instance-id*] **collector**

Default

No sFlow instance or sFlow collector is specified for flow sampling.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

instance *instance-id*: Specifies an sFlow instance by its ID in the range of 1 to 4. The default ID for an sFlow instance is 1. If you do not specify an sFlow instance, this command specifies sFlow instance 1 for flow sampling.

collector-id: Specifies an sFlow collector by its ID. The value range for this argument is 1 to 10.

Usage guidelines

This command enables the device to send flow sampling information on an interface to the specified sFlow collector.

On an interface, one sFlow instance has only one sFlow collector. To specify multiple sFlow collectors for flow sampling, execute this command multiple times and use different sFlow instances each time. If you execute this command multiple times but use the same sFlow instance and different sFlow collectors each time, the most recent configuration takes effect.

On an interface, counter sampling and flow sampling are separate from each other. They can have the same sFlow instance but different sFlow collectors specified.

Settings of sFlow instances and sFlow collectors for different interfaces do not affect each other. Configure this command based on actual requirement.

Examples

Specify sFlow instance 2 and sFlow collector 2 on GigabitEthernet 1/0/1 for flow sampling.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] sflow flow instance 2 collector 2
```

sflow flow max-header

Use **sflow flow max-header** to set the maximum number of bytes (starting from the packet header) that flow sampling can copy per packet.

Use **undo sflow flow max-header** to restore the default.

Syntax

sflow flow max-header *length*

undo sflow flow max-header

Default

Flow sampling can copy up to 128 bytes of a packet.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

length: Specifies the maximum number of bytes that can be copied, in the range of 18 to 512. As a best practice, use the default value.

Examples

Set the maximum number of bytes to 60 for flow sampling to copy per packet on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
```

```
[Sysname-GigabitEthernet1/0/1] sflow flow max-header 60
```

sflow sampling-mode

Use **sflow sampling-mode** to specify a flow sampling mode.

Use **undo sflow sampling-mode** to restore the default.

Syntax

sflow sampling-mode random

undo sflow sampling-mode

Default

Random sampling is used.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

random: Specifies the random sampling mode. For example, if the packet sampling interval is set to 4000 (by using the **sflow sampling-rate** command), the device samples packets randomly as follows:

- The device might sample one packet from the first 4000 packets.
- The device might sample multiple packets from the next 4000 packets.
- The device might sample no packets from the third 4000 packets.

However, the device samples one packet from 4000 packets on average.

Examples

Specify random flow sampling mode on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] sflow sampling-mode random
```

Related commands

sflow sampling-rate

sflow sampling-rate

Use **sflow sampling-rate** to enable flow sampling and specify the number of packets out of which flow sampling will sample a packet.

Use **undo sflow sampling-rate** to disable flow sampling.

Syntax

sflow sampling-rate *rate*

undo sflow sampling-rate

Default

Flow sampling is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

rate: Specifies the number of packets out of which flow sampling will sample a packet on the interface. The value range for this argument is 1000 to 500000. As a best practice, set the sampling interval to 2^n that is greater than or equal to 8192, for example, 32768.

Examples

Enable flow sampling to sample a packet out of 32768 packets on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] sflow sampling-rate 32768
```

Related commands

sflow sampling-mode

sflow source

Use **sflow source** to specify the source IP address of sent sFlow packets.

Use **undo sflow source** to restore the default.

Syntax

sflow source { **ip** *ipv4-address* | **ipv6** *ipv6-address* } *

undo sflow source { **ip** | **ipv6** } *

Default

The source IP address of sent sFlow packets is determined by routing.

Views

System view

Predefined user roles

network-admin

Parameters

ip *ipv4-address*: Specifies the source IPv4 address of sent sFlow packets.

ipv6 *ipv6-address*: Specifies the source IPv6 address of sent sFlow packets.

Examples

Specify the source IPv4 address of sent sFlow packets as 10.0.0.1.

```
<Sysname> system-view
[Sysname] sflow source ip 10.0.0.1
```

Contents

Information center commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

diagnostic-logfile save

Use **diagnostic-logfile save** to manually save diagnostic logs from the diagnostic log file buffer to the diagnostic log file.

Syntax

diagnostic-logfile save

Views

Any view

Predefined user roles

network-admin

Usage guidelines

You can specify the directory to save the diagnostic log file by using the **info-center diagnostic-logfile directory** command.

The system clears the diagnostic log file buffer after saving the buffered diagnostic logs to the diagnostic log file.

If the diagnostic log file buffer is empty, this command displays a success message event though no logs are saved to the diagnostic log file.

Examples

Manually save diagnostic logs from the diagnostic log file buffer to the diagnostic log file.

```
<Sysname> diagnostic-logfile save
The contents in the diagnostic log file buffer have been saved to the file
flash:/diagfile/diagfile.log.
```

Related commands

info-center diagnostic-logfile enable

info-center diagnostic-logfile directory

display diagnostic-logfile summary

Use **display diagnostic-logfile summary** to display the diagnostic log file configuration.

Syntax

display diagnostic-logfile summary

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the diagnostic log file configuration.

```
<Sysname> display diagnostic-logfile summary
  Diagnostic log file: Enabled.
  Diagnostic log file size quota: 10 MB
  Diagnostic log file directory: flash:/diagfile
  Writing frequency: 24 hour 0 min 0 sec
```

Table 1 Command output

Field	Description
Diagnostic log file	Status of the diagnostic log file: • **Enabled**—Diagnostic logs can be output to the diagnostic log file. • **Disabled**—Diagnostic logs cannot be output to the diagnostic log file.
Diagnostic log file size quota	Maximum size for the diagnostic log file, in MB.
Log file directory	Directory where the diagnostic log file is saved.
Writing frequency	Interval at which the system saves diagnostic logs from the buffer to the diagnostic log file.

display info-center

Use **`display info-center`** to display information center configuration.

Syntax

`display info-center`

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information center configuration.

```
<Sysname> display info-center
Information Center: Enabled
Console: Enabled
Monitor: Enabled
Log host: Enabled
    192.168.0.1, log output filter: loghost1,
    port number: 5000, host facility: local7
Log buffer: Enabled
    Max buffer size 1024, current buffer size 512,
    Current messages 0, dropped messages 0, overwritten messages 0
Log file: Enabled
Security log file: Enabled
Information timestamp format:
```

```
Log host: Date
Other output destination: Date
```

display info-center filter

Use **display info-center filter** to display information about log output filters.

Syntax

display info-center filter [*filter-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

filter-name: Specifies an existing log output filter by its name. If you do not specify a log output filter, this command displays information about all log output filters.

Examples

Display information about log output filter **loghost1**.

```
<Sysname> display info-center filter loghost1
 Log output filter: loghost1
 Module                        Rule
 ARP                           Debugging
 CFGLOG                        Deny
 Default                       Informational
```

Table 2 Command output

Field	Description
Log output filter:	Name of the log output filter.
Module	Module to which the log output filter applies.
Rule	Rules in the log output filter.

Related commands

info-center filter

display logbuffer

Use **display logbuffer** to display log buffer information and buffered logs.

Syntax

display logbuffer [**reverse**] [**level** *severity* | **size** *buffersize* | **slot** *slot-number*]* [**last-mins** *mins*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

reverse: Displays log entries chronologically, with the most recent entry at the top. If you do not specify this keyword, the command displays log entries chronologically, with the oldest entry at the top.

level *severity*: Specifies a severity level in the range of 0 to 7. If you do not specify a severity level, this command displays log information for all levels.

Table 3 Log levels

Severity value	Level	Description	Keyword in commands
0	Emergency	The system is unusable. For example, the system authorization has expired.	**emergency**
1	Alert	Action must be taken immediately. For example, traffic on an interface exceeds the upper limit.	**alert**
2	Critical	Critical condition. For example, the device temperature exceeds the upper limit, the power module fails, or the fan tray fails.	**critical**
3	Error	Error condition. For example, the link state changes.	**error**
4	Warning	Warning condition. For example, an interface is disconnected, or the memory resources are used up.	**warning**
5	Notification	Normal but significant condition. For example, a terminal logs in to the device, or the device reboots.	**notification**
6	Informational	Informational message. For example, a command or a **ping** operation is executed.	**informational**
7	Debugging	Debugging message.	**debugging**

size *buffersize*: Specifies the number of latest logs to be displayed. The value range is 1 to 1024. If you do not specify this option, the command displays all logs in the log buffer.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

last-mins *mins*: Displays logs buffered over the last specified period of time. The *mins* argument specifies a time period in the range of 1 to 43200 minutes. If you do not specify a time period, the command displays all logs in the log buffer.

Examples

Display log buffer information and buffered logs.

```
<Sysname> display logbuffer
Log buffer: Enabled
Max buffer size: 1024
Actual buffer size: 512
Dropped messages: 0
Overwritten messages: 718
Current messages: 512
%Jun 17 15:57:09:578 2016 Sysname SYSLOG/7/SYS_RESTART:System restarted --
```

```
...
```

Display log buffer information and logs buffered over the last 5 minutes.

```
<Sysname> display logbuffer last-mins 5
Log buffer: Enabled
Max buffer size: 1024
Actual buffer size: 512
Dropped messages: 0
Overwritten messages: 0
Current messages: 191
%Jan  1 01:00:06:784 2011 Sysname SHELL/6/SHELL_CMD:
-Line=vty0-IPAddr=192.168.1.242-User=**; Command is display current-configuration
%Jan  1 01:03:19:691 2018 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 192.168.1.33.
%Jan  1 01:03:21:269 2018 Sysname SHELL/6/SHELL_CMD:
-Line=vty1-IPAddr=192.168.1.33-User=**; Command is display logbuffer last-mins 5
```

Table 4 Command output

Field	Description
Log buffer	Status of the log buffer: • **Enabled**—Logs can be output to the log buffer. • **Disabled**—Logs cannot be output to the buffer.
Max buffer size	Maximum buffer size supported by the device.
Actual buffer size	Maximum buffer size configured by using the **info-center logbuffer size** command.
Dropped messages	Number of dropped messages.
Overwritten messages	Number of overwritten messages.
Current messages	Number of current messages.

Related commands

info-center logbuffer

display logbuffer summary

Use **display logbuffer summary** to display the log buffer summary.

Syntax

display logbuffer summary [**level** *severity* | **slot** *slot-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

level *severity*: Specifies a severity level in the range of 0 to 7. If you do not specify a severity level, this command displays log information of all levels in the log buffer. For more information about log levels, see Table 3.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Examples

Display the summary of the log buffer.

```
<Sysname> display logbuffer summary
  Slot EMERG ALERT  CRIT ERROR  WARN NOTIF  INFO DEBUG
     1     0     0     0     7     0    34    38     0
```

Table 5 Command output

Field	Description
EMERG	Represents emergency. For more information, see Table 3.
ALERT	Represents alert. For more information, see Table 3.
CRIT	Represents critical. For more information, see Table 3.
ERROR	Represents error. For more information, see Table 3.
WARN	Represents warning. For more information, see Table 3.
NOTIF	Represents notification. For more information, see Table 3.
INFO	Represents informational. For more information, see Table 3.
DEBUG	Represents debug. For more information, see Table 3.

display logfile buffer

Use **display logfile buffer** to display the content of the log file buffer.

Syntax

display logfile buffer

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

The system saves logs to the log file buffer before the logs are saved to the log file automatically or manually.

After saving the buffered logs to the log file, the system clears the log file buffer.

Examples

Display the content of the log file buffer.

```
<Sysname> display logfile buffer
%@356%Dec 13 16:53:45:495 2017 H3C SHELL/6/SHELL_CMD: -Line=con0-IPAddr=**-User=**;
Command is logfile save.

  Log file directory: flash:/logfile
  Writing frequency: 24 hour 0 min 10 sec
```

Table 6 Command output

Field	Description
Log file	Log file status: • **Enabled**—Logs can be output to the log file. • **Disabled**—Logs cannot be output to the log file.
Log file size quota	Maximum log file size, in MB.
Log file directory	Log file directory.
Writing frequency	Log file writing frequency.

display security-logfile buffer

Use **display security-logfile buffer** to display the content of the security log file buffer.

Syntax

display security-logfile buffer

Views

Any view

Predefined user roles

security-audit

Usage guidelines

The system saves security logs to the security log file buffer before the logs are saved to the security log file automatically or manually.

After saving the buffered security logs to the security log file, the system clears the security log file buffer.

To use this command, a local user must have the security-audit user role. For information about configuring the security-audit user role, see AAA commands in *Security Command Reference*.

Examples

Display the content of the security log file buffer.

```
<Sysname> display security-logfile buffer
%@1%Sep 17 11:13:16:609 2017 Sysname SHELL/5/SHELL_LOGIN: Console logged in from con0.
```

authorization-attribute (*Security Command Reference*)

enable log updown

Use **enable log updown** to enable an interface to generate link up or link down logs when the interface state changes.

Use **undo enable log updown** to disable an interface from generating link up or link down logs when the interface state changes.

Syntax

enable log updown

undo enable log updown

Default

All interfaces are allowed to generate link up and link down logs.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable GigabitEthernet 1/0/1 from generating link up or link down logs.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo enable log updown
```

info-center diagnostic-logfile directory

Use **info-center diagnostic-logfile directory** to configure the directory to save the diagnostic log file.

Syntax

info-center diagnostic-logfile directory *dir-name*

Default

The diagnostic log file directory is **flash:/diagfile**.

Views

System view

Predefined user roles

network-admin

Parameters

dir-name: Specifies a directory by its name, a string of 1 to 64 characters.

Usage guidelines

The specified directory must have been created.

This command cannot survive an IRF reboot or a master/subordinate switchover.

Examples

Set the diagnostic log file directory to **flash:/test**.

```
<Sysname> mkdir test
Creating directory flash:/test... Done.
<Sysname> system-view
[Sysname] info-center diagnostic-logfile directory flash:/test
```

info-center diagnostic-logfile enable

Use **info-center diagnostic-logfile enable** to enable saving diagnostic logs to the diagnostic log file.

Use **undo info-center diagnostic-logfile enable** to disable saving diagnostic logs to the diagnostic log file.

Syntax

info-center diagnostic-logfile enable

undo info-center diagnostic-logfile enable

Default

Saving diagnostic logs to the diagnostic log file is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables saving diagnostic logs to the diagnostic log file for centralized management. Users can view the diagnostic logs to monitor device activities and to troubleshoot problems.

Examples

Enable saving diagnostic logs to the diagnostic log file.

```
<Sysname> system-view
[Sysname] info-center diagnostic-logfile enable
```

info-center diagnostic-logfile frequency

Use **info-center diagnostic-logfile frequency** to configure the interval at which the system saves diagnostic logs from the diagnostic log file buffer to the diagnostic log file.

Use **undo info-center diagnostic-logfile frequency** to restore the default.

Syntax

info-center diagnostic-logfile frequency *freq-sec*

undo info-center diagnostic-logfile frequency

Default

The diagnostic log file saving interval is 86400 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

freq-sec: Specifies the diagnostic log file saving interval in seconds. The value range is 10 to 86400.

Usage guidelines

The system outputs diagnostic logs to the diagnostic log file buffer, and then saves the buffered logs to the diagnostic log file at the specified interval.

Examples

Set the diagnostic log file saving interval to 600 seconds.

```
<Sysname> system-view
[Sysname] info-center diagnostic-logfile frequency 600
```

Related commands

info-center diagnostic-logfile enable

info-center diagnostic-logfile quota

Use **info-center diagnostic-logfile quota** to set the maximum size for the diagnostic log file.

Use **undo info-center diagnostic-logfile quota** to restore the default.

Syntax

info-center diagnostic-logfile quota *size*

undo info-center diagnostic-logfile quota

Default

The maximum size for the diagnostic log file is 10 MB.

Views

System view

Predefined user roles

network-admin

Parameters

size: Specifies the maximum size for the diagnostic log file, in MB. The value range is 1 to 10.

Examples

Set the maximum size to 6 MB for the diagnostic log file.

```
<Sysname> system-view
```

```
[Sysname] info-center diagnostic-logfile quota 6
```

info-center enable

Use **info-center enable** to enable the information center.

Use **undo info-center enable** to disable the information center.

Syntax

info-center enable

undo info-center enable

Default

The information center is enabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the information center.

```
<Sysname> system-view
[Sysname] info-center enable
Information center is enabled.
```

info-center filter

Use **info-center filter** to create a log output filter.

Syntax

info-center filter *filter-name* { *module-name* | **default** } { **deny** | **level** *severity* }

undo info-center filter *filter-name* [*module-name* | **default**]

Default

No log output filters exist.

Views

System view

Predefined user roles

network-admin

Parameters

filter-name: Specifies a name for the log output filter, a case-insensitive string of 1 to 8 characters.

module-name: Specifies a module by its name. To view the names of supported modules, execute the **info-center filter** *filter-name* **?** command.

default: Specifies all supported modules.

deny: Disables log output.

level *severity*: Specifies a log severity level by its name. Supported severity levels are **alert**, **critical**, **debugging**, **emergency**, **error**, **informational**, **notification**, and **warning**. See Table 3 for more information about the log severity levels. The log output filter applies to logs of the specified severity level and all higher levels.

Usage guidelines

A log output filter contains a set of log output filter rules for modules. You can use this command to create multiple log output filters. When specifying a log host, you can apply a log output filter to control log output to the log host.

You can also use the **info-center source** command to configure log output rules for the log host output destination. The system chooses the settings to control log output to a log host in the following order:

1. Log output filter specified for the log host by using the **info-center loghost** command.
2. Log output rules configured for the log host output destination by using the **info-center source** command.
3. Default log output rules (see Table 8).

Follow these restrictions and guidelines when you configure a log output filter:

- To set a log output filter rule for a module, use the *module-name* argument to specify the module name.

  If you set log output filter rules for the same module multiple times, the most recent configuration takes effect.
- To set a general log output filter rule for all modules, use the **default** keyword. The general log output filter rule applies to all modules that do not have module-specific filter rules.

  If you set a general log output filter rule multiple times, the most recent configuration takes effect.
- If no general log output filter rule is set, the system outputs logs with severity levels **informational** through **alert** for modules that do not have module-specific filter rules.
- To remove a module-specific log output filter rule, you must use the *module-name* argument. If you do not specify any parameters, the entire log output filter is deleted.

Examples

Create log output filter **loghost1**. In the log output filter, enable the ARP module to output logs with severity levels **notification** through **alert**, the SNMP module to output logs with severity levels **warning** through **alert**, and disable log output of all other modules.

```
<Sysname> system-view
[Sysname] info-center filter loghost1 arp level notification
[Sysname] info-center filter loghost1 snmp level warning
[Sysname] info-center filter loghost1 default deny
```

Related commands

display info-center filter

info-center loghost

info-center source

info-center format

Use **info-center format** to set the format for logs sent to log hosts.

Use **undo info-center format** to restore the default.

Syntax

info-center format { **cmcc** | **unicom** }

undo info-center format

Default

Logs are sent to log hosts in standard format.

Views

System view

Predefined user roles

network-admin

Parameters

cmcc: Specifies the China Mobile Communications Corporation (CMCC) format.

unicom: Specifies the China Unicom format.

Usage guidelines

Logs can be sent to log hosts in standard, China Unicom, or CMCC format. For more information about log formats, see *Network Management and Monitoring Configuration Guide*.

Examples

Set the log format to China Unicom for logs sent to log hosts.

```
<Sysname> system-view
[Sysname] info-center format unicom
```

info-center logbuffer

Use **info-center logbuffer** to enable log output to the log buffer.

Use **undo info-center logbuffer** to disable log output to the log buffer.

Syntax

info-center logbuffer

undo info-center logbuffer

Default

Log output to the log buffer is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables log output to log buffers based on the log source modules.

- Logs generated by modules that have separate log buffers are saved to their respective log buffers.

  For example, session logs are saved to the session log buffer.
- Logs generated by other modules are saved to the general log buffer.

To view log buffer information and buffered logs, use the **display logbuffer** command.

To set the log buffer size, use the **info-center logbuffer size** command.

Examples

Enable log output to the log buffer.

```
<Sysname> system-view
[Sysname] info-center logbuffer
```

Related commands

display logbuffer

info-center enable

info-center logbuffer size

Use **info-center logbuffer size** to set the maximum number of logs that can be buffered.

Use **undo info-center logbuffer size** to restore the default.

Syntax

info-center logbuffer size *buffersize*

undo info-center logbuffer size

Default

A maximum of 512 logs can be buffered.

Views

System view

Predefined user roles

network-admin

Parameters

buffersize: Specifies the maximum log buffer size. The value range is 0 to 1024.

Examples

Set the maximum log buffer size to 50.

```
<Sysname> system-view
[Sysname] info-center logbuffer size 50
```

Restore the default maximum log buffer size.

```
<Sysname> system-view
[Sysname] undo info-center logbuffer size
```

Related commands

display logbuffer

info-center enable

info-center logfile directory

Use **info-center logfile directory** to specify the directory to save the log file.

Syntax

info-center logfile directory *dir-name*

Default

The log file directory is **flash:/logfile**.

Views

System view

Predefined user roles

network-admin

Parameters

dir-name: Specifies a directory by its name, a string of 1 to 64 characters.

Usage guidelines

The specified log file directory must have been created.

The log file uses the .log extension.

This command cannot survive an IRF reboot or a master/subordinate switchover.

Examples

Set the log file directory to **flash:/test**.

```
<Sysname> mkdir test
Creating directory flash:/test... Done.
<Sysname> system-view
[Sysname] info-center logfile directory flash:/test
```

Related commands

info-center logfile enable

info-center logfile enable

Use **info-center logfile enable** to enable the log file feature.

Use **undo info-center logfile enable** to disable the log file feature.

Syntax

info-center logfile enable

undo info-center logfile enable

Default

The log file feature is enabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable log output to the log file.

```
<Sysname> system-view
[Sysname] info-center logfile enable
```

info-center logfile frequency

Use **info-center logfile frequency** to configure the interval at which the system saves logs from the log file buffer to the log file.

Use **undo info-center logfile frequency** to restore the default.

Syntax

info-center logfile frequency *freq-sec*

undo info-center logfile frequency

Default

The log file saving interval is 86400 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

freq-sec: Specifies the log file saving interval in seconds. The value range is 1 to 86400.

Usage guidelines

This command enables the system to automatically save logs in the log file buffer to the log file at the specified interval.

Examples

Set the log file saving interval to 60000 seconds.

```
<Sysname> system-view
[Sysname] info-center logfile frequency 60000
```

Related commands

info-center logfile enable

info-center logfile overwrite-protection

Use **info-center logfile overwrite-protection** to enable log file overwrite-protection.

Use **undo info-center logfile overwrite-protection** to disable log file overwrite-protection.

Syntax

info-center logfile overwrite-protection [**all-port-powerdown**]

undo info-center logfile overwrite-protection

Default

Log file overwrite-protection is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

all-port-powerdown: Shuts down all the service ports on the device when no log file space or storage device space is available. If you do not specify this keyword, the device does not shut down service ports when no log file space or storage device space is available.

Usage guidelines

This command is available only in FIPS mode.

Log file overwrite protection enables the system to stop saving new logs when no log file space or storage device space is available.

Examples

Enable log file overwrite-protection.

```
<Sysname> system-view
[Sysname] info-center logfile overwrite-protection
```

info-center logfile size-quota

Use **info-center logfile size-quota** to set the maximum log file size.

Use **undo info-center logfile size-quota** to restore the default.

Syntax

info-center logfile size-quota *size*

undo info-center logfile size-quota

Default

The maximum log file size is 10 MB.

Views

System view

Predefined user roles

network-admin

Parameters

size: Specifies the maximum log file size in MB. The value range is 1 to 10.

Examples

Set the maximum log file size to 2 MB.

```
<Sysname> system-view
[Sysname] info-center logfile size-quota 2
```

Related commands

info-center logfile enable

info-center logging suppress duplicates

Use **info-center logging suppress duplicates** to enable duplicate log suppression.

Use **undo info-center logging suppress duplicates** to disable duplicate log suppression.

Syntax

info-center logging suppress duplicates

undo info-center logging suppress duplicates

Default

Duplicate log suppression is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Outputting consecutive duplicate logs wastes system and network resources and increases device maintenance costs. You can enable this feature to suppress output of consecutive duplicate logs.

Examples

Enable duplicate log suppression on device A.

```
<Sysname> system-view
[Sysname] info-center logging suppress duplicates
```

info-center logging suppress module

Use **info-center logging suppress module** to configure a log suppression rule for a module.

Use **undo info-center logging suppress module** to delete a log suppression rule.

Syntax

info-center logging suppress module *module-name* **mnemonic** { **all** | *mnemonic-value* }

undo info-center logging suppress module *module-name* **mnemonic** { **all** | *mnemonic-value* }

Default

The device does not suppress output of any logs from any modules.

Views

System view

Predefined user roles

network-admin

Parameters

module-name: Specifies a log source module by its name, a case-insensitive string of 1 to 8 characters. To view the list of available log source modules, use the **info-center logging suppress module ?** command.

mnemonic { **all** | *mnemonic-value* }: Configures a mnemonic filter for log suppression.

- **all**: Suppresses output of all logs of the module.
- *mnemonic-value*: Suppresses output of logs with the specified mnemonic value. The *mnemonic-value* argument is a case-insensitive string of 1 to 32 characters, which must be the complete value contained in the mnemonic field of the log message. Log suppression will fail if a partial mnemonic value is specified.

Usage guidelines

You can configure log suppression rules to filter out the logs that you are not concerned with. A log suppression rule suppresses output of all logs or only logs with a specific mnemonic value for a module.

Examples

Configure a log suppression rule to suppress output of logs with the **shell_login** mnemonic value for the shell module.

```
<Sysname> system-view
[Sysname] info-center logging suppress module shell mnemonic shell_login
```

Related commands

info-center source

info-center loghost

Use **info-center loghost** to specify a log host and to configure output parameters.

Use **undo info-center loghost** to remove a log host.

Syntax

info-center loghost { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**dscp** *dscp-value*] [**facility** *local-number*] [**filter** *filter-name*]

undo info-center loghost { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* }

Default

No log hosts are specified.

Views

System view

Predefined user roles

network-admin

Parameters

hostname: Specifies a log host by its name, a case-insensitive string of 1 to 253 characters. The host name can contain letters, digits, and special characters including hyphen (-), underscore (_), and dot (.).

ipv4-address: Specifies a log host by its IPv4 address.

ipv6 *ipv6-address*: Specifies a log host by its IPv6 address.

port *port-number*: Specifies the port number of the log host, in the range of 1 to 65535. The default is 514. It must be the same as the value configured on the log host. Otherwise, logs cannot be sent to the log host.

dscp *dscp-value*: Specifies the DSCP value in log packets sent to the log host. The value range for the *dscp-value* argument is 0 to 63, and the default is 0. The DSCP value of a packet defines the priority of the packet and affects the transmission priority of the packet. A greater DSCP value represents a higher priority.

facility *local-number*: Specifies a logging facility from local0 to local7 for the log host. The default value is local7. Logging facilities are used to mark different logging sources, and query and filer logs.

filter *filter-name*: Specifies a log output filter to control log output to the log host. The *filter-name* argument represents the filter name, a case-insensitive string of 1 to 8 characters. If you do not specify a log output filter, the log output rules configured by using the **info-center source** command for the log host destination are used.

Usage guidelines

The **info-center loghost** command takes effect only after the information center is enabled by using **info-center enable** command.

The device supports a maximum of 20 log hosts.

Examples

Output logs to the log host at 1.1.1.1.

```
<Sysname> system-view
[Sysname] info-center loghost 1.1.1.1
```

Related commands

info-center filter

info-center source

info-center loghost source

Use **info-center loghost source** to specify a source IP address for logs sent to log hosts.

Use **undo info-center loghost source** to restore the default.

Syntax

info-center loghost source *interface-type interface-number*

undo info-center loghost source

Default

The source IP address of logs sent to log hosts is the primary IP address of the outgoing interface.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The system uses the primary IP address of the specified interface as the source IP address of the logs sent to log hosts.

The **info-center loghost source** command takes effect only after the information center is enabled by using **info-center enable** command.

Examples

Use the IP address of interface Loopback 0 as the source IP address of the logs sent to log hosts.

```
<Sysname> system-view
[Sysname] interface loopback 0
[Sysname-LoopBack0] ip address 2.2.2.2 32
[Sysname-LoopBack0] quit
```

```
[Sysname] info-center loghost source loopback 0
```

info-center security-logfile alarm-threshold

Use **info-center security-logfile alarm-threshold** to set the alarm threshold for security log file usage.

Use **undo info-center security-logfile alarm-threshold** to restore the default.

Syntax

info-center security-logfile alarm-threshold *usage*

undo info-center security-logfile alarm-threshold

Default

The alarm threshold for security log file usage is 80. When the usage of the security log file reaches 80%, the system outputs a message to inform the administrator.

Views

System view

Predefined user roles

network-admin

Parameters

usage: Specifies an alarm threshold. The value must be an integer in the range of 1 to 100.

Usage guidelines

When the security log file is full, the system deletes the oldest logs and then writes new logs to the security log file. This feature helps avoid security log loss by setting an alarm threshold for the security log file usage. When the threshold is reached, the system outputs log information to inform the administrator. The administrator can log in to the device with the security-audit user role and back up the security log file.

Examples

Set the alarm threshold for security log file usage to 90.

```
<Sysname> system-view
[Sysname] info-center security-logfile alarm-threshold 90
```

Related commands

info-center security-logfile size-quota

info-center security-logfile directory

Use **info-center security-logfile directory** to specify the security log file directory.

Syntax

info-center security-logfile directory *dir-name*

Default

The security log file is saved in the **flash:/seclog** directory.

Views

System view

Predefined user roles

security-audit

Parameters

dir-name: Specifies a directory by its name, a string of 1 to 64 characters.

Usage guidelines

The specified directory must have been created.

To use this command, a local user must have the security-audit user role. For information about configuring the security-audit user role, see AAA commands in *Security Command Reference.*

This command cannot survive an IRF reboot or a master/subordinate switchover.

Examples

Set the security log file directory to **flash:/test**.

```
<Sysname> mkdir test
Creating directory flash:/test... Done.
<Sysname> system-view
[Sysname] info-center security-logfile directory flash:/test
```

info-center security-logfile enable

Use **info-center security-logfile enable** to enable saving of security logs to the security log file.

Use **undo info-center security-logfile enable** to restore the default.

Syntax

info-center security-logfile enable

undo info-center security-logfile enable

Default

The saving of security logs to the security log file is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature enables the system to output security logs to the security log file buffer, and then saves the buffered logs to the security log file regularly.

Examples

Enable saving security logs to the security log file.

```
<Sysname> system-view
[Sysname] info-center security-logfile enable
```

info-center security-logfile frequency

Use **info-center security-logfile frequency** to configure the interval for saving security logs to the security log file.

Use **undo info-center security-logfile frequency** to restore the default.

Syntax

info-center security-logfile frequency *freq-sec*

undo info-center security-logfile frequency

Default

The security log file saving interval is 86400 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

freq-sec: Specifies the security log file saving interval in seconds. The value range is 10 to 86400 seconds.

Usage guidelines

The system outputs security logs to the security log file buffer, and then saves the buffered logs to the security log file at the specified interval.

Examples

Set the security log file saving interval to 600 seconds.

```
<Sysname> system-view
[Sysname] info-center security-logfile frequency 600
```

Related commands

info-center security-logfile enable

info-center security-logfile size-quota

Use **info-center security-logfile size-quota** to set the maximum size for the security log file.

Use **undo info-center security-logfile size-quota** to restore the default.

Syntax

info-center security-logfile size-quota *size*

undo info-center security-logfile size-quota

Default

The maximum size for the security log file is 10 MB.

Views

System view

Predefined user roles

network-admin

Parameters

size: Sets the maximum size for the security log file, in MB. The value range is 1 to 10.

Examples

Set the maximum size to 6 MB for the security log file.

```
<Sysname> system-view
[Sysname] info-center security-logfile size-quota 6
```

Related commands

info-center security-logfile alarm-threshold

info-center source

Use **info-center source** to configure a log output rule for a module.

Use **undo info-center source** to restore the default.

Syntax

info-center source { *module-name* | **default** } { **console** | **logbuffer** | **logfile** | **loghost** | **monitor** } { **deny** | **level** *severity* }

undo info-center source { *module-name* | **default** } { **console** | **logbuffer** | **logfile** | **loghost** | **monitor** }

Default

Table 8 lists the default log output rules.

Table 8 Default output rules

Destination	Log source modules	Output switch	Severity
Console	All supported modules	Enabled	Debug
Monitor terminal	All supported modules	Disabled	Debug
Log host	All supported modules	Enabled	Informational
Log buffer	All supported modules	Enabled	Informational
Log file	All supported modules	Enabled	Informational

Views

System view

Predefined user roles

network-admin

Parameters

module-name: Specifies a module by its name. You can use the **info-center source ?** command to view the modules supported by the device.

default: Specifies all supported modules.

console: Outputs logs to the console.

logbuffer: Outputs logs to the log buffer.

logfile: Outputs logs to the log file.

loghost: Outputs logs to the log host.

monitor: Outputs logs to the monitor terminal.

deny: Disables log output.

level *severity*: Specifies a severity level in the range of 0 to 7. The smaller the severity value, the higher the severity level. See Table 3 for more information. Logs at the specified severity level and higher levels are allowed or denied to be output.

Usage guidelines

If you do not set an output rule for a module, the module uses the output rule set by using the **default** keyword. If no rule is set by using the **default** keyword, the module uses the default output rule.

To modify or remove an output rule set for a module, you must use the *module-name* argument. A new output rule configured by using the **default** keyword does not take effect on the module.

If you execute this command for a module multiple times, the most recent configuration takes effect.

If you execute this command for the **default** modules multiple times, the most recent configuration takes effect.

Examples

Output only VLAN module's information with the emergency level to the console.

```
<Sysname> system-view
[Sysname] info-center source default console deny
[Sysname] info-center source vlan console level emergency
```

Based on the previous configuration, disable output of VLAN module's information to the console so no system information is output to the console.

```
<Sysname> system-view
[Sysname] undo info-center source vlan console
```

info-center synchronous

Use **info-center synchronous** to enable synchronous information output.

Use **undo info-center synchronous** to disable synchronous information output.

Syntax

info-center synchronous

undo info-center synchronous

Default

Synchronous information output is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

System log output interrupts ongoing configuration operations, including obscuring previously entered commands. Synchronous information output shows the obscured commands. It also provides a command prompt in command editing mode, or a [Y/N] string in interaction mode so you can continue your operation from where you were stopped.

Examples

Enable synchronous information output, and then execute the **display current-configuration** command to view the current configuration of the device.

```
<Sysname> system-view
[Sysname] info-center synchronous
Info-center synchronous output is on
[Sysname] display current-
```

At this time, the system receives log information. It displays the log information first, and then displays your previous input, which is **display current-** in this example.

```
%May 21 14:33:19:425 2007 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 192.168.1.44
[Sysname] display current-
```

Enter **configuration** to complete the **display current-configuration** command, and press the **Enter** key to execute the command.

Enable synchronous information output, and then save the current configuration (enter interactive information).

```
<Sysname> system-view
[Sysname] info-center synchronous
Info-center synchronous output is on
[Sysname] save
The current configuration will be written to the device. Are you sure? [Y/N]:
```

At this time, the system receives the log information. It displays the log information first and then displays [Y/N].

```
%May 21 14:33:19:425 2007 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 192.168.1.44
[Y/N]:
```

Enter **Y** or **N** to complete your input.

info-center syslog min-age

Use **info-center syslog min-age** to set the minimum storage period for logs in the log buffer and log file.

Use **undo info-center syslog min-age** to restore the default.

Syntax

info-center syslog min-age *min-age*

undo info-center syslog min-age

Default

The minimum storage period is not set.

Views

System view

Predefined user roles

network-admin

Parameters

min-age: Sets the minimum storage period in hours. The value range is 1 to 8760.

Examples

Set the minimum storage period to 168 hours.

```
<Sysname> system-view
[Sysname] info-center syslog min-age 168
```

info-center syslog trap buffersize

Use **info-center syslog trap buffersize** to set the maximum number of log traps that can be stored in the log trap buffer.

Use **undo info-center syslog trap buffersize** to restore the default.

Syntax

info-center syslog trap buffersize *buffersize*

undo info-center syslog trap buffersize

Default

The log trap buffer can store a maximum of 1024 traps.

Views

System view

Predefined user roles

network-admin

Parameters

buffersize: Specifies the maximum number of log traps that can be stored in the log trap buffer. The value range is 0 to 65535. Value 0 indicates that the device does not buffer log traps.

Usage guidelines

Log traps are SNMP notifications stored in the log trap buffer. After the **snmp-agent trap enable syslog** command is configured, the device sends log messages in SNMP notifications to the log trap buffer. You can view the log traps by accessing the MIB corresponding to the trap buffer.

The default buffer size is usually used. You can adjust the buffer size according to your network condition. New traps overwrite the oldest traps when the log trap buffer is full.

Examples

Set the log trap buffer size to 2048.

```
<Sysname> system-view
[Sysname] info-center syslog trap buffersize 2048
```

Related commands

snmp-agent trap enable syslog

info-center timestamp

Use **info-center timestamp** to set the timestamp format for logs sent to the console, monitor terminal, log buffer, and log file.

Use **undo info-center timestamp** to restore the default.

Syntax

info-center timestamp { **boot** | **date** | **none** }

undo info-center timestamp

Default

The timestamp format for logs sent to the console, monitor terminal, log buffer, and log file is **date**.

Views

System view

Predefined user roles

network-admin

Parameters

boot: Sets the timestamp format to xxx.yyy, where xxx is the most significant 32 bits (in milliseconds) and yyy is the least significant 32 bits. For example, 0.21990989 equals Jun 25 14:09:26:881 2007. The **boot** time shows the time since system startup.

date: Sets the timestamp format to MMM DD hh:mm:ss:ms YYYY, such as Dec 8 10:12:21:708 2007. The **date** time shows the current system time.

- MMM: Abbreviations of the months in English, which could be Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, or Dec.
- DD: Date, starting with a space if it is less than 10, for example " 7".
- hh:mm:ss:ms: Local time, with hh in the range of 00 to 23, mm and ss in the range of 00 to 59, and ms in the range of 0 to 999.
- YYYY: Year.

none: Indicates no time information is provided.

Examples

Set the timestamp format to **boot** for logs sent to the console, monitor terminal, log buffer, and log file.

```
<Sysname> system-view
[Sysname] info-center timestamp boot
```

Related commands

info-center timestamp loghost

info-center timestamp loghost

Use **info-center timestamp loghost** to set the timestamp format for logs sent to log hosts.

Use **undo info-center timestamp loghost** to restore the default.

Syntax

info-center timestamp loghost { **date** [**with-milliseconds**] | **iso** [**with-milliseconds** | **with-timezone**] * | **no-year-date** | **none** }

undo info-center timestamp loghost

Default

The timestamp format for logs sent to log hosts is **date**.

Views

System view

Predefined user roles

network-admin

Parameters

date: Sets the timestamp format to MMM DD hh:mm:ss YYYY, such as Dec 8 10:12:21 2007. The **date** time shows the current system time.

iso: Sets the ISO 8601 timestamp format, for example, 2009-09-21T15:32:55.

with-milliseconds: Sets the timestamp to be accurate to milliseconds for logs output to log hosts in date or ISO 8601 format. The millisecond value is appended to the time information in the timestamp with a dot as the separator. If you do not specify this keyword, the timestamp in date or ISO 8601 format is accurate to seconds.

- Example of a timestamp in date format with millisecond accuracy: Dec 8 10:12:21.708 2018.
- Example of a timestamp in ISO 8601 format with millisecond accuracy: 2018-09-21T15:32:55.708.

with-timezone: Includes the time zone information in the ISO format timestamp. For example, 2009-09-21T15:32:55+01:00. By default, the ISO format timestamp does not contain the time zone information.

no-year-date: Sets the timestamp format to the current system date and time without year or millisecond information.

none: Indicates that no timestamp information is provided.

Examples

Set the timestamp format to **no-year-date** for logs sent to log hosts.

```
<Sysname> system-view
[Sysname] info-center timestamp loghost no-year-date
```

Related commands

info-center timestamp

info-center trace-logfile quota

Use **info-center trace-logfile quota** to set the maximum size for the trace log file.

Use **undo info-center trace-logfile quota** to restore the default.

Syntax

info-center trace-logfile quota *size*

undo info-center trace-logfile quota

Default

The maximum size for the trace log file is 1 MB.

Views

System view

Predefined user roles

network-admin

Parameters

size: Sets the maximum size for the trace log file, in MB. The value range is 1 to 10.

Examples

Set the maximum size to 6 MB for the trace log file.

```
<Sysname> system-view
```

```
[Sysname] info-center trace-logfile quota 6
```

logfile save

Use **logfile save** to manually save logs in the log file buffer to the log file.

Syntax

logfile save

Views

Any view

Predefined user roles

network-admin

Usage guidelines

You can specify the directory to save the log file by using the **info-center logfile directory** command.

The system clears the log file buffer after saving the buffered logs to the log file automatically or manually.

If the log file buffer is empty, this command displays a success message event though no logs are saved to the log file.

Examples

Manually save logs from the log file buffer to the log file.

```
<Sysname> logfile save
The contents in the log file buffer have been saved to the file flash:/logfile/logfile.log.
```

Related commands

info-center logfile enable

info-center logfile directory

reset logbuffer

Use **reset logbuffer** to clear the log buffer.

Syntax

reset logbuffer

Views

User view

Predefined user roles

network-admin

Examples

Clear the log buffer.

```
<Sysname> reset logbuffer
```

Related commands

display logbuffer

security-logfile save

Use **security-logfile save** to manually save security logs from the security log file buffer to the security log file.

Syntax

security-logfile save

Views

Any view

Predefined user roles

security-audit

Usage guidelines

The system clears the security log file buffer after saving the buffered security logs to the security log file automatically or manually.

If the security log file buffer is empty, this command displays a success message event though no security logs are saved to the security log file.

To use this command, a local user must have the security-audit user role. For information about configuring the security-audit user role, see AAA commands in *Security Command Reference*.

Examples

Manually save the security logs in the security log file buffer to the security log file.

```
<Sysname> security-logfile save
The contents in the security log file buffer have been saved to the file
flash:/seclog/seclog.log.
```

Related commands

info-center security-logfile directory

authorization-attribute (*Security Command Reference*)

snmp-agent trap enable syslog

Use **snmp-agent trap enable syslog** to enable SNMP notifications for log messages.

Use **undo snmp-agent trap enable syslog** to disable SNMP notifications for log messages.

Syntax

snmp-agent trap enable syslog

undo snmp-agent trap enable syslog

Default

The device does not send SNMP notifications for log messages.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to send an SNMP notification for each log message it outputs. The device encapsulates logs in SNMP notifications and then sends them to the SNMP module and the log trap buffer.

For the SNMP module to send the received SNMP notifications correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

To view the traps in the log trap buffer, access the MIB corresponding to the log trap buffer. The log trap buffer size can be set by using the **info-center syslog trap buffersize** command.

Examples

Enable the device to send SNMP notifications for log messages.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable syslog
```

Related commands

info-center syslog trap buffersize

terminal debugging

Use **terminal debugging** to enable display of debug information on the current terminal.

Use **undo terminal debugging** to disable display of debug information on the current terminal.

Syntax

terminal debugging

undo terminal debugging

Default

Display of debug information is disabled on the current terminal.

Views

User view

Predefined user roles

network-admin

Usage guidelines

To enable display of debug information on the console, perform the following tasks:

1. Execute the **terminal debugging** command.
2. Enable the information center. The information center is enabled by default.
3. Use a debugging command to enable the related debugging.

To enable display of debug information on the current terminal, perform the following tasks:

1. Execute the **terminal monitor** and **terminal debugging** commands.
2. Enable the information center. The information center is enabled by default.
3. Use a debugging command to enable the related debugging.

This command takes effect only for the current connection between the terminal and the device. If a new connection is established, the default is restored.

You can also enable display of debug information on the current terminal by executing the **terminal logging level 7** command. This command has the following differences from the **terminal debugging** command:

- The **terminal logging level 7** command enables log display for all levels (levels **0** through **7**) on the current terminal.
- The **terminal debugging** command only enables display of logs with the following severity levels:
  - Debug level (level **7**).
  - Severity level higher than or equal to the level specified in the **terminal logging level** command.

Examples

Enable display of debug information on the current terminal.

```
<Sysname> terminal debugging
The current terminal is enabled to display debugging logs.
```

Related commands

terminal logging level

terminal monitor

terminal logging level

Use **terminal logging level** to set the lowest level of logs that can be output to the current terminal.

Use **undo terminal logging level** to restore the default.

Syntax

terminal logging level *severity*

undo terminal logging level

Default

The lowest level of logs that can be output to the current terminal is 6 (Informational).

Views

User view

Predefined user roles

network-admin

Parameters

severity: Specifies a log severity level. Valid values are alert, critical, debugging, emergency, error, informational, notification, warning, and digits from 0 to 7.

Usage guidelines

This command enables the device to output logs with a severity level higher than or equal to the specified level to the current terminal. For example, if you set the *severity* argument to 6, logs with a severity value from 0 to 6 are output to the current terminal.

This command takes effect only for the current connection between the terminal and the device. If a new connection is established, the default is restored.

Examples

Configure the device to output logs with the debugging level and higher levels to the current terminal.

```
<Sysname> terminal logging level 7
```

terminal monitor

Use **terminal monitor** to enable monitoring of logs on the current terminal.

Use **undo terminal monitor** to disable monitoring of logs on the current terminal.

Syntax

terminal monitor

undo terminal monitor

Default

Monitoring of logs is enabled on the console and disabled on the monitor terminal.

Views

User view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only for the current connection between the terminal and the device. If a new connection is established, the default is restored.

Examples

Enable monitoring of logs on the current terminal.

```
<Sysname> terminal monitor
The current terminal is enabled to display logs.
```

IRF allocation	IRF configurations, including IRF bridge MAC address of the IRF fabric, IRF status, and the IRF member ID of the device.

Related commands

vcf-fabric underlay autoconfigure

display vcf-fabric underlay template-version

Use **display vcf-fabric underlay template-version** to display the supported version and the current version of the template file for automated VCF fabric deployment.

Syntax

display vcf-fabric underlay template-version

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

The version format of a template file for automated VCF fabric deployment is *x*.*y*. Only the *x* part is examined during a version compatibility check. For successful automated deployment, make sure *x* in the version of the template file to be used is not greater than *x* in the supported version.

Examples

Display the supported version and the current version of the template file for automated VCF fabric deployment when automated deployment is not started.

```
<Sysname> display vcf-fabric underlay template-version
Supported template version: 6.0
Current template version: Not available
```

Display the supported version and the current version of the template file for automated VCF fabric deployment when automated deployment has finished.

```
<Sysname> display vcf-fabric underlay template-version
Supported template version: 6.0
Current template version: 6.0
```

Table 3 Command output

Field	Description
Supported template version	Supported version of the template file for automated VCF fabric deployment.
Current template version	Current version of the template file for automated VCF fabric deployment. This field displays **Not available** if automated VCF fabric deployment has not started. This field displays **None** if automated VCF fabric deployment has finished but the template file does not contain a version number.

vcf-fabric topology enable

Use **`vcf-fabric topology enable`** to enable VCF fabric topology discovery.

Use **`undo vcf-fabric topology enable`** to disable VCF fabric topology discovery.

Syntax

`vcf-fabric topology enable`

`undo vcf-fabric topology enable`

Default

VCF fabric topology discovery is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable VCF fabric topology discovery.

```
<Sysname> system-view
[Sysname] vcf-fabric topology enable
```

vcf-fabric underlay autoconfigure

Use **vcf-fabric underlay autoconfigure** to specify the template file for automated underlay network deployment.

Use **undo vcf-fabric underlay autoconfigure** to restore the default.

Syntax

vcf-fabric underlay autoconfigure *template*

undo vcf-fabric underlay autoconfigure

Default

No template file is specified for automated underlay network deployment.

Views

System view

Predefined user roles

network-admin

Parameters

template: Specifies a template file by its name, a case-insensitive string of 1 to 127 characters. A template file is a file ending with the **.template** file extension.

Usage guidelines

After this command is executed, the device uses the specified template file to deploy the underlay network.

Examples

Specify template file **1_access.template** for automated underlay network deployment.

```
<Sysname> system-view
[Sysname] vcf-fabric underlay autoconfigure 1_access.template
```

vcf-fabric underlay pause

Use **vcf-fabric underlay pause** to pause automated underlay network deployment.

Use **undo vcf-fabric underlay pause** to continue automated underlay network deployment.

Syntax

vcf-fabric underlay pause

undo vcf-fabric underlay pause

Default

Automated underlay network deployment is not paused.

Views

System view

Predefined user roles

network-admin

Usage guidelines

You can use this command to pause automated underlay network deployment if the device is in the process of automated underlay network deployment.

Examples

Pause automated underlay network deployment.

```
<Sysname> system-view
[Sysname] vcf-fabric underlay pause
```

Contents

Cloud connection commands

The S3100V3-EI switch series does not support cloud connections.

cloud-management keepalive

Use **cloud-management keepalive** to set the keepalive interval for the local device to send keepalive packets to the H3C cloud server.

Use **undo cloud-management keepalive** to restore the default.

Syntax

cloud-management keepalive *interval*

undo cloud-management keepalive

Default

The keepalive interval is 180 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the keepalive interval in the range of 180 to 600 seconds.

Usage guidelines

If the device does not receive a response from the H3C cloud server within three keepalive intervals, the device sends a registration request to re-establish the cloud connection.

Examples

Set the keepalive interval to 360 seconds.

```
<Sysname> system-view
[Sysname] cloud-management keepalive 360
```

cloud-management server domain

Use **cloud-management server domain** to configure the domain name of the H3C cloud server.

Use **undo cloud-management server domain** to restore the default.

Syntax

cloud-management server domain *domain-name*

undo cloud-management server domain

Default

The default settings are as follows:

- The domain name of the cloud server is not configured for the S5130S-HI, S5130S-EI, S3100V3-EI, E500C, E500D, and E128C & E152C switch series.
- For the S5130S-SI and S5120V2-SI switch series:

- The domain name of the cloud server is not configured for a switch that starts up with the initial configuration.
- The domain name of the cloud server is **oasis.h3c.com** for a switch that starts up with the factory defaults.

For more information about the initial configuration and factory defaults, see *Fundamentals Configuration Guide*.

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the domain name of the H3C cloud server, a case-sensitive string of 1 to 253 characters.

Usage guidelines

Before you configure the domain name of the H3C cloud server, make sure a DNS server has been configured to translate the domain name.

If you execute the command multiple times, the most recent configuration takes effect.

Examples

Configure the domain name of the H3C cloud server as **abc.com**.

```
<Sysname> system-view
[Sysname] cloud-management server domain abc.com
```

cloud-management server password

Use **cloud-management server password** to set the password for establishing cloud connections to the cloud server.

Use **cloud-management server password** to restore the default.

NOTE:

This command is supported only in Release 6328 and later.

Syntax

cloud-management server password { **cipher** | **simple** } *string*

undo cloud-management server password

Default

No password is set for establishing cloud connections to the cloud server.

Views

System view

Predefined user roles

network-admin

mdc-admin

Parameters

cipher: Specifies the password in encrypted form.

simple: Specifies the password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. The plaintext form is a case-sensitive string of 1 to 63 characters. The encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

After you change the password, the device terminates the cloud connections that have been established (if any) and uses the new password to establish cloud connections.

Examples

Set the password for establishing cloud connections to the cloud server to **12345678TESTplat&!** in plaintext format.

```
<Sysname> system-view
[Sysname] cloud-management server password simple 12345678TESTplat&!
```

display cloud-management state

Use **display cloud-management state** to display cloud connection state information.

Syntax

display cloud-management state

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display cloud connection state information.

```
<Sysname> display cloud-management state
Cloud connection state   : Established

SmartMC commands

boot-loader file

Use **boot-loader file** to specify the upgrade startup software files for a SmartMC group.

Use **undo boot-loader** to restore the default.

Syntax

boot-loader file { *ipe-filename* | **boot** *boot-filename* **system** *system-filename* }

undo boot-loader

Default

No upgrade startup software files are specified for a SmartMC group.

Views

SmartMC group view

Predefined user roles

network-admin

Parameters

ipe-filename: Specifies an IPE software file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.ipe** extension.

boot *boot-filename*: Specifies a boot image file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.bin** extension.

system *system-filename*: Specifies a system image file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.bin** extension.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify IPE software file **device.ipe** for SmartMC group **testgroup**.

```
<Sysname> system-view
[Sysname] smartmc group testgroup
[Sysname-smartmc-group-testgroup] boot-loader file device.ipe
```

Related commands

smartmc group

smartmc upgrade boot-loader

create batch-file

Use **create batch-file** to create a batch file.

Syntax

create batch-file *batch-file-name*

Default

No batch files exist.

Views

User view

Predefined user roles

network-admin

Parameters

batch-file-name: Specifies the name of the batch file, a case-insensitive string of 1 to 255 characters. If you do not specify a file extension when specifying a file name, the default extension **.cmdset** is used.

Usage guidelines

After executing this command, you will enter the batch edit mode. In this mode, each command occupies a line. When you finish editing all command lines, enter a percent sign (%) to return to user view.

Make sure the command lines that you enter are correct because the system does not verify whether the command lines are correct.

Examples

Create a batch file named **test.cmdset**, and enter the command lines for specifying the device name as **Sysname** and enabling Telnet.

```
<Sysname> create batch-file test.cmdset
Begin to edit batch commands, and quit with the character '%'.
system-view
sysname Sysname
telnet server enable%
<Sysname>
```

Related commands

display smartmc batch-file status

smartmc batch-file deploy

display smartmc backup configuration status

Use **display smartmc backup configuration status** to display the backup status on members.

Syntax

display smartmc backup configuration status

Views

Any view

Predefined user roles

network-admin

Usage guidelines

This command displays the status of the ongoing backup task or the most recent backup task if the member is not performing backup.

Examples

Display the backup status on members.

```
<Sysname> display smartmc backup configuration status
ID     IpAddress        MacAddress          Status       Time
1      192.168.56.30    08d2-38ff-0300      Finished     2017-04-05 11:30:35
2      192.168.56.40    62d2-c21c-0400      Finished     2017-04-05 11:30:40
```

Table 1 Command output

Field	Description
ID	ID of the member.
IpAddress	IP address of the member.
MacAddress	MAC address of the member.
Status	Backup status: • **Waiting**—The member is waiting for configuration backup. • **Processing**—The member is backing up the configuration. • **Finished**—The member has finished backing up the configuration. • **Timeout**—Configuration backup times out. • **Failed**—The member failed to back up the configuration.
Time	Time when the member finished backing up the configuration. If the member has not finished backing up the configuration, this field displays a hyphen (**-**).

Related commands

smartmc backup configuration max-number

display smartmc batch-file status

Use **display smartmc batch-file status** to display the batch file deployment result.

Syntax

display smartmc batch-file status [**ap** | **last** *number* | **phone**]

Views

Any view

Predefined user roles

network-admin

Parameters

ap: Displays the result of the most recent batch file deployment for ports connected to APs.

last *number*: Specifies a batch file deployment (performed by using the **smartmc batch-file deploy** command) by its number counting from the most recent batch file deployment. The value range for the *number* argument is 1 to 5.

phone: Displays the result of the most recent batch file deployment for ports connected to IP phones.

Usage guidelines

If you do not specify any parameters, this command displays the result of the most recent batch file deployment performed by using the **smartmc batch-file deploy** command.

Examples

Display the result of the most recent batch file deployment. In this example, the batch file contains the **display smartmc configuration** command.

```
<Sysname> display smartmc batch-file status last 1
TC ID 1
Device MAC : 8a73-60c3-0200
Start Time : 2018-12-24 14:55:39
End   Time : 2018-12-24 14:55:43
Result     :

<Sysname>display smartmc configuration

display smartmc configuration

Use **display smartmc configuration** to display the SmartMC configuration.

Syntax

display smartmc configuration

Views

Any view

Predefined user roles

network-admin

Examples

Display the SmartMC configuration on the commander.

Release 6318P01 and earlier:

```
<Sysname> display smartmc configuration
Device role                          : TM
FTP server IP                        : 192.168.22.103
FTP server username                  : admin
Topology-refresh interval            : 60(s)
Backup startup-configuration interval : N/A
Sync backup number                   : 5
Device status                        : Lack
Some configurations are absent on the TM, such as Telnet or LLDP configuration.
```

Release 6328 and later:

```
<Sysname> display smartmc configuration
Device role                          : TM
File server:
  Type: FTP
  IP address: 192.168.22.103
  Username: admin
  Port: 21
  VPN instance: N/A
  Directory: /FTP
Topology-refresh interval            : 60(s)
Backup startup-configuration interval : N/A
Sync backup number                   : 5
Device status                        : Lack
Some configurations are absent on the TM, such as Telnet or LLDP configuration.
```

Display the commander information on a member.

```
<Sysname> display smartmc configuration
Device role       : TC
TM IP             : 192.168.22.103
TM MAC            : 8288-468d-0100
TM sysname        : Sysname
```

Table 3 Command output

Field	Description
Device role	Role of the device.
FTP server IP	This field is supported only in Release 6318P01 and earlier. IP address of the FTP server. If no FTP server IP address is configured, this field displays **N/A**.
FTP server username	This field is supported only in Release 6318P01 and earlier. FTP server username. If no username is configured, this field displays **N/A**.
File server	This field is supported only in Release 6328 and later. File server configuration.
Type	This field is supported only in Release 6328 and later. File server type. If no file server is specified, this field displays **N/A**.
IP address	This field is supported only in Release 6328 and later. File server IP address. If no file server is specified, this field displays **N/A**.
Username	This field is supported only in Release 6328 and later. File server username. If no file server is specified, this field displays **N/A**.
Port	This field is supported only in Release 6328 and later. File server port. If no file server is specified, this field displays **N/A**.
VPN instance	This field is supported only in Release 6328 and later. VPN instance to which the file server belongs. If no file server is specified, this field displays **N/A**.
Directory	This field is supported only in Release 6328 and later. Storage directory of files on the file server. If no file server is specified, this field displays **N/A**.
Topology-refresh interval	Topology refresh interval, in seconds.
Backup startup-configuration interval	Automatic configuration file backup interval, in hours. If no interval is set, this field displays **N/A**.
Sync backup number	Number of members that can perform configuration backup at the same time.
Device status	Commander status: • **Normal**. • **Lack**—Lack of configuration, such as NETCONF, Telnet, local user, and LLDP.
TM IP	IP address of the commander. If the member failed to obtain the commander IP address, this field displays **N/A**.
TM MAC	MAC address of the commander, If the member failed to obtain the commander MAC address, this field displays **N/A**.
TM sysname	Name of the commander. If the member failed to obtain the commander name, this field displays **N/A**.
Some configurations are absent on the TM, such as XXX.	This field is available only when the **Device status** field displays **Lack**. Lack of configuration will affect SmartMC functions. Please follow the prompt to complete the configuration.

display smartmc group

Use **display smartmc group** to display SmartMC group information.

Syntax

display smartmc group [*group-name*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

Parameters

group-name: Specifies a SmartMC group by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this argument, the command displays information about all SmartMC groups.

Verbose: Displays detailed SmartMC group information. If you do not specify this keyword, the command displays brief SmartMC group information.

Examples

Display detailed SmartMC group information.

```
<Sysname> display smartmc group verbose
Group name                    : test
TC count                      : 3
Boot-loader file              :
Startup-configuration file    :
Rule:
 Match Device-type S5130S-LI
TCID DeviceType Sysname  IpAddress       MacAddress     Status   Version
1    S5130S-LI  S1       192.168.56.103  0e74-e2fb-0400 Normal   COMWAREV700R001
2    S5130S-LI  S2       192.168.56.102  0e74-ea13-0500 Normal   COMWAREV700R001
3    S5130S-LI  S3       192.168.56.104  0e74-db54-0300 Normal   COMWAREV700R001
```

Table 5 Command output

Field	Description
GroupName	Name of the SmartMC group.
TC count	Number of members in the SmartMC group.
Boot-loader file	Names of the upgrade startup software files for upgrading the SmartMC group. If no upgrade startup software files are specified, this field displays null.
Startup-configuration file	Name of the configuration file for upgrading the SmartMC group. If no configuration file is specified, this field displays null.
Rule	Match criteria of the SmartMC group.
Match	Match type and its value. The match types include the following: • **Device-type**—Matches members by device type. • **IP-address**—Matches members by IP address. • **MAC-address**—Matches members by MAC address.
TCID	ID of the member.
DeviceType	Device type of the member.
Sysname	Device name of the member.
IpAddress	IP address of the member.
MacAddress	MAC address of the member.

Field	Description
Version	Software version of the member.
Status	Operating status of the member: • **Offline**—The member is offline. • **Normal**—The member is online.

display smartmc replace status

Use **display smartmc replace status** to display faulty member replacement status.

Syntax

display smartmc replace status

Views

Any view

Predefined user roles

network-admin

Examples

Display faulty member replacement status.

```
<Sysname> display smartmc replace status
Faulty ID      : 2
Faulty MAC     : 94e2-cdcb-0600
Replacement ID : 3
Replacement MAC: 2443-5f8c-0200
Mode           : Manual
Status         : Successful
Start time     : 2017-03-21 15:01:31
End time       : 2017-03-21 15:01:40
```

Table 6 Command output

Field	Description
Faulty ID	ID of the faulty member.
Faulty MAC	MAC address of the faulty member.
Replacement ID	ID of the new member.
Replacement MAC	MAC address of the new member.
Mode	Replacement method, which can be **Manual** or **Auto**.
Status	Replacement status: • **Successful**. • **Failed**. • **Replacing**. • **Timeout**.

Field	Description
Start time	Replacement start time
End time	Replacement end time.

display smartmc resource-monitor

Use **display smartmc resource-monitor** to display resource monitoring information.

Syntax

display smartmc resource-monitor [**cpu** | **memory** | **temperature**] * [**tc** *tc-id* | **tm**]

Views

Any view

Predefined user roles

network-admin

Parameters

cpu: Displays CPU usage.

memory: Displays memory usage.

temperature: Displays temperature information.

tc *tc-id*: Specify a member by its ID in the range of 1 to 255.

tm: Specify the commander.

Usage guidelines

This command displays CPU usage, memory usage, and temperature information of the commander and members on the commander. For packet dropping information, log in to the Web interface of the commander and access the **SmartMC** > **Intelligent O&M** > **Resource monitoring** page. Packet dropping information can be viewed only in Release 6328 and later.

If you do not specify a resource type, this command displays the resource monitoring information of all types.

If you do not specify a member or the commander, this command displays the resource monitoring information for the commander and all members.

Examples

Display the resource monitoring information for member 1.

```
<Sysname> display smartmc resource-monitor tc 1
TC 1
  Collection time : 2017-07-25 18:02:30
  Slot 1:
    CPU 0 CPU usage: 1%
    Memory usage   : 587076/903332
    Temperature    : 30
```

Table 7 Command output

Field	Description
Collection time	Time when the resource monitoring information was collected.

Related commands

smartmc resource-monitor

display smartmc resource-monitor configuration

Use **display smartmc resource-monitor configuration** to display resource monitoring configuration.

Syntax

display smartmc resource-monitor configuration

Views

Any view

Predefined user roles

network-admin

Usage guidelines

This command displays CPU usage, memory usage, and temperature monitoring configuration of the commander. In Release 6328 and later, you can view the status of packet dropping monitoring by using the **display current-configuration | include smartmc** command.

Examples

Display resource monitoring configuration.

```
<Sysname> display smartmc resource-monitor configuration
ID  MacAddress      CPU  Memory  Temperature
1   1111-2222-3333  Y    N       N
2   1111-2222-3334  Y    N       N
3   1111-2222-3335  Y    N       N
```

Table 8 Command output

Field	Description
ID	Device ID.
MacAddress	MAC address of the device.
CPU	CPU usage monitoring status: • **Y**—CPU usage monitoring is enabled. • **N**—CPU usage monitoring is disabled. • **-**—The device does not support CPU usage monitoring.
Memory	Memory usage monitoring status: • **Y**—Memory usage monitoring is enabled. • **N**—Memory usage monitoring is disabled. • **-**—The device does not support memory usage monitoring.
Temperature	Temperature monitoring status: • **Y**—Temperature monitoring is enabled. • **N**—Temperature monitoring is disabled.

Field	Description
	• -—The device does not support temperature monitoring.

Related commands

smartmc resource-monitor

display smartmc tc

Use **display smartmc tc** to display member information.

Syntax

display smartmc tc [*tc-id*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

Parameters

tc-id: Specifies a member by its ID in the range of 1 to 255. If you do not specify a member, this command displays information about all members.

verbose: Displays detailed member information. If you do not specify this keyword, the command displays brief member information.

Examples

Display brief information about all members.

```
<Sysname> display smartmc tc
TCID DeviceType Sysname  IpAddress       MacAddress     Status   Version
1    S5130S-LI  S1       192.168.22.104  201c-e7c3-0300 Normal   COMWAREV700R001
```

Table 9 Command output

Table 10 Command output

Field	Description
TC ID	ID of the member.
Adding method	Method through which the member is added to the SmartMC network: • Manual. • Auto.
Sysname	Device name of the member.
Model	Device model of the member.
Device type	Device type of the member.
SYSOID	SYSOID of the member.
MAC address	MAC address of the member.
IP address	IP address of the member.
Boot image	Boot image file that the member runs.
Boot image version	Version of the boot image file.
System image	System image file that the member runs.
System image version	Version of the system image file.
Current-configuration file	Current startup configuration file used by the member.
Uptime	Operation duration of the member.
System CPU usage	CPU usage on the member.
System memory usage	Memory usage on the member.
Status	Operating status of the member: • **Normal**—The member is operating correctly. • **Offline**—The member is offline.
Boot-loader file	Upgrade startup software files.
Startup-configuration file	Upgrade configuration file.

display smartmc tc log buffer

Use **display smartmc tc log buffer** to display log information in the log buffer on a member.

Syntax

display smartmc tc *tc-id* **log buffer** [**module** *module-name* [**mnemonic** *mnemonic-value*]]

Views

Any view

Predefined user roles

network-admin

Parameters

tc-id: Specifies a member by its ID in the range of 1 to 255.

module *module-name*: Specifies a module by its name, a case-insensitive string of 1 to 8 characters. To display module names, use the **info-center source** command (see information center commands in *Network Management and Monitoring Command Reference*).

mnemonic *mnemonic-value*: Specifies a mnemonic, a case-insensitive string of 1 to 32 characters.

Examples

Display the log information for the SHELL module with the SHELL_CMD mnemonic for member 1.

```
<Sysname> display smartmc tc 1 log buffer module SHELL mnemonic SHELL_CMD
Time     : 2017-07-15 13:51:46
Level    : Informational
Module   : SHELL
Mnemonic : SHELL_CMD
Content  : -Line=con0-IPAddr=**-User=**; Command is qu

Time     : 2017-07-15 13:51:39
Level    : Informational
Module   : SHELL
Mnemonic : SHELL_CMD
Content  : -Line=con0-IPAddr=**-User=**; Command is local-user admin
```

Table 11 Command output

Field	Description
Time	Time when the log was generated.
Level	Log level.

display smartmc tc log restart

Use **display smartmc tc log restart** to display the restart log information for a member.

Syntax

display smartmc tc *tc-id* **log restart**

Views

Any view

Predefined user roles

network-admin

Parameters

tc-id: Specifies a member by its ID in the range of 1 to 255.

Usage guidelines

In addition to saving the logs generated by modules to the log buffer, a member sends restart logs to the commander. The commander creates a restart log buffer for each member to store their restart logs.

The commander stores a maximum of 10 restart logs for each member. The most recent restart log overwrites the oldest one when there are more than 10 restart logs for a member.

You can also use the **display smartmc tc** *tc-id* **log buffer module** SYSLOG **mnemonic** SYSLOG_RESTART command to display the restart log information.

Examples

Display the restart log information for member 1.

```
<Sysname> display smartmc tc 1 log restart
Time     : 2017-07-15 13:51:46
Level    : Informational
Module   : SYSLOG
Mnemonic : SYSLOG_RESTART
Content  : System restarted -- H3C Comware Software.
```

Table 12 Command output

Field	Description
Time	Time when the log was generated.
Level	Log level.

Related commands

display smartmc tc log buffer

display smartmc upgrade status

Use **display smartmc upgrade status** to display member upgrade status.

Syntax

display smartmc upgrade status

Views

Any view

Predefined user roles

network-admin

Examples

Display member upgrade status.

```
<Sysname> display smartmc upgrade status
```

```
ID    IpAddress         MacAddress      Status      UpdateTime        UpdateFile
1     192.168.56.1      82dd-a434-0200  Finished    Immediately       bootloader.ipe
2     192.168.56.103    5caf-2e5f-0100  Finished    Immediately       bootloader.ipe
```

Table 13 Command output

Field	Description
ID	ID of the member.
MacAddress	MAC address of the member.
IpAddress	IP address of the member.
Status	Upgrade status: • **Waiting**—The member is waiting for downloading the upgrade file. • **Download-failed**—The member failed to download the upgrade file. • **Download-finished**—The member has downloaded the upgrade file. • **Downloading**—The member is downloading the upgrade file. • **Updating**—The member is upgrading. • **Finished**—The member has finished upgrading. • **Failed**—The member failed to upgrade. • **Unknown**—The upgrade status of the member is unknown.
Updated File	Name of the upgrade file.
UpdateTime	Upgrade time: • **Immediately**—Upgrade at once. • **Delay(m)**—Upgrade after the specified delay. • **Time(HH:MM)**—Upgrade at the specified time.

Related commands

`smartmc upgrade tc`

display smartmc vlan

Use **`display smartmc vlan`** to display VLAN creation results for members.

Syntax

`display smartmc vlan`

Views

Any view

Predefined user roles

network-admin

Examples

Display VLAN creation results.

```
<Sysname> display smartmc vlan
ID     IpAddress         MacAddress        Vlan      Status
1      192.168.22.222    703d-15ad-cd02    2         Success
2      192.168.22.3      24ff-2264-0100    2         Success
3      192.168.22.4      24ff-2f74-0200    2         Success
4      192.168.22.223    487a-dac8-29ba    2         Success
```

Table 14 Command output

Field	Description
ID	Member ID.
IpAddress	IP address of the member.
MacAddress	MAC address of the member.
Vlan	VLAN created for the member.
Status	VLAN creation status: • **Processing**—The VLAN is being created. • **Success**—The VLAN has been created successfully. • **Failure. The port xxx is not an access port**—The VLAN fails to be created, because ports connected to non-SmartMC devices are not access ports. • **Failure. xxx not exist**—The VLAN fails to be created, because all access ports are connected to SmartMC devices.

Related commands

smartmc vlan

match

Use **match** to set a match criterion to add all matching members to a SmartMC group.

Use **undo match** to delete a match criterion.

Syntax

match { **device-type** *device-type* | **ip-address** *ip-address* { *ip-mask-length* | *ip-mask* } | **mac-address** *mac-address mac-mask-length* }

undo match { **device-type** *device-type* | **ip-address** *ip-address* { *ip-mask-length* | *ip-mask* } | **mac-address** *mac-address mac-mask-length* }

Default

No match criterion is set.

Views

SmartMC group view

Predefined user roles

network-admin

Parameters

device-type *device-type*: Sets a device type match criterion.

ip-address *ip-address* { *ip-mask-length* | *ip-mask* }: Sets an IP address match criterion. The *ip-address* argument specifies an IP address in dotted decimal notation. The *ip-mask* argument specifies the subnet mask in dotted decimal notation. The *ip-mask-length* argument specifies the subnet mask length in the range of 1 to 32.

mac-address *mac-address mac-mask-length*: Sets a MAC address match criterion. The *mac-address* argument specifies a MAC address in the format of *H-H-H*. The *mac-mask-length* argument specifies the mask length in the range of 1 to 48.

Examples

Create a SmartMC group named **a** and add members in subnet 192.168.1.0/24 to the group.

```
<Sysname> system-view
[Sysname] smartmc group a
[Sysname-smartmc-group-a] match ip-address 192.168.1.0 24
```

Related commands

smartmc group

display smartmc group

smartmc auto-link-aggregation enable

Use **smartmc auto-link-aggregation enable** to enable automatic Ethernet link aggregation.

Use **undo smartmc auto-link-aggregation enable** to disable automatic Ethernet link aggregation.

Syntax

smartmc auto-link-aggregation enable

undo smartmc auto-link-aggregation enable

Default

Automatic Ethernet link aggregation is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Automatic Ethernet link aggregation is performed only between member devices.

Enabling or disabling automatic Ethernet link aggregation might cause network flapping, and the members might go offline for a short period of time.

Examples

Enable automatic Ethernet link aggregation.

```
<Sysname> system-view
[Sysname] smartmc auto-link-aggregation enable
```

smartmc auto-replace enable

Use **smartmc auto-replace enable** to enable the automatic faulty member replacement feature.

Use **undo smartmc auto-replace enable** to disable the automatic faulty member replacement feature.

Syntax

smartmc auto-replace enable

undo smartmc auto-replace enable

Default

The automatic faulty member replacement feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

To perform an automatic fault replacement, first enable this feature on the commander, and then perform the following tasks:

1. Install the new member at the location where the faulty member was installed.
2. Connect all cables to the new member.

Make sure the new member and the faulty member have the same neighbor relationship, device model, and IRF member ID.

Examples

Enable the automatic faulty member replacement feature.

```
<Sysname> system-view
[Sysname] smartmc auto-replace enable
```

Related commands

smartmc replace

smartmc backup configuration

Use **smartmc backup configuration** to manually back up the configuration file on members.

Syntax

smartmc backup configuration { **group** *group-name-list* | **tc** [*tc-id-list*] }

Views

System view

Predefined user roles

network-admin

Parameters

group *group-name-list*: Specifies a space-separated list of up to 10 SmartMC groups. The group name is a case-sensitive string of 1 to 31 characters.

tc *tc-id-list*: Specifies a space-separated list of up to 10 member items. Each item specifies a device or a range of devices in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 0 to 255, with 0 representing the commander and 1 to 255 representing members. If you do not specify the commander or any members, all devices will perform configuration backup.

Usage guidelines

After you execute this command, the members immediately save the running configuration to the next-startup configuration files and upload the configuration files to the file server.

The backup configuration files are named in the format of *bridge MAC address*_**backup.cfg**.

Examples

Back up the configuration file on member 1, member 2, member 3, and member 4.

```
<Sysname> system-view
[Sysname] smartmc backup configuration tc 1 to 4
```

Back up the configuration file on all members in SmartMC groups **test1**, **test2**, and **test3**.

```
<Sysname> system-view
[Sysname] smartmc backup configuration group test1 test2 test3
```

Related commands

display smartmc configuration

smartmc backup configuration interval

smartmc backup configuration max-number

Use **smartmc backup configuration max-number** to set the maximum number of members that can perform automatic configuration backup at the same time.

Use **undo smartmc backup configuration max-number** to restore the default.

Syntax

smartmc backup configuration max-number *max-number*

undo smartmc backup configuration max-number

Default

A maximum of five members can perform automatic configuration backup at the same time.

Views

System view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of members that can perform automatic configuration backup at the same time, in the range of 2 to 20.

Usage guidelines

The maximum number of members that can perform automatic configuration at the same time is limited by the performance of the file server. If automatic configuration backup fails, set the maximum number of members to a smaller value.

Examples

Specify that a maximum of 10 members can perform automatic configuration backup at the same time.

```
<Sysname> system-view
[Sysname] smartmc backup configuration max-number 10
```

Related commands

smartmc backup configuration interval

Use **smartmc backup configuration interval** to enable the automatic configuration file backup feature and set the automatic backup interval.

Use **undo smartmc backup configuration interval** to restore the default.

Syntax

smartmc backup configuration interval *interval*

undo smartmc backup configuration interval

Default

The automatic configuration file backup feature is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the automatic configuration file backup interval in the range of 1 to 720 hours.

Usage guidelines

This command enables the commander and members to back up their configuration files by saving the running configuration to the files and then uploading them to the file server. When you execute this command, the commander and members immediately perform a backup. After that, they back up the configuration files at the specified interval. The backup configuration files are named in the format of *bridge MAC address*_**backup.cfg**.

Examples

Enable the automatic configuration file backup feature and set the backup interval to 24 hours.

```
<Sysname> system-view
[Sysname] smartmc backup configuration interval 24
```

smartmc batch-file apply

Use **smartmc batch-file apply** to specify a batch file to deploy to ports connecting APs or IP phones.

Use **undo smartmc batch-file apply** to remove a batch file specified for ports connecting APs or IP phones.

Syntax

smartmc batch-file *batch-file-name* **apply** { **ap** | **phone** }

undo smartmc batch-file apply { **ap** | **phone** }

Default

No batch file is specified for ports connecting APs or IP phones.

Views

System view

Predefined user roles

network-admin

Parameters

batch-file-name: Specifies a batch file by its name, a case-insensitive string of 1 to 255 characters.

ap: Specifies ports connecting APs.

phone: Specifies ports connecting IP phones.

Usage guidelines

With batch file deployment enabled, the commander automatically deploys configurations in the specified batch file to a port connecting an AP or IP phone, simplifying access port configuration.

When the commander first detects the association of an AP or IP phone on a port through LLDP, it deploys the command lines in the specified batch file to the port. If no batch file is specified for the device type, the configurations on the port remain unchanged.

If the AP or IP phone disconnects from the port, the configurations on the port remain. When a new device comes online from the port, configurations used by the port depend on the new device type.

- If the new device is an AP or IP phone and has the same type as the disconnected device, the configurations on the port remain unchanged.
- If the new device is an AP or IP phone but has a different type as the disconnected device, the commander deploys the command lines in the specified batch file to the port. If no batch file is specified for the device type, the configurations on the port remain unchanged.
- If the new device is neither an AP nor an IP phone, the configurations on the port remain unchanged.

To disable the commander from deploying a batch file to ports, remove the specified batch file or execute the **undo smartmc batch-file-apply enable** command to disable batch file deployment. The **undo smartmc batch-file-apply enable** command is supported only in Release 6328 and later.

Examples

Specify batch file **ap.cmdset** for ports connecting APs or IP phones.

```
<Sysname> system-view
[Sysname] smartmc batch-file ap.cmdset apply ap
```

Related commands

create batch-file

Syntax

smartmc batch-file *batch-file-name* **deploy** { **group** *group-name-list* | **tc tc**-*id-list* }

Views

System view

Predefined user roles

network-admin

Parameters

batch-file-name: Specifies the name of a batch file, a case-insensitive string of 1 to 255 characters.

group *group-name-list*: Specifies a space-separated list of up to 10 SmartMC groups. The group name is a case-sensitive string of 1 to 31 characters.

tc *tc-id-list*: Specifies a space-separated list of up to 10 member items. Each item specifies a member or a range of members in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

Examples

Deploy batch file **startup.cmdset** to SmartMC group **testgroup**.

```
<Sysname> system-view
[Sysname] smartmc batch-file startup.cmdset deploy group testgroup
```

Related commands

Use **undo smartmc batch-file-apply enable** to disable batch file deployment.

NOTE:

This command is supported only in Release 6328 and later.

Syntax

smartmc batch-file-apply enable

undo smartmc batch-file-apply enable

Default

Batch file deployment is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

With batch file deployment enabled, the commander automatically deploys configurations in the specified batch file to a port connecting an AP or IP phone, simplifying access port configuration. To disable the commander from deploying a batch file to ports, remove the specified batch file or disable batch file deployment.

Examples

Disable batch file deployment.

```
<Sysname> system-view
[Sysname] undo smartmc batch-file-apply enable
```

Related commands

smartmc batch-file apply

smartmc enable

Use **smartmc enable** to enable SmartMC and set the device role.

Use **undo smartmc enable** to disable SmartMC.

Syntax

smartmc { **tc** | **tm** **username** *username* **password** { **cipher** | **simple** } *string* } **enable**

undo smartmc enable

Default

SmartMC is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

tc: Enables SmartMC and sets the device role to member.

tm: Enables SmartMC and sets the device role to commander.

username *username*: Specifies a username for the local user, a case-sensitive string of 1 to 55 characters.

password: Specifies a password for the local user.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

A SmartMC network must have one and only one commander.

To enable SmartMC, execute this command on both the commander and members. To configure the other SmartMC features, execute associated commands only on the commander.

If you change the role of the commander to member or disable SmartMC on the commander, all SmartMC settings in its running configuration will be cleared.

SmartMC fails to be enabled if ACL resources are insufficient. If ACL resources are insufficient, use the **undo acl** command to delete unnecessary ACLs and then enable SmartMC. You can execute the **display acl** command to view ACL configuration and match statistics. For more information about ACLs, see *ACL and QoS Configuration Guide*.

SmartMC fails to be enabled if ports 80 and 443 have been used.

If you execute this command multiple times, the most recent configuration takes effect. You can execute the command to change the device role or the password.

Examples

Enable SmartMC and set the device role to member.

```
<Sysname> system-view
[Sysname] smartmc tc enable
```

smartmc { ftp-server | sftp-server }

Use **smartmc { ftp-server | sftp-server }** to configure the file server information.

Use **undo smartmc { ftp-server | sftp-server }** to delete the file server information.

Syntax

Release 6318P01 and earlier:

smartmc ftp-server *server-address* **username** *username* **password { cipher | simple }** *string*

undo smartmc ftp-server

Release 6328 and later:

smartmc { ftp-server | sftp-server } { *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port*] [**vpn-instance** *vpn-instance-name*] [**directory** *directory*] **username** *username* **password { cipher | simple }** *string*

undo smartmc { ftp-server | sftp-server }

Default

No file server information is configured.

Views

System view

Predefined user roles

network-admin

Parameters

ftp-server: Specifies an FTP server.

sftp-server: Specifies an SFTP server.

ipv4-address: Specifies the IPv4 address of the file server.

ipv6 *ipv6-address*: Specifies the IPv6 address of the file server.

port *port*: Specifies the port number of the file server, in the range of 1 to 65535. The default pot for an FTP server and an SFTP server is 21 and 22, respectively.

vpn-instance *vpn-instance-name*: Specifies the name of the MPLS L3VPN instance to which the file server belongs, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command considers that the file server is in the public network.

directory *directory*: Specifies the working directory of the file server, a case-insensitive string. By default, the root directory is used.

username *username*: Specifies the file server username, a case-sensitive string of 1 to 55 characters.

password: Specifies the file server password.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

You can specify only one file server. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the file server type to FTP, and specify the server IP address, username, and password as 192.168.22.19, **admin**, and **hello12345**, respectively.

```
<Sysname> system-view
[Sysname] smartmc ftp-server 192.168.22.19 username admin password simple hello12345
```

Related commands

display smartmc configuration

smartmc group

Use **smartmc group** to create a SmartMC group and enter its view, or enter the view of an existing SmartMC group.

Use **undo smartmc group** to delete a SmartMC group.

Syntax

smartmc group *group-name*

undo smartmc group *group-name*

Default

No SmartMC groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-name: Specifies the name of the SmartMC group, a case-sensitive string of 1 to 31 characters.

Usage guidelines

When you perform the following operations, you can specify a SmartMC group to apply the operations to all members in the group:

- Startup software upgrade.
- Configuration file upgrade.
- Configuration deployment.

Examples

Create SmartMC group **testgroup**.

```
<Sysname> system-view
[Sysname] smartmc group testgroup
[Sysname-smartmc-group-testgroup]
```

Related commands

match

smartmc outbound

Use **smartmc outbound** to configure an outgoing interface for the SmartMC network.

Use **undo smartmc outbound** to restore the default.

Syntax

smartmc outbound

undo smartmc outbound

Default

No interface is used as an outgoing interface, and the SmartMC network cannot communicate with outside networks.

Views

VLAN interface view

Predefined user roles

network-admin

Usage guidelines

VLAN interface 1 cannot be used as an outgoing interface, because the SmartMC network is established in VLAN 1.

Examples

Configure GigabitEthernet 1/0/1 as an outgoing interface for the SmartMC network.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] smartmc outbound
```

smartmc resource-monitor

Use **smartmc resource-monitor** to enable resource monitoring.

Use **undo smartmc resource-monitor** to disable resource monitoring.

Syntax

smartmc resource-monitor [**cpu** | **memory** | **packet-drop** | **temperature**] * [**group** *group-name-list* | **tc** { *tc-id-list* | **mac-address** *mac-address* } | **tm**]

undo smartmc resource-monitor [**cpu** | **memory** | **packet-drop** | **temperature**] * [**group** *group-name-list* | **tc** { *tc-id-list* | **mac-address** *mac-address* } | **tm**]

Default

Resource monitoring is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

cpu: Enables CPU usage monitoring.

memory: Enables memory usage monitoring.

packet-drop: Enables packet dropping monitoring.

NOTE:

The **packet-drop** keyword is supported only in Release 6328 and later.

temperature: Enables temperature monitoring.

group *group-name-list*: Specifies the SmartMC groups to monitor. You can specify a space-separated list of up to 10 SmartMC groups. The group name is a case-sensitive string of 1 to 31 characters.

tc: Specifies the members to monitor.

tc-id-list: Specifies a space-separated list of up to 10 member items. Each item specifies a member or a range of members in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

mac-address *mac-address*: Specifies a member by its MAC address in the format of H-H-H.

tm: Enables resource monitoring on the commander.

Usage guidelines

Packet dropping monitoring monitors packet dropping on members and on interfaces.

If you do not specify a resource type, this command enables resource monitoring for all resource types.

If you do not specify a device to monitor (member or the commander), this command enables resource monitoring on the commander and all members.

Examples

Enable resource monitoring for all resource types on member 1 through member 3.

```
<Sysname> system-view
[Sysname] smartmc resource-monitor tc 1 to 3
```

Related commands

display smartmc resource-monitor

smartmc resource-monitor interval

smartmc resource-monitor max-age

smartmc resource-monitor interval

Use **smartmc resource-monitor interval** to set the interval for the commander to obtain resource monitoring information.

Use **undo smartmc resource-monitor interval** to restore the default.

Syntax

smartmc resource-monitor interval *interval*

undo smartmc resource-monitor interval

Default

The interval for the commander to obtain resource monitoring information is 1 minute.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval for the commander to obtain resource monitoring information, in the range of 1 to 60 minutes.

Usage guidelines

For packet dropping monitoring, the specified interval applies only to obtaining of member packet dropping information. Because of the great amount of interface information, the commander obtains interface packet dropping information from members only when Web displaying is requested.

Examples

Set the interval for the commander to obtain resource monitoring information to 5 minutes.

```
<Sysname> system-view
[Sysname] smartmc resource-monitor interval 5
```

Related commands

display smartmc resource-monitor

smartmc resource-monitor

smartmc resource-monitor max-age

Use **smartmc resource-monitor max-age** to set the aging time for resource monitoring information.

Use **undo smartmc resource-monitor max-age** to restore the default.

Syntax

smartmc resource-monitor max-age *max-age*

undo smartmc resource-monitor max-age

Default

The aging time for resource monitoring information is 24 hours.

Views

System view

Predefined user roles

network-admin

Parameters

max-age: Specifies the aging time for resource monitoring information, in the range of 1 to 168 hours.

Usage guidelines

For packet dropping monitoring, the specified aging time applies only to member packet dropping information. Each member saves its interface packet dropping information for as long as 30 days.

To view interface packet dropping information, log in to the Web interface of the commander and access the **SmartMC** > **Intelligent O&M** > **Resource monitoring** page. You can view information in the past 1 hour, 1 day, or 30 days.

Examples

Set the aging time for resource monitoring information to 1 hour.

```
<Sysname> system-view
[Sysname] smartmc resource-monitor max-age 1
```

Related commands

display smartmc resource-monitor

smartmc replace

Use **smartmc replace** to manually replace a faulty member.

Syntax

smartmc replace tc *tc-id1* **faulty-tc** *tc-id2*

Views

System view

Predefined user roles

network-admin

Parameters

tc *tc-id1*: Specifies the ID of the new member, in the range of 1 to 255.

faulty-tc *tc-id2*: Specifies the ID of the faulty member, in the range of 1 to 255.

Usage guidelines

Before you execute this command, perform the following tasks:

1. Install the new member at the location where the faulty member was installed.
2. Connect all cables to the new member.

Make sure the new member and the faulty member have the same neighbor relationship, device model, and IRF member ID.

Examples

Replace faulty member 5 with new member 10.

```
<Sysname> system-view
[Sysname] smartmc replace tc 10 faulty-tc 5
```

Related commands

display smartmc replace status

smartmc auto-replace enable

smartmc tc boot-loader

Use **smartmc tc boot-loader** to specify the upgrade startup software files for a member.

Use **undo smartmc tc boot-loader** to remove the configuration.

Syntax

smartmc tc *tc-id* **boot-loader** { *ipe-filename* | **boot** *boot-filename* **system** *system-filename* }

undo smartmc tc *tc-id* **boot-loader**

Views

System view

Predefined user roles

network-admin

Parameters

tc *tc-id*: Specifies a member by its ID in the range of 1 to 255.

ipe-filename: Specifies an IPE software file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.ipe** extension.

boot *boot-filename*: Specifies a boot image file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.bin** extension.

system *system-filename*: Specifies a system image file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.bin** extension.

Examples

Specify upgrade boot image **boot.bin** and upgrade system image **system.bin** for member 1.

```
<Sysname> system-view
[Sysname] smartmc tc 1 boot-loader boot boot.bin system system.bin
```

Related commands

display smartmc tc

smartmc tc device-type

Use **smartmc tc device-type** to define a member type on the commander.

Use **undo smartmc tc device-type** to delete a member type.

Syntax

smartmc tc sysoid *sysoid* **device-type** *device-type*

undo smartmc tc sysoid *sysoid* **device-type** *device-type*

Views

System view

Predefined user roles

network-admin

Parameters

sysoid *sysoid*: Specifies the SYSOID of a member.

device-type *device-type*: Specifies a member type.

Usage guidelines

A device type can correspond to multiple device models. You can identify different device models with different SYSOIDs by specifying a SYSOID for each device model. The commander identifies member types by SYSOID.

The system predefines the device types for some device models based on SYSOIDs. For device models without predefined device types, you must define their member types by SYSOID manually. If you do not do so, the commander cannot identify the types of such devices.

You cannot modify the predefined device types.

Before defining a device type for a member, you can use the **display smartmc tc** command to determine whether the member has a predefined one.

- If the member has been predefined with one device type, the **DeviceType** field displays the actual predefined device type.
- If the member does not have a predefined device type, the **DeviceType** field displays **unknown**.

To obtain the SYSOID of a member, use the **display smartmc tc verbose** command.

Examples

Define a member type by specifying the SYSOID as 1.3.6.1.4.1.25506.1.1588 and the member type as SW.

```
<Sysname> system-view
[Sysname] smartmc tc sysoid 1.3.6.1.4.1.25506.1.1588 device-type SW
```

smartmc tc password

Use **smartmc tc password** to modify the password for the default user (admin) on members.

Use **undo smartmc tc password** to restore the default.

Syntax

smartmc tc password [**cipher**] *string*

undo smartmc tc password

Default

The password for the default user on members is **admin**.

Views

System view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form. If you do not specify this keyword, the command creates a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

NOTE:

The **cipher** keyword is supported only in Release 6328 and later.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 33 to 117 characters.

Usage guidelines

During SmartMC network establishment, the commander establishes NETCONF sessions to members and adds them to the network. The default username and password on the members for NETCONF session establishment are **admin** and **admin**. To enhance security, you can perform this task to change the password for the default user **admin** of the members after the commander adds the members to the network.

If the default password cannot meet the password complexity requirements on members, you cannot execute the **undo smartmc tc password** command to restore the default.

Do not modify the password for members that are manually added to the SmartMC network. If you modify the password for a manually added member, you will not be able to manage that member from the commander.

Examples

Configure default user admin on members to use plaintext password **hello12345**.

```
<Sysname> system-view
[Sysname] smartmc tc password hello12345
```

smartmc tc startup-configuration

Use **smartmc tc startup-configuration** to specify the upgrade configuration file for a member.

Use **undo smartmc tc startup-configuration** to remove the configuration.

Syntax

smartmc tc *tc-id* **startup-configuration** *cfg-filename*

undo smartmc tc *tc-id* **startup-configuration**

Views

System view

Predefined user roles

network-admin

Parameters

tc *tc-id*: Specifies a member by its ID in the range of 1 to 255.

cfg-filename: Specifies a configuration file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.cfg** extension.

Examples

Specify upgrade configuration file **startup.cfg** for member 1.

```
<Sysname> system-view
[Sysname] smartmc tc 1 startup-configuration startup.cfg
```

smartmc upgrade boot-loader

Use **smartmc upgrade boot-loader** to upgrade the startup software on a list of members or SmartMC groups.

Use **undo smartmc upgrade** delete the startup software upgrade task.

Syntax

smartmc upgrade boot-loader { **group** | **tc** } *list* [**delay** *minutes* | **time** *time*]

smartmc upgrade boot-loader { **group** | **tc** } { *list* { **boot** *boot-filename* **system** *system-filename* | **file** *ipe-filename* } }&<1-40> [**delay** *delay-time* | **time** *time*]

undo smartmc upgrade

Views

System view

Predefined user roles

network-admin

Parameters

group: Specifies the SmartMC groups to be upgraded.

tc: Specifies the members to be upgraded.

list: Specifies a space-separated list of up to 10 member items or SmartMC group items.

- **SmartMC group**—Each item specifies a SmartMC group name, a case-sensitive string of 1 to 31 characters.
- **Member**—Each item specifies a member ID or a range of member IDs in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

boot *boot-filename*: Specifies a boot image by its name.

system *system-filename*: Specifies a system image by its name.

file *ipe-filename*: Specifies an IPE file by its name, a case-insensitive string of 5 to 45 characters.

delay *delay-time*: Specifies the upgrade delay time in the range of 1 to 1440 minutes.

time *in-time*: Specifies the upgrade time in the format of *hh:mm*. The value range for the *hh* argument is 0 to 23 hours. The value range for the *mm* argument is 0 to 59 minutes.

Usage guidelines

CAUTION:

Upgrading the startup software might interrupt services. Before upgrading the startup software, make sure no services will be interrupted.

To use this command to upgrade the startup software on members without specifying the upgrade files, you must first perform one of the following tasks:

- Execute the **smartmc tc boot-loader** command to specify the upgrade files for members.
- Execute the **boot-loader** command to specify the upgrade files for a SmartMC group.

A member can perform only one upgrade task at a time.

If you execute this command without specifying the delay time or update time, the members or SmartMC group immediately upgrades the startup software and the upgrade operation cannot be cancelled. If you specify a delay time or upgrade time to perform a scheduled upgrade, the upgrade operation can be cancelled by using the **undo smartmc upgrade** command before it starts.

Examples

Upgrade startup software images **boot.bin** and **sys.bin** on all members in SmartMC groups **test1** and **test2**.

```
<Sysname> system-view
[Sysname] smartmc upgrade boot-loader group test1 test2 boot boot.bin system sys.bin
```

network-admin

Parameters

group: Specifies the SmartMC groups to be upgraded.

tc: Specifies the members to be upgraded.

list: Specifies a space-separated list of up to 10 member items or SmartMC group items.

- **SmartMC group**—Each item specifies a SmartMC group name, a case-sensitive string of 1 to 31 characters.
- **Member**—Each item specifies a member ID or a range of member IDs in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

file *cfg-filename*: Specifies a configuration file by its name.

NOTE:

The **file** keyword needs to be entered only in Release 6328 and later.

delay *delay-time*: Specifies the upgrade delay time in the range of 1 to 1440 minutes.

time *in-time*: Specifies the upgrade time in the format of *hh:mm*. The value range for the *hh* argument is 0 to 23 hours. The value range for the *mm* argument is 0 to 59 minutes.

Usage guidelines

CAUTION:

After you update the configuration file, the configuration in the new configuration file will become the running configuration. Before upgrading the configuration file, make sure the contents of the new configuration file are correct.

To use this command to upgrade the configuration file on members without specifying the upgrade file, you must first perform one of the following tasks:

- Execute the **smartmc tc startup-configuration** command to specify the upgrade file for members.
- Execute the **startup-configuration** command to specify the upgrade file for a SmartMC group.

A member can perform only one upgrade task at a time.

If you execute this command without specifying the delay time or update time, the members or SmartMC group immediately upgrades the configuration file and the upgrade operation cannot be cancelled. If you specify a delay time or upgrade time to perform a scheduled upgrade, the upgrade operation can be cancelled by using the **undo smartmc upgrade** command before it starts.

Examples

Upgrade configuration file **startup.cfg** on all members in SmartMC groups **test1** and **test2**.

```
<Sysname> system-view
[Sysname] smartmc upgrade boot-loader group test1 test2 startup.cfg
```

Related commands

boot-loader

startup-configuration

smartmc vlan

Use **smartmc vlan** to create a VLAN for members.

Syntax

smartmc vlan *vlan-id* { **group** *group-name-list* | **tc** *tc-id-list* }

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies the VLAN ID in the range of 1 to 4094.

group *group-name-list*: Specifies the SmartMC groups for which the VLAN is created. You can specify a space-separated list of up to 10 SmartMC groups. The group name is a case-sensitive string of 1 to 31 characters.

tc *tc-id-list*: Specifies the members for which the VLAN is created. You can specify a space-separated list of up to 10 member items. Each item specifies a member or a range of members in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

Usage guidelines

Execute this command when the network topology is stable. As a best practice, use the **smartmc topology-refresh** command to refresh the network topology before executing this command.

After you execute this command, all access ports on members except the following access ports are assigned to the VLAN:

- Access ports connecting to the commander.
- Access ports connecting to other members.
- Access ports connecting to offline devices. Remove offline devices before configuring this command.

If the VLAN is successfully created but some access ports of a member cannot be assigned to the VLAN, the VLAN memberships of the member is restored to the state before the VLAN is created.

The failure to assign an access port of a member to the created VLAN does not affect the VLAN assignment for other members.

After command execution, you can use the **display smartmc vlan** command to examine the VLAN creation result.

Examples

Create a VLAN for member 1 and member 2.

```
<Sysname> system-view
[Sysname] smartmc vlan 2 tc 1 to 2
As a best practice, execute the display smartmc vlan command to verify that the VLAN has
been created successfully.
```

startup-configuration

Use **startup-configuration** to specify an upgrade configuration file for a SmartMC group .

Use **undo startup-configuration** to restore the default.

Syntax

startup-configuration *cfgfile*

undo startup-configuration

Default

No upgrade configuration file is specified for the SmartMC group.

Views

SmartMC group view

Predefined user roles

network-admin

Parameters

cfgfile: Specifies a configuration file by its name, a string of 5 to 45 characters. The file name must include the **.cfg** extension.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify configuration file **startup.cfg** for SmartMC group **testgroup**.

```
<Sysname> system-view
[Sysname] smartmc group testgroup
[Sysname-smartmc-group-testgroup] startup-configuration startup.cfg
```

Related commands

smartmc group

Contents

WiNet commands

boot-loader file

Use **boot-loader file** to specify the upgrade startup software files for a WiNet group.

Use **undo boot-loader** to restore the default.

Syntax

boot-loader file { *ipe-filename* | **boot** *boot-filename* **system** *system-filename* }

undo boot-loader

Default

No upgrade startup software files are specified for a WiNet group.

Views

WiNet group view

Predefined user roles

network-admin

Parameters

ipe-filename: Specifies an IPE software file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.ipe** extension.

boot *boot-filename*: Specifies a boot image file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.bin** extension.

system *system-filename*: Specifies a system image file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.bin** extension.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify IPE software file **device.ipe** for WiNet group **testgroup**.

```
<Sysname> system-view
[Sysname] winet group testgroup
[Sysname-winet-group-testgroup] boot-loader file device.ipe
```

Related commands

winet group

winet upgrade boot-loader

create batch-file

Use **create batch-file** to create a batch file.

Syntax

create batch-file *batch-file-name*

Default

No batch files exist.

Views

User view

Predefined user roles

network-admin

Parameters

batch-file-name: Specifies the name of the batch file, a case-insensitive string of 1 to 255 characters. If you do not specify a file extension when specifying a file name, the default extension **.cmdset** is used.

Usage guidelines

After executing this command, you will enter the batch edit mode. In this mode, each command occupies a line. When you finish editing all command lines, enter a percent sign (%) to return to user view.

Make sure the command lines that you enter are correct because the system does not verify whether the command lines are correct.

Examples

Create a batch file named **test.cmdset**, and enter the command lines for specifying the device name as **Sysname** and enabling Telnet.

```
<Sysname> create batch-file test.cmdset
Begin to edit batch commands, and quit with the character '%'.
system-view
sysname Sysname
telnet server enable%
<Sysname>
```

Related commands

display winet backup configuration status

Use **display winet backup configuration status** to display the backup status on members.

Syntax

display winet backup configuration status

Views

Any view

Predefined user roles

network-admin

Usage guidelines

This command displays the status of the ongoing backup task or the most recent backup task if the member is not performing backup.

Examples

Display the backup status on members.

```
<Sysname> display winet backup configuration status
ID     IpAddress        MacAddress          Status       Time
1      192.168.56.30    08d2-38ff-0300      Finished     2017-04-05 11:30:35
2      192.168.56.40    62d2-c21c-0400      Finished     2017-04-05 11:30:40
```

Table 1 Command output

Field	Description
ID	ID of the member.
IpAddress	IP address of the member.
MacAddress	MAC address of the member.
Status	Backup status: • **Waiting**—The member is waiting for configuration backup. • **Processing**—The member is backing up the configuration. • **Finished**—The member has finished backing up the configuration. • **Timeout**—Configuration backup times out. • **Failed**—The member failed to back up the configuration.
Time	Time when the member finished backing up the configuration. If the member has not finished backing up the configuration, this field displays a hyphen (**-**).

display winet batch-file status

Use **display winet batch-file status** to display the batch file deployment result.

Syntax

display winet batch-file status [**ap** | **last** *number* | **phone**]

Views

Any view

Predefined user roles

network-admin

Parameters

ap: Displays the result of the most recent batch file deployment for ports connected to APs.

last *number*: Specifies a batch file deployment (performed by using the **winet batch-file deploy** command) by its number counting from the most recent batch file deployment. The value range for the *number* argument is 1 to 5.

phone: Displays the result of the most recent batch file deployment for ports connected to IP phones.

Usage guidelines

If you do not specify any parameters, this command displays the result of the most recent batch file deployment performed by using the **winet batch-file deploy** command.

Examples

Display the result of the most recent batch file deployment. In this example, the batch file contains the **display winet configuration** command.

```
<Sysname> display winet batch-file status last 1
TC ID 1
Device MAC : 8a73-60c3-0200
Start Time : 2018-12-24 14:55:39
End   Time : 2018-12-24 14:55:43
Result     :

display winet configuration

Use **display winet configuration** to display the WiNet configuration.

Syntax

display winet configuration

Views

Any view

Predefined user roles

network-admin

Examples

Display the WiNet configuration on the commander.

Release 6318P01 and earlier:

```
<Sysname> display winet configuration
Device role                          : TM
FTP server IP                        : 192.168.22.103
FTP server username                  : admin
Topology-refresh interval            : 60(s)
Backup startup-configuration interval : N/A
Sync backup number                   : 5
Device status                        : Lack
Some configurations are absent on the TM, such as Telnet or LLDP configuration.
```

Release 6328 and later:

```
<Sysname> display smartmc configuration
Device role                          : TM
File server:
  Type: FTP
  IP address: 192.168.22.103
  Username: admin
  Port: 21
  VPN instance: N/A
  Directory: /FTP
Topology-refresh interval            : 60(s)
Backup startup-configuration interval : N/A
Sync backup number                   : 5
Device status                        : Lack
Some configurations are absent on the TM, such as Telnet or LLDP configuration.
```

Display the commander information on a member.

```
<Sysname> display winet configuration
Device role       : TC
TM IP             : 192.168.22.103
TM MAC            : 8288-468d-0100
TM sysname        : Sysname
```

Table 3 Command output

Field	Description
Device role	Role of the device.
FTP server IP	This field is supported only in Release 6318P01 and earlier. IP address of the FTP server. If no FTP server IP address is configured, this field displays **N/A**.
FTP server username	This field is supported only in Release 6318P01 and earlier. FTP server username. If no username is configured, this field displays **N/A**.
File server	This field is supported only in Release 6328 and later. File server configuration.
Type	This field is supported only in Release 6328 and later. File server type. If no file server is specified, this field displays **N/A**.
IP address	This field is supported only in Release 6328 and later. File server IP address. If no file server is specified, this field displays **N/A**.
Username	This field is supported only in Release 6328 and later. File server username. If no file server is specified, this field displays **N/A**.
Port	This field is supported only in Release 6328 and later. File server port. If no file server is specified, this field displays **N/A**.
VPN instance	This field is supported only in Release 6328 and later. VPN instance to which the file server belongs. If no file server is specified, this field displays **N/A**.
Directory	This field is supported only in Release 6328 and later. Storage directory of files on the file server. If no file server is specified, this field displays **N/A**.
Topology-refresh interval	Topology refresh interval, in seconds.
Backup startup-configuration interval	Automatic configuration file backup interval, in hours. If no interval is set, this field displays **N/A**.
Sync backup number	Number of members that can perform configuration backup at the same time.
Device status	Commander status: • **Normal**. • **Lack**—Lack of configuration, such as NETCONF, Telnet, local user, and LLDP.
TM IP	IP address of the commander. If the member failed to obtain the commander IP address, this field displays **N/A**.
TM MAC	MAC address of the commander, If the member failed to obtain the commander MAC address, this field displays **N/A**.
TM sysname	Name of the commander. If the member failed to obtain the commander name, this field displays **N/A**.
Some configurations are absent on the TM, such as XXX.	This field is available only when the **Device status** field displays **Lack**. Lack of configuration will affect WiNet functions. Please follow the prompt to complete the configuration.

display winet resource-monitor

Use **display winet resource-monitor** to display resource monitoring information.

Syntax

display winet resource-monitor [**cpu** | **memory** | **temperature**] * [**tc** *tc-id* | **tm**]

Views

Any view

Predefined user roles

network-admin

Parameters

cpu: Displays CPU usage.

memory: Displays memory usage.

temperature: Displays temperature information.

tc *tc-id*: Specify a member by its ID in the range of 1 to 255.

tm: Specify the commander.

Usage guidelines

This command displays CPU usage, memory usage, and temperature information of the commander and members on the commander. For packet dropping information, log in to the Web interface of the commander and access the **WiNet** > **Intelligent O&M** > **Resource monitoring** page. Packet dropping information can be viewed only in Release 6328 and later.

If you do not specify a resource type, this command displays the resource monitoring information of all types.

If you do not specify a member or the commander, this command displays the resource monitoring information for the commander and all members.

Examples

Display the resource monitoring information for member 1.

```
<Sysname> display winet resource-monitor tc 1
TC 1
  Collection time : 2017-07-25 18:02:30
  Slot 1:
    CPU 0 CPU usage: 1%
    Memory usage   : 587076/903332
    Temperature    : 30
```

Table 10 Command output

Field	Description
TC ID	ID of the member.
Adding method	Method through which the member is added to the WiNet network: • Manual. • Auto.
Sysname	Device name of the member.
Model	Device model of the member.
Device type	Device type of the member.
SYSOID	SYSOID of the member.
MAC address	MAC address of the member.
IP address	IP address of the member.
Boot image	Boot image file that the member runs.
Boot image version	Version of the boot image file.
System image	System image file that the member runs.
System image version	Version of the system image file.
Current-configuration file	Current startup configuration file used by the member.
Uptime	Operation duration of the member.
System CPU usage	CPU usage on the member.
System memory usage	Memory usage on the member.
Status	Operating status of the member: • **Normal**—The member is operating correctly. • **Offline**—The member is offline.
Boot-loader file	Upgrade startup software files.
Startup-configuration file	Upgrade configuration file.

display winet tc log buffer

Use **display winet tc log buffer** to display log information in the log buffer on a member.

Syntax

display winet tc *tc-id* **log buffer** [**module** *module-name* [**mnemonic** *mnemonic-value*]]

Views

Any view

Predefined user roles

network-admin

Parameters

tc-id: Specifies a member by its ID in the range of 1 to 255.

module *module-name*: Specifies a module by its name, a case-insensitive string of 1 to 8 characters. To display module names, use the **info-center source** command (see information center commands in *Network Management and Monitoring Command Reference*).

mnemonic *mnemonic-value*: Specifies a mnemonic, a case-insensitive string of 1 to 32 characters.

Examples

Display the log information for the SHELL module with the SHELL_CMD mnemonic for member 1.

```
<Sysname> display winet tc 1 log buffer module SHELL mnemonic SHELL_CMD
Time     : 2017-07-15 13:51:46
Level    : Informational
Module   : SHELL
Mnemonic : SHELL_CMD
Content  : -Line=con0-IPAddr=**-User=**; Command is qu

Time     : 2017-07-15 13:51:39
Level    : Informational
Module   : SHELL
Mnemonic : SHELL_CMD
Content  : -Line=con0-IPAddr=**-User=**; Command is local-user admin
```

Table 11 Command output

Field	Description
Time	Time when the log was generated.
Level	Log level.

display winet tc log restart

Use **display winet tc log restart** to display the restart log information for a member.

Syntax

display winet tc *tc-id* **log restart**

Views

Any view

Predefined user roles

network-admin

Parameters

tc-id: Specifies a member by its ID in the range of 1 to 255.

Usage guidelines

In addition to saving the logs generated by modules to the log buffer, a member sends restart logs to the commander. The commander creates a restart log buffer for each member to store their restart logs.

The commander stores a maximum of 10 restart logs for each member. The most recent restart log overwrites the oldest one when there are more than 10 restart logs for a member.

You can also use the **display winet tc** *tc-id* **log buffer module** SYSLOG **mnemonic** SYSLOG_RESTART command to display the restart log information.

Examples

Display the restart log information for member 1.

```
<Sysname> display winet tc 1 log restart
Time     : 2017-07-15 13:51:46
Level    : Informational
Module   : SYSLOG
Mnemonic : SYSLOG_RESTART
Content  : System restarted -- H3C Comware Software.
```

Table 12 Command output

Field	Description
Time	Time when the log was generated.
Level	Log level.

display winet upgrade status

Use **display winet upgrade status** to display member upgrade status.

Syntax

display winet upgrade status

Views

Any view

Predefined user roles

network-admin

Examples

Display member upgrade status.

```
<Sysname> display winet upgrade status
```

```
ID    IpAddress         MacAddress      Status      UpdateTime        UpdateFile
1     192.168.56.1      82dd-a434-0200  Finished    Immediately       bootloader.ipe
2     192.168.56.103    5caf-2e5f-0100  Finished    Immediately       bootloader.ipe
```

Table 13 Command output

Field	Description
ID	ID of the member.
MacAddress	MAC address of the member.
IpAddress	IP address of the member.
Status	Upgrade status: • **Waiting**—The member is waiting for downloading the upgrade file. • **Download-failed**—The member failed to download the upgrade file. • **Download-finished**—The member has downloaded the upgrade file. • **Downloading**—The member is downloading the upgrade file. • **Updating**—The member is upgrading. • **Finished**—The member has finished upgrading. • **Failed**—The member failed to upgrade. • **Unknown**—The upgrade status of the member is unknown.
Updated File	Name of the upgrade file.
UpdateTime	Upgrade time: • **Immediately**—Upgrade at once. • **Delay(m)**—Upgrade after the specified delay. • **Time(HH:MM)**—Upgrade at the specified time.

`winet upgrade tc`

display winet vlan

Use **`display winet vlan`** to display VLAN creation results for members.

Syntax

`display winet vlan`

Views

Any view

Predefined user roles

network-admin

Examples

Display VLAN creation results.

```
<Sysname> display winet vlan
ID     IpAddress         MacAddress        Vlan      Status
1      192.168.22.222    703d-15ad-cd02    2         Success
2      192.168.22.3      24ff-2264-0100    2         Success
3      192.168.22.4      24ff-2f74-0200    2         Success
4      192.168.22.223    487a-dac8-29ba    2         Success
```

Table 14 Command output

Field	Description
ID	Member ID.
IpAddress	IP address of the member.
MacAddress	MAC address of the member.
Vlan	VLAN created for the member.
Status	VLAN creation status: • **Processing**—The VLAN is being created. • **Success**—The VLAN has been created successfully. • **Failure. The port xxx is not an access port**—The VLAN fails to be created, because ports connected to non-WiNet devices are not access ports. • **Failure. xxx not exist**—The VLAN fails to be created, because all access ports are connected to WiNet devices.

Related commands

winet vlan

match

Use **match** to set a match criterion to add all matching members to a WiNet group.

Use **undo match** to delete a match criterion.

Syntax

match { **device-type** *device-type* | **ip-address** *ip-address* { *ip-mask-length* | *ip-mask* } | **mac-address** *mac-address mac-mask-length* }

undo match { **device-type** *device-type* | **ip-address** *ip-address* { *ip-mask-length* | *ip-mask* } | **mac-address** *mac-address mac-mask-length* }

Default

No match criterion is set.

Views

WiNet group view

Predefined user roles

network-admin

Parameters

device-type *device-type*: Sets a device type match criterion.

ip-address *ip-address* { *ip-mask-length* | *ip-mask* }: Sets an IP address match criterion. The *ip-address* argument specifies an IP address in dotted decimal notation. The *ip-mask* argument specifies the subnet mask in dotted decimal notation. The *ip-mask-length* argument specifies the subnet mask length in the range of 1 to 32.

mac-address *mac-address mac-mask-length*: Sets a MAC address match criterion. The *mac-address* argument specifies a MAC address in the format of *H-H-H*. The *mac-mask-length* argument specifies the mask length in the range of 1 to 48.

Examples

Create a WiNet group named **a** and add members in subnet 192.168.1.0/24 to the group.

```
<Sysname> system-view
[Sysname] winet group a
[Sysname-winet-group-a] match ip-address 192.168.1.0 24
```

Related commands

winet group

display winet group

winet auto-link-aggregation enable

Use **winet auto-link-aggregation enable** to enable automatic Ethernet link aggregation.

Use **undo winet auto-link-aggregation enable** to disable automatic Ethernet link aggregation.

Syntax

winet auto-link-aggregation enable

undo winet auto-link-aggregation enable

Default

Automatic Ethernet link aggregation is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Automatic Ethernet link aggregation is not performed between the commander and a member.

Enabling or disabling automatic Ethernet link aggregation might cause network flapping, and the members might go offline for a short period of time.

Examples

Enable automatic Ethernet link aggregation.

```
<Sysname> system-view
[Sysname] winet auto-link-aggregation enable
```

winet auto-replace enable

Use **winet auto-replace enable** to enable the automatic faulty member replacement feature.

Use **undo winet auto-replace enable** to disable the automatic faulty member replacement feature.

Syntax

winet auto-replace enable

undo winet auto-replace enable

Default

The automatic faulty member replacement feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

To perform an automatic fault replacement, first enable this feature on the commander, and then perform the following tasks:

1. Install the new member at the location where the faulty member was installed.
2. Connect all cables to the new member.

Make sure the new member and the faulty member have the same neighbor relationship, device model, and IRF member ID.

Examples

Enable the automatic faulty member replacement feature.

```
<Sysname> system-view
[Sysname] winet auto-replace enable
```

Related commands

winet replace

winet backup configuration

Use **winet backup configuration** to manually back up the configuration file on members.

Syntax

winet backup configuration { **group** *group-name-list* | **tc** [*tc-id-list*] }

Views

System view

Predefined user roles

network-admin

Parameters

group *group-name-list*: Specifies a space-separated list of up to 10 WiNet groups. The group name is a case-sensitive string of 1 to 31 characters.

tc *tc-id-list*: Specifies a space-separated list of up to 10 member items. Each item specifies a device or a range of devices in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 0 to 255, with 0 representing the commander and 1 to 255 representing members. If you do not specify the commander or any members, all devices will perform configuration backup.

Usage guidelines

After you execute this command, the members immediately save the running configuration to the next-startup configuration files and upload the configuration files to the file server.

The backup configuration files are named in the format of *bridge MAC address*_**backup.cfg**.

Examples

Back up the configuration file on member 1, member 2, member 3, and member 4.

```
<Sysname> system-view
[Sysname] winet backup configuration tc 1 to 4
```

Back up the configuration file on all members in WiNet groups **test1**, **test2**, and **test3**.

```
<Sysname> system-view
```

```
[Sysname] winet backup configuration group test1 test2 test3
```

Related commands

display winet configuration

winet backup configuration interval

winet backup configuration max-number

Use **winet backup configuration max-number** to set the maximum number of members that can perform automatic configuration backup at the same time.

Use **undo winet backup configuration max-number** to restore the default.

Syntax

winet backup configuration max-number *max-number*

undo winet backup configuration max-number

Default

A maximum of five members can perform automatic configuration backup at the same time.

Views

System view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of members that can perform automatic configuration backup at the same time, in the range of 2 to 20.

Usage guidelines

The maximum number of members that can perform automatic configuration at the same time is limited by the performance of the file server. If automatic configuration backup fails, set the maximum number of members to a smaller value.

Examples

Specify that a maximum of 10 members can perform automatic configuration backup at the same time.

```
<Sysname> system-view
[Sysname] winet backup configuration max-number 10
```

Related commands

display winet configuration

winet backup configuration

winet backup configuration interval

winet backup configuration interval

Use **winet backup configuration interval** to enable the automatic configuration file backup feature and set the automatic backup interval.

Use **undo winet backup configuration interval** to restore the default.

Syntax

winet backup configuration interval *interval*

undo winet backup configuration interval

Default

The automatic configuration file backup feature is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the automatic configuration file backup interval in the range of 1 to 720 hours.

Usage guidelines

This command enables the commander and members to back up their configuration files by saving the running configuration to the files and then uploading them to the file server. When you execute this command, the commander and members immediately perform a backup. After that, they back up the configuration files at the specified interval. The backup configuration files are named in the format of *bridge MAC address*_**backup.cfg**.

Examples

Enable the automatic configuration file backup feature and set the backup interval to 24 hours.

```
<Sysname> system-view
[Sysname] winet backup configuration interval 24
```

Related commands

winet backup configuration

winet batch-file apply

Use **winet batch-file apply** to specify a batch file to deploy to ports connecting APs or IP phones.

Use **undo winet batch-file apply** to remove a batch file specified for ports connecting APs or IP phones.

Syntax

winet batch-file *batch-file-name* **apply** { **ap** | **phone** }

undo winet batch-file apply { **ap** | **phone** }

Default

No batch file is specified for ports connecting APs or IP phones.

Views

System view

Predefined user roles

network-admin

Parameters

batch-file-name: Specifies a batch file by its name, a case-insensitive string of 1 to 255 characters.

ap: Specifies ports connecting APs.

phone: Specifies ports connecting IP phones.

Usage guidelines

With batch file deployment enabled, the commander automatically deploys configurations in the specified batch file to a port connecting an AP or IP phone, simplifying access port configuration.

When the commander first detects the association of an AP or IP phone on a port through LLDP, it deploys the command lines in the specified batch file to the port. If no batch file is specified for the device type, the configurations on the port remain unchanged.

If the AP or IP phone disconnects from the port, the configurations on the port remain. When a new device comes online from the port, configurations used by the port depend on the new device type.

- If the new device is an AP or IP phone and has the same type as the disconnected device, the configurations on the port remain unchanged.
- If the new device is an AP or IP phone but has a different type as the disconnected device, the commander deploys the command lines in the specified batch file to the port. If no batch file is specified for the device type, the configurations on the port remain unchanged.
- If the new device is neither an AP nor an IP phone, the configurations on the port remain unchanged.

To disable the commander from deploying a batch file to ports, remove the specified batch file or execute the **undo winet batch-file-apply enable** command to disable batch file deployment. The **undo winet batch-file-apply enable** command is supported only in Release 6328 and later.

Examples

Specify batch file **ap.cmdset** for ports connecting APs or IP phones.

```
<Sysname> system-view
[Sysname] winet batch-file ap.cmdset apply ap
```

Related commands

create batch-file

winet batch-file-apply enable

winet batch-file deploy

Use **winet batch-file deploy** to deploy bulk command lines to a list of members or WiNet groups.

Syntax

winet batch-file *batch-file-name* **deploy** { **group** *group-name-list* | **tc** **tc**-*id-list* }

Views

System view

Predefined user roles

network-admin

Parameters

batch-file-name: Specifies the name of a batch file, a case-insensitive string of 1 to 255 characters.

group *group-name-list*: Specifies a space-separated list of up to 10 WiNet groups. The group name is a case-sensitive string of 1 to 31 characters.

tc *tc-id-list*: Specifies a space-separated list of up to 10 member items. Each item specifies a member or a range of members in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

Examples

Deploy batch file **startup.cmdset** to WiNet group **testgroup**.

```
<Sysname> system-view
[Sysname] winet batch-file startup.cmdset deploy group testgroup
```

Related commands

create batch-file

display winet batch-file status

winet batch-file-apply enable

Use **winet batch-file-apply enable** to enable batch file deployment.

Use **undo winet batch-file-apply enable** to disable batch file deployment.

NOTE:
This command is supported only in Release 6328 and later.

Syntax

winet batch-file-apply enable

undo winet batch-file-apply enable

Default

Batch file deployment is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

With batch file deployment enabled, the commander automatically deploys configurations in the specified batch file to a port connecting an AP or IP phone, simplifying access port configuration. To disable the commander from deploying a batch file to ports, remove the specified batch file or disable batch file deployment.

Examples

Disable batch file deployment.

```
<Sysname> system-view
[Sysname] undo winet batch-file-apply enable
```

Related commands

winet batch-file apply

winet enable

Use **winet enable** to enable WiNet and set the device role.

Use **undo winet enable** to disable WiNet.

Syntax

winet { **tc** | **tm** **username** *username* **password** { **cipher** | **simple** } *string* } **enable**

undo winet enable

Default

WiNet is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

tc: Enables WiNet and sets the device role to member.

tm: Enables WiNet and sets the device role to commander.

username *username*: Specifies a username for the local user, a case-sensitive string of 1 to 55 characters.

password: Specifies a password for the local user.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

A WiNet network must have one and only one commander.

To enable WiNet, execute this command on both the commander and members. To configure the other WiNet features, execute associated commands only on the commander.

If you change the role of the commander to member or disable WiNet on the commander, all WiNet settings in its running configuration will be cleared.

WiNet fails to be enabled if ACL resources are insufficient. If ACL resources are insufficient, use the **undo acl** command to delete unnecessary ACLs and then enable WiNet. You can execute the **display acl** command to view ACL configuration and match statistics. For more information about ACLs, see *ACL and QoS Configuration Guide*.

WiNet fails to be enabled if ports 80 and 443 have been used.

If you execute this command multiple times, the most recent configuration takes effect. You can execute the command to change the device role or the password.

Examples

Enable WiNet and set the device role to member.

```
<Sysname> system-view
[Sysname] winet tc enable
```

winet { ftp-server | sftp-server }

Use **winet** { **ftp-server** | **sftp-server** } to configure the file server information.

Use **undo winet** { **ftp-server** | **sftp-server** } to delete the file server information.

Syntax

Release 6318P01 and earlier:

winet ftp-server *server-address* **username** *username* **password** { **cipher** | **simple** } *string*

undo winet ftp-server

Release 6328 and later:

winet { **ftp-server** | **sftp-***server* } { *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port*] [**vpn-instance** *vpn-instance-name*] [**directory** *directory*] **username** *username* **password** { **cipher** | **simple** } *string*

undo winet { **ftp-server** | **sftp-server** }

Default

No file server information is configured.

Views

System view

Predefined user roles

network-admin

Parameters

ftp-server: Specifies an FTP server.

sftp-server: Specifies an SFTP server.

ipv4-address: Specifies the IPv4 address of the file server.

ipv6 *ipv6-address*: Specifies the IPv6 address of the file server.

port *port*: Specifies the port number of the file server, in the range of 1 to 65535. The default pot for an FTP server and an SFTP server is 21 and 22, respectively.

vpn-instance *vpn-instance-name*: Specifies the name of the MPLS L3VPN instance to which the file server belongs, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command considers that the file server is in the public network.

directory *directory*: Specifies the working directory of the file server, a case-insensitive string. By default, the root directory is used.

username *username*: Specifies the file server username, a case-sensitive string of 1 to 55 characters.

password: Specifies the file server password.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the file server type to FTP, and specify the server IP address, username, and password as 192.168.22.19, **admin**, and **hello12345**, respectively.

```
<Sysname> system-view
[Sysname] winet ftp-server 192.168.22.19 username admin password simple hello12345
```

Related commands

display winet configuration

winet group

Use **winet group** to create a WiNet group and enter its view, or enter the view of an existing WiNet group.

Use **undo winet group** to delete a WiNet group.

Syntax

winet group *group-name*

undo winet group *group-name*

Default

No WiNet groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-name: Specifies the name of the WiNet group, a case-sensitive string of 1 to 31 characters.

Usage guidelines

When you perform the following operations, you can specify a WiNet group to apply the operations to all members in the group:

- Startup software upgrade.
- Configuration file upgrade.
- Configuration deployment.

Examples

Create WiNet group **testgroup**.

```
<Sysname> system-view
[Sysname] winet group testgroup
[Sysname-winet-group-testgroup]
```

Related commands

match

winet outbound

Use **winet outbound** to configure an outgoing interface for the WiNet network.

Use **undo winet outbound** to restore the default.

Syntax

winet outbound

undo winet outbound

Default

No interface is used as an outgoing interface, and the WiNet network cannot communicate with outside networks.

Views

Layer 3 Ethernet interface view

VLAN interface view

Predefined user roles

network-admin

Usage guidelines

VLAN interface 1 cannot be used as an outgoing interface, because the WiNet network is established in VLAN 1.

Examples

Configure GigabitEthernet 1/0/1 as an outgoing interface for the WiNet network.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] winet outbound
```

winet resource-monitor

Use **winet resource-monitor** to enable resource monitoring.

Use **undo winet resource-monitor** to disable resource monitoring.

Syntax

winet resource-monitor [**cpu** | **memory** | **packet-drop** | **temperature**] * [**group** *group-name-list* | **tc** { *tc-id-list* | **mac-address** *mac-address* } | **tm**]

undo winet resource-monitor [**cpu** | **memory** | **packet-drop** | **temperature**] * [**group** *group-name-list* | **tc** { *tc-id-list* | **mac-address** *mac-address* } | **tm**]

Default

Resource monitoring is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

cpu: Enables CPU usage monitoring.

memory: Enables memory usage monitoring.

packet-drop: Enables packet dropping monitoring.

NOTE:

The **packet-drop** keyword is supported only in Release 6328 and later.

temperature: Enables temperature monitoring.

group *group-name-list*: Specifies the WiNet groups to monitor. You can specify a space-separated list of up to 10 WiNet groups. The group name is a case-sensitive string of 1 to 31 characters.

tc: Specifies the members to monitor.

tc-id-list: Specifies a space-separated list of up to 10 member items. Each item specifies a member or a range of members in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

mac-address *mac-address*: Specifies a member by its MAC address in the format of H-H-H.

tm: Enables resource monitoring on the commander.

Usage guidelines

Packet dropping monitoring monitors packet dropping on members and on interfaces.

If you do not specify a resource type, this command enables resource monitoring for all resource types.

If you do not specify a device to monitor (member or the commander), this command enables resource monitoring on the commander and all members.

Examples

Enable resource monitoring for all resource types on member 1 through member 3.

```
<Sysname> system-view
[Sysname] winet resource-monitor tc 1 to 3
```

Related commands

display winet resource-monitor

winet resource-monitor max-age

winet resource-monitor interval

Use **winet resource-monitor interval** to set the interval for the commander to obtain resource monitoring information.

Use **undo winet resource-monitor interval** to restore the default.

Syntax

winet resource-monitor interval *interval*

undo winet resource-monitor interval

Default

The interval for the commander to obtain resource monitoring information is 1 minute.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval for the commander to obtain resource monitoring information, in the range of 1 to 60 minutes.

Usage guidelines

For packet dropping monitoring, the specified interval applies only to obtaining of member packet dropping information. Because of the great amount of interface information, the commander obtains interface packet dropping information from members only when Web displaying is requested.

Examples

Set the interval for the commander to obtain resource monitoring information to 5 minutes.

```
<Sysname> system-view
[Sysname] winet resource-monitor interval 5
```

Related commands

winet resource-monitor

winet resource-monitor max-age

Use **winet resource-monitor max-age** to set the aging time for resource monitoring information.

Use **undo winet resource-monitor max-age** to restore the default.

Syntax

winet resource-monitor max-age *max-age*

undo winet resource-monitor max-age

Default

The aging time for resource monitoring information is 24 hours.

Views

System view

Predefined user roles

network-admin

Parameters

max-age: Specifies the aging time for resource monitoring information, in the range of 1 to 168 hours.

Usage guidelines

For packet dropping monitoring, the specified aging time applies only to member packet dropping information. Each member saves its interface packet dropping information for as long as 30 days.

To view interface packet dropping information, log in to the Web interface of the commander and access the **WiNet** > **Intelligent O&M** > **Resource monitoring** page. You can view information in the past 1 hour, 1 day, or 30 days.

Examples

Set the aging time for resource monitoring information to 1 hour.

```
<Sysname> system-view
[Sysname] winet resource-monitor max-age 1
```

Related commands

display winet resource-monitor

winet replace

Use **winet replace** to manually replace a faulty member.

Syntax

winet replace tc *tc-id1* **faulty-tc** *tc-id2*

Views

System view

Predefined user roles

network-admin

Parameters

tc *tc-id1*: Specifies the ID of the new member, in the range of 1 to 255.

faulty-tc *tc-id2*: Specifies the ID of the faulty member, in the range of 1 to 255.

Usage guidelines

Before you execute this command, perform the following tasks:

1. Install the new member at the location where the faulty member was installed.
2. Connect all cables to the new member.

Make sure the new member and the faulty member have the same neighbor relationship, device model, and IRF member ID.

Examples

Replace faulty member 5 with new member 10.

```
<Sysname> system-view
[Sysname] winet replace tc 10 faulty-tc 5
```

display winet replace status

winet auto-replace enable

winet tc boot-loader

Use **winet tc boot-loader** to specify the upgrade startup software files for a member.

Use **undo winet tc boot-loader** to remove the configuration.

Syntax

winet tc *tc-id* **boot-loader** { *ipe-filename* | **boot** *boot-filename* **system** *system-filename* }

undo winet tc *tc-id* **boot-loader**

Views

System view

Predefined user roles

network-admin

Parameters

tc *tc-id*: Specifies a member by its ID in the range of 1 to 255.

ipe-filename: Specifies an IPE software file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.ipe** extension.

boot *boot-filename*: Specifies a boot image file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.bin** extension.

system *system-filename*: Specifies a system image file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.bin** extension.

Examples

Specify upgrade boot image **boot.bin** and upgrade system image **system.bin** for member 1.

```
<Sysname> system-view
[Sysname] winet tc 1 boot-loader boot boot.bin system system.bin
```

Related commands

display winet tc

winet tc device-type

Use **winet tc device-type** to define a member type on the commander.

Use **undo winet tc device-type** to delete a member type.

Syntax

winet tc sysoid *sysoid* **device-type** *device-type*

undo winet tc sysoid *sysoid* **device-type** *device-type*

Views

System view

Predefined user roles

network-admin

Parameters

sysoid *sysoid*: Specifies the SYSOID of a member.

device-type *device-type*: Specifies a member type.

Usage guidelines

A device type can correspond to multiple device models. You can identify different device models with different SYSOIDs by specifying a SYSOID for each device model. The commander identifies member types by SYSOID.

The system predefines the device types for some device models based on SYSOIDs. For device models without predefined device types, you must define their member types by SYSOID manually. If you do not do so, the commander cannot identify the types of such devices.

You cannot modify the predefined device types.

Before defining a device type for a member, you can use the **display winet tc** command to determine whether the member has a predefined one.

- If the member has been predefined with one device type, the **DeviceType** field displays the actual predefined device type.
- If the member does not have a predefined device type, the **DeviceType** field displays **unknown**.

To obtain the SYSOID of a member, use the **display winet tc verbose** command.

Examples

Define a member type by specifying the SYSOID as 1.3.6.1.4.1.25506.1.1588 and the member type as SW.

```
<Sysname> system-view
[Sysname] winet tc sysoid 1.3.6.1.4.1.25506.1.1588 device-type SW
```

winet tc password

Use **winet tc password** to modify the password for the default user (admin) on members.

Use **undo winet tc password** to restore the default.

Syntax

winet tc password [**cipher**] *string*

undo winet tc password

Default

The password for the default user on members is **admin**.

Views

System view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form. If you do not specify this keyword, the command creates a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

NOTE:

The **cipher** keyword is supported only in Release 6328 and later.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 33 to 117 characters.

Usage guidelines

During WiNet network establishment, the commander establishes NETCONF sessions to members and adds them to the network. The default username and password on the members for NETCONF session establishment are **admin** and **admin**. To enhance security, you can perform this task to change the password for the default user **admin** of the members after the commander adds the members to the network.

If the default password cannot meet the password complexity requirements on members, you cannot execute the **undo smartmc tc password** command to restore the default.

Do not modify the password for members that are manually added to the WiNet network. If you modify the password for a manually added member, you will not be able to manage that member from the commander.

Examples

Configure default user admin on members to use plaintext password **hello12345**.

```
<Sysname> system-view
[Sysname] smartmc tc password hello12345
```

winet tc startup-configuration

Use **winet tc startup-configuration** to specify the upgrade configuration file for a member.

Use **undo winet tc startup-configuration** to remove the configuration.

Syntax

winet tc *tc-id* **startup-configuration** *cfg-filename*

undo winet tc *tc-id* **startup-configuration**

Views

System view

Predefined user roles

network-admin

Parameters

tc *tc-id*: Specifies a member by its ID in the range of 1 to 255.

cfg-filename: Specifies a configuration file by its name, a case-insensitive string of 5 to 45 characters. The file name must include the **.cfg** extension.

Examples

Specify upgrade configuration file **startup.cfg** for member 1.

```
<Sysname> system-view
[Sysname] winet tc 1 startup-configuration startup.cfg
```

Related commands

display winet tc

winet topology-refresh

Use **winet topology-refresh** to manually refresh the network topology.

Syntax

winet topology-refresh

Views

Any view

Predefined user roles

network-admin

Usage guidelines

To display topology changes, use this command to manually refresh the topology.

Examples

Manually refresh the network topology.

```
<Sysname> winet topology-refresh
```

Related commands

display winet device-link

winet topology-refresh interval

Use **winet topology-refresh interval** to set the automatic network topology refresh interval.

Use **undo winet topology-refresh interval** to restore the default.

Syntax

winet topology-refresh interval *interval*

undo winet topology-refresh interval

Default

The automatic network topology refresh interval is 60 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the automatic network topology refresh interval in the range of 60 to 300 seconds.

Examples

Set the automatic network topology refresh interval to 100 seconds.

```
<Sysname> system-view
[Sysname] winet topology-refresh interval 100
```

Related commands

display winet device-link

winet topology-save

Use **winet topology-save** to save the current network topology.

Syntax

winet topology-save

Views

System view

Predefined user roles

network-admin

Usage guidelines

This task allows you to save the current network topology to the **topology.dba** file in the flash memory. After the commander reboots, it uses the **topology.dba** file to restore the network topology.

Examples

Save the current network topology

```
<Sysname> system-view
[Sysname] winet topology-save
```

Related commands

display winet device-link

winet upgrade boot-loader

Use **winet upgrade boot-loader** to upgrade the startup software on a list of members or WiNet groups.

Use **undo winet upgrade** delete the startup software upgrade task.

Syntax

winet upgrade boot-loader { **group** | **tc** } *list* [**delay** *minutes* | **time** *time*]

winet upgrade boot-loader { **group** | **tc** } { *list* { **boot** *boot-filename* **system** *system-filename* | **file** *ipe-filename* } }&<1-40> [**delay** *delay-time* | **time** *time*]

undo winet upgrade

Views

System view

Predefined user roles

network-admin

Parameters

group: Specifies the WiNet groups to be upgraded.

tc: Specifies the members to be upgraded.

list: Specifies a space-separated list of up to 10 member items or WiNet group items.

- **WiNet group**—Each item specifies a WiNet group name, a case-sensitive string of 1 to 31 characters.
- **Member**—Each item specifies a member ID or a range of member IDs in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

boot *boot-filename*: Specifies a boot image by its name.

system *system-filename*: Specifies a system image by its name.

file *ipe-filename*: Specifies an IPE file by its name, a case-insensitive string of 5 to 45 characters.

delay *delay-time*: Specifies the upgrade delay time in the range of 1 to 1440 minutes.

time *in-time*: Specifies the upgrade time in the format of *hh:mm*. The value range for the *hh* argument is 0 to 23 hours. The value range for the *mm* argument is 0 to 59 minutes.

Usage guidelines

CAUTION:

Upgrading the startup software might interrupt services. Before upgrading the startup software, make sure no services will be interrupted.

To use this command to upgrade the startup software on members without specifying the upgrade files, you must first perform one of the following tasks:

- Execute the **winet tc boot-loader** command to specify the upgrade files for members.
- Execute the **boot-loader** command to specify the upgrade files for a WiNet group.

A member can perform only one upgrade task at a time.

If you execute this command without specifying the delay time or update time, the members or WiNet group immediately upgrades the startup software and the upgrade operation cannot be cancelled. If you specify a delay time or upgrade time to perform a scheduled upgrade, the upgrade operation can be cancelled by using the **undo winet upgrade** command before it starts.

Examples

Upgrade startup software images **boot.bin** and **sys.bin** on all members in WiNet groups **test1** and **test2**.

```
<Sysname> system-view
[Sysname] winet upgrade boot-loader group test1 test2 boot boot.bin system sys.bin
```

Related commands

boot-loader

startup-configuration

winet upgrade startup-configuration

Use **winet upgrade startup-configuration** to upgrade the configuration file on a list of members or on all members in WiNet groups.

Use **undo winet upgrade** delete the configuration file upgrade task.

Syntax

winet upgrade startup-configuration { **group** | **tc** } *list* [**delay** *minutes* | **time** *time*]

winet upgrade startup-configuration group { *list* **file** *cfg-filename* }&<1-40> [**delay** *delay-time* | **time** *time*]

winet upgrade startup-configuration tc { **group** | **tc** } { *list* *cfg-filename* }&<1-40> [**delay** *delay-time* | **time** *time*]

undo winet upgrade

Views

System view

Predefined user roles

network-admin

Parameters

group: Specifies the WiNet groups to be upgraded.

tc: Specifies the members to be upgraded.

list: Specifies a space-separated list of up to 10 member items or WiNet group items.

- **WiNet group**—Each item specifies a WiNet group name, a case-sensitive string of 1 to 31 characters.
- **Member**—Each item specifies a member ID or a range of member IDs in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

file *cfg-filename*: Specifies a configuration file by its name.

NOTE:

The **file** keyword needs to be entered only in Release 6328 and later.

delay *delay-time*: Specifies the upgrade delay time in the range of 1 to 1440 minutes.

time *in-time*: Specifies the upgrade time in the format of *hh:mm*. The value range for the *hh* argument is 0 to 23 hours. The value range for the *mm* argument is 0 to 59 minutes.

Usage guidelines

CAUTION:

After you update the configuration file, the configuration in the new configuration file will become the running configuration. Before upgrading the configuration file, make sure the contents of the new configuration file are correct.

To use this command to upgrade the configuration file on members without specifying the upgrade file, you must first perform one of the following tasks:

- Execute the **winet tc startup-configuration** command to specify the upgrade file for members.
- Execute the **startup-configuration** command to specify the upgrade file for a WiNet group.

A member can perform only one upgrade task at a time.

If you execute this command without specifying the delay time or update time, the members or WiNet group immediately upgrades the configuration file and the upgrade operation cannot be cancelled. If you specify a delay time or upgrade time to perform a scheduled upgrade, the upgrade operation can be cancelled by using the **undo winet upgrade** command before it starts.

Examples

Upgrade configuration file **startup.cfg** on all members in WiNet groups **test1** and **test2**.

```
<Sysname> system-view
[Sysname] winet upgrade boot-loader group test1 test2 startup.cfg
```

Related commands

boot-loader

startup-configuration

winet vlan

Use **winet vlan** to create a VLAN for members.

Syntax

winet vlan *vlan-id* { **group** *group-name-list* | **tc** *tc-id-list* }

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies the VLAN ID in the range of 1 to 4094.

group *group-name-list*: Specifies the WiNet groups for which the VLAN is created. You can specify a space-separated list of up to 10 WiNet groups. The group name is a case-sensitive string of 1 to 31 characters.

tc *tc-id-list*: Specifies the members for which the VLAN is created. You can specify a space-separated list of up to 10 member items. Each item specifies a member or a range of members in the form of *tc-id1* **to** *tc-id2*. The value for *tc-id2* must be greater than or equal to the value for *tc-id1*. The value range for the *tc-id* argument is 1 to 255.

Usage guidelines

Execute this command when the network topology is stable. As a best practice, use the **winet topology-refresh** command to refresh the network topology before executing this command.

After you execute this command, all access ports on members except the following access ports are assigned to the VLAN:

- Access ports connecting to the commander.
- Access ports connecting to other members.
- Access ports connecting to offline devices. Remove offline devices before configuring this command.

If the VLAN is successfully created but some access ports of a member cannot be assigned to the VLAN, the VLAN memberships of the member is restored to the state before the VLAN is created.

The failure to assign an access port of a member to the created VLAN does not affect the VLAN assignment for other members.

After command execution, you can use the **display winet vlan** command to examine the VLAN creation result.

Examples

Create a VLAN for member 1 and member 2.

```
<Sysname> system-view
[Sysname] winet vlan 2 tc 1 to 2
As a best practice, execute the display winet vlan command to verify that the VLAN has
been created successfully.
```

startup-configuration

Use **startup-configuration** to specify an upgrade configuration file for a WiNet group .

Use **undo startup-configuration** to restore the default.

Syntax

startup-configuration *cfgfile*

undo startup-configuration

Default

No upgrade configuration file is specified for the WiNet group.

Views

WiNet group view

Predefined user roles

network-admin

Parameters

cfgfile: Specifies a configuration file by its name, a string of 5 to 45 characters. The file name must include the **.cfg** extension.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify configuration file **startup.cfg** for WiNet group **testgroup**.

```
<Sysname> system-view
[Sysname] winet group testgroup
[Sysname-winet-group-testgroup] startup-configuration startup.cfg
```

Related commands

winet group

Contents

EPA commands

This feature is supported only in Release 6328 and later.

display epa monitor-information

Use **display epa monitor-information** to display endpoint association and disassociation information detected by EPA.

Syntax

display epa monitor-information [**online** | **offline**] [**device** *device-id* | **mac** *mac-address* [**vlan** *vlan-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

online: Displays endpoint association information.

offline: Displays endpoint disassociation information.

device *device-id*: Specifies a device by its bridge MAC address in the H-H-H format. In a SmartMC (or WiNet) network, you can specify the bridge MAC address of a member to display only information about endpoints connecting to the member.

mac *mac-address*: Specifies an endpoint by its MAC address in the H-H-H format.

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094. If you do not specify this option, the command displays information in all VLANs.

Usage guidelines

In a SmartMC (or WiNet) network, you can execute this command on the commander or on a member.

- If you execute this command on the commander, you can view information on all devices in the network or information on a specific device.
- If you execute this command on a member, you can view only association events of endpoints connecting to the member.

In a non-SmartMC (or non-WiNet) network, this command displays information only on the device on which the command is executed.

For more information about SmartMC (or WiNet), see *Network Management and Monitoring Configuration Guide*.

Examples

In a SmartMC (or WiNet) network, display endpoint association and disassociation information on the member device with bridge MAC address **3cf5-cc97-772f**.

```
<Sysname> display epa monitor-information device 3cf5-cc97-772f
Local device type   : SmartMC TM
Local device ID     : ae05-0607-eaaa
Endpoint information:
```

```
  Access device ID    MAC address     VLAN    Interface               Status
  3cf5-cc97-772f      0e74-e2fb-0400  11      GE1/0/1                 Online
  3cf5-cc97-772f      5caf-2e5f-0100  11      GE1/0/2                 Offline
```

In a non-SmartMC (or non-WiNet) network, display endpoint association and disassociation information on the current device.

```
<Sysname> display epa monitor-information
Local device type   : Self-managed
Local device ID     : 3cf5-cc97-772e
Endpoint information:
  Access device ID    MAC address     VLAN    Interface               Status
  3cf5-cc97-772e      1cab-34aa-d00e  10      GE1/0/1                 Online
  3cf5-cc97-772e      0000-02b5-ed00  10      GE1/0/2                 Offline
```

Table 1 Command output

Field	Description
Local device type	Local device type. For SmartMC, options include: • **Self-managed**—Indicates a device in a non-SmartMC network. • **SmartMC TM**—Indicates the commander in a SmartMC network. • **SmartMC TC**—Indicates a member in a SmartMC network. For WiNet, options include: • **Self-managed**—Indicates a device in a non-WiNet network. • **WiNet TM**—Indicates the commander in a WiNet network. • **WiNet TC**—Indicates a member in a WiNet network.
Local device ID	Local device ID (bridge MAC address).
Access device ID	ID (bridge MAC address) of the connected device.
MAC address	MAC address of the endpoint.
VLAN	VLAN in which the endpoint resides.
Interface	Interface to which the endpoint is connected.
Status	Endpoint status. Options include: • Online. • Offline.

Related commands

epa monitor-rule

epa monitor-rule

Use **epa monitor-rule** to create an endpoint monitor rule.

Use **undo epa monitor-rule** to remove an endpoint monitor rule.

Syntax

epa monitor-rule [*monitor-rule-id*] **mac** *mac-address* [**mask** *mac-mask*] [**vlan** *vlan-id*]

undo epa monitor-rule { *monitor-rule-id* | **mac** *mac-address* [**mask** *mac-mask*] [**vlan** *vlan-id*] }

Default

No endpoint monitor rules exist.

Views

System view

Predefined user roles

network-admin

Parameters

monitor-rule-id: Specifies the rule ID in the range of 1 to 1024. If you do not specify this argument, the command assigns the smallest available ID to the rule.

mac *mac-address*: Specifies the MAC address of the endpoint to monitor, in the H-H-H format.

mask *mac-mask*: Specifies a MAC address mask, in the H-H-H format.

vlan *vlan-id*: Specifies the VLAN in which the endpoint will be monitored. The *vlan-id* argument represents the VLAN ID in the range of 1 to 4094. If you do not specify this option, the command creates a rule that monitors the endpoint in all VLANs.

Usage guidelines

In a SmartMC (or WiNet) network, you can execute this command only on the commander. The commander will deploy the rule to all members to monitor associations and disassociations of the specified endpoint in the entire network.

In a non-SmartMC (or non-WiNet) network, this command enables the device to monitor associations and disassociations of the specified endpoint only on the device itself.

Examples

Create an endpoint monitor rule to monitor endpoints whose MAC address starts with **0e74** in all VLANs.

```
<Sysname> system-view
[Sysname] epa monitor-rule mac 0e74-e2fb-0400 mask ffff-0000-0000
```

Related commands

display epa monitor-information

epa online-offline-log disable

Use **epa online-offline-log disable** to disable EPA logging.

Use **undo epa online-offline-log disable** to enable EPA logging.

Syntax

epa online-offline-log disable

undo epa online-offline-log disable

Default

EPA logging is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, the EPA module logs endpoint associations and disassociations. If a monitored endpoint comes online or goes offline frequently, the device will generate a large number of log entries. In this case, to avoid affecting device performance, disable EPA logging as a best practice.

Examples

Disable EPA logging.

```
<Sysname> system-view
[Sysname] epa online-offline-log disable
```

Related commands

epa monitor-rule

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This command reference describes gRPC configuration commands.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

gRPC commands

Before you can use gRPC commands, you must install a gRPC feature software image compatible with the device software version. For information about the installation procedure, see software upgrade in *Fundamentals Configuration Guide*.

Generic gRPC commands

display grpc

Use **display grpc** to display gRPC information.

Syntax

display grpc [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

verbose: Display detailed gRPC information. If you do not specify this keyword, the command displays brief gRPC information.

NOTE:

The **verbose** keyword is supported only in Release 6343P08 and later.

Examples

Display brief gRPC information. The sample output is applicable to versions earlier than Release 6343P08.

```
<Sysname> display grpc
gRPC status : enabled.
gRPC port : 50051
gRPC idle-timeout : 3 minutes
Session count: 1.
  Session ID: 1
    User name: test
    Login time:2011-01-05 06:46:43 Idle time : 2 mins 56 s
    Client IP address : 169.254.100.170:40810
    Received RPCs        : 0         Received error RPCs : 0
    Received subscription: 0         Output notifications: 0
```

Table 1 Command output

Field	Description
gRPC status	Status of the gRPC service: • **enabled**—The gRPC service is enabled.

Field	Description
	• **disabled**—The gRPC service is disabled.
gRPC port	Port number for the gRPC service.
gRPC idle-timeout	gRPC session idle timeout timer, in minutes.
Session count	Number of gRPC sessions.
Session ID	ID of a gRPC session.
User name	Username of the gRPC user.
Login time	Date and time when the gRPC user logged in to the device.
Idle time	Amount of time in which the session idle timeout timer will expire. If the value in this field is 0, gRPC sessions will never time out.
Client IP address	IP address and port number of the gRPC client.
Received RPCs	Number of received gRPC requests.
Received error RPCs	Number of received erroneous gRPC requests.
Received subscription	Number of received gRPC subscription requests.
Output notifications	Number of gRPC notifications reported to the collector.

Display brief gRPC information. The sample output is applicable to Release 6343P08 and later.

```
<Sysname> display grpc
gRPC status : Enabled
Current-time: 2020-05-20T04:12:48.119
------------Dial-in mode information------------

   Status: Connected
```

Table 2 Command output

Field	Description
gRPC status	Status of the gRPC service: • **Enabled**—The gRPC service is enabled. • **Disabled**—The gRPC service is disabled.
Current-time	Current system time.

Field	Description
Dial-in mode information	Information about gRPC in dial-in mode.
gRPC server port	Port number for the gRPC service.
Session idle-timeout	gRPC session idle timeout timer, in minutes.
Session count	Number of gRPC sessions.
ID	ID of a gRPC session.
IP Address:Port	IP address and port number of the gRPC client.
UserName	Username of the gRPC user.
Dial-out mode information	Information about gRPC in dial-out mode.
Sensor group count	Number of sensor groups.
Sensor path count	Number of sensor paths.
Destination group count	Number of destination groups.
Destination count	Number of collectors.
Subscription count	Number of subscriptions.
Connection ID	ID of the connection between the device and a collector.
IP address:Port	IP address and service port number of the collector.
Domain name:Port	Domain name and service port number of the collector. This field also displays the first reachable IP address in parentheses for the domain name. If no reachable IP address is available for the domain name, this field displays two hyphens (--) in parentheses.
Status	Status of the channel between the device and the collector: • **Init**—The channel is being initialized. • **Idle**—The channel is idle. • **Connecting**—The channel is being established. • **Connected**—The channel has been established. • **Transient failure**—The channel has failed transiently and is attempting to recover. • **Shutdown**—The channel has been closed because of an issue.

Display detailed gRPC information (available only in Release 6343P08 and later).

```
<Sysname> display grpc verbose

Table 3 Command output

Field	Description
gRPC status	Status of the gRPC service: • **Enabled**—The gRPC service is enabled. • **Disabled**—The gRPC service is disabled.
Current-time	Current system time.
Dial-in mode information	Information about gRPC in dial-in mode.
gRPC server port	Port number for the gRPC service.
Session idle-timeout	gRPC session idle timeout timer, in minutes.
Session count	Number of gRPC sessions.
Session ID	ID of a gRPC session.
User name	Username of the gRPC user.
Login time	Date and time when the gRPC user logged in to the device.
Idle time	Amount of time in which the session idle timeout timer will expire. If the value in this field is 0, gRPC sessions will never time out.
Client IP address	IP address and port number of the gRPC client.
Received RPCs	Number of received gRPC requests.
Received erroneous RPCs	Number of received erroneous gRPC requests.
Received subscription	Number of received gRPC subscription requests.
Sent notifications	Number of gRPC notifications reported to the collector.

Field	Description
Dial-out mode information	Information about gRPC in dial-out mode.
Sensor group count	Number of sensor groups.
Sensor path count	Number of sensor paths.
Destination group count	Number of destination groups.
Destination count	Number of collectors.
Subscription count	Number of subscriptions.
Subscription	Name of the subscription.
Source address or interface	Source IP address or source interface for packets sent to the collector. This field displays **not-configure** if no source IP address or source interface has been specified.
Sensor group	Name of the sensor group.
Sampling interval	Data sampling interval, in seconds. This field displays **0** for event-triggered sampling.
Sampling type	Data sampling type: • **Event-triggered**—Event-triggered sampling. • **Periodic**—Periodical sampling.
Effective sampling interval	Data sampling interval that takes effect.
Sensor path	Sensor path.
Destination-group	Name of the destination group.
Start-time	Date and time when the gRPC connection was established.
IP:Port	IP address and service port number of the collector (gRPC server).
Domain name:Port	Domain name and service port number of the collector. This field also displays the first reachable IP address in parentheses for the domain name. If no reachable IP address is available for the domain name, this field displays two hyphens (--) in parentheses.
VPN	VPN instance to which the collector belongs. This field displays **N/A** if the collector belongs to the public network.
Periodic sampling statistics	Statistics for periodic sampling.
Event-triggered statistics	Statistics for event-triggered sampling.
Effective count	Number of effective samplings. This counter does not count a sampling if it does not collect any data.
Sent successfully	Number of sent data packets.
Failed	Number of data packets failed to be sent.
Queued packets/Queue size	Number of data packets in queue and the size of the queue.
Dropped	Number of data packets dropped because the queue is full.

Last error	Most recent error:
	• **VPN doesn't exist**—The VPN instance did not exist.
	• **Channel *(reason)***—An error occurred on the gRPC channel. Possible reasons:
	  ○ **Init**—The channel was being initialized.
	  ○ **Idle**—The channel was idle.
	  ○ **Connecting**—The channel was being established.

Field	Description
	○ **Transient failure**—The channel was attempting to recover from a transient failure. ○ **Shutdown**—The channel was closed because of an issue. This field displays two hyphens (**--**) if no errors have occurred.

grpc enable

Use **grpc enable** to enable the gRPC service.

Use **undo grpc enable** to disable the gRPC service.

Syntax

grpc enable

undo grpc enable

Default

The gRPC service is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

If this command fails, use the **display tcp** or **display ipv6 tcp** command to verify whether the gRPC service port number has been used by another feature. If yes, specify a free port as the gRPC service port number and try to enable the gRPC service again.

Examples

Enable the gRPC service.

```
<Sysname> system
[Sysname] grpc enable
```

Related commands

display ipv6 tcp (*Layer 3—IP Services Command Reference*)

display tcp (*Layer 3—IP Services Command Reference*)

grpc port

gRPC dial-in mode commands

grpc idle-timeout

Use **grpc idle-timeout** to set the gRPC session idle timeout timer.

Use **undo grpc idle-timeout** to restore the default.

Syntax

grpc idle-timeout *minutes*

undo grpc idle-timeout

Default

The gRPC session idle timeout timer is 5 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

minutes: Specifies the gRPC session idle timeout timer in minutes, in the range of 0 to 30. To disable gRPC sessions from being timed out, set it to 0.

Usage guidelines

If no gRPC packet exchanges occur on the session between a gRPC and the server before the idle timeout timer expires, the device closes the session.

Examples

Set the gRPC session idle timeout timer to 6 minutes.

```
<Sysname> system
[Sysname] grpc idle-timeout 6
```

grpc port

Use **grpc port** to specify the gRPC service port number.

Use **undo grpc port** to restore the default.

Syntax

grpc port *port-number*

undo grpc port

Default

The gRPC service port number is 50051.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies the gRPC service port number, in the range of 1 to 65535.

Usage guidelines

Changing the gRPC service port number when the gRPC service is enabled reboots the gRPC service and closes gRPC connections to gRPC clients. The gRPC clients must re-initiate the connections.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the gRPC service port number to 50052.

```
<Sysname> system
[Sysname] grpc port 50052
```

Related commands

grpc enable

gRPC dial-out mode commands

destination-group (subscription view)

Use **destination-group** to specify a destination group for a subscription.

Use **undo destination-group** to remove a destination group from a subscription.

Syntax

destination-group *group-name*

undo destination-group *group-name*

Default

A subscription does not have a destination group.

Views

Subscription view

Predefined user roles

network-admin

Parameters

group-name: Specifies a destination group by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

A subscription binds sensor groups to destination groups. Then, the device pushes data from the specified sensors to the collectors.

The specified destination group must have been created by using the **destination-group** command in telemetry view.

You can specify a maximum of five destination groups for a subscription.

Examples

Specify destination group **collector1** for subscription **A**.

```
<Sysname> system-view
[Sysname] telemetry
[Sysname-telemetry] subscription A
[Sysname-telemetry-subscription-A] destination-group collector1
```

Related commands

destination-group (telemetry view)

destination-group (telemetry view)

Use **destination-group** to create a destination group and enter its view, or enter the view of an existing destination group.

Use **undo destination-group** to delete a destination group.

Syntax

destination-group *group-name*

undo destination-group *group-name*

Default

No destination groups exist.

Views

Telemetry view

Predefined user roles

network-admin

Parameters

group-name: Specifies the destination group name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

As a best practice, configure a maximum of five destination groups. Configuring too many destination groups might degrade the system performance.

To delete a destination group that is already used by a subscription, you must remove the destination group from the subscription first.

Examples

Create a destination group named **collector1**.

```
<Sysname> system-view
[Sysname] telemetry
[Sysname-telemetry] destination-group collector1
[Sysname-telemetry-destination-group-collector1]
```

Related commands

destination-group (subscription view)

subscription

domain-name

Use **domain-name** to add the domain name of an IPv4 collector to a destination group.

Use **undo domain-name** to remove the domain name of an IPv4 collector from a destination group.

NOTE:

This command is supported only in Release 6343P08 and later.

Syntax

domain-name *domain-name* [**port** *port-number*] [**vpn-instance** *vpn-instance-name*]

undo domain-name *domain-name* [**port** *port-number*] [**vpn-instance** *vpn-instance-name*]

Default

A destination group does not contain IPv4 collectors.

Views

Destination group view

Predefined user roles

network-admin

Parameters

domain-name: Domain name mapped to the IPv4 address of a collector. It can be a case-insensitive string of 1 to 253 characters and can contain letters, digits, hyphens (-), underscores (_), and dots (.).

port *port-number*: Specifies the service port number on which the collector receives data. The value range is 1 to 65535 and the default is 50051. To have the collector receive data, make sure the specified service port number is the same as the one used on the collector.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the collector belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. Make sure the specified VPN instance already exists. If the collector is on the public network, do not specify this option.

Usage guidelines

If you specify collectors by their domain names, you must configure DNS to make sure the device can translate the domain names of the collectors to IPv4 addresses. For more information about DNS, see *Layer 3—IP Services Configuration Guide*.

To view domain name and IP address mappings, use the **display dns host** command. If a domain name maps to multiple IP addresses, the device pushes data to the first reachable IP address.

To add multiple collectors, repeat this command.

A collector is uniquely identified by a three-tuple of domain name, port number, and VPN instance name. One collector must have a different domain name, port number, or VPN instance name than the other collectors.

A destination group can have a maximum of five collectors.

To modify the collector configuration for a destination group that is already used by a subscription, you must remove the destination group from the subscription first.

Examples

Add the IPv4 collector at sample.com to destination group collector1.

```
<Sysname> system-view
[Sysname] telemetry
[Sysname-telemetry] destination-group collector1
[Sysname-telemetry-destination-group-collector1] domain-name sample.com
```

Related commands

destination-group (subscription view)

subscription

display dns host (*Layer 3—IP Services Command Reference*)

ipv4-address

Use **ipv4-address** to add an IPv4 collector to a destination group.

Use **undo ipv4-address** to remove an IPv4 collector from a destination group.

Syntax

ipv4-address *ipv4-address* [**port** *port-number*]

undo ipv4-address *ipv4-address* [**port** *port-number*]

Default

A destination group does not have IPv4 collectors.

Views

Destination group view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies the IPv4 address of the collector.

port *port-number*: Specifies the listening port of the collector, in the range of 1 to 65535. The default is 50051.

Usage guidelines

To add multiple collectors to a destination group, execute this command multiple times.

One collector must have a different address, port, or VPN instance than the other collectors.

You can specify a maximum of five collectors for a destination group.

To modify the collector configuration for a destination group that is already used by a subscription, you must remove the destination group from the subscription first.

Examples

Add a collector that uses IPv4 address 192.168.21.21 and the default port number to destination group **collector1**.

```
<Sysname> system-view
[Sysname] telemetry
[Sysname-telemetry] destination-group collector1
[Sysname-telemetry-destination-group-collector1] ipv4-address 192.168.21.21
```

Related commands

destination-group (subscription view)

subscription

ipv6-address

Use **ipv6-address** to add an IPv6 collector to a destination group.

Use **undo ipv6-address** to remove an IPv6 collector from a destination group.

Syntax

ipv6-address *ipv6-address* [**port** *port-number*]

undo ipv6-address *ipv6-address* [**port** *port-number*]

Default

A destination group does not have IPv6 collectors.

Views

Destination group view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of the collector.

port *port-number*: Specifies the listening port of the collector, in the range of 1 to 65535. The default is 50051.

Usage guidelines

To add multiple collectors to a destination group, execute this command multiple times.

One collector must have a different address, port, or VPN instance than the other collectors.

You can specify a maximum of five collectors for a destination group.

To modify the collector configuration for a destination group that is already used by a subscription, you must remove the destination group from the subscription first.

Examples

Add a collector that uses IPv6 address 1: : 1 and the default port number to destination group **collector1**.

```
<Sysname> system-view
[Sysname] telemetry
[Sysname-telemetry] destination-group collector1
[Sysname-telemetry-destination-group-collector1] ipv6-address 1: : 1
```

Related commands

display dns host (*Layer 3—IP Services Command Reference*)

sensor path

Use **sensor path** to configure a sensor path.

Use **undo sensor path** to delete a sensor path.

Syntax

sensor path *path*

undo sensor path *path*

Default

No sensor paths exist.

Views

Sensor group view

Predefined user roles

network-admin

Parameters

path: Specifies a data path. For information about the available paths, enter a question mark (?) in the position of this argument.

Usage guidelines

To configure multiple sensor paths, execute this command multiple times.

The device supports a maximum of 128 sensor paths.

If the device does not support the specified sensor path, the command displays an error message.

To modify the sensor path configuration for a sensor group that is already used by a subscription, you must remove the sensor group from the subscription first.

Examples

Configure sensor path **ifmgr/devicecapabilities/** for sensor group **test**.

```
<Sysname> system-view
[Sysname] telemetry
[Sysname-telemetry] sensor-group test
[Sysname-telemetry-sensor-group-test] sensor path ifmgr/devicecapabilities/
```

Related commands

sensor-group (subscription view)

subscription

sensor-group (subscription view)

Use **sensor-group** to specify a sensor group for a subscription.

Use **undo sensor-group** to remove a sensor group from a subscription.

Syntax

sensor-group *group-name* [**sample-interval** *interval*]

undo sensor-group *group-name*

Default

A subscription does not have a sensor group.

Views

Subscription view

Predefined user roles

network-admin

Parameters

group-name: Specifies a sensor group by its name, a case-sensitive string of 1 to 31 characters.

sample-interval *interval*: Specifies the data sampling interval in seconds. The value range is 1 to 86400.

Usage guidelines

Specify the **sample-interval** *interval* option for periodic sensor paths and only for periodic sensor paths.

- If you specify the option for event-triggered sensor paths, the sensor paths do not take effect.
- If you do not specify the option for periodic sensor paths, the device does not sample or push data.

The specified sensor group must have been created by using the **sensor-group** command in telemetry view.

Examples

Specify sensor group **test** for subscription **A**. Set the data sampling interval to 10 seconds.

```
<Sysname> system-view
[Sysname] telemetry
[Device-telemetry] subscription A
[Device-telemetry-subscription-A] sensor-group test sample-interval 10
```

Related commands

sensor path

sensor-group (telemetry view)

sensor-group (telemetry view)

Use **sensor-group** to create a sensor group and enter its view, or enter the view of an existing sensor group.

Use **undo sensor-group** to delete a sensor group.

Syntax

sensor-group *group-name*

undo sensor-group *group-name*

Default

No sensor groups exist.

Views

Telemetry view

Predefined user roles

network-admin

Parameters

group-name: Specifies the sensor group name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

The device supports a maximum of 32 sensor groups.

To delete a sensor group that is already used by a subscription, you must remove the sensor group from the subscription first.

Examples

Create a sensor group named **test**.

```
<Sysname> system-view
[Sysname] telemetry
```

```
[Sysname-telemetry] sensor-group test
[Sysname-telemetry-sensor-group-test]
```

Related commands

sensor-group (subscription view)

subscription

source-address

Use **source-address** to specify the source IP address for packets sent to collectors.

Use **undo source-address** to restore the default.

Syntax

source-address { *ipv4-address* | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

undo source-address

Default

The device uses the primary IPv4 address of the output interface for the route to the collectors as the source address.

Views

Subscription view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies an IPv4 address.

interface *interface-type interface-number*: Specifies an interface by its type and number. In the current software version, you must specify a loopback interface. The device will use the interface's primary IPv4 address as the source address. If the interface does not have a primary IPv4 address, the device uses the primary IPv4 address of the output interface for the route to the collectors.

ipv6 *ipv6-address*: Specifies an IPv6 address.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Changing the source IP address for packets sent to collectors causes the device to re-establish the connection to the gRPC server.

Examples

Specify the source IPv4 address of 169.254.1.1 for packets sent to collectors.

```
<Sysname> system-view
[Sysname] telemetry
[Sysname-telemetry] subscription A
[Sysname-telemetry-subscription-A] source-address 169.254.1.1
```

subscription

Use **subscription** to create a subscription and enter its view, or enter the view of an existing subscription.

Use **undo sensor-group** to delete a subscription.

Syntax

subscription *subscription-name*

undo subscription *subscription-name*

Default

No subscription groups exist.

Views

Telemetry view

Predefined user roles

network-admin

Parameters

subscription-name: Specifies the subscription name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

The device supports a maximum of 10 subscriptions.

Examples

Configure a subscription named **A**.

```
<Sysname> system-view
[Sysname] telemetry
[Sysname-telemetry] subscription A
[Sysname-telemetry-subscription-A]
```

Related commands

destination-group (subscription view)

sensor-group (subscription view)

telemetry

Use **telemetry** to enter telemetry view.

Syntax

Preface

This command reference describes OpenFlow configuration commands.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

OpenFlow commands

active instance

Use **active instance** to activate an OpenFlow instance.

Use **undo active instance** to deactivate an OpenFlow instance.

Syntax

active instance

undo active instance

Default

An OpenFlow instance is not activated.

Views

OpenFlow instance view

Predefined user roles

network-admin

Usage guidelines

After an OpenFlow instance is created or modified, use this command to activate or reactivate the instance to make the instance take effect. After an OpenFlow instance is reactivated, it disconnects from all controllers, clears the deployed flow tables, updates the capability set, and then reconnects to controllers.

Examples

Activate OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] active instance
```

classification

Use **classification** to configure the OpenFlow instance mode.

Use **undo classification** to restore the default.

Syntax

classification vlan *vlan-id* [**mask** *vlan-mask*] [**loosen**]

undo classification

Default

The OpenFlow instance mode is not configured.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

vlan: Specifies the VLAN mode.

vlan-id: Specifies a VLAN ID in the range of 1 to 4094.

vlan-mask: Specifies a VLAN mask in the range of 0 to 4095. The default value is 4095.

loosen: Specifies the loosen mode. If the loosen mode is used, a port belongs to the OpenFlow instance when VLANs associated with the OpenFlow instance overlap with the port's allowed VLANs. If you do not specify the loosen mode, a port belongs to an OpenFlow instance only when VLANs associated with the OpenFlow instance are within the port's allowed VLAN list.

Usage guidelines

The VLANs to be associated are calculated by a bitwise AND operation on the specified VLAN ID and mask. The VLAN mask supports non-contiguous 1s and ignores all 0 bits. To view the associated VLANs, use the **display openflow instance** command.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Enable the VLAN mode for OpenFlow instance 1 and associate OpenFlow instance 1 with VLANs determined by VLAN ID 255 and VLAN mask 7.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] classification vlan 255 mask 7
```

Related commands

display openflow instance

controller address

Use **controller address** to specify a controller for an OpenFlow switch and configure the main connection to the controller.

Use **undo controller address** to delete the main connection to the specified controller.

Syntax

controller *controller-id* **address** { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**local address** { **ip** *local-ipv4-address* | **ipv6** *local-ipv6-address* } [**port** *local-port-number*]] [**ssl** *ssl-policy-name*] [**vrf** *vrf-name*]

undo controller *controller-id* **address**

Default

An OpenFlow instance does not have a main connection to a controller.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

controller-id: Specifies a controller by its ID in the range of 0 to 63.

ip *ipv4-address*: Specifies the IPv4 address of the controller.

ipv6 *ipv6-address*: Specifies the IPv6 address of the controller.

port *port-number*: Sets the port number used by the controller to establish TCP connections to the OpenFlow switch. The value range for the port number is 1 to 65535. The default value is 6633.

local address: Specifies the source IP address used to establish TCP connections to the controller. When multiple routes are available between a controller and a switch, you can use this keyword to configure a source IP address for the switch. When the switch restarts or an active/standby switchover occurs, the switch can use the original route to reconnect to the controller without selecting a new route.

ip *local-ipv4-address*: Specifies the source IPv4 address.

ipv6 *local-ipv6-address*: Specifies the source IPv6 address.

port *local-port-number*: Specifies the source port number in the range of 1 to 65535. If you do not specify this option, the system automatically assigns a source port number for establishing the main connection to the controller.

ssl *ssl-policy-name*: Specifies the SSL client policy that the controller uses to authenticate the OpenFlow switch. The *ssl-policy-name* argument is a case-insensitive string of 1 to 31 characters. You must configure a separate SSL client policy for the main connection to each controller.

Usage guidelines

You can specify multiple controllers for an OpenFlow switch. The OpenFlow channel between the OpenFlow switch and each controller can have only one main connection.

The OpenFlow switch uses the main connection to a controller to exchange control messages with the controller to perform the following operations:

- Receive flow table entries or data from the controller.
- Report information to the controller.

As a best practice, configure a unicast IP address for a controller. An OpenFlow switch might fail to establish a connection with the controller that does not use a unicast IP address.

The main connection must be a reliable TCP or SSL connection. The OpenFlow switch uses the main connection to a controller to exchange control messages with the controller to perform the following operations:

- Receive flow table entries or data from the controller.
- Report information to the controller.

Examples

Specify controller 1 for OpenFlow instance 1. The controller's IP address is 1.1.1.1 and the port number is 6666.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] controller 1 address ip 1.1.1.1 port 6666
```

controller auxiliary

Use **controller auxiliary** to specify a controller for an OpenFlow switch and configure an auxiliary connection to the controller.

Use **undo controller auxiliary** to delete the specified auxiliary connection to the specified controller.

Syntax

controller *controller-id* **auxiliary** *auxiliary-id* **transport** { **tcp** | **udp** | **ssl** *ssl-policy-name* } [**address** { **ip** *ipv4-address* | **ipv6** *ipv6-address* }] [**port** *port-number*]

undo controller *id* **auxiliary** *auxiliary-id*

Default

An OpenFlow instance does not have auxiliary connections to a controller.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

controller-id: Specifies a controller by its ID in the range of 0 to 63.

auxiliary *auxiliary-id*: Specifies an auxiliary connection ID in the range of 1 to 255.

transport: Specifies the transport layer protocol.

tcp: Specifies TCP connections.

udp: Specifies UDP connections.

ssl *ssl-policy-name*: Specifies the SSL client policy that the controller uses to authenticate the OpenFlow switch. The *ssl-policy-name* argument is a case-insensitive string of 1 to 31 characters.

ip *ipv4-address*: Specifies the IPv4 address of the controller.

ipv6 *ipv6-address*: Specifies the IPv6 address of the controller.

port *port-number*: Sets the port number used to establish TCP connections to the controller. The value range for the port number is 1 to 65535. The default value is 6633.

Usage guidelines

Auxiliary connections are used to improve the communication performance between the controller and OpenFlow switches.

For an auxiliary connection to be successfully established, make sure the configuration of the auxiliary connection does not conflict with the configuration of the main connection.

An auxiliary connection can have a different destination IP address and port number than the main connection. If no destination IP address and port number are specified, the auxiliary connection uses the destination IP address and port number configured for the main connection.

Examples

Specify controller 1 for OpenFlow instance 1 and configure auxiliary connection 1 to the controller.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] controller 10 auxiliary 1 transport tcp
```

controller connect interval

Use **controller connect interval** to set the reconnection interval.

Use **undo controller connect interval** to restore the default.

Syntax

controller connect interval *interval*

undo controller connect interval

Default

The reconnection interval is 60 seconds.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

interval: Specifies the reconnection interval in the range of 10 to 120 seconds.

Examples

Set the reconnection interval to 10 seconds for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] controller connect interval 10
```

controller echo-request interval

Use **controller echo-request interval** to set the connection detection interval for an OpenFlow switch.

Use **undo controller echo-request interval** to restore the default.

Syntax

controller echo-request interval *interval*

undo controller echo-request interval

Default

The connection detection interval is 5 seconds for an OpenFlow switch.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

interval: Specifies the connection detection interval in the range of 1 to 10 seconds.

Examples

Set the connection detection interval to 10 seconds for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] controller echo-request interval 10
```

controller mode

Use **controller mode** to set the controller connection mode for an OpenFlow instance.

Use **undo controller mode** to restore the default.

Syntax

controller mode { **multiple** | **single** }

undo controller mode

Default

The controller connection mode is **multiple**.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

multiple: Specifies the **multiple** mode. In **multiple** mode, the OpenFlow switch simultaneously connects to all controllers. If one or more controllers become invalid or disconnected, the OpenFlow switch continues to exchange messages with the rest of the controllers.

single: Specifies the **single** mode. In **single** mode, the OpenFlow switch connects to only one controller at a time. When communication with the current controller fails, the OpenFlow instance connects to the controller with the lowest ID among the rest controllers.

Examples

Set all controllers of OpenFlow instance 1 to operate in **single** mode.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] controller mode single
```

datapath-id

Use **datapath-id** to set the datapath ID for an OpenFlow instance.

Use **undo datapath-id** to restore the default.

Syntax

datapath-id *id*

undo datapath-id

Default

The datapath ID of an OpenFlow instance contains the instance ID and the bridge MAC address of the device. The lower 16 bits are the instance ID and the upper 48 bits are the bridge MAC address of the device.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

id: Specifies the datapath ID for the OpenFlow instance, in the range of 1 to ffffffffffffffff in hexadecimal format.

Usage guidelines

The datapath ID uniquely identifies an OpenFlow instance.

Examples

Set the datapath ID to **123456** for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] datapath-id 123456
```

default table-miss permit

Use **default table-miss permit** to configure the default action of table-miss flow entries to forward packets to the normal pipeline.

Use **undo default table-miss permit** to restore the default.

Syntax

default table-miss permit

undo default table-miss permit

Default

The default action of a table-miss flow entry is to drop packets.

Views

OpenFlow instance view

Predefined user roles

network-admin

Examples

Configure the default action of table-miss flow entries to forward packets to the normal pipeline.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] default table-miss permit
```

description

Use **description** to configure a description for an OpenFlow instance.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

An OpenFlow instance does not have a description.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Examples

Configure the description as **test-desc** for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] description test-desc
```

display openflow

Use **display openflow** to display controller information for an OpenFlow instance.

Syntax

display openflow instance *instance-id* { **controller** [*controller-id*] | **listened** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-id: Specifies an OpenFlow instance by its ID in the range of 1 to 4094.

controller-id: Specifies a controller by its ID in the range of 0 to 63. If you do not specify a controller ID, this command displays information about all controllers for an OpenFlow instance.

listened: Specifies the controllers acting as SSL clients to which the OpenFlow instance connects as an SSL server.

Examples

Display controller information for OpenFlow instance 100.

```
<Sysname> display openflow instance 100 controller
Instance 1 controller information:
 Reconnect interval : 60 (s)
 Echo interval      : 5  (s)

 Controller ID           : 1
 Controller IP address   : 192.168.49.49
 Controller port         : 6633
 Local IP address        : 192.0.0.1
 Local port              : 5566
 Controller role         : Equal
 Connect type            : TCP
 Connect state           : Established
 Packets sent            : 9
 Packets received        : 9
 SSL policy              : --
 VRF name                : --
```

Table 1 Command output

Field	Description
Reconnect interval	Reconnection interval (in seconds) for an OpenFlow instance to reconnect to all controllers.
Echo interval	Connection detection interval (in seconds) at which an OpenFlow instance sends an echo request message to all controllers.
Controller IP address	IP address of the controller.
Controller port	TCP port number of the controller.
Local IP address	Source IP address of the controller that is connected to the OpenFlow instance.
Local port	Source TCP port number of the current controller.
Controller role	Role of the controller: • **Equal**—The controller has the same mode as other controllers that are specified for the OpenFlow instance. • **Master**—The controller is the master controller for the OpenFlow instance. • **Slave**—The controller is a subordinate controller for the OpenFlow instance. If the controller is not configured with any role, this field displays two hyphens (**--**).
Connect type	Type of the connection between the OpenFlow instance and the controller: **TCP** or **SSL**.
Connect state	State of the connection between the OpenFlow instance and the controller: **Idle** or **Established**.
Packets sent	Number of packets that have been sent to the controller.
Packets received	Number of packets that have been received from the controller.
SSL policy	Name of the SSL client policy used for SSL connections. If no SSL client policy is configured, this field displays two hyphens (**--**).
VRF name	Name of the MPLS L3VPN to which the controller belongs. If no MPLS L3VPN instance is configured, this field displays two hyphens (**--**). This field is not supported in the current software version.

display openflow auxiliary

Use **display openflow auxiliary** to display auxiliary connection information for an OpenFlow instance.

Syntax

display openflow instance *instance-id* **auxiliary** [*controller-id* [**auxiliary** *auxiliary-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-id: Specifies an OpenFlow instance by its ID in the range of 1 to 4094.

controller-id: Specifies a controller by its ID in the range of 0 to 63.

auxiliary *auxiliary-id*: Specifies an auxiliary connection by its ID in the range of 1 to 255.

Examples

Display auxiliary connection information for OpenFlow instance 100.

```
<Sysname> display openflow instance 100 auxiliary
Controller ID: 1    Auxiliary connection number: 2
 Auxiliary connection ID : 1
  Controller IP address  : 192.168.49.48
  Controller port        : 6633
  Connect type           : TCP
  Connect state          : Established
  Packets sent           : 9
  Packets received       : 9
  SSL policy             : --

 Auxiliary connection ID : 2
  Controller IP address  : 192.168.49.49
   Controller port       : 6633
   Connect type          : TCP
   Connect state         : Established
   Packets sent          : 9
   Packets received      : 9
   SSL policy            : --
```

Table 2 Command output

Field	Description
Auxiliary connection number	Total number of auxiliary connections.
Auxiliary connection ID	ID of an auxiliary connection.
Controller IP address	IP address of the controller.
Controller port	TCP port number of the controller.
Connect type	Type of the connection between the OpenFlow instance and the controller: **TCP UDP**, or **SSL**.
Connect state	State of the connection between the OpenFlow instance and the controller: **Idle** or **Established**.
Packets sent	Number of packets that have been sent to the controller.
Packets received	Number of packets that have been received from the controller.
SSL policy	Name of the SSL client policy used for SSL connections. If no SSL client policy is configured, this field displays two hyphens (**--**).

display openflow flow-table

Use **display openflow flow-table** to display flow table information for an OpenFlow instance.

Syntax

display openflow instance *instance-id* **flow-table** [*table-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-id: Specifies an OpenFlow instance by its ID in the range of 1 to 4094.

table-id: Specifies a flow table by its ID in the range of 0 to 254. If you do not specify a flow table ID, the command displays information about all flow tables for the specified OpenFlow instance.

Examples

Display information about all flow tables for OpenFlow instance 100.

```
<Sysname> display openflow instance 100 flow-table
Instance 100 flow table information:

Table 0 information:
 Table type: MAC-IP, flow entry count: 1, total flow entry count: 2

MissRule (default) flow entry information:

```

Table 3 Command output

Field	Description
Table information	Information about the flow table.
Table type	Type of the flow table: **MAC-IP** or **Extensibility**.
flow entry count	Number of flow entries deployed by the controller.
total flow entry count	Total number of flow entries in the table.
Flow entry information	Information about the flow entry. If the flow entry does not take effect, this field displays **Not effective**.
cookie	Cookie ID of the flow entry.
priority	Priority of the flow entry. The larger the value, the higher the priority.
hard time	Hard timeout of the flow entry, in seconds. The flow entry is removed when the timer times out, whether or not the flow entry matches any data stream. If the flow entry has no hard timeout, the field displays **0**.
idle time	Idle timeout of the flow entry, in seconds. The flow entry is removed if the flow entry does not match any data stream during the idle time. If the flow entry has no idle timeout, the field displays **0**.

Field	Description
flags	Flags that the flow entry includes: • **flow_send_rem**—Sends a flow removed message when the flow entry is removed or expires. • **check_overlap**—Checks for overlapping flow entries. • **reset_counts**—Resets flow table counters. • **no_pkt_counts**—Does not count packets. • **no_byte_counts**—Does not count bytes. If the flow entry does not include any flags, this field displays **none**.
byte count	Number of bytes that have matched the flow entry.
packet count	Number of packets that have matched the flow entry.
Create time	Time when the flow entry was created.
Last modified time	Time when the flow entry was modified for the last time.
Match information	Contents of the match field of the flow entry (see Table 4).
Instruction information	Contents of the instruction set of the flow entry: • **Set meter**—Sends the matched packet to a specific meter. • **Goto table**—Sends the matched packet to the next flow table for processing. • **Clear actions**—Immediately clears all actions in the action set. • **Apply actions**—Immediately applies specified actions in the action set. • **Write actions**—Writes specified actions into the current action set. For more information about actions, see Table 5.

Table 4 Match field types (supported fields vary by device model)

Field	Mask field	Description
Input interface	N/A	Ingress port (see Table 6).
Physical input interface	N/A	Ingress physical port.
Metadata	Metadata mask	Metadata and mask.
Ethernet destination MAC address	Ethernet destination MAC address mask	Ethernet destination MAC address and mask.
Ethernet source MAC address	Ethernet source MAC address mask	Ethernet source MAC address and mask.
Ethernet type	N/A	Ethernet type of the OpenFlow packet payload.
VLAN ID	Mask	VLAN ID and mask.
VLAN PCP	N/A	VLAN priority.
IP DSCP	N/A	Differentiated Services Code Point (DSCP) value.
IP ECN	N/A	Explicit Congestion Notification (ECN) value in the IP header.
IP protocol	N/A	IPv4 or IPv6 protocol number.
IPv4 source address	Mask	IPv4 source address and mask.
IPv4 destination address	Mask	IPv4 destination address and mask.
TCP source port	Mask	TCP source port and mask.

Field	Mask field	Description
TCP destination port	Mask	TCP destination port and mask.
UDP source port	Mask	UDP source port and mask.
UDP destination port	Mask	UDP destination port and mask.
ICMPv4 type	N/A	ICMPv4 type.
ICMPv4 code	N/A	ICMPv4 code.
ARP source IPv4 address	Mask	Sender IPv4 address and mask in the ARP payload.
ARP source MAC address	ARP source MAC address mask	Sender MAC address and mask in the ARP payload.
IPv6 source address	IPv6 source address mask	Source IPv6 address and mask.
IPv6 destination address	IPv6 destination address mask	Destination IPv6 address and mask.
IPv6 flow label	Mask	IPv6 flow label and mask.
ICMPv6 type	N/A	ICMPv6 type.
ICMPv6 code	N/A	ICMPv6 code.
Output interface	N/A	Output port.

Table 5 Actions

Field	Description
Drop	Drops the matched packet. This action is not defined in the OpenFlow specifications.
Output interface	Sends the packet through a specific port. For more information about ports, see Table 6.
Group	Specifies a group table to process the packet.
Set queue	Maps the flow entry to a queue specified by its ID.
Set field	Modifies a field of the packet.
Decrement IP TTL	Decreases the IP TTL by 1.

Table 6 Ports

Port name	Ingress port	Output port	Description
In port	Not supported.	Supported.	Forwarding the packet out of the ingress port.
Normal	Not supported.	Supported.	Processing the packet by using the normal forwarding process.
Flood	Not supported.	Supported.	Flooding the packet.
All	Not supported.	Supported.	Forwarding the packet out of all ports.
Controller	Supported.	Supported.	Sending the packet to the controller.
Local	Supported.	Supported.	Sending the packet to the local CPU.
Any	Not supported.	Not supported.	Special value used in some OpenFlow commands when you do not specify a port.

Port name	Ingress port	Output port	Description
port name	Supported.	Supported.	Valid physical or logical port on the switch.

display openflow group

Use **display openflow group** to display group information for an OpenFlow instance.

Syntax

display openflow instance *instance-id* **group** [*group-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-id: Specifies an OpenFlow instance by its ID in the range of 1 to 4094.

group-id: Specifies a group by its ID in the range of 0 to 4294967040. If you do not specify a group ID, this command displays information about all group entries for an OpenFlow instance.

Examples

Display group information for OpenFlow instance 100.

```
<Sysname> display openflow instance 100 group
Instance 100 group table information:
 Group count: 2

Group entry 103:
 Type: All, byte count: 55116, packet count: 401
 Bucket 1 information:
  Action count 1, watch port: any, watch group: any
  Byte count 55116, packet count 401
  Output interface: BAGG100
 Bucket 2 information:
 Action count 1, watch port: any, watch group: any
  Byte count 0, packet count 0
  Output interface: Controller, send length: 128 bytes
 Referenced information:
  Count: 3
  Flow table 0
  Flow entry: 1, 2, 3

Group entry 104:
 Some buckets are invalid.
 Type: All, byte count: 0, packet count: 0
 Bucket 1 information:
  Action count 2, watch port: any, watch group: any
  Byte count 0, packet count 0
```

```
  Set field:
   Ethernet destination MAC address: 0000-0000-0013
   Ethernet source MAC address: 0000-0000-0012
   IPv4 destination address: 100.0.0.21
   UDP destination port: 1001
  Output interface: Controller, send length: 128 bytes
 Referenced information:
  Count: 0
```

Table 7 Command output

Field	Description
Group count	Total number of group entries included in the OpenFlow instance.
Some buckets are invalid.	Some buckets of the group entry are invalid because the hardware resources are insufficient or the device fails.
Type	Type of the group entry. The value of **All** indicates that the device executes all buckets in the group. This group is used for multicast or broadcast forwarding.
Bucket	Buckets included in the group table.
Action count	Number of actions included in the bucket.
Byte count	Number of bytes processed by a group or by a bucket. If the statistics cannot be collected, this field displays two hyphens (**--**).
packet count	Number of packets processed by a group or by a bucket. If the statistics cannot be collected, this field displays two hyphens (**--**).
watch port	Port whose state affects whether this bucket is live.
watch group	Group whose state affects whether this bucket is live.
Set field	Fields to be modified for packets, for example, the destination/source MAC address, destination IPv4 address, and destination UDP port number.
Output interface	OpenFlow port to which packets are forwarded.
Referenced information	Information about the group entry used by flow entries.
Count	Total number of flow entries that use the group entry.
Flow table	Flow table to which the flow entries that use the group entry belong.
Flow entry	Flow entries that use the group entry.

display openflow instance

Use **display openflow instance** to display detailed information about an OpenFlow instance.

Syntax

display openflow instance [*instance-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-id: Specifies an OpenFlow instance by its ID in the range of 1 to 4094. If you do not specify an instance ID, this command displays detailed information about all OpenFlow instances.

Examples

Display detailed information about all OpenFlow instances.

```
<Sysname> display openflow instance
Instance 100 information:

Configuration information:
 Description   : test-desc
 Active status : Active
 Inactive configuration:
  None
 Active configuration:
  Classification: VLAN, loosen mode, total VLANs(1)
   2
  In-band management VLAN, total VLANs(0)
   Empty VLAN
  Connect mode: Multiple
  MAC address learning: Disabled
  TCP DSCP value: 10
  Flow table:
   Table ID(type): 0(MAC-IP), count: 0
  Flow-entry max-limit: 65535
  Datapath ID: 0x0000001234567891
  Default table-miss: Drop
  Forbidden port: None
  Qinq Network: Disabled
  TCP connection backup: Enabled
Port information:
 GigabitEthernet1/0/3
Active channel information:
 Controller 1 IP address: 192.168.49.49  port: 6633
 Controller 2 IP address: 192.168.43.49  port: 6633
…
```

Table 8 Command output

Field	Description
Configuration information	Information about the configuration.
Description	Description of the OpenFlow instance.
Active status	OpenFlow instance status: **Active** or **Inactive**.
Inactive configuration	Inactive configuration for the OpenFlow instance.
Active configuration	Active configuration for the OpenFlow instance.
Classification: VLAN, total VLANs	VLANs that are associated with the OpenFlow instance and the total number of these VLANs.

Field	Description
loose mode	The loose mode is used.
In-band management VLAN, total VLANs	Inband management VLANs and the total number of them.
Connect mode	Connection mode of the controller: • **Single**—The OpenFlow instance connects to only one controller at a time. • **Multiple**—The OpenFlow instance can simultaneously connect to multiple controllers.
MAC address learning	Whether MAC address learning is disabled: **Enabled** or **Disabled**.
TCP DSCP value	DSCP value for OpenFlow packets.
Flow table	Flow table information for the OpenFlow instance.
Table ID(type)	Type of the flow table: **MAC-IP** or **Extensibility**.
count	Total number of flow entries included in the current flow table.
Flow-entry max-limit	Maximum number of flow entries allowed in the extensibility flow table.
Datapath ID	Datapath ID of the OpenFlow instance.
Default table-miss	Default action of the table-miss flow entry: **Permit** or **Drop**.
Forbidden port	Type of interfaces that are forbidden to be reported to the controller: **VLAN interface**.
TCP connection backup	Whether OpenFlow connection backup is enabled: • **Disabled**. • **Enabled**.
Port information	Ports that have been added to the OpenFlow instance.
Active channel information	Information about active channels.
IP address	IP address of the controller configured for the OpenFlow instance.
Port	TCP port number that is used to connect to the controller.
Failopen mode	Connection interruption mode for the OpenFlow instance: • **Standalone**. • **Smart**. • **Secure**.

display openflow meter

Use **display openflow meter** to display meter information for an OpenFlow instance.

Syntax

display openflow instance *instance-id* **meter** [*meter-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-id: Specifies an OpenFlow instance by its ID in the range of 1 to 4094.

meter-id: Specifies a meter by its ID in the range of 1 to 4294901760. If you do not specify a meter ID, this command displays information about all meter entries for an OpenFlow instance.

Examples

Display meter information for OpenFlow instance 100.

```
<Sysname> display openflow instance 100 meter
Meter flags: KBPS  -- Rate value in kb/s, PKTPS -- Rate value in packet/sec
             BURST -- Do burst size,      STATS -- Collect statistics

Instance 100 meter table information:
 meter entry count: 2

Meter entry 100 information:
 Meter flags: KBPS
 Band 1 information
 Type: drop, rate: 1024, burst size: 65536
 Byte count: 0, packet count: 0
 Referenced information:
  Count: 3
  Flow table: 0
  Flow entry: 1, 2, 3

Meter entry 200 information:
 Meter flags: KBPS
 Band 1 information
 Type: drop, rate: 10240, burst size: 655360
 Byte count: 0, packet count: 0
 Referenced information:
  Count: 0
```

Table 9 Command output

Field	Description
Group entry count	Total number of meter entries that the OpenFlow instance has.
Meter flags	Flags configured for the meter: • **KBPS**—The rate value is in kbps. • **PKTPS**—The rate value is in pps. • **BURST**—The burst size field in the band is used and the length of the packet or byte burst is determined by the burst size. • **STATS**—Meter statistics are collected.
Band	Bands contained in the meter.
Type	Type of the band: • **drop**—Discard the packet. • **dscp_remark**—Modify the drop precedence of the DSCP field in the IP header of the packet.

Field	Description
Rate	Rate value above which the corresponding band applies to packets.
Burst size	Length of the packet or byte burst to consider for applying the meter.
Byte count	Number of bytes processed by a band. If the statistics cannot be collected, this field displays two hyphens (**--**).
packet count	Number of packets processed by a band. If the statistics cannot be collected, this field displays two hyphens (**--**).
Referenced information	Information about the meter entry used by flow entries.
Count	Total number of flow entries that use the meter entry.
Flow table	Flow table to which the flow entries that use the meter entry belong.
Flow entry	Flow entries that use the meter entry.

display openflow summary

Use **`display openflow summary`** to display brief OpenFlow instance information.

Syntax

`display openflow instance summary`

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display brief OpenFlow instance information.

```
<Sysname> display openflow summary
Fail-open mode: Se - Secure mode, Sa - Standalone mode, Sm - Smart mode

ID    Status    Datapath-ID         Channel    Table-num  Port-num  Reactivate
1     Active    0x0000000100001221  Connected  2          8         N
10    Inactive  -                   -          -          -         -
4094  Active    0x00000ffe00001221  Failed(Sa) 2          0         N
```

Table 10 Command output

Field	Description
ID	OpenFlow instance ID.
Status	Activation status of the OpenFlow instance: • **Active**—The OpenFlow instance has been activated. • **Inactive**—The OpenFlow instance has not been activated.
Datapath-ID	Datapath ID of the OpenFlow instance. If the OpenFlow instance is not activated, this field displays a hyphen (**-**).

Field	Description
Channel	Status of the OpenFlow channel to the controller: • **Connected**—An OpenFlow channel has been established. • **Failed(Se)**—The OpenFlow channel is disconnected from the controller, and the OpenFlow instance uses the **secure** connection interruption mode. • **Failed(Sm)**—The OpenFlow channel is disconnected from the controller, and the OpenFlow instance uses the **smart** connection interruption mode. • **Failed(Sa)**—The OpenFlow channel is disconnected from the controller, and the OpenFlow instance uses the **standalone** connection interruption mode. If the OpenFlow instance is not activated, this field displays a hyphen (**-**).
Table num	Number of flow tables that the OpenFlow instance has. If the OpenFlow instance is not activated, this field displays a hyphen (**-**).
Port num	Number of ports that belong to the OpenFlow instance. If the OpenFlow instance is not activated, this field displays a hyphen (**-**).
Reactivate	Whether the OpenFlow instance is required to be reactivated. **N** indicates the configuration is unchanged and the OpenFlow instance is not required to be reactivated. If the OpenFlow instance is not activated, this field displays a hyphen (**-**).

fail-open mode

Use **fail-open mode** to set the connection interruption mode for an OpenFlow switch.

Use **undo fail-open mode** to restore the default.

Syntax

fail-open mode { **secure** | **smart** | **standalone** }

undo fail-open mode

Default

The connection interruption mode is **secure**.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

secure: Configures the OpenFlow switch to use flow tables for traffic forwarding after it is disconnected from all controllers. The OpenFlow switch does not remove unexpired flow entries.

smart: Configures the OpenFlow switch to use flow tables for traffic forwarding after it is disconnected from all controllers. If the output action in a matching flow entry is to forward traffic to a controller, the traffic is forwarded in normal process.

standalone: Configures the OpenFlow switch to use the normal forwarding process after it is disconnected from all controllers.

Examples

Set the connection interruption mode to **standalone** for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] fail-open mode standalone
```

flow-entry max-limit

Use **flow-entry max-limit** to set the maximum number of entries for an extensibility flow table on an OpenFlow switch.

Use **undo flow-entry max-limit** to restore the default.

Syntax

flow-entry max-limit *limit-value*

undo flow-entry max-limit

Default

An extensibility flow table can have a maximum of 65535 flow entries.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

limit-value: Specifies the maximum number of flow entries for an extensibility flow table. The value range for this argument is 1 to 65535.

Usage guidelines

If the number of extensibility flow table entries deployed from a controller to an OpenFlow switch exceeds the maximum, the switch returns a failure message to the controller.

Examples

Configure OpenFlow instance 1 to have a maximum of 256 entries in each extensibility flow table.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] flow-entry max-limit 256
```

flow-log disable

Use **flow-log disable** to disable logging for successful flow table modifications.

Use **undo flow-log disable** to restore the default.

Syntax

flow-log disable

undo flow-log disable

Default

Logging for successful flow table modifications is enabled.

Views

OpenFlow instance view

Predefined user roles

network-admin

Examples

Disable logging for successful flow table modifications for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] flow-log disable
```

flow-table

Use **flow-table** to configure the flow table type and the flow table ID for an OpenFlow instance.

Use **undo flow-table** to restore the default.

Syntax

flow-table { **extensibility** *extensibility-table-id* | **mac-ip** *mac-ip-table-id* }*

undo flow-table

Default

An OpenFlow instance has an extensibility flow table with ID 0.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

extensibility *extensibility-table-id*: Specifies an extensibility flow table by its ID in the range of 0 to 254.

mac-ip *mac-ip-table-id*: Specifies a MAC-IP flow table by its ID in the range of 0 to 254.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The ID you enter for an extensibility flow table must be larger than the ID for an MAC-IP flow table.

Examples

Create a MAC-IP flow table with ID 0 and an extensibility flow table with ID 1 for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] flow-table mac-ip 0 extensibility 1
```

forbidden packet-in arp controller

Use **forbidden packet-in arp controller** to configure controllers to which ARP packets are forbidden to be reported.

Use **undo forbidden packet-in arp controller** to restore the default.

Syntax

forbidden packet-in arp controller *controller-id-list*

undo forbidden packet-in arp controller [*controller-id-list*]

Default

No controllers to which ARP packets are forbidden to be reported are configured.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

controller-id-list: Specifies a space-separated list of a maximum of 10 controller items. Each item specifies a controller ID or a range of controller IDs in the form of *controller-id1* **to** *controller-id2*. The value range for controller IDs is 0 to 63. The value for the *controller-id2* argument must be equal to or greater than the value for the *controller-id1* argument. If you do not specify the *controller-id-list* argument, the **undo** form of this command restores all configuration of this feature to the default.

Examples

Forbid the device not to report ARP packets to controller 0.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] forbidden packet-in arp controller 0
```

forbidden port

Use **forbidden port** to forbid an OpenFlow instance from reporting ports of the specified types to controllers.

Use **undo forbidden port** to restore the default.

Syntax

forbidden port { **l3-physical-interface** | **vlan-interface** | **vsi-interface** } *

undo forbidden port

Default

No port types are prevented from being reported to the controllers. All ports that belong to an OpenFlow instance are reported to the controllers.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

l3-physical-interface: Specifies Layer 3 Ethernet interfaces and Layer 3 aggregate interfaces that belong to an OpenFlow instance. This field is not supported in the current software version.

vlan-interface: Specifies VLAN interfaces that belong to an OpenFlow instance.

vsi-interface: Specifies virtual switch instance (VSI) interfaces that belong to an OpenFlow instance. This field is not supported in the current software version.

Examples

Forbid OpenFlow instance 1 from reporting VLAN interfaces that belong to the OpenFlow instance to controllers.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] forbidden port vlan-interface
```

in-band management vlan

Use **in-band management vlan** to configure inband management VLANs for an OpenFlow instance.

Use **undo in-band management vlan** to restore the default.

Syntax

in-band management vlan *vlan-id-list*

undo in-band management vlan

Default

No inband management VLANs are configured for an OpenFlow instance.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094.

Usage guidelines

Traffic in inband management VLANs is forwarded in the normal forwarding process for an OpenFlow instance to establish secure connections to controllers.

Examples

Configure VLAN 10 as the inband management VLAN for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] in-band management vlan 10
```

listening port

Use **listening port** to configure an OpenFlow instance to act as an SSL server to listen to controllers.

Use **undo listening port** to restore the default.

Syntax

listening port *port-number* **ssl** *ssl-policy-name*

undo listening port

Default

An OpenFlow instance is not configured to acts as an SSL server to listen to controllers.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

port-number: Specifies the SSL server port number in the range of 1 to 65535.

ssl *ssl-policy-name*: Specifies the SSL server policy name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

Typically, an OpenFlow instance actively connects to the controller and acts as a TCP/SSL client. After the SSL server is enabled for an OpenFlow instance, the controller acts as the SSL client and actively connects to the OpenFlow instance. For more information about SSL, see *Security Configuration Guide*.

To re-configure the SSL server, first execute the **undo** form of the command to delete the existing SSL server configuration.

Examples

Configure OpenFlow instance 1 to act as an SSL server with port number 20000 and SSL server policy name **ssl_name**.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] listening port 20000 ssl ssl_name
```

loop-protection enable

Use **loop-protection enable** to enable loop guard for an OpenFlow instance.

Use **undo loop-protection enable** to restore the default.

Syntax

loop-protection enable

undo loop-protection enable

Default

Loop guard is disabled for an OpenFlow instance.

Views

OpenFlow instance view

Predefined user roles

network-admin

Usage guidelines

After an OpenFlow instance is deactivated, loops might occur in VLANs associated with the OpenFlow instance. To avoid loops, you can enable loop guard for the OpenFlow instance. This feature enables the deactivated OpenFlow instance to create a flow entry for dropping all traffic in theses VLANs.

Examples

Enable loop guard for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] loop-protection enable
```

mac-ip dynamic-mac aware

Use **mac-ip dynamic-mac aware** to configure an OpenFlow instance to support matching the dynamic MAC addresses in the query and deletion flow entry instructions sent from controllers.

Use **undo mac-ip dynamic-mac aware** to restore the default.

Syntax

mac-ip dynamic-mac aware

undo mac-ip dynamic-mac aware

Default

An OpenFlow instance ignores the dynamic MAC addresses in the query and deletion flow entry instructions sent from controllers.

Views

OpenFlow instance view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only on MAC-IP flow tables.

Examples

Configure OpenFlow instance 1 to support matching the dynamic MAC addresses in the query and deletion flow entry instructions sent from controllers.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] mac-ip dynamic-mac aware
```

mac-learning forbidden

Use **mac-learning forbidden** to configure OpenFlow to forbid MAC address learning in VLANs associated with an OpenFlow instance.

Use **undo mac-learning forbidden** to restore the default.

Syntax

mac-learning forbidden

undo mac-learning forbidden

Default

MAC address learning is allowed for VLANs associated with an OpenFlow instance.

Views

OpenFlow instance view

Predefined user roles

network-admin

Examples

Forbid MAC address learning in VLANs associated with OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] mac-learning forbidden
```

openflow instance

Use **openflow instance** to create an OpenFlow instance and enter its view, or enter the view of an existing OpenFlow instance.

Use **undo openflow instance** to remove an OpenFlow instance.

Syntax

openflow instance *instance-id*

undo openflow instance *instance-id*

Default

No OpenFlow instances exist.

Views

System view

Predefined user roles

network-admin

Parameters

instance-id: Specifies an OpenFlow instance by its ID in the range of 1 to 4094.

Examples

Create OpenFlow instance 1 and enter OpenFlow instance view.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1]
```

openflow shutdown

Use **openflow shutdown** to shut down an interface by OpenFlow.

Use **undo openflow shutdown** to restore the default.

Syntax

openflow shutdown

undo openflow shutdown

Default

An interface is not shut down by OpenFlow.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

After an interface is shut down by OpenFlow, the **Current state** field displays **OFP DOWN** in the **display interface** command output.

To bring up an interface shut down by OpenFlow, use either of the following methods:

- Use the **undo openflow shutdown** command on the interface.
- Use the controller to send port modification messages to the interface.

Examples

Shut down GigabitEthernet 1/0/1 by OpenFlow.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] openflow shutdown
```

permit-port-type member-port

Use **permit-port-type member-port** to allow link aggregation member ports to be in the deployed flow tables.

Use **undo permit-port-type** to restore the default.

Syntax

permit-port-type member-port

undo permit-port-type

Default

Link aggregation member ports cannot be in the deployed flow tables.

Views

OpenFlow instance view

Predefined user roles

network-admin

Examples

Configure OpenFlow instance 1 to allow link aggregation member ports to be in the deployed flow tables.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] permit-port-type member-port
```

precedence dynamic arp

Use **precedence dynamic arp** to allow dynamic ARP entries to overwrite OpenFlow ARP entries.

Use **undo precedence dynamic** to restore the default.

Syntax

precedence dynamic arp

undo precedence dynamic arp

Default

An OpenFlow instance does not allow dynamic ARP entries to overwrite OpenFlow ARP entries.

Views

OpenFlow instance view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only on the MAC-IP flow table of an OpenFlow instance.

Examples

Configure OpenFlow instance 1 to allow dynamic ARP entries to overwrite OpenFlow ARP entries.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] precedence dynamic arp
```

refresh ip-flow

Use **refresh ip-flow** to refresh all Layer 3 flow entries in the MAC-IP flow tables for an OpenFlow instance.

Syntax

refresh ip-flow

Views

OpenFlow instance view

Predefined user roles

network-admin

Usage guidelines

Layer 3 flow entries in the MAC-IP flow tables might be overwritten. In such cases, you can use this command to obtain all Layer 3 flow entries in the MAC-IP flow tables from the controller again.

Examples

Refresh all Layer 3 flow entries in the MAC-IP flow tables for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] refresh ip-flow
```

reset openflow instance statistics

Use **reset openflow instance statistics** to clear statistics on packets that a controller sends and receives for an OpenFlow instance.

Syntax

reset openflow instance *instance-id* { **controller** [*controller-id*] | **listened** } **statistics**

Views

User view

Predefined user roles

network-admin

Parameters

instance-id: Specifies an OpenFlow instance by its ID in the range of 1 to 4094.

controller-id: Specifies a controller by its ID in the range of 0 to 63. If you do not specify a controller ID, this command clears statistics on packets that all controllers send and receive for an OpenFlow instance.

listened: Specifies the client that connects to the server enabled for the OpenFlow instance.

Examples

Clear statistics on packets that all controllers send and receive for OpenFlow instance 1.

```
<Sysname> reset openflow instance 1 controller statistics
```

tcp dscp

Use **tcp dscp** to set a DSCP value for OpenFlow packets.

Use **undo tcp dscp** to restore the default.

Syntax

tcp dscp *dscp-value*

undo tcp dscp

Default

The DSCP value for OpenFlow packets is not set.

Views

OpenFlow instance view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value for OpenFlow packets, in the range of 0 to 63.

Examples

Set the DSCP value to 63 for OpenFlow packets.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] tcp dscp 63
```

tcp-connection backup

Use **tcp-connection backup** to enable OpenFlow connection backup.

Use **undo tcp-connection backup** to disable OpenFlow connection backup.

Syntax

tcp-connection backup

undo tcp-connection backup

Default

OpenFlow connection backup is enabled.

Views

OpenFlow instance view

Predefined user roles

network-admin

Usage guidelines

This command enables an OpenFlow instance to back up OpenFlow connections established over TCP. This prevents connection interruption when an active/standby switchover occurs.

This feature is available only on an IRF fabric with two member devices.

Examples

Disable OpenFlow connection backup for OpenFlow instance 1.

```
<Sysname> system-view
[Sysname] openflow instance 1
[Sysname-of-inst-1] undo tcp-connection backup
```
