About the command references

The command references describe the commands and command syntax options available for the following switch series:

- S5120V2-LI.
- S3100V3-SI.
- S5110V2.
- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000E-X.
- S5000X-EI.
- S5130S-LI.
- S5120V3-LI.
- S5120V3-SI.
- MS4320V2.
- MS4320V3.
- MS4320.
- MS4300V2.
- MS4200.
- WS5810-WiNet.
- WS5820-WiNet.
- WAS6000.

Command reference	Content
Fundamentals Command Reference	Covers the commands for logging in to and setting up the device. This command reference includes: • CLI (command privilege settings and CLI management commands). • RBAC. • Logging in to the switch. • FTP and TFTP. • File system management. • Configuration file management. • Software upgrade. • Device management. • Tcl. • Python. • License management.
Virtual Technologies Command Reference	Covers the commands for configuring the Intelligent Resilient Framework (IRF) technology features. It covers planning the switch roles in the IRF fabric, connecting the IRF links, and detecting and maintaining the IRF fabric.
Layer 2—LAN Switching Command Reference	Covers the commands for configuring Layer 2 technologies and features in a LAN switched network. This command reference includes:

Command reference	Content
	• Ethernet interface. • Loopback, null, and inloopback interfaces. • Bulk interface configuration. • MAC address table and MAC Information. • Ethernet link aggregation. • Port isolation. • Spanning tree. • Loop detection. • VLAN (including VLAN, private VLAN, and voice VLAN). • MVRP. • QinQ. • VLAN mapping. • LLDP. • L2PT. • PPPoE relay.
Layer 3—IP Services Command Reference	Covers the commands for configuring and managing IP addressing (including static and dynamic IPv4 and IPv6 address assignment), network performance optimization, and ARP. This command reference includes: • ARP (including gratuitous ARP, proxy ARP, ARP snooping, and ARP direct route advertisement). • IP addressing. • DHCP. • DNS. • Basic IP forwarding. • Fast forwarding. • IP performance optimization. • UDP helper. • IPv6 basics. • DHCPv6. • IPv6 fast forwarding. • HTTP redirect.
Layer 3—IP Routing Command Reference	Covers the commands for configuring routes for IPv4 and IPv6 networks of different sizes, route filtering, route control, and policy-based routing. This command reference includes: • Basic IP routing. • Static routing. • RIP. • OSPF. • Policy-based routing. • IPv6 static routing. • RIPng. • OSPFv3. • IPv6 policy-based routing. • Routing policy.
IP Multicast Command Reference	Covers the commands for Layer 2 IPv4 multicast protocols (including IGMP snooping, PIM snooping, and multicast VLAN) and Layer 2 IPv6 multicast protocols (including MLD snooping, IPv6 PIM snooping, and IPv6 multicast VLAN). This command reference includes: • IGMP snooping.

Command reference	Content
	• PIM snooping. • Multicast VLAN. • MLD snooping. • IPv6 PIM snooping. • IPv6 multicast VLAN.
ACL and QoS Command Reference	Covers the commands for classifying traffic with ACLs, and allocating network resources and managing congestions with QoS technologies to improve network performance and network use efficiency. This command reference includes: • ACL. • QoS (including QoS policy, priority mapping, GTS and rate limit, congestion management, and aggregate CAR). • Data buffer. • Time range.
Security Command Reference	Covers security feature commands. Available security features include identity authentication (AAA), access security (802.1X, MAC authentication, and port security), secure management (SSH), SSL, and attack protection (IP source guard and ARP attack protection). This command reference includes: • AAA. • 802.1X. • MAC authentication. • Portal. • Web authentication. • Port security. • User profile. • Password control. • Public key management. • PKI. • IPsec (including IPsec, IKE, and IKEv2). • SSH. • SSL. • Attack detection and prevention. • TCP attack prevention. • IP source guard. • ARP attack protection. • ND attack defense. • SAVI. • MFF. • Crypto engine. • FIPS. • 802.1X client.
High Availability Command Reference	Covers high availability commands for managing failure detection and failover. Failure detection technologies focus on fault detection and isolation. Failover technologies focus on network recovery. This command reference includes: • Ethernet OAM. • CFD. • DLDP. • RRPP. • ERPS.

Command reference	Content
	• Smart Link. • Monitor Link. • VRRP. • BFD. • Track. • Loopback MAC SWAP.
Network Management and Monitoring Command Reference	Covers the commands that help you manage and monitor your network, for example, manage system events, collect traffic statistics, sample packets, assess network performance, and test network connectivity. This command reference includes: • System maintenance and debugging (ping, tracert, and system debugging). • NQA. • NTP and SNTP. • PoE. • SNMP. • RMON. • NETCONF. • CWMP. • EAA. • Process monitoring and maintenance. • Mirroring (including both port and traffic mirroring). • sFlow. • Information center. • VCF fabric. • Cloud connection. • SmartMC. • WiNet.
Telemetry Command Reference	Covers the commands for configuring gRPC.
OpenFlow Command Reference	Covers the commands for configuring OpenFlow.

Fundamentals Command Reference

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

New H3C Technologies Co., Ltd.

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This command reference describes commands that help you get started with the device. It includes the commands for the following features and tasks:

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

Basic CLI commands

alias

Use **alias** to configure a command alias.

Use **undo alias** to delete a command alias.

Syntax

alias *alias command*

undo alias *alias*

Default

The device has a set of system-defined command aliases, as listed in Table 1.

Table 1 System-defined command aliases

Command alias	Command or command keyword
access-list	**acl**
end	**return**
erase	**delete**
exit	**quit**
hostname	**sysname**
logging	**info-center**
no	**undo**
show	**display**
write	**save**

Views

System view

Predefined user roles

network-admin

Parameters

alias: Specifies an alias, a case-sensitive string of 1 to 20 characters. An alias cannot be **alias** or contain spaces.

command: Specifies a command string. Make sure the command string meets the syntax requirements.

Usage guidelines

System-defined command aliases cannot be deleted.

You can configure one or more aliases for a command or the starting keywords of commands. Then, you can use the aliases to execute the command or commands. If the command or commands have **undo** forms, you can also use the aliases to execute the **undo** command or commands.

For example, if you configure the alias **shiprt** for **display ip routing-table**, you can enter **shiprt** to execute the **display ip routing-table** command. If you configure the alias **ship** for **display ip**, you can use **ship** to execute all commands that start with **display ip**:

- Enter **ship routing-table** to execute the **display ip routing-table** command.
- Enter **ship interface** to execute the **display ip interface** command.

The command string can include up to nine parameters. Each parameter starts with the dollar sign ($) and a sequence number in the range of 1 to 9. For example, you can configure the alias **shinc** for the **display ip $1 | include $2** command. Then, to execute the **display ip routing-table | include Static** command, you only need to enter **shinc routing-table Static**. To execute the **display ip interface | include GigabitEthernet1/0/1** command, you only need to enter **shinc interface GigabitEthernet1/0/1**.

Examples

Configure **shiprt** as the alias for the **display ip routing-table** command and verify the configuration.

```
<Sysname> system-view
[Sysname] alias shiprt display ip routing-table
[Sysname] shiprt
Destinations : 13        Routes : 13
Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
3.3.3.3/32         Static  60  0           192.168.1.62    Vlan1
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0

169.254.0.255/32   Direct  0   0           169.254.0.188   Vlan1
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

Configure **shinc** as the alias for **display ip $1 | include $2**.

```
[Sysname] alias shinc display ip $1 | include $2
```

Use alias **shinc** to display all static routes.

```
[Sysname] shinc routing-table Static
3.3.3.3/32         Static  60  0           192.168.1.62    Vlan1
```

Related commands

display alias

display [| [by-linenum] { begin | exclude | include }]

Use **display** [**|** [**by-linenum**] { **begin** | **exclude** | **include** }] to filter the output from a **display** command with regular expressions.

Syntax

display *command* [**|** [**by-linenum**] { **begin** | **exclude** | **include** } *regular-expression*]&<1-128>

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

command: Specifies the keywords and arguments of a **display** command. To display available keywords and arguments, enter **display ?**.

[**|** [**by-linenum**] { **begin** | **exclude** | **include** } *regular-expression*]&<1-128>: Specifies a maximum of 128 filter conditions.

- **by-linenum**: Numbers the output lines. You need to specify this keyword in only one filter condition.
- **begin**: Displays the first line matching the specified regular expression and all subsequent lines.
- **exclude**: Displays all lines not matching the specified regular expression.
- **include**: Displays all lines matching the specified regular expression.
- *regular-expression*: Specifies a regular expression, a case-sensitive string of 1 to 256 characters.

Usage guidelines

To quickly locate certain lines in the output from a **display** command, you can use regular expressions to filter the output, and display a number before each output line. For more information about regular expressions, see *Fundamentals Configuration Guide*.

If you specify multiple filter conditions, the system displays the output lines that meet all the conditions.

A line number is a 5-character string and is typically followed by a colon (:). If you specify both the **by-linenum** and **begin** *regular-expression* options, a line number might be followed by a colon or a hyphen (-).

- **Colon**—The line matches the regular expression.
- **Hyphen**—The line does not match the regular expression.

Examples

Display the lines that contain **vlan** in the running configuration.

```
<Sysname> display current-configuration | include vlan
vlan 1
vlan 999
 port access vlan 999
```

Display log entries in the log buffer that contain both **SHELL** and **VTY**.

```
<Sysname> display logbuffer | include SHELL | include VTY
%Sep  6 10:38:12:320 2018 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 169.254.100.171.
%Sep  6 10:52:32:576 2018 Sysname SHELL/5/SHELL_LOGOUT: VTY logged out from
169.254.100.171.
%Sep  6 16:03:27:100 2018 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 169.254.100.171.
```

```
%Sep  6 16:44:18:113 2018 Sysname SHELL/5/SHELL_LOGOUT: VTY logged out from
169.254.100.171.
```

Display the running configuration, starting from the first line that contains **user-group** and numbering the output lines.

```
<Sysname> display current-configuration | by-linenum begin user-group
  114:  user-group system
  115-  #
  116-  return
```

display >

Use **display >** to save the output from a **display** command to a separate file.

Syntax

display *command* **>** *filename*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

command: Specifies the keywords and arguments of a **display** command. To display available keywords and arguments, enter **display ?**.

filename: Specifies the name of the file that is used to save the output, a string of 1 to 63 characters.

Usage guidelines

The **display** commands show the configuration, statistics, and states of the device. You can use the **display >** command to save the output to a file.

If the specified file does not exist, the system creates the file and saves the output to the file. If the file already exists, the system overwrites the file.

Examples

Save VLAN 1 settings to a separate file named **vlan.txt**.

```
<Sysname> display vlan 1 > vlan.txt
```

Check the content of the **vlan.txt** file.

```
<Sysname> more vlan.txt
VLAN ID: 1
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0001
 Name: VLAN 0001
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/2
```

display >>

Use **display >>** to append the output from a **display** command to the end of a file.

Syntax

display *command* **>>** *filename*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

command: Specifies the keywords and arguments of a **display** command. To display available keywords and arguments, enter **display ?**.

filename: Specifies the name of the file that is used to save the output, a string of 1 to 63 characters.

Usage guidelines

The **display** commands show the configuration, statistics, and states of the device. You can use **display >>** to save the output to a file.

If the specified file does not exist, the system creates the file and saves the output to the file. If the file already exists, the system appends the output to the end of the file.

Examples

Append the VLAN 999 settings to the end of the **vlan.txt** file.

```
<Sysname> display vlan 999 >> vlan.txt
<Sysname>
```

Check the content of the **vlan.txt** file.

```
<Sysname> more vlan.txt
VLAN ID: 1
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0001
 Name: VLAN 0001
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/2

 VLAN ID: 999
 VLAN type: Static
 Route interface: Configured
 IPv4 address: 192.168.2.1
 IPv4 subnet mask: 255.255.255.0
 Description: For LAN Access
 Name: VLAN 0999
 Tagged ports:   None
 Untagged ports:
```

```
GigabitEthernet1/0/2
```

display alias

Use **display alias** to display command aliases.

Syntax

display alias [*alias*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

alias: Specifies a command alias. If you do not specify this argument, the command displays all command aliases.

Examples

Display all command aliases.

```
<Sysname> display alias
Index     Alias               Command key
1         access-list         acl
2         end                 return
3         erase               delete
4         exit                quit
5         hostname            sysname
6         logging             info-center
7         no                  undo
8         shinc               display $1 | include $2
9         show                display
10        sirt                display ip routing-table
11        write               save
```

Display the command alias **shinc**.

```
<Sysname> display alias shinc
Alias               Command key
shinc               display ip $1 | include $2
```

Related commands

alias

display history-command

Use **display history-command** to display all commands that are saved in the command history buffer for the current CLI session.

Syntax

display history-command

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

The system automatically saves commands you have successfully executed to the command history buffer for the current CLI session. You can view them and execute them again.

By default, the system can save up to 10 commands in the buffer. You can use the **history-command max-size** command to change the buffer size. To buffer a new command when the buffer is full, the system deletes the oldest command entry in the buffer.

All commands in the command history buffer for the current CLI session will be cleared when you log out.

Examples

Display all commands saved in the command history buffer for the current CLI session.

```
<Sysname> display history-command
  system-view
  vlan 2
  quit
```

Related commands

history-command max-size

display history-command all

Use **display history-command all** to display all commands that are saved in the command history buffer for all CLI sessions.

Syntax

display history-command all

Views

Any view

Predefined user roles

network-admin

Usage guidelines

The system automatically saves commands successfully executed by users to the command history buffer for all CLI sessions. Users can view them but cannot recall them from the buffer.

Up to 1024 commands can be saved in the command history buffer. To buffer a new command when the buffer is full, the system deletes the oldest command entry in the buffer.

A user logout does not cause the system to delete commands from the history buffer for all CLI sessions.

Examples

Display all commands saved in the command history buffer for all CLI sessions.

```
<Sysname> display history-command all
  Date       Time     Terminal   Ip              User
```

```
03/16/2017 20:03:33 vty0       192.168.1.26    **
Cmd:dis his all

03/16/2017 20:03:29 vty0       192.168.1.26    **
Cmd:sys
```

Table 2 Command output

Field	Description
Date	Date when the command was executed.
Time	Time when the command was executed.
Terminal	User line used by the user.
Ip	IP address of the terminal used by the user.
User	Username used by the user if the user login authentication mode is **scheme**. If the login authentication mode is **none** or **password**, this field displays ******.
Cmd	Command string entered by the user.

Related commands

display history-command

display hotkey

Use **display hotkey** to display hotkey information.

Syntax

display hotkey

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display hotkey information.

```
<Sysname> display hotkey
----------------- Hotkeys -----------------
           -Defined function hotkeys-
CTRL_A  Move the cursor to the beginning of the line.
CTRL_B  Move the cursor one character to the left.
CTRL_C  Stop the current command.
CTRL_D  Erase the character at the cursor.
CTRL_E  Move the cursor to the end of the line.
CTRL_F  Move the cursor one character to the right.
CTRL_H  Erase the character to the left of the cursor.
CTRL_N  Display the next command in the history buffer.
CTRL_P  Display the previous command in the history buffer.
CTRL_R  Redisplay the current line.
```

```
CTRL_W  Delete the word to the left of the cursor.
CTRL_X  Delete all characters from the beginning of the line to the cursor.
CTRL_Y  Delete all characters from the cursor to the end of the line.
CTRL_Z  Return to the User View.
CTRL_]  Kill incoming connection or redirect connection.
ESC_B   Move the cursor back one word.
ESC_D   Delete all characters from the cursor to the end of the word.
ESC_F   Move the cursor forward one word.
           -Defined command hotkeys-
CTRL_G  display current-configuration
CTRL_L  display ip routing-table
CTRL_O  undo debugging all
           -Undefined hotkeys-
CTRL_T  NULL
CTRL_U  NULL
```

Related commands

hotkey

hotkey

Use **hotkey** to configure a hotkey.

Use **undo hotkey** to restore the default.

Syntax

hotkey *hotkey* { *command* | **function** *function* | **none** }

undo hotkey *hotkey*

Default

Table 3 shows the default definitions for hotkeys.

Table 3 Default definitions for hotkeys

Hotkey	Function or command
Ctrl+A	**move_the_cursor_to_the_beginning_of_the_line**: Moves the cursor to the beginning of a line.
Ctrl+B	**move_the_cursor_one_character_to_the_left**: Moves the cursor one character to the left.
Ctrl+C	**stop_the_current_command**: Stops the current command.
Ctrl+D	**erase_the_character_at_the_cursor**: Deletes the character at the cursor.
Ctrl+E	**move_the_cursor_to_the_end_of_the_line**: Moves the cursor to the end of a line.
Ctrl+F	**move_the_cursor_one_character_to_the_right**: Moves the cursor one character to the right.
Ctrl+G	**display current-configuration**: Displays the running configuration.
Ctrl+H	**erase_the_character_to_the_left_of_the_cursor**: Deletes the character to the left of the cursor.
Ctrl+L	**display ip routing-table**: Displays the IPv4 routing table information.

Ctrl+N	**display_the_next_command_in_the_history_buffer**: Displays the next command in the history buffer.
Ctrl+O	**`undo debugging all`**: Displays all debugging functions.
Ctrl+P	**display_the_previous_command_in_the_history_buffer**: Displays the previous command in the history buffer.
Ctrl+R	**redisplay_the_current_line**: Redisplays the current line.
Ctrl+T	N/A
Ctrl+U	N/A
Ctrl+W	**delete_the_word_to_the_left_of_the_cursor**: Deletes the word to the left of the cursor.
Ctrl+X	**delete_all_characters_from_the_beginning_of_the_line_to_the_cursor**: Deletes all characters to the left of the cursor.
Ctrl+Y	**delete_all_characters_from_the_cursor_to_the_end_of_the_line**: Deletes all characters from the cursor to the end of the line.
Ctrl+Z	**return_to_the_User_View**: Returns to user view.
Ctrl+]	**kill_incoming_connection_or_redirect_connection**: Terminates the current connection.
Esc+B	**move_the_cursor_back_one_word**: Moves the cursor back one word.
Esc+D	**delete_all_characters_from_the_cursor_to_the_end_of_the_word**: Deletes all characters from the cursor to the end of the word.
Esc+F	**move_the_cursor_forward_one_word**: Moves the cursor forward one word.

System view

Predefined user roles

network-admin

Parameters

`hotkey`: Specifies a hotkey. To display the supported hotkeys, enter **`hotkey ?`** or see Table 3.

`command`: Specifies the command to be assigned to the hotkey.

`function` *`function`*: Specifies the function to be assigned to the hotkey. To display the supported functions, enter **`hotkey`** *`hotkey`* **`function ?`** or see Table 3.

none: Removes the command or function assignment for the hotkey. After you remove the assignment for a hotkey, pressing the hotkey does not execute any command or function.

Usage guidelines

The device supports a set of hotkeys. Pressing a hotkey executes the command or function assigned to the hotkey. You can configure all the hotkeys except **Ctrl+]**.

A hotkey can correspond to only one command or function. If you assign multiple commands or functions to the same hotkey, the most recently assigned command or function takes effect.

A command or function can be assigned to multiple hotkeys. You can use any of those hotkeys to execute the command or function.

If a hotkey is also defined by the terminal software you are using to interact with the device, the terminal software definition takes effect.

Examples

Assign the **display tcp statistics** command to hotkey **Ctrl+T**.

```
<Sysname> system-view
[Sysname] hotkey ctrl_t display tcp statistics
```

Assign move_the_cursor_to_the_beginning_of_the_line function to hotkey **Ctrl+U**.

```
<Sysname> system-view
[Sysname] hotkey ctrl_u function move_the_cursor_to_the_beginning_of_the_line
```

Disable the configurable command or function assigned to hotkey **Ctrl+A**.

```
<Sysname> system-view
[Sysname] hotkey ctrl_a none
```

Related commands

display hotkey

quit

Use **quit** to return to the upper-level view.

Syntax

quit

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Executing this command in user view disconnects you from the device.

Examples

Return from GigabitEthernet 1/0/1 interface view to system view and then to user view.

```
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] quit
<Sysname>
```

repeat

Use **repeat** to repeat commands in the command history buffer for the current CLI session.

Syntax

repeat [*number*] [**count** *times*] [**delay** *seconds*]

Views

Any view

Predefined user roles

network-admin

Parameters

number: Specifies the number of the most recently executed commands in the command history buffer for the current CLI session that you want to execute. The value range is 1 to 10. The default is 1.

count *times*: Specifies the number of times that you want to execute the commands. The value range is 0 to 4294967295. The default is 0. If you do not specify this option, the system keeps executing the commands until you press the escape key to terminate the execution.

delay *seconds*: Specifies the time (in seconds) for the system to wait before executing the commands again. The value range is 0 to 4294967295. The default is 1.

Usage guidelines

To repeat a command, first enter the view for the command. To repeat multiple commands, first enter the view for the first command.

The **repeat** command executes commands in the order they were executed.

The system waits for your interaction when it repeats an interactive command.

Examples

Configure the system to execute the two most recently executed commands (**display cpu-usage** and **display clock**) three times at an interval of 10 seconds.

```
<Sysname> repeat 2 count 3 delay 10
<Sysname> display cpu
Slot 1 CPU 0 CPU usage:
      33% in last 5 seconds
      32% in last 1 minute
      33% in last 5 minutes
<Sysname> display clock
07:02:18.230 UTC Thu 06/19/2017
<Sysname> display cpu-usage
Slot 1 CPU 0 CPU usage:
      33% in last 5 seconds
      32% in last 1 minute
      33% in last 5 minutes
<Sysname> display clock
07:02:28.263 UTC Thu 06/19/2017
<Sysname> display cpu-usage
Slot 1 CPU 0 CPU usage:
      33% in last 5 seconds
      32% in last 1 minute
      33% in last 5 minutes
<Sysname> display clock
07:02:38.293 UTC Thu 06/19/2017
```

return

Use **return** to return to user view from any other view (except the Tcl configuration view and Python shell).

Syntax

return

Views

Any view except user view, Tcl configuration view, and Python shell

Predefined user roles

network-admin

network-operator

Usage guidelines

Pressing **Ctrl+Z** has the same effect as the **return** command, which can place you in to user view from any other view except the Tcl configuration view and Python shell.

To return to user view from Tcl configuration view, execute the **tclquit** command in Tcl configuration view.

To return to user view from the Python shell, execute the **exit()** command in the Python shell.

Examples

Return to user view from GigabitEthernet 1/0/1 interface view.

```
[Sysname-GigabitEthernet1/0/1] return
<Sysname>
```

screen-length disable

Use **screen-length disable** to disable pausing between screens of output for the current CLI session.

Use **undo screen-length disable** to enable pausing between screens of output for the current CLI session.

Syntax

screen-length disable

undo screen-length disable

Default

The default depends on the configuration of the **screen-length** command in user line view.

The following are the default settings for the **screen-length** command:

- Pausing between screens of output.
- Displaying up to 24 lines on a screen.

Views

User view

Predefined user roles

network-admin

Usage guidelines

If you disable pausing between screens of output, all output is displayed. The screen is refreshed continuously until the final screen is displayed.

This command takes effect only for the current CLI session. When you are logged out, the default is restored.

Examples

Disable pausing between screens of output for the current CLI session.

```
<Sysname> screen-length disable
```

Related commands

screen-length

system-view

Use **system-view** to enter system view from user view.

Syntax

system-view

Views

User view

Predefined user roles

network-admin

network-operator

Examples

Enter system view from user view.

```
<Sysname> system-view
System View: return to User View with Ctrl+Z.
[Sysname]
```

Contents

RBAC commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

description

Use **description** to configure a description for a user role for easy identification.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

A user role does not have a description.

Views

User role view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 128 characters.

Examples

Configure the description as **labVIP** for user role **role1**.

```
<Sysname> system-view
[Sysname] role name role1
[Sysname-role-role1] description labVIP
```

Related commands

Table 1 Command output

Field	Description
Role	User role name. Predefined user role names: • network-admin. • network-operator. • level-*n* (where *n* represents an integer in the range of 0 to 15). • security-audit. • guest-manager. This user role is not supported in the current software version.
Description	User role description.
VLAN policy	VLAN policy of the user role: • **deny**—Denies access to any VLANs except for permitted VLANs. • **permit (default)**—Default VLAN policy, which enables the user role to access all VLANs.
Permitted VLANs	VLANs accessible to the user role.
Interface policy	Interface policy of the user role: • **deny**—Denies access to any interfaces except for permitted interfaces. • **permit (default)**—Default interface policy, which enables the user role to access all interfaces.

Field	Description
Permitted interfaces	Interfaces accessible to the user role.
VPN instance policy	This field is not supported in the current software version. VPN instance policy of the user role: • **deny**—Denies access to any VPN instances except for permitted VPN instances. • **permit (default)**—Default VPN instance policy, which enables the user role to access all VPN instances.
Permitted VPN instances	This field is not supported in the current software version. VPN instances accessible to the user role.
Rule	User role rule number. Predefined user role rules are identified by sys-*n*, where *n* represents an integer.
Perm	Access control type: • **permit**—User role has access to the items in the **Entity** field. • **deny**—User role does not have access to the items in the **Entity** field.
Type	Controlled type: • **R**—Read-only. • **W**—Write. • **X**—Execute.
Scope	Rule control scope: • **command**—Controls access to the command or commands, as specified in the **Entity** field. • **feature**—Controls access to the commands of the feature, as specified in the **Entity** field. • **feature-group**—Controls access to the commands of the features in the feature group, as specified in the **Entity** field. • **web-menu**—Controls access to Web menus. • **xml-element**—Controls access to XML elements. • **oid**—Controls access to MIB nodes.
Entity	Command string, feature name, feature group, Web menu, XML element, or OID specified in the user role rule: • An en dash (–) represents any feature. • An asterisk (*) represents zero or more characters.

Related commands

`role`

display role feature

Use **`display role feature`** to display features available in the system.

Syntax

`display role feature` [**`name`** *`feature-name`* | **`verbose`**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *feature-name*: Specifies a feature by feature name. The *feature-name* argument represents the feature name, and all letters must be in lower case.

verbose: Displays the commands of each feature.

Usage guidelines

If you do not specify any parameters, the command displays only the list of features available in the system.

Examples

Display the list of feature names.

```
<Sysname> display role feature
Feature: device          (Device configuration related commands)
Feature: interface       (Interface related commands)
Feature: syslog          (Syslog related commands)
...
```

Display the commands of each feature.

```
<Sysname> display role feature verbose
Feature: device          (Device configuration related commands)
  display clock    (R)
  debugging dev    (W)
  display debugging dev    (R)
  display device *    (R)
  display diagnostic-information *    (R)
  display environment *    (R)
  display fan *    (R)
  display power *    (R)
  display current-configuration *    (R)
  display saved-configuration *    (R)
  display default-configuration *    (R)
  display startup    (R)
  display this *    (R)
...
```

Display the commands of feature **aaa**.

```
<Sysname> display role feature name aaa
Feature: aaa             (AAA related commands)
  system-view ; domain *    (W)
  system-view ; header *    (W)
  system-view ; aaa *    (W)
  display domain *    (R)
  display aaa *    (R)
  system-view ; user-group *    (W)
  system-view ; local-user *    (W)
  display local-user *    (R)
  display user-group *    (R)
```

```
  display debugging local-server    (R)
  debugging local-server *    (W)
  super *    (X)
  display password-control *    (R)
  reset password-control *    (W)
  system-view ; password-control *    (W)
...
```

Table 2 Command output (display role feature name aaa)

Field	Description
Feature	Displays the name and brief function description of the feature.
system-view ; domain *	All commands that start with the **domain** keyword in system view, and all commands in ISP domain view.
system-view ; header *	All commands that start with the **header** keyword in system view.
system-view ; aaa *	All commands that start with the **aaa** keyword in system view.
display domain *	All commands that start with the **display domain** keywords in user view.
system-view ; user-group *	All commands that start with the **user-group** keyword in system view, and all commands in user group view.
system-view ; local-user *	All commands that start with the **local-user** keyword in system view, and all commands in local user view.
display user-group *	All commands that start with the **display user-group** keywords in user view.
display debugging local-server	All commands that start with the **display debugging local-server** keywords in user view.
debugging local-server *	All commands that start with the **debugging local-server** keywords in user view.
super *	All commands that start with the **super** keyword in user view.
display password-control *	All commands that start with the **display password-control** keywords in user view.
reset password-control *	All commands that start with the **reset password-control** keywords in user view.
system-view ; password-control *	All commands that start with the **password-control** keyword in system view.
(W)	Command type is Write. A write command configures the system.
(R)	Command type is Read. A read command displays configuration or maintenance information.
(X)	Command type is Execute. An execute command executes a specific function.

Related commands

feature

display role feature-group

Use **display role feature-group** to display feature group information.

Syntax

display role feature-group [**name** *feature-group-name*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *feature-group-name*: Specifies a feature group. The *feature-group-name* argument represents the feature group name, a case-sensitive string of 1 to 31 characters. If you do not specify a feature group, the command displays information about all feature groups.

verbose: Displays the commands of each feature in feature groups. If you do not specify this keyword, the command displays only the feature lists of feature groups.

Usage guidelines

Feature groups **L2** and **L3** are predefined feature groups.

Examples

Display the feature lists of feature groups.

```
<Sysname> display role feature-group
Feature group: L2
Feature: igmp-snooping   (IGMP-Snooping related commands)
Feature: mld-snooping    (MLD-Snooping related commands)
Feature: lacp            (LACP related commands)
Feature: stp             (STP related commands)
Feature: lldp            (LLDP related commands)
Feature: dldp            (DLDP related commands)
Feature: cfm             (CFM related commands)
Feature: eoam            (EOAM related commands)
Feature: smart-link      (Smart-link related commands)
Feature: monitor-link    (Monitor-link related commands)
Feature: loopbk-detect   (Loopback-detection related commands)
Feature: vlan            (Virtual LAN related commands)
Feature: mvrp            (MVRP related commands )
Feature: rrpp            (RRPP related commands)
Feature: erps            (ERPS related commands)
Feature: ofp             (OFP related commands)
Feature: port-security   (Port-security related commands)
Feature: l2pt            (L2PT related commands)
Feature: dot1xc          (Dot1x client related commands)

Feature group: L3
Feature: route           (Route management related commands)
Feature: staticrt        (Unicast static route related commands)
```

```
Feature: ospf           (Open Shortest Path First protocol related commands)
Feature: rip            (Routing Information Protocol related commands)
Feature: lisp           (LISP protocol related commands)
Feature: route-policy   (Routing Policy related commands)
Feature: multicast      (Multicast related commands)
```

Display the commands in each feature group. For more information about the wildcards and marks used in the command list, see Table 2.

```

Feature: multicast       (Multicast related commands)
```

Related commands

`feature`

`role feature-group`

feature

Use **`feature`** to add a feature to a feature group.

Use **`undo feature`** to remove a feature from a feature group.

Syntax

`feature` *`feature-name`*

`undo feature` *`feature-name`*

Default

A user-defined feature group does not have any features.

Views

Feature group view

Predefined user roles

network-admin

Parameters

`feature-name`: Specifies a feature name. You must enter the feature name in lower case.

Usage guidelines

Repeat the **`feature`** command to add multiple features to a feature group.

Examples

Add the AAA and ACL features to feature group **security-features**.

```
<Sysname> system-view
[Sysname] role feature-group name security-features
[Sysname-featuregrp-security-features] feature aaa
[Sysname-featuregrp-security-features] feature acl
```

Related commands

display role feature

display role feature-group

role feature-group

interface policy deny

Use **interface policy deny** to enter user role interface policy view.

Use **undo interface policy deny** to restore the default.

Syntax

interface policy deny

undo interface policy deny

Default

A user role has access to all interfaces.

Views

User role view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

This command denies the access of the user role to any interfaces if you do not specify accessible interfaces by using the **permit interface** command. To configure an interface, make sure the interface is permitted by the user role interface policy in use.

To restrict the interface access of a user role to a set of interfaces, perform the following tasks:

1. Use **interface policy deny** to enter user role interface policy view.
2. Use **permit interface** to specify accessible interfaces.

You can perform the following tasks on an accessible interface:

- Create, remove, or configure the interface.
- Enter interface view.
- Specify the interface in feature commands.

The create and remove operations are available only for logical interfaces.

Any change to a user role interface policy takes effect only on users who log in with the user role after the change.

Examples

Enter user role interface policy view of **role1**, and deny **role1** to access any interfaces.

```
<Sysname> system-view
[Sysname] role name role1
[Sysname-role-role1] interface policy deny
[Sysname-role-role1-ifpolicy] quit
```

Enter user role interface policy view of **role1**, and deny **role1** to access any interfaces except for GigabitEthernet 1/0/1 to GigabitEthernet 1/0/4.

```
<Sysname> system-view
[Sysname] role name role1
[Sysname-role-role1] interface policy deny
[Sysname-role-role1-ifpolicy] permit interface gigabitethernet 1/0/1 to gigabitethernet
1/0/4
```

Related commands

display role

permit interface

role

permit interface

Use **permit interface** to configure a list of interfaces accessible to a user role.

Use **undo permit interface** to disable the access of a user role to specific interfaces.

Syntax

permit interface *interface-list*

undo permit interface [*interface-list*]

Default

No permitted interfaces are configured in user role interface policy view.

Views

User role interface policy view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a space-separated list of up to 10 interface items. Each interface item specifies one interface in the *interface-type interface-number* form or a range of interfaces in the *interface-type interface-number* **to** *interface-type interface-number* form. If you specify an interface range, the end interface must meet the following requirements:

- Be the same type as the start interface.
- Have a higher interface number than the start interface.

Usage guidelines

To permit a user role to access an interface after you configure the **interface policy deny** command, you must add the interface to the permitted interface list of the policy. With the user role, you can perform the following tasks to the interfaces in the permitted interface list:

- Create, remove, or configure the interfaces.
- Enter the interface views.
- Specify the interfaces in feature commands.

The create and remove operations are available only for logical interfaces.

You can repeat the **permit interface** command to add multiple permitted interfaces to a user role interface policy.

The **undo permit interface** command removes the entire list of permitted interfaces if you do not specify an interface.

Any change to a user role interface policy takes effect only on users who log in with the user role after the change.

Examples

1. Configure user role **role1**:

Permit user role **role1** to execute all commands available in interface view and VLAN view.

```
<Sysname> system-view
[Sysname] role name role1
[Sysname-role-role1] rule 1 permit command system-view ; interface *
[Sysname-role-role1] rule 2 permit command system-view ; vlan *
```

Permit the user role to access GigabitEthernet 1/0/1, and GigabitEthernet 1/0/3 to GigabitEthernet 1/0/5.

```
[Sysname-role-role1] interface policy deny
[Sysname-role-role1-ifpolicy] permit interface gigabitethernet 1/0/1
gigabitethernet 1/0/3 to gigabitethernet 1/0/5
[Sysname-role-role1-ifpolicy] quit
[Sysname-role-role1] quit
```

2. Verify that you cannot use user role **role1** to work on any interfaces except for GigabitEthernet 1/0/1 and GigabitEthernet 1/0/3 to GigabitEthernet 1/0/5:

Verify that you can enter GigabitEthernet 1/0/1 interface view.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] quit
```

Verify that you can assign GigabitEthernet 1/0/5 to VLAN 10. In this example, the user role can access all VLANs because the default VLAN policy of the user role is used.

```
[Sysname] vlan 10
[Sysname-vlan10] port gigabitethernet 1/0/5
[Sysname-vlan10] quit
```

Verify that you cannot enter interface view of GigabitEthernet 1/0/2.

```
[Sysname] interface gigabitethernet 1/0/2
Permission denied.
```

Related commands

display role

interface policy deny

role

permit vlan

Use **permit vlan** to configure a list of VLANs accessible to a user role.

Use **undo permit vlan** to remove the permission for a user role to access specific VLANs.

Syntax

permit vlan *vlan-id-list*

undo permit vlan [*vlan-id-list*]

Default

No permitted VLANs are configured in user role VLAN policy view.

Views

User role VLAN policy view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each VLAN item specifies a VLAN by VLAN ID or specifies a range of VLANs in the form of *vlan-id1* **to** *vlan-id2*. The value range for the VLAN IDs is 1 to 4094. If you specify a VLAN range, the value for the *vlan-id2* argument must be greater than the value for the *vlan-id1* argument.

Usage guidelines

To permit a user role to access a VLAN after you configure the **vlan policy deny** command, you must add the VLAN to the permitted VLAN list of the policy. With the user role, you can perform the following tasks on the VLANs in the permitted VLAN list:

- Create, remove, or configure the VLANs.
- Enter the VLAN views.
- Specify the VLANs in feature commands.

You can repeat the **permit vlan** command to add multiple permitted VLANs to a user role VLAN policy.

The **undo permit vlan** command removes the entire list of permitted VLANs if you do not specify a VLAN.

Any change to a user role VLAN policy takes effect only on users who log in with the user role after the change.

By default, all access ports belong to VLAN 1. To assign an access port to any other VLAN by using the **port access vlan** command, make sure you have a user role that can access both VLAN 1 and the new VLAN.

Examples

1. Configure user role **role1**:

Permit user role **role1** to execute all commands available in interface view and VLAN view.

```
<Sysname> system-view
[Sysname] role name role1
[Sysname-role-role1] rule 1 permit command system-view ; interface *
[Sysname-role-role1] rule 2 permit command system-view ; vlan *
```

Permit user role **role1** to access VLANs 1, 2, 4, and 50 to 100.

```
[Sysname-role-role1] vlan policy deny
[Sysname-role-role1-vlanpolicy] permit vlan 1 2 4 50 to 100
[Sysname-role-role1-vlanpolicy] quit
[Sysname-role-role1] quit
```

2. Verify that you cannot use user role **role1** to work on any VLANs except for VLANs 1, 2, 4, and 50 to 100:

Verify that you can create VLAN 100 and enter VLAN view.

```
[Sysname] vlan 100
[Sysname-vlan100] quit
```

Verify that you can add GigabitEthernet 1/0/1 to VLAN 100 as an access port.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port access vlan 100
[Sysname-GigabitEthernet1/0/1] quit
```

Verify that you cannot create VLAN 101 or enter VLAN view.

```
[Sysname] vlan 101
```

```
Permission denied.
```

Related commands

display role

role

vlan policy deny

role

Use **role** to create a user role and enter its view, or enter the view of an existing user role.

Use **undo role** to delete a user role.

Syntax

role name *role-name*

undo role name *role-name*

Default

The system has the following predefined user roles: network-admin, network-operator, level-*n* (where *n* represents an integer in the range of 0 to 15), and security-audit.

Views

System view

Predefined user roles

network-admin

Parameters

name *role-name*: Specifies a username. The *role-name* argument is a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can create a maximum of 64 user roles in addition to the predefined user roles.

You cannot delete the predefined user roles or change the permissions assigned to network-admin, network-operator, level-15, or security-audit.

You cannot assign the security-audit user role to non-AAA authentication users.

The access permissions of the level-0 to level-14 user roles can be modified through user role rules and resource access policies. However, you cannot make changes on the predefined access permissions of these user roles. For example, you cannot change the access permission of these user roles to the **display history-command all** command.

Examples

Create user role **role1** and enter its view.

```
<Sysname> system-view
[Sysname] role name role1
[Sysname-role-role1]
```

Related commands

display role

interface policy deny

rule

vlan policy deny

role default-role enable

Use **role default-role enable** to enable the default user role feature for remote AAA users.

Use **undo role default-role enable** to restore the default.

Syntax

role default-role enable [*role-name*]

undo role default-role enable

Default

The default user role feature is disabled. AAA users who do not have a user role cannot log in to the device.

Views

System view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role by its name for the default user role. The user role must already exist. The argument is a case-sensitive string of 1 to 63 characters.

Usage guidelines

The default user role feature assigns the default user role to AAA-authenticated users if the authentication server (local or remote) does not assign any user roles to the users. These users are allowed to access the system with the default user role.

For local authorization, this command is required if you do not use the **authorization-attribute user role** command to assign user roles to local users.

If AAA users have been assigned user roles, they log in with the user roles.

If you do not specify the *role-name* argument, the default user role is network-operator.

Examples

Enable the default user role feature.

```
<Sysname> system-view
[Sysname] role default-role enable
```

Related commands

role

role feature-group

Use **role feature-group** to create a user role feature group and enter its view, or enter the view of an existing user role feature group.

Use **undo role feature-group** to delete a user role feature group.

Syntax

role feature-group name *feature-group-name*

undo role feature-group name *feature-group-name*

Default

Two user role feature groups **L2** and **L3** exist.

Views

System view

Predefined user roles

network-admin

Parameters

name *feature-group-name*: Specifies a feature group name. The *feature-group-name* argument is a case-sensitive string of 1 to 31 characters.

Usage guidelines

The **L2** feature group includes all Layer 2 feature commands, and the **L3** feature group includes all Layer 3 feature commands. These predefined feature groups are not user configurable.

In addition to the predefined feature groups **L2** and **L3**, you can create a maximum of 64 user role feature groups.

Examples

Create feature group **security-features** and enter its view.

```
<Sysname> system-view
[Sysname] role feature-group name security-features
[Sysname-featuregrp-security-features]
```

Related commands

display role feature

display role feature-group

feature

rule

Use **rule** to create or change a user role rule.

Use **undo rule** to delete user role rules.

Syntax

rule *number* { **deny** | **permit** } { **command** *command-string* | { **execute** | **read** | **write** } * { **feature** [*feature-name*] | **feature-group** *feature-group-name* | **oid** *oid-string* | **web-menu** [*web-string*] | **xml-element** [*xml-string*] } }

undo rule { *number* | **all** }

Default

A user-defined user role does not have any rules and cannot access any resources.

Views

User role view

Predefined user roles

network-admin

Parameters

number: Specifies a rule number in the range of 1 to 256.

deny: Denies access to the specified commands, Web menus, XML elements, or MIB nodes.

permit: Permits access to the specified commands, Web menus, XML elements, or MIB nodes.

command *command-string*: Specifies a command string. The command string can represent a command or a group of commands. The *command-string* argument is a case-sensitive string of 1 to 128 characters, including the following characters:

- The wildcard asterisk (*).
- The delimiters space and tab.
- All printable characters.

execute: Specifies the execute commands, Web menus, XML elements, or MIB nodes to execute a specific function or program. The **ping** command is an example of execute commands.

read: Specifies the read commands, Web menus, XML elements, or MIB nodes to display configuration or maintenance information. The **display**, **dir**, **more**, and **pwd** commands are examples of read commands.

write: Specifies the write commands, Web menus, XML elements, or MIB nodes to configure the system. The **ssh server enable** command is an example of write commands.

feature [*feature-name*]: Specifies one or all features. The *feature-name* argument is a case-sensitive character string. If you do not specify a feature name, you specify all the features in the system.

feature-group *feature-group-name*: Specifies a user-defined or predefined feature group. The *feature-group-name* argument represents the feature group name, a case-sensitive string of 1 to 31 characters. If the feature group has not been created, the rule takes effect after the group is created. To display the feature groups that have been created, use the **display role feature-group** command.

oid *oid-string*: Specifies an OID of a MIB node. The *oid-string* argument represents the OID, a case-insensitive string of 1 to 255 characters. The OID is a dotted numeric string that uniquely identifies the path from the root node to this node. For example, 1.3.6.1.4.1.25506.8.35.14.19.1.1.

web-menu [*web-string*]: Specifies a Web menu. The *web-string* argument represents the ID path of the Web menu, a case-insensitive string of 1 to 255 characters. Use the forward slash (/) to separate ID items, for example, M_DEVICE/I_BASIC_INFO/I_reboot. If you do not specify a Web menu, the rule applies to all Web items. To verify the ID path of a Web menu, use the **display web menu** command.

xml-element [*xml-string*]: Specifies an XML element. The *xml-string* argument represents the XPath of the XML element, a case-insensitive string of 1 to 255 characters. Use the forward slash (/) to separate Xpath items, for example, Interfaces/Index/Name. If you do not specify an XML element, the rule applies to all XML elements.

all: Specifies all the user role rules.

Usage guidelines

You can define the following types of rules for different access control granularities:

- **Command rule**—Controls access to a command or a set of commands that match a regular expression.
- **Feature rule**—Controls access to the commands of a feature by command type.
- **Feature group rule**—Controls access to the commands of a group of features by command type.
- **Web menu rule**—Controls access to Web menus by menu type.
- **XML element rule**—Controls access to XML elements by element type.
- **OID rule**—Controls access to the specified MIB node and its child nodes by node type.

A user role can access the set of permitted resources specified in the user role rules. User role rules include predefined (identified by sys-n) and user-defined user role rules.

You can configure a maximum of 256 user-defined rules for a user role. The total number of user-defined user role rules cannot exceed 1024.

Any rule modification, addition, or removal for a user role takes effect only on the users who log in with the user role after the change.

Access to the file system commands is controlled by both the file system command rules and the file system feature rule.

A command with output redirection to the file system is permitted only when the command type write is assigned to the file system feature.

The following guidelines apply to non-OID rules:

- If two user-defined rules of the same type conflict, the rule with the higher ID takes effect. For example, a user role can use the **`tracert`** command but not the **`ping`** command if the user role contains rules configured by using the following commands:
  - **`rule`** *`1`* **`permit command`** *`ping`*
  - **`rule`** *`2`* **`permit command`** *`tracert`*
  - **`rule`** *`3`* **`deny command`** *`ping`*
- If a predefined user role rule and a user-defined user role rule conflict, the user-defined user role rule takes effect.

The following guidelines apply to OID rules:

- The system compares an OID with the OIDs specified in rules, and it uses the longest match principle to select a rule for the OID. For example, a user role cannot access the MIB node with OID 1.3.6.1.4.1.25506.141.3.0.1 if the user role contains rules configured by using the following commands:
  - **`rule`** *`1`* **`permit read write oid`** *`1.3.6`*
  - **`rule`** *`2`* **`deny read write oid`** *`1.3.6.1.4.1`*
  - **`rule`** *`3`* **`permit read write oid`** *`1.3.6.1.4`*
- If the same OID is specified in multiple rules, the rule with the higher ID takes effect. For example, a user role can access the MIB node with OID 1.3.6.1.4.1.25506.141.3.0.1 if the user role contains rules configured by using the following commands:
  - **`rule`** *`1`* **`permit read write oid`** *`1.3.6`*
  - **`rule`** *`2`* **`deny read write oid`** *`1.3.6.1.4.1`*
  - **`rule`** *`3`* **`permit read write oid`** *`1.3.6.1.4.1`*

When you specify a command string, follow the guidelines in Table 3.

Table 3 Command string configuration rules

Rule	Guidelines
Semicolon (;) is the delimiter.	Use a semicolon to separate the command of each view that you must enter before you access a command or a set of commands. However, do not use a semicolon to separate commands available in user view or any view, for example, **display** and **dir**. Each semicolon-separated segment must have a minimum of one printable character. To specify the commands in a view but not the commands in the view's subviews, use a semicolon as the last printable character in the last segment. To specify the commands in a view and the view's subviews, the last printable character in the last segment must not be a semicolon. For example, you must enter system view before you enter interface view. To specify all commands starting with the **ip** keyword in any interface view, you must use the "system ; interface * ; ip * ;" command string. For another example, the "system ; radius scheme * ;" command string represents all commands that start with the **radius scheme** keywords in system view. The "system ; radius scheme *" command string represents all commands that start with the **radius scheme** keywords in system view and all commands in RADIUS scheme view.
Asterisk (*) is the wildcard.	An asterisk represents zero or multiple characters. In a non-last segment, you can use an asterisk only at the end of the segment. In the last segment, you can use an asterisk in any position of the segment. If the asterisk appears at the beginning, you cannot specify a printable character behind the asterisk. For example, the "system ; *" command string represents all commands available in system view and all subviews of the system view. The "debugging * event" command string represents all event debugging commands available in user view.
Keyword abbreviation is allowed.	You can specify a keyword by entering the first few characters of the keyword. Any command that starts with this character string matches the rule. For example, "rule 1 deny command dis arp source *" denies access to the commands **display arp source-mac interface** and **display arp source-suppression**.
To control the access to a command, you must specify the command immediately after the view that has the command.	To control access to a command, you must specify the command immediately behind the view to which the command is assigned. The rules that control command access for any subview do not apply to the command. For example, the "rule 1 deny command system ; interface * ; *" command string disables access to any command that is assigned to interface view. However, you can still execute the **acl advanced** command in interface view, because this command is assigned to system view rather than interface view. To disable access to this command, use "rule 1 deny command system ; acl *;".
Do not include the vertical bar (|), greater-than sign (>), or double greater-than sign (>>) when you specify **display** commands in a user role command rule.	The system does not treat the redirect signs and the parameters that follow the signs as part of command lines. However, in user role command rules, these redirect signs and parameters are handled as part of command lines. As a result, no rule that includes any of these signs can find a match. For example, "rule 1 permit command display debugging > log" can never find a match. This is because the system has a **display debugging** command but not a **display debugging > log** command.

Examples

Permit user role **role1** to execute the **display acl** command.

```
<Sysname> system-view
[Sysname] role name role1
[Sysname-role-role1] rule 1 permit command display acl
```

Permit user role **role1** to execute all commands that start with the **display** keyword.

```
[Sysname-role-role1] rule 2 permit command display *
```

Permit user role **role1** to execute the **radius scheme aaa** command in system view and use all commands assigned to RADIUS scheme view.

```
[Sysname-role-role1] rule 3 permit command system ; radius scheme aaa
```

Deny the access of **role1** to the read or write commands of any features.

```
[Sysname-role-role1] rule 4 deny read write feature
```

Deny the access of **role1** to the read commands of the **aaa** feature.

```
[Sysname-role-role1] rule 5 deny read feature aaa
```

Permit **role1** to access all read, write, and execute commands of feature group **security-features**.

```
[Sysname-role-role1] rule 6 permit read write execute feature-group security-features
```

Permit **role1** to access all read and write MIB nodes starting from the node with OID 1.1.2.

```
[Sysname-role-role1] rule 7 permit read write oid 1.1.2
```

Related commands

display role feature-group

display web menu

role

super

Use **super** to obtain another user role without reconnecting to the device.

Syntax

super [*role-name*]

Views

User view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role, a case-sensitive string of 1 to 63 characters. The user role must exist in the system and cannot be security-audit. If you do not specify a user role, you obtain the default target user role which is set by using the **super default role** command.

Usage guidelines

The obtained user role is a temporary user role, because this command is effective only on the current login. The next time you are logged in with the user account, the original user role settings take effect.

To enable a user to obtain another user role without reconnecting to the device, you must configure user role authentication.

- If no local password is configured in the local password authentication (**local**), an AUX user can obtain the user role by either entering a string or not entering anything.
- If no local password is configured in the local-then-remote authentication (**local scheme**), the following rules apply:
  - A VTY user performs remote authentication.
  - An AUX user can obtain user role authorization by either entering a string or not entering anything.

Examples

Obtain the user role network-operator.

```
<Sysname> super network-operator
Password:
User privilege role is network-operator, and only those commands that authorized to the role can be used.
```

Related commands

authentication super (*Security Command Reference*)

super authentication-mode

super password

super authentication-mode

Use **super authentication-mode** to set an authentication mode for temporary user role authorization.

Use **undo super authentication-mode** to restore the default.

Syntax

super authentication-mode { **local** | **scheme** } *

undo super authentication-mode

Default

Local password authentication applies.

Views

System view

Predefined user roles

network-admin

Parameters

local: Enables local password authentication.

scheme: Enables remote AAA authentication.

Usage guidelines

For local password authentication, use the **super password** command to set a password.

For remote AAA authentication, set the username and password on the RADIUS or HWTACACS server.

If you specify both **local** and **scheme** keywords, the keyword first entered in the command takes precedence.

- **scheme local**—Enables remote-then-local authentication mode. The device first performs AAA authentication to obtain a temporary user role. Local password authentication is performed if the remote HWTACACS or RADIUS server does not respond, or if the AAA configuration on the device is invalid.
- **local scheme**—Enables local-then-remote authentication mode. The device first performs local password authentication. If no password is configured for the user role, the device performs remote authentication for VTY users. An AUX user can obtain another user role by either entering a string or not entering anything.

For more information about AAA, see *Security Configuration Guide*.

Examples

Enable local-only authentication for temporary user role authorization.

```
<Sysname> system-view
[Sysname] super authentication-mode local
```

Enable remote-then-local authentication for temporary user role authorization.

```
<Sysname> system-view
[Sysname] super authentication-mode scheme local
```

Related commands

authentication super (*Security Command Reference*)

super password

super default role

Use **super default role** to specify the default target user role for temporary user role authorization.

Use **undo super default role** to restore the default.

Syntax

super default role *role-name*

undo super default role

Default

The default target user role is network-admin.

Views

System view

Predefined user roles

network-admin

Parameters

role-name: Specifies the name of the default target user role, a case-sensitive string of 1 to 63 characters. The user role must exist in the system and cannot be security-audit.

Usage guidelines

The default target user role is applied to the **super** or **super password** command when you do not specify a user role for the command.

Examples

Specify **network-operator** as the default target user role for temporary user role authorization.

```
<Sysname> system-view
```

```
[Sysname] super default role network-operator
```

Related commands

super

super password

super password

Use **super password** to set a password for a user role.

Use **undo super password** to delete the password for a user role.

Syntax

In non-FIPS mode:

super password [**role** *role-name*] [{ **hash** | **simple** } *string*]

undo super password [**role** *role-name*]

In FIPS mode:

super password [**role** *role-name*]

undo super password [**role** *role-name*]

Default

No password is set for a user role.

Views

System view

Predefined user roles

network-admin

Parameters

role *role-name*: Specifies a user role, a case-sensitive string of 1 to 63 characters. The user role must exist in the system and cannot be security-audit. If you do not specify a user role, the command sets a password for the default target user role which is set by using the **super default role** command.

hash: Specifies a password in hashed form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in hashed form.

string: Specifies the password. In non-FIPS mode, the plaintext form of the password is a case-sensitive string of 1 to 63 characters. The hashed form of the password is a case-sensitive string of 1 to 110 characters. In FIPS mode, the password must be a case-sensitive plaintext string of 15 to 63 characters. The string must contain four character types including digits, uppercase letters, lowercase letters, and special characters.

Usage guidelines

If you do not specify any parameters, you specify a plaintext password in the interactive mode.

The FIPS mode supports only the interactive mode for setting a password.

Set a password if you configure local password authentication for temporary user role authorization.

It is a good practice to specify different passwords for different user roles.

When the global password control feature is enabled, all history super passwords are stored in hashed form.

- If you set a new super password in plaintext form, make sure the new super password is different from the current one and those stored in the history super password records.
- If you set a new super password in hashed form, the system does not compare the new super password with the current one or those stored in the history super password records.

Examples

Set the password to **123456TESTplat&!** in plaintext form for user role network-operator.

```
<Sysname> system-view
[Sysname] super password role network-operator simple 123456TESTplat&!
```

Set the password to **123456TESTplat&!** in the interactive mode for user role network-operator.

```
<Sysname> system-view
[Sysname] super password role network-operator
Password:
Confirm :
Updating user information. Please wait... ...
```

Related commands

super authentication-mode

super default role

super use-login-username

Use **super use-login-username** to enable the device to automatically obtain the login username when a login user requests temporary user role authorization from a remote authentication server.

Use **undo super use-login-username** to restore the default.

Syntax

super use-login-username

undo super use-login-username

Default

The device prompts for a username when a login user requests temporary user role authorization from a remote authentication server.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command is applicable only to the login from a user line that uses scheme authentication, which requires a username for login.

If the user was logged in from a user line that uses password authentication or no authentication, the device cannot obtain the login username. The request for temporary user role authorization from a remote authentication server will fail.

This command does not take effect on local password authentication for temporary user role authorization.

Examples

Enable the device to automatically obtain the login username when a login user requests temporary user role authorization from a remote authentication server.

```
<Sysname> system-view
[Sysname] super use-login-username
```

Related commands

authentication super (*Security Command Reference*)

super authentication-mode

super password

vlan policy deny

Use **vlan policy deny** to enter user role VLAN policy view.

Use **undo vlan policy deny** to restore the default.

Syntax

vlan policy deny

undo vlan policy deny

Default

A user role has access to all VLANs.

Views

User role view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

The **vlan policy deny** command denies the access of the user role to any VLANs if you do not specify accessible VLANs by using the **permit vlan** command. To configure a VLAN, make sure the VLAN is permitted by the user role VLAN policy in use.

To restrict the VLAN access of a user role to a set of VLANs, perform the following tasks:

1. Use **vlan policy deny** to enter user role VLAN policy view.
2. Use **permit vlan** to specify accessible VLANs.

You can perform the following tasks on an accessible VLAN:

- Create, remove, or configure the VLAN.
- Enter VLAN view.
- Specify the VLAN in feature commands.

Any change to a user role VLAN policy takes effect only on users who log in with the user role after the change.

Examples

Enter user role VLAN policy view of **role1**, and deny the access of **role1** to any VLANs.

```
<Sysname> system-view
[Sysname] role name role1
```

```
[Sysname-role-role1] vlan policy deny
[Sysname-role-role1-vlanpolicy] quit
```

Enter user role VLAN policy view of **role1**, and deny the access of **role1** to any VLANs except for VLANs 50 to 100.

```
<Sysname> system-view
[Sysname] role name role1
[Sysname-role-role1] vlan policy deny
[Sysname-role-role1-vlanpolicy] permit vlan 50 to 100
```

Login management commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

Some login management commands are available in both user line view and user line class view. For these commands, the device uses the following rules to determine the settings to be activated:

- A setting in user line view applies only to the user line. A setting in user line class view applies to all user lines of the class.
- A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.
- A setting in user line class view takes effect for login sessions that are established after the setting is configured.

activation-key

Use **activation-key** to set the terminal session activation key. Pressing this shortcut key starts a terminal session.

Use **undo activation-key** to restore the default.

Syntax

activation-key *key-string*

undo activation-key

Default

The terminal session activation key is **Enter**.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

key-string: Specifies a shortcut key. It can be a character (case sensitive), or an ASCII code value in the range of 0 to 127. For example, if you configure **activation-key 1**, the shortcut key is **Ctrl+A**. If you configure **activation-key a**, the shortcut key is **a**. For information about ASCII code values of individual characters, see the standard ASCII code chart. For information about ASCII code values of combined keys that use the **Ctrl** key, see Table 1.

Usage guidelines

This command is not supported in VTY line view or VTY line class view.

This command takes effect immediately.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

You can use only the specified terminal session activation key to start a terminal session. To display the current terminal session activation key, use the **`display current-configuration | include activation-key`** command.

Table 1 ASCII code values for combined keys that use the Ctrl key

Combined key	ASCII code value
Ctrl+A	1
Ctrl+B	2
Ctrl+C	3
Ctrl+D	4
Ctrl+E	5
Ctrl+F	6
Ctrl+G	7
Ctrl+H	8
Ctrl+I	9
Ctrl+J	10
Ctrl+K	11
Ctrl+L	12
Ctrl+M	13
Ctrl+N	14
Ctrl+O	15
Ctrl+P	16
Ctrl+Q	17
Ctrl+R	18
Ctrl+S	19
Ctrl+T	20
Ctrl+U	21
Ctrl+V	22
Ctrl+W	23
Ctrl+X	24
Ctrl+Y	25
Ctrl+Z	26
CTRL+ [	27
CTRL+\	28
CTRL+]	29
CTRL+^	30
CTRL+_	31

Examples

Configure character **s** as the terminal session activation key for AUX line 0.

```
<Sysname> system-view
[Sysname] line aux 0
[Sysname-line-aux0] activation-key s
```

To verify the configuration:

1. Exit the AUX session.

   ```
   [Sysname-line-aux0] return
   <Sysname> quit
   ```

2. Log in again through the AUX line.

   The following message appears:

   ```
   Press ENTER to get started.
   ```

3. Press **Enter**.

   Pressing **Enter** does not start a session.

4. Press **s**.

   A terminal session is started.

   ```
   <Sysname>
   ```

authentication-mode

Use **authentication-mode** to set the authentication mode for a user line.

Use **undo authentication-mode** to restore the default.

Syntax

In non-FIPS mode:

authentication-mode { **none** | **password** | **scheme** }

undo authentication-mode

In FIPS mode:

authentication-mode scheme

undo authentication-mode

Default

In non-FIPS mode:

- The authentication mode is **password** for a VTY line.
- The authentication mode for console login depends on the device model.
  - On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the default setting varies by startup configuration.
    - If the device starts up with factory defaults, the authentication mode is **scheme**.
    - If the device starts up with the initial configuration, the authentication mode is **none**.
  - On the other switch series, the authentication mode is **none**.

In FIPS mode:

The authentication mode is **scheme**.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

none: Disables authentication.

password: Performs local password authentication.

scheme: Performs AAA authentication. For more information about AAA, see *Security Configuration Guide*.

Usage guidelines

CAUTION:

- When authentication is disabled, users can login without authentication. For security purpose, disable authentication with caution.
- When you enable password authentication, you must also configure an authentication password for the line or line class. If no authentication password is configured, you cannot log in to the device through the line or line class at the next time.
- When you enable scheme authentication, make sure an authentication user account is available. If no authentication user account is available, you cannot log in to the device through the line or line class at the next time.

Only users assigned the network-admin, or level-15 user role can execute this command. Other users cannot execute this command, even if they are granted the right to execute this command.

In VTY line view, this command is associated with the **protocol inbound** command.

- If the settings of the two commands in VTY line view are both the default settings, the settings for the commands in VTY line class view take effect.
- If the settings of the two commands in VTY line view are both non-default settings, the non-default settings in VTY line view take effect.
- If only one command has a non-default setting in VTY line view, the other command uses the default setting, regardless of the setting in VTY line class view.

An authentication mode change does not take effect for the current session. It takes effect for subsequent login sessions.

Examples

Enable the **none** authentication mode for VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] authentication-mode none
```

Enable password authentication for VTY line 0 and set the password to **hello12345**.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] authentication-mode password
[Sysname-line-vty0] set authentication password simple hello12345
```

Enable scheme authentication for VTY line 0. Configure the local user **123** and set the password to **hello12345**. Assign the Telnet service and the user role network-admin to the user.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] authentication-mode scheme
```

```
[Sysname-line-vty0] quit
[Sysname] local-user 123
[Sysname-luser-manage-123] password simple hello12345
[Sysname-luser-manage-123] service-type telnet
[Sysname-luser-manage-123] authorization-attribute user-role network-admin
```

Related commands

set authentication password

auto-execute command

Use **auto-execute command** to specify the command to be automatically executed for a login user.

Use **undo auto-execute command** to restore the default.

Syntax

auto-execute command *command*

undo auto-execute command

Default

No command is specified to be automatically executed for a login user.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

command: Specifies the command to be automatically executed.

Usage guidelines

CAUTION:

After configuring this command for a user line, you might be unable to access the CLI through the user line. Make sure you can access the CLI through a different user line before you configure this command and save the configuration.

The device will automatically execute the specified command when a user logs in through the user line, and close the user connection after the command is executed.

This command is not supported in AUX line view or AUX line class view.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

A configuration change made by this command does not take effect for the current session. It takes effect for subsequent login sessions.

Examples

Configure the device to automatically execute the **telnet 192.168.1.41** command when a user logs in through VTY line 0.

```
<Sysname> system-view
```

```
[Sysname] line vty 0
[Sysname-line-vty0] auto-execute command telnet 192.168.1.41
This action will lead to configuration failure through line-vty0. Are you sure?
[Y/N]:y
[Sysname-line-vty0]
```

To verify the configuration, Telnet to the device (192.168.1.40).

The device automatically Telnets to 192.168.1.41. The following output is displayed on the configuration terminal:

```
C:\> telnet 192.168.1.40
******************************************************************************
* Copyright (c) 2004-2017 New H3C Technologies Co., Ltd. All rights reserved.*
* Without the owner's prior written consent,                                 *
* no decompiling or reverse-engineering shall be allowed.                    *
******************************************************************************

<Sysname>
Trying 192.168.1.41 ...
Press CTRL+K to abort
Connected to 192.168.1.41 ...
******************************************************************************
* Copyright (c) 2004-2017 New H3C Technologies Co., Ltd. All rights reserved.*
* Without the owner's prior written consent,                                 *
* no decompiling or reverse-engineering shall be allowed.                    *
******************************************************************************
<Sysname.41>
```

This operation is the same as directly logging in to the device at 192.168.1.41 through Telnet. When you close the Telnet connection to 192.168.1.41, the Telnet connection to 192.168.1.40 is closed at the same time.

command accounting

Use **command accounting** to enable command accounting.

Use **undo command accounting** to disable command accounting.

Syntax

command accounting

undo command accounting

Default

Command accounting is disabled. The accounting server does not record executed commands.

Views

User line view

User line class view

Predefined user roles

network-admin

Usage guidelines

When command accounting is enabled but command authorization is not, every executed command is recorded on the HWTACACS server. When both command accounting and command authorization are enabled, only authorized commands that are executed are recorded on the HWTACACS server.

Invalid commands are not recorded.

A configuration change made by this command does not take effect for the current session. It takes effect for subsequent login sessions.

After you configure the **command accounting** command in user line class view, you cannot configure the **undo command accounting** command in any user line views in the class.

Examples

Enable command accounting for VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] command accounting
```

Related commands

accounting command (*Security Command Reference*)

command authorization

command authorization

Use **command authorization** to enable command authorization.

Use **undo command authorization** to disable command authorization.

Syntax

command authorization

undo command authorization

Default

Command authorization is disabled. Logged-in users can execute commands without authorization.

Views

User line view

User line class view

Predefined user roles

network-admin

Usage guidelines

When command authorization is enabled, a user can only use commands that are permitted by both the AAA scheme and user role.

A configuration change made by this command does not take effect for the current session. It takes effect for subsequent login sessions.

If you configure the **command authorization** command in user line class view, command authorization is enabled for all user lines in the class. You cannot configure the **undo command authorization** command in the view of a user line in the class.

Examples

Enable command authorization for VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] command authorization
```

Related commands

authorization command (*Security Command Reference*)

databits

Use **databits** to specify the number of data bits for a character.

Use **undo databits** to restore the default.

Syntax

databits { **5** | **6** | **7** | **8** }

undo databits

Default

Eight data bits are used for a character.

Views

User line view

Predefined user roles

network-admin

Parameters

5: Uses five data bits for a character.

6: Uses six data bits for a character.

7: Uses seven data bits for a character.

8: Uses eight data bits for a character.

Usage guidelines

This command is not supported in VTY line class view.

This setting must be the same as the setting on the configuration terminal.

Examples

Configure AUX 0 to use seven data bits for a character.

```
<Sysname> system-view
[Sysname] line aux 0
[Sysname-line-aux0] databits 7
```

display line

Use **display line** to display user line information.

Syntax

display line [*number1* | { **aux** | **usb** | **vty** } *number2*] [**summary**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

number1: Specifies the absolute number of a user line. The value range is 0 to 83.

aux: Specifies the AUX line.

usb: Specifies the USB line.

vty: Specifies the VTY line.

number2: Specifies the relative number of a user line. The value range is 0 to 9 for AUX and USB lines and 0 to 63 for VTY lines.

summary: Displays summary information about user lines. If you do not specify this keyword, the command displays detailed information.

Examples

Display information about line 0.

```
<Sysname> display line 0
  Idx  Type     Tx/Rx      Modem Auth  Int        Location
F 0    AUX 0    9600       -     N     -           1/0
```

```
  +    : Line is active.
  F    : Line is active and in async mode.
  Idx  : Absolute index of line.
  Type : Type and relative index of line.
  Auth : Login authentication mode.
  Int  : Physical port of the line.
  A    : Authentication use AAA.
  N    : No authentication is required.
  P    : Password authentication.
```

Table 4 Command output

Field	Description
Modem	Whether the modem allows calling in or out. By default, this attribute is not configured and this field displays a hyphen (-). This field is not supported in the current software version.
Int	Physical port for the line. If there is no physical port for the line or the port is a console port, this field displays a hyphen (-).
Location	Physical position of the line, in the form of *slot number*/*CPU number*.

Display summary information about all user lines.

```
<Sysname> display line summary
  Line type : [AUX]
           0:XXXX XXXX XX
  Line type : [VTY]
          10:UXXX XXXX XXXX XXXX

Table 5 Command output

Fields	Description
Line type	Type of the user line: • **AUX**—AUX line. • **USB**—USB line. • **VTY**—VTY line.
number:*status*	*number*: Absolute number of the first user line in the user line class. *status*: User line status. **X** is for unused and **U** is for used.

display telnet client

Use **`display telnet client`** to display the packet source setting for the Telnet client.

Syntax

display telnet client

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command displays the source IPv4 address or source interface specified for the Telnet client to use in outgoing Telnet packets, depending on the **telnet client source** command.

Examples

Display the packet source setting for the Telnet client.

```
<Sysname> display telnet client
 The source IP address is 1.1.1.1.
```

Related commands

telnet client source

display user-interface

Use **display user-interface** to display user line information.

Syntax

display user-interface [*number1* | { **aux** | **usb** | **vty** } *number2*] [**summary**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

number1: Specifies the absolute number of a user line. The value range is 0 to 83.

aux: Specifies the AUX line.

usb: Specifies the USB line.

vty: Specifies the VTY line.

number2: Specifies the relative number of a user line. The value range is 0 to 9 for AUX and USB lines and 0 to 63 for VTY lines.

summary: Displays summary information about user lines. If you do not specify this keyword, the detailed information is displayed.

Usage guidelines

This command is an older version reserved for backward compatibility purposes. It has the same functionality and output as the **display line** command. As a best practice, use the **display line** command.

Examples

Display information about line 0.

```
<Sysname> display user-interface 0
  Idx  Type     Tx/Rx      Modem Auth  Int        Location
F 0    AUX 0    9600       -     N     -          1/0

  +    : Line is active.
  F    : Line is active and in async mode.
  Idx  : Absolute index of line.
  Type : Type and relative index of line.
  Auth : Login authentication mode.
  Int  : Physical port of the line.
  A    : Authentication use AAA.
  N    : No authentication is required.
  P    : Password authentication.
```

Table 6 Command output

Field	Description
Modem	Whether the modem allows calling in or out. By default, this attribute is not configured and this field displays a hyphen (-). This field is not supported in the current software version.
Int	Physical port for the line. If there is no physical port for the line or the port is a console port, this field displays a hyphen (-).
Location	Physical position of the line, in the form of *slot number*/*CPU number*.

Display summary information about all user lines.

```
<Sysname> display user-interface summary
  Line type : [AUX]
            0:XXXX XXXX XX
  Line type : [VTY]
           10:UXXX XXXX XXXX XXXX
           26:XXXX XXXX XXXX XXXX
           42:XXXX XXXX XXXX XXXX
           58:XXXX XXXX XXXX XXXX
  Line type : [USB]
           74:XXXX XXXX XX

   1 lines used.      (U)
  83 lines not used.  (X)
```

Table 7 Command output

Fields	Description
Line type	Type of the user line: • **AUX**—AUX line. • **USB**—USB line. • **VTY**—VTY line.

Fields	Description
number:*status*	*number*: Absolute number of the first user line in the user line class. *status*: User line status. **X** is for unused and **U** is for used.

display users

Use **display users** to display online CLI users.

Syntax

display users [**all**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Displays all user lines supported by the device.

Examples

Display online user information.

```
<Sysname> display users
  Idx  Line     Idle       Time              Pid     Type
+ 10   VTY 0    00:00:00   Jan 01 00:33:10   484     TEL
  12   VTY 2    00:06:22   Jan 01 00:33:22   495     TEL

Following are more details.
VTY 0   :
        User role list: network-admin network-operator
        Location: 192.168.1.107
VTY 2   :
        User role list: level-0 network-admin network-operator
        Location: 192.168.1.134
 +    : Current operation user.
 F    : Current operation user works in async mode.
```

Table 8 Command output

Field	Description
Idx	Absolute number of the user line.
Line	Type and relative number of the user line.
Idle	Time elapsed after the user's most recent input, in the *hh*:*mm*:*ss* format.
Time	Login time of the user.
Pid	Process ID of the user session.

Field	Description
Type	User type: • **TEL**—Telnet user. • **SSH**—SSH user. • For a user who logged in through the console or USB port, this field does not display anything.
+	User line you are using.
User name	Username used by the user. This field is displayed only if the user provided a username and password for authentication at login.
User role list	User roles assigned to the user.
Location	IP address of the user.

display web menu

Use **display web menu** to display Web interface navigation tree information.

Syntax

display web menu [**chinese**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

chinese: Displays information about the Chinese Web interface navigation tree. If you do not specify this keyword, the command displays information about the English Web interface navigation tree.

Usage guidelines

This command displays all options on the Web interface navigation tree.

Examples

Display Web interface navigation tree information.

```
<Sysname> display web menu
.
  |--Dashboard: ID = m_dashboard
  |--Device: ID = m_device
  |    |--Maintenance: ID = m_maintenance
  |    |    |--Settings: ID = m_devicesettings

display web users

Use **display web users** to display online Web users.

Syntax

display web users

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display online Web users.

```
<Sysname> display web users
UserID          Name            Type   Language JobCount LoginTime LastOperation
AB2039483271293 Administrator   HTTP   Chinese     3     12:00:23  14:10:05
F09382BA2014AC8 user            HTTPS  English     1     13:05:00  14:11:00
```

Table 9 Command output

Field	Description
UserID	ID used to uniquely identify the online Web user.
JobCount	Number of connections established by the user.

escape-key

Use **escape-key** to set the escape key.

Use **undo escape-key** to disable the escape key.

Syntax

escape-key { *key-string* | **default** }

undo escape-key

Default

The escape key is **Ctrl+C**.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

key-string: Specifies a shortcut key. It can be a character (case sensitive, except for **d** and **D**), or an ASCII code value in the range of 0 to 127. For example, if you configure **escape-key 1**, the shortcut key is **Ctrl+A**. If you configure **escape-key a**, the shortcut key is **a**. If you specify the character **d** or **D** for this argument, the actual shortcut key is **Ctrl+C**. To use **d** or **D** as the shortcut key, you must specify the ASCII code value of the character for this argument. For information about ASCII code values of individual characters, see the standard ASCII code chart. For information about ASCII code values of combined keys that use the **Ctrl** key, see Table 1.

default: Restores the default escape key **Ctrl+C**.

Usage guidelines

You can press the escape key to abort a command that is being executed, for example, a **ping** or **tracert** command. Whether a command can be aborted by **Ctrl+C** by default depends on the

software implementation of the command. For more information, see the usage guidelines for the command.

As a best practice, use a key sequence as the escape key. If you define a single character as the escape key, pressing the key while a command is being executed stops the command. If no command is being executed, pressing the key enters the character as a common character. If you Telnet from the device to a remote device, pressing the key enters the character as a common character on the remote device. The key acts as the escape key on the remote device only when the following conditions are met:

- You define the same character as the escape key on the remote device.
- You press the key while a command is being executed on the remote device.

The **undo escape-key** command disables the current escape key. After you execute this **undo** command, no escape key is available.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

The setting in user line view takes effect immediately for the current session. The setting in user line class view takes effect for login sessions that are established after the setting is configured.

To display the current escape key, use the **display current-configuration | include escape-key** command.

Examples

Configure character **a** as the escape key for VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] escape-key a
```

To verify the configuration:

1. Ping IP address 192.168.1.80, specifying the **-c** keyword to set the number of ICMP echo request packets to 20.

   ```
   <Sysname> ping -c 20 192.168.1.80
   Ping 192.168.1.80 (192.168.1.80): 56 data bytes, press 'a' to break
   56 bytes from 192.168.1.80: icmp_seq=0 ttl=255 time=2.363 ms
   56 bytes from 192.168.1.80: icmp_seq=1 ttl=255 time=2.384 ms
   ```

2. Press **a**.

   The system aborts the command and returns to user view.

   ```
   --- Ping statistics for 192.168.1.80 ---
   20 packet(s) transmitted, 20 packet(s) received, 0.0% packet loss
   round-trip min/avg/max/std-dev = 2.000/2.406/6.748/1.022 ms
   <Sysname>
   ```

flow-control

Use **flow-control** to configure the flow control mode.

Use **undo flow-control** to restore the default.

Syntax

flow-control { **hardware** | **none** | **software** }

undo flow-control

Default

Flow control is disabled.

Views

User line view

Predefined user roles

network-admin

Parameters

hardware: Performs hardware flow control.

none: Disables flow control.

software: Performs software flow control.

Usage guidelines

This command is not supported in VTY line view.

The device supports flow control in both the inbound and outbound directions.

- For flow control in the inbound direction, the local device listens to flow control information from the remote device.
- For flow control in the outbound direction, the local device sends flow control information to the remote device.

The flow control setting takes effect in both directions.

To communicate, two devices must operate in the same flow control mode.

Examples

Configure software flow control in the inbound and outbound directions for AUX line 0.

```
<Sysname> system-view
[Sysname] line aux 0
[Sysname-line-aux0] flow-control software
```

free line

Use **free line** to release a user line.

Syntax

free line { *number1* | { **aux** | **usb** | **vty** } *number2* }

Views

User view

Predefined user roles

network-admin

Parameters

number1: Specifies the absolute number of a user line. The value range is 0 to 83.

aux: Specifies the AUX line.

usb: Specifies the USB line.

vty: Specifies the VTY line.

number2: Specifies the relative number of a user line. The value range is 0 to 9 for AUX and USB lines and 0 to 63 for VTY lines.

Usage guidelines

This command does not release the line you are using.

Examples

Release VTY line 1.

```
<Sysname> free line vty 1
Are you sure to free line vty1? [Y/N]:y
 [OK]
```

free user-interface

Use **free user-interface** to release a user line.

Syntax

free user-interface { *number1* | { **aux** | **usb** | **vty** } *number2* }

Views

User view

Predefined user roles

network-admin

Parameters

number1: Specifies the absolute number of a user line. The value range is 0 to 83.

aux: Specifies the AUX line.

usb: Specifies the USB line.

vty: Specifies the VTY line.

number2: Specifies the relative number of a user line. The value range is 0 to 9 for AUX and USB lines and 0 to 63 for VTY lines.

Usage guidelines

This command does not release the line you are using.

This command is an older version reserved for backward compatibility purposes. It has the same functionality and output as the **free line** command. As a best practice, use the **free line** command.

Examples

Release VTY line 1.

```
<Sysname> free user-interface vty 1
Are you sure to free line vty1? [Y/N]:y
 [OK]
```

free web users

Use **free web users** to log off online Web users.

Syntax

free web users { **all** | **user-id** *user-id* | **user-name** *user-name* }

Views

User view

Predefined user roles

network-admin

Parameters

all: Specifies all Web users.

user-id: Specifies a Web user by the ID, a hexadecimal number of 15 digits. The system assigns each Web user a unique ID at login to identify the user.

user-name: Specifies a Web user by the username, a case-sensitive string of 1 to 255 characters.

Examples

Log off all online Web users.

```
<Sysname> free web users all
```

Related commands

display web users

history-command max-size

Use **history-command max-size** to set the size of the command history buffer for a user line.

Use **undo history-command max-size** to restore the default.

Syntax

history-command max-size *size-value*

undo history-command max-size

Default

The command history buffer for a user line stores up to 10 history commands.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

size-value: Specifies the maximum number of history commands the buffer can store, in the range of 0 to 256.

Usage guidelines

Each user line uses a separate command history buffer to store commands successfully executed by its user. The buffer size determines how many history commands the buffer can store.

To display history commands in the buffer for your session, press the up or down arrow key, or execute the **display history-command** command. For more information about the command history buffer, see *Fundamentals Configuration Guide*.

Terminating a CLI session clears the commands in the command history buffer.

The setting in user line view takes effect immediately for the current session. The setting in user line class view takes effect for login sessions that are established after the setting is configured.

Examples

Set the command history buffer size to 20 for VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] history-command max-size 20
```

idle-timeout

Use **idle-timeout** to set the CLI connection idle-timeout timer.

Use **undo idle-timeout** to restore the default.

Syntax

idle-timeout *minutes* [*seconds*]

undo idle-timeout

Default

The CLI connection idle-timeout timer is 10 minutes.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

minutes: Specifies the number of minutes, in the range of 0 to 35791.

seconds: Specifies the number of seconds, in the range of 0 to 59. The default is 0 seconds.

Usage guidelines

The system automatically terminates a user connection if no information interaction occurs on the connection within the idle-timeout interval.

To disable the idle-timeout feature, execute the **idle-timeout 0** command.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

The setting in user line view takes effect immediately for the current session. The setting in user line class view takes effect for login sessions that are established after the setting is configured.

Examples

Set the CLI connection idle-timeout timer to 1 minute and 30 seconds for VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] idle-timeout 1 30
```

ip http acl

Use **ip http acl** to apply an ACL to the HTTP service.

Use **undo ip http acl** to restore the default.

Syntax

ip http acl { *acl-number* | **name** *acl-name* }

undo ip http acl

Default

No ACL is applied to the HTTP service.

Views

System view

Predefined user roles

network-admin

Parameters

acl-number: Specifies an ACL by its number. The value range is 2000 to 2999.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter and to avoid confusion, it cannot be **all**. The specified ACL takes effect only when the ACL exists and is a basic ACL.

Usage guidelines

This command is not supported in FIPS mode.

If you execute this command multiple times, the most recent configuration takes effect.

Only clients permitted by the applied ACL can access the device through HTTP.

Examples

Use ACL 2001 to allow only users from 10.10.0.0/16 to access the device through HTTP.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 10.10.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] ip http acl 2001
```

Related commands

acl (*ACL and QoS Command Reference*)

ip http enable

Use **ip http enable** to enable the HTTP service.

Use **undo ip http enable** to disable the HTTP service.

Syntax

ip http enable

undo ip http enable

Default

On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, WS5810-WiNet, WS5820-WiNet, and WAS6000 switch series, the default setting varies by startup configuration.

- If the device starts up with factory defaults, the HTTP service is enabled.
- If the device starts up with the initial configuration, the HTTP service is disabled.

On the other switch series, the HTTP service is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command is not supported in FIPS mode.

To allow users to access the device through HTTP, you must enable the HTTP service.

To improve device security, the system automatically enables the HTTPS service when you enable the HTTP service. When the HTTP service is enabled, you cannot disable the HTTPS service.

Examples

Enable the HTTP service.

```
<Sysname> system-view
[Sysname] ip http enable
```

Related commands

ip https enable

ip http port

Use **ip http port** to specify the HTTP service port number.

Use **undo ip http port** to restore the default.

Syntax

ip http port *port-number*

undo ip http port

Default

The HTTP service port number is 80.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies a port number in the range of 1 to 65535.

Usage guidelines

This command is not supported in FIPS mode.

When the HTTP service is enabled, changing the HTTP service port number re-enables the HTTP service and closes all HTTP connections. To log in again, users must enter the new URL in the Web browser's address bar.

Examples

Set the HTTP service port number to 80.

```
<Sysname> system-view
[Sysname] ip http port 80
```

ip https acl

Use **ip https acl** to apply an ACL to the HTTPS service.

Use **undo ip https acl** to restore the default.

Syntax

ip https acl { *acl-number* | **name** *acl-name* }

undo ip https acl

Default

No ACL is applied to the HTTP service.

Views

System view

Predefined user roles

network-admin

Parameters

acl-number: Specifies an ACL by its number. The value range is 2000 to 2999.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter and to avoid confusion, it cannot be **all**. The specified ACL takes effect only when the ACL exists and is a basic ACL.

Usage guidelines

To access the device, HTTPS clients must be permitted by the ACL applied to the HTTPS service.

Because the device always uses HTTPS to transfer Web login requests, the ACL applied to the HTTPS service controls both HTTPS and HTTP logins. To access the device, HTTP clients must be permitted by the following ACLs:

- ACL applied to the HTTP service.
- ACL applied to the HTTPS service.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Use ACL 2001 to allow only users from 10.10.0.0/16 to access the device through HTTPS or HTTP.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 10.10.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] ip https acl 2001
```

Related commands

acl (*ACL and QoS Command Reference*)

ip https certificate access-control-policy

Use **ip https certificate access-control-policy** to apply a certificate-based access control policy to control HTTPS access.

Use **undo ip https certificate access-control-policy** to restore the default.

Syntax

ip https certificate access-control-policy *policy-name*

undo ip https certificate access-control-policy

Default

No certificate-based access control policy is applied for HTTPS access control.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a certificate-based access control policy by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

For more information about the certificate-based access control policy, see PKI configuration in *Security Configuration Guide*.

Examples

Use certificate-based access control policy **myacl** to control HTTPS access.

```
<Sysname> system-view
[Sysname] ip https certificate access-control-policy myacl
```

Related commands

pki certificate access-control-policy (*Security Command Reference*)

ip https enable

Use **ip https enable** to enable the HTTPS service.

Use **undo ip https enable** to disable the HTTPS service.

Syntax

ip https enable

undo ip https enable

Default

On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, WS5810-WiNet, WS5820-WiNet, and WAS6000 switch series, the default setting varies by startup configuration.

- If the device starts up with factory defaults, the HTTPS service is enabled.
- If the device starts up with the initial configuration, the HTTPS service is disabled.

On the other switch series, the HTTPS service is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

To allow users to access the device through HTTPS, you must enable the HTTPS service.

Enabling the HTTPS service triggers the SSL handshake negotiation process.

- If the device has a local certificate, the SSL handshake negotiation succeeds and the HTTPS service starts up.

- If the device does not have a local certificate, the certificate application process starts. Because the certificate application process takes a long time, the SSL handshake negotiation might fail and the HTTPS service might not be started. To solve the problem, execute this command again until the HTTPS service is enabled.

Examples

Enable the HTTPS service.

```
<Sysname> system-view
[Sysname] ip https enable
```

Related commands

ip https certificate access-control-policy

ip https ssl-server-policy

ip https port

Use **ip https port** to specify the HTTPS service port number.

Use **undo ip https port** to restore the default.

Syntax

ip https port *port-number*

undo ip https port

Default

The HTTPS service port number is 443.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies a port number in the range of 1 to 65535.

Usage guidelines

When the HTTPS service is enabled, changing the HTTPS service port number re-enables the HTTPS service and closes all HTTPS and HTTP connections. To log in again, users must enter the new URL in the Web browser's address bar.

Examples

Set the HTTPS service port number to 8080.

```
<Sysname> system-view
[Sysname] ip https port 8080
```

ip https ssl-server-policy

Use **ip https ssl-server-policy** to apply an SSL server policy to control HTTPS access.

Use **undo ip https ssl-server-policy** to restore the default.

Syntax

ip https ssl-server-policy *policy-name*

undo ip https ssl-server-policy

Default

No SSL server policy is applied. The HTTPS service uses a self-signed certificate.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies an SSL server policy name, a string of 1 to 31 characters.

Usage guidelines

If the HTTP service and HTTPS service are enabled, changes to the applied SSL server policy do not take effect. For the changes to take effect, you must disable HTTP and HTTPS, and then apply the policy and enable HTTP and HTTPS again.

To restore the default, you must disable HTTP and HTTPS, execute the **undo ip https ssl-server-policy** command, and then enable HTTP and HTTPS again.

Examples

Apply SSL server policy **myssl** to the HTTPS service.

```
<Sysname> system-view
[Sysname] ip https ssl-server-policy myssl
```

Related commands

ssl server-policy (*Security Command Reference*)

line

Use **line** to enter one or multiple user line views.

Syntax

line { *first-number1* [*last-number1*] | { **aux** | **usb** | **vty** } *first-number2* [*last-number2*] }

Views

System view

Predefined user roles

network-admin

Parameters

first-number1: Specifies the absolute number of the first user line. The value range is 0 to 83.

last-number1: Specifies the absolute number of the last user line. The value range is 1 to 83. This number must be greater than *first-number1*.

aux: Specifies the AUX line.

usb: Specifies the USB line.

vty: Specifies the VTY line.

first-number2: Specifies the relative number of the first user line. The value range is 0 to 9 for AUX and USB lines and 0 to 63 for VTY lines.

last-number2: Specifies the relative number of the last user line. The value range is 1 to 9 for AUX and USB lines and 1 to 63 for VTY lines. This number must be greater than *first-number2*.

Examples

Enter the view of VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0]
```

Enter the views of VTY lines 0 to 63.

```
<Sysname> system-view
[Sysname] line vty 0 63
[Sysname-line-vty0-63]
```

Related commands

line class

line class

Use **line class** to enter user line class view.

Syntax

line class { **aux** | **usb** | **vty** }

Views

System view

Predefined user roles

network-admin

Parameters

aux: Specifies the AUX line class view.

usb: Specifies the USB line.

vty: Specifies the VTY line class view.

Usage guidelines

To configure the same settings for all user lines of a line class, use this command to enter the user line class view.

In user line class view, you can execute the following commands:

- **activation-key**
- **auto-execute command**
- **authentication-mode**
- **command accounting**
- **command authorization**
- **escape-key**
- **history-command max-size**
- **idle-timeout**
- **protocol inbound**
- **screen-length**

- **set authentication password**
- **shell**
- **terminal type**
- **user-role**

For commands that are available in both user line view and user line class view, the device uses the following rules to determine the settings to use:

- A setting in user line view applies only to the user line. A setting in user line class view applies to all user lines of the class.
- A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.
- A setting in user line class view does not take effect for current online users. It takes effect only for new login users.

Examples

Set the CLI connection idle-timeout timer to 15 minutes in VTY line class view.

```
<Sysname> system-view
[Sysname] line class vty
[Sysname-line-class-vty] idle-timeout 15
```

In AUX line class view, configure the character **s** as the terminal session activation key.

```
<Sysname> system-view
[Sysname] line class aux
[Sysname-line-class-aux] activation-key s
[Sysname-line-class-aux] quit
```

In the view of AUX line 0, restore the default terminal session activation key.

```
[Sysname] line aux 0
[Sysname-line-aux0] undo activation-key
```

Alternatively, you can use the following command:

```
[Sysname-line-aux0] activation-key 13
```

To verify the configuration:

1. Exit the session on AUX line 0.

   ```
   [Sysname-line-aux0] return
   <Sysname> quit
   ```

2. Log in again through the user line.

   The following message appears:

   ```
   Press ENTER to get started.
   ```

3. Press **Enter**.

   Pressing **Enter** does not start a session.

4. Enter **s**.

   A terminal session is started.

   ```
   <Sysname>
   ```

Related commands

line

lock

Use **lock** to lock the current user line and set the password for unlocking the line.

Syntax

lock

Default

The system does not lock any user lines.

Views

User view

Predefined user roles

network-admin

Usage guidelines

This command is not supported in FIPS mode.

This command locks the current user line to prevent unauthorized users from using the line. You must set the password for unlocking the line as prompted. The user line is locked after you enter the password and confirm the password.

To unlock the user line, press **Enter** and enter the password you set.

Examples

Lock the current user line and set the password for unlocking the line.

```
<Sysname> lock
Please input password<1 to 16> to lock current line:
Password:
Again:

                    locked !
```

// The user line is locked. To unlock it, press **Enter** and enter the password:

```
Password:
<Sysname>
```

lock reauthentication

Use **lock reauthentication** to lock the current user line and enable unlocking authentication.

Syntax

lock reauthentication

Default

The system does not lock any user lines or initiate reauthentication.

Views

Any view

Predefined user roles

network-admin

Usage guidelines

This command locks the current user line. To unlock the user line, you must press **Enter** and provide the login password to pass reauthentication. If you have changed the login password after login, you must provide the new password. If no login password is set, the system unlocks the user line after you press **Enter**.

Examples

Lock the current user line and enable unlocking authentication.

```
<Sysname> lock reauthentication

Please press Enter to unlock the screen.
```

// The user line is locked. To unlock it, press **Enter** and enter the login password:

```
Password:

<Sysname>
```

Related commands

lock-key

lock-key

Use **lock-key** to set the user line locking key. Pressing this shortcut key locks the current user line and enables unlocking authentication.

Use **undo lock-key** to restore the default.

Syntax

lock-key *key-string*

undo lock-key

Default

No user line locking key is set.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

key-string: Specifies a shortcut key. It can be a character (case sensitive), or an ASCII code value in the range of 0 to 127. For example, if you configure **lock-key 1**, the shortcut key is **Ctrl+A**. If you configure **lock-key a**, the shortcut key is **a**. For information about ASCII code values of individual characters, see the standard ASCII code chart. For information about ASCII code values of combined keys that use the **Ctrl** key, see Table 1.

Usage guidelines

As a best practice, specify a combined key as the user line locking key. If you specify a single character as the key, the character acts only as the user line locking key. You cannot type the character for any commands, keywords, or arguments.

Pressing the user line locking key is equivalent to executing the **lock reauthentication** command.

This command takes effect immediately.

To display the current user line locking key, use the **display current-configuration | include lock-key** command.

Examples

Set the user line locking key to **Ctrl+A** for VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] lock-key 1
[Sysname-line-vty0] quit
```

To verify the configuration:

1. Press **Ctrl+A**.

```
[Sysname]

Please press Enter to unlock the screen.
```

2. Press **Enter** and enter the login password.

```
Password:

[Sysname]
```

Related commands

lock reauthentication

parity

Use **parity** to specify the parity.

Use **undo parity** to restore the default.

Syntax

parity { **even** | **mark** | **none** | **odd** | **space** }

undo parity

Default

The setting is **none**. No parity is used.

Views

User line view

Predefined user roles

network-admin

Parameters

even: Uses even parity.

mark: Uses mark parity.

none: Uses no parity.

odd: Uses odd parity.

space: Uses space parity.

Usage guidelines

This command is not supported in VTY line view.

The configuration terminal and the device must use the same parity.

Examples

Configure AUX line 0 to use odd parity.

```
<Sysname> system-view
[Sysname] line aux 0
[Sysname-line-aux0] parity odd
```

protocol inbound

Use **protocol inbound** to specify the supported protocols.

Use **undo protocol inbound** to restore the default.

Syntax

In non-FIPS mode:

protocol inbound { **all** | **ssh** | **telnet** }

undo protocol inbound

In FIPS mode:

protocol inbound ssh

undo protocol inbound

Default

In non-FIPS mode, both protocols are supported.

In FIPS mode, SSH is supported.

Views

VTY line view

VTY line class view

Predefined user roles

network-admin

Parameters

all: Supports both SSH and Telnet protocols.

ssh: Supports SSH only.

telnet: Supports Telnet only.

Usage guidelines

Only users assigned the network-admin, or level-15 user role can execute this command. Other users cannot execute this command, even if they are granted the right to execute this command.

A configuration change in user line view does not take effect for the current session. It takes effect for subsequent login sessions.

Before configuring a user line to support SSH, set the authentication mode to **scheme** for the user line.

In VTY line view, this command is associated with the **authentication-mode** command. If you specify a non-default value for one of the two commands, the other command uses the default setting, regardless of the setting in VTY line class view.

- If the settings of the two commands in VTY line view are both the default settings, the settings for the commands in VTY line class view take effect.
- If the settings of the two commands in VTY line view are both non-default settings, the non-default settings in VTY line view take effect.
- If only one command has a non-default setting in VTY line view, the other command uses the default setting, regardless of the setting in VTY line class view.

Examples

Enable user lines VTY 0 through VTY 4 to support only SSH.

```
<Sysname> system-view
[Sysname] line vty 0 4
[Sysname-line-vty0-4] authentication-mode scheme
[Sysname-line-vty0-4] protocol inbound ssh
```

Enable SSH support and set the authentication mode to scheme in VTY line class view. Enable user lines VTY 0 through VTY 4 to support all protocols and disable authentication for the user lines.

```
<Sysname> system-view
[Sysname] line class vty
[Sysname-line-class-vty] authentication-mode scheme
[Sysname-line-class-vty] protocol inbound ssh
[Sysname-line-class-vty] line vty 0 4
[Sysname-line-vty0-4] authentication-mode none
```

To verify the configuration:

1. Telnet to the device.

```
<Client> telnet 192.168.1.241
Trying 192.168.1.241 ...
Press CTRL+K to abort
Connected to 192.168.1.241 ...

******************************************************************************

******************************************************************************

<Server>
```

You are logged in without authentication.

2. Display online CLI user information.

```
<Server> display users
  Idx  Line     Idle       Time              Pid     Type
+ 50   VTY 0    00:00:00   Jan 17 15:29:27   189     TEL

Following are more details.
VTY 0   :
        User role list: network-admin network-operator
        Location: 192.168.1.186
 +    : Current operation user.
```

```
F    : Current operation user works in async mode.
```

The output shows that you are using VTY 0. The configuration in user line view is effective.

Related commands

authentication-mode

restful http enable

Use **restful http enable** to enable RESTful access over HTTP.

Use **undo restful http enable** to disable RESTful access over HTTP.

Syntax

restful http enable

undo restful http enable

Default

RESTful access over HTTP is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command is not supported in FIPS mode.

For users to access the device through the HTTP-based RESTful API, you must enable RESTful access over HTTP.

Examples

Enable RESTful access over HTTP.

```
<Sysname> system-view
[Sysname] restful http enable
```

restful https enable

Use **restful https enable** to enable RESTful access over HTTPS.

Use **undo restful https enable** to disable RESTful access over HTTPS.

Syntax

restful https enable

undo restful https enable

Default

RESTful access over HTTPS is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

For users to access the device through the HTTPS-based RESTful API, you must enable RESTful access over HTTPS.

Examples

Enable RESTful access over HTTPS.

```
<Sysname> system-view
[Sysname] restful https enable
```

screen-length

Use **screen-length** to set the maximum number of lines of command output to send to the terminal at a time when the screen pausing feature is enabled.

Use **undo screen-length** to restore the default.

Syntax

screen-length *screen-length*

undo screen-length

Default

A maximum of 24 lines are sent.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

screen-length: Specifies the maximum number of lines to send, in the range of 0 to 512. To send command output without pausing, set the number to 0 or execute the **screen-length disable** command.

Usage guidelines

The number of lines that can be displayed on the terminal screen is restricted by both this setting and the display specification of the terminal. For example, if this setting is 40, the device sends 40 lines to the terminal at a time. If the terminal display specification is 24 lines, only the last 24 lines are displayed on the terminal screen. To view the previous 16 lines, you must press **PgUp**.

To continue to display command output after a pause, press the space bar.

By default, pausing between screens of output is enabled.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

The setting in user line view takes effect immediately for the current session. The setting in user line class view takes effect for login sessions that are established after the setting is configured.

Examples

Set the maximum number of lines to send at a time to 30 for VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] screen-length 30
```

Related commands

screen-length disable

send

Use **send** to send messages to online login users.

Syntax

send { **all** | *number1* | { **aux** | **usb** | **vty** } *number2* }

Views

User view

Predefined user roles

network-admin

Parameters

all: Specifies all user lines.

number1: Specifies the absolute number of a user line. The value range is 0 to 83.

aux: Specifies the AUX line.

usb: Specifies the USB line.

vty: Specifies the VTY line.

number2: Specifies the relative number of a user line. The value range is 0 to 9 for AUX and USB lines and 0 to 63 for VTY lines.

Usage guidelines

You can use this command to send notifications to online users before performing an operation that might affect other online users, for example, before rebooting the device.

To end a message, press **Enter**. To abort the send operation, press **Ctrl+C**.

Examples

Send a notification to the user on VTY 1.

```
<Sysname> send vty 1
Input message, end with Enter; abort with CTRL+C:
Your attention, please. I will reboot the system in 3 minutes.
Send message? [Y/N]:y
```

The message should appear on the user's terminal screen as follows:

```
[Sysname]

***
***
***Message from vty0 to vty1
***
Your attention, please. I will reboot the system in 3 minutes.
```

set authentication password

Use **set authentication password** to set the password for local password authentication.

Use **undo set authentication password** to restore the default.

Syntax

set authentication password { **hash** | **simple** } *string*

undo set authentication password

Default

No password is set for local password authentication.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

hash: Specifies a password in hashed form.

simple: Sets a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in hashed form.

string: Specifies the password. Its hashed form is a case-sensitive string of 1 to 110 characters. In versions earlier than Release 6318P01, its plaintext form is a case-sensitive string of 1 to 16 characters. In Release 6318P01 and later, its plaintext form is a case-sensitive string of 4 to 16 characters, and must contain a minimum of two character types.

Usage guidelines

This command is not supported in FIPS mode.

Only users assigned the network-admin, or level-15 user role can execute this command. Other users cannot execute this command, even if they are granted the right to execute this command.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

A password change does not take effect for the current session. It takes effect for subsequent login sessions.

Examples

Set the password to **hello12345** for local password authentication on VTY line 0.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] authentication-mode password
[Sysname-line-vty0] set authentication password simple hello12345
```

Related commands

authentication-mode

shell

Use **shell** to enable the terminal service for user lines.

Use **undo shell** to disable the terminal service for user lines.

Syntax

shell

undo shell

Default

The terminal service is enabled on all user lines.

Views

User line view

User line class view

Predefined user roles

network-admin

Usage guidelines

The **undo shell** command is not supported in AUX line view or AUX line class view.

You cannot disable the terminal service on the user line you are using.

When the device acts as a Telnet or SSH server, you cannot configure the **undo shell** command.

If the **undo shell** command is configured in user line class view, you cannot configure the **shell** command in the view of a user line in the class.

Examples

Disable the terminal service for VTY lines VTY 0 through 4 so no user can log in to the device through the user lines.

```
<Sysname> system-view
[Sysname] line vty 0 4
[Sysname-line-vty0-4] undo shell
Disable ui-vty0-4 , are you sure? [Y/N]:y
[Sysname-line-vty0-4]
```

speed

Use **speed** to set the transmission rate (also called the baud rate) on a user line.

Use **undo speed** to restore the default.

Syntax

speed *speed-value*

undo speed

Default

The transmission rate is 9600 bps on a user line.

Views

User line view

Predefined user roles

network-admin

Parameters

speed-value: Specifies the transmission rate in bps. Supported transmission rates depend on the network environment. The transmission rates for asynchronous serial interfaces might include:

- 300 bps.
- 600 bps.
- 1200 bps.

- 2400 bps.
- 4800 bps.
- 9600 bps.
- 19200 bps.
- 38400 bps.
- 57600 bps.
- 115200 bps.

Usage guidelines

This command is not supported in VTY line view.

The configuration terminal and the device must be configured with the same transmission rate to communicate.

Examples

Set the transmission rate to 19200 bps for AUX line 0.

```
<Sysname> system-view
[Sysname] line aux 0
[Sysname-line-aux0] speed 19200
```

stopbits

Use **stopbits** to specify the number of stop bits for a character.

Use **undo stopbits** to restore the default.

Syntax

stopbits { **1** | **1.5** | **2** }

undo stopbits

Default

One stop bit is used.

Views

User line view

Predefined user roles

network-admin

Parameters

1: Uses one stop bit.

1.5: Uses one and a half stop bits. The device does not support using one and a half stop bits. If you specify this keyword, two stop bits are used.

2: Uses two stop bits.

Usage guidelines

This command is not supported in VTY line view.

The configuration terminal and the device must use the same number of stop bits to communicate.

Examples

Set the number of stop bits to 1 for AUX line 0.

```
<Sysname> system-view
```

```
[Sysname] line aux 0
[Sysname-line-aux0] stopbits 1
```

telnet

Use **telnet** to Telnet to a host in an IPv4 network.

Syntax

telnet *remote-host* [*service-port*] [**source** { **interface** *interface-type interface-number* | **ip** *ip-address* } | **dscp** *dscp-value*] *

Views

User view

Predefined user roles

network-admin

Parameters

remote-host: Specifies the IPv4 address or host name of a remote host. A host name can be a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

service-port: Specifies the TCP port number for the Telnet service on the remote host. The value range is 0 to 65535 and the default is 23.

source: Specifies a source IPv4 address or source interface for outgoing Telnet packets. If you do not specify this option, the device uses the primary IPv4 address of the output interface for the route to the server as the source address.

interface *interface-type interface-number*: Specifies the source interface. The primary IPv4 address of the interface will be used as the source IPv4 address for outgoing Telnet packets.

ip *ip-address*: Specifies the source IPv4 address for outgoing Telnet packets.

dscp *dscp-value*: Specifies a DSCP value for outgoing Telnet packets. The value range is 0 to 63. The default is 48.

Usage guidelines

This command is not supported in FIPS mode.

To terminate the current Telnet connection, press **Ctrl+K** or execute the **quit** command.

The source address or interface specified by this command is applied only to the Telnet connection that is being established.

Examples

Telnet to host 1.1.1.2, using 1.1.1.1 as the source IP address for outgoing Telnet packets.

```
<Sysname> telnet 1.1.1.2 source ip 1.1.1.1
```

Related commands

telnet client source

telnet client source

Use **telnet client source** to specify a source IPv4 address or source interface for the Telnet client to use for outgoing Telnet packets.

Use **undo telnet client source** to restore the default.

Syntax

telnet client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

undo telnet client source

Default

No source IPv4 address or source interface is specified. The Telnet client uses the primary IPv4 address of the output interface for the route to the server as the source IPv4 address.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface. The primary IPv4 address of the interface will be used as the source IPv4 address for outgoing Telnet packets.

ip *ip-address*: Specifies a source IPv4 address.

Usage guidelines

This command is not supported in FIPS mode.

The setting configured by this command applies to all Telnet connections but has a lower precedence than the source setting specified for the **telnet** command.

Examples

Set the source IPv4 address to 1.1.1.1 for outgoing Telnet packets.

```
<Sysname> system-view
[Sysname] telnet client source ip 1.1.1.1
```

Related commands

display telnet client configuration

network-admin

Parameters

remote-host: Specifies the IPv6 address or host name of a remote host. A host name can be a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

-i *interface-type interface-number*: Specifies the interface for sending Telnet packets. This option is required when the remote host address is a link-local address. When the server address is a global unicast address, you cannot specify this option.

port-number: Specifies the TCP port number for the Telnet service on the remote host. The value range is 0 to 65535 and the default is 23.

source: Specifies a source IPv6 address or source interface for outgoing Telnet packets. If you do not specify this option, the device uses the primary IPv6 address of the output interface for the route to the server as the source address.

interface *interface-type interface-number*: Specifies the source interface. The primary IPv6 address of the interface will be used as the source IPv6 address for outgoing Telnet packets.

ipv6 *ipv6-address*: Specifies the source IPv6 address for outgoing Telnet packets.

dscp *dscp-value*: Specifies a DSCP value for outgoing Telnet packets. The value range is 0 to 63. The default is 48.

Usage guidelines

This command is not supported in FIPS mode.

To terminate the current Telnet connection, press **Ctrl+K** or execute the **quit** command.

Examples

Telnet to the host at 5000::1.

```
<Sysname> telnet ipv6 5000::1
```

Telnet to the host at 2000::1. Use 1000::1 as the source address for outgoing Telnet packets.

```
<Sysname> telnet ipv6 2000::1 source ipv6 1000::1
```

telnet server acl

Use **telnet server acl** to apply an ACL to filter Telnet logins.

Use **undo telnet server acl** to restore the default.

Syntax

telnet server acl [**mac**] *acl-number*

undo telnet server acl

Default

No ACL is used to filter Telnet logins.

Views

System view

Predefined user roles

network-admin

Parameters

mac: Specifies a Layer 2 ACL. To specify an ACL of a different type, do not specify this keyword.

acl-number: Specifies an ACL by its number. If you specify the **mac** keyword, the value range of this argument is 4000 to 4999. If you do not specify the **mac** keyword, the value range of this argument is 2000 to 3999.

Usage guidelines

This command is not supported in FIPS mode.

You can specify an ACL that does not exist for this command. However, this command takes effect only after you create the ACL and configure rules for the ACL. For more information about ACL, see *ACL and QoS Configuration Guide*.

If you execute this command multiple times, the most recent configuration takes effect.

This command does not take effect on existing Telnet connections.

Examples

Permit only the user at 1.1.1.1 to Telnet to the device.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] telnet server acl 2001
```

telnet server acl-deny-log enable

Use **telnet server acl-deny-log enable** to enable logging for Telnet login attempts that are denied by the Telnet login control ACL.

Use **undo telnet server acl-deny-log enable** to disable logging for Telnet login attempts that are denied by the Telnet login control ACL.

Syntax

telnet server acl-deny-log enable

undo telnet server acl-deny-log enable

Default

Logging is disabled for Telnet login attempts that are denied by the Telnet login control ACL.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Only clients permitted by the Telnet login control ACL can Telnet to the device. This logging feature generates log messages for Telnet login attempts that are denied by the Telnet login control ACL.

For information about log message output, see the information center in *Network Management and Monitoring Configuration Guide*. For information about configuring a Telnet login control ACL, see the **telnet server acl** or **telnet server ipv6 acl** command.

Examples

Enable logging for Telnet login attempts that are denied by the Telnet login control ACL.

```
<Sysname> system-view
[Sysname] telnet server acl-deny-log enable
```

Related commands

telnet server acl

telnet server ipv6 acl

telnet server dscp

Use **telnet server dscp** to specify the DSCP value for IPv4 to use for Telnet packets sent to a Telnet client.

Use **undo telnet server dscp** to restore the default.

Syntax

telnet server dscp *dscp-value*

undo telnet server dscp

Default

IPv4 uses the DSCP value 48 for Telnet packets sent to a Telnet client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

This command is not supported in FIPS mode.

The DSCP value is carried in the ToS field of an IPv4 packet to indicate the packet transmission priority.

Examples

Set the DSCP value for IPv4 to use for outgoing Telnet packets to 30 on a Telnet server.

```
<Sysname> system-view
[Sysname] telnet server dscp 30
```

telnet server enable

Use **telnet server enable** to enable the Telnet server.

Use **undo telnet server enable** to disable the Telnet server.

Syntax

telnet server enable

undo telnet server enable

Default

The Telnet server is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command is not supported in FIPS mode.

Users can Telnet to the device only when the Telnet server is enabled.

Examples

Enable the Telnet server.

```
<Sysname> system-view
[Sysname] telnet server enable
```

telnet server ipv6 acl

Use **telnet server ipv6 acl** to apply an IPv6 ACL to filter IPv6 Telnet logins.

Use **undo telnet server ipv6 acl** to restore the default.

Syntax

telnet server ipv6 acl { **ipv6** | **mac** } *acl-number*

undo telnet server ipv6 acl

Default

No IPv6 ACL is used to filter IPv6 Telnet logins.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6: Specifies an IPv6 ACL.

mac: Specifies a Layer 2 ACL. To specify an ACL of a different type, do not specify this keyword.

acl-number: Specifies an ACL by its number. If you specify the **ipv6** keyword, the value range of this argument is 2000 to 3999. If you specify the **mac** keyword, the value range of this argument is 4000 to 4999.

Usage guidelines

This command is not supported in FIPS mode.

You can specify an ACL that does not exist for this command. However, this command takes effect only after you create the ACL and configure rules for the ACL. For more information about ACL, see *ACL and QoS Configuration Guide*.

If you execute this command multiple times, the most recent configuration takes effect.

This command does not take effect on existing Telnet connections.

Examples

Permit only the user at 2000::1 to Telnet to the device.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2001
[Sysname-acl6-ipv6-basic-2001] rule permit source 2000::1 128
[Sysname-acl6-ipv6-basic-2001] quit
[Sysname] telnet server ipv6 acl ipv6 2001
```

telnet server ipv6 dscp

Use **telnet server ipv6 dscp** to specify the DSCP value for IPv6 to use for Telnet packets sent to a Telnet client.

Use **undo telnet server ipv6 dscp** to restore the default.

Syntax

telnet server ipv6 dscp *dscp-value*

undo telnet server ipv6 dscp

Default

IPv6 uses the DSCP value 48 for Telnet packets sent to a Telnet client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

This command is not supported in FIPS mode.

The DSCP value is carried in the Traffic class field of an IPv6 packet to indicate the packet transmission priority.

Examples

Set the DSCP value for IPv6 to use for outgoing Telnet packets to 30 on a Telnet server.

```
<Sysname> system-view
[Sysname] telnet server ipv6 dscp 30
```

telnet server ipv6 port

Use **telnet server ipv6 port** to specify the IPv6 Telnet service port number.

Use **undo telnet server ipv6 port** to restore the default.

Syntax

telnet server ipv6 port *port-number*

undo telnet server ipv6 port

Default

The IPv6 Telnet service port number is 23.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies a port number. The value can be 23 or in the range of 1025 to 65535.

Usage guidelines

This command terminates all existing Telnet connections to the IPv6 Telnet server. To use the Telnet service, users must reestablish Telnet connections.

Examples

Set the IPv6 Telnet service port number to 1026.

```
<Sysname> system-view
[Sysname] telnet server ipv6 port 1026
```

telnet server port

Use **telnet server port** to specify the IPv4 Telnet service port number.

Use **undo telnet server port** to restore the default.

Syntax

telnet server port *port-number*

undo telnet server port

Default

The IPv4 Telnet service port number is 23.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies a port number. The value can be 23 or in the range of 1025 to 65535.

Usage guidelines

This command terminates all existing Telnet connections to the IPv4 Telnet server. To use the Telnet service, users must reestablish Telnet connections.

Examples

Set the IPv4 Telnet service port number to 1025.

```
<Sysname> system-view
[Sysname] telnet server port 1025
```

terminal type

Use **terminal type** to specify the terminal display type.

Use **undo terminal type** to restore the default.

Syntax

terminal type { **ansi** | **vt100** }

undo terminal type

Default

The terminal display type is ANSI.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

ansi: Specifies the ANSI type.

vt100: Specifies the VT100 type.

Usage guidelines

The device supports two terminal display types: ANSI and VT100. As a best practice, specify the VT100 type on both the device and the configuration terminal. If either side uses the ANSI type, a display problem might occur when a command line has more than 80 characters. For example, a cursor positioning error might occur.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

A terminal display type change does not take effect for the current session. It takes effect for subsequent login sessions.

Examples

Set the terminal display type to VT100.

```
<Sysname> system-view
[Sysname] line vty 0
[Sysname-line-vty0] terminal type vt100
```

user-interface

Use **user-interface** to enter one or multiple user line views.

Syntax

user-interface { *first-number1* [*last-number1*] | { **aux** | **usb** | **vty** } *first-number2* [*last-number2*] }

Views

System view

Predefined user roles

network-admin

Parameters

first-number1: Specifies the absolute number of the first user line. The value range is 0 to 83.

last-number1: Specifies the absolute number of the last user line. The value range is 1 to 83. This number must be greater than *first-number1*.

aux: Specifies the AUX line.

usb: Specifies the USB line.

vty: Specifies the VTY line.

first-number2: Specifies the relative number of the first user line. The value range is 0 to 9 for AUX and USB lines and 0 to 63 for VTY lines.

last-number2: Specifies the relative number of the last user line. The value range is 1 to 9 for AUX and USB lines and 1 to 63 for VTY lines. This number must be greater than *first-number2*.

Usage guidelines

This command is an older version reserved for backward compatibility purposes. It has the same functionality and output as the **line** command. As a best practice, use the **line** command.

To configure settings for a single user line, use this command to enter the user line view.

To configure the same settings for multiple user lines, use this command to enter multiple user line views.

Examples

Enter the view of AUX line 0.

```
<Sysname> system-view
[Sysname] user-interface aux 0
[Sysname-line-aux0]
```

Enter the views of VTY lines 0 to 4.

```
<Sysname> system-view
[Sysname] user-interface vty 0 4
[Sysname-line-vty0-4]
```

Related commands

user-interface class

user-interface class

Use **user-interface class** to enter user line class view.

Syntax

user-interface class { **aux** | **usb** | **vty** }

Views

System view

Predefined user roles

network-admin

Parameters

aux: Specifies the AUX line class view.

usb: Specifies the USB line.

vty: Specifies the VTY line class view.

Usage guidelines

This command is an older version reserved for backward compatibility purposes. It has the same functionality and output as the **line class** command. As a best practice, use the **line class** command.

To configure the same settings for all user lines of a line class, you can use this command to enter the user line class view.

The following commands are available in user line class view:

- **activation-key**
- **auto-execute command**
- **authentication-mode**
- **command accounting**
- **command authorization**
- **escape-key**
- **history-command max-size**
- **idle-timeout**
- **protocol inbound**
- **screen-length**
- **set authentication password**
- **shell**
- **terminal type**
- **user-role**

For commands that are available in both user line view and user line class view, the device uses the following rules to determine the settings to use:

- A setting in user line view applies only to the user line. A setting in user line class view applies to all user lines of the class.
- A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.
- A setting in user line class view does not take effect for current online users. It takes effect only for new login users.

Examples

Set the CLI connection idle-timeout timer to 15 minutes in VTY line class view.

```
<Sysname> system-view
[Sysname] user-interface class vty
[Sysname-line-class-vty] idle-timeout 15
```

In AUX line class view, configure character **s** as the terminal session activation key.

```
<Sysname> system-view
[Sysname] user-interface class aux
[Sysname-line-class-aux] activation-key s
[Sysname-line-class-aux] quit
```

In the view of AUX line 0, restore the default terminal session activation key.

```
[Sysname] user-interface aux 0
[Sysname-line-aux0] undo activation-key
```

Alternatively, you can use the following command:

```
[Sysname-line-aux0] activation-key 13
```

To verify the configuration:

1. Exit the session on AUX line 0.

   ```
   [Sysname-line-aux0] return
   <Sysname> quit
   ```

2. Log in again through the AUX line.

   The following message appears:

```
Press ENTER to get started.
```

3. Press **Enter**.

   Pressing **Enter** does not start a session.

4. Enter **s**.

   A terminal session is started.

   ```
   <Sysname>
   ```

Related commands

user-interface

user-role

Use **user-role** to assign a user role to a user line. The device assigns the user role to a user of the line when the user logs in.

Use **undo user-role** to remove a user role or restore the default.

Syntax

user-role *role-name*

undo user-role [*role-name*]

Default

A console or USB user is assigned the network-admin user role. Other users are assigned the network-operator user role.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role name, a case-sensitive string of 1 to 63 characters. The user role can be user-defined or predefined. Available predefined user roles include network-admin, network-operator, and level-0 to level-15. The predefined security-audit and guest-manager user roles are not supported in user line view or user line class view. If you do not specify this argument, the **undo user-role** command restores the default user role.

Usage guidelines

This command is not supported in FIPS mode.

Only users assigned the network-admin, or level-15 user role can execute this command. Other users cannot execute this command, even if they are granted the right to execute this command.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

A user role change does not take effect for the current session. It takes effect for subsequent login sessions.

You can assign up to 64 user roles to a user line.

For more information about user roles, see RBAC configuration in *Fundamentals Configuration Guide*.

Examples

Assign user role network-admin to AUX line 0.

```
<Sysname> system-view
[Sysname] line aux 0
[Sysname-line-aux0] user-role network-admin
```

web captcha

Use **web captcha** to specify a fixed verification code for Web login.

Use **undo web captcha** to restore the default.

Syntax

web captcha *verification-code*

undo web captcha

Default

No fixed verification code is specified for Web login. A Web user must enter the verification code displayed on the login page.

Views

User view

Predefined user roles

network-admin

Parameters

verification-code: Specifies the fixed verification code, a case-sensitive 4-character string.

Usage guidelines

In test environments where a script is used for Web function tests, you can configure a fixed verification code to improve test efficiency.

For Web access security purposes, do not use this feature in production environments.

If you execute the **web captcha** command multiple times, the most recent configuration takes effect.

This command is not saved to the configuration file and will not take effect after a reboot.

Examples

Set the fixed verification code to **test** for Web login.

```
<Sysname> web captcha test
```

web https-authorization mode

Use **web https-authorization mode** to set the authentication mode for HTTPS login.

Use **undo web https-authorization mode** to restore the default.

Syntax

web https-authorization mode { **auto** | **manual** }

undo web https-authorization mode

Default

Manual authentication mode is used for HTTPS login.

Views

System view

Predefined user roles

network-admin

Parameters

auto: Uses the PKI certificate of an HTTPS client to authenticate the client automatically.

manual: Sends the login page to the HTTPS client, and uses the username and password entered on the page to authenticate the client.

Usage guidelines

In auto authentication mode, the device uses the PKI certificate of an HTTPS client to authenticate the client automatically.

- If the certificate is valid, the value of the CN field is used as the username for AAA authentication.
  - If the authentication succeeds, the Web interface appears on the client.
  - If the authentication fails, the login page appears on the client. The user can log in to the Web interface after entering the correct username and password.
- If the certificate is invalid (for example, expired), the device closes the HTTPS connection.

Examples

Set the HTTPS login authentication mode to **auto**.

```
<Sysname> system-view
[Sysname] web https-authorization mode auto
```

web idle-timeout

Use **web idle-timeout** to set the Web connection idle-timeout timer.

Use **undo web idle-timeout** to restore the default.

Syntax

web idle-timeout *idle-time*

undo web idle-timeout

Default

The Web connection idle-timeout timer is 10 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

idle-time: Specifies the Web connection idle-timeout timer in minutes. The value range is 1 to 999.

Usage guidelines

The system automatically terminates a Web user connection if no mouse or keyboard operation occurs within the idle-timeout interval.

This command takes effect immediately for current Web connections.

Examples

Set the Web connection idle-timeout timer to 100 minutes.

```
<Sysname> system-view
[Sysname] web idle-timeout 100
```

webui log enable

Use **webui log enable** to enable Web operation logging.

Use **undo webui log enable** to disable Web operation logging.

Syntax

webui log enable

undo webui log enable

Default

Web operation logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When Web operation logging is enabled, the device generates log messages for important Web operations, for example, system time change. The device outputs log messages as indicated by information center settings.

Web operations that can trigger Web operation logging depend on the device model.

A Web operation log message includes the following information:

- Module name **WEB**.
- Mnemonic prefix **WEBOPT**_.
- Web client IP address.
- Web user's username.

The following is a sample log message:

```
%Mar 25 14:32:38:802 2013 H3C WEB/6/WEBOPT_SET_TIME: -HostIP=192.168.100.235-User=Admin;
Set the system date and time to 2013-05-27T10:00:00.
```

Examples

Enable Web operation logging.

```
<Sysname> system-view
[Sysname] webui log enable
```

Contents

FTP commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

FTP is not supported in FIPS mode.

FTP server commands

display ftp-server

Use **display ftp-server** to display FTP server configuration and status information.

Syntax

display ftp-server

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display FTP server configuration and status information.

```
<Sysname> display ftp-server
FTP server is running.
User count:                         1
Idle-timeout timer (in minutes):  30
```

Table 1 Command output

Field	Description
User count	Number of the current logged-in users.
Idle-timeout timer (in minutes)	If no packet is exchanged between the FTP server and client during this period, the FTP connection is closed.

                                         89/123456789
```

Table 2 Command output

Field	Description
UserName	Name of the user.
HostIP	IP address of the user.
Port	Port number of the user.
HomeDir	Authorized directory for the user.

free ftp user

Use **free ftp user** to manually release the FTP connections established by using a specific user account.

Syntax

free ftp user *username*

Views

User view

Predefined user roles

network-admin

Parameters

username: Specifies a username. To display online FTP users, execute the **display ftp-user** command.

Examples

Release the FTP connections established by using user account **ftpuser**.

```
<Sysname> free ftp user ftpuser
Are you sure to free FTP connection? [Y/N]:y
<Sysname>
```

free ftp user-ip

Use **free ftp user-ip** to manually release the FTP connections established from a specific IPv4 address.

Syntax

free ftp user-ip *ip-address* [**port** *port*]

Views

User view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address of an FTP connection. To view the source IP addresses of FTP connections, execute the **display ftp-user** command.

port *port*: Specifies the source port of an FTP connection. To view the source ports of FTP connections, execute the **display ftp-user** command.

Examples

Release the FTP connections established from the IP address 192.168.20.184.

```
<Sysname> free ftp user-ip 192.168.20.184
Are you sure to free FTP connection? [Y/N]:y
<Sysname>
```

free ftp user-ip ipv6

Use **free ftp user-ip ipv6 to** manually release the FTP connections established from a specific IPv6 address.

Syntax

free ftp user-ip ipv6 *ipv6-address* [**port** *port*]

Views

User view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the source IPv6 address of an FTP connection. To view the source IPv6 addresses of FTP connections, execute the **display ftp-user** command.

port *port*: Specifies the source port of an FTP connection. To view the source ports of FTP connections, execute the **display ftp-user** command.

Examples

Release the FTP connections established from IPv6 address 2000::154.

```
<Sysname> free ftp user-ip ipv6 2000::154
Are you sure to free FTP connection? [Y/N]:y
<Sysname>
```

ftp server acl

Use **ftp server acl** to use an ACL to control FTP clients' access to the FTP server.

Use **undo ftp server acl** to restore the default.

Syntax

ftp server acl { *advanced-acl-number* | *basic-acl-number* | **ipv6** { *advanced-acl-number* | *basic-acl-number* } }

undo ftp server acl [**ipv6**]

Default

No ACL is used to control FTP clients' access to the FTP server.

Views

System view

Predefined user roles

network-admin

Parameters

advanced-acl-number: Specifies an advanced IPv4 ACL number in the range of 3000 to 3999.

basic-acl-number: Specifies a basic IPv4 ACL number in the range of 2000 to 2999.

ipv6 *advanced-acl-number*: Specifies an advanced IPv6 ACL number in the range of 3000 to 3999.

ipv6 *basic-acl-number*: Specifies a basic IPv6 ACL number in the range of 2000 to 2999.

Usage guidelines

You can use this command to permit only FTP requests from specific FTP clients. This configuration takes effect only for FTP connections to be established. It does not impact existing FTP connections.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Use ACL 2001 to allow only client 1.1.1.1 to access the FTP server.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule 0 permit source 1.1.1.1 0
[Sysname-acl-ipv4-basic-2001] rule 1 deny source any
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] ftp server acl 2001
```

ftp server acl-deny-log enable

Use **ftp server acl-deny-log enable** to enable logging for FTP login attempts that are denied by the FTP login control ACL.

Use **undo ftp server acl-deny-log enable** to disable logging for FTP login attempts that are denied by the FTP login control ACL.

Syntax

ftp server acl-deny-log enable

undo ftp server acl-deny-log enable

Default

Logging is disabled for FTP login attempts that are denied by the FTP login control ACL.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Only clients permitted by the FTP login control ACL can use FTP to access the device. This logging feature generates log messages for FTP login attempts that are denied by the FTP login control ACL.

For information about log message output, see the information center in *Network Management and Monitoring Configuration Guide*. For information about configuring an FTP login control ACL, see the **ftp server acl** command.

Examples

Enable logging for FTP login attempts that are denied by the FTP login control ACL.

```
<Sysname> system-view
[Sysname] FTP server acl-deny-log enable
```

Related commands

ftp server acl

ftp server dscp

Use **ftp server dscp** to set the DSCP value for IPv4 to use for FTP packets sent to an FTP client.

Use **undo ftp server dscp** to restore the default.

Syntax

ftp server dscp *dscp-value*

undo ftp server dscp

Default

IPv4 uses the DSCP value 0 for FTP packets sent to an FTP client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value is carried in the ToS field of an IP packet to indicate the transmission priority of the packet.

Examples

Set the DSCP value for IPv4 to use for outgoing FTP packets to 30 on an FTP server.

```
<Sysname> system-view
[Sysname] ftp server dscp 30
```

ftp server enable

Use **ftp server enable** to enable the FTP server.

Use **undo ftp server enable** to disable the FTP server.

Syntax

ftp server enable

undo ftp server enable

Default

The FTP server is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the FTP server.

```
<Sysname> system-view
[Sysname] ftp server enable
```

ftp server ipv6 dscp

Use **ftp server ipv6 dscp** to set the DSCP value for IPv6 to use for FTP packets sent to an FTP client.

Use **undo ftp server ipv6 dscp** to restore the default.

Syntax

ftp server ipv6 dscp *dscp-value*

undo ftp server ipv6 dscp

Default

IPv6 uses the DSCP value 0 for FTP packets sent to an FTP client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value is carried in the Traffic class field of an IPv6 packet to indicate the transmission priority of the packet.

Examples

Set the DSCP value for IPv6 to use for outgoing FTP packets to 30 on an FTP server.

```
<Sysname> system-view
[Sysname] ftp server ipv6 dscp 30
```

ftp server ssl-server-policy

Use **ftp server ssl-server-policy** to associate an SSL server policy with the FTP server.

Use **undo ftp server ssl-server-policy** to restore the default.

Syntax

ftp server ssl-server-policy *policy-name*

undo ftp server ssl-server-policy

Default

No SSL server policy is associated with the FTP server.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies an SSL server policy by its name, a string of 1 to 31 characters.

Usage guidelines

After you associate an SSL server policy with the device, a client that supports SFTP will establish a secure connection to the device to ensure data security.

Examples

Associate SSL server policy **myssl** with the FTP server.

```
<Sysname> system-view
[Sysname] ftp server ssl-server-policy myssl
```

Related commands

ftp server enable

ssl server-policy (*Security Command Reference*)

ftp timeout

Use **ftp timeout** to set the FTP connection idle-timeout timer.

Use **undo ftp timeout** to restore the default.

Syntax

ftp timeout *minute*

undo ftp timeout

Default

The FTP connection idle-timeout timer is 30 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

minute: Specifies a time interval in the range of 1 to 35791 minutes.

Usage guidelines

If no data transfer occurs on an FTP connection within the idle-timeout interval, the FTP server closes the FTP connection to release resources.

Examples

Set the FTP connection idle-timeout timer to 36 minutes.

```
<Sysname> system-view
[Sysname] ftp timeout 36
```

FTP client commands

For FTP users to execute FTP client configuration commands, you must configure authorization settings for users on the FTP server. Authorized operations include viewing the files in the working directory, reading/downloading/uploading/renaming/removing files, and creating directories.

The FTP client commands in this section are supported by the device, but whether they can be executed successfully depends on the FTP server.

The output in the examples of this section varies by FTP server type.

?

Use **?** to display all commands supported by an FTP client.

Use **?** *command-name* to display the help information for a command.

Syntax

? [*command-name*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

command-name: Specifies a command supported by the FTP client.

Usage guidelines

In FTP client view, entering **?** is the same as executing the **help** command.

Examples

Display all commands supported by the FTP client.

```
ftp> ?
Commands may be abbreviated.  Commands are:

append          delete          ls              quit            rmdir
ascii           debug           mkdir           reget           status
binary          dir             newer           rstatus         system
bye             disconnect      open            rhelp           user
cd              get             passive         rename          verbose
cdup            help            put             reset           ?
close           lcd             pwd             restart
```

Display the help information for the **dir** command.

```
ftp> ? dir
dir              list contents of remote directory
```

Related commands

help

append

Use **append** to add the content of a file on the FTP client to a file on the FTP server.

Syntax

append *localfile* [*remotefile*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

localfile: Specifies a file on the FTP client.

remotefile: Specifies a file on the FTP server.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Append the content of the local **a.txt** file to the **b.txt** file on the FTP server.

```
ftp> append a.txt b.txt
227 Entering Passive Mode (192,168,1,84,8,145)
150 Accepted data connection
226 File successfully transferred
1657 bytes sent in 0.000736 seconds (2.15 Mbyte/s)
```

ascii

Use **ascii** to set the file transfer mode to ASCII.

Syntax

ascii

Default

The file transfer mode is binary.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

FTP transfers files in either of the following modes:

- **Binary mode**—Transfers non-text files.
- **ASCII mode**—Transfers text files.

When the device acts as the FTP server, the transfer mode is determined by the FTP client. When the device acts as the FTP client, you can set the transfer mode. The transfer mode is binary by default.

Examples

Set the file transfer mode to ASCII.

```
ftp> ascii
200 TYPE is now ASCII
```

Related commands

binary

binary

Use **binary** to set the file transfer mode to binary, which is also called the flow mode.

Syntax

binary

Default

The file transfer mode is binary.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

FTP transfers files in either of the following modes:

- **Binary mode**—Transfers program file or pictures.

- **ASCII mode**—Transfers text files.

When the device acts as the FTP server, the transfer mode is determined by the FTP client. When the device acts as the FTP client, you can set the transfer mode. The default transfer mode is binary.

Examples

Set the file transfer mode to binary.

```
ftp> binary
200 TYPE is now 8-bit binary
```

Related commands

ascii

bye

Use **bye** to terminate the connection to the FTP server and return to user view. If no connection is established between the device and the FTP server, use this command to return to user view.

Syntax

bye

Views

FTP client view

Predefined user roles

network-admin

Examples

Terminate the connection to the FTP server and return to user view.

```
ftp> bye
221-Goodbye. You uploaded 2 and downloaded 2 kbytes.
221 Logout.
<Sysname>
```

Related commands

quit

cd

Use **cd** to change the current working directory to another directory on the FTP server.

Syntax

cd { *directory* | **..** | **/** }

Views

FTP client view

Predefined user roles

network-admin

Parameters

directory: Specifies the target directory. If the target directory does not exist, the **cd** command does not change the current working directory.

..: Specifies the upper directory. Executing the **cd ..** command is the same as executing the **cdup** command. If the current working directory is the FTP root directory, the **cd ..** command does not change the current working directory.

/: Specifies the FTP root directory.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

The directory that can be accessed must be authorized by the FTP server.

Examples

Change the working directory to the **logfile** subdirectory of the current directory.

```
ftp> cd logfile
250 OK. Current directory is /logfile
```

Change the working directory to the **folder** subdirectory of the FTP root directory.

```
ftp> cd /folder
250 OK. Current directory is /folder
```

Change the working directory to the upper directory of the current directory.

```
ftp> cd ..
250 OK. Current directory is /
```

Change the working directory to the FTP root directory.

```
ftp> cd /
250 OK. Current directory is /
```

Related commands

cdup

pwd

cdup

Use **cdup** to enter the upper directory of the FTP server.

Syntax

cdup

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

This command does not change the working directory if the current directory is the FTP root directory.

Examples

Change the working directory to the upper directory.

```
ftp> pwd
257 "/ftp/subdir" is your current location
ftp> cdup
250 OK. Current directory is /ftp
```

```
ftp> pwd
257 "/ftp" is your current location
```

Related commands

cd

pwd

close

Use **close** to terminate the connection to the FTP server without exiting FTP client view.

Syntax

close

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Terminate the connection to the FTP server without exiting the FTP client view.

```
ftp> close
221-Goodbye. You uploaded 0 and downloaded 0 kbytes.
221 Logout.
ftp>
```

Related commands

disconnect

debug

Use **debug** to enable or disable FTP client debugging.

Syntax

debug

Default

FTP client debugging is disabled.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

When FTP client debugging is enabled, executing this command disables FTP client debugging.

When FTP client debugging is disabled, executing this command enables FTP client debugging.

Examples

Enable and then disable FTP client debugging.

```
ftp> debug
Debugging on (debug=1).
ftp> debug
Debugging off (debug=0).
```

delete

Use **delete** to permanently delete a file from the FTP server.

Syntax

delete *remotefile*

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a file on the FTP server.

Usage guidelines

CAUTION:

Permanently delete a file from the FTP server with caution. When you permanently delete a file from the FTP server, make sure the file is no longer in use.

You can perform this operation only after you log in to the FTP server.

To perform this operation, you must have delete permission on the FTP server.

Examples

Delete the **b.txt** file.

```
ftp> delete b.txt
250 Deleted b.txt
```

dir

Use **dir** to display or save detailed information about files and directories on the FTP server.

Syntax

dir [*remotefile* [*localfile*]]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a file or directory on the FTP server.

localfile: Specifies the name of the local file used to save the displayed information.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To display detailed information about the files and subdirectories in the working directory on the FTP server, use the **dir** command.

To display detailed information about a file or directory on the FTP server, use the **dir** *remotefile* command.

To save detailed information about a file or directory on the FTP server to a local file, use the **dir** *remotefile localfile* command.

In FTP client view, executing the **dir** command is the same as executing the **ls** command.

Examples

Display detailed information about the files and subdirectories in the working directory on the FTP server.

```
ftp> dir

<Sysname> display ftp client source
The source IP address of the FTP client is 1.1.1.1.
```

ftp

Use **ftp** to log in to an IPv4 FTP server and enter FTP client view.

Syntax

ftp [*ftp-server* [*service-port*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ip** *source-ip-address* } | **-d**] *]

Views

User view

Predefined user roles

network-admin

Parameters

ftp-server: Specifies the IPv4 address or host name of an FTP server. A host name can be a case-insensitive string of 1 to 253 characters. Valid characters for a host name include letters, digits, hyphens (-), underscores (_), and dots (.).

service-port: Specifies the TCP port number of the FTP server, in the range of 0 to 65535. The default is 21.

dscp *dscp-value*: Specifies the DSCP value for IPv4 to use in outgoing FTP packets to indicate the packet transmission priority. The value range is 0 to 63. The default is 0.

source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }: Specifies the source address used to establish the FTP connection.

- **interface** *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's primary IPv4 address as the source address. To establish the FTP connection successfully, make sure the interface is up and has the primary IPv4 address configured.
- **ip** *source-ip-address*: Specifies an IPv4 address. To establish the FTP connection successfully, make sure this address is the IPv4 address of an interface in up state on the device.

-d: Enables FTP client debugging.

Usage guidelines

This command is only applicable to IPv4 networks.

If no parameters are specified, this command enters the FTP client view without logging in to an FTP server.

If the server parameters are specified, you are prompted to enter the username and password for logging in to the FTP server.

Examples

Log in to FTP server 192.168.0.211. Use 192.168.0.212 as the source IPv4 address for outgoing FTP packets.

```
<Sysname>ftp 192.168.0.211 source ip 192.168.0.212
Press CTRL+C to abort.
Connected to 192.168.0.211 (192.168.0.211).

ftp client ipv6 source

Use **ftp client ipv6 source** to specify the source IPv6 address for FTP packets sent to an IPv6 FTP server.

Use **undo ftp client ipv6 source** to restore the default.

Syntax

ftp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }

undo ftp client ipv6 source

Default

No source address is specified for FTP packets sent to an IPv6 FTP server. The device selects a source IPv6 address as defined in RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's IPv6 address as the source address. For successful FTP packet transmission, make sure the interface is up and is configured with an IPv6 address.

ipv6 *source-ipv6-address*: Specifies an IPv6 address. For successful FTP packet transmission, make sure this address is the IPv6 address of an interface in up state on the device.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The source address specified with the **ftp ipv6** command takes precedence over the source address specified with the **ftp client ipv6 source** command.

The source address specified with the **ftp client ipv6 source** command applies to all FTP connections. The source address specified with the **ftp ipv6** command applies only to the FTP connection that is being established.

Examples

Specify the source IPv6 address of 2000::1 for FTP packets sent to an IPv6 FTP server.

```
<Sysname> system–view
[Sysname] ftp client ipv6 source ipv6 2000::1
```

Related commands

ftp ipv6

ftp client source

Use **ftp client source** to specify the source IPv4 address for FTP packets sent to an IPv4 FTP server.

Use **undo ftp client source** to restore the default.

Syntax

ftp client source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }

undo ftp client source

Default

No source IPv4 address is specified for FTP packets sent to an IPv4 FTP server. The device uses the primary IPv4 address of the output interface for the route to the server as the source address.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's primary IPv4 address as the source address. For successful FTP packet transmission, make sure the interface is up and has the primary IPv4 address configured.

ip *source-ip-address*: Specifies an IPv4 address. For successful FTP packet transmission, make sure this address is the IPv4 address of an interface in up state on the device.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The source address specified with the **ftp** command takes precedence over the source address specified with the **ftp client source** command.

The source address specified with the **ftp client source** command applies to all FTP connections. The source address specified with the **ftp** command applies only to the FTP connection that is being established.

Examples

Specify the source IPv4 address of 192.168.20.222 for FTP packets sent to an IPv4 FTP server.

```
<Sysname> system-view
[Sysname] ftp client source ip 192.168.20.222

Parameters

ftp-server: Specifies the IPv6 address or host name of an FTP server. A host name can be a case-insensitive string of 1 to 253 characters. Valid characters for a host name include letters, digits, hyphens (-), underscores (_), and dots (.).

service-port: Specifies the TCP port number of the FTP server, in the range of 0 to 65535. The default is 21.

dscp *dscp-value*: Specifies the DSCP value for IPv6 to use in outgoing FTP packets to indicate the packet transmission priority. The value range is 0 to 63. The default is 0.

source { **ipv6** *source-ipv6-address* | **interface** *interface-type interface-number* }: Specifies the source address used to establish the FTP connection.

- **interface** *interface-type interface-number*: Specifies an interface by its type and number. This option can be used only when the FTP server address is a link local address and the specified output interface has a link local address. For information about link local addresses, see *Layer 3—IP Services Configuration Guide*.
- **ipv6** *source-ipv6-address*: Specifies an IPv6 address. To establish the FTP connection successfully, make sure this address is the IPv6 address of an interface in up state on the device.

-i *interface-type interface-number*: Specifies an output interface by its type and number. This option can be used only when the FTP server address is a link local address and the specified output interface has a link local address.

-d: Enables FTP client debugging.

Usage guidelines

This command is only applicable to IPv6 networks.

If no parameters are specified, this command enters the FTP client view.

If the FTP server parameters are specified, you are prompted to enter the username and password for logging in to the FTP server.

Examples

Log in to FTP server 2000::154.

```
<Sysname>ftp ipv6 2000::154

get

Use **get** to download a file from the FTP server and save the file.

Syntax

get *remotefile* [*localfile*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies the file to be downloaded.

localfile: Specifies a name for the downloaded file. If you do not specify this argument, the system uses the name of the source file.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To save the downloaded file to the working directory accessed by the **ftp** command, perform one of the following tasks:

- Execute the command without specifying the *localfile* argument.
- Specify a file name without any path information for the *localfile* argument, for example, a.cfg.

To save the downloaded file to some other directory, you must specify a fully qualified file name for the *localfile* argument, for example, flash:/subdirectory/a.cfg.

Examples

Download the **a.txt** file and save it as **b.txt** in the working directory accessed by the **ftp** command.

```
ftp> get a.txt b.txt
local: b.txt remote: a.txt
150 Connecting to port 47457
226 File successfully transferred
1569 bytes received in 0.00527 seconds (290.6 kbyte/s)
```

Download the **a.txt** file to the **test** directory in the working directory accessed by the **ftp** command.

```
ftp> get a.txt flash:/test/b.txt
local: flash:/test/b.txt remote: a.txt
150 Connecting to port 47457
226 File successfully transferred
1569 bytes received in 0.00527 seconds (290.6 kbyte/s)
```

Download the **a.txt** file to the root directory of the flash memory on a member device. Save the file as **c.txt**.

```
ftp> get a.txt slot1#flash:/c.txt
local: slot1#flash:/c.txt remote: a.txt
150 Connecting to port 47460
226 File successfully transferred
1569 bytes received in 0.0564 seconds (27.2 kbyte/s)
```

Related commands

put

help

Use **help** to display all commands supported by the FTP client.

Use **help** *command-name* to display the help information for a command.

Syntax

help [*command-name*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

command-name: Specifies a command supported by the FTP client.

Usage guidelines

In FTP client view, executing the **help** command is the same as entering **?**.

Examples

Display all commands supported by the FTP client.

```
ftp> help

append          delete          ls              quit            rmdir
ascii           debug           mkdir           reget           status
binary          dir             newer           rstatus         system
bye             disconnect      open            rhelp           user
```

```
cd              get             passive         rename          verbose
cdup            help            put             reset           ?
close           lcd             pwd             restart
```

Display the help information for the **dir** command.

```
ftp> help dir
dir              list contents of remote directory
```

Related commands

?

lcd

Use **lcd** to display or change the local working directory of the FTP client.

Syntax

lcd [*directory* | **/**]

Views

FTP client view

Predefined user roles

network-admin

Parameters

directory: Changes the local working directory of the FTP client to the specified local directory. There must be a slash sign (/) before the name of the storage medium, for example, /flash:/logfile.

/: Changes the local working directory of the FTP client to the local root directory.

Usage guidelines

To display the local working directory of the FTP client, do not specify the *directory* or **/** argument.

Examples

Display the local working directory.

```
ftp> lcd
Local directory now /flash:
```

Change the local working directory to **flash:/logfile**.

```
ftp> lcd /flash:/logfile
Local directory now /flash:/logfile
```

ls

Use **ls** to display or save detailed information about files and directories on the FTP server.

Syntax

ls [*remotefile* [*localfile*]]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a file or directory on the FTP server.

localfile: Specifies the name of the local file used to save the displayed information.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To display detailed information about the files and subdirectories in the working directory on the FTP server, use the **ls** command.

To display detailed information about a file or directory on the FTP server, use the **ls** *remotefile* command.

To save detailed information about a file or directory on the FTP server to a local file, use the **ls** *remotefile localfile* command.

In FTP client view, executing the **ls** command is the same as executing the **dir** command.

Examples

Display detailed information about the files and subdirectories in the working directory on the FTP server.

```
ftp> ls
150 Connecting to port 50201
-rwxr-xr-x    1 0          0               1481 Jul  7 15:36 a.txt
drwxr-xr-x    2 0          0               8192 Jul  2 14:33 diagfile
drwxr-xr-x    3 0          0               8192 Jul  7 15:21 ftp
drwxr-xr-x    2 0          0               8192 Jul  5 09:15 logfile
drwxr-xr-x    2 0          0               8192 Jul  2 14:33 seclog
-rwxr-xr-x    1 0          0           40808448 Jul  2 14:33 system-a1801.bin
-rwxr-xr-x    1 0          0               3050 Jul  7 12:26 startup.cfg
-rwxr-xr-x    1 0          0              54674 Jul  4 09:24 startup.mdb
-rwxr-xr-x    1 0          0               1481 Jul  7 12:34 x.cfg
226 9 matches total
```

Save detailed information about the file **a.txt** to **s.txt**.

```
ftp> ls a.txt s.txt
output to local-file: s.txt ? [Y/N]y
150 Connecting to port 50203
226-Glob: s.txt
```

Display the content of the file **s.txt**.

```
ftp> bye
221-Goodbye. You uploaded 0 and downloaded 2 kbytes.
221 Logout.
<Sysname> more s.txt
-rwxr-xr-x    1 0          0               1481 Jul  7 12:34 a.txt
```

Related commands

dir

mkdir

Use **mkdir** to create a subdirectory in the current directory on the FTP server.

Syntax

mkdir *directory*

Views

FTP client view

Predefined user roles

network-admin

Parameters

directory: Specifies the name for the directory to be created.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

You must have permission to perform this operation on the FTP server.

Examples

Create a subdirectory named **newdir** in the current directory of the FTP server.

```
ftp> mkdir newdir
257 "newdir" : The directory was successfully created
```

newer

Use **newer** to update a local file by using a file on the FTP server.

Syntax

newer *remotefile* [*localfile*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a file on the FTP server.

localfile: Specifies the local file to be updated.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

If the local file does not exist, this command downloads the file from the FTP server and saves it locally.

If the file on the FTP server is not newer than the local file, this command does not update the local file.

Examples

Update the local file with the **a.txt** file on the FTP server.

```
ftp> newer a.txt
local: a.txt remote: a.txt
150 Connecting to port 63513
226 File successfully transferred
1573 bytes received in 0.0293 seconds (52.3 kbyte/s)
```

open

Use **open** to log in to an FTP server from FTP client view.

Syntax

open *server-address* [*service-port*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

server-address: Specifies the IPv4 address, IPv6 address, or host name of the FTP server.

service-port: Specifies the TCP port number of the FTP server, in the range of 0 to 65535. The default is 21.

Usage guidelines

After you issue this command, the system will prompt you to enter the username and password.

After you log in to one FTP server, you must disconnect from the server before you can use the **open** command to log in to another server.

Examples

In FTP client view, log in to FTP server 192.168.40.7.

```
<Sysname>ftp
ftp> open 192.168.40.7
Press CTRL+C to abort.
Connected to 192.168.40.7 (192.168.40.7).
220 FTP service ready.
User (192.168.40.7:(none)): root
331 Password required for root.
Password:
230 User logged in.
Remote system type is H3C.
ftp>
```

passive

Use **passive** to change the FTP operation mode.

Syntax

passive

Default

The FTP operation mode is passive.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

FTP can operate in either of the following modes:

- **Active mode**—The FTP server initiates the TCP connection.
- **Passive mode**—The FTP client initiates the TCP connection.

When the FTP operation mode is passive, executing this command changes the mode to active.

When the FTP operation mode is active, executing this command changes the mode to passive.

This command is typically used together with a firewall to control FTP session establishment between private network users and public network users.

Examples

Change the FTP operation mode to passive.

```
ftp> passive
Passive mode on.
ftp> passive
Passive mode off.
```

put

Use **put** to upload a file from the FTP client to the FTP server.

Syntax

put *localfile* [*remotefile*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

localfile: Specifies the local file to be uploaded.

remotefile: Specifies the name of the file for saving the uploaded file on the FTP server.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To upload a file in the current working directory, specify a file name without the path for the *localfile* argument, for example, a.cfg.

To upload a file in some other directory, specify a fully qualified file name for the *localfile* argument, for example, flash:/subdirectory/a.cfg.

Examples

Upload the **a.txt** file from the local working directory to the FTP server. Save the file as **b.txt**.

```
ftp> put a.txt b.txt
local: a.txt remote: b.txt
150 Connecting to port 47461
226 File successfully transferred
1569 bytes sent in 0.000671 seconds (2.23 Mbyte/s)
```

Upload the **a.txt** file from the **test** directory of the local working directory to the FTP server. Save the file as **b.txt**.

```
ftp> put flash:/test/a.txt b.txt
```

```
local: flash:/test/a.txt remote: b.txt
150 Connecting to port 47461
226 File successfully transferred
1569 bytes sent in 0.000671 seconds (2.23 Mbyte/s)
```

Upload file **a.txt** from the **test** directory of the storage medium on a member device. Save the file as **b.txt** on the FTP server.

```
ftp> put slot2#flash:/test/a.txt b.txt
local: slot2#flash:/test/a.txt remote: b.txt
150 Connecting to port 47461
226 File successfully transferred
1569 bytes sent in 0.000671 seconds (2.23 Mbyte/s)
```

Related commands

get

pwd

Use **pwd** to display the currently accessed directory on the FTP server.

Syntax

pwd

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Display the currently accessed directory on the FTP server.

```
ftp> cd subdir
250 OK. Current directory is /subdir
ftp> pwd
257 "/subdir" is your current location
```

quit

Use **quit** to terminate the connection to the FTP server and return to user view.

Syntax

quit

Views

FTP client view

Predefined user roles

network-admin

Examples

Terminate the connection to the FTP server and return to user view.

```
ftp> quit
221-Goodbye. You uploaded 0 and downloaded 0 kbytes.
221 Logout.
<Sysname>
```

Related commands

bye

reget

Use **reget** to get the missing part of a file from the FTP server.

Syntax

reget *remotefile* [*localfile*]

Views

FTP client view

Predefined user roles

network-admin

network-operator

Parameters

remotefile: Specifies a file on the FTP server.

localfile: Specifies a local file.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

If a file download is not completed due to network or storage space problems, use this command to get the part that has not been downloaded yet.

Examples

Get the part of the **s.bin** file that has not been downloaded yet.

```
ftp> reget s.bin
local: s.bin remote: s.bin
350 Restarting at 1749706
150-Connecting to port 47429
150 38143.3 kbytes to download
226 File successfully transferred
39058742 bytes received in 66.2 seconds (576.1 kbyte/s)
```

rename

Use **rename** to rename a file.

Syntax

rename [*oldfilename* [*newfilename*]]

Views

FTP client view

Predefined user roles

network-admin

Parameters

oldfilename: Specifies the original file name.

newfilename: Specifies the new file name.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Rename the **a.txt** file as **b.txt**.

- Method 1:

```
ftp> rename
(from-name) a.txt
(to-name) b.txt
350 RNFR accepted - file exists, ready for destination
250 File successfully renamed or moved
```

- Method 2:

```
ftp> rename a.txt
(to-name) b.txt
350 RNFR accepted - file exists, ready for destination
250 File successfully renamed or moved
```

- Method 3:

```
ftp> rename a.txt b.txt
350 RNFR accepted - file exists, ready for destination
250 File successfully renamed or moved
```

reset

Use **reset** to clear the reply information received from the FTP server in the buffer.

Syntax

reset

Views

FTP client view

Predefined user roles

network-admin

Examples

Clear the reply information received from the FTP server.

```
ftp> reset
```

restart

Use **restart** to specify the file retransmission offset.

Syntax

restart *marker*

Views

FTP client view

Predefined user roles

network-admin

Parameters

marker: Specifies the retransmission offset, in bytes.

Usage guidelines

Use this command to continue with a file retransmission. The file retransmission starts from the (offset+1)th byte.

You can perform this operation only after you log in to the FTP server.

Support for this command depends on the FTP server.

Examples

Set retransmission offset to 2 bytes and retransmit the **h.c** file. The file has 82 bytes in total.

```
ftp> restart 2
restarting at 2. execute get, put or append to initiate transfer
ftp> put h.c h.c
local: h.c remote: h.c
350 Restart position accepted (2).
150 Ok to send data.
226 File receive OK.
80 bytes sent in 0.000445 seconds (175.6 kbyte/s)
ftp> dir
150 Here comes the directory listing.
-rw-r--r--    1 0        0              82 Jul 18 02:58 h.c
```

rhelp

Use **rhelp** to display the FTP commands supported by the FTP server.

Use **rhelp** *protocol-command* to display the help information for an FTP command supported by the FTP server.

Syntax

rhelp [*protocol-command*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

protocol-command: Specifies an FTP command.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Display the FTP-related commands supported by the FTP server.

```
ftp> rhelp
214-The following FTP commands are recognized
 USER PASS NOOP QUIT SYST TYPE
 HELP CWD  XCWD PWD  CDUP XCUP
 XPWD LIST NLST MLSD PORT EPRT
 PASV EPSV REST RETR STOR APPE
 DELE MKD  XMKD RMD  XRMD ABOR
 SIZE RNFR RNTO
214 UNIX Type: L8
```

Table 3 Command output

Field	Description
USER	Username.
PASS	Password.
NOOP	Null operation.
SYST	System parameters.
TYPE	Request type.
CWD	Changes the current working directory.
XCWD	Extended command with the meaning of CWD.
PWD	Prints the working directory.
CDUP	Changes the directory to the upper directory.
XCUP	Extended command with the meaning of CDUP.
XPWD	Extended command with the meaning of PWD.
LIST	Lists files.
NLST	Lists brief file description.
MLSD	Lists file content.
PORT	Active mode (IPv4).
EPRT	Active mode (IPv6).
PASV	Passive mode (IPv4).
EPSV	Passive mode (IPv6).
REST	Restarts.
RETR	Downloads files.
STOR	Uploads files.
APPE	Appends uploading.
DELE	Deletes files.
MKD	Creates folders.
XMKD	Extended command with the meaning of MKD.
RMD	Deletes folders.
XRMD	Extended command with the meaning of RMD.
ABOR	Aborts the transmission.

Field	Description
SIZE	Size of the transmission file.
RNFR	Original name.
RNTO	New name.

rmdir

Use **rmdir** to permanently delete a directory from the FTP server.

Syntax

rmdir *directory*

Views

FTP client view

Predefined user roles

network-admin

Parameters

directory: Specifies a directory on the FTP server.

Usage guidelines

CAUTION:

Permanently delete a directory from the FTP server with caution. When you permanently delete a directory from the FTP server, make sure the directory is no longer in use.

You can perform this operation only after you log in to the FTP server.

To perform this operation, you must have delete permission on the FTP server.

Delete all files and subdirectories in a directory before you delete the directory. For more information about how to delete files, see the **delete** command.

The **rmdir** command does not delete the files of the specified directory from the recycle bin.

Examples

Delete empty directory **subdir1**.

```
ftp>rmdir subdir1
250 The directory was successfully removed
```

Related commands

delete

rstatus

Use **rstatus** to display FTP server status information.

Use **rstatus** *remotefile* to display detailed information about a directory or file on the FTP server.

Syntax

rstatus [*remotefile*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a directory or file on the FTP server.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Support for this command depends on the FTP server.

Examples

Display FTP server status information.

```
ftp> rstatus
211-FTP server status:
     Connected to 192.168.20.177
     Logged in as root
     TYPE: ASCII
     No session bandwidth limit
     Session timeout in seconds is 300
     Control connection is plain text
     Data connections will be plain text
     At session startup, client count was 1
     vsFTPd 2.0.6 - secure, fast, stable
211 End of status
```

Table 4 Command output

Filed	Description
211-FTP server status:	Beginning of the display of FTP server status, where 211 specifies the FTP command.
Connected to 192.168.20.177	IP address of the FTP client.
Logged in as root	Login username root.
TYPE: ASCII	File transfer mode ASCII.
Session timeout in seconds is 300	FTP connection idle-timeout interval is 300 seconds.
Control connection is plain text	Control connection type is plain text.
Data connections will be plain text	Data connection type is plain text.
At session startup, client count was 1	FTP connection number is 1.
vsFTPd 2.0.6 - secure, fast, stable	FTP version is 2.0.6.
211 End of status	End of the display of FTP server status.

Display the file **a.txt**.

```
ftp> rstatus a.txt
213-Status follows:
-rw-r--r--    1 0        0             80 Jul 18 02:58 a.txt
213 End of status
```

Table 5 Command output

Field	Description
213-Status follows:	Beginning of the display of the file, where 213 specifies the FTP command.
-rw-r--r--	The first bit specifies the file type. • **-**—Common. • **B**—Block. • **c**—Character. • **d**—Directory. • **l**—Symbol connection file. • **p**—Pipe. • **s**—socket. The second bit through the tenth bit are divided into three groups. Each group contains three characters, representing the access permission of the owner, group, and other users. • **-**—No permission. • **r**—Read permission. • **w**—Write permission. • **x**—Execution permission.
1	Number of connections.
0	Name of the file owner.
0	Group number of the file owner.
80	File size, in bytes.
Jul 18 02:58	Date and time when the file was most recently modified.
a.txt	File name.
213 End of status	End of the display of the file information.

status

Use **status** to display FTP status information.

Syntax

status

Views

FTP client view

Predefined user roles

network-admin

Examples

Display FTP status information.

```
ftp> status
Connected to 192.168.1.56.
No proxy connection.
Not using any security mechanism.
Mode: stream; Type: ascii; Form: non-print; Structure: file
Verbose: on; Bell: off; Prompting: on; Globbing: off
Store unique: off; Receive unique: off
```

```
Case: off; CR stripping: on
Ntrans: off
Nmap: off
Hash mark printing: off; Use of PORT cmds: on
```

Table 6 Command output

Field	Description
Connected to 192.168.1.56.	IP address of the FTP server that is connected to the FTP client.
Verbose: on; Bell: off; Prompting: on; Globbing: off	Displays debugging information.
Store unique: off; Receive unique: off	The name of the file on the FTP server is unique and the name of the local file is unique.
Case: off; CR stripping: on	Does not support obtaining multiple files once and deletes "\r" when downloading text files.
Ntrans: off	Does not use the input-output transmission table.
Nmap: off	The file name does not use the input-to-output mapping template.
Hash mark printing: off; Use of PORT cmds: on	Does not end with a pound sign (#) and uses "PORT" data transmission.

system

Use **system** to display the system information of the FTP server.

Syntax

system

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Display the system information of the FTP server.

```
ftp> system
215 UNIX Type: L8
```

user

Use **user** to initiate an FTP authentication on the current FTP connection.

Syntax

user *username* [*password*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

username: Specifies the username.

password: Specifies the password.

Usage guidelines

If you tried to access an FTP server but failed to pass the authentication, you can use this command to try again before the connection to the FTP server expires.

After you log in to an FTP server, you can initiate an FTP authentication to change to a new account. By changing to a new account, you can get a different privilege without re-establishing the FTP connection.

Make sure the specified username and password have been configured on the FTP server. If the username or password is not configured, this command fails and the FTP connection is closed.

Examples

After logging in to the FTP server, use username **ftp** and password **hello12345** to log in again to the FTP server.

- Method 1:

```
ftp> user ftp hello12345
331 Password required for ftp.
230 User logged in.
```

- Method 2:

```
ftp> user ftp
331 Password required for ftp.
Password:
230 User logged in.
```

verbose

Use **verbose** to enable or disable the device to display detailed information about FTP operations.

Syntax

verbose

Default

The device displays detailed information about FTP operations.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

This command affects only the current FTP session.

Examples

Disable the device from displaying detailed information about FTP operations.

```
ftp> verbose
Verbose mode off.
```

Execute the **get** command.

```
ftp> get a.cfg 1.cfg
```

Enable the device to display detailed information about FTP operations.

```
ftp> verbose
Verbose mode on.
```

Execute the **get** command.

```
ftp> get a.cfg 2.cfg
227 Entering Passive Mode (192,168,1,58,68,14)
150-Accepted data connection
150 The computer is your friend. Trust the computer
226 File successfully transferred
3796 bytes received in 0.00762 seconds (486.5 kbyte/s)
```

TFTP commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

TFTP is not supported in FIPS mode.

tftp

Use **tftp** to download a file from a TFTP server or upload a file to a TFTP server in an IPv4 network.

Syntax

tftp *tftp-server* { **get** | **put** | **sget** } *source-filename* [*destination-filename*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ip** *source-ip-address* }] *

Views

User view

Predefined user roles

network-admin

Parameters

tftp-server: Specifies the IPv4 address or host name of a TFTP server. The host name can be a case-insensitive string of 1 to 253 characters and can contain only letters, digits, hyphens (-), underscores (_), and dots (.).

get: Downloads a file and writes the file directly to the destination folder. If the destination folder already has a file with the same name, the system deletes the existing file before starting the download operation. The existing file is permanently deleted even if the download operation fails.

put: Uploads a file.

sget: Downloads a file and saves the file to memory before writing it to the destination folder. The system starts to write the file to the destination folder only after the file is downloaded and saved to memory successfully. If the destination folder already has a file with the same name, the system overwrites the existing file. If the download or save-to-memory operation fails, the existing file in the destination folder is not overwritten.

source-filename: Specifies the source file name, a case-insensitive string of 1 to 1 to 255 characters.

destination-filename: Specifies the destination file name, a case-insensitive string of 1 to 255 characters. If this argument is not specified, the file uses the source file name.

dscp *dscp-value*: Specifies the DSCP value for IPv4 to use for outgoing TFTP packets to indicate the packet transmission priority. The value range is 0 to 63. The default is 0.

source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }: Specifies the source address for outgoing TFTP packets. If you do not specify this option, the device uses the primary IPv4 address of the output interface for the route to the TFTP server as the source address.

- **interface** *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's primary IPv4 address as the source IPv4 address. For successful TFTP packet transmission, make sure the interface is up and has the primary IPv4 address configured.

- **ip** *source-ip-address*: Specifies an IPv4 address. For successful TFTP packet transmission, make sure this address is the IPv4 address of an interface in up state on the device.

Usage guidelines

The source address specified with the **tftp** command takes precedence over the source address specified with the **tftp client source** command.

The source address specified with the **tftp client source** command applies to all TFTP connections. The source address specified with the **tftp** command applies only to the current TFTP connection.

Examples

Download the **new.bin** file from TFTP server 192.168.1.1 and save the file as **new.bin**.

```
<Sysname> tftp 192.168.1.1 get new.bin
Press CTRL+C to abort.
  % Total    % Received % Xferd  Average Speed   Time    Time     Time   Current
                                 Dload  Upload   Total   Spent    Left   Speed
100 13.9M  100 13.9M    0     0  1206k      0  0:00:11  0:00:11  --:--:-- 1206k
Writing file...Done.
<System>
```

Table 7 Command output

Field	Description
%	Percentage of file transmission progress.
Total	Size of files to be transmitted, in bytes.
%	Percentage of received file size to total file size.
Received	Received file size, in bytes.
%	Percentage of sent file size to total file size.
Xferd	Sent file size, in bytes.
Average Dload	Average download speed, in bps.
Speed Upload	Average upload speed, in bps.
Writing file…	The system was writing the downloaded file to the storage medium. This field is displayed only when the **get** or **sget** keyword is specified. If the operation succeeded, this command displays **Done** at the end of this field. If the operation failed, this command displays **Failed**.

Related commands

tftp client source

tftp client ipv6 source

Use **tftp client ipv6 source** to specify the source IPv6 address for TFTP packets sent to an IPv6 TFTP server.

Use **undo tftp client ipv6 source** to restore the default.

Syntax

tftp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }

undo tftp client ipv6 source

Default

No source address is specified for TFTP packets sent to an IPv6 TFTP server. The device selects a source IPv6 address as defined in RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's IPv6 address as the source address. For successful TFTP packet transmission, make sure the interface is up and is configured with an IPv6 address.

ipv6 *source-ipv6-address*: Specifies an IPv6 address . For successful TFTP packet transmission, make sure this address is the IPv6 address of an interface in up state on the device.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The source address specified with the **tftp ipv6** command takes precedence over the source address specified with the **tftp client ipv6 source** command.

The source address specified with the **tftp client ipv6 source** command applies to all TFTP connections. The source address specified with the **tftp ipv6** command applies only to the TFTP connection that is being established.

Examples

Specify the source IPv6 address of 2000::1 for TFTP packets sent to an IPv6 TFTP server.

```
<Sysname> system–view
[Sysname] tftp client ipv6 source ipv6 2000::1
```

Related commands

tftp ipv6

tftp client source

Use **tftp client source** to specify the source IPv4 address for TFTP packets sent to an IPv4 TFTP server.

Use **undo tftp client source** to restore the default.

Syntax

tftp client source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }

undo tftp client source

Default

No source IPv4 address is specified for TFTP packets sent to an IPv4 TFTP server. The device uses the primary IPv4 address of the output interface for the route to the server as the source address.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's primary IPv4 address as the source address. For successful TFTP packet transmission, make sure the interface is up and has the primary IPv4 address configured.

ip *source-ip-address*: Specifies an IPv4 address. For successful TFTP packet transmission, make sure this address is the IPv4 address of an interface in up state on the device.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The source address specified with the **tftp** command takes precedence over the source address specified with the **tftp client source** command.

The source address specified with the **tftp client source** command applies to all TFTP connections. The source address specified with the **tftp** command applies only to the TFTP connection that is being established.

Examples

Specify the source IP address of 192.168.20.222 for TFTP packets sent to an IPv4 TFTP server.

```
<Sysname> system-view
[Sysname] tftp client source ip 192.168.20.222
```

Related commands

tftp

tftp ipv6

Use **tftp ipv6** to download a file from a TFTP server or upload a file to a TFTP server in an IPv6 network.

Syntax

tftp ipv6 *tftp-server* [**-i** *interface-type interface-number*] { **get** | **put** | **sget** } *source-filename* [*destination-filename*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }] *

Views

User view

Predefined user roles

network-admin

Parameters

tftp-server: Specifies the IPv6 address or host name of a TFTP server. The host name can be a case-insensitive string of 1 to 253 characters and can contain only letters, digits, hyphens (-), underscores (_), and dots (.).

-i *interface-type interface-number*: Specifies an output interface by its type and number. This option can be used only when the TFTP server address is a link local address and the specified

output interface has a link local address. For information about link local addresses, see *Layer 3—IP Services Configuration Guide*.

get: Downloads a file and writes the file directly to the destination folder. If the destination folder already has a file with the same name, the system deletes the existing file before starting the download operation. The existing file is permanently deleted even if the download operation fails.

put: Uploads a file.

sget: Downloads a file and saves the file to memory before writing it to the destination folder. The system starts to write the file to the destination folder only after the file is downloaded and saved to memory successfully. If the destination folder already has a file using the same name, the system overwrites the existing file. If the download or save-to-memory operation fails, the existing file in the destination folder is not overwritten.

source-filename: Specifies the source file name, a case-insensitive string of 1 to 255 characters.

destination-filename: Specifies the destination file name, a case-insensitive string of 1 to 255 characters. If this argument is not specified, the file uses the source file name.

dscp *dscp-value*: Specifies the DSCP value for IPv6 to use in outgoing TFTP packets to indicate the packet transmission priority. The value range is 0 to 63. The default is 0.

source { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }: Specifies the source address for outgoing TFTP packets. If you do not specify this option, the device selects a source IPv6 address as defined in RFC 3484.

- **interface** *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's IPv6 address as the source IPv6 address. For successful TFTP packet transmission, make sure the interface is up and is configured with an IPv6 address.
- **ipv6** *source-ipv6-address*: Specifies an IPv6 address. For successful TFTP packet transmission, make sure this address is the IPv6 address of an interface in up state on the device.

Usage guidelines

The source address specified with the **tftp ipv6** command takes precedence over the source address specified with the **tftp client ipv6 source** command.

The source address specified with the **tftp client ipv6 source** command applies to all TFTP connections. The source address specified with the **tftp ipv6** command applies only to the current TFTP connection.

Examples

Download the **new.bin** file from TFTP server 2001::1 and save the file as **new.bin**.

```
<Sysname> tftp ipv6 2001::1 get new.bin new.bin
Press CTRL+C to abort.
   % Total    % Received % Xferd  Average Speed   Time    Time     Time   Current
                                  Dload  Upload   Total   Spent    Left   Speed
100 13.9M  100 13.9M    0     0  1206k      0  0:00:11  0:00:11  --:--:-- 1206k
Writing file...Done.
```

For more information about the command output, see Table 7.

tftp-server acl

Use **tftp-server acl** to use an ACL to control the device's access to TFTP servers in an IPv4 network.

Use **undo tftp-server acl** to restore the default.

Syntax

tftp-server acl *acl-number*

undo tftp-server acl

Default

No ACL is used to control the device's access to TFTP servers.

Views

System view

Predefined user roles

network-admin

Parameters

acl-number: Specifies the number of a basic ACL, in the range of 2000 to 2999.

Usage guidelines

You can use an ACL to deny or permit the device's access to specific TFTP servers.

Examples

Allow the device to access only TFTP server 1.1.1.1.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule permit source 1.1.1.1 0
[Sysname-acl-ipv4-basic-2000] quit
[Sysname] tftp-server acl 2000
```

tftp-server ipv6 acl

Use **tftp-server ipv6 acl** to use an ACL to control the device's access to TFTP servers in an IPv6 network.

Use **undo tftp-server ipv6 acl** to restore the default.

Syntax

tftp-server ipv6 acl *ipv6-acl-number*

undo tftp-server ipv6 acl

Default

No ACL is used to control the device's access to TFTP servers.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies the number of a basic ACL, in the range of 2000 to 2999.

Usage guidelines

You can use an ACL to deny or permit the device's access to specific TFTP servers.

Examples

Allow the device to access only TFTP server 2001::1.

```
<Sysname> System-view
[Sysname] acl ipv6 basic 2001
[Sysname-acl-ipv6-basic-2001] rule permit source 2001::1/128
[Sysname-acl-ipv6-basic-2001] quit
[Sysname] tftp-server ipv6 acl 2001
```

Contents

File system management commands

IMPORTANT:

- Before managing storage media, file systems, directories, and files, make sure you know the possible impact.
- A file or directory whose name starts with a dot character (.) is a hidden file or directory. To prevent the system from hiding a file or directory, make sure the file or directory name does not start with a dot character.
- Some system files and directories are hidden. For correct system operation and full functionality, do not modify or delete hidden files or directories.

File system names, directory names, and file names must be compliant with the naming conventions. For more information about the naming conventions and the methods for specifying the names, see file system management in *Fundamentals Configuration Guide*.

Before you use the **copy**, **delete**, **fixdisk**, **format**, **gunzip**, **gzip**, **mkdir**, **move**, **rename**, **rmdir**, or **undelete** command on a file system, make sure the file system is not write protected.

You cannot access a storage medium that is being partitioned, or a file system that is being formatted or repaired. To access the file system, wait for the ongoing operation to be completed and then use one of the following methods:

- Use the absolute path to specify a file or directory. For example, use the **dir flash:/** command to display the files and directories in the **flash:** file system.
- Use the **cd** command to change the working directory to the root directory of the file system before accessing a file or directory in the file system. For example, to display the files and directories in the root directory of the **flash:** file system, perform the following tasks:
  a. Use the **cd flash:/** command to change the working directory to the root directory of the file system.
  b. Execute the **dir** command.

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

cd

Use **cd** to change the working directory.

Syntax

cd { *directory* | **..** }

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies the destination directory.

..: Specifies the parent directory. If the working directory is the root directory, an error message appears when you execute the **cd ..** command. No online help information is available for this keyword.

Examples

Access the **test** directory after logging in to the device.

```
<Sysname> cd test
```

Change to the parent directory.

```
<Sysname> cd ..
```

copy

Use **copy** to copy a file.

Syntax

In non-FIPS mode:

copy *source-file* { *dest-file* | *dest-directory* } [**source interface** *interface-type interface-number*]

In FIPS mode:

copy *source-file* { *dest-file* | *dest-directory* }

Views

User view

Predefined user roles

network-admin

Parameters

source-file: Specifies the name or URL of the file to be copied in non-FIPS mode, and specifies the name of the file to be copied in FIPS mode. If the file resides on a remote file server rather than on the device, specify the URL of the file. Whether a URL is case sensitive depends on the server.

dest-file: Specifies the name or URL for the destination file in non-FIPS mode, and specifies the name for the destination file in FIPS mode. To copy the source file to a remote file server, specify a URL. Whether a URL is case sensitive depends on the server.

dest-directory: Specifies the destination directory or URL in non-FIPS mode, and specifies the destination directory in FIPS mode. To copy the source file to a remote file server, specify a URL. The device copies the source file to the destination location and saves the file with its original file name. Whether a URL is case sensitive depends on the server.

source interface *interface-type interface-number*: Specifies the source interface used to connect to the server. After you specify the source interface, the device uses the primary IP address of the source interface as the source IP address for outgoing packets. If you do not specify this option, the device uses the outgoing interface as the source interface.

Usage guidelines

In FIPS mode, the **copy** command can only copy a local file and save it locally.

In non-FIPS mode, you can use the **copy** command to perform the following tasks:

- Copy a local file and save it locally.
- Copy a local file and save it to an FTP, TFTP, or HTTP server.
- Copy a file from an FTP, TFTP, or HTTP server and save it locally.

To specify a file or directory, use the following guidelines:

Location	Name format	Remarks
On the device	Use the file name guidelines in *Fundamentals Configuration Guide*.	N/A
On an FTP server	Enter the URL in the format of **ftp://***FTP username*[**:***password*]*@server address*[**:***port number*]**/***file path*[**/***file name*].	The username and password must be the same as the username and password configured on the FTP server. If the server authenticates users only by the username, you are not required to enter the password. For example, to use the username a and password 1 and specify the startup.cfg file in the authorized working directory on the FTP server 1.1.1.1, enter ftp://a:1@1.1.1.1/startup.cfg.
On a TFTP server	Enter the URL in the format of **tftp://***server address*[**:***port number*]**/***file path*[**/***file name*].	For example, to specify the startup.cfg file in the working directory on TFTP server 1.1.1.1, enter the URL tftp://1.1.1.1/startup.cfg.
On an HTTP server	Enter the URL in the format of **http://**[*HTTP username*[**:***password*]@]*server address*[**:***port number*]**/***filepath*[**/***file name*].	The username and password in the URL must be the same as the username and password configured on the server. If only the username is required for authentication, you do not need to enter the password. If authentication is not required, you do not need to enter the username or password. For example, the **startup.cfg** file is saved in the authorized directory on the HTTP server at 1.1.1.1. The HTTP account username and password are **a** and **1**, respectively. To copy the file, enter the URL http://a:1@1.1.1.1/startup.cfg. If authentication is not required, enter the URL http://1.1.1.1/startup.cfg.

To specify an IPv6 address, enclose the IPv6 address in square brackets ([ ]), for example, ftp://test:test@[2001::1]:21/test.cfg.

Examples

Copy the **test.cfg** file in the current directory and save it to the current directory as **testbackup.cfg**.

```
<Sysname> copy test.cfg testbackup.cfg
Copy flash:/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file flash:/test.cfg to flash:/testbackup.cfg...Done.
```

Copy the **1.cfg** file from the **flash:** file system's **test** directory to the USB disk. Save the copy to the **testbackup** directory on the first partition as **1backup.cfg**.

```
<Sysname> copy flash:/test/1.cfg usba0:/testbackup/1backup.cfg
Copy flash:/test/1.cfg to usba0:/testbackup/1backup.cfg? [Y/N]:y
Copying file flash:/test/1.cfg to usba0:/testbackup/1backup.cfg...Done.
```

Copy the **test.cfg** file in the current directory and save it to the root directory of a file system in a specific slot as **testbackup.cfg**.

```
<Sysname> copy test.cfg slot2#flash:/
Copy flash:/test.cfg to slot2#flash:/test.cfg? [Y/N]:y
Copying file flash:/test.cfg to slot2#flash:/test.cfg...Done.
```

Copy **test.cfg** from the working directory on FTP server 1.1.1.1. Save the copy to the local current directory as **testbackup.cfg.** The FTP username is **user**. The password is **private**.

```
<Sysname> copy ftp://user:private@1.1.1.1/test.cfg testbackup.cfg
Copy ftp://user:private@1.1.1.1/test.cfg to flash:/testbackup.cfg? [Y/N]:y
```

```
Copying file ftp://user:private@1.1.1.1/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the current directory. Save the copy to the working directory on FTP server 1.1.1.1 as **testbackup.cfg**. The FTP username is **user**. The password is **private**.

```
<Sysname> copy test.cfg ftp://user:private@1.1.1.1/testbackup.cfg
Copy flash:/test.cfg to ftp://user:private@1.1.1.1/testbackup.cfg? [Y/N]:y
Copying file flash:/test.cfg to ftp://user:private@1.1.1.1/testbackup.cfg... Done.
```

Copy **test.cfg** from the working directory on TFTP server 1.1.1.1. Save the copy to the local current directory as **testbackup.cfg**.

```
<Sysname> copy tftp://1.1.1.1/test.cfg testbackup.cfg
Copy tftp://1.1.1.1/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file tftp://1.1.1.1/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the current directory. Save the copy to the working directory on TFTP server 1.1.1.1 as **testbackup.cfg**.

```
<Sysname> copy test.cfg tftp://1.1.1.1/testbackup.cfg
Copy flash:/test.cfg to tftp://1.1.1.1/testbackup.cfg? [Y/N]:y
Copying file flash:/test.cfg to tftp://1.1.1.1/testbackup.cfg... Done.
```

Copy **test.cfg** from the working directory on FTP server 2001::1. Save the copy to the local current directory as **testbackup.cfg**. The FTP username is **user**. The password is **private**.

```
<Sysname> copy ftp://user:private@[2001::1]/test.cfg testbackup.cfg
Copy ftp://user:private@[2001::1]/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file ftp://user:private@[2001::1]/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the working directory on TFTP server 2001::1. Save the copy to the local current directory as **testbackup.cfg**.

```
<Sysname> copy tftp://[2001::1]/test.cfg testbackup.cfg
Copy tftp://[2001::1]/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file tftp://[2001::1]/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the authorized directory on HTTP server 1.1.1.1. Save the copy to the local current directory as **testbackup.cfg**. The HTTP login username is **user**. The password is **private**.

```
<Sysname> copy http://user:private@1.1.1.1/test.cfg testbackup.cfg
Copy http://user:private@1.1.1.1/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file http://user:private@1.1.1.1/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the current directory. Save the copy to the authorized directory on HTTP server 1.1.1.1 as **testbackup.cfg**. The HTTP login username is **user**. The password is **private**.

```
<Sysname> copy test.cfg http://user:private@1.1.1.1/testbackup.cfg
Copy flash:/test.cfg to http://user:private@1.1.1.1/testbackup.cfg? [Y/N]:y
Copying file flash:/test.cfg to http://user:private@1.1.1.1/testbackup.cfg... Done.
```

Copy **test.cfg** from the authorized directory on HTTP server 2001::1. Save the copy to the local current directory as **testbackup.cfg**. The HTTP login username is **user**. The password is **private**.

```
<Sysname> copy http://user:private@[2001::1]/test.cfg testbackup.cfg
Copy http://user:private@[2001::1]/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file http://user:private@[2001::1]/test.cfg to flash:/testbackup.cfg... Done.
```

delete

Use **`delete`** to delete a file.

Syntax

`delete` [**`/unreserved`**] *`file`*

Views

User view

Predefined user roles

network-admin

Parameters

/unreserved: Permanently deletes the specified file. If you do not specify this keyword, the command moves the file to the recycle bin.

file: Specifies the name of the file to be deleted. Asterisks (*) are acceptable as wildcards. For example, to remove files with the **.txt** extension in the current directory, enter **delete *.txt**.

Usage guidelines

CAUTION:

The **delete /unreserved** *file* command deletes a file permanently. The file cannot be restored.

The **delete** *file* command (without **/unreserved**) moves a file to the recycle bin. A file moved to the recycle bin can be restored by using the **undelete** command.

Do not use the **delete** command to delete files from the recycle bin. To delete files from the recycle bin, use the **reset recycle-bin** command.

If you delete two files that have the same name from different directories, both files are retained in the recycle bin. If you successively delete two files that have the same name from the same directory, only the most recently deleted file is retained in the recycle bin.

Examples

Remove the **1.cfg** file from the current directory.

```
<Sysname> delete 1.cfg
Delete flash:/1.cfg? [Y/N]:y
Deleting file flash:/1.cfg...Done.
```

Permanently delete the **1.cfg** file from the current directory.

```
<Sysname> delete /unreserved 1.cfg
The file cannot be restored. Delete flash:/1.cfg? [Y/N]:y
Deleting the file permanently will take a long time. Please wait...
Deleting file flash:/1.cfg...Done.
```

Related commands

reset recycle-bin

undelete

dir

Use **dir** to display files or directories.

Syntax

dir [**/all**] [*file* | *directory* | **/all-filesystems**]

Views

User view

Predefined user roles

network-admin

Parameters

/all: Displays all files and directories in the current directory, visible or hidden. If you do not specify this option, only visible files and directories are displayed.

file: Displays a specific file. This argument can use the asterisk (*) as a wildcard. For example, to display files with the **.txt** extension in the current directory, enter **dir *.txt**.

directory: Displays a specific directory.

/all-filesystems: Displays files and directories in the root directories of all file systems on the device.

Usage guidelines

If no option is specified, the command displays all visible files and directories in the current directory.

The directory name of the recycle bin is **.trash**. To display files in the recycle bin, use either of the following methods:

- Execute the **dir /all .trash** command.
- Execute the **cd .trash** command and then the **dir** command.

If multiple users perform file operations (for example, creating or deleting files or directories) at the same time, the output for this command might be incorrect.

Examples

Display information about all files and directories in the current directory.

```
<Sysname> dir /all
Directory of flash:/
...
```

Display files and directories in the root directories of all file systems on the device.

```
<Sysname> dir /all-filesystems
Directory of flash:/
...

Directory of usba0:/
...
```

Table 1 Command output

Field	Description
Directory of	Current directory.

Field	Description
0 -rwh 3144 Apr 26 2014 13:45:28 xx.xx	File or directory information: • **0**—File or directory number, which is automatically allocated by the system. • **-rwh**—Attributes of the file or directory. The first character is the directory indicator (**d** for directory and **–** for file). The second character indicates whether the file or directory is readable (**r** for readable). The third character indicates whether the file or directory is writable (**w** for writable). The fourth character indicates whether the file or directory is hidden (**h** for hidden, **-** for visible). Modifying, renaming, or deleting hidden files might affect functions. • **3144**—File size in bytes. For a directory, a hyphen (-) is displayed. • **Apr 26 2014 13:45:28**—Last date and time when the file or directory was modified. • **xx.xx**—File or directory name.

execute

Use **`execute`** to execute a batch file.

Syntax

`execute` *`filename`*

Views

System view

Predefined user roles

network-admin

Parameters

`filename:` Specifies the name of a batch file.

Usage guidelines

A batch file contains a set of commands. Executing a batch file executes the commands in the file one by one.

To execute a batch file on the device, create a batch file on a PC and load the batch file to the device.

As a best practice, try every command on the device to make sure the command can be executed correctly before adding the command to a batch file. If a command is invalid or a condition for executing the command is not met, the command fails and the system continues to execute the next command.

When executing an interactive command in a batch file, the system uses the default inputs.

Examples

Execute batch file **test.bat**.

```
<Sysname> fdisk usba: 3
[Sysname] execute test.bat
```

fdisk

Use **`fdisk`** to partition a storage medium.

Syntax

`fdisk` *`medium`* [*`partition-number`*]

Views

User view

Predefined user roles

network-admin

Parameters

medium: Specifies the name of the storage medium to be partitioned.

partition-number: Specifies the number of partitions, in the range of 1 to 4. If you specify this argument, the storage medium is divided evenly into the specified number of partitions. To customize the sizes of partitions, do not provide this argument.

Usage guidelines

The flash memory cannot be partitioned. A partition cannot be partitioned.

Before partitioning a storage medium, perform the following tasks:

- Back up the files in the storage medium. The partition operation clears all data on the medium.
- Make sure no other users are accessing the medium.
- Make sure the storage medium to be partitioned is not write protected. If the storage medium is write protected, the operation will fail, and you must remount or reinstall the storage medium to restore access to the storage medium.

After partitioning a storage medium, you must format the partitions to create the file systems before you can access the file systems.

The actual partition size and the specified partition size might have a difference of less than 5% of the storage medium's total size.

To change the sizes of partitions on a storage medium, partition the storage medium again and specify the required sizes for the partitions.

Before removing a partitioned storage medium, you must unmount all file systems on the storage medium.

Examples

Divide the USB disk on the device evenly into three partitions.

```
<Sysname> fdisk usba: 3
Capacity of usba: : 256M bytes
usba: will be divided into the following partitions:
DeviceName      Capacity
usba0:            85MB
usba1:            85MB
usba2:            86MB
All data on usba: will be lost, continue? [Y/N]:y
Partitioning usba:...Done.
```

Divide the USB disk on the device into one partition.

```
<Sysname> fdisk usba:
The capacity of usba: : 256M bytes
Partition 1 (32MB~224MB, 256MB. Press CTRL+C to quit or Enter to use all available space):
```

// Press **Enter** or enter **256.**

```
usba: will be divided into the following partition(s):
DeviceName    Capacity
usba0:          256MB
All data on usba: will be lost, continue? [Y/N]:y
```

```
Partitioning usba:...Done.
```

Divide the USB disk on the device into three partitions and specify the size for each partition.

```
<Sysname> fdisk usba:
The capacity of usba: : 256M bytes
Partition 1 (32MB~224MB, 256MB, Press CTRL+C to quit or Enter to use all available
space):128
```

// Enter **128** to set the size of the first partition to 128 MB.

```
Partition 2 (32MB~96MB, 128MB, Press CTRL+C to quit or Enter to use all available space):31
```

// Enter **31** to set the size of the second partition to 31 MB.

```
The partition size must be greater than or equal to 32MB.
Partition 2 (32MB~96MB, 128MB, Press CTRL+C to quit or Enter to use all available
space):1000
```

// Enter **1000** to set the size of the second partition to 1000 MB.

```
The partition size must be less than or equal to 128MB.
Partition 2 (32MB~96MB, 128MB, Press CTRL+C to quit or Enter to use all available space):127
```

// Enter **127** to set the size of the second partition to 127 MB.

```
The remaining space is less than 32MB. Please enter the size of partition 2 again.
Partition 2 (32MB~96MB, 128MB, Press CTRL+C to quit or Enter to use all available space):56
```

// Enter **56** to set the size of the second partition to 56 MB.

```
Partition 3 (32MB~40MB, 72MB, Press CTRL+C to quit or Enter to use all available space):
```

// Press **Enter** to assign the remaining space to the third partition.

```
usba: will be divided into the following partition(s):
DeviceName     Capacity
usba0:            128MB
usba1:            56MB
usba2:            72MB
All data on usba: will be lost, continue? [Y/N]:y
Partitioning usba:...Done.
```

file prompt

Use **file prompt** to set the operation mode for files and directories.

Use **undo file prompt** to restore the default.

Syntax

file prompt { **alert** | **quiet** }

undo file prompt

Default

The operation mode is **alert**. The system prompts for confirmation when you perform a destructive file or directory operation.

Views

System view

Predefined user roles

network-admin

Parameters

alert: Prompts for confirmation when a destructive file or directory operation is being performed.

quiet: Gives no confirmation prompt for file or directory operations except the recycle bin emptying operation.

Usage guidelines

In quiet mode, the system does not prompt for confirmation when a user performs a file or directory operation except the recycle bin emptying operation. The **alert** mode provides an opportunity to cancel a disruptive operation.

Examples

Set the file and directory operation mode to **alert**.

```
<Sysname> system-view
[Sysname] file prompt alert
```

fixdisk

Use **fixdisk** to check a file system for damage and repair any damage.

Syntax

fixdisk *filesystem*

Views

User view

Predefined user roles

network-admin

Parameters

filesystem: Specifies the name of a file system.

Usage guidelines

Use this command to fix a file system when space in the file system cannot be used or released.

You can repair a file system only when no other users are accessing the file system.

Examples

Repair file system **flash:**.

```
<Sysname> fixdisk flash:
Restoring flash: may take some time...
Restoring flash:...Done.
```

format

Use **format** to format a file system.

Syntax

format *filesystem*

Views

User view

Predefined user roles

network-admin

Parameters

filesystem: Specifies the name of a file system.

Usage guidelines

CAUTION:

Formatting a file system permanently deletes all files and directories in the file system. You cannot restore the deleted files or directories. If a startup configuration file exists in the file system, back up the file if necessary.

The device requires that the file systems on hot swappable storage media be VFAT file systems. To use a file system of a different type on the device, you must use this command to format the file system.

You can format a file system only when no other users are accessing the file system.

A file system to be formatted cannot contain security log files. Only a user with the security-audit user role can delete security log files. For more information about the security-audit user role, see RBAC in *Fundamentals Configuration Guide*.

Examples

Format file system **flash:**.

```
<Sysname> format flash:
All data on flash: will be lost, continue? [Y/N]:y
Formatting flash:... Done.
```

Format the file system on the third partition of the USB disk.

```
<Sysname> format usba2:
All data on usba2: will be lost, continue? [Y/N]:y
Formatting usba2:... Done.
```

gunzip

Use **gunzip** to decompress a file.

Syntax

gunzip *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of the file to be decompressed. This argument must use the **.gz** extension.

Usage guidelines

This command deletes the specified file after decompressing it.

Examples

Decompress file **system.bin.gz**:

1. Before decompressing the file, you can display files whose names start with the **system.** string.

```
<Sysname> dir system.*
Directory of flash:
   1 -rw-          20 Jun 14 2012 10:18:53   system.bin.gz
```

```
251904 KB total (193312 KB free)
```

2. Decompress the file **system.bin.gz**.

```
<Sysname> gunzip system.bin.gz
Decompressing file flash:/system.bin.gz..... Done.
```

3. Verify the decompress operation.

```
<Sysname> dir system.*
Directory of flash:
   1 -rw-           0 May 30 2012 11:42:25   system.bin

251904 KB total (193312 KB free)
```

gzip

Use **gzip** to compress a file.

Syntax

gzip *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of the file to be compressed.

Usage guidelines

This command saves the compressed file to the *file***.gz** file and deletes the source file.

Examples

Compress file **system.bin**:

1. Before compressing the file, you can display files whose names start with the **system.** string.

```
<Sysname> dir system.*
Directory of flash:
   1 -rw-           0 May 30 2012 11:42:24   system.bin

1251904 KB total (193312 KB free)
```

2. Compress the file **system.bin**.

```
<Sysname> gzip system.bin
Compressing file flash:/system.bin..... Done.
```

3. Verify the compress operation.

```
<Sysname> dir system.*
Directory of flash:
   1 -rw-          20 Jun 14 2012 10:18:53   system.bin.gz
```

```
251904 KB total (193312 KB free)
```

md5sum

Use **md5sum** to use the MD5 algorithm to calculate the digest of a file.

Syntax

md5sum *file*

Views

User view

Predefined user roles

network-admin

network-operator

Parameters

file: Specifies the name of a file.

Usage guidelines

You can use file digests to verify file integrity.

Examples

Use the MD5 algorithm to calculate the digest of file **system.bin**.

```
<Sysname> md5sum system.bin
MD5 digest:
4f22b6190d151a167105df61c35f0917
```

mkdir

Use **mkdir** to create a directory.

Syntax

mkdir *directory*

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies a directory.

Usage guidelines

The name of the directory to be created must be unique in the parent directory.

You can create a directory only in an existing directory. For example, to create the **flash:/test/mytest** directory, make sure the **test** directory already exists.

Examples

Create the **test** directory in the current directory.

```
<Sysname> mkdir test
Creating directory flash:/test... Done.
```

Create the **test/subtest** directory in the current directory.

```
<Sysname> mkdir test/subtest
Creating directory flash:/test/subtest... Done.
```

more

Use **more** to display the contents of a text file.

Syntax

more *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of a file.

Examples

Display the contents of the **test.txt** file.

```
<Sysname> more test.txt
Have a nice day.
```

Display the contents of the **testcfg.cfg** file.

```
<Sysname> more testcfg.cfg

#
 version 7.1.070, Release 1201
#
 sysname Sysname
#
vlan 2
#
return
<Sysname>
```

mount

Use **mount** to mount a file system.

Syntax

mount *filesystem*

Views

User view

Predefined user roles

network-admin

Parameters

filesystem: Specifies the name of a file system.

Usage guidelines

Generally, file systems on a hot-swappable storage medium are automatically mounted when the storage medium is connected to the device. If the system cannot recognize a file system, however, you must mount the file system before you can access it.

To avoid file system corruption, do not perform the following tasks while the system is mounting a file system:

- Reboot, power cycle, or power off the device.
- Install or remove storage media.
- Perform a switchover.

To remove a hot-swappable storage medium from the device, you must first unmount all file systems on the storage medium. Removing a mounted hot-swappable storage medium might damage files on the storage medium or even the storage medium.

Examples

Mount a file system on the USB disk.

```
<Sysname> mount usba0:
```

Related commands

umount

move

Use **move** to move a file.

Syntax

move *source-file* { *dest-file* | *dest-directory* }

Views

User view

Predefined user roles

network-admin

Parameters

source-file: Specifies the name of the source file.

dest-file: Specifies the name of the destination file.

dest-directory: Specifies the name of the destination directory.

Usage guidelines

If you specify a destination directory, the system moves the source file to the specified directory without changing the file name.

Examples

Move the **flash:/test/sample.txt** file to **flash:/**, and save it as **1.txt**.

```
<Sysname> move test/sample.txt 1.txt
Move flash:/test/sample.txt to flash:/1.txt? [Y/N]:y
Moving file flash:/test/sample.txt to flash:/1.txt ...Done.
```

Move the **b.cfg** file to the **test2** directory.

```
<Sysname> move b.cfg test2
Move flash:/b.cfg to flash:/test2/b.cfg? [Y/N]:y
Moving file flash:/b.cfg to flash:/test2/b.cfg... Done.
```

pwd

Use **pwd** to display the working directory.

Syntax

pwd

Views

User view

Predefined user roles

network-admin

Examples

Display the working directory.

```
<Sysname> pwd
flash:
```

rename

Use **rename** to rename a file or directory.

Syntax

rename { *source-file* | *source-directory* } { *dest-file* | *dest-directory* }

Views

User view

Predefined user roles

network-admin

Parameters

source-file: Specifies the name of the source file.

source-directory: Specifies the name of the source directory.

dest-file: Specifies the name of the destination file.

dest-directory: Specifies the name of the destination directory.

Usage guidelines

This command is not executed if the destination file or directory name is already used by an existing file or directory in the working directory.

Examples

Rename the **copy.cfg** file as **test.cfg**.

```
<Sysname> rename copy.cfg test.cfg
Rename flash:/copy.cfg as flash:/test.cfg? [Y/N]:y
Renaming flash:/copy.cfg as flash:/test.cfg... Done.
```

reset recycle-bin

Use **reset recycle-bin** to delete files from the recycle bin.

Syntax

reset recycle-bin [**/force**]

Views

User view

Predefined user roles

network-admin

Parameters

/force: Deletes all files in the recycle bin without prompting for confirmation. If you do not specify this option, the command prompts you to confirm the deletion operation for each file.

Usage guidelines

CAUTION:

The files in a recycle bin can be restored by using the **undelete** command. If you delete a file from the recycle bin, that file cannot be restored. Before you delete files from a recycle bin, make sure the files are no longer in use.

The **delete** *file* command only moves a file to the recycle bin. To permanently delete the file, use the **reset recycle-bin** command to delete the file from the recycle bin.

Examples

Empty the recycle bin. (In this example there are two files in the recycle bin.)

```
<Sysname> reset recycle-bin
Clear flash:/a.cfg? [Y/N]:y
Clearing file flash:/a.cfg... Done.
Clear flash:/b.cfg? [Y/N]:y
Clearing file flash:/b.cfg... Done.
```

Delete the **b.cfg** file from the recycle bin. (In this example there are two files in the recycle bin.)

```
<Sysname> reset recycle-bin
Clear flash:/a.cfg? [Y/N]:n
Clear flash:/b.cfg? [Y/N]:y
Clearing file flash:/b.cfg... Done.
```

Related commands

delete

rmdir

Use **rmdir** to delete a directory.

Syntax

rmdir *directory*

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies a directory.

Usage guidelines

CAUTION:

To delete a directory, you must first delete all files and subdirectories in the directory permanently or move them to the recycle bin. If you move them to the recycle bin, executing the **rmdir** command to delete the directory will delete them permanently. Before you use the **rmdir** command to delete a directory, you must make sure the directory and its files and subdirectories are no longer in use.

Examples

Delete the **subtest** directory.

```
<Sysname>rmdir subtest/
Remove directory flash:/test/subtest and the files in the recycle-bin under this directory
will be deleted permanently. Continue? [Y/N]:y
Removing directory flash:/test/subtest... Done.
```

sha256sum

Use **sha256sum** to use the SHA-256 algorithm to calculate the digest of a file.

Syntax

sha256sum *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of a file.

Usage guidelines

You can use file digests to verify file integrity.

Examples

Use the SHA-256 algorithm to calculate the digest of file **system.bin**.

```
<Sysname> sha256sum system.bin
SHA256 digest:
0851e0139f2770e87d01ee8c2995ca9e59a8f5f4062e99af14b141b1a36ca152
```

tar create

Use **tar create** to archive files and directories.

Syntax

tar create [**gz**] **archive-file** *dest-file* [**verbose**] **source** { *source-file* | *source-directory* }&<1-5>

Views

User view

Predefined user roles

network-admin

Parameters

gz: Uses gzip to compress the files and directories before archiving them. If you do not specify this keyword, the command archives the files and directories without compressing them.

archive-file *dest-file*: Specifies the archive file name. If you specified the **gz** keyword, the extension of the archive file name must be **.tar.gz**. If you did not specify the **gz** keyword, the extension of the archive file name must be **.tar**.

verbose: Displays the names of the successfully archived files and directories. If you do not specify this keyword, the command does not display the names of the successfully archived files and directories.

source { *source-file* | *source-directory* }&<1-5>: Specifies the files and directories to be archived. The argument can be a space-separated list of up to five items. Each item can be a file or directory name.

Examples

Archive the **1.cfg** and **2.cfg** files and the **test** directory to **a.tar**.

```
<Sysname> tar create archive-file a.tar source 1.cfg 2.cfg test
Creating archive flash:/a.tar Done.
```

Compress and archive the **1.cfg** and **2.cfg** files and the **test** directory to **b.tar.gz**.

```
<Sysname> tar create gz archive-file b.tar.gz source 1.cfg 2.cfg test
Creating archive flash:/b.tar.gz Done.
```

Compress and archive files and directories, and display the successfully archived files and directories.

```
<Sysname> tar create gz archive-file c.tar.gz verbose source 1.cfg 2.cfg test
1.cfg
2.cfg
test/
test/a.log
test/subtest/
test/subtest/aa.log
```

Related commands

tar extract

tar list

tar extract

Use **tar extract** to extract files and directories.

Syntax

tar extract archive-file *file* [**verbose**] [**screen** | **to** *directory*]

Views

User view

Predefined user roles

network-admin

Parameters

`archive-file` *`file`*: Specifies the archive file name. The extension can be **.tar** or **.tar.gz**.

`verbose`: Displays the names of the successfully extracted files and directories.

`screen`: Displays the content of the extracted files and directories on the screen. The extracted files are not saved.

`to` *`directory`*: Saves the extracted files and directories to a different directory. The *`directory`* argument specifies the directory.

Usage guidelines

IMPORTANT:

Before specifying the **`screen`** keyword for this command, use the **`tar list`** command to identify the types of the archived files. As a best practice, specify the keyword only if all archived files are text files. Displaying the content of an archived non-text file that contains terminal control characters might result in garbled characters and even cause the terminal unable to operate correctly. To use the terminal again, you must close the current connection and log in to the device again.

If you do not specify the **`screen`** keyword or the **`to`** *`directory`* option, the command saves the extracted files and directories to the working directory.

The command saves the extracted files and directories by using their original names. If a file or directory that has the same name as an extracted file or directory already exists in the destination directory, the file or directory is overwritten.

Examples

Extract files and directories from archive file **a.tar**.

```
<Sysname> tar extract archive-file a.tar
Extracting archive flash:/a.tar Done.
```

Extract files and directories from archive file **a.tar**, and display the names of the successfully extracted files and directories.

```
<Sysname> tar extract archive-file b.tar.gz verbose
1.cfg
2.cfg
test/
test/a.log
test/subtest/
test/subtest/aa.log
```

Extract files and directories from archive file **a.tar**, and display the content of the files on the screen.

```
<Sysname> tar extract archive-file c.tar.gz screen
#
 version 7.1.070, Release 1201
#
 sysname Sysname
#
...
```

Related commands

`tar create`

`tar list`

tar list

Use **tar list** to display the names of archived files and directories.

Syntax

tar list archive-file *file*

Views

User view

Predefined user roles

network-admin

Parameters

archive-file *file*: Specifies the archive file name. The extension can be **.tar** or **.tar.gz**.

Examples

Display the names of archived files and directories.

```
<Sysname> tar list archive-file a.tar
1.cfg
2.cfg
test/
test/a.log
test/subtest/
test/subtest/aa.log
```

Related commands

tar create

tar extract

umount

Use **umount** to unmount a file system.

Syntax

umount *filesystem*

Views

User view

Predefined user roles

network-admin

Parameters

filesystem: Specifies the name of a file system.

Usage guidelines

File systems on a storage medium are automatically mounted when the storage medium is connected to the device. To remove a hot-swappable storage medium from the device, you must first unmount all file systems on the storage medium. Removing a mounted hot-swappable storage medium might damage files on the storage medium or even the storage medium.

You can unmount a file system only when no other users are accessing the file system.

To avoid file system corruption, do not perform the following tasks while the system is unmounting a file system:

- Reboot, power cycle, or power off the device.
- Install, remove, or access storage media.
- Perform a switchover.

Examples

Unmount a file system on a USB disk.

```
<Sysname> umount usba0:
```

Related commands

mount

undelete

Use **undelete** to restore a file from the recycle bin.

Syntax

undelete *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of the file to be restored.

Usage guidelines

If a file with the same name already exists in the directory, the system prompts whether or not you want to overwrite the existing file. If you enter **Y**, the existing file is overwritten. If you enter **N**, the command is not executed.

Examples

Restore the **copy.cfg** file, which was moved from the root directory of the **flash:** file system to the recycle bin.

```
<Sysname>undelete copy.cfg
Undelete flash:/copy.cfg? [Y/N]:y
Undeleting file flash:/copy.cfg... Done.
```

Restore the **startup.cfg** file, which was moved from the **flash:/seclog** directory to the recycle bin.

- Method 1:

  ```
  <Sysname>undelete seclog/startup.cfg
  Undelete flash:/seclog/startup.cfg? [Y/N]:y
  Undeleting file flash:/seclog/startup.cfg... Done.
  <Sysname>
  ```

- Method 2:

  ```
  <Sysname> cd seclog
  <Sysname> undelete startup.cfg
  Undelete flash:/seclog/startup.cfg? [Y/N]:y
  Undeleting file flash:/seclog/startup.cfg... Done.
  ```

Contents

Configuration file management commands

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

archive configuration

Use **archive configuration** to manually archive the running configuration to the configuration archive directory.

Syntax

archive configuration

Views

User view

Predefined user roles

network-admin

Usage guidelines

This command saves the running configuration to the specified configuration archive directory with file names generated from the specified name prefix.

Before executing this command, you must use one of the following methods to specify a directory and a name prefix for the configuration archives:

- For local archiving, use the **archive configuration location** command to specify a local configuration archive directory and a name prefix.
- For remote archiving, use the **archive configuration server** command to specify a configuration archive directory and a name prefix on a remote SCP server. In addition, you must use the **archive configuration server user** and **archive configuration server password** commands to configure a username and password for accessing the server.

If you use the **archive configuration location** command to specify a local configuration archive directory, manual configuration archiving saves the running configuration only on the master device.

Examples

Archive the running configuration.

```
<Sysname> archive configuration
Save the running configuration to an archive file. Continue? [Y/N]: Y
The running configuration was saved to myarchive_1.cfg.
```

Related commands

archive configuration interval

archive configuration location

archive configuration max

archive configuration server

archive configuration server password

archive configuration server user

display archive configuration

archive configuration interval

Use **archive configuration interval** to enable automatic running-configuration archiving and set the archiving interval.

Use **undo archive configuration interval** to disable automatic running-configuration archiving.

Syntax

archive configuration interval *interval*

undo archive configuration interval

Default

The automatic running-configuration archiving feature is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval for automatically saving the running configuration. The value range is 10 to 525600, in minutes.

Usage guidelines

Automatic configuration archiving enables the system to periodically save the running configuration to the archive directory. After the system finishes an automatic archive, it resets the archiving interval timer.

Before enabling automatic configuration archiving, you must use one of the following methods to specify a directory and a name prefix for the configuration archives:

- For local archiving, use the **archive configuration location** command to specify a local configuration archive directory and a name prefix.
- For remote archiving, use the **archive configuration server** command to specify a configuration archive directory and a name prefix on a remote SCP server. In addition, you must use the **archive configuration server user** and **archive configuration server password** commands to configure a username and password for accessing the server.

If you use the **archive configuration location** command to specify a local configuration archive directory, automatic configuration archiving saves the running configuration only on the master device.

Examples

Set the system to archive the running configuration every 60 minutes.

```
<Sysname> system-view
[Sysname] archive configuration interval 60
Archive file will be saved every 60 minutes.
```

Related commands

archive configuration

archive configuration location

archive configuration max

archive configuration server

archive configuration server password

archive configuration server user

display archive configuration

archive configuration location

Use **archive configuration location** to specify a local directory and file name prefix for archiving the running configuration.

Use **undo archive configuration location** to restore the default.

Syntax

archive configuration location *directory* **filename-prefix** *filename-prefix*

undo archive configuration location

Default

No local directory or file name prefix is specified on the device for archiving the running configuration.

Views

System view

Predefined user roles

network-admin

Parameters

directory: Specifies the archive directory, a string of 1 to 63 characters. The value for this argument must take the format of *storage-medium-name:/folder-name*. The directory must already exist on the master.

filename-prefix: Specifies a file name prefix for configuration archives, a case-insensitive string of 1 to 30 characters. Valid characters are letters, digits, underscores (_), and hyphens (-).

Usage guidelines

Before archiving the running configuration, either manually or automatically, you must specify a local or remote directory and file name prefix for configuration archives.

The local configuration archives on the device are named in the format of *prefix_serial number***.cfg**, for example, **archive_1.cfg** and **archive_2.cfg**. The serial number is automatically assigned from 1 to 1000, increasing by 1. After the serial number reaches 1000, it restarts from 1.

If you change the file directory or file name prefix on the device, the following events occur:

- The old configuration archives change to common configuration files.
- The configuration archive counter is reset. The serial number for new configuration archives starts at 1.
- The **display archive configuration** command no longer displays the old configuration archives.

The configuration archive counter does not restart when you delete configuration archives from the archive directory. However, if the device reboots after all configuration archives have been deleted,

the configuration archive counter restarts. The serial number for new configuration archives starts at 1.

The **undo archive configuration location** command removes the local configuration archive directory and file name prefix settings. The command also performs the following operations:

- Disables the configuration archive feature (both manual and automatic methods).
- Restores the default settings of the **archive configuration interval** and **archive configuration max** commands.
- Clears the configuration archive information displayed by using the **display archive configuration** command.

Examples

Set the configuration archive directory as **flash:/archive** and the archive file name prefix as **my_archive**.

```
<Sysname> mkdir flash:/archive
Creating directory flash:/archive... Done.
<Sysname> system-view
[Sysname] archive configuration location flash:/archive filename-prefix my_archive
```

Related commands

archive configuration

archive configuration interval

archive configuration max

display archive configuration

archive configuration max

Use **archive configuration max** to set the maximum number of configuration archives that can be saved on the device.

Use **undo archive configuration max** to restore the default.

Syntax

archive configuration max *file-number*

undo archive configuration max

Default

The maximum number is 5.

Views

System view

Predefined user roles

network-admin

Parameters

file-number: Specifies the maximum number of configuration archives that can be saved on the device. The value range is 1 to 10. Adjust the setting depending on the amount of storage space available.

Usage guidelines

Before you execute this command, use the **archive configuration location** command to specify a configuration archive directory and archive file name prefix on the device.

After the maximum number of configuration archives is reached, the system deletes the oldest archive for the new archive.

Changing the limit setting to a lower value does not cause immediate deletion of excess archives. Instead, the configuration archive feature deletes the oldest *n* files when a new archive is manually or automatically saved, where *n* = current archive count – new archive limit + 1. For example, seven configuration archives have been saved before the archive limit is set to four. When saving a new configuration archive, the system first deletes the oldest four (7 – 4 + 1) archives.

If you execute the **undo archive configuration location** command, the default archive limit is restored.

Examples

Set the maximum number of configuration archives to 10.

```
<Sysname> system-view
[Sysname] archive configuration max 10
```

Related commands

archive configuration

archive configuration location

archive configuration interval

display archive configuration

archive configuration server

Use **archive configuration server** to configure the parameters for archiving the running configuration to a remote SCP server.

Use **undo archive configuration server** to restore the default.

Syntax

archive configuration server scp { *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**directory** *directory*] **filename-prefix** *filename-prefix*

undo archive configuration server

Default

No parameters are set for archiving the running configuration to a remote SCP server.

Views

System view

Predefined user roles

network-admin

Parameters

scp: Specifies a remote SCP server.

ipv4-address: Specifies the SCP server by its IPv4 address.

ipv6 *ipv6-address*: Specifies the SCP server by its IPv6 address.

port *port-number*: Specifies the TCP port number of the SCP server. The value range for the *port-number* argument is 0 to 65535, and the default port number is 22.

directory *directory*: Specifies the archive directory, a case-insensitive string. If you do not specify this option, the archive directory is the root directory of the SCP server.

filename-prefix *filename-prefix*: Specifies a file name prefix for configuration archives, a case-insensitive string of 1 to 30 characters. Valid characters are letters, digits, underscores (_), and hyphens (-).

Usage guidelines

IMPORTANT:

In FIPS mode, the device does not support archiving the running configuration to a remote SCP server.

Before archiving the running configuration to a remote SCP server, you must perform the following tasks:

- Use this command to specify a configuration archive directory and a name prefix on the remote SCP server.
- Use the **archive configuration server user** and **archive configuration server password** commands to configure a username and password for accessing the server.

To manually archive the running configuration, use the **archive configuration** command. To periodically archive the running configuration, use the **archive configuration interval** command.

On the specified remote SCP server, configuration archives are named in the format of *filename-prefix_YYYYMMDD_HHMMSS***.cfg**, for example, **archive_20170526_203430.cfg**.

Local archiving (the **archive configuration location** command) and remote archiving (the **archive configuration server** command) are mutually exclusive. You cannot use the two features at the same time.

The maximum number of configuration archives on a remote SCP server depends on the SCP server setting and is not restricted by the **archive configuration max** command.

The **undo archive configuration server** command removes the configuration archive directory and file name prefix settings, but it does not delete the configuration archives saved on the server. The command also performs the following operations:

- Disables the configuration archive feature (both manual and automatic methods).
- Restores the default setting for the **archive configuration interval** command.
- Clears the configuration archive information displayed by using the **display archive configuration** command.

Examples

Set the configuration archive directory as **archive/** on the SCP server at 192.168.1.1 and set the archive file name prefix as **my_archive**.

```
<Sysname> system-view
[Sysname] archive configuration server scp 192.168.1.1 port 22 directory /archive/
filename-prefix my_archive
```

Use **undo archive configuration server password** to restore the default.

Syntax

archive configuration server password { **cipher** | **simple** } *string*

undo archive configuration server password

Default

No password is configured for accessing the SCP server that saves the configuration archives.

Views

System view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 33 to 117 characters.

Examples

Set the password to **admin** in plaintext form for accessing the SCP server that saves the configuration archives.

```
<Sysname> system-view
[Sysname] archive configuration server password simple admin
```

backup startup-configuration

Use **backup startup-configuration** to back up the main next-startup configuration file to a TFTP server.

Syntax

backup startup-configuration to { *ipv4-server* | **ipv6** *ipv6-server* } [*dest-filename*]

Views

User view

Predefined user roles

network-admin

Parameters

ipv4-server: Specifies a TFTP server by its IPv4 address or host name. The host name is a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

ipv6 *ipv6-server*: Specifies a TFTP server by its IPv6 address or host name. The host name is a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

dest-filename: Specifies the name of the target file used for saving the file on the server. The file must be a .cfg file. The file name is a case-insensitive string of up to 255 characters. If you do not specify a target file name, the source file name is used.

Usage guidelines

This command is not supported in FIPS mode.

Examples

Back up the main next-startup configuration file to the IPv4 TFTP server at 2.2.2.2, and set the target file name to **192-168-1-26.cfg**.

```
<Sysname> backup startup-configuration to 2.2.2.2 192-168-1-26.cfg
Backing up the main startup configuration file to 2.2.2.2...
```

```
Done.
```

Back up the main next-startup configuration file to the IPv6 TFTP server at 2001::2, and set the target file name to **192-168-1-26.cfg**.

```
<Sysname> backup startup-configuration to ipv6 2001::2 192-168-1-26.cfg
Backing up the main startup configuration file to 2001::2...
Done.
```

Related commands

`restore startup-configuration`

configuration commit

Use **`configuration commit`** to commit the settings configured after the configuration commit delay timer was set.

Syntax

`configuration commit`

Views

System view

Predefined user roles

network-admin

Usage guidelines

You must execute the **`configuration commit delay`** command to set the configuration delay timer before executing this command.

The settings you made during the commit delay interval are automatically removed if you have not manually committed them before the configuration commit delay timer expires.

As a best practice, configure the information center to output logs to the console. Use the logs to determine whether you want to commit the settings. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Set the configuration commit delay timer to 10 minutes.

```
<Sysname> system-view
[Sysname] configuration commit delay 10
```

Commit the settings configured after the configuration commit delay timer was set and before the delay timer expires.

```
[Sysname] configuration commit
```

Related commands

`configuration commit delay`

configuration commit delay

Use **`configuration commit delay`** to enable the configuration commit delay feature and start the configuration commit delay timer.

Syntax

`configuration commit delay` *`delay-time`*

Views

System view

Predefined user roles

network-admin

Parameters

delay-time: Sets the configuration commit delay interval. The value range is 1 to 65535 minutes.

Usage guidelines

The system creates a rollback point to record the configuration status when you execute this command to start the configuration commit delay timer. The settings you made during the commit delay interval takes effect immediately. However, these settings will be removed automatically if you have not manually committed them before the configuration commit delay timer expires. Then, the system returns to the configuration status when the commit delay timer started.

This feature prevents a misconfiguration from causing the inability to access the device and is especially useful when you configure the device remotely.

When you use this feature, follow these restrictions and guidelines:

- In a multi-user context, make sure no one else is configuring the device.
- To avoid unexpected errors, do not perform any operations during the configuration rollback.
- You can reconfigure the configuration commit delay timer before it expires to shorten or extend the commit delay interval. However, the rollback point will not change.
- The configuration commit delay feature is a one-time setting. The feature is disabled with the rollback point removed when the commit delay timer expires or after a manual commit operation is performed. To use this feature again, you must re-execute this command.

Examples

Set the configuration commit delay timer to 10 minutes.

```
<Sysname> system-view
[Sysname] configuration commit delay 10
```

Change the configuration commit delay timer to 60 minutes before the old delay timer expires.

```
[Sysname] configuration commit delay 60
The commit delay already set 10 minutes, overwrite it? [Y/N]:y
```

Related commands

configuration commit

configuration encrypt

Use **configuration encrypt** to enable configuration encryption.

Use **undo configuration encrypt** to disable configuration encryption.

Syntax

configuration encrypt { **private-key** | **public-key** }

undo configuration encrypt

Default

Configuration encryption is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

`private-key`: Encrypts configuration with a private key. All devices running Comware 7 software use the same private key.

`public-key`: Encrypts configuration with a public key. All devices running Comware 7 software use the same public key.

Usage guidelines

Configuration encryption enables the device to automatically encrypt a configuration file when saving the running configuration to the file.

Any devices running Comware 7 software can decrypt the encrypted configuration file. To prevent an encrypted file from being decoded by unauthorized users, make sure the file is accessible only to authorized users.

Examples

Enable the public-key method for configuration encryption.

```
<Sysname> system-view
[Sysname] configuration encrypt public-key
```

configuration replace file

Use **`configuration replace file`** to perform configuration rollback.

Syntax

`configuration replace file` *`filename`*

Views

System view

Predefined user roles

network-admin

Parameters

`filename`: Specifies the path of the replacement configuration file, a string of up to 255 characters. The file must be a .cfg file. The file and file path must be valid and on the local system.

Usage guidelines

CAUTION:

The configuration rollback feature replaces the running configuration with the configuration in a configuration file without rebooting the device. This operation will cause settings not in the replacement configuration file to be lost, which might cause service interruption. When you perform configuration rollback, make sure you fully understand its impact on your network.

The configuration rollback feature helps you revert to a previous configuration state or adapt the running configuration to different network environments.

To ensure a successful rollback, follow these guidelines:

- Make sure the replacement configuration file is created by using the configuration archive feature or the **`save`** command on the device.
- If the configuration file is not created on the device, make sure the command lines in the configuration file are fully compatible with the device.

- If the replacement configuration file is encrypted, make sure the device can decrypt it.

Examples

Replace the running configuration with the configuration in the **my_archive_1.cfg** configuration file.

```
<Sysname> system-view
[Sysname] configuration replace file my_archive_1.cfg
Current configuration will be lost, save current configuration? [Y/N]:n
Now replacing the current configuration. Please wait...
Succeeded in replacing current configuration with the file my_archive_1.cfg.

display current-configuration

Use **display current-configuration** to display the running configuration.

Syntax

display current-configuration [[**configuration** [*module-name*] | **interface** [*interface-type* [*interface-number*]]] [**all**] | **slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

configuration [*module-name*]: Displays the feature configuration. The *module-name* argument specifies a feature module. If you do not specify a feature module, the command displays all feature settings you have made.

interface [*interface-type* [*interface-number*]]: Displays interface configuration, where the *interface-type* argument represents the interface type and the *interface-number* argument represents the interface number. If you do not specify the *interface-type interface-number* arguments, the command displays the running configuration for all interfaces. If you specify only the *interface-type* argument, the command displays the running configuration for all interfaces of this type.

all: Displays all settings in the running configuration, including the default settings. If you do not specify this keyword, the command displays only non-default settings in the running configuration.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify an IRF member device, this command displays the running configuration for all IRF member devices.

NOTE:

The **all** keyword is supported only in Release 6343P08 and later.

Usage guidelines

Use this command to verify the configuration you have made.

If the system has automatically changed the setting you have made for a parameter, this command displays the effective setting instead of the configured one. An automatic change typically occurs because of system restrictions. This command does not display parameters that are using the default settings.

Examples

Display local user configuration.

```
<Sysname> display current-configuration configuration local-user
#
local-user ftp
 password hash
$h$6$Twd73mLrN8O2vvD5$Cz1vgdpR4KoTiRQNE9pg33gU14Br2p1VguczLSVyJLO2huV5Syx/LfDIf8ROLtV

ErJ/C31oq2rFtmNuyZf4STw==
 service-type ssh telnet terminal
 authorization-attribute user-role network-admin
#
return
```

Display VLAN interface configuration.

```
<Sysname> display current-configuration interface Vlan-interface
#
interface Vlan-interface1
 ip address 192.168.1.84 255.255.255
#
Return
```

display current-configuration diff

Use **display current-configuration diff** to display the differences that the running configuration has as compared with the next-startup configuration.

Syntax

display current-configuration diff

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command searches for the next-startup configuration in the following order:

1. The .cfg main next-startup configuration file.
2. The .cfg backup next-startup configuration file if the .cfg main next-startup configuration file is unavailable.

If both configuration files are unavailable, the system displays a message indicating that no next-startup configuration files exist.

Examples

Display the differences that the running configuration has as compared with the next-startup configuration.

```
<Sysname> display current-configuration diff
--- Startup configuration
+++ Current configuration
@@ -5,7 +5,7 @@
 #
  sysname Sysname
 #
-alias dhc display history-command
+alias dh display hotkey
 #
  system-working-mode standard
<Sysname>
```

Table 2 Command output

Field	Description
--- *A* +++ *B*	• *A* represents the source configuration for comparison, which can be **Startup configuration**, **Current configuration**, or the name of the source configuration file with its directory information. • *B* represents the target configuration for comparison, which can be **Current configuration**, **Startup configuration**, or the name of the target configuration file with its directory information. In this example, the startup configuration and the current configuration are the source and target, respectively.

Field	Description
@@ -linenumber1,number1 +linenumber2,number2 @@	Location information for identifying the command line differences: • *-linenumber1,number1*—Source configuration section that contains differences. The *linenumber1* argument represents the start line of the section. The *number1* argument represents the number of lines between the start line and the end line of the section. • *+linenumber2,number2*—Target configuration section that contains differences. The *linenumber2* argument represents the start line of the section. The *number2* argument represents the number of lines between the start line and the end line of the section.
cmd1 *- cmd2* *+ cmd3* *cmd4*	Displays command differences. • *cmd1* and *cmd4*—Command lines are contained in both source and target configurations if they are not prefixed with a minus (-) or plus (+) sign. Predefined user roles

network-admin

network-operator

Usage guidelines

Factory defaults are custom basic settings that came with the device. Factory defaults vary by device models and might differ from the initial default settings for the commands.

The device starts up with the factory defaults if no next-startup configuration files are available.

Examples

Display the factory defaults.

```
<Sysname> display default-configuration
```

display diff

Use **display diff** to display differences between configurations.

Syntax

display diff configfile *file-name-s* { **configfile** *file-name-d* | **current-configuration** | **startup-configuration** }

display diff current-configuration { **configfile** *file-name-d* | **startup-configuration** }

display diff startup-configuration { **configfile** *file-name-d* | **current-configuration** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

configfile *file-name-s*: Specifies the source configuration file for comparison.

configfile *file-name-d*: Specifies the target configuration file for comparison.

current-configuration: Specifies the running configuration. In the **display diff current-configuration** command, this keyword specifies the source configuration for comparison. In the **display diff configfile** *file-name-s* and **display diff startup-configuration** commands, this keyword specifies the target configuration.

startup-configuration: Specifies the next-startup configuration. In the **display diff startup-configuration** command, this keyword specifies the source configuration for comparison. In the **display diff configfile** *file-name-s* and **display diff current-configuration** commands, this keyword specifies the target configuration.

Usage guidelines

If you specify the **startup-configuration** keyword, the system searches for the next-startup configuration in the following order:

1. The .cfg main next-startup configuration file.
2. The .cfg backup next-startup configuration file if the .cfg main next-startup configuration file is unavailable.

If both configuration files are unavailable, the system displays a message indicating that no next-startup configuration files exist.

Examples

Display the differences between **startup.cfg** and **test.cfg**.

display saved-configuration

display saved-configuration

Use **display saved-configuration** to display the contents of the configuration file for the next system startup.

Syntax

display saved-configuration

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Use this command to verify that important settings have been saved to the configuration file for the next system startup.

This command selects the configuration file to display in the following order:

1. If the main startup configuration file is available, this command displays the contents of the main startup configuration file.
2. If only the backup startup configuration file is available, this command displays the contents of the backup file.
3. If both the main and backup startup configuration files are not available, this command does not display anything.

Examples

Display the contents of the configuration file for the next system startup.

```
<Sysname> display saved-configuration
#
 version 7.1.070, Release 1201
#
 sysname Sysname
#
 ftp server enable
#
 telnet server enable
#

#
vlan 1
#
domain system
#
  ---- More ----
```

Related commands

reset saved-configuration

save

display startup

Use **display startup** to display the names of the current startup configuration file and the next-startup configuration files.

Syntax

display startup

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

All IRF members use the same current startup configuration file as the master.

After a master/subordinate switchover, it is normal that the current startup configuration files on all IRF members are displayed as NULL. This is because the new master continues to run with the running configuration rather than rebooting with a startup configuration file.

Examples

Display names of the startup configuration files.

```
<Sysname> display startup
MainBoard:
 Current startup saved-configuration file: flash:/startup.cfg(*)
 Next main startup saved-configuration file: flash:/startup.cfg
 Next backup startup saved-configuration file: NULL
```

Table 3 Command output

Field	Description
MainBoard	Displays the startup configuration files on the master device.
Current startup saved-configuration file	Configuration file that the device has started up with. If the field is suffixed with an asterisk (*), the startup configuration file is a binary configuration file.
Next main startup saved-configuration file	Primary configuration file to be used at the next startup.
Next backup startup saved-configuration file	Backup configuration file to be used at the next startup.

Related commands

`startup saved-configuration`

display this

Use **`display this`** to display the running configuration in the current view.

Syntax

`display this [ all ]`

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`all`: Displays all settings in the running configuration in the current view, including the default settings. If you do not specify this keyword, the command displays only non-default settings in the running configuration.

NOTE:

The **`all`** keyword is supported only in Release 6343P08 and later.

Usage guidelines

Use this command to verify the configuration you have made in a certain view.

This command does not display parameters that are using the default settings.

Some parameters can be successfully set even if their dependent features are not enabled. For these parameters, this command displays their settings after the dependent features are enabled.

This command can be executed in any user line view to display the running configuration of all user lines.

Examples

Display the running configuration on VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] display this
#
interface Vlan-interface1
#
return
```

reset saved-configuration

Use **reset saved-configuration** to delete a next-startup configuration file.

Syntax

reset saved-configuration [**backup** | **main**]

Views

User view

Predefined user roles

network-admin

Parameters

backup: Specifies the backup next-startup configuration file.

main: Specifies the main next-startup configuration file.

Usage guidelines

CAUTION:

By default, this command permanently deletes the specified next-startup configuration file from all IRF member devices. To delete the configuration file only from the master device, disable automatic system-wide next-startup configuration file operations. For more information about disabling these operations, see *Fundamentals Configuration Guide*.

You can delete the main file, the backup file, or both.

To delete a file that is set as both main and backup next-startup configuration files, you must execute both the **reset saved-configuration backup** command and the **reset saved-configuration main** command. Using only one of the commands sets the target file attribute to NULL instead of deleting the file.

If you do not specify a configuration file attribute, the **reset saved-configuration** command deletes the main next-startup configuration file.

Examples

Delete the main next-startup configuration file.

```
<Sysname> reset saved-configuration
The saved configuration file will be erased. Are you sure? [Y/N]:y
Configuration file in flash: is being cleared.
Please wait ...........
Configuration file is cleared.
```

Related commands

display saved-configuration

restore startup-configuration

Use **restore startup-configuration** to download a configuration file from a TFTP server and specify it as the main next-startup configuration file.

Syntax

restore startup-configuration from { *ipv4-server* | **ipv6** *ipv6-server* } *src-filename*

Views

User view

Predefined user roles

network-admin

Parameters

ipv4-server: Specifies a TFTP server by its IPv4 address or host name. The host name is a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

ipv6 *ipv6-server*: Specifies a TFTP server by its IPv6 address or host name. The host name is a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

src-filename: Specifies the name of the configuration file to be downloaded. The file must be a .cfg file. The file name is a case-insensitive string of up to 255 characters.

Usage guidelines

This command is not supported in FIPS mode.

Before restoring the configuration file for the next startup, make sure the following requirements are met:

- The server is reachable.
- The server is enabled with TFTP service.
- You have read and write permissions to the server.

This command downloads the configuration file to the root directory of the default storage medium on each member device and specifies the file as the main next-startup configuration file. If a partitioned USB disk is used as the default storage medium, the configuration file is saved on the first partition. Make sure all IRF members use the same type of default storage media. If a subordinate device uses a different type of default storage medium than the master, the command cannot propagate the configuration file to the subordinate device. For example, the subordinate device uses a USB disk, but the master uses a flash memory. In this situation, you must manually restore the main next-startup configuration file on the subordinate device.

Examples

Download **test.cfg** from the IPv4 TFTP server at 2.2.2.2, and specify the file as the main next-startup configuration file.

```
<Sysname> restore startup-configuration from 2.2.2.2 test.cfg
Restoring the next startup-configuration file from 2.2.2.2. Please wait...finished.
```

Download **test.cfg** from the IPv6 TFTP server at 2001::2, and specify the file as the main next-startup configuration file.

```
<Sysname> restore startup-configuration from ipv6 2001::2 test.cfg
```

```
Restoring the next startup-configuration file from 2001::2. Please wait...finished.
```

Related commands

backup startup-configuration

save

Use **save** *file-url* [**all** | **slot** *slot-number*] to save the running configuration to a configuration file, without specifying the file as a next-startup configuration file.

Use **save** [**safely**] [**backup** | **main**] [**force**] [**changed**] to save the running configuration as a next-startup configuration file in the root directory of the storage medium.

Syntax

save *file-url* [**all** | **slot** *slot-number*]

save [**safely**] [**backup** | **main**] [**force**] [**changed**]

Views

Any view

Predefined user roles

network-admin

Parameters

file-url: Specifies a file path, a string of up to 255 characters. The file must be a .cfg file. If you specify the **all** keyword or the **slot** *slot-number* option, the file path cannot include a member ID. If the file path includes a folder name, the folder must already exist on the specified IRF member devices.

all: Saves the running configuration to all member devices. If you do not specify this keyword or the **slot** *slot-number* option, the command saves the running configuration only to the master.

slot *slot-number*: Specifies a subordinate device by its member ID. If you do not specify a subordinate device or the **all** keyword, this command saves the running configuration only to the master.

safely: Saves the configuration file in safe mode. If you do not specify this keyword, the device saves the configuration file in fast mode.

backup: Saves the running configuration to a configuration file, and specifies the file as the backup next-startup configuration file. If you do not specify this keyword or the **main** keyword, the command specifies the saved file as the main next-startup configuration file.

main: Saves the running configuration to a configuration file, and specifies the file as the main next-startup configuration file. If you do not specify this keyword or the **backup** keyword, the command specifies the saved file as the main next-startup configuration file.

force: Saves the running configuration to the existing next-startup configuration file without prompting for confirmation. If you do not specify this keyword, the system prompts you to confirm the operation. If you do not confirm the operation within 30 seconds, the system automatically aborts the operation. If you enter **Y** within the time limit, you can continue the save process and change the target file name during the process.

changed: Overwrites the target configuration file with the running configuration if an inconsistency is detected between the settings in the configuration file and the running configuration. The **save** command does not take effect if no inconsistency is detected. If you do not specify this keyword, the **save** command always overwrites the target configuration file with the running configuration.

Usage guidelines

CAUTION:

Use the **save** command with caution. This command will overwrite the settings in the target configuration file. When you execute this command, carefully read the messages displayed by the system and make sure you fully understand the impact of this command on services.

If the file specified for this command does not exist, the system creates the file before saving the configuration. If the file already exists, the system prompts you to confirm whether to overwrite the file. If you choose to not overwrite the file, the system cancels the save operation.

This command saves the running configuration to an .mdb binary file as well as a .cfg text file. The two files use the same file name. An .mdb file takes less time to load than a .cfg file.

When you use the **save** [**safely**] [**backup** | **main**] [**force**] [**changed**] command, follow these guidelines:

- In safe mode, the system saves configuration in a temporary file and starts overwriting the target next-startup configuration file after the save operation is complete. If a reboot, power failure, or out of memory or storage space event occurs during the save operation, the next-startup configuration file is retained.
- In fast mode, the device directly overwrites the target next-startup configuration file. If a reboot, power failure, or out of memory or storage space event occurs during this process, all settings in the next-startup configuration file are lost.

Safe mode is slower than fast mode, but more secure. As a best practice, specify the **safely** keyword for reliable configuration saving.

By default, the **save** [**safely**] [**backup** | **main**] [**force**] [**changed**] command saves the configuration to all IRF member devices. To save the configuration only to the master device, disable automatic system-wide next-startup configuration file operations. For more information about disabling these operations, see *Fundamentals Configuration Guide*.

Examples

Save the running configuration to **backup.cfg**, without specifying the file as a next-startup configuration file.

```
<Sysname> save backup.cfg
The current configuration will be saved to flash:/backup.cfg. Continue? [Y/N]:y
Now saving current configuration to the device.
Saving configuration flash:/backup.cfg. Please wait...
Configuration is saved to device successfully.
```

Save the running configuration to the main next-startup configuration file without any confirmation required.

```
<Sysname> save force
Validating file. Please wait....
Saved the current configuration to mainboard device successfully.
```

Save the running configuration to a file in the root directory of the default storage medium, and specify the file as the main next-startup configuration file.

```
<Sysname> save
The current configuration will be written to the device. Are you sure? [Y/N]:y
Please input the file name(*.cfg)[flash:/backup.cfg]
(To leave the existing filename unchanged, press the enter key):test.cfg
Validating file. Please wait.....
Saved the current configuration to mainboard device successfully.
```

display saved-configuration

standby auto-update config

Use **standby auto-update config** to enable automatic system-wide next-startup configuration file operations.

Use **undo standby auto-update config** to disable automatic system-wide next-startup configuration file operations.

Syntax

standby auto-update config

undo standby auto-update config

Default

Next-startup configuration file operations are automatically synchronized across the entire system.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, automatic system-wide next-startup configuration file operations are enabled. The system performs the following operations on all IRF subordinate devices in addition to the master device:

- Saves the running configuration to the next-startup configuration file on each member device when you execute the **save** [**safely**] [**backup** | **main**] [**force**] [**changed**] command.
- Deletes the next-startup configuration file on each member device when you execute the **reset saved-configuration** command.

If you disable automatic system-wide next-startup configuration file operations, the system saves the running configuration or deletes the next-startup configuration file only on the master device.

Automatic system-wide operations ensure start-up configuration file consistency between the master and subordinate devices. However, a system-wide operation takes more time than an operation performed only on the master device. In addition, the amount of time required to complete a system-wide configuration operation increases as the amount of configuration data grows.

If you are disabling automatic system-wide operations for faster configuration saving, be aware that the next-startup configuration files will be inconsistent between the master device and the subordinate devices.

Examples

Enable automatic system-wide next-startup configuration file operations.

```
<Sysname> system-view
[Sysname] standby auto-update config
```

Related commands

reset saved-configuration

save

startup saved-configuration

Use **startup saved-configuration** to specify a file as a next-startup configuration file.

Use **undo startup saved-configuration** to configure the system to start up with the factory defaults at the next startup.

Syntax

startup saved-configuration *cfgfile* [**backup** | **main**]

undo startup saved-configuration

Default

No next-startup configuration files are specified.

Views

User view

Predefined user roles

network-admin

Parameters

cfgfile: Specifies the path of a configuration file, a string of up to 255 characters. The file must be a .cfg file. The file path can include only the file name, or the storage medium information and file name. If the file is not on the default storage medium, you must specify the file name with storage medium information.

backup: Specifies the configuration file as the backup next-startup configuration file.

main: Specifies the configuration file as the main next-startup configuration file. This is the primary configuration file that the device attempts to load at startup. If the loading attempt fails, the device tries the backup next-startup configuration file.

Usage guidelines

CAUTION:

In an IRF fabric, the **undo startup saved-configuration** command can cause an IRF split after the IRF fabric or an IRF member reboots.

The **startup saved-configuration** command applies to all IRF members. To successfully execute this command, make sure the specified file has been saved in the root directory of the storage medium on each member.

If you do not specify the **backup** or **main** keyword, the **startup saved-configuration** command specifies the main next-startup configuration file.

As a best practice, specify different files as the main and backup next-startup configuration files.

The **undo startup saved-configuration** command changes the file attribute of the main and backup next-startup configuration files to NULL. However, the command does not delete the two configuration files.

You can also specify a configuration file as a next startup file when you use the **save** command to save the running configuration.

Examples

Specify the main next-startup configuration file.

```
<Sysname> startup saved-configuration testcfg.cfg
Please wait ....... Done.
```

Related commands

display startup

Contents

Software upgrade commands

As a best practice, store the startup images in a fixed storage medium. If you store the startup images in a hot swappable storage medium, do not remove the hot swappable storage medium during the startup process.

boot-loader file

Use **boot-loader file** to specify startup image files.

Syntax

boot-loader file boot *filename* **system** *filename* [**feature** *filename*&<1-30>] [**patch** *filename*&<1-16>] { **all** | **slot** *slot-number* } { **backup** | **main** }

boot-loader file *ipe-filename* [**patch** *filename*&<1-16>] { **all** | **slot** *slot-number* } { **backup** | **main** }

Views

User view

Predefined user roles

network-admin

Parameters

boot: Specifies a boot image file.

system: Specifies a system image file.

feature: Specifies a space-separated list of up to 30 feature image files.

patch: Specifies a space-separated list of up to 16 patch image files. You can specify only non-incremental patch image files.

filename: Specifies a .bin file in the *filesystemname*:*filename***.bin** format. The file must be stored in the root directory of a file system on the device. Excluding the file system location section (if any), the value string can have a maximum of 63 characters. For more information about specifying a file, see *Fundamentals Configuration Guide*.

ipe-filename: Specifies an .ipe image package file in the *filesystemname*:*filename***.ipe** format. The file must be stored in the root directory of a file system on the device. Excluding the file system location section (if any), the value string can have a maximum of 63 characters. For more information about specifying a file, see *Fundamentals Configuration Guide*.

all: Specifies all hardware components to which the specified images apply.

slot *slot-number*: Specifies the IRF member ID of a member device.

backup: Specifies the files as backup startup image files. Backup images are used only when main images are not available.

main: Specifies the files as main startup image files. The device always first attempts to start up with main startup files.

Usage guidelines

The **boot-loader file** command overwrites the entire startup image list. To add new startup feature images, specify all feature image files in the old startup image list, including feature image files. The new startup image list will contain only the feature image files that are specified in the command.

To load the specified startup software images, you must reboot the system.

If the upgrade images are not found in the file system on the slot specified to upgrade, the system automatically copies the images to that file system. The destination directory is the root directory of the file system. If the destination root directory already contains a startup image with the same name as an upgrade image, you must choose whether to overwrite the image.

Examples

Specify **flash:/all.ipe** as the main startup image file for slot 1.

```
<Sysname> boot-loader file flash:/all.ipe slot 1 main
Verifying the IPE file and the images.....Done.
H3C S5130S-28S-HPWR-LI Switch images in IPE:

Related commands

display boot-loader

boot-loader update

Use **boot-loader update** to synchronize startup images.

Syntax

boot-loader update { **all** | **slot** *slot-number* }

Views

User view

Predefined user roles

network-admin

Parameters

all: Synchronizes startup images from the master to all subordinate devices.

slot *slot-number*: Specifies the IRF member ID of a subordinate device.

Usage guidelines

You can use this command to synchronize startup images after adding new member devices.

The startup images synchronized to the subordinate device are set as main startup images, regardless of whether the source startup images are main or backup.

- If the master device has started up with main startup images, its main startup images are synchronized to the subordinate device, regardless of whether any main startup image has been respecified on the master device.
- If the master device has started up with backup startup images, its backup startup images are synchronized to the subordinate device, regardless of whether any backup startup image has been respecified on the master device.

If patches have been installed on the master, use the **install commit** command to update the set of main startup images on the master before software synchronization. This command ensures startup image consistency between the master and the subordinate device.

Startup image synchronization fails if any software image being synchronized is not available or is corrupted.

Examples

Synchronize startup images to a slot.

```
<Sysname> boot-loader update slot 2
This command will update the specified standby MPU. Continue? [Y/N]:y
Updating. Please wait...
Verifying the file flash:/s5130s_li-cmw710-boot-a6103p06.bin on slot 1...Done.
Verifying the file flash:/s5130s_li-cmw710-system-a6103p06.bin on slot 1....Done.
Verifying the file flash:/s5130s_li -cmw710-devkit-a6103p06.bin on slot 1...Done.
Copying main startup software images to slot 2. Please wait...
Done.
Setting copied images as main startup software images for slot 2...
The images that have passed all examinations will be used as the main startup software
images at the next reboot on slot 2.
Done.
Successfully updated the startup software images of slot 2.
```

Related commands

display boot-loader

bootrom update

Use **bootrom update** to load the BootWare image from a file system to the Normal BootWare area.

Syntax

bootrom update file *file* **slot** *slot-number-list*

Views

User view

Predefined user roles

network-admin

Parameters

file *file*: Specifies the file that contains the BootWare image. The *file* argument represents the file name, a string of 1 to 63 characters.

slot *slot-number-list*: Specifies a space-separated list of up to seven slot number items. An item specifies an IRF member device by its member ID or a range of IRF member devices in the form of *start-slot-number* **to** *end-slot-number*. The end slot number must be equal to or greater than the start slot number.

Usage guidelines

BootWare images are contained in the .bin Comware boot image file. You can specify a Comware boot image file in this command to upgrade the BootWares in the system before you upgrade the Comware images. If you do not upgrade BootWares before upgrading Comware images, the system automatically upgrades BootWares as necessary when loading Comware images.

The new BootWare images take effect after you reboot the device.

Examples

Use the file **a.bin** in the root directory of the flash memory to upgrade the BootWare image.

```
<Sysname> bootrom update file flash:/a.bin slot 1
   This command will update the Boot ROM file on the specified board(s), Continue? [Y/N]:y
   Now updating the Boot ROM, please wait.............Done.
```

`install active`

display install committed

Use **display install committed** to display main startup software images.

Syntax

display install committed [**slot** *slot-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify an IRF member device, this command displays information for all IRF member devices.

verbose: Displays detailed information. If you do not specify this keyword, the command displays only image names.

Usage guidelines

Some **install** commands modify the current software image list but do not modify the main startup image list. For the software image changes to take effect after a reboot, you must execute the **install commit** command to update the main startup image list with the image changes. You can use the **display install committed** command to verify the operation results.

Both the **install commit** and **boot-loader file** commands modify the main startup software image list.

Examples

Display brief information about main startup software images.

```
<Sysname> display install committed
Committed packages on slot 1:
 flash:/boot-t5101.bin
 flash:/system-t5101.bin
 flash:/feature.bin
```

Display detailed information about main startup software images.

Description: ssh package
```

For information about the command output, see Table 2.

Related commands

boot-loader file

install commit

install activate

Use **install activate** to activate feature or patch images.

Syntax

install activate feature *filename*&<1-30> **slot** *slot-number*

install activate patch *filename* { **all** | **slot** *slot-number* }

Views

User view

Predefined user roles

network-admin

Parameters

feature: Specifies a space-separated list of up to 30 feature image files.

patch: Specifies a patch image file. You can specify only one patch image file for the command at a time. However, you can execute the command multiple times to activate multiple patch image files.

filename: Specifies a .bin file in the *filesystemname*:/*filename*.**bin** format. The file must be stored in the root directory of a file system on the device. Excluding the file system location section (if any),

the value string can have a maximum of 63 characters. For more information about specifying a file, see file system management in *Fundamentals Configuration Guide*.

all: Specifies all IRF member devices.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

This command activates images and adds the images to the current image list. Images run in memory immediately after they are activated. However, only images activated by using the **install activate patch** *filename* **all** command still run in memory after a reboot. For other images to take effect after a reboot, you must commit the software change by using the **install commit** command.

If the image file is not on the member device to be upgraded, the **install activate** command automatically copies the image file to the member device.

Examples

Activate **system-patch.bin** on IRF member device 1.

```
<Sysname> install activate system-patch.bin slot 1
```

Related commands

display install active

install commit

install deactivate

install commit

Use **install commit** to commit software changes.

Syntax

install commit

Views

User view

Predefined user roles

network-admin

Usage guidelines

This command adds the patch image file to the startup image list that the device used at startup.

- If the device used the main startup software image list at startup, this command adds the patch image file to the main startup software image list.
- If the device used the backup startup software image list at startup, this command adds the patch image file to the backup startup software image list.

Both the **install commit** and **boot-loader file** commands modify the main startup software image list. To modify the backup startup image list or add inactive images as main startup images, however, you must use the **boot-loader file** command.

For more information about main and backup startup software images, see *Fundamentals Configuration Guide*.

Examples

Commit software changes.

```
<Sysname> install commit
```

```
This operation will take several minutes, please wait.........................Done.
```

Related commands

`install activate`

`install deactivate`

install deactivate

Use **`install deactivate`** to deactivate feature or patch images.

Syntax

`install deactivate feature` *`filename`*&<1-30> **`slot`** *`slot-number`*

`install deactivate patch` *`filename`* { **`all`** | **`slot`** *`slot-number`* }

Views

User view

Predefined user roles

network-admin

Parameters

`feature`: Specifies a space-separated list of up to 30 feature image files.

`patch`: Specifies a patch image file. You can specify only one patch image file for the command at a time. However, you can execute the command multiple times to deactivate multiple patch image files.

`filename`: Specifies a .bin file in the *filesystemname*/*filename***.bin** format. The file must be stored in the root directory of a file system on the device. Excluding the file system location section (if any), the value string can have a maximum of 63 characters. For more information about specifying a file, see file system management in *Fundamentals Configuration Guide*.

`all`: Specifies all IRF member devices.

`slot` *`slot-number`*: Specifies an IRF member device by its member ID.

Usage guidelines

You can deactivate only active feature and patch images.

Images stop running in memory immediately after they are deactivated. However, only patch images deactivated by using the **`install deactivate patch`** *`filename`* **`all`** command do not run after a reboot. To prevent other deactivated images from running after a reboot, you must commit the software change by using the **`install commit`** command.

Examples

Deactivate **route-patch.bin** on IRF member device 1.

```
<Sysname> install deactivate patch flash:/route-patch.bin slot 1
```

Related commands

`display install active`

Device management commands

clock datetime

Use **clock datetime** to set the system time.

Syntax

clock datetime *time date*

Default

The system time is UTC time 00:00:00 01/01/2013.

Views

User view

Predefined user roles

network-admin

Parameters

time: Specifies a time in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

date: Specifies a date in the *MM/DD/YYYY* or *YYYY/MM/DD* format. The value range for *YYYY* is 2000 to 2035. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.

Usage guidelines

CAUTION:

This command changes the system time, which affects the execution of system time-related features (for example, scheduled tasks) and collaborative operations of the device with other devices (for example, log reporting and statistics collection). Before executing this command, make sure you fully understand its impact on your live network.

Correct system time is essential to network management and communication. You must configure the system time correctly before you run the device on the network.

For the device to use the local system time, execute the **clock protocol none** command and this command in turn. The specified system time takes effect immediately. Then, the device uses the clock signals generated by its built-in crystal oscillator to maintain the system time.

A device power cycling operation restores the local system time to the default. After the device is power cycled, you must execute this command again to set the local system time.

Examples

Set the system time to 08:08:08 01/01/2015.

```
<Sysname> clock datetime 8:8:8 1/1/2015
```

Set the system time to 08:10:00 01/01/2015.

```
<Sysname> clock datetime 8:10 2015/1/1
```

Related commands

clock protocol

clock summer-time

clock timezone

display clock

clock protocol

Use **clock protocol** to specify the system time source.

Use **undo clock protocol** to restore the default.

Syntax

clock protocol { **none** | **ntp** }

undo clock protocol

Default

The device obtains the UTC time from an NTP time source.

Views

System view

Predefined user roles

network-admin

Parameters

none: Uses the system time set by using the **clock datetime** command.

ntp: Uses NTP to obtain the UTC time. You must configure NTP correctly. For more information about NTP and NTP configuration, see *Network Management and Monitoring Configuration Guide*.

Usage guidelines

Correct system time is essential to network management and communication. You must configure the system time correctly before you run the device on the network.

The device can use the locally set system time, or obtain the UTC time from a time source on the network and calculate the system time.

If you execute the **clock protocol none** command, the device uses the locally set system time. The device then uses the clock signals generated by its built-in crystal oscillator to maintain the system time.

If you execute the **clock protocol ntp** command, the device obtains the UTC time through NTP and calculates the system time. The device then periodically synchronizes the UTC time and recalculates the system time.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the device to use the local UTC time.

```
<Sysname> system-view
[Sysname] clock protocol none
```

clock summer-time

Use **clock summer-time** to set the daylight saving time.

Use **undo clock summer-time** to restore the default.

Syntax

clock summer-time *name* *start-time* *start-date* *end-time* *end-date* *add-time*

undo clock summer-time

Default

The daylight saving time is not set.

Views

System view

Predefined user roles

network-admin

Parameters

name: Specifies a name for the daylight saving time schedule, a case-sensitive string of 1 to 32 characters.

start-time: Specifies the start time in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

start-date: Specifies the start date in one of the following formats:

- *MM/DD*. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.
- *month week day*, where:
  - *month*—Takes **January**, **February**, **March**, **April**, **May**, **June**, **July**, **August**, **September**, **October**, **November** or **December**.
  - *week*—Represents week of the month. It takes **first**, **second**, **third**, **fourth**, **fifth**, or **last**.
  - *day*—Takes **Sunday**, **Monday**, **Tuesday**, **Wednesday**, **Thursday**, **Friday**, or **Saturday**.

end-time: Specifies the end time in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

end-date: Specifies the end date in one of the following formats:

- *MM/DD*. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.
- *month week day*, where:
  - *month*—Takes **January**, **February**, **March**, **April**, **May**, **June**, **July**, **August**, **September**, **October**, **November** or **December**.
  - *week*—Represents week of the month. It takes **first**, **second**, **third**, **fourth**, **fifth**, or **last**.
  - *day*—Takes **Sunday**, **Monday**, **Tuesday**, **Wednesday**, **Thursday**, **Friday**, or **Saturday**.

add-time: Specifies the time to be added to the standard time, in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

Usage guidelines

Correct system time is essential to network management and communication. You must configure the system time correctly before you run the device on the network.

After you set the daylight saving time, the device recalculates the system time. To view the system time, use the **display clock** command.

Make sure all devices on the network are using the same daylight saving time as the local time.

Examples

Set the system time ahead 1 hour for the period between 06:00:00 on 08/01 and 06:00:00 on 09/01.

```
<Sysname> system-view
[Sysname] clock summer-time PDT 6 08/01 6 09/01 1
```

Related commands

clock datetime

clock timezone

display clock

clock timezone

Use **clock timezone** to set the time zone.

Use **undo clock timezone** to restore the default.

Syntax

clock timezone *zone-name* { **add** | **minus** } *zone-offset*

undo clock timezone

Default

The UTC time zone is used.

Views

System view

Predefined user roles

network-admin

Parameters

zone-name: Specifies a time zone by its name, a case-sensitive string of 1 to 32 characters.

add: Adds an offset to the UTC time.

minus: Decreases the UTC time by an offset.

zone-offset: Specifies an offset to the UTC time, in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

Usage guidelines

Correct system time is essential to network management and communication. You must configure the system time correctly before you run the device on the network.

After you set the time zone, the device recalculates the system time. To view the system time, use the **display clock** command.

Make sure all devices on the network are using the same time zone as the local time.

Examples

Set the name of the time zone to **Z5**, and add 5 hours to the UTC time.

```
<Sysname> system-view
[Sysname] clock timezone Z5 add 5
```

Related commands

clock datetime

clock summer-time

display clock

command

Use **command** to assign a command to a job.

Use **undo command** to revoke a command.

Syntax

command *id command*

undo command *id*

Default

No command is assigned to a job.

Views

Job view

Predefined user roles

network-admin

Parameters

id: Specifies an ID for the command, in the range of 0 to 4294967295. A command ID uniquely identifies a command in a job. Commands in a job are executed in ascending order of their command IDs.

command: Specifies the command to be assigned to the job.

Usage guidelines

To assign a command (command A) to a job, you must first assign the job the command or commands for entering the view of command A.

If you specify the ID of an existing command for another command, the existing command is replaced.

Make sure all commands in a schedule are compliant to the command syntax. The system does not examine the syntax when you assign a command to a job.

If a command requires a yes or no answer, the system always assumes that a **Y** or **Yes** is entered. If a command requires a character string input, the system assumes that either the default character string (if any) or a null string is entered.

A job cannot contain the **telnet**, **ftp**, **ssh2**, or **monitor process** command.

Examples

Assign commands to the **backupconfig** job to back up the **startup.cfg** file to the TFTP server at 192.168.100.11.

```
<Sysname> system-view
[Sysname] scheduler job backupconfig
```

```
[Sysname-job-backupconfig] command 2 tftp 192.168.100.11 put flash:/startup.cfg
backup.cfg
```

Assign commands to the **shutdownGE** job to shut down GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] scheduler job shutdownGE
[Sysname-job-shutdownGE] command 1 system-view
[Sysname-job-shutdownGE] command 2 interface gigabitethernet 1/0/1
[Sysname-job-shutdownGE] command 3 shutdown
```

Related commands

display cpu-usage

Use **display cpu-usage** to display the current CPU usage statistics.

Syntax

display cpu-usage [**summary**] [**slot** *slot-number* [**cpu** *cpu-number* [**core** { *core-number*| **all** }]]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

summary: Displays CPU usage statistics in table form. If you do not specify this keyword, the command displays CPU usage statistics in text form.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays CPU usage statistics for all member devices.

cpu *cpu-number*: Specifies a CPU by its number.

core *core-number*: Specifies a CPU core by its number.

core all: Specifies all CPU cores.

Examples

Display the current CPU usage statistics in text form.

```
<Sysname> display cpu-usage
Slot 1 CPU 0 CPU usage:
       1% in last 5 seconds
       1% in last 1 minute
       1% in last 5 minutes
```

Display the current CPU usage statistics in table form.

```
<Sysname> display cpu-usage
Slot CPU        Last 5 sec        Last 1 min        Last 5 min
1    0          17%               29%               28%
```

Table 1 Command output

Field	Description
x% in last 5 seconds Last 5 sec	Average CPU or CPU core usage during the most recent 5-second interval.
y% in last 1 minute Last 1 min	Average CPU or CPU core usage during the most recent 1-minute interval.
z% in last 5 minutes Last 5 min	Average CPU or CPU core usage during the most recent 5-minute interval.

display cpu-usage configuration

Use **display cpu-usage configuration** to display CPU usage monitoring settings.

Syntax

display cpu-usage configuration [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the CPU usage monitoring settings for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display the CPU usage monitoring settings.

```
<Sysname> display cpu-usage configuration
CPU usage monitor is enabled.
Current monitor interval is 60 seconds.
Current severe alarm threshold is 99%.
Current minor alarm threshold is 98%.
Current recovery-threshold is 50%.
```

Table 2 Command output

Field	Description
CPU usage monitor is *xxx*.	Whether CPU usage tracking is enabled.
Current monitor interval is *xxx*.	Sampling interval for CPU usage tracking.
Current severe alarm threshold is *xxx*.	Severe CPU usage alarm threshold.
Current minor alarm threshold is *xxx*.	Minor CPU usage alarm threshold.
Current recovery threshold is *xxx*.	CPU usage recovery threshold.

Related commands

monitor cpu-usage enable

monitor cpu-usage interval

monitor cpu-usage threshold

display cpu-usage history

Use **display cpu-usage history** to display the historical CPU usage statistics in a coordinate system.

Syntax

display cpu-usage history [**job** *job-id*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

job *job-id*: Specifies a process by its ID. The value range for *job-id* is 1 to 2147483647. If you do not specify a process, this command displays the statistics for the entire system's CPU usage (the total CPU usage of all processes). To view the IDs and names of the running processes, use the **display process** command. For more information, see *Network Management and Monitoring Configuration Guide*.

slot *slot-number*: Specifies an IRF member device by its member ID. If you specify a process but do not specify a member device, this command displays the statistics for the process on the master device. If you do not specify any options, this command displays the statistics for all processes on all member devices.

cpu *cpu-number*: Specifies a CPU by its number. If you specify a process but do not specify a CPU, this command displays the statistics for the default CPU. If you do not specify a process or CPU, this command displays the historical statistics for all CPUs.

Usage guidelines

After CPU usage monitoring is enabled, the system regularly samples CPU usage and saves the samples to the history record buffer. This command displays the most recent 60 samples in a coordinate system as follows:

The vertical axis represents the CPU usage. If a statistic is not a multiple of the usage step, it is rounded up or down to the closest multiple of the usage step. For example, if the CPU usage step is 5%, the statistic 53% is rounded up to 55%, and the statistic 52% is rounded down to 50%.

The horizontal axis represents the time.

Pound signs (#) indicate the CPU usage. The value on the vertical axis for the topmost pound sign at a specific time represents the CPU usage at that time.

Examples

Display the historical CPU usage statistics.

```
<Sysname> display cpu-usage history
100%|
 95%|
 90%|
 85%|
 80%|
 75%|
 70%|
 65%|
 60%|
 55%|
 50%|
 45%|
 40%|
 35%|
 30%|
 25%|
 20%|
 15%|             #
 10%|            ###  #
  5%|           ########
    ------------------------------------------------------------
              10        20        30        40        50        60  (minutes)
```

```
                    cpu-usage (Slot 1 CPU 0) last 60 minutes (SYSTEM)
```

The output shows the following items:

- Process name. The name **SYSTEM** represents the entire system.
- CPU that is holding the process: CPU 0 in slot 1.
- Historical CPU usage statistics for the entire system during the last 60 minutes.
  - **12 minutes ago**—Approximately 5%.
  - **13 minutes ago**—Approximately 10%.
  - **14 minutes ago**—Approximately 15%.
  - **15 minutes ago**—Approximately 10%.
  - **16 and 17 minutes ago**—Approximately 5%.
  - **18 minutes ago**—Approximately 10%.
  - **19 minutes ago**—Approximately 5%.
  - **Other time**—2% or lower.

Related commands

`monitor cpu-usage enable`

`monitor cpu-usage interval`

display device

Use **`display device`** to display device information.

Syntax

`display device`[**`flash`** | **`usb`**] [**`slot`** *`slot-number`* | **`verbose`**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`flash`: Displays flash memory information.

`usb`: Displays USB interface information.

`slot` *`slot-number`*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

`verbose`: Displays detailed information. If you do not specify this keyword, this command displays brief information.

Usage guidelines

If you do not specify the **`flash`** and **`usb`** keywords, this command displays information about member devices.

Examples

Display device information.

```
<Sysname> display device
Slot 1
Slot Type             State    Subslot  Soft Ver            Patch Ver
```

```
1    S5130S-52S-HI    Master   0       S5130S-52S-HI6103P06 None
```

Table 3 Command output

Field	Description
Type	Device type.
State	Role of the device in an IRF fabric: • **Master**—The device is the master. • **Standby**—The device is a subordinate member.
Soft Ver	Software version of the device.
Patch Ver	Most recently released patch image version that is running on the device. If no patch image is installed, this field displays **None**. If both incremental and non-incremental patch images are running on the device, this field displays the most recently released incremental patch image version. For more information about patch image types, see software upgrade in *Fundamentals Configuration Guide*.

display device manuinfo

Use **display device manuinfo** to display electronic label information for the device.

Syntax

display device manuinfo [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays electronic label information for all member devices.

Usage guidelines

An electronic label contains the permanent configuration information, including the hardware serial number, manufacturing date, MAC address, and vendor name. The data is written to the storage component during hardware debugging or testing. This command displays only part of the electronic label information.

Examples

Display electronic label information for the device.

```
<Sysname> display device manuinfo
...
```

display device manuinfo power

Use **display device manuinfo power** to display electronic label information for a power supply.

Syntax

display device manuinfo slot *slot-number* **power** *power-id*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

power-id: Specifies a power supply by its ID.

Examples

Display electronic label information for a power supply.

```
<Sysname> display device manuinfo slot 1 power 1
...
```

display diagnostic-information

Use **display diagnostic-information** to display or save operating information for features and hardware modules.

Syntax

display diagnostic-information [**hardware** | **infrastructure** | **l2** | **l3** | **service**] [**key-info**] [*filename*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

hardware: Specifies hardware-related operating information.

infrastructure: Specifies operating information for the fundamental features.

l2: Specifies operating information for the Layer 2 features.

l3: Specifies operating information for the Layer 3 features.

service: Specifies operating information for Layer 4 and upper-layer features.

key-info: Displays or saves only critical operating information. The device might have a large amount of operating information if an exception occurs or after the device runs for a long period of time. Specifying this keyword reduces the command execution time and helps you focus on critical operating information. If you do not specify this keyword, the command displays or saves both critical and non-critical operating information.

filename: Saves the information to a file. The *filename* argument must use the **.tar.gz** extension. If you do not specify this argument, the command prompts you to choose whether to save the information to a file or display the information.

Usage guidelines

You can use one of the following methods to collect operating statistics for diagnostics and troubleshooting:

- Use separate **display** commands to collect operating information feature by feature or module by module.
- Use the **display diagnostic-information** command to collect operating information for multiple or all features and hardware modules.

To save storage space, this command automatically compresses the information before saving the information to a file. To view the file content:

1. Use the **tar extract** command to extract the file.
2. Use the **gunzip** command to decompress the extracted file.
3. Use the **more** command to view the content of the decompressed file.

If you abort the **display diagnostic-information** command, the **gunzip** command might not be able to decompress the extracted file. To decompress the extracted file, export the extracted file to a PC that is running Linux, and use the **gunzip -c** command.

If you do not specify a file name for the command, the system prompts you to choose whether to display or save the information. If you choose to save the information, the system automatically assigns a file name and displays the file name in brackets. For file name uniqueness, the file name includes the device name and the current system time. If the device name contains any of the following special characters, the system uses an underscore (_) to replace each special character: forward slashes (/), backward slashes (\), colons (:), asterisks (*), question marks (?), less than signs (<), greater than signs (>), pipeline signs (|), and quotation marks ("). For example, device name **A/B** will change to **A_B** in the file name, as in **flash:/diag_A_B_20160101-000438.tar.gz**.

If you do not specify any feature parameters, this command displays or saves the operating information for all features and modules.

This command does not support the |, **>**, and **>>** options.

While the device is executing this command, do not execute any other commands. Executing other commands might affect the collected operating information.

Examples

Display the operating information for all features and modules.

```
<Sysname> display diagnostic-information
Save or display diagnostic information (Y=save, N=display)? [Y/N]:n
================================================
  ===============display clock===============
14:03:55 UTC Thu 01/05/2015
================================================
  ===============display version===============
...
```

Save the operating information to the default file.

```
<Sysname> display diagnostic-information
Save or display diagnostic information (Y=save, N=display)? [Y/N]:y
Please input the file name(*.tar.gz)[flash:/diag_Sysname_20160101-024601.tar.gz]:
Diagnostic information is outputting to flash:/diag_Sysname_20160101-024601.tar.gz.
Please wait...
Save successfully.
```

Press **Enter** when the system prompts you to enter the file name.

Save the operating information for all features and modules to file **test.tar.gz**.

```
<Sysname> display diagnostic-information test.tar.gz
Diagnostic information is outputting to flash:/test.tar.gz.
Please wait...
Save successfully.
```

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays temperature information for all member devices.

Examples

Display information about all temperature sensors on the device.

```
<Sysname> display environment
 System temperature information (degree centigrade):
 ---------------------------------------------------------------------
 Slot  Sensor    Temperature  Lower  Warning  Alarm  Shutdown
 1     hotspot 1 69           0      84       98     NA
 1     hotspot 2 67           0      84       98     NA
 1     hotspot 3 33           0      100      110    NA
 1     hotspot 4 33           0      100      110    NA
 1     hotspot 5 38           0      100      110    NA
 1     hotspot 6 36           0      100      110    NA
 1     hotspot 7 35           0      100      110    NA
 1     hotspot 8 42           0      100      110    NA
```

Table 5 Command output

Field	Description
System Temperature information (degree centigrade)	Temperature information (°C).
sensor	Temperature sensor: **hotspot**—Hotspot sensor.
Slot	Sensor position.
Temperature	Current temperature.
Lower	Lower temperature limit. If the device does not support this field, this field displays **NA**.
Warning	Warning temperature threshold. If the device does not support this field, this field displays **NA**.
Alarm	Alarming temperature threshold. If the device does not support this field,

Field	Description
	this field displays **NA**.
Shutdown	Shutdown temperature threshold. When the sensor temperature reaches the limit, the system shuts down automatically. If the device does not support this field, this field displays **NA**.

display fan

Use **display fan** to display fan tray operating status information.

Syntax

display fan [**slot** *slot-number* [*fan-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays fan tray operating status information for all member devices.

fan-id: Specifies a fan tray by its ID. If you do not specify a fan tray, this command displays operating status information for all fan trays at the specified position.

Examples

Display the operating states of all fan trays.

```
<Sysname> display fan
 Slot 1:
 Fan 1:
 State    : Normal
```

Table 6 Command output

Field	Description
Slot 1	Number of the member device.
Fan 1	Fan tray number.
State	Fan tray status: • **Absent**—The slot is not installed with a fan tray. • **Fault**—The fan tray is faulty. • **Normal**—The fan tray is operating correctly.

display memory

Use **display memory** to display memory usage information.

Syntax

display memory [**summary**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

summary: Displays brief information about memory usage. If you do not specify this keyword, the command displays detailed information about memory usage.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays memory usage for all member devices.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display detailed memory usage information.

```
<Sysname> display memory
Memory statistics are measured in KB:
Slot 1:
             Total      Used      Free    Shared   Buffers    Cached   FreeRatio
Mem:        498284    293884    204400         0      1316     76332       41.0%
-/+ Buffers/Cache:    216236    282048
Swap:            0         0         0
```

Display brief memory usage information.

```
<Sysname> display memory summary
Memory statistics are measured in KB:
Slot CPU   Total      Used      Free      Buffers  Caches    FreeRatio
1    0     498284     293884    204400    1316     76332     41.0%
```

Table 7 Command output

Field	Description
Mem	Memory usage information.
Total	Total size of the physical memory space that can be allocated. The memory space is virtually divided into two parts. Part 1 is solely used for kernel code and kernel management functions. Part 2 can be allocated and used for such tasks as running service modules and storing files. The size of part 2 equals the total size minus the size of part 1.
Used	Used physical memory.
Free	Free physical memory.
Shared	Physical memory shared by processes. If this field is not supported, two hyphens (--) are displayed.
Buffers	Physical memory used for buffers. If this field is not supported, two hyphens (--) are displayed.
Cached Caches	Physical memory used for caches. If this field is not supported, two hyphens (--) are displayed.
FreeRatio	Free memory ratio.
-/+ Buffers/Cache	-/+ Buffers/Cache:used = Mem:Used – Mem:Buffers – Mem:Cached, which

Field	Description
	indicates the physical memory used by applications. -/+ Buffers/Cache:free = Mem:Free + Mem:Buffers + Mem:Cached, which indicates the physical memory available for applications.
Swap	Memory space for swapping.

display memory-threshold

Use **display memory-threshold** to display memory alarm thresholds and statistics.

Syntax

display memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the memory usage thresholds and statistics for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

For more information about memory usage notifications, see log information containing **MEM_EXCEED_THRESHOLD** or **MEM_BELOW_THRESHOLD**.

Examples

Display memory alarm thresholds and statistics.

```
<Sysname> display memory-threshold
Memory usage threshold: 100%
Free-memory thresholds:
    Minor: 60M
    Severe: 56M
    Critical: 52M
    Normal: 64M

Current free-memory state: Normal
Free-memory event statistics:
 [Back to normal state]
    First notification: 0.0
    Latest notification: 0.0
    Total number of notifications sent: 0
 [Entered minor alarm state]
    First notification at: 0.0
    Latest notification at: 0.0
    Total number of notifications sent: 0
 [Back to minor alarm state]
```

```
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
 [Entered severe alarm state]
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
 [Back to severe alarm state]
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
 [Entered critical alarm state]
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
```

display power

Use **display power** to display power supply information.

Syntax

display power [**slot** *slot-number* [*power-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays power supply information for all member devices.

power-id: Specifies a power supply by its ID. If you do not specify a power supply, this command displays information about all power supplies at the specified position.

Examples

Display power supply information.

```
<Sysname> display power
 Slot 1:
 PowerID State    Mode   Current(A)  Voltage(V)  Power(W)
 1       Absent   --        --          --          --
 2       Normal   AC        --          --          --
```

Table 8 Command output

Field	Description
PowerID	Power supply ID. On a device that supports only one power supply, you need to view only information about power supply 1.
State	Power supply status. • **Absent**—The slot is not installed with a hot-swappable power supply.

Field	Description
	• **Fault**—The power supply is faulty or is not powered on. • **Normal**—The power supply is operating correctly.
Mode	Mode of the power supply: • **AC**—AC power supply. • **DC**—DC power supply.
Current(A)	Output current of the power supply, in amperes. If this field is not supported, two hyphens (--) are displayed.
Voltage(V)	Output voltage of the power supply, in volts. If this field is not supported, two hyphens (--) are displayed.
Power(W)	Output power of the power supply, in watts. If this field is not supported, two hyphens (--) are displayed.

display scheduler job

Use **display scheduler job** to display job configuration information.

Syntax

display scheduler job [*job-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

job-name: Specifies a job by its name, a case-sensitive string of 1 to 47 characters. If you do not specify a job, this command displays configuration information for all jobs.

Examples

Display configuration information for all jobs.

```
<Sysname> display scheduler job
Job name: saveconfig
 copy startup.cfg backup.cfg

Job name: backupconfig

Job name: creat-VLAN100
 system-view
 vlan 100
```

// The output shows that the device has three jobs: the first has one command, the second does not have any commands, and the third has two commands. Jobs are separated by blank lines.

display scheduler logfile

Use **display scheduler logfile** to display job execution log information.

Syntax

display scheduler logfile

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display job execution log information.

```
<Sysname> display scheduler logfile
Logfile Size: 1902 Bytes.

Job name        : shutdown
Schedule name   : shutdown
Execution time  : Tue Dec 27 10:44:42 2015
Completion time : Tue Dec 27 10:44:47 2015
-------------------------------- Job output ---------------------------------
<Sysname>system-view
System View: return to User View with Ctrl+Z.
[Sysname]interface rang gigabitethernet 1/0/1 to gigabitethernet 1/0/3
[Sysname-if-range]shutdown
```

Table 9 Command output

Field	Description
Logfile Size	Size of the log file, in bytes.
Schedule name	Schedule to which the job belongs.
Execution time	Time when the job was started.
Completion time	Time when the job was completed. If the job has never been executed or the job does not have any commands, this field is blank.
Job output	Commands in the job and their output.

Related commands

reset scheduler logfile

display scheduler reboot

Use **display scheduler reboot** to display the automatic reboot schedule.

Syntax

display scheduler reboot

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the automatic reboot schedule.

```
<Sysname> display scheduler reboot
System will reboot at 16:32:00 05/23/2015 (in 1 hours and 39 minutes).
```

Related commands

scheduler reboot at

scheduler reboot delay

display scheduler schedule

Use **display scheduler schedule** to display schedule information.

Syntax

display scheduler schedule [*schedule-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

schedule-name: Specifies a schedule by its name, a case-sensitive string of 1 to 47 characters. If you do not specify a schedule, this command displays information about all schedules.

Examples

Display information about all schedules.

```
<Sysname> display scheduler schedule
Schedule name        : shutdown
Schedule type        : Run once after 0 hours 2 minutes
Start time           : Tue Dec 27 10:44:42 2015
Last execution time  : Tue Dec 27 10:44:42 2015
Last completion time : Tue Dec 27 10:44:47 2015
Execution counts     : 1
------------------------------------------------------------------------
Job name                                        Last execution status
shutdown                                        Successful
```

Table 10 Command output

Field	Description
Schedule type	Execution time setting of the schedule. If no execution time is specified, this field is not displayed.

Field	Description
Start time	Time to execute the schedule for the first time. If no execution time is specified, this field is not displayed.
Last execution time	Last time when the schedule was executed. If no execution time is specified, this field is not displayed. If the schedule has never been executed, "Yet to be executed" is displayed for this field.
Last completion time	Last time when the schedule was completed. If no execution time is specified, this field is not displayed.
Execution counts	Number of times the schedule has been executed. If the schedule has never been executed, this field is not displayed.
Job name	Name of a job under the schedule.
Last execution status	Result of the most recent execution: • **Successful**. • **Failed**. • **Waiting**—The device is executing the schedule and the job is waiting to be executed. • **In process**—The job is being executed. • **-NA-**—The execution time has not arrived yet. To view information about whether the commands in the job has been executed and the execution results, execute the **`display scheduler logfile`** command.

display system stable state

Use **`display system stable state`** to display system stability and status information.

Syntax

`display system stable state`

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Before performing a switchover, execute this command multiple times to identify whether the system is operating stably. If the value of the **Redundancy Stable** field is not **Stable**, you cannot perform a switchover.

The device startup process takes some time. If the values of the status fields do not change to **Stable**, execute this command multiple times to identify the devices that are not in **Stable** state. You can also use other commands to identify the faulty components. For example:

- Use the **`display device`** command to identify the device operating status.
- Use the **`display system internal process state`** command in probe view to display service operating status.

Examples

Display system stability and status information.

```
<Sysname> display system stable state
System state    : Stable
```

```
Redundancy state: No redundance
  Slot   CPU   Role      State
 1      0     Active    Stable
```

Table 11 Command output

Field	Description
System state	System status: **Stable**—The system is operating stably.
Redundancy state	System redundancy status: • **Stable**—Member devices are operating stably. You can perform a switchover. • **No redundance**—The system has only one member device. You cannot perform a switchover. • **Not ready**—The system is not operating stably. You cannot perform a switchover.
Role	Role of the member device in the system: • **Active**—The member device is the master. • **Standby**—The member device is a subordinate member.
State	Member device status: • **Stable**—The member device is operating stably. • **Board inserted**—The member device has just been installed. • **Kernel initiating**—Member device kernel is being initialized. • **Service starting**—Services are starting on the member device. • **Service stopping**—Services are stopping on the member device. • **HA Batch backup**—An HA batch backup is going on. • **Interface data batch backup**—An interface data batch backup is in progress.
*	The object is not operating stably.

Related commands

`display device`

display transceiver alarm

Use **`display transceiver alarm`** to display transceiver alarms.

Syntax

`display transceiver alarm interface` [*`interface-type interface-number`*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`interface` [*`interface-type interface-number`*]: Specifies an interface by its type and number. If no interface is specified, this command displays the alarms present on every transceiver module.

Usage guidelines

Table 12 shows the common transceiver alarm components. If no error occurs, "None" is displayed.

Table 12 Common transceiver alarm components

Field	Description
APD	Avalanche photo diode
PCS	Physical coding sublayer
PHY XS	PHY extended sublayer
PMA/PMD	Physical medium attachment/physical medium dependent
power	Optical power
REFCLK	Reference clock
RX	Receive
TEC	Thermoelectric cooler
Temp	Temperature
TX	Transmit
WIS	WAN interface sublayer

Examples

Display the alarms present on the transceiver module in interface GigabitEthernet 1/0/1.

```
<Sysname> display transceiver alarm interface gigabitethernet 1/0/1
GigabitEthernet1/0/1 transceiver current alarm information:
  RX loss of signal
  RX power low
```

Table 13 Command output

Field	Description
transceiver current alarm information	Alarms present on the transceiver module.
RX loss of signal	Received signals are lost.
RX power low	Received power is low.

display transceiver diagnosis

Use **`display transceiver diagnosis`** to display the current values of the digital diagnosis parameters on transceiver modules.

Syntax

`display transceiver diagnosis interface` [*`interface-type interface-number`*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface [*interface-type interface-number*]: Specifies an interface by its type and number. If no interface is specified, this command displays the current values of the digital diagnosis parameters on every transceiver module.

Examples

Display the current values of the digital diagnosis parameters on the transceiver module in interface GigabitEthernet 1/0/1.

```
<Sysname> display transceiver diagnosis interface gigabitethernet 1/0/1
GigabitEthernet1/0/1 transceiver diagnostic information:
  Current diagnostic parameters:
    Temp(°C)  Voltage(V)  Bias(mA)  RX power(dBm)  TX power(dBm)
    36        3.31        6.13      -35.64          -5.19
  Alarm thresholds:
            Temp(°C)   Voltage(V)  Bias(mA)  RX power(dBM)  TX power(dBM)
    High    50         3.55        1.44      -10.00         5.00
    Low     30         3.01        1.01      -30.00         0.00
```

Table 14 Command output

Field	Description
transceiver diagnostic information	Digital diagnosis information for the transceiver module in the interface.
Temp.(°C)	Temperature in °C, accurate to 1°C.
Voltage(V)	Voltage in V, accurate to 0.01 V.
Bias(mA)	Bias current in mA, accurate to 0.01 mA.
RX power(dBm)	Receive power in dBm, accurate to 0.01 dBm.
TX power(dBm)	Transmit power in dBm, accurate to 0.01 dBm.
High	High alarm threshold.
Low	Low alarm threshold.

display transceiver interface

Use **display transceiver interface** to display the key parameters of transceiver modules.

Syntax

display transceiver interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the key parameters of every transceiver module.

Examples

Display the key parameters of the transceiver module in interface GigabitEthernet 1/0/1.

```
<Sysname> display transceiver interface gigabitethernet 1/0/1
...
```

display transceiver manuinfo

Use **display transceiver manuinfo** to display electronic label information for transceiver modules.

Syntax

display transceiver manuinfo interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface [*interface-type interface-number*]: Specifies an interface by its type and number. If no interface is specified, this command displays electronic label information for all transceiver modules.

Examples

Display electronic label information for the transceiver module in interface Ten-GigabitEthernet 1/0/49.

```
<Sysname> display transceiver manuinfo interface ten-gigabitethernet 1/0/49
...
```

display version

Use **display version** to display system version information.

Syntax

display version

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display system version information.

```
<Sysname> display version
H3C Comware Software, Version 7.1.070, Release 6309P01
Copyright (c) 2004-2019 New H3C Technologies Co., Ltd. All rights reserved.
H3C S5130S-52S-HI uptime is 0 weeks, 0 days, 6 hours, 43 minutes
```

```
Last reboot reason : Cold reboot

Boot image: flash:/s5130s_hi-cmw710-boot-r6309p01.bin
Boot image version: 7.1.070, Release 6309P01
  Compiled Jan 21 2019 11:00:00
System image: flash:/s5130s_hi-cmw710-system-r6309p01.bin
System image version: 7.1.070, Release 6309P01
  Compiled Jan 21 2019 11:00:00
...
```

Table 15 Command output

Field	Description
Last reboot reason	Reason for the last reboot: • **User reboot**—The reboot was manually initiated from a user interface, such as the CLI or SNMP. • **Cold reboot**—The reboot was caused by a power cycle. • **Kernel abnormality reboot**—The reboot was caused by kernel exceptions. • **DeadLoop reboot**—The reboot was caused by a kernel thread dead loop. • **DEV HandShake reboot**—The reboot was caused by a device management handshake failure. • **SlaveSwitch reboot**—The reboot was caused by a master/subordinate switchover. • **IRF Merge reboot**—The reboot was caused by an IRF merge. • **Auto Update reboot**—The reboot was caused by an automatic software upgrade. • **Memory exhaust reboot**—The reboot was caused by a card-memory-exhausted event.

display version-update-record

Use **`display version-update-record`** to display startup software image upgrade records.

Syntax

`display version-update-record`

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

The device records its current startup software version information whenever it starts up, and records all software version update information. Such information can survive reboots.

Examples

Display the startup software image upgrade records.

```
<Sysname> display version-update-record
Record 1  (updated on Apr 18 2019 at 06:23:54):
 *Name        : simware-cmw710-boot.bin
```

```
  Version     : 7.1.070 Release 6309P01
  Compile time: Mar 25 2019 15:52:43

 *Name        : simware-cmw710-system.bin
  Version     : 7.1.070 Release 6309P01
  Compile time: Mar 25 2019 15:52:43
```

Table 16 Command output

Field	Description
Record *n*	Number of the startup software image upgrade record. Record 1 is the most recent record.
Name	Software image file name.
*	The software image version changed during the upgrade.

Related commands

reset version-update-record

dying-gasp host

Use **dying-gasp host** to configure poweroff alarm destination host settings.

Use **undo dying-gasp host** to remove poweroff alarm destination host settings.

NOTE:

This command is supported only on the following devices:

- PoE devices and 52-port non-PoE devices.
- Devices that support hot-swappable power supplies.

Syntax

dying-gasp host { *ip-address* | **ipv6** *ipv6-address* } **snmp-trap version** { **v1** | **v2c** } **securityname** *security-string*

dying-gasp host { *ip-address* | **ipv6** *ipv6-address* } **syslog**

undo dying-gasp host { *ip-address* | **ipv6** *ipv6-address* } { **snmp-trap** | **syslog** }

Default

No poweroff alarm destination host settings are configured.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IPv4 address of the destination host to which the device sends the poweroff alarm.

ipv6 *ipv6-address*: Specifies the IPv6 address of the destination host to which the device sends the poweroff alarm.

snmp-trap: Uses an SNMP notification to send the poweroff alarm.

version: Specifies the SNMP version.

v1: Uses SNMPv1.

v2c: Uses SNMPv2c.

securityname *security-string*: Specifies an SNMPv1 or SNMPv2c community name, a case-sensitive string of 1 to 32 characters.

syslog: Uses a log message to send the poweroff alarm.

Usage guidelines

The device can send the poweroff alarm by using either or both of an SNMP notification and a log message.

The device can send the poweroff alarm to multiple destination hosts at the same time.

Examples

Configure the device to send the poweroff alarm to the host at 1.1.1.1 by using an SNMPv1 notification. The community name is **public**.

```
<Sysname> system-view
[Sysname] dying-gasp host 1.1.1.1 snmp-trap version v1 securityname public
```

Related commands

display dying-gasp host

dying-gasp source

dying-gasp source

Use **dying-gasp source** to specify the source interface for sending the poweroff alarm.

Use **undo dying-gasp source** to restore the default.

NOTE:

This command is supported only on the following devices:

- PoE devices and 52-port non-PoE devices.
- Devices that support hot-swappable power supplies.

Syntax

dying-gasp source *interface-type interface-number*

undo dying-gasp source

Default

No source interface is specified. On an IPv4 network, the device uses the primary IPv4 address of the output interface for the route to the destination host as the source address. On an IPv6 network, the device selects a source IPv6 address as defined in RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies a Layer 3 interface by its type and number.

Usage guidelines

The device uses the IPv6 address or primary IPv4 address of the specified source interface as the source address for outgoing poweroff alarm packets. The destination hosts use this address to identify SNMP notifications or log messages received from the device.

If no address is configured for the specified source interface, this command does not take effect. For this command to take effect, assign an address to the source interface.

Examples

Use the Loopback 1 interface as the source interface for sending the poweroff alarm.

```
<Sysname> system-view
[Sysname] dying-gasp source loopback 1
```

Related commands

dying-gasp host

header

Use **header** to configure a banner.

Use **undo header** to delete a banner.

Syntax

header { **legal** | **login** | **motd** | **shell** } *text*

undo header { **legal** | **login** | **motd** | **shell** }

Default

The device does not have banners.

Views

System view

Predefined user roles

network-admin

Parameters

legal: Configures the banner to be displayed before a user inputs the username and password to access the CLI.

login: Configures the banner to be displayed before password or scheme authentication is performed for a login user.

motd: Configures the greeting banner to be displayed before the legal banner appears.

shell: Configures the banner to be displayed before a user accesses user view.

text: Specifies the banner message. You can enter the banner message on the same line as the keywords or on different lines. For more information, see *Fundamentals Configuration Guide*.

Examples

Configure the legal banner.

```
<Sysname> system-view
[Sysname] header legal
Please input banner content, and quit with the character '%'.
```

```
Welcome to use the legal banner%
```

job

Use **job** to assign a job to a schedule.

Use **undo job** to revoke a job.

Syntax

job *job-name*

undo job *job-name*

Default

No job is assigned to a schedule.

Views

Schedule view

Predefined user roles

network-admin

Parameters

job-name: Specifies the job name, a case-sensitive string of 1 to 47 characters.

Usage guidelines

You can assign multiple jobs to a schedule. The jobs in a schedule are executed concurrently.

The jobs to be assigned to a schedule must already exist. To create a job, use the **scheduler job** command.

Examples

Assign job **save-job** to schedule **saveconfig**.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] job save-job
```

Related commands

scheduler job

scheduler schedule

memory-threshold

Use **memory-threshold** to set free-memory thresholds.

Use **undo memory-threshold** to restore the defaults.

Syntax

memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]] [**ratio**] **minor** *minor-value* **severe** *severe-value* **critical** *critical-value* **normal** *normal-value*

undo memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Minor alarm threshold: 60 MB.

Severe alarm threshold: 56 MB.

Critical alarm threshold: 52 MB.

Normal state threshold: 64 MB.

Views

System view

Predefined user roles

network-admin

Parameters

ratio: Specifies free-memory thresholds in percentage. If you do not specify this keyword, the command sets free-memory thresholds in MB.

minor *minor-value*: Specifies the minor alarm threshold. To view the value range for this threshold, enter a question mark (?) in the place of the *minor-value* argument. Setting this threshold to 0 disables the minor alarm feature.

severe *severe-value*: Specifies the severe alarm threshold. To view the value range for this threshold, enter a question mark (?) in the place of the *severe-value* argument. Setting this threshold to 0 disables the severe alarm feature.

critical *critical-value*: Specifies the critical alarm threshold. To view the value range for this threshold, enter a question mark (?) in the place of the *critical-value* argument. Setting this threshold to 0 disables the critical alarm feature.

normal *normal-value*: Specifies the normal state threshold. To view the value range for this threshold, enter a question mark (?) in the place of the *normal-value* argument.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets free-memory thresholds for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

To ensure correct operation and improve memory efficiency, the system monitors the amount of free memory space in real time. If the amount of free memory space decreases to or below the minor, severe, or critical alarm threshold, the system issues an alarm to affected service modules or processes.

If a memory alarm occurs, delete unused configuration items or disable some features to increase the free memory space. Because the memory space is insufficient, some configuration items might not be able to be deleted.

For more information about the thresholds, see *Fundamentals Configuration Guide*.

Examples

Set the minor alarm, severe alarm, critical alarm, and normal state thresholds to 64 MB, 48 MB, 32 MB, and 96 MB, respectively.

```
<Sysname> system-view
[Sysname] memory-threshold minor 64 severe 48 critical 32 normal 96
```

Set the minor alarm, severe alarm, critical alarm, and normal state thresholds to 3%, 2%, 1%, and 5% of the total memory size, respectively.

```
<Sysname> system-view
[Sysname] memory-threshold ratio minor 3 severe 2 critical 1 normal 5
```

Related commands

display memory-threshold

memory-threshold usage

Use **memory-threshold usage** to set the memory usage threshold.

Use **undo memory-threshold usage** to restore the default.

Syntax

memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]] **usage** *memory-threshold*

undo memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]] **usage**

Default

The memory usage threshold is 100%.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets the memory usage threshold for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

memory-threshold: Specifies the memory usage threshold in percentage. The value range is 0 to 100.

Usage guidelines

The device samples memory usage at 1-minute intervals. If the sample is greater than the memory usage threshold, the device sends a trap.

Examples

Set the memory usage threshold to 80%.

```
<Sysname> system-view
[Sysname] memory-threshold usage 80
```

Related commands

display memory-threshold

monitor cpu-usage enable

Use **monitor cpu-usage enable** to enable CPU usage monitoring.

Use **undo monitor cpu-usage enable** to disable CPU usage monitoring.

Syntax

monitor cpu-usage enable [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor cpu-usage enable [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

CPU usage monitoring is enabled.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command enables CPU usage monitoring for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

After CPU usage monitoring is enabled, the system samples and saves CPU usage at the interval specified by the **monitor cpu-usage interval** command. You can use the **display cpu-usage history** command to view recent CPU usage.

Examples

Enable CPU usage monitoring.

```
<Sysname> system-view
[Sysname] monitor cpu-usage enable
```

Related commands

display cpu-usage configuration

display cpu-usage history

monitor cpu-usage interval

monitor cpu-usage interval

Use **monitor cpu-usage interval** to set the sampling interval for CPU usage monitoring.

Use **undo monitor cpu-usage interval** to restore default settings.

Syntax

monitor cpu-usage interval *interval* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor cpu-usage interval [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The system samples CPU usage every 1 minute.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the sampling interval for CPU usage monitoring. Valid values include **5Sec** (5 seconds), **1Min** (1 minute), and **5Min** (5 minutes), case insensitive.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets the interval for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

After CPU usage monitoring is enabled, the system samples and saves CPU usage at the specified interval. You can use the **display cpu-usage history** command to view recent CPU usage.

Examples

Set the sampling interval for CPU usage monitoring to 5 seconds.

```
<Sysname> system-view
[Sysname] monitor cpu-usage interval 5Sec
```

Related commands

display cpu-usage configuration

display cpu-usage history

monitor cpu-usage enable

monitor cpu-usage threshold

Use **monitor cpu-usage threshold** to set CPU usage alarm thresholds.

Use **undo monitor cpu-usage threshold** to restore default settings.

Syntax

monitor cpu-usage threshold *severe-threshold* **minor-threshold** *minor-threshold* **recovery-threshold** *recovery-threshold* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor cpu-usage threshold minor-threshold recovery-threshold [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Severe CPU usage alarm threshold: 99%.

Minor CPU usage alarm threshold: 98%.

CPU usage recovery threshold: 50%.

Views

System view

Predefined user roles

network-admin

Parameters

severe-threshold: Specifies the severe CPU usage alarm threshold in percentage. The value range for this argument is 2 to 100.

minor-threshold *minor-threshold*: Specifies the minor CPU usage alarm threshold in percentage. The value range for this argument is 1 to the severe CPU usage alarm threshold minus 1.

recovery-threshold *recovery-threshold*: Specifies the CPU usage recovery threshold in percentage. The value range for this argument is 0 to the minor CPU usage alarm threshold minus 1.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets the CPU usage threshold for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The device samples CPU usage at 1-minute intervals. If the sample is greater than the CPU usage threshold, the device sends a trap.

Examples

Set the severe CPU usage alarm threshold to 90%, minor CPU usage alarm threshold to 80%, and CPU usage recovery threshold to 70%.

```
<Sysname> system-view
[Sysname] monitor cpu-usage threshold 90 minor-threshold 80 recovery-threshold 70
```

Related commands

display cpu-usage configuration

monitor disk-usage disk

Use **monitor disk-usage disk** to set the disk usage threshold.

Use **undo monitor disk-usage disk** to restore the default.

NOTE:

This command is available only in Release 6348P01 and later.

Syntax

monitor disk-usage [**slot** *slot-number*] **disk** *disk-name* **threshold** *threshold-value*

undo monitor disk-usage [**slot** *slot-number*] **disk** *disk-name* **threshold**

Default

The disk usage threshold is 95%.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify an IRF member device, the command applies to the master device.

disk *disk-name*: Specifies a disk by its name. This option is case sensitive. The system will prompt a parameter error if you enter this option incorrectly.

threshold *threshold-value*: Specifies the disk usage threshold in percentage, in the range of 1 to 100.

Usage guidelines

After you configure the disk usage threshold, the device compares the usage of the disk with the threshold at each sampling. If the usage exceeds the threshold, the device sends a high disk usage alarm to the NETCONF module. For more information about the NETCONF module see *Network Management and Monitoring Configuration Guide*.

Examples

Set the disk usage threshold to 80%.

```
<Sysname> system-view
[Sysname] monitor disk-usage disk flash threshold 80
```

Related commands

monitor disk-usage interval

monitor disk-usage interval

Use **monitor disk-usage interval** to set the disk usage sampling interval.

Use **undo monitor disk-usage interval** to restore the default.

NOTE:
This command is available only in Release 6348P01 and later.

Syntax

monitor disk-usage interval *interval*

undo monitor disk-usage interval

Default

The disk usage sampling interval is 300 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval-time*: Specifies the disk usage sampling interval in seconds, a multiple of five in the range of 5 to 1800.

Usage guidelines

After you set the disk usage sampling interval, the device samples disk usages at the specified intervals.

Examples

Set the disk usage sampling interval to 120 seconds.

```
<Sysname> system-view
[Sysname] monitor disk-usage interval 120
```

Related commands

monitor disk-usage disk

monitor resend cpu-usage

Use **monitor resend cpu-usage** to set CPU usage alarm resending intervals.

Use **undo monitor resend cpu-usage** to restore default settings.

Syntax

monitor resend cpu-usage { **minor-interval** *minor-interval* | **severe-interval** *severe-interval* } * [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor resend cpu-usage [**minor-interval** | **severe-interval**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The minor alarm resending interval is 300 seconds. The severe alarm resending interval is 60 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

minor-interval *minor-interval*: Specifies the minor alarm resending interval in seconds, a multiple of five in the range of 10 to 3600.

severe-interval *severe-interval*: Specifies the severe alarm resending interval in seconds, a multiple of five in the range of 10 to 3600.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets alarm resending intervals for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The device samples CPU usage periodically and compares the sample with the CPU usage threshold. If the sample increases above an alarm threshold, the CPU usage enters an alarm state and the device sends an alarm.

While the CPU usage is in minor alarm state, the device sends minor alarms periodically until the CPU usage increases above the severe threshold or the minor alarm is removed.

While the CPU usage is in severe alarm state, the device sends severe alarms periodically until the severe alarm is removed.

You can use this command to change CPU usage alarm resending intervals.

If you do not specify the **minor-interval** or **severe-interval** keyword, the **undo monitor resend cpu-usage** command restores default settings for both the minor and severe alarm resending intervals.

Examples

Set the CPU usage minor alarm resending interval to 60 seconds for CPU 0 in slot 1.

```
<Sysname> system-view
[Sysname] monitor resend cpu-usage minor-interval 60 slot 1 cpu 0
```

monitor resend memory-threshold

Use **monitor resend memory-threshold** to set memory depletion alarm resending intervals.

Use **undo monitor resend memory-threshold** to restore default settings.

Syntax

monitor resend memory-threshold { **critical-interval** *critical-interval* | **minor-interval** *minor-interval* | **severe-interval** *severe-interval* } * [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor resend memory-threshold [**critical-interval** | **minor-interval** | **severe-interval**] * [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

- Minor alarm resending interval: 12 hours.
- Severe alarm resending interval: 3 hours.
- Critical alarm resending interval: 1 hour.

Views

System view

Predefined user roles

network-admin

Parameters

critical-interval *critical-interval*: Specifies the critical alarm resending interval in hours, in the range of 1 to 48.

minor-interval *minor-interval*: Specifies the minor alarm resending interval in hours, in the range of 1 to 48.

severe-interval *severe-interval*: Specifies the severe alarm resending interval in hours, in the range of 1 to 48.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets alarm resending intervals for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The device samples the amount of free memory space periodically and compares the sample with free-memory thresholds. If the sample decreases to or below a threshold, the device enters a memory depletion alarm state and sends an alarm.

In critical alarm state, the device sends critical alarm notifications periodically until the critical alarm is removed.

In a lower alarm state, the device sends notifications for the alarm state periodically until it enters a higher alarm state or the current alarm is removed.

You can use this command to change the alarm resending intervals.

If you do not specify any memory depletion alarm resending intervals, the **undo monitor resend memory-threshold** command restores default settings for all memory depletion alarm resending intervals.

Examples

Set the minor memory depletion alarm resending interval to 12 hours for CPU 0 in slot 1.

```
<Sysname> system-view
[Sysname] monitor resend memory-threshold minor-interval 12 slot 1 cpu 0
```

password-recovery enable

Use **password-recovery enable** to enable password recovery capability.

Use **undo password-recovery enable** to disable password recovery capability.

Syntax

password-recovery enable

undo password-recovery enable

Default

Password recovery capability is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Password recovery capability controls console user access to the device configuration and SDRAM from BootWare menus.

If password recovery capability is enabled, a console user can access the device configuration without authentication to configure new passwords.

If password recovery capability is disabled, console users must restore the factory-default configuration before they can configure new passwords. Restoring the factory-default configuration deletes the next-startup configuration files.

To enhance system security, disable password recovery capability.

Availability of BootWare menu options depends on the password recovery capability setting. For more information, see the release notes.

Examples

Disable password recovery capability.

```
<Sysname> system-view
[Sysname] undo password-recovery enable
```

reboot

Use **reboot** to reboot the device.

Syntax

reboot [**slot** *slot-number*] [**force**]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify an IRF member device, the command reboots all IRF member devices.

force: Reboots the device immediately without performing software or hard disk check. If this keyword is not specified, the system first identifies whether the reboot might result in data loss or a system failure. For example, the system identifies whether the main system software image file exists and whether a write operation is in progress on a storage medium. If the reboot might cause problems, the system does not reboot the device.

Usage guidelines

CAUTION:

- A reboot might interrupt network services.
- Use the **force** keyword only when the device fails or a **reboot** command without the **force** keyword cannot perform a reboot correctly. A **reboot** command with the **force** keyword might result in file system corruption because it does not perform data protection.

If the main startup software images are corrupt or missing, you must re-specify a set of main startup software images before executing the **reboot** command.

For data security, the device does not reboot if you reboot the device while the device is performing file operations.

If the IRF fabric has only one member device, rebooting the member device reboots the entire IRF fabric. If the IRF fabric has a subordinate member and the member is operating correctly, rebooting the master triggers a master/subordinate switchover.

To ensure correct operation of the IRF fabric and member devices, do not trigger a switchover by rebooting the master if no subordinate member devices are in **Stable** state. To view the status of subordinate member devices, execute the **display system stable state** command.

Examples

Reboot the device. Save the running configuration at prompt.

```
<Sysname> reboot
Start to check configuration with next startup configuration file, please
wait.........DONE!
Current configuration will be lost after the reboot, save current configuration? [Y/N]:y
Please input the file name(*.cfg)[flash:/startup.cfg]
(To leave the existing filename unchanged, press the enter key):
flash:/startup.cfg exists, overwrite? [Y/N]:y
Validating file. Please wait...
Configuration is saved to mainboard device successfully.
This command will reboot the device. Continue? [Y/N]:y
Now rebooting, please wait...
```

Reboot the device immediately without performing software check.

```
<Sysname> reboot force
A forced reboot might cause the storage medium to be corrupted. Continue? [Y/N]:y
Now rebooting, please wait...
```

scheduler job

Use **scheduler job** to create a job and enter its view, or enter the view of an existing job.

Use **undo scheduler job** to delete a job.

Syntax

scheduler job *job-name*

undo scheduler job *job-name*

Default

No job exists.

Views

System view

Predefined user roles

network-admin

Parameters

job-name: Specifies the job name, a case-sensitive string of 1 to 47 characters.

Usage guidelines

A job can be referenced by multiple schedules. In job view, you can assign commands to the job.

Examples

Create a job named **backupconfig** and enter job view.

```
<Sysname> system-view
[Sysname] scheduler job backupconfig
[Sysname-job-backupconfig]
```

Related commands

command

scheduler schedule

scheduler logfile size

Use **scheduler logfile size** to set the size of the job execution log file.

Syntax

scheduler logfile size *value*

Default

The size of the job execution log file is 16 KB.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the size of the job execution log file, in KB. The value range is 16 to 1024.

Usage guidelines

The job execution log file saves the execution information of jobs. If the file is full, old records are deleted to make room for new records. If the size of the log information to be written to the file is greater than the file size, the excessive information is not written to the file.

Examples

Set the size of the job execution log file to 32 KB.

```
<Sysname> system-view
[Sysname] scheduler logfile size 32
```

Related commands

display scheduler logfile

scheduler reboot at

Use **scheduler reboot at** to specify the reboot date and time.

Use **undo scheduler reboot** to delete the reboot schedule configuration.

Syntax

scheduler reboot at *time* [*date*]

undo scheduler reboot

Default

No reboot date or time is specified.

Views

User view

Predefined user roles

network-admin

Parameters

time: Specifies the reboot time in the *hh:mm* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59.

date: Specifies the reboot date in the *MM/DD/YYYY* or *YYYY/MM/DD* format. The value range for *YYYY* is 2000 to 2035. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.

Usage guidelines

CAUTION:

This command enables the device to reboot at a scheduled time, which causes service interruption. Before executing this command, make sure you fully understand its impact on your live network.

When the *date* argument is not specified, the system uses the following rules to determine the reboot time:

- If the reboot time is later than the current time, a reboot occurs at the reboot time of the current day.
- If the reboot time is earlier than the current time, a reboot occurs at the reboot time the next day.

The device supports only one device reboot schedule. If you execute both the **scheduler reboot delay** and **scheduler reboot at** commands or execute one of the commands multiple times, the most recent configuration takes effect.

For data security, the system does not reboot at the reboot time if a file operation is being performed.

Examples

Configure the device to reboot at 12:00 p.m. This example assumes that the current time is 11:43 a.m. on June 6, 2015.

```
<Sysname> scheduler reboot at 12:00
Reboot system at 12:00:00 06/06/2015 (in 0 hours and 16 minutes). Confirm? [Y/N]:
```

Related commands

scheduler reboot delay

scheduler reboot delay

Use **scheduler reboot delay** to specify the reboot delay time.

Use **undo scheduler reboot** to delete the reboot schedule configuration.

Syntax

scheduler reboot delay *time*

undo scheduler reboot

Default

No reboot delay time is specified.

Views

User view

Predefined user roles

network-admin

Parameters

time: Specifies the reboot delay time in the *hh:mm* or *mm* format. This argument can contain up to six characters. When in the *hh:mm* format, *mm* must be in the range of 0 to 59.

Usage guidelines

CAUTION:

This command enables the device to reboot after a delay, which causes service interruption. Before executing this command, make sure you fully understand its impact on your live network.

The device supports only one device reboot schedule. If you execute both the **scheduler reboot delay** and **schedule reboot at** commands or execute one of the commands multiple times, the most recent configuration takes effect.

For data security, the system does not reboot at the reboot time if a file operation is being performed.

Examples

Configure the device to reboot after 88 minutes. This example assumes that the current time is 11:48 a.m. on June 6, 2015.

```
<Sysname> scheduler reboot delay 88
Reboot system at 13:16 06/06/2015(in 1 hours and 28 minutes). Confirm? [Y/N]:
```

scheduler schedule

Use **scheduler schedule** to create a schedule and enter its view, or enter the view of an existing schedule.

Use **undo scheduler schedule** to delete a schedule.

Syntax

scheduler schedule *schedule-name*

undo scheduler schedule *schedule-name*

Default

No schedule exists.

Views

System view

Predefined user roles

network-admin

Parameters

schedule-name: Specifies the schedule name, a case-sensitive string of 1 to 47 characters.

Usage guidelines

You can configure a schedule to have the device automatically run a command or a set of commands without administrative interference.

To configure a schedule:

1. Use the **scheduler job** command to create a job and enter job view.
2. Use the **command** command to assign commands to the job.
3. Use the **scheduler schedule** command to create a schedule and enter schedule view.
4. Use the **job** command to assign the job to the schedule. You can assign multiple jobs to a schedule. The jobs must already exist.
5. Use the **user-role** command to assign user roles to the schedule. You can assign up to 64 user roles to a schedule.
6. Use the **time at**, **time once**, or **time repeating** command to specify an execution time for the schedule. You can specify only one execution time for a schedule.

Examples

Create a schedule named **saveconfig**.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
```

Related commands

job

time at

time once

shutdown-interval

Use **shutdown-interval** to set the port status detection timer.

Use **undo shutdown-interval** to restore the default.

Syntax

shutdown-interval *interval*

undo shutdown-interval

Default

The port status detection timer setting is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the port status detection timer value in seconds. In a version earlier than Release 6333, the value range is 0 to 300. In Release 6333 and later, the value range is 0 to 3600. To disable port status detection, set this argument to 0.

Usage guidelines

The device starts a port status detection timer when a port is shut down by a protocol. Once the timer expires, the device brings up the port so the port status reflects the port's physical status.

If you change the timer setting during port detection, the device compares the new setting (T1) with the time that elapsed since the port was shut down (T).

If T < T1, the port will be brought up after T1 – T seconds.

If T ≥ T1, the port is brought up immediately.

For example, the timer setting is 30 seconds. If you change it to 10 seconds 2 seconds after the port is shut down, the port will come up 8 seconds later. If you change the timer setting to 2 seconds 10 seconds after the port is shut down, the port comes up immediately.

Examples

Set the port status detection timer to 100 seconds.

```
<Sysname> system-view
[Sysname] shutdown-interval 100
```

sysname

Use **sysname** to set the device name.

Use **undo sysname** to restore the default.

Syntax

sysname *sysname*

undo sysname

Default

The device name is H3C.

Views

System view

Predefined user roles

network-admin

Parameters

sysname: Specifies a name for the device, a string of 1 to 64 characters.

Usage guidelines

A device name identifies a device in a network and is used in CLI view prompts. For example, if the device name is **Sysname**, the user view prompt is <Sysname>.

Examples

Set the name of the device to **R2000**.

```
<Sysname> system-view
[Sysname] sysname R2000
[R2000]
```

transceiver monitor enable

Use **transceiver monitor enable** to enable transceiver monitoring.

Use **undo transceiver monitor enable** to restore the default.

NOTE:
This command is available only in 6343P08 and later.

Syntax

transceiver monitor enable

undo transceiver monitor enable

Default

Transceiver monitoring is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After transceiver monitoring is enabled, the device samples the parameters of transceiver modules periodically, including the input power and output power of transceiver modules. If a sampled value reaches the alarm threshold, the device generates a log to notify users.

Examples

Enable transceiver monitoring.

```
<Sysname> system-view
[Sysname] transceiver monitor enable
```

Related commands

transceiver monitor interval

transceiver monitor interval

Use **transceiver monitor interval** to set a transceiver monitoring interval.

Use **undo transceiver monitor interval** to restore the default.

NOTE:

This command is available only in 6343P08 and later.

Syntax

transceiver monitor interval *interval*

undo transceiver monitor interval

Default

The transceiver monitoring interval is 600 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the transceiver monitoring interval in seconds, in the range of 300 to 3600.

Usage guidelines

After transceiver monitoring is enabled, the device samples the parameters of transceiver modules periodically, including the input power and output power of transceiver modules. If a sampled value reaches the alarm threshold, the device generates a log entry to notify users.

This command takes effect only when the **transceiver monitor enable** command is used.

Examples

Set the transceiver monitoring interval to 500 seconds.

```
<Sysname> system-view
[Sysname] transceiver monitor interval 500
```

Related commands

transceiver monitor enable

temperature-limit

Use **temperature-limit** to set the temperature alarm thresholds.

Use **undo temperature-limit** to restore the default.

Syntax

temperature-limit slot *slot-number* **hotspot** *sensor-number lowlimit warninglimit* [*alarmlimit*]

undo temperature-limit slot *slot-number* **hotspot** *sensor-number*

Default

The defaults vary by temperature sensor model. To view the defaults, execute the **undo temperature-limit** and **display environment** commands in turn.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

hotspot: Configures temperature alarm thresholds for hotspot sensors. A hotspot sensor is typically near the chip that generates a great amount of heat and used to monitor the chip.

sensor-number: Specifies a sensor by its number. To view the value range, enter a question mark (?) in the place of this argument.

lowlimit: Specifies the low-temperature threshold in Celsius degrees. The value range varies by temperature sensor. To view the value range, enter a question mark (?) in the place of this argument.

warninglimit: Specifies the high-temperature warning threshold in Celsius degrees. This threshold must be greater than the low-temperature threshold. To view the value range, enter a question mark (?) in the place of this argument.

alarmlimit: Specifies the high-temperature alarming threshold in Celsius degrees. This threshold must be greater than the warning threshold. To view the value range, enter a question mark (?) in the place of this argument.

Usage guidelines

When the device temperature drops below the low-temperature threshold or reaches the high-temperature warning or alarming threshold, the device performs the following operations:

- Sends log messages and traps.
- Sets LEDs on the device panel.

Examples

Set temperature alarm thresholds for hotspot sensor 1 in a slot.

```
<Sysname> system-view
[Sysname] temperature-limit slot 1 hotspot 1 -10 50 60
```

Related commands

display environment

time at

Use **time at** to specify an execution date and time for a non-periodic schedule.

Use **undo time** to delete the execution date and time configuration for a non-periodic schedule.

Syntax

time at *time date*

undo time

Default

No execution time or date is specified for a non-periodic schedule.

Views

Schedule view

Predefined user roles

network-admin

Parameters

time: Specifies the schedule execution time in the *hh:mm* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59.

date: Specifies the schedule execution date in the *MM/DD/YYYY* or *YYYY/MM/DD* format. The value range for *YYYY* is 2000 to 2035. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.

Usage guidelines

The specified time (date plus time) must be later than the current system time.

The **time at** command, the **time once** command, and the **time repeating** command overwrite one another. The most recently executed command takes effect.

Examples

Configure the device to execute schedule **saveconfig** at 01:01 a.m. on May 11, 2015.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time at 1:1 2015/05/11
```

Related commands

scheduler schedule

time once

Use **time once** to specify one or more execution days and the execution time for a non-periodic schedule.

Use **undo time** to delete the execution day and time configuration for a non-periodic schedule.

Syntax

time once at *time* [**month-date** *month-day* | **week-day** *week-day*&<1-7>]

time once delay *time*

undo time

Default

No execution time or day is specified for a non-periodic schedule.

Views

Schedule view

Predefined user roles

network-admin

Parameters

at *time*: Specifies the execution time in the *hh:mm* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59.

month-date *month-day*: Specifies a day in the current month, in the range of 1 to 31. If you specify a day that does not exist in the current month, the configuration takes effect on that day in the next month.

week-day *week-day*&<1-7>: Specifies a space-separated list of up to seven week days for the schedule. Valid week day values include **Mon**, **Tue**, **Wed**, **Thu**, **Fri**, **Sat**, and **Sun**.

delay *time*: Specifies the delay time for executing the schedule, in the *hh:mm* or *mm* format. This argument can have up to six characters. When in the *hh:mm* format, *mm* must be in the range of 0 to 59.

Usage guidelines

If the specified time has already occurred, the schedule will be executed at the specified time the following day.

If the day in the month has already occurred, the schedule will be executed at the specified day in the following month.

If the specified day in a week has already occurred, the schedule will be executed at the specified day in the following week.

The **time at** command, the **time once** command, and the **time repeating** command overwrite one another. The most recently executed command takes effect.

Examples

Configure the device to execute schedule **saveconfig** once at 15:00.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time once at 15:00
Schedule starts at 15:00 5/11/2011.
```

Configure the device to execute schedule **saveconfig** once at 15:00 on the coming 15th day in a month.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time once at 15:00 month-date 15
```

Configure the device to execute schedule **saveconfig** at 12:00 p.m. on the coming Monday and Friday.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time once at 12:00 week-day mon fri
```

Configure the device to execute schedule **saveconfig** after 10 minutes.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time once delay 10
```

Related commands

scheduler schedule

time repeating

Use **time repeating** to specify an execution time table for a periodic schedule.

Use **undo time** to delete the execution time table configuration for a periodic schedule.

Syntax

time repeating [**at** *time* [*date*]] **interval** *interval*

time repeating at *time* [**month-date** [*month-day* | **last**] | **week-day** *week-day*&<1-7>]

undo time

Default

No execution time table is specified for a periodic schedule.

Views

Schedule view

Predefined user roles

network-admin

Parameters

at *time*: Specifies the execution time in the *hh:mm* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. If you do not specify this option, the current system time is used as the execution time.

date: Specifies the start date for the periodic schedule, in the *MM/DD/YYYY* or *YYYY/MM/DD* format. The value range for *YYYY* is 2000 to 2035. The value range for *MM* is 1 to 12. The value range for *DD* varies by month. If you do not specify this argument, the execution start date is the first day when the specified time arrives.

interval *interval*: Specifies the execution time interval in the *hh:mm or mm* format. This argument can have up to six characters. When in the *hh:mm* format, *mm* must be in the range of 0 to 59. When in the *mm* format, this argument must be equal to or greater than 1 minute.

month-date [*month-day* | **last**]: Specifies a day in a month, in the range 1 to 31. The **last** keyword indicates the last day of a month. If you specify a day that does not exist in a month, the configuration takes effect on that day in the next month.

week-day *week-day*&<1-7>: Specifies a space-separated list of up to seven week days for the schedule. Valid week day values include **Mon**, **Tue**, **Wed**, **Thu**, **Fri**, **Sat**, and **Sun**.

Usage guidelines

The **time repeating** [**at** *time* [*date*]] **interval** *interval* command configures the device to execute a schedule at intervals from the specified time on.

The **time repeating at** *time* [**month-date** [*month-day* | **last**] | **week-day** *week-day*&<1-7>] command configures the device to execute a schedule at the specified time on every specified day in a month or week.

The **time at** command, the **time once** command, and the **time repeating** command overwrite one another, whichever is executed most recently takes effect.

Examples

Configure the device to execute schedule **saveconfig** once an hour from 8:00 a.m. on.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time repeating at 8:00 interval 60
```

Configure the device to execute schedule **saveconfig** at 12:00 p.m. every day.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time repeating at 12:00
```

Configure the device to execute schedule **saveconfig** at 8:00 a.m. on the 5th of every month.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time repeating at 8:00 month-date 5
```

Configure the device to execute schedule **saveconfig** at 8:00 a.m. on the last day of every month.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time repeating at 8:00 month-date last
```

Configure the device to execute schedule **saveconfig** at 8:00 a.m. every Friday and Saturday.

```
<Sysname> system-view
[Sysname] scheduler schedule saveconfig
[Sysname-schedule-saveconfig] time repeating at 8:00 week-day fri sat
```

Related commands

scheduler schedule

user-role

Use **user-role** to assign user roles to a schedule.

Use **undo user-role** to remove user roles from a schedule.

Syntax

user-role *role-name*

undo user-role *role-name*

Default

A schedule has the user roles of the schedule creator.

Views

Schedule view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role name, a case-sensitive string of 1 to 63 characters. The user role can be user-defined or predefined. Predefined user roles include network-admin, network-operator, and level-0 to level-15.

Usage guidelines

A schedule must have one or more user roles. A command in a schedule can be executed if it is permitted by one or more user roles of the schedule. For more information about user roles, see the RBAC configuration in *Fundamentals Configuration Guide*.

A schedule can have a maximum of 64 user roles. After the limit is reached, you cannot assign additional user roles to the schedule.

Examples

Assign user role **rolename** to schedule **test**.

```
<Sysname> system-view
[Sysname] scheduler schedule test
[Sysname-schedule-test] user-role rolename
```

Related commands

command

scheduler schedule

Contents

Tcl commands

cli

Use **cli** to enable a Comware command to be executed in Tcl configuration view when it conflicts with a Tcl command.

Syntax

cli *command*

Views

Tcl configuration view

Predefined user roles

network-admin

Parameters

command: Specifies the commands to be executed. They must be complete command lines.

Usage guidelines

In Tcl configuration view, if a Comware command conflicts with a Tcl command, the Tcl command will be executed. To execute the Comware command when a conflict occurs, execute the **cli** command.

Examples

Perform the following steps to execute a Comware command that conflicts with a Tcl command in Tcl configuration view.

1. Execute a Comware command in Tcl configuration view. The output shows that the Comware command cannot be executed because it conflicts with a Tcl command.

```
<Sysname> tclsh
<Sysname-tcl> system-view
[Sysname-tcl] route-policy 1 permit node 10
[Sysname-tcl-route-policy-1-10] apply cost 10
can't interpret "cost" as a lambda expression
```

2. Configure the **cli** command to execute the Comware command again.

```
[Sysname-tcl-route-policy-1-10] cli apply cost 10
```

Execute multiple Comware commands in one operation.

```
<Sysname> tclsh
<Sysname-tcl> system-view
```

- Method 1:

```
[Sysname-tcl] cli "vlan 2 ; description Tech"
```

- Method 2:

```
[Sysname-tcl] cli vlan 2 ; cli description Tech
```

tclquit

Use **tclquit** to return from Tcl configuration view to user view.

Syntax

tclquit

Views

Tcl configuration view

Predefined user roles

network-admin

Usage guidelines

To return from Tcl configuration view to user view, you can also use the **quit** command.

To return to the upper-level view after you execute Comware commands to enter system view or a Comware feature view, use the **quit** command.

Examples

Return from Tcl configuration view to user view.

```
<Sysname-tcl> tclquit
<Sysname>
```

Related commands

tclsh

tclsh

Use **tclsh** to enter Tcl configuration view from user view.

Syntax

tclsh

Views

User view

Predefined user roles

network-admin

Usage guidelines

In Tcl configuration view, you can execute the following commands:

- All Tcl 8.5 commands.
- Comware commands. The Tcl configuration view is equivalent to the user view. You can use Comware commands in Tcl configuration view in the same way they are used in user view.

Examples

Enter Tcl configuration view from user view.

```
<Sysname> tclsh
<Sysname-tcl>
```

Related commands

tclquit

Contents

Python commands

exit()

Use **exit()** to exit the Python shell.

Syntax

exit()

Views

Python shell

Predefined user roles

network-admin

Usage guidelines

To return to user view from the Python shell, you cannot use the **quit** command. You must use the **exit()** command.

Examples

Exit the Python shell.

```
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>>
>>> exit()
<Sysname>
```

python

Use **python** to enter the Python shell.

Syntax

python

Views

User view

Predefined user roles

network-admin

Usage guidelines

In the Python shell, you can use the following items:

- Python 2.7 commands.
- Python 2.7 standard API.
- Comware 7 extended API.

Examples

Enter the Python shell.

```
<Sysname> python
Python 2.7.3 (default)
```

```
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

python *filename*

Use **python** *filename* to execute a Python script.

Syntax

python *filename* [*param*]

Views

User view

Predefined user roles

network-admin

Parameters

filename: Specifies the name of a Python script on a storage medium of the device. The script name is case sensitive and must use the extension .py. The extension .py is case insensitive.

param: Specifies the parameters to be passed to the script. To enter multiple parameters, use spaces as the delimiter.

Usage guidelines

You cannot perform any operations while you are executing a Python script.

Make sure the statements in the script meet the syntax requirements. The system stops executing a Python script if it finds a statement with syntax errors.

When executing a script, the system uses the defaults for interactive statements. The system does not stop for human input.

Examples

Execute Python script **test.py**.

```
<Sysname> python test.py 1 2
['/flash:/test.py', '1', '2']
```

Contents

License management commands

display license

Use **display license** to display detailed license information.

Syntax

display license [**activation-file**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

activation-file: Displays license information about activation files.

slot *slot-number*: Specifies the member ID of an IRF member device. If no member device is specified, this command displays license information for all IRF member devices.

Usage guidelines

If you do not specify any parameters, this command displays detailed information about all licenses.

Examples

Display detailed information about all licenses.

```
<Sysname> display license
Slot 1:
flash:/license/210235A1XE012345678920170503175748826 33.ak
Feature: APMGR
Product Description: Enhanced Access Controller License,128 APs,for Verticals,fo
r V7
Registered at: 2013-01-01 09:26:52
License Type: Trial (days restricted)
Trial Time Left (days): 30
Current State: In use
```

Table 1 Command output

Field	Description
Feature	Feature name.
Product Description	License description.
Registered at	Time when the license was installed.
License Type	License type by validity period: • **NA**—The system cannot obtain the license type. • **Permanent**—Purchased license that never expires and is always valid. • **Trial (days restricted)**—Free trial license that is valid for a period of days.
Trial Time Left (days)	Remaining days of the trial period. This field is available for a trial license.

Field	Description

Current State	State of the license:
	• **In use**—The license is being used.
	• **Usable**—The license is available for use.
	  ○ If multiple days-restricted licenses for one feature are installed, only one license is in **In use** state and the rest licenses are in **Usable** state.
	  ○ A date restricted license is in this state if its start date is not reached.
	• **Expired**—The license has expired.
	• **Uninstalled**—The license has been uninstalled.
	• **Unusable**—The license cannot be used.
	• **Invalid**—The license is invalid and cannot be used.

Uninstall Key	This field is available for licenses that have been uninstalled.
Uninstall Date	Date when the activation file was uninstalled.

display license device-id

Use **display license device-id** to display SN and DID information.

Syntax

display license device-id slot *slot-number*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies the member ID of an IRF member device.

Usage guidelines

When you register a license for a device, you must provide its unique SN and DID.

The DID changes each time you use the **license compress** command to compress the license storage. Use the **display license device-id** command to identify the up-to-date DID each time you register licenses.

Examples

Display the SN and DID for the specified slot.

```
<Sysname> display license device-id slot 1
SN: 210235A045B05B0004350
Device ID: flash:/license/210235A045B05B0004350.did
```

display license feature

Use **display license feature** to display brief license information for features.

Syntax

display license feature

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display brief feature license information.

```
<Sysname> display license feature
Slot 1:
Slot 1:
Total: 64  Usage: 0
Feature                         Licensed        State
APMGR                           N               -
```

Table 2 Command output

Field	Description
Total	Total number of licenses that can be installed.
Usage	Number of licenses stored in the license storage.
Feature	Feature that must be licensed before being used.
Licensed	Licensing state of the feature: • **N**—Not licensed. • **Y**—Licensed.
State	License type by purchasing state: • **Formal**—Purchased license. • **Trial**—Trial license. If the feature is not licensed, this field displays a hyphen (-). To use the feature, you must install a valid license for the feature.

license activation-file install

Use **`license activation-file install`** to install an activation file.

Syntax

`license activation-file install` *`file-name`* **`slot`** *`slot-number`*

Views

System view

Predefined user roles

network-admin

Parameters

`file-name`: Specifies the file path, a case-sensitive string of 1 to 127 characters. The activation file must be valid and stored on the device.

`slot` *`slot-number`*: Specifies the member ID of an IRF member device.

Usage guidelines

To install a license activation file successfully, make sure the SN and DID used for registering the feature license matches the current SN and DID of the device.

Activation files are device locked. A licensed feature can run on an IRF member device even after the member device is moved from one IRF fabric to another IRF fabric.

Examples

Install activation file 20130811.ak to the specified slot.

```
<Sysname> system-view
[Sysname] license activation-file install flash:/license/20130811.ak slot 1
This operation might take some time. Do not perform any other operations until the operation
is completed or a failure message is displayed. Please wait...
```

Related commands

display license

display license device-id

license activation-file uninstall

license activation-file uninstall

Use **license activation-file uninstall** to uninstall an activation file.

Syntax

license activation-file uninstall *file-name* **slot** *slot-number*

Views

System view

Predefined user roles

network-admin

Parameters

file-name: Specifies the file path, a case-sensitive string of 1 to 127 characters.

slot *slot-number*: Specifies the member ID of an IRF member device.

Usage guidelines

Use this command to revoke an unexpired license if you want to transfer the license from one device to another.

When an activation file is uninstalled, the system creates an Uninstall file. Use this file together with the SN and DID of the transfer destination to register the license for the transfer destination.

A feature cannot run after you uninstall all of its activation files.

Trial licenses are not transferrable. When you uninstall the activation file of a trial license, no Uninstall file is created.

Examples

Uninstall activation file flash:/license/20130811.ak from the specified slot.

```
<Sysname> system-view
[Sysname] license activation-file uninstall flash:/license/20130811.ak slot 1
This operation might take some time. Do not perform any other operations until the operation
is completed or a failure message is displayed. Please wait...
Uninstall file: flash:/license/20130813.uak
```

Related commands

display license

license activation-file install

license compress

Use **license compress** to compress the license storage.

Syntax

license compress slot *slot-number*

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies the member ID of an IRF member device.

Usage guidelines

The license storage is limited. You can execute this command to clear expired licenses and uninstalled licenses from the license storage.

If uninstalled licenses or expired licenses exist on the device, the compression operation will make the DID or DID file change. Before performing a compression, make sure all licenses registered with the old DID or DID file have been installed. You will be unable to install such licenses after the compression.

Examples

Compress the license storage on the specified slot.

```
<Sysname> system-view
[Sysname] license compress slot 1
This command will delete all data relevant to uninstalled and expired keys/licenses,
including Uninstall keys, and create a new device ID for activation keys/files. Make sure
you have saved the Uninstall keys so you can apply for a new activation key/file for the
unexpired licenses that were covered by the uninstalled activation keys/files.
Are you sure you want to continue? [Y/N]: Y

This operation might take some time. Do not perform any other operations until the operation
is completed or a failure message is displayed. Please wait...
```

Virtual Technologies Command Reference

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)

Preface

This command reference describes IRF configuration commands for setting up and maintaining an IRF fabric, including:

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

network-operator

Examples

Display IRF fabric information.

```
<Sysname> display irf
MemberID   Role     Priority    CPU-Mac           Description
   1       Loading  1           00e0-fcbe-3102    F1Num001
 *+2       Master   1           00e0-fcb1-ade2    F1Num002
-------------------------------------------------------------

 * indicates the device is the master.
 + indicates the device through which the user logs in.

 The Bridge MAC of the IRF is: 00e0-fc00-1000
 Auto upgrade                  : yes
 Mac persistent                : always
 Domain ID                     : 30
```

Table 1 Command output

Field	Description
MemberID	IRF member ID: • ID of the master is prefixed with an asterisk (*) sign. • ID of the device where you are logged in is prefixed with a plus (+) sign.
Role	Role of the member device in the IRF fabric: • **Standby**—Subordinate device. • **Master**—Master device. • **Loading**—The device is loading software images.
Priority	IRF member priority.
CPU-MAC	MAC address of the CPU in the device.

Field	Description
Description	Description you have configured for the member device. • If no description is configured, this field displays a dashed line (-----). • If the description exceeds the maximum number of characters that can be displayed, an ellipsis (…) is displayed in place of the exceeding text. To display the complete description, use the **display current-configuration** command.
Auto upgrade	Status of the software auto-update feature: • **yes**—Enabled. • **no**—Disabled.
MAC persistent	IRF bridge MAC persistence setting: • **6 min**—Bridge MAC address of the IRF fabric remains unchanged for 6 minutes after the address owner leaves. • **always**—Bridge MAC address of the IRF fabric does not change after the address owner leaves. • **no**—Bridge MAC address of the current master replaces the original bridge MAC address as soon as the owner of the original address leaves.
Domain ID	Domain ID of the IRF fabric. The domain ID you assign to an IRF fabric must uniquely identify the fabric in a multi-IRF fabric network.

Examples

Display IRF link information.

```
<Sysname> display irf link
Member 1
 IRF Port    Interface                      Status
 1           disable                        --
 2           Ten-GigabitEthernet1/0/51      UP
             Ten-GigabitEthernet1/0/52      ADM
Member 2
 IRF Port    Interface                      Status
 1           Ten-GigabitEthernet2/0/51      UP
             Ten-GigabitEthernet2/0/52      DOWN
 2           disable                        --
```

Table 3 Command output

Field	Description
Member *ID*	IRF member ID.
IRF Port	IRF port number: • **1**—IRF-port 1. • **2**—IRF-port 2.

Field	Description
Interface	Physical interfaces bound to the IRF port. This field displays **disable** if no physical interfaces have been bound to the IRF port.
Status	Link state of the IRF physical interface: • **UP**—The link is up. • **DOWN**—The link is down. • **ADM**—The interface has been manually shut down by using the **shutdown** command.

display irf topology

Use **display irf topology** to display IRF fabric topology information.

Syntax

display irf topology

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the IRF fabric topology.

```
<Sysname> display irf topology
                          Topology Info
 ------------------------------------------------------------------------
              IRF-Port1                 IRF-Port2
 MemberID   Link        neighbor      Link        neighbor     Belong To
 1          DOWN        ---           UP          2            000f-cbb8-1a82
 2          UP          1             DIS         ---          000f-cbb8-1a82
```

Table 4 Command output

Field	Description
IRF-Port1	Information about IRF-port 1, including its link state and neighbor.
IRF-Port2	Information about IRF-port 2, including its link state and neighbor.
MemberID	IRF member ID.

Field	Description

Link	Link state of the IRF port:
	• **UP**—The IRF link is up.
	• **DOWN**—The IRF link is down because the port has no physical link or has not been activated by the **irf-port-configuration active** command.
	• **DIS**—No physical interfaces have been bound to the IRF port.
	• **TIMEOUT**—IRF hello interval has timed out.
	• **ISOLATE**—The device is isolated from the IRF fabric. This issue might be caused by the following reasons:
	  ○ The IRF fabric does not support the device model.
	  ○ The maximum number of member devices has exceeded the upper limit.

neighbor	IRF member ID of the device connected to the IRF port. This field displays three hyphens (---) if no device is connected to the port.
Belong To	IRF fabric that has the device, represented by the CPU MAC address of the master in the IRF fabric.

display irf configuration

display mad

Use **display mad** to display MAD status and settings.

Syntax

display mad [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

verbose: Displays detailed MAD information. If you do not specify this keyword, the command only displays whether a MAD mechanism is enabled or disabled.

Examples

Display brief MAD information.

```
<Sysname> display mad
MAD ARP disabled.
MAD ND disabled.
MAD LACP enabled.
MAD BFD enabled.
```

Display detailed MAD information.

```
<Sysname> display mad verbose
Multi-active recovery state: No
```

```
Excluded ports (user-configured):
  Bridge-Aggregation4
  Vlan-interface999
Excluded ports (system-configured):
  IRF physical interfaces:
    Ten-GigabitEthernet1/0/51
    Ten-GigabitEthernet1/0/52
    Ten-GigabitEthernet2/0/51
    Ten-GigabitEthernet2/0/52
  BFD MAD interfaces:
    GigabitEthernet1/0/10
    GigabitEthernet2/0/10
    Vlan-interface3
  Member interfaces of excluded interface Bridge-Aggregation 4:
    GigabitEthernet1/0/11
    GigabitEthernet2/0/11
MAD ARP disabled.
MAD ND disabled.
MAD LACP enabled interface: Bridge-Aggregation 1
  MAD status                 : Normal
  Member ID       Port                       MAD status
  1               GigabitEthernet1/0/1       Normal
  2               GigabitEthernet2/0/1       Normal
MAD BFD enabled interface: VLAN-interface 3
  MAD status                 : Normal
  Member ID   MAD IP address       Neighbor    MAD status

  2           192.168.1.2/24       1           Normal
```

Table 5 Command output

Field	Description
MAD ARP disabled.	Status of ARP MAD. This field displays **MAD ARP enabled** if ARP MAD is enabled.
MAD ND disabled.	Status of ND MAD. This field displays **MAD ND enabled** if ND MAD is enabled.
MAD LACP enabled.	Status of LACP MAD. This field displays **MAD LACP disabled** if LACP MAD is disabled.
MAD BFD enabled.	Status of BFD MAD. This field displays **MAD BFD disabled** if BFD MAD is disabled.
Multi-active recovery state	Whether the IRF fabric is in Recovery state: • **Yes**—The IRF fabric is in Recovery state. When MAD detects that an IRF fabric has split into multiple IRF fabrics, it allows one fabric to forward traffic. All the other IRF fabrics are set to the Recovery state. In Recovery state, MAD shuts down all common network interfaces in the fabric except for the system- and user-excluded network interfaces. • **No**—The IRF fabric is not in Recovery state. It is active and can forward traffic.

Field	Description
Excluded ports (user-configured)	Network interfaces manually configured to not shut down when the IRF fabric transits to the Recovery state.

Excluded ports (system-configured)	Network interfaces set to not shut down by the system when the IRF fabric transits to the Recovery state. These interfaces are not manually configured.
	• IRF physical interfaces.
	• BFD MAD interfaces:
	  ○ VLAN interfaces used for BFD MAD and the Layer 2 Ethernet ports in the VLANs.
	  ○ Management Ethernet ports used for BFD MAD.
	• Member interfaces of a Layer 2 aggregate interface if the aggregate interface is excluded from the MAD shutdown action.

MAD ARP enabled interface:	Interfaces on which ARP MAD is enabled. This field displays **MAD ARP disabled** if ARP MAD is disabled.
MAD ND enabled interface:	Interfaces on which ND MAD is enabled. This field displays **MAD ND disabled** if ND MAD is disabled.
MAD LACP enabled interface	Interface on which LACP MAD is enabled. This field is displayed for each interface enabled with LACP MAD. This field displays **MAD LACP disabled** if LACP MAD is disabled.

MAD status	LACP MAD operating status:
	• **Normal**—LACP MAD is operating correctly.
	• **Faulty**—LACP MAD is not operating correctly. Verify the following items:
	  ○ Verify that the ports on LACP MAD links are up.
	  ○ Verify that the intermediate device supports extended LACPDUs.
	  ○ Verify that all member devices have member ports used for LACP MAD.

Member ID Port MAD status	LACP MAD details: • **Member ID**—IRF member ID of a device. • **Port**—Member ports of the aggregate interface used for LACP MAD. • **MAD status**—LACP MAD operating state on a member port. Values include **Normal** and **Faulty**.
MAD BFD enabled interface:	Layer 3 interface on which BFD MAD is enabled. This field displays **MAD BFD disabled** if BFD MAD is disabled.
MAD status	BFD MAD operating status: • **Normal**—BFD MAD is operating correctly. • **Faulty**—BFD MAD is not operating correctly. Check the BFD MAD link for connectivity issues. • **N/A**—BFD MAD link status cannot be detected. If BFD MAD is enabled on a management Ethernet port, it is normal that this field displays **N/A**.

Member ID
MAD IP address
Neighbor
MAD status
	BFD MAD details:
	• **Member ID**—IRF member ID of the local device.
	• **MAD IP address**—MAD IP address of a member device.
	• **Neighbor**—IRF member ID of the neighboring member device.
	• **MAD status**—BFD MAD link state. The following values are available:
	  ○ **Normal**—BFD MAD is operating correctly.
	  ○ **Faulty**—BFD MAD is not operating correctly. Check the BFD MAD link for connectivity issues.
	  ○ **N/A**—BFD MAD link status cannot be detected. If BFD MAD is enabled on a management Ethernet port, it is normal that this field displays **N/A**.

easy-irf

Use **easy-irf** to bulk-configure basic IRF settings for an IRF member device.

Syntax

easy-irf [**member** *member-id* [**renumber** *new-member-id*] **domain** *domain-id* [**priority** *priority*] [**irf-port1** *interface-list1*] [**irf-port2** *interface-list2*]]

Views

System view

Predefined user roles

network-admin

Parameters

member *member-id*: Specifies the member ID of a member device. The value range for the member ID is 1 to 10.

renumber *new-member-id*: Specifies a new member ID for the device. The value range for the member ID is 1 to 10. The member device automatically reboots for the new member ID to take effect. If you do not specify this option, the command does not change the member ID.

domain *domain-id*: Specifies an IRF domain ID in the range of 0 to 4294967295. Assign the same domain ID to all devices you are adding to the same IRF fabric.

priority *priority*: Specifies an IRF priority in the range of 1 to 32. The greater the priority value, the higher the priority. A member with higher priority is more likely to be the master.

irf-port1 *interface-list1*: Specifies interfaces bound to IRF-port 1. The *interface-list1* argument represents a space-separated list of up to eight interface items. Each interface item specifies one interface in the *interface-type interface-number* form.

irf-port2 *interface-list2*: Specifies interfaces bound to IRF-port 2. A physical interface can be bound to only one IRF port. The *interface-list2* argument represents a space-separated list of up to eight interface items. Each interface item specifies one interface in the *interface-type interface-number* form.

Usage guidelines

This command bulk-configures basic IRF settings for a member device, including the member ID, domain ID, priority, and IRF port bindings.

The easy IRF feature provides the following configuration methods:

- **Interactive method**—Enter the **easy-irf** command without parameters. The system will guide you to set the parameters step by step.
- **Non-interactive method**—Enter the **easy-irf** command with parameters.

As a best practice, use the interactive method if you are new to IRF.

If you execute this command multiple times, the following settings take effect:

- The most recent settings for the member ID, domain ID, and priority.
- IRF port bindings added through repeated executions of the command.

The software supports binding a maximum of eight physical interfaces to an IRF port. However, you might be unable to bind as many as eight physical interfaces to an IRF port due to hardware restrictions.

When you specify physical interfaces for an IRF port, you must follow the IRF port binding requirements in *Virtual Technologies Configuration Guide*.

If you specify physical interfaces by using the interactive method, you must also follow these restrictions and guidelines:

- Do not enter spaces between the interface type and interface number.
- Use a comma (,) to separate two physical interfaces. No spaces are allowed between interfaces.

To remove an IRF physical interface from an IRF port, you must use the **undo port group interface** command in IRF port view.

Examples

Bulk-configure basic IRF settings by using the non-interactive method. Change the member ID from 2 to 3, set the domain ID to 10, configure the member priority as 10, and bind Ten-GigabitEthernet 2/0/51 and Ten-GigabitEthernet 2/0/52 to IRF-port 1.

```
<Sysname> system-view
[Sysname] easy-irf member 2 renumber 3 domain 10 priority 10 irf-port1 ten-gigabitethernet
2/0/51 ten-gigabitethernet 2/0/52

The device will reboot for the new member ID to take effect. Continue? [Y/N] y
```

irf auto-update enable

Use **irf auto-update enable** to enable the software auto-update feature.

Use **undo irf auto-update enable** to disable the software auto-update feature.

Syntax

irf auto-update enable

undo irf auto-update enable

Default

Software auto-update is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command automatically propagates the current software images of the master device in the IRF fabric to any devices you are adding to the IRF fabric.

To ensure a successful software update, verify that the new device you are adding to the IRF fabric has sufficient storage space for the new software images. If sufficient storage space is not available, the device automatically deletes the current software images. If the reclaimed space is still insufficient, the device cannot complete the auto-update. You must reboot the device, and then access the BootWare menu to delete files.

Examples

Enable the software auto-update feature.

```
<Sysname> system-view
[Sysname] irf auto-update enable
```

irf domain

Use **irf domain** to assign a domain ID to the IRF fabric.

Use **undo irf domain** to restore the default.

Syntax

irf domain *domain-id*

undo irf domain

Default

The IRF domain ID is 0.

Views

System view

Predefined user roles

network-admin

Parameters

domain-id: Specifies a domain ID for the IRF fabric. The value range is 0 to 4294967295.

Usage guidelines

CAUTION:

Changing the IRF domain ID of an IRF member device will remove that member device from the IRF fabric. This member device will be unable to exchange IRF protocol packets with the remaining member devices in the IRF fabric.

One IRF fabric forms one IRF domain. IRF uses IRF domain IDs to uniquely identify IRF fabrics and prevent IRF fabrics from interfering with one another.

If one IRF fabric uses another IRF fabric as the intermediate device for LACP MAD, ARP MAD, or ND MAD, you must assign the two IRF fabrics different domain IDs for correct split detection. False detection causes IRF split.

An IRF fabric has only one IRF domain ID. You can change the IRF domain ID by using the following commands: **irf domain**, **mad enable**, **mad arp enable**, or **mad nd enable**. The IRF domain IDs configured by using these commands overwrite each other.

Examples

Set the IRF domain ID to 10.

```
<Sysname> system-view
[Sysname] irf domain 10
```

irf link-delay

Use **irf link-delay** to set a delay for the IRF ports to report a link status change event.

Use **undo irf link-delay** to restore the default.

Syntax

irf link-delay *interval*

undo irf link-delay

Default

The delay time is 4 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the IRF link status change report delay, in the range of 0 to 10000 milliseconds. If the interval is set to 0, link status change events are reported without any delay.

Usage guidelines

The device delays reporting link status change events of an IRF port, but it does not delay reporting link status change events of an IRF physical interface.

Examples

Set the IRF link status change report delay to 300 milliseconds.

```
<Sysname> system-view
[Sysname] irf link-delay 300
```

irf mac-address persistent

Use **irf mac-address persistent** to configure IRF bridge MAC persistence.

Use **undo irf mac-address persistent** to disable IRF bridge MAC persistence.

Syntax

irf mac-address persistent { **always** | **timer** }

undo irf mac-address persistent

Default

The IRF bridge MAC address remains unchanged for 6 minutes after the address owner leaves.

Views

System view

Predefined user roles

network-admin

Parameters

always: Enables the IRF bridge MAC address to be permanent. The IRF bridge MAC address does not change after the address owner leaves the fabric.

timer: Enables the IRF bridge MAC address to remain unchanged for 6 minutes after the address owner leaves. If the owner rejoins the IRF fabric within the time limit, the IRF bridge MAC address does not change. If the owner does not rejoin the IRF fabric within the time limit, the IRF fabric uses the bridge MAC address of the current master as the bridge MAC address.

Usage guidelines

CAUTION:

IRF bridge MAC address change will cause transient traffic disruption.

If the **undo** form of this command is used, bridge MAC address of the current master replaces the original IRF bridge MAC as soon as the original address owner leaves.

If ARP MAD or ND MAD is used with the spanning tree feature, disable IRF bridge MAC persistence by using the **undo irf mac-address persistent** command.

If the IRF fabric uses a daisy-chain topology and has aggregate links with upstream or downstream devices, do not execute the **undo irf mac-address persistent** command. Use of this command might result in transmission delay or packet loss after the address owner leaves or reboots.

If the IRF fabric has multichassis aggregate links, do not use the **undo irf mac-address persistent** command. Use of this command might cause traffic disruption.

By default, an IRF fabric uses the bridge MAC address of the master device as its bridge MAC address.

On a switched LAN, the IRF bridge MAC address must be unique for correct traffic transmission.

When IRF fabrics merge, IRF ignores the IRF bridge MAC address and checks the bridge MAC address of each member device in the IRF fabrics. IRF merge fails if any two member devices have the same bridge MAC address.

Examples

Enable the IRF bridge MAC address to persist forever.

```
<Sysname> system-view
[Sysname] irf mac-address persistent always
```

irf member description

Use **irf member description** to configure a description for an IRF member device.

Use **undo irf member description** to restore the default.

Syntax

irf member *member-id* **description** *text*

undo irf member *member-id* **description**

Default

No description is configured for an IRF member device.

Views

System view

Predefined user roles

network-admin

Parameters

member-id: Specifies the ID of an IRF member.

text: Specifies a description, a string of 1 to 127 characters.

Examples

Configure the description as **F1Num001** for IRF member 1.

```
<Sysname> system-view
[Sysname] irf member 1 description F1Num001
```

irf member priority

Use **irf member priority** to change the priority of an IRF member device.

Use **undo irf member priority** to restore the default.

Syntax

irf member *member-id* **priority** *priority*

undo irf member *member-id* **priority**

Default

The IRF member priority is 1.

Views

System view

Predefined user roles

network-admin

Parameters

member-id: Specifies an IRF member ID. The value range for IRF member IDs is 1 to 10.

priority: Sets priority in the range of 1 to 32. The greater the priority value, the higher the priority. A member with higher priority is more likely to be the master.

Usage guidelines

The new priority setting takes effect at the next master election, but it does not trigger a master election.

Examples

Set the priority of IRF member 2 to 32.

```
<Sysname> system-view
[Sysname] irf member 2 priority 32
```

irf member renumber

Use **irf member renumber** to change the member ID of an IRF member device.

Use **undo irf member renumber** to restore the previous IRF member ID of the device.

Syntax

irf member *member-id* **renumber** *new-member-id*

undo irf member *member-id* **renumber**

Default

The IRF member ID is 1.

Views

System view

Predefined user roles

network-admin

Parameters

member-id: Specifies the ID of an IRF member. The value range for IRF member IDs is 1 to 10.

new-member-id: Assigns a new ID to the IRF member. The value range for IRF member IDs is 1 to 10.

Usage guidelines

CAUTION:

IRF member ID change can invalidate member ID-related settings, including interface and file path settings, and cause data loss. Make sure you fully understand its impact on your live network.

To have the new ID take effect, you must reboot the IRF member. To cancel the member ID change before you reboot the member device, use the **undo irf member renumber** command. In the command, set the new member ID to be the same as the old member ID.

When adding a device into an IRF fabric, you must assign a unique IRF member ID to the device. If its IRF member ID has been used in the IRF fabric, the device cannot join the IRF fabric.

Interchanging member IDs between IRF member devices might cause undesirable configuration changes and data loss. For example, the IRF member IDs of Device A and Device B are 2 and 3, respectively. After you interchange their member IDs, their port settings also interchange.

Examples

Change the ID of an IRF member device from 1 to 2.

```
<Sysname> display irf
[Sysname] irf member 1 renumber 2
Renumbering the member ID may result in configuration change or loss. Continue?[Y/N]Y
```

Before rebooting the device, cancel the change in the preceding example.

```
[Sysname] undo irf member 1 renumber
Renumbering the member ID may result in configuration change or loss. Continue?[Y/N]y
```

If you reboot the device after executing the **irf member 1 renumber 2** command, the device member ID changes to 2 at system reboot. Using **undo irf member 1 renumber** cannot restore the member ID to 1. You must use the **irf member 2 renumber 1** command to reconfigure the member ID.

irf-port

Use **irf-port** to enter IRF port view.

Use **undo irf-port** to remove all port bindings on an IRF port.

Syntax

irf-port *member-id/irf-port-number*

undo irf-port *member-id/irf-port-number*

Views

System view

Predefined user roles

network-admin

Parameters

member-id: Specifies an IRF member device by its member ID.

irf-port-number: Specifies an IRF port on the member device. The *irf-port-number* argument represents the IRF port index and must be 1 or 2.

Usage guidelines

To bind physical interfaces to an IRF port, you must enter IRF port view.

Examples

Enter IRF-port 2/1 view.

```
<Sysname> system-view
[Sysname] irf-port 2/1
[Sysname-irf-port2/1]
```

Related commands

`port group interface`

irf-port-configuration active

Use **`irf-port-configuration active`** to activate IRF ports.

Syntax

`irf-port-configuration active`

Views

System view

Predefined user roles

network-admin

Usage guidelines

After connecting the physical interfaces between two devices and binding them to the correct IRF ports, you must use this command to activate the settings on the IRF ports. This command merges the two devices into one IRF fabric.

The system activates the IRF port settings automatically in the following situations:

- The configuration file that the device starts with contains IRF port bindings.
- You are binding physical interfaces to an IRF port after an IRF fabric is formed.

Examples

To configure and activate IRF-port 1/2 when the port is in DIS state:

Bind Ten-GigabitEthernet 1/0/51 to IRF-port 1/2.

```
<Sysname> system-view
[Sysname] interface ten-gigabitethernet 1/0/51
[Sysname-Ten-GigabitEthernet1/0/51] shutdown
[Sysname-Ten-GigabitEthernet1/0/51] quit
[Sysname] irf-port 1/2
[Sysname-irf-port1/2] port group interface ten-gigabitethernet 1/0/51
You must perform the following tasks for a successful IRF setup:
Save the configuration after completing IRF configuration.
Execute the "irf-port-configuration active" command to activate the IRF ports.
[Sysname-irf-port1/2] quit
[Sysname] interface ten-gigabitethernet 1/0/51
[Sysname-Ten-GigabitEthernet1/0/51] undo shutdown
[Sysname-Ten-GigabitEthernet1/0/51] quit
```

Save the configuration so the IRF port settings can take effect after the device reboots.

```
[Sysname] save
The current configuration will be written to the device. Are you sure? [Y/N]:y
Please input the file name(*.cfg)[flash:/startup.cfg]
(To leave the existing filename unchanged, press the enter key):
flash:/startup.cfg exists, overwrite? [Y/N]:y
Validating file. Please wait.........................
Saved the current configuration to mainboard device successfully.
```

Activate the IRF port.

```
[Sysname] irf-port-configuration active
```

mad arp enable

Use **mad arp enable** to enable ARP MAD.

Use **undo mad arp enable** to disable ARP MAD.

Syntax

mad arp enable

undo mad arp enable

Default

ARP MAD is disabled.

Views

Management Ethernet interface view

VLAN interface view

Predefined user roles

network-admin

Usage guidelines

Do not configure ARP MAD together with LACP MAD or BFD MAD, because they handle collisions differently.

When you configure ARP MAD on a VLAN interface, follow these restrictions and guidelines:

Category	Restrictions and guidelines

ARP MAD VLAN	• Do not enable ARP MAD on VLAN-interface 1.
	• If you are using an intermediate device, perform the following tasks:
	  ○ On the IRF fabric and the intermediate device, create a VLAN for ARP MAD.
	  ○ On the IRF fabric and the intermediate device, assign the ports of ARP MAD links to the ARP MAD VLAN.
	  ○ On the IRF fabric, create a VLAN interface for the ARP MAD VLAN.
	• As a best practice, do not use the ARP MAD VLAN for any other purposes.

ARP MAD and feature configuration	If an intermediate device is used, make sure the following requirements are met: • Run the spanning tree feature between the IRF fabric and the intermediate device to ensure that there is only one ARP MAD link in forwarding state. For more information about the spanning tree feature and its configuration, see *Layer 2—LAN Switching Configuration Guide*. • Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

When you configure ARP MAD on a management Ethernet port, follow these restrictions and guidelines:

Category	Restrictions and guidelines
Management Ethernet ports for ARP MAD	Connect a management Ethernet port on each member device to the common Ethernet ports on the intermediate device.

Category	Restrictions and guidelines
ARP MAD VLAN	On the intermediate device, create a VLAN for ARP MAD, and assign the ports used for ARP MAD to the VLAN. On the IRF fabric, you do not need to assign the management Ethernet ports to the VLAN.
ARP MAD and feature configuration	• Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

When you use the **mad arp enable** command, the system prompts you to enter a domain ID. If you do not want to change the current domain ID, press **enter** at the prompt.

An IRF fabric has only one IRF domain ID. You can change the IRF domain ID by using the following commands: **irf domain**, **mad enable**, **mad arp enable**, or **mad nd enable**. The IRF domain IDs configured by using these commands overwrite each other.

Examples

Enable ARP MAD on VLAN-interface 3.

```
<Sysname> system-view
[Sysname] interface vlan-interface 3
[Sysname-Vlan-interface3] mad arp enable
You need to assign a domain ID (range: 0-4294967295)
[Current domain is: 0]: 1
The assigned domain ID is: 1
```

Related commands

irf domain

mad bfd enable

Use **mad bfd enable** to enable BFD MAD.

Use **undo mad bfd enable** to disable BFD MAD.

Syntax

mad bfd enable

undo mad bfd enable

Default

BFD MAD is disabled.

Views

VLAN interface view

Management Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Do not configure BFD MAD together with ARP MAD or ND MAD, because they handle collisions differently.

When you configure BFD MAD on a VLAN interface, follow these guidelines:

Category	Restrictions and guidelines

BFD MAD VLAN	• Do not enable BFD MAD on VLAN-interface 1.
	• If you are using an intermediate device, perform the following tasks:
	  ○ On the IRF fabric and the intermediate device, create a VLAN for BFD MAD.
	  ○ On the IRF fabric and the intermediate device, assign the ports of BFD MAD links to the BFD MAD VLAN.
	  ○ On the IRF fabric, create a VLAN interface for the BFD MAD VLAN.
	• Make sure the IRF fabrics on the network use different BFD MAD VLANs.
	• Make sure the BFD MAD VLAN contains only ports on the BFD MAD links. Exclude a port from the BFD MAD VLAN if that port is not on a BFD MAD link. If you have assigned that port to all VLANs by using the **`port trunk permit vlan all`** command, use the **`undo port trunk permit`** command to exclude that port from the BFD MAD VLAN.

BFD MAD VLAN and feature compatibility	Do not use the BFD MAD VLAN for any purposes other than configuring BFD MAD. • Use only the **`mad bfd enable`** and **`mad ip address`** commands on the BFD MAD-enabled VLAN interface. If you configure other features, both BFD MAD and other features on the interface might run incorrectly. • Disable the spanning tree feature on any Layer 2 Ethernet ports in the BFD MAD VLAN. The MAD feature is mutually exclusive with the spanning tree feature.
MAD IP address	• To avoid network issues, only use the **`mad ip address`** command to configure IP addresses on the BFD MAD-enabled VLAN interface. Do not configure an IP address by using the **`ip address`** command on the BFD MAD-enabled VLAN interface. • Make sure all the MAD IP addresses are on the same subnet.

When you configure BFD MAD on a management Ethernet port, follow these restrictions and guidelines:

Category	Restrictions and guidelines
Management Ethernet ports for BFD MAD	Connect a management Ethernet port on each member device to the common Ethernet ports on the intermediate device.
BFD MAD VLAN	• On the intermediate device, create a VLAN for BFD MAD, and assign the ports used for BFD MAD to the VLAN. On the IRF fabric, you do not need to assign the management Ethernet ports to the VLAN. • Make sure the IRF fabrics on the network use different BFD MAD VLANs. • Make sure the BFD MAD VLAN on the intermediate device contains only ports on the BFD MAD links.
MAD IP address	• Use the **`mad ip address`** command instead of the **`ip address`** command to configure MAD IP addresses on the BFD MAD-enabled management Ethernet ports. • Make sure all the MAD IP addresses are on the same subnet.

Examples

Enable BFD MAD on VLAN-interface 3.

```
<Sysname> system-view
[Sysname] interface vlan-interface 3
[Sysname-Vlan-interface3] mad bfd enable
```

mad enable

Use **mad enable** to enable LACP MAD.

Use **undo mad enable** to disable LACP MAD.

Syntax

mad enable

undo mad enable

Default

LACP MAD is disabled.

Views

Aggregate interface view

Predefined user roles

network-admin

Usage guidelines

LACP MAD handles collisions differently than ARP MAD and ND MAD. To avoid conflicts, do not enable LACP MAD together with ARP MAD and ND MAD on an IRF fabric.

LACP MAD requires a device that supports extended LACPDUs for MAD to act as the intermediate device. You must set up a dynamic link aggregation group that spans all IRF member devices between the IRF fabric and the intermediate device. To enable dynamic link aggregation, configure the **link-aggregation mode dynamic** command on the aggregate interface.

If one IRF fabric uses another IRF fabric as the intermediate device for LACP MAD, you must assign the two IRF fabrics different domain IDs for correct split detection. False detection causes IRF split.

When you use the **mad enable** command, the system prompts you to enter a domain ID. If you do not want to change the current domain ID, press **enter** at the prompt.

An IRF fabric has only one IRF domain ID. You can change the IRF domain ID by using the following commands: **irf domain**, **mad enable**, **mad arp enable**, or **mad nd enable**. The IRF domain IDs configured by using these commands overwrite each other.

Examples

Enable LACP MAD on Bridge-Aggregation 1, a Layer 2 dynamic aggregate interface.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation mode dynamic
[Sysname-Bridge-Aggregation1] mad enable
You need to assign a domain ID (range: 0-4294967295)
[Current domain ID is: 0]: 1
The assigned domain ID is: 1
```

Related commands

irf domain

mad exclude interface

Use **mad exclude interface** to exclude an interface from being shut down when the IRF fabric transits to the Recovery state upon detection of a multi-active collision.

Use **undo mad exclude interface** to configure the IRF fabric to shut down an interface when it transits to the Recovery state upon detection of a multi-active collision.

Syntax

mad exclude interface *interface-type interface-number*

undo mad exclude interface *interface-type interface-number*

Default

Except for the network interfaces automatically excluded by the system, all network interfaces are shut down when the IRF fabric transits to the Recovery state. The system automatically excludes the following network interfaces from being shut down:

- IRF physical interfaces.
- Interfaces used for BFD MAD.
- Member interfaces of an aggregate interface if the aggregate interface is excluded from being shut down.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

If an interface must be kept in up state for special purposes such as Telnet connection, exclude the interface from the shutdown action. As a best practice to avoid incorrect traffic forwarding, do not exclude any interfaces except the interfaces used for Telnet.

The interfaces that have been shut down by MAD come up when the member devices reboot to join the recovered IRF fabric. If the active IRF fabric fails before the IRF link is recovered, use the **mad restore** command on the inactive IRF fabric to recover the inactive IRF fabric. This command also brings up all interfaces that were shut down by MAD.

Examples

Exclude GigabitEthernet 1/0/1 from being shut down when the MAD status transits to Recovery.

```
<Sysname> system-view
[Sysname] mad exclude interface gigabitethernet 1/0/1
```

Related commands

mad restore

mad ip address

Use **mad ip address** to assign a MAD IP address to an IRF member device for BFD MAD.

Use **undo mad ip address** to delete the MAD IP address for an IRF member device.

Syntax

mad ip address *ip-address* { *mask* | *mask-length* } **member** *member-id*

undo mad ip address *ip-address* { *mask* | *mask-length* } **member** *member-id*

Default

No MAD IP address is configured for an IRF member device.

Views

VLAN interface view

Management Ethernet interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IP address in dotted decimal notation.

mask: Specifies a subnet mask in decimal dotted notation.

mask-length: Specifies a subnet mask in length, in the range of 0 to 32.

member *member-id*: Specifies the ID of an IRF member.

Usage guidelines

To use BFD MAD, configure a MAD IP address for each IRF member. Make sure all the MAD IP addresses are on the same subnet.

Do not configure a MAD IP address by using the **ip address** command on the BFD MAD-enabled port or interface.

The master attempts to establish BFD sessions with other member devices by using its MAD IP address as the source IP address.

- If the IRF fabric is integrated, only the MAD IP address of the master takes effect. The master cannot establish a BFD session with any other member. If you execute the **display bfd session** command, the state of the BFD sessions is **Down**.
- When the IRF fabric splits, the IP addresses of the masters in the partitioned IRF fabrics take effect. The masters can establish a BFD session. If you execute the **display bfd session** command, the state of the BFD session between the two devices is **Up**.

Examples

Assign a MAD IP address to IRF member 1 on VLAN-interface 3.

```
<Sysname> system-view
[Sysname] interface vlan-interface 3
[Sysname-Vlan-interface3] mad ip address 192.168.0.1 255.255.255.0 member 1
```

Assign a MAD IP address to IRF member 2 on VLAN-interface 3.

```
[Sysname-Vlan-interface3] mad ip address 192.168.0.2 255.255.255.0 member 2
```

Related commands

mad bfd enable

mad nd enable

Use **mad nd enable** to enable ND MAD.

Use **undo mad nd enable** to disable ND MAD.

Syntax

mad nd enable

undo mad nd enable

Default

ND MAD is disabled.

Views

VLAN interface view

Management Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Do not configure ND MAD together with LACP MAD or BFD MAD, because they handle collisions differently.

When you configure ND MAD on a VLAN interface, follow these restrictions and guidelines:

Category	Restrictions and guidelines

ND MAD VLAN	• Do not enable ND MAD on VLAN-interface 1.
	• If you are using an intermediate device, perform the following tasks:
	  ○ On the IRF fabric and the intermediate device, create a VLAN for ND MAD.
	  ○ On the IRF fabric and the intermediate device, assign the ports of ND MAD links to the ND MAD VLAN.
	  ○ On the IRF fabric, create a VLAN interface for the ND MAD VLAN.
	• If no intermediate device is used, connect each IRF member device to all other member devices.
	• As a best practice, do not use the ND MAD VLAN for any other purposes.

ND MAD and feature configuration	If an intermediate device is used, make sure the following requirements are met: • Run the spanning tree feature between the IRF fabric and the intermediate device to ensure that there is only one ND MAD link in forwarding state. For more information about the spanning tree feature and its configuration, see *Layer 2—LAN Switching Configuration Guide*. • Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

When you configure ND MAD on a management Ethernet port, follow these restrictions and guidelines:

Category	Restrictions and guidelines
Management Ethernet ports for ND MAD	Connect a management Ethernet port on each member device to the common Ethernet ports on the intermediate device.
ND MAD VLAN	On the intermediate device, create a VLAN for ND MAD, and assign the ports used for ND MAD to the VLAN. On the IRF fabric, you do not need to assign the management Ethernet ports to the VLAN.
ND MAD and feature configuration	• Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

When you use the **mad nd enable** command, the system prompts you to enter a domain ID. If you do not want to change the current domain ID, press **enter** at the prompt.

An IRF fabric has only one IRF domain ID. You can change the IRF domain ID by using the following commands: **irf domain**, **mad enable**, **mad arp enable**, or **mad nd enable**. The IRF domain IDs configured by using these commands overwrite each other.

Examples

Enable ND MAD on VLAN-interface 3.

```
<Sysname> system-view
[Sysname] interface vlan-interface 3
[Sysname-Vlan-interface3] mad nd enable
You need to assign a domain ID (range: 0-4294967295)
[Current domain is: 0]: 1
The assigned domain ID is: 1
```

Related commands

irf domain

mad restore

Use **mad restore** to restore the normal MAD state of the IRF fabric in Recovery state.

Syntax

mad restore

Views

System view

Predefined user roles

network-admin

Usage guidelines

If the active IRF fabric has failed to work before the IRF split problem is fixed, use this command to restore an IRF fabric in Recovery state. The recovered IRF fabric will take over the active IRF fabric role.

Examples

Restore the normal MAD state of the IRF fabric in Recovery state.

```
<Sysname> system-view
[Sysname] mad restore
This command will restore the device from multi-active conflict state. Continue? [Y/N]:Y
Restoring from multi-active conflict state, please wait...
```

port group interface

Use **port group interface** to bind a physical interface to an IRF port.

Use **undo port group interface** to remove the binding of a physical interface to an IRF port.

Syntax

port group interface *interface-type interface-number*

undo port group interface *interface-name*

Default

No physical interfaces are bound to an IRF port.

Views

IRF port view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies a physical interface by its type and number.

interface-name: Specifies a physical interface in the *interface-typeinterface-number* format. No space is allowed between the *interface-type* and *interface-number* arguments.

Usage guidelines

CAUTION:

Use the **undo port group interface** command with caution. If the physical interface is the only up member interface of the IRF port, the IRF fabric will split after you remove the binding.

Execute this command multiple times to bind multiple physical interfaces to an IRF port. You can bind a maximum of eight physical interfaces to an IRF port. However, you might be unable to bind as many as eight physical interfaces to an IRF port due to hardware restrictions. For more information about IRF physical port restrictions, see the installation guide for the device.

Use the **shutdown** command to shut down a physical interface before you bind it to or remove it from an IRF port. To bring up the physical interface after a binding or binding removal operation, use the **undo shutdown** command.

For more information about IRF port binding requirements, see *Virtual Technologies Configuration Guide*.

Examples

Bind Ten-GigabitEthernet 1/0/51 to IRF-port 1/1 on IRF member 1.

```
<Sysname> system-view
[Sysname] interface ten-gigabitethernet 1/0/51
[Sysname-Ten-GigabitEthernet1/0/51] shutdown
[Sysname-Ten-GigabitEthernet1/0/51] quit
[Sysname] irf-port 1/1
[Sysname-irf-port1/1] port group interface ten-gigabitethernet 1/0/51
[Sysname-irf-port1/1] quit
[Sysname] interface ten-gigabitethernet 1/0/51
[Sysname-Ten-GigabitEthernet1/0/51] undo shutdown
```

Related commands

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This command reference describes Layer 2—LAN switching configuration commands.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

Ethernet interface commands

Common Ethernet interface commands

bandwidth

Use **bandwidth** to set the expected bandwidth of an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth (in kbps) is the interface baud rate divided by 1000.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth of GigabitEthernet 1/0/1 to 1000 kbps.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bandwidth 1000
```

Related commands

speed

broadcast-suppression

Use **broadcast-suppression** to enable broadcast suppression and set the broadcast suppression threshold.

Use **undo broadcast-suppression** to disable broadcast suppression.

Syntax

broadcast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo broadcast-suppression

Default

Ethernet interfaces do not suppress broadcast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

ratio: Sets the broadcast suppression threshold as a percentage of the interface bandwidth. The value range for this argument is 0 to 100. A smaller value means that less broadcast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of broadcast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of broadcast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The broadcast storm suppression features limits the size of broadcast traffic to a threshold on an interface. When the broadcast traffic on the interface exceeds this threshold, the system drops packets until the traffic drops below this threshold.

Both the **storm-constrain** command and the **broadcast-suppression** command can suppress broadcast storms on a port. The **broadcast-suppression** command uses the chip to physically suppress broadcast traffic. It has less influence on the device performance than the **storm-constrain** command, which uses software to suppress broadcast traffic.

For the traffic suppression result to be determined, do not configure both the **storm-constrain broadcast** command and the **broadcast-suppression** command on an interface.

When you configure the suppression threshold in kbps, the actual suppression threshold might be different from the configured one as follows:

- If the configured value is smaller than 64, the value of 64 takes effect.
- If the configured value is greater than 64 but not an integer multiple of 64, the integer multiple of 64 that is greater than and closest to the configured value takes effect.

For the suppression threshold that takes effect, see the prompt on the device.

Examples

Set the broadcast suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] broadcast-suppression kbps 10000
The actual value is 10048 on port GigabitEthernet1/0/1 currently.
```

The output shows that the value that takes effect is 10048 kbps (157 times of 64), because the chip only supports step 64.

Related commands

multicast-suppression

unicast-suppression

combo enable

Use **combo enable** to activate the copper or fiber combo port of a combo interface.

Syntax

combo enable { **auto** | **copper** | **fiber** }

Default

The copper or fiber combo port is automatically activated depending on the medium inserted in the combo interface.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

auto: Automatically identifies the media inserted and activates the corresponding combo port.

copper: Activates the copper combo port. In this case, use twisted pairs to connect the port.

fiber: Activates the fiber combo port. In this case, use optical fibers to connect the port.

Usage guidelines

A combo interface is a logical interface that physically contains one fiber combo port and one copper combo port on the device panel. The two ports share one forwarding interface. As a result, they cannot work simultaneously. When you activate either port, the other port is automatically disabled. You can select to activate the copper combo port or fiber combo port.

This command is available only on devices that support combo interfaces.

If you execute the **combo enable auto** command on a combo interface and the combo interface is connected to cables or optical fibers, you can use the **display interface** command to display the interface information.

- If the **display interface** command output contains "Media type is twisted pair," the copper combo port is activated.
- Otherwise, the fiber combo port is activated.

Before using this command, perform the following tasks according to the marks on the device panel:

- Determine the combo interfaces on your device.
- Identify the two physical interfaces that belong to each combo interface.

Examples

Activate the copper combo port of combo interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] combo enable copper
```

Activate the fiber combo port of combo interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] combo enable fiber
```

dampening

Use **dampening** to enable the device to dampen an interface when the interface is flapping.

Use **undo dampening** to restore the default.

Syntax

dampening [*half-life reuse suppress max-suppress-time*]

undo dampening

Default

Interface dampening is disabled on Ethernet interfaces.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

half-life: Specifies the amount of time after which a penalty is decreased, in the range of 1 to 120 seconds. The default value is 54 seconds.

reuse: Specifies the reuse threshold in the range of 200 to 20000. The default value is 750. The reuse threshold must be less than the suppression threshold.

suppress: Specifies the suppression threshold in the range of 200 to 20000. The default value is 2000.

max-suppress-time: Specifies the maximum amount of time the interface can be dampened, in the range of 1 to 255 seconds. The default value is 162 seconds (three times the half-life timer).

Usage guidelines

When configuring the **dampening** command, follow these rules to set the values mentioned above:

- The ceiling is equal to 2 (Max-suppress-time/Decay) × reuse-limits. It is not user configurable.
- The configured suppress limit is lower than or equal to the ceiling.
- The ceiling is lower than or equal to the maximum suppress limit supported.

This command, the **link-delay** command, and the **port link-flap protect enable** command are mutually exclusive on an interface.

This command does not take effect on the administratively down events. When you execute the **shutdown** command, the penalty restores to 0, and the interface reports the down event to the higher layer protocols.

Do not enable the dampening function on an interface with RRPP, MSTP, or Smart Link enabled. The S5000E-X, S5000X-EI, S5110V2-SI, S5000V3-EI, S5000V5-EI, and WAS6000 switches do not support RRPP or Smart Link.

After an interface in down state is dampened, the interface state displayed through the **display interface** command is always down.

Examples

Enable interface dampening on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dampening
```

Enable interface dampening on GigabitEthernet 1/0/1, and set the following parameters:

- Half life time to 2 seconds.
- Reuse value to 800.
- Suppression threshold to 3000.
- Maximum suppression interval to 5 seconds.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dampening 2 800 3000 5
```

Related commands

port link-flap protect enable

default

Use **default** to restore the default settings for an interface.

Syntax

default

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impacts of this command when you use it in a live network.

This command might fail to restore the default settings for some commands because of command dependencies or system restrictions. You can use the **display this** command in interface view to identify these commands, and use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to solve the problem.

Examples

Restore the default settings for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] default
```

description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of an interface is the interface name plus **Interface** (for example, **GigabitEthernet1/0/1 Interface**).

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

text: Specifies the interface description, a case-sensitive string of 1 to 255 characters.

Examples

Set the description of GigabitEthernet 1/0/1 to **lan-interface**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] description lan-interface
```

display counters

Use **display counters** to display interface traffic statistics.

Syntax

display counters { **inbound** | **outbound** } **interface** [*interface-type* [*interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

inbound: Displays inbound traffic statistics.

outbound: Displays outbound traffic statistics.

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

Usage guidelines

To clear the Ethernet interface traffic statistics, use the **reset counters interface** command.

If you do not specify an interface type, this command displays traffic statistics for all interfaces that have traffic counters.

If you specify an interface type but do not specify an interface number, this command displays traffic statistics for all interfaces of the specified type.

If you specify an interface type and number, this command displays traffic statistics for the specified interface.

Examples

Display inbound traffic statistics for all interfaces.

```
<Sysname> display counters inbound interface
Interface            Total (pkts)    Broadcast (pkts)    Multicast (pkts)  Err (pkts)
GE1/0/1                       100                 100                   0           0
GE1/0/2                  Overflow            Overflow            Overflow    Overflow

 Overflow: More than 14 digits (7 digits for column "Err").
       --: Not supported.
```

Table 1 Command output

Field	Description
Interface	Abbreviated interface name.
Total (pkts)	Total number of packets received or sent through the interface.
Broadcast (pkts)	Total number of broadcast packets received or sent through the interface.
Multicast (pkts)	Total number of multicast packets received or sent through the interface.
Err (pkts)	Total number of error packets received or sent through the interface.
Overflow: More than 14 digits (7 digits for column "Err")	The command displays **Overflow** when any of the following conditions exist: • The data length of an **Err** field value is greater than 7 decimal digits. • The data length of a non-Err field value is greater than 14 decimal digits.
--: Not supported	The statistical item is not supported.

Related commands

`reset counters interface`

display counters rate

Use **`display counters rate`** to display traffic rate statistics for interfaces in up state for the most recent statistics polling interval.

Syntax

`display counters rate` { **`inbound`** | **`outbound`** } **`interface`** [*`interface-type`* [*`interface-number`*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`inbound`: Displays inbound traffic rate statistics.

`outbound`: Displays outbound traffic rate statistics.

`interface-type`: Specifies an interface type.

interface-number: Specifies an interface number.

Usage guidelines

If you do not specify an interface type, this command displays traffic rate statistics for all up interfaces that have traffic counters.

If you specify an interface type but do not specify an interface number, this command displays traffic rate statistics for all up interfaces of the specified type.

If you specify an interface type and an interface, this command displays traffic rate statistics for the specified interface.

If an interface that you specify is always down for the most recent statistics polling interval, the system prompts that the interface does not support the command.

To set the statistics polling interval, use the **flow-interval** command.

Examples

Display the inbound traffic rate statistics for all interfaces.

```
<Sysname> display counters rate inbound interface
Usage: Bandwidth utilization in percentage
Interface            Usage (%)   Total (pps)   Broadcast (pps)   Multicast (pps)
GE1/0/1                      0             0                --                --

 Overflow: More than 14 digits.
       --: Not supported.
```

Table 2 Command output

Field	Description
Interface	Abbreviated interface name.
Usage (%)	Bandwidth usage (in percentage) of the interface for the last statistics polling interval.
Total (pps)	Average receiving or sending rate (in pps) for unicast packets for the last statistics polling interval.
Broadcast (pps)	Average receiving or sending rate (in pps) for broadcast packets for the last statistics polling interval.
Multicast (pps)	Average receiving or sending rate (in pps) for multicast packets for the last statistics polling interval. .
Overflow: more than 14 decimal digits	The command displays **Overflow** if the data length of a statistical item is greater than 14 decimal digits.
--: not supported	The statistical item is not supported.

```

Table 3 Output description

Field	Description
ETH receive packet statistics	Statistics about the Ethernet packets received by the Ethernet module: • **Totalnum**—Total number of received packets. • **ETHIINum**—Number of packets encapsulated by using Ethernet II. • **SNAPNum**—Number of packets encapsulated by using SNAP. • **RAWNum**—Number of packets encapsulated by using RAW. • **ISISNum**—Number of packets encapsulated by using ISIS. This field is not supported in the current software version. • **LLCNum**—Number of packets encapsulated by using LLC. • **UnknownNum**—Number of packets encapsulated by using unknown methods.

Field	Description
	• **ForwardNum**—Number of packets forwarded at Layer 2 or sent to the CPU. • **ARP**—Number of ARP packets. • **MPLS**—Number of MPLS packets. This field is not supported in the current software version. • **ISIS**—Number of IS-IS packets. This field is not supported in the current software version. • **ISIS2**—Number of large 802.3/802.2 frames encapsulated by using IS-IS. This field is not supported in the current software version. • **IP**—Number of IP packets. • **IPv6**—Number of IPv6 packets.
ETH receive error statistics	Statistics about the error Ethernet packets in the inbound direction on the Ethernet module. Errors might be included in packets or occur during the receiving process. The items include: • **NullPoint**—Number of packets that include null pointers. • **ErrIfindex**—Number of packets that include incorrect interface indexes. • **ErrIfcb**—Number of packets that include incorrect interface control blocks. • **IfShut**—Number of packets that are being received when the interface is shut down. • **ErrAnalyse**—Number of packets that include packet parsing errors. • **ErrSrcMAC**—Number of packets that include incorrect source MAC addresses. • **ErrHdrLen**—Number of packets that include header length errors.
ETH send packet statistics	Statistics about the Ethernet packets sent by the Ethernet module: • **L3OutNum**—Number of packets sent out of Layer 3 Ethernet interfaces. This field is not supported in the current software version. • **VLANOutNum**—Number of packets sent out of VLAN interfaces. • **FastOutNum**—Number of packets fast forwarded. • **L2OutNum**—Number of packets sent out of Layer 2 Ethernet interfaces. • **MbufRelayNum**—Number of packets transparently sent.
ETH send error statistics	Statistics about the error Ethernet packets in the outbound direction on the Ethernet module: • **NullMbuf**—Number of packets with null pointers. • **ErrAdjFwd**—Number of packets with adjacency table errors. • **ErrPrepend**—Number of packets with extension errors. • **ErrHdrLen**—Number of packets with header length errors. • **ErrPad**—Number of packets with padding errors. • **ErrQoSTrs**—Number of packets that failed to be sent by QoS. • **ErrVLANTrs**—Number of packets that failed to be sent in VLANs. • **ErrEncap**—Number of packets that failed to be sent due to link header encapsulation failures. • **ErrTagVLAN**—Number of packets that failed to be sent due to VLAN tag encapsulation failures. • **IfShut**—Number of packets that are being sent when the interface is shut down. • **IfErr**—Number of packets with incorrect outgoing interfaces.

Related commands

`reset ethernet statistics`

display interface

Use **display interface** to display interface information.

Syntax

display interface [*interface-type* [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

If you do not specify an interface type, this command displays information about all interfaces.

If you specify an interface type but do not specify an interface number, this command displays information about all interfaces of the specified type.

Examples

Display detailed information about Layer 2 interface GigabitEthernet 1/0/1.

```
<Sysname> display interface gigabitethernet 1/0/1
GigabitEthernet1/0/1
Current state: DOWN
Line protocol state: DOWN
IP packet frame type: Ethernet II, hardware address: 000c-2963-b767
Description: GigabitEthernet1/0/1 Interface
Bandwidth: 100000 kbps
Loopback is not set
Media type is twisted pair, port hardware type is 1000_BASE_T_AN_SFP
Unknown-speed mode, unknown-duplex mode
Link speed type is autonegotiation, link duplex type is autonegotiation
Flow-control is not enabled
Maximum frame length: 9216
Allow jumbo frame to pass
Broadcast max-ratio: 100%
Multicast max-ratio: 100%
Unicast max-ratio: 100%
PVID: 1
```

```
MDI type: Automdix

          0 lost carrier, 0 no carrier
```

Table 4 Command output

Field	Description
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **DOWN (Link-Aggregation interface down)**—The aggregate interface to which the interface belongs has been shut down by using the **shutdown** command. • **DOWN (Monitor-Link uplink down)**—The interface has been shut down by Monitor Link. • **mac-address moving down**—The interface has been shut down by the MAC address move suppression feature. • **MAD ShutDown**—The interface has been shut down by IRF MAD. This state occurs if the interface is on an IRF fabric placed in Recovery state after an IRF split. • **OFP DOWN**—The interface has been shut down by OpenFlow. • **Storm-Constrain**—The interface has been shut down because the storm control feature detected that unknown

Field	Description
	unicast traffic, multicast traffic, or broadcast traffic exceeded the upper threshold. • **STP DOWN**—The interface has been shut down by the BPDU guard feature. • **UP**—The interface is both administratively and physically up.

Line protocol state	Data link layer state of the interface. The state is determined through automatic parameter negotiation at the data link layer.
	• **UP**—The data link layer protocol is up.
	• **UP (spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces.
	• **DOWN**—The data link layer protocol is down.
	• **DOWN (***protocols***)**—The data link layer has been shut down by protocols included in the parentheses. Available protocols include:
	  ○ **DLDP**—Shuts down the data link layer when it detects that the link is unidirectional.
	  ○ **OAM**—Shuts down the data link layer when it detects a remote link failure.
	  ○ **LAGG**—Shuts down the data link layer when it detects that the aggregate interface does not have Selected ports.
	  ○ **BFD**—Shuts down the data link layer when it detects a link failure.

Bandwidth	Expected bandwidth of the interface.
Maximum transmission unit	MTU of the interface.
IP packet frame type	IPv4 packet framing format.
hardware address	MAC address of the interface.
Port priority	Port priority of the interface.
Loopback is set internal	An internal loopback test is running on the interface. This field depends on your configuration.
Loopback is set external	An external loopback test is running on the interface. This field depends on your configuration.
Loopback is not set	No loopback test is running on the interface. This field depends on your configuration.
10Mbps-speed mode	The interface is operating at 10 Mbps. This field depends on your configuration and the link parameter negotiation result.
100Mbps-speed mode	The interface is operating at 100 Mbps. This field depends on your configuration and the link parameter negotiation result.
1000Mbps-speed mode	The interface is operating at 1000 Mbps. This field depends on your configuration and the link parameter negotiation result.
10Gbps-speed mode	The interface is operating at 10 Gbps. This field depends on your configuration and the link parameter negotiation result.
Unknown-speed mode	The speed of the interface is unknown because the speed negotiation fails or the interface is physically disconnected.
half-duplex mode	The interface is operating in half duplex mode. This field depends on your configuration and the link parameter negotiation result.
full-duplex mode	The interface is operating in full duplex mode. This field depends

Field	Description
	on your configuration and the link parameter negotiation result.
unknown-duplex mode	The duplex mode of the interface is unknown because the duplex mode negotiation fails or the interface is physically disconnected.
Link speed type is autonegotiation	The interface is configured with the **speed auto** command.
Link speed type is force link	The interface is manually configured with a speed (for example, 1000 Mbps) by using the **speed** command.
link duplex type is autonegotiation	The interface is configured with the **duplex auto** command.
link duplex type is force link	The interface is manually configured with a duplex mode (for example, half or full) by using the **duplex** command.
Flow-control is not enabled	Generic flow control is disabled on the interface. This field depends on your configuration and the link parameter negotiation result.
Maximum frame length	Maximum length of Ethernet frames allowed to pass through the interface.
Allow jumbo frame to pass	The interface allows jumbo frames to pass through.
Broadcast max-	Broadcast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
Multicast max-	Multicast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
Unicast max-	Unknown unicast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
PVID	Port VLAN ID (PVID) of the interface.
MDI type	MDIX mode of the interface: • automdix. • mdi. • mdix.
Port link-type	Link type of the interface: • access. • trunk. • hybrid.
Tagged VLANs	VLANs for which the interface sends packets without removing VLAN tags.
Untagged VLANs	VLANs for which the interface sends packets after removing VLAN tags.
VLAN Passing	VLANs whose packets can be forwarded by the port. The VLANs must have been created.
VLAN permitted	VLANs whose packets are permitted by the port.
Trunk port encapsulation	Encapsulation protocol type for the trunk port.
Last link flapping	The amount of time that has elapsed since the most recent physical state change of the interface. This field displays **Never** if the interface has been physically down since device startup.
Last clearing of counters	Time when the **reset counters interface** command was last used to clear the interface statistics. This field displays **Never** if the **reset counters interface** command has never been used on the interface since device startup.

Field	Description
Current system time	Current system time in the YYYY/MM/DD HH:MM:SS format. If the time zone is configured, this field is in the YYYY/MM/DD HH:MM:SS *zone-name*±HH:MM:SS format, where the *zone-name* argument is the local time zone.
Last time when physical state changed to up	Last time when the physical state of the interface changed to up. If the time zone is configured, this field is in the YYYY/MM/DD HH:MM:SS *zone-name*±HH:MM:SS format, where the *zone-name* argument is the local time zone. A hyphen (-) indicates that the physical state of the interface has never changed.
Last time when physical state changed to down	Last time when the physical state of the interface changed to down. If the time zone is configured, this field is in the YYYY/MM/DD HH:MM:SS *zone-name*±HH:MM:SS format, where the *zone-name* argument is the local time zone. A hyphen (-) indicates that the physical state of the interface has never changed.
Last 300 seconds input: 0 packets/sec 0 bytes/sec 0% Last 300 seconds output: 0 packets/sec 0 bytes/sec 0%	Average inbound or outbound traffic rate (in pps and Bps) in the last 300 seconds, and the ratio of the actual rate to the interface bandwidth. A hyphen (-) indicates that the statistical item is not supported.
Input(total): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the inbound traffic statistics (in packets and bytes) for the interface. All inbound normal packets, abnormal packets, and normal pause frames were counted. The four fields on the second line represent: • Number of inbound unicast packets. • Number of inbound broadcasts. • Number of inbound multicasts. • Number of inbound pause frames. A hyphen (-) indicates that the statistical item is not supported.
Input(normal): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the inbound normal traffic and pause frame statistics (in packets and bytes) for the interface. The four fields on the second line represent: • Number of inbound normal unicast packets. • Number of inbound normal broadcasts. • Number of inbound normal multicasts. • Number of inbound normal pause frames. A hyphen (-) indicates that the statistical item is not supported.
input errors	Statistics of incoming error packets.
runts	Number of inbound frames meeting the following conditions: • Shorter than 64 bytes. • In correct format. • Containing valid CRCs.
giants	Number of inbound giants. Giants refer to frames larger than the maximum frame length supported on the interface. For an Ethernet interface that does not permit jumbo frames, the maximum frame length is as follows: • 1518 bytes (without VLAN tags). • 1522 bytes (with VLAN tags).

Field	Description
	For an Ethernet interface that permits jumbo frames, the maximum Ethernet frame length is set when you configure jumbo frame support on the interface.
throttles	Number of inbound frames that had a non-integer number of bytes.
CRC	Total number of inbound frames that had a normal length, but contained CRC errors.
frame	Total number of inbound frames that contained CRC errors and a non-integer number of bytes.
overruns	Number of packets dropped because the input rate of the port exceeded the queuing capability.

aborts	Total number of illegal inbound packets:
	• **Fragment frames**—CRC error frames shorter than 64 bytes. The length (in bytes) can be an integral or non-integral value.
	• **Jabber frames**—CRC error frames greater than the maximum frame length supported on the Ethernet interface (with an integral or non-integral length).
	  ○ For an Ethernet interface that does not permit jumbo frames, the maximum frame length is 1518 bytes (without VLAN tags) or 1522 bytes (with VLAN tags).
	  ○ For an Ethernet interface that permits jumbo frames, the maximum Ethernet frame length is set when you configure jumbo frame support on the interface.
	• **Symbol error frames**—Frames that contained a minimum of one undefined symbol.
	• **Unknown operation code frames**—Non-pause MAC control frames.
	• **Length error frames**—Frames whose 802.3 length fields did not match the actual frame length (46 to 1500 bytes).

ignored	Number of inbound frames dropped because the receiving buffer of the port ran low.
parity errors	Total number of frames with parity errors.
Output(total): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the outbound traffic statistics (in packets and bytes) for the interface. All outbound normal packets, abnormal packets, and normal pause frames were counted. The four fields on the second line represent: • Number of outbound unicast packets. • Number of outbound broadcasts. • Number of outbound multicasts. • Number of outbound pause frames. A hyphen (-) indicates that the statistical item is not supported.
Output(normal): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the outbound normal traffic and pause frame statistics (in packets and bytes) for the interface. The four fields on the second line represent: • Number of outbound normal unicast packets. • Number of outbound normal broadcasts. • Number of outbound normal multicasts. • Number of outbound normal pause frames.

Field	Description
	A hyphen (-) indicates that the statistical item is not supported.
output errors	Number of outbound packets with errors.
underruns	Number of packets dropped because the output rate of the interface exceeded the output queuing capability. This is a low-probability hardware anomaly.
buffer failures	Number of packets dropped because the transmitting buffer of the interface ran low.
aborts	Number of packets that failed to be transmitted, for example, because of Ethernet collisions.
deferred	Number of frames that the interface deferred to transmit because of detected collisions.
collisions	Number of frames that the interface stopped transmitting because Ethernet collisions were detected during transmission.
late collisions	Number of frames that the interface deferred to transmit after transmitting their first 512 bits because of detected collisions.
lost carrier	Number of carrier losses during transmission. This counter increases by one when a carrier is lost, and applies to serial WAN interfaces.
no carrier	Number of times that the port failed to detect the carrier when attempting to send frames. This counter increases by one when a port failed to detect the carrier, and applies to serial WAN interfaces.
Peak input rate	Peak rate of inbound traffic in Bps, and the time when the peak inbound traffic rate occurred.
Peak output rate	Peak rate of outbound traffic in Bps, and the time when the peak outbound traffic rate occurred.

Display brief information about all interfaces.

```

Table 5 Command output

Field	Description
Interface	Interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Description	Description of the interface.
Brief information of interfaces in bridge mode:	Brief information about Layer 2 interfaces.
Type: A - access; T - trunk; H – hybrid	Link type options for interfaces.
Speed	Speed of the interface, in bps.

Field	Description
	This field displays the **(a)** flag next to the speed if the speed is automatically negotiated. This field displays **auto** if the interface is configured to autonegotiate its speed but the autonegotiation has not started.
Duplex	Duplex mode of the interface: • **A**—Autonegotiation. The interface is configured to autonegotiate its duplex mode but the autonegotiation has not started. • **F**—Full duplex. • **F(a)**—Autonegotiated full duplex. • **H**—Half duplex. • **H(a)**—Autonegotiated half duplex.
Type	Link type of the interface: • **A**—Access. • **H**—Hybrid. • **T**—Trunk.
PVID	Port VLAN ID.
Cause	Cause for the physical link state of an interface to be **DOWN**: • **Administratively**—The interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **DOWN (Link-Aggregation interface down)**—The interface is a member port of an aggregate interface, and the aggregate interface is down. • **DOWN (Loopback detection down)**—The loopback detection module has detected loops. • **DOWN (Monitor-Link uplink down)**—The monitor link module has detected that the uplink is down. • **MAD ShutDown**—The interface is on an IRF fabric placed by IRF MAD in Recovery state after an IRF split. • **Not connected**—No physical connection exists (possibly because the network cable is disconnected or faulty). • **Storm-Constrain**—The storm control feature has detected that unknown unicast traffic, multicast traffic, or broadcast traffic exceeded the upper threshold. • **STP DOWN**—The interface has been shut down by the BPDU guard feature. • **Port Security Disabled**—The interface has been shut down by the intrusion detection mechanism because the interface received illegal packets. • **OFP DOWN**—The interface has been shut down by OpenFlow.

Related commands

reset counters interface

display interface link-info

Use **display interface link-info** to display the status and packet statistics of interfaces.

Syntax

display interface link-info

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display status and statistics of all interfaces.

```
<Sysname> display interface link-info
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface        Link Protocol  InUsage OutUsage         InErrs        OutErrs
GE1/0/1          UP   UP            10%       0%              0              0
NULL0            UP   UP(s)          0%       0%              0              0

 Overflow: More than 7 digits.
       --: Not supported.
```

Table 6 Command output

Field	Description
Link: ADM - administratively down; Stby - standby	Physical link state of the interface: • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.
Protocol: (s) – spoofing	The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces, loopback interfaces, and InLoopback interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces, loopback interfaces, and InLoopback interfaces.
InUsage	Inbound bandwidth usage within the most recent statistics polling interval. It is calculated by this formula: Average inbound speed of the interface within the most recent statistics polling interval/interface bandwidth. To set the statistics polling interval, use the **flow-interval** command.

Field	Description
OutUsage	Outbound bandwidth usage within the most recent statistics polling interval. It is calculated by this formula: Average outbound speed of the interface within the most recent statistics polling interval/interface bandwidth. To set the statistics polling interval, use the **flow-interval** command.
InErrs	Number of error packets received.
OutErrs	Number of error packets sent.
Overflow: More than 7 digits.	The data length of a statistical item value is greater than 7 decimal digits.
--: Not supported.	A hyphen (-) indicates that the corresponding statistical item is not supported.

Related commands

flow-interval

display link-flap protection

Use **display link-flap protection** to display information about link flapping protection on an interface.

Syntax

display link-flap protection [**interface** *interface-type* [*interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type: Specifies an interface type. If you do not specify an interface type, the command displays information about link flapping protection on all interfaces.

interface-number: Specifies an interface number. If you do not specify an interface number, the command displays information about link flapping protection on all interfaces of the specified type.

Examples

Display information about link flapping protection on all interfaces.

```
<Sysname> display link-flap protection
Link-flap protection: Enabled
Interface            Link-flap  Status  Interval  Threshold
GE1/0/1              Enabled    Down    10        5
GE1/0/2              Disabled   N/A     --        --
```

Table 7 Command output

Field	Description
Link-flap protection	Status of global link flapping protection: • **Enabled**—Link flapping protection is enabled globally.

Field	Description
	• **Disabled**—Link flapping protection is disabled globally.
Link-flap	Status of link flapping protection on an interface: • **Enabled**—Link flapping protection is enabled on an interface. • **Disabled**—Link flapping protection is disabled on an interface.
Status	Status of an interface: • **Down**—The interface has been shut down by the link flapping protection feature. • **N/A**—The interface status is not affected by the link flapping protection feature.
Interval	Link flapping detection interval for an interface.
Threshold	Link flapping detection threshold for an interface.

Related commands

link-flap protect enable

port link-flap protect enable

duplex

Use **duplex** to set the duplex mode for an Ethernet interface.

Use **undo duplex** to restore the default.

Syntax

duplex { **auto** | **full** | **half** }

undo duplex

Default

An Ethernet interface operates in autonegotiation mode.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

auto: Configures the interface to autonegotiate the duplex mode with the peer.

full: Configures the interface to operate in full duplex mode. In this mode, the interface can receive and transmit packets simultaneously.

half: Configures the interface to operate in half duplex mode. In this mode, the interface can only receive or transmit packets at a given time. Fiber ports, 1000-Mbps Ethernet interfaces, and 10000-Mbps Ethernet interfaces do not support this keyword.

Examples

Configure GigabitEthernet 1/0/1 to operate in full duplex mode.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] duplex full
```

eee enable

IMPORTANT:
Fiber ports do not support this command.

Use **eee enable** to enable Energy Efficient Ethernet (EEE) on an interface.

Use **undo eee enable** to disable EEE on an interface.

Syntax

eee enable

undo eee enable

Default

EEE is disabled.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

With EEE enabled, a link-up interface enters low power state if it has not received any packet for a period of time. The time period depends on the chip specifications and is not configurable. When a packet arrives later, the interface restores to the normal state.

Examples

Enable EEE on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] eee enable
```

flow-control

Use **flow-control** to enable TxRx-mode generic flow control on an Ethernet interface.

Use **undo flow-control** to disable TxRx-mode generic flow control on the Ethernet interface.

Syntax

flow-control

undo flow-control

Default

TxRx-mode generic flow control is disabled on an Ethernet interface.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

With TxRx-mode generic flow control configured, an interface can both send and receive flow control frames:

- When congested, the interface sends a flow control frame to its peer.
- Upon receiving a flow control frame from the peer, the interface suspends sending packets.

To implement flow control on a link, enable generic flow control at both ends of the link.

Examples

Enable TxRx-mode generic flow control on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] flow-control
```

flow-control receive enable

Use **flow-control receive enable** to enable Rx-mode generic flow control on an Ethernet port.

Use **undo flow-control** to disable Rx-mode generic flow control on an Ethernet port.

Syntax

flow-control receive enable

undo flow-control

Default

Rx-mode generic flow control is disabled on Ethernet interfaces.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

With Rx-mode flow control enabled, an interface can receive but cannot send flow control frames.

- When the interface receives a flow control frame from its peer, it suspends sending packets to the peer.
- When traffic congestion occurs on the interface, it cannot send flow control frames to the peer.

To handle unidirectional traffic congestion on a link, configure the **flow-control receive enable** command at one end, and the **flow-control** command at the other. To enable both ends of the link to handle traffic congestion, configure the **flow-control** command at both ends.

Examples

Enable Rx-mode generic flow control on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-gigabitethernet 1/0/1] flow-control receive enable
```

Related commands

flow-control

flow-interval

Use **flow-interval** to set the statistics polling interval.

Use **undo flow-interval** to restore the default.

Syntax

flow-interval *interval*

undo flow-interval

Default

The statistics polling interval is 300 seconds.

Views

System view

Ethernet interface view

Predefined user roles

network-admin

Parameters

interval: Sets the statistics polling interval in seconds. The interval is in the range of 5 to 300 and must be a multiple of 5.

Usage guidelines

Configuring the statistics polling interval in system view is supported in only Release 6328 and later.

A device supports either the system view settings or the Ethernet interface view settings.

- The statistics polling interval configured in system view takes effect on all Ethernet interfaces.
- The statistics polling interval configured in Ethernet interface view takes effect only on the current interface.

For an Ethernet interface, the statistics polling interval configured in Ethernet interface view takes priority.

As a best practice, use the default setting when you set the statistics polling interval in system view. A short statistics polling interval might decrease the system performance and result in inaccurate statistics.

Examples

Set the statistics polling interval to 100 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] flow-interval 100
```

ifmonitor crc-error

Use **ifmonitor crc-error** to configure global CRC error packet alarm parameters.

Use **undo ifmonitor crc-error** to restore the default.

NOTE:

This command is supported only in Release 6340 and later.

Syntax

ifmonitor crc-error slot *slot-number* **high-threshold** *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

undo ifmonitor crc-error slot *slot-number*

Default

The upper threshold is 1000, the lower threshold is 100, and the statistics collection and comparison interval is 10 seconds for CRC error packet alarms.

Views

System view

Predefined user roles

network-admin

Parameters

high-threshold *high-value*: Specifies the upper threshold for CRC error packet alarms, in the range of 1 to 4294967295 packets.

low-threshold *low-value*: Specifies the lower threshold for CRC error packet alarms, in the range of 1 to 4294967295 packets.

interval *interval*: Specifies the statistics collection and comparison interval for CRC error packets, in the range of 1 to 65535 seconds.

shutdown: Shuts down an interface when the number of incoming CRC error packets on the interface exceeds the upper threshold. Then, the interface stops forwarding all packets. To recover the interface, execute the **undo shutdown** command on the interface. If you do not specify this keyword, an upper threshold exceeding alarm is generated and the interface enters the alarm state when the number of incoming CRC error packets exceeds the upper threshold on the interface.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

With the CRC error packet alarm function enabled, when the number of incoming CRC error packets on an interface in normal state within the specified interval exceeds the upper threshold, the interface generates an upper threshold exceeding alarm and enters the alarm state. When the number of incoming CRC error packets on an interface in the alarm state within the specified interval drops below the lower threshold, the interface generates a recovery alarm and restores to the normal state.

You can configure the CRC error packet alarm parameters in system view and interface view.

- The configuration in system view takes effect on all interfaces of the specified slot. The configuration in interface view takes effect only on the current interface.
- For an interface, the configuration in interface view takes priority, and the configuration in system view is used only when no configuration is made in interface view.

When you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the upper threshold to 5000, lower threshold to 400, and statistics collection and comparison interval to 6 seconds for CRC error packet alarms.

```
<Sysname> system-view
[Sysname] ifmonitor crc-error slot 1 high-threshold 5000 low-threshold 400 interval 6
```

Related commands

snmp-agent trap enable ifmonitor

ifmonitor input-error

Use **ifmonitor input-error** to configure global input error packet alarm parameters.

Use **undo ifmonitor input-error** to restore the default.

NOTE:
This command is supported only in Release 6340 and later.

Syntax

ifmonitor input-error slot *slot-number* **high-threshold** *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

undo ifmonitor input-error slot *slot-number*

Default

The upper threshold is 1000, the lower threshold is 100, and the statistics collection and comparison interval is 10 seconds for input error packet alarms.

Views

System view

Predefined user roles

network-admin

Parameters

high-threshold *high-value*: Specifies the upper threshold for input error packet alarms, in the range of 1 to 4294967295 packets.

low-threshold *low-value*: Specifies the lower threshold for input error packet alarms, in the range of 1 to 4294967295 packets.

interval *interval*: Specifies the statistics collection and comparison interval for input error packets, in the range of 1 to 65535 seconds.

shutdown: Shuts down an interface when the number of input error packets on the interface exceeds the upper threshold. Then, the interface stops forwarding all packets. To recover the interface, execute the **undo shutdown** command on the interface. If you do not specify this keyword, an upper threshold exceeding alarm is generated and the interface enters the alarm state when the number of input error packets exceeds the upper threshold on the interface.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

With the input error packet alarm function enabled, when the number of input error packets on an interface in normal state within the specified interval exceeds the upper threshold, the interface generates an upper threshold exceeding alarm and enters the alarm state. When the number of input error packets on an interface in the alarm state within the specified interval drops below the lower threshold, the interface generates a recovery alarm and restores to the normal state.

You can configure the input error packet alarm parameters in system view and interface view.

- The configuration in system view takes effect on all interfaces of the specified slot. The configuration in interface view takes effect only on the current interface.
- For an interface, the configuration in interface view takes priority, and the configuration in system view is used only when no configuration is made in interface view.

When you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the upper threshold to 5000, lower threshold to 400, and statistics collection and comparison interval to 6 seconds for input error packet alarms.

```
<Sysname> system-view
[Sysname] ifmonitor input-error slot 1 high-threshold 5000 low-threshold 400 interval 6
```

Related commands

snmp-agent trap enable ifmonitor

ifmonitor output-error

Use **ifmonitor output-error** to configure global output error packet alarm parameters.

Use **undo ifmonitor output-error** to restore the default.

NOTE:

This command is supported only in Release 6340 and later.

Syntax

ifmonitor output-error slot *slot-number* **high-threshold** *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

undo ifmonitor output-error slot *slot-number*

Default

The upper threshold is 1000, the lower threshold is 100, and the statistics collection and comparison interval is 10 seconds for output error packet alarms.

Views

System view

Predefined user roles

network-admin

Parameters

high-threshold *high-value*: Specifies the upper threshold for output error packet alarms, in the range of 1 to 4294967295 packets.

low-threshold *low-value*: Specifies the lower threshold for output error packet alarms, in the range of 1 to 4294967295 packets.

interval *interval*: Specifies the statistics collection and comparison interval for output error packets, in the range of 1 to 65535 seconds.

shutdown: Shuts down an interface when the number of output error packets on the interface exceeds the upper threshold. Then, the interface stops forwarding all packets. To recover the interface, execute the **undo shutdown** command on the interface. If you do not specify this keyword, an upper threshold exceeding alarm is generated and the interface enters the alarm state when the number of output error packets exceeds the upper threshold on the interface.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

With the output error packet alarm function enabled, when the number of output error packets on an interface in normal state within the specified interval exceeds the upper threshold, the interface generates an upper threshold exceeding alarm and enters the alarm state. When the number of

output error packets on an interface in the alarm state within the specified interval drops below the lower threshold, the interface generates a recovery alarm and restores to the normal state.

You can configure the output error packet alarm parameters in system view and interface view.

- The configuration in system view takes effect on all interfaces of the specified slot. The configuration in interface view takes effect only on the current interface.
- For an interface, the configuration in interface view takes priority, and the configuration in system view is used only when no configuration is made in interface view.

When you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the upper threshold to 5000, lower threshold to 400, and statistics collection and comparison interval to 6 seconds for output error packet alarms.

```
<Sysname> system-view
[Sysname] ifmonitor output-error slot 1 high-threshold 5000 low-threshold 400 interval
6
```

Related commands

snmp-agent trap enable ifmonitor

interface

Use **interface** to enter interface view.

Syntax

interface *interface-type interface-number*

Views

System view

Predefined user roles

network-admin

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

Examples

Enter the view of GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1]
```

jumboframe enable

Use **jumboframe enable** to allow jumbo frames within the specified length to pass through.

Use **undo jumboframe enable** to prevent jumbo frames from passing through.

Use **undo jumboframe enable** *size* to restore the default.

Syntax

jumboframe enable [*size*]

undo jumboframe enable [*size*]

Default

The device allows jumbo frames within 10240 bytes to pass through.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

size: Sets the maximum length of (in bytes) Ethernet frames that are allowed to pass through. The value range for this argument is 1522 to 10240.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Allow jumbo frames to pass through GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] jumboframe enable
```

link-delay

Use **link-delay** to set the physical state change suppression interval on an Ethernet interface.

Use **undo link-delay** to restore the default.

Syntax

link-delay { **down** | **up** } [**msec**] *delay-time*

undo link-delay { **down** | **up** }

Default

Each time the physical link of a port goes up or comes down, the interface immediately reports the change to the CPU.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

down: Suppresses link-down events.

up: Suppresses link-up events.

msec: Enables the physical state change suppression interval to be accurate to milliseconds. If you do not specify this keyword, the suppression interval is accurate to seconds.

delay-time: Sets the physical state change suppression interval on the Ethernet interface. A value of 0 means that physical state changes are immediately reported to the CPU and are not suppressed.

- If you do not specify the **msec** keyword, the value range is 0 to 30 seconds.
- If you specify the **msec** keyword, the value range is 0 to 10000 milliseconds, and the value must be a multiple of 100.

Usage guidelines

You can configure this feature to suppress only link-down events, only link-up events, or both. If an event of the specified type still exists when the suppression interval expires, the system reports the event.

When you configure this feature, follow these guidelines:

- To suppress link-down events, configure the **link-delay down** command.
- To suppress link-up events, configure the **link-delay up** command.

On an interface, you can configure different suppression intervals for link-up and link-down events. If you execute the **link-delay** command multiple times on an interface, the following rules apply:

- You can configure the suppression intervals for link-up and link-down events separately.
- If you configure the suppression interval multiple times for link-up or link-down events, the most recent configuration takes effect.

Do not execute this command on an interface that has RRPP, spanning tree protocols, or Smart Link enabled. The S5000E-X, S5000X-EI, S5110V2-SI, S5000V3-EI, S5000V5-EI, and WAS6000 switches do not support RRPP or Smart Link.

This command, the **dampening** command, and the **port link-flap protect enable** command are mutually exclusive on an Ethernet interface.

Examples

Set the link-down event suppression interval to 8 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] link-delay down 8
```

Set the link-up event suppression interval to 800 milliseconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] link-delay up msec 800
```

Related commands

dampening

port link-flap protect enable

link-flap protect enable

Use **link-flap protect enable** to enable link flapping protection globally.

Use **undo link-flap protect enable** to disable link flapping protection globally.

Syntax

link-flap protect enable

undo link-flap protect enable

Default

Link flapping protection is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Link flapping on any interface changes network topology and increases the system overhead. For example, in an active/standby link scenario, when the interface status on the active link changes between **UP** and **DOWN**, traffic switches between active and standby links. To solve this problem, execute this command.

With link flapping protection enabled on an interface, when the interface goes down, the system enables link flapping detection on the interface. During the link flapping detection interval, if the number of detected flaps reaches or exceeds the link flapping detection threshold, the system shuts down the interface.

Link flapping protection takes effect only when it is enabled in both system view and interface view.

Examples

Enable link flapping protection globally.

```
<Sysname> system-view
[Sysname] link-flap protect enable
```

Related commands

port link-flap protect enable

loopback

Use **loopback** to enable loopback testing on an Ethernet interface.

Use **undo loopback** to disable loopback testing on an Ethernet interface.

Syntax

loopback { **external** | **internal** }

undo loopback

Default

Loopback testing is disabled on an Ethernet interface.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

external: Enables external loopback testing on the Ethernet interface.

internal: Enables internal loopback testing on the Ethernet interface.

Usage guidelines

An Ethernet interface in a loopback test cannot correctly forward data packets.

You cannot perform a loopback test on Ethernet interfaces manually brought down (displayed as in **ADM** or **Administratively DOWN** state).

The **speed**, **duplex**, and **shutdown** commands cannot be configured on an Ethernet interface in a loopback test.

The **shutdown**, **port up-mode**, and **loopback** commands are mutually exclusive.

Examples

Enable internal loopback testing on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] loopback internal
```

loopback-test

Use **loopback-test** to perform a loopback test.

NOTE:
This command is supported only in Release 6346 and later.

Syntax

loopback-test { **external** | **internal** }

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

external: Performs an external loopback test.

internal: Performs an internal loopback test.

Usage guidelines

The **shutdown**, **port up-mode**, **loopback**, and **loopback-test** commands are mutually exclusive on an interface.

Examples

Perform an internal loopback test on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] loopback-test internal
```

multicast-suppression

Use **multicast-suppression** to enable multicast storm suppression and set the multicast storm suppression threshold.

Use **undo multicast-suppression** to disable multicast storm suppression.

Syntax

multicast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo multicast-suppression

Default

Ethernet interfaces do not suppress multicast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

ratio: Sets the multicast suppression threshold as a percentage of the interface bandwidth. The value range for this argument (in percentage) is 0 to 100. A smaller value means that less multicast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of multicast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of multicast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The multicast storm suppression feature limits the size of multicast traffic to a threshold on an interface. When the multicast traffic on the interface exceeds this threshold, the system drops packets until the traffic drops below this threshold.

Both the **storm-constrain** command and the **multicast-suppression** command can suppress multicast storms on a port. The **multicast-suppression** command uses the chip to physically suppress multicast traffic. It has less influence on the device performance than the **storm-constrain** command, which uses software to suppress multicast traffic.

For the traffic suppression result to be determined, do not configure both the **storm-constrain multicast** command and the **multicast-suppression** command on an interface.

When you configure the suppression threshold in kbps, the actual suppression threshold might be different from the configured one as follows:

- If the configured value is smaller than 64, the value of 64 takes effect.
- If the configured value is greater than 64 but not an integer multiple of 64, the integer multiple of 64 that is greater than and closest to the configured value takes effect.

To determine the suppression threshold that takes effect, see the prompts on the switch.

Examples

Set the multicast storm suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] multicast-suppression kbps 10000
The actual value is 10048 on port GigabitEthernet1/0/1 currently.
```

The output shows that the value that takes effect is 10048 kbps (157 times of 64), because the chip only supports step 64.

Related commands

broadcast-suppression

unicast-suppression

port auto-power-down

IMPORTANT:
Fiber ports do not support this command.

Use **port auto-power-down** to enable auto power-down on an Ethernet interface.

Use **undo port auto-power-down** to disable auto power-down on an Ethernet interface.

Syntax

port auto-power-down

undo port auto-power-down

Default

Auto power-down is disabled on Ethernet interfaces.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

When an interface with auto power-down enabled has been down for a specific period of time, both of the following events occur:

- The device automatically stops supplying power to the interface.
- The interface enters the power save mode.

The time period depends on the chip specifications and is not configurable.

When the interface comes up, both of the following events occur:

- The device automatically restores the power supply to the interface.
- The interface restores to its normal state.

Examples

Enable auto power-down on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port auto-power-down
```

port ifmonitor crc-error

Use **port ifmonitor crc-error** to configure CRC error packet alarm parameters for an interface.

Use **undo port ifmonitor crc-error** to restore the default.

Syntax

port ifmonitor crc-error high-threshold *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

undo port ifmonitor crc-error

NOTE:

This command is supported only in Release 6340 and later.

Default

An interface uses the global CRC error packet alarm parameters.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

high-threshold *high-value*: Specifies the upper threshold for CRC error packet alarms. If you specify the **ratio** keyword, the value range is 1 to 100. If you do not specify the **ratio** keyword, the value range is 1 to 4294967295 packets.

low-threshold *low-value*: Specifies the lower threshold for CRC error packet alarms. If you specify the **ratio** keyword, the value range is 1 to 100. If you do not specify the **ratio** keyword, the value range is 1 to 4294967295 packets.

interval *interval*: Specifies the statistics collection and comparison interval for CRC error packets, in the range of 1 to 65535 seconds.

shutdown: Shuts down an interface when the number of incoming CRC error packets on the interface exceeds the upper threshold. Then, the interface stops forwarding all packets. To recover the interface, execute the **undo shutdown** command on the interface. If you do not specify this keyword, an upper threshold exceeding alarm is generated and the interface enters the alarm state when the number of incoming CRC error packets exceeds the upper threshold on the interface.

Usage guidelines

With the CRC error packet alarm function enabled, when the number of incoming CRC error packets on an interface in normal state within the specified interval exceeds the upper threshold, the interface generates an upper threshold exceeding alarm and enters the alarm state. When the number of incoming CRC error packets on an interface in the alarm state within the specified interval drops below the lower threshold, the interface generates a recovery alarm and restores to the normal state.

You can configure the CRC error packet alarm parameters in system view and interface view.

- The configuration in system view takes effect on all interfaces of the specified slot. The configuration in interface view takes effect only on the current interface.
- For an interface, the configuration in interface view takes priority, and the configuration in system view is used only when no configuration is made in interface view.

When you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the upper threshold to 5000, lower threshold to 400, and statistics collection and comparison interval to 6 seconds for CRC error packet alarms on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port ifmonitor crc-error high-threshold 5000
low-threshold 400 interval 6
```

Related commands

port ifmonitor input-error

Use **port ifmonitor input-error** to configure input error packet alarm parameters for an interface.

Use **undo port ifmonitor input-error** to restore the default.

Syntax

port ifmonitor input-error high-threshold *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

undo port ifmonitor input-error

NOTE:

This command is supported only in Release 6342 and later.

Default

An interface uses the global input error packet alarm parameters.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

high-threshold *high-value*: Specifies the upper threshold for input error packet alarms, in the range of 1 to 4294967295 packets.

low-threshold *low-value*: Specifies the lower threshold for input error packet alarms, in the range of 1 to 4294967295 packets.

interval *interval*: Specifies the statistics collection and comparison interval for input error packets, in the range of 1 to 65535 seconds.

shutdown: Shuts down an interface when the number of input error packets on the interface exceeds the upper threshold. Then, the interface stops forwarding all packets. To recover the interface, execute the **undo shutdown** command on the interface. If you do not specify this keyword, an upper threshold exceeding alarm is generated and the interface enters the alarm state when the number of input error packets exceeds the upper threshold on the interface.

Usage guidelines

With the input error packet alarm function enabled, when the number of input error packets on an interface in normal state within the specified interval exceeds the upper threshold, the interface generates an upper threshold exceeding alarm and enters the alarm state. When the number of input error packets on an interface in the alarm state within the specified interval drops below the lower threshold, the interface generates a recovery alarm and restores to the normal state.

You can configure the input error packet alarm parameters in system view and interface view.

- The configuration in system view takes effect on all interfaces of the specified slot. The configuration in interface view takes effect only on the current interface.
- For an interface, the configuration in interface view takes priority, and the configuration in system view is used only when no configuration is made in interface view.

When you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the upper threshold to 5000, lower threshold to 400, and statistics collection and comparison interval to 6 seconds for input error packet alarms on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port ifmonitor input-error high-threshold 5000
low-threshold 400 interval 6
```

Related commands

snmp-agent trap enable ifmonitor

port ifmonitor output-error

Use **port ifmonitor output-error** to configure output error packet alarm parameters for an interface.

Use **undo port ifmonitor output-error** to restore the default.

NOTE:

This command is supported only in Release 6342 and later.

Syntax

port ifmonitor output-error high-threshold *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

undo port ifmonitor output-error

Default

An interface uses the global output error packet alarm parameters.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

high-threshold *high-value*: Specifies the upper threshold for output error packet alarms, in the range of 1 to 4294967295 packets.

low-threshold *low-value*: Specifies the lower threshold for output error packet alarms, in the range of 1 to 4294967295 packets.

interval *interval*: Specifies the statistics collection and comparison interval for output error packets, in the range of 1 to 65535 seconds.

shutdown: Shuts down an interface when the number of output error packets on the interface exceeds the upper threshold. Then, the interface stops forwarding all packets. To recover the interface, execute the **undo shutdown** command on the interface. If you do not specify this keyword, an upper threshold exceeding alarm is generated and the interface enters the alarm state when the number of output error packets exceeds the upper threshold on the interface.

Usage guidelines

With the output error packet alarm function enabled, when the number of output error packets on an interface in normal state within the specified interval exceeds the upper threshold, the interface generates an upper threshold exceeding alarm and enters the alarm state. When the number of output error packets on an interface in the alarm state within the specified interval drops below the lower threshold, the interface generates a recovery alarm and restores to the normal state.

You can configure the output error packet alarm parameters in system view and interface view.

- The configuration in system view takes effect on all interfaces of the specified slot. The configuration in interface view takes effect only on the current interface.
- For an interface, the configuration in interface view takes priority, and the configuration in system view is used only when no configuration is made in interface view.

When you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the upper threshold to 5000, lower threshold to 400, and statistics collection and comparison interval to 6 seconds for output error packet alarms on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port ifmonitor output-error high-threshold 5000
low-threshold 400 interval 6
```

Related commands

snmp-agent trap enable ifmonitor

port link-flap protect enable

Use **port link-flap protect enable** to enable link flapping protection on an interface.

Use **undo port link-flap protect enable** to disable link flapping protection on an interface.

Syntax

port link-flap protect enable [**interval** *interval* | **threshold** *threshold*] *

undo port link-flap protect enable [**interval** | **threshold**]

Default

Link flapping protection is disabled on an interface.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the link flapping detection interval in seconds. The value range for this argument is 10 to 60. The default value for this argument is 10.

threshold: Specifies the link flapping detection threshold in the range of 5 to 10. The default value for this argument is 5.

Usage guidelines

Link flapping protection takes effect only when it is enabled in both system view and interface view.

If you do not specify the **interval** *interval* or **threshold** *threshold* option when you execute the **port link-flap protect enable** command, the command uses the default settings.

If you specify the **interval** or **threshold** keyword when you execute the **undo port link-flap protect enable** command, the command restores the default setting for the keyword.

With link flapping protection enabled on an interface, when the interface goes down, the system enables link flapping detection on the interface. During the link flapping detection interval, if the number of detected flaps reaches or exceeds the link flapping detection threshold, the system shuts down the interface.

To bring up an interface that has been shut down by link flapping protection, execute the **undo shutdown** command.

This command, the **dampening** command, and the **link-delay** command are mutually exclusive on an Ethernet interface.

Examples

Enable link flapping protection on an interface. Set the link flapping detection interval to 10 seconds, and set the link flapping detection threshold to 5.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet 1/0/1] port link-flap protect enable interval 10 threshold 5
```

Related commands

dampening

link-delay

link-flap protect enable

port up-mode

Use **port up-mode** to forcibly bring up a fiber Ethernet port.

Use **undo port up-mode** to restore the default.

Syntax

port up-mode

undo port up-mode

Default

A fiber Ethernet port is not forcibly brought up. The physical state of a fiber port depends on the physical state of the fibers.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

This command forcibly brings up a fiber Ethernet port and enables the port to forward packets unidirectionally over a single link. In this way, transmission links are well utilized.

Copper ports and combo interfaces do not support this command. This command is supported only in Release 6312 and later.

This command is not supported on interfaces 1 through 24 on an S5024FV3-EI switch.

The **shutdown**, **port up-mode**, and **loopback** commands are mutually exclusive.

A fiber Ethernet port does not support this command if the port is shut down by a protocol or by using the **shutdown** command.

A fiber Ethernet port does not support this command if the port joins an aggregation group.

Examples

Forcibly bring up fiber port GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port up-mode
```

reset counters interface

Use **reset counters interface** to clear the interface statistics.

Syntax

reset counters interface [*interface-type* [*interface-number*]]

Views

User view

Predefined user roles

network-admin

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

Usage guidelines

Use this command to clear history statistics if you want to collect traffic statistics for a specific time period.

If you do not specify an interface type, this command clears statistics for all interfaces.

If you specify an interface type but do not specify an interface number, this command clears statistics for all interfaces of the specified type.

Examples

Clear the statistics for GigabitEthernet 1/0/1.

```
<Sysname> reset counters interface gigabitethernet 1/0/1
```

Related commands

display counters interface

display counters rate interface

display interface

reset ethernet statistics

Use **reset ethernet statistics** to clear the Ethernet module statistics.

Syntax

reset ethernet statistics [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number:* Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears statistics for all IRF member devices.

Examples

Clear the Ethernet module statistics for the specified slot.

```
<Sysname> reset ethernet statistics slot 1
```

Related commands

display ethernet statistics

shutdown

Use **shutdown** to shut down an Ethernet interface.

Use **undo shutdown** to bring up an Ethernet interface.

Syntax

shutdown

undo shutdown

Default

Ethernet interfaces are in up state.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:
Executing the **shutdown** command on an interface will disconnect the link of the interface and interrupt communication. Use this command with caution.

Some interface configurations might require an interface restart before taking effect.

The **shutdown** command cannot be executed on an interface in a loopback test.

The **shutdown**, **port up-mode**, and **loopback** commands are mutually exclusive.

Examples

Shut down and then bring up GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] shutdown
[Sysname-GigabitEthernet1/0/1] undo shutdown
```

snmp-agent trap enable ifmonitor

Use **snmp-agent trap enable ifmonitor** to enable interface alarm functions.

Use **undo snmp-agent trap enable ifmonitor** to disable interface alarm functions.

NOTE:
This command is supported only in Release 6340 and later.

Syntax

snmp-agent trap enable ifmonitor [**crc-error** | **input-error** | **output-error**] *

undo snmp-agent trap enable ifmonitor [**crc-error** | **input-error** | **output-error**] *

Default

Interface alarm functions are enabled.

Views

System view

Predefined user roles

network-admin

Parameters

crc-error: Enables the CRC error packet alarm function for interfaces.

input-error: Enables the input error packet alarm function for interfaces.

output-error: Enables the output error packet alarm function for interfaces.

Examples

Enable the CRC error packet alarm function for interfaces.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable ifmonitor crc-error
```

speed

Use **speed** to set the speed of an Ethernet interface.

Use **undo speed** to restore the default.

Syntax

speed { **100** | **1000** | **2500** | **5000** | **10000** | **auto** }

undo speed

Default

An Ethernet interface negotiates a speed with its peer.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

10: Sets the interface speed to 10 Mbps.

100: Sets the interface speed to 100 Mbps.

1000: Sets the interface speed to 1000 Mbps.

2000: Sets the interface speed to 2000 Mbps.

2500: Sets the interface speed to 2500 Mbps.

5000: Sets the interface speed to 5000 Mbps.

10000: Sets the interface speed to 10000 Mbps.

auto: Enables the interface to negotiate a speed with its peer.

Usage guidelines

For an Ethernet copper port, use the **speed** command to set its speed to match the speed of the peer interface. Support of copper ports for keywords of this command varies by copper port type. For more information, use the **speed ?** command in interface view. If the system does not prompt that operation failed when you configure a speed for a copper port, the copper port supports this speed. Otherwise, the copper port does not support this speed.

For a fiber port, use the **speed** command to set its speed to match the rate of a transceiver module. Support of fiber ports for keywords of this command varies by fiber port type. For more information, use the **speed ?** command in interface view. If the system does not prompt that operation failed when you configure a speed for a fiber port, the fiber port supports this speed. Otherwise, the fiber port does not support this speed.

Additionally, you must select a speed for a fiber port according to the transceiver module installed to ensure that the transceiver module can be used properly. If the transceiver module installed in a fiber port does not support the speed for the fiber port, the transceiver module cannot be used. For example, if the transceiver module installed in an SFP+ fiber port is an SFP GE transceiver module and the **speed 10000** command is executed on the fiber port, the transceiver module can be used.

After a SFP-GE-T or SFP-GE-T-D transceiver module is installed in a fixed SFP port of the device, the port supports only the speed of 1000 Mbps. You can set the speed to 1000 Mbps by using the **speed** command or configure the port to autonegotiate the speed as 1000 Mbps by using the **speed auto** command.

Examples

Configure GigabitEthernet 1/0/1 to autonegotiate the speed.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] speed auto
```

Related commands

speed auto

speed auto downgrade

Use **speed auto downgrade** to enable automatic negotiation for speed downgrading.

Use **undo speed auto downgrade** to disable automatic negotiation for speed downgrading.

Syntax

speed auto downgrade

undo speed auto downgrade

Default

Automatic negotiation for speed downgrading is enabled.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect after you configure it on the interface at either end of a link and the two interfaces are configured to automatically negotiate the speed.

This command is applicable only to GE interfaces.

Examples

Enable automatic negotiation for speed downgrading on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] speed auto downgrade
```

Related commands

speed auto

unicast-suppression

Use **unicast-suppression** to enable unknown unicast storm suppression and set the unknown unicast storm suppression threshold.

Use **undo unicast-suppression** to disable unknown unicast storm suppression.

Syntax

unicast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo unicast-suppression

Default

Ethernet interfaces do not suppress unknown unicast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

ratio: Sets the unknown unicast suppression threshold as a percentage of the interface bandwidth. The value range for this argument (in percentage) is 0 to 100. A smaller value means that less unknown unicast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of unknown unicast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of unknown unicast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The unknown unicast storm suppression feature limits the size of unknown unicast traffic to a threshold on an interface. When the unknown unicast traffic on the interface exceeds this threshold, the system discards packets until the unknown unicast traffic drops below this threshold.

Both the **storm-constrain** command and the **unicast-suppression** command can suppress unknown unicast storms on a port. The **unicast-suppression** command uses the chip to physically suppress unknown unicast traffic. It has less influence on the device performance than the **storm-constrain** command, which uses software to suppress unknown unicast traffic.

For the unknown unicast traffic suppression result to be determined, do not configure both the **storm-constrain unicast** command and the **unicast-suppression** command on an interface.

When you configure the suppression threshold in kbps, the actual suppression threshold might be different from the configured one as follows:

- If the configured value is smaller than 64, the value of 64 takes effect.
- If the configured value is greater than 64 but not an integer multiple of 64, the integer multiple of 64 that is greater than and closest to the configured value takes effect.

To determine the suppression threshold that takes effect, see the prompts on the switch.

Examples

Set the unknown unicast storm suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] unicast-suppression kbps 10000
The actual value is 10048 on port GigabitEthernet1/0/1 currently.
```

The output shows that the value that takes effect is 10048 kbps (157 times of 64), because the chip only supports step 64.

display storm-constrain

Use **display storm-constrain** to display storm control settings and statistics.

Syntax

display storm-constrain [**broadcast** | **multicast** | **unicast**] [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

broadcast: Displays broadcast storm control settings and statistics.

multicast: Displays multicast storm control settings and statistics.

unicast: Displays unknown unicast storm control settings and statistics.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command displays storm control settings and statistics for all storm control-enabled interfaces.

Usage guidelines

If you do not specify any keywords, this command displays all storm control settings on all storm control-enabled interfaces.

Examples

Display the storm control settings on all storm control-enabled ports.

```
<Sysname> display storm-constrain
```

```
 Abbreviation: BC - broadcast; MC - multicast; UC - unknown unicast;
               KNUC - known unicast; FW - forwarding
 Flow Statistic Interval: 5 (in seconds)
Port          Type Lower     Upper     Unit  Mode     Status   Trap Log StateChg
------------------------------------------------------------------------------
GE1/0/1       MC   100       200       kbps  shutdown shutdown off  on  10
```

Table 8 Command output

Field	Description
Flow Statistic Interval	Traffic polling interval (in seconds) of the storm control module.
Port	Abbreviated interface name.
Type	Type of traffic subjected to storm control: • **BC**—Broadcast packets. • **MC**—Multicast packets. • **UC**—Unknown unicast packets. • **KNUC**—Known unicast packets. This field is not supported in the current software version.
Lower	Lower storm control threshold, in pps, kbps, or percentage.
Upper	Upper storm control threshold, in pps, kbps, or percentage.
Unit	Storm control threshold unit: • pps. • kbps. • percentage.
Mode	Action (block or shutdown) taken on the interface when the upper threshold is reached. N/A indicates that no action is configured.
Status	Packet forwarding status: • **FW**—The port is forwarding traffic correctly. • **shutdown**—The port has been shut down. • **block**—The port drops the type of traffic.
Trap	Status of the storm control threshold event trap switch: • **on**—The port sends threshold event traps. • **off**—The port does not send threshold event traps.
Log	Status of the storm control threshold event log switch: • **on**—The port sends threshold event log messages. • **off**—The port does not send threshold event log messages.
StateChg	Number of forwarding state changes of the interface. When the **StateChg** field reaches 65535, it resets automatically.

display virtual-cable-test

Use **`display virtual-cable-test`** to display test results for the cable connected to an Ethernet interface.

IMPORTANT:

This command is supported only in Release 6350 and later versions.

Syntax

display virtual-cable-test interface [*interface-type interface-number* | *interface-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an Ethernet interface by its interface type and interface number. If you do not specify this parameter, the command displays test results for the cable connected to all Ethernet interfaces.

Usage guidelines

The test results are for reference only. The maximum error in length tested is 10 m (32.81 ft).

The test result is displayed as Invalid when the test cable length is in the range of 0 to 3 m (0 to 9.84 ft).

Fiber ports and interfaces operating at 10 Mbps or 100 Mbps and in up state do not support cable connection test.

When the local interface is shut down, cable connection test cannot be performed. When the peer interface is shut down, the length of the cable cannot be tested.

Examples

Display test results for the cable connected to all Ethernet interfaces.

```
<Sysname>display virtual-cable-test
Interface                   Result          Length(meters)      Date
GigabitEthernet1/0/1        Not test
GigabitEthernet1/0/2        Abnormal(open)  <50                 2013-03-06 23:01:34
```

Display test results for the cable connected to GigabitEthernet 1/0/2.

```
<Sysname> display virtual-cable-test interface GigabitEthernet 1/0/2
 Cable status:
  Pair A length: Invalid meters
  Pair B length: Invalid meters
  Pair C length: Invalid meters
  Pair D length: Invalid meters
  Pair A state: Abnormal(open)
  Pair B state: Abnormal(open)
  Pair C state: Abnormal(open)
  Pair D state: Abnormal(open)
Pair Impedance mismatch: no
Pair skew: - ns
Pair swap: -
Pair polarity: -
Insertion loss: - db
Return loss: - db
Near-end crosstalk: - db
```

Table 9 Command output

Field	Description
Interface	Name of the interface.
Result	Test results: • **Abnormal (open)**—An open circuit is detected. • **Abnormal (short)**—A short circuit is detected. • **Not test**—The test failed.
Length(meters)	Total length of the wire pair in meters.
Date	Time when the test was performed.
Pair x length	When the cable pair state is **OK**, this field displays the total length of the cable pair. When the cable pair is in any other state, this field displays the length from the local interface to the faulty point.
Pair x state	Cable pair state: • **OK**—The cable pair is in good condition. • **Abnormal**—The cable pair is abnormal. • **Abnormal (open)**—An open circuit is detected. • **Abnormal (short)**—A short circuit is detected. • **Invalid**—The test failed.
Pair Impedance mismatch	Pair impedance state: • **yes**—The pair impedance matches. • **no**—The pair impedance does not match.
Pair skew	If this field displays a hyphen (**-**), this field is not supported in the current software version.
Pair swap	If this field displays a hyphen (**-**), this field is not supported in the current software version.
Pair polarity	If this field displays a hyphen (**-**), this field is not supported in the current software version.
Insertion loss	If this field displays a hyphen (**-**), this field is not supported in the current software version.
Return loss	If this field displays a hyphen (**-**), this field is not supported in the current software version.
Near-end crosstalk	If this field displays a hyphen (**-**), this field is not supported in the current software version.

Related commands

`virtual-cable-test`

mdix-mode

IMPORTANT:

Fiber ports do not support this command.

Use **`mdix-mode`** to configure the Medium Dependent Interface Cross-Over (MDIX) mode of an Ethernet interface.

Use **`undo mdix-mode`** to restore the default.

Syntax

mdix-mode { **automdix** | **mdi**| **mdix** }

undo mdix-mode

Default

Ethernet interfaces operate in **automdix** mode.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

automdix: Specifies that the interface negotiates pin roles with its peer.

mdi: Specifies that pins 1 and 2 are transmit pins and pins 3 and 6 are receive pins.

mdix: Specifies that pins 1 and 2 are receive pins and pins 3 and 6 are transmit pins.

Examples

Configure GigabitEthernet 1/0/1 to operate in **automdix** mode.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mdix-mode automdix
```

port bridge enable

Use **port bridge enable** to enable bridging on an Ethernet interface.

Use **undo port bridge enable** to disable bridging on an Ethernet interface.

Syntax

port bridge enable

undo port bridge enable

Default

Bridging is disabled on an Ethernet interface.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

By default, the device drops packets whose outgoing interface and incoming interface are the same.

To enable the device to forward such packets rather than drop them, execute this command in Ethernet interface view. After the device receives a broadcast or unknown unicast packet, the device forwards the packet through all interfaces in the VLAN to which the incoming interface of the packet belongs.

Do not add interfaces configured with this command to an aggregation group.

Examples

Enable bridging on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port bridge enable
```

reset interface virtual-cable-test

Use **reset interface virtual-cable-test** to clear test results for the cable connected to an Ethernet interfaces.

IMPORTANT:
This command is supported only in Release 6350 and later versions.

Syntax

reset interface [*interface-type interface-number* | *interface-name*] **virtual-cable-test**

Views

User view

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an Ethernet interface by its type and number.

Examples

Clear test results for the cable connected to GigabitEthernet 1/0/1.

```
<Sysname> reset interface GigabitEthernet 1/0/1 virtual-cable-test
```

Related commands

virtual-cable-test

speed auto

Use **speed auto** to set options for speed autonegotiation.

Use **undo speed** to restore the default.

Syntax

speed auto { **10** | **100** | **1000** } *

undo speed

Default

No option is set for speed autonegotiation.

Views

100-Mbps or 1000-Mbps Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

10: Configures 10 Mbps as an option for speed autonegotiation.

100: Configures 100 Mbps as an option for speed autonegotiation.

1000: Configures 1000 Mbps as an option for speed autonegotiation.

Usage guidelines

The **speed** command and the **speed auto** command supersede each other. The most recent command that you configure takes effect. For example:

- If you configure **speed auto 100 1000** and then **speed 100** on the interface, the interface speed is forcibly set to 100 Mbps.
- If you configure **speed 100** and then **speed auto 100 1000** on the interface, the interface negotiates with its peer for a speed. The negotiated speed is either 100 Mbps or 1000 Mbps.

Speed autonegotiation enables an Ethernet interface to negotiate with its peer for the highest speed that both ends support. You can narrow down the speed option list for negotiation. To avoid negotiation failures, make sure a minimum of one speed option is supported at both ends.

Examples

Configure GigabitEthernet 1/0/1 to use 10 Mbps and 1000 Mbps for speed negotiation.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] speed auto 10 1000
```

Related commands

speed

storm-constrain

Use **storm-constrain** to enable storm control and set thresholds for broadcast, multicast, or unknown unicast packets on an Ethernet interface.

Use **undo storm-constrain** to disable storm control for broadcast, multicast, unknown unicast, or all types of traffic.

Syntax

storm-constrain { **broadcast** | **multicast** | **unicast** } { **pps** | **kbps** | **ratio** } *upperlimit lowerlimit*

undo storm-constrain { **all** | **broadcast** | **multicast** | **unicast** }

Default

Traffic storm control is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

all: Disables storm control for all types of traffic: broadcast, multicast, and unknown unicast.

broadcast: Enables or disables broadcast storm control.

multicast: Enables or disables multicast storm control.

unicast: Enables or disables unknown unicast storm control.

pps: Sets storm control thresholds in pps.

kbps: Sets storm control thresholds in kbps.

ratio: Sets storm control thresholds as a percentage of the transmission capacity of the interface.

upperlimit: Sets the upper threshold, in pps, kbps, or percentage.

- If you specify the **pps** keyword, the value range for the *upperlimit* argument is 0 to 1.4881 × the interface bandwidth.
- If you specify the **kbps** keyword, the value range for the *upperlimit* argument is 0 to the interface bandwidth.
- If you specify the **ratio** keyword, the value range for the *upperlimit* argument is 0 to 100.

lowerlimit: Sets the lower threshold, in pps, kbps, or percentage.

- If you specify the **pps** keyword, the value range for the *lowerlimit* argument is 0 to 1.4881 × the interface bandwidth.
- If you specify the **kbps** keyword, the value range for the *lowerlimit* argument is 0 to the interface bandwidth.
- If you specify the **ratio** keyword, the value range for the *lowerlimit* argument is 0 to 100.

Usage guidelines

After you configure storm control for a type of traffic, the device collects the statistics for the type of traffic at the interval configured by using the **storm-constrain interval** command. When the type of traffic exceeds its upper threshold, the interface takes an action configured by using the **storm-constrain control** command.

The **storm-constrain**, **broadcast-suppression**, **multicast-suppression**, and **unicast-suppression** commands can suppress storms on an interface. The **broadcast-suppression**, **multicast-suppression**, and **unicast-suppression** commands use the chip to physically suppress traffic. They have less influence on the device performance than the **storm-constrain** command, which uses software to suppress traffic.

For the traffic suppression result to be determined, do not configure both storm control and storm suppression for the same type of traffic.

When configuring this command, make sure *upperlimit* is greater than *lowerlimit*.

Examples

Enable unknown unicast storm control on GigabitEthernet 1/0/1 and set the upper and lower thresholds to 200 pps and 150 pps, respectively.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] storm-constrain unicast pps 200 150
```

Enable broadcast storm control on GigabitEthernet 1/0/2, and set the upper and lower thresholds to 2000 kbps and 1500 kbps, respectively.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] storm-constrain broadcast kbps 2000 1500
```

Enable multicast storm control on GigabitEthernet 1/0/3, and set the upper and lower thresholds to 80% and 15%, respectively.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/3
[Sysname-GigabitEthernet1/0/3] storm-constrain multicast ratio 80 15
```

Related commands

storm-constrain control

storm-constrain interval

storm-constrain control

Use **storm-constrain control** to set the action to take on an Ethernet interface when a type of traffic (unknown unicast, multicast, or broadcast) exceeds the upper storm control threshold.

Use **undo storm-constrain control** to restore the default.

Syntax

storm-constrain control { **block** | **shutdown** }

undo storm-constrain control

Default

No action is taken on an Ethernet interface when a type of traffic exceeds the upper storm control threshold.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

block: Blocks this type of traffic and forwards other types of traffic. Even though the interface does not forward the blocked traffic, it still counts the traffic. When the blocked traffic drops below the lower threshold, the port begins to forward the traffic.

shutdown: Goes down automatically. The interface goes down automatically and stops forwarding any traffic. When the blocked traffic drops below the lower threshold, the interface does not forward the traffic. To bring up the interface, use the **undo shutdown** command or disable storm control on the interface.

Examples

Configure GigabitEthernet 1/0/1 to block a specific type of traffic when the type of traffic exceeds the upper storm control threshold.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] storm-constrain control block
```

Related commands

storm-constrain

storm-constrain control

storm-constrain enable log

Use **storm-constrain enable log** to enable an Ethernet interface to output log messages when it detects storm control threshold events.

Use **undo storm-constrain enable log** to disable an Ethernet interface from outputting log messages for storm control threshold events.

Syntax

storm-constrain enable log

undo storm-constrain enable log

Default

An Ethernet interface outputs log messages when monitored traffic exceeds the upper threshold or drops below the lower threshold from a value above the upper threshold.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable GigabitEthernet 1/0/1 to output log messages when it detects storm control threshold events.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] storm-constrain enable log
```

storm-constrain enable trap

Use **storm-constrain enable trap** to enable an Ethernet interface to send storm control threshold event traps.

Use **undo storm-constrain enable trap** to disable an Ethernet interface from sending storm control threshold event traps.

Syntax

storm-constrain enable trap

undo storm-constrain enable trap

Default

An interface sends out storm control threshold event traps when monitored traffic exceeds the upper threshold or drops below the lower threshold from a value above the upper threshold.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable GigabitEthernet 1/0/1 to send traps when it detects storm control threshold events.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] storm-constrain enable trap
```

storm-constrain interval

Use **storm-constrain interval** to set the traffic polling interval of the storm control module.

Use **undo storm-constrain interval** to restore the default.

Syntax

storm-constrain interval *interval*

undo storm-constrain interval

Default

The storm control module polls traffic statistics every 10 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the traffic polling interval of the storm control module. The value range is 1 to 300 seconds. To ensure network stability, as a best practice, do not use a traffic polling interval shorter than 10 seconds.

Usage guidelines

The traffic polling interval set by using the **storm-constrain interval** command is specific to storm control. To set the statistics polling interval of an interface, use the **flow-interval** command.

Examples

Set the traffic statistics polling interval of the storm control module to 60 seconds.

```
<Sysname> system-view
[Sysname] storm-constrain interval 60
```

Related commands

storm-constrain

storm-constrain control

virtual-cable-test

Use **virtual-cable-test** to test the cable connection of an Ethernet interface and display the test result.

Syntax

virtual-cable-test interface [*interface-type interface-number* | *interface-name*]

Views

Any view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an Ethernet interface by its type and number.

IMPORTANT:

This command is supported only in Release 6350 and later versions.

Usage guidelines

This command is not available on fiber ports.

If the link of an Ethernet interface is up, testing its cable connection will cause the link to go down and then up.

The test result is for reference only. The cable length detection error is up to 5 m (about 16 ft).

If a test item is not available, a hyphen (-) is displayed.

Examples

Test the cable connection of GigabitEthernet 1/0/1. (Available in version earlier than Release 6328.)

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] virtual-cable-test
Cable status: abnormal(open), 140 metre(s)
Pair Impedance mismatch: -
Pair skew: - ns
Pair swap: -
Pair polarity: -
Insertion loss: - db
Return loss: - db
Near-end crosstalk: - db
```

Test the cable connection of GigabitEthernet 1/0/1. (Available in Release 6328 and later.)

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] virtual-cable-test
Cable status:
  Pair A length: 1 meters
  Pair B length: 5 meters
  Pair C length: 1 meters
  Pair D length: 1 meters
  Pair A state: Abnormal(open)
  Pair B state: Abnormal(open)
  Pair C state: Abnormal(open)
  Pair D state: Abnormal(open)
Pair Impedance mismatch: yes
Pair skew: - ns
Pair swap: -
Pair polarity: -
Insertion loss: - db
Return loss: - db
Near-end crosstalk: - db
```

Table 10 Command output

Field	Description
Cable status (Available in version earlier than Release 6328.)	Cable status: • **Normal**—The cable is in good condition. • **Abnormal**—The cable is abnormal. • **Abnormal (open)**—An open circuit is detected.

Field	Description
	• **Abnormal (short)**—A short circuit is detected. • **Failure**—The test failed.
n metre(s) (Available in version earlier than Release 6328.)	If the cable connection is working correctly, this field displays the total length of the cable. If the cable connection fails, this field displays the length from the local port to the faulty point.
Pair *x* length (Available in Release 6328 and later.)	When the cable pair state is **OK**, this field displays the total length of the cable pair. When the cable pair is in any other state, this field displays the length from the local interface to the faulty point.
Pair x state (Available in Release 6328 and later.)	Cable pair state: • **OK**—The cable pair is in good condition. • **Abnormal**—The cable pair is abnormal. • **Abnormal (open)**—An open circuit is detected. • **Abnormal (short)**—A short circuit is detected. • **Invalid**—The test failed.

Contents

Loopback, null, and inloopback interface commands

bandwidth

Use **bandwidth** to set the expected bandwidth for an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth of a loopback interface is 0 kbps.

Views

Loopback interface view

Predefined user roles

network-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth of Loopback 1 to 1000 kbps.

```
<Sysname> system-view
[Sysname] interface loopback 1
[Sysname-LoopBack1] bandwidth 1000
```

default

Use **default** to restore the default settings for an interface.

Syntax

default

Views

Loopback interface view

Null interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command before using it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies and system restrictions. Use the **display this** command in interface view to identify these commands, and then use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for Loopback 1.

```
<Sysname> system-view
[Sysname] interface loopback 1
[Sysname-LoopBack1] default
```

description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The interface description uses the *interface name* **Interface** format, for example, LoopBack1 **Interface**.

Views

Loopback interface view

Null interface view

Predefined user roles

network-admin

Parameters

text: Specifies the description, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure a description for an interface for easy identification and management purposes.

You can use the **display interface** command to view the configured description.

Examples

Configure the description of Loopback 1 as **for RouterID**.

```
<Sysname> system-view
[Sysname] interface loopback 1
[Sysname-LoopBack1] description for RouterID
```

display interface inloopback

Use **display interface inloopback** to display information about the inloopback interface.

Syntax

display interface [**inloopback** [**0**]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

inloopback [**0**]: Specifies Inloopback 0. If you do not specify the **inloopback** keyword, the command displays information about all interfaces.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions. The description of an inloopback interface is always **InLoopBack0 Interface** and cannot be configured.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

The device has only one inloopback interface Inloopback 0. If you specify the **inloopback** keyword, the command displays information about the interface Inloopback 0 regardless of whether you specify the **0** keyword.

Examples

Display detailed information about Inloopback 0.

```
<Sysname> display interface inloopback
InLoopBack0
Current state: UP
Line protocol state: UP(spoofing)
Description: InLoopBack0 Interface
Maximum transmission unit: 1536
Physical: InLoopBack
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 1 Command output

Field	Description
Current state	Physical link state of the interface, which is always **UP**, meaning that the inloopback interface can receive and transmit packets.

Field	Description
Line protocol state	Data link layer state of the interface, which is always **UP(spoofing)**. **UP(spoofing)** represents that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces.
Description	Description of the interface, which is always **InLoopBack0 Interface** and cannot be configured.
Maximum transmission unit	MTU of the interface, which is always 1536 and cannot be configured
Physical: InLoopBack	The physical type of the interface is inloopback.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average input rate during the last 300 seconds (displayed when the interface supports traffic statistics collection): • **bytes/sec**—Average number of bytes received per second. • **bits/sec**—Average number of bits received per second. • **packets/sec**—Average number of packets received per second.
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average output rate over the last 300 seconds (displayed when the interface supports traffic statistics collection): • **bytes/sec**—Average number of bytes sent per second. • **bits/sec**—Average number of bits sent per second. • **packets/sec**—Average number of packets sent per second.
Input: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of incoming packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).
Output: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of outgoing packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).

Display brief information about Inloopback 0.

```
<Sysname> display interface inloopback 0 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
InLoop0              UP   UP(s)    --
```

Table 2 Command output

Field	Description
Link	Physical link state of the interface, which is always **UP**, meaning that the link is physically up.
Protocol	Data link layer protocol state of the interface, which is always **UP(s)**. **UP(s)** represents that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	IP address of the interface. Because inloopback interfaces do not support CLI configuration, this field does not display a value.

Field	Description
Description	Description of the interface. Because inloopback interfaces do not support CLI configuration, this field does not display a value.

display interface loopback

Use **display interface loopback** to display information about the specified or all existing loopback interfaces.

Syntax

display interface [**loopback** [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

loopback *interface-number*: Specifies a loopback interface by its number, which can be the number of any existing loopback interface. If you do not specify the **loopback** keyword, the command displays information about all interfaces. If you specify the **loopback** keyword but do not specify the *interface-number* argument, the command displays information about all existing loopback interfaces on the device.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

This command is supported only after a loopback interface is created.

Examples

Display detailed information about Loopback 0.

```
<Sysname> display interface loopback 0
LoopBack0
Current state: UP
Line protocol state: UP(spoofing)
Description: LoopBack0 Interface
Bandwidth: 1000 kbps
Maximum transmission unit: 1536
Internet protocol processing: Disabled
Physical: Loopback
Last clearing of counters:  Never
```

```
Last 300 seconds input rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 3 Command output

Field	Description
Current state	Physical link state of the interface: • **UP**—The loopback interface can receive and transmit packets. • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command.
Line protocol state	Data link layer state of the interface. **UP (spoofing)** means that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces.
Description	Description of the interface.
Bandwidth	Expected bandwidth of the interface. This field is not displayed when the value is 0.
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Internet address: 1.1.1.1/32 (primary)	IP address of the interface. The **primary** attribute indicates that the address is the primary IP address.
Physical: Loopback	The physical type of the interface is loopback.
baudrate	Baud rate, in Kbps.
Last clearing of counters	Time when statistics on the logical interface were last cleared by using the **reset counters interface** command. If the statistics of the interface have never been cleared by using the **reset counters interface** command since the device started, this field displays **Never**.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average input rate during the last 300 seconds (displayed when the interface supports traffic statistics collection): **bytes/sec**—Average number of bytes received per second. **bits/sec**—Average number of bits received per second. **packets/sec**—Average number of packets received per second.
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average output rate over the last 300 seconds (displayed when the interface supports traffic statistics collection): • **bytes/sec**—Average number of bytes sent per second. • **bits/sec**—Average number of bits sent per second. • **packets/sec**—Average number of packets sent per second.
Input: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of incoming packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).
Output: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of outgoing packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).

Display brief information about all loopback interfaces.

```
<Sysname> display interface loopback brief
```

```
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
Loop1                UP   UP(s)    --              forLAN1
```

Display information about all loopback interfaces in down state and the causes.

```
<Sysname> display interface loopback brief down
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Interface            Link Cause
Loop1                ADM  Administratively
```

Table 4 Command output

Field	Description
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Protocol	Data link layer protocol state of the interface, which is always **UP(s)**. **UP(s)** represents that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface.
Description	Description of the interface.
Cause	Cause for the physical link state of the interface to be **DOWN**. **Administratively** represents that the interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command.

Related commands

interface loopback

reset counters interface loopback

display interface null

Use **display interface null** to display information about the null interface.

Syntax

display interface [**null** [**0**]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

null [**0**]: Specifies Null 0. If you do not specify the **null** keyword, the command displays information about all interfaces.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

The device has only one null interface Null 0. If you specify the **null** keyword, the command displays information about the interface Null 0 regardless of whether you specify the **0** keyword.

Examples

Display detailed information about Null 0.

```
<Sysname> display interface null 0
NULL0
Current state: UP
Line protocol state: UP(spoofing)
Description: NULL0 Interface
Bandwidth: 1000000 kbps
Maximum transmission unit: 1500
Internet protocol processing: Disabled
Physical: NULL DEV, baudrate: 1000000 kbps
Last clearing of counters: Never
Last 300 seconds input rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Display brief information about Null 0.

```
<Sysname> display interface null 0 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
NULL0                UP   UP(s)    --
```

For the command output, see Table 3 and Table 4.

Related commands

interface null

reset counters interface null

interface loopback

Use **interface loopback** to create a loopback interface and enter its view, or enter the view of an existing loopback interface.

Use **undo interface loopback** to remove a loopback interface.

Syntax

interface loopback *interface-number*

undo interface loopback *interface-number*

Default

No loopback interfaces exist.

Views

System view

Predefined user roles

network-admin

Parameters

interface-number: Specifies a loopback interface by its number. The value range for this argument is 0 to 127.

Usage guidelines

The physical layer state and link layer protocols of a loopback interface are always up unless the loopback interface is manually shut down. You can use a loopback interface to achieve the following purposes:

- Prevent the connection from being affected by the physical state of the interface.
- Improve the reliability of the connection.

For example, you can configure a loopback interface as the source interface for establishing an FTP connection.

Examples

Create Loopback 1.

```
<Sysname> system-view
[Sysname] interface loopback 1
[Sysname-LoopBack1]
```

interface null

Use **interface null** to enter null interface view.

Syntax

interface null 0

Default

A device has only one null interface (Null 0), which cannot be created or deleted.

Views

System view

Predefined user roles

network-admin

Parameters

0: Specifies Null 0. The null interface number is always 0.

Examples

Enter Null 0 interface view.

```
<Sysname> system-view
[Sysname] interface null 0
[Sysname-NULL0]
```

reset counters interface loopback

Use **reset counters interface loopback** to clear the statistics on the specified or all loopback interfaces.

Syntax

reset counters interface [**loopback** [*interface-number*]]

Views

User view

Predefined user roles

network-admin

Parameters

loopback [*interface-number*]: Specifies a loopback interface by its number, which can be the number of any existing loopback interface. If you do not specify the **loopback** keyword, the command clears the statistics on all interfaces. If you specify the **loopback** keyword but do not specify the *interface-number* argument, the command clears the statistics on all loopback interfaces.

Usage guidelines

To determine whether a loopback interface works correctly within a period by collecting the traffic statistics within that period, first use the **reset counters interface** [**loopback** [*interface-number*]] command to clear the statistics. Then have the interface automatically collect the statistics.

This command is available only if a minimum of one loopback interface has been created.

Examples

Clear the statistics on Loopback 1.

```
<Sysname> reset counters interface loopback 1
```

Related commands

display interface loopback

reset counters interface null

Use **reset counters interface null** to clear the statistics on the null interface.

Syntax

reset counters interface [**null** [**0**]]

Views

User view

Predefined user roles

network-admin

Parameters

null [**0**]: Specifies Null 0. If you do not specify the **null** keyword, the command clears the statistics on all interfaces.

Usage guidelines

To determine whether the null interface works correctly within a period by collecting the traffic statistics within that period, first use the **reset counters interface** [**null** [**0**]] command to clear the statistics. Then have the interface automatically collect the statistics.

Examples

Clear the statistics on Null 0.

```
<Sysname> reset counters interface null 0
```

Related commands

display interface null

shutdown

Use **shutdown** to shut down a loopback interface.

Use **undo shutdown** to bring up a loopback interface.

Syntax

shutdown

undo shutdown

Default

A loopback interface is up.

Views

Loopback interface view

Predefined user roles

network-admin

Usage guidelines

Use the **shutdown** command with caution, because the command disconnects the connection of the interface and disables the interface from communicating.

Examples

Shut down Loopback 1.

```
<Sysname> system-view
[Sysname] interface loopback 1
[Sysname-LoopBack1] shutdown
```

Contents

Bulk interface configuration commands

display interface range

Use **display interface range** to display information about named interface ranges created by using the **interface range name** command.

Syntax

display interface range [**name** *name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *name*: Specifies an interface range by its name, a case-sensitive string of 1 to 32 characters. If you do not specify an interface range name, this command displays information about all interface ranges created by using the **interface range name** command.

Examples

Display information about the interface ranges created by using the **interface range name** command.

```
<Sysname> display interface range
Interface range name t2 GigabitEthernet1/0/1 GigabitEthernet1/0/2
Interface range name test GigabitEthernet1/0/3 GigabitEthernet1/0/4
```

The output shows the following:

- Interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are added to interface range **t2**.
- Interfaces GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are added to interface range **test**.

Related commands

interface range name

interface range

Use **interface range** to create an interface range and enter the interface range view.

Syntax

interface range *interface-list*

Views

System view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a space-separated list of up to 24 interface items. Each item specifies an interface by its type and number or specifies a subrange of interfaces in the form of

interface-type interface-number1 **to** *interface-type interface-number2*.When you specify a subrange of interfaces, the interfaces must be all fixed interfaces or on the same interface card. The start interface number must be identical to or lower than the end interface number.

Usage guidelines

Use this command to bulk configure multiple interfaces with the same feature instead of configuring them one by one. For example, execute the **shutdown** command in interface range view to shut down a range of interfaces.

The interface range created by using this command is not saved to the running configuration. You cannot use the interface range repeatedly. To create an interface range that can be used repeatedly, use the **interface range name** command.

In interface range view, only the commands supported by the first interface in the specified interface list (alphabetically sorted) are available for configuration. To view available commands, enter a question mark (?) in interface range view.

After a command is executed in interface range view, one of the following situations might occur:

- The system displays an error message and stays in interface range view. It means that the execution failed on one or multiple member interfaces.
  - If the execution failed on the first member interface, the command is not executed on any member interfaces.
  - If the execution failed on a non-first member interface, the command takes effect on the remaining member interfaces.
- The system returns to system view. It means that:
  - The command is supported in both system view and interface view.
  - The execution failed on a member interface in interface range view and succeeded in system view.
  - The command is not executed on the subsequent member interfaces.

  You can use the **display this** command to verify the configuration in interface view of each member interface. In addition, if the configuration in system view is not needed, use the **undo** form of the command to remove the configuration.

To verify the configuration of the first member interface, you can execute the **display this** command in interface range view.

The device does not output prompt or alarm messages during the bulk interface configuration process. Make sure you are fully aware of the impacts of the bulk interface configuration.

When you bulk configure interfaces, follow these guidelines:

- Before you configure an interface as the first interface in an interface range, make sure you can enter the view of the interface by using the **interface** *interface-type interface-number* command.
- Do not assign both an aggregate interface and any of its member interfaces to an interface range. Some commands, after being executed on both an aggregate interface and its member interfaces, can break up the aggregation.
- Understand that the more interfaces you specify, the longer the command execution time.

Examples

Shut down interfaces GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5.

```
<Sysname> system-view
[Sysname] interface range gigabitethernet 1/0/1 to gigabitethernet 1/0/5
[Sysname-if-range] shutdown
```

interface range name

Use **interface range name** *name* **interface** *interface-list* to create a named interface range and enter the interface range view.

Use **interface range name** *name* without the **interface** keyword to enter the view of a named interface range.

Use **undo interface range name** to delete the interface range with the specified name.

Syntax

interface range name *name* [**interface** *interface-list*]

undo interface range name *name*

Views

System view

Predefined user roles

network-admin

Parameters

name: Specifies an interface range name, a case-sensitive string of 1 to 32 characters.

interface-list: Specifies a space-separated list of up to 24 interface items. Each item specifies an interface by its type and number or a subrange of interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*.When you specify a subrange of interfaces, the interfaces must be all fixed interfaces or on the same interface card. The start interface number must be identical to or lower than the end interface number.

Usage guidelines

A named interface range is saved in the running configuration and can be used repeatedly to bulk configure its member interfaces.

In interface range view, only the commands supported by the first interface in the specified interface list (alphabetically sorted) are available for configuration. To view available commands, enter a question mark (?) in interface range view.

After a command is executed in interface range view, one of the following situations might occur:

- The system displays an error message and stays in interface range view. It means that the execution failed on one or multiple member interfaces.
  - If the execution failed on the first member interface, the command is not executed on any member interfaces.
  - If the execution failed on a non-first member interface, the command takes effect on the remaining member interfaces.
- The system returns to system view. It means that:
  - The command is supported in both system view and interface view.
  - The execution failed on a member interface in interface range view and succeeded in system view.
  - The command is not executed on the subsequent member interfaces.

  You can use the **display this** command to verify the configuration in interface view of each member interface. In addition, if the configuration in system view is not needed, use the **undo** form of the command to remove the configuration.

To verify the configuration of the first interface, you can execute the **display this** command in interface range view.

To view the member interfaces of a named interface range, use the **display interface range** command.

The device does not output prompt or alarm messages during the bulk interface configuration process. Make sure you are fully aware of the impacts of the bulk interface configuration.

When you bulk configure interfaces, follow these guidelines:

- Before you configure an interface as the first interface in an interface range, make sure you can enter the view of the interface by using the **interface** *interface-type interface-number* command.
- Do not assign both an aggregate interface and any of its member interfaces to an interface range. Some commands, after being executed on both an aggregate interface and its member interfaces, can break up the aggregation.
- Understand that the more interfaces you specify, the longer the command execution time.
- To guarantee bulk interface configuration performance, configure fewer than 1000 interface range names.

Examples

Add GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to interface range **myEthPort**, and enter the interface range view.

```
<Sysname> system-view
[Sysname] interface range name myEthPort interface gigabitethernet 1/0/1 to
gigabitethernet 1/0/5
[Sysname-if-range-myEthPort]
```

Enter the view of interface range **myEthPort**.

```
<Sysname> system-view
[Sysname] interface range name myEthPort
[Sysname-if-range-myEthPort]
```

Related commands

display interface range

Contents

MAC address table commands

This document covers the configuration of unicast MAC address entries, including static, dynamic, blackhole, and multiport unicast MAC address entries. For more information about configuring static multicast MAC address entries, see IGMP snooping and IPv6 multicast routing and forwarding in *IP Multicast Configuration Guide*.

display mac-address

Use **display mac-address** to display MAC address entries.

Syntax

display mac-address [*mac-address* [**vlan** *vlan-id*] | [[**dynamic** | **static**] [**interface** *interface-type interface-number*] | **blackhole** | **multiport**] [**vlan** *vlan-id*] [**count**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mac-address: Specifies a MAC address in the format of H-H-H. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

dynamic: Displays dynamic MAC address entries.

static: Displays static MAC address entries.

interface *interface-type interface-number*: Specifies an interface by its type and number.

blackhole: Displays blackhole MAC address entries.

multiport: Displays multiport unicast MAC address entries.

count: Displays only the number of MAC address entries that match all entry attributes you specify in the command. Detailed information about MAC address entries is not displayed. For example, you can use the **display mac-address vlan 20 dynamic count** command to display the number of dynamic entries for VLAN 20. If you do not specify an entry attribute, the command displays the number of entries in the MAC address table. If you do not specify this keyword, the command displays detailed information about the specified MAC address entries.

Usage guidelines

A MAC address entry includes a destination MAC address, an outgoing interface, and a VLAN ID.

If you do not specify any parameters, the command displays all MAC address entries.

This command displays dynamic MAC address entries for an aggregate interface only when the aggregate interface has a minimum of one Selected member port.

Multiport unicast MAC address entries have no impact on the MAC address learning. When receiving a frame whose source MAC address matches a multiport unicast entry, the device can still learn the MAC address of the frame and generate a dynamic entry. However, the generated dynamic

entry has lower priority. The device prefers to use the multiport unicast entry to forward frames destined for the MAC address in the entry.

Examples

Display MAC address entries for VLAN 100.

```
<Sysname> display mac-address vlan 100
MAC Address      VLAN ID    State           Port/Nickname           Aging
0001-0101-0101   100        Multiport       GE1/0/1                 N
                                            GE1/0/2
0033-0033-0033   100        Blackhole       N/A                     N
0000-0000-0002   100        Static          GE1/0/3                 N
00e0-fc00-5829   100        Learned         GE1/0/4                 Y
```

Display the number of MAC address entries.

```
<Sysname> display mac-address count
1 mac address(es) found.
```

Table 1 Command output

Field	Description
VLAN ID	ID of the VLAN to which the outgoing interface of the MAC address entry belongs.
State	MAC address entry state: • **Static**—Static MAC address entry. • **Learned**—Dynamic MAC address entry. Dynamic entries can be learned or manually configured. • **Blackhole**—Blackhole MAC address entry. • **Multiport**—Multiport unicast MAC address entry. • **OpenFlow**—MAC address entry for an OpenFlow instance. • **Block**—MAC address entry for a user who failed MAC authentication.
Port/Nickname	When the field displays an interface name, the field indicates the outgoing interface for packets that are destined for the MAC address. This field displays **N/A** for a blackhole MAC address entry.
Aging	Whether the entry can age out: • **Y**—The entry can age out. • **N**—The entry never ages out.
mac address(es) found	Number of matching MAC address entries.

Related commands

mac-address

mac-address timer

display mac-address aging-time

Use **display mac-address aging-time** to display the aging timer for dynamic MAC address entries.

Syntax

display mac-address aging-time

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the aging timer for dynamic MAC address entries.

```
<Sysname> display mac-address aging-time
MAC address aging time: 300s.
```

Related commands

mac-address timer

display mac-address hash-bucket-size

Use **display mac-address hash-bucket-size** to display the hash bucket size for the MAC address table.

Syntax

display mac-address hash-bucket-size

Views

Any view

Predefined user roles

network-admin

Usage guidelines

Examples

Display the hash bucket size for the MAC address table.

```
<Sysname> display mac-address hash-bucket-size
  Hash-bucket-size in use: 4
  Hash-bucket-size at the next reboot: 8
```

Table 2 Command output

Field	Description
Hash-bucket-size in use	Current hash bucket size.
Hash-bucket-size at the next reboot	Hash bucket size that will take effect at the next startup.

Related commands

mac-address hash-bucket-size

display mac-address hash-conflict-record

Use **display mac-address hash-conflict-record** to display the log messages generated for MAC hashing conflicts.

NOTE:

This command is supported only in Release 6328 and later.

Syntax

display mac-address hash-conflict-record slot *slot-number*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

A device enabled with MAC hashing conflict logging records the MAC hashing conflicts that occur in MAC address learning. To identify the MAC addresses that the device fails to learn, you can execute this command to display the log messages generated for MAC hashing conflicts. The output fields of this command are displayed only when the MAC hashing conflict logging feature is enabled.

Examples

Display the log messages generated for MAC hashing conflicts on slot 1.

```
<Sysname> display mac-address hash-conflict-record slot 1
MAC Address      VLAN     Port                      Count  Timestamp
0001-0101-0101   100      GE1/0/1                   1      2020/11/11 21:11:29
0000-0000-0002   100      GE1/0/3                   1      2020/11/11 21:11:29
00e0-fc00-5829   100      GE1/0/4                   1      2020/11/11 21:11:29
```

Table 3 Command output

Field	Description
MAC Address	MAC address that the device fails to learn because of MAC hashing conflicts.
VLAN	VLAN to which the outgoing interface of the MAC address entry belongs.
Port	Outgoing interface of the MAC address entry.
Count	Number of MAC hashing conflicts for the MAC address and VLAN after the MAC hashing conflict logging feature is enabled.
Timestamp	Last time when the MAC hashing conflict occurs.

Related commands

mac-address hash-conflict-record enable

display mac-address mac-learning

Use **display mac-address mac-learning** to display the global MAC address learning status and the MAC learning status of the specified interface or all interfaces.

Syntax

display mac-address mac-learning [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays the global MAC address learning status and the MAC address learning status of all interfaces.

Examples

Display the global MAC address learning status and the MAC learning status of all interfaces.

```
<Sysname> display mac-address mac-learning
Global MAC address learning status: Enabled.

Port                        Learning Status
GE1/0/1                     Enabled
GE1/0/2                     Enabled
```

Table 4 Command output

Field	Description
Global MAC address learning status	Global MAC address learning status: • Enabled. • Disabled.
Learning Status	MAC address learning status of an interface: • Enabled. • Disabled.

Related commands

mac-address mac-learning enable

display mac-address mac-move

Use **display mac-address mac-move** to display the MAC address move records after the device is started.

Syntax

display mac-address mac-move [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, the command displays MAC address move records for all IRF member devices.

Usage guidelines

When a MAC address frequently moves between the specified two interfaces, Layer 2 loops might occur in the network. To discover and locate loops, you can view the MAC address move records.

In the MAC address move records, records with the same MAC address, VLAN, source port, and current port are considered to be one record.

An IRF member device can generate a maximum of 200 MAC address move records.

Examples

Display the MAC address move records for a slot.

```
<Sysname> display mac-address mac-move slot 1
MAC address    VLAN Current port  Source port   Last time           Times
0000-0001-002c 1    GE1/0/1       GE1/0/2       2013-05-20 13:40:52 1
0000-0001-002c 1    GE1/0/2       GE1/0/1       2013-05-20 13:41:30 1
---  2 MAC address moving records found  ---
```

Display the MAC address move records for all slots.

```
<Sysname> display mac-address mac-move
MAC address    VLAN Current port  Source port   Last time           Times
0000-0001-002c 1    GE1/0/1       GE1/0/2       2013-05-20 13:40:52 20
0000-0001-002c 1    GE1/0/2       GE1/0/1       2013-05-20 13:41:32 20
0000-0094-0001 1    GE1/0/3       GE1/0/4       2013-05-20 13:42:22 13
0000-0094-0001 1    GE1/0/4       GE1/0/3       2013-05-20 13:42:21 12
---  4 MAC address moving records found  ---
```

Table 5 Command output

Field	Description
VLAN	VLAN to which the outgoing interface of the MAC address entry belongs.
Current port	Interface to which the MAC address was moved.
Source port	Interface from which the MAC address was moved.
Last time	Last time when the MAC address was moved.
Times	Number of MAC address moves after the device is started. For a MAC address record, the number of MAC address moves is increased by 1 when a new MAC address move has the same **MAC address**, **VLAN**, **Current Port**, and **Source Port** fields as the MAC address record.

Related commands

mac-address notification mac-move

display mac-address statistics

Use **display mac-address statistics** to display MAC address table statistics.

Syntax

display mac-address statistics

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command displays the number of MAC address entries per type and the maximum number of MAC address entries allowed for each type.

Examples

Display MAC address table statistics.

```
<Sysname> display mac-address statistics
MAC Address Count:
Dynamic Unicast Address (Learned) Count:                        3
Dynamic Unicast Address (Security-service-defined) Count:       4
Static Unicast Address (User-defined) Count:                    0
Static Unicast Address (System-defined) Count:                  3
Total Unicast MAC Addresses In Use:                             10
Total Unicast MAC Addresses Available:                          16384
Multicast and Multiport MAC Address Count:                      1
Static Multicast and Multiport MAC Address (User-defined) Count: 1
Total Multicast and Multiport MAC Addresses Available:          256
```

Table 6 Command output

Field	Description
Dynamic Unicast Address (Learned) Count	Number of dynamic unicast MAC address entries triggered by packets.
Dynamic Unicast Address (Security-service-defined) Count	Number of dynamic unicast MAC address entries triggered by the security service.
Static Unicast Address (User-defined) Count	Number of static unicast MAC address entries added by users.
Static Unicast Address (System-defined) Count	Number of static unicast MAC address entries added by the system.
Total Unicast MAC Addresses In Use	Number of unicast MAC address entries.
Total Unicast MAC Addresses Available	Maximum number of unicast MAC address entries allowed.
Multicast and Multiport MAC Address Count	Number of multicast and multiport unicast MAC address entries.
Static Multicast and Multiport MAC Address (User-defined) Count	Number of static multicast and multiport unicast MAC address entries added by users.
Total Multicast and Multiport MAC Addresses Available	Maximum number of multicast and multiport unicast MAC address entries allowed.

mac-address (interface view)

Use **mac-address** to add or modify a MAC address entry on an interface.

Use **undo mac-address** to delete a MAC address entry on an interface.

Syntax

mac-address { **dynamic** | **multiport** | **static** } *mac-address* **vlan** *vlan-id*

undo mac-address { **dynamic** | **multiport** | **static** } *mac-address* **vlan** *vlan-id*

Default

An interface is not configured with MAC address entries.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

dynamic: Specifies dynamic MAC address entries.

static: Specifies static MAC address entries.

multiport: Specifies multiport unicast MAC address entries. A frame whose destination MAC address matches a multiport unicast MAC address entry is sent out of multiple ports.

mac-address: Specifies a MAC address in the format of H-H-H, excluding multicast, all-zero, and all-F MAC addresses. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies an existing VLAN to which the specified interface belongs. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Typically, the device automatically builds the MAC address table by learning the source MAC addresses of incoming frames on each interface. However, you can manually configure static MAC address entries. For a MAC address, a manually configured static entry takes precedence over a dynamically learned entry. To improve the security for the user device connected to an interface, manually configure a static entry to bind the user device to the interface. Then, the frames destined for the user device (for example, Host A) are always sent out of the interface. Other hosts using the forged MAC address of Host A cannot obtain the frames destined for Host A.

The MAC address entry configuration cannot survive a reboot unless you save it. The dynamic MAC address entries, however, are lost upon reboot whether or not you save the configuration.

Examples

Add a static entry for MAC address 000f-e201-0101 on GigabitEthernet 1/0/1 that belongs to VLAN 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address static 000f-e201-0101 vlan 2
```

Add a static entry for MAC address 000f-e201-0101 on Bridge-Aggregation 1 that belongs to VLAN 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] mac-address static 000f-e201-0102 vlan 1
```

Add a multiport unicast MAC address entry for MAC address 0001-0001-0101 on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 that belong to VLAN 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address multiport 0001-0001-0101 vlan 2
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] mac-address multiport 0001-0001-0101 vlan 2
```

Related commands

display mac-address

mac-address (system view)

mac-address (system view)

Use **mac-address** to add or modify a MAC address entry.

Use **undo mac-address** to delete one or all MAC address entries.

Syntax

mac-address { **dynamic** | **static** } *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*

mac-address blackhole *mac-address* **vlan** *vlan-id*

mac-address multiport *mac-address* **interface** *interface-list* **vlan** *vlan-id*

undo mac-address [[**dynamic** | **static**] *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*]

undo mac-address [**blackhole** | **dynamic** | **static**] [*mac-address*] **vlan** *vlan-id*

undo mac-address [**dynamic** | **static**] **interface** *interface-type interface-number*

undo mac-address multiport *mac-address* **interface** *interface-list* **vlan** *vlan-id*

undo mac-address [**multiport**] [[*mac-address*] **vlan** *vlan-id*]

Default

The system is not configured with MAC address entries.

Views

System view

Predefined user roles

network-admin

Parameters

dynamic: Specifies dynamic MAC address entries.

static: Specifies static MAC address entries.

blackhole: Specifies blackhole MAC address entries. Packets whose source or destination MAC addresses match blackhole MAC address entries are dropped.

multiport: Specifies multiport unicast MAC address entries. A frame whose destination MAC address matches a multiport unicast MAC address entry is sent out of multiple ports.

mac-address: Specifies a MAC address in the format of H-H-H, excluding multicast, all-zero, and all-F MAC addresses. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies an existing VLAN to which the interface belongs. The value range for the *vlan-id* argument is 1 to 4094.

interface *interface-type interface-number*: Specifies an outgoing interface by its type and number.

interface *interface-list*: Specifies a list of up to four interface items. Each interface item can be an individual interface in the format of *interface-type interface-number* or a range of interfaces in the format of *interface-type interface-number1* **to** *interface-type interface-number2*. The interfaces can only be Layer 2 Ethernet interfaces or Layer 2 aggregate interfaces. The value for the *interface-number2* argument cannot be lower than the value for the *interface-number1* argument.

Usage guidelines

You can use this command to configure the following types of MAC address entries:

- Dynamic entries.

  Dynamic entries include manually configured dynamic entries and automatically learned dynamic entries.

- Static entries.

  For a MAC address, a manually configured static entry takes precedence over a dynamic entry. To improve the security for the user device connected to an interface, manually configure a static entry to bind the user device to the interface. Then, the frames destined for the user device (for example, Host A) are always sent out of the interface. Other hosts using the forged MAC address of Host A cannot obtain the frames destined for Host A.

- Blackhole entries.

  To drop frames with the specified source MAC addresses or destination MAC addresses, you can configure blackhole entries.

- Multiport unicast entries.

  To send frames with a specific destination MAC address out of multiple ports, configure a multiport unicast entry. When you execute this command for the first time, the command adds an entry. When you execute the command again with the same MAC address and VLAN but with different interfaces, this command adds the specified interfaces for this entry.

A static or blackhole entry can overwrite a dynamic entry, but not vice versa.

If you execute the **undo mac-address** command without specifying any parameters, this command deletes all unicast MAC address entries and static multicast MAC address entries.

You can delete all the MAC address entries (including unicast and static multicast MAC address entries) from the specified VLAN. You can also delete only one type (dynamic, static, blackhole, or multiport unicast) of MAC address entries. You can single out an interface and delete the unicast MAC address entries on it, but not the static multicast MAC address entries.

The MAC address entry configuration cannot survive a reboot unless you save it. The dynamic MAC address entries, however, are lost upon reboot whether or not you save the configuration.

Examples

Add a static entry for MAC address 000f-e201-0101. Then, all frames that are destined for this MAC address are sent out of GigabitEthernet 1/0/1, which belongs to VLAN 2.

```
<Sysname> system-view
[Sysname] mac-address static 000f-e201-0101 interface gigabitethernet 1/0/1 vlan 2
```

Add a multiport unicast MAC address entry for MAC address 000f-e201-0101. Then, all frames that are destined for this MAC address are sent out of GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3, which belong to VLAN 2.

```
<Sysname> system-view
[Sysname] mac-address multiport 000f-e201-0101 interface gigabitethernet 1/0/1 to
gigabitethernet 1/0/3 vlan 2
```

Related commands

display mac-address

mac-address (interface view)

mac-address hash-bucket-size

Use **mac-address hash-bucket-size** to set the hash bucket size of the MAC address table.

Use **undo mac-address hash-bucket-size** to restore the default.

Syntax

mac-address hash-bucket-size *size*

undo mac-address hash-bucket-size

Default

The hash bucket size of the MAC address table is 4.

Views

System view

Predefined user roles

network-admin

Parameters

size: Sets the hash bucket size. Available values are 4, 8, and 16.

Usage guidelines

The device saves the MAC address table through hash chains. If multiple MAC addresses obtain the same key through hashing, MAC address hash conflicts occur, and the device cannot learn some of these MAC addresses. The device will broadcast the traffic destined for the unknown MAC addresses, which consumes bandwidth and resources.

You can increase the hash bucket size of the MAC address table to reduce MAC address hash conflicts. A larger hash bucket size requires more system resources. Please set the hash bucket size appropriately depending on system resources.

The set hash bucket size takes effect at the next startup.

Examples

Set the hash bucket size of the MAC address table to 8.

```
<Sysname> system-view
[Sysname] mac-address hash-bucket-size 8
The configuration will take effect at the next reboot. Continue? [Y/N]:y
Reboot device to make the configuration take effect.
```

Related commands

display mac-address hash-bucket-size

mac-address hash-conflict-record enable

Use **mac-address hash-conflict-record enable** to enable MAC hashing conflict logging.

Use **undo mac-address hash-conflict-record enable** to disable MAC hashing conflict logging.

NOTE:

This command is supported only in Release 6328 and later.

Syntax

mac-address hash-conflict-record enable slot *slot-number*

undo mac-address hash-conflict-record enable slot *slot-number*

Default

MAC hashing conflict logging is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

The device generates a unique hashing key for each MAC address when learning MAC addresses. If the device incorrectly generates the same hashing key for multiple MAC addresses, it might fail to learn some of the MAC addresses. MAC hashing conflict logging enables the device to record the MAC hashing conflicts that occur in MAC address learning. You can use this feature to identify the MAC addresses that the device fails to learn because of hashing conflicts. To display the log messages generated for MAC hashing conflicts, execute the **display mac-address hash-conflict-record** command.

This feature consumes system resources. When you enable it on the device, make sure you are fully aware of the impact on device performance.

Examples

Enable MAC hashing conflict logging on slot 1.

```
<Sysname> system-view
[Sysname] mac-address hash-conflict-record enable slot 1
```

Related commands

display mac-address hash-conflict-record

mac-address mac-learning enable

Use **mac-address mac-learning enable** to enable MAC address learning globally, on an interface, or on a VLAN.

Use **undo mac-address mac-learning enable** to disable MAC address learning globally, on an interface, or on a VLAN.

Syntax

mac-address mac-learning enable

undo mac-address mac-learning enable

Default

MAC address learning is enabled.

Views

System view

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

VLAN view

Predefined user roles

network-admin

Usage guidelines

To prevent the MAC address table from becoming saturated, you can disable MAC address learning.

For example, a number of packets with different source MAC addresses reaching a device can affect the MAC address table update. To avoid such attacks, you can disable MAC address learning by following these guidelines:

- You can disable MAC address learning on a per-interface basis. If you disable MAC address learning globally, MAC address learning is disabled for all interfaces. The device then stops learning MAC addresses and cannot dynamically update the MAC address table.
- Because disabling MAC address learning can result in broadcast storms, enable broadcast storm suppression after you disable MAC address learning on an interface. For more information about broadcast storm suppression, see *Interface Configuration Guide*.
- With MAC address learning enabled globally, you can disable MAC address learning for an interface or VLAN.
- After MAC address learning is disabled, the device immediately deletes existing dynamic MAC address entries.

Examples

Disable MAC address learning globally.

```
<Sysname> system-view
[Sysname] undo mac-address mac-learning enable
```

Disable MAC address learning for VLAN 10.

```
<Sysname> system-view
[Sysname] vlan 10
[Sysname-vlan10] undo mac-address mac-learning enable
```

Disable MAC address learning on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo mac-address mac-learning enable
```

Disable MAC address learning on Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] undo mac-address mac-learning enable
```

Related commands

display mac-address mac-learning

mac-address mac-move fast-update

Use **mac-address mac-move fast-update** to enable ARP fast update for MAC address moves.

Use **undo mac-address mac-move fast-update** to disable ARP fast update for MAC address moves.

Syntax

mac-address mac-move fast-update

undo mac-address mac-move fast-update

Default

ARP fast update is disabled for MAC address moves.

Views

System view

Predefined user roles

network-admin

Examples

Enable ARP fast update for MAC address moves.

```
<Sysname> system-view
[Sysname] mac-address mac-move fast-update
```

mac-address mac-roaming enable

Use **mac-address mac-roaming enable** to enable MAC address synchronization.

Use **undo mac-address mac-roaming enable** to disable MAC address synchronization.

Syntax

mac-address mac-roaming enable

undo mac-address mac-roaming enable

Default

MAC address synchronization is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

On an IRF fabric, if ports on different IRF member devices are Selected ports from the same aggregation group, MAC address entries are synchronized among these IRF member devices. They are synchronized whether or not MAC address synchronization is enabled for the IRF fabric. For more information about aggregation groups, see *Layer 2—LAN Switching Configuration Guide*.

The MAC address table size might vary by IRF member device. With MAC address synchronization enabled, MAC address entries exceeding the table size of an IRF member device cannot be synchronized to the MAC address table.

Examples

Enable MAC address synchronization.

```
<Sysname> system-view
[Sysname] mac-address mac-roaming enable
```

mac-address max-mac-count

Use **mac-address max-mac-count** to set the MAC learning limit on an interface.

Use **undo mac-address max-mac-count** to restore the default.

Syntax

mac-address max-mac-count *count*

undo mac-address max-mac-count

Default

The number of MAC addresses that can be learned on an interface is not limited.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

count: Specifies the maximum number of MAC addresses that can be learned on an interface. When the argument is set to 0, the interface is not allowed to learn MAC addresses. The value range for this argument is 0 to 4096.

Usage guidelines

This command helps limit the MAC address table size. When the number of MAC address entries learned by an interface reaches the limit, the interface stops learning MAC address entries.

Examples

Configure GigabitEthernet 1/0/1 to learn a maximum of 600 MAC address entries.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address max-mac-count 600
```

Related commands

mac-address

mac-address max-mac-count enable-forwarding

mac-address max-mac-count enable-forwarding

Use **mac-address max-mac-count enable-forwarding** to enable the device to forward unknown frames received on an interface after the MAC learning limit on the interface is reached. Unknown frames refer to frames whose source MAC addresses are not in the MAC address table.

Use **undo mac-address max-mac-count enable-forwarding** to disable the device from forwarding unknown frames received on an interface after the MAC learning limit on the interface is reached.

Syntax

mac-address max-mac-count enable-forwarding

undo mac-address max-mac-count enable-forwarding

Default

When the MAC learning limit on an interface is reached, the device can forward unknown frames received on the interface.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Configure GigabitEthernet 1/0/1 to learn a maximum of 600 MAC address entries.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address max-mac-count 600
```

Disable the device from forwarding unknown frames received on GigabitEthernet 1/0/1 after the MAC learning limit on GigabitEthernet 1/0/1 is reached.

```
[Sysname-GigabitEthernet1/0/1] undo mac-address max-mac-count enable-forwarding
```

Related commands

mac-address

mac-address max-mac-count

mac-address multicast-source packet-filter

Use **mac-address multicast-source packet-filter** to enable packet filter on the device where its source MAC address is a multicast or broadcast MAC address.

Use **undo mac-address multicast-source packet-filter** to disable packet filter on the device where its source MAC address is a multicast or broadcast MAC address.

Syntax

mac-address multicast-source packet-filter

undo mac-address multicast-source packet-filter

Default

Packet filter is enabled on the device where its source MAC address is a multicast or broadcast MAC address.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, the device will drop a frame whose source MAC address is a multicast or broadcast MAC address. To avoid the user traffic loss and ensure user trasffic to be forwarded correctly in this scenario, you can disable packet filter on the device where its source MAC address is a multicast or broadcast MAC address.

Examples

Disable packet filter when the source MAC address is a multicast or broadcast MAC address.

```
<Sysname> system-view
[Sysname] undo mac-address multicast-source packet-filter
```

mac-address notification mac-move

Use **mac-address notification mac-move** to enable MAC address move notifications and optionally specify a MAC move detection interval.

Use **undo mac-address notification mac-move** to disable MAC address move notifications.

Syntax

mac-address notification mac-move [**interval** *interval*]

undo mac-address notification mac-move

Default

MAC address move notifications are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the interval for detecting MAC address moves, in the range of 1 to 60 minutes. If you do not specify this option, the default setting of 1 minute is used.

Usage guidelines

With MAC address move notifications enabled, the system records the MAC address move logs every MAC move detection interval. Each record of the MAC address move logs contains the following information:

- MAC address.
- VLAN ID of the MAC address entry.
- Current port and source port of the MAC address moves.
- Number of MAC address moves within a detection interval.

A MAC address can have only one MAC address move record. If a MAC address moves multiple times, the new record overrides the old record.

Within a detection interval, an IRF member device can record MAC address move information for a maximum of 20 MAC addresses. The records are ranked in descending order of MAC move counts. If the number of MAC address move records exceeds 20, only the first 20 records are retained. Then in the next detection interval, the device discards all MAC address move records generated in the previous detection interval and starts another round of MAC move record generation.

After you execute this command, the system sends only syslog messages to the information center module. If the **snmp-agent trap enable mac-address** command is also executed, the system also sends SNMP notifications to the SNMP module.

Examples

Enable MAC address move notifications.

```
<Sysname> system-view
[Sysname] mac-address notification mac-move
[Sysname]
%May 14 17:16:45:688 2013 Sysname MAC/4/MAC_NOTIFICATION: MAC address 0000-0012-0034 in VLAN 500 has moved from port GE1/0/1 to port GE1/0/2 for 1 times
```

The output shows that:

- The VLAN ID of MAC address 0000-0012-0034 is VLAN 500.
- The MAC address moved from GigabitEthernet 1/0/1 to GigabitEthernet 1/0/2.
- The MAC address has moved once within a MAC move detection interval.

Related commands

display mac-address mac-move

mac-address notification mac-move suppression (interface view)

Use **mac-address notification mac-move suppression** to enable MAC address move suppression on an interface.

Use **undo mac-address notification mac-move suppression** to disable MAC address move suppression on an interface.

Syntax

mac-address notification mac-move suppression

undo mac-address notification mac-move suppression

Default

MAC address moves are not suppressed.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

This feature shuts an interface down when a MAC address has been moved to or from the interface more than the suppression threshold within a MAC move detection interval. The shutdown interface automatically goes up after a suppression interval. Also, you can use the **shutdown** command and then the **undo shutdown** command to bring up the interface.

When MAC address move suppression shuts an interface down, the system sends only syslog messages to the information center module. If the **snmp-agent trap enable mac-address** command is also executed, the system also sends SNMP notifications to the SNMP module.

Examples

Enable MAC address move suppression on GigabitEthernet 1/0/1.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address notification mac-move suppression
```

Related commands

mac-address notification mac-move suppression (system view)

mac-address notification mac-move suppression (system view)

Use **mac-address notification mac-move suppression** to set the suppression interval or the suppression threshold.

Use **undo mac-address notification mac-move suppression** to restore the default.

Syntax

mac-address notification mac-move suppression { **interval** *interval* | **threshold** *threshold* }

undo mac-address notification mac-move suppression { **interval** | **threshold** }

Default

The suppression interval is 30 seconds. The suppression threshold is 3.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the MAC address move suppression interval during which a suppressed interface stays down. The value range for the *interval-value* argument is 30 to 86400 seconds. If you do not specify this option, the default suppression interval of 30 seconds is used.

threshold *threshold*: Specifies the suppression threshold for MAC address moves sourced from or destined for an interface within a MAC move detection interval. The value range for this argument is 0 to 1024. If you do not specify this option, the default suppression threshold of 3 is used.

Usage guidelines

For this command to take effect on an interface, you must also enable MAC address move suppression on the interface.

If you set the suppression interval or suppression threshold multiple times, the most recent configuration applies. The suppression interval setting is independent of the suppression threshold setting.

Examples

Set the suppression interval to 40 seconds and the suppression threshold to 1 for MAC address moves.

```
<Sysname> system-view
[Sysname] mac-address notification mac-move suppression interval 40
```

```
[Sysname] mac-address notification mac-move suppression threshold 1
```

Related commands

mac-address notification mac-move suppression (interface view)

mac-address timer

Use **mac-address timer** to set the aging timer for dynamic MAC address entries.

Use **undo mac-address timer** to restore the default.

Syntax

mac-address timer { **aging** *seconds* | **no-aging** }

undo mac-address timer

Default

The aging timer is 300 seconds for dynamic MAC address entries.

Views

System view

Predefined user roles

network-admin

Parameters

aging *seconds*: Specifies an aging timer for dynamic MAC address entries, in seconds. The value range for the *seconds* argument is 10 to 630 in versions earlier than Release 6328. The value range for the *seconds* argument is 10 to 100000 in Release 6328 and later.

no-aging: Configures dynamic MAC address entries not to age.

Usage guidelines

To set the aging timer appropriately, follow these guidelines:

- A long aging interval causes the MAC address table to retain outdated entries and fail to accommodate the most recent network changes.
- A short aging interval results in removal of valid entries. Then, unnecessary broadcast packets appear and affect device performance.

Examples

Set the aging time to 500 seconds for dynamic MAC address entries.

```
<Sysname> system-view
[Sysname] mac-address timer aging 500
```

Related commands

display mac-address aging-time

snmp-agent trap enable mac-address

Use **snmp-agent trap enable mac-address** to enable SNMP notifications for the MAC address table.

Use **undo snmp-agent trap enable mac-address** to disable SNMP notifications for the MAC address table.

Syntax

snmp-agent trap enable mac-address [**mac-move**]

undo snmp-agent trap enable mac-address [**mac-move**]

Default

SNMP notifications are enabled for the MAC address table.

Views

System view

Predefined user roles

network-admin

Parameters

mac-move: Specifies notifications about the MAC address moves for the MAC address table. If you do not specify this keyword, the command enables all types of SNMP notifications for the MAC address table.

Usage guidelines

To report critical MAC address move events to an NMS, enable SNMP notifications for the MAC address table. For MAC address move event notifications to be sent correctly, you must also configure SNMP on the device.

When SNMP notifications are disabled for the MAC address table, the device sends the generated logs to the information center. To display the logs, configure the log destination and output rule configuration in the information center.

For information about SNMP and information center configuration, see the network management and monitoring configuration guide for the device.

The MAC address table supports only SNMP notifications about MAC address moves. When you enable or disable SNMP notifications about MAC address moves, you enable or disable all types of SNMP notifications for the MAC address table.

Examples

Disable SNMP notifications about MAC address moves for the MAC address table.

```
<Sysname> system-view
[Sysname] undo snmp-agent trap enable mac-address mac-move
```

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the MAC change notification interval in the range of 1 to 20000 seconds.

Usage guidelines

To prevent syslog messages or SNMP notifications from being sent too frequently, set the MAC change notification interval to a larger value.

Examples

Set the MAC change notification interval to 200 seconds.

```
<Sysname> system-view
[Sysname] mac-address information interval 200
```

mac-address information mode

Use **mac-address information mode** to set the MAC Information mode. The MAC Information mode specifies the type of messages (syslog messages or SNMP notifications) used to notify MAC changes.

Use **undo mac-address information mode** to restore the default.

Syntax

mac-address information mode { **syslog** | **trap** }

undo mac-address information mode

Default

SNMP notifications are sent to notify MAC changes.

Views

System view

Predefined user roles

network-admin

Parameters

syslog: Specifies that the device sends syslog messages to notify MAC changes.

trap: Specifies that the device sends SNMP notifications to notify MAC changes.

Examples

Configure the MAC Information mode as **trap**.

```
<Sysname> system-view
[Sysname] mac-address information mode trap
```

mac-address information queue-length

Use **mac-address information queue-length** to set the MAC Information queue length.

Use **undo mac-address information queue-length** to restore the default.

Syntax

mac-address information queue-length *value*

undo mac-address information queue-length

Default

The MAC Information queue length is 50.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the MAC Information queue length in the range of 0 to 1000. The MAC Information queue length indicates the number of MAC change messages.

Usage guidelines

If the MAC Information queue length is 0, the device sends a syslog message or SNMP notification immediately after learning or deleting a MAC address.

If the MAC Information queue length is not 0, the device stores MAC changes in the queue:

- The device overwrites the oldest MAC change written into the queue with the most recent MAC change when the following conditions exist:
  - The MAC change notification interval does not expire.
  - The queue has been exhausted.

- The device sends syslog messages or SNMP notifications only if the MAC change notification interval expires.

Examples

Set the MAC Information queue length to 600.

```
<Sysname> system-view
[Sysname] mac-address information queue-length 600
```

Contents

Ethernet link aggregation commands

bandwidth

Use **bandwidth** to set the expected bandwidth for an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth (in kbps) is the interface baud rate divided by 1000.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth to 10000 kbps for Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] bandwidth 10000
```

default

Use **default** to restore the default settings for an aggregate interface.

Syntax

default

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

△ **CAUTION:**

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impacts of this command when you execute it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies and system restrictions. Use the **display this** command in interface view to identify these commands, and then use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for Layer 2 aggregate interface 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] default
```

description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of an interface is *interface-name* **Interface**. For example, the default description of Bridge-Aggregation 1 is **Bridge-Aggregation1 Interface**.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Examples

Configure the description as **connect to the lab** for Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] description connect to the lab
```

display interface

Use **display interface** to display aggregate interface information.

Syntax

display interface [**bridge-aggregation** [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

interface-number: Specifies an existing aggregate interface number.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays information about interfaces in down state and the causes for the down state. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

If you do not specify an aggregate interface type, the command displays information about all interfaces.

If you specify an aggregate interface type but do not specify an interface number, the command displays information about all aggregate interfaces of the specified type.

Examples

Display detailed information about Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> display interface bridge-aggregation 1
Bridge-Aggregation1
Current state: UP
Line protocol state: UP
IP packet frame type: Ethernet II, hardware address: 000f-e207-f2e0
Description: Bridge-Aggregation1 Interface
Bandwidth: 1000 kbps
2Gbps-speed mode, full-duplex mode
Link speed type is autonegotiation, link duplex type is autonegotiation
PVID: 1
Port link-type: Access
 Tagged VLANs:   None
 UnTagged VLANs: 1
Last clearing of counters: Never
Last 300 seconds input:  6900 packets/sec 885160 bytes/sec    0%
Last 300 seconds output:  3150 packets/sec 404430 bytes/sec    0%
Input (total):  5364747 packets, 686688416 bytes
         2682273 unicasts, 1341137 broadcasts, 1341337 multicasts, 0 pauses
Input (normal):  5364747 packets, 686688416 bytes
         2682273 unicasts, 1341137 broadcasts, 1341337 multicasts, 0 pauses
Input:  0 input errors, 0 runts, 0 giants, 0 throttles
         0 CRC, 0 frame, 0 overruns, - aborts
         - ignored, - parity errors
Output (total): 1042508 packets, 133441832 bytes
         1042306 unicasts, 0 broadcasts, 202 multicasts, - pauses
Output (normal): 1042508 packets, 133441832 bytes
         1042306 unicasts, 0 broadcasts, 202 multicasts, 0 pauses
```

```
Output: 0 output errors, - underruns, - buffer failures
         0 aborts, 0 deferred, 0 collisions, 0 late collisions
         - lost carrier, - no carrier
```

Display brief information about Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> display interface bridge-aggregation 1 brief
Brief information on interfaces in bridge mode:
Link: ADM - administratively down; Stby - standby
Speed: (a) – auto
Duplex: (a)/A - auto; H - half; F - full
Type: A - access; T - trunk; H - hybrid
Interface            Link Speed   Duplex Type PVID Description
BAGG1                DOWN auto    A      A    1
```

Table 1 Command output

Field	Description
Bridge-Aggregation1	Layer 2 aggregate interface name.
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP**—The interface is both administratively and physically up.
IP packet frame type	IPv4 packet framing format.
Description	Description of the interface.
Bandwidth	Expected bandwidth of the interface. This field is not displayed when the bandwidth is 0 kbps.
Port priority	Port priority of the interface.
Unknown-speed mode, unknown-duplex mode	The interface speed and duplex mode are unknown.
Port link-type	Port link type: • Access. • Trunk. • Hybrid.
Tagged VLANs	VLAN whose packets are sent out of this interface with a tag.
Untagged VLANs	VLAN whose packets are sent out of this interface without a tag.
Last clearing of counters	Time when the **reset counters interface** command was last used to clear the interface statistics. This field displays **Never** if the **reset counters interface** command has never been used on the interface since device startup.
Last 300 seconds input/output rate	Average input or output rate over the last 300 seconds.
Input/Output (total)	Statistics of all packets received or sent on the interface.
Input/Output (normal)	Statistics of all normal packets received or sent on the interface.
Line protocol state	Data link layer state of the interface: • **UP**. • **DOWN**.

Field	Description
Maximum transmission unit	MTU of the interface.
Brief information on interfaces in bridge mode	Brief information about Layer 2 interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command.
Speed	Speed of the interface, in bps. This field displays the **(a)** flag next to the speed if the speed is automatically negotiated. This field displays **auto** if the interface is configured to autonegotiate its speed but the autonegotiation has not started.
Duplex	Duplex mode of the interface: • **A**—Autonegotiation. The interface is configured to autonegotiate its duplex mode but the autonegotiation has not started. • **F**—Full duplex. • **F(a)**—Autonegotiated full duplex. • **H**—Half duplex. • **H(a)**—Autonegotiated half duplex.
Type	Link type of the interface: • **A**—Access. • **H**—Hybrid. • **T**—Trunk.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Cause	Cause for the physical link state of an interface to be **DOWN**.

display lacp system-id

Use **`display lacp system-id`** to display the local system ID.

Syntax

`display lacp system-id`

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

You can use the **lacp system-priority** command to change the LACP priority of the local system. The LACP priority value is specified in decimal format in the **lacp system-priority** command. However, it is displayed in hexadecimal format in the output from the **display lacp system-id** command.

Examples

Display the local system ID.

```
<Sysname> display lacp system-id
Actor System ID: 0x8000, 0000-fc00-6504
```

Table 2 Command output

Field	Description
Actor System ID: 0x8000, 0000-fc00-6504	Local system ID, which contains the LACP system priority (0x8000 in this sample output) and the LACP system MAC address (0000-FC00-6504 in this sample output).

Related commands

lacp system-priority

display link-aggregation load-sharing mode

Use **display link-aggregation load-sharing mode** to display global or group-specific link-aggregation load sharing modes.

Syntax

display link-aggregation load-sharing mode [**interface** [**bridge-aggregation** *interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

interface-number: Specifies an existing aggregate interface number.

Usage guidelines

If you do not specify the **interface** keyword, the command displays the global link-aggregation load sharing modes.

If you specify the **interface** keyword, but do not specify an interface, the command displays all group-specific load sharing modes.

The **bridge-aggregation** keyword is available only when Layer 2 aggregate interfaces exist on the device.

Examples

Display the global link-aggregation load sharing mode. This example displays the default setting.

```
<Sysname> display link-aggregation load-sharing mode
Link-aggregation load-sharing mode:
Layer 2 traffic: packet type-based sharing
Layer 3 traffic: packet type-based sharing
```

Display the global link-aggregation load sharing mode. This example displays a user-configured setting.

```
<Sysname> display link-aggregation load-sharing mode
Link-aggregation load-sharing mode:
destination-mac address, source-mac address
```

Display the link-aggregation load sharing mode of Layer 2 aggregation group 10. This example displays the default setting.

```
<Sysname> display link-aggregation load-sharing mode interface bridge-aggregation 10
Bridge-Aggregation10 load-sharing mode:
Layer 2 traffic: packet type-based sharing
Layer 3 traffic: packet type-based sharing
```

Display the link-aggregation load sharing mode of Layer 2 aggregation group 10. This example displays a user-configured setting.

```
<Sysname> display link-aggregation load-sharing mode interface bridge-aggregation 10
Bridge-Aggregation10 load-sharing mode:
destination-mac address, source-mac address
```

Table 3 Command output

Field	Description
Link-aggregation load-sharing mode	Global link-aggregation load sharing mode. By default, this field displays the link-aggregation load sharing modes for Layer 2 and Layer 3 traffic. If you have configured the global link-aggregation load sharing mode, this field displays the configured mode.
Bridge-Aggregation10 load-sharing mode	Link-aggregation load sharing mode of Layer 2 aggregation group 10. By default, this field displays the global link-aggregation load sharing modes. If you have configured a link-aggregation load sharing mode for this aggregation group, this field displays the configured mode.
Layer 2 traffic: packet type-based sharing	Default link-aggregation load sharing mode for Layer 2 traffic. In this sample output, Layer 2 traffic is distributed based on the source and destination IP addresses and source and destination MAC addresses.
Layer 3 traffic: packet type-based sharing	Default link-aggregation load sharing mode for Layer 3 traffic. In this sample output, Layer 3 traffic is distributed based on the source and destination IP addresses and source and destination MAC addresses.
destination-mac address, source-mac address	User-configured link-aggregation load sharing mode. In this sample output, traffic is load shared based on source and destination MAC addresses.

display link-aggregation member-port

Use **display link-aggregation member-port** to display detailed link aggregation information about the specified member ports.

Syntax

display link-aggregation member-port [*interface-list* | **auto**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-list: Specifies a list of link aggregation member ports, in the format *interface-type interface-number1* [**to** *interface-type interface-number2*]. The value for the *interface-number2* argument must be equal to or greater than the value for the *interface-number1* argument.

auto: Specifies all link aggregation member ports that are enabled with automatic assignment.

Usage guidelines

A member port in a static aggregation group cannot obtain information about the peer group. For such member ports, the command displays the port number, port priority, and operational key of only the local end.

Examples

Display detailed information about GigabitEthernet 1/0/1, which is a member port of a static aggregation group.

```
<Sysname> display link-aggregation member-port gigabitethernet 1/0/1
Flags: A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
       D -- Synchronization, E -- Collecting, F -- Distributing,
       G -- Defaulted, H -- Expired

GigabitEthernet1/0/1:
Aggregate Interface: Bridge-Aggregation1
Port Number: 1
Port Priority: 32768
Oper-Key: 1
```

Display detailed information about GigabitEthernet 1/0/2, which is a member port of a dynamic aggregation group.

```
<Sysname> display link-aggregation member-port gigabitethernet 1/0/2
Flags: A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
       D -- Synchronization, E -- Collecting, F -- Distributing,
       G -- Defaulted, H -- Expired

GigabitEthernet1/0/2:
Aggregate Interface: Bridge-Aggregation10
Local:
    Port Number: 2
```

```
    Port Priority: 32768
    Oper-Key: 2
    Flag: {ACDEF}
Remote:
    System ID: 0x8000, 000f-e267-6c6a
    Port Number: 26
    Port Priority: 32768
    Oper-Key: 2
    Flag: {ACDEF}
Received LACP Packets: 5 packet(s)
Illegal: 0 packet(s)
Sent LACP Packets: 7 packet(s)
```

Display detailed information about all link aggregation member ports that are enabled with automatic assignment.

```
<Sysname> display link-aggregation member-port auto
Flags: A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
       D -- Synchronization, E -- Collecting, F -- Distributing,
       G -- Defaulted, H -- Expired

GigabitEthernet1/0/3:
Preference Aggregation Interface: Bridge-Aggregation11
Aggregate Interface: Bridge-Aggregation11
Local:
    Port Number: 3
    Port Priority: 32768
    Oper-Key: 1
    Flag: {ACDEF}
Remote:
    System ID: 0x8000, a057-75a2-0100
    Port Number: 3
    Port Priority: 32768
    Oper-Key: 1
    Flag: {ACDEF}
Received LACP Packets: 3 packet(s)
Illegal: 0 packet(s)
Sent LACP Packets: 6 packet(s)
```

Table 4 Command output

Field	Description
Flags	LACP state flags. This field is one byte long, represented by ABCDEFGH from the least significant bit to the most significant bit. A letter appears when its bit is 1 and does not appear when its bit is 0. • **A**—Indicates whether LACP is active on the port. 1 indicates active. 0 indicates passive. • **B**—Indicates the LACP timeout interval. 1 indicates the short timeout interval. 0 indicates the long timeout interval. • **C**—Indicates whether the sending system considers that the link is aggregatable. 1 indicates yes. 0 indicates no. • **D**—Indicates whether the sending system considers that the link has been aggregated. 1 indicates yes. 0 indicates no.

Field	Description
	• **E**—Indicates whether the sending system considers that the link can collect frames. 1 indicates yes. 0 indicates no. • **F**—Indicates whether the sending system considers that the link can distribute frames. 1 indicates yes. 0 indicates no. • **G**—Indicates whether the RX state machine of the sending system is in default state. 1 indicates yes. 0 indicates no. • **H**—Indicates whether the RX state machine of the sending system is in expired state. 1 indicates yes. 0 indicates no.
Aggregate Interface	Aggregate interface to which the member port belongs.
Preferred Aggregate Interface	Aggregate interface to which you prefer to assign the member port during automatic assignment.
Local	Information about the local end.
Oper-key	Operational key.
Flag	LACP protocol state flag.
Remote	Information about the peer end.
System ID	Peer system ID, containing the LACP system priority and the LACP system MAC address.
Received LACP Packets	Total number of LACP packets received.
Illegal	Total number of illegal packets.
Sent LACP Packets	Total number of LACP packets sent.

display link-aggregation summary

Use **display link-aggregation summary** to display brief information about all aggregation groups.

Syntax

display link-aggregation summary

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Static link aggregation groups cannot obtain information about the peer groups. As a result, the **Partner ID** field displays **None** for a static link aggregation group.

Examples

Display brief information about all aggregation groups.

```
<Sysname> display link-aggregation summary
Aggregate Interface Type:
BAGG -- Bridge-Aggregation, BLAGG –- Blade-Aggregation, RAGG -- Route-Aggregation, SCH-B
– Schannel-Bundle
Aggregation Mode: S -- Static, D -- Dynamic
```

```
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Actor System ID: 0x8000, 000f-e267-6c6a

AGG        AGG   Partner ID              Selected  Unselected  Individual  Share
Interface  Mode                          Ports     Ports       Ports       Type
--------------------------------------------------------------------------------
BAGG20     D     0x8000,00e0-fcff-ff01   2         0           0           Shar
```

Table 5 Command output

Field	Description
Aggregate Interface Type	Aggregate interface type: • **BAGG**—Layer 2. • **RAGG**—Layer 3.
Aggregation Mode	Aggregation group type: • **S**—Static. • **D**—Dynamic.
Loadsharing Type	Load sharing type: • **Shar**—Load-sharing. • **NonS**—Non-load-sharing.
Actor System ID	Local system ID, which contains the local LACP system priority and the local LACP system MAC address.
AGG Interface	Type and number of the aggregate interface.
AGG Mode	Aggregation group type.
Partner ID	System ID of the peer system, which contains the peer LACP system priority and the peer LACP system MAC address.
Selected Ports	Total number of Selected ports.
Unselected Ports	Total number of Unselected ports.
Individual Ports	Total number of Individual ports.
Share Type	Load sharing type.

display link-aggregation verbose

Use **display link-aggregation verbose** to display detailed information about the aggregation groups that correspond to the specified aggregate interfaces.

Syntax

display link-aggregation verbose [**bridge-aggregation** [*interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

interface-number: Specifies an existing aggregate interface by its number.

Usage guidelines

If you do not specify an aggregate interface type, the command displays detailed information about all aggregation groups.

If you specify an aggregate interface type but do not specify an interface number, the command displays detailed information about all aggregation groups of the specified type.

The **bridge-aggregation** keyword is available only when Layer 2 aggregate interfaces exist on the device.

This command does not display the interfaces that are enabled with automatic assignment if they have not joined an aggregation group.

Examples

Display detailed information about Layer 2 aggregation group 10, which is a dynamic aggregation group.

```
<Sysname> display link-aggregation verbose bridge-aggregation 10
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Port Status: S -- Selected, U -- Unselected, I -- Individual
Port: A -- Auto port, M -- Management port, R -- Reference port

  GE1/0/3          S       32768    1
```

Table 6 Command output

Field	Description
Loadsharing Type	Load sharing type: • **Shar**—Load-sharing. • **NonS**—Non-load-sharing.
Port Status	Port state: • **Selected**. • **Unselected**. • **Individual**.
Port	Port type: • **Auto port**—The port was assigned to the aggregation group by the automatic link aggregation feature or the automatic member port assignment feature. • **Management port**—The port is a management port. This value is not supported in the current software version. • **Reference port**—The port is a reference port.
Flags	LACP state flags. This field is one byte long, represented by ABCDEFGH from the least significant bit to the most significant bit. A letter appears when its bit is 1 and does not appear when its bit is 0. • **A**—Indicates whether LACP is active on the port. 1 indicates active. 0 indicates passive. • **B**—Indicates the LACP timeout interval. 1 indicates the short timeout interval. 0 indicates the long timeout interval. • **C**—Indicates whether the sending system considers that the link is aggregatable. 1 indicates yes. 0 indicates no. • **D**—Indicates whether the sending system considers that the link has been aggregated. 1 indicates yes. 0 indicates no. • **E**—Indicates whether the sending system considers that the link can collect frames. 1 indicates yes. 0 indicates no. • **F**—Indicates whether the sending system considers that the link can distribute frames. 1 indicates yes. 0 indicates no. • **G**—Indicates whether the RX state machine of the sending system is in default state. 1 indicates yes. 0 indicates no. • **H**—Indicates whether the RX state machine of the sending system is in expired state. 1 indicates yes. 0 indicates no.
Aggregate Interface	Name of the aggregate interface.
Creation Mode	Creation mode of the dynamic aggregate interface: • **Auto**. • **Manual**.
Aggregation Mode	Aggregation group type:

Field	Description
	• **S**—Static. • **D**—Dynamic.
Management VLANs	(This field is not supported in the current software version.) Management VLANs. If no management VLANs are specified, this field displays **None**.
System ID	Local system ID, containing the local LACP system priority and the local LACP system MAC address.
Local	Information about the local end: • **Port**—Port type and number. • **Status**—Port state, which can be Selected, Unselected, or Individual. • **Priority**—Port priority. • **Index**—Port index. • **Oper-Key**—Operational key. • **Flag**—LACP state flag. **NOTE:** For static aggregation groups, the **Index** and **Flag** fields are not displayed.
Remote	Information about the peer end: • **Actor**—Type and number of the local port. This field displays the **(R)** flag next to the port if its peer port is the reference port. • **Priority**—Priority of the peer port. • **Index**—Index of the peer port. • **Oper-Key**—Operational key of the peer port. • **System ID**—System ID of the peer end. • **Flag**—LACP state flag of the peer end.

interface bridge-aggregation

Use **`interface bridge-aggregation`** to create a Layer 2 aggregate interface and enter its view, or enter the view of an existing Layer 2 aggregate interface.

Use **`undo interface bridge-aggregation`** to delete a Layer 2 aggregate interface.

Syntax

`interface bridge-aggregation` *`interface-number`*

`undo interface bridge-aggregation` *`interface-number`*

Default

No Layer 2 aggregate interfaces exist.

Views

System view

Predefined user roles

network-admin

Parameters

`interface-number`: Specifies a Layer 2 aggregate interface number. The value range for the *`interface-number`* argument is 1 to 1024.

Usage guidelines

When you create a Layer 2 aggregate interface, the system automatically creates a Layer 2 aggregation group with the same number. The aggregation group operates in static aggregation mode by default.

Deleting a Layer 2 aggregate interface also deletes the Layer 2 aggregation group. At the same time, the member ports of the aggregation group, if any, leave the aggregation group.

Examples

Create Layer 2 aggregate interface Bridge-Aggregation 1, and enter its view.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1]
```

jumboframe enable

Use **jumboframe enable** to allow the jumbo frames on an interface to pass through.

Use **undo jumboframe enable** to deny jumbo frames on an interface.

Use **undo jumboframe enable** *size* to restore the default.

Syntax

jumboframe enable [*size*]

undo jumboframe enable [*size*]

Default

An interface allows jumbo frames with a maximum length of 10240 bytes to pass through.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

size: Specifies the maximum length of jumbo frames, in bytes. The value range for this argument is 1522 to 10240.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Allow jumbo frames on Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> System-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] jumboframe enable
```

lacp default-selected-port disable

Use **lacp default-selected-port disable** to disable the default port selection action for dynamic aggregation groups.

Use **undo lacp default-selected-port disable** to enable the default port selection action for dynamic aggregation groups.

Syntax

lacp default-selected-port disable

undo lacp default-selected-port disable

Default

The default port selection action is enabled for dynamic aggregation groups.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The default port selection action applies to dynamic aggregation groups.

This action automatically chooses the port with the lowest ID from among all up member ports as a Selected port if none of them has received LACPDUs before the LACP timeout interval expires.

After this action is disabled, a dynamic aggregation group will not have any Selected ports to forward traffic if it has not received LACPDUs before the LACP timeout interval expires.

Examples

Disable the default port selection action.

```
<Sysname> system-view
[Sysname] lacp default-selected-port disable
```

lacp edge-port

Use **lacp edge-port** to configure an aggregate interface as an edge aggregate interface.

Use **undo lacp edge-port** to restore the default.

Syntax

lacp edge-port

undo lacp edge-port

Default

An aggregate interface does not operate as an edge aggregate interface.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

Use this command on the aggregate interface that connects the device to a server if dynamic link aggregation is configured only on the device. This feature improves link reliability by enabling all member ports of the aggregation group to forward packets.

This command takes effect only on an aggregate interface corresponding to a dynamic aggregation group.

Link-aggregation traffic redirection cannot operate correctly on an edge aggregate interface.

Examples

Configure Layer 2 aggregate interface Bridge-Aggregation 1 as an edge aggregate interface.

```
<Sysname> System-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] lacp edge-port
```

lacp mode

Use **lacp mode passive** to configure LACP to operate in passive mode on a port.

Use **undo lacp mode** to restore the default.

Syntax

lacp mode passive

undo lacp mode

Default

LACP operates in active mode on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only on member ports of dynamic aggregation groups.

When LACP is operating in passive mode on a local member port and its peer port, both ports cannot send LACPDUs. When LACP is operating in active mode on either end of a link, both ports can send LACPDUs.

Examples

Configure LACP to operate in passive mode on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lacp mode passive
```

lacp period short

Use **lacp period short** to enable the short LACP timeout interval (3 seconds) on an interface.

Use **undo lacp period** to restore the default.

Syntax

lacp period short

undo lacp period

Default

The LACP timeout interval is the long timeout interval (90 seconds) on an interface.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable the short LACP timeout interval (3 seconds) on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lacp period short
```

lacp select speed

Use **lacp select speed** to configure a dynamic aggregation group to use port speed as the prioritized criterion for reference port selection.

Use **undo lacp select speed** to restore the default.

IMPORTANT:

This feature is supported only in Release 6348P01 and later versions.

Syntax

lacp select speed

undo lacp select speed

Default

Port ID is the prioritized criterion for reference port selection in a dynamic aggregation group.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

Changing reference port selection criteria might cause transient traffic interruption. When you use this command, make sure you understand its impact on your network.

This command enables a dynamic aggregation group to select a high-speed member port as the reference port.

You must execute this command at both ends of the aggregate link so the peer aggregation systems use the same criteria for reference port selection.

As a best practice, shut down the peer aggregate interfaces before you execute this command and bring up the interfaces after this command is executed on both of them.

This command takes effect only on dynamic aggregate interfaces. On a static aggregate interface, you can execute this command, but the setting cannot take effect.

Examples

Specify port speed as the prioritized criterion for reference port selection on Layer 2 dynamic aggregate interface Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
```

```
[Sysname-Bridge-Aggregation1] link-aggregation mode dynamic
[Sysname-Bridge-Aggregation1] lacp select speed
```

lacp system-mac

Use **lacp system-mac** to set the LACP system MAC address.

Use **undo lacp system** to restore the default.

Syntax

lacp system-mac *mac-address*

undo lacp system-mac

Default

The LACP system MAC address is the bridge MAC address of the device.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a MAC address in the format of H-H-H. The MAC address cannot be an all-zero, all-F, or multicast MAC address.

Usage guidelines

All S-MLAG devices must use the same LACP system MAC address.

The LACP system MAC address configured by using this command takes effect only on aggregate interfaces in S-MLAG groups. Aggregate interfaces not in S-MLAG groups do not use the configured LACP system MAC address to send LACPDUs. To identify the LACP system MAC address used by a link aggregation group, examine the **System ID** field in the output from the **display link-aggregation verbose** command.

Examples

Set the LACP system MAC address to **0001-0001-0001**.

```
<Sysname> system-view
[Sysname] lacp system-mac 1-1-1
```

Related commands

display link-aggregation verbose

lacp system-number

Use **lacp system-number** to set the LACP system number used by the local device.

Use **undo lacp system-number** to restore the default.

Syntax

lacp system-number *number*

undo lacp system-number

Default

The LACP system number is not set.

Views

System view

Predefined user roles

network-admin

Parameters

number: Specifies a number in the range of 1 to 3.

Usage guidelines

You must assign a unique LACP system number to each S-MLAG device.

The LACP system number configured by using this command takes effect only on aggregate interfaces in S-MLAG groups. Aggregate interfaces not in S-MLAG groups do not use the configured LACP system number in LACPDUs. To view the LACP system number in LACPDUs, examine the **Index** field in the output from the **display link-aggregation verbose** command.

Examples

Set the LACP system number to 1.

```
<Sysname> system-view
[Sysname] lacp system-number 1
```

Related commands

display link-aggregation verbose

lacp system-priority

Use **lacp system-priority** to set the LACP system priority.

Use **undo lacp system-priority** to restore the default.

Syntax

lacp system-priority *priority*

undo lacp system-priority

Default

The LACP system priority is 32768.

Views

System view

Predefined user roles

network-admin

Parameters

priority: Specifies the LACP system priority in the range of 0 to 65535. The smaller the value, the higher the LACP system priority.

Usage guidelines

All S-MLAG devices must use the same LACP system priority.

Examples

Set the LACP system priority to 64.

```
<Sysname> system-view
[Sysname] lacp system-priority 64
```

Related commands

link-aggregation port-priority

link-aggregation bfd ipv4

Use **link-aggregation bfd ipv4** to enable BFD for an aggregation group.

Use **undo link-aggregation bfd** to disable BFD for an aggregation group.

Syntax

link-aggregation bfd ipv4 source *ip-address* **destination** *ip-address*

undo link-aggregation bfd

Default

BFD is disabled for an aggregation group.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

source *ip-address*: Specifies the unicast source IP address of BFD sessions. The source IP address cannot be 0.0.0.0.

destination *ip-address*: Specifies the unicast destination IP address of BFD sessions. The destination IP address cannot be 0.0.0.0.

Usage guidelines

Make sure the source and destination IP addresses are reversed between the two ends of an aggregate link. For example, if you execute **link-aggregation bfd ipv4 source 1.1.1.1 destination 2.2.2.2** at the local end, execute **link-aggregation bfd ipv4 source 2.2.2.2 destination 1.1.1.1** at the peer end. The source and destination IP addresses cannot be the same.

The BFD parameters configured on an aggregate interface take effect on all BFD sessions established by the member ports in its aggregation group. BFD on an aggregate link supports only control packet mode for session establishment and maintenance. The two ends of an established BFD session can only operate in Asynchronous mode. For more information about BFD, see *High Availability Configuration Guide*.

As a best practice, do not configure BFD for any protocols on a BFD-enabled aggregate interface.

Make sure the number of member ports in the BFD-enabled aggregation group is less than or identical to the number of BFD sessions supported by the device. If the aggregation group contains more member ports than the supported sessions, some Selected ports might change to the Unselected state.

If the number of BFD sessions differs between the two ends of an aggregate link, check their settings for inconsistency in the maximum number of Selected ports. You must make sure the two ends have the same setting for the maximum number of Selected ports.

Examples

Enable BFD for Layer 2 aggregation group 1, and specify the source and destination IP addresses as 1.1.1.1 and 2.2.2.2 for BFD sessions.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
```

```
[Sysname-Bridge-Aggregation1] link-aggregation bfd ipv4 source 1.1.1.1 destination
2.2.2.2
```

link-aggregation global load-sharing mode

Use **link-aggregation global load-sharing mode** to set the global link-aggregation load sharing mode.

Use **undo link-aggregation global load-sharing mode** to restore the default.

Syntax

link-aggregation global load-sharing mode { **destination-ip** | **destination-mac** | **destination-port** | **ingress-port** | **source-ip** | **source-mac** | **source-port** } *

undo link-aggregation global load-sharing mode

Default

Packets are load shared based on the following information:

- Source and destination IP addresses.
- Source and destination MAC addresses.

Views

System view

Predefined user roles

network-admin

Parameters

destination-ip: Distributes traffic based on destination IP addresses.

destination-mac: Distributes traffic based on destination MAC addresses.

destination-port: Distributes traffic based on destination ports.

ingress-port: Distributes traffic based on ingress ports.

source-ip: Distributes traffic based on source IP addresses.

source-mac: Distributes traffic based on source MAC addresses.

source-port: Distributes traffic based on source ports.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If an unsupported load sharing mode is set, the device displays an error message.

The following are global load sharing modes supported on the device:

- Default mode (load sharing mode automatically determined based on the packet type).
- Source IP.
- Destination IP.
- Source MAC.
- Destination MAC.
- Ingress port.
- Source IP and destination IP.
- Source IP and source port.

- Destination IP and destination port.
- Source IP, source port, destination IP, and destination port.
- Any combinations of ingress port, source MAC, and destination MAC.

Examples

Set the global load sharing mode to load share packets based on destination MAC addresses.

```
<Sysname> system-view
[Sysname] link-aggregation global load-sharing mode destination-mac
```

link-aggregation lacp traffic-redirect-notification enable

Use **link-aggregation lacp traffic-redirect-notification enable** to enable link-aggregation traffic redirection.

Use **undo link-aggregation lacp traffic-redirect-notification enable** to disable link-aggregation traffic redirection.

Syntax

link-aggregation lacp traffic-redirect-notification enable

undo link-aggregation lacp traffic-redirect-notification enable

Default

Link-aggregation traffic redirection is disabled.

Views

System view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

This feature redirects traffic on a Selected port to the remaining available Selected ports of an aggregation group if one of the following events occurs:

- The port is shut down by using the **shutdown** command.
- The slot that hosts the port reboots, and the aggregation group spans multiple slots.

NOTE:

The device does not redirect traffic to member ports that become Selected during the traffic redirection process.

This feature ensures zero packet loss for known unicast traffic, but does not protect unknown unicast traffic.

This feature applies only to dynamic link aggregation groups.

To prevent traffic interruption, enable link-aggregation traffic redirection on devices at both ends of the aggregate link.

To prevent packet loss that might occur when a slot reboots, do not enable spanning tree together with link-aggregation traffic redirection.

Link-aggregation traffic redirection cannot operate correctly on an edge aggregate interface.

Global link-aggregation traffic redirection settings take effect on all aggregation groups. A link aggregation group preferentially uses the group-specific link-aggregation traffic redirection settings.

If group-specific link-aggregation traffic redirection is not configured, the group uses the global link-aggregation traffic redirection settings.

As a best practice, enable link-aggregation traffic redirection on a per-interface basis. If you enable this feature globally, communication with a third-party peer device might be affected if the peer is not compatible with this feature.

Examples

Enable link-aggregation traffic redirection.

```
<Sysname> system-view
[Sysname] link-aggregation lacp traffic-redirect-notification enable
```

link-aggregation load-sharing mode local-first

Use **link-aggregation load-sharing mode local-first** to enable local-first load sharing for link aggregation.

Use **undo link-aggregation load-sharing mode local-first** to disable local-first load sharing for link aggregation.

Syntax

link-aggregation load-sharing mode local-first

undo link-aggregation load-sharing mode local-first

Default

Local-first load sharing is enabled for link aggregation.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use local-first load sharing in a multidevice link aggregation scenario to distribute traffic preferentially across member ports on the ingress device. Local-first load sharing takes effect only on known unicast traffic.

If you disable local-first load sharing, packets of an aggregate interface are load shared among all Selected ports on IRF member devices.

Examples

Disable local-first load sharing for link aggregation.

```
<Sysname> system-view
[Sysname] undo link-aggregation load-sharing mode local-first
```

link-aggregation mode

Use **link-aggregation mode dynamic** to configure an aggregation group to operate in dynamic aggregation mode and enable LACP.

Use **undo link-aggregation mode** to restore the default.

Syntax

link-aggregation mode dynamic

undo link-aggregation mode

Default

An aggregation group operates in static aggregation mode.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

When you change the aggregation mode, make sure you understand the impact of the change on services.

Aggregation mode change might cause Selected member ports to become Unselected.

Examples

Configure Layer 2 aggregation group 1 to operate in dynamic aggregation mode.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation mode dynamic
```

link-aggregation port-priority

Use **link-aggregation port-priority** to set the port priority of an interface.

Use **undo link-aggregation port-priority** to restore the default.

Syntax

link-aggregation port-priority *priority*

undo link-aggregation port-priority

Default

The port priority of an interface is 32768.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

priority: Specifies the port priority in the range of 0 to 65535. The smaller the value, the higher the port priority.

Examples

Set the port priority to 64 for Layer 2 Ethernet interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] link-aggregation port-priority 64
```

Related commands

lacp system-priority

link-aggregation selected-port maximum

Use **link-aggregation selected-port maximum** to set the maximum number of Selected ports allowed in an aggregation group.

Use **undo link-aggregation selected-port maximum** to restore the default.

Syntax

link-aggregation selected-port maximum *max-number*

undo link-aggregation selected-port maximum

Default

The maximum number of Selected ports allowed in an aggregation group is 8.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of Selected ports allowed in an aggregation group. The value range for this argument is 1 to 8.

Usage guidelines

Executing this command might cause some of the Selected ports in an aggregation group to become Unselected ports.

The maximum number of Selected ports allowed in the aggregation groups must be the same for the local and peer ends.

For an aggregation group, the maximum number of Selected ports must be equal to or higher than the minimum number of Selected ports.

The maximum number of Selected ports allowed in an aggregation group is limited by one of the following values, whichever value is smaller:

- Maximum number set by using the **link-aggregation selected-port maximum** command.
- Maximum number of Selected ports allowed by the link aggregation capability.

You can implement backup between two ports by performing the following tasks:

- Assigning two ports to an aggregation group.
- Setting the maximum number of Selected ports to 1 for the aggregation group.

Then, only one Selected port is allowed in the aggregation group at any point in time, while the Unselected port acts as a backup port.

Examples

Set the maximum number of Selected ports to 5 for Layer 2 aggregation group 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation selected-port maximum 5
```

Related commands

link-aggregation selected-port minimum

link-aggregation selected-port minimum

Use **link-aggregation selected-port minimum** to set the minimum number of Selected ports in an aggregation group.

Use **undo link-aggregation selected-port minimum** to restore the default.

Syntax

link-aggregation selected-port minimum { *min-number* | **percentage** *number* }

undo link-aggregation selected-port minimum

Default

The minimum number of Selected ports in an aggregation group is not specified.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

min-number: Specifies the minimum number of Selected ports in an aggregation group required to bring up the aggregate interface. The value range for this argument is 1 to 8.

percentage *number*: Sets the minimum percentage of Selected ports in an aggregation group. The value range for the *number* argument is 1 to 100.

Usage guidelines

IMPORTANT:

After you set the minimum percentage of Selected ports for an aggregation group, aggregate interface flapping might occur when ports join or leave an aggregation group. Make sure you are fully aware of the impacts of this setting when you configure it on a live network.

You can set either the minimum number or the minimum percentage of Selected ports for an aggregation group. If you configure both settings on an aggregate interface, the higher Selected port number limit takes effect.

Executing this command might cause all member ports in the aggregation group to become Unselected ports.

You must set the same minimum number or minimum percentage of Selected ports at the two ends of an aggregate link.

For an aggregation group, the minimum number of Selected ports must be equal to or lower than the maximum number of Selected ports.

Examples

Set the minimum number of Selected ports to 3 for Layer 2 aggregation group 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation selected-port minimum 3
```

Related commands

link-aggregation selected-port maximum

link-delay

Use **link-delay** to set the physical state change suppression interval on an aggregate interface.

Use **undo link-delay** to restore the default.

Syntax

link-delay { **down** | **up** } [**msec**] *delay-time*

undo link-delay { **down** | **up** }

Default

Each time the physical link of an aggregate interface goes up or comes down, the system immediately reports the change to the CPU.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

down: Suppresses the link-down events.

up: Suppresses the link-up events.

msec: Sets the physical state change suppression interval in milliseconds. If you do not specify this keyword, the suppression interval is in seconds.

delay-time: Sets the physical state change suppression interval. To report a physical state change immediately to the CPU, set the interval to 0.

- If you do not specify the **msec** keyword, the value range is 0 to 30 seconds.
- If you specify the **msec** keyword, the value range is 0 to 10000 milliseconds, and the value must be a multiple of 100.

Usage guidelines

You can configure this feature to suppress link-down events, link-up events, or both. If an event of the specified type still exists when the suppression interval expires, the system reports the event.

On an interface, you can configure different suppression intervals for link-up and link-down events. If you execute the **link-delay** command multiple times for an event type, the most recent configuration takes effect on that event type.

Do not use this feature in combination with S-MLAG.

When you use this feature on an aggregate interface, make sure its peer is also an aggregate interface. In addition, you must set the physical state change suppression interval to the same value on those aggregate interfaces.

Examples

Set the link-down event suppression interval to 8 seconds on Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-delay down 8
```

port link-aggregation group

Use **port link-aggregation group** to assign an interface to an aggregation group.

Use **undo port link-aggregation group** to remove an interface from the aggregation group to which it belongs.

Syntax

port link-aggregation group { *group-id* [**force**] | **auto** [*group-id*] }

undo port link-aggregation group

Default

An interface does not belong to any aggregation group.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies an aggregation group by its aggregate interface number. The value range for the *number* argument is 1 to 1024.

force: Enables the current interface to synchronize attribute configurations from the aggregate interface. If you do not specify this keyword, the current interface does not synchronize attribute configurations from the aggregate interface when it joins the aggregation group.

auto: Enables automatic assignment.

Usage guidelines

An interface can belong to only one aggregation group.

An interface cannot join an aggregation group if it has different attribute configurations from the aggregate interface. After joining an aggregation group, an interface inherits the attribute configurations on the aggregate interface. You can modify the attribute configurations only on the aggregate interface.

The **force** keyword takes effect only when you assign the interface to an aggregation group. It cannot be saved in the running configuration or a configuration file.

When you enable automatic assignment, you can specify a preferred aggregation group, which must be in dynamic mode.

The device assigns the interface to the preferred aggregation group as long as the LACPDUs received on the interface match the peer information of the reference port in the group.

If you do not specify a preferred group or if the preferred group match fails, the device attempts to select a matching group from the existing dynamic aggregation groups. If no match is found, the device creates a dynamic aggregation group based on the LACPDUs and assigns the interface to that aggregation group.

As a best practice, do not modify the configuration on an automatically created aggregate interface or its member ports.

Examples

Assign Layer 2 Ethernet interface GigabitEthernet 1/0/1 to Layer 2 aggregation group 1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-aggregation group 1
```

port s-mlag group

Use **port s-mlag group** to assign an aggregate interface to an S-MLAG group.

Use **undo port s-mlag group** to restore the default.

Syntax

port s-mlag group *group-id*

undo port s-mlag group

Default

An aggregate interface is not in any S-MLAG group.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies an S-MLAG group number in the range of 1 to 1024.

Usage guidelines

Use S-MLAG to set up link aggregations only with servers.

You can assign only Layer 2 aggregate interfaces in dynamic mode to an S-MLAG group.

Each S-MLAG group can contain only one aggregate interface on each device.

Examples

Assign Bridge-Aggregation 1 to S-MLAG group 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] port s-mlag group 1
```

reset counters interface

Use **reset counters interface** to clear statistics for the specified aggregate interfaces.

Syntax

reset counters interface [**bridge-aggregation** [*interface-number*]]

Views

User view

Predefined user roles

network-admin

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

interface-number: Specifies an existing aggregate interface number.

Usage guidelines

Use this command to clear history statistics before you collect traffic statistics for a time period.

If you do not specify an aggregate interface type, the command clears statistics for all interfaces in the system.

If you specify only an aggregate interface type, the command clears statistics for all aggregate interfaces of the specified type.

The **bridge-aggregation** keyword is available only when Layer 2 aggregate interfaces exist on the device.

Examples

Clear statistics for Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> reset counters interface bridge-aggregation 1
```

reset lacp statistics

Use **reset lacp statistics** to clear LACP statistics for the specified link aggregation member ports.

Syntax

reset lacp statistics [**interface** *interface-list*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-list*: Specifies a list of link aggregation member ports, in the format *interface-type interface-number1* [**to** *interface-type interface-number2*]. The value for the *interface-number1* argument must be equal to or greater than the value for the *interface-number2* argument. If you do not specify any member ports, the command clears LACP statistics for all member ports.

Examples

Clear LACP statistics for all link aggregation member ports.

```
<Sysname> reset lacp statistics
```

Related commands

display link-aggregation member-port

shutdown

Use **shutdown** to shut down an aggregate interface.

Use **undo shutdown** to bring up an aggregate interface.

Syntax

shutdown

undo shutdown

Views

network-operator

Parameters

group-id: Specifies an isolation group by its ID. The value range is 1 to 8.

Examples

Display all isolation groups.

```
<Sysname> display port-isolate group
 Port isolation group information:
 Group ID: 1
 Group members:
    GigabitEthernet1/0/1

 Group ID: 5
 Group members:
    GigabitEthernet1/0/2            GigabitEthernet1/0/4
```

Display information about isolation group 1.

```
<Sysname> display port-isolate group 1
 Port isolation group information:
 Group ID: 1
 Group members:
    GigabitEthernet1/0/1
```

Table 1 Command output

Field	Description
Group ID	ID of the isolation group.
Group members	Isolated ports in the isolation group. **No ports** indicates that the isolation group does not contain isolated ports.

Related commands

port-isolate enable

port-isolate enable

Use **port-isolate enable** to assign a port to an isolation group.

Use **undo port-isolate enable** to remove a port from an isolation group.

Syntax

port-isolate enable group *group-id*

undo port-isolate enable

Default

The port is not assigned to an isolation group.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group *group-id*: Specifies an isolation group by its ID. The value range is 1 to 8.

Usage guidelines

The configuration in Layer 2 Ethernet interface view applies only to the interface.

The configuration in Layer 2 aggregate interface view applies to the Layer 2 aggregate interface and its aggregation member ports. If the device fails to apply the configuration to the aggregate interface, it does not assign any aggregation member port to the isolation group. If the failure occurs on an aggregation member port, the device skips the port and continues to assign other aggregation member ports to the isolation group.

To assign ports to an isolation group, make sure the isolation group already exists.

One port can be assigned to only one isolation group.

Examples

Assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to isolation group 1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port-isolate enable group 1
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] port-isolate enable group 1
```

Related commands

display port-isolate group

port-isolate group

Use **port-isolate group** to create an isolation group.

Use **undo port-isolate group** to delete isolation groups.

Syntax

port-isolate group *group-id*

undo port-isolate group { *group-id* | **all** }

Default

No isolation groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies an isolation group by its ID. The value range is 1 to 8.

all: Deletes all isolation groups.

Examples

Create isolation group 1.

```
<Sysname> system-view
[Sysname] port-isolate group 1
```

Contents

Spanning tree commands

active region-configuration

Use **active region-configuration** to activate your MST region configuration.

Syntax

active region-configuration

Views

MST region view

Predefined user roles

network-admin

Usage guidelines

When you configure MST region parameters, MSTP launches a new spanning tree calculation process that might cause network topology instability. This is most likely to occur when you configure the VLAN-to-instance mapping table. The launch occurs after you execute the **active region-configuration** command or the **stp global enable** command.

As a best practice, use the **check region-configuration** command to determine whether the MST region configurations to be activated are correct. Run this command only when they are correct.

Examples

Map VLAN 2 to MSTI 1 and activate the MST region configuration.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] instance 1 vlan 2
[Sysname-mst-region] active region-configuration
```

Related commands

check region-configuration

instance

revision-level

stp global enable

vlan-mapping modulo

bpdu-drop any

Use **bpdu-drop any** to enable BPDU drop on a port.

Use **undo bpdu-drop any** to disable BPDU drop on a port.

Syntax

bpdu-drop any

undo bpdu-drop any

Default

BPDU drop is disabled on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable BPDU drop on port GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bpdu-drop any
```

check region-configuration

Use **check region-configuration** to display MST region pre-configuration information.

Syntax

check region-configuration

Views

MST region view

Predefined user roles

network-admin

Usage guidelines

Spanning tree devices belong to the same MST region only when they are connected through a physical link and configured with the same details as follows:

- Format selector (0 by default and not configurable).
- MST region name.
- MST region revision level.
- VLAN-to-instance mapping entries in the MST region.

As a best practice, use this command to determine whether the MST region configurations to be activated are correct. Activate them only when they are correct.

Examples

Display MST region pre-configurations.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] check region-configuration
 Admin Configuration
   Format selector      : 0
   Region name          : 001122334400
   Revision level       : 0
   Configuration digest : 0x3ab68794d602fdf43b21c0b37ac3bca8

   Instance  VLANs Mapped
   0         1, 3 to 4094
```

15 2

Table 1 Command output

Field	Description
Format selector	Format selector of the MST region, which is 0 (not configurable).
Region name	MST region name.
Revision level	Revision level of the MST region.
Instance VLANs Mapped	VLAN-to-instance mappings in the MST region.

display stp

Use **display stp** to display spanning tree status and statistics.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] [**interface** *interface-list* | **slot** *slot-number*] [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

interface *interface-list*: Specifies a space-separated list of up to 10 interface items. Each item specifies an interface or a range of interfaces in the form of *interface-type interface-number 1* [**to** *interface-type interface-number 2*]. The interface number for *interface-number 2* must be equal to or greater than the interface number for *interface-number 1*.

brief: Displays brief spanning tree status and statistics. If this keyword is not specified, the command displays detailed spanning tree status and statistics.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port name.

- If you do not specify a port, this command applies to all ports.
- If you specify a port list, this command applies to the specified ports.

In PVST mode, the command output is sorted by VLAN ID and by port name in each VLAN.

- If you do not specify a VLAN or port, this command applies to all ports in all VLANs.
- If you only specify a VLAN list but not a port, this command applies to all ports in the specified VLANs.
- If you only specify a port list but not a VLAN, this command applies to the specified ports in all VLANs.
- If you specify both a VLAN list and a port list, this command applies to the ports in the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port name in each MSTI.

- If you do not specify an MSTI or port, this command applies to all MSTIs on all ports.
- If you specify an MSTI list but not a port, this command applies to all ports in the specified MSTIs.
- If you specify a port list but not an MSTI, this command applies to all MSTIs on the specified ports.
- If you specify both an MSTI list and a port list, this command applies to the specified ports in the specified MSTIs.

Examples

In MSTP mode, display the brief spanning tree status and statistics for MSTI 0 on port GigabitEthernet 1/0/1.

```
<Sysname> display stp instance 0 interface GigabitEthernet 1/0/1 brief
 MST ID      Port                        Role  STP State     Protection
 0           0           GigabitEthernet1/0/1         ALTE  DISCARDING    LOOP
```

In PVST mode, display the brief spanning tree status and statistics for VLAN 2 on port GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] stp mode pvst
[Sysname] display stp vlan 2 interface gigabitethernet 1/0/1 brief
 VLAN ID     Port                        Role  STP State     Protection
 2           GigabitEthernet1/0/1        ALTE  DISCARDING    LOOP
```

Table 2 Command output

Field	Description
MST ID	MSTI ID in the MST region.
Port	Port name, corresponding to each MSTI or VLAN.
Role	Port role: • **ALTE**—The port is an alternate port. • **BACK**—The port is a backup port. • **ROOT**—The port is a root port. • **DESI**—The port is a designated port. • **MAST**—The port is a master port.

Field	Description
	• **DISA**—The port is disabled.
STP State	Spanning tree status on the port: • **FORWARDING**—The port can receive and send BPDUs and also forward user traffic. • **DISCARDING**—The port can receive and send BPDUs but cannot forward user traffic. • **LEARNING**—The port is in a transitional state. It can receive and send BPDUs but cannot forward user traffic.
Protection	Effective spanning tree protection feature on the port: • **ROOT**—Root guard. • **LOOP**—Loop guard. • **BPDU**—BPDU guard. If no spanning tree protection feature is configured or spanning tree protection is not triggered, this field displays **NONE**.

In MSTP mode, display the detailed spanning tree status and statistics for all MSTIs on all ports.

Table 3 Command output

Field	Description
Bridge ID	Bridge ID, which contains the device's priority and its MAC address. For example, in output 32768.000f-e200-2200, the value preceding the dot is the device's priority. The value following the dot is the device's MAC address.
Bridge times	Major parameters for the bridge: • **Hello**—Hello timer. • **MaxAge**—Maximum age timer. • **FwdDelay**—Forward delay timer. • **MaxHops**—Maximum hops within the MST region.
Root ID/ERPC	CIST root ID and external path cost (the path cost from the device to the CIST root).
RegRoot ID/IRPC	CIST regional root ID and internal path cost (the path cost from the device to the

Field	Description
	CIST regional root).
VlanRoot ID/RPC	VLAN root ID and root path cost (the path cost from the device to the VLAN root bridge).
RootPort ID	Root port ID. The value **0.0** indicates that the device is the root and there is no root port.
BPDU-Protection	Global status of the BPDU guard feature.
Bridge Config-Digest-Snooping	Global status of Digest Snooping.
TC or TCN received	Number of TC/TCN BPDUs received in the MSTI or VLAN.
Time since last TC	Time since the latest topology change in the MSTI or VLAN.
[FORWARDING]	The port is in forwarding state.
[DISCARDING]	The port is in discarding state.
[LEARNING]	The port is in learning state.
Port protocol	Status of the spanning tree feature on the port.
Port role	Port role: • Alternate. • Backup. • Root. • Designated. • Master. • Disabled.
(Boundary)	The port is a regional boundary port.
Port cost(Legacy)	Path cost of the port. The field in parentheses indicates the standard (legacy, dot1d-1998, or dot1t) used for port path cost calculation. • **Config**—Configured value. • **Active**—Actual value.
Desg.bridge/port	Designated bridge ID and port ID of the port. The port ID displayed is insignificant for a port which does not support port priority.
Port edged	The port is an edge port or non-edge port. • **Config**—Configured value. • **Active**—Actual value.
Point-to-Point	The port is connected to a point-to-point link or not. • **Config**—Configured value. • **Active**—Actual value.
Transmit limit	Maximum number of BPDUs sent by a port within each hello time.
Protection type	Whether spanning tree protection is configured on the port: • **Config**—Configured spanning tree protection feature. • **Active**—Effective spanning tree protection feature. Spanning tree protection features are as follows: • **ROOT**—Root guard. • **LOOP**—Loop guard. • **BPDU**—BPDU guard. • **PVST BPDU**—PVST BPDU guard. If no spanning tree protection feature is configured or spanning tree protection is not

Field	Description
	triggered, this field displays **NONE**.
TC-Restriction	Status of TC transmission restriction on the port.
Role-Restriction	Status of port role restriction on the port.
MST BPDU format	Format of the MST BPDUs that the port can send: • **Config**—Configured value (legacy or 802.1s). • **Active**—Actual value (legacy or 802.1s).
Port Config-Digest-Snooping	Status of Digest Snooping on the port.
Rapid transition	Indicates whether the port rapidly transits to the forwarding state in the MSTI or VLAN.
Num of VLANs mapped	Number of VLANs that are mapped to the MSTI.
Port times	Major parameters for the port: • **Hello**—Hello timer. • **MaxAge**—Maximum age timer. • **FwdDelay**—Forward delay timer. • **MsgAge**—Message age timer. • **RemHops**—Remaining hops.
BPDU sent	Statistics on sent BPDUs.
BPDU received	Statistics on received BPDUs.
RegRoot ID/IRPC	MSTI regional root/internal path cost.
Root Type	MSTI root type: • **Primary root**. • **Secondary root**.
Master bridge	MSTI root bridge ID.
Cost to master	Path cost from the MSTI to the master bridge.
TC received	Number of received TC BPDUs.
Protocol status	Spanning tree protocol status.
Protocol Std.	Spanning tree protocol standard.
Version	Spanning tree protocol version.
Bridge-Prio.	In MSTP mode: Device's priority in the CIST. In PVST mode: Device's priority in VLAN 1.
Max age(s)	Aging timer for BPDUs (in seconds, which is the same as the aging timer for VLAN 1 in PVST mode).
Forward delay(s)	Port state transition delay (in seconds, which is the same as the port state transition delay for VLAN 1 in PVST mode).
Hello time(s)	Interval for the root bridge to send BPDUs (in seconds, which is the same as the interval for VLAN 1 in PVST mode).
Max hops	Maximum hops in the MSTI.
TC Snooping	Status of TC Snooping: **Enabled** or **Disabled**.

Related commands

`reset stp`

display stp abnormal-port

Use **`display stp abnormal-port`** to display history about ports that are blocked by spanning tree protection features.

Syntax

`display stp abnormal-port`

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

In an MSTI or VLAN, this command can display a maximum of three history records for a port that is blocked by spanning tree protection features.

Examples

In MSTP mode, display history about ports that are blocked by spanning tree protection features.

```
---[GigabitEthernet1/0/1]---
    MST ID   BlockReason                    Time
    0        Root-Protected                 14:39:04 04/15/2016
    0        Root-Protected                 14:39:02 04/15/2016
    0        Root-Protected                 14:39:00 04/15/2016
```

In PVST mode, display history about ports that are blocked by spanning tree protection features.

```
---[GigabitEthernet1/0/1]---
    VLAN ID  BlockReason                    Time
    1        Root-Protected                 14:49:17 04/15/2016
    1        Root-Protected                 14:49:15 04/15/2016
    1        Root-Protected                 14:49:12 04/15/2016
```

Table 4 Command output

Field	Description
MST ID	MSTI of a blocked port.
VLAN ID	VLAN of a blocked port.
BlockReason	Reason that the port was blocked: • **Root-Protected**—Root guard feature. • **Loop-Protected**—Loop guard feature. • **Loopback-Protected**—Self-loop protection. A port in the MSTI receives a BPDU sent by itself. • **Disputed**—Dispute guard. A port receives a low-priority BPDU from a non-blocked designated port in forwarding or learning state. • **InconsistentPortType-Protected**—Inconsistent port type protection. • **InconsistentPvid-Protected**—Inconsistent PVID protection.
Time	Protection feature trigger time.

display stp bpdu-statistics

Use **display stp bpdu-statistics** to display the BPDU statistics for ports.

Syntax

display stp bpdu-statistics [**interface** *interface-type interface-number* [**instance** *instance-list*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

Usage guidelines

In MSTP mode, the command output is sorted by port name and by MSTI ID on each port.

- If you do not specify an MSTI or port, this command applies to all MSTIs on all ports.
- If you specify a port but not an MSTI, this command applies to all MSTIs on the port.
- If you specify both an MSTI ID and a port, this command applies to the specified MSTI on the port.

In STP, RSTP, or PVST mode, the command output is sorted by port name.

- If you do not specify a port, this command applies to all ports.
- If you specify a port, this command applies to the port.

Examples

In MSTP mode, display the BPDU statistics for all MSTIs on GigabitEthernet 1/0/1.

```
<Sysname> display stp bpdu-statistics interface gigabitethernet 1/0/1
 Port: GigabitEthernet1/0/1

 Instance-Independent:

 Type                        Count      Last Updated
 --------------------------- ---------- -----------------
 Invalid BPDUs               0
 Looped-back BPDUs           0
 Max-aged BPDUs              0

Table 5 Command output

Field	Description
Port	Port name.
Instance-Independent	Statistics not related to a specific MSTI.

Field	Description
Type	Statistical item.
Looped-back BPDUs	Number of BPDUs sent and then received by the same port.
Max-aged BPDUs	Number of BPDUs whose max age was exceeded.
TCN sent	Number of sent TCN BPDUs.
TCN received	Number of received TCN BPDUs.
TCA sent	Number of sent TCA BPDUs.
TCA received	Number of received TCA BPDUs.
Config sent	Number of sent configuration BPDUs.
Config received	Number of received configuration BPDUs.
RST sent	Number of sent RSTP BPDUs.
RST received	Number of received RSTP BPDUs.
MST sent	Number of sent MSTP BPDUs.
MST received	Number of received MSTP BPDUs.
Instance	Statistics for a specific MSTI.
Timeout BPDUs	Number of expired BPDUs.
Max-hoped BPDUs	Number of BPDUs whose maximum hops were exceeded.
TC detected	Number of detected topology changes.
TC sent	Number of sent TC BPDUs.
TC received	Number of received TC BPDUs.
PVID inconsistency BPDUs	Number of received PVST BPDUs with a PVID inconsistent with the incoming port.

display stp down-port

Use **display stp down-port** to display information about ports that were shut down by spanning tree protection features.

Syntax

display stp down-port

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information about ports that were shut down by spanning tree protection features.

```
<Sysname> display stp down-port
 Down Port                      Reason
 GigabitEthernet1/0/1           BPDU protection
```

Table 6 Command output

Field	Description
Down Port	Name of a port that was shut down by the spanning tree protection features.
Reason	Reason that the port was shut down: • **BPDU protection**—Indicates the BPDU guard feature. • **PVST BPDU protection**—Indicates the PVST BPDU guard feature.

display stp history

Use **display stp history** to display port role calculation history.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **history** [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port role calculation time.

In PVST mode, the command output is sorted by VLAN ID and by port role calculation time in each VLAN.

- If you do not specify a VLAN, this command applies to all VLANs.
- If you specify a VLAN list, this command applies to the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port role calculation time in each MSTI.

- If you do not specify an MSTI, this command applies to all MSTIs.
- If you specify an MSTI list, this command applies to the specified MSTIs.

Examples

In MSTP mode, display the port role calculation history on the specified slot in MSTI 2.

```
<Sysname> display stp instance 2 history slot 1
```

```
 -------------- STP slot 1 history trace --------------
 ------------------  Instance 2   --------------------
Port GigabitEthernet1/0/1
   Role change         : ROOT->DESI (Aged)
   Time                : 2009/02/08 00:22:56

```

Table 7 Command output

Field	Description
Port	Port name.
Role change	Role change of the port (**Aged** means that the change was caused by expiration of the received configuration BPDU).
Time	Time of port role calculation.
Port priority	Current priority of the port: • For STP mode, RSTP mode, and ISTs (MSTI 0) in MSTP mode, port priority includes common root bridge ID, cost of the path to the common root bridge, regional root bridge ID, cost of the path to the regional root bridge, designated bridge ID, designated port ID, and ID of the port that receives messages from the designated port, which are separated with spaces. • For PVST mode and CSTs in MSTP mode, port priority includes regional root bridge ID, cost of the path to the regional root bridge, designated bridge ID, designated port ID, and ID of the port that receives messages from the designated port, which are separated with spaces.
Designated priority	Priority information reported by the current port as a designated port: • For STP mode, RSTP mode, and ISTs (MSTI 0) in MSTP mode, port priority includes common root bridge ID, cost of the path to the common root bridge,

Field	Description
	regional root bridge ID, cost of the path to the regional root bridge, device bridge ID, designated port ID, and current port ID, which are separated with spaces. • For PVST mode and CSTs in MSTP mode, port priority includes regional root bridge ID, cost of the path to the regional root bridge, device bridge ID, designated port ID, and current port ID, which are separated with spaces.

display stp region-configuration

Use **display stp region-configuration** to display effective MST region configuration.

Syntax

display stp region-configuration

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

In MSTP mode, display effective MST region configuration.

```
<Sysname> display stp region-configuration
 Oper Configuration
   Format selector      : 0
   Region name          : hello
   Revision level       : 0
   Configuration digest : 0x5f762d9a46311effb7a488a3267fca9f

   Instance   VLANs Mapped
   0          21 to 4094
   1          1 to 10
   2          11 to 20
```

Table 8 Command output

Field	Description
Format selector	Format selector that is defined by the spanning tree protocol. The default value is 0, and the selector cannot be configured.
Region name	MST region name.
Revision level	Revision level of the MST region. The default value is 0, and the level can be configured by using the **revision-level** command.
VLANs Mapped	VLANs mapped to the MSTI.

Related commands

instance

display stp root

Use **display stp root** to display the root bridge information of spanning trees.

Syntax

display stp root

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

In MSTP mode, display the root bridge information of all spanning trees.

```
<Sysname> display stp root
 MST ID  Root Bridge ID        ExtPathCost IntPathCost Root Port
 0       0.00e0-fc0e-6554      200200      0           GigabitEthernet1/0/1
```

In PVST mode, display the root bridge information of all spanning trees.

```
<Sysname> display stp root
 VLAN ID  Root Bridge ID        ExtPathCost IntPathCost Root Port
 1        0.00e0-fc0e-6554      200200      0           GigabitEthernet1/0/1
```

Table 9 Command output

Field	Description
ExtPathCost	External path cost. The path cost of a port is either automatically calculated by the device or manually configured by using the **stp cost** command.
IntPathCost	Internal path cost. The path cost of a port is either automatically calculated by the device or manually configured by using the **stp cost** command.
Root Port	Root port name (displayed only if a port of the device is the root port of the MSTI).

display stp tc

Use **display stp tc** to display the incoming and outgoing TC/TCN BPDU statistics for ports.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **tc** [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port name.

In PVST mode, the command output is sorted by VLAN ID and by port name in each VLAN.

- If you do not specify a VLAN, this command applies to all VLANs.
- If you specify a VLAN list, this command applies to the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port name in each MSTI.

- If you do not specify an MSTI, this command applies to all MSTIs.
- If you specify an MSTI list, this command applies to the specified MSTIs.

Examples

In MSTP mode, display the incoming and outgoing TC/TCN BPDU statistics for all ports on slot 1 in MSTI 0.

```
<Sysname> display stp instance 0 tc slot 1
 -------------- STP slot 1 TC or TCN count -------------
 MST ID      Port                        Receive      Send
 0           GigabitEthernet1/0/1        6            4
 0           GigabitEthernet1/0/2        0            2
```

In PVST mode, display the incoming and outgoing TC/TCN BPDU statistics for all ports on slot 1 in VLAN 2.

```
<Sysname> display stp vlan 2 tc slot 1
 -------------- STP slot 1 TC or TCN count -------------
 VLAN ID     Port                        Receive      Send
 2           GigabitEthernet1/0/1        6            4
 2           GigabitEthernet1/0/2        0            2
```

Table 10 Command output

Field	Description
Port	Port name.
Receive	Number of TC/TCN BPDUs received on a port.
Send	Number of TC/TCN BPDUs sent by a port.

instance

Use **instance** to map a list of VLANs to an MSTI.

Use **undo instance** to remap the specified VLAN or all VLANs to the CIST (MSTI 0).

Syntax

instance *instance-id* **vlan** *vlan-id-list*

undo instance *instance-id* [**vlan** *vlan-id-list*]

Default

All VLANs are mapped to the CIST.

Views

MST region view

Predefined user roles

network-admin

Parameters

instance-id: Specifies an MSTI ID in the range of 0 to 4094. A value of 0 represents the CIST. The value range for the *instance-id* argument is 1 to 4094 for the **undo instance** command.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

CAUTION:

Use caution with global Digest Snooping in the following situations:

- When you modify the VLAN-to-instance mappings.
- When you restore the default MST region configuration.

If the local device has different VLAN-to-instance mappings than its neighboring devices, loops or traffic interruption will occur.

If you do not specify any VLANs in the **undo instance** command, all VLANs mapped to the specified MSTI are remapped to the CIST.

You cannot map a VLAN to different MSTIs. If you map a VLAN that has been mapped to an MSTI to a new MSTI, the old mapping is automatically deleted.

You can configure VLAN-to-instance mapping for up to 65 MSTIs.

After configuring this command, run the **active region-configuration** command to activate the VLAN-to-instance mapping.

Examples

Map VLAN 2 to MSTI 1.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] instance 1 vlan 2
```

Related commands

active region-configuration

check region-configuration

display stp region-configuration

region-name

Use **region-name** to configure the MST region name.

Use **undo region-name** to restore the default MST region name.

Syntax

region-name *name*

undo region-name

Default

The MST region name of the device is its MAC address.

Views

MST region view

Predefined user roles

network-admin

Parameters

name: Specifies the MST region name, a string of 1 to 32 characters.

Usage guidelines

The MST region name, the VLAN-to-instance mapping table, and the MSTP revision level of a device determine the device's MST region.

After configuring this command, execute the **active region-configuration** command to activate the configured MST region name.

Examples

Set the MST region name of the device to **hello**.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] region-name hello
```

Related commands

active region-configuration

check region-configuration

display stp region-configuration

instance

revision-level

vlan-mapping modulo

reset stp

Use **reset stp** to clear the spanning tree statistics.

Syntax

reset stp [**interface** *interface-list*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-list*: Specifies a space-separated list of up to 10 interface items. Each item specifies an interface or a range of interfaces in the form of *interface-type interface-number 1* [**to** *interface-type interface-number 2*]. The interface number for *interface-number 2* must be equal to or greater than the interface number for *interface-number 1*. If you do not specify this option, this command clears the spanning tree statistics on all ports.

Examples

Clear the spanning tree statistics on ports GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3.

```
<Sysname> reset stp interface gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Related commands

display stp

revision-level

Use **revision-level** to configure the MSTP revision level.

Use **undo revision-level** to restore the default MSTP revision level.

Syntax

revision-level *level*

undo revision-level

Default

The MSTP revision level is 0.

Views

MST region view

Predefined user roles

network-admin

Parameters

level: Specifies an MSTP revision level in the range of 0 to 65535.

Usage guidelines

The MSTP revision level, the MST region name, and the VLAN-to-instance mapping table of a device determine the device's MST region.

After configuring this command, execute the **active region-configuration** command to activate the configured MST region level.

Examples

Set the MSTP revision level of the MST region to 5.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] revision-level 5
```

Related commands

active region-configuration

check region-configuration

display stp region-configuration

instance

region-name

vlan-mapping modulo

snmp-agent trap enable stp

Use **snmp-agent trap enable stp** to enable SNMP notifications for new-root election events or spanning tree topology changes.

Use **undo snmp-agent trap enable stp** to disable SNMP notifications for new-root election events or spanning tree topology changes.

Syntax

snmp-agent trap enable stp [**new-root** | **tc**]

undo snmp-agent trap enable stp [**new-root** | **tc**]

Default

SNMP notifications are disabled for new-root election events.

In MSTP mode, SNMP notifications are enabled in MSTI 0 and disabled in other MSTIs for spanning tree topology changes.

In PVST mode, SNMP notifications are disabled for spanning tree topology changes in all VLANs.

Views

System view

Predefined user roles

network-admin

Parameters

new-root: Enables the device to send notifications if the device is elected as a new root bridge. This keyword applies only to STP, MSTP, and RSTP modes.

tc: Enables the device to send notifications if the device receives TCN BPDUs. This keyword applies only to PVST mode.

Usage guidelines

If no keyword is specified, the **snmp-agent trap enable stp** command applies to SNMP notifications for different events as follows:

- In STP, MSTP, and RSTP modes, the command applies to SNMP notifications for new-root election events.
- In PVST mode, the command applies to SNMP notifications for spanning tree topology changes.

Examples

Enable SNMP notifications for new-root election events.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable stp new-root
```

stp bpdu-protection

Use **stp bpdu-protection** to enable BPDU guard globally.

Use **undo stp bpdu-protection** to disable BPDU guard globally.

Syntax

stp bpdu-protection

undo stp bpdu-protection

Default

BPDU guard is globally disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

With BPDU guard enabled, the device performs the following operations when edge ports receive configuration BPDUs:

- Shuts down these ports.
- Notifies the NMS that these ports have been shut down by the spanning tree protocol.

The device reactivates the ports that have been shut down when the port status detection timer expires. You can set this timer by using the **shutdown-interval** command. For more information about this command, see device management commands in *Fundamentals Command Reference*.

The global BPDU guard setting takes effect on all edge ports configured by using the **stp edged-port** command.

You can configure the BPDU guard feature globally or on a per-port basis. A port preferentially uses the port-specific BPDU guard setting. If the port-specific BPDU guard setting is not available, the port uses the global BPDU guard setting.

Examples

Enable BPDU guard globally.

```
<Sysname> system-view
[Sysname] stp bpdu-protection
```

Related commands

shutdown-interval (*Fundamentals Command Reference*)

stp edged-port

stp port bpdu-protection

stp bridge-diameter

Use **stp bridge-diameter** to set the network diameter. The switched network diameter refers to the maximum number of devices on the path for an edge device to reach another through the root bridge.

Use **undo stp bridge-diameter** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **bridge-diameter** *diameter*

undo stp [**vlan** *vlan-id-list*] **bridge-diameter**

Default

The network diameter of the switched network is 7.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP switched network diameter, do not specify this option.

diameter: Specifies the switched network diameter in the range of 2 to 7.

Usage guidelines

An appropriate setting of hello time, forward delay, and max age can speed up network convergence. The values of these timers are related to the network size, and you can set the timers by setting the network diameter. With the network diameter set to 7 (the default), the three timers are also set to their defaults.

In STP, RSTP, or MSTP mode, each MST region is considered as a device. The configured network diameter of the switched network takes effect only on the CIST (or the common root bridge).

In PVST mode, the configured network diameter takes effect only on the root bridges of the specified VLANs.

Examples

In MSTP mode, set the network diameter of the switched network to 5.

```
<Sysname> system-view
[Sysname] stp bridge-diameter 5
```

In PVST mode, set the network diameter of VLAN 2 in the switched network to 5.

```
<Sysname> system-view
[Sysname] stp vlan 2 bridge-diameter 5
```

Related commands

stp timer forward-delay

stp timer hello

stp timer max-age

stp compliance

Use **stp compliance** to configure the mode a port uses to recognize and send MSTP BPDUs.

Use **undo stp compliance** to restore the default.

Syntax

stp compliance { **auto** | **dot1s** | **legacy** }

undo stp compliance

Default

A port automatically recognizes the formats of received MSTP packets and determines the formats of MSTP packets to be sent based on the recognized formats.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

auto: Configures the port to recognize the MSTP BPDU format automatically and determine the format of MSTP BPDUs to send.

dot1s: Configures the port to receive and send only standard-format (802.1s-compliant) MSTP BPDUs.

legacy: Configures the port to receive and send only compatible-format MSTP BPDUs.

Usage guidelines

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure GigabitEthernet 1/0/1 to send only standard-format (802.1s) MSTP packets.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp compliance dot1s
```

stp config-digest-snooping

Use **stp config-digest-snooping** to enable Digest Snooping.

Use **undo stp config-digest-snooping** to disable Digest Snooping.

Syntax

stp config-digest-snooping

undo stp config-digest-snooping

Default

Digest Snooping is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

For Digest Snooping to take effect, you must enable Digest Snooping both globally and on associated ports. As a best practice, first enable Digest Snooping on ports connected to third-party vendor devices and then enable the feature globally. Digest Snooping takes effect on the ports simultaneously, which reduces impact on the network.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable Digest Snooping on GigabitEthernet 1/0/1 and then globally.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp config-digest-snooping
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] stp global config-digest-snooping
```

Related commands

display stp

stp global config-digest-snooping

stp cost

Use **stp cost** to set the path cost of a port.

Use **undo stp cost** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **cost** *cost-value*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **cost**

Default

The device automatically calculates the path costs of ports in each spanning tree based on the corresponding standard.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for

vlan-id2 must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

cost-value: Specifies the path cost of the port, with an effective range that varies by path cost calculation standard that is used.

- When the IEEE 802.1d-1998 standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 65535.
- When the IEEE 802.1t standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 200000000.
- When the private standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 200000.

Usage guidelines

Path cost is an important factor in spanning tree calculation. Setting different path costs for a port in MSTIs allows VLAN traffic flows to be forwarded along different physical links. This results in VLAN-based load balancing.

The path cost setting of a port can affect the role selection of the port. When the path cost of a port is changed, the system calculates the role of the port and initiates a state transition.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, is takes effect only after the port leaves the aggregation group.

If you do not specify an MSTI or VLAN, this command sets the path cost of a port in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the path cost to 200 for GigabitEthernet 1/0/1 in MSTI 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp instance 2 cost 200
```

In PVST mode, set the path cost to 200 for GigabitEthernet 1/0/1 in VLAN 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp vlan 2 cost 200
```

Related commands

stp pathcost-standard

stp dispute-protection

Use **stp dispute-protection** to enable dispute guard.

Use **undo stp dispute-protection** to disable dispute guard.

Syntax

stp dispute-protection

undo stp dispute-protection

Default

Dispute guard is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Dispute guard blocks a port to prevent loops when a unidirectional link is detected on the port by the spanning tree feature.

In some VLAN networks, an uplink port on a downstream device is configured to deny packets from the PVID. As a result, the downstream device cannot receive BPDUs of the PVID from the upstream device. However, the upstream device can receive BPDUs from the downstream device. In this case, dispute guard blocks the receiving port on the upstream device, which causes traffic interruption.

To ensure service continuity and prevent the link from being blocked, you can disable dispute guard by using the **undo stp dispute-protection** command.

Examples

Disable dispute guard.

```
<Sysname> system-view
[Sysname] undo stp dispute-protection
```

stp edged-port

Use **stp edged-port** to configure a port as an edge port.

Use **undo stp edged-port** to restore the default.

Syntax

stp edged-port

undo stp edged-port

Default

All ports are non-edge ports.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

A port directly connecting to a user terminal rather than another device or a shared LAN segment can be configured as an edge port. In case the network topology changes, an edge port does not cause a temporary loop. You can enable the port to transit to the forwarding state rapidly by configuring it as an edge port. As a best practice, configure ports that directly connect to user terminals as edge ports.

Typically, configuration BPDUs from other devices cannot reach an edge port, because the edge port does not connect to any other device. When BPDU guard is disabled on a port configured as an edge port, the port acts as a non-edge port if it receives configuration BPDUs.

On a port, the loop guard feature and the edge port setting are mutually exclusive.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure GigabitEthernet 1/0/1 as an edge port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp edged-port
```

stp enable

stp mode

stp global mcheck

Use **stp global mcheck** to perform mCheck globally.

Syntax

stp global mcheck

Views

System view

Predefined user roles

network-admin

Usage guidelines

When a port on an MSTP, RSTP, or PVST device connects to an STP device and receives STP BPDUs, the port automatically transits to the STP mode. However, the port cannot automatically transit back to the original mode when the following conditions exist:

- The peer STP device is shut down or removed.
- The port cannot detect the change.

In this case, you can perform an mCheck operation to forcibly transit the port to operate in the original mode.

The device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

The **stp global mcheck** command takes effect only when the device operates in MSTP, RSTP, or PVST mode.

Examples

Perform mCheck globally.

```
<Sysname> system-view
[Sysname] stp global mcheck
```

Related commands

stp mcheck

stp mode

stp ignore-pvid-inconsistency

Use **stp ignore-pvid-inconsistency** to disable inconsistent PVID protection.

Use **undo stp ignore-pvid-inconsistency** to enable inconsistent PVID protection.

Syntax

stp ignore-pvid-inconsistency

undo stp ignore-pvid-inconsistency

Default

Inconsistent PVID protection is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only when the device is operating in PVST mode.

Disabling inconsistent PVID protection might cause spanning tree calculation errors. To avoid such errors, make sure the following requirements are met:

- Make sure the VLANs on one device do not use the same ID as the PVID of its peer port (except the default VLAN) on another device.
- If the local port or its peer is a hybrid port, do not configure the local and peer ports as untagged members of the same VLAN.
- Disable inconsistent PVID protection on both the local device and the peer device.

Examples

In PVST mode, disable the inconsistent PVID protection feature.

```
<Sysname> system-view
[Sysname] stp mode pvst
[Sysname] stp ignore-pvid-inconsistency
```

stp log enable tc

Use **stp log enable tc** to enable the device to log events of detecting or receiving TC BPDUs.

Use **undo stp log enable tc** to restore the default.

Syntax

stp log enable tc

undo stp log enable tc

Default

In PVST mode, the device does not generate logs when it detects or receives TC BPDUs.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command applies only to PVST mode.

Examples

In PVST mode, enable the device to log events of detecting or receiving TC BPDUs.

```
<Sysname> system-view
[Sysname] stp log enable tc
```

stp loop-protection

Use **stp loop-protection** to enable loop guard on a port.

Use **undo stp loop-protection** to disable loop guard on a port.

Syntax

stp loop-protection

undo stp loop-protection

Default

Loop guard is disabled.

Views

Usage guidelines

When a port on an MSTP, RSTP, or PVST device connects to an STP device and receives STP BPDUs, the port automatically transits to the STP mode. However, the port cannot automatically transit back to the original mode when the following conditions exist:

- The peer STP device is shut down or removed.
- The port cannot detect the change.

In this case, you can perform an mCheck operation to forcibly transit the port to operation in the original mode.

For example, Device A, Device B, and Device C are connected in sequence. Device A runs STP, Device B does not run any spanning tree protocol, and Device C runs RSTP, MSTP, or PVST. When Device C receives an STP BPDU transparently transmitted by Device B, the receiving port transits to the STP mode. If you configure Device B to run RSTP, MSTP, or PVST with Device C, perform mCheck operations on the ports that connect Device B and Device C.

The device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

The **stp mcheck** command takes effect only when the device operates in MSTP, RSTP, or PVST mode.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Perform mCheck on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp mcheck
```

stp mode

Use **stp mode** to configure the spanning tree operating mode.

Use **undo stp mode** to restore the default.

Syntax

stp mode { **mstp** | **pvst** | **rstp** | **stp** }

undo stp mode

Default

A spanning tree device operates in MSTP mode.

Views

System view

Predefined user roles

network-admin

Parameters

mstp: Configures the spanning tree device to operate in MSTP mode.

pvst: Configures the spanning tree device to operate in PVST mode.

rstp: Configures the spanning tree device to operate in RSTP mode.

stp: Configures the spanning tree device to operate in STP mode.

Usage guidelines

The MSTP mode is compatible with the RSTP mode, and the RSTP mode is compatible with the STP mode.

The PVST mode's compatibility with other modes is as follows:

- **Access port**—The PVST mode is compatible with other modes in any VLAN.
- **Trunk or hybrid port**—The PVST mode is compatible with other modes only in the default VLAN.

Examples

Configure the spanning tree device to operate in STP mode.

```
<Sysname> system-view
[Sysname] stp mode stp
```

```

stp pathcost-standard

Use **stp pathcost-standard** to specify a standard for the device to use when calculating the default path costs for ports.

Use **undo stp pathcost-standard** to restore the default.

Syntax

stp pathcost-standard { **dot1d-1998** | **dot1t** | **legacy** }

undo stp pathcost-standard

Default

The default standard used by the device is **legacy**.

Views

System view

Predefined user roles

network-admin

Parameters

dot1d-1998: Configures the device to calculate the default path cost for ports based on IEEE 802.1d-1998.

dot1t: Configures the device to calculate the default path cost for ports based on IEEE 802.1t.

legacy: Configures the device to calculate the default path cost for ports based on a private standard.

Usage guidelines

If you change the standard that the device uses in calculating the default path costs, you restore the path costs to the default.

Examples

Configure the device to calculate the default path cost for ports based on IEEE 802.1d-1998.

```
<Sysname> system-view
[Sysname] stp pathcost-standard dot1d-1998
```

Related commands

display stp

stp cost

stp point-to-point

Use **stp point-to-point** to configure the link type of a port.

Use **undo stp point-to-point** to restore the default.

Syntax

stp point-to-point { **auto** | **force-false** | **force-true** }

undo stp point-to-point

Default

The default setting is **auto,** and the spanning tree device automatically detects whether a port connects to a point-to-point link.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

auto: Specifies automatic detection of the link type.

force-false: Specifies the non-point-to-point link type.

force-true: Specifies the point-to-point link type.

Usage guidelines

When connecting to a non-point-to-point link, a port is incapable of rapid state transition.

You can configure the link type as point-to-point for a Layer 2 aggregate interface or a port that operates in full duplex mode. As a best practice, use the default setting to let the device automatically detect the port link type.

In MSTP or PVST mode, the **stp point-to-point force-false** or **stp point-to-point force-true** command configured on a port takes effect on all MSTIs or VLANs.

Before you set the link type of a port to point-to-point, make sure the port is connected to a point-to-point link. Otherwise, a temporary loop might occur.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure the link type of GigabitEthernet 1/0/1 as point-to-point.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp point-to-point force-true
```

Related commands

display stp

stp port bpdu-protection

Use **stp port bpdu-protection** to configure BPDU guard on an interface.

Use **undo stp port bpdu-protection** to restore the default.

Syntax

stp port bpdu-protection { **enable** | **disable** }

undo stp port bpdu-protection

Default

BPDU guard is not configured on a per-edge port basis. The status of BPDU guard on an interface is the same as the global BPDU guard status.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

enable: Enables BPDU guard.

disable: Disables BPDU guard.

Usage guidelines

With BPDU guard enabled, the device performs the following operations when an edge port receives configuration BPDUs:

- Shuts down the port.
- Notifies the NMS that the port has been shut down by the spanning tree protocol.

The device reactivates the port that has been shut down when the port status detection timer expires. You can set this timer by using the **shutdown-interval** command. For more information about this command, see device management commands in *Fundamentals Command Reference*.

You can configure the BPDU guard feature globally or on a per-port basis. A port preferentially uses the port-specific BPDU guard setting. If the port-specific BPDU guard setting is not available, the port uses the global BPDU guard setting.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable BPDU guard on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp port bpdu-protection enable
```

Related commands

shutdown-interval (*Fundamentals Command Reference*)

stp bpdu-protection

stp port priority

Use **stp port priority** to set the priority of a port. The port priority affects the role of a port in a spanning tree.

Use **undo stp port priority** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **port priority** *priority*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **port priority**

Default

The port priority is 128.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

priority: Specifies the port priority in the range of 0 to 240 in increments of 16 (as in 0, 16, 32).

Usage guidelines

The smaller the value, the higher the port priority. If all ports on your device use the same priority value, the port priority depends on the port index. The smaller the index, the higher the priority.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

If you do not specify an MSTI or VLAN, this command configures the priority of the ports in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the port priority of GigabitEthernet 1/0/1 to 16 in MSTI 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp instance 2 port priority 16
```

In PVST mode, set the port priority of GigabitEthernet 1/0/1 to 16 in VLAN 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp vlan 2 port priority 16
```

Related commands

stp port shutdown permanent

Use **stp port shutdown permanent** to disable the device from reactivating edge ports shut down by BPDU guard.

Use **undo stp port shutdown permanent** to restore the default.

Syntax

stp port shutdown permanent

undo stp port shutdown permanent

Default

The device reactivates an edge port shut down by BPDU guard after the port status detection timer expires.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only on edge ports shut down by BPDU guard after this command is configured. The device does not bring up the shutdown ports if you execute the **undo stp port shutdown permanent** command. To bring up these ports, you must use the **undo shutdown** command.

For more information about the port status detection timer, see device management configuration in *Fundamentals Configuration Guide*.

Examples

Disable the device from reactivating edge ports shut down by BPDU guard.

```
<Sysname> system-view
[Sysname] stp port shutdown permanent
```

stp port-log

Use **stp port-log** to enable outputting port state transition information.

Use **undo stp port-log** to disable outputting port state transition information.

Syntax

stp port-log { **all** | **instance** *instance-list* | **vlan** *vlan-id-list* }

undo stp port-log { **all** | **instance** *instance-list* | **vlan** *vlan-id-list* }

Default

The default differs depending on the software version, as shown below:

Hardware platform	Versions	Default setting
S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, WAS6000	All versions	Outputting port state transition information is disabled.
Other switch series	Versions earlier than Release 6350	Outputting port state transition information is disabled.
	Release 6350 and later	• If the device starts up with the initial configuration, outputting port state transition information is disabled. • If the device starts up with the factory defaults, outputting port state transition information is enabled.

For more information about initial configuration and factory defaults, see configuration file management in *Fundamentals Configuration Guide*.

Views

System view

Predefined user roles

Parameters

all: Specifies all MSTIs or VLANs.

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Examples

In MSTP mode, enable outputting port state transition information for MSTI 2.

```
<Sysname> system-view
[Sysname] stp port-log instance 2
%Aug 16 00:49:41:856 2011 Sysname STP/3/STP_DISCARDING: Instance 2's port
GigabitEthernet1/0/1 has been set to discarding state.
%Aug 16 00:49:41:856 2011 Sysname STP/3/STP_FORWARDING: Instance 2's port
GigabitEthernet1/0/2 has been set to forwarding state.
```

The output shows that GigabitEthernet 1/0/1 in MSTI 2 transited to the discarding state and GigabitEthernet 1/0/2 in MSTI 2 transited to the forwarding state.

In PVST mode, enable outputting port state transition information for VLAN 1 through VLAN 4094.

```
<Sysname> system-view
[Sysname] stp port-log vlan 1 to 4094
%Aug 16 00:49:41:856 2006 Sysname STP/3/STP_DISCARDING: VLAN 2's GigabitEthernet1/0/1 has been set to discarding state.
%Aug 16 00:49:41:856 2006 Sysname STP/3/STP_FORWARDING: VLAN 2's GigabitEthernet1/0/2 has been set to forwarding state.
```

The output shows that GigabitEthernet 1/0/1 in VLAN 2 transited to the discarding state and GigabitEthernet 1/0/2 in VLAN 2 transited to the forwarding state.

stp priority

Use **stp priority** to set the priority of the device.

Use **undo stp priority** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **priority** *priority*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **priority**

Default

The device priority is 32768.

Views

System view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

priority: Specifies the device priority in the range of 0 to 61440 in increments of 4096 (as in 0, 4096, 8192). You can set up to 16 priority values on the device. The smaller the value, the higher the device priority.

Usage guidelines

If you do not specify an MSTI or VLAN, this command configures the priority of the device in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the device priority to 4096 in MSTI 1.

```
<Sysname> system-view
[Sysname] stp instance 1 priority 4096
```

In PVST mode, set the device priority to 4096 in VLAN 1.

```
<Sysname> system-view
```

```
[Sysname] stp vlan 1 priority 4096
```

stp pvst-bpdu-protection

Use **stp pvst-bpdu-protection** to enable PVST BPDU guard.

Use **undo stp pvst-bpdu-protection** to disable PVST BPDU guard.

Syntax

stp pvst-bpdu-protection

undo stp pvst-bpdu-protection

Default

PVST BPDU guard is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

PVST BPDU guard enables an MSTP-enabled device to shut down a port if the port receives PVST BPDUs. The shutdown port is brought up after a detection timer expires. To set the detection timer, use the **shutdown-interval** command.

Examples

In MSTP mode, enable PVST BPDU guard.

```
<Sysname> system-view
[Sysname] stp pvst-bpdu-protection
```

Related commands

shutdown-interval (For more information, see *Fundamentals Command Reference*.)

stp region-configuration

Use **stp region-configuration** to enter MST region view.

Use **undo stp region-configuration** to restore the default MST region configurations.

Syntax

stp region-configuration

undo stp region-configuration

Default

The default settings for an MST region are as follows:

- The MST region name of the device is its MAC address.
- All VLANs are mapped to the CIST.
- The MSTP revision level is 0.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After you enter MST region view, you can configure MST region parameters, including the region name, VLAN-to-instance mappings, and revision level.

Examples

Enter MST region view.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region]
```

stp role-restriction

Use **stp role-restriction** to enable port role restriction.

Use **undo stp role-restriction** to disable port role restriction.

Syntax

stp role-restriction

undo stp role-restriction

Default

Port role restriction is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

When port role restriction is enabled on a port, the port cannot become a root port.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable port role restriction on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp role-restriction
```

stp root primary

Use **stp root primary** to configure the device as the root bridge.

Use **undo stp root** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root primary**

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root**

Default

The device is not a root bridge.

Views

System view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Once you specify the device as the root bridge, you cannot change the priority of the device.

If you do not specify an MSTI or VLAN, this command configures the device as the root bridge of the MSTP CIST or of the STP or RSTP spanning tree.

Examples

In MSTP mode, specify the device as the root bridge of MSTI 1.

```
<Sysname> system-view
[Sysname] stp instance 1 root primary
```

In PVST mode, specify the device as the root bridge of VLAN 1.

```
<Sysname> system-view
[Sysname] stp vlan 1 root primary
```

Related commands

stp priority

stp root secondary

stp root secondary

Use **stp root secondary** to configure the device as a secondary root bridge.

Use **undo stp root** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root secondary**

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root**

Default

The device is not a secondary root bridge.

Views

System view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Once you specify the device as a secondary root bridge, you cannot change the priority of the device.

If you do not specify an MSTI or VLAN, this command configures a secondary root bridge for the MSTP CIST or the STP or RSTP spanning tree.

Examples

In MSTP mode, specify the device as a secondary root bridge in MSTI 1.

```
<Sysname> system-view
[Sysname] stp instance 1 root secondary
```

In PVST mode, specify the device as a secondary root bridge in VLAN 1.

```
<Sysname> system-view
[Sysname] stp vlan 1 root secondary
```

Related commands

stp priority

stp root primary

stp root-protection

Use **stp root-protection** to enable root guard on a port.

Use **undo stp root-protection** to disable root guard on a port.

Syntax

stp root-protection

undo stp root-protection

Default

Root guard is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

On a port, the loop guard feature and the root guard feature are mutually exclusive.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable root guard on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp root-protection
```

Related commands

stp edged-port

stp tc-protection

Use **stp tc-protection** to enable TC-BPDU attack guard for the device.

Use **undo stp tc-protection** to disable TC-BPDU attack guard for the device.

Syntax

stp tc-protection

undo stp tc-protection

Default

TC-BPDU attack guard is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

With TC-BPDU guard, you can set the maximum number of immediate forwarding address entry flushes that the device can perform every 10 seconds. For TC-BPDUs received that exceed the limit, the device performs a forwarding address entry flush when the interval elapses. This prevents frequent flushing of forwarding address entries.

Examples

Disable TC-BPDU attack guard for the device.

```
<Sysname> system-view
[Sysname] undo stp tc-protection
```

Related commands

stp tc-protection threshold

stp tc-protection threshold

Use **stp tc-protection threshold** to set the maximum number of forwarding address entry flushes that the device can perform every 10 seconds.

Use **undo stp tc-protection threshold** to restore the default.

Syntax

stp tc-protection threshold *number*

undo stp tc-protection threshold

Default

By default, the device can perform a maximum of 6 forwarding address entry flushes every 10 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of immediate forwarding address entry flushes that the device can perform every 10 seconds. The value is in the range of 1 to 255.

Examples

Configure the device to perform up to 10 forwarding address entry flushes every 10 seconds.

```
<Sysname> system-view
[Sysname] stp tc-protection threshold 10
```

Related commands

stp tc-protection

stp tc-restriction

Use **stp tc-restriction** to enable TC-BPDU transmission restriction.

Use **undo stp tc-restriction** to disable TC-BPDU transmission restriction.

Syntax

stp tc-restriction

undo stp tc-restriction

Default

TC-BPDU transmission restriction is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

When TC-BPDU transmission restriction is enabled on a port, the port does not send TC-BPDUs to other ports. It also does not delete MAC address entries.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable TC-BPDU transmission restriction on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp tc-restriction
```

stp tc-snooping

Use **stp tc-snooping** to enable TC Snooping.

Use **undo stp tc-snooping** to disable TC Snooping.

Syntax

stp tc-snooping

undo stp tc-snooping

Default

TC Snooping is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

TC Snooping and the spanning tree feature are mutually exclusive. You must globally disable the spanning tree feature before enabling TC Snooping.

Examples

Globally disable the spanning tree feature and enable TC Snooping.

```
<Sysname> system-view
[Sysname] undo stp global enable
[Sysname] stp tc-snooping
```

stp global enable

stp timer forward-delay

Use **stp timer forward-delay** to set the forward delay timer.

Use **undo stp timer forward-delay** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **timer forward-delay** *time*

undo stp [**vlan** *vlan-id-list*] **timer forward-delay**

Default

The forward delay timer is 1500 centiseconds.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP forward delay, do not specify this option.

time: Specifies the forward delay in centiseconds, in the range of 400 to 3000 in increments of 100 (as in 400, 500, 600).

Usage guidelines

The forward delay timer determines the time interval of state transition. To prevent temporary loops, a spanning tree port goes through the learning (intermediate) state before it transits from the discarding state to the forwarding state. To stay synchronized with the remote device, the port has a wait period that is determined by the forward delay timer between transition states.

As a best practice, do not set the forward delay with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the forward delay timer. If the network diameter uses the default value, the forward delay timer also uses the default value.

Examples

In MSTP mode, set the forward delay timer to 2000 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer forward-delay 2000
```

In PVST mode, set the forward delay timer for VLAN 2 to 2000 centiseconds.

```
<Sysname> system-view
[Sysname] stp vlan 2 timer forward-delay 2000
```

undo stp [**vlan** *vlan-id-list*] **timer hello**

Default

The hello time is 200 centiseconds.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP hello time, do not specify this option.

time: Specifies the hello time in centiseconds, in the range of 100 to 1000 in increments of 100 (as in 100, 200, 300).

Usage guidelines

Hello time is the interval at which spanning tree devices send configuration BPDUs to maintain the spanning tree. If a device fails to receive configuration BPDUs within the set period of time, a new spanning tree calculation process is triggered.

As a best practice, do not set the hello time with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the hello timer. If the network diameter uses the default value, the hello timer also uses the default value.

Examples

In MSTP mode, set the hello time to 400 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer hello 400
```

In PVST mode, set the hello time for VLAN 2 to 400 centiseconds.

```
<Sysname> system-view
[Sysname] stp vlan 2 timer hello 400
```

stp timer max-age

Use **stp timer max-age** to set the max age timer.

Use **undo stp timer max-age** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **timer max-age** *time*

undo stp [**vlan** *vlan-id-list*] **timer max-age**

Default

The max age is 2000 centiseconds.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP max age, do not specify this option.

time: Specifies the max age in centiseconds, in the range of 600 to 4000 in increments of 100 (as in 600, 700, 800).

Usage guidelines

In the CIST of an MSTP network, the device determines whether a configuration BPDU received on a port has expired based on the max age timer. If the configuration BPDU has expired, a new spanning tree calculation process starts. The max age timer takes effect only on the CIST (or MSTI 0).

As a best practice, do not set the max age timer with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the max age timer. If the network diameter uses the default value, the max age timer also uses the default value.

Examples

In MSTP mode, set the max age timer to 1000 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer max-age 1000
```

In PVST mode, set the max age timer for VLAN 2 to 1000 centiseconds.

```
<Sysname> system-view
[Sysname] stp vlan 2 timer max-age 1000
```

Related commands

stp bridge-diameter

stp timer forward-delay

stp timer hello

stp timer-factor

Use **stp timer-factor** to configure the timeout period by setting the timeout factor.

Timeout period = timeout factor × 3 × hello time.

Use **undo stp timer-factor** to restore the default.

Syntax

stp timer-factor *factor*

undo stp timer-factor

Default

The timeout factor of the device is set to 3.

Views

System view

Predefined user roles

network-admin

Parameters

factor: Specifies the timeout factor in the range of 1 to 20.

Usage guidelines

In a stable network, each non-root-bridge forwards configuration BPDUs to surrounding devices at the interval of hello time to determine whether any link fails. If a device does not receive a BPDU from the upstream device within nine times of the hello time, it assumes that the upstream device has failed. Then it will start a new spanning tree calculation process.

As a best practice, set the timeout factor to 5, 6, or 7 in the following situations:

- To prevent undesired spanning tree calculations. An upstream device might be too busy to forward configuration BPDUs in time, for example, many Layer 2 interfaces are configured on the upstream device. In this case, the downstream device fails to receive a BPDU within the timeout period and then starts an undesired spanning tree calculation.
- To save network resources on a stable network.

Examples

Set the timeout factor of the device to 7.

```
<Sysname> system-view
[Sysname] stp timer-factor 7
```

Related commands

stp timer hello

stp transmit-limit

Use **stp transmit-limit** to set the BPDU transmission rate of a port.

Use **undo stp transmit-limit** to restore the default.

Syntax

stp transmit-limit *limit*

undo stp transmit-limit

Default

The BPDU transmission rate of all ports is 10.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

limit: Specifies the BPDU transmission rate in the range of 1 to 255.

Usage guidelines

The maximum number of BPDUs a port can send within each hello time equals the BPDU transmission rate plus the hello timer value.

A larger BPDU transmission rate value requires more system resources. An appropriate BPDU transmission rate setting can prevent spanning tree protocols from using excessive bandwidth resources during network topology changes. As a best practice, use the default value.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Set the BPDU transmission rate of GigabitEthernet 1/0/1 to 5.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp transmit-limit 5
```

stp vlan enable

Use **stp vlan enable** to enable the spanning tree feature for VLANs.

Use **undo stp enable** to disable the spanning tree feature for VLANs.

Syntax

stp vlan *vlan-id-list* **enable**

undo stp vlan *vlan-id-list* **enable**

Default

The spanning tree feature is enabled in VLANs.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

When you enable the spanning tree feature, the device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

When you enable the spanning tree feature, the device dynamically maintains the spanning tree status of VLANs, based on received configuration BPDUs. When you disable the spanning tree feature, the device stops maintaining the spanning tree status.

Examples

In PVST mode, globally enable the spanning tree feature and then enable the spanning tree feature for VLAN 2.

```
<Sysname> system-view
[Sysname] stp mode pvst
[Sysname] stp global enable
[Sysname] stp vlan 2 enable
```

Related commands

stp enable

stp global enable

stp mode

vlan-mapping modulo

Use **vlan-mapping modulo** to map VLANs in an MST region to MSTIs according to the specified modulo value and quickly create a VLAN-to-instance mapping table.

Syntax

vlan-mapping modulo *modulo*

Default

All VLANs are mapped to the CIST (MSTI 0).

Views

MST region view

Predefined user roles

network-admin

Parameters

modulo: Specifies the modulo value. The value range for this argument is 1 to 64.

Usage guidelines

You cannot map a VLAN to different MSTIs. If you map a VLAN that has been mapped to an MSTI to a new MSTI, the old mapping is automatically deleted.

This command maps each VLAN to the MSTI with ID (VLAN ID – 1) % *modulo* + 1. (VLAN ID – 1) % *modulo* is the modulo operation for (VLAN ID – 1). If the modulo value is 15, then VLAN 1 is mapped to MSTI 1, VLAN 2 to MSTI 2, …, VLAN 15 to MSTI 15, VLAN 16 to MSTI 16, and so on.

Examples

Map VLANs to MSTIs as per modulo 8.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] vlan-mapping modulo 8
```

display loopback-detection

Use **display loopback-detection** to display the loop detection configuration and status.

Syntax

display loopback-detection

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

In the command output, a port shut down by loop detection stays in looped state until it comes up.

Example

Display the loop detection configuration and status.

```
<Sysname> display loopback-detection
Loop detection is enabled.
Loop detection interval is 30 second(s).
Loop is detected on following interfaces:
 Interface                     Action mode     VLANs
 GigabitEthernet1/0/3          None            10
```

Table 1 Command output

Field	Description

Action mode	Loop protection action:
	• **Block**—When a loop is detected on a port, the device performs the following operations:
	  ○ Generates a log.
	  ○ Disables the port from learning MAC addresses.
	  ○ Blocks the port.
	• **None**—When a loop is detected on a port, the device generates a log but performs no action on the port.
	• **No-learning**—When a loop is detected on a port, the device generates a log and disables the port from learning MAC addresses.
	• **Shutdown**—When a loop is detected on a port, the device performs the following operations:
	  ○ Generates a log.
	  ○ Shuts down the port to disable the port from receiving or sending frames. The device automatically sets the port to the forwarding state after a time interval. Set the time interval by using the **shutdown-interval** command (see *Fundamentals Command Reference*).

VLANs	VLANs to which the interface belongs and where loops are detected.

loopback-detection action

Use **loopback-detection action** to set the loop protection action on a per-port basis.

Use **undo loopback-detection action** to restore the default.

Syntax

In Layer 2 Ethernet interface view:

loopback-detection action { **block** | **no-learning** | **shutdown** }

undo loopback-detection action

In Layer 2 aggregate interface view:

loopback-detection action shutdown

undo loopback-detection action

Default

When the device detects a loop on a port, it generates a log but performs no action on the port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

block: Enables the block mode. If a loop is detected, the device performs the following operations:

- Generates a log.
- Disables MAC address learning.
- Blocks the port.

Layer 2 aggregate interfaces do not support this keyword.

no-learning: Enables the no-learning mode. If a loop is detected, the device generates a log and disables MAC address learning on the port. Layer 2 aggregate interfaces do not support this keyword.

shutdown: Enables the shutdown mode. If a loop is detected, the device generates a log and shuts down the port. The device automatically sets the port to the forwarding state after the time interval set by using the **shutdown-interval** command (see *Fundamentals Command Reference*).

Usage guidelines

To set the loop protection action globally, use the **loopback-detection global action** command.

The global action applies to all ports. The per-port action applies to the individual ports. The per-port action takes precedence over the global action.

Example

Set the loop protection action to **shutdown** on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[System-GigabitEthernet1/0/1] loopback-detection action shutdown
```

Related commands

display loopback-detection

loopback-detection global action

loopback-detection enable

Use **loopback-detection enable** to enable loop detection on a per-port basis.

Use **undo loopback-detection enable** to disable loop detection on a port.

Syntax

loopback-detection enable vlan { *vlan-id-list* | **all** }

undo loopback-detection enable vlan { *vlan-id-list* | **all** }

Default

Loop detection is disabled on ports.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* to *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The ID for *vlan-id2* must be no less than the ID for *vlan-id1*.

all: Specifies all existing VLANs.

Usage guidelines

You can enable loop detection globally or on a per-port basis. When a port receives a detection frame in any VLAN, the loop protection action is triggered on that port, regardless of whether loop detection is enabled on it.

Example

Enable loop detection on GigabitEthernet 1/0/1 for VLAN 10 through VLAN 20.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[System-GigabitEthernet1/0/1] loopback-detection enable vlan 10 to 20
```

Related commands

display loopback-detection

loopback-detection global enable

loopback-detection global action

Use **loopback-detection global action** to set the global loop protection action.

Use **undo loopback-detection global action** to restore the default.

Syntax

loopback-detection global action shutdown

undo loopback-detection global action

Default

When the device detects a loop on a port, it generates a log but performs no action on the port.

Views

System view

Predefined user roles

network-admin

Parameters

shutdown: Enables the shutdown mode. If a loop is detected, the device generates a log and shuts down the port. The device automatically sets the port to the forwarding state after you set the time interval by using the **shutdown-interval** command (see *Fundamentals Command Reference*).

Usage guidelines

To set the loop protection action on a per-port basis, use the **loopback-detection action** command in interface view.

The global action applies to all ports. The per-port action applies to the individual ports. The per-port action takes precedence over the global action.

Example

Set the global loop protection action to **shutdown**.

```
<Sysname> system-view
[System] loopback-detection global action shutdown
```

Related commands

display loopback-detection

loopback-detection action

loopback-detection global enable

Use **loopback-detection global enable** to enable loop detection globally.

Use **undo loopback-detection global enable** to disable loop detection globally.

Syntax

loopback-detection global enable vlan { *vlan-id-list* | **all** }

undo loopback-detection global enable vlan { *vlan-id-list* | **all** }

Default

Loop detection is globally disabled.

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* to *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The ID for *vlan-id2* must be equal to or greater than the ID for *vlan-id1*.

all: Specifies all existing VLANs.

Usage guidelines

You can enable loop detection globally or on a per-port basis. When a port receives a detection frame in any VLAN, the loop protection action is triggered on that port, regardless of whether loop detection is enabled on it.

Example

Globally enable loop detection for VLAN 10 through VLAN 20.

```
<Sysname> system-view
[System] loopback-detection global enable vlan 10 to 20
```

Related commands

display loopback-detection

loopback-detection enable

loopback-detection interval-time

Use **loopback-detection interval-time** to set the loop detection interval.

Use **undo loopback-detection interval-time** to restore the default.

Syntax

loopback-detection interval-time *interval*

undo loopback-detection interval-time

Default

The loop detection interval is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the loop detection interval in the range of 1 to 300 seconds.

Usage guidelines

With loop detection enabled, the device sends loop detection frames at the specified interval. A shorter interval offers more sensitive detection but consumes more resources. Consider the system performance and loop detection speed when you set the loop detection interval.

Example

Set the loop detection interval to 10 seconds.

```
<Sysname> system-view
[Sysname] loopback-detection interval-time 10
```

Related commands

display loopback-detection

loopback-detection led-flashing enable

Use **loopback-detection led-flashing enable** to enable LED flashing for loop detection.

Use **loopback-detection led-flashing enable** to disable LED flashing for loop detection.

NOTE:

This command is supported only by the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6100 switch series.

This command is supported only in Release 6328 and later.

Syntax

loopback-detection led-flashing enable

undo loopback-detection led-flashing enable

Default

LED flashing is disabled for loop detection.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to flash port LEDs in Link/Active mode for loops when loop detection is enabled globally or on a per-port basis. When a loop is detected, port LEDs flash as follows:

- The LED for a looped port turns to steady green.
- The LEDs for unlooped ports turn to flashing green.

The device flashes port LEDs for a loop only when LED flashing is enabled on all ports that form the loop on the device. As a best practice, enable LED flashing for loop detection on all physically up Layer 2 interfaces.

Example

Enable LED flashing for loop detection on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface GigabitEthernet 1/0/1
[Sysname-GigabitEthernet1/0/1] loopback-detection led-flashing enable
```

Contents

VLAN commands

Basic VLAN commands

bandwidth

Use **bandwidth** to set the expected bandwidth of an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth (in kbps) is the interface baud rate divided by 1000.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth to 10000 kbps for VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] bandwidth 10000
```

default

Use **default** to restore the default settings for a VLAN interface.

Syntax

default

Views

VLAN interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command when you use it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies or system restrictions. Use the **display this** command in interface view to identify these commands, and then use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] default
```

description

Use **description** to configure the description of a VLAN or VLAN interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

For a VLAN, the description is **VLAN** *vlan-id*. The *vlan-id* argument specifies the VLAN ID in a four-digit format. If the VLAN ID has fewer than four digits, leading zeros are added. For example, the default description of VLAN 100 is **VLAN 0100**.

For a VLAN interface, the description is the name of the interface. For example, **Vlan-interface1 Interface**.

Views

VLAN view

VLAN interface view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Usage guidelines

To manage VLANs and VLAN interfaces efficiently, configure descriptions for them based on their functions or connections.

Examples

Configure the description of VLAN 2 as **sales-private**.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] description sales-private
```

Configure the description of VLAN-interface 2 as **linktoPC56**.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] quit
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] description linktoPC56
```

Related commands

display interface vlan-interface

display vlan

display interface vlan-interface

Use **display interface vlan-interface** to display VLAN interface information.

Syntax

display interface [**vlan-interface** [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-interface *interface-number*: Specifies a VLAN interface number. If you do not specify the **vlan-interface** keyword, the command displays information about all interfaces supported by the device. If you specify the **vlan-interface** keyword without specifying an interface number, the command displays information about all existing VLAN interfaces.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays VLAN interfaces in down state and their down causes. If you do not specify this keyword, the command displays information about VLAN interfaces in all states.

Examples

Display information about VLAN-interface 10.

```
<Sysname> display interface vlan-interface 10
Vlan-interface10
Current state: UP
Line protocol state: UP
Description: Vlan-interface10 Interface
Bandwidth: 100000 kbps
Maximum transmission unit: 1500
Internet Address is 192.168.1.54/24 Primary
IP packet frame type: Ethernet II, hardware address: 0023-89b6-d613
IPv6 packet frame type: Ethernet II, hardware address: 0023-89b6-d613
Last clearing of counters: Never
```

Display brief information about VLAN-interface 2.

```
<Sysname> display interface vlan-interface 2 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
Vlan2                DOWN DOWN     --
```

Table 1 Command output

Field	Description
Vlan-interface2	VLAN interface name.
Current state	Physical link state of the VLAN interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down. The VLAN of this VLAN interface does not contain any physical ports in up state. The ports might not be connected correctly or the links might have failed. • **UP**—The interface is both administratively and physically up.
Line protocol state	Data link layer state of the VLAN interface: • **DOWN**—The link layer protocol state of the interface is down. • **UP**—The link layer protocol state of the interface is up.
Description	Description of the VLAN interface.
Bandwidth	Expected bandwidth of the VLAN interface.
Maximum transmission unit	MTU of the VLAN interface.
Internet protocol processing : Disabled	The VLAN interface is not assigned an IP address and cannot process IP packets.
Internet Address	IP address of the VLAN interface. The **primary** attribute indicates that the address is the primary IP address.
IP packet frame type	IPv4 packet framing format.
hardware address	MAC address of the VLAN interface.
IPv6 packet frame type	IPv6 packet framing format.
Last clearing of counters	The most recent time that the **reset counters interface vlan-interface** command was executed. This field displays **Never** if you have never executed this command.
Brief information on interfaces in route mode	Brief information about Layer 3 interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.

Field	Description
	To see the primary interface, use the **display interface-backup state** command.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol state of the interface is up. • **DOWN**—The data link layer protocol state of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag.
Primary IP	Primary IP address of the interface.

Related commands

reset counters interface vlan-interface

display vlan

Use **display vlan** to display VLAN information.

Syntax

display vlan [*vlan-id1* [**to** *vlan-id2*] | **all** | **dynamic** | **reserved** | **static**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-id1: Specifies a VLAN by its ID in the range of 1 to 4094.

vlan-id1 **to** *vlan-id2*: Specifies a VLAN ID range. Both the *vlan-id1* and the *vlan-id2* arguments are in the range of 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all VLANs except the reserved VLANs.

dynamic: Specifies dynamic VLANs. If you specify this keyword, the command displays the total number of dynamic VLANs and each dynamic VLAN ID. Dynamic VLANs are generated through MVRP or assigned by a RADIUS server.

reserved: Specifies reserved VLANs. Protocol modules determine which VLANs are reserved according to function implementation. The reserved VLANs provide services for protocol modules. You cannot configure reserved VLANs.

static: Specifies static VLANs. If you specify this keyword, the command displays the total number of static VLANs and each static VLAN ID. Static VLANs are manually created.

Examples

Display information about VLAN 2.

```
<Sysname> display vlan 2
 VLAN ID: 2
 VLAN type: Static
```

```
 Route interface: Not configured
 Description: VLAN 0002
 Name: VLAN 0002
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/1  GigabitEthernet1/0/2  GigabitEthernet1/0/3
```

Display information about VLAN 3.

```
<Sysname> display vlan 3
 VLAN ID: 3
 VLAN type: static
 Route interface: Configured
 IPv4 address: 1.1.1.1
 IPv4 subnet mask: 255.255.255.0
 Description: VLAN 0003
 Name: VLAN 0003
 Tagged ports:   None
 Untagged ports: None
```

Table 2 Command output

Field	Description
VLAN type	VLAN type, static or dynamic.
Route interface	Whether the VLAN interface is configured for the VLAN. • Not configured. • Configured.
Description	Description of the VLAN.
Name	VLAN name.
IP address	Primary IPv4 address of the VLAN interface. This field is displayed only when an IPv4 address is configured for the VLAN interface. When the VLAN interface is also configured with secondary IPv4 addresses, you can view them by using one of the following commands: • **display interface vlan-interface**. • **display this** (VLAN interface view).
Subnet mask	Subnet mask of the primary IP address. This field is available only when an IP address is configured for the VLAN interface.
Tagged ports	Tagged members of the VLAN.
Untagged ports	Untagged members of the VLAN.

Related commands

vlan

display vlan brief

Use **display vlan brief** to display brief VLAN information.

Syntax

`display vlan brief`

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display brief VLAN information.

```
<Sysname> display vlan brief
Brief information about all VLANs:
Supported Minimum VLAN ID: 1
Supported Maximum VLAN ID: 4094
Default VLAN ID: 1
VLAN ID   Name                                Port
1         VLAN 0001                           GE1/0/1  GE1/0/2  GE1/0/3  GE1/0/4
                                              GE1/0/5  GE1/0/6  GE1/0/7  GE1/0/8
                                              GE1/0/9  GE1/0/10  GE1/0/11
                                              GE1/0/12  GE1/0/13  GE1/0/14
                                              GE1/0/15  GE1/0/16  GE1/0/17
                                              GE1/0/18  GE1/0/19  GE1/0/20
                                              GE1/0/21  GE1/0/22  GE1/0/23
                                              GE1/0/24  GE1/0/25  GE1/0/26
                                              GE1/0/27  GE1/0/28  GE1/0/29
                                              GE1/0/30  GE1/0/31  GE1/0/32
                                              GE1/0/33  GE1/0/34  GE1/0/35
                                              GE1/0/36  GE1/0/37  GE1/0/38
                                              GE1/0/39  GE1/0/40  GE1/0/41
                                              GE1/0/42  GE1/0/43  GE1/0/44
                                              GE1/0/45  GE1/0/46  GE1/0/47
                                              GE1/0/48
2         VLAN 0002
3         VLAN 0003
```

Table 3 Command output

Field	Description
Default VLAN ID	System default VLAN ID.
Name	VLAN name.
Port	Ports that allow packets from the VLAN to pass through.

interface vlan-interface

Use **`interface vlan-interface`** to create a VLAN interface and enter its view, or enter the view of an existing VLAN interface.

Use **undo interface vlan-interface** to delete a VLAN interface.

Syntax

interface vlan-interface *interface-number*

undo interface vlan-interface *interface-number*

Default

No VLAN interfaces exist.

Views

System view

Predefined user roles

network-admin

Parameters

interface-number: Specifies a VLAN interface number in the range of 1 to 4094.

Usage guidelines

Create the VLAN before you create the VLAN interface for a VLAN.

You cannot create VLAN interfaces for secondary VLANs that meet the following requirements:

- Associated with the same primary VLAN.
- Enabled with Layer 3 communication in VLAN interface view of the primary VLAN interface.

Examples

Create VLAN-interface 2, and enter its view.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] quit
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2]
```

Related commands

display interface vlan-interface

mtu

Use **mtu** to set the MTU for a VLAN interface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The MTU of a VLAN interface is 1500 bytes.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

size: Sets the MTU in bytes. The value range for this argument is 128 to 1500.

Usage guidelines

If you configure both the **mtu** and **ip mtu** commands on a VLAN interface, the MTU set by the **ip mtu** command is used for fragmentation. For more information about the **ip mtu** command, see *Layer 3—IP Services Command Reference*.

Examples

Set the MTU to 1492 bytes for VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] mtu 1492
```

Related commands

display interface vlan-interface

name

Use **name** to assign a name to a VLAN.

Use **undo name** to restore the default.

Syntax

name *text*

undo name

Default

The name of a VLAN is **VLAN** *vlan-id.* The *vlan-id* argument specifies the VLAN ID in a four-digit format. If the VLAN ID has fewer than four digits, leading zeros are added. For example, the name of VLAN 100 is **VLAN 0100**.

Views

VLAN view

Predefined user roles

network-admin

Parameters

text: Specifies a VLAN name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

For 802.1X or MAC authentication, you can specify authorization VLANs by their names or IDs. If a large number of VLANs are configured, use VLAN names to identify them.

Examples

Assign the name **test vlan** to VLAN 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] name test vlan
```

Related commands

display vlan

reset counters interface vlan-interface

Use **reset counters interface vlan-interface** to clear statistics on a VLAN interface.

Syntax

reset counters [interface vlan-interface [*interface-number*]]

Views

User view

Predefined user roles

network-admin

Parameters

vlan-interface *interface-number*: Specifies a VLAN interface by its number. If you do not specify the **vlan-interface** keyword, the command clears statistics on all interfaces. If you specify the **vlan-interface** keyword without specifying an interface number, the command clears statistics on all existing VLAN interfaces.

Usage guidelines

Use this command to clear the history statistics before you collect statistics within a time period.

Examples

Clear statistics on VLAN-interface 2.

```
<Sysname> reset counters interface vlan-interface 2
```

Related commands

display interface vlan-interface

shutdown

Use **shutdown** to shut down a VLAN interface.

Use **undo shutdown** to bring up a VLAN interface.

Syntax

shutdown

undo shutdown

Default

A VLAN interface is not manually shut down, and the following guidelines apply to the interface state:

- The VLAN interface is down if all ports in the VLAN are down.
- The VLAN interface is up if one or more ports in the VLAN are up.

Views

VLAN interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

Executing the **shutdown** command on a VLAN interface will disconnect the link of the VLAN interface and interrupt communication. Use this command with caution.

When you use this command to shut down a VLAN interface, the VLAN interface remains in DOWN (Administratively) state. In this case, the VLAN interface state is not affected by the state of the ports in the VLAN.

Before you configure parameters for a VLAN interface, use this command to shut it down to prevent the configuration from affecting the network. After you complete the VLAN interface configuration, use the **undo shutdown** command to make the settings take effect.

To troubleshoot a failed VLAN interface, you can use the **shutdown** command and then the **undo shutdown** command on the interface to see whether it recovers.

In a VLAN, the state of each Ethernet port is independent of the state of the VLAN interface.

Examples

Shut down VLAN-interface 2, and then bring it up.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] shutdown
[Sysname-Vlan-interface2] undo shutdown
```

vlan

Use **vlan** *vlan-id-list* to create VLANs in batches, except reserved VLANs.

Use **vlan all** to create VLANs 1 through 4094.

Use **undo vlan** to delete the specified VLANs.

Syntax

vlan { *vlan-id-list* | **all** }

undo vlan { *vlan-id-list* | **all** }

Default

VLAN 1 (system default VLAN) exists.

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 32 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

all: Specifies all VLANs except reserved VLANs. The keyword is not supported when the maximum number of VLANs that can be created on a device is less than 4094.

Usage guidelines

You cannot create or delete the system default VLAN (VLAN 1) or reserved VLANs.

Before you delete a dynamic VLAN or a VLAN locked by an application, you must first remove the configuration from the VLAN.

Examples

Create VLAN 2 and enter its view.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2]
```

Create VLAN 2 and VLANs 4 through 100.

```
<Sysname> system-view
[Sysname] vlan 2 4 to 100
```

Related commands

`display vlan`

Port-based VLAN commands

display port

Use **`display port`** to display information about hybrid or trunk ports.

Syntax

`display port` { **`hybrid`** | **`trunk`** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`hybrid`: Specifies hybrid ports.

`trunk`: Specifies trunk ports.

Examples

Display information about hybrid ports.

```
<Sysname> display port hybrid
Interface            PVID  VLAN Passing
GE1/0/1              100   Tagged:  1000, 1002, 1500, 1600-1611, 2000,

Table 4 Command output

Field	Description
Interface	Interface name.
PVID	Port VLAN ID.
VLAN Passing	Existing VLANs allowed on the port.
Tagged	VLANs from which the port sends packets without removing VLAN tags.
Untagged	VLANs from which the port sends packets after removing VLAN tags.

port

Use **port** to assign the specified access ports to a VLAN.

Use **undo port** to remove the specified access ports from a VLAN.

Syntax

port *interface-list*

undo port *interface-list*

Default

All ports are in VLAN 1.

Views

VLAN view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a space-separated list of up to 10 Ethernet interface items. Each item specifies an Ethernet interface or a range of Ethernet interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*. The value for the *interface-number2* argument must be equal to or greater than the value for the *interface-number1* argument.

Usage guidelines

This command is applicable only to access ports. This command is not supported in the view of VLAN 1.

By default, all ports are access ports. You can manually configure the port link type. For more information, see "port link-type."

Examples

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to VLAN 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Related commands

display vlan

port access vlan

Use **port access vlan** to assign an access port to the specified VLAN.

Use **undo port access vlan** to restore the default.

Syntax

port access vlan *vlan-id*

undo port access vlan

Default

All access ports belong to VLAN 1.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

By default, all access ports belong to VLAN 1. Therefore, this command cannot be used to assign access ports to VLAN 1. To move an access port to VLAN 1, execute the **undo port access vlan** command on the access port.

Before assigning an access port to a VLAN, make sure the VLAN has been created.

Examples

Assign GigabitEthernet 1/0/1 to VLAN 3.

```
<Sysname> system-view
[Sysname] vlan 3
[Sysname-vlan3] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port access vlan 3
```

port hybrid pvid

Use **port hybrid pvid** to set the PVID of a hybrid port.

Use **undo port hybrid pvid** to set the PVID of a hybrid port to 1.

Syntax

port hybrid pvid vlan *vlan-id*

undo port hybrid pvid

Default

The PVID of a hybrid port is the ID of the VLAN to which the port belongs when its link type is **access**.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

You can use a nonexistent VLAN as the PVID of a hybrid port. When you delete the PVID of a hybrid port by using the **undo vlan** command, the PVID setting of the port does not change.

For correct packet transmission, set the same PVID for a local hybrid port and its peer.

To enable a hybrid port to transmit packets from its PVID, you must assign the hybrid port to the PVID by using the **port hybrid vlan** command.

Examples

Configure GigabitEthernet 1/0/1 as a hybrid port, set its PVID to VLAN 100, and assign it to VLAN 100 as an untagged member.

```
<Sysname> system-view
[Sysname] vlan 100
[Sysname-vlan100] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type hybrid
[Sysname-GigabitEthernet1/0/1] port hybrid pvid vlan 100
[Sysname-GigabitEthernet1/0/1] port hybrid vlan 100 untagged
```

Related commands

port hybrid vlan

port link-type

port hybrid vlan

Use **port hybrid vlan** to assign a hybrid port to the specified VLANs.

Use **undo port hybrid vlan** to remove a hybrid port from the specified VLANs.

Syntax

port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }

undo port hybrid vlan *vlan-id-list*

Default

A hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 32 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. The specified VLANs must already exist on the device.

tagged: Configures the port as a tagged member of the specified VLANs. A tagged member of a VLAN sends packets from the VLAN without removing VLAN tags.

untagged: Configures the port as an untagged member of the specified VLANs. An untagged member of a VLAN sends packets from the VLAN after removing VLAN tags.

Usage guidelines

A hybrid port can allow multiple VLANs. If you execute this command multiple times on a hybrid port, the hybrid port allows all the specified VLANs.

Examples

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign it to VLAN 2, VLAN 4, and VLAN 50 through VLAN 100 as a tagged member.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type hybrid
[Sysname-GigabitEthernet1/0/1] port hybrid vlan 2 4 50 to 100 tagged
```

Related commands

port link-type

port link-type

Use **port link-type** to set the link type of a port.

Use **undo port link-type** to restore the default link type of a port.

Syntax

port link-type { **access** | **hybrid** | **trunk** }

undo port link-type

Default

Each port is an access port.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

access: Sets the port link type to access.

hybrid: Sets the port link type to hybrid.

trunk: Sets the port link type to trunk.

Usage guidelines

To change the link type of a port from trunk to hybrid or vice versa, first set the link type to access.

Examples

Configure GigabitEthernet 1/0/1 as a trunk port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type trunk
```

port trunk permit vlan

Use **port trunk permit vlan** to assign a trunk port to the specified VLANs.

Use **undo port trunk permit vlan** to remove a trunk port from the specified VLANs.

Syntax

port trunk permit vlan { *vlan-id-list* | **all** }

undo port trunk permit vlan { *vlan-id-list* | **all** }

Default

A trunk port allows packets only from VLAN 1 to pass through.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 32 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all VLANs. To prevent unauthorized VLAN users from accessing restricted resources through the port, use the **port trunk permit vlan all** command with caution.

Usage guidelines

A trunk port can allow multiple VLANs. If you execute this command multiple times on a trunk port, the trunk port allows all the specified VLANs.

On a trunk port, packets only from the PVID can pass through untagged.

Examples

Configure GigabitEthernet 1/0/1 as a trunk port, and assign it to VLAN 2, VLAN 4, and VLAN 50 through VLAN 100.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type trunk
[Sysname-GigabitEthernet1/0/1] port trunk permit vlan 2 4 50 to 100
```

Related commands

port link-type

port trunk pvid

Use **port trunk pvid** to set the PVID for a trunk port.

Use **undo port trunk pvid** to restore the default.

Syntax

port trunk pvid vlan *vlan-id*

undo port trunk pvid

Default

The PVID of a trunk port is VLAN 1.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

You can use a nonexistent VLAN as the PVID for a trunk port. When you delete the PVID of a trunk port by using the **undo vlan** command, the PVID setting of the port does not change.

For correct packet transmission, set the same PVID for a local trunk port and its peer.

To enable a trunk port to transmit packets from its PVID, you must assign the trunk port to the PVID by using the **port trunk permit vlan** command.

Examples

Configure GigabitEthernet 1/0/1 as a trunk, set its PVID to VLAN 100, and assign it to VLAN 100.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type trunk
[Sysname-GigabitEthernet1/0/1] port trunk pvid vlan 100
[Sysname-GigabitEthernet1/0/1] port trunk permit vlan 100
```

Related commands

port trunk permit vlan

MAC-based VLAN commands

display mac-vlan

Use **display mac-vlan** to display MAC-to-VLAN entries.

Syntax

display mac-vlan { **all** | **dynamic** | **mac-address** *mac-address* [**mask** *mac-mask*] | **static** | **vlan** *vlan-id* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Specifies all MAC-to-VLAN entries.

dynamic: Specifies dynamically configured MAC-to-VLAN entries.

mac-address *mac-address*: Specifies the MAC address in the MAC-to-VLAN entry. The format of the *mac-address* argument is H-H-H.

mask *mac-mask*: Specifies the mask for matching MAC addresses in MAC-to-VLAN entries. For the *mac-mask* argument, the high-order bits must be consecutive 1s in binary notation or consecutive Fs in hexadecimal notation. The default value is ffff-ffff-ffff.

static: Specifies statically configured MAC-to-VLAN entries.

vlan *vlan-id*: Specifies the VLAN in MAC-to-VLAN entries. The value range for the *vlan-id* argument is 1 to 4094.

Examples

Display all MAC-to-VLAN entries.

```
<Sysname> display mac-vlan all
The following MAC VLAN entries exist:
State: S - Static, D - Dynamic

MAC address        Mask               VLAN ID   Dot1p      State
0008-0001-0000     ffff-ff00-0000     5         3          S
0002-0001-0000     ffff-ffff-ffff     5         3          S&D

Total MAC VLAN entries count: 2
```

Table 5 Command output

Field	Description
S - Static	Statically configured MAC-to-VLAN entries.
D - Dynamic	Dynamically configured MAC-to-VLAN entries.
MAC address	MAC address of the MAC-to-VLAN entry.
Mask	MAC address mask of the MAC-to-VLAN entry.
VLAN ID	VLAN ID of the MAC-to-VLAN entry.
Dot1p	802.1p priority of the VLAN in the MAC-to-VLAN entry.
State	State of a MAC-to-VLAN entry: • **S**—The MAC-to-VLAN entry is configured statically. • **D**—The MAC-to-VLAN entry is dynamically issued by the authentication server. • **S&D**—The MAC-to-VLAN entry is configured both statically and dynamically.

Any view

Predefined user roles

network-admin

network-operator

Examples

Display all ports that are enabled with the MAC-based VLAN feature.

```
<Sysname> display mac-vlan interface
MAC VLAN is enabled on following ports:
GigabitEthernet1/0/1  GigabitEthernet1/0/2  GigabitEthernet1/0/3
```

Related commands

mac-vlan enable

mac-vlan enable

Use **mac-vlan enable** to enable the MAC-based VLAN feature on a port.

Use **undo mac-vlan enable** to disable the MAC-based VLAN feature on a port.

Syntax

mac-vlan enable

undo mac-vlan enable

Default

The MAC-based VLAN feature is disabled on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable the MAC-based VLAN feature on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname–GigabitEthernet1/0/1] mac-vlan enable
```

Related commands

display mac-vlan interface

mac-vlan mac-address

Use **mac-vlan mac-address** to configure a MAC-to-VLAN entry.

Use **undo mac-vlan** to delete the specified MAC-to-VLAN entries.

Syntax

mac-vlan mac-address *mac-address* [**mask** *mac-mask*] **vlan** *vlan-id* [**dot1p** *priority*]

undo mac-vlan { **all** | **mac-address** *mac-address* [**mask** *mac-mask*] | **vlan** *vlan-id* }

Default

No MAC-to-VLAN entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address *mac-address*: Specifies a MAC address in the format of H-H-H. The MAC address cannot be a multicast MAC address or all 0s. When you configure a MAC address, leading zeros in each H section can be omitted. For example, to configure a MAC address 000f-00e2-0001, you can enter only **f-e2-1**.

mask *mac-mask*: Specifies the MAC address mask. For the *mac-mask* argument, the high-order bits must be consecutive 1s in binary notation or consecutive Fs in hexadecimal notation. The default value is ffff-ffff-ffff.

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094.

dot1p *priority*: Specifies the 802.1p priority of the VLAN specific to the MAC-to-VLAN entry. The value range for the *priority* argument is 0 to 7, and the default value is 0. The higher the value, the higher the 802.1p priority.

all: Specifies all static MAC-to-VLAN entries.

Usage guidelines

For successful dynamic MAC-based VLAN assignment, use static VLANs when you create MAC-to-VLAN entries.

Different types of MAC-to-VLAN entries are created depending on whether you specify the **mask** keyword.

- When you specify this keyword, the created MAC-to-VLAN entry describes the relationship among a group of MAC addresses, a VLAN, and the 802.1p priority for the VLAN.
- When you do not specify this keyword, the created MAC-to-VLAN entry describes the relationship among a MAC address, a VLAN, and the 802.1p priority for the VLAN.

These different types of MAC-to-VLAN entries are stored separately in two tables. The system updates the two tables according to the configuration.

Examples

Associate the MAC address 0000-0001-0001 with VLAN 100, and set the 802.1p priority to 7 for VLAN 100 in this entry.

```
<Sysname> system-view
[Sysname] mac-vlan mac-address 0-1-1 vlan 100 dot1p 7
```

Associate VLAN 100 with MAC addresses whose six high-order bits are 121122, and set the 802.1p priority to 4 for VLAN 100 in this entry.

```
<Sysname> system-view
[Sysname] mac-vlan mac-address 1211-2222-3333 mask ffff-ff00-0000 vlan 100 dot1p 4
```

Related commands

display mac-vlan

mac-vlan trigger enable

Use **mac-vlan trigger enable** to enable dynamic MAC-based VLAN assignment on a port.

Use **undo mac-vlan trigger enable** to disable dynamic MAC-based VLAN assignment on a port.

Syntax

mac-vlan trigger enable

undo mac-vlan trigger enable

Default

Dynamic MAC-based VLAN assignment is disabled on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

VLAN assignment for a port is triggered only when the source MAC address of its received packet exactly matches the MAC address in a MAC-to-VLAN entry.

Examples

Enable dynamic MAC-based VLAN assignment on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-vlan trigger enable
```

Related commands

mac-vlan mac-address

port pvid forbidden

port pvid forbidden

Use **port pvid forbidden** to disable a port from forwarding packets that fail the exact MAC address match in its PVID.

Use **undo port pvid forbidden** to restore the default.

Syntax

port pvid forbidden

undo port pvid forbidden

Default

When a port receives packets whose source MAC addresses fail the exact MAC address match, the port forwards them in its PVID.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Use this feature only with dynamic MAC-based VLAN assignment.

Examples

Disable GigabitEthernet 1/0/1 from forwarding packets that fail the exact MAC address match in its PVID.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port pvid forbidden
```

Related commands

mac-vlan trigger enable

vlan precedence

Use **vlan precedence** to set the VLAN matching order.

Use **undo vlan precedence** to restore the default.

Syntax

vlan precedence { **mac-vlan** | **ip-subnet-vlan** }

undo vlan precedence

Default

A port matches VLANs based on MAC addresses preferentially.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

mac-vlan: Matches VLANs based on MAC addresses preferentially.

ip-subnet-vlan: Matches VLANs based on IP subnets preferentially.

Usage guidelines

This command takes effect only on MAC-based VLANs and IP subnet-based VLANs.

When you enable dynamic MAC-based VLAN assignment, configure the **vlan precedence mac-vlan** command as a best practice to ensure the priority of MAC-based VLAN matching. If you execute the **vlan precedence ip-subnet-vlan** command, the command does not take effect.

Examples

Configure GigabitEthernet 1/0/1 to match VLANs based on MAC addresses preferentially.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] vlan precedence mac-vlan
```

Related commands

mac-vlan trigger enable

IP subnet-based VLAN commands

display ip-subnet-vlan interface

Use **display ip-subnet-vlan interface** to display IP subnet-based VLANs that are associated with the specified ports.

Syntax

display ip-subnet-vlan interface { *interface-type interface-number1* [**to** *interface-type interface-number2*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number1 **to** *interface-type interface-number2*: Specifies an interface range. Both the *interface-type interface-number1* argument and the *interface-type interface-number2* argument represent the interface type and interface number. The value for the *interface-number2* argument must be greater than or equal to the value for the *interface-number1* argument.

all: Specifies all ports.

Examples

Display IP subnet-based VLANs on GigabitEthernet 1/0/1.

```
<Sysname> display ip-subnet-vlan interface gigabitethernet 1/0/1
 Interface: GigabitEthernet1/0/1
  VLAN ID   Subnet index    IP address       Subnet mask       Status
  3         0               192.168.1.0      255.255.255.0     Active
  4         N/A             N/A              N/A               Inactive
  4094      65535           172.16.1.1       255.255.0.0       Inactive
```

Table 6 Command output

Field	Description
VLAN ID	ID of the IP subnet-based VLAN.
Subnet index	Index of the IP subnet. This field displays **N/A** if no IP subnet-based VLAN is configured.
IP address	IP address of the subnet. It can be an IP address or a subnet address. This field displays **N/A** if no IP subnet address is configured for the VLAN.
Subnet mask	Mask of the IP subnet. This field displays **N/A** if no subnet mask is configured for the VLAN.

Status	Whether the IP subnet-based VLAN has taken effect on the port:
	• **Active**—The IP subnet-based VLAN has taken effect.
	• **Inactive**—The IP subnet-based VLAN has not taken effect. For example, this field displays **Inactive** in one of the following conditions:
	  ○ The configuration of the IP subnet-based VLAN is not complete.
	  ○ The port does not allow the IP subnet-based VLAN.

Related commands

`display ip-subnet-vlan vlan`

`ip-subnet-vlan`

`port hybrid ip-subnet-vlan`

display ip-subnet-vlan vlan

Use **`display ip-subnet-vlan vlan`** to display information about IP subnet-based VLANs.

Syntax

`display ip-subnet-vlan vlan` { *`vlan-id1`* [**`to`** *`vlan-id2`*] | **`all`** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`vlan-id1`: Specifies an IP subnet-based VLAN by its VLAN ID in the range of 1 to 4094.

`vlan-id1` **`to`** *`vlan-id2`*: Specifies an IP subnet-based VLAN ID range. Both the *`vlan-id1`* and the *`vlan-id2`* arguments are in the range of 1 to 4094. The value for the *`vlan-id2`* argument must be equal to or greater than the value for the *`vlan-id1`* argument.

`all`: Specifies all IP subnet-based VLANs.

Examples

Display information about all IP subnet-based VLANs.

```
<Sysname> display ip-subnet-vlan vlan all
 VLAN ID: 3
  Subnet index      IP address      Subnet mask
```

```
0                   192.168.1.0     255.255.255.0
```

Table 7 Command output

Field	Description
VLAN ID	ID of the IP subnet-based VLAN.
Subnet index	Index of the IP subnet.
IP address	IP address of the subnet. It can be an IP address or a subnet address.
Subnet mask	Mask of the IP subnet.

Related commands

display ip-subnet-vlan interface

ip-subnet-vlan

port hybrid ip-subnet-vlan

ip-subnet-vlan

Use **ip-subnet-vlan** to associate a VLAN with the specified IP subnet or IP address.

Use **undo ip-subnet-vlan** to disassociate a VLAN from the specified IP subnet or IP address.

Syntax

ip-subnet-vlan [*ip-subnet-index*] **ip** *ip-address* [*mask*]

undo ip-subnet-vlan { *ip-subnet-index* [**to** *ip-subnet-end*] | **all** }

Default

A VLAN is not associated with an IP subnet or IP address.

Views

VLAN view

Predefined user roles

network-admin

Parameters

ip-subnet-index: Specifies a beginning IP subnet index in the range of 0 to 65535. The value can be configured by users. It can also be automatically numbered by the system based on the order in which the IP subnets or IP addresses are associated with the VLAN.

ip *ip-address* [*mask*]: Specifies the source IP address or network address that is associated with the VLAN. The *ip-address* argument specifies the source IP address or network address in dotted decimal notation. The *mask* argument is the subnet mask of the source IP address or network address, in dotted decimal notation with a default value of 255.255.255.0.

to *ip-subnet-end*: Specifies an end IP subnet index of an IP subnet index range, in the range of 0 to 65535. The value for the *ip-subnet-end* argument must be greater than or equal to the beginning IP subnet index.

all: Specifies all IP subnets or IP addresses that are associated with the VLAN.

Usage guidelines

The IP subnet or IP address cannot be a multicast network segment or a multicast address.

Examples

Configure VLAN 3 as an IP subnet-based VLAN and associate it with the subnet 192.168.1.0/24.

```
<Sysname> system-view
[Sysname] vlan 3
[Sysname-vlan3] ip-subnet-vlan ip 192.168.1.0 255.255.255.0
```

port hybrid ip-subnet-vlan

Use **port hybrid ip-subnet-vlan** to associate a port with the specified IP subnet-based VLAN.

Use **undo port hybrid ip-subnet-vlan** to disassociate a port from the specified IP subnet-based VLAN.

Syntax

port hybrid ip-subnet-vlan vlan *vlan-id*

undo port hybrid ip-subnet-vlan { **vlan** *vlan-id* | **all** }

Default

A port is not associated with an IP subnet-based VLAN.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

all: Specifies all VLANs.

Usage guidelines

For this command to take effect, perform the following tasks:

1. Create a VLAN and associate it with the specified IP subnet or IP address.
2. Set the port link type to hybrid.
3. Configure the port to allow the IP subnet-based VLAN to pass through.

Examples

Associate GigabitEthernet 1/0/1 with IP subnet-based VLAN 3.

```
<Sysname> system-view
[Sysname] vlan 3
[Sysname-vlan3] ip-subnet-vlan ip 192.168.1.0 255.255.255.0
[Sysname-vlan3] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type hybrid
```

```
[Sysname-GigabitEthernet1/0/1] port hybrid vlan 3 untagged
[Sysname-GigabitEthernet1/0/1] port hybrid ip-subnet-vlan vlan 3
```

Associate Layer 2 aggregate interface Bridge-Aggregation 1 with IP subnet-based VLAN 3.

```
<Sysname> system-view
[Sysname] vlan 3
[Sysname-vlan3] ip-subnet-vlan ip 192.168.1.0 255.255.255.0

Protocol-based VLAN commands

S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, WAS6000 switches do not support protocol-based VLAN.

display protocol-vlan interface

Use **display protocol-vlan interface** to display protocol-based VLANs that are associated with the specified ports.

Syntax

display protocol-vlan interface { *interface-type interface-number1* [**to** *interface-type interface-number2*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number1 **to** *interface-type interface-number2*: Specifies an interface range. Both the *interface-type interface-number1* argument and the *interface-type interface-number2* argument represent the interface type and interface number. The value for the *interface-number2* argument must be greater than or equal to the value for the *interface-number1* argument.

all: Specifies all ports.

Examples

Display protocol-based VLAN information on GigabitEthernet 1/0/1.

```
<Sysname> display protocol-vlan interface gigabitethernet 1/0/1
 Interface: GigabitEthernet1/0/1
```

```
VLAN ID  Protocol index  Protocol type            Status
2        0               IPv6                     Active
2        1               N/A                      Inactive
4094     65535           IPv4                     Inactive
```

Table 8 Command output

Field	Description
VLAN ID	ID of the protocol-based VLAN.
Protocol index	Protocol template index.
Protocol type	Protocol type specified by the protocol template. This field displays **N/A** if the protocol type is not specified.
Status	Whether the protocol-based VLAN has taken effect: • **Active**—The protocol-based VLAN has taken effect. • **Inactive**—The protocol-based VLAN has not taken effect.

Related commands

display protocol-vlan vlan

port hybrid protocol-vlan

protocol-vlan

display protocol-vlan vlan

Use **display protocol-vlan vlan** to display information about protocol-based VLANs.

Syntax

display protocol-vlan vlan { *vlan-id1* [**to** *vlan-id2*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-id1: Specifies a protocol-based VLAN ID in the range of 1 to 4094.

vlan-id1 **to** *vlan-id2:* Specifies a protocol-based VLAN ID range. Both the *vlan-id1* and the *vlan-id2* arguments are in the range of 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all protocol-based VLANs.

Examples

Displays information about all protocol-based VLANs.

```
<Sysname> display protocol-vlan vlan all
 VLAN ID: 2
  Protocol index  Protocol type
  0               IPv4
  65535           IPv6
```

```
VLAN ID: 3
 Protocol index  Protocol type
 0               IPv4
 65535           LLC DSAP 0x11 SSAP 0x22
```

Table 9 Command output

Field	Description
VLAN ID	ID of the protocol-based VLAN.
Protocol index	Protocol template index.
Protocol type	Protocol type or encapsulation format specified by the protocol template.

Related commands

display protocol-vlan interface

port hybrid protocol-vlan

protocol-vlan

port hybrid protocol-vlan

Use **port hybrid protocol-vlan** to associate a port with the specified protocol-based VLAN.

Use **undo port hybrid protocol-vlan** to disassociate a port from the specified protocol-based VLAN.

Syntax

port hybrid protocol-vlan vlan *vlan-id* { *protocol-index* [**to** *protocol-end*] | **all** }

undo hybrid protocol-vlan { **vlan** *vlan-id* { *protocol-index* [**to** *protocol-end*] | **all** } | **all** }

Default

A port is not associated with a protocol-based VLAN.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

protocol-index: Specifies a beginning protocol template index in the range of 0 to 65535.

to *protocol-end*: Specifies an end protocol template index of a protocol template range, in the range of 0 to 65535. The value for this argument must be greater than or equal to the beginning protocol template index.

all: Specifies all protocol templates.

Usage guidelines

For this command to take effect, perform the following tasks:

1. Create a VLAN and associate it with the specified protocol templates.
2. Set the port link type to hybrid.
3. Configure the port to allow the protocol-based VLAN to pass through.

When you execute the **undo port hybrid protocol-vlan** command on a port, follow these guidelines:

- If you specify both the *vlan-id* argument and the **all** keyword, this command disassociates the port from all protocol templates of the specified VLAN.
- If you specify only the **all** keyword, this command disassociates the port from all protocol templates of all VLANs.

Examples

Configure GigabitEthernet 1/0/1 as a hybrid port, assign it to VLAN 2 as an untagged member, and associated it with protocol template 1 in VLAN 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] protocol-vlan 1 ipv4
[Sysname-vlan2] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type hybrid
[Sysname-GigabitEthernet1/0/1] port hybrid vlan 2 untagged
[Sysname-GigabitEthernet1/0/1] port hybrid protocol-vlan vlan 2 1
```

Configure Layer 2 aggregate interface Bridge-Aggregation 1 as a hybrid port, assign it to VLAN 2 as an untagged member, and associated it with protocol template 1 in VLAN 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] protocol-vlan 1 ipv4
[Sysname-vlan2] quit
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] port link-type hybrid
[Sysname-Bridge-Aggregation1] port hybrid vlan 2 untagged
[Sysname-Bridge-Aggregation1] port hybrid protocol-vlan vlan 2 1
```

protocol-vlan

Use **protocol-vlan** to associate a VLAN with the specified protocol template.

Use **undo protocol-vlan** to disassociate a VLAN from the specified protocol template.

Syntax

protocol-vlan [*protocol-index*] { **at** | **ipv4** | **ipv6** | **ipx** { **ethernetii** | **llc** | **raw** | **snap** } | **mode** { **ethernetii etype** *etype-id* | **llc** { **dsap** *dsap-id* [**ssap** *ssap-id*] | **ssap** *ssap-id* } | **snap etype** *etype-id* } }

undo protocol-vlan { *protocol-index* [**to** *protocol-end*] | **all** }

Default

A VLAN is not associated with a protocol template.

Views

VLAN view

Predefined user roles

network-admin

Parameters

at: Specifies the AppleTalk-based VLAN.

ipv4: Specifies the IPv4-based VLAN.

ipv6: Specifies the IPv6-based VLAN.

ipx: Specifies the IPX-based VLAN. The keywords **ethernetii**, **llc**, **raw**, and **snap** specify IPX encapsulation formats.

mode: Configures a user-defined protocol template for the VLAN. The keywords **ethernetii**, **llc**, and **snap** specify the available encapsulation formats.

ethernetii etype *etype-id*: Matches the Ethernet II encapsulation format and the specified protocol type ID. The *etype-id* argument specifies the protocol type ID of inbound packets, in the range of 600 to ffff in hexadecimal notation, excluding 800, 86dd, 809b, and 8137.

llc: Matches the LLC encapsulation format.

dsap *dsap-id*: Specifies the destination service access point in hexadecimal notation, in the range of 0 to ff.

ssap *ssap-id*: Specifies the source service access point in hexadecimal notation, in the range of 0 to ff.

snap etype *etype-id*: Matches the SNAP encapsulation format and the specified protocol type value. The *etype-id* argument specifies the Ethernet type of inbound packets, in the range of 600 to ffff in hexadecimal notation, excluding 8137.

protocol-index: Specifies a protocol template index that is associated with the VLAN. The value range for this argument is 0 to 65535. The system will automatically assign an index if you do not specify this argument.

to *protocol-end*: Specifies an end protocol template index of a protocol template range, in the range of 0 to 65535. The value for the *protocol-end* argument must be greater than or equal to the value for the *protocol-index* argument.

all: Specifies all protocols associated with the VLAN.

Usage guidelines

CAUTION:

IP uses ARP for address resolution in Ethernet. To prevent communication failures, configure the IP and ARP templates in the same VLAN and associate them with the same port.

When you use the **mode** keyword to configure a protocol template, follow these restrictions and guidelines:

- Do not set the *etype-id* argument in the **ethernetii etype** *etype-id* option to the following hexadecimal values:
  - **800**—Specifies the IPv4 protocol in Ethernet II encapsulation.
  - **809b**—Specifies the AppleTalk protocol in Ethernet II encapsulation.
  - **8137**—Specifies the IPX protocol in Ethernet II encapsulation.
  - **86dd**—Specifies the IPv6 protocol in Ethernet II encapsulation.

- Do not set both the *dsap-id* and *ssap-id* arguments to any of the following hexadecimal values:
  - **e0**—Specifies the 802.2 LLC encapsulation format for IPX packets.
  - **ff**—Specifies the 802.3 raw encapsulation format for IPX packets.
  - **aa**—Specifies the 802.2 SNAP encapsulation format.

  When either of the *dsap-id* and *ssap-id* arguments is configured, the system assigns the hexadecimal value **aa** to the other argument.
- Do not set the *etype-id* argument in the **snap etype** *etype-id* option to the hexadecimal value 8137. Otherwise, the template format will be the same as that of the IPX protocol. You can set the *etype-id* argument to the hexadecimal value 800, 809b, or 86dd. The hexadecimal values 800, 809b, and 86dd correspond to IPv4, AppleTalk, and IPv6, respectively.

Examples

Assign ARP packets in Ethernet II encapsulation and IPv4 packets to VLAN 3 for transmission. (The protocol type ID for ARP is 0806 in hexadecimal notation.)

```
<Sysname> system-view
[Sysname] vlan 3
[Sysname-vlan3] protocol-vlan 1 ipv4
[Sysname-vlan3] protocol-vlan 2 mode ethernetii etype 0806
```

display vlan-group

Use **display vlan-group** to display VLAN group information.

Syntax

display vlan-group [*group-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-name: Specifies a VLAN group by its name, a case-sensitive string of 1 to 31 characters. The first character must be an alphabetical character. If you do not specify this argument, the command displays information about all VLAN groups.

Examples

Display information about VLAN group **test001**.

```
<Sysname> display vlan-group test001
VLAN group: test001
```

```
     VLAN list: 2-4 100 200
```

Display information about all VLAN groups.

```
<Sysname> display vlan-group
VLAN group: test001
     VLAN list: 2-4 100 200
VLAN group: rnd
     VLAN list: Null
```

Table 10 Command output

VLAN group	Name of the VLAN group.
VLAN list	VLAN list in the VLAN group.

Related commands

vlan-group

vlan-list

vlan-group

Use **vlan-group** to create a VLAN group and enter its view, or enter the view of an existing VLAN group.

Use **undo vlan-group** to delete a VLAN group.

Syntax

vlan-group *group-name*

undo vlan-group *group-name*

Default

No VLAN groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-name: Specifies a VLAN group by its name, a case-sensitive string of 1 to 31 characters. The first character must be an alphabetical character.

Usage guidelines

A VLAN group includes a set of VLANs. You can add multiple VLAN lists to a VLAN group.

Examples

Create a VLAN group named **test001** and enter VLAN group view.

```
<Sysname> system-view
[Sysname] vlan-group test001
[Sysname-vlan-group-test001]
```

Related commands

vlan-list

vlan-list

Use **vlan-list** to add VLANs to a VLAN group.

Use **undo vlan-list** to remove VLANs from a VLAN group.

Syntax

vlan-list *vlan-id-list*

undo vlan-list *vlan-id-list*

Default

No VLANs exist in a VLAN group.

Views

VLAN group view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

Examples

Add VLAN 2 through VLAN 4, VLAN 100, and VLAN 200 to VLAN group **test001**.

```
<Sysname> system-view
[Sysname] vlan-group test001
[Sysname-vlan-group-test001] vlan-list 2 to 4 100 200
```

display private-vlan

Use **display private-vlan** to display information about primary VLANs and their associated secondary VLANs.

Syntax

display private-vlan [*primary-vlan-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

primary-vlan-id: Specifies a primary VLAN ID in the range of 1 to 4094. If you do not specify a primary VLAN ID, this command displays information about all primary VLANs and their associated secondary VLANs.

Examples

Display information about primary VLANs and their associated secondary VLANs.

```
<Sysname> display private-vlan
 Primary VLAN ID: 2
 Secondary VLAN ID: 3-4

 VLAN ID: 2
 VLAN type: Static
 Private VLAN type: Primary
 Route interface: Configured
 IPv4 address: 1.1.1.1
 IPv4 subnet mask: 255.255.255.0
 IPv6 global unicast addresses:
   2001::1, subnet is 2001::/64 [TENTATIVE]
 Description: VLAN 0002
 Name: VLAN 0002
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/2
    GigabitEthernet1/0/3
    GigabitEthernet1/0/4

 VLAN ID: 3
 VLAN type: Static
 Private VLAN type: Secondary
```

```
Route interface: Not configured
Description: VLAN 0003
Name: VLAN 0003
Tagged ports:   None
Untagged ports:
   GigabitEthernet1/0/2
   GigabitEthernet1/0/3

VLAN ID: 4
VLAN type: Static
Private VLAN type: Secondary
Route interface: Not configured
Description: VLAN 0004
Name: VLAN 0004
Tagged ports:   None
Untagged ports:
   GigabitEthernet1/0/2
   GigabitEthernet1/0/4
```

Table 11 Command output

Field	Description
VLAN type	VLAN type, dynamic or static.
Private VLAN type	Private VLAN type: • **Primary**—Primary VLAN. • **Secondary**—Secondary VLAN. • **Isolated secondary**—Secondary VLAN configured with port isolation at Layer 2.
Route interface	Whether a VLAN interface is created for the VLAN: • Configured. • Not configured.
IPv4 address	Primary IPv4 address of the VLAN interface. This field is displayed only when an IPv4 address is configured for the VLAN interface. When the VLAN interface is also configured with secondary IPv4 addresses, you can view them by using one of the following commands: • **`display interface vlan-interface`**. • **`display this`** (VLAN interface view).
IPv4 subnet mask	Subnet mask for the primary IPv4 address of the VLAN interface. This field is displayed only when an IPv4 address is configured for the VLAN interface.
IPv6 global unicast addresses	Global unicast IPv6 address of the VLAN interface. This field is not displayed when no IPv6 address is configured for the VLAN interface. The IPv6 address states are as follows: • **TENTATIVE**—Initial state. DAD is being performed or is to be performed on the address. An address in this state cannot be used as the source address or destination address of packets. • **DUPLICATE**—DAD has been completed for the address. The address is not unique on the link and cannot be used. • **PREFERRED**—The address is preferred and can be used as the source or destination address of a packet. If an address is in this state, the command does not display the address state.

Field	Description
	• **DEPRECATED**—The address is beyond the preferred lifetime but within the valid lifetime. It is valid, but it cannot be used as the source address for a new connection. Packets destined to the address are processed correctly.
Description	VLAN description.
Name	VLAN name.
Tagged ports	Tagged members of the VLAN.
Untagged ports	Untagged members of the VLAN.

Syntax

`port private-vlan host`

`undo port private-vlan`

Default

A port is not a host port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

If the port has been assigned to a secondary VLAN, the command assigns the port to the primary VLAN associated with the secondary VLAN. Also, the following events occur:

- For an access port, the device performs the following operations:
  - Changes the port link type to hybrid.
  - Configures the secondary VLAN as the PVID.
  - Assigns the port to the primary VLAN as an untagged member.
- For a trunk port, the device does not change the port link type or PVID.
- For a hybrid port, the device does not change the port link type or PVID.
  - If the hybrid port has been a tagged or untagged member of the primary VLAN, this member attribute remains in the primary VLAN.
  - If the hybrid port does not allow the primary VLAN, the device assigns the port to the primary VLAN as an untagged member.

You can assign the port to a secondary VLAN before or after you execute this command.

The **undo port private-vlan** command does not change the VLAN attributes (allowed VLANs, port link type, and PVID) of the port.

The **port private-vlan host** command is mutually exclusive with the **port private-vlan trunk promiscuous** and **port private-vlan trunk secondary** commands.

Examples

In this example, VLAN 20 is a secondary VLAN and is associated with primary VLAN 2.

Configure GigabitEthernet 1/0/1 as a host port, and then verify the configuration.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port private-vlan host
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port private-vlan host
#
return
```

The output show that GigabitEthernet 1/0/1 is operating in bridge mode and is a host port.

Assign GigabitEthernet 1/0/1 to VLAN 20, and then verify the configuration.

```
[Sysname-GigabitEthernet1/0/1] port access vlan 20
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port private-vlan host
 port link-type hybrid
 undo port hybrid vlan 1
 port hybrid vlan 2 20 untagged
 port hybrid pvid vlan 20
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is an untagged member of secondary VLAN 20 and primary VLAN 2.
- The port link type of GigabitEthernet 1/0/1 is hybrid and its PVID is VLAN 20.

Related commands

port private-vlan promiscuous

port private-vlan trunk promiscuous

port private-vlan trunk secondary

private-vlan (VLAN view)

private-vlan primary

port private-vlan promiscuous

Use **port private-vlan promiscuous** to configure a port as a promiscuous port of the specified VLAN and assign the port to the VLAN.

Use **undo port private-vlan** to restore the default.

Syntax

port private-vlan *vlan-id* **promiscuous**

undo port private-vlan

Default

A port is not a promiscuous port of any VLANs.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN ID in the range of 1 to 4094. Though VLAN 1 is in the valid value range, it cannot be configured in the command.

Usage guidelines

If the specified VLAN is a primary VLAN that has been associated with secondary VLANs, the command assigns the port to the associated secondary VLANs. Also, the following events occur:

- For an access port, the device performs the following operations:
  - Changes the port link type to hybrid.
  - Configures the primary VLAN as the PVID.
  - Assigns the port to the primary VLAN and its associated secondary VLANs as an untagged member.
- For a trunk port, the device does not change the port link type or PVID.
- For a hybrid port, the device does not change the port link type or PVID.
  - If the hybrid port has been a tagged or untagged member of the primary VLAN and part of its associated secondary VLANs, this member attribute remains in these VLANs. The device assigns the hybrid port to the rest of the associated secondary VLANs as an untagged member.
  - If the hybrid port does not allow any of the primary VLAN and its associated secondary VLANs, the command assigns the port to these VLANs as an untagged member.

If you execute this command on a promiscuous port multiple times, the most recent configuration takes effect.

The **undo port private-vlan** command does not change the VLAN attributes (allowed secondary VLANs, link type, and PVID) of the port. When you execute the **undo port private-vlan** command on a promiscuous port of a VLAN, the command removes the port from the VLAN.

You can configure the VLAN as a primary VLAN before or after you execute the **port private-vlan promiscuous** command.

This command is mutually exclusive with the **port private-vlan trunk promiscuous** and **port private-vlan trunk secondary** commands.

Examples

In this example, VLAN 2 is a primary VLAN, and it is associated with secondary VLAN 20.

Display information about GigabitEthernet 1/0/1.

```
<Sysname> system-view
```

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
#
return
```

Configure GigabitEthernet 1/0/1 as a promiscuous port of VLAN 2, and then verify the configuration.

```
[Sysname-GigabitEthernet1/0/1] port private-vlan 2 promiscuous
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port private-vlan 2 promiscuous
 undo port hybrid vlan 1
 port hybrid vlan 2 20 untagged
 port hybrid pvid vlan 2
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is a promiscuous port of VLAN 2.
- GigabitEthernet 1/0/1 is an untagged member of primary VLAN 2 and secondary VLAN 20.
- The port link type of GigabitEthernet 1/0/1 is hybrid and its PVID is VLAN 2.

Execute the **undo port private-vlan** command on GigabitEthernet 1/0/1, and then verify the configuration.

```
[Sysname-GigabitEthernet1/0/1] undo port private-vlan
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 undo port hybrid vlan 1
 port hybrid vlan 20 untagged
 port hybrid pvid vlan 2
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is removed from primary VLAN 2.
- GigabitEthernet 1/0/1 is an untagged member of VLAN 20.
- The link type and PVID of GigabitEthernet 1/0/1 do not change.

Related commands

port private-vlan host

port private-vlan trunk promiscuous

port private-vlan trunk secondary

private-vlan (VLAN view)

private-vlan primary

port private-vlan trunk promiscuous

Use **port private-vlan trunk promiscuous** to configure a port as a trunk promiscuous port of the specified VLANs and assign the port to these VLANs.

Use **undo port private-vlan trunk promiscuous** to cancel the trunk promiscuous attribute of a port in the specified VLANs.

Syntax

port private-vlan *vlan-id-list* **trunk promiscuous**

undo port private-vlan *vlan-id-list* **trunk promiscuous**

Default

A port is not a trunk promiscuous port of any VLANs.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 primary VLAN items. Each item specifies a primary VLAN ID or a range of primary VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for primary VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. Though the system default VLAN (VLAN 1) is in the valid value range, it cannot be configured in the command.

Usage guidelines

If the specified VLANs are primary VLANs that have been associated with secondary VLANs, the command assigns the port to the associated secondary VLANs. Also, the following events occur:

- For an access port, the device performs the following operations:
  - Changes the port link type to hybrid. The PVID of the port does not change.
  - Assigns the port to the primary VLANs and the associated secondary VLANs as a tagged member.
- For a trunk port, the device does not change the port link type or PVID.
- For a hybrid port, the device does not change the port link type or PVID.
  - If the hybrid port has been a tagged or untagged member of part of the primary VLANs and their associated secondary VLANs, this member attribute remains in these VLANs. The device assigns the hybrid port to the rest of the primary VLANs and their associated secondary VLANs as a tagged member.
  - If the hybrid port does not allow any of the primary VLANs and their associated secondary VLANs, the device assigns the port to these VLANs as a tagged member.

The **undo** form of this command does not change the VLAN attributes (allowed secondary VLANs, port link type, and PVID) of the port.

If you execute the **undo** form of this command on a trunk promiscuous port, the command removes the port from the VLANs specified by the *vlan-id-list* argument.

You can configure the specified VLANs as primary VLANs before or after you execute this command.

This command is mutually exclusive with the **port private-vlan host**, **port private-vlan promiscuous** and **port private-vlan trunk secondary** commands.

For an uplink port to permit multiple primary VLANs, use the **port private-vlan trunk promiscuous** command to assign the port to these VLANs. The port can then transmit packets from these primary VLANs with VLAN tags. For an uplink port to permit only one primary VLAN, use the **port private-vlan promiscuous** command to assign the port to the VLAN. The port can then transmit packets from the primary VLAN without VLAN tags.

Examples

In this example, VLANs 2 and 3 are primary VLANs. VLAN 2 is associated with secondary VLAN 20. VLAN 3 is associated with secondary VLAN 30.

Display information about GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
#
return
```

Configure GigabitEthernet 1/0/1 as a trunk promiscuous port of VLANs 2 and 3, and then verify the configuration.

```
[Sysname-GigabitEthernet1/0/1] port private-vlan 2 3 trunk promiscuous
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port private-vlan 2 3 trunk promiscuous
 port hybrid vlan 2 3 20 30 tagged
 port hybrid vlan 1 untagged
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is a trunk promiscuous port of VLANs 2 and 3.
- GigabitEthernet1/0/1 is a tagged member of VLANs 2, 3, 20, and 30.
- The port link type of GigabitEthernet 1/0/1 is hybrid.

Execute the **undo port private-vlan trunk promiscuous** command on GigabitEthernet 1/0/1, and then verify the configuration.

```
[Sysname-GigabitEthernet1/0/1] undo port private-vlan 2 3 trunk promiscuous
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 20 30 tagged
 port hybrid vlan 1 untagged
```

```
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is removed from VLANs 2 and 3.
- GigabitEthernet 1/0/1 is a tagged member of VLANs 20 and 30.
- The port link type and PVID of GigabitEthernet 1/0/1 do not change.

Related commands

port private-vlan host

port private-vlan promiscuous

port private-vlan trunk secondary

private-vlan (VLAN view)

private-vlan primary

port private-vlan trunk secondary

Use **port private-vlan trunk secondary** to configure a port as a trunk secondary port of the specified VLANs and assign the port to these VLANs.

Use **undo port private-vlan trunk secondary** to cancel the trunk secondary attribute of a port in the specified VLANs.

Syntax

port private-vlan *vlan-id-list* **trunk secondary**

undo port private-vlan *vlan-id-list* **trunk secondary**

Default

A port is not a trunk secondary port of any VLANs.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 secondary VLAN items. Each item specifies a secondary VLAN ID or a range of secondary VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for secondary VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. Though the system default VLAN (VLAN 1) is in the valid value range, it cannot be configured in the command.

Usage guidelines

If the specified VLANs are secondary VLANs that have been associated with primary VLANs, the command also assigns the port to the associated primary VLANs. Also, the following events occur:

- For an access port, the device performs the following operations:
  - Changes the port link type to hybrid. The PVID of the port does not change.
  - Assigns the port to the secondary VLANs and the associated primary VLANs as a tagged member.

- For a trunk port, the device does not change the port link type or PVID.
- For a hybrid port, the device does not change the port link type or PVID.
  - If the port has been an untagged or tagged member of part of the secondary VLANs and their associated primary VLANs, this member attribute remains in these VLANs. The device assigns the port to the rest of the secondary VLANs and their associated primary VLANs as a tagged member.
  - If the hybrid port does not allow any of the secondary VLANs and their associated primary VLANs, the device assigns the port to these VLANs as a tagged member.

A trunk secondary port can join only one secondary VLAN among all secondary VLANs associated with a primary VLAN. However, it can join multiple secondary VLANs that are associated with different primary VLANs.

The **undo** form of this command does not change the VLAN attributes (allowed primary VLANs, port link type, and PVID) of the port.

When you execute the **undo** form of this command on a trunk secondary port of the VLANs specified by the *vlan-id-list* argument, one of the following events occurs:

- If the port is an access port, the device does not change the VLAN configuration of the port.
- If the port is a trunk or hybrid port, the device removes the port from the specified VLANs.

You can associate the specified VLANs with their respective primary VLANs before or after you execute this command.

This command does not take effect on the specified VLAN if any of the following conditions applies:

- The specified VLAN does not exist.
- The specified VLAN is not a secondary VLAN and is used for other purposes.
- The specified VLAN shares the same primary VLAN with other secondary VLANs, and the current port has been configured as a trunk secondary port in one of the other secondary VLANs.

This command is mutually exclusive with the **port private-vlan host**, **port private-vlan promiscuous** and **port private-vlan trunk promiscuous** commands.

For a downlink port to permit multiple secondary VLANs associated with different primary VLANs, use the **port private-vlan trunk secondary** command to assign the port to these secondary VLANs. The port can then transmit packets from these secondary VLANs with VLAN tags. For a downlink port to permit only one secondary VLAN, use the **port private-vlan host** command to assign the port to the secondary VLAN. The port can then transmit packets from the secondary VLAN without VLAN tags.

Examples

- In this example, VLANs 2 and 3 are primary VLANs. VLAN 2 is associated with secondary VLAN 20. VLAN 3 is associated with secondary VLAN 30.

  # Display information about GigabitEthernet 1/0/1.

  ```
  <Sysname> system-view
  [Sysname] interface gigabitethernet 1/0/1
  [Sysname-GigabitEthernet1/0/1] display this
  #
  interface GigabitEthernet1/0/1
   port link-mode bridge
  #
  return
  ```

  # Configure GigabitEthernet 1/0/1 as a trunk secondary port of VLANs 20 and 30, and then verify the configuration.

  ```
  [Sysname-GigabitEthernet1/0/1] port private-vlan 20 30 trunk secondary
  ```

```
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 2 3 20 30 tagged
 port hybrid vlan 1 untagged
 port private-vlan 20 30 trunk secondary
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is a trunk secondary port of VLANs 20 and 30.
- GigabitEthernet 1/0/1 is a tagged member of VLANs 2, 3, 20, and 30.
- The port link type of GigabitEthernet 1/0/1 is hybrid.

Execute the **undo port private-vlan trunk secondary** command on GigabitEthernet 1/0/1, and then verify the configuration.

```
[Sysname-GigabitEthernet1/0/1] undo port private-vlan 20 30 trunk secondary
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 2 3 tagged
 port hybrid vlan 1 untagged
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is removed from VLANs 20 and 30.
- GigabitEthernet 1/0/1 is a tagged member of VLANs 2 and 3.
- The port link type and PVID of GigabitEthernet 1/0/1 do not change.

- In this example, VLAN 10 is not a secondary VLAN.

  # Display information about GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
#
return
```

  # Configure GigabitEthernet 1/0/1 as a trunk secondary port of VLAN 10, and then verify the configuration.

```
[Sysname-GigabitEthernet1/0/1] port private-vlan 10 trunk secondary
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
```

```
 port link-type hybrid
 port hybrid vlan 10 tagged
 port hybrid vlan 1 untagged
 port private-vlan 10 trunk secondary
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is a trunk secondary port of VLAN 10.
- GigabitEthernet 1/0/1 is a tagged member of VLAN 10.
- The port link type of GigabitEthernet 1/0/1 is hybrid.

Execute the **undo port private-vlan trunk secondary** command on GigabitEthernet1/0/1, and then verify the configuration.

```
[Sysname-GigabitEthernet1/0/1] undo port private-vlan 10 trunk secondary
[Sysname-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 1 untagged
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is removed from VLAN 10.
- The port link type and PVID of GigabitEthernet 1/0/1 do not change.

Related commands

port private-vlan host

port private-vlan promiscuous

port private-vlan trunk promiscuous

private-vlan (VLAN view)

private-vlan isolated

private-vlan primary

private-vlan (VLAN interface view)

Use **private-vlan secondary** to enable Layer 3 communication between secondary VLANs that are associated with a primary VLAN.

Use **undo private-vlan** to cancel the Layer 3 communication configuration for secondary VLANs that are associated with a primary VLAN.

Syntax

private-vlan secondary *vlan-id-list*

undo private-vlan [**secondary** *vlan-id-list*]

Default

Secondary VLANs are isolated at Layer 3.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 secondary VLAN items. Each item specifies a secondary VLAN ID or a range of secondary VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for secondary VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

Usage guidelines

This command takes effect only when the following conditions exist:

- This command is executed in VLAN interface view of the primary VLAN interface.
- Secondary VLANs are associated with the primary VLAN.
- No VLAN interfaces are created for secondary VLANs.
- An IP address is assigned to the primary VLAN interface.
- Local proxy ARP or ND is enabled on the primary VLAN interface.

You can create VLAN interfaces for secondary VLANs that are not enabled with Layer 3 communication. If secondary VLANs are enabled with Layer 3 communication, do not create VLAN interfaces for them.

When you execute this command in the same primary VLAN interface view multiple times, all the specified secondary VLANs are interoperable at Layer 3.

When you execute the **undo private-vlan** command, follow these guidelines:

- If you specify the **secondary** *vlan-id-list* option, this command cancels the Layer 3 communication configuration only for the specified secondary VLANs.
- If you do not specify the **secondary** *vlan-id-list* option, this command cancels the Layer 3 communication configuration for all secondary VLANs of the primary VLAN.

Examples

This example shows how to meet the following requirements:

- VLAN 4 is a secondary VLAN, and it is associated with primary VLAN 2.
- The uplink port (GigabitEthernet 1/0/2) is a promiscuous port of VLAN 2.
- Downlink ports GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are host ports of VLANs 3 and 4, respectively.
- Secondary VLANs 3 and 4 can communicate at Layer 3.

Configure VLAN 2 as a primary VLAN and associate it with secondary VLANs 3 and 4.

```
<Sysname> system-view
[Sysname] vlan 3 to 4
[Sysname] vlan 2
[Sysname-vlan2] private-vlan primary
[Sysname-vlan2] private-vlan secondary 3 to 4
[Sysname-vlan2] quit
```

Configure the uplink port (GigabitEthernet 1/0/2) as a promiscuous port of VLAN 2.

```
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] port private-vlan 2 promiscuous
[Sysname-GigabitEthernet1/0/2] quit
```

Assign downlink port GigabitEthernet 1/0/3 to VLAN 3 and configure the port as a host port.

```
[Sysname] interface gigabitethernet 1/0/3
[Sysname-GigabitEthernet1/0/3] port access vlan 3
[Sysname-GigabitEthernet1/0/3] port private-vlan host
[Sysname-GigabitEthernet1/0/3] quit
```

Assign downlink port GigabitEthernet 1/0/4 to VLAN 4 and configure the port as a host port.

```
[Sysname] interface gigabitethernet 1/0/4
[Sysname-GigabitEthernet1/0/4] port access vlan 4
[Sysname-GigabitEthernet1/0/4] port private-vlan host
[Sysname-GigabitEthernet1/0/4] quit
```

Create VLAN-interface 2 and enable Layer 3 communication between secondary VLANs 3 and 4.

```
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] private-vlan secondary 3 to 4
```

Assign an IP address to VLAN-interface 2.

```
[Sysname-Vlan-interface2] ip address 192.168.1.1 255.255.255.0
```

Enable local proxy ARP on VLAN-interface 2.

```
[Sysname-Vlan-interface2] local-proxy-arp enable
```

Related commands

private-vlan (VLAN view)

private-vlan primary

private-vlan (VLAN view)

Use **private-vlan** to associate a primary VLAN with the specified secondary VLANs.

Use **undo private-vlan** to dissociate a primary VLAN from the specified secondary VLANs.

Syntax

private-vlan secondary *vlan-id-list*

undo private-vlan [**secondary** *vlan-id-list*]

Default

A primary VLAN is not associated with any secondary VLANs.

Views

VLAN view

Predefined user roles

network-admin

Parameters

secondary *vlan-id-list*: Specifies a space-separated list of up to 10 secondary VLAN items. Each item specifies a secondary VLAN ID or a range of secondary VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for secondary VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. Though the system default VLAN (VLAN 1) is in the valid value range, it cannot be configured in the command.

Usage guidelines

A primary VLAN can be associated with multiple secondary VLANs. When you execute this command in the same VLAN view multiple times, all the specified secondary VLANs are associated with the primary VLAN.

The configuration synchronization is triggered based on the interface configuration when the following conditions exist:

- This command is configured for a primary VLAN.
- Ports on the device are promiscuous, trunk promiscuous, or host ports.

When you execute the **undo private-vlan** command, follow these guidelines:

- If you specify the **secondary** *vlan-id-list* option, this command dissociates the primary VLAN from the specified secondary VLANs.
- If you do not specify the **secondary** *vlan-id-list* option, this command dissociates the primary VLAN from all secondary VLANs.

Examples

Associate primary VLAN 2 with secondary VLANs 3 and 4.

```
<Sysname> system-view
[Sysname] vlan 3 to 4
[Sysname] vlan 2
[Sysname-vlan2] private-vlan primary
[Sysname-vlan2] private-vlan secondary 3 to 4
```

primary-vlan primary

private-vlan community

Use **private-vlan community** to enable Layer 2 communication between ports in a secondary VLAN.

Syntax

private-vlan community

Default

Ports in the same secondary VLAN can communicate with each other at Layer 2.

Views

VLAN view

Predefined user roles

network-admin

Usage guidelines

This command and the **undo private-vlan isolated** command have the same function.

When you use the **save** command to save the configuration, the **private-vlan community** command is not saved into the configuration file.

Examples

This example shows how to meet the following requirements:

- VLAN 4 is a secondary VLAN, and it is associated with primary VLAN 2.
- GigabitEthernet 1/0/1 is a promiscuous port of VLAN 2.
- GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 are host ports.
- GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 can communicate at Layer 2 in secondary VLAN 4.

Configure VLAN 2 as a primary VLAN and associate it with secondary VLAN 4.

```
<Sysname> system-view
[Sysname] vlan 4
[Sysname-vlan4] quit
[Sysname] vlan 2
[Sysname-vlan2] private-vlan primary
[Sysname-vlan2] private-vlan secondary 4
[Sysname-vlan2] quit
```

Configure GigabitEthernet 1/0/1 as a promiscuous port of VLAN 2.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port private-vlan 2 promiscuous
[Sysname-GigabitEthernet1/0/1] quit
```

Assign GigabitEthernet 1/0/2 to VLAN 4 and configure the port as a host port.

```
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] port access vlan 4
[Sysname-GigabitEthernet1/0/2] port private-vlan host
[Sysname-GigabitEthernet1/0/2] quit
```

Assign GigabitEthernet 1/0/3 to VLAN 4 and configure the port as a host port.

```
[Sysname] interface gigabitethernet 1/0/3
[Sysname-GigabitEthernet1/0/3] port access vlan 4
[Sysname-GigabitEthernet1/0/3] port private-vlan host

Usage guidelines

This command takes effect when the following conditions exist:

- The secondary VLAN is associated with a primary VLAN.
- The ports are configured as host ports or trunk secondary ports of the secondary VLAN.

This command is mutually exclusive with the primary VLAN configuration commands.

Examples

This example shows how to meet the following requirements:

- VLAN 4 is a secondary VLAN, and it is associated with primary VLAN 2.
- GigabitEthernet 1/0/1 is a promiscuous port of VLAN 2.
- GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 are host ports.
- GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 are isolated at Layer 2 in secondary VLAN 4.

Configure VLAN 2 as a primary VLAN and associate it with secondary VLAN 4.

```
<Sysname> system-view
[Sysname] vlan 4
[Sysname-vlan4] quit
[Sysname] vlan 2
[Sysname-vlan2] private-vlan primary
[Sysname-vlan2] private-vlan secondary 4
[Sysname-vlan2] quit
```

Configure GigabitEthernet 1/0/1 as a promiscuous port of VLAN 2.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port private-vlan 2 promiscuous
[Sysname-GigabitEthernet1/0/1] quit
```

Assign GigabitEthernet 1/0/2 to VLAN 4 and configure the port as a host port.

```
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] port access vlan 4
[Sysname-GigabitEthernet1/0/2] quit

voice-vlan aging

Use **voice-vlan aging** to set the voice VLAN aging timer.

Use **undo voice-vlan aging** to restore the default.

Syntax

voice-vlan aging *minutes*

undo voice-vlan aging

Default

The voice VLAN aging timer is 1440 minutes (24 hours).

Views

System view

Predefined user roles

network-admin

Parameters

minutes: Sets the voice VLAN aging timer to 0 minutes or a value in the range of 5 to 43200 minutes. If you set the voice VLAN aging timer to 0 minutes, the voice VLAN does not age out.

Usage guidelines

In automatic voice VLAN assignment mode, after a port is assigned to a voice VLAN, the voice VLAN is controlled by a voice VLAN aging timer. The voice VLAN aging timer starts only when the dynamic MAC address entry of the voice VLAN ages out. If no voice packets are received on the port before the voice VLAN aging timer expires, the device removes the port from the voice VLAN.

The aging period for a voice VLAN equals the sum of the voice VLAN aging timer and the aging timer for its dynamic MAC address entry. For more information about the aging timer for dynamic MAC address entries, see MAC address table configuration in *Layer 2—LAN Switching Configuration Guide*.

Set the voice VLAN aging timer only when the voice VLAN assignment mode is automatic.

Examples

Set the voice VLAN aging timer to 100 minutes.

```
<Sysname> system-view
[Sysname] voice-vlan aging 100
```

Related commands

display voice-vlan state

voice-vlan enable

Use **voice-vlan enable** to enable the voice VLAN feature on a port.

Use **undo voice-vlan enable** to disable the voice VLAN feature on a port.

Syntax

voice-vlan *vlan-id* **enable**

undo voice-vlan [*vlan-id*] **enable**

Default

The voice VLAN feature is disabled on ports.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a voice VLAN ID in the range of 2 to 4094.

Usage guidelines

Use this command only on a hybrid or trunk port operating in automatic voice VLAN assignment mode.

Before you execute this command, make sure the specified VLAN already exists.

Examples

Enable the voice VLAN feature on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] voice-vlan 2 enable

Views

System view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a source MAC address of voice traffic, in the format of H-H-H. For example, 1234-1234-1234.

mask *oui-mask*: Specifies the valid length of the OUI address by using a mask in the format of H-H-H. The mask contains consecutive 1s and 0s. For example, ffff-0000-0000. To match the voice devices of a vendor, set the mask to ffff-ff00-0000.

description *text*: Specifies the OUI address description, a case-sensitive string of 1 to 30 characters.

oui: Specifies an OUI address to delete, in the format of H-H-H. For example, 1234-1200-0000. An OUI address is the logical AND result of the *mac-address* and *oui-mask* arguments. It cannot be a broadcast address, a multicast address, or an all-zero address.

Usage guidelines

You can manually delete or add the system default OUI addresses.

The device supports a maximum of 128 OUI addresses.

Examples

Add OUI address **1234-1200-0000** by specifying the MAC address as 1234-1234-1234 and the mask as fff-ff00-0000. Configure the OUI address description as **PhoneA**.

```
<Sysname> system-view
[Sysname] voice-vlan mac-address 1234-1234-1234 mask ffff-ff00-0000 description PhoneA
```

Related commands

display voice-vlan mac-address

voice-vlan mode auto

Use **voice-vlan mode auto** to configure a port to operate in automatic voice VLAN assignment mode.

Use **undo voice-vlan mode auto** to configure a port to operate in manual voice VLAN assignment mode.

Syntax

voice-vlan mode auto

undo voice-vlan mode auto

Default

A port operates in automatic voice VLAN assignment mode.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

To make a voice VLAN take effect on a port operating in manual mode, you must manually assign the port to the voice VLAN.

Examples

Configure GigabitEthernet 1/0/1 to operate in manual voice VLAN assignment mode.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo voice-vlan mode auto
```

Related commands

display voice-vlan state

voice-vlan security enable

Use **voice-vlan security enable** to enable the voice VLAN security mode.

Use **undo voice-vlan security enable** to disable the voice VLAN security mode.

Syntax

voice-vlan security enable

undo voice-vlan security enable

Default

The voice VLAN security mode is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

In security mode, a voice VLAN transmits only voice packets whose source MAC addresses match the OUI addresses of the device.

In normal mode, a voice VLAN transmits voice packets and non-voice packets.

Examples

Disable the voice VLAN security mode.

```
<Sysname> system-view
[Sysname] undo voice-vlan security enable
```

Related commands

display voice-vlan state

voice-vlan track lldp

Use **voice-vlan track lldp** to enable LLDP for automatic IP phone discovery.

Use **undo voice-vlan track lldp** to disable LLDP for automatic IP phone discovery.

Syntax

voice-vlan track lldp

undo voice-vlan track lldp

Views

System view

Default

LLDP for automatic IP phone discovery is disabled.

Predefined user roles

network-admin

Examples

Enable LLDP for automatic IP phone discovery.

```
<Sysname> system-view
[Sysname] voice-vlan track lldp
```

Contents

MVRP commands

display mvrp running-status

Use **display mvrp running-status** to display MVRP running status.

Syntax

display mvrp running-status [**interface** *interface-list*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-list*: Specifies a range of Ethernet interfaces in the form of *interface-type interface-number1* [**to** *interface-type interface-number2*]. The *interface-type interface-number* argument represents the interface type and interface number. The value for the *interface-number2* argument must be greater than or equal to the value for the *interface-number1* argument. If the specified interfaces are not enabled with MVRP, this command displays global MVRP information. If you do not specify this option, the command displays global MVRP information and MVRP running status for all MVRP-enabled ports.

Examples

Display global MVRP information and MVRP running status for all MVRP-enabled ports.

```
<Sysname> display mvrp running-status
 -------[MVRP Global Info]-------
 Global Status     : Enabled
 Compliance-GVRP   : False

 ----[GigabitEthernet1/0/1]----
 Config Status                  : Enabled
 Running Status                 : Enabled
 Join Timer                     : 20 (centiseconds)
 Leave Timer                    : 60 (centiseconds)
 Periodic Timer                 : 100 (centiseconds)
 LeaveAll Timer                 : 1000 (centiseconds)
 Registration Type              : Normal
 Registered VLANs :
  1(default), 2-10
 Declared VLANs :
  1(default), 2-10
 Propagated VLANs :
  1(default), 2-10

 ----[GigabitEthernet1/0/2]----
 Config Status                  : Enabled
```

```
Running Status                  : Disabled
Join Timer                      : 20 (centiseconds)
Leave Timer                     : 60 (centiseconds)
Periodic Timer                  : 100 (centiseconds)
LeaveAll Timer                  : 1000 (centiseconds)
Registration Type               : Normal
Registered VLANs :
 None
Declared  VLANs :
 None
Propagated VLANs :
 None
```

Table 1 Command output

Field	Description
MVRP Global Info	Global MVRP information.
Global Status	Global MVRP status: • Enabled. • Disabled.
Compliance-GVRP	GVRP compatibility status: • **True**—Compatible. • **False**—Incompatible.
Config Status	Whether MVRP is enabled on the port: • Enabled. • Disabled.
Running Status	Whether MVRP takes effect on the port: • **Enabled**—MVRP takes effect on the port. • **Disabled**—MVRP does not take effect on the port. Whether MVRP takes effect on a port is determined by the following items: • Global and port-specific MVRP enabling status. • Physical link state of the port. • Port link type. • Whether the port is a member of an aggregation group.
Registration Type	MVRP registration mode: • Normal. • Fixed. • Forbidden.
Registered VLANs	VLANs that the port has registered.
Declared VLANs	VLANs that the port has declared to its peer participant.
Propagated VLANs	VLANs that the port has learned and notified other participants on the same device to declare to their respective peer participants.

display mvrp state

Use **`display mvrp state`** to display the MVRP state of a port in a VLAN.

Syntax

display mvrp state interface *interface-type interface-number* **vlan** *vlan-id*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

Examples

Display the MVRP state of GigabitEthernet 1/0/1 in VLAN 2.

```
<Sysname> display mvrp state interface gigabitethernet 1/0/1 vlan 2
 MVRP state of VLAN 2 on port GE1/0/1:
 Port                      VLAN   App-state   Reg-state
 ------------------------ ------ ----------- -----------
 GE1/0/1                     2       VP          IN
```

Table 2 Command output

Field	Description
MVRP state of VLAN 2 on port GE1/0/1	MVRP state of GigabitEthernet 1/0/1 in VLAN 2.
App-state	State of the attribute that the local participant declares to its peer participant: • **VO**—Very anxious observer. • **VP**—Very anxious passive. • **VN**—Very anxious new. • **AN**—Anxious new. • **AA**—Anxious active. • **QA**—Quiet active. • **LA**—Leaving active. • **AO**—Anxious observer. • **QO**—Quiet observer. • **AP**—Anxious passive. • **QP**—Quiet passive. • **LO**—Leaving observer.
Reg-state	Registration state of the attribute declared by the peer participant on the local participant: • **IN**—The attribute is registered. • **LV**—The attribute is previously registered, but now it is being deregistered. • **MT**—The attribute is not registered.

display mvrp statistics

Use **display mvrp statistics** to display MVRP statistics.

Syntax

display mvrp statistics [**interface** *interface-list*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-list*: Specifies a range of Ethernet interfaces in the form of *interface-type interface-number1* [**to** *interface-type interface-number2*]. The *interface-type interface-number* argument represents the interface type and interface number. The value for the *interface-number2* argument must be greater than or equal to the value for the *interface-number1* argument. If you do not specify this option, the command displays MVRP statistics of all MVRP-enabled ports.

Usage guidelines

If MVRP is disabled on the specified ports, this command does not provide any output.

Examples

Display MVRP statistics of all ports.

```
<Sysname> display mvrp statistics

 ----[GigabitEthernet1/0/1]----
 Failed Registrations        : 1
 Last PDU Origin             : 000f-e200-0010

  LeaveAll Event Transmitted  : 0
 Frames Discarded            : 0
```

Table 3 Command output

Field	Description
Failed Registrations	Number of VLAN registration failures through MVRP on the local participant.
Last PDU Origin	Source MAC address of the last MVRPDU.
Frames Received	Number of MVRP frames received.
New Event Received	Number of New events received.
JoinIn Event Received	Number of JoinIn events received.
In Event Received	Number of In events received.
JoinMt Event Received	Number of JoinMt events received.
Mt Event Received	Number of Mt events received.
Leave Event Received	Number of Leave events received.
LeaveAll Event Received	Number of LeaveAll events received.
Frames Transmitted	Number of MVRP frames sent.
New Event Transmitted	Number of New events sent.
JoinIn Event Transmitted	Number of JoinIn events sent.
In Event Transmitted	Number of In events sent.
JoinMt Event Transmitted	Number of JoinMt events sent.
Mt Event Transmitted	Number of Mt events sent.
Leave Event Transmitted	Number of Leave events sent.
LeaveAll Event Transmitted	Number of LeaveAll events sent.
Frames Discarded	Number of MVRP frames dropped.

mrp timer join

Use **mrp timer join** to set the Join timer.

Use **undo mrp timer join** to restore the default.

Syntax

mrp timer join *timer-value*

undo mrp timer join

Default

The Join timer is 20 centiseconds.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

timer-value: Specifies the Join timer value (in centiseconds). The Join timer must meet the following requirements:

- Not less than 20 centiseconds.
- Less than half the Leave timer.
- Divisible by 20 centiseconds.

Examples

Set the Join timer to 40 centiseconds. (In this example, the Leave timer is 100 centiseconds.)

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mrp timer join 40
```

Related commands

display mvrp running-status

mrp timer leave

mrp timer leave

Use **mrp timer leave** to set the Leave timer.

Use **undo mrp timer leave** to restore the default.

Syntax

mrp timer leave *timer-value*

undo mrp timer leave

Default

The Leave timer is 60 centiseconds.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

timer-value: Specifies the Leave timer value (in centiseconds). The Leave timer must meet the following requirements:

- Greater than two times the Join timer.
- Less than the LeaveAll timer.
- Divisible by 20 centiseconds.

Examples

Set the Leave timer to 100 centiseconds. (In this example, the Join timer and LeaveAll timer use their default settings.)

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mrp timer leave 100
```

Related commands

display mvrp running-status

mrp timer join

mrp timer leaveall

mrp timer leaveall

Use **mrp timer leaveall** to set the LeaveAll timer.

Use **undo mrp timer leaveall** to restore the default.

Syntax

mrp timer leaveall *timer-value*

undo mrp timer leaveall

Default

The LeaveAll timer is 1000 centiseconds.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameter

timer-value: Specifies the LeaveAll timer value (in centiseconds). The LeaveAll timer must meet the following requirements:

- Greater than any Leave timer on each port.
- Not greater than 32760 centiseconds.
- Divisible by 20 centiseconds.

Usage guidelines

Each time the LeaveAll timer of a port expires, all attributes of the MSTIs on the port are deregistered throughout the network. To prevent this type of deregistration from affecting the network, do not set the LeaveAll timer to less than its default value.

To keep the dynamic VLANs learned through MVRP stable, do not set the LeaveAll timer less than its default value.

The device randomly changes the LeaveAll timer within a certain range when an MRP participant restarts its LeaveAll timer. This prevents the LeaveAll timer of a particular participant from always expiring first.

Examples

Set the LeaveAll timer to 1500 centiseconds. (In this example, the Leave timer on each port uses the default setting.)

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mrp timer leaveall 1500
```

Related commands

display mvrp running-status

mrp timer leave

mrp timer periodic

Use **mrp timer periodic** to set the Periodic timer.

Use **undo mrp timer periodic** to restore the default.

Syntax

mrp timer periodic *timer-value*

undo mrp timer periodic

Default

The Periodic timer is 100 centiseconds.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

timer-value: Specifies the Periodic timer, which can be 0 or 100 centiseconds.

Usage guidelines

Setting the Periodic timer to 0 disables the Periodic timer.

Setting the Periodic timer to 100 enables the Periodic timer. The participant then sends MRP frames at an interval of 100 centiseconds.

Examples

Disable the Periodic timer.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mrp timer periodic 0
```

Related commands

display mvrp running-status

mvrp enable

Use **mvrp enable** to enable MVRP on a port.

Use **undo mvrp enable** to disable MVRP on a port.

Syntax

mvrp enable

undo mvrp enable

Default

MVRP is disabled on a port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

For MVRP to take effect on a port, make sure the following requirements are met:

- MVRP is enabled both globally and on the port.
- The port is physically up.
- The port link type is trunk.
- The port is not a member of an aggregation group.

Examples

Enable MVRP on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] mvrp global enable
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type trunk
[Sysname-GigabitEthernet1/0/1] mvrp enable
```

Related commands

display mvrp running-status

mvrp global enable

Use **mvrp global enable** to enable MVRP globally.

Use **undo mvrp global enable** to disable MVRP globally.

Syntax

mvrp global enable

undo mvrp global enable

Default

MVRP is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

For MVRP to take effect on a port, enable MVRP both on the port and globally.

Examples

Enable MVRP globally.

```
<Sysname> system-view
[Sysname] mvrp global enable
```

Related commands

display mvrp running-status

mvrp gvrp-compliance enable

Use **mvrp gvrp-compliance enable** to enable GVRP compatibility for MVRP.

Use **undo mvrp gvrp-compliance enable** to restore the default.

Syntax

mvrp gvrp-compliance enable

undo mvrp gvrp-compliance enable

Default

MVRP is incompatible with GVRP.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When you enable GVRP compatibility for MVRP, the device can receive and send both MVRP and GVRP frames.

Examples

Enable GVRP compatibility for MVRP.

```
<Sysname> system-view
[Sysname] mvrp gvrp-compliance enable
```

Related commands

display mvrp running-status

mvrp registration

Use **mvrp registration** to set the MVRP registration mode on a port.

Use **undo mvrp registration** to restore the default.

Syntax

mvrp registration { **fixed** | **forbidden** | **normal** }

undo mvrp registration

Default

The MVRP registration mode is normal.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

fixed: Specifies the fixed registration mode.

forbidden: Specifies the forbidden registration mode.

normal: Specifies the normal registration mode.

Examples

Set the MVRP registration mode to fixed on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mvrp registration fixed
```

Related commands

display mvrp running-status

reset mvrp statistics

Use **reset mvrp statistics** to clear MVRP statistics for ports.

Syntax

reset mvrp statistics [**interface** *interface-list*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-list*: Specifies a range of Ethernet interfaces in the form of *interface-type interface-number1* [**to** *interface-type interface-number2*]. The *interface-type interface-number* argument represents the interface type and interface number. The value for the *interface-number2* argument must be greater than or equal to the value for the *interface-number1* argument. If you do not specify this option, the command clears MVRP statistics of all ports.

Examples

Clear MVRP statistics for all ports.

```
<Sysname> reset mvrp statistics
```

Related commands

display mvrp statistics

QinQ commands

The S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series do not support QinQ.

This document uses the following terms:

- **CVLAN**—Customer network VLANs, also called inner VLANs, refer to VLANs that a customer uses on the private network.
- **SVLAN**—Service provider network VLANs, also called outer VLANs, refer to VLANs that a service provider uses to transmit VLAN tagged traffic for customers.

display qinq

Use **display qinq** to display QinQ-enabled interfaces.

Syntax

display qinq [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays all QinQ-enabled interfaces.

Usage guidelines

If QinQ is not enabled on any interfaces, this command does not provide any output.

Examples

Enable QinQ on GigabitEthernet 1/0/1. Then, verify that QinQ is enabled on the interface.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qinq enable
[Sysname-GigabitEthernet1/0/1] display qinq interface gigabitethernet 1/0/1
Interface
 GigabitEthernet1/0/1
```

Enable QinQ on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/3. Then, verify that QinQ is enabled on the interfaces.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qinq enable
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] interface gigabitethernet 1/0/3
[Sysname-GigabitEthernet1/0/3] qinq enable
[Sysname-GigabitEthernet1/0/3] display qinq
Interface
```

```
GigabitEthernet1/0/1
GigabitEthernet1/0/3
```

Related commands

qinq enable

qinq enable

Use **qinq enable** to enable QinQ on an interface.

Use **undo qinq enable** to disable QinQ on an interface.

Syntax

qinq enable

undo qinq enable

Default

QinQ is disabled on interfaces.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Examples

Enable QinQ on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qinq enable
```

Related commands

display qinq

qinq ethernet-type (interface view)

Use **qinq ethernet-type** to set the TPID value in SVLAN tags on an interface.

Use **undo qinq ethernet-type** to restore the default TPID value in SVLAN tags on an interface.

Syntax

qinq ethernet-type service-tag *hex-value*

undo qinq ethernet-type service-tag

Default

The TPID value in SVLAN tags is 8100 in hexadecimal notation.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

service-tag: Sets the TPID value in the SVLAN tag.

hex-value: Sets a hexadecimal TPID value in the range of 1 to ffff, excluding the reserved EtherType values listed in Table 1.

Table 1 Reserved EtherType values

Protocol type	Value
ARP	0x0806
PUP	0x0200
RARP	0x8035
IP	0x0800
IPv6	0x86dd
PPPoE	0x8863/0x8864
MPLS	0x8847/0x8848
IPX/SPX	0x8137
IS-IS	0x8000
LACP	0x8809
LLDP	0x88cc
802.1X	0x888e
802.1ag	0x8902
Cluster	0x88a7
Reserved	0xfffd/0xfffe/0xffff

Usage guidelines

A port without QinQ enabled uses the SVLAN TPID to match incoming tagged frames. The port modifies the TPID in the SVLAN tag of outgoing frames as the configured value.

Examples

Set the TPID value in SVLAN tags to 9100 (hexadecimal) on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qinq ethernet-type service-tag 9100
```

Related commands

qinq ethernet-type (system view)

qinq ethernet-type (system view)

Use **qinq ethernet-type** to set the TPID value in CVLAN tags.

Use **undo qinq ethernet-type** to restore the default TPID value in CVLAN tags.

Syntax

qinq ethernet-type customer-tag *hex-value*

undo qinq ethernet-type customer-tag

Default

The TPID value in CVLAN tags is 8100 in hexadecimal notation.

Views

System view

Predefined user roles

network-admin

Parameters

customer-tag: Sets the TPID value in the CVLAN tag.

hex-value: Sets a hexadecimal TPID value in the range of 1 to ffff, excluding the reserved EtherType values listed in Table 2.

Table 2 Reserved EtherType values

Protocol type	Value
ARP	0x0806
PUP	0x0200
RARP	0x8035
IP	0x0800
IPv6	0x86dd
PPPoE	0x8863/0x8864
MPLS	0x8847/0x8848
IPX/SPX	0x8137
IS-IS	0x8000
LACP	0x8809
LLDP	0x88cc
802.1X	0x888e
802.1ag	0x8902
Cluster	0x88a7
Reserved	0xfffd/0xfffe/0xffff

Examples

Set the TPID value in CVLAN tags to 8200 (hexadecimal).

```
<Sysname> system-view
[Sysname] qinq ethernet-type customer-tag 8200
```

Related commands

qinq ethernet-type (interface view)

qinq transparent-vlan

Use **qinq transparent-vlan** to enable transparent transmission for a list of VLANs on a port.

Use **undo qinq transparent-vlan** to disable transparent transmission for a list of VLANs on a port.

Syntax

qinq transparent-vlan *vlan-id-list*

undo qinq transparent-vlan { *vlan-id-list* | **all** }

Default

Transparent transmission is disabled for all VLANs.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a single VLAN ID or a VLAN ID range in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The end VLAN ID must be equal to or greater than the start VLAN ID.

all: Specifies all VLANs.

Usage guidelines

By default, QinQ tags all incoming frames with the PVID on a port. This command disables QinQ to tag incoming traffic from a list of VLANs. These VLANs are called transparent VLANs.

You can repeat this command to add VLANs to the list of transparent VLANs.

To ensure successful transmission for a transparent VLAN, follow these configuration guidelines:

- Set the link type of the port to trunk or hybrid, and assign the port to the transparent VLAN.
- Do not configure any other VLAN manipulation actions for the transparent VLAN on the port.
- Make sure all ports on the traffic path permit the transparent VLAN to pass through.
- If you use both transparent VLANs and VLAN mappings on an interface, the transparent VLANs cannot be the original or translated VLANs of one-to-one or one-to-two VLAN mappings.

Examples

Configure GigabitEthernet 1/0/1 as a trunk port, and assign the port to VLAN 2, VLAN 3, and VLANs 50 through 100. Enable QinQ on GigabitEthernet 1/0/1, and configure the port to transparently transmit frames from VLAN 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type trunk
[Sysname-GigabitEthernet1/0/1] port trunk permit vlan 2 3 50 to 100
[Sysname-GigabitEthernet1/0/1] qinq enable
[Sysname-GigabitEthernet1/0/1] qinq transparent-vlan 2
```

VLAN mapping commands

display vlan mapping

Use **display vlan mapping** to display VLAN mapping information.

Syntax

display vlan mapping [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays VLAN mapping information on all interfaces.

Examples

Display VLAN mapping information on all interfaces.

```
<Sysname> display vlan mapping

Interface GigabitEthernet1/0/1:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  10            N/A           120                      N/A

Interface GigabitEthernet1/0/2:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  1024-4094     N/A           100                      N/A

Interface GigabitEthernet1/0/3:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  12            N/A           110                      12
```

Table 1 Command output

Field	Description
Outer VLAN	Original outer VLAN. This field indicates the original VLAN for a one-to-one, many-to-one, or one-to-two VLAN mapping.
Inner VLAN	Original inner VLAN. This field displays **N/A** for a one-to-one, many-to-one, or one-to-two VLAN mapping.
Translated Outer VLAN	Translated outer VLAN. This field indicates the translated VLAN for a one-to-one or

Field	Description
	many-to-one VLAN mapping. This field indicates the SVLAN to be added for a one-to-two VLAN mapping.
Translated Inner VLAN	Translated inner VLAN. This field displays **N/A** for a one-to-one or many-to-one VLAN mapping.

Related commands

vlan mapping

vlan mapping

Use **vlan mapping** to configure VLAN mapping on an interface.

Use **undo vlan mapping** to cancel the VLAN mapping configuration.

NOTE:

Many-to-one VLAN mapping is supported only in Release 6350 and later.

Syntax

vlan mapping { *vlan-id* **translated-vlan** *vlan-id* | **nest** { **range** *vlan-range-list* | **single** *vlan-id-list* } **nested-vlan** *vlan-id* | **uni** { **range** *vlan-range-list* | **single** *vlan-id-list* } **translated-vlan** *vlan-id* }

undo vlan mapping { *vlan-id* **translated-vlan** *vlan-id* | **all** | **nest** { **range** *vlan-range-list* | **single** *vlan-id-list* } **nested-vlan** *vlan-id* | **uni** { **range** *vlan-range-list* | **single** *vlan-id-list* } **translated-vlan** *vlan-id* }

Default

No VLAN mapping is configured on an interface.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id **translated-vlan** *vlan-id*: Specifies the original VLAN and translated VLAN for a one-to-one VLAN mapping. The value range for the *vlan-id* argument is 1 to 4094. The original VLAN and the translated VLAN cannot be the same.

uni range *vlan-range-list* **translated-vlan** *vlan-id*: Specifies the original VLAN ranges and the translated VLAN for a many-to-one VLAN mapping on the customer-side port. The *vlan-range-list* argument specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be greater than the value for the *vlan-id1* argument. The value range for the *vlan-id* argument is 1 to 4094. Different VLAN ranges cannot overlap. Any of the original VLANs cannot be the same as the translated VLAN.

uni single *vlan-id-list* **translated-vlan** *vlan-id*: Specifies the original VLANs and the translated VLAN for a many-to-one VLAN mapping on the customer-side port. The

vlan-id-list argument specifies a space-separated list of up to 10 VLAN IDs, each of which is in the range of 1 to 4094. The value range for the *vlan-id* argument is 1 to 4094. Any of the original VLANs cannot be the same as the translated VLAN.

nest range *vlan-range-list* **nested-vlan** *vlan-id*: Specifies the CVLAN ranges and the SVLAN for a one-to-two VLAN mapping. The *vlan-range-list* argument specifies a space-separated list of up to 10 CVLAN items. Each item specifies a CVLAN ID or a range of CVLAN IDs in the format of *vlan-id1* **to** *vlan-id2*. The value range for CVLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be greater than the value for the *vlan-id1* argument. Different CVLAN ranges cannot overlap. The *vlan-id* argument specifies the SVLAN ID in the range of 1 to 4094.

nest single *vlan-id-list* **nested-vlan** *vlan-id*: Specifies the CVLANs and the SVLAN for a one-to-two VLAN mapping. The *vlan-id-list* argument specifies a space-separated list of up to 10 CVLAN IDs, each of which is in the range of 1 to 4094. The *vlan-id* argument specifies the SVLAN ID in the range of 1 to 4094.

all: Deletes all VLAN mapping configurations from the interface.

Usage guidelines

VLAN mapping takes effect only on VLAN-tagged packets received on an interface.

The original and translated VLANs in VLAN mappings on the same interface must meet the following requirements:

- Different types of VLAN mapping entries cannot include the same original VLANs or translated VLANs.
- Different one-to-one VLAN mapping entries cannot include the same translated VLANs. If you configure multiple one-to-one VLAN mapping entries for the same original VLANs, the most recent configuration takes effect.

Before you enable or disable QinQ on a port, you must remove all VLAN mappings on the port.

If you use both transparent VLANs and VLAN mappings on an interface, the transparent VLANs cannot be the following VLANs:

- Original or translated VLANs of one-to-one and one-to-two VLAN mappings.

The MTU of an interface is 1500 bytes by default. After a VLAN tag is added to a packet, the packet length is added by 4 bytes. As a best practice, set the MTU to a minimum of 1504 bytes for ports on the forwarding path of the packet on the service provider network.

Examples

Configure a one-to-one VLAN mapping on GigabitEthernet 1/0/1 to map VLAN 1 to VLAN 101.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] vlan mapping 1 translated-vlan 101
```

Configure many-to-one VLAN mappings on the customer-side port (GigabitEthernet 1/0/2) to map VLANs 1 through 50 and 80 to VLAN 101.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] vlan mapping uni range 1 to 50 translated-vlan 101
[Sysname-GigabitEthernet1/0/2] vlan mapping uni single 80 translated-vlan 101
```

Configure one-to-two VLAN mappings on GigabitEthernet 1/0/4 to add SVLAN tag 101 to packets carrying VLAN tags 1 through 10 and VLAN tag 80.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/4
[Sysname-GigabitEthernet1/0/4] vlan mapping nest range 1 to 10 nested-vlan 101
```

```
[Sysname-GigabitEthernet1/0/4] vlan mapping nest single 80 nested-vlan 101
```

Related commands

display vlan mapping

Contents

LLDP commands

cdp voice-vlan

Use **cdp voice-vlan** to set the voice VLAN ID carried in CDP frames.

Use **undo cdp voice-vlan** to restore the default.

NOTE:

This command is not available on the S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, or WAS6000 switch series.

Syntax

cdp voice-vlan *vlan-id*

undo cdp voice-vlan

Default

No voice VLAN ID is configured to be carried in CDP frames.

Views

Layer 2 Ethernet interface view

Default command level

network-admin

Parameters

vlan-id: Specifies a voice VLAN ID to be advertised, in the range of 1 to 4094.

Usage guidelines

With this command configured, CDP frames sent to IP phones from the interface carry the voice VLAN ID specified in this command. IP phones use the voice VLAN ID to send voice traffic.

Examples

Set the voice VLAN ID carried in CDP frames to 100.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] cdp voice-vlan 100
```

display lldp local-information

Use **display lldp local-information** to display local LLDP information.

Syntax

display lldp local-information [**global** | **interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

global: Displays the global local LLDP information.

interface *interface-type interface-number*: Specifies a port by its type and number.

Usage guidelines

If you do not specify any keywords or arguments, the command displays all local LLDP information, which includes the following:

- The global LLDP information.
- The LLDP information about the LLDP-enabled ports in up state.

Examples

Display all local LLDP information.

```

Table 1 Command output

Field	Description
Chassis ID	Bridge MAC address of the device.
System capabilities supported	Supported capabilities: • **Bridge**—Switching is supported. • **Router**—Routing is supported. • **Repeater**—Signal repeating is supported. • **Telephone**—The local device can act as a telephone.

Field	Description
	• **DocsisCableDevice**—The local device can act as a DOCSIS-compliant cable device. • **StationOnly**—The local device can act as a station only. • **Customer Bridge**—The customer bridge feature is supported. • **Service Bridge**—The service bridge feature is supported. • **TPMR**—The TPMR feature is supported. • **Other**—Features other than those listed above are supported.
System capabilities enabled	Enabled capabilities: • **Bridge**—Switching is enabled. • **Router**—Routing is enabled. • **Repeater**—Signal repeating is enabled. • **Telephone**—The local device is acting as a telephone. • **DocsisCableDevice**—The local device is acting as a DOCSIS-compliant cable device. • **StationOnly**—The local device is acting as a station only. • **Customer Bridge**—The customer bridge feature is enabled. • **Service Bridge**—The service bridge feature is enabled. • **TPMR**—The TPMR feature is enabled. • **Other**—Features other than those listed above are enabled.
Device class	MED device class: • **Connectivity device**—Network device. • **Class I**—Normal terminal device. It requires the basic LLDP discovery services. • **Class II**—Media terminal device. It supports media streams, and can also act as a normal terminal device. • **Class III**—Communication terminal device. It supports the IP communication systems of end users, and can also act as a normal terminal device or media terminal device.
MED inventory information of master board	MED inventory information about the .
HardwareRev	Hardware version.
FirmwareRev	Firmware version.
SoftwareRev	Software version.
SerialNum	Serial number.
Manufacturer name	Device manufacturer.
Model name	Device model.
Port ID type	Port ID type: • MAC address. • Interface name.
Port ID	Port ID, the value of which depends on the port ID type.
Management address interface type	Numbering type of the interface identified by the management address.
Management address interface ID	Index of the interface identified by the management address.
Management address OID	Management address object ID.
Port VLAN ID(PVID)	Port PVID.

Field	Description
Port and protocol VLAN ID(PPVID)	Port protocol VLAN ID.
Port and protocol VLAN supported	Indicates whether protocol VLAN is supported on the port.
Port and protocol VLAN enabled	Indicates whether protocol VLAN is enabled on the port.
Link aggregation supported	Indicates whether link aggregation is supported on the port.
Link aggregation enabled	Indicates whether link aggregation is enabled on the port.
Aggregation port ID	Member port ID, which is 0 when link aggregation is disabled.
Auto-negotiation supported	Indicates whether autonegotiation is supported on the port.
Auto-negotiation enabled	Indicates whether autonegotiation is enabled on the port.
OperMau	Speed and duplex state of the port.
Power port class	PoE port class: • **PSE**—Power sourcing equipment. • **PD**—Powered device.
PSE power supported	Indicates whether the device can operate as a PSE.
PSE power enabled	Indicates whether the device is operating as a PSE.
PSE pairs control ability	Indicates whether the pair selection ability is available.
Power pairs	Power supply mode: • **Signal**—Uses data pairs to supply power. • **Spare**—Uses spare pairs to supply power.
Port power classification	Power class of the PD: • Class 0. • Class 1. • Class 2. • Class 3. • Class 4.
PoE PSE power source	PSE power source type: • **Unknown**—Unknown power supply. • **Primary**—Primary power supply. • **Backup**—Backup power supply.
PoE PD power source	PD power source type: • **Unknown**—Unknown power supply. • **PSE**—PSE power supply. • **Local**—Local power supply. • **PSE and local**—PSE and local power supplies.
Port PSE priority	PoE power supply priority of PSE ports: • Unknown. • Critical. • High. • Low.
Port PD priority	PoE power receiving priority of PD ports: • Unknown. • Critical. • High.

Field	Description
	• Low.
Port available power value	Available PoE power on PSE ports, or power needed on PD ports, in watts.
Transmit Tw	Sleep time of the local client, in μs.
Receive Tw	Sleep time of the peer client expected by the local client, in μs.
Fallback Tw	Candidate sleep time of the peer client expected by the local client, in μs.
Echo Transmit Tw	Sleep time of the peer client, in μs. This field displays zero when one of the following cases occurs: • The local client has not received the sleep time of the peer client. • The sleep time of the peer client is 0 μs.
Echo Receive Tw	Sleep time of the local client expected by the peer client, in μs. This field displays zero when one of the following cases occurs: • The local client has not received the expected sleep time from the peer client. • The sleep time of the local client expected by the peer client is 0 μs.
Current power	Current power of a PoE interface, including PD consumption power and transmission loss.
Average power	Average power of a PoE interface.
Peak power	Peak power of a PoE interface.
Max Power	This field is supported only in R6350 and later. Maximum power of a PoE interface.
Current	This field is supported only in R6350 and later. Current of a PoE interface at the moment, in mA.

display lldp neighbor-information

Use **display lldp neighbor-information** to display the LLDP information received from the neighboring devices.

Syntax

display lldp neighbor-information [[[**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }] [**verbose**]] | **list** [**system-name** *system-name*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the LLDP information that all ports receive from the neighboring devices.

agent: Specifies an agent type. If you do not specify an agent type, the command displays the LLDP information that all LLDP agents receive from the neighboring devices.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

verbose: Displays the detailed LLDP information that the local device receives from the neighboring devices. If you do not specify this keyword, the command displays the brief LLDP information that the local device receives from the neighboring devices.

list: Displays the LLDP information that the local device receives from the neighboring devices in the form of a list.

system-name *system-name*: Displays the LLDP information that the local device receives from a neighboring device specified by its system name. The *system-name* argument is a string of 1 to 255 characters. If you do not specify this option, the command displays the LLDP information that the local device receives from all neighboring devices in a list.

Examples

Display detailed LLDP information that the nearest bridge agents on all ports received from the neighboring devices.

```
<Sysname> display lldp neighbor-information agent nearest-bridge verbose

Table 2 Command output

Field	Description
LLDP neighbor-information of port 1	LLDP information received through port 1.
Update time	Time when LLDP information about a neighboring device was last updated.
LLDP mac type	Type of the neighbor MAC address: • Nearest bridge. • Nearest customer bridge.

Field	Description
	• Nearest non-TPMR bridge.
Chassis type	Chassis ID type: • **Chassis component**. • **Interface alias**. • **Port component**. • **MAC address**. • **Network address (ipv4)**. • **Interface name**. • **Locally assigned**—Locally-defined chassis type other than those listed above.
Chassis ID	ID that identifies the LLDP sending device, which can be a MAC address, a network address, an interface, or some other value, depending on the chassis ID type of the neighboring device.
Port ID type	Port ID type: • **Interface alias**. • **Port component**. • **MAC address**. • **Network address (ipv4)**. • **Interface name**. • **Agent circuit ID**. • **Locally assigned**—Locally-defined port ID type other than those listed above.
Port ID	Value of the type of the port ID.
System name	System name of the neighboring device.
System description	System description of the neighboring device.
System capabilities supported	Capabilities supported on the neighboring device: • **Repeater**—Signal repeating is supported. • **Bridge**—Switching is supported. • **Router**—Routing is supported. • **Telephone**—The neighboring device can act as a telephone. • **DocsisCableDevice**—The neighboring device can act as a DOCSIS-compliant cable device. • **StationOnly**—The neighboring device can act as a station only. • **Customer Bridge**—The customer bridge feature is enabled. • **Service Bridge**—The service bridge feature is enabled. • **TPMR**—The TPMR feature is enabled. • **Other**—Features other than those listed above are supported.
System capabilities enabled	Capabilities enabled on the neighboring device: • **Repeater**—Signal repeating is enabled. • **Bridge**—Switching is enabled. • **Router**—Routing is enabled. • **Telephone**—The neighboring device is acting as a telephone. • **DocsisCableDevice**—The neighboring device is acting as a DOCSIS-compliant cable device. • **StationOnly**—The neighboring device is acting as a station only. • **Customer Bridge**—The customer bridge feature is enabled. • **Service Bridge**—The service bridge feature is enabled.

Field	Description
	• **TPMR**—The TPMR feature is enabled. • **Other**—Features other than those listed above are supported.
Management address OID	Management address object ID.
Link aggregation supported	Indicates whether link aggregation is supported.
Link aggregation enabled	Indicates whether link aggregation is enabled.
Aggregation port ID	Member port ID, which is 0 when link aggregation is disabled.
Auto-negotiation supported	Indicates whether autonegotiation is supported on the port.
Auto-negotiation enabled	Indicates whether autonegotiation is enabled on the port.
OperMau	Speed and duplex state on the port.
Power port class	PoE port class: • **PSE**—Power sourcing equipment. • **PD**—Powered device.
PSE power supported	Indicates whether the device can operate as a PSE.
PSE power enabled	Indicates whether the device is operating as a PSE.
PSE pairs control ability	Indicates whether the pair selection ability is available.
Power pairs	Power supply mode: • **Signal**—Uses data pairs to supply power. • **Spare**—Uses spare pairs to supply power.
Port power classification	Power class of the PD: • Class 0. • Class 1. • Class 2. • Class 3. • Class 4.
TLV type	Unknown basic TLV type.
TLV information	Information contained in the unknown basic TLV type.
Unknown organizationally-defined TLV	Unknown organizationally specific TLV.
TLV OUI	OUI of the unknown organizationally specific TLV.
TLV subtype	Unknown organizationally specific TLV subtype.
Index	Unknown organization index.
Capabilities	Capabilities enabled on the neighboring device: • **Repeater**—Signal repeating is enabled. • **Bridge**—Switching is enabled. • **Router**—Routing is enabled. • **Telephone**—The neighboring device is acting as a telephone. • **DocsisCableDevice**—The neighboring device is acting as a DOCSIS-compliant cable device. • **StationOnly**—The neighboring device is acting as a station only. • **Other**—Features other than those listed above are supported. • **None**—The neighboring device does not advertise this TLV.
Local Interface	Local port that receives the LLDP information.

Field	Description
Chassis ID : * -- -- Nearest nontpmr bridge neighbor #-- -- Nearest customer bridge neighbor	Chassis ID flag: • An asterisk (*) indicates the nearest non-TPMR bridge neighbor. • A pound sign (#) indicates the nearest customer bridge neighbor.

display lldp statistics

Use **display lldp statistics** to display the global LLDP statistics or the LLDP statistics of a port.

Syntax

display lldp statistics [**global** | [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

global: Displays the global LLDP statistics.

interface *interface-type interface-number*: Specifies a port by its type and number.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the statistics for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Usage guidelines

If you do not specify any keywords or arguments, the command displays the global LLDP statistics and the LLDP statistics of all ports.

Examples

Display the global LLDP statistics and the LLDP statistics of all ports.

```
<Sysname> display lldp statistics
LLDP statistics global information:
LLDP neighbor information last change time:0 days, 0 hours, 4 minutes, 40 seconds
The number of LLDP neighbor information inserted : 1
The number of LLDP neighbor information deleted  : 1
The number of LLDP neighbor information dropped  : 0
The number of LLDP neighbor information aged out : 1

LLDP statistics information of port 1 [GigabitEthernet1/0/1]:
LLDP agent nearest-bridge:
```

```
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0

LLDP agent nearest-nontpmr:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0

LLDP agent nearest-customer:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0
```

Display the LLDP statistics for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Sysname> display lldp statistics interface GigabitEthernet1/0/1 agent nearest-customer
LLDP statistics information of port 1 [GigabitEthernet1/0/1]:
LLDP agent nearest-customer:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
```

```
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0
```

Table 3 Command output

Field	Description
LLDP statistics global information	Global LLDP statistics.
LLDP neighbor information last change time	Time when the neighbor information was last updated.
The number of LLDP neighbor information inserted	Number of times neighbor information was added.
The number of LLDP neighbor information deleted	Number of times neighbor information was removed.
The number of LLDP neighbor information dropped	Number of times neighbor information was dropped due to lack of available memory space.

display lldp status

Use **display lldp status** to display LLDP status.

Syntax

display lldp status [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the global LLDP status and the LLDP status of all ports.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the status information for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Examples

Display the global LLDP status and the LLDP status of each port.

```
<Sysname> display lldp status
Global status of LLDP: Enable
Bridge mode of LLDP: customer-bridge
The current number of LLDP neighbors: 5
The current number of CDP neighbors: 0
LLDP neighbor information last changed time: 0 days, 0 hours, 4 minutes, 40 seconds
```

```
Transmit interval              : 30s
Fast transmit interval         : 1s
Transmit max credit            : 5
Hold multiplier                : 4
Reinit delay                   : 2s
Trap interval                  : 5s
Fast start times               : 3

LLDP status information of port 1 [GigabitEthernet1/0/1]:
LLDP agent nearest-bridge:
Port status of LLDP            : Enable
Admin status                   : TX_RX
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5

LLDP agent nearest-nontpmr:
Port status of LLDP            : Enable
Admin status                   : TX_RX
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5

LLDP agent nearest-customer:
Port status of LLDP            : Enable
Admin status                   : TX_RX
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5
```

Table 4 Command output

Field	Description
Bridge mode of LLDP	LLDP bridge mode: service-bridge or customer-bridge.

Field	Description
Global status of LLDP	Indicates whether LLDP is globally enabled.
LLDP neighbor information last changed time	Time when the neighbor information was last updated.
Transmit interval	LLDP frame transmission interval.
Hold multiplier	TTL multiplier.
Reinit delay	LLDP reinitialization delay.
Transmit max credit	Token bucket size for sending LLDP frames.
Trap interval	Trap transmission interval.
Fast start times	Number of LLDP frames sent each time fast LLDP frame transmission is triggered.
Port 1	LLDP status of port 1.
Port status of LLDP	Indicates whether LLDP is enabled on the port.
Admin status	LLDP operating mode of the port: • **TX_RX**—The port can send and receive LLDP frames. • **Rx_Only**—The port can only receive LLDP frames. • **Tx_Only**—The port can only send LLDP frames. • **Disable**—The port cannot send or receive LLDP frames.
Trap Flag	Indicates whether trapping is enabled.
Polling interval	LLDP polling interval, which is 0 when LLDP polling is disabled.
Number of neighbors	Number of LLDP neighbors connecting to the port.
Number of MED neighbors	Number of MED neighbors connecting to the port.
Number of CDP neighbors	Number of CDP neighbors connecting to the port.
Number of sent optional TLV	Number of optional TLVs contained in an LLDP frame sent through the port.
Number of received unknown TLV	Number of unknown TLVs contained in a received LLDP frame.

display lldp tlv-config

Use **display lldp tlv-config** to display the types of advertisable optional LLDP TLVs of a port.

Syntax

display lldp tlv-config [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the types of advertisable optional TLVs of all ports.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the types of advertisable optional LLDP TLVs for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Examples

Display the types of advertisable optional LLDP TLVs of GigabitEthernet 1/0/1.

```
<Sysname> display lldp tlv-config interface gigabitethernet 1/0/1
LLDP tlv-config of port 1[GigabitEthernet1/0/1]:
LLDP agent nearest-bridge:

Table 5 Command output

Field	Description
LLDP tlv-config of port 1	Advertisable optional TLVs of port 1.
NAME	TLV type.
STATUS	Indicates whether the type of TLV is sent through a port.
DEFAULT	Indicates whether the type of TLV is sent through a port by default.
Basic optional TLV	Basic optional TLVs: • Port Description TLV. • System Name TLV. • System Description TLV. • System Capabilities TLV. • Management Address TLV.
IEEE 802.1 extended TLV	IEEE 802.1 organizationally specific TLVs: • Port PVID TLV. • Port and protocol VLAN ID TLV. • VLAN name TLV. • DCBX TLV. DCBX TLVs are not supported in the current software version. • EVB TLV. EVB TLVs are not supported in the current software version. • Management VID TLV.
IEEE 802.3 extended TLV	IEEE 802.3 organizationally specific TLVs: • MAC-Physic TLV. • Power via MDI TLV. • Link aggregation TLV. • Maximum frame size TLV.
LLDP-MED extend TLV	LLDP-MED TLVs: • Capabilities TLV. • Network Policy TLV. • Extended Power-via-MDI TLV. • Location Identification TLV. • Inventory TLV.
Inventory TLV	Inventory TLVs: • Hardware Revision TLV. • Firmware Revision TLV. • Software Revision TLV. • Serial Number TLV. • Manufacturer Name TLV. • Model name TLV. • Asset ID TLV.

lldp admin-status

Use **lldp admin-status** to set the LLDP operating mode.

Use **undo lldp admin-status** to restore the default.

Syntax

In Layer 2 Ethernet interface view or management Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **admin-status** { **disable** | **rx** | **tx** | **txrx** }

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **admin-status**

In Layer 2 aggregate interface view:

lldp agent { **nearest-customer** | **nearest-nontpmr** } **admin-status** { **disable** | **rx** | **tx** | **txrx** }

undo lldp agent { **nearest-customer** | **nearest-nontpmr** } **admin-status**

Default

The nearest bridge agent operates in **TxRx** mode, and the nearest customer bridge agent and nearest non-TPMR bridge agent operate in **Disable** mode.

Views

Layer 2 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command sets the operating mode for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

disable: Specifies the **Disable** mode. A port in this mode cannot send or receive LLDP frames.

rx: Specifies the **Rx** mode. A port in this mode can only receive LLDP frames.

tx: Specifies the **Tx** mode. A port in this mode can only send LLDP frames.

txrx: Specifies the **TxRx** mode. A port in this mode can send and receive LLDP frames.

Examples

Set the LLDP operating mode to **Rx** for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent nearest-customer admin-status rx
```

lldp check-change-interval

Use **lldp check-change-interval** to enable LLDP polling and set the polling interval.

Use **undo lldp check-change-interval** to disable LLDP polling.

Syntax

In Layer 2 Ethernet interface view or management Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **check-change-interval** *interval*

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **check-change-interval**

In Layer 2 aggregate interface view:

lldp agent { **nearest-customer** | **nearest-nontpmr** } **check-change-interval** *interval*

undo lldp agent { **nearest-customer** | **nearest-nontpmr** } **check-change-interval**

Default

LLDP polling is disabled.

Views

Layer 2 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command enables LLDP polling and sets the polling interval for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

interval: Sets the LLDP polling interval in the range of 1 to 30 seconds.

Examples

Enable LLDP polling and set the polling interval to 30 seconds for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent nearest-customer check-change-interval 30
```

lldp compliance admin-status cdp

Use **lldp compliance admin-status cdp** to set the operating mode of CDP-compatible LLDP.

Use **undo lldp compliance admin-status cdp** to restore the default.

Syntax

lldp compliance admin-status cdp { **disable** | **rx** | **txrx** }

undo lldp compliance admin-status cdp

Default

CDP-compatible LLDP operates in **Disable** mode.

Views

Layer 2 Ethernet interface view

Management Ethernet interface view

Predefined user roles

network-admin

Parameters

`disable`: Specifies the **Disable** mode. CDP-compatible LLDP in this mode cannot receive or transmit CDP packets.

`txrx`: Specifies the **TxRx** mode. CDP-compatible LLDP in this mode can send and receive CDP packets.

`rx`: Specifies the **Rx** mode. CDP-compatible LLDP in this mode can receive but cannot send CDP packets.

Usage guidelines

For your device to work with Cisco IP phones, you must perform the following tasks:

- Enable CDP-compatible LLDP globally.
- Configure CDP-compatible LLDP to operate in TxRx mode on the specified ports.

Examples

Enable CDP-compatible LLDP globally and configure CDP-compatible LLDP to operate in **TxRx** mode on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] lldp compliance cdp
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp compliance admin-status cdp txrx
```

Related commands

`lldp compliance cdp`

lldp compliance cdp

Use **`lldp compliance cdp`** to enable CDP compatibility.

Use **`undo lldp compliance cdp`** to disable CDP compatibility.

Syntax

`lldp compliance cdp`

`undo lldp compliance cdp`

Default

CDP compatibility is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The maximum TTL that CDP allows is 255 seconds. To make CDP-compatible LLDP work correctly with Cisco IP phones, set the LLDP frame transmission interval to be no more than 1/3 of the TTL value.

Examples

Enable CDP compatibility.

```
<Sysname> system-view
[Sysname] lldp compliance cdp
```

Related commands

lldp hold-multiplier

lldp timer tx-interval

lldp enable

Use **lldp enable** to enable LLDP on a port.

Use **undo lldp enable** to disable LLDP on a port.

Syntax

lldp enable

undo lldp enable

Default

LLDP is enabled on a port.

Views

Layer 2 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

LLDP takes effect on a port only when LLDP is enabled both globally and on the port.

Examples

Disable LLDP on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo lldp enable
```

Related commands

lldp global enable

lldp encapsulation snap

Use **lldp encapsulation snap** to set the encapsulation format for LLDP frames to SNAP.

Use **undo lldp encapsulation** to restore the default.

Syntax

In Layer 2 Ethernet interface view or management Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **encapsulation snap**

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **encapsulation**

In Layer 2 aggregate interface view:

lldp agent { **nearest-customer** | **nearest-nontpmr** } **encapsulation snap**

undo lldp agent { **nearest-customer** | **nearest-nontpmr** } **encapsulation**

Default

The encapsulation format for LLDP frames is Ethernet II.

Views

Layer 2 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command sets the LLDP frame encapsulation format for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Usage guidelines

LLDP-CDP packets use only SNAP encapsulation.

Examples

Set the encapsulation format for LLDP frames to SNAP on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp encapsulation snap
```

lldp fast-count

Use **lldp fast-count** to set the number of LLDP frames sent each time fast LLDP frame transmission is triggered.

Use **undo lldp fast-count** to restore the default.

Syntax

lldp fast-count *count*

undo lldp fast-count

Default

Four LLDP frames are sent each time fast LLDP frame transmission is triggered.

Views

System view

Predefined user roles

network-admin

Parameters

count: Sets the number of LLDP frames sent each time fast LLDP frame transmission is triggered. The value range is 1 to 8.

Examples

Configure the device to send five LLDP frames each time fast LLDP frame transmission is triggered.

```
<Sysname> system-view
[Sysname] lldp fast-count 5
```

lldp global enable

Use **lldp global enable** to enable LLDP globally.

Use **undo lldp global enable** to disable LLDP globally.

Syntax

lldp global enable

undo lldp global enable

Default

If the device starts up with the initial configuration, LLDP is disabled globally.

If the device starts up with the factory defaults, LLDP is enabled globally.

For more information about device startup with the initial configuration or factory defaults, see *Fundamentals Configuration Guide*.

Views

System view

Predefined user roles

network-admin

Usage guidelines

LLDP takes effect on a port only when LLDP is enabled both globally and on the port.

Examples

Disable LLDP globally.

```
<Sysname> system-view
[Sysname] undo lldp global enable
```

Related commands

lldp enable

lldp global tlv-config basic-tlv port-id

Use **lldp global tlv-config basic-tlv port-id** to set the type of port ID TLVs advertised by LLDP globally.

Use **undo lldp global tlv-config basic-tlv port-id** to restore the default.

NOTE:

This command is supported only in Release 6331 and later.

Syntax

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **global tlv-config basic-tlv port-id** *type-id*

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **global tlv-config basic-tlv port-id**

Default

An interface advertises port ID TLVs that contain interface MAC addresses if it receives LLDP-MED TLVs and advertises port ID TLVs that contain interface names if no LLDP-MED TLVs are received.

Views

System view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command sets the port ID TLV type for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

type-id: Specifies a port ID TLV type. The available value is 5, which represents that port ID TLVs contain interface names.

Usage guidelines

This command enables the device to advertise only port ID TLVs that contain interface names. Execute this command if LLDP neighbors must obtain interface names from LLDPDUs.

You can configure the port ID TLV type in system view or interface view. The interface-specific setting takes precedence over the global setting.

Examples

Enable the device to advertise port ID TLVs that contain interface names.

```
<Sysname> system-view
[Sysname] lldp global tlv-config basic-tlv port-id 5
```

Related commands

lldp tlv-config basic-tlv port-id

lldp global tlv-enable basic-tlv management-address-tlv

Use **lldp global tlv-enable basic-tlv management-address-tlv** to enable advertisement of the management address TLV globally and set the management address to be advertised.

Use **undo lldp global tlv-enable basic-tlv management-address-tlv** to restore the default.

Syntax

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **global tlv-enable basic-tlv management-address-tlv** [**ipv6**] { *ip-address* | **interface loopback** *interface-number* | **interface m-gigabitethernet** *interface-number* | **interface vlan-interface** *interface-number* }

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **global tlv-enable basic-tlv management-address-tlv**

Default

Advertisement of the management address TLV is disabled globally.

Views

System view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type, this command applies to the nearest bridge agent.

- **nearest-customer**: Specifies the nearest customer bridge agent.
- **nearest-nontpmr**: Specifies the nearest non-TPMR bridge agent.

ipv6: Specifies an IPv6 management address. If you do not specify this keyword, an IPv4 management address will be advertised.

ip-address: Specifies the management address to be advertised.

interface loopback *interface-number*: Specifies a loopback interface by its number in the range of 0 to 127. The IP address of the loopback interface will be advertised as the management address. The value range for the *interface-number* argument is 0 to 127.

interface m-gigabitethernet *interface-number*: Specifies an M-GigabitEthernet interface by is number. The IP address of the M-GigabitEthernet interface will be advertised as the management address.

interface vlan-interface *interface-number*: Specifies a VLAN interface by is number in the range of 1 to 4094. The IP address of the VLAN interface will be advertised as the management address.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

You can configure advertisement of the management address TLV globally or on a per-interface basis. The device selects the management address TLV advertisement setting for an interface in the following order:

1. Interface-based setting, configured by using the **lldp tlv-enable** command with the **management-address-tlv** keyword.
2. Global setting, configured by using the **lldp global tlv-enable basic-tlv management-address-tlv** command.
3. Default setting for the interface.

   By default:

   - The nearest bridge agent and nearest customer bridge agent advertise the management address TLV.
   - The nearest non-TPMR bridge agent does not advertise the management address TLV.

The IPv4 or IPv6 address of the LLDP frame sending port will be advertised as the management address when the following conditions exist:

- The *ip-address* argument is not configured.
- The specified loopback interface, M-GigabitEthernet interface, or VLAN interface does not have an IPv4 or IPv6 address, or the specified interface does not exist.

If the LLDP frame sending port does not have an IPv4 or IPv6 address, the MAC address of the port will be advertised.

If you specify the **ipv6** keyword, the management address is the IPv6 address. If you do not specify the **ipv6** keyword, the management address is the IPv4 address.

Examples

Enable advertisement of the management address TLV globally and set the advertised management address to 192.168.1.1.

```
<Sysname> system-view
[Sysname] lldp agent nearest-customer global tlv-enable basic-tlv management-address-tlv
192.168.1.1
```

Related commands

lldp tlv-enable

lldp hold-multiplier

Use **lldp hold-multiplier** to set the TTL multiplier.

Use **undo lldp hold-multiplier to** restore the default.

Syntax

lldp hold-multiplier *value*

undo lldp hold-multiplier

Default

The TTL multiplier is 4.

Views

System view

Predefined user roles

network-admin

Parameters

value: Sets the TTL multiplier in the range of 2 to 10.

Usage guidelines

The TTL TLV carried in an LLDPDU determines how long the device information carried in the LLDPDU can be saved on a recipient device.

By setting the TTL multiplier, you can set the TTL of locally sent LLDP frames. The TTL is expressed by using the following formula:

TTL = Min (65535, (TTL multiplier × LLDP frame transmission interval + 1))

As the expression shows, the TTL can be up to 65535 seconds.

Examples

Set the TTL multiplier to 6.

```
<Sysname> system-view
[Sysname] lldp hold-multiplier 6
```

Related commands

lldp timer tx-interval

lldp ignore-pvid-inconsistency

Use **lldp ignore-pvid-inconsistency** to disable LLDP PVID inconsistency check.

Use **undo lldp ignore-pvid-inconsistency** to enable LLDP PVID inconsistency check.

Syntax

lldp ignore-pvid-inconsistency

undo lldp ignore-pvid-inconsistency

Default

LLDP PVID inconsistency check is enabled.

Views

System view

Default command level

network-admin

Usage guidelines

By default, when the system receives an LLDP packet, it compares the PVID value contained in packet with the PVID configured on the receiving interface. If the two PVIDs do not match, a log message will be printed to notify the user.

You can disable PVID inconsistency check if different PVIDs are required on a link.

Examples

Disable LLDP PVID inconsistency check.

```
<Sysname> system-view
[Sysname] lldp ignore-pvid-inconsistency
```

lldp local-information all-interface

Use **lldp local-information all-interface** to enable displaying LLDP local information about all interfaces.

Use **undo lldp local-information all-interface** to disable displaying LLDP local information about interfaces not in physically up state.

NOTE:

This command is supported only in Release 6331 and later.

Syntax

lldp local-information all-interface

undo lldp local-information all-interface

Default

The **display lldp local-information** command displays information about physically up interfaces.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the **display lldp local-information** command to display LLDP local information about all interfaces.

By default, the **display lldp local-information** command displays information about physically up interfaces. The media devices from some vendors can obtain interface information from H3C devices only through LLDP. For the media devices to obtain all interface information, enable the **display lldp local-information** command to display LLDP local information about all interfaces.

Examples

Enable displaying LLDP local information about all interfaces.

```
<Sysname> system-view
[Sysname] lldp local-information all-interface
```

Related commands

display lldp local-information

lldp management-address

Use **lldp management-address** to enable the device to generate an ARP or ND entry after receiving an LLDP frame that carries a management address TLV.

Use **undo lldp management-address** to restore the default.

Syntax

In Layer 2 Ethernet interface view:

lldp management-address { **arp-learning** | **nd-learning** } **vlan** *vlan-id*

undo lldp management-address { **arp-learning** | **nd-learning** }

Default

The device does not generate an ARP or ND entry after receiving an LLDP frame that carries a management address TLV.

Views

Layer 2 Ethernet interface view

Default command level

network-admin

Parameters

arp-learning: Generates an ARP entry if the received management address TLV contains an IPv4 address.

nd-learning: Generates an ND entry if the received management address TLV contains an IPv6 address.

vlan *vlan-id*: Specifies the ID of the VLAN to which the generated ARP or ND entry belongs. The value range for the VLAN ID is 1 to 4094.

Usage guidelines

You can enable the device to generate both ARP entries and ND entries.

In Layer 2 Ethernet interface view, after you execute this command, the Layer 2 Ethernet interface is recorded as the output interface in the generated entries. The VLAN to which the entries belong is the VLAN specified by this command. The device cannot generate ARP or ND entries in one of the following situations:

- The specified VLAN or the corresponding VLAN interface does not exist.
- The VLAN interface to which the VLAN ID belongs is physically down.

In Layer 2 Ethernet interface view, this command must be configured together with the **lldp source-mac vlan** command. The **lldp source-mac vlan** command enables the Layer 2 Ethernet interface to use the MAC address of a VLAN interface instead of its own MAC address as the source MAC address of LLDP frames. This ensures that the LLDP neighbor can learn correct ARP or ND entries.

Examples

Configure GigabitEthernet 1/0/1 to generate an ARP entry after receiving an LLDP frame carrying an IPv4 management address TLV.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp management-address arp-learning
```

Related commands

lldp source-mac vlan

lldp management-address-format string

Use **lldp management-address-format string** to set the encoding format of the management address to string.

Use **undo lldp management-address-format** to restore the default.

Syntax

In Layer 2 Ethernet interface view/management Ethernet interface view:

lldp [agent { nearest-customer | nearest-nontpmr }] management-address-format string

undo lldp [agent { nearest-customer | nearest-nontpmr }] management-address-format

In Layer 2 aggregate interface view:

lldp agent { nearest-customer | nearest-nontpmr } management-address-format string

undo lldp agent { nearest-customer | nearest-nontpmr } management-address-format

Default

The encoding format of the management address is numeric.

Views

Layer 2 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command sets the encoding format of the management address for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Usage guidelines

LLDP neighbors must use the same encoding format for the management address.

The device supports only the numeric encoding format for IPv6 management addresses.

Examples

Set the encoding format of the management address to string for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent nearest-customer management-address-format
string
```

lldp max-credit

Use **lldp max-credit** to set the token bucket size for sending LLDP frames.

Use **undo lldp max-credit** to restore the default.

Syntax

lldp max-credit *credit-value*

undo lldp max-credit

Default

The token bucket size for sending LLDP frames is 5.

Views

System view

Predefined user roles

network-admin

Parameters

credit-value: Specifies the token bucket size for sending LLDP frames, in the range of 1 to 100.

Examples

Set the token bucket size for sending LLDP frames to 10.

```
<Sysname> system-view
[Sysname] lldp max-credit 10
```

lldp mode

Use **lldp mode** to configure LLDP to operate in service bridge mode.

Use **undo lldp mode** to restore the default.

Syntax

lldp mode service-bridge

undo lldp mode

Default

LLDP operates in customer bridge mode.

Views

System view

Predefined user roles

network-admin

Parameters

service-bridge: Specifies the service bridge mode.

Usage guidelines

The LLDP agent types supported by LLDP depend on the LLDP bridge mode:

- **Service bridge mode**—LLDP supports nearest bridge agents and nearest non-TPMR bridge agents. LLDP processes the LLDP frames with destination MAC addresses for these agents and transparently transmits the LLDP frames with other destination MAC addresses in a VLAN.
- **Customer bridge mode**—LLDP supports nearest bridge agents, nearest non-TPMR bridge agents, and nearest customer bridge agents. LLDP processes the LLDP frames with destination MAC addresses for these agents and transparently transmits the LLDP frames with other destination MAC addresses in a VLAN.

The bridge mode configuration takes effect only when LLDP is enabled globally. If LLDP is disabled globally, LLDP can only operate in customer bridge mode.

Examples

Configure LLDP to operate in service bridge mode.

```
<Sysname> system-view
[Sysname] lldp mode service-bridge
```

Related commands

[Sysname-GigabitEthernet1/0/1] lldp notification med-topology-change enable
```

lldp notification remote-change enable

Use **lldp notification remote-change enable** to enable LLDP trapping.

Use **undo lldp notification remote-change enable** to disable LLDP trapping.

Syntax

In Layer 2 Ethernet interface view/management Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **notification remote-change enable**

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **notification remote-change enable**

In Layer 2 aggregate interface view:

lldp agent { **nearest-customer** | **nearest-nontpmr** } **notification remote-change enable**

undo lldp agent { **nearest-customer** | **nearest-nontpmr** } **notification remote-change enable**

Default

LLDP trapping is disabled.

Views

Layer 2 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command enables LLDP trapping for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Examples

Enable LLDP trapping for the nearest customer bridge agent on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface GigabitEthernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent nearest-customer notification remote-change
enable
```

lldp source-mac vlan

Use **lldp source-mac vlan** to set the source MAC address of LLDP frames to the MAC address of a VLAN interface.

Use **undo lldp source-mac vlan** to restore the default.

Syntax

lldp source-mac vlan *vlan-id*

undo lldp source-mac vlan

Default

The source MAC address of LLDP frames is the MAC address of the interface.

Views

Layer 2 Ethernet interface view

Default command level

network-admin

Parameters

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094. The MAC address of the VLAN interface will be used as the source MAC address of outgoing LLDP frames.

Usage guidelines

In Layer 2 Ethernet interface view, this command must be configured together with the **lldp management-address arp-learning** command to ensure that the LLDP neighbor can learn correct ARP or ND entries.

In Layer 2 Ethernet interface view, the source MAC address of outgoing LLDP frames is the MAC address of a VLAN interface to which the specified VLAN ID belongs. The source MAC address of outgoing LLDP frames is the MAC address of the Layer 2 Ethernet interface in the following situations:

- The specified VLAN or the corresponding VLAN interface does not exist.
- The VLAN interface to which the VLAN ID belongs is physically down.

Examples

Set the source MAC address of LLDP frames to the MAC address of VLAN-interface 4094.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp source-mac vlan 4094
```

Related commands

lldp tlv-config basic-tlv port-id

Use **lldp tlv-config basic-tlv port-id** to set the type of port ID TLVs advertised by LLDP on an interface.

Use **undo lldp tlv-config basic-tlv port-id** to restore the default.

NOTE:

This command is supported only in Release 6331 and later.

Syntax

In Layer 2 Ethernet interface view or management Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **tlv-config basic-tlv port-id** *type-id*

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **tlv-config basic-tlv port-id**

In Layer 2 aggregate interface view:

lldp agent { **nearest-customer** | **nearest-nontpmr** } **tlv-config basic-tlv port-id** *type-id*

undo lldp agent { **nearest-customer** | **nearest-nontpmr** } **tlv-config basic-tlv port-id**

Default

An interface advertises port ID TLVs that contain interface MAC addresses if it receives LLDP-MED TLVs and advertises port ID TLVs that contain interface names if no LLDP-MED TLVs are received.

Views

Layer 2 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command sets the port ID TLV type for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

type-id: Specifies a port ID TLV type. The available value is 5, which represents that port ID TLVs contain interface names.

Usage guidelines

This command enables an interface to advertise only port ID TLVs that contain interface names. Execute this command if LLDP neighbors must obtain interface names from LLDPDUs.

You can configure the port ID TLV type in system view or interface view. The interface-specific setting takes precedence over the global setting.

Examples

Enable GigabitEthernet 1/0/1 to advertise port ID TLVs that contain interface names.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp tlv-config basic-tlv port-id 5
```

Related commands

undo lldp tlv-enable dot1-tlv { **protocol-vlan-id** | **vlan-name** | **management-vid** }

Default

On Layer 2 Ethernet interfaces:

- Nearest bridge agents can advertise all types of LLDP TLVs except the following types:
  - Location identification TLVs.
  - Port and protocol VLAN ID TLVs.
  - VLAN name TLVs.
  - Management VLAN ID TLVs.
- Nearest non-TPMR bridge agents do not advertise any TLVs.
- Nearest customer bridge agents can advertise basic TLVs and IEEE 802.1 organizationally specific TLVs.

On management Ethernet interfaces:

- Nearest bridge agents can advertise all types of LLDP TLVs except network policy TLVs. Among all the 802.1 organizationally specific TLVs, only the link aggregation TLV is supported.
- Nearest non-TPMR bridge agents do not advertise any TLVs.
- Nearest customer bridge agents can advertise basic TLVs and IEEE 802.1 organizationally specific TLVs (only link aggregation TLV is supported).

On Layer 2 aggregate interfaces:

- Nearest non-TPMR bridge agents do not advertise any TLVs.
- Nearest customer bridge agents can advertise basic TLVs and IEEE 802.1 organizationally specific TLVs. Among the IEEE 802.1 organizationally specific TLVs, only port and protocol VLAN ID TLVs, VLAN name TLVs, and management VLAN ID TLVs are supported.

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command configures the types of advertisable TLVs for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

all: Advertises all TLVs of the specified type. This keyword enables the interface to advertise following TLVs:

- All basic LLDP TLVs if the **all** keyword is specified for **basic-tlv**.

- All IEEE 802.1 organizationally specific LLDP TLVs if the **all** keyword is specified for **dot1-tlv**.
- All IEEE 802.3 organizationally specific LLDP TLVs if the **all** keyword is specified for **dot3-tlv**.
- All LLDP-MED TLVs except location identification TLVs if the **all** keyword is specified for **med-tlv**.

basic-tlv: Advertises basic LLDP TLVs.

management-address-tlv [**ipv6**] [*ip-address* | **interface loopback** *interface-number*]: Advertises management address TLVs. The **ipv6** keyword indicates that the management address to be advertised is in IPv6 format. The *ip-address* argument specifies the management address to be advertised. The **interface loopback** *interface-number* option specifies the management address as the IP address of a loopback interface specified by its number. By default, the following rules apply:

- When you execute the **lldp tlv-enable** command:
  - For a Layer 2 Ethernet interface, the IPv4 or IPv6 address of a VLAN interface will be advertised as the management address when one of the following conditions exists:
    - Both the *ip-address* argument and the **interface loopback** *interface-number* option are not configured.
    - The specified loopback interface does not have an IPv4 or IPv6 address, or the specified loopback interface does not exist.

    The VLAN interface belongs to a VLAN that meets the following requirements:
    - In up state.
    - The corresponding VLAN ID is the lowest among the VLANs permitted on the interface.

    If you specify the **ipv6** keyword, the IPv6 address of the VLAN interface will be advertised. If you do not specify the **ipv6** keyword, both the IPv4 and IPv6 addresses of the VLAN interface will be advertised.

    If none of the VLAN interfaces of the permitted VLANs is assigned an IPv4 or IPv6 address or all VLAN interfaces are down, the MAC address of the interface will be advertised.
  - For a Layer 2 aggregate interface, the IPv4 or IPv6 address of a VLAN interface will be advertised as the management address if the *ip-address* argument is not configured.

    The VLAN interface belongs to a VLAN that meets the following requirements:
    - In up state.
    - The corresponding VLAN ID is the lowest among the VLANs permitted on the interface.

    If you specify the **ipv6** keyword, the IPv6 address of the VLAN interface will be advertised. If you do not specify the **ipv6** keyword, both the IPv4 and IPv6 addresses of the VLAN interface will be advertised.

    If none of the VLAN interfaces of the permitted VLANs is assigned an IPv4 or IPv6 address or all VLAN interfaces are down, the MAC address of the interface will be advertised.
  - For a management Ethernet interface, the IPv4 or IPv6 address of the interface will be advertised when the *ip-address* argument is not configured.

    If you specify the **ipv6** keyword, the IPv6 address of the interface will be advertised. If you do not specify the **ipv6** keyword, both the IPv4 and IPv6 addresses of the interface will be advertised.

    If the interface does not have an IPv4 or IPv6 address, the MAC address of the interface will be advertised.
- When you execute the **undo lldp tlv-enable** command for a Layer 2 Ethernet interface, Layer 2 aggregate interface, or management Ethernet interface:

- If you do not specify *ip-address*, **ipv6**, or **interface loopback** *interface-number*, the interface does not advertise any management address TLVs.
- If you specify *ip-address*, **ipv6**, or **interface loopback** *interface-number*, the interface advertises the default management address TLVs.

port-description: Advertises port description TLVs.

system-capability: Advertises system capabilities TLVs.

system-description: Advertises system description TLVs.

system-name: Advertises system name TLVs.

dot1-tlv: Advertises IEEE 802.1 organizationally specific LLDP TLVs.

port-vlan-id: Advertises port PVID TLVs.

protocol-vlan-id [*vlan-id*]: Advertises port and protocol VLAN ID TLVs. The *vlan-id* argument specifies a VLAN ID in the TLVs to be advertised. The VLAN ID is in the range of 1 to 4094, and the default is the lowest VLAN ID on the port.

vlan-name [*vlan-id*]: Advertises VLAN name TLVs. The *vlan-id* argument specifies a VLAN ID in the TLVs to be advertised. The VLAN ID is in the range of 1 to 4094, and the default is the lowest VLAN ID on the port. If you do not specify a VLAN ID and the port is not assigned to any VLAN, the PVID of the port is advertised.

management-vid [*mvlan-id*]: Advertises management VLAN ID TLVs. The m*vlan-id* argument specifies a management VLAN ID in the TLVs to be advertised. The management VLAN ID is in the range of 1 to 4094. If you do not specify this option, the value 0 is advertised, which means that the LLDP agent is not configured with a management VLAN ID.

link-aggregation: Advertises link aggregation TLVs.

dot3-tlv: Advertises IEEE 802.3 organizationally specific LLDP TLVs.

mac-physic: Advertises MAC/PHY configuration/status TLVs.

max-frame-size: Advertises maximum frame size TLVs.

power: Advertises power in MDI TLVs and power stateful control TLVs.

med-tlv: Advertises LLDP-MED TLVs.

capability: Advertises LLDP-MED capabilities TLVs.

inventory: Advertises the following TLVs: hardware revision, firmware revision, software revision, serial number, manufacturer name, model name, and asset ID.

location-id: Advertises location identification TLVs.

civic-address: Inserts the typical address information about the network device in location identification TLVs .

device-type: Sets a device type value in the range of 0 to 2:

- Value 0 specifies a DHCP server.
- Value 1 specifies a network device.
- Value 2 specifies an LLDP-MED endpoint.

country-code: Sets a country code defined in ISO 3166.

{ *ca-type ca-value* }&<1-10>: Configures address information. *ca-type* represents the address information type in the range of 0 to 255. *ca-value* represents address information, a string of 1 to 250 characters. &<1-10> indicates that you can specify up to 10 *ca-type ca-value* pairs.

elin-address: Inserts telephone numbers for emergencies in location identification TLVs.

tel-number: Sets the telephone number for emergencies, a string of 10 to 25 characters.

network-policy [*vlan-id*]: Advertises network policy TLVs. The *vlan-id* argument specifies the voice VLAN ID to be advertised, in the range of 1 to 4094. This option is not available on the S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, or WAS6000 switch series.

power-over-ethernet: Advertises extended power-via-MDI TLVs.

Usage guidelines

Nearest bridge agents are not supported on aggregate interfaces.

You can enable the device to advertise multiple types of TLVs by using this command without the **all** keyword specified.

If the MAC/PHY configuration/status TLV is not advertisable, none of the LLDP-MED TLVs will be advertised whether or not they are advertisable. If the LLDP-MED capabilities TLV is not advertisable, the other LLDP-MED TLVs will not be advertised regardless of whether or not they are advertisable.

The port and protocol VLAN ID, VLAN name, and management VLAN ID TLVs in IEEE 802.1 organizationally specific LLDP TLVs can be configured only for nearest bridge agents. The configuration can be inherited by nearest customer bridge agents and nearest non-TPMR bridge agents.

Examples

Enable the nearest customer bridge agents on GigabitEthernet 1/0/1 to advertise link aggregation TLVs of the IEEE 802.1 organizationally specific TLVs.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent nearest-customer tlv-enable dot1-tlv
link-aggregation
```

lldp tlv-enable private-tlv

Use **lldp tlv-enable private-tlv** to specify types of H3C-proprietary TLVs advertisable on an interface.

Use **undo lldp tlv-enable private-tlv** to disable advertising H3C-proprietary TLVs on an interface.

NOTE:

- This command is supported only on PoE devices.
- This command is supported only in Release 6343P08 and later.

Syntax

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **tlv-enable private-tlv actual-power**

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **tlv-enable private-tlv actual-power**

Default

No H3C-proprietary TLVs can be advertised on an interface.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an agent type. If you do not specify an agent type, the command specifies types of H3C- proprietary TLVs that can be advertised by nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

actual-power: Specifies actual power TLVs.

Usage guidelines

H3C-proprietary TLVs are defined to meet specific transmission requirements on network management. Devices of other vendors cannot identify H3C-proprietary TLVs carried in LLDPDUs.

Only actual power TLVs are supported in the current software version. This type of TLV provides PoE power information on an interface.

Examples

Configure nearest customer bridge agents to advertise actual power TLVs on interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent neareset-customer tlv-enable private-tlv
actual-power
```

reset lldp statistics

Use **reset lldp statistics** to clear LLDP statistics on ports.

Syntax

reset lldp statistics [**interface** *interface-type interface number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command clears LLDP statistics on all ports.

agent: Specifies an agent type. If you do not specify an agent type, the command clears LLDP statistics for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Usage guidelines

If you do not specify any parameters, the **reset lldp statistics** command clears LLDP statistics on all ports but does not clear global LLDP statistics.

Examples

Clear LLDP statistics on all ports.

```
<Sysname> reset lldp statistics
```

Related commands

display lldp statistic

DTP         0                 0                 0                 0
CFD         0                 0                 0                 0
```

Table 1 Command output

Field	Description
Protocol	Protocol. The DTP and CFD protocols are supported only in Release 6331 and later.
Encapsulated	Number of encapsulated packets. The number increases by 1 when the interface receives and encapsulates a protocol packet from a customer network. For protocol **Tunnel**, which represents tunneled packets, this field displays **N/A**.
Decapsulated	Number of decapsulated packets. The number increases by 1 when the interface receives and decapsulates a tunneled packet from the service provider network. For protocol **Tunnel**, which represents tunneled packets, this field displays **N/A**.
Forwarded	Number of forwarded packets. The number increases by 1 when the interface receives a protocol packet and forwards it. The number increases by 1 for protocol **Tunnel** when the interface receives a tunneled packet and forwards it. If no interface of the PE is connected to customer networks, the number does not increase.
Dropped	Number of dropped packets. The number increases by 1 when the interface receives a protocol packet and drops it. Protocol packets dropped by hardware are not counted. The number increases by 1 for protocol **Tunnel** when the interface receives a tunneled packet and drops it.

l2protocol tunnel dot1q

Use **l2protocol tunnel dot1q** to enable L2PT for a protocol.

Use **undo l2protocol tunnel dot1q** to disable L2PT for a protocol.

Syntax

In Layer 2 Ethernet interface view:

l2protocol { **cdp** | **cfd** | **dldp** | **dtp** | **eoam** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

undo l2protocol { **cdp** | **cfd** | **dldp** | **dtp** | **eoam** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

In Layer 2 aggregate interface view:

l2protocol { **cdp** | **cfd** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

undo l2protocol { **cdp** | **cfd** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

Default

L2PT is disabled for all protocols.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

cdp: Specifies CDP.

cfd: Specifies CFD.

dldp: Specifies DLDP.

dtp: Specifies DTP.

eoam: Specifies EOAM.

gvrp: Specifies GVRP.

lacp: Specifies LACP.

lldp: Specifies LLDP. L2PT for LLDP supports LLDP packets from only nearest bridge agents.

mvrp: Specifies MVRP.

pagp: Specifies PAgP.

pvst: Specifies PVST.

stp: Specifies STP.

udld: Specifies UDLD.

vtp: Specifies VTP.

NOTE:

The **dtp** and **cfd** keywords are supported only in Release 6331 and later.

Usage guidelines

Before you enable L2PT for a protocol on a port, perform the following tasks:

- Enable the protocol on the CE, and disable the protocol on the port.
- Enable L2PT only on customer-facing PE ports. If you enable L2PT on ports connected to the service provider network, L2PT determines that the ports are connected to a customer network.
- Disable the protocol (for example, STP) on the PE ports connecting to an aggregate interface on a CE when the following conditions exist:
  - The protocol is running on the aggregate interface on the CE.
  - The aggregate interface on the CE connects to an L2PT-enabled port on the PE.

You can enable L2PT on member ports of a Layer 2 aggregation group, but the configuration does not take effect.

Examples

Disable STP and enable L2PT for STP on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo stp enable
[Sysname-GigabitEthernet1/0/1] l2protocol stp tunnel dot1q
```

Disable STP and enable L2PT for STP on Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] undo stp enable
[Sysname-Bridge-Aggregation1] l2protocol stp tunnel dot1q
```

l2protocol tunnel-dmac

Use **l2protocol tunnel-dmac** to set the destination multicast MAC address for tunneled packets of all protocols.

Use **undo l2protocol tunnel-dmac** to restore the default.

Syntax

l2protocol tunnel-dmac *mac-address*

undo l2protocol tunnel-dmac

Default

The tunneled packets use 010f-e200-0003 as the destination multicast MAC address.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a destination multicast MAC address. The available addresses are 0100-0ccd-cdd0, 0100-0ccd-cdd1, 0100-0ccd-cdd2, and 010f-e200-0003.

Usage guidelines

The **l2protocol tunnel-dmac** command sets the destination multicast MAC address for tunneled packets of all protocols. The **l2protocol type tunnel-dmac** command sets the destination multicast MAC address for tunneled packets of the specified protocol. If both commands are executed, the **l2protocol type tunnel-dmac** command takes priority.

NOTE:

The **l2protocol type tunnel-dmac** command is supported only in Release 6331 and later.

Examples

Set the destination multicast MAC address to 0100-0ccd-cdd0 for tunneled packets.

```
<Sysname> system-view
[Sysname] l2protocol tunnel-dmac 0100-0ccd-cdd0
```

Related commands

l2protocol type tunnel-dmac

l2protocol type tunnel-dmac

Use **l2protocol type tunnel-dmac** to set the destination multicast MAC address for tunneled packets of the specified protocol.

Use **undo l2protocol type tunnel-dmac** to restore the default.

NOTE:

The **l2protocol type tunnel-dmac** command is supported only in Release 6331 and later.

Syntax

l2protocol type { **cdp** | **cfd** | **dldp** | **dtp** | **eoam** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel-dmac** *mac-address*

undo l2protocol type { **cdp** | **cfd** | **dldp** | **dtp** | **eoam** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel-dmac**

Default

The tunneled packets of all protocols use 010f-e200-0003 as the destination multicast MAC address.

Views

System view

Predefined user roles

network-admin

Parameters

cdp: Specifies CDP.

cfd: Specifies CFD.

dldp: Specifies DLDP.

dtp: Specifies DTP.

eoam: Specifies EOAM.

gvrp: Specifies GVRP.

lacp: Specifies LACP.

lldp: Specifies LLDP.

mvrp: Specifies MVRP.

pagp: Specifies PAgP.

pvst: Specifies PVST.

stp: Specifies STP.

udld: Specifies UDLD.

vtp: Specifies VTP.

mac-address: Specifies a destination multicast MAC address for tunneled packets of the specified protocol, in the range of 0100-0000-0000 to 01ff-ffff-ffff.

Usage guidelines

The **l2protocol tunnel-dmac** command sets the destination multicast MAC address for tunneled packets of all protocols. This command sets the destination multicast MAC address for

tunneled packets of the specified protocol. If both commands are executed, the **l2protocol type tunnel-dmac** command takes priority.

For tunneled packets to be recognized, set the same destination multicast MAC address for packets of the same protocol on PEs that are connected to the same customer network.

If you execute this command multiple times for a protocol, the most recent configuration takes effect.

Examples

Set the destination multicast MAC address to 0100-0ccd-cddc for tunneled packets of CFD.

```
<Sysname> system-view
[Sysname] l2protocol type cfd tunnel-dmac 0100-0ccd-cddc
```

Related commands

PPPoE relay commands

display pppoe-relay client-information

Use **display pppoe-relay client-information** to display the vendor-specific tag processing configuration for client-side packets on the PPPoE relay.

Syntax

display pppoe-relay client-information { **format** | **strategy** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

format: Displays the format configuration for the vendor-specific tag processing for client-side packets on the PPPoE relay.

strategy: Displays the policy configuration for the vendor-specific tag processing for client-side packets on the PPPoE relay.

Examples

Display the format configuration for the vendor-specific tag processing for client-side packets on the PPPoE relay.

```
<Sysname> display pppoe-relay client-information format
The current client-information format:
Circuit ID: ASCII
Remote ID: ASCII
```

Display the policy configuration for the vendor-specific tag processing for client-side packets on the PPPoE relay.

```
<Sysname> display pppoe-relay client-information strategy
The current global client-information strategy: Replace
The current interface client-information strategy:
  Interface                      Strategy
  GigabitEthernet1/0/1           Keep
  GigabitEthernet1/0/2           Drop
```

Table 1 Command output

Field	Description
The current client-information format	Circuit ID and remote ID padding formats in the vendor-specific tag: • **ASCII**—ASCII string padding format. • **Hex**—Hexadecimal padding format. • **User-defined**—User-defined padding format.
The current global	Global vendor-specific tag processing policy for the client-side PADI and

Field	Description
client-information strategy	PADR packets on the PPPoE relay: • **Drop**—Strips the vendor-specific tag from the PADI or PADR packets. • **Keep**—Keeps the vendor-specific tag unchanged. • **Replace**—Pads the vendor-specific tag in the configured padding format.
The current interface client-information strategy	Interface-level vendor-specific tag processing policy for the client-side PADI and PADR packets on the PPPoE relay.
Interface	Interface name. This field displays only the interfaces whose processing policies are different from the global processing policy.
Strategy	Vendor-specific tag processing policy for the client-side PADI and PADR packets of the interface on the PPPoE relay: • **Drop**—Strips the vendor-specific tag from the PADI or PADR packets. • **Keep**—Keeps the vendor-specific tag unchanged. • **Replace**—Pads the vendor-specific tag in the configured padding format.

display pppoe-relay statistics

Use **display pppoe-relay statistics** to display packets statistics for the PPPoE relay.

Syntax

display pppoe-relay statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

Usage guidelines

When this command is executed, this command displays statistics only for packets with non-zero packet counts.

Examples

Display packet statistics on GigabitEthernet 1/0/1.

```
<Sysname> display pppoe-relay statistics interface GigabitEthernet 1/0/1
Interface: GigabitEthernet1/0/1
  Packets received:
    ALL = 5 PADI = 5 PADO = 0 PADR = 0 PADS = 0 PADT = 0
  Packets sent:
```

```
    ALL = 5 PADI = 0 PADO = 5 PADR = 0 PADS = 0 PADT = 0
  Packets dropped:
    Server responses from untrusted ports = 0
    Client requests towards untrusted ports = 0
    Malformed PPPoE Discovery packets = 0
```

Table 2 Command output

Field	Description
Interface	Statistics on an interface.
Packets received	Incoming packet statistics of the interface: • **ALL**—Number of all PAD packets. • **PADI**—Number of PADI packets. • **PADO**—Number of PADO packets. • **PADR**—Number of PADR packets. • **PADS**—Number of PADS packets. • **PADT**—Number of PADT packets.
Packets sent	Outgoing packet statistics of the interface: • **ALL**—Number of all PAD packets. • **PADI**—Number of PADI packets. • **PADO**—Number of PADO packets. • **PADR**—Number of PADR packets. • **PADS**—Number of PADS packets. • **PADT**—Number of PADT packets.
Packets dropped	Dropped packets statistics of the interface.
Server responses from untrusted ports	Number of PADO and PADS packets dropped on untrusted ports.
Client requests towards untrusted ports	Number of PADR packets dropped by untrusted ports.

Related commands

reset pppoe-relay statistics

pppoe-relay client-information format

Use **pppoe-relay client-information format** to configure the circuit ID and remote ID padding formats for the client-side PPPoE packets on the PPPoE relay.

Use **undo pppoe-relay client-information format** to restore the default.

Syntax

pppoe-relay client-information format { **circuit-id** | **remote-id** } { **ascii** | **hex** | **user-defined** *text* }

undo pppoe-relay client-information format { **circuit-id** | **remote-id** }

Default

Both the circuit ID padding format and the remote ID padding format for the client-side PPPoE packets are the ASCII string on the PPPoE relay.

Views

System view

Predefined user roles

network-admin

Parameters

circuit-id: Specifies the circuit ID padding format.

remote-id: Specifies the remote ID padding format.

ascii: Specifies the ASCII string format. When this format is configured, **"**%portname:%svlan.%cvlan %sysname**"** is extracted and used as the circuit ID content, and **"**%mac**"** is used as the remote ID content. The circuit ID and remote ID are padded with the corresponding contents in the ASCII string format.

hex: Specifies the hexadecimal format. When this format is configured, **"**%length%port%svlan%cvlan**"** is extracted and used as the circuit ID content, and **"**%length%mac**"** is used as the remote ID content. The circuit ID and remote ID are padded with the corresponding contents in the hexadecimal format.

user-defined *text*: Specifies the user-defined format. The *text* argument is a case-sensitive string of 1 to 127 characters. When this format is configured, the corresponding information is extracted from the configured text and padded in the circuit ID and remote ID.

Usage guidelines

When the PPPoE relay receives PPPoE packets from the PPPoE client, the PPPoE relay pads the circuit ID and remote ID with the contents in the format configured by using this command.

Both the circuit ID and remote ID are of up to 63 characters. When the content to be padded exceeds 63 characters, the first 63 characters are padded.

When the user-defined format is used, the system automatically recognizes the escape keyword input by the user and translates it to the actual information. For more information about the supported escape keywords, see Table 3. For example, suppose the interface that receives packet on the PPPoE relay is GigabitEthernet 1/0/1. In this case, you can input the escape keyword **%portname**. Then, the system automatically recognizes the escape keyword and translates the escape keyword into the actual port information GigabitEthernet 1/0/1. For the system to correctly recognize the escape keywords, you must add the dollar sign (%) before each keyword. Otherwise, the system directly uses the input keyword and does not translate it. Non-escape keywords are directly used.

An integer can be added between the dollar sign (%) and the escape keyword. The integer specifies the width of the translated characters. When the translated characters do not reach the width specified by the integer, spaces are padded on the left to fill the width.

Table 3 Description of escape keywords supported by the user-defined format

Keyword	Description
sysname	System name of the PPPoE relay.
portname	Port name.
porttype	Port type.
slot	Slot number of the port.
subslot	Subslot number of the port.
port	Port number.
svlan	Outer VLAN ID.
cvlan	Inner VLAN ID.
mac	MAC address of the PPPoE relay.
Length	Length of the subsequent string. The padded content is of double digits.

Keyword	Description
	When the length is a single digit, one digit of 0 is padded on the left.

When you use different padding formats, the packet contents are different. For example, the contents of the circuit ID are as follows: the user access interface is GigabitEthernet 1/0/1, the outer VLAN ID is 200, the inner VLAN ID is 100, and the system name of the PPPoE relay is Sysname. The contents of the remote ID are as follows: the MAC address of the PPPoE relay is 04f9-38a9-44b0.

When you use the ASCII string format, the contents are as follows:

```
Circuit ID: GigabitEthernet1/0/1:200.100 Sysname
Remote ID: 04f9-38a9-44b0
```

When you use the hexadecimal format, the contents are as follows:

```
Circuit ID: 00 05 00 00 c8 00 64
Remote ID: 00 06 04 f9 38 a9 44 b0
```

When you use the user-defined format, the contents are as follows:

Configure the user-defined format "%portname:%svlan.%cvlan %sysname" for the circuit ID.

```
[Sysname] pppoe-relay client-information format circuit-id user-defined
"%portname:%svlan.%cvlan %sysname"
```

Configure the user-defined format %mac for the remote ID.

```
[Sysname] pppoe-relay client-information format remote-id user-defined "%mac"
```

Examples

Configure the circuit ID padding format as the ASCII string format for the client-side PPPoE packets on the PPPoE relay.

```
<Sysname> system-view
[Sysname] pppoe-relay client-information format circuit-id ascii
```

Related commands

display pppoe-relay client-information

pppoe-relay client-information strategy

pppoe-relay client-information strategy

Use **pppoe-relay client-information strategy** to configure the vendor-specific tag processing policy for the client-side PADI and PADR packets on the PPPoE relay.

Use **undo pppoe-relay client-information strategy** to restore the default.

Syntax

pppoe-relay client-information strategy { **drop** | **keep** | **replace** }

undo pppoe-relay client-information strategy

Default

The global vendor-specific tag processing policy for the client-side PADI and PADR packets on the PPPoE relay is replace.

No interface-level vendor-specific tag processing policy for the client-side PADI and PADR packets on the PPPoE relay is configured.

Views

System view

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

drop: Strips the vendor-specific tag from the PADI or PADR packets.

keep: Keeps the vendor-specific tag unchanged.

replace: Pads the vendor-specific tag in the configured format.

Usage guidelines

This feature can be configured both in system view and in interface view. The configuration in system view takes effect on all interfaces. The configuration in interface view takes effect only on the current interface. The configuration in interface view takes precedence over the configuration in system view.

The processing policy takes effect only on incoming packets of interfaces.

This command is not supported on Layer 2 aggregation group member ports. If a Layer 2 Ethernet interface is configured with this command before joining a Layer 2 aggregation group, the command is cleared on the member port after the member ports joins the aggregation group.

Examples

Configure the global processing policy for the client-side PADI and PADR packets as drop on the PPPoE relay.

```
<Sysname> system-view
[Sysname] pppoe-relay client-information strategy drop
```

Related commands

display pppoe-relay client-information

pppoe-relay client-information format

pppoe-relay enable

Use **pppoe-relay enable** to enable the PPPoE relay function.

Use **undo pppoe-relay enable** to disable the PPPoE relay function.

Syntax

pppoe-relay enable

undo pppoe-relay enable

Default

The PPPoE relay function is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the PPPoE relay function.

```
<Sysname> system-view
```

```
[Sysname] pppoe-relay enable
```

pppoe-relay server-information vendor-specific strip

Use **pppoe-relay server-information vendor-specific strip** to enable an interface to strip the vendor-specific tags of the PPPoE server-side packets.

Use **undo pppoe-relay server-information vendor-specific strip** to disable an interface from stripping the vendor-specific tags of the PPPoE server-side packets.

Syntax

pppoe-relay server-information vendor-specific strip

undo pppoe-relay server-information vendor-specific strip

Default

The function of stripping vendor-specific tags of the PPPoE server-side packets is disabled on an interface.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

When the PPPoE relay receives PADO and PADS packets from the PPPoE server on a PPPoE relay trusted port with this feature enabled, the PPPoE relay strips the vendor-specific tags of the packets before forwarding the packets.

This command takes effect only on packets received on PPPoE relay trusted ports.

This command is not supported on Layer 2 aggregation group member ports. If a Layer 2 Ethernet interface is configured with this command before joining a Layer 2 aggregation group, the command is cleared on the member port after the member ports joins the aggregation group.

Examples

Enable GigabitEthernet 1/0/1 to strip the vendor-specific tags of the PPPoE server-side packets..

```
<Sysname> system-view
[Sysname] interface GigabitEthernet 1/0/1
[Sysname-GigabitEthernet1/0/1] pppoe-relay trust
[Sysname-GigabitEthernet1/0/1] pppoe-relay server-information vendor-specific strip
```

Related commands

pppoe-relay trust

pppoe-relay trust

Use **pppoe-relay trust** to configure an interface as PPPoE relay trusted port.

Use **undo pppoe-relay trust** to restore the default.

Syntax

pppoe-relay trust

undo pppoe-relay trust

Default

An interface is a PPPoE relay untrusted port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

A PPPoE relay-enabled device processes PPPoE protocol packets as follows:

- When receiving PADI, PADR, and PADT on untrusted ports, the device can forward the packets out of only the trusted ports.
- When receiving PADO and PADS packets on untrusted ports, the device directly drops the packets.
- When receiving PADO, PADS, and PADT packets on trusted ports, the device can forward the packets out of any port.
- When receiving PADI and PADR packets on trusted ports, the device can forward the packets out of only the trusted ports.

For a PPPoE relay to correctly forward and process PPPoE protocol packets, you must configure the PPPoE server-facing interfaces on the PPPoE relay as trusted ports, and configure the PPPoE client-facing interfaces on the PPPoE relay as untrusted ports.

This command is not supported on Layer 2 aggregation group member ports. If a Layer 2 Ethernet interface is configured with this command before joining a Layer 2 aggregation group, the command is cleared on the member port after the member ports joins the aggregation group.

Examples

Configure GigabitEthernet 1/0/1 as a PPPoE relay trusted port.

```
<Sysname> system-view
[Sysname] interface GigabitEthernet 1/0/1
[Sysname-GigabitEthernet1/0/1] pppoe-relay trust
```

Preface

This command reference describes IP services configuration commands.

This preface includes the following topics about the documentation:

- Audience
- Conventions
- Documentation feedback

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

ARP commands

arp check enable

Use **arp check enable** to enable dynamic ARP entry check.

Use **undo arp check enable** to disable dynamic ARP entry check.

Syntax

arp check enable

undo arp check enable

Default

Dynamic ARP entry check is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Dynamic ARP entry check disables a device from supporting dynamic ARP entries with multicast MAC addresses. The device cannot learn dynamic ARP entries containing multicast MAC addresses. You cannot manually add static ARP entries that contain multicast MAC addresses.

When dynamic ARP entry check is disabled, ARP entries containing multicast MAC addresses are supported. The device can learn dynamic ARP entries containing multicast MAC addresses obtained from the ARP packets sourced from a unicast MAC address. You can also manually add static ARP entries containing multicast MAC addresses.

Examples

Enable dynamic ARP entry check.

```
<Sysname> system-view
[Sysname] arp check enable
```

arp check log enable

Use **arp check log enable** to enable the ARP logging feature.

Use **undo arp check log enable** to disable the ARP logging feature.

Syntax

arp check log enable

undo arp check log enable

Default

ARP logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature enables a device to log ARP events when ARP cannot resolve IP addresses correctly. The log information helps administrators locate and solve problems. The device can log the following ARP events:

- On a proxy ARP-disabled interface, the target IP address of a received ARP packet is not one of the following IP addresses:
  - The IP address of the receiving interface.
  - The virtual IP address of the VRRP group.
- The sender IP address of a received ARP reply conflicts with one of the following IP addresses:
  - The IP address of the receiving interface.
  - The virtual IP address of the VRRP group.

The device sends ARP log messages to the information center. You can use the **info-center source** command to specify the log output rules for the information center. For more information about information center, see *Network Management and Monitoring Configuration Guide*.

The device can generate a large number of ARP logs. To conserve system resources, enable ARP logging only when you are auditing or troubleshooting ARP events.

Examples

Enable ARP logging.

```
<Sysname> system-view
[Sysname] arp check log enable
```

arp mac-interface-consistency check enable

Use **arp mac-interface-consistency check enable** to enable interface consistency check between ARP and MAC address entries.

Use **undo arp mac-interface-consistency check enable** to disable this feature.

Syntax

arp mac-interface-consistency check enable

undo arp mac-interface-consistency check enable

Default

Interface consistency check between ARP and MAC address entries is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

In an unstable network, the receiving interface for packets from a user might change. The interface in the MAC address entry can be updated immediately while the interface in the ARP entry cannot. In this case, the packets matching the ARP entry will be sent out of an incorrect interface. To solve this problem, you can use this feature to periodically check the interface consistency between the ARP and MAC address entry for a user. If the interfaces are not the same, ARP sends ARP requests in the VLAN of the ARP entry and updates the entry with the ARP reply receiving interface.

Use **display mac-address** to display MAC address entries.

Examples

Enable interface consistency check between ARP and MAC address entries.

```
<Sysname> system-view
[Sysname] arp mac-interface-consistency check enable
```

Related commands

display mac-address (*Layer 2—LAN Switching Command Reference*)

arp max-learning-num

Use **arp max-learning-num** to set the dynamic ARP learning limit for an interface.

Use **undo arp max-learning-num** to restore the default.

Syntax

arp max-learning-num *max-number* [**alarm** *alarm-threshold*]

undo arp max-learning-num

Default

The following matrix shows the default values for the dynamic ARP learning limit:

Hardware	Dynamic ARP learning limit on an interface
S5110V2-SI switch series S5000V3-EI switch series S5000V5-EI switch series S5000E-X switch series S5000X-EI switch series	128
WAS6000 switch series	• WAS6124-X and WAS6108: 1024 • Other switches: 128
S5110V2 switch series	256
WS5810-WiNet switch series	512
S5120V2-LI switch series S5130S-LI switch series S5120V3-SI switch series MS4320V2 switch series MS4320 switch series	1024
S3100V3-SI switch series	• Switches with product codes LS-3100V3-28TP-SI-H1, LS-3100V3-18TP-SI-H1, LS-3100V3-52TP-SI-H1, and LS-3100V3-20TP-PWR-SI-H1: 512 • Other switches: 1024

S5120V3-LI switch series	• S5120V3-20P-LI, S5120V3-28P-LI, S5120V3-52P-LI, S5120V3-28P-PWR-LI, S5120V3-52P-PWR-LI: 0 to 512 • Other switches: 0 to 1024

alarm *alarm-threshold*: Specifies an alarm threshold for dynamic ARP learning, in percentage. The value range for the *alarm-threshold* argument is 1 to 100. The device generates a log message when the number of dynamic ARP entries learned on an interface reaches the value calculated by using the formula: (*max-number* × *alarm-threshold*)/100. If you do not specify the alarm threshold, the device does not generate log messages.

Usage guidelines

An interface can dynamically learn ARP entries. To prevent an interface from holding too many ARP entries, you can set the maximum number of dynamic ARP entries that the interface can learn. When the maximum number is reached, the interface stops learning ARP entries.

When the *number* argument is set to 0, the interface is disabled from learning dynamic ARP entries.

Examples

Specify VLAN-interface 40 to learn a maximum of 10 dynamic ARP entries.

```
<Sysname> system-view
[Sysname] interface vlan-interface 40
[Sysname-Vlan-interface40] arp max-learning-num 10
```

Specify GigabitEthernet 1/0/1 to learn a maximum of 10 dynamic ARP entries.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] arp max-learning-num 10
```

Specify Layer 2 aggregate interface Bridge-Aggregation 1 to learn a maximum of 10 dynamic ARP entries.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] arp max-learning-num 10
```

arp max-learning-number

Use **arp max-learning-number** to set the dynamic ARP learning limit for a device.

Use **undo arp max-learning-number** to restore the default.

Syntax

arp max-learning-number *max-number* **slot** *slot-number*

undo arp max-learning-number slot *slot-number*

Default

The following matrix shows the default values for the dynamic ARP learning limit:

Hardware	ARP learning limit on the device
S5110V2-SI switch series S5000V3-EI switch series S5000V5-EI switch series S5000E-X switch series S5000X-EI switch series	128

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

A device can dynamically learn ARP entries. To prevent a device from holding too many ARP entries, you can set the maximum number of dynamic ARP entries that the device can learn. When the maximum number is reached, the device stops learning ARP entries.

When the *number* argument is set to 0, the device is disabled from learning dynamic ARP entries.

Examples

Set the ARP learning limit to 64 for slot 1.

```
<Sysname> system-view
[Sysname] arp max-learning-number 64 slot 1
```

arp multiport

Use **arp multiport** to configure a multiport ARP entry.

Use **undo arp** to delete an ARP entry.

Syntax

arp multiport *ip-address mac-address vlan-id*

undo arp *ip-address*

Default

No multiport ARP entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IP address for the multiport ARP entry.

mac-address: Specifies a MAC address for the multiport ARP entry, in the format of H-H-H.

vlan-id: Specifies a VLAN for the multiport ARP entry, in the range of 1 to 4094. The specified VLAN must already exist.

Usage guidelines

If the corresponding VLAN or the VLAN interface is deleted, the multiport ARP entry is also deleted.

To make the multiport ARP entry effective for packet forwarding, you must configure a multicast or multiport unicast MAC address entry to specify multiple output interfaces. The MAC address entry must have the same MAC address and VLAN ID as the multiport ARP entry. In addition, the IP address in the multiport ARP entry must reside on the same subnet as the VLAN interface of the specified VLAN.

If an aggregate interface is the output interface of an entry and its member ports reside on multiple IRF member devices, the device cannot use the entry to forward packets. To resolve this issue, set the global link-aggregation load sharing mode to a mode other than source or destination MAC address-based by using the **link-aggregation global load-sharing mode** command. For more information about this command, see Ethernet link aggregation in *Layer 2—LAN Switching Command Reference*.

Examples

Configure a multiport ARP entry that contains IP address 202.38.10.2 and MAC address 00e0-fc01-0000 in VLAN 10.

```
<Sysname> system-view
[Sysname] arp multiport 202.38.10.2 00e0-fc01-0000 10
```

arp static

Use **arp static** to configure a static ARP entry.

Use **undo arp** to delete an ARP entry.

Syntax

arp static *ip-address mac-address* [*vlan-id interface-type interface-number*]

undo arp *ip-address*

Default

No static ARP entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IP address for the static ARP entry.

mac-address: Specifies a MAC address for the static ARP entry, in the format of H-H-H.

vlan-id: Specifies the ID of a VLAN to which the static ARP entry belongs. The value range is 1 to 4094.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

A static ARP entry is manually configured and maintained. It does not age out and cannot be overwritten by any dynamic ARP entry.

Static ARP entries can be short or long.

A resolved short static ARP entry becomes unresolved upon certain events, for example, when the resolved output interface goes down, or the corresponding VLAN or VLAN interface is deleted.

Long static ARP entries are effective or ineffective. Ineffective long static ARP entries cannot be used for packet forwarding. A long static ARP entry is ineffective when any of the following conditions exists:

- The IP address in the entry conflicts with a local IP address.
- No local interface has an IP address in the same subnet as the IP address in the ARP entry.

If you specify the *vlan-id interface-type interface-number* argument, follow these restrictions and guidelines:

- The interface can be an Ethernet interface or an aggregate interface.
- The VLAN and VLAN interface must already exist. The specified Ethernet interface must belong to the specified VLAN.
- The IP address of the VLAN interface and the IP address specified by the *ip-address* argument must be on the same network.
- A long static ARP entry for a VLAN is deleted if the VLAN or VLAN interface is deleted.

Examples

Configure a long static ARP entry that contains IP address 202.38.10.2, MAC address 00e0-fc01-0000, and output interface GigabitEthernet 1/0/1 in VLAN 10.

```
<Sysname> system-view
[Sysname] arp static 202.38.10.2 00e0-fc01-0000 10 gigabitethernet 1/0/1
```

Related commands

display arp

reset arp

arp timer aging

Use **arp timer aging** to set the aging timer for dynamic ARP entries.

Use **undo arp timer aging** to restore the default.

Syntax

arp timer aging { *aging-minutes* | **second** *aging-seconds* }

undo arp timer aging

Default

In system view, the aging timer for dynamic ARP entries is 20 minutes.

In interface view, the aging timer for dynamic ARP entries is the aging timer set in system view.

Views

System view

VLAN interface view

Predefined user roles

network-admin

Parameters

aging-minutes: Specifies the aging timer in minutes. The value range for this argument is 1 to 1440.

second *aging-seconds*: Specifies the aging timer in seconds. The value range for the *aging-seconds* argument is 5 to 86400.

Usage guidelines

Each dynamic ARP entry in the ARP table has a limited lifetime, called an aging timer. The aging timer of a dynamic ARP entry is reset each time the dynamic ARP entry is updated. Dynamic ARP entries that are not updated before their aging timers expire are deleted from the ARP table.

You can set the aging timer for dynamic ARP entries in system view or in interface view. The aging timer set in interface view takes precedence over the aging timer set in system view.

Set the aging timer for dynamic ARP entries as needed. For example, when you configure proxy ARP, set a short aging time so that invalid dynamic ARP entries can be deleted in a timely manner.

Examples

Set the aging timer for dynamic ARP entries to 10 minutes.

```
<Sysname> system-view
[Sysname] arp timer aging 10
```

Set the aging timer for dynamic ARP entries to 200 seconds.

```
<Sysname> system-view
[Sysname] arp timer aging second 200
```

Set the aging timer for dynamic ARP entries to 200 seconds on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] arp timer aging second 200
```

Related commands

arp timer aging probe-count

arp timer aging probe-interval

display arp timer aging

arp timer aging probe-count

Use **arp timer aging probe-count** to set the maximum number of probes for dynamic ARP entries.

Use **undo arp timer aging probe-count** to restore the default.

Syntax

arp timer aging probe-count *count*

undo arp timer aging probe-count

Default

In system view, the maximum number of probes is three for dynamic ARP entries.

In interface view, the maximum number of probes for dynamic ARP entries is the maximum probe count set in system view.

Views

System view

VLAN interface view

Predefined user roles

network-admin

Parameters

count: Specifies the maximum number of probes. The value range for this argument is 0 to 10. To disable the device from probing dynamic ARP entries, set the value to 0.

Usage guidelines

This probe mechanism keeps legal dynamic ARP entries valid and avoids unnecessary ARP resolution during later traffic forwarding. This probe feature sends ARP requests for the IP address in a dynamic ARP entry.

- If the device receives an ARP reply before the entry aging timer expires, the device resets the aging timer.
- If the device does not receive any ARP reply after the maximum number of probes is made, the device deletes the entry when the entry aging timer expires.

You can set the maximum number of probes in system view and in interface view. The probe count set in interface view takes precedence over the probe count set in system view.

Examples

Allow the device to perform a maximum of five probes for dynamic ARP entries.

```
<Sysname> system-view
[Sysname] arp timer aging probe-count 5
```

Allow the device to perform a maximum of five probes for dynamic ARP entries on VLAN-interface 2.

<Sysname> system-view

```
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] arp timer aging probe-count 5
```

Related commands

arp timer aging

arp timer aging probe-interval

arp timer aging probe-interval

Use **arp timer aging probe-interval** to set the interval for probing dynamic ARP entries.

Use **undo arp timer aging probe-interval** to restore the default.

Syntax

arp timer aging probe-interval *interval*

undo arp timer aging probe-interval

Default

In system view, the probe interval is 5 seconds.

In interface view, the probe interval equals the setting in system view.

Views

System view

VLAN interface view

Predefined user roles

network-admin

Parameters

Interval: Specifies the probe interval in seconds. The value rang is 1 to 60.

Usage guidelines

The probing feature keeps legal dynamic ARP entries valid and avoids unnecessary ARP resolution during later traffic forwarding.

Before a dynamic ARP entry is aged out, the device sends ARP requests for the IP address in the ARP entry.

- If the device receives an ARP reply during the probe interval, the device resets the aging timer.

- If the device does not receive any ARP reply during the probe interval, the device starts a new probe.
- If the maximum number probes are made, and still no ARP reply is received, the device deletes the entry.

You can set the probe interval in system view and in interface view. The probe interval in interface view takes precedence over the probe interval in system view.

Examples

Set the probe interval to 10 seconds for dynamic ARP entries.

```
<Sysname> system-view
[Sysname] arp timer aging probe-interval 10
```

Set the probe interval to 10 seconds for dynamic ARP entries on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] arp timer aging probe-interval 10
```

Related commands

arp user-ip-conflict record enable

Use **arp user-ip-conflict record enable** to enable recording user IP address conflicts.

Use **undo arp user-ip-conflict record enable** to disable recording user IP address conflicts.

Syntax

```
arp user-ip-conflict record enable
undo arp user-ip-conflict record enable
```

Default

The default differs depending on the software version, as shown below:

Versions	Default setting
Versions earlier than Release 6350	Recording user IP address conflicts is disabled.
Release 6350 and later	• If the device starts up with the initial configuration, recording user IP address conflicts is disabled. • If the device starts up with the factory defaults, recording user IP address conflicts is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature enables the device to detect and record user IP address conflicts. The device determines that a conflict occurs if an incoming non-gratuitous ARP packet has the same sender IP address as an existing ARP entry but a different sender MAC address. The device generates a user IP address conflict record, logs the conflict, and sends the log to the information center. For

information about the log destination and output rule configuration, see the information center in *Network Management and Monitoring Configuration Guide*.

An IRF member device can generate a maximum of 10 user IP address conflict logs per second.

To display user IP address conflict records, use the **display arp user-ip-conflict record** command.

Examples

Enable recording user IP address conflicts.

```
<Sysname> system-view
[Sysname] arp user-ip-conflict record enable
```

Related commands

display arp user-ip-conflict record

arp user-move record enable

Use **user-move record enable** to enable recording user port migrations.

Use **undo arp user-move record enable** to disable recording user port migrations.

Syntax

arp user-move record enable

undo arp user-move record enable

Default

Recording user port migrations is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Each IRF member device can generate a maximum of 10 user port migration logs per second.

To display user port migration records, use the **display arp user-move record** command.

Examples

Enable recording user port migration.

```
<Sysname> system-view
[Sysname] arp user-move record enable
```

display arp user-move record

display arp

Use **display arp** to display ARP entries.

Syntax

display arp [[**all** | **dynamic** | **multiport** | **static**] [**slot** *slot-number*] | **vlan** *vlan-id* | **interface** *interface-type interface-number*] [**count** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`all`: Displays all ARP entries.

`dynamic`: Displays dynamic ARP entries.

`multiport`: Displays multiport ARP entries.

`static`: Displays static ARP entries.

`slot` *`slot-number`*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ARP entries for the master device.

`vlan` *`vlan-id`*: Specifies a VLAN by its VLAN ID. The VLAN ID is in the range of 1 to 4094.

`interface` *`interface-type interface-number`*: Specifies an interface by its type and number. If you do not specify an interface, this command displays ARP entries for all interfaces.

`count`: Displays the number of ARP entries.

`verbose`: Displays detailed information about ARP entries.

Usage guidelines

This command displays information about ARP entries, including the IP address, MAC address, VLAN ID, output interface, entry type, and aging timer.

Examples

Display all ARP entries.

```
<Sysname> display arp all
  Type: S-Static   D-Dynamic   O-Openflow   R-Rule   M-Multiport  I-Invalid

Table 1 Command output

Field	Description
IP address	IP address in an ARP entry.
MAC address	MAC address in an ARP entry.
VLAN/VSI	ID of the VLAN to which the ARP entry belongs. This field displays hyphens (**--**) in either of the following situations: • The ARP entry is an unresolved short static ARP entry. • The output interface of the ARP entry does not belong to the VLAN.
Interface	Output interface in an ARP entry. This field displays hyphens (**--**) in either of the following situations: • The ARP entry is an unresolved short static ARP entry. • The ARP entry is a multiport ARP entry and has no output interface information. To obtain the output interface information of the multiport ARP entry, look up the MAC address table according to the MAC address in the ARP entry.
Link ID	This field is not supported in the current software version. Link ID in an ARP entry. This field displays hyphens (**--**) if the ARP entry does not belong to any VSI.
Aging	Aging time for an ARP entry in seconds. For a static ARP entry, this field always displays hyphens (**--**). The static ARP entry never ages out unless you delete it manually. For a dynamic ARP entry, this field displays hyphens (**--**) if the aging time is unknown.
Type	ARP entry type: • **D**—Dynamic. • **S**—Static.

Field	Description
	• **O**—OpenFlow. • **R**—Rule. • **M**—Multiport. • **I**—Invalid.
VPN instance	This field is not supported in the current software version. Name of VPN instance. If no VPN instance is configured for the ARP entry, this field displays hyphens (--).
Service instance	This field is not supported in the current software version. Ethernet service instance in an ARP entry. This field displays hyphens (**--**) if no Ethernet service instance is specified for the Layer 2 Ethernet interface or Layer 2 aggregate interface in the ARP entry.
VXLAN ID	This field is not supported in the current software version. ID of the VXLAN to which the ARP entry belongs. VXLAN ID is also called VNI. If the ARP entry does not belong to any VXLAN, this field displays hyphens (**--**).
VSI name	This field is not supported in the current software version. Name of the VSI to which the ARP entry belongs. If the ARP entry does not belong to any VSI, this field displays hyphens (**--**).
VSI interface	This field is not supported in the current software version. Name of the gateway interface of the VSI. If no gateway interface is specified for the VSI, this field displays hyphens (**--**).
Nickname	This field is not supported in the current software version. Nickname of the ARP entry. The nickname is a string of four hexadecimal numbers, for example, 012a.
Total number of entries	Number of ARP entries.

Related commands

`arp static`

`reset arp`

display arp entry-limit

Use **`display arp entry-limit`** to display the maximum number of ARP entries that a device supports.

Syntax

`display arp entry-limit`

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the maximum number of ARP entries that the device supports.

```
<Sysname> display arp entry-limit
```

```
ARP entries: 1024
```

display arp *ip-address*

Use **display arp** *ip-address* to display the ARP entry for an IP address.

Syntax

display arp *ip-address* [**slot** *slot-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip-address: Displays the ARP entry for the specified IP address.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

verbose: Displays the detailed information about the specified ARP entry.

Usage guidelines

The ARP entry information includes the IP address, MAC address, VLAN ID, output interface, entry type, and aging timer.

Examples

Display the ARP entry for the IP address 20.1.1.1.

```
<Sysname> display arp 20.1.1.1
  Type: S-Static   D-Dynamic   O-Openflow   R-Rule   M-Multiport  I-Invalid
IP address      MAC address    VLAN/VSI   Interface                Aging Type
20.1.1.1        00e0-fc00-0001 --         --                       --    S
```

Related commands

arp static

reset arp

display arp openflow count

Use **display arp openflow count** to display the number of OpenFlow ARP entries.

Syntax

display arp openflow count [**slot** *slot-number*]

Views

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the number of OpenFlow ARP entries for the master device.

Examples

Display the number of OpenFlow ARP entries.

```
<Sysname> display arp openflow count
 Total number of OpenFlow ARP entries: 6
```

display arp timer aging

Use **display arp timer aging** to display the aging timer of dynamic ARP entries.

Syntax

display arp timer aging

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command always displays the aging time in seconds no matter which unit you set in the **arp timer aging** command.

Examples

Display the aging timer of dynamic ARP entries.

```
<Sysname> display arp timer aging
Current ARP aging time is 1200 seconds
```

Related commands

arp timer aging

display arp user-ip-conflict record

Use **display arp user-ip-conflict record** to display user IP address conflict records.

Syntax

display arp user-ip-conflict record [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays user IP address conflict records for all member devices.

Usage guidelines

Each IRF member device can save a maximum of 200 user IP address conflict records.

If the maximum number is reached, a new record will override the earliest record.

Examples

Display all user IP address conflict records.

```
<Sysname> display arp user-ip-conflict record
IP address: 10.1.1.1
System time: 2018-02-02 11:22:29
Conflict count: 1
Log suppress count: 0
Old interface: GigabitEthernet1/0/1
New interface: GigabitEthernet1/0/2
Old SVLAN/CVLAN: 100/2
New SVLAN/CVLAN: 100/2
Old MAC: 00e0-ca63-8141
New MAC: 00e0-ca63-8142

IP address: 10.1.1.2
System time: 2018-02-02 10:20:30
Conflict count: 1
Log suppress count: 0
Old interface: GigabitEthernet1/0/1
New interface: GigabitEthernet1/0/2
Old SVLAN/CVLAN: 100/--
New SVLAN/CVLAN: 100/--
Old MAC: 00e0-ca63-8141
New MAC: 00e0-ca63-8142
```

Table 2 Command output

Field	Description
IP address	IP address of a user.
System time	Time when the user IP address conflict occurred.
Conflict count	Number of times that conflicts for the IP address.
Log suppress count	Number of times that user IP address conflict logs are suppressed.
Old interface	Output interface in the old ARP entry.
New interface	Output interface in the new ARP entry.
Old SVLAN/CVLAN	ID of the outer VLAN or inner VLAN in the old ARP entry. This field displays hyphens (**--**) if the ARP entry does not belong to any outer VLAN or inner VLAN.
New SVLAN/CVLAN	ID of the outer VLAN or inner VLAN in the new ARP entry. This field displays hyphens (**--**) if the ARP entry does not belong to any outer VLAN or inner VLAN.
Old MAC	MAC address in the old ARP entry.
New MAC	MAC address in the new ARP entry.

Related commands

arp user-ip-conflict record enable

display arp user-move record

Use **display arp user-move record** to display user port migration records.

Syntax

display arp user-move record [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays user port migration records for all member devices.

Usage guidelines

Each IRF member device can save a maximum of 200 user port migration records.

When the number of user port migration records reaches the upper limit, new records will overwrite the earliest ones.

Examples

Display all user port migration records.

```
<Sysname> display arp user-move record
IP address: 10.1.1.1
MAC address: 0001-0201-0e81
System time: 2018-02-02 11:22:29
Move count: 1
Log suppress count: 0
Before:
  interface: GigabitEthernet1/0/1
  SVLAN/CVLAN: 100/2
After:
  interface: GigabitEthernet1/0/2
  SVLAN/CVLAN: 100/2

IP address: 10.1.1.2
MAC address: 0001-0201-0e82
System time: 2018-02-02 10:20:30
Move count: 1
Log suppress count: 0
Before:
  interface: GigabitEthernet1/0/1
  SVLAN/CVLAN: 100/--
After:
  interface: GigabitEthernet1/0/2
```

```
SVLAN/CVLAN: 100/--
```

Table 3 Command output

Field	Description
IP address	IP address of the user.
MAC address	MAC address of the user.
System time	Time when the user port migration occurred.
Move count	Number of times that user port migrated.
Log suppress count	Number of times that the generation of user port migration logs is suppressed.
Interface	Output interface in the ARP entry.
SVLAN/CVLAN	ID of the outer VLAN or inner VLAN in the ARP entry. This field displays hyphens (**--**) if the ARP entry does not belong to any outer VLAN or inner VLAN.

Related commands

arp user-move record enable

reset arp

Use **reset arp** to clear ARP entries from the ARP table.

Syntax

reset arp { **all** | **dynamic** | **interface** *interface-type interface-number* | **multiport** | **slot** *slot-number* | **static** }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears all ARP entries.

dynamic: Clears all dynamic ARP entries.

multiport: Clears all multiport ARP entries.

static: Clears all static ARP entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears ARP entries for the master device.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears ARP entries for all interfaces.

Usage guidelines

CAUTION:

The **reset arp** command will clear existing ARP entries from the ARP table. It might cause that external users cannot quickly communicate with the LAN users. Make sure you are fully aware of the impacts of this command when you use it on a live network.

Examples

Clear all static ARP entries.

```
<Sysname> reset arp static
```

Related commands

arp static

display arp

Gratuitous ARP commands

arp ip-conflict log prompt

Use **arp ip-conflict log prompt** to enable IP conflict notification.

Use **undo arp ip-conflict log prompt** to restore the default.

Syntax

arp ip-conflict log prompt

undo arp ip-conflict log prompt

Default

The default differs depending on the software version, as shown below:

Versions	Default setting
Versions earlier than Release 6350	IP conflict notification is disabled.
Release 6350 and later	• If the device starts up with the initial configuration, IP conflict notification is disabled. • If the device starts up with the factory defaults, IP conflict notification is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, the device performs the following operations if it is using the sender IP address of a received ARP packet:

- Sends a gratuitous ARP request.
- Displays an error message after the device receives an ARP reply about the conflict.

You can use this command to enable the device to display error messages before sending a gratuitous ARP reply or request for conflict confirmation.

Examples

Enable IP conflict notification on the device.

```
<Sysname> system-view
[Sysname] arp ip-conflict log prompt
```

arp send-gratuitous-arp

Use **arp send-gratuitous-arp** to enable periodic sending of gratuitous ARP packets on an interface.

Use **undo arp send-gratuitous-arp** to disable the interface from periodically sending gratuitous ARP packets.

Syntax

arp send-gratuitous-arp [**interval** *interval*]

undo arp send-gratuitous-arp

Default

Periodic sending of gratuitous ARP packets is disabled.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the sending interval in the range of 200 to 200000 milliseconds. The default value is 2000 milliseconds.

Usage guidelines

This feature takes effect on an interface only when the interface has an IP address and the data link layer state of the interface is up.

This feature can send gratuitous ARP requests only for the sending interface's primary IP address or manually configured secondary IP address. The primary IP address can be configured manually or automatically, whereas the secondary IP address must be configured manually.

If you change the sending interval for gratuitous ARP packets, the configuration takes effect at the next sending interval.

The sending interval for gratuitous ARP packets might be much longer than the set interval when any of the following conditions exist:

- This feature is enabled on multiple interfaces.
- Each interface is configured with multiple secondary IP addresses.
- A small sending interval is configured in the preceding cases.

Examples

Enable VLAN-interface 2 to send gratuitous ARP packets every 300 milliseconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] arp send-gratuitous-arp interval 300
```

gratuitous-arp mac-change retransmit

Use **gratuitous-arp mac-change retransmit** to set the times and the interval for retransmitting a gratuitous ARP packet for the device MAC address change.

Use **undo gratuitous-arp mac-change retransmit** to restore the default.

Syntax

gratuitous-arp mac-change retransmit *times* **interval** *seconds*

undo gratuitous-arp mac-change retransmit

Default

The device sends a gratuitous packet for its MAC address change once only.

Views

System view

Predefined user roles

network-admin

Parameters

times: Specifies the times of retransmitting a gratuitous packet, in the range of 1 to 10.

interval *seconds*: Specifies the interval for retransmitting a gratuitous packet, in the range of 1 to 10 seconds.

Usage guidelines

The device sends a gratuitous ARP packet to inform other devices of its MAC address change. However, the other devices might fail to receive the packet because the device sends the gratuitous ARP packet once only by default. Use this command to configure gratuitous ARP retransmission parameters to ensure that the other devices can receive the packet.

After you execute this command, the device will retransmit a gratuitous ARP packet for its MAC address change at the specified interval for the specified times.

Examples

Set the times to 3 and the interval to 5 for retransmitting a gratuitous ARP packet for the device MAC address change.

```
<Sysname> system-view
[Sysname] gratuitous-arp mac-change retransmit 3 interval 5
```

gratuitous-arp-learning enable

Use **gratuitous-arp-learning enable** to enable learning of gratuitous ARP packets.

Use **undo gratuitous-arp-learning enable** to disable learning of gratuitous ARP packets.

Syntax

```
gratuitous-arp-learning enable
undo gratuitous-arp-learning enable
```

Default

Learning of gratuitous ARP packets is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The learning of gratuitous ARP packets feature allows a device to maintain its ARP table by creating or updating ARP entries based on received gratuitous ARP packets.

When this feature is disabled, the device uses received gratuitous ARP packets to update existing ARP entries only. ARP entries are not created based on the received gratuitous ARP packets, which saves ARP table space.

Examples

Enable learning of gratuitous ARP packets.

```
<Sysname> system-view
[Sysname] gratuitous-arp-learning enable
```

gratuitous-arp-sending enable

Use **gratuitous-arp-sending enable** to enable sending gratuitous ARP packets upon receiving ARP requests whose sender IP address is on a different subnet.

Use **undo gratuitous-arp-sending enable** to disable sending gratuitous ARP packets upon receiving ARP requests whose sender IP address is on a different subnet.

Syntax

gratuitous-arp-sending enable

undo gratuitous-arp-sending enable

Default

A device does not send gratuitous ARP packets when it receives ARP requests whose sender IP address is on a different subnet.

Views

System view

Predefined user roles

network-admin

Examples

Disable a device from sending gratuitous ARP packets upon receiving ARP requests whose sender IP address is on a different subnet.

```
<Sysname> system-view
[Sysname] undo gratuitous-arp-sending enable
```

Proxy ARP commands

display local-proxy-arp

Use **display local-proxy-arp** to display the local proxy ARP status.

Syntax

display local-proxy-arp [**interface** *interface-type interface-number*]

Views

local-proxy-arp enable

Use **local-proxy-arp enable** to enable local proxy ARP.

Use **undo local-proxy-arp enable** to disable local proxy ARP.

Syntax

local-proxy-arp enable [**ip-range** *start-ip-address* **to** *end-ip-address*]

undo local-proxy-arp enable

Default

Local proxy ARP is disabled.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

ip-range *start-ip-address* **to** *end-ip-address*: Specifies the IP address range for which local proxy ARP is enabled. The start IP address must be lower than or equal to the end IP address.

Usage guidelines

Proxy ARP enables a device on a network to answer ARP requests for an IP address not on that network. With proxy ARP, hosts in different broadcast domains can communicate with each other as they do on the same network.

Proxy ARP includes common proxy ARP and local proxy ARP.

Common proxy ARP allows communication between hosts that connect to different Layer 3 interfaces and reside in different broadcast domains.

Local proxy ARP allows communication between hosts that connect to the same Layer 3 interface and reside in different broadcast domains.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Enable local proxy ARP on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] local-proxy-arp enable
```

Enable local proxy ARP on VLAN-interface 2 for an IP address range.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] local-proxy-arp enable ip-range 1.1.1.1 to 1.1.1.20
```

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan: Displays ARP snooping entries for a VLAN.

vlan-id: Specifies a VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays ARP snooping entries for all VLANs.

count: Displays the number of the ARP snooping entries. If you do not specify this keyword, the command displays ARP snooping entries.

ip *ip-address*: Displays the ARP snooping entry for the specified IP address in VLANs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ARP snooping entries for the master device.

Examples

Display ARP snooping entries for VLAN 2.

```
<Sysname> display arp snooping vlan 2
IP Address   MAC Address    VLAN ID Interface  Aging       Status
3.3.3.3         0003-0003-0003 2       GE1/0/1    20          Valid
3.3.3.4         0004-0004-0004 2       GE1/0/2    5           Invalid
```

Display the ARP snooping entry for IP address 1.1.1.1 in a VLAN.

```
<Sysname> display arp snooping vlan ip 1.1.1.1
IP address      MAC address    VLAN ID Interface  Aging       Status
1.1.1.1         001f-e201-0111 2       GE1/0/1    15          Valid
```

Table 4 Command output

Field	Description
IP Address	IP address in an ARP snooping entry.
MAC Address	MAC address in an ARP snooping entry.
VLAN ID	ID of the VLAN to which the ARP snooping entry belongs.
Interface	Input interface in an ARP snooping entry.
Aging	Aging time for an ARP snooping entry in minutes. If the member device learns an ARP snooping entry from another member, the member device cannot learn the aging time of the entry, and this field displays **N/A**.
Status	Status of an ARP snooping entry: **Valid**, **Invalid**, **Collision**.
Total entries	Number of ARP snooping entries.

Related commands

reset arp snooping

Contents

IP addressing commands

display ip interface

Use **display ip interface** to display IP configuration and statistics for Layer 3 interfaces.

Syntax

display ip interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays IP configuration and statistics for all Layer 3 interfaces.

Usage guidelines

Use the **display ip interface** command to display IP configuration and statistics for the specified Layer 3 interface. The statistics include the following information:

- The number of unicast packets, bytes, and multicast packets the interface has sent and received.
- The number of TTL-invalid packets and ICMP packets the interface has received.

The packet statistics helps you locate a possible attack on the network.

Examples

Display IP configuration and statistics for VLAN-interface 10.

```
<Sysname> display ip interface vlan-interface 10
Vlan-interface10 current state : DOWN
Line protocol current state : DOWN
Internet Address is 1.1.1.1/8 Primary
Broadcast address : 1.255.255.255
The Maximum Transmit Unit : 1500 bytes
input packets : 0, bytes : 0, multicasts : 0
output packets : 0, bytes : 0, multicasts : 0
TTL invalid packet number:         0
ICMP packet input number:          0
  Echo reply:                      0
  Unreachable:                     0
  Source quench:                   0
  Routing redirect:                0
  Echo request:                    0
  Router advert:                   0
  Router solicit:                  0
  Time exceed:                     0
```

```
IP header bad:                  0
Timestamp request:              0
Timestamp reply:                0
Information request:            0
Information reply:              0
Netmask request:                0
Netmask reply:                  0
Unknown type:                   0
```

Table 1 Command output

Field	Description
current state	Physical link state of the interface: • **Administrative DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP**—The interface is both administratively and physically up.
Line protocol current state	Data link layer state of the interface. • **DOWN**—The data link layer protocol is down. • **UP**—The data link layer protocol is up. • **UP (spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist.
Internet Address	IP address of an interface followed by: • **Primary**—A primary IP address. • **Sub**—A secondary IP address. • **Unnumbered**—An unnumbered IP address. • **DHCP-Allocated**—An IP address obtained through DHCP. • **BOOTP-Allocated**—An IP address obtained through BOOTP.
Broadcast address	Broadcast address of the subnet attached to an interface.
The Maximum Transmit Unit	MTU of the interface, in bytes.
input packets, bytes, multicasts output packets, bytes, multicasts	All received and sent packets and bytes, and received and sent multicast packets on an interface (statistics start at the device startup).
TTL invalid packet number	Number of TTL-invalid packets received on the interface (statistics start at the device startup).

Field	Description
ICMP packet input number: Echo reply: Unreachable: Source quench: Routing redirect: Echo request: Router advert: Router solicit: Time exceed: IP header bad: Timestamp request: Timestamp reply: Information request: Information reply: Netmask request: Netmask reply: Unknown type:	Total number of ICMP packets received on the interface (statistics start at the device startup): • Echo reply packets. • Unreachable packets. • Source quench packets. • Routing redirect packets. • Echo request packets. • Router advertisement packets. • Router solicitation packets. • Time exceeded packets. • IP header bad packets. • Timestamp request packets. • Timestamp reply packets. • Information request packets. • Information reply packets. • Netmask request packets. • Netmask reply packets. • Unknown type packets.

display ip interface brief

Use **display ip interface brief** to display brief IP configuration for Layer 3 interfaces.

Syntax

display ip interface [*interface-type* [*interface-number*]] **brief** [**description**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type: Specifies an interface type. If you do not specify an interface type, this command displays brief IP configuration for all Layer 3 interfaces.

interface-number: Specifies an interface number. If you do not specify an interface number, this command displays brief IP configuration for all Layer 3 interfaces of the specified type.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays a maximum of 13 characters for each interface description. If the description is longer than 13 characters, the first 10 characters are displayed, followed by an ellipsis (...).

Usage guidelines

Information displayed by the command includes the state of the physical and link layer protocols, IP address, and interface descriptions.

Examples

Display brief IP configuration for VLAN interfaces.

```
<Sysname> display ip interface vlan-interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address      VPN instance Description
Vlan10              down     down     6.6.6.1         --           Link to Co...
```

Display brief IP configuration for VLAN interfaces, including complete interface descriptions.

```
<Sysname> display ip interface vlan-interface brief description
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address      VPN instance Description
Vlan10              down     down     6.6.6.1         --           Link to CoreR
                                                                   Outer
```

Table 2 Command output

Field	Description
*down: administratively down	The interface is administratively shut down by using the **shutdown** command.
(s) : spoofing	Spoofing attribute of the interface. The link protocol state of the interface is up, but the link is temporarily established on demand or does not exist.
Interface	Interface name.
Physical	Physical state of the interface: • ***down**—The interface is administratively shut down by using the **shutdown** command. • **down**—The interface is administratively up but its physical state is down, possibly because of a connection or link failure. • **up**—Both the administrative and physical states of the interface are up.
Protocol	Link layer protocol state of the interface: • **down**—The protocol state of the interface is down. • **down(l)**—The protocol state of the interface is down (loopback). • **up**—The protocol state of the interface is up. • **up(l)**—The protocol state of the interface is up (loopback). • **up(s)**—The protocol state of the interface is up (spoofing).
IP address	IP address of the interface. If no IP address is configured, this field displays hyphens (**--**).
VPN instance	This field is not supported in the current software version. Name of the VPN instance to which the interface belongs. This field displays a maximum of 12 characters. If the VPN instance name is longer than 12 characters, the first 9 characters are displayed, followed by an ellipsis (...). If the interface does not belong to any VPN instance, this field displays hyphens (**--**).
Description	Description of the interface. This field displays a maximum of 13 characters. If the description is longer than 13 characters, the first 10 characters are displayed, followed by an ellipsis (...). If no description is configured, this field displays hyphens (**--**).

Related commands

display ip interface

ip address

ip address

Use **ip address** to assign an IP address to the interface.

Use **undo ip address** to remove the IP address from the interface.

Syntax

ip address *ip-address* { *mask-length* | *mask* } [**irf-member** *member-id* | **sub**]

undo ip address *ip-address* { *mask-length* | *mask* } [**irf-member** *member-id* | **sub**]

Default

No IP address is assigned to an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of the interface, in dotted decimal notation.

mask-length: Specifies the subnet mask length in the range of 1 to 31. For a loopback interface, the value range is 1 to 32.

mask: Specifies the subnet mask in dotted decimal notation.

irf-member *member-id*: Assigns an IP address to the management Ethernet port of the specified IRF member device. The *member-id* argument specifies an IRF member device by its member ID. The value range for the *member-id* argument is 1 to 10.

sub: Assigns a secondary IP address to the interface.

Usage guidelines

Use the command to assign a primary or secondary IP address to an interface.

An interface can have only one primary IP address. If you execute this command multiple times to specify different primary IP addresses on an interface, the most recent configuration takes effect. If the interface connects to multiple subnets, configure primary and secondary IP addresses on the interface so the subnets can communicate with each other through the interface.

You cannot assign secondary IP addresses to an interface that obtains an IP address through BOOTP IP unnumbered, or DHCP.

If you do not specify any parameters, the **undo ip address** command removes all IP addresses from the interface. The **undo ip address** *ip-address* { *mask* | *mask-length* } command removes the primary IP address. The **undo ip address** *ip-address* { *mask* | *mask-length* } **sub** command removes a secondary IP address.

The primary and secondary IP addresses assigned to the interface can be located on the same network segment. Different interfaces on your device must reside on different network segments.

If you assign IP addresses to the management Ethernet ports of IRF member devices, make sure the following requirements are met:

- The IP addresses must be in the same subnet if you assign them through the same management Ethernet port of the master device.
- The IP addresses must be in different subnets if you assign them through different management Ethernet ports of the master device.

In an IRF fabric, only the IP address assigned to the management Ethernet port of the master takes effect. Make sure no IP address conflict exists when you assign IP addresses to the management Ethernet ports of subordinates. The system does not warn of an IP address conflict because the IP addresses assigned to the management Ethernet ports of subordinates do not take effect. After an IRF fabric split, the IP addresses assigned to the management Ethernet ports of the new masters (original subordinates) take effect.

Examples

Assign VLAN-interface 10 a primary IP address 129.12.0.1 and a secondary IP address 202.38.160.1, with subnet masks both 255.255.255.0.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ip address 129.12.0.1 255.255.255.0
[Sysname-Vlan-interface10] ip address 202.38.160.1 255.255.255.0 sub
```

Related commands

display ip interface

display ip interface brief

ip address unnumbered

Use **ip address unnumbered** to configure the current interface as IP unnumbered to borrow an IP address from the specified interface.

Use **undo ip address unnumbered** to restore the default.

Syntax

ip address unnumbered interface *interface-type interface-number*

undo ip address unnumbered

Default

The interface does not borrow IP addresses from other interfaces.

Views

Interface view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface from which the current interface can borrow an IP address.

Usage guidelines

Typically, you assign an IP address to an interface either manually or through DHCP. If the IP addresses are not enough, or the interface is used only occasionally, you can configure an interface to borrow an IP address from other interfaces. This is called IP unnumbered, and the interface borrowing the IP address is called IP unnumbered interface.

Loopback interfaces cannot borrow IP addresses of other interfaces, but other interfaces can borrow IP addresses of loopback interfaces.

Multiple interfaces can use the same unnumbered IP address. If an interface has multiple manually configured IP addresses, only the primary IP address manually configured can be borrowed.

You cannot enable a dynamic routing protocol on the interface that has no IP address configured. To enable the interface to communicate with other devices, you must configure a static route to the peer device on the interface.

Examples

Configure VLAN-interface 10 to borrow the IP address of VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ip address unnumbered interface vlan-interface 100
```

Contents

DHCP commands

Common DHCP commands

dhcp client-detect

Use **dhcp client-detect** to enable client offline detection on the DHCP server or DHCP relay agent.

Use **undo dhcp client-detect** to disable client offline detection on the DHCP server or DHCP relay agent.

Syntax

dhcp client-detect

undo dhcp client-detect

Default

Client offline detection is disabled on the DHCP server or DHCP relay agent.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The client offline detection feature on the DHCP server reclaims an assigned IP address and deletes the binding entry when the ARP entry ages out for the IP address.

This feature on the DHCP relay agent deletes the related relay entry and sends a RELEASE message to the DHCP server when an ARP entry ages out.

Examples

Enable client offline detection.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp client-detect
```

dhcp dscp

Use **dhcp dscp** to set the DSCP value for DHCP packets sent by the DHCP server or the DHCP relay agent.

Use **undo dhcp dscp** to restore the default.

Syntax

dhcp dscp *dscp-value*

undo dhcp dscp

Default

The DSCP value is 56 in DHCP packets sent by the DHCP server or the DHCP relay agent.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value for DHCP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for DHCP packets sent by the DHCP server or the DHCP relay agent.

```
<Sysname> system-view
[Sysname] dhcp dscp 30
```

dhcp enable

Use **dhcp enable** to enable DHCP.

Use **undo dhcp enable** to disable DHCP.

Syntax

dhcp enable

undo dhcp enable

Default

DHCP is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

DHCP related configuration takes effect only after you enable DHCP.

Enable DHCP before you configure the DHCP server or relay agent.

Examples

Enable DHCP.

```
<Sysname> system-view
[Sysname] dhcp enable
```

dhcp log enable

Use **dhcp log enable** to enable DHCP server logging.

Use **undo dhcp log enable** to disable DHCP server logging.

Syntax

dhcp log enable

undo dhcp log enable

Default

DHCP server logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the DHCP server to generate DHCP logs and send them to the information center. The information helps administrators to locate and solve problems. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

As a best practice, disable this feature if the log generation affects the device performance or reduces the address allocation efficiency. For example, this situation might occur when a large number of clients frequently come online or go offline.

Examples

Enable DHCP server logging.

```
<Sysname> system-view
[Sysname] dhcp log enable
```

dhcp select

Use **dhcp select** to enable the DHCP server or DHCP relay agent on an interface.

Use **undo dhcp select** to disable the DHCP server or DHCP relay agent on an interface. The interface will discard incoming DHCP packets.

Syntax

dhcp select { **relay** [**proxy**] | **server** }

undo dhcp select { **relay** | **server** }

Default

The interface operates in the DHCP server mode and responds to DHCP requests with configuration parameters.

Views

Interface view

Predefined user roles

network-admin

Parameters

relay: Enables the DHCP relay agent on the interface.

proxy: Enables the DHCP server proxy on the relay agent.

server: Enables the DHCP server on the interface.

Usage guidelines

Before enabling a DHCP server to operate as a DHCP relay agent, use the **reset dhcp server ip-in-use** command to clear address bindings and authorized ARP entries. These authorized ARP entries might conflict with ARP entries that are created after the DHCP relay agent is enabled.

When DHCP server proxy is enabled on the DHCP relay agent, the proxy forwards packets between the DHCP clients and DHCP server.

- When receiving DHCP requests from DHCP clients, the proxy forwards them to the DHCP server.
- When receiving DHCP responses from the DHCP server, the proxy modifies the DHCP server's IP address in these responses as its own IP address.

Examples

Enable the DHCP relay agent on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] dhcp select relay
```

Related commands

dhcp relay server-address

dhcp relay source-address

dhcp server request-ip-address check

dhcp smart-relay enable

reset dhcp server ip-in-use

DHCP server commands

NOTE:

- S5110V2-SI, S5000V3-EI, S5000E-X, S5000X-EI, and WAS6000 do not support the DHCP server functionality.
- S5000V5-EI supports the DHCP server functionality as from Release 6328P02 and Release 6337.

address range

Use **address range** to configure an IP address range in a DHCP address pool for dynamic allocation.

Use **undo address range** to restore the default.

Syntax

address range *start-ip-address end-ip-address*

undo address range

Default

No IP address range exists.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

start-ip-address: Specifies the start IP address.

end-ip-address: Specifies the end IP address.

Usage guidelines

If no IP address range is specified, all IP addresses in the subnet specified by the **network** command in address pool view are assignable. If an IP address range is specified, only the IP addresses in the IP address range are assignable.

After you use the **address range** command, you cannot use the **network secondary** command to specify a secondary subnet in the address pool.

If you execute this command multiple times, the most recent configuration takes effect.

The address range specified by the **address range** command must be within the subnet specified by the **network** command. The addresses outside of the subnet cannot be assigned.

Examples

Specify an address range of 192.168.8.1 through 192.168.8.150 in address pool 1.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 1
[Sysname-dhcp-pool-1] address range 192.168.8.1 192.168.8.150
```

Related commands

class

dhcp class

display dhcp server pool

network

bims-server

Use **bims-server** to specify the IP address, port number, and shared key of the BIMS server in a DHCP address pool.

Use **undo bims-server** to restore the default.

Syntax

bims-server ip *ip-address* [**port** *port-number*] **sharekey** { **cipher** | **simple** } *string*

undo bims-server

Default

No BIMS server information is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Specifies the IP address of the BIMS server.

port *port-number*: Specifies the port number of the BIMS server, in the range of 1 to 65534.

cipher: Specifies a key in encrypted form.

simple: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key string. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 1 to 53 characters. The DHCP client uses the shared key to encrypt packets sent to the BIMS server.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify BIMS server IP address 1.1.1.1, port number 80, and shared key **aabbcc** in address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] bims-server ip 1.1.1.1 port 80 sharekey simple aabbcc
```

Related commands

display dhcp server pool

bootfile-name

Use **bootfile-name** to specify a configuration file name or URL.

Use **undo bootfile-name** to restore the default.

Syntax

bootfile-name { *bootfile-name* | *url* }

undo bootfile-name

Default

No configuration file name or URL is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

bootfile-name: Specifies the configuration file name, a case-sensitive string of 1 to 63 characters.

url: Specifies the HTTP URL of the configuration file. It is a case-sensitive string of 1 to 63 characters.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

To specify a configuration file on a TFTP server, use the *bootfile-name* argument.

To specify a configuration file on an HTTP server, use the *url* argument.

Examples

Specify configuration file name **boot.cfg** in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] bootfile-name boot.cfg
```

Specify configuration file URL **http://10.1.1.1/boot.cfg** in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] bootfile-name http://10.1.1.1/boot.cfg
```

Related commands

display dhcp server pool

tftp-server ip-address

class ip-pool

Use **class ip-pool** to specify a DHCP address pool for a DHCP user class.

Use **undo class ip-pool** to remove the DHCP address pool specified for a DHCP user class.

Syntax

class *class-name* **ip-pool** *pool-name*

undo class *class-name* **ip-pool**

Default

No DHCP address pool is specified for a DHCP user class.

Views

DHCP policy view

Predefined user roles

network-admin

Parameters

class-name: Specifies a DHCP user class by its name, a case-insensitive string of 1 to 63 characters.

pool-name: Specifies a DHCP address pool by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can specify only one DHCP address pool for a DHCP user class in a DHCP policy. If you execute this command multiple times for a user class, the most recent configuration takes effect.

Examples

Specify DHCP address pool **pool1** for DHCP user class **test** in DHCP policy 1.

```
<Sysname> system-view
[Sysname] dhcp policy 1
[Sysname-dhcp-policy-1] class test ip-pool pool1
```

Related commands

default ip-pool

dhcp policy

dhcp server ip-pool

class option-group

Use **class option-group** to specify a DHCP option group for a DHCP user class.

Use **undo class option-group** to remove the configuration.

Syntax

class *class-name* **option-group** *option-group-number*

undo class *class-name* **option-group**

Default

No DHCP option group is specified for a DHCP user class.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

class-name: Specifies a DHCP user class by its name, a case-insensitive string of 1 to 63 characters.

option-group-number: Specifies a DHCP option group by its number in the range of 1 to 32768.

Usage guidelines

When receiving a DHCP-DISCOVER message, the server compares the client against the user classes in the order that they are specified by this command. If a match is found, the server assigns the client the DHCP options in the option group. If multiple matches are found, the server selects option groups by using the following methods:

- If the option groups have options in common, the server selects the option group specified for the first matching user class.
- If the option groups have different options, the server selects all the matching option groups.

You can specify only one option group for a DHCP user class in a DHCP address pool. If you execute this command multiple times for a user class, the most recent configuration takes effect.

Examples

Specify DHCP option group 1 for user class **user** in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] class user option-group 1
```

Related commands

dhcp option-group

class range

Use **class range** to specify an IP address range for a DHCP user class.

Use **undo class range** to remove the IP address range for the DHCP user class.

Syntax

class *class-name* **range** *start-ip-address end-ip-address*

undo class *class-name* **range**

Default

No IP address range is specified for a DHCP user class.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

class-name: Specifies a DHCP user class name, a case-insensitive string of 1 to 63 characters. If the specified user class does not exist, the DHCP server will not assign the addresses in the address range specified for the user class to any clients.

start-ip-address: Specifies the start IP address.

end-ip-address: Specifies the end IP address.

Usage guidelines

The **class range** command allows you to divide an address range into multiple address ranges for different DHCP user classes. The address range for a user class must be within the primary subnet specified by the **network** command. If the DHCP client does not match any DHCP user class, the DHCP server selects an address in the IP address range specified by the **address range** command. If the address range has no assignable IP addresses or no address range is configured, the address allocation fails.

After you specify an address range for a user class, you cannot use the **network secondary** command to specify a secondary subnet in the address pool.

You can specify only one address range for a DHCP user class in an address pool. If you execute this command multiple times for a DHCP user class, the most recent configuration takes effect.

Examples

Specify an IP address range of 192.168.8.1 through 192.168.8.150 for DHCP user class **user** in DHCP address pool 1.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 1
[Sysname-dhcp-pool-1] class user range 192.168.8.1 192.168.8.150
```

Related commands

address range

dhcp class

display dhcp server pool

default ip-pool

Use **default ip-pool** to specify the default DHCP address pool.

Use **undo default ip-pool** to restore the default.

Syntax

default ip-pool *pool-name*

undo default ip-pool

Default

No default DHCP address pool is specified.

Views

DHCP policy view

Predefined user roles

network-admin

Parameters

pool-name: Specifies a DHCP address pool by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

In a DHCP policy, the DHCP server uses the default DHCP address pool to assign IP addresses and other parameters to clients that do not match any user classes. If no default address pool is specified or the default address pool does not have assignable IP addresses, the address assignment fails.

You can specify only one default address pool in a DHCP policy. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify DHCP address pool **pool1** as the default DHCP address pool in DHCP policy 1.

```
<Sysname> system-view
[Sysname] dhcp policy 1
[Sysname-dhcp-policy-1] default ip-pool pool1
```

Related commands

class ip-pool

class ip-pool

default ip-pool

dhcp apply-policy

dhcp class

dhcp server always-broadcast

Use **dhcp server always-broadcast** to enable the DHCP server to broadcast all responses.

Use **undo dhcp server always-broadcast** to restore the default.

Syntax

dhcp server always-broadcast

undo dhcp server always-broadcast

Default

The DHCP server reads the broadcast flag in a DHCP request to decide whether to broadcast or unicast the response.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the DHCP server to ignore the broadcast flag in DHCP requests and broadcast all responses.

The DHCP server always unicasts a response in the following situations, regardless of whether this command is executed:

- The DHCP request is from a DHCP client that has an IP address (the **ciaddr** field is not 0).
- The DHCP request is forwarded by a DHCP relay agent from a DHCP client (the **giaddr** field is not 0).

Examples

Enable the DHCP server to broadcast all responses.

```
<Sysname> system-view
[Sysname] dhcp server always-broadcast
```

dhcp server apply ip-pool

Use **dhcp server apply ip-pool** to apply an address pool to an interface.

Use **undo dhcp server apply ip-pool** to restore the default.

Syntax

dhcp server apply ip-pool *pool-name*

undo dhcp server apply ip-pool

Default

No address pool is applied to an interface

Views

Interface view

Predefined user roles

network-admin

Parameters

pool-name: Specifies the name of a DHCP address pool, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Upon receiving a DHCP request from the interface, the DHCP server searches for a static binding for the client from all address pools. If no static binding is found, the server assigns configuration parameters from the address pool applied on the interface to the client. If the address pool has no assignable IP address or does not exist, the DHCP client cannot obtain an IP address.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Apply DHCP address pool 0 to VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] dhcp server apply ip-pool 0
```

Related commands

dhcp server ip-pool

dhcp server bootp ignore

Use **dhcp server bootp ignore** to configure the DHCP server to ignore BOOTP requests.

Use **undo dhcp server bootp ignore** to restore the default.

Syntax

dhcp server bootp ignore

undo dhcp server bootp ignore

Default

The DHCP server does not ignore BOOTP requests.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The lease duration of IP addresses obtained by BOOTP clients is unlimited. For scenarios that do not allow unlimited leases, you can configure the DHCP server to ignore BOOTP requests.

Examples

Configure the DHCP server to ignore BOOTP requests.

```
<Sysname> system-view
[Sysname] dhcp server bootp ignore
```

dhcp server bootp reply-rfc-1048

Use **dhcp server bootp reply-rfc-1048** to enable the sending of BOOTP responses in RFC 1048 format.

Use **undo dhcp server bootp reply-rfc-1048** to disable this feature.

Syntax

dhcp server bootp reply-rfc-1048

undo dhcp server bootp reply-rfc-1048

Default

This feature is disabled. The DHCP server does not process the Vend field of RFC 1048-incompliant requests but copies the Vend field into responses.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Not all BOOTP clients can send requests compliant with RFC 1048. This command enables the DHCP server to fill the Vend field in RFC 1048-compliant format in DHCP responses to RFC 1048-incompliant requests sent by BOOTP clients.

Examples

Enable the sending of BOOTP responses in RFC 1048 format on the DHCP server.

```
<Sysname> system-view
[Sysname] dhcp server bootp reply-rfc-1048
```

dhcp server check mac-address

Use **dhcp server check mac-address** to enable MAC address check on the DHCP server.

Use **undo dhcp server check mac-address** to disable MAC address check on the DHCP server.

Syntax

dhcp server check mac-address

undo dhcp server check mac-address

Default

MAC address check is disabled on the DHCP server.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This feature enables the DHCP server to compare the **chaddr** field of a received DHCP request with the source MAC address in the frame header. If they are the same, the DHCP server verifies the packet as legal and continues processing the packet. If they are not the same, the DHCP server discards the request.

Examples

Enable MAC address check on the DHCP server.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp server check mac-address
```

dhcp server database filename

Use **dhcp server database filename** to configure the DHCP server to back up the DHCP bindings to a file.

Use **undo dhcp server database filename** to restore the default.

Syntax

dhcp server database filename { *filename* | **url** *url* [**username** *username* [**password** { **cipher** | **simple** } *string*]] }

undo dhcp server database filename

Default

The DHCP server does not back up the DHCP bindings.

Views

System view

Predefined user roles

network-admin

Parameters

filename: Specifies the name of a local backup file. For information about the *filename* argument, see *Fundamentals Configuration Guide*.

url *url*: Specifies the URL of a remote backup file, a case-sensitive string of 1 to 255 characters. Do not include a username or password in the URL.

username *username*: Specifies the username for accessing the URL of the remote backup file, a case-sensitive string of 1 to 32 characters. Do not specify this option if a username is not required for accessing the URL of the remote backup file.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 32 characters. Its encrypted form is a case-sensitive string of 1 to 73 characters. Do not specify this argument if a password is not required for accessing the URL of the remote backup file.

Usage guidelines

The command automatically creates the file if you specify a nonexistent file.

With this command executed, the DHCP server backs up its bindings immediately and runs auto backup. The server, by default, waits 300 seconds after a binding change to update the backup file. You can use the **dhcp server database update interval** command to change the waiting time. If no DHCP binding changes, the backup file is not updated.

As a best practice, back up the bindings to a remote file. If you use the local storage medium, the frequent erasing and writing might damage the medium and then cause the DHCP server to malfunction.

When the backup file is on a remote device, follow these restrictions and guidelines to specify the URL, username, and password:

If the file is on an FTP server, enter URL in the following format: ftp://*server address:port/file path*, where the port number is optional.

If the file is on a TFTP server, enter URL in the following format: tftp://*server address:port/file path*, where the port number is optional.

- The username and password must be the same as those configured on the FTP server. If the server authenticates only the username, the password can be omitted.
- If the IP address of the server is an IPv6 address, enclose the address in a pair of brackets, for example, **ftp://[1::1]/database.dhcp**.
- You can also specify the DNS domain name for the server address field, for example, **ftp://company/database.dhcp**.

Examples

Configure the DHCP server to back up its bindings to file **database.dhcp**.

```
<Sysname> system-view
[Sysname] dhcp server database filename database.dhcp
```

Configure the DHCP server to back up its bindings to file **database.dhcp** in the working directory of the FTP server at 10.1.1.1.

```
<Sysname> system-view
[Sysname] dhcp server database filename url ftp://10.1.1.1/database.dhcp username 1
password simple 1
```

Related commands

dhcp server database update interval

dhcp server database update now

dhcp server database update stop

dhcp server database update interval

Use **dhcp server database update interval** to set the waiting time for the DHCP server to update the backup file after a DHCP binding change.

Use **undo dhcp server database update interval** to restore the default.

Syntax

dhcp server database update interval *interval*

undo dhcp server database update interval

Default

The DHCP server waits 300 seconds to update the backup file after a DHCP binding change. If no DHCP binding changes, the backup file is not updated.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the waiting time in the range of 60 to 864000 seconds.

Usage guidelines

When a DHCP binding is created, updated, or removed, the waiting period starts. The DHCP server updates the backup file when the waiting period is reached. All bindings changed during the period will be saved to the backup file.

The waiting time takes effect only after you configure the DHCP binding auto backup by using the **dhcp server database filename** command.

Examples

Set the waiting time to 10 minutes for the DHCP server to update the backup file.

```
<Sysname> system-view
[Sysname] dhcp server database update interval 600
```

Related commands

dhcp server database filename

dhcp server database update now

dhcp server database update stop

dhcp server database update now

Use **dhcp server database update now** to manually save the DHCP bindings to the backup file.

Syntax

dhcp server database update now

Views

System view

Predefined user roles

network-admin

Usage guidelines

Each time this command is executed, the DHCP bindings are saved to the backup file.

For this command to take effect, you must configure the DHCP auto backup by using the **dhcp server database filename** command.

Examples

Manually save the DHCP bindings to the backup file.

```
<Sysname> system-view
[Sysname] dhcp server database update now
```

Related commands

dhcp server database filename

dhcp server database update interval

dhcp server database update stop

dhcp server database update stop

Use **dhcp server database update stop** to terminate the download of DHCP bindings from the backup file.

Syntax

dhcp server database update stop

Views

System view

Predefined user roles

network-admin

Usage guidelines

The DHCP server does not provide services during the binding download process. If the connection disconnects during the process, the waiting timeout timer is 60 minutes. When the timer expires, the DHCP server stops waiting and starts providing address allocation services.

To enable the DHCP server to provide services without waiting for the connection to be repaired, use this command to terminate the download immediately. The IP addresses associated with the undownloaded bindings will be assigned to clients. Address conflicts might occur.

Examples

Terminate the download of the backup DHCP bindings.

```
<Sysname> system-view
[Sysname] dhcp server database update stop
```

dhcp server database filename

dhcp server database update interval

dhcp server database update now

dhcp server forbidden-ip

Use **dhcp server forbidden-ip** to exclude IP addresses from dynamic allocation globally.

Use **undo dhcp server forbidden-ip** to remove the configuration.

Syntax

dhcp server forbidden-ip *start-ip-address* [*end-ip-address*]

undo dhcp server forbidden-ip *start-ip-address* [*end-ip-address*]

Default

No IP addresses are excluded from dynamic allocation globally.

Views

System view

Predefined user roles

network-admin

Parameters

start-ip-address: Specifies the start IP address.

end-ip-address: Specifies the end IP address, which cannot be lower than the *start-ip-address*. If you do not specify this argument, only the *start-ip-address* is excluded from dynamic allocation.

Usage guidelines

The IP addresses of some devices such as the gateway and FTP server cannot be assigned to clients. Use this command to exclude such addresses from dynamic allocation.

If the excluded IP address is in a static DHCP binding, the address can still be assigned to the client.

The address or address range specified in the **undo dhcp server forbidden-ip** command must be the same as that specified in the **dhcp server forbidden-ip** command. To remove an IP address from the specified address range, you must remove the entire address range.

You can execute this command multiple times to exclude multiple IP address ranges from dynamic allocation.

Examples

Exclude the IP addresses of 10.110.1.1 through 10.110.1.63 from dynamic allocation globally.

```
<Sysname> system-view
[Sysname] dhcp server forbidden-ip 10.110.1.1 10.110.1.63
```

Related commands

forbidden-ip

static-bind

dhcp server ip-pool

Use **dhcp server ip-pool** to create a DHCP address pool and enter its view, or enter the view of an existing DHCP address pool.

Use **undo dhcp server ip-pool** to delete the specified DHCP address pool.

Syntax

dhcp server ip-pool *pool-name*

undo dhcp server ip-pool *pool-name*

Default

No DHCP address pools exist.

Views

System view

Predefined user roles

network-admin

Parameters

pool-name: Specifies a DHCP address pool name, a case-insensitive string of 1 to 63 characters. The pool name uniquely identifies an address pool.

Usage guidelines

A DHCP address pool is used to store the configuration parameters to be assigned to DHCP clients.

Examples

Create a DHCP address pool named **pool1**.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool pool1
[Sysname-dhcp-pool-pool1]
```

Related commands

class ip-pool

dhcp server apply ip-pool

display dhcp server pool

dhcp server ping packets

Use **dhcp server ping packets** to set the maximum number of ping packets.

Use **undo dhcp server ping packets** to restore the default.

Syntax

dhcp server ping packets *number*

undo dhcp server ping packets

Default

The maximum number of ping packets is 1.

Views

System view

Predefined user roles

network-admin

Parameters

number: Sets the maximum number of ping packets, in the range of 0 to 10. To disable the address conflict detection, set the value to 0.

Usage guidelines

To avoid IP address conflicts, the DHCP server pings an IP address before assigning it to a DHCP client.

If a ping attempt succeeds, the server determines that the IP address is in use and picks a new IP address. If all the ping attempts fail, the server assigns the IP address to the requesting DHCP client.

Examples

Set the maximum number of ping packets to 10.

```
<Sysname> system-view
[Sysname] dhcp server ping packets 10
```

Related commands

dhcp server ping timeout

display dhcp server conflict

reset dhcp server conflict

dhcp server ping timeout

Use **dhcp server ping timeout** to set the ping response timeout time on the DHCP server.

Use **undo dhcp server ping timeout** to restore the default.

Syntax

dhcp server ping timeout *milliseconds*

undo dhcp server ping timeout

Default

The ping response timeout time is 500 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

milliseconds: Specifies the timeout time in the range of 0 to 10000 milliseconds. To disable the ping operation for address conflict detection, set the value to 0 milliseconds.

Usage guidelines

To avoid IP address conflicts, the DHCP server pings an IP address before assigning it to a DHCP client.

If a ping attempt succeeds, the server determines that the IP address is in use and picks a new IP address. If all the ping attempts fail, the server assigns the IP address to the requesting DHCP client.

Examples

Set the response timeout time to 1000 milliseconds.

```
<Sysname> system-view
[Sysname] dhcp server ping timeout 1000
```

Related commands

dhcp server ping packets

display dhcp server conflict

reset dhcp server conflict

dhcp server relay information enable

Use **dhcp server relay information enable** to enable the DHCP server to handle Option 82.

Use **undo dhcp server relay information enable** to configure the DHCP server to ignore Option 82.

Syntax

dhcp server relay information enable

undo dhcp server relay information enable

Default

The DHCP server handles Option 82.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Upon receiving a DHCP request that contains Option 82, the server copies the original Option 82 into the response. If the server is configured to ignore Option 82, the response will not contain Option 82.

Examples

Configure the DHCP server to ignore Option 82.

```
<Sysname> system-view
[Sysname] undo dhcp server relay information enable
```

dhcp server request-ip-address check

Use **dhcp server request-ip-address check** to enable the DHCP server to return a DHCP-NAK message if the client notions of their IP addresses are incorrect.

Use **undo dhcp server request-ip-address check** to restore the default.

Syntax

dhcp server request-ip-address check

undo dhcp server request-ip-address check

Default

The DHCP server does not return a DHCP-NAK message if the client notions of their IP addresses are incorrect.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A DHCP client can send a DHCP-REQUEST message directly or upon receiving a DHCP-OFFER message. Upon receiving the request, the DHCP server will check if the client notion of its IP address is correct. If the requested IP address is different from the allocated one or has no matching lease

record, the DHCP server remains silent by default. After the allocated IP address lease for the client expires, the DHCP server will make response to request from the client.

This feature enables the DHCP server to return DHCP-NAK messages if the client notions of their IP addresses are incorrect. After receiving the DHCP-NAK message, the DHCP client will request an IP address again.

Examples

Enable the DHCP server to return a DHCP-NAK message if the client notions of their IP addresses are incorrect.

```
<Sysname> system-view
[Sysname] dhcp server request-ip-address check
```

Related commands

dhcp select server

display dhcp server conflict

Use **display dhcp server conflict** to display information about IP address conflicts.

Syntax

display dhcp server conflict [**ip** *ip-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip *ip-address*: Displays conflict information about the specified IP address. If you do not specify this option, this command displays information about all IP address conflicts.

Usage guidelines

The DHCP server generates IP address conflict information in the following situations:

- Before assigning an IP address to a DHCP client, the DHCP server pings the IP address and discovers that another host is using the address.
- The DHCP client sends a DECLINE packet to the DHCP server to inform the server of an IP address conflict.
- The DHCP server discovers that the only assignable address in the address pool is its own IP address.

Examples

Display information about all IP address conflicts.

```
<Sysname> display dhcp server conflict
IP address          Detect time
4.4.4.1             Apr 25 16:57:20 2007
4.4.4.2             Apr 25 17:00:10 2007
```

Table 1 Command output

Field	Description
IP address	Conflicted IP address.

Field	Description
Detect time	Time when the conflict was discovered.

Examples

Display information about DHCP binding auto backup.

```
<Sysname> display dhcp server database
 File name               :   database.dhcp
 Username                :
 Password                :
 Update interval         :   600 seconds
 Latest write time       :   Feb  8 16:09:53 2014
 Status                  :   Last write succeeded.
```

Table 2 Command output

Field	Description
File name	Name of the DHCP binding backup file.
Username	Username for accessing the URL of the remote backup file.
Password	Password for accessing the URL of the remote backup file. This field displays ********** if a password is configured.
Update interval	Waiting time in seconds after a DHCP binding change for the DHCP server to update the backup file.
Latest write time	Time of the latest update.
Status	Status of the update: • **Writing**—The backup file is being updated. • **Last write succeeded**—The backup file was successfully updated. • **Last write failed**—The backup file failed to be updated.

display dhcp server expired

Use **`display dhcp server expired`** to display the lease expiration information.

Syntax

display dhcp server expired [**ip** *ip-address* | **pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip *ip-address*: Displays lease expiration information about the specified IP address. If you do not specify an IP address, this command displays lease expiration information about all IP addresses.

pool *pool-name*: Displays lease expiration information about the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command displays lease expiration information about all address pools.

Usage guidelines

DHCP assigns these expired IP addresses to DHCP clients when all available addresses have been assigned.

Examples

Display all lease expiration information.

```
<Sysname> display dhcp server expired
IP address       Client-identifier/Hardware address    Lease expiration
4.4.4.6          3030-3066-2e65-3230-302e-3130-3234    Apr 25 17:10:47 2007
                 -2d45-7468-6572-6e65-7430-2f31
```

Predefined user roles

network-admin

network-operator

Parameters

pool *pool-name*: Displays assignable IP addresses in the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command displays all assignable IP addresses for all address pools.

Examples

Display assignable IP addresses in all address pools.

```
<Sysname> display dhcp server free-ip
Pool name: 1
  Network: 10.0.0.0 mask 255.0.0.0
    IP ranges from 10.0.0.10 to 10.0.0.100
    IP ranges from 10.0.0.105 to 10.0.0.255
  Secondary networks:
    10.1.0.0 mask 255.255.0.0
      IP ranges from 10.1.0.0 to 10.1.0.255
    10.2.0.0 mask 255.255.0.0
      IP Ranges from 10.2.0.0 to 10.2.0.255

Pool name: 2
  Network: 20.1.1.0 mask 255.255.255.0
    IP ranges from 20.1.1.0 to 20.1.1.255
```

display dhcp server ip-in-use

Use **display dhcp server ip-in-use** to display binding information about assigned IP addresses.

Syntax

display dhcp server ip-in-use [**ip** *ip-address* | **pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip *ip-address*: Displays binding information about the specified assigned IP address. If you do not specify an IP address, this command displays binding information about all assigned IP addresses.

pool *pool-name*: Displays binding information about assigned IP addresses in the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command displays binding information about assigned IP addresses in all address pools.

Usage guidelines

The binding information can be used by other security modules only when the DHCP server is configured on the gateway of DHCP clients.

If the lease deadline exceeds the year 2100, the lease expiration time is displayed as **After 2100**.

Examples

Display binding information about all assigned DHCP addresses.

```
<Sysname> display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration      Type
                 Hardware address
10.1.1.1         4444-4444-4444        Not used              Static(F)
10.1.1.2         3030-3030-2e30-3030-  May 1 14:02:49 2015   Auto(C)
                 662e-3030-3033-2d45-
                 7468-6572-6e65-74
10.1.1.3         1111-1111-1111        After 2100            Static(C)
```

Table 5 Command output

Field	Description
IP address	IP address assigned.
Client-identifier/Hardware address	Client ID or hardware address.
Lease expiration	Lease expiration time: • **Exact time (May 1 14:02:49 2015 in this example)**—Time when the lease will expire. • **Not used**—The IP address of the static binding has not been assigned to the specific client. • **Unlimited**—Infinite lease expiration time. • **After 2100**—The lease will expire after 2100.
Type	Binding types: • **Static(F)**—A free static binding whose IP address has not been assigned. • **Static(O)**—An offered static binding whose IP address has been selected and sent by the DHCP server in a DHCP-OFFER packet to the client. **Static(C)**—A committed static binding whose IP address has been assigned to the DHCP client. • **Auto(O)**—An offered dynamic binding whose IP address has been dynamically selected by the DHCP server and sent in a DHCP-OFFER packet to the DHCP client. • **Auto(C)**—A committed dynamic binding whose IP address has been dynamically assigned to the DHCP client.

voice-config fail-over	Failover route.

display dhcp server statistics

Use **display dhcp server statistics** to display the DHCP server statistics.

Syntax

display dhcp server statistics [**pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pool *pool-name*: Specifies an address pool by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, this command displays information about all address pools.

Examples

Display the DHCP server statistics.

```
<Sysname> display dhcp server statistics
    Pool number:                    1
    Pool utilization:               0.39%
    Bindings:
      Automatic:                    1
      Manual:                       0
      Expired:                      0
    Conflict:                       1
    Messages received:             10

Table 7 Command output

Field	Description
Pool number	Total number of address pools. This field is not displayed when you display statistics for a specific address pool.
Pool utilization	Pool usage rate: • If you display statistics for all address pools, this field displays the usage rate of all address pools. • If you display statistics for an address pool, this field displays the pool usage rate of the specified address pool.
Bindings	Bindings include the following types: • **Automatic**—Number of dynamic bindings. • **Manual**—Number of static bindings. • **Expired**—Number of expired bindings.
Conflict	Total number of conflict addresses. This field is not displayed if you display statistics for a specific address pool.
Messages received	DHCP packets received from clients: • DHCPDISCOVER. • DHCPREQUEST. • DHCPDECLINE. • DHCPRELEASE. • DHCPINFORM. • BOOTPREQUEST. This field is not displayed if you display statistics for a specific address pool.
Messages sent	DHCP packets sent to clients: • DHCPOFFER. • DHCPACK. • DHCPNAK. • BOOTPREPLY. This field is not displayed if statistics about a specific address pool are displayed.
Bad Messages	Number of bad messages. This field is not displayed if you display statistics for a specific address pool.

Related commands

`reset dhcp server statistics`

dns-list

Use **`dns-list`** to specify DNS server addresses in a DHCP address pool.

Use **`undo dns-list`** to remove DNS server addresses from a DHCP address pool.

Syntax

`dns-list` *`ip-address`*`&<1-8>`

`undo dns-list` [*`ip-address`*`&<1-8>`]

Default

No DNS server address is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight DNS servers.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If you do not specify any parameters, the **undo dns-list** command deletes all DNS server addresses in the DHCP address pool.

Examples

Specify DNS server address 10.1.1.254 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] dns-list 10.1.1.254
```

Related commands

display dhcp server pool

domain-name

Use **domain-name** to specify a domain name in a DHCP address pool.

Use **undo domain-name** to restore the default.

Syntax

domain-name *domain-name*

undo domain-name

Default

No domain name is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the domain name, a case-sensitive string of 1 to 50 characters.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify domain name **company.com** in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] domain-name company.com
```

Related commands

display dhcp server pool

expired

Use **expired** to set the lease duration in a DHCP address pool.

Use **undo expired** to restore the default lease duration for a DHCP address pool.

Syntax

expired { **day** *day* [**hour** *hour* [**minute** *minute* [**second** *second*]]] | **unlimited** }

undo expired

Default

The lease duration of a dynamic DHCP address pool is one day.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

day *day*: Specifies the number of days, in the range of 0 to 365.

hour *hour*: Specifies the number of hours, in the range of 0 to 23. The default is 0.

minute *minute*: Specifies the number of minutes, in the range of 0 to 59. The default is 0.

second *second*: Specifies the number of seconds, in the range of 0 to 59. The default is 0.

unlimited: Specifies the unlimited lease duration, which is actually 136 years.

Usage guidelines

The DHCP server assigns an IP address together with the lease duration to the DHCP client. Before the lease expires, the DHCP client must extend the lease duration.

- If the lease extension operation succeeds, the DHCP client can continue to use the IP address.
- If the lease extension operation does not succeed, both of the following events occur:
  - The DHCP client cannot use the IP address after the lease duration expires.
  - The DHCP server will label the IP address as an expired address.

Examples

Set the lease duration to 1 day, 2 hours, 3 minutes, and 4 seconds in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] expired day 1 hour 2 minute 3 second 4
```

Related commands

display dhcp server expired

display dhcp server pool

reset dhcp server expired

forbidden-ip

Use **forbidden-ip** to exclude IP addresses from dynamic allocation in an address pool.

Use **undo forbidden-ip** to remove the configuration.

Syntax

forbidden-ip *ip-address*&<1-8>

undo forbidden-ip [*ip-address*&<1-8>]

Default

No IP addresses are excluded from dynamic allocation in an address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight excluded IP addresses.

Usage guidelines

The excluded IP addresses in an address pool are still assignable in other address pools.

You can exclude a maximum of 4096 IP addresses in an address pool by executing this command multiple times.

If you do not specify any parameters, the **undo forbidden-ip** command removes all excluded IP addresses.

Examples

Exclude IP addresses 192.168.1.3 and 192.168.1.10 from dynamic allocation in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] forbidden-ip 192.168.1.3 192.168.1.10
```

Related commands

dhcp server forbidden-ip

display dhcp server pool

gateway-list

Use **gateway-list** to specify gateway addresses in a DHCP address pool or a DHCP secondary subnet.

Use **undo gateway-list** to remove the specified gateway addresses from a DHCP address pool or a DHCP secondary subnet.

Syntax

gateway-list *ip-address*&<1-64>

undo gateway-list [*ip-address*&<1-64>]

Default

No gateway address is configured in a DHCP address pool or a DHCP secondary subnet.

Views

DHCP address pool view

DHCP secondary subnet view

Predefined user roles

network-admin

Parameters

ip-address&<1-64>: Specifies a space-separated list of up to 64 gateway addresses. Gateway addresses must reside on the same subnet as the assignable IP addresses.

Usage guidelines

The DHCP server assigns gateway addresses to clients on a secondary subnet in the following ways:

- If gateways are specified in both address pool view and secondary subnet view, DHCP assigns those specified in the secondary subnet view.
- If gateways are specified in address pool view but not in secondary subnet view, DHCP assigns those specified in address pool view.

If you do not specify any parameters, the **undo gateway-list** command deletes all gateway addresses.

Examples

Specify gateway address 10.1.1.1 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] gateway-list 10.1.1.1
```

Related commands

display dhcp server pool

if-match

Use **if-match** to configure a match rule for a DHCP user class.

Use **undo if-match** to delete a match rule for a DHCP user class.

Syntax

if-match rule *rule-number* { **hardware-address** *hardware-address* **mask** *hardware-address-mask* | **option** *option-code* [**ascii** *ascii-string* [**offset** *offset* | **partial**] | **hex** *hex-string* [**mask** *mask* | **offset** *offset* **length** *length* | **partial**]] | **relay-agent** *gateway-address* }

undo if-match rule *rule-number*

Default

No match rules are configured for the DHCP user class.

Views

DHCP user class view

Predefined user roles

network-admin

Parameters

rule *rule-number*: Assigns the match rule an ID in the range of 1 to 16. A smaller ID represents a higher match priority.

hardware-address *hardware-address*: Specifies a hardware address, a string of 4 to 39 characters. The string contains hyphen-separated hexadecimal numbers. The last hexadecimal number can be a two-digit or four-digit number, and the other hexadecimal numbers must be four-digit numbers. For example, **aabb-ccdd-ee** is valid, and **aabb-c-dddd** or **aabb-cc-dddd** is invalid.

mask *hardware-address-mask*: Specifies the mask to be ANDed with the specified hardware address for the match operation. The length of the mask must be the same as that of the hardware address.

option *option-code*: Specifies a DHCP option by its number in the range of 1 to 254.

ascii *ascii-string*: Specifies an ASCII string of 1 to 128 characters.

offset *offset*: Specifies the offset in bytes after which the match operation starts. The value range is 0 to 254. If you do not specify an offset value, the match starts from the first byte of the option content. If you specify an ASCII string, a packet matches the rule if the option content after the offset is the same as the ASCII string. If you specify a hexadecimal number, a packet matches the rule if the option content of the specified length after the offset is the same as the hexadecimal number.

partial: Enables partial match. A packet matches a rule if the specified option in the packet contains the ASCII string or hexadecimal number specified in the rule. For example, if you specify **abc** in the rule, option content **xabc**, **xyzabca**, **xabcyz**, and **abcxyz** all match the rule.

hex *hex-string*: Specifies a hexadecimal number. The length of the hexadecimal number must be an even number in the range of 2 to 256.

mask *mask*: Specifies a hexadecimal mask for the match operation. The mask length must be an even number in the range of 2 to 256 and be the same as the *hex-string* length. The DHCP server selects option content of the mask length from the start and ANDs the selected option content and the specified hexadecimal number with the mask. The packet matches the rule if the two AND operation results are the same.

length *length*: Specifies the length of the option content to be matched, in the range of 1 to 128 bytes. The length must be the same as the *hex-string* length.

relay-agent *gateway-address*: Specifies a **giaddr** field value. The value is an IPv4 address in the dotted decimal notation. A packet matches the rule if its **giaddr** field value is the same as that in the rule.

Usage guidelines

If a DHCP request sent by a DHCP client matches a rule in a DHCP user class, the DHCP client matches the user class.

You can configure multiple match rules for a DHCP user class. Each match rule is uniquely identified by a rule ID within its type (hardware address, option, or relay agent address).

- If the rule that you are configuring has the same ID and type as an existing rule, the new rule overwrites the existing rule.
- If the rule that you are configuring has the same ID as an existing rule but a different type, the new rule takes effect and coexists with the existing rule. As a best practice, do not assign the same ID to rules of different types.
- Rules of different IDs cannot have the same rule content.

When you configure an **if-match hardware-address** rule, follow these guidelines:

- The hardware address type supports only the MAC address. A rule does not match clients with hardware addresses of other types.
- The specified hardware address must be of the same length as the client hardware addresses to be matched. To match MAC addresses, the specified hardware address must be six bytes long.
- The fs and 0s in the mask for the hardware match operation can be noncontiguous. For example, the rule **if-match rule** 1 **hardware-address** 0094-0000-1100 **mask** ffff-0000-ff00 matches hardware addresses in which the first two bytes are 0094 and the fifth byte is 11.

When you configure an **if-match option** rule, follow these guidelines:

- To match packets that contain an option, specify only the *option-code* argument.
- To match a hexadecimal number by AND operations, specify the **option** *option-code* **hex** *hex-string* **mask** *mask* options.
- To match a hexadecimal number directly, specify the **option** *option-code* **hex** *hex-string* [**offset** *offset* **length** *length* | **partial**] options. If you do not specify the **offset**, **length**, or **partial** parameter, a packet matches a rule if the option content starts with the hexadecimal number.
- To match an ASCII string, specify the **option** *option-code* **ascii** *ascii-string* [**offset** *offset* | **partial**] options. If you do not specify the **offset** or **partial** parameter, a packet matches a rule if the option content starts with the ASCII string.

Examples

Configure match rule **1** for DHCP user class **exam** to match DHCP requests in which the hardware address is six bytes long and begins with **0094**.

```
<Sysname> system-view
[Sysname] dhcp class exam
[Sysname-dhcp-class-exam] if-match rule 1 hardware-address 0094-0000-0101 mask
ffff-0000-0000
```

Configure match rule **2** for DHCP user class **exam** to match DHCP requests that contain Option 82.

```
<Sysname> system-view
[Sysname] dhcp class exam
[Sysname-dhcp-class-exam] if-match rule 2 option 82
```

Configure match rule **3** for DHCP user class **exam**. The rule matches DHCP requests in which the highest bit of the fourth byte in Option 82 is the hexadecimal number **1**.

```
<Sysname> system-view
[Sysname] dhcp class exam
[Sysname-dhcp-class-exam] if-match rule 3 option 82 hex 00000080 mask 00000080
```

Configure match rule **4** for DHCP user class **exam**. The rule matches DHCP requests in which the first three bytes of Option 82 are the hexadecimal number **13ae92**.

```
<Sysname> system-view
[Sysname] dhcp class exam
[Sysname-dhcp-class-exam] if-match rule 4 option 82 hex 13ae92 offset 0 length 3
```

Configure match rule **5** for DHCP user class **exam**. The rule matches DHCP requests in which the Option 82 contains the hexadecimal number **13ae**.

```
<Sysname> system-view
[Sysname] dhcp class exam
[Sysname-dhcp-class-exam] if-match rule 5 option 82 hex 13ae partial
```

Configure match rule **6** for DHCP user class **exam** to match DHCP requests in which the **giaddr** field is 10.1.1.1.

```
<Sysname> system-view
[Sysname] dhcp class exam
[Sysname-dhcp-class-exam] if-match rule 6 relay-agent 10.1.1.1
```

Related commands

dhcp class

ip-in-use threshold

Use **ip-in-use threshold** to set a threshold for the address pool usage alarming.

Use **undo ip-in-use threshold** to restore the default.

Syntax

ip-in-use threshold *threshold-value*

undo ip-in-use threshold

Default

The address pool usage threshold is 100%.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the threshold for the address pool usage percentage. The value range is 1 to 100.

Usage guidelines

If you execute this command in the same address pool view multiple times, the most recent configuration takes effect.

When the address pool usage exceeds the threshold, the system sends log messages to the information center. According to the log information, you can optimize the address pool configuration. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Set the address pool usage threshold to 85%.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool p1
[Sysname-dhcp-pool-p1] ip-in-use threshold 85
```

nbns-list

Use **nbns-list** to specify WINS server addresses in a DHCP address pool.

Use **undo nbns-list** to remove the specified WINS server addresses.

Syntax

nbns-list *ip-address*&<1-8>

undo nbns-list [*ip-address*&<1-8>]

Default

No WINS server address is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight WINS server IP addresses.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If you do not specify any parameters, the **undo nbns-list** command deletes all WINS server addresses.

Examples

Specify WINS server address 10.1.1.1 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] nbns-list 10.1.1.1
```

Related commands

display dhcp server pool

netbios-type

netbios-type

Use **netbios-type** to specify the NetBIOS node type in a DHCP address pool.

Use **undo netbios-type** to restore the default.

Syntax

netbios-type { **b-node** | **h-node** | **m-node** | **p-node** }

undo netbios-type

Default

No NetBIOS node type is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

b-node: Specifies the broadcast node. A b-node client sends the destination name in a broadcast message to get the name-to-IP mapping from a server.

h-node: Specifies the hybrid node. An h-node client unicasts the destination name to a WINS server. If it does not receive a response, the h-node client broadcasts the destination name to get the mapping from a server.

m-node: Specifies the mixed node. An m-node client broadcasts the destination name. If it does not receive a response, the m-node client unicasts the destination name to the WINS server to get the mapping.

p-node: Specifies the peer-to-peer node. A p-node client sends the destination name in a unicast message to get the mapping from the WINS server.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the NetBIOS node type as p-node in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] netbios-type p-node
```

Related commands

display dhcp server pool

nbns-list

network

Use **network** to specify the subnet for dynamic allocation in a DHCP address pool.

Use **undo network** to remove the specified subnet.

Syntax

network *network-address* [*mask-length* | **mask** *mask*] [**secondary**]

undo network *network-address* [*mask-length* | **mask** *mask*] [**secondary**]

Default

No subnet is specified in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

network-address: Specifies the subnet for dynamic allocation. If no mask length or mask is specified, the natural mask will be used.

mask-length: Specifies the mask length in the range of 1 to 30.

mask *mask*: Specifies the mask in dotted decimal format.

secondary: Specifies the subnet as a secondary subnet. If you do not specify this keyword, this command specifies the primary subnet. If the addresses in the primary subnet are used up, the DHCP server can select addresses from a secondary subnet for clients.

Usage guidelines

You can use the **secondary** keyword to specify a secondary subnet and enter its view. In secondary subnet view, you can specify gateways by using the **gateway-list** command for DHCP clients in the secondary subnet.

You can specify only one primary subnet for a DHCP address pool. If you execute the **network** command multiple times, the most recent configuration takes effect.

You can specify up to 32 secondary subnets for a DHCP address pool.

The primary subnet and secondary subnets in a DHCP address pool must not have the same network address and mask.

If you have used the **address range** or **class** command in an address pool, you cannot specify a secondary subnet in the same address pool.

Modifying or removing the **network** configuration deletes the assigned addresses from the current address pool.

Examples

Specify primary subnet 192.168.8.0/24 and secondary subnet 192.168.10.0/24 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] network 192.168.8.0 mask 255.255.255.0
[Sysname-dhcp-pool-0] network 192.168.10.0 mask 255.255.255.0 secondary
[Sysname-dhcp-pool-0-secondary]
```

Related commands

display dhcp server pool

gateway-list

next-server

Use **next-server** to specify the IP address of a server in a DHCP address pool.

Use **undo next-server** to restore the default.

Syntax

next-server *ip-address*

undo next-server

Default

No server's IP address is specified in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a server.

Usage guidelines

Upon startup, the DHCP client obtains an IP address and the specified server IP address. Then it contacts the specified server, such as a TFTP server, to get other boot information.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify a server's IP address 10.1.1.254 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] next-server 10.1.1.254
```

Related commands

display dhcp server pool

option

Use **option** to customize a DHCP option.

Use **undo option** to remove a customized DHCP option.

Syntax

option *code* { **ascii** *ascii-string* | **hex** *hex-string* | **ip-address** *ip-address*&<1-8> }

undo option *code*

Default

No DHCP option is customized.

Views

DHCP address pool view

DHCP option group view

Predefined user roles

network-admin

Parameters

code: Specifies the number of the customized option, in the range of 2 to 254, excluding 50 through 54, 56, 58, 59, 61, and 82.

ascii *ascii-string*: Specifies a case-sensitive ASCII string of 1 to 255 characters as the option content.

hex *hex-string*: Specifies a hexadecimal number as the option content. The length of the hexadecimal number must be an even number in the range of 2 to 256.

ip-address *ip-address*&<1-8>: Specifies a space-separated list of up to eight IP addresses as the option content.

Usage guidelines

The DHCP server fills the customized option with the specified ASCII string, hexadecimal number, or IP addresses, and sends it in a response to the client.

You can customize options for the following purposes:

- Add newly released options.
- Add options for which the vendor defines the contents, for example, Option 43.
- Add options for which the CLI does not provide a dedicated configuration command. For example, you can use the **option 4 ip-address 1.1.1.1** command to define the time server address 1.1.1.1 for DHCP clients.
- Add all option values if the actual requirement exceeds the limit for a dedicated option configuration command. For example, the **dns-list** command can specify up to eight DNS servers. To specify more than eight DNS server, you must use the **option 6** command to define all DNS servers.

DHCP options specified by dedicated commands take precedence over those specified by the **option** commands. For example, if a DNS server address is specified by both the **dns-list** command and the **option 6** command, the server uses the address specified by the **dns-list** command.

DHCP options specified in DHCP option groups take precedence over those specified in DHCP address pools.

If you execute this command multiple times with the same *code* specified, the most recent configuration takes effect.

Examples

Configure Option 7 to specify log server address 2.2.2.2 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] option 7 ip-address 2.2.2.2
```

Related commands

display dhcp server pool

reset dhcp server conflict

Use **reset dhcp server conflict** to clear IP address conflict information.

Syntax

reset dhcp server conflict [**ip** *ip-address*]

Views

User view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Clears conflict information about the specified IP address. If you do not specify this option, this command clears all address conflict information.

Usage guidelines

Address conflicts occur when dynamically assigned IP addresses have been statically configured for other hosts. After you modify the address pool configuration, the conflicted addresses might become assignable. To assign these addresses, use the **reset dhcp server conflict** command to clear the conflict information first.

Examples

Clear all IP address conflict information.

```
<Sysname> reset dhcp server conflict
```

Related commands

display dhcp server conflict

reset dhcp server expired

Use **reset dhcp server expired** to clear binding information about expired IP addresses.

Syntax

reset dhcp server expired [**ip** *ip-address* | **pool** *pool-name*]

Views

User view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Clears binding information about the specified expired IP address. If you do not specify an IP address, this command clears binding information about all expired IP addresses.

pool *pool-name*: Clears binding information about the expired IP addresses in the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command clears binding information about expired IP addresses in all address pools.

Examples

Clear binding information about all expired IP addresses.

```
<Sysname> reset dhcp server expired
```

Related commands

display dhcp server expired

reset dhcp server ip-in-use

Use **reset dhcp server ip-in-use** to clear binding information about assigned IP addresses.

Syntax

reset dhcp server ip-in-use [**ip** *ip-address* | **pool** *pool-name*]

Views

User view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Clears binding information about the specified assigned IP address. If you do not specify an IP address, this command clears binding information about all assigned IP addresses.

pool *pool-name*: Clears binding information about assigned IP addresses in the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command clears binding information about assigned IP addresses in all address pools.

Usage guidelines

If you use this command to clear information about an assigned static binding, the static binding becomes a free static binding.

Examples

Clear binding information about IP address 10.110.1.1.

```
<Sysname> reset dhcp server ip-in-use ip 10.110.1.1
```

Related commands

display dhcp server ip-in-use

reset dhcp server statistics

Use **reset dhcp server statistics** to clear DHCP server statistics.

Syntax

reset dhcp server statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear DHCP server statistics.

```
<Sysname> reset dhcp server statistics
```

Related commands

display dhcp server statistics

static-bind

Use **static-bind** to statically bind a client ID or MAC address to an IP address.

Use **undo static-bind** to remove a static binding.

Syntax

static-bind ip-address *ip-address* [*mask-length* | **mask** *mask*] { **client-identifier** *client-identifier* | **hardware-address** *hardware-address* [**ethernet** | **token-ring**] }

undo static-bind ip-address *ip-address*

Default

No static binding is specified in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address *ip-address*: Specifies the IP address of the static binding. The natural mask is used if no mask length or mask is specified.

mask-length: Specifies the mask length in the range of 1 to 30.

mask *mask*: Specifies the mask, in dotted decimal format.

client-identifier *client-identifier*: Specifies the client ID of the static binding, a string of 4 to 254 characters. The string can contain only hexadecimal numbers and hyphen (-), in the format of H-H-H…. The last H can be a two-digit or four-digit hexadecimal number while the other Hs must be all four-digit hexadecimal numbers. For example, aabb-cccc-dd is correct, and aabb-c-dddd and aabb-cc-dddd are not correct.

hardware-address *hardware-address*: Specifies the client hardware address of the static binding, a string of 4 to 39 characters. The string can contain only hexadecimal numbers and hyphen

(-), in the format of H-H-H…. The last H can be a two-digit or four-digit hexadecimal number while the other Hs must be all four-digit hexadecimal numbers. For example, aabb-cccc-dd is correct, and aabb-c-dddd and aabb-cc-dddd are not correct.

ethernet: Specifies the client hardware address type as Ethernet. The default type is Ethernet.

token-ring: Specifies the client hardware address type as token ring.

Usage guidelines

The IP address of a static binding must not be an interface address of the DHCP server. Otherwise, an IP address conflict occurs, and the bound client cannot obtain the IP address.

You can specify multiple static bindings in an address pool. The total number of static bindings in all address pools cannot exceed 8192.

An IP address can be bound to only one DHCP client. To modify the binding for a DHCP client, first execute the **undo** form of the command to delete the existing binding and then create a new binding.

Examples

Bind IP address 10.1.1.1/24 to client ID **00aa-aabb** in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] static-bind ip-address 10.1.1.1 mask 255.255.255.0
client-identifier 00aa-aabb
```

Related commands

display dhcp server pool

tftp-server domain-name

Use **tftp-server domain-name** to specify a TFTP server name in a DHCP address pool.

Use **undo tftp-server domain-name** to restore the default.

Syntax

tftp-server domain-name *domain-name*

undo tftp-server domain-name

Default

No TFTP server name is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the TFTP server name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify TFTP server name **aaa** in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
```

```
[Sysname-dhcp-pool-0] tftp-server domain-name aaa
```

Related commands

display dhcp server pool

tftp-server ip-address

tftp-server ip-address

Use **tftp-server ip-address** to specify a TFTP server address in a DHCP address pool.

Use **undo tftp-server ip-address** to restore the default.

Syntax

tftp-server ip-address *ip-address*

undo tftp-server ip-address

Default

No TFTP server address is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a TFTP server.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify TFTP server address 10.1.1.1 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] tftp-server ip-address 10.1.1.1
```

Related commands

display dhcp server pool

tftp-server domain-name

valid class

Use **valid class** to add DHCP user classes to the whitelist.

Use **undo valid class** to remove DHCP user classes from the whitelist.

Syntax

valid class *class-name*&<1-8>

undo valid class *class-name*&<1-8>

Default

No DHCP user class is listed on the whitelist.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

class-name&<1-8>: Specifies a space-separated list of up to eight DHCP user classes by their names, a case-insensitive string of 1 to 63 characters.

Usage guidelines

For this command to take effect, you must enable the DHCP user class whitelist.

Examples

Add DHCP user classes **test1** and **test2** to the whitelist in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] valid class test1 test2
```

Related commands

dhcp class

verify class

verify class

Use **verify class** to enable the DHCP user class whitelist.

Use **undo verify class** to disable the DHCP user class whitelist.

Syntax

verify class

undo verify class

Default

The DHCP user class whitelist is disabled.

Views

DHCP address pool view

Predefined user roles

network-admin

Usage guidelines

After you enable the DHCP user class whitelist, the DHCP server processes requests only from clients on the DHCP user class whitelist.

The DHCP user class whitelist does not take effect on clients that request static IP addresses, and the server always processes their requests.

Examples

Enable the DHCP user class whitelist in DHCP address pool 0.

```
[Sysname] system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] verify class
```

Related commands

valid class

voice-config

Use **voice-config** to configure the content for Option 184 in a DHCP address pool.

Use **undo voice-config** to remove the Option 184 content from a DHCP address pool.

Syntax

voice-config { **as-ip** *ip-address* | **fail-over** *ip-address dialer-string* | **ncp-ip** *ip-address* | **voice-vlan** *vlan-id* { **disable** | **enable** } }

undo voice-config [**as-ip** | **fail-over** | **ncp-ip** | **voice-vlan**]

Default

No Option 184 content is configured in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

as-ip *ip-address*: Specifies the IP address of the backup network calling processor.

fail-over *ip-address dialer-string*: Specifies the failover IP address and dialer string. The *dialer-string* is a string of 1 to 39 characters. Valid characters are digits and asterisk (*).

ncp-ip *ip-address*: Specifies the IP address of the primary network calling processor.

voice-vlan *vlan-id*: Specifies the voice VLAN ID in the range of 2 to 4094.

- **disable**: Disables the specified VLAN. DHCP clients will not take this VLAN as their voice VLAN.
- **enable**: Enables the specified VLAN. DHCP clients will take this VLAN as their voice VLAN.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure Option 184 in DHCP address pool 0. The primary and backup network calling processors are at 10.1.1.1 and 10.2.2.2, respectively. The voice VLAN 3 is enabled. The failover IP address is 10.3.3.3. The dialer string is 99*.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] voice-config ncp-ip 10.1.1.1
[Sysname-dhcp-pool-0] voice-config as-ip 10.2.2.2
[Sysname-dhcp-pool-0] voice-config voice-vlan 3 enable
[Sysname-dhcp-pool-0] voice-config fail-over 10.3.3.3 99*
```

Related commands

display dhcp server pool

DHCP relay agent commands

dhcp relay check mac-address

Use **dhcp relay check mac-address** to enable MAC address check on the relay agent.

Use **undo dhcp relay check mac-address** to disable MAC address check on the relay agent.

Syntax

dhcp relay check mac-address

undo dhcp relay check mac-address

Default

The MAC address check feature is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This feature enables the DHCP relay agent to compare the **chaddr** field of a received DHCP request with the source MAC address in the frame header. If they are the same, the DHCP relay agent forwards the request to the DHCP server. If they are not the same, the DHCP relay agent discards the request.

The MAC address check feature takes effect only when the **dhcp select relay** command has already been configured on the interface.

Enable the MAC address check feature only on the DHCP relay agent directly connected to the DHCP clients. A DHCP relay agent changes the source MAC address of DHCP packets before sending them.

Examples

Enable MAC address check on the DHCP relay agent.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp relay check mac-address
```

Related commands

dhcp select relay

dhcp relay check mac-address aging-time

Use **dhcp relay check mac-address aging-time** to set the aging time for MAC address check entries on the DHCP relay agent.

Use **undo dhcp relay check mac-address aging-time** to restore the default.

Syntax

dhcp relay check mac-address aging-time *time*

undo dhcp relay check mac-address aging-time

Default

The aging time is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time: Specifies the aging time for MAC address check entries, in the range of 30 to 600 seconds.

Usage guidelines

This command takes effect only after you execute the **dhcp relay check mac-address** command.

Examples

Set the aging time to 60 seconds for MAC address check entries on the DHCP relay agent.

```
<Sysname> system-view
[Sysname] dhcp relay check mac-address aging-time 60
```

dhcp relay client-information record

Use **dhcp relay client-information record** to enable recording client information in relay entries.

Use **undo dhcp relay client-information record** to disable the feature.

Syntax

dhcp relay client-information record

undo dhcp relay client-information record

Default

The DHCP relay agent does not record client information in relay entries.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Client information is recorded only when the DHCP relay agent is configured on the gateway of DHCP clients. A relay entry contains information about a client such as the client's IP and MAC addresses.

Disabling the recording of client information deletes all recorded relay entries.

Examples

Enable the recording of relay entries on the relay agent.

```
<Sysname> system-view
[Sysname] dhcp relay client-information record
```

Related commands

dhcp relay client-information refresh

dhcp relay client-information refresh enable

dhcp relay client-information refresh

Use **dhcp relay client-information refresh** to set the interval at which the DHCP relay agent refreshes relay entries.

Use **undo dhcp relay client-information refresh** to restore the default.

Syntax

dhcp relay client-information refresh [**auto** | **interval** *interval*]

undo dhcp relay client-information refresh

Default

The refresh interval is automatically calculated based on the number of relay entries.

Views

System view

Predefined user roles

network-admin

Parameters

auto: Automatically calculates the refresh interval. The more the entries, the shorter the refresh interval. The shortest interval is 50 ms.

interval *interval*: Specifies the refresh interval in the range of 1 to 120 seconds.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the refresh interval to 100 seconds.

```
<Sysname> system-view
[Sysname] dhcp relay client-information refresh interval 100
```

Related commands

dhcp relay client-information refresh enable

dhcp relay client-information refresh enable

Use **dhcp relay client-information refresh enable** to enable the DHCP relay agent to periodically refresh dynamic relay entries.

Use **undo dhcp relay client-information refresh enable** to disable the DHCP relay agent to periodically refresh dynamic relay entries.

Syntax

dhcp relay client-information refresh enable

undo dhcp relay client-information refresh enable

Default

The DHCP relay agent periodically refreshes relay entries.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A DHCP client unicasts a DHCP-RELEASE message to the DHCP server to release its IP address. The DHCP relay agent conveys the message to the DHCP server and does not remove the IP-to-MAC entry of the client.

With this feature, the DHCP relay agent uses a client's IP address to periodically send a DHCP-REQUEST message to the DHCP server.

- If the server returns a DHCP-ACK message or does not return any message within an interval, the DHCP relay agent performs the following operations:
  - Removes the relay entry.
  - Sends a DHCP-RELEASE message to the DHCP server to release the IP address.
- If the server returns a DHCP-NAK message, the relay agent keeps the entry.

With this feature disabled, the DHCP relay agent does not remove relay entries automatically. After a DHCP client releases its IP address, you must use the **reset dhcp relay client-information** on the relay agent to remove the corresponding relay entry.

Examples

Disable periodic refresh of relay entries.

```
<Sysname> system-view
[Sysname] undo dhcp relay client-information refresh enable
```

Related commands

dhcp relay dhcp-server timeout

Use **dhcp relay dhcp-server timeout** to set the DHCP server response timeout time for DHCP server switchover.

Use **undo dhcp relay dhcp-server timeout** to restore the default.

Syntax

dhcp relay dhcp-server timeout *time*

undo dhcp relay dhcp-server timeout

Default

The DHCP server response timeout time is 30 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies the DHCP server response timeout time in the range of 1 to 65535 seconds.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the DHCP server response timeout time to 60 seconds for DHCP server switchover on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] dhcp relay dhcp-server timeout 60
```

Related commands

dhcp relay server-address algorithm

dhcp relay gateway

Use **dhcp relay gateway** to specify the DHCP relay agent address to be inserted in DHCP requests.

Use **undo dhcp relay gateway** to restore the default.

Syntax

dhcp relay gateway *ip-address*

undo dhcp relay gateway

Default

The primary IP address of the interface is inserted in DHCP requests as the DHCP relay agent address.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the DHCP relay agent address. It must be an IP address of the interface.

Usage guidelines

The DHCP relay agent uses the specified IP address instead of the primary IP address of the relay interface as the DHCP relay agent address.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify 10.1.1.1 as the DHCP relay agent address to be inserted in DHCP requests on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] dhcp relay gateway 10.1.1.1
```

Related commands

gateway-list

dhcp relay information circuit-id

Use **dhcp relay information circuit-id** to configure the padding mode and padding format for the Circuit ID sub-option of Option 82.

Use **undo dhcp relay information circuit-id** to restore the default.

Syntax

dhcp relay information circuit-id { **bas** | **string** *circuit-id* | { **normal** | **verbose** [**node-identifier** { **mac** | **sysname** | **user-defined** *node-identifier* }] [**interface**] } [**format** { **ascii** | **hex** }] }

undo dhcp relay information circuit-id

Default

The padding mode is **normal** and the padding format is **hex**.

Views

Interface view

Predefined user roles

network-admin

Parameters

bas: Specifies the bas mode that uses the interface and VLAN information to pad the Circuit ID sub-option.

string *circuit-id*: Specifies the string mode that uses a case-sensitive string of 3 to 63 characters as the content of the Circuit ID sub-option.

normal: Specifies the normal mode, in which the padding content consists of the VLAN ID and port number.

verbose: Specifies the verbose mode. The padding content includes the node identifier, interface information, and VLAN ID. The default node identifier is the MAC address of the access node. The default interface information consists of the Ethernet type (fixed to **eth**), chassis number, slot number, sub-slot number, and interface number.

node-identifier: Specifies the access node identifier.

- **mac**: Uses the MAC address of the access node as the node identifier.
- **sysname**: Uses the device name as the node identifier. You can set the device name by using the **sysname** command in system view. The padding format for the device name is always ASCII regardless of the specified padding format. If the **sysname** keyword is specified, make sure the device name does not include any spaces. Otherwise, the DHCP relay agent fails to add or replace Option 82.
- **user-defined** *node-identifier:* Uses a case-sensitive string of 1 to 50 characters as the node identifier. The padding format for the specified character string is always ASCII regardless of the specified padding format.

interface: Uses the interface name as the interface information. The padding format for the interface name is always ASCII regardless of the specified padding format.

format: Specifies the padding format for the Circuit ID sub-option.

ascii: Specifies the ASCII padding format.

hex: Specifies the hex padding format.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The padding format for the string mode, the normal mode, or the verbose mode varies by command configuration. Table 8 shows how the padding format is determined for different modes.

Table 8 Padding format for different modes

Keyword (mode)	If no padding format is set	If the padding format is ascii	If the padding format is hex
string *circuit-id*	The padding format is ASCII, and is not configurable.	N/A	N/A
normal	Hex.	ASCII.	Hex.
verbose	Hex for the VLAN ID. ASCII for the node identifier, Ethernet type, chassis number, slot number, sub-slot number, and interface number.	ASCII.	ASCII for the node identifier and Ethernet type. Hex for the chassis number, slot number, sub-slot number, interface number, and VLAN ID.

Examples

Specify the content mode as verbose, node identifier as the device name, and the padding format as ASCII for the Circuit ID sub-option.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp relay information enable
[Sysname-Vlan-interface10] dhcp relay information strategy replace
[Sysname-Vlan-interface10] dhcp relay information circuit-id verbose node-identifier
sysname format ascii
```

Related commands

dhcp relay information enable

dhcp relay information strategy

display dhcp relay information

dhcp relay information enable

Use **dhcp relay information enable** to enable the DHCP relay agent to support Option 82.

Use **undo dhcp relay information enable** to disable Option 82 support.

Syntax

dhcp relay information enable

undo dhcp relay information enable

Default

The DHCP relay agent does not support Option 82.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command enables the DHCP relay agent to add Option 82 to DHCP requests that do not contain Option 82 before forwarding the requests to the DHCP server. The content of Option 82 is determined by the **dhcp relay information circuit-id** and **dhcp relay information remote-id** commands. If the DHCP requests contain Option 82, the relay agent handles the requests according to the strategy configured with the **dhcp relay information strategy** command.

If this feature is disabled, the relay agent forwards requests that contain or do not contain Option 82 to the DHCP server.

Examples

Enable Option 82 support on the relay agent.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp relay information enable
```

Related commands

dhcp relay information circuit-id

dhcp relay information remote-id

dhcp relay information strategy

display dhcp relay information

dhcp relay information remote-id

Use **dhcp relay information remote-id** to configure the padding mode and padding format for the Remote ID sub-option of Option 82.

Use **undo dhcp relay information remote-id** to restore the default.

Syntax

dhcp relay information remote-id { **normal** [**format** { **ascii** | **hex** }] | **string** *remote-id* | **sysname** }

undo dhcp relay information remote-id

Default

The padding mode is **normal** and the padding format is **hex**.

Views

Interface view

Predefined user roles

network-admin

Parameters

normal: Specifies the normal mode in which the padding content is the MAC address of the receiving interface.

format: Specifies the padding format for the Remote ID sub-option. The default padding format is hex.

ascii: Specifies the ASCII padding format.

hex: Specifies the hex padding format.

string *remote-id*: Specifies the string mode that uses a case-sensitive string of 1 to 63 characters as the content of the Remote ID sub-option.

sysname: Specifies the sysname mode that uses the device name as the content of the Remote ID sub-option. You can set the device name by using the **sysname** command.

Usage guidelines

The padding format for the specified character string (**string**) or the device name (**sysname**) is always ASCII. The padding format for the **normal** mode is determined by the command.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the padding content for the Remote ID sub-option of Option 82 as **device001**.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp relay information enable
[Sysname-Vlan-interface10] dhcp relay information strategy replace
[Sysname-Vlan-interface10] dhcp relay information remote-id string device001
```

Related commands

dhcp relay information enable

dhcp relay information strategy

display dhcp relay information

dhcp relay information strategy

Use **dhcp relay information strategy** to configure the strategy for the DHCP relay agent to handle messages containing Option 82.

Use **undo dhcp relay information strategy** to restore the default handling strategy.

Syntax

dhcp relay information strategy { **drop** | **keep** | **replace** }

undo dhcp relay information strategy

Default

The handling strategy for messages that contain Option 82 is **replace**.

Views

Interface view

Predefined user roles

network-admin

Parameters

drop: Drops DHCP messages that contain Option 82 messages.

keep: Keeps the original Option 82 intact and forwards the DHCP messages.

replace: Replaces the original Option 82 with the configured Option 82 before forwarding the DHCP messages.

Usage guidelines

This command takes effect only on DHCP requests that contain Option 82.

For DHCP requests that do not contain Option 82, the DHCP relay agent always adds Option 82 to the requests before forwarding the requests to the DHCP server.

If the handling strategy is **replace**, configure a padding mode and padding format for Option 82. If the handling strategy is **keep** or **drop**, you do not need to configure any padding mode or padding format. The settings do not take effect even if you configure them.

Examples

Specify the handling strategy for Option 82 as **keep**.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp relay information enable
[Sysname-Vlan-interface10] dhcp relay information strategy keep
```

dhcp relay master-server switch-delay

Use **dhcp relay master-server switch-delay** to enable the switchback to the master DHCP server and set the switchback delay time.

Use **undo dhcp relay master-server switch-delay** to restore the default.

Syntax

dhcp relay master-server switch-delay *delay-time*

undo dhcp relay master-server switch-delay

Default

The DHCP relay agent does not switch back to the master DHCP server.

Views

Interface view

Predefined user roles

network-admin

Parameters

delay-time: Specifies the delay time in the range of 1 to 65535 minutes.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the DHCP relay agent to switch back to the master DHCP server 3 minutes after it switches to a backup DHCP server on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] dhcp relay master-server switch-delay 3
```

Related commands

dhcp relay server-address algorithm

dhcp relay release ip

Use **dhcp relay release ip** to release a client IP address.

Syntax

dhcp relay release ip *ip-address*

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address to be released.

Usage guidelines

After you execute this command, the relay agent sends a DHCP-RELEASE packet to the DHCP server and removes the relay entry of the IP address. Upon receiving the packet, the server removes binding information about the specified IP address to release the IP address.

Examples

Release IP address 1.1.1.1.

```
<Sysname> system-view
[Sysname] dhcp relay release ip 1.1.1.1
```

dhcp relay server-address

Use **dhcp relay server-address** to specify DHCP servers on the DHCP relay agent.

Use **undo dhcp relay server-address** to remove DHCP servers.

Syntax

dhcp relay server-address *ip-address* [**class** *class-name*]

undo dhcp relay server-address [*ip-address* [**class** *class-name*]]

Default

No DHCP server is specified on the DHCP relay agent.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a DHCP server. The DHCP relay agent forwards DHCP packets received from DHCP clients to this DHCP server.

class *class-name*: Specifies a DHCP user class to match DHCP request packets. The class name is a case-sensitive string of 1 to 63 characters. If you do not specify this option, no DHCP user class is used to match DHCP requests.

Usage guidelines

The specified IP address of the DHCP server must not reside on the same subnet as the IP address of the DHCP relay agent interface. Otherwise, the DHCP clients might fail to obtain IP addresses.

You can specify a maximum of eight DHCP servers on an interface.

After receiving a DHCP request, the DHCP relay agent forwards the packets as follows:

- If the request matches a user class rule, the DHCP relay agent forwards the packet to DHCP servers that are configured with the user class.
- If the request does not match any user class rule, the DHCP relay agent forwards the request to DHCP servers with no user classes configured.

If you execute this command with the same user class but different values for the *ip-address* argument, you specify the same user class for different DHCP servers. If you execute the command with different user classes for the same *ip-address*, the most recent configuration takes effect.

If you do not specify an IP address, the **undo dhcp relay server-address** command removes all DHCP servers on the interface.

If the DHCP server selecting algorithm is **master-backup**, make sure both the master and backup servers have the same user class configured or have no user classes configured. Otherwise, DHCP clients cannot obtain IP addresses correctly.

Examples

Specify DHCP server address 1.1.1.1 on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp relay server-address 1.1.1.1
```

Related commands

dhcp select relay

display dhcp relay interface

dhcp relay server-address algorithm

Use **dhcp relay server-address algorithm** to specify the DHCP server selecting algorithm.

Use **undo dhcp relay server-address algorithm** to restore the default.

Syntax

dhcp relay server-address algorithm { **master-backup** | **polling** }

undo dhcp relay server-address algorithm

Default

The **polling** algorithm is used. The DHCP relay agent forwards DHCP requests to all DHCP servers at the same time.

Views

Interface view

Predefined user roles

network-admin

Parameters

master-backup: Forwards DHCP requests to the master DHCP server first. If the master server is not available or does not have assignable IP addresses, the relay agent forwards DHCP requests to backup DHCP servers in the order they are specified.

polling: Forwards DHCP requests to all DHCP servers at the same time.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **master-backup** as the DHCP server selecting algorithm on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] dhcp relay server-address algorithm master-backup
```

dhcp relay server-address

remote-server algorithm

dhcp relay source-address

Use **dhcp relay source-address** to specify the source IP address for relayed DHCP requests.

Use **undo dhcp relay source-address** to restore the default.

Syntax

dhcp relay source-address { *ip-address* | **interface** *interface-type interface-number* }

undo dhcp relay source-address

Default

The DHCP relay agent uses the IP address of the interface that connects to the DHCP server as the source IP address for relayed DHCP requests.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address.

interface *interface-type interface-number*: Uses the IP address of an interface as the source IP address. The *interface-type interface-number* arguments specify an interface by its type and number.

Usage guidelines

This command is required if multiple relay interfaces share the same IP address or if a relay interface does not have routes to DHCP servers. You can use this command to specify the IP address of another interface, typically the loopback interface, on the DHCP relay agent as the source IP

address for DHCP requests. The relay interface inserts the source IP address in the source IP address field as well as the **giaddr** field in DHCP requests.

If multiple relay interfaces share the same IP address, you must also configure the relay interface to support Option 82. Upon receiving a DHCP request, the relay interface inserts the subnet information in sub-option 5 in Option 82. The DHCP server assigns an IP address according to sub-option 5. The DHCP relay agent looks the output interface up in the MAC address table to forward the DHCP reply.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify 1.1.1.1 as the source IP address for relayed DHCP requests on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] dhcp relay source-address 1.1.1.1
```

network-admin

Usage guidelines

The smart relay feature allows the relay agent to use secondary IP addresses as the gateway address when the DHCP server does not reply the DHCP-OFFER message. The relay agent initially inserts its primary IP address in the **giaddr** field before forwarding a request to the DHCP server. If no DHCP-OFFER is returned after two retries, the relay agent switches to secondary IP addresses.

Without this feature, the relay agent always uses the primary IP address as the gateway address.

Examples

Enable the DHCP smart relay feature.

```
<Sysname> system-view
[Sysname] dhcp smart-relay enable
```

dhcp-server timeout

Use **dhcp-server timeout** to set the DHCP server response timeout time for DHCP server switchover.

Use **undo dhcp-server timeout** to restore the default.

Syntax

dhcp-server timeout *time*

undo dhcp-server timeout

Default

The DHCP server response timeout time is 30 seconds.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

time: Specifies the DHCP server response timeout time in the range of 1 to 65535 seconds.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the DHCP server response timeout time to 60 seconds for DHCP server switchover in DHCP relay address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] dhcp-server timeout 60
```

Predefined user roles

network-admin

network-operator

Examples

Display MAC address check entries on the DHCP relay agent.

```
<Sysname> display dhcp relay check mac-address
```

```
Source-MAC        Interface                Aging-time
23f3-1122-adf1    Vlan2                    10
23f3-1122-2230    Vlan3                    30
```

Table 9 Command output

Field	Description
Source MAC	Source MAC address of the attacker.
Interface	Interface where the attack comes from.
Aging-time	Aging time of the MAC address check entry, in seconds.

display dhcp relay client-information

Use **display dhcp relay client-information** to display relay entries on the relay agent.

Syntax

display dhcp relay client-information [**interface** *interface-type interface-number* | **ip** *ip-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Displays relay entries on the specified interface. If you do not specify an interface, this command displays relay entries on all interfaces.

ip *ip-address*: Displays the relay entry for the specified IP address. If you do not specify an IP address, this command displays relay entries for all IP addresses.

Usage guidelines

The DHCP relay agent records relay entries only after you configure the **dhcp relay client-information record** command.

Examples

Display all relay entries on the relay agent.

```
<Sysname> display dhcp relay client-information
Total number of client-information items: 2
Total number of dynamic items: 1
Total number of temporary items: 1
IP address       MAC address      Type        Interface           VPN name
10.1.1.5         00e0-0000-0000   Temporary   Vlan2               N/A
```

Table 10 Command output

Field	Description
Total number of client-information items	Total number of relay entries.
Total number of dynamic items	Total number of dynamic relay entries.

Field	Description
Total number of temporary items	Total number of temporary relay entries.
IP address	IP address of the DHCP client.
MAC address	MAC address of the DHCP client.
Type	Relay entry type: • **Dynamic**—The relay agent creates a dynamic relay entry upon receiving an ACK response from the DHCP server. • **Temporary**—The relay agent creates a temporary relay entry upon receiving a REQUEST packet from a DHCP client.
Interface	Layer 3 interface connected to the DHCP client. **N/A** is displayed for relay entries without interface information.
VPN name	This field is not supported in the current software version. Name of the VPN instance to which the DHCP client belongs. If the DHCP client does not belong to any VPN, this field displays **N/A**.

Related commands

dhcp relay client-information record

reset dhcp relay client-information

display dhcp relay information

Use **display dhcp relay information** to display Option 82 configuration information for the DHCP relay agent.

Syntax

display dhcp relay information [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Displays Option 82 configuration information for the specified interface. If you do not specify an interface, this command displays Option 82 configuration information about all interfaces.

Examples

Display Option 82 configuration information for all interfaces.

```
<Sysname> display dhcp relay information
Interface: Vlan-interface100
   Status: Enable
   Strategy: Replace
   Circuit ID Pattern: Verbose
   Remote ID Pattern: Sysname
```

```
   Circuit ID format-type: Undefined
   Remote ID format-type: ASCII
   Node identifier: aabbcc
Interface: Vlan-interface200
   Status: Enable
   Strategy: Replace
   Circuit ID Pattern: User Defined
   Remote ID Pattern: User Defined
   Circuit ID format-type: ASCII
   Remote ID format-type: ASCII
   User defined:
   Circuit ID: vlan100
   Remote ID: device001
```

Table 11 Command output

Field	Description
Interface	Interface name.
Status	Option 82 states: • **Enable**—DHCP relay agent support for Option 82 is enabled. • **Disable**—DHCP relay agent support for Option 82 is disabled.
Strategy	Handling strategy for request messages containing Option 82, **Drop**, **Keep**, or **Replace**.
Circuit ID Pattern	Padding content mode of the Circuit ID sub-option, **Verbose**, **Normal**, or **User Defined**.
Remote ID Pattern	Padding content mode of the Remote ID sub-option, **Sysname**, **Normal**, or **User Defined**.
Circuit ID format-type	Padding format of the Circuit ID sub-option, **ASCII**, **Hex**, or **Undefined**.
Remote ID format-type	Padding format of the Remote ID sub-option, **ASCII**, **Hex**, or **Undefined**.
Node identifier	Access node identifier.
User defined	Content of the user-defined sub-options.
Circuit ID	User-defined content of the Circuit ID sub-option.
Remote ID	User-defined content of the Remote ID sub-option.

display dhcp relay server-address

Use **display dhcp relay server-address** to display DHCP server addresses configured on an interface.

Syntax

display dhcp relay server-address [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Displays DHCP server addresses on the specified interface. If you do not specify an interface, this command displays DHCP server addresses on all interfaces.

Examples

Display DHCP server addresses on all interfaces.

```
<Sysname> display dhcp relay server-address
Interface name      Server IP address   Public/VRF name      Class name
Vlan2               2.2.2.2             Y/--                 --
Vlan2               2.2.2.3             Y/--                 abc
```

Table 12 Command output

Field	Description
Interface name	Interface name.
Server IP address	DHCP server IP address.
Public/VRF name	This field is not supported in the current software version. Location of the DHCP server, which is determined by the configuration of the **dhcp relay server-address** command. • If neither the **public** keyword nor the **vpn-instance** *vpn-instance-name* option is specified, this field displays **--/--**. • If the **public** keyword is specified, this field displays **Y/--**. • If the **vpn-instance** *vpn-instance-name* option is specified, the VPN instance name is displayed after the slash (/), for example, **--/abc**.
Class name	Name of a DHCP user class to match DHCP requests. This field displays hyphens (**--**) if the **class** *class-name* option is not specified in the **dhcp relay server-address** command.

Related commands

   BOOTPREQUEST:                       0
DHCP packets sent to clients:          0
   DHCPOFFER:                          0
   DHCPACK:                            0
   DHCPNAK:                            0
   BOOTPREPLY:                         0
```

Related commands

reset dhcp relay statistics

gateway-list

Use **gateway-list** to specify gateway addresses for DHCP clients in a DHCP address pool.

Use **undo gateway-list** to remove gateway addresses from a DHCP address pool.

Syntax

gateway-list *ip-address*&<1-64>

undo gateway-list [*ip-address*&<1-64>]

Default

No gateway address is specified in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address&<1-64>: Specifies a space-separated list of up to 64 addresses.

Usage guidelines

DHCP clients of the same access type can be classified into different types by their locations. In this case, the relay interface typically has no IP address configured. You can use the **gateway-list** command to specify gateway addresses for clients matching the same DHCP address pool and bind the gateway addresses to the device's MAC address.

Upon receiving a DHCP DISCOVER or REQUEST from a client that matches a DHCP address pool, the relay agent processes the packet as follows:

1. Fills the **giaddr** field of the packet with the specified gateway address.
2. Forwards the packet to all DHCP servers in the matching DHCP address pool.

The DHCP servers select a DHCP address pool according to the gateway address.

Examples

Specify gateway address 10.1.1.1 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] gateway-list 10.1.1.1
```

Related commands

dhcp smart-relay enable

master-server switch-delay

Use **master-server switch-delay** to enable the switchback to the master DHCP server and set the switchback delay time.

Use **undo master-server switch-delay** to restore the default.

Syntax

master-server switch-delay *delay-time*

undo master-server switch-delay

Default

The DHCP relay agent does not switch back to the master DHCP server.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

delay-time: Specifies the delay time in the range of 1 to 65535 minutes.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the DHCP relay agent to switch back to the master DHCP server 3 minutes after it switches to a backup DHCP server in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] master-server switch-delay 3
```

Related commands

remote-server algorithm

remote-server

Use **remote-server** to specify DHCP servers for a DHCP relay address pool.

Use **undo remote-server** to remove DHCP servers from a DHCP relay address pool.

Syntax

remote-server *ip-address*&<1-8>

undo remote-server [*ip-address*&<1-8>]

Default

No DHCP server is specified for the DHCP relay address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight DHCP server addresses.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If you do not specify a DHCP server address, the **undo remote-server** command removes all DHCP servers in the DHCP address pool.

Examples

Specify DHCP server 10.1.1.1 for DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] remote-server 10.1.1.1
```

remote-server algorithm

Use **remote-server algorithm** to specify the DHCP server selecting algorithm.

Use **undo remote-server algorithm** to restore the default.

Syntax

remote-server algorithm { **master-backup** | **polling** }

undo remote-server algorithm

Default

The **polling** algorithm is used. The DHCP relay agent forwards DHCP requests to all DHCP servers at the same time.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

master-backup: Forwards DHCP requests to the master DHCP server first. If the master server is not available or does not have assignable IP addresses, the relay agent forwards DHCP requests to backup DHCP servers in the order they are specified.

polling: Forwards DHCP requests to all DHCP servers at the same time.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **master-backup** as the DHCP server selecting algorithm in DHCP relay address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] remote-server algorithm master-backup
```

reset dhcp relay client-information

Use **reset dhcp relay client-information** to clear relay entries on the DHCP relay agent.

Syntax

reset dhcp relay client-information [**interface** *interface-type interface-number* | **ip** *ip-address*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Clears relay entries on the specified interface. If you do not specify an interface, this command clears relay entries on all interfaces.

ip *ip-address*: Clears the relay entry for the specified IP address. If you do not specify an IP address, this command clears relay entries for all IP addresses.

Examples

Clear all relay entries on the DHCP relay agent.

```
<Sysname> reset dhcp relay client-information
```

Related commands

display dhcp relay client-information

reset dhcp relay statistics

Use **reset dhcp relay statistics** to clear relay agent statistics.

Syntax

reset dhcp relay statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears all DHCP relay agent statistics.

Examples

Clear all DHCP relay agent statistics.

```
<Sysname> reset dhcp relay statistics
```

Related commands

display dhcp relay statistics

DHCP client commands

dhcp client class-id

Use **dhcp client class-id** to configure Option 60.

Use **undo dhcp client class-id** to restore the default.

NOTE:

This command is supported only in Release 6340 and later.

Syntax

dhcp client class-id { **ascii** *ascii-string* | **hex** *hex-string* }

undo dhcp client class-id

Default

Option 60 contains the vendor name and the product name.

Views

Interface view

Predefined user roles

network-admin

Parameters

ascii *ascii-string*: Specifies a case-sensitive ASCII string of 1 to 63 characters as the content in Option 60.

hex *hex-string*: Specifies a case-sensitive hexadecimal string of 4 to 64 characters as the value in Option 60.

Usage guidelines

Option 60 acts as a vendor class identifier (VCI). You can configure a DHCP client to send a request with Option 60 for the DHCP server to make class-based IP address assignment. When the DHCP server receives a request with Option 60 from a client, the server identifies the user class of the client. Then, the server assigns the client an IP address from the IP range specified for the user class.

By default, Option 60 contains the vendor name and the product name. To customize this option, use this command.

Examples

Configure FFFFFFFF as the content of Option 60 on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp client class-id hex FFFFFFFF
```

dhcp client dad enable

Use **dhcp client dad enable** to enable duplicate address detection.

Use **undo dhcp client dad enable** to disable duplicate address detection.

Syntax

dhcp client dad enable

undo dhcp client dad enable

Default

Duplicate address detection is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

DHCP client detects IP address conflict through ARP packets. An attacker can act as the IP address owner to send an ARP reply. This makes the client unable to use the IP address assigned by the server. As a best practice, disable duplicate address detection when ARP attacks exist on the network.

Examples

Disable the duplicate address.

```
<Sysname> system-view
[Sysname] undo dhcp client dad enable
```

dhcp client dscp

Use **dhcp client dscp** to set the DSCP value for DHCP packets sent by the DHCP client.

Use **undo dhcp client dscp** to restore the default.

Syntax

dhcp client dscp *dscp-value*

undo dhcp client dscp

Default

The DSCP value is 56 in DHCP packets sent by the DHCP client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Sets the DSCP value for DHCP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for DHCP packets sent by the DHCP client.

```
<Sysname> system-view
[Sysname] dhcp client dscp 30
```

dhcp client identifier

Use **dhcp client identifier** to configure a DHCP client ID for an interface.

Use **undo dhcp client identifier** to restore the default.

Syntax

dhcp client identifier { **ascii** *ascii-string* | **hex** *hex-string* | **mac** *interface-type interface-number* }

undo dhcp client identifier

Default

An interface generates the DHCP client ID based on its MAC address. If the interface has no MAC address, it uses the MAC address of the first Ethernet interface to generate its client ID.

Views

Interface view

Predefined user roles

network-admin

Parameters

ascii *ascii-string*: Specifies a case-sensitive ASCII string of 1 to 63 characters as the client ID.

hex *hex-string*: Specifies a hexadecimal number of 4 to 64 characters as the client ID.

mac *interface-type interface-number*: Uses the MAC address of the specified interface as a DHCP client ID. The *interface-type interface-number* argument specifies an interface by its type and number.

Usage guidelines

A DHCP client ID is added to the DHCP option 61. A DHCP server can specify IP addresses for clients based on the DHCP client ID. You can specify a DHCP client ID by performing one of the following operations:

- Naming an ASCII string or hexadecimal number as the client ID.
- Using the MAC address of an interface to generate a client ID.

Whichever method you use, make sure the IDs for different DHCP clients are unique.

Examples

Use a hexadecimal number of FFFFFFFF as the client ID for VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] dhcp client identifier hex FFFFFFFF
```

Related commands

display dhcp client

display dhcp client

                            6433-2e38-3635-392d-
                            4574-6830-2f30-2f32
 T1 will timeout in 1 day 11 hours 58 minutes 52 seconds.
```

Table 13 Command output

Field	Description
DHCP client information	Information about the interface that acts as the DHCP client.

Field	Description
Current state	Current state of the DHCP client: • **HALT**—The client stops applying for an IP address. • **INIT**—The initialization state. • **SELECTING**—The client has sent out a DHCP-DISCOVER message in search for a DHCP server and is waiting for the response from DHCP servers. • **REQUESTING**—The client has sent out a DHCP-REQUEST message requesting for an IP address and is waiting for the response from DHCP servers. • **BOUND**—The client has received the DHCP-ACK message from a DHCP server and obtained an IP address successfully. • **RENEWING**—The T1 timer expires. • **REBOUNDING**—The T2 timer expires.
Allocated IP	IP address allocated by the DHCP server.
Allocated lease	Allocated lease time.
T1	1/2 lease time (in seconds) of the DHCP client IP address.
T2	7/8 lease time (in seconds) of the DHCP client IP address.
Lease from….to….	Start and end time of the lease.
DHCP server	DHCP server IP address that assigned the IP address.
Transaction ID	Transaction ID, a random number chosen by the client to identify an IP address allocation.
Default router	Gateway address assigned to the client.
Classless static routes	Classless static routes assigned to the client.
Static routes	Classful static routes assigned to the client.
DNS servers	DNS server address assigned to the client.
Domain name	Domain name suffix assigned to the client.
Boot servers	PXE server addresses (up to 16 addresses) specified for the DHCP client, which are obtained through Option 43.
ACS parameter	Parameters about the ACS.
URL	URL of the ACS.
Username	Username for logging in to the ACS.
Password	Password for logging in to the ACS. If a password is configured, this field displays **********. If no password is configured, this field is not displayed.
Client ID type	DHCP client ID type: • If an ASCII string is used as the client ID value, the type value is 00. • If the MAC address of a specific interface is used as the client ID value, the type value is 01. • If a hexadecimal number is used as the client ID value, the type value is the first two characters in the string.
Client ID value	Value of the DHCP client ID.
Client ID (with type) hex	DHCP client ID with the type field, a hexadecimal number.

Field	Description
T1 will timeout in 1 day 11 hours 58 minutes 52 seconds.	How long the T1 (1/2 lease time) timer will timeout.

Syntax

ip address dhcp-alloc

undo ip address dhcp-alloc

Default

For the S3100V3-SI switch series, MS4320V2 switch series, MS4320 switch series, MS4200 switch series, and MS4300V2 switch series, an interface does not use DHCP for IP address acquisition.

For the S5110V2 switch series, S5110V2-SI switch series, S5130S-LI switch series, S5130S-SI switch series, S5000V3-EI switch series, S5000E-X switch series, WS5810-WiNet switch series, WS5820-WiNet switch series, and WAS6100 switch series:

- If the switch starts with initial configuration, an interface does not use DHCP for IP address acquisition.
- If the switch starts with factory defaults, VLAN-interface 1 obtains an IP address through DHCP.

For more information about initial configuration and factory defaults, see configuration file management configuration in *Fundamentals Configuration Guide*.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

When you execute the **undo ip address dhcp-alloc** command, the interface sends a DHCP-RELEASE message to release the IP address obtained through DHCP. If the interface is down, the message cannot be sent out. This situation can occur when a subinterface obtained an IP address through DHCP, and the **shutdown** command is executed on its primary interface. The subinterface will fail to send a DHCP-RELEASE message.

Examples

Configure VLAN-interface 10 to use DHCP for IP address acquisition.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ip address dhcp-alloc
```

DHCP snooping commands

DHCP snooping works between the DHCP client and the DHCP server or between the DHCP client and the relay agent. DHCP snooping does not work between the DHCP server and the DHCP relay agent.

dhcp snooping binding database filename

Use **dhcp snooping binding database filename** to configure the DHCP snooping device to back up DHCP snooping entries to a file.

Use **undo dhcp snooping binding database filename** to restore the default.

Syntax

dhcp snooping binding database filename { *filename* | **url** *url* [**username** *username* [**password** { **cipher** | **simple** } *string*]] }

undo dhcp snooping binding database filename

Default

The DHCP snooping device does not back up DHCP snooping entries.

Views

System view

Predefined user roles

network-admin

Parameters

filename: Specifies the name of a local backup file. For information about the *filename* argument, see *Fundamentals Configuration Guide*.

url *url*: Specifies the URL of a remote backup file, a case-sensitive string of 1 to 255 characters. Do not include a username or password in the URL. Supported path format type varies by server.

username *username*: Specifies the username for accessing the URL of the remote backup file, a case-sensitive string of 1 to 32 characters. Do not specify this option if a username is not required for accessing the URL.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 32 characters. Its encrypted form is a case-sensitive string of 1 to 73 characters. Do not specify this argument if a password is not required for accessing the URL of the remote backup file.

Usage guidelines

This command automatically creates the file if you specify a nonexistent file.

With this command executed, the DHCP snooping device backs up DHCP snooping entries immediately and runs auto backup. The DHCP snooping device, by default, waits 300 seconds after a DHCP snooping entry change to update the backup file. To change the waiting period, use the **dhcp snooping binding database update interval** command. If no DHCP snooping entry changes, the backup file is not updated.

As a best practice, back up the DHCP snooping entries to a remote file. If you use the local storage medium, the frequent erasing and writing might damage the medium and then cause the DHCP snooping device to malfunction.

When the file is on a remote device, follow these restrictions and guidelines to specify the URL, username, and password:

If the file is on an FTP server, enter URL in the following format: ftp://*server address:port/file path*, where the port number is optional.

If the file is on a TFTP server, enter URL in the following format: tftp://*server address:port/file path*, where the port number is optional.

- The username and password must be the same as those configured on the FTP server. If the server authenticates only the username, the password can be omitted.
- If the IP address of the server is an IPv6 address, enclose the address in a pair of brackets, for example, **ftp://[1::1]/database.dhcp**.
- You can also specify the DNS domain name for the server address field, for example, **ftp://company/database.dhcp**.

Examples

Configure the DHCP snooping device to back up DHCP snooping entries to file **database.dhcp**.

```
<Sysname> system-view
[Sysname] dhcp snooping binding database filename database.dhcp
```

Configure the DHCP snooping device to back up DHCP snooping entries to file **database.dhcp** in the working directory of the FTP server at 10.1.1.1.

```
<Sysname> system-view
[Sysname] dhcp snooping binding database filename url ftp://10.1.1.1/database.dhcp
username 1 password simple 1
```

Configure the DHCP snooping device to back up DHCP snooping entries to file **database.dhcp** in the working directory of the TFTP server at 10.1.1.1.

```
<Sysname> system-view
[Sysname] dhcp snooping binding database filename tftp://10.1.1.1/database.dhcp
```

Related commands

dhcp snooping binding database update interval

dhcp snooping binding database update interval

Use **dhcp snooping binding database update interval** to set the waiting time for the DHCP snooping device to update the backup file after a DHCP snooping entry change.

Use **undo dhcp snooping binding database update interval** to restore the default.

Syntax

dhcp snooping binding database update interval *interval*

undo dhcp snooping binding database update interval

Default

The DHCP snooping device waits 300 seconds to update the backup file after a DHCP snooping entry change. If no DHCP snooping entry changes, the backup file is not updated.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the waiting time in seconds, in the range of 60 to 864000.

Usage guidelines

When a DHCP snooping entry is learned, updated, or removed, the waiting period starts. The DHCP snooping device updates the backup file when the waiting period is reached. All changed entries during the period will be saved to the backup file.

The waiting time takes effect only after you configure the DHCP snooping entry auto backup by using the **dhcp snooping binding database filename** command.

Examples

Set the waiting time to 600 seconds for the DHCP snooping device to update the backup file.

```
<Sysname> system-view
[Sysname] dhcp snooping binding database update interval 600
```

Related commands

dhcp snooping binding database filename

dhcp snooping binding database update now

Use **dhcp snooping binding database update now** to manually save DHCP snooping entries to the backup file.

Syntax

dhcp snooping binding database update now

Views

System view

Predefined user roles

network-admin

Usage guidelines

Each time this command is executed, the DHCP snooping entries are saved to the backup file.

This command takes effect only after you configure the DHCP snooping auto backup by using the **dhcp snooping binding database filename** command.

Examples

Manually save DHCP snooping entries to the backup file.

```
<Sysname> system-view
[Sysname] dhcp snooping binding database update now
```

Related commands

dhcp snooping binding database filename

dhcp snooping binding record

Use **dhcp snooping binding record** to enable recording of client information in DHCP snooping entries.

Use **undo dhcp snooping binding record** to disable recording of client information in DHCP snooping entries.

Syntax

dhcp snooping binding record

undo dhcp snooping binding record

Default

DHCP snooping does not record client information.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

VLAN view

Predefined user roles

network-admin

Usage guidelines

This command enables DHCP snooping on the port directly connecting to the clients to record client information in DHCP snooping entries.

Examples

Enable the recording of client information in DHCP snooping entries on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping binding record
```

dhcp snooping check mac-address

Use **dhcp snooping check mac-address** to enable MAC address check for DHCP snooping.

Use **undo dhcp snooping check mac-address** to disable MAC address check for DHCP snooping.

Syntax

dhcp snooping check mac-address

undo dhcp snooping check mac-address

Default

MAC address check for DHCP snooping is disabled.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

With MAC address check enabled, DHCP snooping compares the **chaddr** field of a received DHCP request with the source MAC address field in the frame header. If they are the same, DHCP snooping considers this request valid and forwards it to the DHCP server. If they are not the same, DHCP snooping discards the DHCP request.

Examples

Enable MAC address check for DHCP snooping.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
```

```
[Sysname-GigabitEthernet1/0/1] dhcp snooping check mac-address
```

dhcp snooping check request-message

Use **dhcp snooping check request-message** to enable DHCP-REQUEST check for DHCP snooping.

Use **undo dhcp snooping check request-message** to disable DHCP-REQUEST check for DHCP snooping.

Syntax

dhcp snooping check request-message

undo dhcp snooping check request-message

Default

DHCP-REQUEST check for DHCP snooping is disabled.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

DHCP-REQUEST packets include lease renewal packets, DHCP-DECLINE packets, and DHCP-RELEASE packets. This feature prevents unauthorized clients that forge DHCP-REQUEST packets from attacking the DHCP server.

With this feature enabled, DHCP snooping looks for a matching DHCP snooping entry for each received DHCP-REQUEST message.

- If a match is found, DHCP snooping compares the entry with the message. If they have consistent information, DHCP snooping considers the packet valid and forwards it to the DHCP server. If they have different information, DHCP snooping considers the message invalid and discards it.
- If no match is found, DHCP snooping forwards the message to the DHCP server.

Examples

Enable DHCP-REQUEST check for DHCP snooping.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping check request-message
```

dhcp snooping deny

Use **dhcp snooping deny** to configure a port as DHCP packet blocking port.

Use **undo dhcp snooping deny** to restore the default.

Syntax

dhcp snooping deny

undo dhcp snooping deny

Default

A port does not block DHCP requests.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

To avoid IP address acquisition failure, configure a port to block DHCP packets only if no DHCP clients are attached to it.

To enable a port on the snooping device to drop all incoming DHCP requests, configure that port as a DHCP packet blocking port.

Examples

Configure GigabitEthernet 1/0/1 as a DHCP packet blocking port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping deny
```

dhcp snooping disable

Use **dhcp snooping disable** to disable DHCP snooping on an interface.

Use **undo dhcp snooping disable** to restore the default.

Syntax

dhcp snooping disable

undo dhcp snooping disable

Default

If you enable DHCP snooping globally or for a VLAN, DHCP snooping is enabled on all interfaces on the device or on all interfaces in the VLAN.

If you do not enable DHCP snooping globally or for a VLAN, DHCP snooping is disabled on all interfaces on the device or on all interfaces in the VLAN.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command allows you to narrow down the interface range where DHCP snooping takes effect. For example, to enable DHCP snooping globally except for a specific interface, you can enable DHCP snooping globally and execute this command on the target interface.

Examples

Disable DHCP snooping on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping disable
```

dhcp snooping enable

Use **dhcp snooping enable** to enable DHCP snooping globally.

Use **undo dhcp snooping enable** to disable DHCP snooping globally.

Syntax

dhcp snooping enable

undo dhcp snooping enable

Default

DHCP snooping is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After you enable DHCP snooping globally on the device, trusted ports forward responses from DHCP servers and untrusted ports discard responses. This mechanism ensures that DHCP clients obtain IP addresses from authorized DHCP servers.

When DHCP snooping is disabled globally, all ports on the device can forward responses from DHCP servers.

Examples

Enable DHCP snooping globally.

```
<Sysname> system-view
[Sysname] dhcp snooping enable
```

dhcp snooping enable vlan

Use **dhcp snooping enable vlan** to enable DHCP snooping for VLANs.

Use **undo dhcp snooping enable vlan** to disable DHCP snooping for VLANs.

Syntax

dhcp snooping enable vlan *vlan-id-list*

undo dhcp snooping enable vlan *vlan-id-list*

Default

DHCP snooping is disabled for all VLANs.

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each VLAN item specifies a VLAN by VLAN ID or specifies a range of VLANs in the form of *vlan-id1* to *vlan-id2*.

The value range for the VLAN IDs is 1 to 4094. If you specify a VLAN range, the value for the *vlan-id2* argument must be greater than the value for the *vlan-id1* argument.

Usage guidelines

After you enable DHCP snooping for a VLAN, DHCP snooping untrusted ports in the VLAN discard incoming DHCP responses. This mechanism ensures that DHCP clients obtain IP addresses from authorized DHCP servers.

After you disable DHCP snooping for a VLAN, all interfaces in the VLAN can forward DHCP responses.

Examples

Enable DHCP snooping for VLANs 5, 10 to 20, and 32.

```
<Sysname> system-view
[Sysname] dhcp snooping enable vlan 5 10 to 20 32
```

dhcp snooping information circuit-id

Use **dhcp snooping information circuit-id** to configure the padding mode and padding format for the Circuit ID sub-option.

Use **undo dhcp snooping information circuit-id** to restore the default.

Syntax

dhcp snooping information circuit-id { **normal-extended** | [**vlan** *vlan-id*] **string** *circuit-id* | { **normal** | **verbose** [**node-identifier** { **mac** | **sysname** | **user-defined** *node-identifier* }] } [**format** { **ascii** | **hex** }] }

undo dhcp snooping information circuit-id [**vlan** *vlan-id*]

Default

The padding mode is normal and the padding format is hex.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

VLAN view

NOTE:

VLAN view is supported only in Release 6348P01 and later.

Predefined user roles

network-admin

Parameters

normal-extended: Specifies the extended normal mode. The padding content for the Circuit ID sub-option includes the VLAN ID, slot number, and interface number. This keyword is available only in Release 6328 and later.

vlan *vlan-id*: Pads the Circuit ID sub-option for packets received from the specified VLAN. If you do not specify a VLAN, the device pads the Circuit ID sub-option for packets received from the default VLAN.

string *circuit-id*: Specifies the string mode, in which the padding content for the Circuit ID sub-option is a case-sensitive string of 3 to 63 characters.

normal: Specifies the normal mode. The padding content includes the VLAN ID and interface number.

verbose: Specifies the verbose mode. The padding content includes the node identifier, interface information, and VLAN ID. The default node identifier is the MAC address of the access node. The default interface information consists of the Ethernet type (fixed to **eth**), chassis number, slot number, sub-slot number, and interface number.

node-identifier: Specifies the access node identifier.

- **mac**: Uses the MAC address of the access node as the node identifier.
- **sysname**: Uses the device name as the node identifier. You can set the device name by using the **sysname** command in system view. The padding format for the device name is always ASCII regardless of the specified padding format. If this keyword is specified, make sure the device name does not include any spaces. Otherwise, the DHCP snooping device fails to add or replace Option 82.
- **user-defined** *node-identifier*: Uses a case-sensitive string of 1 to 50 characters as the node identifier. The padding format for the specified character string is always ASCII regardless of the specified padding format.

format: Specifies the padding format for the Circuit ID sub-option.

ascii: Specifies the ASCII padding format.

hex: Specifies the hex padding format.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The padding format for the string mode, the normal mode, or the verbose mode varies by command configuration. Table 14 shows how the padding format is determined for different modes.

Table 14 Padding format for different modes

Keyword (mode)	If no padding format is set	If the padding format is ascii	If the padding format is hex
string *circuit-id*	The padding format is always ASCII, and is not configurable.	N/A	N/A
normal	Hex.	ASCII.	Hex.
verbose	Hex for the VLAN ID. ASCII for the node identifier, Ethernet type, chassis number, slot number, sub-slot number, and interface number.	ASCII.	ASCII for the node identifier and Ethernet type. Hex for the chassis number, slot number, sub-slot number, interface number, and VLAN ID.

Examples

Configure verbose as the padding mode, device name as the node identifier, and ASCII as the padding format for the Circuit ID sub-option.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping information enable
[Sysname-GigabitEthernet1/0/1] dhcp snooping information strategy replace
[Sysname-GigabitEthernet1/0/1] dhcp snooping information circuit-id verbose
node-identifier sysname format ascii
```

display dhcp snooping information

dhcp snooping information enable

Use **dhcp snooping information enable** to enable DHCP snooping to support Option 82.

Use **undo dhcp snooping information enable** to disable this feature.

Syntax

dhcp snooping information enable

undo dhcp snooping information enable

Default

DHCP snooping does not support Option 82.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

VLAN view

NOTE:

VLAN view is supported only in Release 6348P01 and later.

Predefined user roles

network-admin

Usage guidelines

This command enables DHCP snooping to add Option 82 into DHCP requests that do not contain Option 82 before forwarding the requests to the DHCP server. The content of Option 82 is determined by the **dhcp snooping information circuit-id** and **dhcp snooping information remote-id** commands. If the received DHCP request packets contain Option 82, DHCP snooping handles the packets according to the strategy configured by the **dhcp snooping information strategy** command.

Examples

Enable DHCP snooping to support Option 82.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping information enable
```

dhcp snooping information remote-id

Use **dhcp snooping information remote-id** to configure the padding mode and padding format for the Remote ID sub-option.

Use **undo dhcp snooping information remote-id** to restore the default.

NOTE:

This command is supported only in Release 6343P08 and later.

Syntax

dhcp snooping information remote-id { **normal** [**format** { **ascii** | **hex** }] | [**vlan** *vlan-id*] { **string** *remote-id* | **sysname** } }

undo dhcp snooping information remote-id [**vlan** *vlan-id*]

Default

The padding mode is normal and the padding format is hex.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

VLAN view

NOTE:

VLAN view is supported only in Release 6348P01 and later.

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Pads the Remote ID sub-option for packets received from the specified VLAN. If you do not specify a VLAN, the device pads the Remote ID sub-option for packets received from the default VLAN.

string *remote-id*: Specifies the string mode that uses a case-sensitive string of 1 to 63 characters as the content of the Remote ID sub-option.

sysname: Specifies the sysname mode that uses the device name as the Remote ID sub-option. You can configure the device name by using the **sysname** command in system view.

normal: Specifies the normal mode. The padding content is the MAC address of the receiving interface.

format: Specifies the padding format for the Remote ID sub-option. The default padding format is hex.

ascii: Specifies the ASCII padding format.

hex: Specifies the hex padding format.

Usage guidelines

DHCP snooping uses ASCII to pad the specified string or device name for the Remote ID sub-option. The padding format for the normal padding mode is determined by the command configuration.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Pad the Remote ID sub-option with a character string of **device001**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping information enable
[Sysname-GigabitEthernet1/0/1] dhcp snooping information strategy replace
[Sysname-GigabitEthernet1/0/1] dhcp snooping information remote-id string device001
```

dhcp snooping information enable

dhcp snooping information strategy

display dhcp snooping information

dhcp snooping information strategy

Use **dhcp snooping information strategy** to configure the handling strategy for Option 82 in request messages.

Use **undo dhcp snooping information strategy** to restore the default.

Syntax

dhcp snooping information strategy { **append** | **drop** | **keep** | **replace** }

undo dhcp snooping information strategy

Default

The handling strategy for Option 82 in request messages is **replace**.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

VLAN view

NOTE:

VLAN view is supported only in Release 6348P01 and later.

Predefined user roles

network-admin

Parameters

append: Processes a DHCP message as follows:

- If the DHCP message does not carry Option 82, the device forwards the message after adding the Option 82 according to the padding configuration.
- If the DHCP message carries Option 82, the device processes the message as follows:
  - Forwards the message after padding the Vendor-Specific sub-option with the content specified in the **dhcp snooping information vendor-specific** command.
  - Forwards the message without changing Option 82 if the **dhcp snooping information vendor-specific** command is not configured.

drop: Drops DHCP messages that contain Option 82.

keep: Keeps the original Option 82 intact and forwards the DHCP messages.

replace: Replaces the Option 82 with the configured Option 82 before forwarding the DHCP messages. If the DHCP messages do not carry Option 82, the device adds Option 82 according to the padding configuration before forwarding the DHCP messages.

Usage guidelines

This command takes effect only on DHCP requests that contain Option 82. For DHCP requests that do not contain Option 82, the DHCP snooping device always adds Option 82 into the requests before forwarding them to the DHCP server.

If the handling strategy is **append** or **replace**, configure a padding mode and a padding format for Option 82. If the handling strategy is **keep** or **drop**, you do not need to configure a padding mode or padding format for Option 82.

Examples

Specify the handling strategy for Option 82 in request messages as **keep**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping information enable
[Sysname-GigabitEthernet1/0/1] dhcp snooping information strategy keep
```

Related commands

dhcp snooping information vendor-specific

dhcp snooping information vendor-specific

Use **dhcp snooping information vendor-specific** to configure the padding mode for the Vendor-Specific sub-option.

Use **undo dhcp snooping information vendor-specific** to restore the default.

Syntax

dhcp snooping information vendor-specific [**vlan** *vlan-id*] **bas** [**node-identifier** { **mac** | **sysname** | **user-defined** *string* }]

undo dhcp snooping information vendor-specific [**vlan** *vlan-id*]

Default

The device does not pad the Vendor-Specific sub-option.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

VLAN view

NOTE:

VLAN view is supported only in Release 6348P01 and later.

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Pads the Vendor-Specific sub-option for packets received from the specified VLAN. If you do not specify a VLAN, the device pads the Vendor-Specific sub-option for all packets received on the interface.

bas: Specifies the bas mode to pad the Vendor-Specific sub-option.

node-identifier: Specifies the access node identifier. If you do not specify this keyword, the device pads the Vendor-Specific sub-option with the bridge MAC address of the access node as the node identifier. The padding format for the Vendor-Specific sub-option is ASCII.

- **mac**: Uses the bridge MAC address of the access node as the node identifier.
- **sysname**: Uses the device name as the node identifier. You can set the device name by using the **sysname** command in system view. If the **sysname** keyword is specified, make sure the device name does not include any spaces. Otherwise, the DHCP snooping device fails to add the Vendor-Specific sub-option. If the device name contains more than 50 characters, only the first 50 characters are padded.
- **user-defined** *string*: Uses a case-sensitive string of 1 to 50 characters as the node identifier. Do not include any spaces in the string.

Usage guidelines

After you configure this command, the DHCP snooping device pads the Vendor-Specific sub-option after receiving a DHCP request. The device forwards the DHCP request without padding the Vendor-Specific sub-option if the following conditions exist:

- The **dhcp snooping information strategy append** command is configured.
- The length of Option 82 in the request reaches the upper limit.

Examples

Pad the Vendor-Specific sub-option in bas mode with the device name as the node identifier.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping information enable
[Sysname-GigabitEthernet1/0/1] dhcp snooping information vendor-specific bas
node-identifier sysname
```

Related commands

Use **dhcp snooping log enable** to enable DHCP snooping logging.

Use **undo dhcp snooping log enable** to disable DHCP snooping logging.

Syntax

dhcp snooping log enable

undo dhcp snooping log enable

Default

DHCP snooping logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the DHCP snooping device to generate DHCP snooping logs and send them to the information center. The information helps administrators locate and solve problems. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

As a best practice, disable this feature if the log generation affects the device performance.

Examples

Enable DHCP snooping logging.

```
<Sysname> system-view
[Sysname] dhcp snooping log enable
```

dhcp snooping max-learning-num

Use **dhcp snooping max-learning-num** to set the maximum number of DHCP snooping entries that an interface can learn.

Use **undo dhcp snooping max-learning-num** to restore the default.

Syntax

dhcp snooping max-learning-num *max-number*

undo dhcp snooping max-learning-num

Default

The maximum number of DHCP snooping entries for an interface to learn is unlimited.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of DHCP snooping entries for an interface to learn. The value range is 1 to 4294967295.

Usage guidelines

When an interface learns the maximum number of DHCP snooping entries, the interface stops learning DHCP snooping entries. This does not affect the operating of the DHCP snooping feature.

Examples

Allow Layer 2 Ethernet interface GigabitEthernet 1/0/1 to learn a maximum of 10 DHCP snooping entries.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping max-learning-num 10
```

dhcp snooping rate-limit

Use **dhcp snooping rate-limit** to enable DHCP snooping packet rate limit on an interface and set the limit value.

Use **undo dhcp snooping rate-limit** to disable DHCP snooping packet rate limit.

Syntax

dhcp snooping rate-limit *rate*

undo dhcp snooping rate-limit

Default

The DHCP snooping packet rate limit is disabled on an interface.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

network-admin

Parameters

rate: Specifies the maximum rate in Kbps. The value range is 64 to 512.

Usage guidelines

This command takes effect only when DHCP snooping is enabled.

With the rate limit feature, the interface discards DHCP packets that exceed the maximum rate.

The rate configured on a Layer 2 aggregate interface applies to all members of the aggregate interface. If a member interface leaves the aggregation group, it uses the rate configured in its Ethernet interface view.

The device-supported maximum rate is an integer multiple of eight. If you set the maximum rate to 67, the value 64 or 72 takes effect.

Examples

Set the maximum rate to 64 Kbps at which Layer 2 Ethernet interface GigabitEthernet 1/0/1 can receive DHCP packets.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping rate-limit 64
```

dhcp snooping trust

Use **dhcp snooping trust** to configure a port as a trusted port.

Use **undo dhcp snooping trust** to restore the default state of a port.

Syntax

dhcp snooping trust

undo dhcp snooping trust

Default

After you enable DHCP snooping, all ports are untrusted.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

Specify the ports facing the DHCP server as trusted ports and specify the other ports as untrusted ports so DHCP clients can obtain valid IP addresses.

Examples

Specify Layer 2 Ethernet interface GigabitEthernet 1/0/1 as a trusted port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dhcp snooping trust
```

Related commands

display dhcp snooping trust

dhcp snooping trust interface

Use **dhcp snooping trust interface** to configure an interface in a VLAN as a DHCP snooping trusted port.

Use **undo dhcp snooping trust interface** to configure an interface in a VLAN as a DHCP snooping untrusted port.

Syntax

dhcp snooping trust interface *interface-type interface-number*

undo dhcp snooping trust interface *interface-type interface-number*

Default

After you enable DHCP snooping for a VLAN, all interfaces in the VLAN are DHCP snooping untrusted ports.

Views

VLAN view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

In a VLAN, configure interfaces facing the DHCP server as trusted ports, and configure other interfaces as untrusted ports. The trusted ports forward response messages from the DHCP server to the clients. The untrusted ports connected to unauthorized DHCP servers discard incoming DHCP response messages.

You can execute this command multiple times in a VLAN to configure multiple trusted ports in the VLAN.

Make sure the specified interface is in the VLAN for which the **dhcp snooping enable vlan** command is configured.

Examples

Configure GigabitEthernet 1/0/1 as a trusted port in VLAN 1.

```
<Sysname> system-view
[Sysname] vlan 1
[Sysname-vlan 1] dhcp snooping trust interface gigabitethernet 1/0/1
```

Related commands

display dhcp snooping trust

display dhcp snooping binding

Use **display dhcp snooping binding** to display DHCP snooping entries.

Syntax

display dhcp snooping binding [**ip** *ip-address* [**vlan** *vlan-id*]] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip *ip-address*: Displays the DHCP snooping entry for the specified IP address.

vlan *vlan-id*: Specifies the VLAN ID where the IP address resides.

verbose: Displays detailed DHCP snooping entry information. If you do not specify this keyword, the command displays brief DHCP snooping entry information.

Usage guidelines

If you do not specify any parameters, this command displays all DHCP snooping entries.

Examples

Display summary information about all DHCP snooping entries.

```
<Sysname> display dhcp snooping binding
 2 DHCP snooping entries found
 IP address      MAC address    Lease        VLAN  SVLAN Interface
 =============== ============== ============ ===== ===== =================
 1.1.1.7         0000-0101-0107 16907533     2     3     GE1/0/1
 1.1.1.11        0000-0101-010b 16907537     2     3     GE1/0/3
```

Display detailed information about all DHCP snooping entries.

```
<Sysname> display dhcp snooping binding verbose
 IP address: 1.1.1.7
 MAC address: 0000-0101-0107
 Lease: 16907553 seconds
 VLAN: 2
 SVLAN: 3
 Interface: GigabitEthernet1/0/1
 Parameter request list: 03 06 21

 IP address: 1.1.1.104
 MAC address: 0000-0101-010b
 Lease: 16907537 seconds
 VLAN: 2
 SVLAN: 3
 Interface: GigabitEthernet1/0/3
```

```
Parameter request list: 37 0B 01 0F 03 06 2C 2E 2F 1F 21 F9 2B
```

Table 15 Command output

Field	Description
DHCP snooping entries found	Number of DHCP snooping entries.
IP address	IP address assigned to the DHCP client.
MAC address	MAC address of the DHCP client.
Lease	Remaining lease duration in seconds.
VLAN	When both DHCP snooping and QinQ are enabled or the DHCP packet contains two VLAN tags, this field identifies the outer VLAN tag. Otherwise, it identifies the VLAN where the port connecting the DHCP client resides.
SVLAN	When both DHCP snooping and QinQ are enabled or the DHCP packet contains two VLAN tags, this field identifies the inner VLAN tag. Otherwise, it displays **N/A**.
Interface	Port connected to the DHCP client.
Parameter request list	Parameters that the DHCP client requests, in hexadecimal notation.

Related commands

dhcp snooping enable

reset dhcp snooping binding

display dhcp snooping binding database

Use **display dhcp snooping binding database** to display information about DHCP snooping entry auto backup.

Syntax

display dhcp snooping binding database

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information about DHCP snooping entry auto backup.

```
<Sysname> display dhcp snooping binding database
File name               :   database.dhcp
Username                :
Password                :
Update interval         :   600 seconds
Latest write time       :   Feb 27 18:48:04 2012
Status                  :   Last write succeeded.
```

Table 16 Command output

Field	Description
File name	Name of the DHCP snooping entry backup file.
Username	Username for accessing the URL of the remote backup file.
Password	Password for accessing the URL of the remote backup file. This field displays ********** if a password is configured.
Update interval	Waiting time in seconds after a DHCP snooping entry change for the DHCP snooping device to update the backup file.
Latest write time	Time of the latest update.
Status	Status of the update: • **Writing**—The backup file is being updated. • **Last write succeeded**—The backup file was successfully updated. • **Last write failed**—The backup file failed to be updated.

display dhcp snooping information

Use **display dhcp snooping information** to display Option 82 configuration on the DHCP snooping device.

Syntax

display dhcp snooping information { **all** | **interface** *interface-type interface-number* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Displays Option 82 configuration on all Layer 2 Ethernet interfaces.

interface *interface-type interface-number*: Specifies an interface by its type and number.

Examples

Display Option 82 configuration on all interfaces.

```
<Sysname> display dhcp snooping information all
Interface: Bridge-Aggregation1
   Status: Disable
   Strategy: Drop
   Circuit ID:
     Padding format: User Defined
       User defined: abcd
     Format: ASCII
   Remote ID:
     Padding format: Normal
     Format: ASCII
```

```
Vendor-specific:
  Padding format: BAS
  Node identifier: MAC
VLAN 10:
  Circuit ID: abcd
  Remote ID: company
  Vendor-specific:
    Padding format: BAS
    Node identifier: User defined(abcd)
```

Table 17 Command output

Field	Description
Interface	Interface name.
Status	Option 82 status, **Enable** or **Disable**.
Strategy	Handling strategy for DHCP requests that contain Option 82, **Drop**, **Keep**, or **Replace**.
Circuit ID	Content of the Circuit ID sub-option.
Padding format	Padding format of Option 82: • For Circuit ID sub-option, the padding format can be Normal, **Normal-extented**, **User Defined**, **Verbose (sysname)**, **Verbose (MAC)**, or **Verbose (user defined)**. • For Remote ID sub-option, the padding format can be **Normal**, **Sysname**, or **User Defined**. • For Vendor-Specific sub-option, the padding format is **BAS**.
Node identifier	Access node identifier. • For the Circuit ID sub-option, this field displays the user-defined node identifier string. • For the Remote ID sub-option, this field displays the user-defined string. • For the Vendor-Specific sub-option, the node identifier can be **MAC**, **Sysname**, or **User Defined(string)**, where **string** in the brackets indicates the user-defined node identifier.
User defined	Content of the user-defined sub-option.
Format	Code type of Option 82 sub-option: • For Circuit ID sub-option, the code type can be **ASCII**, **Default**, or **Hex**. • For Remote ID sub-option, the code type can be **ASCII** or **Hex**.
Remote ID	Content of the Remote ID sub-option.
Vendor-specific	Content of the Vendor-Specific sub-option. This field is displayed only when the Vendor-Specific sub-option is configured.
VLAN	Pads Circuit ID, Remote ID, and Vendor-Specific sub-options in the DHCP packets received in the specified VLAN.

display dhcp snooping packet statistics

Use **display dhcp snooping packet statistics** to display DHCP packet statistics for DHCP snooping.

Syntax

display dhcp snooping packet statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DHCP packet statistics for the master device.

Examples

Display DHCP packet statistics for DHCP snooping.

```
<Sysname> display dhcp snooping packet statistics
 DHCP packets received                  : 100
 DHCP packets sent                      : 200
 Invalid DHCP packets dropped           : 0
```

Related commands

reset dhcp snooping packet statistics

VSI name                                Tunnel trusted
============================            ==============
a                                       Trusted

AC                                      Trusted
============================            ============
GE1/0/1 srv 1                           Trusted
```

Table 18 Command output

Field	Description
Interface	Interface name.
Trusted	For a DHCP snooping trusted port specified in the global DHCP snooping configuration, this field displays **Trusted**. For a trusted port specified in VLAN-based DHCP snooping configuration, this field displays a hyphen (**-**).
VLAN	VLAN to which the trusted port belongs. If the trusted port is specified in global DHCP snooping configuration, this field displays a hyphen (**-**).
VSI name	This field is not supported in the current software version. VSI name of the VXLAN tunnel interface. This field is available when you configure the tunnel interface assigned to the VSI as a DHCP snooping trusted interface by using the **dhcp snooping trust tunnel** command.
Tunnel trusted	This field is not supported in the current software version. Trusted tunnel interface specified in VXLAN-based DHCP snooping configuration.
AC	This field is not supported in the current software version. AC name, which is indicated by the interface name and Ethernet service instance name. This field is available when you configure the AC as the DHCP snooping trusted interface by using the **dhcp snooping trust** command in Ethernet service instance view.
Trusted	This field is not supported in the current software version. Trusted AC specified in VXLAN-based DHCP snooping configuration.

reset dhcp snooping binding

Use **reset dhcp snooping binding** to clear DHCP snooping entries.

Syntax

reset dhcp snooping binding { **all** | **ip** *ip-address* [**vlan** *vlan-id*] }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears all DHCP snooping entries.

ip *ip-address*: Clears the DHCP snooping entry for the specified IP address.

vlan *vlan-id*: Clears DHCP snooping entries for the specified VLAN. If you do not specify a VLAN, this command clears DHCP snooping entries for the default VLAN.

Examples

Clear all DHCP snooping entries.

```
<Sysname> reset dhcp snooping binding all
```

Related commands

display dhcp snooping binding

reset dhcp snooping packet statistics

Use **reset dhcp snooping packet statistics** to clear DHCP packet statistics for DHCP snooping.

Syntax

reset dhcp snooping packet statistics [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears DHCP packet statistics for the master device.

Examples

Clear DHCP packet statistics for DHCP snooping.

```
<Sysname> reset dhcp snooping packet statistics
```

BOOTP client commands

display bootp client

Use **display bootp client** to display information about a BOOTP client.

Syntax

display bootp client [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays BOOTP client information on all interfaces.

Examples

Display BOOTP client information on VLAN-interface 10.

```
<Sysname> display bootp client interface vlan-interface 10
Vlan-interface10 BOOTP client information:
Allocated IP: 169.254.0.2 255.255.0.0
Transaction ID: 0x3d8a7431
MAC Address: 00e0-fc0a-c3ef
```

Table 19 Command output

Field	Description
BOOTP client information	Information about the interface that acts as a BOOTP client.
Allocated IP	BOOTP client's IP address allocated by the BOOTP server.
Transaction ID	Value of the **XID** field in a BOOTP message. The BOOTP client chooses a random number for the **XID** field when sending a BOOTP request to the BOOTP server. It is used to match a response message from the BOOTP server. If the values of the **XID** field are different in the BOOTP response and request, the BOOTP client drops the BOOTP response.
Mac Address	MAC address of a BOOTP client.

Related commands

DNS commands

display dns domain

Use **display dns domain** to display the domain name suffixes.

Syntax

display dns domain [**dynamic**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

dynamic: Displays the domain name suffixes dynamically obtained through DHCP or other protocols. If you do not specify this keyword, the command displays the statically configured and dynamically obtained domain name suffixes.

Examples

Display the statically configured and dynamically obtained domain name suffixes for the public network.

```
<Sysname> display dns domain
Type:
  D: Dynamic    S: Static

No.     Type    Domain suffix
1       S       com
2       D       net
```

Table 1 Command output

Field	Description
No.	Sequence number.
Type	Domain name suffix type: • **S**—A statically configured domain name suffix. • **D**—A domain name suffix dynamically obtained through DHCP or other protocols.
Domain suffix	Domain name suffixes.

Related commands

dns domain

display dns host

Use **display dns host** to display information about domain name-to-IP address mappings.

Syntax

display dns host [**ip** | **ipv6**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip: Specifies type A queries. A type A query resolves a domain name to the mapped IPv4 address.

ipv6: Specifies type AAAA queries. A type AAAA query resolves a domain name to the mapped IPv6 address.

Usage guidelines

If you do not specify the **ip** or **ipv6** keyword, this command displays domain name-to-IP address mappings of all query types.

Examples

Display domain name-to-IP address mappings of all query types.

```
<Sysname> display dns host
Type:
  D: Dynamic    S: Static

Total number: 3
No.  Host name         Type  TTL        Query type   IP addresses
1    sample.com        D     3132       A            192.168.10.1
                                                     192.168.10.2
                                                     192.168.10.3
2    zig.sample.com    S     -          A            192.168.1.1
3    sample.net        S     -          AAAA         FE80::4904:4448
```

Table 2 Command output

Field	Description
No.	Sequence number.
Host name	Domain name.
Type	Domain name-to-IP address mapping type: • **S**—A static mapping configured by the **ip host** or **ipv6 host** command. • **D**—A mapping dynamically obtained through dynamic domain name resolution.
TTL	Time in seconds that a mapping can be stored in the cache. For a static mapping, a hyphen (-) is displayed.
Query type	Query type: A and AAAA.
IP addresses	Replied IP address: • For a type A query, the replied IP address is an IPv4 address. • For a type AAAA query, the replied IP address is an IPv6 address.

Predefined user roles

network-admin

network-operator

Parameters

dynamic: Displays IPv4 DNS server information dynamically obtained through DHCP or other protocols. If you do not specify this keyword, the command displays statically configured and dynamically obtained IPv4 DNS server information.

Examples

Display IPv4 DNS server information for the public network.

```
<Sysname> display dns server
Type:
  D: Dynamic    S: Static

No. Type  IP address
1   S     202.114.0.124
2   S     169.254.65.125
```

Table 3 Command output

Field	Description
No.	Sequence number.
Type	DNS server type: • **S**—A manually configured DNS server. • **D**—DNS server information dynamically obtained through DHCP or other protocols.
IP address	IPv4 address of the DNS server.

Related commands

dns server

display ipv6 dns server

Use **display ipv6 dns server** to display IPv6 DNS server information.

Syntax

display ipv6 dns server [**dynamic**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

dynamic: Displays IPv6 DNS server information dynamically obtained through DHCP or other protocols. If you do not specify this keyword, the command displays the statically configured and dynamically obtained IPv6 DNS server information.

Examples

Display IPv6 DNS server information for the public network.

```
<Sysname> display ipv6 dns server
Type:
  D: Dynamic    S: Static

No. Type  IPv6 address                              Outgoing Interface
1   S     2::2
```

Table 4 Command output

Field	Description
No.	Sequence number.
Type	DNS server type: • **S**—A manually configured DNS server. • **D**—DNS server information dynamically obtained through DHCP or other protocols.
IPv6 address	IPv6 address of the DNS server.
Outgoing Interface	Output interface.

Related commands

ipv6 dns server

dns domain

Use **dns domain** to configure a domain name suffix.

Use **undo dns domain** to delete the specified domain name suffix.

Syntax

dns domain *domain-name*

undo dns domain *domain-name*

Default

No domain name suffix is configured. Only the provided domain name is resolved.

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a domain name suffix. It is a dot-separated, case-insensitive string that can include letters, digits, hyphens (-), underscores (_), and dots (.), for example, aabbcc.com. The domain name suffix can include a maximum of 253 characters, and each separated string includes no more than 63 characters.

Usage guidelines

For domain name resolution, the resolver automatically uses the suffix list to supply the missing part of an incomplete name entered by a user.

A domain name suffix applies to both IPv4 DNS and IPv6 DNS.

The system allows a maximum of 16 domain name suffixes for the public network.

Examples

Configure domain name suffix **com** for the public network.

```
<Sysname> system-view
[Sysname] dns domain com
```

Related commands

display dns domain

dns dscp

Use **dns dscp** to set the DSCP value for DNS packets sent by a DNS client or DNS proxy.

Use **undo dns dscp** to restore the default.

Syntax

dns dscp *dscp-value*

undo dns dscp

Default

The DSCP value is 0 in DNS packets sent by a DNS client or DNS proxy.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for outgoing DNS packets.

```
<Sysname> system-view
[Sysname] dns dscp 30
```

dns proxy enable

Use **dns proxy enable** to enable DNS proxy.

Use **undo dns proxy enable** to disable DNS proxy.

Syntax

dns proxy enable

undo dns proxy enable

Default

DNS proxy is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This configuration applies to both IPv4 DNS and IPv6 DNS.

Examples

Enable DNS proxy.

```
<Sysname> system-view
[Sysname] dns proxy enable
```

dns server

Use **dns server** to specify the IPv4 address of a DNS server.

Use **undo dns server** to remove the IPv4 address of a DNS server.

Syntax

dns server *ip-address*

undo dns server [*ip-address*]

Default

In versions earlier than Release 6348P01, in the factory-default settings, no DNS server IPv4 address is specified.

In Release 6348P01 and later:

- In the initial configuration, no DNS server address is specified.
- In the factory-default settings, a DNS server with IP address 114.114.114.114 is specified.

For more information about the initial configuration and factory-default settings, see configuration file management in *Fundamentals Configuration Guide*.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IPv4 address of a DNS server.

Usage guidelines

The device sends a DNS query request to the DNS servers in the order their IPv4 addresses are specified.

The system allows a maximum of six DNS server IPv4 addresses for the public network.

If you do not specify an IPv4 address, the **undo dns server** command removes all DNS server IPv4 addresses for the public network.

Examples

Specify DNS server IPv4 address 172.16.1.1.

```
<Sysname> system-view
[Sysname] dns server 172.16.1.1
```

Related commands

display dns server

dns source-interface

Use **dns source-interface** to specify the source interface for DNS packets.

Use **undo dns source-interface** to restore the default.

Syntax

dns source-interface *interface-type interface-number*

undo dns source-interface *interface-type interface-number*

Default

No source interface is specified for DNS packets. The device uses the primary IP address of the output interface of the matching route as the source IP address for a DNS request.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

This configuration applies to both IPv4 and IPv6.

In IPv4 DNS, the device uses the primary IPv4 address of the specified source interface as the source IP address of a DNS query. In IPv6 DNS, the device selects an IPv6 address of the specified source interface as the source IP address of a DNS query. The method of selecting the IPv6 address is defined in RFC 3484.

The system allows only one source interface for the public network. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify VLAN-interface 2 as the source interface for DNS packets on the public network.

```
<Sysname> system-view
[Sysname] dns source-interface vlan-interface 2
```

dns spoofing

Use **dns spoofing** to enable DNS spoofing and specify the IPv4 address for spoofing DNS requests.

Use **undo dns spoofing** to disable DNS spoofing.

Syntax

dns spoofing *ip-address*

undo dns spoofing *ip-address*

Default

DNS spoofing is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IPv4 address used to spoof DNS requests.

Usage guidelines

Use the **dns spoofing** command together with the **dns proxy enable** command.

DNS spoofing functions when the DNS proxy does not know the DNS server address or cannot reach the DNS server. It enables the DNS proxy to spoof DNS queries of type A by responding with the specified IPv4 address.

The system allows only one replied IPv4 address for the public network. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Enable DNS spoofing for the public network and specify IPv4 address 1.1.1.1 for spoofing DNS requests.

```
<Sysname> system-view
[Sysname] dns proxy enable
[Sysname] dns spoofing 1.1.1.1
```

Related commands

dns proxy enable

dns trust-interface

Use **dns trust-interface** to specify a DNS trusted interface.

Use **undo dns trust-interface** to remove a DNS trusted interface.

Syntax

dns trust-interface *interface-type interface-number*

undo dns trust-interface [*interface-type interface-number*]

Default

No DNS trusted interface is specified.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

By default, an interface obtains DNS suffix and DNS server information from DHCP. A network attacker might act as the DHCP server to assign a wrong DNS suffix and DNS server address to the device. As a result, the device fails to obtain the resolved IP address or might get the wrong IP address. With the DNS trusted interface specified, the device only uses the DNS suffix and DNS server information obtained through the trusted interface to avoid attacks.

This configuration applies to both IPv4 DNS and IPv6 DNS.

You can configure a maximum of 128 DNS trusted interfaces on the device.

If you do not specify an interface, the **undo dns trust-interface** command removes all DNS trusted interfaces and restores the default.

Examples

Specify VLAN-interface 2 as a DNS trusted interface.

```
<Sysname> system-view
[Sysname] dns trust-interface vlan-interface 2
```

ip host

Use **ip host** to create a host name-to-IPv4 address mapping.

Use **undo ip host** to remove a host name-to-IPv4 address mapping.

Syntax

ip host *host-name ip-address*

undo ip host *host-name ip-address*

Default

No host name-to-IPv4 address mappings exist.

Views

System view

Predefined user roles

network-admin

Parameters

host-name: Specifies a host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, hyphens (-), underscores (_), and dots (.).

ip-address: Specifies the IPv4 address of the host.

Usage guidelines

The system allows a maximum of 1024 host name-to-IPv4 address mappings for the public network.

For the public network, each host name maps to only one IPv4 address. If you execute this command multiple times, the most recent configuration takes effect.

Do not use the **ping** command parameter **ip**, **-a**, **-c**, **-f**, **-h**, **-i**, **-m**, **-n**, **-p**, **-q**, **-r**, **-s**, **-t**, **-tos**, **-v**, or **-vpn-instance** as the host name. For more information about the **ping** command parameters, see *Network Management and Monitoring Command Reference*.

Examples

Map IPv4 address 10.110.0.1 to host name **aaa** for the public network.

```
<Sysname> system-view
[Sysname] ip host aaa 10.110.0.1
```

Related commands

display dns host

ipv6 dns dscp

Use **ipv6 dns dscp** to set the DSCP value for IPv6 DNS packets sent by an IPv6 DNS client or IPv6 DNS proxy.

Use **undo ipv6 dns dscp** to restore the default.

Syntax

ipv6 dns dscp *dscp-value*

undo ipv6 dns dscp

Default

The DSCP value is 0 in IPv6 DNS packets sent by an IPv6 DNS client or IPv6 DNS proxy.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for outgoing IPv6 DNS packets.

```
<Sysname> system-view
[Sysname] ipv6 dns dscp 30
```

ipv6 dns server

Use **ipv6 dns server** to specify the IPv6 address of a DNS server.

Use **undo ipv6 dns server** to remove the IPv6 address of a DNS server.

Syntax

ipv6 dns server *ipv6-address* [*interface-type interface-number*]

undo ipv6 dns server [*ipv6-address* [*interface-type interface-number*]]

Default

No DNS server IPv6 address is specified.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of a DNS server.

interface-type interface-number: Specifies the output interface by its type and number. If you do not specify an interface, the device forwards DNS packets out of the output interface of the matching route. Specify this argument if the IPv6 address of the DNS server is a link-local address. Do not specify this argument if the IPv6 address of the DNS server is a global unicast address.

Usage guidelines

For dynamic DNS, the device sends a DNS query request to the DNS servers in the order their IPv6 addresses are specified.

The system allows a maximum of six DNS server IPv6 addresses for the public network.

If you do not specify an IPv6 address, the **undo ipv6 dns server** command removes all DNS server IPv6 addresses for the public network.

Examples

Specify DNS server IPv6 address 2002::1 for the public network.

```
<Sysname> system-view
[Sysname] ipv6 dns server 2002::1
```

Related commands

display ipv6 dns server

ipv6 dns spoofing

Use **ipv6 dns spoofing** to enable DNS spoofing and specify the IPv6 address to spoof DNS requests.

Use **undo ipv6 dns spoofing** to disable DNS spoofing.

Syntax

ipv6 dns spoofing *ipv6-address*

undo ipv6 dns spoofing *ipv6-address*

Default

DNS spoofing is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address used to spoof DNS requests.

Usage guidelines

Use the **ipv6 dns spoofing** command together with the **dns proxy enable** command.

DNS spoofing functions when the DNS proxy does not know the DNS server address or cannot reach the DNS server. It enables the DNS proxy to spoof DNS queries of type AAAA by responding with the specified IPv6 address.

The system allows only one replied IPv6 address for the public network. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Enable DNS spoofing for the public network and specify IPv6 address 2001::1 for spoofing DNS requests.

```
<Sysname> system-view
[Sysname] dns proxy enable
[Sysname] ipv6 dns spoofing 2001::1
```

Related commands

dns proxy enable

ipv6 host

Use **ipv6 host** to create a host name-to-IPv6 address mapping.

Use **undo ipv6 host** to remove a host name-to-IPv6 address mapping.

Syntax

ipv6 host *host-name ipv6-address*

undo ipv6 host *host-name ipv6-address*

Default

No host name-to-IPv6 address mappings exist.

Views

System view

Predefined user roles

network-admin

Parameters

host-name: Specifies a host name, a case-insensitive string of 1 to 253 characters. It can include letters, digits, hyphens (-), underscores (_), and dots (.).

ipv6-address: Specifies the IPv6 address of the host.

Usage guidelines

The system allows a maximum of 1024 host name-to-IPv6 address mappings for the public network.

For the public network, each host name maps to only one IPv6 address. If you execute this command multiple times, the most recent configuration takes effect.

Do not use the **ping ipv6** command parameter **-a**, **-c**, **-i**, **-m**, **-q**, **-s**, **-t**, **-tc**, **-v**, or **-vpn-instance** as the host name. For more information about the **ping ipv6** command parameters, see *Network Management and Monitoring Command Reference*.

Examples

Map IPv6 address 2001::1 to host name **aaa** for the public network.

```
<Sysname> system-view
[Sysname] ipv6 host aaa 2001::1
```

Related commands

ip host

reset dns host

Use **reset dns host** to clear dynamic DNS entries.

Syntax

reset dns host [**ip** | **ipv6**]

Views

User view

Predefined user roles

network-admin

Parameters

ip: Specifies type A queries. A type A query resolves a domain name to the mapped IPv4 address.

ipv6: Specifies type AAAA queries. A type AAAA query resolves a domain name to the mapped IPv6 address.

Usage guidelines

If you do not specify the **ip** or **ipv6** keyword, the **reset dns host** command clears dynamic DNS entries of all query types.

Examples

Clear dynamic DNS entries of all query types for the public network.

```
<Sysname> reset dns host
```

Related commands

display dns host

Basic IP forwarding commands

display fib

Use **display fib** to display FIB entries.

Syntax

display fib [*ip-address* [*mask* | *mask-length*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip-address: Displays the FIB entry that matches the specified destination IP address.

mask: Specifies the mask for the IP address.

mask-length: Specifies the mask length for the IP address. The value range is 0 to 32.

Usage guidelines

If you specify an IP address without a mask or mask length, this command displays the longest matching FIB entry.

If you specify an IP address and a mask or mask length, this command displays the exactly matching FIB entry.

Examples

Display all FIB entries of the public network.

```
<Sysname> display fib

Destination count: 5 FIB entry count: 5

Flag:
  U:Usable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Relay     F:FRR

Destination/Mask   Nexthop         Flag     OutInterface/Token       Label
0.0.0.0/32         127.0.0.1       UH       InLoop0                  Null
1.1.1.0/24         192.168.126.1   USGF     M-GE0/0/0                Null
127.0.0.0/8        127.0.0.1       U        InLoop0                  Null
127.0.0.0/32       127.0.0.1       UH       InLoop0                  Null
127.0.0.1/32       127.0.0.1       UH       InLoop0                  Null
```

Display the FIB entries matching the destination IP address 10.2.1.1.

```
<Sysname> display fib 10.2.1.1

Destination count: 1 FIB entry count: 1
```

```
Flag:
  U:Usable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Relay     F:FRR

Destination/Mask   Nexthop         Flag     OutInterface/Token       Label
10.2.1.1/32        127.0.0.1       UH       InLoop0                  Null
```

Table 1 Command output

Field	Description
Destination count	Total number of destination addresses.
FIB entry count	Total number of FIB entries.
Destination/Mask	Destination address and the mask length.
Nexthop	Next hop address.
Flag	Flags of routes: • **U**—Usable route. • **G**—Gateway route. • **H**—Host route. • **B**—Blackhole route. • **D**—Dynamic route. • **S**—Static route. • **R**—Relay route. • **F**—Fast reroute.
OutInterface/Token	Output interface/LSP index number.
Label	Inner label.

ip forwarding-table save

Use **ip forwarding-table save** to save the IP forwarding entries to a file.

Syntax

ip forwarding-table save filename *filename*

Views

Any view

Predefined user roles

network-admin

Parameters

filename *filename*: Specifies the name of a file, a string of 1 to 255 characters. For information about the *filename* argument, see file system management in *Fundamentals Configuration Guide*.

Usage guidelines

The command automatically creates the file if you specify a nonexistent file. If the file already exists, this command overwrites the file content.

To automatically save the IP forwarding entries periodically, configure a schedule for the device to automatically run the **ip forwarding-table save** command. For information about scheduling a task, see *Fundamentals Configuration Guide*.

Examples

Save the IP forwarding entries to the **fib.txt** file.

```
<Sysname> ip forwarding-table save filename fib.txt
```

Contents

display ip fast-forwarding cache

Use **display ip fast-forwarding cache** to display fast forwarding entries.

Syntax

display ip fast-forwarding cache [*ip-address*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip-address: Specifies an IP address. If you do not specify an IP address, this command displays all fast forwarding entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays fast forwarding entries for all member devices.

Examples

Display all fast forwarding entries.

```
<Sysname> display ip fast-forwarding cache
Total number of fast-forwarding entries: 1
SIP            SPort DIP            DPort Pro Input_If   Output_If   Flg
7.0.0.13       68    8.0.0.1        67    17  GE1/0/3    GE1/0/1     5
```

Table 1 Command output

Field	Description
SIP	Source IP address.
SPort	Source port number.
DIP	Destination IP address.
DPort	Destination port number.
Pro	Protocol number.
Input_If	Input interface type and number. If no interface is involved in fast forwarding, this field displays **N/A**. If the input interface does not exist, this field displays a hyphen (-).
Output_If	Output interface type and number. If no interface is involved in fast forwarding, this field displays **N/A**. If the output interface does not exist, this field displays a hyphen (-).
Flg	Internal tag, marking internal operation information, such as fragmentation.

Related commands

`reset ip fast-forwarding cache`

display ip fast-forwarding fragcache

Use **`display ip fast-forwarding fragcache`** to display fast forwarding entries for fragmented packets.

Syntax

`display ip fast-forwarding fragcache` [*`ip-address`*] [**`slot`** *`slot-number`*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`ip-address`: Specifies an IP address. If you do not specify an IP address, this command displays fast forwarding entries for all fragmented packets.

`slot` *`slot-number`*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays fast forwarding entries for fragmented packets on all member devices.

Examples

Display fast forwarding entries about all fragmented packets.

```
<Sysname> display ip fast-forwarding fragcache
Total number of fragment fast-forwarding entries: 1
SIP             SPort DIP             DPort Pro Input_If    ID
```

```
7.0.0.13        68    8.0.0.1         67    17  GE1/0/3     2
```

Table 2 Command output

Field	Description
SIP	Source IP address.
SPort	Source port number.
DIP	Destination IP address.
DPort	Destination port number.
Pro	Protocol number.
Input_If	Input interface type and number. If no interface is involved in fast forwarding, this field displays **N/A**. If the input interface does not exist, this field displays a hyphen (-).
ID	Fragment ID.

Related commands

`reset ip fast-forwarding cache`

ip fast-forwarding aging-time

Use **`ip fast-forwarding aging-time`** to configure the aging time for fast forwarding entries.

Use **`undo ip fast-forwarding aging-time`** to restore the default.

Syntax

`ip fast-forwarding aging-time` *`aging-time`*

`undo ip fast-forwarding aging-time`

Default

The aging time is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

`aging-time`: Specifies the aging time in the range of 10 to 300 seconds.

Examples

Set the aging time to 20 seconds for fast forwarding entries.

```
<Sysname> system-view
[Sysname] ip fast-forwarding aging-time 20
```

Related commands

`display ip fast-forwarding aging-time`

ip fast-forwarding load-sharing

Use **ip fast-forwarding load-sharing** to enable fast forwarding load sharing.

Use **undo ip fast-forwarding load-sharing** to disable fast forwarding load sharing.

Syntax

ip fast-forwarding load-sharing

undo ip fast-forwarding load-sharing

Default

Fast forwarding load sharing is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Fast forwarding load sharing enables the device to load share packets of the same flow. This feature identifies a data flow by using the packet information.

If fast forwarding load sharing is disabled, the device identifies a data flow by the packet information and the input interface. No load sharing is implemented.

Examples

Enable fast forwarding load sharing.

```
<Sysname> system-Views
[Sysname] ip fast-forwarding load-sharing
```

reset ip fast-forwarding cache

Use **reset ip fast-forwarding cache** to clear the fast forwarding table.

Syntax

reset ip fast-forwarding cache [**slot** *slot-number*]

Views

User view

Predefined use roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears the fast forwarding table for all member devices.

Examples

Clear the fast forwarding table.

```
<Sysname> reset ip fast-forwarding cache
```

display ip statistics

Use **display ip statistics** to display IP packet statistics.

Syntax

display ip statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IP packet statistics for all member devices.

Usage guidelines

IP statistics include information about received and sent packets, fragments, and reassembly.

Examples

Display IP packet statistics.

```
<Sysname> display ip statistics
  Input:   sum            7120            local            112
           bad protocol   0               bad format       0
           bad checksum   0               bad options      0
  Output:  forwarding     0               local            27
           dropped        0               no route         2
           compress fails 0
  Fragment:input          0               output           0
           dropped        0
           fragmented     0               couldn't fragment 0
  Reassembling:sum        0               timeouts         0
```

Table 1 Command output

Field	Description
Input	Statistics about received packets: • **sum**—Total number of packets received. • **local**—Total number of packets destined for the device. • **bad protocol**—Total number of unknown protocol packets. • **bad format**—Total number of packets with incorrect format. • **bad checksum**—Total number of packets with incorrect checksum. • **bad options**—Total number of packets with incorrect option.
Output	Statistics about sent packets: • **forwarding**—Total number of packets forwarded. • **local**—Total number of packets locally sent. • **dropped**—Total number of packets discarded. • **no route**—Total number of packets for which no route is available. • **compress fails**—Total number of packets failed to be compressed.

Field	Description
Fragment	Statistics about fragments: • **input**—Total number of fragments received. • **output**—Total number of fragments sent. • **dropped**—Total number of fragments dropped. • **fragmented**—Total number of packets successfully fragmented. • **couldn't fragment**—Total number of packets failed to be fragmented.
Reassembling	Statistics about reassembly: • **sum**—Total number of packets reassembled. • **timeouts**—Total number of reassembly timeouts.

display rawip

Use **display rawip** to display brief information about RawIP connections.

Syntax

display rawip [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about RawIP connections for all member devices.

Usage guidelines

Brief RawIP connection information includes local and peer addresses, protocol, and PCB.

Examples

Display brief information about RawIP connections.

```
<Sysname> display rawip
 Local Addr       Foreign Addr     Protocol  Slot   PCB
 0.0.0.0          0.0.0.0          1         1      0x0000000000000009
 0.0.0.0          0.0.0.0          1         1      0x0000000000000008
```

Table 2 Command output

Field	Description
Local Addr	Local IP address.
Foreign Addr	Peer IP address.
Protocol	Protocol number.

Field	Description
PCB	Protocol control block.

display rawip verbose

Use **display rawip verbose** to display detailed information about RawIP connections.

Syntax

display rawip verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed RawIP connection information for the specified PCB. The *pcb-index* argument specifies the index of the PCB. The index is a hexadecimal string in the range of 1 to ffffffffffffffff.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about RawIP connections for all member devices.

Usage guidelines

The detailed information includes socket creator, state, option, type, protocol number, and the source and destination IP addresses of RawIP connections.

Examples

Display detailed information about RawIP connections.

```
<Sysname> display rawip verbose
Total RawIP socket number: 1

 Connection info: src = 0.0.0.0, dst = 0.0.0.0
 Location: slot 6 cpu 0
 Creator: ping[320]
 State: N/A
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/drop/state): 0 / 9216 / 1 / 0 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 9216 / 512 / N/A
 Type: 3
 Protocol: 1
 Inpcb flags: N/A
 Inpcb extflag: INP_EXTRCVICMPERR INP_EXTFILTER
 Inpcb vflag: INP_IPV4
 TTL: 255(minimum TTL: 0)
 Send VRF: 0xffff
 Receive VRF: 0xffff
```

Table 3 Command output

Field	Description
Total RawIP socket number	Total number of RawIP sockets.
Connection info	Connection information, including source IP address and destination IP address.
Location	Socket location. This field is not available on the centralized devices.
Creator	Name of the operation that created the socket. The number in brackets is the process number of the creator.
State	State of the socket.
Options	Socket options.
Error	Error code.

Receiving buffer (cc/hiwat/lowat/drop/state)	Displays receive buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **drop**—Number of dropped packets.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Sending buffer (cc/hiwat/lowat/state)	Displays send buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket.

Field	Description
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IP options. • **INP_RECVRETOPTS**—Receives replied IP options. • **INP_RECVDSTADDR**—Receives destination IP address. • **INP_HDRINCL**—Provides the entire IP header. • **INP_REUSEADDR**—Reuses the IP address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • I**NP_RECVIF**—Records the input interface of the packet. • **INP_RECVTTL**—Receives TTL of the packet. Only UDP and RawIP support this flag. • **INP_DONTFRAG**—Sets the **Don't Fragment** flag. • **INP_ROUTER_ALERT**—Receives packets with the router alert option. Only RawIP supports this flag. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_RECVTOS**—Receives TOS of the packet. Only UDP and RawIP support this flag. • **INP_USEICMPSRC**—Uses the specified IP address as the source IP address for outgoing ICMP packets. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **INP_EXTRCVICMPERR**—Receives an ICMP error packet. • **INP_EXTFILTER**—Filters the contents in the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
TTL	TTL value in the Internet PCB.
Send VRF	This field is not supported in the current software version. VRF from which packets are sent.
Receive VRF	This field is not supported in the current software version. VRF from which packets are received.

display tcp

Use **display tcp** to display brief information about TCP connections.

Syntax

display tcp [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about TCP connections for all member devices.

Usage guidelines

Brief TCP connection information includes local IP address, local port number, peer IP address, peer port number, and TCP connection state.

Examples

Display brief information about TCP connections.

```
<Sysname> display tcp
 *: TCP connection with authentication
 Local Addr:port       Foreign Addr:port     State       Slot  PCB
*0.0.0.0:21            0.0.0.0:0             LISTEN      1     0x000000000000c387
 192.168.20.200:23     192.168.20.14:1284    ESTABLISHED 1     0x0000000000000009
 192.168.20.200:23     192.168.20.14:1283    ESTABLISHED 1     0x0000000000000002
```

Table 4 Command output

Field	Description
*	Indicates that the TCP connection uses authentication.
Local Addr:port	Local IP address and port number.
Foreign Addr:port	Peer IP address and port number.
State	TCP connection state.
PCB	PCB index.

display tcp statistics

Use **display tcp statistics** to display TCP traffic statistics.

Syntax

display tcp statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays TCP traffic statistics for all member devices.

Usage guidelines

TCP traffic statistics include information about received and sent TCP packets and Syncache/syncookie.

Examples

Display TCP traffic statistics.

```
<Sysname> display tcp statistics
Received packets:
    Total: 4150
    packets in sequence: 1366 (134675 bytes)
    window probe packets: 0, window update packets: 0
    checksum error: 0, offset error: 0, short error: 0
    packets dropped for lack of memory: 0
    packets dropped due to PAWS: 0
    duplicate packets: 12 (36 bytes), partially duplicate packets: 0 (0 bytes)
    out-of-order packets: 0 (0 bytes)
    packets with data after window: 0 (0 bytes)
    packets after close: 0
    ACK packets: 3531 (795048 bytes)
    duplicate ACK packets: 33, ACK packets for unsent data: 0

Sent packets:
    Total: 4058
    urgent packets: 0
    control packets: 50
    window probe packets: 3, window update packets: 11
    data packets: 3862 (795012 bytes), data packets retransmitted: 0 (0 bytes)
    ACK-only packets: 150 (52 delayed)
    unnecessary packet retransmissions: 0

Syncache/syncookie related statistics:
    entries added to syncache: 12
    syncache entries retransmitted: 0
    duplicate SYN packets: 0
    reply failures: 0
    successfully build new socket: 12
    bucket overflows: 0
    zone failures: 0
    syncache entries removed due to RST: 0
    syncache entries removed due to timed out: 0
    ACK checked by syncache or syncookie failures: 0
    syncache entries aborted: 0
```

```
    syncache entries removed due to bad ACK: 0
    syncache entries removed due to ICMP unreachable: 0
    SYN cookies sent: 0
    SYN cookies received: 0

SACK related statistics:
    SACK recoveries: 1
    SACK retransmitted segments: 0 (0 bytes)
    SACK blocks (options) received: 0
    SACK blocks (options) sent: 0
    SACK scoreboard overflows: 0

Other statistics:
    retransmitted timeout: 0, connections dropped in retransmitted timeout: 0
    persist timeout: 0
    keepalive timeout: 21, keepalive probe: 0
    keepalive timeout, so connections disconnected: 0
    fin_wait_2 timeout, so connections disconnected: 0
    initiated connections: 29, accepted connections: 12, established connections:
23
    closed connections: 50051 (dropped: 0, initiated dropped: 0)
    bad connection attempt: 0
    ignored RSTs in the window: 0
    listen queue overflows: 0
    RTT updates: 3518(attempt segment: 3537)
    correct ACK header predictions: 0
    correct data packet header predictions: 568
    resends due to MTU discovery: 0
    packets dropped due to MD5 authentication failure: 0
    packets that passed MD5 authentication: 0
    sent Keychain-encrypted packets: 0
    packets that passed Keychain authentication: 0
    packets dropped due to Keychain authentication failure: 0
```

reset tcp statistics

display tcp verbose

Use **display tcp verbose** to display detailed information about TCP connections.

Syntax

display tcp verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed TCP connection information for the specified PCB. The index is a hexadecimal string in the range of 1 to ffffffffffffffff.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about TCP connections for all member devices.

Usage guidelines

The detailed TCP connection information includes socket creator, state, option, type, protocol number, source IP address and port number, destination IP address and port number, and connection state.

Examples

Display detailed information about TCP connections.

```
<Sysname> display tcp verbose
TCP inpcb number: 1(tcpcb number: 1)

 Connection info: src = 192.168.20.200:179 ,  dst = 192.168.20.14:4181
 Location: slot 6 cpu 0
 NSR standby: N/A
 Creator: bgpd[199]
 State: ISCONNECTED
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/state): 0 / 65700 / 1 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 65700 / 512 / N/A
 Type: 1
 Protocol: 6
 Inpcb flags: N/A
 Inpcb extflag: N/A
 Inpcb vflag: INP_IPV4
 TTL: 255(minimum TTL: 0)
 Connection state: ESTABLISHED
 TCP options: TF_REQ_SCALE TF_REQ_TSTMP TF_SACK_PERMIT TF_NSR
 NSR state: READY(M)
 Send VRF: 0x0
 Receive VRF: 0x0
```

Table 5 Command output

Field	Description
TCP inpcb number	Number of TCP IP PCBs.
Connection info	Connection information, including source IP address, source port number, destination IP address, and destination port number.
Location	Socket location. This field is not available on the centralized devices.
tcpcb number	Number of TCP PCBs. This field is not displayed if the state of the TCP connection is **TIME_WAIT**.
Creator	Name of the operation that created the socket. The number in brackets is the process number of the creator.

Field	Description
State	State of the socket.
Options	Socket options.
Error	Error code.

Receiving buffer (cc/hiwat/lowat/state)	Displays receive buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Sending buffer (cc/hiwat/lowat/state)	Displays send buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket.

Field	Description
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IP options. • **INP_RECVRETOPTS**—Receives replied IP options. • **INP_RECVDSTADDR**—Receives destination IP address. • **INP_HDRINCL**—Provides the entire IP header. • **INP_REUSEADDR**—Reuses the IP address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • I**NP_RECVIF**—Records the input interface of the packet. • **INP_RECVTTL**—Receives TTL of the packet. Only UDP and RawIP support this flag. • **INP_DONTFRAG**—Sets the **Don't Fragment** flag. • **INP_ROUTER_ALERT**—Receives packets with the router alert option. Only RawIP supports this flag. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_RECVTOS**—Receives TOS of the packet. Only UDP and RawIP support this flag. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **INP_EXTDONTDROP**—Does not drop the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
TTL	TTL value in the Internet PCB.

Field	Description
TCP options	TCP options: • **TF_MD5SIG**—Enables MD5 signature. • **TF_NODELAY**—Disables the Nagle algorithm that buffers the sent data inside the TCP. • **TF_NOOPT**—No TCP options. • **TF_NOPUSH**—Forces TCP to delay sending any TCP data until a full sized segment is buffered in the TCP buffers. • **TF_BINDFOREIGNADDR**—Binds the peer IP address. • **TF_NSR**—Enables TCP NSR. • **TF_REQ_SCALE**—Enables the TCP window scale option. • **TF_REQ_TSTMP**—Enables the time stamp option. • **TF_SACK_PERMIT**—Enables the TCP selective acknowledgement option. • **TF_ENHANCED_AUTH**—Enables the enhanced authentication option.
NSR state	State of the TCP connections. Between the parentheses is the role of the connection: • **M**—Main connection. • **S**—Standby connection.
Send VRF	This field is not supported in the current software version. VRF from which packets are sent.
Receive VRF	This field is not supported in the current software version. VRF from which packets are received.

display udp

Use **display udp** to display brief information about UDP connections.

Syntax

display udp [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about UDP connections for all member devices.

Usage guidelines

Brief UDP connection information includes local IP address and port number, and peer IP address and port number.

Examples

Display brief information about UDP connections.

```
<Sysname> display udp
```

```
Local Addr:port        Foreign Addr:port     Slot  PCB
0.0.0.0:69             0.0.0.0:0             1     0x0000000000000003
```

Table 6 Command output

Field	Description
Local Addr:port	Local IP address and port number.
Foreign Addr:port	Peer IP address and port number.
PCB	PCB index.

display udp statistics

Use **display udp statistics** to display UDP traffic statistics.

Syntax

display udp statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays UDP traffic statistics for all member devices.

Usage guidelines

UDP traffic statistics include information about received and sent UDP packets.

Examples

Display UDP traffic statistics.

```
<Sysname> display udp statistics
Received packets:
     Total: 240
     checksum error: 0, no checksum: 0
     shorter than header: 0, data length larger than packet: 0
     no socket on port(unicast): 0
     no socket on port(broadcast/multicast): 240
     not delivered, input socket full: 0
Sent packets:
     Total: 0
```

Related commands

reset udp statistics

display udp verbose

Use **display udp verbose** to display detailed information about UDP connections.

Syntax

display udp verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed UDP connection information for the specified PCB. The index is a hexadecimal string in the range of 1 to ffffffffffffffff.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about UDP connections for all member devices.

Usage guidelines

The detailed information includes socket creator, status, option, type, protocol number, source IP address and port number, and destination IP address and port number for UDP connections.

Examples

Display detailed UDP connection information.

```
<Sysname> display udp verbose
Total UDP socket number: 1

 Connection info: src = 0.0.0.0:69, dst = 0.0.0.0:0
 Location: slot 6 cpu 0
 Creator: sock_test_mips[250]
 State: N/A
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/drop/state): 0 / 41600 / 1 / 0 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 9216 / 512 / N/A
 Type: 2
 Protocol: 17
 Inpcb flags: N/A
 Inpcb extflag: N/A
 Inpcb vflag: INP_IPV4
 TTL: 255(minimum TTL: 0)
 Send VRF: 0xffff
 Receive VRF: 0xffff
```

Table 7 Command output

Field	Description
Total UDP socket number	Total number of UDP sockets.
Connection info	Connection information, including source IP address, source port number, destination IP address, and destination port number.
Location	Socket location. This field is not available on the centralized devices.

Field	Description
Creator	Name of the operation that created the socket. The number in brackets is the process number of the creator.
State	Socket state.
Options	Socket option.
Error	Error code.

Receiving buffer(cc/hiwat/lowat/drop/state)	Displays receive buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **drop**—Number of dropped packets.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Sending buffer(cc/hiwat/lowat/state)	Displays send buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket.

Field	Description
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IP options. • **INP_RECVRETOPTS**—Receives replied IP options. • **INP_RECVDSTADDR**—Receives destination IP address. • **INP_HDRINCL**—Provides the entire IP header. • **INP_REUSEADDR**—Reuses the IP address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • I**NP_RECVIF**—Records the input interface of the packet. • **INP_RECVTTL**—Receives TTL of the packet. Only UDP and RawIP support this flag. • **INP_DONTFRAG**—Sets the **Don't Fragment** flag. • **INP_ROUTER_ALERT**—Receives packets with the router alert option. Only RawIP supports this flag. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_RECVTOS**—Receives TOS of the packet. Only UDP and RawIP support this flag. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
TTL	TTL value in the Internet PCB.
Send VRF	This field is not supported in the current software version. VRF from which packets are sent.
Receive VRF	This field is not supported in the current software version. VRF from which packets are received.

ip forward-broadcast

Use **ip forward-broadcast** to enable an interface to forward directed broadcast packets destined for the directly connected network.

Use **undo ip forward-broadcast** to disable an interface from forwarding directed broadcast packets destined for the directly connected network.

Syntax

ip forward-broadcast [**acl** *acl-number*]

undo ip forward-broadcast

Default

An interface cannot forward directed broadcasts destined for the directly connected network.

Views

Interface view

Predefined user roles

network-admin

Parameters

acl *acl-number*: Specifies an ACL by its number. The interface forwards only the directed broadcasts permitted by the ACL. The value range for basic ACLs is 2000 to 2999. The value range for advanced ACLs is 3000 to 3999.

Usage guidelines

A directed broadcast packet is destined for all hosts on a specific network. In the destination IP address of the directed broadcast, the network ID identifies the target network, and the host ID is made up of all ones.

If an interface is allowed to forward directed broadcasts destined for the directly connected network, hackers can exploit this vulnerability to attack the target network. In some scenarios, however, an interface must send such directed broadcast packets to support UDP helper and Wake on LAN.

The command enables the interface to forward directed broadcast packets that are destined for the directly connected network and are received from another subnet to support Wake on LAN. Wake on LAN sends the directed broadcasts to wake up the hosts on the target network.

Examples

Enable VLAN-interface 2 to forward directed broadcast packets destined for the directly connected network.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ip forward-broadcast
```

ip icmp error-interval

Use **ip icmp error-interval** to set the interval for tokens to arrive in the bucket and the bucket size for ICMP error messages.

Use **undo ip icmp error-interval** to restore the default.

Syntax

ip icmp error-interval *interval* [*bucketsize*]

undo ip icmp error-interval

Default

A token is placed in the bucket every 100 milliseconds, and the bucket allows a maximum of 10 tokens.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval for tokens to arrive in the bucket. The value range is 0 to 2147483647 milliseconds. To disable the ICMP rate limit, set the value to 0.

bucketsize: Specifies the maximum number of tokens allowed in the bucket. The value range is 1 to 200.

Usage guidelines

This command limits the rate at which ICMP error messages are sent. Use this command to avoid sending excessive ICMP error messages within a short period that might cause network congestion. A token bucket algorithm is used with one token representing one ICMP error message.

A token is placed in the bucket at intervals until the maximum number of tokens that the bucket can hold is reached.

A token is removed from the bucket when an ICMP error message is sent. When the bucket is empty, ICMP error messages are not sent until a new token is placed in the bucket.

Examples

Set the interval to 200 milliseconds for tokens to arrive in the bucket and the bucket size to 40 tokens for ICMP error messages.

```
<Sysname> system-view
[Sysname] ip icmp error-interval 200 40
```

ip icmp receive enable

Use **ip icmp receive enable** to enable the device to receive a specific type of ICMP messages.

Use **undo ip icmp receive enable** to disable the device from receiving a specific type of ICMP messages.

NOTE:

This command is supported only in R6348P01 and later.

Syntax

ip icmp { **name** *icmp-name* | **type** *icmp-type* **code** *icmp-code* } **receive enable**

undo ip icmp { **name** *icmp-name* | **type** *icmp-type* **code** *icmp-code* } **receive enable**

Default

The device can receive all types of ICMP messages.

Views

System view

Predefined user roles

network-admin

Parameters

name *icmp-name*: Specifies an ICMP message name, a case-insensitive string of 1 to 20 characters.

type *icmp-type*: Specifies an ICMP message type. The value range for the *icmp-type* argument is 0 to 255.

code *icmp-code*: Specifies an ICMP message code. The value range for the *icmp-code* argument is 0 to 255.

Usage guidelines

CAUTION:

Disabling receiving ICMP messages of a specific type might affect network operation. Please use this feature with caution.

By default, the device receives all types of ICMP messages. Such a setting might affect device performance if a large number of ICMP responses are received within a short time. To solve this issue, you can use this command to disable the device from receiving a specific type of ICMP messages.

Table 8 shows common ICMP messages and their meanings.

Table 8 Common ICMP messages

Name	Type	Code	Description
echo	8	0	Echo request used to ping a target node.
echo-reply	0	0	Echo reply sent by a target node after receiving an echo request.
fragmentneed-dfset	3	4	Packets that need fragmentation but have the DF bit set.
host-redirect	5	1	Host redirection.
host-tos-redirect	5	3	Host ToS redirection.
host-unreachable	3	1	Unreachable host.
information-reply	16	0	Information reply.
information-request	15	0	Information request.
net-redirect	5	0	Network redirection.
net-tos-redirect	5	2	Network ToS redirection.
net-unreachable	3	0	Unreachable network.
parameter-problem	12	0	Invalid parameter.
port-unreachable	3	3	Unreachable port.
protocol-unreachable	3	2	Unreachable protocol.
reassembly-timeout	11	1	Fragment reassembly timeout.
source-quench	4	0	Source quench message.
source-route-failed	3	5	Source route failure.
timestamp-reply	14	0	Timestamp reply.
timestamp-request	13	0	Timestamp request.
ttl-exceeded	11	0	TTL exceeded in transit.

Examples

Enable the device to receive ICMP echo reply messages.

```
<Sysname> system-view
[Sysname] ip icmp name echo-reply receive enable
```

ip icmp send enable

Use **ip icmp send enable** to enable the device to send a specific type of ICMP messages.

Use **undo ip icmp send enable** to disable the device from sending a specific type of ICMP messages.

NOTE:

This command is supported only in R6348P01 and later.

Syntax

ip icmp { **name** *icmp-name* | **type** *icmp-type* **code** *icmp-code* } **send enable**

undo ip icmp { **name** *icmp-name* | **type** *icmp-type* **code** *icmp-code* } **send enable**

Default

The device sends all types of ICMP messages except Destination Unreachable, Time Exceeded, and Redirect messages.

Views

System view

Predefined user roles

network-admin

Parameters

name *icmp-name*: Specifies an ICMP message name, a case-insensitive string of 1 to 20 characters.

type *icmp-type*: Specifies an ICMP message type. The value range for the *icmp-type* argument is 0 to 255.

code *icmp-code*: Specifies an ICMP message code. The value range for the *icmp-code* argument is 0 to 255.

Usage guidelines

CAUTION:

Disabling sending ICMP messages of a specific type might affect network operation. Please use this feature with caution.

By default, the device sends all types of ICMP messages except Destination Unreachable, Time Exceeded, and Redirect messages. Attackers might obtain information from specific types of ICMP messages, causing security issues.

For security purposes, you can use this command to disable the device from sending ICMP messages of specific types.

To enable sending Destination Unreachable, Time Exceeded, or Redirect messages, you can perform one of the following tasks:

- Execute the **ip icmp send enable** command.
- Execute one of the following commands as needed:
  - **ip unreachables enable**
  - **ip ttl-expires enable**
  - **ip redirects enable**

Table 8 shows common ICMP messages and their meanings.

Examples

Enable the device to send ICMP echo reply messages.

```
<Sysname> system-view
[Sysname] ip icmp name echo-reply send enable
```

ip icmp source

Use **ip icmp source** to specify the source address for outgoing ICMP packets.

Use **undo ip icmp source** to remove the specified source address for outgoing ICMP packets.

Syntax

ip icmp source *ip-address*

undo ip icmp source

Default

No source address is specified for outgoing ICMP packets. The default source IP addresses for different types of ICMP packets vary as follows:

- For an ICMP error message, the source IP address is the IP address of the receiving interface of the packet that triggers the ICMP error message. ICMP error messages include Time Exceeded, Port Unreachable, and Parameter Problem messages.
- For an ICMP echo request, the source IP address is the IP address of the sending interface.
- For an ICMP echo reply, the source IP address is the destination IP address of the ICMP echo request specific to this reply.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IP address.

Usage guidelines

It is a good practice to specify the IP address of the loopback interface as the source IP address for outgoing ping echo request and ICMP error messages. This feature helps users to locate the sending device easily.

Examples

Specify 1.1.1.1 as the source address for outgoing ICMP packets.

```
<Sysname> system-view
[Sysname] ip icmp source 1.1.1.1
```

ip mtu

Use **ip mtu** to set the interface MTU for IPv4 packets. The setting defines the largest size of an IPv4 packet that an interface can transmit without fragmentation.

Use **undo ip mtu** to restore the default.

Syntax

ip mtu *mtu-size*

undo ip mtu

Default

The interface MTU is not set.

Views

Interface view

Predefined user roles

network-admin

Parameters

mtu-size: Specifies the MTU in bytes. The value range for the *mtu-size* argument is 128 to 1500.

Usage guidelines

When a packet exceeds the MTU of the sending interface, the device processes the packet in one of the following ways:

- If the packet disallows fragmentation, the device discards it.
- If the packet allows fragmentation, the device fragments it and forwards the fragments.

Fragmentation and reassembling consume system resources, so set an appropriate MTU to avoid fragmentation.

If an interface supports both the **mtu** and **ip mtu** commands, the device fragments a packet based on the MTU set by the **ip mtu** command.

Examples

Set the interface MTU for IPv4 packets to 1280 bytes on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ip mtu 1280
```

ip reassemble local enable

Use **ip reassemble local enable** to enable IPv4 local fragment reassembly.

Use **undo ip reassemble local enable** to disable local fragment reassembly.

Syntax

ip reassemble local enable

undo ip reassemble local enable

Default

IPv4 local fragment reassembly is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use this feature on a multichassis IRF fabric to improve fragment reassembly efficiency. This feature enables a subordinate to reassemble the IPv4 fragments of a packet if all the fragments arrive at it. If

this feature is disabled, all IPv4 fragments are delivered to the master device for reassembly. The feature applies only to fragments destined for the same subordinate.

Examples

Enable IPv4 local fragment reassembly.

```
<Sysname> system-view
[Sysname] ip reassemble local enable
```

ip redirects enable

Use **ip redirects enable** to enable sending ICMP redirect messages.

Use **undo ip redirects enable** to disable sending ICMP redirect messages.

Syntax

ip redirects enable

undo ip redirects enable

Default

Sending ICMP redirect messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

ICMP redirect messages simplify host management and enable hosts to gradually optimize their routing tables.

A host that has only one route destined for the default gateway sends all packets to the default gateway. The default gateway sends an ICMP redirect message to inform the host of a correct next hop by following these rules:

- The receiving and sending interfaces are the same.
- The packet source IP address and the IP address of the packet receiving interface are on the same segment.
- There is no source route option in the received packet.

Examples

Enable sending ICMP redirect messages.

```
<Sysname> system-view
[Sysname] ip redirects enable
```

ip ttl-expires enable

Use **ip ttl-expires enable** to enable sending ICMP time exceeded messages.

Use **undo ip ttl-expires enable** to disable sending ICMP time exceeded messages.

Syntax

ip ttl-expires enable

undo ip ttl-expires enable

Default

Sending ICMP time exceeded messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A device sends ICMP time exceeded messages by following these rules:

- The device sends an ICMP TTL exceeded in transit message to the source when the following conditions are met:
  - The received packet is not destined for the device.
  - The TTL field of the packet is 1.
- When the device receives the first fragment of an IP datagram destined for the device itself, it starts a timer. If the timer expires before all the fragments of the datagram are received, the device sends an ICMP fragment reassembly time exceeded message to the source.

A device disabled from sending ICMP time exceeded messages does not send ICMP TTL exceeded in transit messages but can still send ICMP fragment reassembly time exceeded messages.

Examples

Enable sending ICMP time exceeded messages.

```
<Sysname> system-view
[Sysname] ip ttl-expires enable
```

ip unreachables enable

Use **ip unreachables enable** to enable sending ICMP destination unreachable messages.

Use **undo ip unreachables enable** to disable sending ICMP destination unreachable messages.

Syntax

ip unreachables enable

undo ip unreachables enable

Default

Sending ICMP destination unreachable messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A device sends ICMP destination unreachable messages by following these rules:

- The device sends the source an ICMP network unreachable message when the following conditions are met:
  - The received packet does not match any route.
  - No default route exists in the routing table.

- The device sends the source an ICMP protocol unreachable message when the following conditions are met:
  - The received packet is destined for the device.
  - The transport layer protocol of the packet is not supported by the device.
- The device sends the source an ICMP port unreachable message when the following conditions are met:
  - The received UDP packet is destined for the device.
  - The packet's port number does not match the running process.
- The device sends the source an ICMP source route failed message when the following conditions are met:
  - The source uses Strict Source Routing to send packets.
  - The intermediate device finds that the next hop specified by the source is not directly connected.
- The device sends the source an ICMP fragmentation needed and DF set message when the following conditions are met:
  - The MTU of the sending interface is smaller than the packet.
  - The packet has Don't Fragment set.

Examples

Enable sending ICMP destination unreachable messages.

```
<Sysname> system-view
[Sysname] ip unreachables enable
```

reset ip statistics

Use **reset ip statistics** to clear IP traffic statistics.

Syntax

reset ip statistics [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears IP traffic statistics for all member devices.

Usage guidelines

Use this command to clear history IP traffic statistics before you collect IP traffic statistics for a time period.

Examples

Clear IP traffic statistics.

```
<Sysname> reset ip statistics
```

Related commands

display ip interface

display ip statistics

reset tcp statistics

Use **reset tcp statistics** to clear TCP traffic statistics.

Examples

Clear UDP traffic statistics.

```
<Sysname> reset udp statistics
```

Related commands

display udp statistics

tcp mss

Use **tcp mss** to set the TCP maximum segment size (MSS).

Use **undo tcp mss** to restore the default.

Syntax

tcp mss *value*

undo tcp mss

Default

The TCP MSS is not set.

Views

Interface view

Predefined user roles

network-admin

Parameters

value: Specifies the TCP MSS in bytes. The value range for this argument is 128 to 1460.

Usage guidelines

The MSS option informs the receiver of the largest segment that the sender can accept. Each end announces its MSS during TCP connection establishment. If the size of a TCP segment is smaller than the MSS of the receiver, TCP sends the TCP segment without fragmentation. If not, TCP fragments the segment according to the receiver's MSS.

If you set the TCP MSS on an interface, the size of each TCP segment received or sent on the interface cannot exceed the MSS value.

This configuration takes effect only on TCP connections that are established after the configuration and not on the TCP connections that already exist.

This configuration is effective only on IP packets.

Examples

Set the TCP MSS to 300 bytes on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] tcp mss 300
```

tcp path-mtu-discovery

Use **tcp path-mtu-discovery** to enable TCP path MTU discovery.

Use **undo tcp path-mtu-discovery** to disable TCP path MTU discovery.

Syntax

tcp path-mtu-discovery [**aging** *age-time* | **no-aging**]

undo tcp path-mtu-discovery

Default

TCP path MTU discovery is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

aging *age-time*: Specifies the aging time for the path MTU, in the range of 10 to 30 minutes. The default aging time is 10 minutes.

no-aging: Does not age out the path MTU.

Usage guidelines

After you enable TCP path MTU discovery, all new TCP connections detect the path MTU. The device uses the path MTU to calculate the MSS to avoid IP fragmentation.

After you disable TCP path MTU discovery, the system stops all path MTU timers. The TCP connections established later do not detect the path MTU, but the TCP connections previously established still can detect the path MTU.

Examples

Enable TCP path MTU discovery and set the path MTU aging time to 20 minutes.

```
<Sysname> system-view
[Sysname] tcp path-mtu-discovery aging 20
```

tcp syn-cookie enable

Use **tcp syn-cookie enable** to enable SYN Cookie to protect the device from SYN flood attacks.

Use **undo tcp syn-cookie enable** to disable SYN Cookie.

Syntax

tcp syn-cookie enable

undo tcp syn-cookie enable

Default

SYN Cookie is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A TCP connection is established through a three-way handshake:

1. The sender sends a SYN packet to the server.
2. The server receives the SYN packet, establishes a TCP semi-connection in SYN_RECEIVED state, and replies with a SYN ACK packet to the sender.
3. The sender receives the SYN ACK packet and replies with an ACK packet. Then, a TCP connection is established.

An attacker can exploit this mechanism to mount SYN flood attacks. The attacker sends a large number of SYN packets, but they do not respond to the SYN ACK packets from the server. As a result, the server establishes a large number of TCP semi-connections and cannot handle normal services.

SYN Cookie can protect the server from SYN flood attacks. When the server receives a SYN packet, it responds to the request with a SYN ACK packet without establishing a TCP semi-connection.

The server establishes a TCP connection and enters ESTABLISHED state only when it receives an ACK packet from the sender.

Examples

Enable SYN Cookie.

```
<Sysname> system-view
[Sysname] tcp syn-cookie enable
```

tcp timer fin-timeout

Use **tcp timer fin-timeout** to set the TCP FIN wait timer.

Use **undo tcp timer fin-timeout** to restore the default.

Syntax

tcp timer fin-timeout *time-value*

undo tcp timer fin-timeout

Default

The TCP FIN wait timer is 675 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time-value: Specifies the TCP FIN wait timer in the range of 76 to 3600 seconds.

Usage guidelines

TCP starts the FIN wait timer when the state of a TCP connection changes to FIN_WAIT_2. If no FIN packet is received within the timer interval, the TCP connection is terminated.

If a FIN packet is received, TCP changes the connection state to TIME_WAIT. If a non-FIN packet is received, TCP restarts the timer and tears down the connection when the timer expires.

Examples

Set the TCP FIN wait timer to 800 seconds.

```
<Sysname> system-view
[Sysname] tcp timer fin-timeout 800
```

tcp timer syn-timeout

Use **tcp timer syn-timeout** to set the TCP SYN wait timer.

Use **undo tcp timer syn-timeout** to restore the default.

Syntax

tcp timer syn-timeout *time-value*

undo tcp timer syn-timeout

Default

The TCP SYN wait timer is 75 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time-value: Specifies the TCP SYN wait timer in the range of 2 to 600 seconds.

Usage guidelines

TCP starts the SYN wait timer after sending a SYN packet. Within the SYN wait timer if no response is received or the upper limit on TCP connection tries is reached, TCP fails to establish the connection.

Examples

Set the TCP SYN wait timer to 80 seconds.

```
<Sysname> system-view
[Sysname] tcp timer syn-timeout 80
```

tcp timestamps enable

Use **tcp timestamps enable** to enable the device to encapsulate the TCP Timestamps option in outgoing TCP packets.

Use **undo tcp timestamps enable** to disable the device from encapsulating the TCP Timestamps option in outgoing TCP packets.

Syntax

tcp timestamps enable

undo tcp timestamps enable

Default

The TCP Timestamps option is encapsulated in outgoing TCP packets.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Devices at each end of the TCP connection can calculate the RTT value by using the TCP Timestamps option carried in TCP packets. For security purpose in some networks, you can disable the TCP Timestamps option encapsulation at one end of the TCP connection to prevent intermediate devices from obtaining the option information.

This command takes effect only on new connections that are established after you execute the command. Existing TCP connections are not affected.

Examples

Enable the device to encapsulate the TCP Timestamps option in outgoing TCP packets.

```
<Sysname> system-view
[Sysname] undo tcp timestamps enable
```

tcp window

Use **tcp window** to set the size of the TCP receive/send buffer.

Use **undo tcp window** to restore the default.

Syntax

tcp window *window-size*

undo tcp window

Default

The size of the TCP receive/send buffer is 63 KB.

Views

System view

Predefined user roles

network-admin

Parameters

window-size: Specifies the size of the TCP receive/send buffer, in the range of 1 to 64 KB.

Examples

Set the size of the TCP receive/send buffer to 3 KB.

```
<Sysname> system-view
[Sysname] tcp window 3
```

UDP helper commands

The following switch series do not support UDP helper:

- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000E-X.
- S5000X-EI.
- WAS6000.

display udp-helper interface

Use **display udp-helper interface** to display information about broadcast to unicast conversion by UDP helper on an interface.

Syntax

display udp-helper interface *interface-type interface-number*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

This command displays information about destination servers and total number of unicast packets converted from UDP broadcast packets by UDP helper.

Examples

Display information about broadcast to unicast conversion by UDP helper on VLAN-interface 100.

```
<Sysname> display udp-helper interface vlan-interface 100
Interface               Server VPN instance          Server address Packets sent
Vlan-interface100       N/A                          192.1.1.2      0
```

Table 1 Command output

Field	Description
Interface	Interface name.
Server VPN instance	This field is not supported in the current software version. VPN instance to which the destination server belongs.
Server address	Destination server to which UDP packets are forwarded.
Packets sent	Number of unicast packets that are converted from broadcast packets by UDP helper.

Related commands

reset udp-helper statistics

udp-helper server

reset udp-helper statistics

Use **reset udp-helper statistics** to clear statistics about broadcast to unicast conversion by UDP helper.

Syntax

reset udp-helper statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear the statistics about broadcast to unicast conversion by UDP helper.

```
<Sysname> reset udp-helper statistics
```

Related commands

display udp-helper interface

udp-helper broadcast-map

Use **udp-helper broadcast-map** to specify a multicast address for UDP helper to convert broadcast to multicast.

Use **undo udp-helper broadcast-map** to restore the default.

Syntax

udp-helper broadcast-map *multicast-address* [**acl** *acl-number*]

undo udp-helper broadcast-map *multicast-address*

Default

No multicast address is specified for UDP helper to convert broadcast to multicast.

Views

Interface view

Predefined user roles

network-admin

Parameters

multicast-address: Specifies the destination multicast address to which the destination broadcast address is converted.

acl *acl-number*: Specifies an ACL by its number. The ACL filters incoming broadcast packets for UDP helper. Packets permitted by the ACL can be converted. If no ACL is specified, all incoming broadcast packets are checked for UDP helper.

- For a basic ACL, the value range is 2000 to 2999.
- For an advanced ACL, the value range is 3000 to 3999.

Usage guidelines

Use this command on the interface that receives broadcast packets.

You can configure a maximum of 20 unicast and multicast addresses for UDP helper to convert broadcast packets.

Examples

Configure UDP helper to convert received broadcast packets on VLAN-interface 100 to multicast packets destined for 225.0.0.1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] udp-helper broadcast-map 225.0.0.1
```

udp-helper enable

Use **udp-helper enable** to enable UDP helper.

Use **undo udp-helper enable** to disable UDP helper.

Syntax

udp-helper enable

undo udp-helper enable

Default

UDP helper is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

For UDP helper to take effect on an interface, make sure the following conditions are met:

- UDP helper is enabled.
- A UDP port number is specified by using the **udp-helper port** command.
- Packet conversion for UDP helper is configured on the interface.

Examples

Enable UDP helper.

```
<Sysname> system-view
[Sysname] udp-helper enable
```

Related commands

udp-helper port

udp-helper server

udp-helper broadcast-map

udp-helper port

Use **udp-helper port** to specify a UDP port number for UDP helper.

Use **undo udp-helper port** to remove UDP port numbers.

Syntax

udp-helper port { *port-number* | **dns** | **netbios-ds** | **netbios-ns** | **tacacs** | **tftp** | **time** }

undo udp-helper port { *port-number* | **dns** | **netbios-ds** | **netbios-ns** | **tacacs** | **tftp** | **time** }

Default

No UDP port numbers are specified for UDP helper.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies a UDP port number in the range of 1 to 65535 (except 67 and 68).

dns: Specifies the UDP port 53 used by DNS packets.

netbios-ds: Specifies the UDP port 138 used by NetBIOS distribution service packets.

netbios-ns: Specifies the UDP port 137 used by NetBIOS name service packets.

tacacs: Specifies the UDP port 49 used by TACACS packets.

tftp: Specifies the UDP port 69 used by TFTP packets.

time: Specifies the UDP port 37 used by time protocol packets.

Usage guidelines

Upon receiving a UDP broadcast or multicast packet, UDP helper uses the specified UDP ports to match the UDP destination port number of the packet.

To specify a UDP port, you can specify the port number or the protocol keyword. For example, **udp-helper port** 53 and **udp-helper port dns** specify the same UDP port.

You can specify a maximum of 256 UDP ports on a device.

Examples

Specify the UDP port 100 for UDP helper.

```
<Sysname> system-view
[Sysname] udp-helper port 100
```

udp-helper server

Use **udp-helper server** to specify a destination server for UDP helper to convert broadcast to unicast.

Use **undo udp-helper server** to remove a destination server.

Syntax

udp-helper server *ip-address*

undo udp-helper server [*ip-address*]

Default

No destination server is specified for UDP helper to convert broadcast to unicast.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a destination server, in dotted decimal notation.

Usage guidelines

Specify destination servers on an interface that receives UDP broadcast packets. If the packets' destination UDP port numbers match the UDP helper ports, UDP helper forwards the broadcasts to the specified servers.

You can specify a maximum of 20 unicast and multicast addresses for UDP helper to convert broadcast packets on an interface.

If you do not specify the *ip-address* argument, the **undo udp-helper server** command removes all destination servers on the interface.

Examples

Specify the destination server 192.1.1.2 for UDP helper to convert broadcast to unicast on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] udp-helper server 192.1.1.2
```

Related commands

display udp-helper interface

IPv6 basics commands

display ipv6 fib

Use **display ipv6 fib** to display IPv6 FIB entries.

Syntax

display ipv6 fib [*ipv6-address* [*prefix-length*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-address: Displays IPv6 FIB entries for a destination IPv6 address. If you do not specify an IPv6 address, this command displays all IPv6 FIB entries.

prefix-length: Specifies a prefix length for the IPv6 address, in the range of 0 to 128. If you do not specify the prefix length, this command displays the IPv6 FIB entry longest matching the IPv6 address.

Examples

Display all IPv6 FIB entries.

```
<Sysname> display ipv6 fib

Destination count: 1 FIB entry count: 1

Flag:
  U:Usable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Relay    F:FRR

Destination: ::1                                    Prefix length: 128
Nexthop    : ::1                                    Flags: UH
Time stamp : 0x1                                    Label: Null
Interface  : InLoop0                                Token: Invalid
```

Table 1 Command output

Field	Description
Destination count	Total number of destination addresses.
FIB entry count	Total number of IPv6 FIB entries.
Destination	Destination address.
Prefix length	Prefix length of the destination address.
Nexthop	Next hop address.
Flags	Route flag: • **U**—Usable route.

Field	Description
	• **G**—Gateway route. • **H**—Host route. • **B**—Black hole route. • **D**—Dynamic route. • **S**—Static route. • **R**—Recursive route. • **F**—Fast re-route.
Time stamp	Time when the IPv6 FIB entry was generated.
Label	Inner MPLS label. For IPv6 FIB entries on the public network, this field displays **Null**.
Interface	Outgoing interface.
Token	Label switched path index number.

display ipv6 icmp statistics

Use **display ipv6 icmp statistics** to display ICMPv6 packet statistics.

Syntax

display ipv6 icmp statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ICMPv6 packet statistics for all member devices.

Examples

Display ICMPv6 packet statistics.

```
<Sysname> display ipv6 icmp statistics
  Input: bad code              0         too short               0
         checksum error        0         bad length              0
         path MTU changed      0        destination unreachable  0
         too big               0        parameter problem        0
         echo request          0        echo reply               0
         neighbor solicit      0         neighbor advertisement  0
         router solicit        0        router advertisement     0
         redirect              0        router renumbering       0
 output: parameter problem     0         echo request            0
         echo reply            0         unreachable no route     0
         unreachable admin     0         unreachable beyond scope 0
         unreachable address   0        unreachable no port      0
         too big               0         time exceed transit     0
         time exceed reassembly 0         redirect                0
```

```
        ratelimited            0         other errors           0
```

display ipv6 interface

Use **display ipv6 interface** to display IPv6 interface information.

Syntax

display ipv6 interface [*interface-type* [*interface-number*]] [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type: Specifies an interface by its type.

interface-number: Specifies an interface by its number.

brief: Displays brief IPv6 interface information, including physical status, link-layer protocols, and IPv6 address. If you do not specify the keyword, this command displays detailed IPv6 interface information, including IPv6 configuration and operating information, and IPv6 packet statistics.

Usage guidelines

If you do not specify an interface, this command displays IPv6 information about all interfaces.

If you specify only the *interface-type* argument, this command displays IPv6 information about the interfaces of the specified type.

If you specify both the *interface-type* and the *interface-number* arguments, this command displays IPv6 information about the specified interface.

Examples

Display IPv6 information about VLAN-interface 2.

```
<Sysname> display ipv6 interface vlan-interface 2
Vlan-interface2 current state: UP
Line protocol current state: UP
IPv6 is enabled, link-local address is FE80::1234:56FF:FE65:4322/64 [TENTATIVE]
  Global unicast address(es):
    10::1234:56FF:FE65:4322, subnet is 10::/64 [TENTATIVE] [AUTOCFG]
      [valid lifetime 4641s/preferred lifetime 4637s]
    20::1234:56ff:fe65:4322, subnet is 20::/64 [TENTATIVE] [EUI-64]
    30::1, subnet is 30::/64 [TENTATIVE] [ANYCAST]
    40::2, subnet is 40::/64 [TENTATIVE] [DHCP]
    50::3, subnet is 50::/64 [TENTATIVE]
  Joined group address(es):

Table 2 Command output

Field	Description
Vlan-interface2 current state	Physical state of the interface: • **Administratively DOWN**—The interface has been administratively shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up but its physical state is down, possibly because of a connection or link failure. • **UP**—The administrative and physical states of the interface are both up.
Line protocol current state	Link layer state of the interface: • **DOWN**—The link layer protocol state of the interface is down. • **UP**—The link layer protocol state of the interface is up.
IPv6 is enabled	IPv6 is enabled on the interface. This feature is automatically enabled after an IPv6 address is configured for an interface.
link-local address	Link-local address of the interface.
Global unicast address(es)	Global unicast addresses of the interface. IPv6 address states: • **TENTATIVE**—Initial state. DAD is being performed or is to be performed on the address.

Field	Description
	• **DUPLICATE**—The address is not unique on the link. • **PREFERRED**—The address is preferred and can be used as the source or destination address of a packet. If an address is in this state, the command does not display the address state. • **DEPRECATED**—The address is beyond the preferred lifetime but in the valid lifetime. It is valid, but it cannot be used as the source address for a new connection. Packets destined for the address are processed correctly. If a global unicast address is not manually configured, the following notations indicate how the address is obtained: • **AUTOCFG**—Stateless autoconfigured. • **DHCP**—Assigned by a DHCPv6 server. • **EUI-64**—Manually configured EUI-64 IPv6 address. • **RANDOM**—Random address automatically generated. If the address is a manually configured anycast address, it is noted with **ANYCAST**.
valid lifetime	Specifies how long autoconfigured global unicast addresses using a prefix are valid.
preferred lifetime	Specifies how long autoconfigured global unicast addresses using a prefix are preferred.
Joined group address(es)	Addresses of the multicast groups that the interface has joined.
MTU	MTU of the interface.
ND DAD is enabled, number of DAD attempts	DAD is enabled. • If DAD is enabled, this field displays the number of attempts to send an NS message for DAD (set by using the **`ipv6 nd dad attempts`** command). • If DAD is disabled, this field displays **ND DAD is disabled**. To disable DAD, set the number of attempts to 0.
ND reachable time	Time during which a neighboring device is reachable.
ND retransmit interval	Interval for retransmitting an NS message.
Hosts use stateless autoconfig for addresses	Hosts obtained IPv6 addresses through stateless autoconfiguration.
InReceives	Received IPv6 packets, including error messages.
InTooShorts	Received IPv6 packets that are too short. For example, the received IPv6 packet is less than 40 bytes.
InTruncatedPkts	Received IPv6 packets with a length less than the payload length field specified in the packet header.
InHopLimitExceeds	Received IPv6 packets with a hop count exceeding the hop limit field specified in the packet header.
InBadHeaders	Received IPv6 packets with incorrect basic headers.
InBadOptions	Received IPv6 packets with incorrect extension headers.
ReasmReqds	Received IPv6 fragments.
ReasmOKs	Number of reassembled IPv6 packets.
InFragDrops	Received IPv6 fragments that are discarded because of certain errors.
InFragTimeouts	Received IPv6 fragments that are discarded because the amount of time they stay in the system buffer exceeds the specified interval.

Field	Description
OutFragFails	IPv6 packets that fail to be fragmented on the output interface.
InUnknownProtos	Received IPv6 packets with unknown or unsupported protocol type.
InDelivers	Received IPv6 packets that are delivered to user protocols (such as ICMPv6, TCP, and UDP).
OutRequests	Local IPv6 packets sent by IPv6 user protocols.
OutForwDatagrams	IPv6 packets forwarded by the interface.
InNoRoutes	Received IPv6 packets that are discarded because no matching route can be found.
InTooBigErrors	Received IPv6 packets that fail to be forwarded because they exceeded the Path MTU.
OutFragOKs	Fragmented IPv6 packets on the output interface.
OutFragCreates	Number of IPv6 fragments on the output interface.
InMcastPkts	Received IPv6 multicast packets.
InMcastNotMembers	Received IPv6 multicast packets that are discarded because the interface is not in the multicast group.
OutMcastPkts	IPv6 multicast packets sent by the interface.
InAddrErrors	Received IPv6 packets that are discarded due to invalid destination addresses.
InDiscards	Received IPv6 packets that are discarded due to resource problems rather than packet errors.
OutDiscards	IPv6 packets that fail to be sent due to resource problems rather than packet errors.

Display brief IPv6 information about all interfaces.

```
<Sysname> display ipv6 interface brief
*down: administratively down
(s): spoofing
Interface                          Physical Protocol IPv6 Address
Vlan-interface1                    down    down     Unassigned
Vlan-interface2                    up        up     2001::1
Vlan-interface100                   up        up       Unassigned
```

Table 3 Command output

Field	Description
*down: administratively down	The interface has been administratively shut down by using the **shutdown** command.
(s): spoofing	Spoofing attribute of the interface. The link protocol state of the interface is up, but the link is temporarily established on demand or does not exist.
Interface	Name of the interface.
Physical	Physical state of the interface: • ***down**—The interface has been administratively shut down by using the **shutdown** command. • **down**—The interface is administratively up but its physical state is down, possibly because of a connection or link failure. • **up**—The administrative and physical states of the interface are both

Field	Description
	up.
Protocol	Link layer protocol state of the interface: • **down**—The network layer protocol state of the interface is down. • **up**—The network layer protocol state of the interface is up.
IPv6 Address	IPv6 address of the interface. • If multiple global unicast addresses are configured, this field displays the lowest address. • If no global unicast address is configured, this field displays the link-local address. • If no address is configured, this field displays **Unassigned**.

display ipv6 interface prefix

Use **display ipv6 interface prefix** to display IPv6 prefix information for an interface.

Syntax

display ipv6 interface *interface-type interface-number* **prefix**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Examples

Display IPv6 prefix information for VLAN-interface 10.

```
<Sysname> display ipv6 interface vlan-interface 10 prefix
Prefix: 1001::/65                                  Origin: ADDRESS
Age:    -                                           Flag:   AL
Lifetime(Valid/Preferred): 2592000/604800
Preference: -

Prefix: 2001::/64                                  Origin: STATIC
Age:    -                                           Flag:   L
Lifetime(Valid/Preferred): 3000/2000
Preference: -

Prefix: 3001::/64                                  Origin: RA
Age:    600                                         Flag:   A
Lifetime(Valid/Preferred): -
Preference: -

Prefix: 4001::/64                                  Origin: STATIC
Age:    -                                           Flag:   ALP
Lifetime(Valid/Preferred): 1000/200
```

```
Preference: 200
```

Table 4 Command output

Filed	Description
Prefix	IPv6 address prefix.
Origin	How the prefix is generated: • **STATIC**—Manually configured by using the **ipv6 nd ra prefix** command. • **RA**—Advertised in RA messages after stateless autoconfiguration is enabled. • **ADDRESS**—Generated by a manually configured address.
Age	Aging time in seconds. If the prefix does not age out, this field displays a hyphen (-).
Flag	Flags carried in RA messages. If no flags are available, this field displays a hyphen (-). • **L**—The address with the prefix is directly reachable on the link. • **A**—The prefix is used for stateless autoconfiguration. • **N**—The prefix is not advertised in RA messages. • **P**—The prefix has a preference.
Lifetime	Lifetime in seconds advertised in RA messages. If the prefix does not need to be advertised, this field displays a hyphen (-). • **Valid**—Valid lifetime of the prefix. • **Preferred**—Preferred lifetime of the prefix.
Preference	Preference of the IPv6 prefix.

Related commands

ipv6 nd ra prefix

display ipv6 nd snooping count vlan

Use **display ipv6 nd snooping count vlan** to display the number of IPv6 ND snooping entries for VLANs.

Syntax

display ipv6 nd snooping count vlan [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays the total number of ND snooping entries in all VLANs.

Examples

Display the total number of IPv6 ND snooping entries in all VLANs.

```
<Sysname> display ipv6 nd snooping count vlan
Total entries for VLANs: 5
```

Display the total number of IPv6 ND snooping entries on GigabitEthernet 1/0/1.

```
<Sysname> display ipv6 nd snooping count vlan interface gigabitethernet 1/0/1
Total entries on interface GE1/0/1: 2
```

Table 5 Command output

Field	Description
Total entries for VLANs	Total number of ND snooping entries in all VLANs.
Total entries on interface *xxx*	Total number of ND snooping entries on the interface.

Related commands

ipv6 nd snooping enable global

ipv6 nd snooping enable link-local

reset ipv6 nd snooping vlan

display ipv6 nd snooping vlan

Use **display ipv6 nd snooping vlan** to display ND snooping entries in the specified VLAN.

Syntax

display ipv6 nd snooping vlan [[*vlan-id* | **interface** *interface-type interface-number*] [**global** | **link-local**] | *ipv6-address*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *vlan-id*: Displays ND snooping entries for the specified VLAN. The value range for the VLAN ID is 1 to 4094.

interface *interface-type interface-number*: Displays ND snooping entries for the specified interface in a VLAN. The *interface-type interface-number* argument specifies an interface by its type and number.

global: Displays ND snooping entries for global unicast addresses in the VLAN.

link-local: Displays ND snooping entries for link-local addresses in the VLAN.

ipv6-address: Displays the ND snooping entry for the specified IPv6 address.

verbose: Displays detailed information about ND snooping entries in the VLAN. If you do not specify the keyword, this command displays brief information about ND snooping entries.

Usage guidelines

If you do not specify any parameters, this command displays all ND snooping entries.

Examples

Display brief information about IPv6 ND snooping entries for VLAN 1.

```
<Sysname> display ipv6 nd snooping vlan 1
IPv6 address            MAC address    VID  Interface    Status      Age
1::2                    0000-1234-0c01  1   GE1/0/2      VALID       57
```

Display detailed information about IPv6 ND snooping entries for VLAN 1.

```
<Sysname> display ipv6 nd snooping vlan 1 verbose
IPv6 address: 1::2
MAC address: 0000-1234-0c01
Interface: GE1/0/2
First VLAN ID: 1   Second VLAN ID: N/A
Status: VALID   Age: 57
```

Table 6 Command output

Field	Description
IPv6 address	IPv6 address in the ND snooping entry.
MAC address	MAC address in the ND snooping entry.
VID	ID of the VLAN to which the ND snooping entry belongs.
First VLAN ID	ID of the SVLAN to which the ND snooping entry belongs.
Second VLAN ID	ID of the CVLAN to which the ND snooping entry belongs. If no CVLAN is configured, this field displays **N/A**. For more information about the SVLAN and CVLAN, see QinQ in *Layer 2—LAN Switching Configuration Guide*.
Interface	Input interface in the ND snooping entry.

Status	Status of the ND snooping entry:
	• **TENTATIVE**—The entry is ineffective.
	• **VALID**—The entry is effective.
	• **TESTING_TPLT**—The entry is being tested by DAD. The device performs DAD for the entry in the following situations:
	  ○ The entry ages out.
	  ○ An ND trusted interface in the VLAN receives an ND message from the IPv6 address in the entry.
	• **TESTING_VP**—The entry is being tested by DAD. The device performs DAD when an ND untrusted interface in the VLAN receives an ND message from the IPv6 address in the entry.

Age	For an ND snooping entry in VALID status, this field displays its remaining aging time in seconds. For an ND snooping entry in other status, this field displays a pound sign (#).

Related commands

ipv6 nd snooping enable global

ipv6 nd snooping enable link-local

display ipv6 nd user-ip-conflict record

Use **display ipv6 nd user-ip-conflict record** to display user IPv6 address conflict records.

Syntax

display ipv6 nd user-ip-conflict record [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays user IP address conflict records for all member devices.

Examples

Display all user IPv6 address conflict records.

```
<Sysname> display ipv6 nd user-ip-conflict record
IPv6 address: 10::1
System time: 2018-02-02 11:22:29
Conflict count: 1
Log suppress count: 0
Old interface: GigabitEthernet1/0/1
New interface: GigabitEthernet1/0/2
Old SVLAN/CVLAN: 100/2
New SVLAN/CVLAN: 100/2
Old MAC: 00e0-ca63-8141
New MAC: 00e0-ca63-8142

IPv6 address: 10::2
System time: 2018-02-02 10:20:30
Conflict count: 1
Log suppress count: 0
Old interface: GigabitEthernet1/0/1
New interface: GigabitEthernet1/0/2
Old SVLAN/CVLAN: 100/--
New SVLAN/CVLAN: 100/--
Old MAC: 00e0-ca63-8141
New MAC: 00e0-ca63-8142
```

Table 7 Command output

Field	Description
IPv6 address	IPv6 address of a user.
System time	Time when the user IPv6 address conflict occurred.
Conflict count	Number of times user IPv6 address conflicts occurred.
Log suppress count	Number of times user IPv6 address conflict log generation has been suppressed.
Old interface	Output interface in the old ND entry.
New interface	Output interface in the new ND entry.
Old SVLAN/CVLAN	ID of the outer VLAN or inner VLAN in the old ND entry. This field displays hyphens (**--**) if the ND entry does not belong to any outer VLAN or inner VLAN.
New SVLAN/CVLAN	ID of the outer VLAN or inner VLAN in the new ND entry. This field displays hyphens (**--**) if the ND entry does not belong to any outer VLAN or inner VLAN.
Old MAC	MAC address in the old ND entry.
New MAC	MAC address in the new ND entry.

Related commands

ipv6 nd user-ip-conflict record enable

display ipv6 nd user-move record

Use **display ipv6 nd user-move record** to display user port migration records.

Syntax

display ipv6 nd user-move record [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays user port migration records for all member devices.

Examples

Display all user port migration records.

```
<Sysname> display ipv6 nd user-move record
IPv6 address: 10::1
MAC address: 00e0-ca63-8141
System time: 2018-02-02 11:22:29
Move count: 1
Log suppress count: 0
Before:
  interface: GigabitEthernet1/0/1
  SVLAN/CVLAN: 100/2
After:
  interface: GigabitEthernet1/0/2
  SVLAN/CVLAN: 100/2

IPv6 address: 10::2
MAC address: 00e0-ca63-8142
System time: 2018-02-02 10:20:30
Move count: 1
Log suppress count: 0
Before:
  interface: GigabitEthernet1/0/1
  SVLAN/CVLAN: 100/--
After:
  interface: GigabitEthernet1/0/2
  SVLAN/CVLAN: 100/--
```

Table 8 Command output

Field	Description
IPv6 address	IPv6 address of the user.
MAC address	MAC address of the user.
System time	Time when the user port migration occurred.
Move count	Number of times the user port migrated.
Log suppress count	Number of times user port migration log generation has been suppressed.
Before	Information before the user port migration.
interface	Interface information in the ND entry.
SVLAN/CVLAN	ID of the outer VLAN or inner VLAN in the ND entry. This field displays hyphens (**--**) if the ND entry does not belong to any outer VLAN or inner VLAN.
After	Information after the user port migration.

Related commands

ipv6 nd user-move record enable

display ipv6 neighbors

Use **display ipv6 neighbors** to display IPv6 neighbor information.

Syntax

display ipv6 neighbors { { *ipv6-address* | **all** | **dynamic** | **static** } [**slot** *slot-number*] | **interface** *interface-type interface-number* | **vlan** *vlan-id* } [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-address: Specifies the IPv6 address of a neighbor whose information is displayed.

all: Displays information about all neighbors, including neighbors acquired dynamically and configured statically.

dynamic: Displays information about all neighbors acquired dynamically.

static: Displays information about all neighbors configured statically.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 neighbor information for all member devices.

interface *interface-type interface-number*: Specifies an interface by its type and number.

vlan *vlan-id*: Displays information about neighbors in the specified VLAN. The value range for VLAN ID is 1 to 4094.

verbose: Displays detailed neighbor information.

Examples

Display all neighbor information.

```
<Sysname> display ipv6 neighbors all
Type: S-Static    D-Dynamic    O-Openflow    R-Rule    IS-Invalid static
IPv6 address              MAC address    VID  Interface        State T  Aging

Table 9 Command output

Field	Description
IPv6 Address	IPv6 address of the neighbor.
MAC address	MAC address of the neighbor.
VID	ID of the VLAN to which the interface connected to a neighbor belongs. This field displays **N/A** if the VLAN ID is invalid.
Interface	Interface connected to a neighbor. If the interface name or link ID is not available, the field displays **N/A**. The link ID is a string with a maximum of eight hexadecimal numbers.
State	State of a neighbor:

Field	Description
	• **INCMP**—The address is being resolved. The link layer address of the neighbor is unknown. • **REACH**—The neighbor is reachable. • **STALE**—The reachability of the neighbor is unknown. The device will not verify the reachability unless it has data to send to the neighbor. • **DELAY**—The reachability of the neighbor is unknown. The device does not send an NS message in the delay period. • **PROBE**—The reachability of the neighbor is unknown. The device sends an NS message to probe the reachability of the neighbor.
Type	Neighbor information type: • **Static**—Statically configured. • **Dynamic**—Dynamically obtained. • **Openflow**—Learned from the OpenFlow module. • **Rule**—Learned from the portal module. • **Invalid static**—Invalid static configuration.
Aging	Reachable time of the neighbor: • For a static neighbor entry, this field displays hyphens (**--**), representing the neighbor entry never expires. • For a dynamic neighbor entry, this field displays the elapsed time in seconds. If the neighbor is never reachable, this field displays a pound sign (#).
VPN instance	This field is not supported in the current software version. Name of a VPN instance. This field displays hyphens (**--**) if no VPN instance is configured.
Service instance	This field is not supported in the current software version. Ethernet service instance. If the neighbor entry does not belong to any Ethernet service instance for the related Layer 2 Ethernet interface or Layer 2 aggregate interface, this field displays hyphens (**--**).
Link ID	This field is not supported in the current software version. ID of the link that connects to the neighbor. The link ID is a string with a maximum of eight hexadecimal numbers. If the neighbor entry does not belong to a VSI, the field displays hyphens (**--**).
Nickname	Nickname of a neighbor entry. The name is a string of four hexadecimal numbers.

Related commands

`ipv6 neighbor`

`reset ipv6 neighbors`

display ipv6 neighbors count

Use **`display ipv6 neighbors count`** to display the number of neighbor entries.

Syntax

`display ipv6 neighbors` { { **`all`** | **`dynamic`** | **`static`** } [**`slot`** *`slot-number`*] | **`interface`** *`interface-type interface-number`* | **`vlan`** *`vlan-id`* } **`count`**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Displays the total number of all neighbor entries, including neighbor entries created dynamically and configured statically.

dynamic: Displays the total number of neighbor entries created dynamically.

static: Displays the total number of neighbor entries configured statically.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the number of neighbor entries for all member devices.

interface *interface-type interface-number*: Specifies an interface by its type and number.

vlan *vlan-id*: Displays the total number of neighbor entries in the specified VLAN. The value range for VLAN ID is 1 to 4094.

Examples

Display the total number of neighbor entries created dynamically.

```
<Sysname> display ipv6 neighbors dynamic count
 Total number of dynamic entries: 2
```

display ipv6 neighbors entry-limit

Use **display ipv6 neighbors entry-limit** to display the maximum number of ND entries that a device supports.

Syntax

display ipv6 neighbors entry-limit

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the maximum number of ND entries that the device supports.

```
<Sysname> display ipv6 neighbors entry-limit
ND entries: 256
```

display ipv6 pathmtu

Use the **display ipv6 pathmtu** command to display IPv6 Path MTU information.

Syntax

display ipv6 pathmtu { *ipv6-address* | { **all** | **dynamic** | **static** } [**count**] }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-address: Specifies the destination IPv6 address for which the Path MTU information is to be displayed.

all: Displays all Path MTU information.

dynamic: Displays all dynamic Path MTU information.

static: Displays all static Path MTU information.

count: Displays the total number of Path MTU entries.

Examples

Display all Path MTU information.

```
<Sysname> display ipv6 pathmtu all
IPv6 destination address             PathMTU   Age   Type
1:2::3:2                             1800      -     Static
1:2::4:2                             1400      10    Dynamic
1:2::5:2                             1280      10    Dynamic
```

Displays the total number of Path MTU entries.

```
<Sysname> display ipv6 pathmtu all count
Total number of entries: 3
```

Table 10 Command output

Field	Description
PathMTU	Path MTU value on the network path to an IPv6 address.
Age	Time for a Path MTU to live. For a static Path MTU, this field displays a hyphen (-).
Type	Path MTU type: • **Dynamic**—Dynamically negotiated. • **Static**—Statically configured.
Total number of entries	Total number of Path MTU entries.

Related commands

ipv6 pathmtu

reset ipv6 pathmtu

display ipv6 prefix

Use **display ipv6 prefix** to display information about IPv6 prefixes, including dynamic and static prefixes.

Syntax

display ipv6 prefix [*prefix-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

prefix-number: Specifies the ID of an IPv6 prefix, in the range of 1 to 1024. If you do not specify an IPv6 prefix ID, this command displays information about all IPv6 prefixes.

Usage guidelines

A static IPv6 prefix is configured by using the **ipv6 prefix** command.

A dynamic IPv6 prefix is obtained from the DHCPv6 server, and its prefix ID is configured by using the **ipv6 dhcp client pd** command. For detailed information, see *Layer 3—IP Services Configuration Guide*.

Examples

Display information about all IPv6 prefixes.

```
<Sysname> display ipv6 prefix
Number  Prefix                                  Type
1       1::/16                                  Static
2       11:77::/32                              Dynamic
```

Display information about the IPv6 prefix with prefix ID 1.

```
<Sysname> display ipv6 prefix 1
Number: 1
Type  : Dynamic
Prefix: ABCD:77D8::/32
Preferred lifetime 90 sec, valid lifetime 120 sec
```

Table 11 Command output

Field	Description
Number	Prefix ID.
Type	Prefix type: • **Static**—Static IPv6 prefix. • **Dynamic**—Dynamic IPv6 prefix.
Prefix	Prefix and its length. If no prefix is obtained, this field displays **Not-available**.
Preferred lifetime 90 sec	Preferred lifetime in seconds. For a static IPv6 prefix, this field is not displayed.
valid lifetime 120 sec	Valid lifetime in seconds. For a static IPv6 prefix, this field is not displayed.

Related commands

ipv6 dhcp client pd

ipv6 prefix

display ipv6 rawip

Use **display ipv6 rawip** to display brief information about IPv6 RawIP connections.

Syntax

display ipv6 rawip [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about IPv6 RawIP connections for all member devices.

Examples

Display brief information about IPv6 RawIP connections.

```
<Sysname> display ipv6 rawip
Local Addr          Foreign Addr       Protocol Slot   PCB
2001:2002:2003:2    3001:3002:3003:3   58       1      0x0000000000000009
004:2005:2006:20    004:3005:3006:30
07:2008             07:3008
2002::100           2002::138          58       2      0x0000000000000008
::                  ::                 58       5      0x0000000000000002
```

Table 12 Command output

Field	Description
Local Addr	Local IPv6 address.
Foreign Addr	Peer IPv6 address.
Protocol	Protocol number.
PCB	PCB index.

display ipv6 rawip verbose

Use **display ipv6 rawip verbose** to display detailed information about IPv6 RawIP connections.

Syntax

display ipv6 rawip verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about IPv6 RawIP connections for all member devices.

pcb *pcb-index*: Displays detailed information about IPv6 RawIP connections of the specified PCB. The value range for the *pcb-index* argument is 1 to 16.

Examples

Display detailed information about an IPv6 RawIP connection.

```
<Sysname> display ipv6 rawip verbose
Total RawIP socket number: 1

 Connection info: src = ::, dst = ::
 Location: slot: 6
 Creator: ping ipv6[320]
 State: N/A
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/drop/state): 0 / 9216 / 1 / 0 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 9216 / 512 / N/A
 Type: 3
 Protocol: 58
 Inpcb flags: N/A
 Inpcb extflag: INP_EXTRCVICMPERR INP_EXTFILTER
 Inpcb vflag: INP_IPV6
 Hop limit: 255 (minimum hop limit: 0)
 Send VRF: 0xffff
 Receive VRF: 0xffff
```

Table 13 Command output

Field	Description
Total RawIP socket number	Total number of IPv6 RawIP sockets.
Connection info	Connection information, including the source and destination IPv6 addresses.
Location	Socket location.
Creator	Task name of the socket. The process number is in the square brackets.
State	Socket state: • **NOFDREF**—The user has closed the connection. • **ISCONNECTED**—The connection has been established. • **ISCONNECTING**—The connection is being established. • **ISDISCONNECTING**—The connection is being interrupted. • **ASYNC**—Asynchronous mode. • **ISDISCONNECTED**—The connection has been terminated. • **PROTOREF**—Indicates strong protocol reference. • **N/A**—None of above state.
Options	Socket options: • **SO_DEBUG**—Records socket debugging information. • **SO_ACCEPTCONN**—Enables the server to listen connection requests. • **SO_REUSEADDR**—Allows the local address reuse. • **SO_KEEPALIVE**—Requires the protocol to test whether the connection is still alive. • **SO_DONTROUTE**—Bypasses the routing table query for outgoing packets because the destination is in a directly connected network. • **SO_BROADCAST**—Supports broadcast packets. • **SO_LINGER**—Closes the socket. The system can still send remaining data in the socket send buffer. • **SO_OOBINLINE**—Stores the out-of-band data in the input queue.

Field	Description
	• **SO_REUSEPORT**—Allows the local port reuse. • **SO_TIMESTAMP**—Records the timestamps of the incoming packets, accurate to milliseconds. This option is applicable to protocols that are not connection orientated. • **SO_NOSIGPIPE**—Disables the socket from sending data. As a result, a sigpipe cannot be established when a return failure occurs. • **SO_TIMESTAMPNS**—Has a similar function with the timestamp, accurate to nanoseconds. • **SO_KEEPALIVETIME**—Sets a keepalive time. This option is supported in TCP. • **SO_FILTER**—Supports setting the packet filter criterion. This option is available for OSI Socket and RawIP. • **SO_USCBINDEX**—Obtains the user profile index from the received packets. • **N/A**—No options are set.
Error	Error code.

Receiving buffer (cc/hiwat/lowat/drop/state)	Displays receive buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **drop**—Number of dropped packets.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Sending buffer(cc/hiwat/lowat/state)	Displays send buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of protocol using the socket. 58 represents ICMP.
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IPv6 options. • **INP_RECVRETOPTS**—Receives replied IPv6 options. • **INP_RECVDSTADDR**—Receives destination IPv6 address. • **INP_HDRINCL**—Provides the entire IPv6 header. • **INP_REUSEADDR**—Reuses the IPv6 address. • **INP_REUSEPORT**—Reuses the port number.

Field	Description
	• **INP_ANONPORT**—Port number not specified. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **IN6P_IPV6_V6ONLY**—Only supports IPv6 protocol stack. • **IN6P_PKTINFO**—Receives the source IPv6 address and input interface of the packet. • **IN6P_HOPLIMIT**—Receives the hop limit. • **IN6P_HOPOPTS**—Receives the hop-by-hop options extension header. • **IN6P_DSTOPTS**—Receives the destination options extension header. • **IN6P_RTHDR**—Receives the routing extension header. • **IN6P_RTHDRDSTOPTS**—Receives the destination options extension header preceding the routing extension header. • **IN6P_TCLASS**—Receives the traffic class of the packet. • **IN6P_AUTOFLOWLABEL**—Attaches a flow label automatically. • **IN6P_RFC2292**—Uses the API specified in RFC 2292. • **IN6P_MTU**—Discovers differences in the MTU size of every link along a given data path. TCP does not support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_USEICMPSRC**—Uses the specified IPv6 address as the source IPv6 address for outgoing ICMP packets. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **INP_EXTRCVICMPERR**—Receives an ICMP error packet. • **INP_EXTFILTER**—Filters the contents in the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flag in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_IPV6**—IPv6 protocol. • **INP_IPV6PROTO**—Creates an Internet PCB based on IPv6 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
Hop limit	Hop limit in the Internet PCB.
Send VRF	This field is not supported in the current software version. VRF from which packets are sent.
Receive VRF	This field is not supported in the current software version. VRF from which packets are received.

display ipv6 statistics

Use **display ipv6 statistics** to display IPv6 and ICMPv6 packet statistics.

Syntax

display ipv6 statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 and ICMPv6 packet statistics for all member devices.

Examples

Display IPv6 and ICMPv6 packet statistics.

```
<Sysname> display ipv6 statistics
  IPv6 statistics:

    Sent packets:
      Total:     0
        Sent locally:        0          Forwarded:            0
        Raw packets:         0          Discarded:            0
        Fragments:           0          Fragments failed:     0
        Routing failed:      0

    Received packets:
      Total:     0
        Received locally:    0          Hop limit exceeded:  0
        Fragments:           0          Reassembled:          0
        Reassembly failures:  0          Reassembly timeout:  0
        Format errors:       0          Option errors:       0
        Protocol errors:     0

  ICMPv6 statistics:

    Sent packets:
      Total:     0
        Unreachable:         0           Too big:             0
        Hop limit exceeded:  0           Reassembly timeouts: 0
        Parameter problems:  0
        Echo requests:       0           Echo replies:        0
        Neighbor solicits:   0           Neighbor adverts:    0
        Router solicits:     0           Router adverts:      0
        Redirects:           0           Router renumbering:  0
      Send failed:
```

```
    Rate limitation:     0          Other errors:        0

  Received packets:
   Total:     0
     Checksum errors:     0          Too short:           0
     Bad codes:           0
     Unreachable:         0          Too big:             0
     Hop limit exceeded:  0          Reassembly timeouts:  0
     Parameter problems:  0          Unknown error types:  0
     Echo requests:       0          Echo replies:        0
     Neighbor solicits:   0          Neighbor adverts:    0
     Router solicits:     0          Router adverts:      0
     Redirects:           0          Router renumbering:  0
     Unknown info types:  0
   Deliver failed:
     Bad length:         0
```

Receive VRF: 0x0
```

Table 15 Command output

Field	Description
TCP inpcb number	Number of IPv6 TCP Internet PCBs.
Connection info	Connection information, including source IPv6 address, source port number, destination IPv6 address, and destination port number.
Location	Socket location.
tcpcb number	Number of IPv6 TCP PCBs (excluding PCBs of TCP in TIME_WAIT state).
Creator	Task name of the socket. The process number is in the square brackets.
State	Socket state: • **NOFDREF**—The user has closed the connection. • **ISCONNECTED**—The connection has been established. • **ISCONNECTING**—The connection is being established. • **ISDISCONNECTING**—The connection is being interrupted. • **ASYNC**—Asynchronous mode. • **ISDISCONNECTED**—The connection has been terminated. • **PROTOREF**—Indicates strong protocol reference. • **N/A**—None of above state.
Options	Socket options: • **SO_DEBUG**—Records socket debugging information. • **SO_ACCEPTCONN**—Enables the server to listen connection requests. • **SO_REUSEADDR**—Allows the local address reuse. • **SO_KEEPALIVE**—Requires the protocol to test whether the connection is still alive. • **SO_DONTROUTE**—Bypasses the routing table query for outgoing packets because the destination is in a directly connected network. • **SO_BROADCAST**—Supports broadcast packets. • **SO_LINGER**—Closes the socket. The system can still send remaining data in the socket send buffer. • **SO_OOBINLINE**—Stores the out-of-band data in the input queue. • **SO_REUSEPORT**—Allows the local port reuse. • **SO_NOSIGPIPE**—Disables the socket from sending data. As a result, a sigpipe cannot be established when a return failure occurs. • **SO_TIMESTAMPNS**—Has a similar function with the timestamp, accurate to nanoseconds. • **SO_KEEPALIVETIME**—Sets a keepalive time. This option is supported in TCP. • **SO_FILTER**—Supports setting the packet filter criterion. This option is available for OSI Socket and RawIP. • **N/A**—No options are set.
Error	Error code.
Receiving buffer(cc/hiwat/lowat/state)	Displays receive buffer information in the following order: • **cc**—Used space.

Field	Description

	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Sending buffer(cc/hiwat/lowat/state)	Displays send buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket. 6 represents TCP.
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IPv6 options. • **INP_RECVRETOPTS**—Receives replied IPv6 options. • **INP_RECVDSTADDR**—Receives destination IPv6 address. • **INP_HDRINCL**—Provides the entire IPv6 header. • **INP_REUSEADDR**—Reuses the IPv6 address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **IN6P_IPV6_V6ONLY**—Only supports IPv6 protocol stack. • **IN6P_PKTINFO**—Receives the source IPv6 address and input interface of the packet. • **IN6P_HOPLIMIT**—Receives the hop limit. • **IN6P_HOPOPTS**—Receives the hop-by-hop options extension header. • **IN6P_DSTOPTS**—Receives the destination options extension header. • **IN6P_RTHDR**—Receives the routing extension header. • **IN6P_RTHDRDSTOPTS**—Receives the destination options extension header preceding the routing extension header. • **IN6P_TCLASS**—Receives the traffic class of the packet. • **IN6P_AUTOFLOWLABEL**—Attaches a flow label automatically. • **IN6P_RFC2292**—Uses the API specified in RFC 2292. • **IN6P_MTU**—Discovers differences in the MTU size of every link along a given data path. TCP does not support this flag.

Field	Description
	• **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **INP_EXTDONTDROP**—Does not drop the received packet. • **INP_EXLISTEN**—Listening socket. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_IPV6**—IPv6 protocol. • **INP_IPV6PROTO**—Creates an Internet PCB based on IPv6 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
Hop limit	Hop limit in the Internet PCB.
Connection state	TCP connection state: • **CLOSED**—The server receives a disconnection request's reply from the client. • **LISTEN**—The server is waiting for connection requests. • **SYN_SENT**—The client is waiting for the server to reply to the connection request. • **SYN_RCVD**—The server receives a connection request. • **ESTABLISHED**—The server and client have established connections and can transmit data bidirectionally. • **CLOSE_WAIT**—The server receives a disconnection request from the client. • **FIN_WAIT_1**—The client is waiting for the server to reply to a disconnection request. • **CLOSING**—The server and client are waiting for peer's disconnection reply when receiving disconnection requests from each other. • **LAST_ACK**—The server is waiting for the client to reply to a disconnection request. • **FIN_WAIT_2**—The client receives a disconnection reply from the server. • **TIME_WAIT**—The client receives a disconnection request from the server.
TCP options	TCP options: • **TF_MD5SIG**—Enables MD5 signature. • **TF_NODELAY**—Disables the Nagle algorithm that buffers the sent data inside the TCP. • **TF_NOOPT**—No TCP options. • **TF_NOPUSH**—Forces TCP to delay sending any TCP data until a full sized segment is buffered in the TCP buffers. • **TF_BINDFOREIGNADDR**—Binds the peer IP address.

Field	Description
	• **TF_NSR**—Enables TCP NSR. • **TF_REQ_SCALE**—Enables the TCP window scale option. • **TF_REQ_TSTMP**—Enables the time stamp option. • **TF_SACK_PERMIT**—Enables the TCP selective acknowledgement option. • **TF_ENHANCED_AUTH**—Enables the enhanced authentication option.
NSR state	State of the TCP connections. Between the parentheses is the role of the connection: • **M**—Main connection. • **S**—Standby connection.
Send VRF	This field is not supported in the current software version. VRF from which packets are sent.
Receive VRF	This field is not supported in the current software version. VRF from which packets are received.

display ipv6 udp

Use **display ipv6 udp** to display brief information about IPv6 UDP connections.

Syntax

display ipv6 udp [**slot** *slot-number*]

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about IPv6 UDP connections for all member devices.

Examples

Displays brief information about IPv6 UDP connections.

```
<Sysname> display ipv6 udp
 LAddr->port        FAddr->port        Slot  PCB
 2001:2002:2003:2   3001:3002:3003:3   1     0x000000000000c387
 004:2005:2006:20   004:3005:3006:30
 07:2008->1200      07:3008->1200
 2001::1->23        2001::5->1284      2     0x0000000000000008
 2003::1->25        2001::2->1283      3     0x0000000000000009
```

Table 16 Command output

Field	Description
LAddr->port	Local IPv6 address and port number.

Field	Description
FAddr->port	Peer IPv6 address and port number.
PCB	PCB index.

display ipv6 udp verbose

Use **display ipv6 udp verbose** to display detailed information about IPv6 UDP connections.

Syntax

display ipv6 udp verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about IPv6 UDP connections for all member devices.

pcb *pcb-index*: Displays detailed information about IPv6 UDP connections of the specified PCB. The value range for the *pcb-index* argument is 1 to 16.

Examples

Display detailed information about an IPv6 UDP connection.

```
<Sysname> display ipv6 udp verbose
Total UDP socket number: 1

 Connection info: src = ::->69, dst = ::->0
 Location: slot: 6
 Creator: sock_test_mips[250]
 State: N/A
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/drop/state): 0 / 41600 / 1 / 0 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 9216 / 512 / N/A
 Type: 2
 Protocol: 17
 Inpcb flags: N/A
 Inpcb extflag: N/A
 Inpcb vflag: INP_IPV6
 Hop limit: 255 (minimum hop limit: 0)
 Send VRF: 0xffff
 Receive VRF: 0xffff
```

Table 17 Command output

Field	Description
Total UDP socket number	Total number of IPv6 UDP sockets.
Connection info	Connection information, including source IPv6 address, source port number, destination IPv6 address, and destination port number.
Location	Socket location.
Creator	Task name of the socket. The progress number is in the square brackets.
State	Socket state: • **NOFDREF**—The user has closed the connection. • **ISCONNECTED**—The connection has been established. • **ISCONNECTING**—The connection is being established. • **ISDISCONNECTING**—The connection is being interrupted. • **ASYNC**—Asynchronous mode. • **ISDISCONNECTED**—The connection has been terminated. • **PROTOREF**—Indicates strong protocol reference. • **N/A**—None of above state.
Options	Socket options: • **SO_DEBUG**—Records socket debugging information. • **SO_ACCEPTCONN**—Enables the server to listen connection requests. • **SO_REUSEADDR**—Allows the local address reuse. • **SO_KEEPALIVE**—Requires the protocol to test whether the connection is still alive. • **SO_DONTROUTE**—Bypasses the routing table query for outgoing packets because the destination is in a directly connected network. • **SO_BROADCAST**—Supports broadcast packets. • **SO_LINGER**—Closes the socket. The system can still send remaining data in the socket send buffer. • **SO_OOBINLINE**—Stores the out-o-band data in the input queue. • **SO_REUSEPORT**—Allows the local port reuse. • **SO_TIMESTAMP**—Records the timestamps of the input packets, accurate to milliseconds. This option is applicable to protocols that are not connection orientated. • **SO_NOSIGPIPE**—Disables the socket from sending data. As a result, a sigpipe cannot be established when a return failure occurs. • **SO_TIMESTAMPNS**—Has a similar function with the timestamp, accurate to nanoseconds. • **SO_KEEPALIVETIME**—Sets a keepalive time. This option is supported in TCP. • **SO_FILTER**—Supports setting the packet filter criterion. This option is available for OSI Socket and RawIP. • **SO_USCBINDEX**—Obtains the user profile index from the received packets. • **N/A**—No options are set.
Error	Error code.
Receiving buffer(cc/hiwat/lowat/drop/state)	Displays receive buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **drop**—Number of dropped packets.

Field	Description

	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Sending buffer(cc/hiwat/lowat/state)	Displays send buffer information in the following order:
	• **cc**—Used space.
	• **hiwat**—Maximum space.
	• **lowat**—Minimum space.
	• **state**—Buffer state:
	  ○ **CANTSENDMORE**—Unable to send data to the peer.
	  ○ **CANTRCVMORE**—Unable to receive data from the peer.
	  ○ **RCVATMARK**—Receiving tag.
	  ○ **N/A**—None of the above states.

Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket. 17 represents UDP.
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IPv6 options. • **INP_RECVRETOPTS**—Receives replied IPv6 options. • **INP_RECVDSTADDR**—Receives destination IPv6 address. • **INP_HDRINCL**—Provides the entire IPv6 header. • **INP_REUSEADDR**—Reuses the IPv6 address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **IN6P_IPV6_V6ONLY**—Only supports IPv6 protocol stack. • **IN6P_PKTINFO**—Receives the source IPv6 address and input interface of the packet. • **IN6P_HOPLIMIT**—Receives the hop limit. • **IN6P_HOPOPTS**—Receives the hop-by-hop options extension header. • **IN6P_DSTOPTS**—Receives the destination options extension header. • **IN6P_RTHDR**—Receives the routing extension header. • **IN6P_RTHDRDSTOPTS**—Receives the destination options extension header preceding the routing extension header. • **IN6P_TCLASS**—Receives the traffic class of the packet. • **IN6P_AUTOFLOWLABEL**—Attaches a flow label automatically. • **IN6P_RFC2292**—Uses the API specified in RFC 2292. • **IN6P_MTU**—Discovers differences in the MTU size of every link along a given data path. TCP does not support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame.

Field	Description
	• **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_IPV6**—IPv6 protocol. • **INP_IPV6PROTO**—Creates an Internet PCB based on IPv6 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
Hop limit	Hop limit in the Internet PCB.
Send VRF	This field is not supported in the current software version. VRF from which packets are sent.
Receive VRF	This field is not supported in the current software version. VRF from which packets are received.

ipv6 address

Use **ipv6 address** to configure an IPv6 global unicast address for an interface.

Use **undo ipv6 address** to delete an IPv6 global unicast address of the interface.

Syntax

ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* }

undo ipv6 address [*ipv6-address prefix-length* | *ipv6-address*/*prefix-length*]

Default

No IPv6 global unicast address is configured for an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 address.

prefix-length: Specifies a prefix length in the range of 1 to 128.

Usage guidelines

Like public IPv4 addresses, IPv6 global unicast addresses are assigned to ISPs. This type of address allows for prefix aggregation to reduce the number of global routing entries.

If you do not specify any parameters, the **undo ipv6 address** command deletes all IPv6 addresses of an interface.

Examples

Set the IPv6 global unicast address of VLAN-interface 100 to 2001::1 with prefix length 64.

Method 1:

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address 2001::1/64
```

Method 2:

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address 2001::1 64
```

ipv6 address anycast

Use **ipv6 address anycast** to configure an IPv6 anycast address for an interface.

Use **undo ipv6 address anycast** to delete the IPv6 anycast address of the interface.

Syntax

ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* } **anycast**

undo ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* } **anycast**

Default

No IPv6 anycast address is configured for an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 anycast address.

prefix-length: Specifies a prefix length in the range of 1 to 128.

Examples

Set the IPv6 anycast address of VLAN-interface 100 to 2001::1 with prefix length 64.

Method 1:

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address 2001::1/64 anycast
```

Method 2:

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
```

```
[Sysname-Vlan-interface100] ipv6 address 2001::1 64 anycast
```

ipv6 address auto

Use **ipv6 address auto** to enable the stateless address autoconfiguration feature on an interface, so that the interface can automatically generate a global unicast address.

Use **undo ipv6 address auto** to disable this feature.

Syntax

ipv6 address auto

undo ipv6 address auto

Default

The stateless address autoconfiguration feature is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

After a global unicast address is generated through stateless autoconfiguration, a link-local address is generated automatically.

To delete the global unicast address and the link-local address that are automatically generated, use either of the following commands:

- **undo ipv6 address auto**
- **undo ipv6 address**

Examples

Enable stateless address autoconfiguration on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address auto
```

ipv6 address auto link-local

Use **ipv6 address auto link-local** to automatically generate a link-local address for an interface.

Use **undo ipv6 address auto link-local** to restore the default.

Syntax

ipv6 address auto link-local

undo ipv6 address auto link-local

Default

No link-local address is configured on an interface. A link-local address is automatically generated after an IPv6 global unicast address is configured for the interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

Link-local addresses are used for neighbor discovery and stateless autoconfiguration on the local link. Packets using link-local addresses as the source or destination addresses cannot be forwarded to other links.

After an IPv6 global unicast address is configured for an interface, a link-local address is automatically generated. This link-local address is the same as the one generated by using the **ipv6 address auto link-local** command.

The **undo ipv6 address auto link-local** command deletes only the link-local addresses generated through the **ipv6 address auto link-local** command. If the **undo** command is executed on an interface with an IPv6 global unicast address configured, the interface still has a link-local address.

You can also manually assign an IPv6 link-local address for an interface by using the **ipv6 address link-local** command. Manual assignment takes precedence over automatic generation for IPv6 link-local addresses.

- If you first use automatic generation and then manual assignment, the manually assigned link-local address overwrites the automatically generated address.
- If you first use manual assignment and then automatic generation, both of the following occur:
  - The automatically generated link-local address does not take effect.
  - The link-local address of an interface is still the manually assigned address.

  If you delete the manually assigned address, the automatically generated link-local address takes effect.

Examples

Configure VLAN-interface 100 to automatically generate a link-local address.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address auto link-local
```

Related commands

ipv6 address link-local

ipv6 address eui-64

Use **ipv6 address eui-64** to configure an EUI-64 IPv6 address for an interface.

Use **undo ipv6 address eui-64** to delete an EUI-64 IPv6 address from an interface.

Syntax

ipv6 address { *ipv6-address prefix-length* | *ipv6-address/prefix-length* } **eui-64**

undo ipv6 address { *ipv6-address prefix-length* | *ipv6-address/prefix-length* } **eui-64**

Default

No EUI-64 IPv6 address is configured for an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address prefix-length: Specifies an IPv6 address and IPv6 prefix length. The *ipv6-address* and *prefix-length* arguments jointly specify the prefix of an EUI-64 IPv6 address. The value range for the *prefix-length* argument is 1 to 64. The IPv6 address and IPv6 prefix length support the following formats:

- *ipv6-address/prefix-length*. For example: 2001::1/64.
- *ipv6-address prefix-length*. For example: 2001::1 64.

Usage guidelines

An EUI-64 IPv6 address is generated based on the specified prefix and the automatically generated interface ID. To display the EUI-64 IPv6 address, use the **display ipv6 interface** command.

The prefix length of an EUI-64 IPv6 address cannot be greater than 64.

Examples

Configure an EUI-64 IPv6 address for VLAN-interface 100. The prefix of the address is the same as that of 2001::1/64, and the interface ID is generated based on the MAC address of the device.

Method 1:

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address 2001::1/64 eui-64
```

Method 2:

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address 2001::1 64 eui-64
```

Related commands

display ipv6 interface

ipv6 address link-local

Use **ipv6 address link-local** to configure a link-local address for the interface.

Use **undo ipv6 address link-local** to restore the default.

Syntax

ipv6 address { *ipv6-address* [*prefix-length*] | *ipv6-address/prefix-length* } **link-local**

undo ipv6 address { *ipv6-address* [*prefix-length*] | *ipv6-address/prefix-length* } **link-local**

Default

No link-local address is configured for the interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 link-local address. The first 10 bits of an address must be 1111111010 (binary). The first group of hexadecimals in the address must be FE80 to FEBF.

prefix-length: Specifies an IPv6 prefix length, in the range of 1 to 128.

Usage guidelines

Manual assignment takes precedence over automatic generation.

If you use automatic generation, and then use manual assignment, the manually assigned link-local address overwrites the one that is automatically generated.

If you use manual assignment and then use automatic generation, both of the following occur:

- The automatically generated link-local address does not take effect.
- The manually assigned link-local address of an interface remains.

After you delete the manually assigned address, the automatically generated link-local address takes effect. For automatic generation of an IPv6 link-local address, see the **ipv6 address auto link-local** command.

When you configure a link-local address, make sure the prefix length is equal to or greater than 10. Otherwise, the configuration fails.

Examples

Configure a link-local address for VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address fe80::1 link-local
```

Configure a link-local address for VLAN-interface 100 and set the prefix length to 64.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address fe80::1 64 link-local
```

Related commands

ipv6 address auto link-local

ipv6 address *prefix-number*

Use **ipv6 address** *prefix-number* to specify an IPv6 prefix for an interface to automatically generate an IPv6 global unicast address and advertise the prefix.

Use **undo ipv6 address** *prefix-number* to restore the default.

Syntax

ipv6 address *prefix-number sub-prefix/prefix-length*

undo ipv6 address *prefix-number*

Default

No IPv6 prefix is specified for IPv6 address autoconfiguration.

Views

Interface view

Predefined user roles

network-admin

Parameters

prefix-number: Specifies an IPv6 prefix by its ID in the range of 1 to 1024. The specified IPv6 prefix can be manually configured or obtained through DHCPv6.

sub-prefix: Specifies the sub-prefix bit and host bit for the IPv6 global unicast address.

prefix-length: Specifies the sub-prefix length in the range of 1 to 128.

Usage guidelines

This command enables an interface to automatically generate an IPv6 global unicast address based on the specified IPv6 prefix, sub-prefix bit, and host bit.

An interface can generate only one IPv6 global unicast address based on the prefix specified by using the **ipv6 address** command. To configure the interface to generate a new IPv6 address, execute the **undo ipv6 address** command to delete the configuration, and then execute the **ipv6 address** command.

Examples

Configure a static IPv6 prefix AAAA::/16 and assign ID 1 to the prefix. Configure VLAN-interface 100 to use this prefix to generate the IPv6 address AAAA:CCCC:DDDD::10/32 and advertise this prefix.

```
<Sysname> system-view
[Sysname] ipv6 prefix 1 AAAA::/16
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address 1 BBBB:CCCC:DDDD::10/32
```

Configure VLAN-interface 10 to obtain an IPv6 prefix through DHCPv6 and assign ID 2 to the obtained prefix. Configure VLAN-interface 100 to use the obtained prefix to generate the IPv6 address AAAA:CCCC:DDDD::10/32 and advertise the prefix.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 dhcp client pd 2 rapid-commit option-group 1
[Sysname-Vlan-interface10] quit
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 address 2 BBBB:CCCC:DDDD::10/32
```

Related commands

ipv6 prefix

ipv6 dhcp client pd

ipv6 hop-limit

Use **ipv6 hop-limit** to set the Hop Limit field in the IPv6 header.

Use **undo ipv6 hop-limit** to restore the default.

Syntax

ipv6 hop-limit *value*

undo ipv6 hop-limit

Default

The hop limit is 64.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the number of hops, in the range of 1 to 255.

Usage guidelines

The hop limit determines the number of hops that an IPv6 packet generated by the device can travel.

The device advertises the hop limit in RA messages. All RA message receivers use the advertised value to fill in the Hop Limit field for IPv6 packets to be sent. To disable the device from advertising the hop limit, use the **ipv6 nd ra hop-limit unspecified** command.

Examples

Set the maximum number of hops to 100.

```
<Sysname> system-view
[Sysname] ipv6 hop-limit 100
```

Related commands

ipv6 nd ra hop-limit unspecified

ipv6 hoplimit-expires enable

Use **ipv6 hoplimit-expires enable** to enable sending ICMPv6 time exceeded messages.

Use **undo ipv6 hoplimit-expires** to disable sending ICMPv6 time exceeded messages.

Syntax

ipv6 hoplimit-expires enable

undo ipv6 hoplimit-expires enable

Default

Sending ICMPv6 time exceeded messages is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

ICMPv6 time exceeded messages are sent to the source of IPv6 packets after the device discards IPv6 packets because hop or reassembly times out.

To prevent too many ICMPv6 error messages from affecting device performance, disable this feature. Even with the feature disabled, the device still sends fragment reassembly time exceeded messages.

Examples

Disable sending ICMPv6 time exceeded messages.

```
<Sysname> system-view
[Sysname] undo ipv6 hoplimit-expires enable
```

ipv6 icmpv6 error-interval

Use **ipv6 icmpv6 error-interval** to set the bucket size and the interval for tokens to arrive in the bucket for ICMPv6 error messages.

Use **undo ipv6 icmpv6 error-interval** to restore the default.

Syntax

ipv6 icmpv6 error-interval *interval* [*bucketsize*]

undo ipv6 icmpv6 error-interval

Default

The bucket allows a maximum of 10 tokens, and a token is placed in the bucket every 100 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval for tokens to arrive in the bucket. The value range is 0 to 2147483647 milliseconds. To disable the ICMPv6 rate limit, set the value to 0.

bucketsize: Specifies the maximum number of tokens allowed in the bucket. The value range is 1 to 200.

Usage guidelines

This command limits the rate at which ICMPv6 error messages are sent. Use this command to prevent network congestion caused by excessive ICMPv6 error messages generated within a short period. A token bucket algorithm is used with one token representing one ICMPv6 error message.

A token is placed in the bucket at intervals until the maximum number of tokens that the bucket can hold is reached.

A token is removed from the bucket when an ICMPv6 error message is sent. When the bucket is empty, ICMPv6 error messages are not sent until a new token is placed in the bucket.

Examples

Set the bucket size to 40 tokens and the interval for tokens to arrive in the bucket to 200 milliseconds for ICMPv6 error messages.

```
<Sysname> system-view
[Sysname] ipv6 icmpv6 error-interval 200 40
```

ipv6 icmpv6 multicast-echo-reply enable

Use **ipv6 icmpv6 multicast-echo-reply enable** to enable replying to multicast echo requests.

Use **undo ipv6 icmpv6 multicast-echo-reply** to restore the default.

Syntax

ipv6 icmpv6 multicast-echo-reply enable

undo ipv6 icmpv6 multicast-echo-reply enable

Default

The device is disabled from replying to multicast echo requests.

Views

System view

Predefined user roles

network-admin

Usage guidelines

If a host is configured to reply to multicast echo requests, an attacker can use this mechanism to attack the host. For example, the attacker can send an echo request to a multicast address with Host A as the source. All hosts in the multicast group will send echo replies to Host A.

To prevent attacks, do not enable the device to reply to multicast echo requests unless necessary.

Examples

Enable replying to multicast echo requests.

```
<Sysname> system-view
[Sysname] ipv6 icmpv6 multicast-echo-reply enable
```

ipv6 icmpv6 source

Use **ipv6 icmpv6 source** to specify a source IPv6 address for unsolicited ICMPv6 packets.

Use **undo ipv6 icmpv6 source** to restore the default.

Syntax

ipv6 icmpv6 source *ipv6-address*

undo ipv6 icmpv6 source

Default

No IPv6 source address is specified for unsolicited ICMPv6 packets.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 address.

Usage guidelines

For ICMPv6 echo requests, the source IPv6 address specified in the **ping ipv6** command has higher priority than the source IPv6 address specified in this command.

Examples

Specify IPv6 address 1::1 as the source address for unsolicited ICMPv6 packets.

```
<Sysname> system-view
[Sysname] ipv6 icmpv6 source 1::1
```

ipv6 mtu

Use **ipv6 mtu** to set the interface MTU for IPv6 packets.

Use **undo ipv6 mtu** to restore the default.

Syntax

ipv6 mtu *size*

undo ipv6 mtu

Default

The interface MTU is not configured.

Views

Interface view

Predefined user roles

network-admin

Parameters

size: Specifies the MTU size in bytes. The value range for this argument is 1280 to 1500.

Usage guidelines

If the size of a packet exceeds the MTU of the sending interface, the device discards the packet. If the device is an intermediate device, it also sends the source host an ICMPv6 Packet Too Big message with the MTU of the sending interface. The source host fragments the packets according to the MTU. To avoid this situation, set a proper interface MTU.

Examples

Set the interface MTU for IPv6 packets to 1280 bytes on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 mtu 1280
```

ipv6 nd autoconfig managed-address-flag

Use **ipv6 nd autoconfig managed-address-flag** to set the managed address configuration flag (M) to 1 in RA advertisements to be sent.

Use **undo ipv6 nd autoconfig managed-address-flag** to restore the default.

Syntax

ipv6 nd autoconfig managed-address-flag

undo ipv6 nd autoconfig managed-address-flag

Default

The M flag is set to **0** in RA advertisements. Hosts receiving the advertisements will obtain IPv6 addresses through stateless autoconfiguration.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The M flag in RA advertisements determines whether receiving hosts use stateful autoconfiguration to obtain IPv6 addresses.

- If the M flag is set to 1 in RA advertisements, receiving hosts use stateful autoconfiguration (for example, from an DHCPv6 server) to obtain IPv6 addresses.
- If the M flag is set to 0 in RA advertisements, receiving hosts use stateless autoconfiguration. Stateless autoconfiguration generates IPv6 addresses according to link-layer addresses and the prefix information in the RA advertisements.

Examples

Set the M flag to 1 in RA advertisements to be sent.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd autoconfig managed-address-flag
```

ipv6 nd autoconfig other-flag

Use **ipv6 nd autoconfig other-flag** to set the other stateful configuration flag (O) to 1 in RA advertisements to be sent.

Use **undo ipv6 nd autoconfig other-flag** to restore the default.

Syntax

ipv6 nd autoconfig other-flag

undo ipv6 nd autoconfig other-flag

Default

The O flag is set to **0** in RA advertisements. Hosts receiving the advertisements will acquire other information through stateless autoconfiguration.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The O flag in RA advertisements determines whether receiving hosts use stateful autoconfiguration to obtain configuration information other than IPv6 addresses.

- If the O flag is set to 1 in RA advertisements, receiving hosts use stateful autoconfiguration (for example, from a DHCPv6 server) to obtain configuration information other than IPv6 addresses.
- If the O flag is set to 0 in RA advertisements, receiving hosts use stateless autoconfiguration to obtain configuration information other than IPv6 addresses.

Examples

Set the O flag to 0 in RA advertisements to be sent.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] undo ipv6 nd autoconfig other-flag
```

ipv6 nd dad attempts

Use **ipv6 nd dad attempts** to set the number of attempts to send an NS message for DAD.

Use **undo ipv6 nd dad attempts** to restore the default.

Syntax

ipv6 nd dad attempts *times*

undo ipv6 nd dad attempts

Default

The number of attempts to send an NS message for DAD is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

times: Specifies the number of attempts to send an NS message for DAD, in the range of 0 to 600. If it is set to 0, DAD is disabled.

Usage guidelines

An interface sends an NS message for DAD after obtaining an IPv6 address.

If the interface does not receive a response within the time specified by using **ipv6 nd ns retrans-timer**, it resends an NS message.

If the interface receives no response after making the maximum sending attempts (set by using **ipv6 nd dad attempts**), the interface uses the obtained address.

Examples

Set the number of attempts to send an NS message for DAD to 20.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd dad attempts 20
```

Related commands

display ipv6 interface

ipv6 nd ns retrans-timer

ipv6 nd ns retrans-timer

Use **ipv6 nd ns retrans-timer** to set the interval for retransmitting an NS message.

Use **undo ipv6 nd ns retrans-timer** to restore the default.

Syntax

ipv6 nd ns retrans-timer *value*

undo ipv6 nd ns retrans-timer

Default

The local interface sends NS messages at every an interval of 1000 milliseconds, and the Retrans Timer field in the RA messages sent is 0. The interval for retransmitting an NS message is determined by the receiving device.

Views

Interface view

Predefined user roles

network-admin

Parameters

value: Specifies the interval value in the range of 1000 to 4294967295 milliseconds.

Usage guidelines

If a device does not receive a response from the peer within the specified interval, the device resends an NS message. The device retransmits an NS message at the specified interval and uses the interval value to fill the Retrans Timer field in RA messages to be sent.

Examples

Specify VLAN-interface 100 to retransmit NS messages every 10000 milliseconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ns retrans-timer 10000
```

Related commands

display ipv6 interface

ipv6 nd nud reachable-time

Use **ipv6 nd nud reachable-time** to set the neighbor reachable time on an interface.

Use **undo ipv6 nd nud reachable-time** to restore the default.

Syntax

ipv6 nd nud reachable-time *time*

undo ipv6 nd nud reachable-time

Default

The neighbor reachable time on the local interface is 1200000 milliseconds, and the value of the Reachable Time field in RA messages is 0. The reachable time is determined by the receiving device.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies the neighbor reachable time in the range of 1 to 3600000 milliseconds.

Usage guidelines

If the neighbor reachability detection shows that a neighbor is reachable, the device considers the neighbor reachable within the specified reachable time. If the device must send a packet to the neighbor after the specified reachable time expires, the device reconfirms whether the neighbor is reachable. The device sets the specified value as the neighbor reachable time on the local interface and uses the value to fill the Reachable Time field in RA messages to be sent.

Examples

Set the neighbor reachable time on VLAN-interface 100 to 10000 milliseconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
```

```
[Sysname-Vlan-interface100] ipv6 nd nud reachable-time 10000
```

ipv6 nd online-offline-log enable

Use **ipv6 nd online-offline-log enable** to enable ND logging for user online and offline events.

Use **undo ipv6 nd online-offline-log enable** to disable ND logging for user online and offline events.

Syntax

ipv6 nd online-offline-log enable [**rate** *rate*]

undo ipv6 nd online-offline-log enable

Default

ND logging for user online and offline events is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

rate *rate*: Specifies the maximum number of logs that can be output per second. The value range is 10 to 300. If you do not specify this option, the maximum log output rate is 100 logs per second.

Usage guidelines

A higher log output rate consumes more CPU resources. Adjust the log output rate based the CPU performance and usage.

Examples

Enable ND logging for user online and offline events, and set the maximum log output rate to 100 logs per second.

```
<Sysname> system-view
[Sysname] ipv6 nd online-offline-log enable rate 100
```

Related commands

ipv6 neighbor

ipv6 nd ra boot-file-url

Use **ipv6 nd ra boot-file-url** to specify the URL of the boot file in RA messages.

Use **undo ipv6 nd ra boot-file-url** to restore the default.

Syntax

ipv6 nd ra boot-file-url *url-string*

undo ipv6 nd ra boot-file-url

Default

RA messages do not carry the URL of the boot file.

Views

Interface view

Predefined user roles

network-admin

Parameters

url-string: Specifies the URL address of the boot file, a case-sensitive string of 1 to 127 characters. The URL address must be started with http://, https://. ftp://, or tftp://.

Usage guidelines

In some specific networks, a device follows the steps to implement automatic configuration:

1. Obtains an IPv6 address through ND or DHCPv6.
2. Obtains the URL address for downloading the boot file from the DHCPv6 server.
3. Downloads the boot file from the FTP server and installs it.

With the boot file URL specified in RA messages, the device can use the ND protocol to obtain both the IPv6 address and the boot file URL for automatic configuration. DHCPv6 is not required in the network, simplifying the network deployment.

Examples

Specify the boot file URL address as tftp://169.254.0.1/file/softimg.iso in RA messages on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra boot-file-url tftp://169.254.0.1/file/softimg.iso
```

ipv6 nd ra dns search-list

Use **ipv6 nd ra dns search-list** to specify DNS suffix information to be advertised in RA messages.

Use **undo ipv6 nd ra dns search-list** to remove a DNS suffix from RA message advertisement.

Syntax

ipv6 nd ra dns search-list *domain-name* [*seconds* | **infinite**] **sequence** *seqno*

undo ipv6 nd ra dns search-list *domain-name*

Default

DNS suffix information is not specified and RA messages do not carry DNS suffix options.

Views

Interface view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a DNS suffix. It is a dot-separated, case-insensitive string that can include letters, digits, hyphens (-), underscores (_), and dots (.), for example, aabbcc.com. The

DNS suffix can include a maximum of 253 characters, and each separated string includes no more than 63 characters.

seconds: Specifies the lifetime of the DNS suffix, in seconds. The value range is 4 to 4294967295. Value 4294967295 indicates that the lifetime of the DNS suffix is infinite.

infinite: Sets the lifetime of the DNS suffix to infinite.

seqno: Specifies the sequence number of the DNS suffix, in the range of 0 to 4294967295. The sequence number for a DNS suffix must be unique. A smaller sequence number represents a higher priority.

Usage guidelines

The DNS search list (DNSSL) option in RA messages provides DNS suffix information for hosts. The RA messages allow hosts to obtain their IPv6 addresses and the DNS suffix through stateless autoconfiguration. This method is useful in a network where DHCPv6 infrastructure is not provided.

The default lifetime of the DNS suffix is three times the maximum interval for advertising RA messages. To set the maximum interval, use the **ipv6 nd ra interval** command.

You can configure a maximum of eight DNS suffixes on an interface. One DNSSL option contains one DNS suffix. All DNSSL options are sorted in ascending order of the sequence number of the DNS suffix.

The sequence number uniquely identifies a DNS suffix. To modify a DNS suffix or its sequence number, you must first use the **undo ipv6 nd ra dns search-list** command to remove the DNS suffix from RA message advertisement.

After you execute the **ipv6 nd ra dns search-list** command, the device immediately sends an RA message with the existing and newly specified DNS suffix information.

After you execute the **undo ipv6 nd ra dns search-list** command, the device immediately sends two RA messages.

- The first RA message carries information about all DNS suffixes, including DNS suffixes specified in the **undo** command with their lifetime set to 0 seconds.
- The second RA message carries information about remaining DNS suffixes.

Each time the device sends an RA message from an interface, it immediately refreshes the RA message advertisement interval for that interface.

Examples

Specify the DNS suffix as **com**, the suffix lifetime as **infinite**, and the sequence number as **1** for RA messages on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra dns search-list com infinite sequence 1
```

ipv6 nd ra interval

ipv6 nd ra dns search-list suppress

Use **ipv6 nd ra dns search-list suppress** to enable DNS suffix suppression in RA messages.

Use **undo ipv6 nd ra dns search-list suppress** to disable DNS suffix suppression in RA messages.

Syntax

ipv6 nd ra dns search-list suppress

undo ipv6 nd ra dns search-list suppress

Default

DNS suffix suppression in RA messages is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command suppresses advertising DNS suffixes in RA messages.

RA messages are suppressed by default. To disable RA message suppression, use the **undo ipv6 nd ra halt** command.

Whether enabling this feature on an interface will trigger sending RA message immediately for DNS suffix update depends on the interface configuration:

- If the interface has been configured with DNS suffix information, the device immediately sends two RA messages. In the first message, the lifetime for DNS suffixes is 0 seconds. The second RA message does not carry any DNSSL options.
- If the interface has no DNS suffix information specified, no RA messages are triggered.
- If you specify a new DNS suffix or remove a DNS suffix, the device immediately sends an RA message without any DNSSL options.

Whether disabling this feature on an interface will trigger sending RA message immediately for DNS suffix update depends on the interface configuration:

- If the interface has been configured with the DNS suffix information, the device immediately sends an RA message carrying the DNS suffix information.
- If the interface has no DNS suffix information specified, no RA messages are triggered.

Each time the device sends an RA message from an interface, it immediately refreshes the RA message advertisement interval for that interface.

Examples

Enable DNS suffix suppression in RA messages on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra dns search-list suppress
```

Related commands

ipv6 nd ra dns search-list

ipv6 nd ra dns server

Use **ipv6 nd ra dns server** to specify DNS server information to be advertised in RA messages.

Use **undo ipv6 nd ra dns server** to remove a DNS server from RA message advertisement.

Syntax

ipv6 nd ra dns server *ipv6-address* [*seconds* | **infinite**] **sequence** *seqno*

undo ipv6 nd ra dns server *ipv6-address*

Default

DNS server information is not specified and RA messages do not carry DNS server options.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of the DNS server, which must be a global unicast address or a link-local address.

seconds: Specifies the lifetime of the DNS server, in seconds. The value range is 4 to 4294967295. Value 4294967295 indicates that the lifetime of the DNS server is infinite.

infinite: Sets the lifetime of the DNS server to infinite.

sequence *seqno*: Specifies the sequence number of the DNS server, in the range of 0 to 4294967295. The sequence number for a DNS server must be unique. A smaller sequence number represents a higher priority.

Usage guidelines

The DNS server option in RA messages provides DNS server information for hosts. The RA messages allow hosts to obtain their IPv6 addresses and the DNS server through stateless autoconfiguration. This method is useful in a network where DHCPv6 infrastructure is not provided.

The default lifetime of the DNS server is three times the maximum interval for advertising RA messages. To set the maximum interval, use the **ipv6 nd ra interval** command.

You can configure a maximum of eight DNS servers on an interface. One DNS server option contains one DNS server. All DNS server options are sorted in ascending order of the DNS server sequence number.

The sequence number uniquely identifies a DNS server. To modify the IPv6 address or sequence number of a DNS server, you must first use the **undo ipv6 nd ra dns server** command to remove the DNS server from RA message advertisement.

After you execute the **ipv6 nd ra dns server** command, the device immediately sends an RA message with the existing and newly specified DNS server options.

After you execute the **undo ipv6 nd ra dns server** command, the device immediately sends two RA messages.

- The first RA message carries information about all DNS servers, including the DNS servers specified in the **undo** command with their lifetime set to 0 seconds.
- The second RA message carries information about remaining DNS servers.

Each time the device sends an RA message from an interface, it immediately refreshes the RA message advertisement interval for that interface.

Examples

Specify the DNS server address as **2001:10::100**, the server lifetime as **infinite**, and the sequence number as **1** for RA messages on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra dns server 2001:10::100 infinite sequence 1
```

undo ipv6 nd ra dns server suppress

Default

DNS server suppression in RA messages is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command suppresses advertising DNS server addresses in RA messages.

RA messages are suppressed by default. To disable RA message suppression, use the **undo ipv6 nd ra halt** command.

Whether enabling this feature on an interface will trigger sending RA message immediately for DNS server information update depends on the interface configuration:

- If the interface has been configured with DNS server information or has obtained an AAA-authorized DNS server address, the device immediately sends two RA messages. In the first message, the lifetime for DNS server addresses is 0 seconds. The second RA message does not carry any DNS server options.
- If the interface has no DNS server information specified or no AAA-authorized DNS server address assigned, no RA messages are triggered.
- If you specify a new DNS server or remove a DNS server, the device immediately sends an RA message without any DNS server address options.

Whether disabling this feature on an interface will trigger sending RA message immediately for DNS server information update depends on the interface configuration:

- If the interface has been configured with the DNS server information or has obtained an AAA-authorized DNS server address, the device immediately sends an RA message carrying the DNS server information.
- If the interface has no DNS server information specified or no AAA-authorized DNS server address assigned, no RA messages are triggered.

Each time the device sends an RA message from an interface, it immediately refreshes the RA message advertisement interval for that interface.

Examples

Enable DNS server suppression in RA messages on VLAN-interface 100.

```
<Sysname> system-view
```

```
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra dns server suppress
```

Related commands

ipv6 nd ra dns server

ipv6 nd ra halt

Use **ipv6 nd ra halt** to suppress an interface from advertising RA messages.

Use **undo ipv6 nd ra halt** to disable this feature.

Syntax

ipv6 nd ra halt

undo ipv6 nd ra halt

Default

An interface is suppressed from sending RA messages.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable RA message suppression on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] undo ipv6 nd ra halt
```

ipv6 nd ra hop-limit unspecified

Use **ipv6 nd ra hop-limit unspecified** to specify unlimited hops in RA messages.

Use **undo ipv6 nd ra hop-limit unspecified** to restore the default.

Syntax

ipv6 nd ra hop-limit unspecified

undo ipv6 nd ra hop-limit unspecified

Default

The maximum number of hops in the RA messages is limited to 64.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

To set the maximum number of hops to a value rather than the default setting, use the **ipv6 hop-limit** command.

Examples

Specify unlimited hops in the RA messages on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 nd ra hop-limit unspecified
```

Related commands

ipv6 hop-limit

ipv6 nd ra interval

Use **ipv6 nd ra interval** to set the maximum and minimum intervals for advertising RA messages.

Use **undo ipv6 nd ra interval** to restore the default.

Syntax

ipv6 nd ra interval *max-interval min-interval*

undo ipv6 nd ra interval

Default

The maximum interval between RA messages is 600 seconds, and the minimum interval is 200 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

max-interval: Specifies the maximum interval value in seconds, in the range of 4 to 1800.

min-interval: Specifies the minimum interval value in the range of 3 seconds to three-fourths of the maximum interval.

Usage guidelines

The device advertises RA messages randomly between the maximum interval and the minimum interval.

The maximum interval for sending RA messages should be less than or equal to the router lifetime in RA messages.

Examples

Set the maximum interval for advertising RA messages to 1000 seconds and the minimum interval to 700 seconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra interval 1000 700
```

Related commands

ipv6 nd ra router-lifetime

ipv6 nd ra no-advlinkmtu

Use **ipv6 nd ra no-advlinkmtu** to turn off the MTU option in RA messages.

Use **undo ipv6 nd ra no-advlinkmtu** to restore the default.

Syntax

ipv6 nd ra no-advlinkmtu

undo ipv6 nd ra no-advlinkmtu

Default

RA messages contain the MTU option.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The MTU option in the RA messages specifies the link MTU to ensure that all nodes on the link use the same MTU.

Examples

Turn off the MTU option in RA messages on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra no-advlinkmtu
```

ipv6 nd ra prefix

Use **ipv6 nd ra prefix** to configure the prefix information in RA messages.

Use **undo ipv6 nd ra prefix** to restore the default.

Syntax

ipv6 nd ra prefix { *ipv6-prefix prefix-length* | *ipv6-prefix*/*prefix-length* } [*valid-lifetime preferred-lifetime* [**no-autoconfig** | **off-link** | **prefix-preference** *level*] * | **no-advertise**]

undo ipv6 nd ra prefix { *ipv6-prefix* | *ipv6-prefix*/*prefix-length* }

Default

No prefix information is configured for RA messages. Instead, the IPv6 address of the interface sending RA messages is used as the prefix information.

If the IPv6 address is manually configured, the prefix uses the fixed valid lifetime 2592000 seconds (30 days) and preferred lifetime 604800 seconds (7 days).

If the IPv6 address is automatically obtained (through DHCP, for example), the prefix uses the valid and preferred lifetime of the IPv6 address.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-prefix: Specifies the IPv6 prefix.

prefix-length: Specifies the prefix length of the IPv6 address.

valid-lifetime: Specifies the valid lifetime of a prefix, in the range of 0 to 4294967295 seconds. The default value is 2592000 seconds (30 days).

preferred-lifetime: Specifies the preferred lifetime of a prefix used for stateless autoconfiguration, in the range of 0 to 4294967295 seconds. The preferred lifetime cannot be longer than the valid lifetime. The default value is 604800 seconds (7 days).

no-autoconfig: Specifies a prefix not to be used for stateless autoconfiguration. If you do not specify this keyword, the prefix is used for stateless autoconfiguration.

off-link: Indicates that the address with the prefix is not directly reachable on the link. If you do not specify this keyword, the address with the prefix is directly reachable on the link.

prefix-preference *level*: Specifies the prefix preference. The *level* argument specifies the preference value in the range of 0 to 255. A larger value indicates a higher preference. The client selects an IPv6 prefix with the highest preference for address generation. If you do not specify this option, the RA message does not carry the preference for the prefix.

no-advertise: Disables the device from advertising the prefix specified in this command. If you do not specify this keyword, the device advertises the prefix specified in this command.

Usage guidelines

After hosts on the same link receive RA messages, they can use the prefix information in the RA messages for stateless autoconfiguration.

A prefix specified without a parameter in this command preferentially uses the default settings configured by using the **ipv6 nd ra prefix default** command. If the default settings are unavailable, the prefix uses the following settings:

- Valid lifetime of 2592000 seconds (30 days).
- Preferred lifetime of 604800 seconds (7 days).
- The prefix is used for stateless autoconfiguration.
- The address with the prefix is directly reachable on the link.
- The prefix is advertised in RA messages.

Examples

Configure the prefix information in RA messages on VLAN-interface 100.

Method 1:

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra prefix 2001:10::100/64 100 10
```

Method 2:

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra prefix 2001:10::100 64 100 10
```

ipv6 nd ra prefix default

Use **ipv6 nd ra prefix default** to configure the default settings for prefixes advertised in RA messages.

Use **undo ipv6 nd ra prefix default** to restore the default.

Syntax

ipv6 nd ra prefix default [*valid-lifetime preferred-lifetime* [**no-autoconfig** | **off-link**] * | **no-advertise**]

undo ipv6 nd ra prefix default

Default

No default settings are configured for prefixes advertised in RA messages.

Views

Interface view

Predefined user roles

network-admin

Parameters

valid-lifetime: Specifies the valid lifetime of a prefix, in the range of 0 to 4294967295 seconds. The default value is 2592000 seconds (30 days).

preferred-lifetime: Specifies the preferred lifetime of a prefix used for stateless autoconfiguration, in the range of 0 to 4294967295 seconds. The preferred lifetime cannot be longer than the valid lifetime. The default value is 604800 seconds (7 days).

no-autoconfig: Specifies a prefix not to be used for stateless autoconfiguration. If you do not specify this keyword, the prefix is used for stateless autoconfiguration.

off-link: Indicates that the address with the prefix is not directly reachable on the link. If you do not specify this keyword, the address with the prefix is directly reachable on the link.

no-advertise: Disables the device from advertising the prefix specified in this command. If you do not specify this keyword, the device advertises the prefix specified in this command.

Usage guidelines

This command specifies the default settings for the prefix specified by using the **ipv6 nd ra prefix** command. If none of the parameters (*valid-lifetime*, *preferred-lifetime*, **no-autoconfig**, **off-link**, and **no-advertise**) is configured in the **ipv6 nd ra prefix** command, the prefix uses the default settings.

Examples

Configure the default settings for prefixes advertised in RA messages on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra prefix default 100 10
```

ipv6 nd ra router-lifetime

Use **ipv6 nd ra router-lifetime** to set the router lifetime in RA messages.

Use **undo ipv6 nd ra router-lifetime** to restore the default.

Syntax

ipv6 nd ra router-lifetime *time*

undo ipv6 nd ra router-lifetime

Default

The router lifetime in RA messages is three times the maximum interval for advertising RA messages.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies the router lifetime in the range of 0 to 9000 seconds. If the value is set to 0, the router does not act as the default router.

Usage guidelines

The router lifetime in RA messages specifies how long the router sending the RA messages acts as the default router. Hosts receiving the RA messages check this value to determine whether to use the sending router as the default router. If the router lifetime is 0, the router cannot be used as the default router.

The router lifetime in RA messages must be greater than or equal to the advertising interval.

Examples

Set the router lifetime in RA messages on VLAN-interface 100 to 1000 seconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra router-lifetime 1000
```

Related commands

ipv6 nd ra interval

ipv6 nd router-preference

Use **ipv6 nd router-preference** to set a router preference in RA messages.

Use **undo ipv6 nd router-preference** to restore the default.

Syntax

ipv6 nd router-preference { **high** | **low** | **medium** }

undo ipv6 nd router-preference

Default

The router preference is **medium**.

Views

Interface view

Predefined user roles

network-admin

Parameters

high: Sets the router preference to the highest setting.

low: Sets the router preference to the lowest setting.

medium: Sets the router preference to the medium setting.

Usage guidelines

A hosts selects a router with the highest preference as the default router.

When router preferences are the same in RA messages, a host selects the router corresponding to the first received RA message as the default gateway.

Examples

Set the router preference in RA messages to the highest on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd router-preference high
```

ipv6 nd snooping dad retrans-timer

Use **ipv6 nd snooping dad retrans-timer** to set the interval for retransmitting an NS message for DAD.

Use **undo ipv6 nd snooping dad retrans-timer** to restore the default.

Syntax

ipv6 nd snooping dad retrans-timer *interval*

undo ipv6 nd snooping dad retrans-timer

Default

The interval for retransmitting an NS message for DAD is 250 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval for retransmitting an NS message for DAD, in the range of 100 to 500 milliseconds.

Usage guidelines

When creating, updating, or deleting an ND snooping entry, the device sends an NS message to test the entry by DAD. When both of the following conditions exist, the device retransmits an NS message by default:

- The device does not receive a reply within the retransmission interval.
- The retransmission interval is less than or equal to the timeout time for ND snooping entries in INVALID status (TENTATIVE, TESTING_TPLT, or TESTING_VP).

For the device to send the NS message only once, set a retransmission interval longer than the timeout time for ND snooping entries in INVALID status.

Example

Set the interval to 200 milliseconds for retransmitting an NS message for DAD.

```
<Sysname> system-view
[Sysname] ipv6 nd snooping dad retrans-timer 200
```

ipv6 nd snooping enable global

Use **ipv6 nd snooping enable global** to enable ND snooping for global unicast addresses.

Use **undo ipv6 nd snooping enable global** to disable ND snooping for global unicast addresses.

Syntax

ipv6 nd snooping enable global

undo ipv6 nd snooping enable global

Default

ND snooping is disabled for global unicast addresses.

<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] ipv6 nd snooping enable link-local
```

ipv6 nd snooping glean source

Use **ipv6 nd snooping glean source** to enable ND snooping for data packets from unknown sources.

Use **undo ipv6 nd snooping glean source** to disable ND snooping for data packets from unknown sources.

Syntax

ipv6 nd snooping glean source

undo ipv6 nd snooping glean source

Default

ND snooping is disabled for data packets from unknown sources.

Views

VLAN view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to learn ND snooping entries from data packets originated by unknown sources.

For this command to take effect, execute the **ipv6 nd snooping enable global** command or the **ipv6 nd snooping enable link-local** command.

Before enabling ND snooping entries learning from data packets for a VLAN, you must configure IPv6 source guard on all untrusted interfaces in the same VLAN. This operation ensures correct forwarding of the data packets received all these interfaces.

Examples

Enable ND snooping for data packets from unknown sources.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] ipv6 nd snooping glean source
```

ipv6 nd snooping lifetime

Use **ipv6 nd snooping lifetime** to set timeout timers for ND snooping entries.

Use **undo ipv6 nd snooping lifetime** to restore the default.

Syntax

ipv6 nd snooping lifetime { **invalid** *invalid-lifetime* | **valid** *valid-lifetime* }

undo ipv6 nd snooping lifetime { **invalid** | **valid** }

Default

The timeout timer for ND snooping entries in INVALID status (TENTATIVE, TESTING_TPLT, or TESTING_VP) is 500 milliseconds.

The timeout timer for ND snooping entries in VALID status is 300 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

invalid *invalid-lifetime*: Sets a timeout timer for ND snooping entries in INVALID status (TENTATIVE, TESTING_TPLT, or TESTING_VP). The value range is 250 to 1000 milliseconds.

valid *valid-lifetime*: Sets a timeout timer for ND snooping entries in VALID status. The value range is 60 to 900 seconds.

Examples

Set the timeout timer to 250 seconds for ND snooping entries in VALID status.

```
<Sysname> system-view
[Sysname] ipv6 nd snooping lifetime valid 250
```

ipv6 nd snooping max-learning-num

Use **ipv6 nd snooping max-learning-num** to set the ND snooping entry learning limit for an interface.

Use **undo ipv6 nd snooping max-learning-num** to restore the default.

Syntax

ipv6 nd snooping max-learning-num *max-number*

undo ipv6 nd snooping max-learning-num

Default

An interface can learn a maximum of 1024 ND snooping entries.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of ND snooping entries that an interface can learn. The value range for this argument is 1 to 1024.

Usage guidelines

An interface can learn ND snooping entries. The learning limit is limited by the ND snooping entry learning limit for all VLANs. To set the learning limit for all VLANs, use the **ipv6 nd snooping vlan max-learning-num** command.

Examples

Allow GigabitEthernet 1/0/1 to learn a maximum of 64 ND snooping entries.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 nd snooping max-learning-num 64
```

ipv6 nd snooping uplink

Use **ipv6 nd snooping uplink** to configure the port as an ND snooping uplink port. The ND snooping uplink port cannot learn ND snooping entries.

Use **undo ipv6 nd snooping uplink** to restore the default.

Syntax

ipv6 nd snooping uplink

undo ipv6 nd snooping uplink

Default

The port is not an ND snooping uplink port. After ND snooping is enabled, the port can learn ND snooping entries.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Examples

Configure GigabitEthernet 1/0/1 as an ND snooping uplink port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 nd snooping uplink
```

Configure Bridge-aggregation 1 as an ND snooping uplink port.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] ipv6 nd snooping uplink
```

ipv6 nd user-ip-conflict record enable

Use **ipv6 nd user-ip-conflict record enable** to enable recording user IPv6 address conflicts.

Use **undo ipv6 nd user-ip-conflict record enable** to disable recording user IPv6 address conflicts.

Syntax

ipv6 nd user-ip-conflict record enable

undo ipv6 nd user-ip-conflict record enable

Default

Recording user IPv6 address conflicts is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature detects and records user IPv6 address conflicts. A conflict occurs if an incoming NA packet has the same source IPv6 address as an existing ND entry but a different source MAC address. The device generates a user IPv6 address conflict record, logs the conflict, and sends the log to the information center. For information about the log destination and output rule configuration in the information center, see the information center in *Network Management and Monitoring Configuration Guide*.

Each IRF member device can generate a maximum of 10 user IPv6 address conflict logs per second. When this maximum number is reached, the member device suppresses generating user IPv6 address conflict logs and records the suppression times. Each IRF member device can save a maximum of 200 user IPv6 address conflict records.

When the number of saved user IPv6 address conflict records reaches the upper limit, new records overwrite old ones.

Examples

Enable recording user IPv6 address conflicts.

```
<Sysname> system-view
[Sysname] ipv6 nd user-ip-conflict record enable
```

Related commands

display ipv6 nd user-ip-conflict record

ipv6 nd user-move record enable

Use **ipv6 nd user-move record enable** to enable recording user port migrations.

Use **undo ipv6 nd user-move record enable** to disable recording user port migrations.

Syntax

ipv6 nd user-move record enable

undo ipv6 nd user-move record enable

Default

Recording user port migrations is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature enables the device to detect and record user port migrations. A user port migrates if an incoming NA packet has the same source IPv6 address and source MAC address as an existing ND entry but a different port. The device generates a user port migration record, logs the migration event, and sends the log to the information center. For information about the log destination and output rule configuration in the information center, see the information center in *Network Management and Monitoring Configuration Guide*.

Each IRF member device can generate a maximum of 10 user port migration logs per second. When this maximum number is reached, the member device suppresses generating user port migration logs and records the suppression times. Each IRF member device can save a maximum of 200 user port migration records.

When the number of saved user port migration records reaches the upper limit, new records overwrite old ones.

Examples

Enable recording user port migrations.

```
<Sysname> system-view
[Sysname] ipv6 nd user-move record enable
```

Related commands

display ipv6 nd user-move record

ipv6 neighbor

Use **ipv6 neighbor** to configure a static neighbor entry.

Use **undo ipv6 neighbor** to delete a neighbor entry.

Syntax

ipv6 neighbor *ipv6-address mac-address* { *vlan-id port-type port-number* | **interface** *interface-type interface-number* }

undo ipv6 neighbor *ipv6-address interface-type interface-number*

Default

No static neighbor entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of the static neighbor entry.

mac-address: Specifies the MAC address (48 bits) of the static neighbor entry, in the format of H-H-H.

vlan-id: Specifies the VLAN ID of the static neighbor entry, in the range of 1 to 4094.

port-type port-number: Specifies a Layer 2 port of the static neighbor entry by its type and number.

interface *interface-type interface-number*: Specifies a Layer 3 interface of the static neighbor entry by its type and number.

Usage guidelines

A neighbor entry stores information about a link-local node. The entry can be created dynamically through NS and NA messages, or configured statically.

The device uniquely identifies a static neighbor entry by using the neighbor's IPv6 address and the number of the Layer 3 interface that connects to the neighbor. You can configure a static neighbor entry by using either of the following methods:

- **Method 1**—Associate a neighbor IPv6 address and link-layer address with the Layer 3 interface of the local node.
- **Method 2**—Associate a neighbor IPv6 address and link-layer address with a Layer 2 port in a VLAN containing the local node.

You can use either of the previous configuration methods to configure a static neighbor entry for a VLAN interface.

- If Method 1 is used, the neighbor entry is in INCMP state. After the device obtains the corresponding Layer 2 port information, the neighbor entry goes into REACH state.
- If Method 2 is used, the port specified by *port-type port-number* must belong to the VLAN specified by *vlan-id* and the corresponding VLAN interface must already exist. After the static neighbor entry is configured, the device associates the VLAN interface with the IPv6 address to uniquely identify the static neighbor entry. The entry will be in REACH state.

You can use the **undo ipv6 neighbor** command to delete both static and dynamic neighbor entries.

To delete a neighbor entry for a VLAN interface, specify only the corresponding VLAN interface.

Examples

Configure a static neighbor entry for VLAN-interface 1.

```
<Sysname> system-view
[Sysname] ipv6 neighbor 2000::1 fe-e0-89 interface Vlan-interface 1
```

Related commands

display ipv6 neighbors

reset ipv6 neighbors

ipv6 neighbor link-local minimize

Use **ipv6 neighbor link-local minimize** to minimize link-local ND entries.

Use **undo ipv6 neighbor link-local minimize** to restore the default.

Syntax

ipv6 neighbor link-local minimize

undo ipv6 neighbor link-local minimize

Default

All ND entries are assigned to the driver.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Perform this command to minimize link-local ND entries assigned to the driver. Link-local ND entries refer to ND entries that contain link-local addresses.

With this feature enabled, the device does not add newly learned link-local ND entries whose link local addresses are not the next hop of any route to the driver. This saves driver resources.

This feature affects only newly learned link-local ND entries rather than existing ND entries.

Examples

Minimize link-local ND entries.

```
<Sysname> system-view
[Sysname] ipv6 neighbor link-local minimize
```

ipv6 neighbor stale-aging

Use **ipv6 neighbor stale-aging** to set the aging timer for ND entries in stale state.

Use **undo ipv6 neighbor stale-aging** to restore the default.

Syntax

ipv6 neighbor stale-aging *aging-time*

undo ipv6 neighbor stale-aging

Default

The aging timer for ND entries in stale state is 240 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

aging-time: Specifies the aging timer for ND entries in stale state, in the range of 1 to 1440 minutes.

Usage guidelines

This aging time applies to all ND entries in stale state. If an ND entry in stale state is not updated before the timer expires, it changes to the delay state. If it is still not updated in 5 seconds, the ND entry changes to the probe state. The device sends an NS message for detection a maximum of three attempts by default. If no response is received, the device deletes the ND entry.

You can set the aging timer for ND entries in stale state in system view and interface view. For ND entries in stale state on an interface, the aging timer in interface view has higher priority than the aging timer in system view.

Examples

Set the aging timer for ND entries in stale state to 120 minutes.

```
<Sysname> system-view
[Sysname] ipv6 neighbor stale-aging 120
```

Related commands

ipv6 neighbor timer stale-aging

ipv6 neighbor timer stale-aging

Use **ipv6 neighbor timer stale-aging** to set the aging timer for ND entries in stale state on an interface.

Use **undo ipv6 neighbor timer stale-aging** to restore the default.

Syntax

ipv6 neighbor timer stale-aging *aging-time*

undo ipv6 neighbor timer stale-aging

Default

The aging timer of ND entries in stale state is not configured on an interface. The aging timer is determined by the configuration of the **ipv6 neighbor stale-aging** command in system view.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

aging-time: Specifies the aging timer for ND entries in stale state on an interface. The value range is 1 to 1440 minutes.

Usage guidelines

This aging timer applies to ND entries in stale state on the interface. If an ND entry in stale state is not updated before the timer expires, it changes to the delay state. If it is still not updated in 5

seconds, the ND entry changes to the probe state. The device sends an NS message for probe and a maximum of three attempts is allowed by default. If no response is received, the device deletes the ND entry.

You can set the aging timer for ND entries in stale state in system view and interface view. For ND entries in stale state on an interface, the aging timer in interface view has higher priority than the aging timer in system view.

Examples

On VLAN-interface 2, set the aging timer to 200 minutes for ND entries in stale state.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 neighbor timer stale-aging 200
```

Related commands

ipv6 neighbor stale-aging

ipv6 neighbors max-learning-num

Use **ipv6 neighbors max-learning-num** to set the dynamic neighbor entry learning limit for an interface. This prevents the interface from occupying too many neighbor table resources.

Use **undo ipv6 neighbors max-learning-num** to restore the default.

Syntax

ipv6 neighbors max-learning-num *max-number*

undo ipv6 neighbors max-learning-num

Default

The following table describes the maximum number of dynamic neighbor entries that an interface can learn on different switches:

Hardware	Maximum value for an interface
S5000V3-EI switch series S5000V5-EI switch series S5000E-X switch series S5000X-EI switch series WAS6000 switch series	64

Views

Layer 2 interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of dynamic neighbor entries that an interface can learn. The following table describes the value ranges for this argument on different switch series:

Hardware	Maximum value for an interface
S5000V3-EI switch series S5000V5-EI switch series S5000E-X switch series S5000X-EI switch series WAS6000 switch series	0 to 64
S5110V2 switch series S5110V2-SI switch series WS5810-WiNet switch series	0 to 128
S5120V2-LI switch series S5130S-LI switch series S5120V3-SI switch series MS4320V2 switch series MS4320 switch series	0 to 256
S3100V3-SI switch series	• 0 to 128: LS-3100V3-28TP-SI-H1, LS-3100V3-18TP-SI-H1, LS-3100V3-52TP-SI-H1,

Hardware	Maximum value for an interface
	LS-3100V3-20TP-PWR-SI-H1 • 0 to 256: Other models.
MS4200 switch series	• 0 to 128: LS-MS4200-28TP-H1, LS-MS4200-20TP-PWR-H1, LS-MS4200-18TP-H1 • 0 to 256: Other models.
WS5820-WiNet switch series	• 0 to 128: WS5820-28P-POE-WiNet • 0 to 256: Other models.
MS4300V2 switch series	• 0 to 128: MS4300V2-28P and MS4300V2-52P • 0 to 256: MS4300V2-10P
MS4320V3 switch series	• 0 to 128: MS4320V3-28P and MS4320V3-52P • 0 to 256: Other models.

S5120V3-LI switch series	• 0 to 128:
	  ○ S5120V3-20P-LI
	  ○ S5120V3-28P-LI
	  ○ S5120V3-52P-LI
	  ○ S5120V3-28P-PWR-LI
	  ○ S5120V3-52P-LI
	• 0 to 256: Other models.

Usage guidelines

The device can dynamically acquire the link-layer address of a neighboring node through NS and NA messages and add it into the neighbor table.

When the number of dynamic neighbor entries reaches the learning limit on an interface, the interface stops learning neighbor information.

Examples

Allow VLAN-interface 100 to learn a maximum of 10 dynamic neighbor entries.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 neighbors max-learning-num 10
```

ipv6 pathmtu

Use **ipv6 pathmtu** to set a static Path MTU for an IPv6 address.

Use **undo ipv6 pathmtu** to delete the Path MTU configuration for an IPv6 address.

Syntax

ipv6 pathmtu *ipv6-address value*

undo ipv6 pathmtu *ipv6-address*

Default

No static Path MTU is set.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 address.

value: Specifies the Path MTU of the specified IPv6 address, in the range of 1280 to 10240 bytes.

Usage guidelines

You can set a static Path MTU for a destination IPv6 address. When a source host sends a packet through an interface, it compares the interface MTU with the static Path MTU of the specified destination IPv6 address. If the packet size is larger than the smaller one of the two values, the host fragments the packet according to the smaller value.

Examples

Set a static Path MTU for an IPv6 address.

```
<Sysname> system-view
[Sysname] ipv6 pathmtu fe80::12 1300
```

Related commands

display ipv6 pathmtu

reset ipv6 pathmtu

ipv6 pathmtu age

Use **ipv6 pathmtu age** to set the aging time for a dynamic Path MTU.

Use **undo ipv6 pathmtu age** to restore the default.

Syntax

ipv6 pathmtu age *age-time*

undo ipv6 pathmtu age

Default

The aging time for dynamic Path MTU is 10 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

age-time: Specifies the aging time for Path MTU in minutes, in the range of 10 to 100.

Usage guidelines

After the path MTU from a source host to a destination host is dynamically determined, the source host sends subsequent packets to the destination host based on this MTU. After the aging time expires, the following events occur:

- The dynamic Path MTU is removed.
- The source host determines a dynamic path MTU through the Path MTU mechanism again.

The aging time is invalid for a static Path MTU.

Examples

Set the aging time for a dynamic Path MTU to 40 minutes.

```
<Sysname> system-view
[Sysname] ipv6 pathmtu age 40
```

Related commands

display ipv6 pathmtu

ipv6 prefer temporary-address

Use **ipv6 prefer temporary-address** to enable the system to preferentially use the temporary IPv6 address of the sending interface as the source address of a packet.

Use **undo ipv6 prefer temporary-address** to disable the system to preferentially use the temporary IPv6 address of the sending interface as the source address of a packet.

Syntax

ipv6 prefer temporary-address

undo ipv6 prefer temporary-address

Default

The system is disabled to preferentially use the temporary IPv6 address of the sending interface as the source address of a packet.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The temporary address feature enables the system to generate and preferentially use the temporary IPv6 address of the sending interface as the source address of a packet. If the temporary IPv6 address cannot be used because of a DAD conflict, the system uses the public IPv6 address.

Examples

Enable the system to preferentially use the temporary IPv6 address of the sending interface as the source address of the packet.

```
<Sysname> system-view
[Sysname] ipv6 prefer temporary-address
```

Related commands

ipv6 address auto

ipv6 nd ra prefix

ipv6 temporary-address

ipv6 prefix

Use **ipv6 prefix** to configure a static IPv6 prefix.

Use **undo ipv6 prefix** to delete a static IPv6 prefix.

Syntax

ipv6 prefix *prefix-number ipv6-prefix/prefix-length*

undo ipv6 prefix *prefix-number*

Default

No static IPv6 prefix is configured.

Views

System view

Predefined user roles

network-admin

Parameters

prefix-number: Specifies a prefix ID in the range of 1 to 1024.

ipv6-prefix/prefix-length: Specifies a prefix and its length. The value range for the *prefix-length* argument is 1 to 128.

Usage guidelines

To modify an existing static prefix, execute the **undo ipv6 prefix** command to delete the existing static prefix, and then execute the **ipv6 prefix** command.

Dynamic IPv6 prefixes obtained from DHCPv6 servers cannot be manually removed or modified.

A static IPv6 prefix can have the same prefix ID with a dynamic IPv6 prefix, but the static one takes precedence over the dynamic one.

Examples

Create static IPv6 prefix 2001:0410::/32 with prefix ID 1.

```
<Sysname> system-view
[Sysname] ipv6 prefix 1 2001:0410::/32
```

Related commands

display ipv6 prefix

ipv6 reassemble local enable

Use **ipv6 reassemble local enable** to enable IPv6 local fragment reassembly.

Use **undo ipv6 reassemble local enable** to disable IPv6 local fragment reassembly.

Syntax

ipv6 reassemble local enable

undo ipv6 reassemble local enable

Default

IPv6 local fragment reassembly is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Configure this command on a multichassis IRF fabric to improve fragment reassembly efficiency. The command enables the subordinate to reassemble the IPv6 fragments of a packet if all the

fragments arrive at it. If this feature is disabled, all IPv6 fragments are delivered to the master for reassembly. The command applies only to fragments destined for the same subordinate.

Examples

Enable IPv6 local fragment reassembly.

```
<Sysname> system-view
[Sysname] ipv6 reassemble local enable
```

ipv6 redirects enable

Use **ipv6 redirects enable** to enable sending ICMPv6 redirect messages.

Use **undo ipv6 redirects enable** to disable sending ICMPv6 redirect messages.

Syntax

ipv6 redirects enable

undo ipv6 redirects enable

Default

Sending ICMPv6 redirect messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The default gateway sends an ICMPv6 redirect message to the source of an IPv6 packet to inform the source of a better first hop.

Sending ICMPv6 redirect messages enables hosts that hold few routes to establish routing tables and find the best route. Because this feature adds host routes into the routing tables, host performance degrades when there are too many host routes. As a result, sending ICMPv6 redirect messages is disabled by default.

Examples

Enable sending ICMPv6 redirect messages.

```
<Sysname> system-view
[Sysname] ipv6 redirects enable
```

ipv6 temporary-address

Use **ipv6 temporary-address** to enable the temporary IPv6 address feature.

Use **undo ipv6 temporary-address** to restore the default.

Syntax

ipv6 temporary-address [*valid-lifetime preferred-lifetime*]

undo ipv6 temporary-address

Default

The system does not generate any temporary IPv6 address.

Views

System view

Predefined user roles

network-admin

Parameters

valid-lifetime: Specifies the valid lifetime for temporary IPv6 addresses, in the range of 600 to 4294967295 seconds. The default valid lifetime is 604800 seconds (7 days).

preferred-lifetime: Specifies the preferred lifetime for temporary IPv6 addresses, in the range of 600 to 4294967295 seconds. The default preferred lifetime is 86400 seconds (1 day).

Usage guidelines

You must enable stateless autoconfiguration before enabling the temporary address feature.

The valid lifetime for temporary IPv6 addresses must be greater than or equal to the preferred lifetime for temporary IPv6 addresses.

In stateless address autoconfiguration, an interface automatically generates an IPv6 global unicast address by using the address prefix in the received RA message and the interface ID. On an IEEE 802 interface (such as an Ethernet interface or a VLAN interface), the interface ID is generated based on the interface's MAC address and is globally unique. An attacker can exploit this rule to easily identify the sending device.

To fix the vulnerability, you can enable the temporary address feature. An IEEE 802 interface generates the following addresses:

- **Public IPv6 address**—Includes an address prefix in the RA message and a fixed interface ID generated based on the interface's MAC address.
- **Temporary IPv6 address**—Includes an address prefix in the RA message and a random interface ID generated through MD5.

When the valid lifetime of a temporary IPv6 address expires, the system deletes the address and generates a new one. This enables the system to send packets with different source addresses through the same interface. The preferred lifetime and valid lifetime for a temporary IPv6 address are determined as follows:

- The preferred lifetime of a temporary IPv6 address takes the smaller of the following values:
  - The preferred lifetime of the address prefix in the RA message.
  - The preferred lifetime configured for temporary IPv6 addresses minus DESYNC_FACTOR (a random number in the range of 0 to 600 seconds).
- The valid lifetime of a temporary IPv6 address takes the smaller of the following values:
  - The valid lifetime of the address prefix.
  - The valid lifetime configured for temporary IPv6 addresses.

Examples

Enable the system to generate a temporary IPv6 address.

```
<Sysname> system-view
[Sysname] ipv6 temporary-address
```

Related commands

reset ipv6 nd snooping vlan

Use **reset ipv6 nd snooping vlan** to clear ND snooping entries in VLANs.

Syntax

reset ipv6 nd snooping vlan { [*vlan-id*] [**global** | **link-local**] | *vlan-id ipv6-address* }

Views

User view

Predefined user roles

network-admin

Parameters

vlan-id: Clears ND snooping entries for the specified VLAN. The value range for the VLAN ID is 1 to 4094.

global: Clears ND snooping entries for global unicast addresses.

link-local: Clears ND snooping entries for link-local addresses.

vlan-id ipv6-address: Clears the ND snooping entry of the specified IPv6 address in the specified VLAN.

Usage guidelines

If you do not specify any parameters, this command clears ND snooping entries in all VLANs.

Examples

Clear ND snooping entries in all VLANs.

```
<Sysname> reset ipv6 nd snooping vlan
```

Related commands

display ipv6 nd snooping count vlan
display ipv6 nd snooping vlan

reset ipv6 neighbors

Use **reset ipv6 neighbors** to clear IPv6 neighbor information.

Syntax

reset ipv6 neighbors { **all** | **dynamic** | **interface** *interface-type interface-number* | **slot** *slot-number* | **static** }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears static and dynamic neighbor information for all interfaces.

dynamic: Clears dynamic neighbor information for all interfaces.

interface *interface-type interface-number*: Clears dynamic neighbor information for the interface specified by its type and number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears dynamic neighbor information for all member devices.

static: Clears static neighbor information for all interfaces.

Examples

Clear neighbor information for all interfaces.

```
<Sysname> reset ipv6 neighbors all
This will delete all the entries. Continue? [Y/N]:Y
```

Clear dynamic neighbor information for all interfaces.

```
<Sysname> reset ipv6 neighbors dynamic
This will delete all the dynamic entries. Continue? [Y/N]:Y
```

Clear all neighbor information for GigabitEthernet 1/0/1.

```
<Sysname> reset ipv6 neighbors interface gigabitethernet 1/0/1
This will delete all the dynamic entries by the interface you specified. Continue? [Y/N]:Y
```

Related commands

reset ipv6 pathmtu

Use **reset ipv6 pathmtu** to clear the Path MTU information.

Syntax

reset ipv6 pathmtu { **all** | **dynamic** | **static** }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears all Path MTUs.

dynamic: Clears all dynamic Path MTUs.

static: Clears all static Path MTUs.

Examples

Clear all Path MTUs.

```
<Sysname> reset ipv6 pathmtu all
```

Related commands

display ipv6 pathmtu

reset ipv6 statistics

Use **reset ipv6 statistics** to clear IPv6 and ICMPv6 packet statistics.

Syntax

reset ipv6 statistics [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears IPv6 and ICMPv6 packet statistics for all member devices.

Examples

Clear IPv6 and ICMPv6 packet statistics.

```
<Sysname> reset ipv6 statistics
```

Related commands

display ipv6 statistics

Contents

DHCPv6 commands

Common DHCPv6 commands

display ipv6 dhcp duid

Use **display ipv6 dhcp duid** to display the DUID of the local device.

Syntax

display ipv6 dhcp duid

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

A DHCP unique identifier (DUID) uniquely identifies a DHCPv6 device (DHCPv6 client, server, or relay agent). A DHCPv6 device adds its DUID in a sent packet.

This command displays output only after the DHCPv6 process is running on the device.

Examples

Display the DUID of the local device.

```
<Sysname> display ipv6 dhcp duid
The DUID of this device: 0003000100e0fc005552.
```

ipv6 dhcp advertise pd-route

Use **ipv6 dhcp advertise pd-route** to enable the DHCPv6 server or DHCPv6 relay agent to advertise IPv6 prefixes.

Use **undo ipv6 dhcp advertise pd-route** to disable the DHCPv6 server or DHCPv6 relay agent from advertising IPv6 prefixes.

Syntax

ipv6 dhcp advertise pd-route

undo ipv6 dhcp advertise pd-route

Default

The DHCPv6 server or DHCPv6 relay agent does not advertise IPv6 prefixes.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A DHCPv6 client can obtain an IPv6 prefix through DHCPv6 and use the IPv6 prefix for IPv6 address assignment in a downstream network. If the IPv6 prefix is in a different subnet than the IPv6 address of the DHCPv6 client's upstream interface, the downstream network cannot access the external network. You can use this command to configure the DHCPv6 server or DHCPv6 relay agent, whichever is on the same link as the DHCPv6 client, to advertise the IPv6 prefix.

To use this command on the DHCPv6 relay agent, you must enable the DHCPv6 relay agent to record DHCPv6 relay entries first.

Examples

Enable the DHCPv6 server to advertise IPv6 prefixes.

```
<Sysname> system-view
[Sysname] ipv6 dhcp advertise pd-route
```

ipv6 dhcp dscp

Use **ipv6 dhcp dscp** to set the DSCP value for the DHCPv6 packets sent by the DHCPv6 server or the DHCPv6 relay agent.

Use **undo ipv6 dhcp dscp** to restore the default.

Syntax

ipv6 dhcp dscp *dscp-value*

undo ipv6 dhcp dscp

Default

The DSCP value is 56 in DHCPv6 packets sent by the DHCPv6 server or the DHCPv6 relay agent.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value for DHCPv6 packets, in the range of 0 to 63.

Usage guidelines

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for DHCPv6 packets sent by the DHCPv6 server or the DHCPv6 relay agent.

```
<Sysname> system-view
[Sysname] ipv6 dhcp dscp 30
```

ipv6 dhcp log enable

Use **ipv6 dhcp log enable** to enable DHCPv6 server logging.

Use **undo ipv6 dhcp log enable** to disable DHCPv6 server logging.

Syntax

ipv6 dhcp log enable

undo ipv6 dhcp log enable

Default

DHCPv6 server logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the DHCPv6 server to generate DHCPv6 logs and send them to the information center. The log information helps administrators locate and solve problems. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

As a best practice, disable this feature if the log generation affects the device performance or reduces the address and prefix allocation efficiency. For example, this situation might occur when a large number of clients frequently come online or go offline.

Examples

Enable DHCPv6 server logging.

```
<Sysname> system-view
[Sysname] ipv6 dhcp log enable
```

ipv6 dhcp select

Use **ipv6 dhcp select** to enable the DHCPv6 server or DHCPv6 relay agent on an interface.

Use **undo ipv6 dhcp select** to restore the default.

Syntax

ipv6 dhcp select { **relay** | **server** }

undo ipv6 dhcp select

Default

An interface does not work in the DHCPv6 server mode or in the DHCPv6 relay agent mode. It discards DHCPv6 packets from DHCPv6 clients.

Views

Interface view

Predefined user roles

network-admin

Parameters

relay: Enables the DHCPv6 relay agent on the interface.

server: Enables the DHCPv6 server on the interface.

Usage guidelines

Before changing the DHCPv6 server mode to the DHCPv6 relay agent mode on an interface, use the following commands to remove IPv6 address/prefix bindings:

- **reset ipv6 dhcp server ip-in-use**
- **reset ipv6 dhcp server pd-in-use**

Do not configure the DHCPv6 client on the interface that has been configured as the DHCPv6 relay agent or DHCPv6 server.

Examples

Enable the DHCPv6 server on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 dhcp select server
```

Enable the DHCPv6 relay agent on VLAN-interface 20.

```
<Sysname> system-view
[Sysname] interface vlan-interface 20
[Sysname-Vlan-interface20] ipv6 dhcp select relay
```

Related commands

display ipv6 dhcp relay server-address

display ipv6 dhcp server

DHCPv6 server commands

NOTE:

S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 do not support the DHCPv6 server functionality.

address range

Use **address range** to specify a non-temporary IPv6 address range in a DHCPv6 address pool for dynamic allocation.

Use **undo address range** to restore the default.

Syntax

address range *start-ipv6-address end-ipv6-address* [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

undo address range

Default

No non-temporary IPv6 address range exists.

Views

DHCPv6 address pool view

Predefined user roles

network-admin

Parameters

start-ipv6-address: Specifies the start IPv6 address.

end-ipv6-address: Specifies the end IPv6 address.

preferred-lifetime *preferred-lifetime*: Specifies the preferred lifetime for the non-temporary IPv6 addresses. The value range is 60 to 4294967295 seconds, and the default is 604800 seconds (7 days).

valid-lifetime *valid-lifetime*: Specifies the valid lifetime for the non-temporary IPv6 addresses. The value range is 60 to 4294967295 seconds, and the default is 2592000 seconds (30 days). The valid lifetime cannot be shorter than the preferred lifetime.

Usage guidelines

If you do not specify a non-temporary IPv6 address range, all unicast addresses on the subnet specified by the **network** command in address pool view are assignable. If you specify a non-temporary IPv6 address range, only the IPv6 addresses in the specified IPv6 address range are assignable.

You can specify only one non-temporary IPv6 address range in an address pool. If you execute this command multiple times, the most recent configuration takes effect.

The non-temporary IPv6 address range specified by the **address range** command must be on the subnet specified by the **network** command.

Examples

Configure a non-temporary IPv6 address range from 3ffe:501:ffff:100::10 through 3ffe:501:ffff:100::31 in address pool 1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] network 3ffe:501:ffff:100::/64
[Sysname-dhcp6-pool-1] address range 3ffe:501:ffff:100::10 3ffe:501:ffff:100::31
```

Related commands

display ipv6 dhcp pool

network

temporary address range

address-alloc-mode eui-64

Use **address-alloc-mode eui-64** to enable the EUI-64 address allocation mode.

Use **undo address-alloc-mode eui-64** to restore the default.

Syntax

address-alloc-mode eui-64

undo address-alloc-mode eui-64

Default

The EUI-64 address allocation mode is disabled. The DHCPv6 server does not allocates IPv6 addresses based on EUI-64.

Views

DHCPv6 address pool view

Predefined user roles

network-admin

Usage guidelines

The IPv6 leases that are allocated before the command execution are not affected.

This command takes effect when the prefix length of the IPv6 subnet does not exceed 64 in the DHCPv6 address pools.

This feature enables the DHCPv6 server to obtain the client MAC address from the link layer header of the DHCP request and generates an EUI-64 IPv6 address for the client. If a DHCPv6 relay agent is between the clients and server, do not configure this feature because the server cannot obtain the MAC addresses from received DHCP requests.

Examples

Enable the EUI-64 address allocation mode in DHCPv6 address pool **pool1**.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool pool1
[Sysname-dhcp6-pool-pool1] address-alloc-mode eui-64
```

class pool

Use **class pool** to specify a DHCPv6 address pool for a DHCPv6 user class.

Use **undo class pool** to restore the default.

Syntax

class *class-name* **pool** *pool-name*

undo class *class-name* **pool**

Default

No DHCPv6 address pool is specified for a DHCPv6 user class.

Views

DHCPv6 policy view

Predefined user roles

network-admin

Parameters

class-name: Specifies a DHCPv6 user class by its name, a case-insensitive string of 1 to 63 characters.

pool-name: Specifies a DHCPv6 address pool by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can specify only one DHCPv6 address pool for a DHCPv6 user class in a DHCPv6 policy. If you execute this command multiple times for a user class, the most recent configuration takes effect.

Examples

Specify DHCPv6 address pool **pool1** for DHCPv6 user class **test** in DHCPv6 policy 1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp policy 1
[Sysname-dhcp6-policy-1] class test pool pool1
```

Related commands

default pool

ipv6 dhcp policy

ipv6 dhcp pool

default pool

Use **default pool** to specify the default DHCPv6 address pool.

Use **undo default pool** to restore the default.

Syntax

default pool *pool-name*

undo default pool

Default

No default DHCPv6 address pool is specified.

Views

DHCPv6 policy view

Predefined user roles

network-admin

Parameters

pool-name: Specifies a DHCPv6 address pool by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

In a DHCPv6 policy, the DHCPv6 server uses the default address pool to assign IPv6 address, IPv6 prefix, or other parameters to clients that do not match any user classes. If no default address pool is specified or the default address pool does not have assignable IPv6 addresses or prefixes, the assignment fails.

You can specify only one default address pool in a DHCPv6 policy. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the DHCPv6 address pool **pool1** as the default DHCPv6 address pool in DHCPv6 policy 1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp policy 1
[Sysname-dhcp6-policy-1] default pool pool1
```

Related commands

class pool

display ipv6 dhcp option-group

Use **display ipv6 dhcp option-group** to display information about a DHCPv6 option group.

Syntax

display ipv6 dhcp option-group [*option-group-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

option-group-number: Specifies a static or dynamic DHCPv6 option group by its ID. The value range for the option group ID is 1 to 100. If you do not specify an option group, this command displays information about all DHCPv6 option groups.

Usage guidelines

A static DHCPv6 option group is created by using the **ipv6 dhcp option-group** command.

A dynamic DHCPv6 option group is created automatically by a DHCPv6 client after it obtains the DHCPv6 configuration parameters. Dynamic option groups cannot be manually modified or deleted.

Examples

Display information about all DHCPv6 option groups.

```
<Sysname> display ipv6 dhcp option-group
DHCPv6 option group: 1
  DNS server addresses:
    Type: Static
    Interface: N/A
    1::1
  DNS server addresses:

display ipv6 dhcp pool

Use **display ipv6 dhcp pool** to display information about a DHCPv6 address pool.

Syntax

display ipv6 dhcp pool [*pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pool-name: Displays information about the specified DHCPv6 address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify a DHCPv6 address pool, this command displays information about all DHCPv6 address pools.

Examples

Display information about DHCPv6 address pool 1.

```
<Sysname> display ipv6 dhcp pool 1
DHCPv6 pool: 1
  Network: 3FFE:501:FFFF:100::/64
    Preferred lifetime 604800 seconds, valid lifetime 2592000 seconds
  Prefix pool: 1
    Preferred lifetime 24000 seconds, valid lifetime 36000 seconds
  Addresses:
    Range: from 3FFE:501:FFFF:100::1
           to 3FFE:501:FFFF:100::99
    Preferred lifetime 70480 seconds, valid lifetime 200000 seconds
    Total address number: 153
    Available: 153
    In-use: 0
  Temporary addresses:
    Range: from 3FFE:501:FFFF:100::200
           to 3FFE:501:FFFF:100::210
    Preferred lifetime 60480 seconds, valid lifetime 259200 seconds
    Total address number: 17
    Available: 17
    In-use: 0
  Static bindings:
    DUID: 0003000100e0fc000001
    IAID: 0000003f
    Prefix: 3FFE:501:FFFF:200::/64
      Preferred lifetime 604800 seconds, valid lifetime 2592000 seconds
    DUID: 0003000100e0fc00cff1
    IAID: 00000001
    Address: 3FFE:501:FFFF:2001::1/64
      Preferred lifetime 604800 seconds, valid lifetime 2592000 seconds

    5::1
  SIP server domain names:
    bbb.com
```

Display information about DHCPv6 address pool 1.

```
<Sysname> display ipv6 dhcp pool 1
DHCPv6 pool: 1
  Network: Not-available
    Preferred lifetime 604800 seconds, valid lifetime 2592000 seconds
```

Display information about DHCPv6 address pool 1.

```
<Sysname> display ipv6 dhcp pool 1
DHCPv6 pool: 1
  Network: 1::/64(Zombie)
    Preferred lifetime 604800 seconds, valid lifetime 2592000 seconds
```

Table 2 Command output

Field	Description
DHCPv6 pool	Name of the DHCPv6 address pool.
Network	IPv6 subnet for dynamic IPv6 address allocation. If the subnet prefix is ineffective, this field displays **Not-available**. If the subnet prefix becomes ineffective after a configuration recovery, the prefix is marked **(Zombie)**.
Prefix pool	Prefix pool referenced by the address pool.
Preferred lifetime	Preferred lifetime in seconds.
valid lifetime	Valid lifetime in seconds.
Addresses	Non-temporary IPv6 address range.
Range	IPv6 address range for dynamic allocation.
Total address number	Total number of IPv6 addresses.
Available	Total number of available IPv6 addresses.
In-use	Total number of assigned IPv6 addresses.
Temporary addresses	Temporary IPv6 address range for dynamic allocation.
Static bindings	Static bindings configured in the address pool.
DUID	Client DUID.
IAID	Client IAID. If no IAID is configured, this field displays **Not configured**.
Prefix	IPv6 address prefix.
Address	Static IPv6 address.
DNS server addresses	DNS server address.
Domain name	Domain name.
SIP server addresses	SIP server address.
SIP server domain names	Domain name of the SIP server.

display ipv6 dhcp prefix-pool

Use **display ipv6 dhcp prefix-pool** to display information about a prefix pool.

Syntax

display ipv6 dhcp prefix-pool [*prefix-pool-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

prefix-pool-number: Displays detailed information about a prefix pool specified by its number in the range of 1 to 128. If you do not specify a prefix pool, this command displays brief information about all prefix pools.

Examples

Display brief information about all prefix pools.

```
<Sysname> display ipv6 dhcp prefix-pool
Prefix-pool Prefix                                  Available In-use Static
1           5::/64                                  64        0      0
```

Display brief information about all prefix pools.

```
<Sysname> display ipv6 dhcp  prefix-pool
Prefix-pool Prefix                                  Available In-use Static
2           Not-available                           0         0      0
```

Display brief information about all prefix pools.

```
<Sysname> display ipv6 dhcp  prefix-pool
Prefix-pool Prefix                                  Available In-use Static
11          21::/112(Zombie)                        0         64     0
```

Display detailed information about prefix pool 1.

```
<Sysname> display ipv6 dhcp prefix-pool 1
Prefix: 5::/64
Assigned length: 70
Total prefix number: 64
Available: 64
In-use: 0
Static: 0
```

Display detailed information about prefix pool 1.

```
<Sysname> display ipv6 dhcp prefix-pool 1
Prefix: Not-available
Assigned length: 70
Total prefix number: 0
Available: 0
In-use: 0
Static: 0
```

Display detailed information about prefix pool 1.

```
<Sysname> display ipv6 dhcp prefix-pool 1
Prefix: 5::/64(Zombie)
Assigned length: 70
Total prefix number: 10
Available: 0
In-use: 10
```

```
Static: 0
```

Table 3 Command output

Field	Description
Prefix-pool	Prefix pool number.
Prefix	Prefix specified in the prefix pool. If the prefix is ineffective, this field displays **Not-available**. If the prefix becomes ineffective after a configuration recovery, the prefix is marked **(Zombie)**.
Available	Number of available prefixes.
In-use	Number of assigned prefixes.
Static	Number of statically bound prefixes.
Assigned length	Length of assigned prefixes.
Total prefix number	Number of prefixes.

display ipv6 dhcp server

Use **display ipv6 dhcp server** to display DHCPv6 server configuration information.

Syntax

display ipv6 dhcp server [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Displays DHCPv6 server configuration information for the specified interface. If you do not specify an interface, this command displays DHCPv6 server configuration information for all interfaces.

Examples

Display DHCPv6 server configuration information for all interfaces.

```
<Sysname> display ipv6 dhcp server
Interface                     Pool
Vlan-interface2               1
Vlan-interface3               global
```

Display DHCPv6 server configuration information for the interface VLAN-interface 2.

```
<Sysname> display ipv6 dhcp server interface vlan-interface 2
Using pool: 1
Preference value: 0
Allow-hint: Enabled
Rapid-commit: Disabled
```

Table 4 Command output

Field	Description
Interface	Interface enabled with DHCPv6 server.
Pool	Address pool applied to the interface. If no address pool is applied to the interface, **global** is displayed. The DHCPv6 server selects a global address pool to assign a prefix, an address, and other configuration parameters to a client.
Using pool	Address pool applied to the interface. If no address pool is applied to the interface, **global** is displayed. The DHCPv6 server selects a global address pool to assign a prefix, an address, and other configuration parameters to a client.
Preference value	Server preference in the DHCPv6 Advertise message. The value range is 0 to 255. The bigger the value is, the higher preference the server has.
Allow-hint	Indicates whether desired address/prefix assignment is enabled.
Rapid-commit	Indicates whether rapid address/prefix assignment is enabled.

display ipv6 dhcp server conflict

Use **display ipv6 dhcp server conflict** to display information about IPv6 address conflicts.

Syntax

display ipv6 dhcp server conflict [**address** *ipv6-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

address *ipv6-address*: Displays conflict information for the specified IPv6 address. If you do not specify an IPv6 address, this command displays information about all IPv6 address conflicts.

Usage guidelines

The DHCPv6 server creates IP address conflict information in the following conditions:

- The DHCPv6 client sends a DECLINE packet to the DHCPv6 server to inform the server of an IPv6 address conflict.
- The DHCPv6 server discovers that the only assignable address in the address pool is its own IPv6 address.

Examples

Display information about all address conflicts.

```
<Sysname> display ipv6 dhcp server conflict
IPv6 address                                Detect time
2001::1                                     Apr 25 16:57:20 2007
1::1:2                                      Apr 25 17:00:10 2007
```

Table 5 Command output

Field	Description
IPv6 address	Conflicted IPv6 address.
Detect time	Time when the conflict was discovered.

Related commands

`reset ipv6 dhcp server conflict`

display ipv6 dhcp server database

Use **`display ipv6 dhcp server database`** to display information about DHCPv6 binding auto backup.

Syntax

`display ipv6 dhcp server database`

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information about DHCPv6 binding auto backup.

```
<Sysname> display ipv6 dhcp server database
 File name               :   database.dhcp
 Username                :
 Password                :
 Update interval         :   600 seconds
 Latest write time       :   Feb  8 16:02:23 2014
 Status                  :   Last write succeeded.
```

Table 6 Command output

Field	Description
File name	Name of the DHCPv6 binding backup file.
Username	Username for accessing the URL of the remote backup file.
Password	Password for accessing the URL of the remote backup file. This field displays ********** if a password is configured.
Update interval	Waiting time in seconds after a DHCPv6 binding change for the DHCPv6 server to update the backup file.
Latest write time	Time of the latest update.
Status	Status of the update: • **Writing**—The backup file is being updated. • **Last write succeeded**—The backup file was successfully updated. • **Last write failed**—The backup file failed to be updated.

display ipv6 dhcp server expired

Use **display ipv6 dhcp server expired** to display lease expiration information.

Syntax

display ipv6 dhcp server expired [**address** *ipv6-address* | **pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

address *ipv6-address*: Displays lease expiration information for the specified IPv6 address. If you do not specify an IPv6 address, this command displays lease expiration information for all IPv6 addresses.

pool *pool-name*: Displays lease expiration information for the DHCPv6 address pool specified by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a DHCPv6 address pool, this command displays lease expiration information for all DHCPv6 address pools.

Usage guidelines

DHCPv6 assigns the expired IPv6 addresses to DHCPv6 clients when all available addresses have been assigned.

Examples

Display all lease expiration information.

```
<Sysname> display ipv6 dhcp server expired
IPv6 address           DUID                          Lease expiration
2001:3eff:fe80:4caa:   3030-3066-2e65-3230-302e-     Apr 25 17:10:47 2007
37ee:7::1              3130-3234-2d45-7468-6572-
                       6e65-7430-2f31
```

Table 7 Command output

Field	Description
IPv6 address	Expired IPv6 address.
DUID	Client DUID bound to the expired IPv6 address.
Lease expiration	Time when the lease expired.

Related commands

reset ipv6 dhcp server expired

display ipv6 dhcp server ip-in-use

Use **display ipv6 dhcp server ip-in-use** to display binding information for assigned IPv6 addresses.

Syntax

display ipv6 dhcp server ip-in-use [**address** *ipv6-address* | **pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

address *ipv6-address*: Displays binding information for the specified IPv6 address. If you do not specify an IPv6 address, this command displays binding information for all IPv6 addresses.

pool *pool-name*: Displays IPv6 address binding information for the DHCPv6 address pool specified by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a DHCPv6 address pool, this command displays IPv6 address binding information for all DHCPv6 address pools.

Examples

Display binding information for all assigned IPv6 address.

```
<Sysname> display ipv6 dhcp server ip-in-use
Pool: 1
 IPv6 address                            Type     Lease expiration
 2:1::1                                  Auto(O)  Jul 10 19:45:01 2008
Pool: 2
 IPv6 address                            Type      Lease expiration
 1:1::2                                  Static(F) Not available
Pool: 3
 IPv6 address                            Type      Lease expiration
 1:2::1F1                                Static(O) Oct  9 09:23:31 2008
Pool: 4
 IPv6 address                            Type      Lease expiration
 1:2::2                                  Auto(Z)   Oct  11 09:23:31 2008
```

Display binding information for all assigned IPv6 addresses for the specified DHCPv6 address pool.

```
<Sysname> display ipv6 dhcp server ip-in-use pool 1
Pool: 1
 IPv6 address                            Type      Lease expiration
 2:1::1                                  Auto(O)   Jul 10 22:22:22 2008
 3:1::2                                  Static(C) Jan  1 11:11:11 2008
```

Display binding information for the specified IPv6 address.

```
<Sysname> display ipv6 dhcp server ip-in-use address 2:1::3
Pool: 1
Client: FE80::C800:CFF0:FE18:0
Type: Auto(O)
DUID: 00030001CA000C180000
IAID: 0x00030001
  IPv6 address: 2:1::3
  Preferred lifetime 400, valid lifetime 500
  Expires at Jul 10 09:45:01 2008 (288 seconds left)
```

Table 8 Command output

Field	Description
Pool	DHCPv6 address pool.
IPv6 address	IPv6 address assigned.
Type	IPv6 address binding types: • **Static(F)**—Free static binding whose IPv6 address has not been assigned. • **Static(O)**—Offered static binding whose IPv6 address has been selected and sent by the DHCPv6 server in a DHCPv6-OFFER packet to the client. • **Static(C)**—Committed static binding whose IPv6 address has been assigned to the client. • **Auto(O)**—Offered dynamic binding whose IPv6 address has been dynamically selected by the DHCPv6 server and sent in a DHCPv6-OFFER packet to the DHCPv6 client. • **Auto(C)**—Committed dynamic binding whose IPv6 address has been dynamically assigned to the DHCPv6 client. • **Auto(Z)**—Zombie dynamic binding whose IPv6 address has been dynamically assigned to the DHCPv6 client. The binding becomes zombie because the subnet prefix goes invalid for address allocation after a configuration recovery.
Lease-expiration	Time when the lease of the IPv6 address will expire. If the lease expires after the year 2100, this field displays **Expires after 2100**. For an unassigned static binding, this field displays **Not available**.
Client	IPv6 address of the DHCPv6 client. For an unassigned static binding, this field is blank.
DUID	Client DUID.
IAID	Client IAID. For an unassigned static binding without IAID specified, this field displays **N/A**.
Preferred lifetime	Preferred lifetime in seconds of the IPv6 address.
valid lifetime	Valid lifetime in seconds of the IPv6 address.
Expires at	Time when the lease of an IPv6 address will expire. If the lease expires after the year 2100, this field displays **Expires after 2100**.

Related commands

`reset ipv6 dhcp server ip-in-use`

display ipv6 dhcp server pd-in-use

Use **`display ipv6 dhcp server pd-in-use`** to display binding information for the assigned IPv6 prefixes.

Syntax

`display ipv6 dhcp server pd-in-use` [**`pool`** *`pool-name`* | **`prefix`** *`prefix/prefix-len`*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pool *pool-name*: Displays IPv6 prefix binding information for the DHCPv6 address pool specified by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a DHCPv6 address pool, this command displays IPv6 prefix binding information for all DHCPv6 address pools.

prefix *prefix/prefix-len*: Displays binding information for the specified IPv6 prefix. The value range for the prefix length is 1 to 128. If you do not specify an IPv6 prefix, this command displays binding information for all IPv6 prefixes.

Examples

Display all IPv6 prefix binding information.

```
<Sysname> display ipv6 dhcp server pd-in-use
Pool: 1
 IPv6 prefix                              Type      Lease expiration
 2:1::/24                                 Auto(O)   Jul 10 19:45:01 2008
Pool: 2
 IPv6 prefix                              Type      Lease expiration
 1:1::/64                                 Static(F) Not available
Pool: 3
 IPv6 prefix                              Type      Lease expiration
 1:2::/64                                 Static(O) Oct  9 09:23:31 2008
Pool: 4
 IPv6 prefix                              Type      Lease expiration
 12::/80                                  Auto(Z)   Oct 17 09:34:59 2008
```

Display IPv6 prefix binding information for DHCPv6 address pool 1.

```
<Sysname> display ipv6 dhcp server pd-in-use pool 1
Pool: 1
 IPv6 prefix                              Type      Lease expiration
 2:1::/24                                 Auto(O)   Jul 10 22:22:22 2008
 3:1::/64                                 Static(C) Jan  1 11:11:11 2008
```

Display binding information for the IPv6 prefix 2:1::3/24.

```
<Sysname> display ipv6 dhcp server pd-in-use prefix 2:1::3/24
Pool: 1
Client: FE80::C800:CFF:FE18:0
Type: Auto(O)
DUID: 00030001CA000C180000
IAID: 0x00030001
  IPv6 prefix: 2:1::/24
  Preferred lifetime 400, valid lifetime 500
  Expires at Jul 10 09:45:01 2008 (288 seconds left)
```

Table 9 Command output

Field	Description
IPv6 prefix	IPv6 prefix assigned.

Field	Description
Type	Prefix binding types: • **Static(F)**—Free static binding whose IPv6 prefix has not been assigned. • **Static(O)**—Offered static binding whose IPv6 prefix has been selected and sent by the DHCPv6 server in a DHCPv6-OFFER packet to the client. • **Static(C)**—Committed static binding whose IPv6 prefix has been assigned to the client. • **Auto(O)**—Offered dynamic binding whose IPv6 prefix has been dynamically selected by the DHCPv6 server and sent in a DHCPv6-OFFER packet to the DHCPv6 client. • **Auto(C)**—Committed dynamic binding whose IPv6 prefix has been dynamically assigned to the DHCPv6 client. • **Auto(Z)**—Zombie dynamic binding whose IPv6 prefix has been dynamically assigned to the DHCPv6 client. The binding becomes zombie because the prefix in the prefix pool goes invalid after a configuration recovery.
Pool	Address pool.
Lease-expiration	Time when the lease of the IPv6 prefix will expire. If the lease will expire after the year 2100, this field displays **Expires after 2100**. For an unassigned static binding, this field displays **Not available**.
Client	IPv6 address of the DHCPv6 client. For an unassigned static binding, this field is blank.
DUID	Client DUID.
IAID	Client IAID. For an unassigned static binding without IAID, this field displays **N/A**.
Preferred lifetime	Preferred lifetime in seconds of the IPv6 prefix.
valid lifetime	Valid lifetime in seconds of the IPv6 prefix.
Expires at	Time when the lease of the prefix will expire. If the lease expires after the year 2100, this field displays **Expires after 2100**.

Related commands

reset ipv6 dhcp server pd-in-use

display ipv6 dhcp server statistics

Use **display ipv6 dhcp server statistics to** display DHCPv6 packet statistics on the DHCPv6 server.

Syntax

display ipv6 dhcp server statistics [**pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pool *pool-name*: Displays DHCPv6 packet statistics for the DHCPv6 address pool specified by its name, a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command displays DHCPv6 packet statistics for all address pools.

Examples

Display all DHCPv6 packet statistics on the DHCPv6 server.

```
<Sysname> display ipv6 dhcp server statistics
Bindings:
    Ip-in-use               :  1
    Pd-in-use               :  0
    Expired                 :  0
Conflict                    :  0
Packets received            :  1
    Solicit                 :  1
    Request                 :  0
    Confirm                 :  0
    Renew                   :  0
    Rebind                  :  0
    Release                 :  0
    Decline                 :  0
    Information-request     :  0
    Relay-forward           :  0
Packets dropped             :  0
Packets sent                :  0
    Advertise               :  0
    Reconfigure             :  0
    Reply                   :  0
    Relay-reply             :  0
```

Table 10 Command output

Field	Description
Bindings	Number of bindings: • **Ip-in-use**—Total number of address bindings. • **Pd-in-use**—Total number of prefix bindings. • **Expired**—Total number of expired address bindings.
Conflict	Total number of conflicted addresses. If statistics about an address pool are displayed, this field is not displayed.

Field	Description
Packets received	Number of messages received by the DHCPv6 server. The message types include: • Solicit. • Request. • Confirm. • Renew. • Rebind. • Release. • Decline. • Information-request. • Relay-forward. If statistics about an address pool are displayed, this field is not displayed.
Packets dropped	Number of packets discarded. If statistics about an address pool are displayed, this field is not displayed.
Packets sent	Number of messages sent by the DHCPv6 server. The message types include: • Advertise. • Reconfigure. • Reply. • Relay-reply. If statistics about an address pool are displayed, this field is not displayed.

Related commands

`reset ipv6 dhcp server statistics`

dns-server

Use **`dns-server`** to specify a DNS server in a DHCPv6 address pool.

Use **`undo dns-server`** to remove the specified DNS server from a DHCPv6 address pool.

Syntax

`dns-server` *`ipv6-address`*

`undo dns-server` *`ipv6-address`*

Default

No DNS server address is specified.

Views

DHCPv6 address pool view

DHCPv6 option group view

Predefined user roles

network-admin

Parameters

`ipv6-address`: Specifies the IPv6 address of a DNS server.

Usage guidelines

You can use the **`dns-server`** command to specify up to eight DNS servers in an address pool. A DNS server specified earlier has a higher preference.

Examples

Specify the DNS server address 2:2::3 in DHCPv6 address pool 1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] dns-server 2:2::3
```

Related commands

display ipv6 dhcp pool

domain-name

Use **domain-name** to specify a domain name in a DHCPv6 address pool.

Use **undo domain-name** to restore the default.

Syntax

domain-name *domain-name*

undo domain-name

Default

No domain name is specified.

Views

DHCPv6 address pool view

DHCPv6 option group view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a domain name, a case-sensitive string of 1 to 50 characters.

Usage guidelines

You can configure only one domain name in an address pool. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the domain name **aaa.com** in DHCPv6 address pool 1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] domain-name aaa.com
```

Related commands

display ipv6 dhcp pool

if-match

Use **if-match** to configure a match rule for a DHCPv6 user class.

Use **undo if-match** to delete a match rule for a DHCP user class.

Syntax

if-match rule *rule-number* { **option** *option-code* [**ascii** *ascii-string* [**offset** *offset* | **partial**] | **hex** *hex-string* [**mask** *mask* | **offset** *offset* **length** *length* | **partial**]] | **relay-agent** *gateway-ipv6-address* }

undo if-match rule *rule-number*

Default

No match rules are configured for the DHCPv6 user class.

Views

DHCPv6 user class view

Predefined user roles

network-admin

Parameters

rule *rule-number*: Assigns the match rule an ID in the range of 1 to 16. A smaller ID represents a higher match priority.

option *option-code*: Specifies a DHCPv6 option by its number in the range of 1 to 65535.

ascii *ascii-string*: Specifies an ASCII string of 1 to 128 characters.

offset *offset*: Specifies the offset in bytes after which the match operation starts. The value range is 0 to 65534. If you specify an ASCII string, a packet matches the rule if the option content after the offset is the same as the ASCII string. If you specify a hexadecimal number, a packet matches the rule if the option content of the specified length after the offset is the same as the hexadecimal number.

partial: Enables partial match. A packet matches the rule if the specified option in the packet contains the ASCII string or hexadecimal number specified in the rule. For example, if you specify **abc** in the rule, option content **xabc**, **xyzabca**, **xabcyz**, and **abcxyz** all match the rule.

hex *hex-string*: Specifies a hexadecimal number. The length of the hexadecimal number must be an even number in the range of 2 to 256.

mask *mask*: Specifies the mask for the match operation. The mask is a hexadecimal number whose length is an even number in the range of 2 to 256 and must be the same as the *hex-string* length. The DHCPv6 server selects option content of the mask length from the start and ANDs the selected option content and the specified hexadecimal number with the mask. The packet matches the rule if the two AND operation results are the same.

length *length*: Specifies the length of the option content to be matched, in the range of 1 to 128 bytes. The length must be the same as the *hex-string* length.

relay-agent *gateway-ipv6-address*: Specifies a **link-address** field value. The value is an IPv6 address. A packet matches the rule if its **link-address** field value is the same as that in the rule.

Usage guidelines

If a DHCPv6 request sent by a DHCPv6 client matches a rule in a DHCPv6 user class, the DHCPv6 client matches the user class.

You can configure multiple match rules for a DHCPv6 user class. Each match rule is uniquely identified by a rule ID within its type (option or relay agent address).

- If the rule that you are configuring has the same ID and type as an existing rule, the new rule overwrites the existing rule.
- If the rule that you are configuring has the same ID as an existing rule but a different type, the new rule takes effect and coexists with the existing rule. As a best practice, do not assign the same ID to rules of different types.

- Rules of different IDs cannot have the same rule content.

When you configure an **if-match option** rule, follow these guidelines:

- To match packets that contain an option, specify only the *option-code* argument.
- To match a hexadecimal number by AND operations, specify the **option** *option-code* **hex** *hex-string* **mask** *mask* options.
- To match a hexadecimal number directly, specify the **option** *option-code* **hex** *hex-string* [**offset** *offset* **length** *length* | **partial**] options. If you do not specify the **offset**, **length**, or **partial** parameter, a packet matches a rule if the option content starts with the hexadecimal number.
- To match an ASCII string, specify the **option** *option-code* **ascii** *ascii-string* [**offset** *offset* | **partial**] options. If you do not specify the **offset** or **partial** parameter, a packet matches a rule if the option content starts with the ASCII string.

Examples

Configure match rule **1** for the DHCPv6 user class **exam** to match DHCPv6 requests that contain Option 16.

```
<Sysname> system-view
[Sysname] ipv6 dhcp class exam
[Sysname-dhcp6-class-exam] if-match rule 1 option 16
```

Configure match rule **2** for the DHCPv6 user class **exam**. The rule matches DHCPv6 requests in which the highest bit of the fourth byte in Option 16 is the hexadecimal number **1**.

```
<Sysname> system-view
[Sysname] ipv6 dhcp class exam
[Sysname-dhcp6-class-exam] if-match rule 2 option 16 hex 00000080 mask 00000080
```

Configure match rule **3** for the DHCPv6 user class **exam**. The rule matches DHCPv6 requests in which the first three bytes of Option 16 are the hexadecimal number **13ae92**.

```
<Sysname> system-view
[Sysname] ipv6 dhcp class exam
[Sysname-dhcp6-class-exam] if-match rule 3 option 16 hex 13ae92 offset 0 length 3
```

Configure match rule **4** for the DHCPv6 user class **exam**. The rule matches DHCPv6 requests in which the Option 16 contains the hexadecimal number **13ae**.

```
<Sysname> system-view
[Sysname] ipv6 dhcp class exam
[Sysname-dhcp6-class-exam] if-match rule 5 option 16 hex 13ae partial
```

Configure match rule **5** for the DHCPv6 user class **exam** to match DHCPv6 requests in which the **link-address** field is 2001::1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp class exam
[Sysname-dhcp6-class-exam] if-match rule 5 relay-agent 2001::1
```

Related commands

ipv6 dhcp class

ipv6 dhcp apply-policy

Use **ipv6 dhcp apply-policy** to apply a DHCPv6 policy to an interface.

Use **undo ipv6 dhcp apply-policy** to restore the default.

Syntax

ipv6 dhcp apply-policy *policy-name*

undo ipv6 dhcp apply-policy

Default

No DHCPv6 policy is applied to an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a DHCPv6 policy by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can apply only one DHCPv6 policy to an interface. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Apply the DHCPv6 policy **test** to VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 dhcp apply-policy test
```

Related commands

ipv6 dhcp class

ipv6 dhcp class

Use **ipv6 dhcp class** to create a DHCPv6 user class and enter its view, or enter the view of an existing DHCPv6 user class.

Use **undo ipv6 dhcp class** to delete the specified DHCPv6 user class.

Syntax

ipv6 dhcp class *class-name*

undo ipv6 dhcp class *class-name*

Default

No DHCPv6 user classes exist.

Views

System view

Predefined user roles

network-admin

Parameters

class-name: Specifies a name for the DHCPv6 user class, a case-insensitive string of 1 to 63 characters.

Usage guidelines

In the DHCPv6 user class view, you can use the **if-match** command to configure match rules for user classification.

Examples

Create a DHCPv6 user class **test** and enter DHCPv6 user class view.

```
<Sysname> system-view
[Sysname] ipv6 dhcp class test
[Sysname-dhcp6-class-test]
```

Related commands

class pool

ipv6 dhcp policy

if-match

ipv6 dhcp option-group

Use **ipv6 dhcp option-group** to create a static DHCPv6 option group and enter its view.

Use **undo ipv6 dhcp option-group** to delete the specified static DHCPv6 option group.

Syntax

ipv6 dhcp option-group *option-group-number*

undo ipv6 dhcp option-group *option-group-number*

Default

No static DHCPv6 option groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

option-group-number: Assigns an ID to the static option group, in the range of 1 to 100.

Usage guidelines

A static DHCPv6 option group can use the same ID as a dynamic DHCPv6 option group. If a static DHCPv6 option group and a dynamic DHCPv6 option group use the same ID, the static one takes precedence over the dynamic one.

Examples

Create static DHCPv6 option group 1 and enter its view.

```
<Sysname> system-view
[Sysname] ipv6 dhcp option-group 1
[Sysname-dhcp6-option-group-1]
```

Related commands

display ipv6 dhcp option-group

ipv6 dhcp policy

Use **ipv6 dhcp policy** to create a DHCPv6 policy and enter its view, or enter the view of an existing DHCPv6 policy.

Use **undo ipv6 dhcp policy** to delete a DHCPv6 policy.

Syntax

ipv6 dhcp policy *policy-name*

undo ipv6 dhcp policy *policy-name*

Default

No DHCPv6 policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Assigns a name to the DHCPv6 policy. The policy name is a case-insensitive string of 1 to 63 characters.

Usage guidelines

In DHCP policy view, you can specify address pools for different user classes. Clients matching a user class will obtain IPv6 addresses and other parameters from the specified address pool.

For a DHCPv6 policy to take effect, you must apply it to an interface.

Examples

Create DHCPv6 policy **test** and enter its view.

```
<Sysname> system-view
[Sysname] ipv6 dhcp policy test
[Sysname-dhcp6-policy-test]
```

ipv6 dhcp pool

Use **ipv6 dhcp pool** to create a DHCPv6 address pool and enter its view, or enter the view of an existing DHCPv6 address pool.

Use **undo ipv6 dhcp pool** to delete the specified DHCPv6 address pool.

Syntax

ipv6 dhcp pool *pool-name*

undo ipv6 dhcp pool *pool-name*

Default

No DHCPv6 address pools exist.

Views

System view

Predefined user roles

network-admin

Parameters

pool-name: Specifies a name for the DHCPv6 address pool, a case-insensitive string of 1 to 63 characters.

Usage guidelines

A DHCPv6 address pool stores IPv6 address/prefix and other configuration parameters to be assigned to DHCPv6 clients.

When you delete a DHCPv6 address pool, binding information for the assigned IPv6 addresses and prefixes in the address pool is also deleted.

Examples

Create a DHCPv6 address pool named **pool1** and enter its view.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool pool1
[Sysname-dhcp6-pool-pool1]
```

Related commands

class pool

display ipv6 dhcp pool

ipv6 dhcp server apply pool

ipv6 dhcp prefix-pool

Use **ipv6 dhcp prefix-pool** to create a prefix pool and specify the prefix and the assigned prefix length for the pool.

Use **undo ipv6 dhcp prefix-pool** to delete the specified prefix pool.

Syntax

ipv6 dhcp prefix-pool *prefix-pool-number* **prefix** { *prefix-number* | *prefix/prefix-len* } **assign-len** *assign-len*

undo ipv6 dhcp prefix-pool *prefix-pool-number*

Default

No prefix pools exist.

Views

System view

Predefined user roles

network-admin

Parameters

prefix-pool-number: Specifies a prefix pool number in the range of 1 to 128.

prefix { *prefix-number* | *prefix/prefix-len* }: Specifies a prefix by its ID or in the format of *prefix*/*prefix length*. The value range for the *prefix-number* argument is 1 to 1024. The value range for the *prefix-len* argument is 1 to 128.

assign-len *assign-len*: Specifies the assigned prefix length. The value range is 1 to 128, and the value must be greater than or equal to *prefix-len*. The difference between *assign-len* and *prefix-len* must be no more than 16.

Usage guidelines

Different prefix pools cannot overlap.

To modify a prefix pool, execute the **undo ipv6 dhcp prefix-pool** command to delete the prefix pool, and then execute the **ipv6 dhcp prefix-pool** command.

Deleting a prefix pool clears all prefix bindings from the prefix pool.

When you specify a prefix by its ID, follow these restrictions and guidelines:

- This command does not take effect if the prefix does not exist. This command takes effect after the prefix is created.
- If the prefix that the ID represents is changed, the prefix range in the prefix pool accordingly changes.

Examples

Create IPv6 prefix 88:99::/32 with ID 3. Configure prefix pool 2 with IPv6 prefix 3 and an assigned prefix length of 42. Prefix pool 2 contains 1024 prefixes from 88:99::/42 to 88:99:FFC0::/42.

```
<Sysname> system-view
[Sysname] ipv6 prefix 3 88:99::/32
[Sysname] ipv6 dhcp prefix-pool 2 prefix 3 assign-len 42
```

Create prefix pool 1, and specify prefix 2001:0410::/32 with an assigned prefix length of 42. Prefix pool 1 contains 1024 prefixes from 2001:0410::/42 to 2001:0410:FFC0::/42.

```
<Sysname> system-view
[Sysname] ipv6 dhcp prefix-pool 1 prefix 2001:0410::/32 assign-len 42
```

Related commands

display ipv6 dhcp prefix-pool

prefix-pool

ipv6 dhcp server

Use **ipv6 dhcp server** to configure global address assignment on an interface. The server on the interface uses a global address pool to assign configuration information to a client.

Use **undo ipv6 dhcp server** to restore the default.

Syntax

ipv6 dhcp server { **allow-hint** | **preference** *preference-value* | **rapid-commit** } *

undo ipv6 dhcp server

Default

The server does not support desired address/prefix assignment or rapid address/prefix assignment. The server preference is set to 0.

Views

Interface view

Predefined user roles

network-admin

Parameters

allow-hint: Enables desired address/prefix assignment.

preference *preference-value*: Specifies the server preference in Advertise messages, in the range of 0 to 255. The default value is 0. A greater value represents a higher preference.

rapid-commit: Enables rapid address/prefix assignment involving two messages.

Usage guidelines

The **allow-hint** keyword enables the server to assign the desired address or prefix to the requesting client. If the desired address or prefix is not included in any global address pool, or is already assigned to another client, the server assigns the client a free address or a prefix. If the **allow-hint** keyword is not specified, the server ignores the desired address or prefix, and selects an address or prefix from a global address pool.

If you use the **ipv6 dhcp server** and **ipv6 dhcp server apply pool** commands on the same interface, the **ipv6 dhcp server apply pool** command takes effect.

Examples

Configure global address assignment on the interface VLAN-interface 2. Use the desired address/prefix assignment and rapid address/prefix assignment, and set the server preference to the highest 255.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 dhcp server allow-hint preference 255 rapid-commit
```

Related commands

display ipv6 dhcp server

ipv6 dhcp select

ipv6 dhcp server apply pool

Use **ipv6 dhcp server apply pool** to apply a DHCPv6 address pool to an interface.

Use **undo ipv6 dhcp server apply pool** to restore the default.

Syntax

ipv6 dhcp server apply pool *pool-name* [**allow-hint** | **preference** *preference-value* | **rapid-commit**] *

undo ipv6 dhcp server apply pool

Default

No DHCPv6 address pool is applied to an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

pool-name: Specifies a DHCPv6 address pool by its name, a case-insensitive string of 1 to 63 characters.

allow-hint: Enables desired address/prefix assignment.

preference *preference-value*: Specifies the server preference in Advertise messages, in the range of 0 to 255. The default value is 0. A greater value represents a higher preference.

rapid-commit: Enables rapid address/prefix assignment involving two messages.

Usage guidelines

Upon receiving a DHCPv6 request, the DHCPv6 server selects an IPv6 address or prefix from the address pool applied to the receiving interface. If no address pool is applied, the server selects an IPv6 address or prefix from a global address pool that matches the IPv6 address of the receiving interface or the DHCPv6 relay agent.

The **allow-hint** keyword enables the server to assign the desired address or prefix to the client. If the desired address or prefix does not exist or is already assigned to another client, the server assigns a free address or prefix. If **allow-hint** is not specified, the server ignores the desired address or prefix, and assigns a free address or prefix.

Only one address pool can be applied to an interface. If you execute this command multiple times, the most recent configuration takes effect.

A non-existing address pool can be applied to an interface, but the server cannot assign any prefix, address, or other configuration information from the address pool until the address pool is created.

Examples

Apply address pool 1 to VLAN-interface 2, configure the address pool to support desired address/prefix assignment and address/prefix rapid assignment, and set the preference to 255.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 dhcp server apply pool 1 allow-hint preference 255
rapid-commit
```

Related commands

display ipv6 dhcp server

ipv6 dhcp server database filename

Use **ipv6 dhcp server database filename** to configure the DHCPv6 server to back up the DHCPv6 bindings to a file.

Use **undo ipv6 dhcp server database filename** to restore the default.

Syntax

ipv6 dhcp server database filename { *filename* | **url** *url* [**username** *username* [**password** { **cipher** | **simple** } *string*]] }

undo ipv6 dhcp server database filename

Default

The DHCPv6 server does not back up the DHCPv6 bindings.

Views

System view

Predefined user roles

network-admin

Parameters

filename: Specifies the name of a local backup file. For information about the *filename* argument, see *Fundamentals Configuration Guide*.

url *url*: Specifies the URL of a remote backup file. The URL is a case-sensitive string of 1 to 255 characters. Do not include a username or password in the URL.

username *username*: Specifies the username for accessing the URL of the remote backup file, a case-sensitive string of 1 to 32 characters. Do not specify this option if a username is not required for accessing the URL of the remote backup file.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 32 characters. Its encrypted form is a case-sensitive string of 1 to 73 characters. Do not specify this argument if a password is not required for accessing the URL of the remote backup file.

Usage guidelines

The command automatically creates the file if you specify a nonexistent file.

With this command executed, the DHCPv6 server backs up its bindings immediately and runs auto backup. The server, by default, waits 300 seconds after a binding change to update the backup file. You can use the **ipv6 dhcp server database update interval** command to change the waiting time. If no DHCPv6 binding changes, the backup file is not updated.

As a best practice, back up the bindings to a remote file. If you use the local storage medium, the frequent erasing and writing might damage the medium and then cause the DHCPv6 server to malfunction.

When the backup file is on a remote device, follow these restrictions and guidelines to specify the URL, username, and password:

- If the file is on an FTP server, enter URL in the format of ftp:*//server address:port/file path*, where the port number is optional.
- If the file is on a TFTP server, enter URL in the format of tftp:*//server address:port/file path*, where the port number is optional.
- The username and password must be the same as those configured on the FTP server. If the server authenticates only the username, the password can be omitted.
- If the IP address of the server is an IPv6 address, enclose the address in a pair of brackets, for example, **ftp://[1::1]/database.dhcp**.
- You can also specify the DNS domain name for the server address field, for example, **ftp://company/database.dhcp**.

Examples

Configure the DHCPv6 server to back up its bindings to the file **database.dhcp**

```
<Sysname> system-view
[Sysname] ipv6 dhcp server database filename database.dhcp
```

Configure the DHCPv6 server to back up its bindings to the file **database.dhcp** in the working directory of the FTP server at 10::1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp server database filename url ftp://[10::1]/database.dhcp username 1
password simple 1
```

Related commands

ipv6 dhcp server database update now

ipv6 dhcp server database update stop

ipv6 dhcp server database update interval

Use **ipv6 dhcp server database update interval** to set the waiting time for the DHCPv6 server to update the backup file after a DHCPv6 binding change.

Use **undo ipv6 dhcp server database update interval** to restore the default.

Syntax

ipv6 dhcp server database update interval *interval*

undo ipv6 dhcp server database update interval

Default

The DHCPv6 server waits 300 seconds to update the backup file after a DHCPv6 binding change. If no DHCPv6 binding changes, the backup file is not updated.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the waiting time in the range of 60 to 864000 seconds.

Usage guidelines

When a DHCPv6 binding is created, updated, or removed, the waiting period starts. The DHCPv6 server updates the backup file when the waiting period is reached. All bindings changed during the period will be saved to the backup file.

The waiting time takes effect only after you configure the DHCPv6 binding auto backup by using the **ipv6 dhcp server database filename** command.

Examples

Set the waiting time to 600 seconds for the DHCPv6 server to update the backup file.

```
<Sysname> system-view
[Sysname] ipv6 dhcp server database update interval 600
```

ipv6 dhcp server database update stop

ipv6 dhcp server database update now

Use **ipv6 dhcp server database update now** to manually save the DHCPv6 bindings to the backup file.

Syntax

ipv6 dhcp server database update now

Views

System view

Predefined user roles

network-admin

Usage guidelines

Each time this command is executed, the DHCPv6 bindings are saved to the backup file.

For this command to take effect, you must configure the DHCPv6 auto backup by using the **ipv6 dhcp server database filename** command.

Examples

Manually save the DHCPv6 bindings to the backup file.

```
<Sysname> system-view
[Sysname] ipv6 dhcp server database update now
```

Related commands

ipv6 dhcp server database filename

ipv6 dhcp server database update interval

ipv6 dhcp server database update stop

ipv6 dhcp server database update stop

Use **ipv6 dhcp server database update stop** to terminate the download of DHCPv6 bindings from the backup file.

Syntax

ipv6 dhcp server database update stop

Views

System view

Predefined user roles

network-admin

Usage guidelines

The DHCPv6 server does not provide services during the binding download process. If the connection breaks up during the process, the waiting timeout timer is 60 minutes. When the timer expires, the DHCPv6 server stops waiting and starts providing address allocation services. You can execute this command to terminate the download immediately.

Manual termination allows the DHCPv6 server to provide services without waiting for the connection to be repaired. The IPv6 addresses and prefixes associated with the undownloaded bindings will be assigned to clients and address conflicts might occur.

Examples

Terminate the download of the backup DHCPv6 bindings.

```
<Sysname> system-view
[Sysname] ipv6 dhcp server database update stop
```

ipv6 dhcp server forbidden-address

Use **ipv6 dhcp server forbidden-address** to exclude IPv6 addresses in the DHCPv6 address pool from dynamic allocation.

Use **undo ipv6 dhcp server forbidden-address** to remove the configuration.

Syntax

ipv6 dhcp server forbidden-address *start-ipv6-address* [*end-ipv6-address*]

undo ipv6 dhcp server forbidden-address *start-ipv6-address* [*end-ipv6-address*]

Default

Except for the DHCPv6 server address, all IPv6 addresses in a DHCPv6 address pool are assignable.

Views

System view

Predefined user roles

network-admin

Parameters

start-ipv6-address: Specifies the start IPv6 address.

end-ipv6-address: Specifies the end IPv6 address, which cannot be lower than *start-ipv6-address*. If you do not specify an end IPv6 address, only the start IPv6 address is excluded from dynamic allocation. If you specify an end IPv6 address, the IP addresses from *start-ipv6-address* through *end-ipv6-address* are all excluded from dynamic allocation.

Usage guidelines

The IPv6 addresses of some devices such as the gateway and FTP server cannot be assigned to clients. Use this command to exclude such addresses from dynamic allocation.

If the excluded IPv6 address is in a static DHCPv6 binding, the address can still be assigned to the client.

The address or address range specified in the **undo** form of the command must be the same as the address or address range specified in the command. To remove an IP address that has been specified as part of an address range, you must remove the entire address range.

You can execute this command multiple times to exclude multiple IPv6 address ranges from dynamic allocation.

Examples

Exclude IPv6 addresses of 2001:10:110::1 through 2001:10:110::20 from dynamic assignment.

```
<Sysname> system-view
[Sysname] ipv6 dhcp server forbidden-address 2001:10:110::1 2001:10:110::20
```

Related commands

ipv6 dhcp server forbidden-prefix

static-bind

ipv6 dhcp server forbidden-prefix

Use **ipv6 dhcp server forbidden-prefix** to exclude IPv6 prefixes in the DHCPv6 prefix pool from dynamic allocation.

Use **undo ipv6 dhcp server forbidden-prefix** to remove the configuration.

Syntax

ipv6 dhcp server forbidden-prefix *start-prefix/prefix-len* [*end-prefix/prefix-len*]

undo ipv6 dhcp server forbidden-prefix *start-prefix/prefix-len* [*end-prefix/prefix-len*]

Default

No IPv6 prefixes in the DHCPv6 prefix pool are excluded from dynamic allocation.

Views

System view

Predefined user roles

network-admin

Parameters

start-prefix/prefix-len: Specifies the start IPv6 prefix. The *prefix-len* argument specifies the prefix length in the range of 1 to 128.

end-prefix/prefix-len: Specifies the end IPv6 prefix. The *prefix-len* argument specifies the prefix length in the range of 1 to 128. The value for *end-prefix* cannot be lower than that for *start-prefix*. If you do not specify this argument, only the *start-prefix/prefix-len* is excluded from dynamic allocation. If you specify this argument, the prefixes from *start-prefix/prefix-len* to *end-prefix/prefix-len* are all excluded.

Usage guidelines

If the excluded IPv6 prefix is in a static binding, the prefix can still be assigned to the client.

The prefix or prefix range specified in the **undo** form of the command must be the same as the prefix or prefix range specified in the command. To remove a prefix that has been specified as part of a prefix range, you must remove the entire prefix range.

You can execute this command multiple times to exclude multiple IPv6 prefix ranges from dynamic allocation.

Examples

Exclude IPv6 prefixes from 2001:3e11::/32 through 2001:3eff::/32 from dynamic allocation.

```
<Sysname> system-view
[Sysname] ipv6 dhcp server forbidden-prefix 2001:3e11::/32 2001:3eff::/32
```

Related commands

ipv6 dhcp server forbidden-address

static-bind

network

Use **network** to specify an IPv6 subnet for dynamic allocation in a DHCPv6 address pool.

Use **undo network** to restore the default.

Syntax

network { *prefix/prefix-length* | **prefix** *prefix-number* [*sub-prefix/sub-prefix-length*] } [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

undo network

Default

No IPv6 subnet is specified in a DHCPv6 address pool.

Views

DHCPv6 address pool view

Predefined user roles

network-admin

Parameters

prefix/prefix-length: Specifies the IPv6 subnet for dynamic allocation. The value range for the *prefix-length* argument is 1 to 128.

prefix *prefix-number*: Specifies an IPv6 prefix by its ID in the range of 1 to 1024.

sub-prefix/*sub-prefix-length*: Specifies an IPv6 sub-prefix and its length. The value range for the *sub-prefix-length* argument is 1 to 128. If the IPv6 prefix is longer than the IPv6 sub-prefix or if you do not specify an IPv6 sub-prefix, the IPv6 subnet defined by the IPv6 prefix is used for dynamic allocation.

preferred-lifetime *preferred-lifetime*: Sets the preferred lifetime. The value range is 60 to 4294967295 seconds, and the default is 604800 seconds (7 days).

valid-lifetime *valid-lifetime*: Sets the valid lifetime. The value range is 60 to 4294967295 seconds, and the default is 2592000 seconds (30 days). The valid lifetime must be longer than or equal to the preferred lifetime.

Usage guidelines

You can specify only one subnet for a DHCPv6 address pool. If you execute the **network** command multiple times, the most recent configuration takes effect.

Modifying or removing the **network** command configuration removes assigned addresses in the current address pool.

The **network prefix** command does not take effect if the specified IPv6 prefix does not exist. This command takes effect after the IPv6 prefix is created.

The **network** command defines the IPv6 subnet for dynamic allocation through the *prefix/prefix-length* arguments or the *prefix-number* [*sub-prefix*/*sub-prefix-length*] arguments. The IPv6 subnets cannot be the same in different DHCPv6 address pools.

If the prefix that the ID represents is changed, the IPv6 subnet in this command accordingly changes, and the assigned prefix and address bindings are cleared.

Examples

Specify the subnet 3ffe:501:ffff:100::/64 in DHCPv6 address pool 1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] network 3ffe:501:ffff:100::/64
```

Create IPv6 prefix 88:99::/32 with the prefix ID 3. Create DHCPv6 address pool 1 and use the IPv6 subnet defined by the IPv6 prefix for dynamic allocation.

```
<Sysname> system-view
[Sysname] ipv6 prefix 3 88:99::/32
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] network prefix 3
```

Create IPv6 prefix 88:99::/32 with the prefix ID 3. Create DHCPv6 address pool 1 and use IPv6 subnet 88:99:ffff:100::/64 defined by IPv6 prefix 3 and IPv6 sub-prefix 3ffe:501:ffff:100::/64 for dynamic allocation. The first 32 bits of the IPv6 subnet are determined by IPv6 prefix 3. The bits 33 to 64 of the IPv6 subnet are determined by the IPv6 sub-prefix and its length. The prefix length of the IPv6 subnet is the IPv6 sub-prefix length.

```
<Sysname> system-view
[Sysname] ipv6 prefix 3 88:99::/32
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] network prefix 3 3ffe:501:ffff:100::/64
```

temporary address range

option

Use **option** to configure a self-defined DHCPv6 option in a DHCPv6 address pool.

Use **undo option** to remove a self-defined DHCPv6 option from a DHCPv6 address pool.

Syntax

option *code* **hex** *hex-string*

undo option *code*

Default

No self-defined DHCPv6 option is configured in a DHCPv6 address pool.

Views

DHCPv6 address pool view

DHCPv6 option group view

Predefined user roles

network-admin

Parameters

code: Specifies a number for the self-defined option, in the range of 21 to 65535, excluding 25 through 26, 37 through 40, and 43 through 48.

hex *hex-string*: Specifies the content of the option, a hexadecimal number whose length is an even number in the range of 2 to 256.

Usage guidelines

The DHCPv6 server fills the self-defined option with the specified hexadecimal number and sends it in a response to the client.

You can self-define options for the following purposes:

- Add newly released options.
- Add options for which the vendor defines the contents, for example, Option 43.

- Add options for which the CLI does not provide a dedicated configuration command like **dns-server**. For example, you can use the **option 31 hex 0200000000000000000000000000001** command to define the NTP server address 200::1 for DHCP clients.

If a DHCPv6 option is specified by both the dedicated command and the **option** command, the DHCPv6 server preferentially assigns the content specified by the dedicated command. For example, if a DNS server address is specified by the **dns-server** command and the **option 23** command, the server uses the address specified by **dns-server** command.

If you execute this command multiple times with the same *code* specified, the most recent configuration takes effect.

Examples

Configure Option 23 that specifies a DNS server address 2001:f3e0::1 in DHCPv6 address pool 1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] option 23 hex 2001f3e000000000000000000000001
```

prefix-pool

Use **prefix-pool** to apply a prefix pool to a DHCPv6 address pool, so the DHCPv6 server can dynamically select a prefix from the prefix pool for a client.

Use **undo prefix-pool** to remove the prefix pool.

Syntax

prefix-pool *prefix-pool-number* [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

undo prefix-pool *prefix-pool-number*

Default

No prefix pool is applied to a DHCPv6 address pool.

Views

DHCPv6 address pool view

Predefined user roles

network-admin

Parameters

prefix-pool-number: Specifies a prefix pool by its number in the range of 1 to 128.

preferred-lifetime *preferred-lifetime*: Sets the preferred lifetime in the range of 60 to 4294967295 seconds. The default value is 604800 seconds (7 days).

valid-lifetime *valid-lifetime*: Sets the valid lifetime in the range of 60 to 4294967295 seconds. The default value is 2592000 seconds (30 days). The valid lifetime must be longer than or equal to the preferred lifetime.

Usage guidelines

Only one prefix pool can be applied to an address pool.

You can apply a prefix pool that has not been created to an address pool. The setting takes effect after the prefix pool is created.

To modify the prefix pool in a DHCPv6 address pool, execute the **undo prefix-pool** command to remove the prefix pool, and then execute the **prefix-pool** command.

Examples

Apply prefix pool 1 to address pool 1, and use the default preferred lifetime and valid lifetime.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] prefix-pool 1
```

Apply prefix pool 2 to address pool 2, and set the preferred lifetime to one day and the valid lifetime to three days.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 2
[Sysname-dhcp6-pool-2] prefix-pool 2 preferred-lifetime 86400 valid-lifetime 259200
```

Parameters

address *ipv6-address*: Clears binding information for the specified assigned IPv6 address. If you do not specify an IPv6 address, this command clears binding information for all assigned IPv6 addresses.

pool *pool-name*: Clears binding information for assigned IPv6 addresses in the address pool specified by its name, a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command clears binding information for assigned IPv6 addresses in all address pools.

Usage guidelines

If you execute this command to clear information about an assigned static binding, the static binding becomes a free static binding.

Examples

Clear binding information for all assigned IPv6 addresses.

```
<Sysname> reset ipv6 dhcp server ip-in-use
```

Clears binding information for assigned IPv6 addresses in DHCPv6 address pool 1.

```
<Sysname> reset ipv6 dhcp server ip-in-use pool 1
```

Clears binding information for the assigned IPv6 address 2001:0:0:1::1.

```
<Sysname> reset ipv6 dhcp server ip-in-use address 2001:0:0:1::1
```

Related commands

display ipv6 dhcp server ip-in-use

reset ipv6 dhcp server pd-in-use

Use **reset ipv6 dhcp server pd-in-use** to clear binding information for assigned IPv6 prefixes.

Syntax

reset ipv6 dhcp server pd-in-use [**pool** *pool-name* | **prefix** *prefix/prefix-len*]

Views

User view

Predefined user roles

network-admin

Parameters

pool *pool-name*: Clears binding information for assigned IPv6 prefixes in the address pool specified by its name, a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command clears binding information for assigned IPv6 prefixes in all address pools.

prefix *prefix/prefix-len*: Clears binding information for the specified assigned IPv6 prefix. The value range for the prefix length is 1 to 128. If you do not specify an IPv6 prefix, this command clears binding information for all assigned IPv6 prefixes.

Usage guidelines

If you execute this command to clear information about an assigned static binding, the static binding becomes a free static binding.

Examples

Clear binding information for all assigned IPv6 prefixes.

```
<Sysname> reset ipv6 dhcp server pd-in-use
```

Clears binding information for assigned IPv6 prefixes in DHCPv6 address pool 1.

```
<Sysname> reset ipv6 dhcp server pd-in-use pool 1
```

Clears binding information for the assigned IPv6 prefix 2001:0:0:1::/64.

```
<Sysname> reset ipv6 dhcp server pd-in-use prefix 2001:0:0:1::/64
```

Related commands

display ipv6 dhcp server pd-in-use

reset ipv6 dhcp server statistics

Use **reset ipv6 dhcp server statistics** to clear DHCPv6 server statistics.

Syntax

reset ipv6 dhcp server statistics

Views

Predefined user roles

network-admin

Examples

Clear DHCPv6 server statistics.

```
<Sysname> reset ipv6 dhcp server statistics
```

Related commands

display ipv6 dhcp server statistics

sip-server

Use **sip-server** to specify the IPv6 address or domain name of a SIP server in the DHCPv6 address pool.

Use **undo sip-server** to remove a SIP server.

Syntax

sip-server { **address** *ipv6-address* | **domain-name** *domain-name* }

undo sip-server { **address** *ipv6-address* | **domain-name** *domain-name* }

Default

No SIP server address or domain name is specified.

Views

DHCPv6 address pool view

DHCPv6 option group view

Predefined user roles

network-admin

Parameters

address *ipv6-address*: Specifies the IPv6 address of a SIP server.

domain-name *domain-name*: Specifies the domain name of a SIP server, a case-insensitive string of 1 to 50 characters.

Usage guidelines

You can specify up to eight SIP server addresses and eight SIP server domain names in an address pool. A SIP server that is specified earlier has a higher preference.

Examples

Specify the SIP server address **2:2::4** in DHCPv6 address pool 1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] sip-server address 2:2::4
```

Specify the SIP server domain name **bbb.com** in DHCPv6 address pool 1.

```
[Sysname-dhcp6-pool-1] sip-server domain-name bbb.com
```

Related commands

display ipv6 dhcp pool

static-bind

Use **static-bind** to statically bind an IPv6 address or prefix to a client in the DHCPv6 address pool.

Use **undo static-bind** to delete a static binding.

Syntax

static-bind { **address** *ipv6-address*/*addr-prefix-length* | **prefix** *prefix*/*prefix-len* } **duid** *duid* [**iaid** *iaid*] [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

undo static-bind { **address** *ipv6-address*/*addr-prefix-length* | **prefix** *prefix*/*prefix-len* }

Default

No static binding is configured in a DHCPv6 address pool.

Views

DHCPv6 address pool view

Predefined user roles

network-admin

Parameters

address *ipv6-address*/*addr-prefix-length*: Specifies the IPv6 address and prefix length. The value range for the prefix length is 1 to 128.

prefix *prefix*/*prefix-len*: Specifies the prefix and prefix length. The value range for the prefix length is 1 to 128.

duid *duid*: Specifies a client DUID. The value is an even hexadecimal number in the range of 2 to 256.

iaid *iaid*: Specifies a client IAID. The value is a hexadecimal number in the range of 0 to FFFFFFFF. If you do not specify an IAID, the server does not match the client IAID for prefix assignment.

preferred-lifetime *preferred-lifetime*: Sets the preferred lifetime of the address or prefix. The value range is 60 to 4294967295 seconds, and the default is 604800 seconds (7 days).

valid-lifetime *valid-lifetime*: Sets the valid lifetime of the address or prefix. The value range is 60 to 4294967295 seconds, and the default is 2592000 seconds (30 days). The valid lifetime cannot be shorter than the preferred lifetime.

Usage guidelines

You can specify multiple static bindings in a DHCPv6 address pool.

An IPv6 address or prefix can be bound to only one DHCPv6 client.

To modify a static binding, execute the **undo static-bind** command to delete the binding, and then execute the **static-bind** command.

Examples

In address pool 1, bind IPv6 address 2001:0410::/35 to the client DUID 0003000100e0fc005552 and IAID A1A1A1A1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] static-bind address 2001:0410::/35 duid 0003000100e0fc005552 iaid A1A1A1A1
```

In address pool 1, bind prefix 2001:0410::/35 to the client DUID 00030001CA0006A400 and IAID A1A1A1A1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] static-bind prefix 2001:0410::/35 duid 00030001CA0006A400 iaid A1A1A1A1
```

Related commands

display ipv6 dhcp pool

temporary address range

Use **temporary address range** to configure a temporary IPv6 address range in a DHCPv6 address pool for dynamic allocation.

Use **undo temporary address range** to restore the default.

Syntax

temporary address range *start-ipv6-address end-ipv6-address* [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

undo temporary address range

Default

No temporary IPv6 address range is configured in a DHCPv6 address pool.

Views

DHCPv6 address pool view

Predefined user roles

network-admin

Parameters

start-ipv6-address: Specifies the start IPv6 address.

end-ipv6-address: Specifies the end IPv6 address.

preferred-lifetime *preferred-lifetime*: Sets the preferred lifetime. The value range is 60 to 4294967295 seconds, and the default is 604800 seconds (7 days).

valid-lifetime *valid-lifetime*: Sets the valid lifetime. The value range is 60 to 4294967295 seconds, and the default is 2592000 seconds (30 days). The valid lifetime cannot be shorter than the preferred lifetime.

Usage guidelines

If you do not execute the **temporary address range** command, the DHCPv6 server does not support temporary address assignment.

You can configure only one temporary IPv6 address range in an address pool. If you execute this command multiple times, the most recent configuration takes effect.

Examples

In DHCPv6 address pool 1, configure a temporary IPv6 address range from 3ffe:501:ffff:100::50 to 3ffe:501:ffff:100::60.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 1
[Sysname-dhcp6-pool-1] network 3ffe:501:ffff:100::/64
[Sysname-dhcp6-pool-1] temporary address range 3ffe:501:ffff:100::50
3ffe:501:ffff:100::60
```

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays DHCPv6 server addresses on all interfaces enabled with DHCPv6 relay agent.

Examples

Display DHCPv6 server addresses on all interfaces enabled with DHCPv6 relay agent.

```
<Sysname> display ipv6 dhcp relay server-address
Interface: Vlan-interface2
 Server address     Outgoing Interface          Public/VRF name
 2::3                                           --/--
 3::4               Vlan-interface4             Y/--
 4::5                                           --/1

Interface: Vlan-interface3
 Server address     Outgoing Interface          Public/VRF name
 2::3                                           --/--
 3::4               Vlan-interface4             Y/--
 4::5                                           --/1
```

Display DHCPv6 server addresses on VLAN-interface 2.

```
<Sysname> display ipv6 dhcp relay server-address interface vlan-interface 2
Interface: Vlan-interface2
 Server address     Outgoing Interface          Public/VRF name
 2::3                                           --/--
 3::4               Vlan-interface4             Y/--
 4::5                                           --/1
```

Table 11 Command output

Field	Description
Server address	DHCPv6 server address specified on the DHCP relay agent.

Field	Description
Outgoing Interface	Output interface of DHCPv6 packets. If no output interface is specified, the device searches the routing table for the output interface.
Public/VRF name	This field is not supported in the current software version. Location of the DHCPv6 server, which is determined by the configuration of the **ipv6 dhcp relay server-address** command. • If neither the **public** keyword nor the **vpn-instance** *vpn-instance-name* option is specified, this field displays **--/--**. • If the **public** keyword is specified, this field displays **Y/--**. • If the **vpn-instance** *vpn-instance-name* option is specified, the VPN instance name is displayed after the slash (/), for example, **--/1**.

Related commands

reset ipv6 dhcp relay statistics

gateway-list

Use **gateway-list** to specify gateway addresses for DHCPv6 clients in a DHCPv6 address pool.

Use **undo gateway-list** to remove gateway addresses from a DHCPv6 address pool.

Syntax

gateway-list *ipv6-address*&<1-8>

undo gateway-list [*ipv6-address*&<1-8>]

Default

No gateway address is specified in a DHCPv6 address pool.

Views

DHCPv6 address pool view

Predefined user roles

network-admin

Parameters

ipv6-address&<1-8>: Specifies a space-separated list of up to eight addresses.

Usage guidelines

DHCPv6 clients of the same access type can be classified into different types by their locations. In this case, the relay interface typically has no IPv6 address configured. You can use the **gateway-list** command to specify gateway addresses for clients matching the same DHCPv6 address pool.

Upon receiving a DHCPv6 Solicit or Request from a client that matches a DHCPv6 address pool, the relay agent processes the packet as follows:

- Fills the **link-address** field of the packet with a specified gateway address.
- Forwards the packet to all DHCPv6 servers in the matching DHCPv6 address pool.

The DHCPv6 servers select a DHCPv6 address pool according to the gateway address.

Examples

Specify the gateway address 10::1 in the DHCPv6 address pool **p1**.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool p1
[Sysname-dhcp6-pool-p1] gateway-list 10::1
```

ipv6 dhcp advertise address-route

Use **ipv6 dhcp advertise address-route** to enable the DHCPv6 relay agent to advertise host routes for IPv6 addresses assigned to DHCP clients.

Use **undo ipv6 dhcp advertise address-route** to disable the DHCPv6 relay agent from advertising host routes for IPv6 addresses assigned to DHCPv6 clients.

Syntax

ipv6 dhcp advertise address-route

undo ipv6 dhcp advertise address-route

Default

The DHCPv6 relay agent does not advertise host routes for IPv6 addresses assigned to DHCPv6 clients.

Views

System view

Predefined user roles

network-admin

Usage guidelines

In a network where ND cannot resolve global unicast addresses, network devices cannot generate ND entries for all global unicast addresses. If a DHCPv6 client obtains a global unicast address, the neighboring devices do not have the ND entries for this global unicast address, thus cannot forward the packets destined for the client. To resolve this problem, enable the DHCPv6 relay agent to advertise host routes for assigned IPv6 addresses in DHCP replies. The advertised route information is as follows:

- The destination IP address is the assigned IPv6 address.
- The next hop is the link-local address of the DHCPv6 client.
- The output interface is the interface that forwards the reply.

After the relay agent receives a packet destined for the assigned IPv6 address, the relay agent looks up the routing table for the next hop. ND resolution can succeed because the next hop is the link-local address of the client. The relay agent searches the ND table for the MAC address of the client based on the next hop and then forwards the packet.

Before using this command on the DHCPv6 relay agent, enable the DHCPv6 relay agent to record DHCPv6 relay entries first.

Examples

Enable the DHCPv6 relay agent to advertise host routes for IPv6 addresses assigned to DHCPv6 clients.

```
<Sysname> system-view
[Sysname] ipv6 dhcp advertise address-route
```

Related commands

ipv6 dhcp relay client-information record

ipv6 dhcp relay client-link-address enable

Use **ipv6 dhcp relay client-link-address enable** to enable the DHCPv6 relay agent to support Option 79.

Use **undo ipv6 dhcp relay client-link-address enable** to disable Option 79 support.

Syntax

ipv6 dhcp relay client-link-address enable

undo ipv6 dhcp relay client-link-address enable

Default

The DHCPv6 relay agent does not support Option 79.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

If DHCPv6 relay agents exist in the network, the DHCPv6 server needs the MAC address of the DHCPv6 client for authentication or for IPv6 address or prefix assignment. To meet the requirement, enable the DHCPv6 relay agent that the client first passes to support Option 79. This feature allows the DHCPv6 relay agent to learn the MAC address in the client request. When the relay agent generates a Relay-Forward packet for the request, it fills the MAC address of the client in Option 79. The Relay-Forward packet is then forwarded to the DHCPv6 server.

Examples

Enable Option 79 support on the relay agent.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 dhcp relay client-link-address enable
```

ipv6 dhcp relay gateway

Use **ipv6 dhcp relay gateway** to specify a gateway address for DHCPv6 clients on the DHCPv6 relay interface.

Use **undo ipv6 dhcp relay gateway** to restore the default.

Syntax

ipv6 dhcp relay gateway *ipv6-address*

undo ipv6 dhcp relay gateway

Default

The first IPv6 address of the relay interface is used as the gateway address for DHCPv6 clients.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies a gateway address. The IPv6 address must be an IPv6 address of the relay interface.

Usage guidelines

The DHCPv6 relay agent uses the specified IPv6 address instead of the first IPv6 address of the relay interface as the gateway address for DHCPv6 clients.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify 10::1 as the gateway address for DHCPv6 clients on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 dhcp relay gateway 10::1
```

Related commands

gateway-list

ipv6 dhcp relay interface-id

Use **ipv6 dhcp relay interface-id** to specify a padding mode for the Interface-ID option.

Use **undo ipv6 dhcp relay interface-id** to restore the default.

Syntax

ipv6 dhcp relay interface-id { **bas** | **interface** }

undo ipv6 dhcp relay interface-id

Default

The DHCPv6 relay agent fills the Interface-ID option with the interface index of the interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

bas: Specifies the BAS mode.

interface: Specifies the interface name mode. This mode pads the Interface-ID option in ASCII code with the interface name and VLAN ID of the interface.

Usage guidelines

Enable the DHCPv6 relay agent on the interface before executing this command. Otherwise, the command does not take effect.

Examples

Specify the BAS mode as the padding mode for the Interface-ID option on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 dhcp relay interface-id bas
```

Specify the interface name mode as the padding mode for the Interface-ID option on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 dhcp relay interface-id interface
```

ipv6 dhcp relay server-address

Use **ipv6 dhcp relay server-address** to specify a DHCPv6 server on the DHCPv6 relay agent.

Use **undo ipv6 dhcp relay server-address** to remove DHCPv6 server addresses.

Syntax

ipv6 dhcp relay server-address *ipv6-address* [**interface** *interface-type interface-number*]

undo ipv6 dhcp relay server-address [*ipv6-address* [**interface** *interface-type interface-number*]]

Default

No DHCPv6 server address is specified on the DHCPv6 relay agent.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of a DHCPv6 server.

interface *interface-type interface-number*: Specifies an output interface through which the relay agent forwards the DHCPv6 requests to the DHCPv6 server. If you do not specify an output interface, the relay agent looks up the routing table for an output interface.

Usage guidelines

Upon receiving a request from a DHCPv6 client, the interface encapsulates the request into a Relay-forward message and forwards the message to the specified DHCPv6 server.

You can specify a maximum of eight DHCPv6 servers on an interface. The DHCPv6 relay agent forwards DHCP requests to all the specified DHCPv6 servers.

If the DHCPv6 server address is a link-local address or multicast address, you must specify an output interface. If you do not specify an output interface, DHCPv6 packets might fail to reach the DHCPv6 server.

If you do not specify an IPv6 address, the **undo ipv6 dhcp relay server-address** command removes all DHCPv6 server addresses specified on the interface.

Do not enable the DHCPv6 client and the DHCPv6 relay agent on the same interface.

Examples

Enable the DHCPv6 relay agent on VLAN-interface 2 and specify the DHCPv6 server address 2001:1::3.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 dhcp select relay
[Sysname-Vlan-interface2] ipv6 dhcp relay server-address 2001:1::3
```

Related commands

display ipv6 dhcp relay server-address

ipv6 dhcp select

ipv6 dhcp relay source-address

Use **ipv6 dhcp relay source-address** to specify the source IPv6 address for relayed DHCPv6 requests.

Use **undo ipv6 dhcp relay source-address** to restore the default.

Syntax

ipv6 dhcp relay source-address { *ipv6-address* | **interface** *interface-type interface-number* }

undo ipv6 dhcp relay source-address

Default

The DHCPv6 relay agent uses the IPv6 global unicast address of the interface that connects to the DHCPv6 server as the source IPv6 address for relayed DHCPv6 requests.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies a source IPv6 address.

interface *interface-type interface-number*: Uses the IPv6 address of an interface as the source IPv6 address. The *interface-type interface-number* arguments specify an interface by its type and number.

Usage guidelines

This command is required if a relay interface does not have routes to DHCPv6 servers. You can specify a global unicast address or the IPv6 address of another interface (typically the loopback interface) as the source IPv6 address for DHCPv6 requests. The relay interface inserts the source IPv6 address in the source IPv6 address field of DHCPv6 requests.

If the specified interface does not have a global unicast IPv6 address, the IPv6 address of the output interface is used as the source address for relayed DHCPv6 requests.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify 10::1 as the source IPv6 address for relayed DHCPv6 requests on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 dhcp relay source-address 10::1
```

remote-server

Use **remote-server** to specify DHCPv6 servers for a DHCPv6 address pool.

Use **undo remote-server** to remove DHCPv6 servers from a DHCPv6 address pool.

Syntax

remote-server *ipv6-address* [**interface** *interface-type interface-number*]

undo remote-server [*ipv6-address* [**interface** *interface-type interface-number*]]

Default

No DHCPv6 server is specified for the DHCPv6 address pool.

Views

DHCPv6 address pool view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies a DHCPv6 server address.

interface *interface-type interface-number*: Specifies the outgoing interface by its type and number for the DHCPv6 relay agent to forward packets to the DHCPv6 server. If you do not specify an outgoing interface, the DHCPv6 relay agent performs a routing table lookup.

Usage guidelines

You can specify a maximum of eight DHCPv6 servers in one DHCPv6 address pool.

If you do not specify any parameters, the **undo remote-server** command removes all DHCPv6 servers in the DHCPv6 address pool.

If a DHCPv6 server address is a link-local address, you must specify an outgoing interface by using the **interface** keyword in this command. If you do not specify an outgoing interface, DHCPv6 packets might fail to reach the DHCPv6 server.

Examples

Specify DHCPv6 server 10::1 for DHCPv6 address pool 0.

```
<Sysname> system-view
[Sysname] ipv6 dhcp pool 0
[Sysname-dhcp6-pool-0] remote-server 10::1
```

reset ipv6 dhcp relay statistics

Use **reset ipv6 dhcp relay statistics** to clear packets statistics on the DHCPv6 relay agent.

Syntax

reset ipv6 dhcp relay statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears all relay agent statistics.

Examples

Clear packet statistics on the DHCPv6 relay agent.

```
<Sysname> reset ipv6 dhcp relay statistics
```

Related commands

display ipv6 dhcp relay statistics

DHCPv6 client commands

display ipv6 dhcp client

Use **display ipv6 dhcp client** to display DHCPv6 client information.

Syntax

display ipv6 dhcp client [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about all DHCPv6 clients.

Examples

Display the DHCPv6 client information on VLAN-interface 2.

```
<Sysname> display ipv6 dhcp client interface vlan-interface 2
Vlan-interface2:
  Type: Stateful client requesting address and prefix
    State: OPEN
    Client DUID: 0003000100e002000000
    Preferred server:
      Reachable via address: FE80::2E0:1FF:FE00:18
      Server DUID: 0003000100e001000000
    IA_NA: IAID 0x00000642, T1 50 sec, T2 80 sec
      Address: 1:1::2/128
        Preferred lifetime 100 sec, valid lifetime 200 sec
        Will expire on Feb 4 2014 at 15:37:20(288 seconds left)
    IA_PD: IAID 0x00000642, T1 50 sec, T2 80 sec
      Prefix: 12:34::/48
        Preferred lifetime 100 sec, valid lifetime 200 sec
        Will expire on Mar 27 2014 at 08:13:24 (199 seconds left)
    DNS server addresses:
      2:2::3
    Domain name:
      aaa.com
    SIP server addresses:
      2:2::4
    SIP server domain names:
      bbb.com
```

```
Options:
  Code: 88
    Length: 3 bytes
    Hex: AABBCC
```

Table 13 Command output

Field	Description
Type	Types of DHCPv6 client: • **Stateful client requesting address**—A DHCPv6 client that requests an IPv6 address. • **Stateful client requesting prefix**—A DHCPv6 client that requests an IPv6 prefix. • **Stateful client requesting address and prefix**—A DHCPv6 client that requests an IPv6 address and prefix. • **Stateless client**—A DHCPv6 client that requests configuration parameters other than an IPv6 address and prefix through stateless DHCPv6.
State	Current state of the DHCPv6 client: • **IDLE**—The client is in idle state. • **SOLICIT**—The client is locating a DHCPv6 server. • **REQUEST**—The client is requesting an IPv6 address or prefix. • **OPEN**—The client has obtained an IPv6 address or prefix. • **RENEW**—The client is extending the lease (after T1 and before T2). • **REBIND**—The client is extending the lease (after T2 and before the lease expires). • **RELEASE**—The client is releasing an IPv6 address or prefix. • **DECLINE**—The client is declining an IPv6 address or prefix because of an address or prefix conflict. • **INFO-REQUESTING**—The client is requesting configuration parameters through stateless DHCPv6.
Client DUID	DUID of the DHCPv6 client.
Preferred server	Information about the DHCPv6 server selected by the DHCPv6 client.
Reachable via address	Reachable address for the DHCPv6 client. It is the link local address of the DHCPv6 server or DHCPv6 relay agent.
Server DUID	DUID of the DHCPv6 server.
IA_NA	IA_NA information.
IA_PD	IA_PD information.
IAID	IA identifier.
T1	T1 value in seconds.
T2	T2 value in seconds.
Address	IPv6 address obtained. This field is displayed only when the DHCPv6 client type is **Stateful client requesting address**.
Prefix	IPv6 prefix obtained. This field is displayed only when the DHCPv6 client type is **Stateful client requesting prefix**.
Preferred lifetime	Preferred lifetime in seconds.
valid lifetime	Valid lifetime in seconds.

Field	Description
Will expire on Feb 4 2014 at 15:37:20 (288 seconds left)	Time when the lease expires and the remaining time of the lease. If the lease expires after the year 2100, this field displays **Will expire after 2100**.
DNS server addresses	IPv6 address of the DNS server.
Domain name	Domain name suffix.
SIP server addresses	IPv6 address of the SIP server.
SIP server domain names	Domain name of the SIP server.
Options	Self-defined options.
Code	Code of the self-defined option.
Length	Self-defined option length in bytes.
Hex	Self-defined option content represented by a hexadecimal number.

Related commands

ipv6 address dhcp-alloc

ipv6 dhcp client duid

display ipv6 dhcp client statistics

Use **display ipv6 dhcp client statistics** to display DHCPv6 client statistics.

Syntax

display ipv6 dhcp client statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays statistics for all DHCPv6 clients.

Examples

Display DHCPv6 client statistics on VLAN-interface 2.

```
<Sysname> display ipv6 dhcp client statistics interface vlan-interface 2
Interface                   :  Vlan-interface2
Packets received            :  1
        Reply               :  1
        Advertise           :  0
        Reconfigure         :  0
        Invalid             :  0
Packets sent                :  5
```

```
Solicit             :  0
Request             :  0
Renew               :  0
Rebind              :  0
Information-request :  5
Release             :  0
Decline             :  0
```

Table 14 Command output

Field	Description
Interface	Interface that acts as the DHCPv6 client.
Packets Received	Number of received packets.
Reply	Number of received reply packets.
Advertise	Number of received advertise packets.
Reconfigure	Number of received reconfigure packets.
Invalid	Number of invalid packets.
Packets sent	Number of sent packets.
Solicit	Number of sent solicit packets.
Request	Number of sent request packets.
Renew	Number of sent renew packets.
Rebind	Number of sent rebind packets.
Information-request	Number of sent information request packets.
Release	Number of sent release packets.
Decline	Number of sent decline packets.

Related commands

reset ipv6 dhcp client statistics

ipv6 address dhcp-alloc

Use **ipv6 address dhcp-alloc** to configure an interface to use DHCPv6 for IPv6 address acquisition.

Use **undo ipv6 address dhcp-alloc** to cancel an interface from using DHCPv6, and clear the obtained IPv6 address and other configuration parameters.

Syntax

ipv6 address dhcp-alloc [**option-group** *option-group-number* | **rapid-commit**] *

undo ipv6 address dhcp-alloc

Default

- In a version earlier than R6348P01, an interface does not use DHCPv6 to obtain IPv6 addresses and other network settings.
- In R6348P01 or later, the default setting of this command varies by device startup method as follows:

- When the device starts up with the initial configuration, an interface uses the default settings of software features and does not use DHCPv6 to obtain IPv6 addresses and other network settings.
- When the device starts up with the factory defaults, only VLAN-interface 1 supports using DHCPv6 to obtain IPv6 addresses and other network settings. Other interfaces do not use DHCPv6 to obtain IPv6 addresses and other network settings.

For more information about initial configuration and factory defaults, see configuration file management in *Fundamentals Configuration Guide*.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

option-group *option-group-number*: Enables the DHCPv6 client to create a dynamic DHCPv6 option group for saving the configuration parameters, and assigns an ID to the option group. The value range for the ID is 1 to 100. If you do not specify this option, the DHCPv6 client does not create any dynamic DHCPv6 option groups.

rapid-commit: Supports rapid address or prefix assignment.

Examples

Configure VLAN-interface 10 to use DHCPv6 for IPv6 address acquisition. Configure the DHCPv6 client to support rapid address assignment and create dynamic DHCPv6 option group 1 for the configuration parameters obtained.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 address dhcp-alloc rapid-commit option-group 1
```

Related commands

display ipv6 dhcp client

ipv6 dhcp client dscp

Use **ipv6 dhcp client dscp** to set the DSCP value for DHCPv6 packets sent by the DHCPv6 client.

Use **undo ipv6 dhcp client dscp** to restore the default.

Syntax

ipv6 dhcp client dscp *dscp-value*

undo ipv6 dhcp client dscp

Default

The DSCP value in DHCPv6 packets is 56.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Sets the DSCP value for DHCP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value is carried in the Traffic class field of a DHCPv6 packet. It specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for DHCPv6 packets sent by the DHCPv6 client.

```
<Sysname> system-view
[Sysname] ipv6 dhcp client dscp 30
```

ipv6 dhcp client duid

Use **ipv6 dhcp client duid** to configure the DHCPv6 client DUID for an interface.

Use **undo ipv6 dhcp client duid** to restore the default.

Syntax

ipv6 dhcp client duid { **ascii** *ascii-string* | **hex** *hex-string* | **mac** *interface-type interface-number* }

undo ipv6 dhcp client duid

Default

The interface uses the device bridge MAC address to generate its DHCPv6 client DUID.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

ascii *ascii-string*: Specifies a case-sensitive ASCII string of 1 to 130 characters as the DHCPv6 client DUID.

hex *hex-string*: Specifies a hexadecimal number of 2 to 260 characters as the DHCPv6 client DUID.

mac *interface-type interface-number*: Specifies the MAC address of the specified interface as the DHCPv6 client DUID. The *interface-type interface-number* arguments specify an interface by its type and number.

Usage guidelines

A DHCPv6 client pads its DUID into the Option 1 of the DHCPv6 packet that it sends to the DHCPv6 server. The DHCPv6 server can assign specific IPv6 addresses or prefixes to DHCPv6 clients with specific DUIDs.

The DUID of a DHCPv6 client is the globally unique identifier of the client, so make sure the DUID that you configure is unique.

Examples

Specify the hexadecimal number FFFFFFFF as the DHCPv6 client DUID for VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 dhcp client duid hex ffffffff
```

Related commands

display ipv6 dhcp client

ipv6 dhcp client pd

Use **ipv6 dhcp client pd** to configure an interface to use DHCPv6 for IPv6 prefix acquisition.

Use **undo ipv6 dhcp client pd** to cancel an interface from using DHCPv6, and clear the obtained IPv6 prefix and other configuration parameters.

Syntax

ipv6 dhcp client pd *prefix-number* [**option-group** *option-group-number* | **rapid-commit**]*

undo ipv6 dhcp client pd

Default

An interface does not use DHCPv6 for IPv6 prefix acquisition.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

prefix-number: Specifies an IPv6 prefix ID in the range of 1 to 1024. After obtaining an IPv6 prefix, the client assigns the ID to the IPv6 prefix.

rapid-commit: Supports rapid address or prefix assignment.

option-group *option-group-number*: Enables the DHCPv6 client to create a dynamic DHCPv6 option group for saving the configuration parameters, and assigns an ID to the option group. The value range for the ID is 1 to 100. If you do not specify this option, the DHCPv6 client does not create any dynamic DHCPv6 option groups.

Examples

Configure VLAN-interface10 to use DHCPv6 for IPv6 prefix acquisition. Specify IDs for the dynamic IPv6 prefix and dynamic DHCPv6 option group, and configure the client to support rapid prefix assignment.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 dhcp client pd 1 rapid-commit option-group 1
```

Related commands

display ipv6 dhcp client

ipv6 dhcp client stateful

Use **ipv6 dhcp client stateful** to configure an interface to use DHCPv6 for IPv6 address and prefix acquisition.

Use **undo ipv6 dhcp client stateful** to cancel an interface from using DHCPv6, and clear the obtained IPv6 address, prefix, and other configuration parameters.

Syntax

ipv6 dhcp client stateful prefix *prefix-number* [**option-group** *option-group-number* | **rapid-commit**] *

undo ipv6 dhcp client stateful

Default

An interface does not use DHCPv6 for IPv6 address and prefix acquisition.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

prefix *prefix-number*: Specifies an IPv6 prefix ID in the range of 1 to 1024. After obtaining an IPv6 prefix, the client assigns the ID to the IPv6 prefix.

rapid-commit: Supports rapid address and prefix assignment.

option-group *option-group-number*: Enables the DHCPv6 client to create a dynamic DHCPv6 option group for saving the configuration parameters, and assigns an ID to the option group. The value range for the ID is 1 to 100. If you do not specify this option, the DHCPv6 client does not create any dynamic DHCPv6 option groups.

Usage guidelines

The **ipv6 dhcp client stateful** command takes effect if it is configured with the **ipv6 address dhcp-alloc** and **ipv6 dhcp client pd** commands on an interface. You must execute the **undo ipv6 dhcp client stateful** command to have the **ipv6 address dhcp-alloc** and **ipv6 dhcp client pd** commands take effect.

Examples

Configure VLAN-interface 10 to use DHCPv6 for IPv6 address and prefix acquisition. Specify IDs for the dynamic IPv6 prefix and dynamic DHCPv6 option group, and configure the client to support rapid address and prefix assignment.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ipv6 dhcp client stateful prefix 1 rapid-commit option-group
1
```

Related commands

ipv6 address dhcp-alloc

ipv6 dhcp client pd

ipv6 dhcp client stateless enable

Use **ipv6 dhcp client stateless enable** to enable stateless DHCPv6.

Use **undo ipv6 dhcp client stateless enable** to disable stateless DHCPv6.

Syntax

ipv6 dhcp client stateless enable

undo ipv6 dhcp client stateless enable

Default

Stateless DHCPv6 is disabled.

Views

VLAN interface view

Predefined user roles

network-admin

Usage guidelines

Stateless DHCPv6 enables the interface to send an Information-request message to the multicast address of all DHCPv6 servers and DHCPv6 relay agents for configuration parameters.

Examples

Enable stateless DHCPv6 on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] ipv6 dhcp client stateless enable
```

reset ipv6 dhcp client statistics

Use **reset ipv6 dhcp client statistics** to clear DHCPv6 client statistics.

Syntax

reset ipv6 dhcp client statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears all DHCPv6 client statistics.

Examples

Clear all DHCPv6 client statistics.

```
<Sysname> reset ipv6 dhcp client statistics
```

Related commands

display ipv6 dhcp client statistics

DHCPv6 snooping commands

DHCPv6 snooping works between the DHCPv6 client and the DHCPv6 server or between the DHCPv6 client and DHCPv6 the relay agent. DHCPv6 snooping does not work between the DHCPv6 server and the DHCPv6 relay agent.

display ipv6 dhcp snooping binding

Use **display ipv6 dhcp snooping binding** to display DHCPv6 snooping address entries.

Syntax

display ipv6 dhcp snooping binding [**address** *ipv6-address* [**vlan** *vlan-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

address *ipv6-address*: Displays the DHCPv6 snooping entry for the specified IPv6 address.

vlan *vlan-id*: Specifies the ID of the VLAN where the IPv6 address resides.

Usage guidelines

If you do not specify any parameters, this command displays all DHCPv6 snooping address entries.

Examples

Display all DHCPv6 snooping address entries.

```
<Sysname> display ipv6 dhcp snooping binding
1 DHCPv6 snooping entries found.
 IPv6 address     MAC address    Lease       VLAN SVLAN Interface
 ================ ============== =========== ==== ===== ========================
 2::1             00e0-fc00-0006 54          2    N/A   GigabitEthernet1/0/1
```

Table 15 Command output

Field	Description
IPv6 Address	IPv6 address assigned to the DHCPv6 client.
MAC Address	MAC address of the DHCPv6 client.
Lease	Remaining lease duration in seconds.
VLAN	When both DHCPv6 snooping and QinQ are enabled or the DHCPv6 packet contains two VLAN tags, this field identifies the outer VLAN tag. Otherwise, it identifies the VLAN where the port connecting the DHCPv6 client resides.
SVLAN	When both DHCPv6 snooping and QinQ are enabled or the DHCPv6 packet contains two VLAN tags, this field identifies the inner VLAN tag. Otherwise, it displays **N/A**.
Interface	Port connecting to the DHCPv6 client.

Related commands

Predefined user roles

network-admin

network-operator

Examples

Display information about DHCPv6 snooping entry auto backup.

```
<Sysname> display ipv6 dhcp snooping binding database
File name              :   database.dhcp
Username               :
Password               :
Update interval        :   600 seconds
Latest write time      :   Feb 27 18:48:04 2012
Status                 :   Last write succeeded.
```

Table 16 Command output

Field	Description
File name	Name of the DHCPv6 snooping entry backup file.
Username	Username for accessing the URL of the remote backup file.
Password	Password for accessing the URL of the remote backup file. This field displays ********** if a password is configured.
Update interval	Waiting time in seconds after a DHCPv6 snooping entry change for the DHCPv6 snooping device to update the backup file.
Latest write time	Time of the latest update.
Status	Status of the update: • **Writing**—The backup file is being updated. • **Last write succeeded**—The backup file was successfully updated. • **Last write failed**—The backup file failed to be updated.

display ipv6 dhcp snooping packet statistics

Use **display ipv6 dhcp snooping packet statistics** to display DHCPv6 packet statistics for DHCPv6 snooping.

Syntax

display ipv6 dhcp snooping packet statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DHCPv6 packet statistics for the master device.

Examples

Display DHCPv6 packet statistics for DHCPv6 snooping.

```
<Sysname> display ipv6 dhcp snooping packet statistics
 DHCPv6 packets received                 : 100
 DHCPv6 packets sent                     : 200
 Invalid DHCPv6 packets dropped          : 0
```

Related commands

reset ipv6 dhcp snooping packet statistics

display ipv6 dhcp snooping pd binding

Use **display ipv6 dhcp snooping pd binding** to display DHCPv6 snooping prefix entries.

Syntax

display ipv6 dhcp snooping pd binding [**prefix** *prefix/prefix-length* [**vlan** *vlan-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

prefix *prefix/prefix-length*: Specifies an IPv6 prefix with its length. The value range for the *prefix-length* argument is 1 to 128.

vlan *vlan-id*: Specifies the ID of the VLAN where the IPv6 prefix resides. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

This command takes effect only after you execute the **ipv6 dhcp snooping pd binding record** command on the port directly connecting to the clients.

If you do not specify any parameters, this command displays all DHCPv6 snooping prefix entries.

Examples

Display all DHCPv6 snooping prefix entries.

```
<Sysname> display ipv6 dhcp snooping pd binding
1 DHCPv6 snooping PD entries found.
IPv6 prefix      Lease       VLAN SVLAN Interface
================ =========== ==== ===== ========================
1:2::/64         54          2    N/A   GigabitEthernet1/0/1
```

Table 17 Command output

Field	Description
n DHCPv6 snooping PD entries found.	Total number of DHCPv6 snooping prefix entries.
IPv6 prefix	IPv6 prefix assigned to the DHCPv6 client.
Lease	Remaining lease duration in seconds.

Field	Description
VLAN	When both DHCPv6 snooping and QinQ are enabled or the DHCPv6 packet contains two VLAN tags, this field identifies the outer VLAN tag. Otherwise, it identifies the VLAN where the port connecting the DHCPv6 client resides.
SVLAN	When both DHCPv6 snooping and QinQ are enabled or the DHCPv6 packet contains two VLAN tags, this field identifies the inner VLAN tag. Otherwise, it displays **N/A**.
Interface	Port connecting to the DHCPv6 client.

============================        ============
```

Table 18 Command output

Field	Description
Interface	Interface name.

Field	Description
Trusted	Trusted port specified in global DHCPv6 snooping configuration. If the trusted port is specified in VLAN-based DHCPv6 snooping configuration, this field displays a hyphen (**-**).
VLAN	VLAN to which the trusted port belongs. If the trusted port is specified in global DHCPv6 snooping configuration, this field displays a hyphen (**-**).
VSI name	This field is not supported in the current software version. VSI name of the VXLAN tunnel interface. This field is available when you configure the tunnel interface assigned to the VSI as a DHCP snooping trusted interface by using the **ipv6 dhcp snooping trust tunnel** command.
Tunnel trusted	This field is not supported in the current software version. Trusted tunnel interface specified in VXLAN-based DHCPv6 snooping configuration.
AC	This field is not supported in the current software version. AC name, which is indicated by the interface name and Ethernet service instance name. This field is available when you configure the AC as the DHCPv6 snooping trusted interface by using the **ipv6 dhcp snooping trust** command in Ethernet service instance view.
Trusted	This field is not supported in the current software version. Trusted AC specified in VXLAN-based DHCPv6 snooping configuration.

Related commands

ipv6 dhcp snooping trust

ipv6 dhcp snooping binding database filename

Use **ipv6 dhcp snooping binding database filename** to configure the DHCPv6 snooping device to back up DHCPv6 snooping entries to a file.

Use **undo ipv6 dhcp snooping binding database filename** to disable the auto backup and remove the backup file.

Syntax

ipv6 dhcp snooping binding database filename { *filename* | **url** *url* [**username** *username* [**password** { **cipher** | **simple** } *string*]] }

undo ipv6 dhcp snooping binding database filename

Default

The DHCPv6 snooping device does not back up DHCPv6 snooping entries.

Views

System view

Predefined user roles

network-admin

Parameters

filename: Specifies the name of a local backup file. For information about the *filename* argument, see *Fundamentals Configuration Guide*.

url *url*: Specifies the URL of a remote backup file. The URL is a case-sensitive string of 1 to 255 characters. Do not include a username or password in the URL. The supported path format type varies by server.

username *username*: Specifies the username for accessing the URL of the remote backup file. The username is a case-sensitive string of 1 to 32 characters. Do not specify this option if a username is not required for accessing the URL.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 32 characters. Its encrypted form is a case-sensitive string of 1 to 73 characters. Do not specify this argument if a password is not required for accessing the URL of the remote backup file.

Usage guidelines

This command automatically creates the file if you specify a nonexistent file.

With this command executed, the DHCPv6 snooping device backs up its snooping entries immediately and runs auto backup. The snooping device, by default, waits 300 seconds after a DHCPv6 snooping entry change to update the backup file. You can use the **ipv6 dhcp snooping binding database update interval** command to change the waiting time. If no DHCPv6 snooping entry changes, the backup file is not updated.

As a best practice, back up the DHCPv6 snooping entries to a remote file. If you use the local storage medium, the frequent erasing and writing might damage the medium and then cause the DHCPv6 snooping device malfunction.

When the file is on a remote device, follow these restrictions and guidelines to specify the URL, username, and password:

- If the file is on an FTP server, enter URL in the format of ftp:*//server address:port/file path*, where the port number is optional.
- If the file is on a TFTP server, enter URL in the format of tftp:*//server address:port/file path*, where the port number is optional.
- The username and password must be the same as those configured on the FTP server. If the server authenticates only the username, the password can be omitted.
- If the IP address of the server is an IPv6 address, enclose the address in a pair of brackets, for example, **ftp://[1::1]/database.dhcp**.
- You can also specify the DNS domain name for the server address field, for example, **ftp://company/database.dhcp**.

Examples

Configure the DHCPv6 snooping device to back up DHCPv6 snooping entries to the file **database.dhcp**.

```
<Sysname> system-view
[Sysname] ipv6 dhcp snooping binding database filename database.dhcp
```

Configure the DHCPv6 snooping device to back up DHCPv6 snooping entries to the file **database.dhcp** in the working directory of the FTP server at 1::1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp snooping binding database filename url ftp://[1::1]/database.dhcp
username 1 password simple 1
```

Configure the DHCPv6 snooping device to back up DHCPv6 snooping entries to the file **database.dhcp** in the working directory of the TFTP server at 2::1.

```
<Sysname> system-view
[Sysname] ipv6 dhcp snooping binding database filename url tftp://[2::1]/database.dhcp
```

Related commands

ipv6 dhcp snooping binding database update interval

ipv6 dhcp snooping binding database update interval

Use **ipv6 dhcp snooping binding database update interval** to set the waiting time for the DHCPv6 snooping device to update the backup file after a DHCPv6 snooping entry change.

Use **undo ipv6 dhcp snooping binding database update interval** to restore the default.

Syntax

ipv6 dhcp snooping binding database update interval *interval*

undo ipv6 dhcp snooping binding database update interval

Default

The DHCPv6 snooping device waits 300 seconds to update the backup file after a DHCPv6 snooping entry change. If no DHCPv6 snooping entry changes, the backup file is not updated.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the waiting time in seconds, in the range of 60 to 864000.

Usage guidelines

When a DHCPv6 snooping entry is learned, updated, or removed, the waiting period starts. The DHCPv6 snooping device updates the backup file when the waiting period is reached. All snooping entries changed during the period will be saved to the backup file.

The waiting time takes effect only after you configure the DHCPv6 snooping entry auto backup by using the **ipv6 dhcp snooping binding database filename** command.

Examples

Set the waiting time to 600 seconds for the DHCPv6 snooping device to update the backup file.

```
<Sysname> system-view
[Sysname] ipv6 dhcp snooping binding database update interval 600
```

Related commands

ipv6 dhcp snooping binding database update now

Use **ipv6 dhcp snooping binding database update now** to manually save DHCPv6 snooping entries to the backup file.

Syntax

ipv6 dhcp snooping binding database update now

Views

System view

Predefined user roles

network-admin

Usage guidelines

Each time this command is executed, the DHCPv6 snooping entries are saved to the backup file.

This command takes effect only after you configure the DHCPv6 snooping entry auto backup by using the **ipv6 dhcp snooping binding database filename** command.

Examples

Manually save DHCPv6 snooping entries to the backup file.

```
<Sysname> system-view
[Sysname] ipv6 dhcp snooping binding database update now
```

Related commands

ipv6 dhcp snooping binding database filename

ipv6 dhcp snooping binding record

Use **ipv6 dhcp snooping binding record** to enable recording DHCPv6 snooping address entries.

Use **undo ipv6 dhcp snooping binding record** to disable recording DHCPv6 snooping address entries.

Syntax

ipv6 dhcp snooping binding record

undo ipv6 dhcp snooping binding record

Default

Recording of DHCPv6 snooping address entries is disabled.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

VLAN view

Predefined user roles

network-admin

Usage guidelines

You can configure this command on the ports that are directly connected to the DHCPv6 clients.

This command enables DHCPv6 snooping to record IP-to-MAC information of the DHCPv6 clients (called DHCPv6 snooping address entries).

Examples

Enable recording DHCPv6 snooping address entries on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 dhcp snooping binding record
```

ipv6 dhcp snooping check request-message

Use **ipv6 dhcp snooping check request-message** to enable the DHCPv6-REQUEST check feature.

Use **undo ipv6 dhcp snooping check request-message** to disable the DHCPv6-REQUEST check feature.

Syntax

ipv6 dhcp snooping check request-message

undo ipv6 dhcp snooping check request-message

Default

The DHCPv6-REQUEST check feature is disabled.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

Use the DHCPv6-REQUEST check feature to protect the DHCPv6 server against DHCPv6 client spoofing attacks. The feature enables the DHCPv6 snooping device to check every received DHCPv6-RENEW, DHCPv6-DECLINE, or DHCPv6-RELEASE message against DHCPv6 snooping entries.

- If any criterion in an entry is matched, the device compares the entry with the message information.
  - If they are consistent, the device considers the message valid and forwards it to the DHCPv6 server.
  - If they are different, the device considers the message forged and discards it.
- If no matching entry is found, the device forwards the message to the DHCPv6 server.

Examples

Enable DHCPv6-REQUEST check.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 dhcp snooping check request-message
```

ipv6 dhcp snooping deny

Use **ipv6 dhcp snooping deny** to configure a port as DHCPv6 packet blocking port.

Use **undo ipv6 dhcp snooping deny** to restore the default.

Syntax

ipv6 dhcp snooping deny

undo ipv6 dhcp snooping deny

Default

A port does not block DHCPv6 requests.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

To avoid IPv6 address and prefix acquisition failure, configure a port to block DHCPv6 packets only if no DHCPv6 clients are connected to it.

To enable a port on the snooping device to drop all incoming DHCPv6 requests, configure that port as a DHCPv6 packet blocking port.

Examples

Configure GigabitEthernet 1/0/1 as a DHCPv6 packet blocking port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 dhcp snooping deny
```

ipv6 dhcp snooping disable

Use **ipv6 dhcp snooping disable** to disable DHCP snooping.

Use **undo ipv6 dhcp snooping disable** to restore the default.

Syntax

ipv6 dhcp snooping disable

undo ipv6 dhcp snooping disable

Default

If you enable DHCPv6 snooping globally or for a VLAN, DHCP snooping is enabled on all interfaces on the device or on all interfaces in the VLAN.

If you do not enable DHCPv6 snooping globally or for a VLAN, DHCP snooping is disabled on all interfaces on the device or on all interfaces in the VLAN.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

This command allows you to narrow down the interface range where DHCPv6 snooping takes effect. For example, to enable DHCPv6 snooping globally except for a specific interface, you can enable DHCPv6 snooping globally and execute this command on the target interface.

Examples

Disable DHCPv6 snooping on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 dhcp snooping disable
```

Related commands

ipv6 dhcp snooping enable

ipv6 dhcp snooping enable vlan

ipv6 dhcp snooping enable

Use **ipv6 dhcp snooping enable** to enable DHCPv6 snooping.

Use **undo ipv6 dhcp snooping enable** to disable DHCPv6 snooping.

Syntax

ipv6 dhcp snooping enable

undo ipv6 dhcp snooping enable

Default

DHCPv6 snooping is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use the DHCPv6 snooping feature together with trusted port configuration. Trusted ports forward responses from DHCPv6 servers and untrusted ports discard responses from DHCPv6 servers. This mechanism ensures that DHCPv6 clients obtain IPv6 addresses or prefixes from authorized DHCPv6 servers.

When DHCPv6 snooping is disabled, all ports on the device forward responses from DHCPv6 servers.

Examples

Enable DHCPv6 snooping.

```
<Sysname> system-view
[Sysname] ipv6 dhcp snooping enable
```

Related commands

ipv6 dhcp snooping disable

ipv6 dhcp snooping enable vlan

Use **ipv6 dhcp snooping enable vlan** to enable DHCPv6 snooping for VLANs.

Use **undo ipv6 dhcp snooping enable vlan** to disable DHCPv6 snooping for VLANs.

Syntax

ipv6 dhcp snooping enable vlan *vlan-id-list*

undo ipv6 dhcp snooping enable vlan *vlan-id-list*

Default

DHCPv6 snooping is disabled for all VLANs.

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each VLAN item specifies a VLAN by VLAN ID or specifies a range of VLANs in the form of *vlan-id1* to *vlan-id2*. The value range for the VLAN IDs is 1 to 4094. If you specify a VLAN range, the value for the *vlan-id2* argument must be greater than the value for the *vlan-id1* argument.

Usage guidelines

After you enable DHCPv6 snooping for a VLAN, DHCPv6 snooping untrusted ports in the VLAN discard incoming DHCP responses. This mechanism ensures that DHCP clients obtain IP addresses from authorized DHCP servers.

After you disable DHCPv6 snooping for a VLAN, all interfaces in the VLAN can forward DHCPv6 responses.

After you enable DHCPv6 snooping globally, all VLANs on the device are also enabled with DHCPv6 snooping. To disable DHCPv6 snooping in a VLAN, disable DHCPv6 snooping globally and in the VLAN.

Examples

Enable DHCPv6 snooping for VLANs 5,10, 20, and 32.

```
<Sysname> system-view
[Sysname] ipv6 dhcp snooping enable vlan 5 10 to 20 32
```

Use **undo ipv6 dhcp snooping log enable** to disable DHCPv6 snooping logging.

Syntax

ipv6 dhcp snooping log enable

undo ipv6 dhcp snooping log enable

Default

DHCPv6 snooping logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the DHCPv6 snooping device to generate DHCPv6 snooping logs and send them to the information center. The log information helps administrators locate and solve problems. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

As a best practice, disable this feature if the log generation affects the device performance.

Examples

Enable DHCPv6 snooping logging.

```
<Sysname> system-view
[Sysname] ipv6 dhcp snooping log enable
```

ipv6 dhcp snooping option interface-id enable

Use **ipv6 dhcp snooping option interface-id enable** to enable support for the interface-ID option (also called Option 18).

Use **undo ipv6 dhcp snooping option interface-id enable** to disable support for the interface-ID option.

Syntax

ipv6 dhcp snooping option interface-id enable

undo ipv6 dhcp snooping option interface-id enable

Default

Option 18 is not supported.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

ipv6 dhcp snooping pd binding record

Use **ipv6 dhcp snooping pd binding record** to enable recording DHCPv6 snooping prefix entries.

Use **undo ipv6 dhcp snooping pd binding record** to disable recording DHCPv6 snooping prefix entries.

Syntax

ipv6 dhcp snooping pd binding record

undo ipv6 dhcp snooping pd binding record

Default

Recording of DHCPv6 snooping prefix entries is disabled.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

VLAN view

Predefined user roles

network-admin

Usage guidelines

This command enables DHCPv6 snooping to record IPv6 prefix-to-port information of the DHCPv6 clients (called DHCPv6 snooping prefix entries). When IP source guard (IPSG) is configured on the DHCP snooping device, IPSG can generate dynamic bindings based on the DHCP snooping prefix entries to filter out illegitimate packets.

Examples

Enable DHCPv6 snooping prefix entries on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname]interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 dhcp snooping pd binding record
```

Related commands

ipv6 dhcp snooping rate-limit

Use **ipv6 dhcp snooping rate-limit** to enable DHCPv6 snooping packet rate limit on an interface and set the limit value.

Use **undo ipv6 dhcp snooping rate-limit** to disable DHCPv6 snooping packet rate limit.

Syntax

ipv6 dhcp snooping rate-limit *rate*

undo ipv6 dhcp snooping rate-limit

Default

The DHCPv6 snooping packet rate limit is disabled on an interface.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

rate: Specifies the maximum rate in Kbps. The value range is 64 to 512.

Usage guidelines

This command takes effect only when DHCPv6 snooping is enabled.

The DHCPv6 packet rate limit feature enables the interface to discard DHCPv6 packets that exceed the maximum rate.

The rate configured on a Layer 2 aggregate interface applies to all members of the aggregate interface. If a member interface leaves the aggregation group, it uses the rate configured in its Ethernet interface view.

The chip-supported maximum rate is an integer multiple of eight. If you set the maximum rate to 67, the value 64 or 72 takes effect.

Examples

Configure GigabitEthernet 1/0/1 to receive DHCPv6 packets at a maximum rate of 64 Kbps.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 dhcp snooping rate-limit 64
```

ipv6 dhcp snooping trust

Use **ipv6 dhcp snooping trust** to configure a port as a trusted port.

Use **undo ipv6 dhcp snooping trust** to restore the default state of a port.

Syntax

ipv6 dhcp snooping trust

undo ipv6 dhcp snooping trust

Default

After you enable DHCPv6 snooping, all ports are untrusted.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

Specify the port facing the DHCP server as trusted and specify the other ports as untrusted so DHCP clients can obtain valid IP addresses.

Examples

Specify GigabitEthernet 1/0/1 as a trusted port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 dhcp snooping trust
```

Related commands

display ipv6 dhcp snooping trust

ipv6 dhcp snooping trust interface

Use **ipv6 dhcp snooping trust interface** to configure a port in a VLAN as a DHCPv6 snooping trusted port.

Use **undo ipv6 dhcp snooping trust interface** to restore the default state of a port in a VLAN.

Syntax

ipv6 dhcp snooping trust interface *interface-type interface-number*

undo ipv6 dhcp snooping trust interface *interface-type interface-number*

Default

After you enable DHCPv6 snooping for a VLAN, all ports in the VLAN are DHCP snooping untrusted ports.

Views

VLAN view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

In a VLAN, specify the port facing the DHCP server as trusted and specify the other ports as untrusted so DHCP clients can obtain valid IP addresses.

You can execute this command multiple times in a VLAN to configure multiple trusted ports in the VLAN.

Make sure the specified port is in the VLAN for which the **ipv6 dhcp snooping enable vlan** command is configured.

Examples

In VLAN 1, configure GigabitEthernet 1/0/1 as a trusted port.

```
<Sysname> system-view
[Sysname] vlan 1
[Sysname-vlan1] ipv6 dhcp snooping trust interface gigabitethernet 1/0/1
```

Related commands

ipv6 dhcp snooping enable vlan

reset ipv6 dhcp snooping binding

Use **reset ipv6 dhcp snooping binding** to clear DHCPv6 snooping address entries.

Syntax

reset ipv6 dhcp snooping binding { **all** | **address** *ipv6-address* [**vlan** *vlan-id*] }

Views

User view

Predefined user roles

network-admin

Parameters

address *ipv6-address*: Clears the DHCPv6 snooping entry for the specified IPv6 address.

vlan *vlan-id*: Clears DHCPv6 snooping address entries for the specified VLAN. If you do not specify a VLAN, this command clears DHCPv6 snooping address entries for the default VLAN.

all: Clears all DHCPv6 snooping address entries.

Examples

Clear all DHCPv6 snooping address entries.

```
<Sysname> reset ipv6 dhcp snooping binding all
```

Related commands

display ipv6 dhcp snooping binding

reset ipv6 dhcp snooping packet statistics

Syntax

reset ipv6 dhcp snooping pd binding { **all** | **prefix** *prefix/prefix-length* [**vlan** *vlan-id*] }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears all DHCPv6 snooping prefix entries.

prefix *prefix/prefix-length*: Clears DHCPv6 snooping entries for the specified IPv6 prefix. The value range for the *prefix-length* argument is 1 to 128.

vlan *vlan-id*: Clears DHCPv6 snooping prefix entries for the specified VLAN. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

If you do not specify any parameters, this command clears all DHCPv6 snooping prefix entries.

Examples

Clear DHCPv6 snooping prefix entries for 1:2::/64.

```
<Sysname> reset ipv6 dhcp snooping pd binding prefix 1:2::/64
```

Related commands

display ipv6 dhcp snooping pd binding

DHCPv6 guard commands

The DHCPv6 guard feature operates correctly only when the device is located between the DHCPv6 client and the DHCPv6 server or between the DHCPv6 client and the DHCPv6 relay agent. If the device is located between the DHCPv6 server and the DHCPv6 relay agent, the DHCPv6 guard feature cannot operate correctly.

When the DHCPv6 guard feature is configured on a DHCPv6 snooping device, both features can take effect. The device forwards DHCPv6 reply packets received on a DHCP snooping trusted port only if they pass the DHCPv6 guard check. These packets are dropped if they fail the DHCPv6 guard check.

device-role

Use **device-role** to set the role of the device attached to the target interface or VLAN.

Use **undo device-role** to restore the default.

Syntax

device-role { **client** | **server** }

undo device-role

Default

The role is DHCPv6 client for the device attached to the target interface or VLAN.

Views

DHCPv6 guard policy view

Predefined user roles

network-admin

Parameters

client: Sets the device role to DHCPv6 client.

server: Sets the device role to DHCPv6 server.

Usage guidelines

The target interface or VLAN refers to the interface or VLAN to which a DHCPv6 guard policy is applied. The device makes forwarding decisions based on the device role as follows:

- Drops DHCPv6 replies received from the device with the device role of DHCPv6 client.
- Forwards DHCP replies received from the device with the device role of DHCPv6 server only if the packets pass the DHCPv6 guard check.

If the target interface or VLAN is attached to an authorized DHCPv6 server, set the device role to DHCPv6 server for the authorized DHCPv6 server. If no authorized DHCP servers are attached to the target interface or VLAN, set the device role to DHCPv6 client for devices attached to the target interface or VLAN.

The **trust port** command has a higher priority than the **device-role** command. If you configure both commands for a DHCPv6 guard policy, the **trust port** command takes effect.

Examples

Set the role to DHCPv6 server for the device attached to the target interface or VLAN.

```
<Sysname> system-view
[Sysname] ipv6 dhcp guard policy p1
[Sysname-dhcp6-guard-policy-p1] device-role server
```

display ipv6 dhcp guard policy

Use **display ipv6 dhcp guard policy** to display information about DHCPv6 guard policies.

Syntax

display ipv6 dhcp guard policy [*policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

policy-name: Displays detailed information about a DHCPv6 guard policy. This argument specifies the name of a DHCPv6 guard policy, a case-insensitive string of 1 to 63 characters. If you do not specify this argument, the command displays brief information about all DHCPv6 guard policies.

Examples

Display detailed information about DHCPv6 guard policy **p1**.

```
<Sysname> display ipv6 dhcp guard policy p1
Guard policy: p1
  Device-role: Server
  Trusted port: No
  Server preference min value: 23
  Server preference max value: 45
  Server rule: ACL sed
  Reply rule: ACL 3434
  Applied to interfaces: GE1/0/1, GE1/0/2
  Applied to VLANs: 100
```

Display brief information about all DHCPv6 guard policies.

```
<Sysname> display ipv6 dhcp guard policy
Guard policy: p1
  Device-role: server
  Trusted port: No
  Server preference min value: 23
  Server preference max value: 45
  Server rule: ACL sed
  Reply rule: ACL 3434
```

```
Guard policy: p2
  Device-role: Server
  Trusted port: Yes
  Server preference min value: 12
  Server preference max value: 34
```

Table 19 Command output

Field	Description
Guard policy	DHCPv6 guard policy name.
Device-role	Device role: • **Client**—DHCPv6 client role. • **Server**—DHCPv6 server role.
Trusted port	Whether the trusted port is configured for the guard policy.
Server preference min value	Minimum preference value of the DHCPv6 server. This field is displayed only when the **preference min** command is configured.
Server preference max value	Maximum preference value of the DHCPv6 server. This field is displayed only when the **preference max** command is configured.
Server rule	DHCP server address match criterion. This field is displayed only when the **if-match server acl** command is configured.
Reply rule	Match criterion for the assigned IPv6 addresses/prefixes. This field is displayed only when the **if-match reply acl** command is configured.
Applied to interfaces	Interfaces to which the DHCPv6 guard policy is applied. Interfaces are separated by commas (,). This field is not displayed when the command displays brief information about DHCPv6 guard policies.
Applied to VLANs	VLANs to which the DHCPv6 guard policy is applied. VLANs are separated by commas (,). This field is not displayed when the command displays brief information about DHCPv6 guard policies.

Related commands

ipv6 dhcp guard policy

if-match reply acl

Use **if-match reply acl** to configure a match criterion for IPv6 addresses/prefixes assigned by a DHCPv6 server.

Use **undo if-match server acl** to restore the default.

Syntax

if-match reply acl { *acl-number* | **name** *acl-name* }

undo if-match reply acl

Default

No match criterion is configured for the assigned IPv6 addresses/prefixes, and all assigned IPv6 addresses/prefixes can pass the address/prefix check.

Views

DHCPv6 guard policy view

Predefined user roles

network-admin

Parameters

acl-number: Specifies an ACL number. The value range for this argument is as follows:

- . 2000 to 2999 for a basic ACL.
- . 3000 to 3999 for an advanced ACL.

name *acl-name*: Specifies a basic or advanced ACL by its name, a case-insensitive string of 1 to 63 characters. The ACL name must start with an English letter and to avoid confusion, it cannot be **all**.

Usage guidelines

The device uses the source IPv6 address attributes in the specified ACL to match the assigned IPv6 address/prefix in the received DHCPv6 Reply message.

- If the assigned IPv6 address/prefix matches a permit statement in the ACL, the device forwards the Reply message. If the assigned IPv6 address/prefix does not match the ACL, the device drops the Reply message.
- If the ACL does not have any source IPv6 address attributes, all DHCPv6 Reply messages fail the address/prefix check and are dropped.
- If the ACL does not exist or does not have any rules, all DHCPv6 Reply messages can pass the check.

If you execute this command multiple times for a DHCPv6 guard policy, the most recent configuration takes effect.

Examples

Specify ACL 2233 to match IPv6 addresses/prefixes assigned by a DHCPv6 server.

```
<Sysname> system-view
[Sysname] ipv6 dhcp guard policy p1
[Sysname-dhcp6-guard-policy-p1] if-match reply acl 2233
```

Related commands

rule (IPv6 advanced ACL view) (*ACL and QoS Command Reference*)

rule (IPv6 basic ACL view) (*ACL and QoS Command Reference*)

if-match server acl

Use **if-match server acl** to configure a DHCPv6 server match criterion

Use **undo if-match server acl** to restore the default.

Syntax

if-match server acl { *acl-number* | **name** *acl-name* }

undo if-match server acl

Default

No DHCP server match criterion is configured, and all DHCPv6 servers are authorized.

Views

DHCPv6 guard policy view

Predefined user roles

network-admin

Parameters

acl-number: Specifies an ACL number. The value range for this argument is as follows:

- . 2000 to 2999 for a basic ACL.
- . 3000 to 3999 for an advanced ACL.

name *acl-name*: Specifies a basic or advanced ACL by its name, a case-insensitive string of 1 to 63 characters. The ACL name must start with an English letter and to avoid confusion, it cannot be **all**.

Usage guidelines

The device uses the source IPv6 address attributes in the specified ACL to match the source IPv6 address in the received DHCPv6 Advertise message.

- If the source IPv6 address matches a permit statement in the ACL, the device continues to use other criterion to verify the message. If the source IPv6 address does not match the ACL, the device drops the Advertise message.
- If the ACL does not have any source IPv6 address attributes, all DHCPv6 Advertise messages fail the address check and are dropped.
- If the ACL does not exist or does not have any rules, all DHCPv6 Advertise messages can pass the check.

If you execute this command multiple times for a DHCPv6 guard policy, the most recent configuration takes effect.

Examples

Specify ACL 2323 to match DHCPv6 servers.

```
<Sysname> system-view
[Sysname] ipv6 dhcp guard policy p1
[Sysname-dhcp6-guard-policy-p1] if-match server acl 2323
```

Related commands

rule (IPv6 basic ACL view) (*ACL and QoS Command Reference*)

ipv6 dhcp guard apply policy

Use **ipv6 dhcp guard apply policy** to apply a DHCPv6 guard policy to an interface or a VLAN.

Use **undo ipv6 dhcp guard apply policy** to restore the default.

Syntax

ipv6 dhcp guard apply policy *policy-name*

undo ipv6 dhcp guard apply policy

Default

No DHCPv6 guard policy is applied to an interface or VLAN.

Views

Interface view

VLAN view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a DHCPv6 guard policy name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

The DHCPv6 guard policy applied to an interface checks all incoming DHCP replies if the interface is not configured as a trusted port for the DHCPv6 guard policy.

The DHCPv6 guard policy applied to a VLAN checks all incoming DHCP replies if the interfaces in the VLAN are not configured as trusted ports for the DHCPv6 guard policy.

If you apply a nonexistent DHCPv6 guard policy to an interface or VLAN, the device forwards received DHCPv6 replies without check.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Apply DHCPv6 guard policy **p1** to GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 dhcp guard apply policy p1
```

Apply DHCPv6 guard policy **p1** to VLAN 100.

```
<Sysname> system-view
[Sysname] vlan 100
[Sysname-vlan100] ipv6 dhcp guard apply policy p1
```

Related commands

ipv6 dhcp guard policy

ipv6 dhcp guard policy

Use **ipv6 dhcp guard policy** to create a DHCPv6 guard policy and enter its view, or enter the view of an existing DHCPv6 guard policy.

Use **undo ipv6 dhcp guard policy** to delete a DHCPv6 guard policy.

Syntax

ipv6 dhcp guard policy *policy-name*

undo ipv6 dhcp guard policy *policy-name*

Default

No DHCPv6 guard policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a DHCPv6 guard policy name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

To provide finer level of filtering granularity, you can specify the following parameters for a DHCPv6 guard policy:

- Device role of the device that attached to the target interface or VLAN.
- DHCPv6 server match criterion.
- Match criterion for IPv6 addresses/prefixes assigned by DHCPv6 servers.
- Allowed DHCPv6 server preference range.

The DHCPv6 guard feature runs correctly after you create a DHCPv6 guard policy and apply it to a VLAN or an interface. The DHCPv6 guard feature determines whether to forward DHCP replies based on the match criteria. Only packets that match all criteria are forwarded.

Examples

Create DHCPv6 guard policy **p1** and enter its view.

```
<Sysname> system-view
[Sysname] ipv6 dhcp guard policy p1
[Sysname-dhcp6-guard-policy-p1]
```

Related commands

display ipv6 dhcp guard policy

ipv6 dhcp guard apply policy

preference

Use **preference** to specify an allowed DHCPv6 server preference range.

Use **undo preference** to restore the maximum or minimum preference to the default value.

Syntax

preference { **max** *max-value* | **min** *min-value* } *

undo preference [**max** | **min**]

Default

No DHCPv6 server preference range is configured, and DHCPv6 servers with preferences 1 to 255 can pass the preference check.

Views

DHCPv6 guard policy view

Predefined user roles

network-admin

Parameters

max *max-value*: Specifies the maximum value of the DHCPv6 server preference, in the range of 1 to 255. The default is 255.

min *min-value*: : Specifies the minimum value of the DHCPv6 server preference, in the range of 1 to 255. The default is 1. The minimum value cannot be higher than the maximum value.

Usage guidelines

The device uses the specified range to match the DHCPv6 server preference in the received DHCPv6 Advertise message.

- If the DHCPv6 server preference is in the allowed range, the device continues to use other criterion to further match the message.
- If the DHCPv6 server preference in the Advertise message is beyond the allowed range or the message does not carry the preference, the device drops the message.

When an H3C device acts as a DHCPv6 server, use the **ipv6 dhcp server preference** command to set the preference of the DHCPv6 server.

If you execute this command multiple times for a DHCPv6 guard policy, the most recent configuration takes effect.

Examples

Set the allowed range to 1 to 100 for the DHCPv6 server preference.

```
<Sysname> system-view
[Sysname] ipv6 dhcp guard policy p1
[Sysname-dhcp6-guard-policy-p1] preference max 100 min 1
```

Related commands

ipv6 dhcp server

trust port

Use **trust port** to configure the port to which the DHCPv6 guard policy applies as a trusted port for the policy.

Use **undo trust port** to restore the default.

Syntax

trust port

undo trust port

Default

No trusted port is configured for a DHCPv6 guard policy.

Views

DHCPv6 guard policy view

Predefined user roles

network-admin

Usage guidelines

After you configure this command for a DHCPv6 guard policy, the interface and all interfaces in the VLAN to which the DHCPv6 guard policy is applied are trusted ports. The device forwards received DHCP replies on the trusted ports without check.

The **trust port** command has a higher priority than the **device-role** command. If you configure both commands for a DHCPv6 guard policy, the **trust port** command takes effect.

Examples

Configure the port as a trusted port for the DHCPv6 guard policy.

```
<Sysname> system-view
[Sysname] ipv6 dhcp guard policy p1
```

```
[Sysname-dhcp6-guard-policy-p1] trust port
```

display ipv6 fast-forwarding cache

Use **display ipv6 fast-forwarding cache** to display IPv6 fast forwarding entries.

Syntax

display ipv6 fast-forwarding cache [*ipv6-address*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-address: Specifies an IPv6 address. If you do not specify an IPv6 address, this command displays all IPv6 fast forwarding entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 fast forwarding entries for all member devices.

Examples

Display all IPv6 fast forwarding entries.

```
<Sysname> display ipv6 fast-forwarding cache
Total number of IPv6 fast-forwarding items: 2
Src IP: 123::2                                          Src Port: 1036
Dst IP: 123::1                                          Dst Port: 32768
Protocol: 58
VPN instance: N/A
Input interface: Vlan2
Output interface: InLoop0

Src IP: 123::1                                          Src Port: 1036
Dst IP: 123::2                                          Dst Port: 33024
Protocol: 58
VPN instance: N/A
Input interface: InLoop0
Output interface: Vlan2
```

Table 2 Command output

Field	Description
Total number of IPv6 fast-forwarding items	Number of IPv6 fast forwarding entries.
Src IP	Source IPv6 address.
Src port	Source port number.
Dst IP	Destination IPv6 address.
Dst Port	Destination port number.
Protocol	Protocol number.
VPN instance	This field is not supported in the current software version. VPN instance. If the entry does not belong to any VPN instance, this field displays **N/A**.
Input interface	Input interface type and number. If no interface is involved in fast forwarding, this field displays **N/A**. If the input interface does not exist, this field displays a hyphen (-).
Output interface	Output interface type and number. If no interface is involved in fast forwarding, this field displays **N/A**. If the output interface does not exist, this field displays a hyphen (-).

Related commands

`reset ipv6 fast-forwarding cache`

ipv6 fast-forwarding aging-time

Use **`ipv6 fast-forwarding aging-time`** to set the aging time for IPv6 fast forwarding entries.

Use **undo ipv6 fast-forwarding aging-time** to restore the default.

Syntax

ipv6 fast-forwarding aging-time *aging-time*

undo ipv6 fast-forwarding aging-time

Default

The aging time is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

aging-time: Sets the aging time in the range of 10 to 300 seconds.

Examples

Set the aging time to 20 seconds for IPv6 fast forwarding entries.

```
<Sysname> system-view
[Sysname] ipv6 fast-forwarding aging-time 20
```

Related commands

display ipv6 fast-forwarding aging-time

ipv6 fast-forwarding load-sharing

Use **ipv6 fast-forwarding load-sharing** to enable IPv6 fast forwarding load sharing.

Use **undo ipv6 fast-forwarding load-sharing** to disable IPv6 fast forwarding load sharing.

Syntax

ipv6 fast-forwarding load-sharing

undo ipv6 fast-forwarding load-sharing

Default

IPv6 fast forwarding load sharing is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

IPv6 fast forwarding load sharing enables the device to load share packets of the same flow. This feature identifies a data flow by using the packet information.

If IPv6 fast forwarding load sharing is disabled, the device identifies a data flow by the packet information and the input interface. No load sharing is implemented.

Examples

Enable IPv6 fast forwarding load sharing.

```
<Sysname> system-Views
```

```
[Sysname] ipv6 fast-forwarding load-sharing
```

reset ipv6 fast-forwarding cache

Use **reset ipv6 fast-forwarding cache** to clear the IPv6 fast forwarding table.

Syntax

reset ipv6 fast-forwarding cache [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears the IPv6 fast forwarding table for all member devices.

Examples

Clear the IPv6 fast forwarding table.

```
<Sysname> reset ipv6 fast-forwarding cache
```

Related commands

display ipv6 fast-forwarding cache

Contents

HTTP redirect commands

http-redirect https-port

Use **http-redirect https-port** to specify the HTTPS redirect listening port number.

Use **undo http-redirect https-port** to restore the default.

Syntax

http-redirect https-port *port-number*

undo http-redirect https-port

Default

The HTTPS redirect listening port number is 6654.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies the TCP port number on which the HTTPS redirect service listens for HTTPS requests. The value range for the port number is 1 to 65535.

Usage guidelines

To avoid service unavailability caused by port conflict, do not specify a TCP port number used by a well-known protocol or used by any other service. To display TCP port numbers that have been used by services, use the **display tcp** command.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify 8888 as the HTTPS redirect listening port number.

```
<Sysname> system-view
[Sysname] http-redirect https-port 8888
```

http-redirect ssl-server-policy

Use **http-redirect ssl-server-policy** to associate an SSL server policy with the HTTPS redirect service.

Use **undo http-redirect ssl-server-policy** to restore the default.

Syntax

http-redirect ssl-server-policy *policy-name*

undo http-redirect ssl-server-policy

Default

No SSL server policy is associated with the HTTPS redirect service. The HTTPS redirect service uses a self-assigned certificate and the default SSL parameters.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies an SSL server policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

HTTPS redirect is unavailable if the associated SSL server policy does not exist. You can first associate a nonexistent SSL server policy with the HTTPS redirect service and then configure the SSL server policy.

If you change the SSL server policy associated with the HTTPS redirect service, the new policy takes effect immediately.

If you perform this task multiple times, the most recent configuration takes effect.

Examples

Associate SSL server policy **policy1** with the HTTPS redirect service.

```
<Sysname> system-view
[Sysname] http-redirect ssl-server-policy policy1
```

NAT commands

NAT is supported only in Release 6328 and later.

display nat session

Use **display nat session** to display NAT sessions.

Syntax

display nat session [{ **source-ip** *source-ip* | **destination-ip** *destination-ip* } *] [**slot** *slot-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

source-ip *source-ip*: Displays NAT sessions for the source IP address specified by the *source-ip* argument. The IP address must be the source IP address of the packet that triggers the session establishment.

destination-ip *destination-ip*: Displays NAT sessions for the destination IP address specified by the *destination-ip* argument. The IP address must be the destination IP address of the packet that triggers the session establishment.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays NAT sessions for all member devices.

verbose: Displays detailed information about NAT sessions. If you do not specify this keyword, this command displays brief information about initiators of NAT sessions.

Usage guidelines

If you do not specify any parameters, this command displays detailed information about initiators of all NAT sessions.

Examples

Display detailed information about NAT session initiators for the specified slot.

```
<Sysname> display nat session
Slot 1:
Initiator:
  Source      IP/port: 5.5.5.5/551
  Destination IP/port: 2.2.2.2/2048
  DS-Lite tunnel peer: -
  VPN instance/VLAN ID/VLL ID: -/-/-
  Protocol: ICMP(1)
  Inbound interface: Vlan-interface100

Total sessions found: 1
```

Display detailed information about NAT sessions for the specified slot.

```
<Sysname> display nat session verbose
Slot 1:
Initiator:
  Source      IP/port: 5.5.5.5/546
  Destination IP/port: 2.2.2.2/2048
  DS-Lite tunnel peer: -
  VPN instance/VLAN ID/VLL ID: -/-/-
  Protocol: ICMP(1)
  Inbound interface: Vlan-interface100
Responder:
  Source      IP/port: 2.2.2.2/546
  Destination IP/port: 2.2.2.1/0
  DS-Lite tunnel peer: -
  VPN instance/VLAN ID/VLL ID: -/-/-
  Protocol: ICMP(1)
  Inbound interface: Vlan-interface101
State: ICMP_REPLY
Application: OTHER
Start time: 2021-04-13 10:27:23  TTL: 27s
Initiator->Responder:            0 packets          0 bytes
Responder->Initiator:            0 packets          0 bytes

Total sessions found: 1
```

Table 1 Command output

Field	Description
Source IP/port	Source IP address and port number.
Destination IP/port	Destination IP address and port number.
DS-Lite tunnel peer	Destination address of the DS-Lite tunnel interface. If the session does not belong to any DS-Lite tunnel, this field displays a hyphen (-).
VPN instance/VLAN ID/VLL ID	The fields identify the following information: • **VPN instance**—MPLS L3VPN instance to which the session belongs. • **VLAN ID**—VLAN to which the session belongs for Layer 2 forwarding. • **VLL ID**—INLINE to which the session belongs for Layer 2 forwarding. If no VPN instance, VLAN ID, or VLL ID is specified, a hyphen (-) is displayed for the related field.
Protocol	Transport layer protocol type: **DCCP**, **ICMP**, **Raw IP**, **SCTP**, **TCP**, **UDP**, or **UDP-Lite**.
Inbound interface	Input interface.
State	NAT session state.
Application	Application layer protocol type, such as **FTP** and **DNS**. This field displays **OTHER** for the protocol types identified by non-well-known ports.
Start time	Time when the session starts.

TTL	Remaining NAT session lifetime in seconds.
Initiator->Responder	Number of packets and bytes from the initiator to the responder.
Responder->Initiator	Number of packets and bytes from the responder to the initiator.
Total sessions found	Total number of sessions.

Related commands

`reset nat session`

display nat static

Use **`display nat static`** to display static NAT mappings.

Syntax

`display nat static`

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display static NAT mappings.

```
<Sysname> display nat static
Static NAT mappings:
  Totally 1 outbound static NAT mappings.
  IP-to-IP:
    Local IP     : 4.4.4.4
    Global IP    : 5.5.5.5
    Config status: Active

Interfaces enabled with static NAT:
  Totally 1 interfaces enabled with static NAT.
  Interface: Vlan-interface100
    Service card : ---
    Config status: Active
```

Table 2 Command output

Field	Description
Static NAT mappings	Information about static NAT mappings.
Totally *n* outbound static NAT mappings	Total number of inbound static NAT mappings.
IP-to-IP	One-to-one static NAT mapping.
Local IP	Private IP address or address range.
Global IP	Public IP address or address range.

Field	Description
Interfaces enabled with static NAT	Interfaces that are enabled with static NAT.
Totally *n* interfaces enabled with static NAT	Total number of interfaces enabled with static NAT.
Interface	Interface enabled with static NAT.
Service card	Service card that processes NAT traffic. If no service card is specified on the interface, this field displays hyphens (---).
Config status	Status of the static NAT mapping configuration: **Active** or **Inactive**.

Related commands

`nat static`

`nat static enable`

nat static enable

Use **`nat static enable`** to enable static NAT on an interface.

Use **`undo nat static enable`** to disable static NAT on an interface

Syntax

`nat static enable`

`undo nat static enable`

Default

Static NAT is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

Static NAT mappings take effect on an interface only after you enable static NAT on the interface.

If you configure modular QoS configuration (MQC) on a device enabled with static NAT, packets that match an ACL rule are sent to the CPU. If the packet IP addresses match a NAT rule, the device generates NAT sessions and performs forwarding in software, which might cause packet loss of established NAT sessions.

Examples

Configure an outbound static NAT mapping between private IP address 192.168.1.1 and public IP address 2.2.2.2, and enable static NAT on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] nat static outbound 192.168.1.1 2.2.2.2
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] nat static enable
```

Related commands

`display nat static`

nat static outbound

nat static outbound

Use **nat static outbound** to configure a mapping for outbound static NAT.

Use **undo nat static outbound** to remove a mapping for outbound static NAT.

Syntax

nat static outbound *local-ip global-ip*

undo nat static outbound *local-ip*

Default

No NAT mappings exist.

Views

System view

Predefined user roles

network-admin

Parameters

local-ip: Specifies a private IP address.

global-ip: Specifies a public IP address.

Usage guidelines

When the source IP address of an outgoing packet matches the *local-ip*, the IP address is translated into the *global-ip*. When the destination IP address of an incoming packet matches the *global-ip*, the destination IP address is translated into the *local-ip*.

Examples

Configure an outbound static NAT mapping between public IP address 2.2.2.2 and private IP address 192.168.1.1.

```
<Sysname> system-view
[Sysname] nat static outbound 192.168.1.1 2.2.2.2
```

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This command reference describes the routing configuration commands.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

Basic IP routing commands

address-family ipv4

Use **address-family ipv4** to create the RIB IPv4 address family and enter its view, or enter the view of the existing RIB IPv4 address family.

Use **undo address-family ipv4** to delete the RIB IPv4 address family and all settings in the view.

Syntax

address-family ipv4

undo address-family ipv4

Default

No RIB IPv4 address family exists.

Views

RIB view

Predefined user roles

network-admin

Examples

Create the RIB IPv4 address family and enter its view.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib] address-family ipv4
[Sysname-rib-ipv4]
```

address-family ipv6

Use **address-family ipv6** to create the RIB IPv6 address family and enter its view, or enter the view of the existing RIB IPv6 address family.

Use **undo address-family ipv6** to delete the RIB IPv6 address family and all settings in the view.

Syntax

address-family ipv6

undo address-family ipv6

Default

No RIB IPv6 address family exists.

Views

RIB view

Predefined user roles

network-admin

Examples

Create the RIB IPv6 address family and enter its view.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib] address-family ipv6
[Sysname-rib-ipv6]
```

display ip routing-table

Use **display ip routing-table** to display routing table information.

Syntax

display ip routing-table [**verbose**]

display ip routing-table [**all-routes**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all-routes: Displays routing table information for all active routes.

verbose: Displays detailed routing table information, including information about both active and inactive routes. If you do not specify this keyword, the command displays only brief information about active routes.

Usage guidelines

If you do not specify any parameters, the command displays only brief information about all active routes in the IPv4 routing table.

Examples

Display brief information about all active routes in the routing table.

```
<Sysname> display ip routing-table

Destinations : 12        Routes : 12

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
0.0.0.0/32          Direct 0    0            127.0.0.1       InLoop0

Table 1 Command output

Field	Description
VPN instance	The routing table belongs to the public network. This field displays **public instance**.
Destinations	Number of destination addresses.
Routes	Number of routes.
Destination/Mask	Destination address/mask length.
Proto	Protocol that installed the route.
Pre	Preference of the route.
Cost	Cost of the route.
NextHop	Next hop address of the route.
Interface	Output interface for packets to be forwarded along the route.
Summary count	Number of routes.

Display detailed information about all routes in the routing table.

```
<Sysname> display ip routing-table verbose

Destinations : 2        Routes : 2

Destination: 0.0.0.0/32

```

Table 2 Command output

Field	Description
Destinations	Number of destination addresses.
Routes	Number of routes.
Destination	Destination address/mask length.
Protocol	Protocol that installed the route.
SubProtID	ID of the subprotocol for routing.
Age	Time for which the route has been in the routing table.
Cost	Cost of the route.
Preference	Preference of the route.
IpPre	IP precedence.
QosLocalID	Local QoS ID.
Tag	Route tag.

Field	Description
State	Route status: • **Active**—Active unicast route. • **Adv**—Route that can be advertised. • **Inactive**—Inactive route. • **NoAdv**—Route that the router must not advertise. • **Vrrp**—Routes generated by VRRP. • **Nat**—Routes generated by NAT. • **TunE**—Tunnel. This state is not supported in the current software version.
OrigTblID	Original routing table ID.
OrigVrf	This field is not supported in the current software version. Original VPN instance that the route belongs to. This field displays **default-vrf** if the route is on the public network.
TableID	ID of the routing table.
OrigAs	Original AS number.
NibID	ID of the next hop.
LastAs	Last AS number.
AttrID	Attribute ID.
Neighbor	Address of the neighbor determined by the routing protocol.
Flags	Flags of the route.
OrigNextHop	Next hop address of the route.
RealNextHop	Real next hop of the route.
BkLabel	Backup label.
BkNexthop	Backup next hop.
SRLabel	Segment routing (SR) label.
BkSRLabel	Backup segment routing (SR) label.
Tunnel ID	This field is not supported in the current software version. Tunnel ID.
Interface	Output interface for packets to be forwarded along the route.
BkTunnel ID	This field is not supported in the current software version. Backup tunnel ID.
BkInterface	Backup output interface.
FtnIndex	Index of the FTN entry.
TrafficIndex	Traffic index in the range of 1 to 64. This field displays **N/A** when the value is invalid.
Connector	This field is not supported in the current software version. BGP connector attribute exchanged between BGP peers along with a VPN IPv4 route. The value of the attribute is the IP address of the remote PE device. The BGP connector attribute is used for MD VPN. This field displays **N/A** if the BGP connector attribute is not supported.
Summary count	Number of routes.
PathID	This field is not supported in the current software version. Add-Path ID of the BGP route.

display ip routing-table acl

Use **display ip routing-table acl** to display information about routes permitted by a basic ACL.

Syntax

display ip routing-table acl *ipv4-acl-number* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv4-acl-number: Specifies a basic ACL by its number in the range of 2000 to 2999.

verbose: Displays detailed information about all routes permitted by the basic ACL. If you do not specify this keyword, the command displays only brief information about active routes permitted by the basic ACL.

Usage guidelines

If the specified ACL does not exist or has no rules configured, the command displays information about all routes.

Examples

Define basic ACL 2000 and set the route filtering rules.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
[Sysname-acl-ipv4-basic-2000] rule deny source any
```

Display brief information about active routes permitted by basic ACL 2000.

```
[Sysname-acl-ipv4-basic-2000] display ip routing-table acl 2000

Summary count : 4

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
192.168.1.0/24      Direct 0    0            192.168.1.111   Vlan11
192.168.1.0/32      Direct 0    0            192.168.1.111   Vlan11
192.168.1.111/32    Direct 0    0            127.0.0.1       InLoop0
192.168.1.255/32    Direct 0    0            192.168.1.111   Vlan11
```

For command output, see Table 1.

Display detailed information about all routes permitted by basic ACL 2000.

```
<Sysname> display ip routing-table acl 2000 verbose

Summary count : 4

Destination: 192.168.1.0/24
   Protocol: Direct
 Process ID: 0
```

```

```

For command output, see Table 2.

display ip routing-table *ip-address*

Use **display ip routing-table** *ip-address* to display information about routes to a specific destination address.

Use **display ip routing-table** *ip-address1* **to** *ip-address2* to display information about routes to a range of destination addresses.

Syntax

display ip routing-table *ip-address* [*mask-length* | *mask*] [**longer-match**] [**verbose**]

display ip routing-table *ip-address1* **to** *ip-address2* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip-address: Specifies a destination IP address in dotted decimal notation.

mask-length: Specifies the mask length, an integer in the range of 0 to 32.

mask: Specifies the IP address mask in dotted decimal notation.

longer-match: Displays the route entry with the longest mask.

ip-address1 **to** *ip-address2*: Specifies a destination IP address range.

verbose: Displays detailed routing table information, including information about both active and inactive routes. If you do not specify this keyword, the command displays brief information about active routes.

Usage guidelines

Executing the command with different parameters yields different outputs.

- **display ip routing-table** *ip-address*
  - The system ANDs the entered destination IP address with the subnet mask in each active route entry.
  - The system ANDs the destination IP address in each active route entry with its own subnet mask.

  If the two operations yield the same result for an entry, the entry is displayed.
- **display ip routing-table** *ip-address mask*
  - The system ANDs the entered destination IP address with the entered subnet mask.
  - The system ANDs the destination IP address in each active route entry with the entered subnet mask.

  If the two operations yield the same result for an entry with a subnet mask not greater than the entered subnet mask, the entry is displayed.
- **display ip routing-table** *ip-address* **longer-match**
  - The system ANDs the entered destination IP address with the subnet mask in each active route entry.
  - The system ANDs the destination IP address in each active route entry with its own subnet mask.

  If the two operations yield the same result for multiple entries, the entry with the longest mask length is displayed.
- **display ip routing-table** *ip-address mask* **longer-match**
  - The system ANDs the entered destination IP address with the entered subnet mask.
  - The system ANDs the destination IP address in each active route entry with the entered subnet mask.

  If the two operations yield the same result for multiple entries with a mask not greater than the entered subnet mask, the entry with the longest mask length is displayed.
- **display ip routing-table** *ip-address1* **to** *ip-address2*

  The system displays active route entries with destinations in the range of *ip-address1*/32 to *ip-address2*/32.

Examples

Display brief information about the routes to the destination IP address 11.0.0.1.

```
<Sysname> display ip routing-table 11.0.0.1

Summary count : 3
```

```
Destination/Mask    Proto  Pre  Cost         NextHop         Interface
11.0.0.0/8          Static 60   0            0.0.0.0         NULL0
11.0.0.0/16         Static 60   0            0.0.0.0         NULL0
11.0.0.0/24         Static 60   0            0.0.0.0         NULL0
```

Display brief information about the routes to the destination IP address 11.0.0.1 and mask length 20.

```
<Sysname> display ip routing-table 11.0.0.1 20

Summary count : 2

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
11.0.0.0/8          Static 60   0            0.0.0.0         NULL0
11.0.0.0/16         Static 60   0            0.0.0.0         NULL0
```

Display brief information about the most specific route to the destination address 11.0.0.1.

```
<Sysname> display ip routing-table 11.0.0.1 longer-match

Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
11.0.0.0/24         Static 60   0            0.0.0.0         NULL0
```

Display brief information about the most specific route to the destination IP address 11.0.0.1 and mask length 20.

```
<Sysname> display ip routing-table 11.0.0.1 20 longer-match

Summary count : 1

```

display ip routing-table prefix-list

Use **display ip routing-table prefix-list** to display routes permitted by an IP prefix list.

Syntax

display ip routing-table prefix-list *prefix-list-name* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

prefix-list-name: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters.

verbose: Displays detailed information about all routes permitted by the IP prefix list. If you do not specify this keyword, the command displays brief information about active routes permitted by the IP prefix list.

Usage guidelines

If the specified IP prefix list does not exist, the command displays information about all routes.

Examples

Create an IP prefix list named **test** to permit the route 1.1.1.0/24.

```
<Sysname> system-view
[Sysname] ip prefix-list test permit 1.1.1.0 24
```

Display brief information about the active route permitted by the IP prefix list.

```
[Sysname] display ip routing-table prefix-list test

Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
1.1.1.0/24          Direct 0    0            1.1.1.2         Vlan11
```

For command output, see Table 1.

Display detailed information about all routes permitted by the IP prefix list.

```
[Sysname] display ip routing-table prefix-list test verbose

Summary count : 1

Destination: 1.1.1.0/24
   Protocol: Direct
 Process ID: 0
  SubProtID: 0x1                  Age: 04h20m37s

```

```
  Connector: N/A                PathID: 0x0
```

For command output, see Table 2.

display ip routing-table protocol

Use **display ip routing-table protocol** to display information about routes installed by a protocol.

Syntax

display ip routing-table protocol *protocol* [**inactive** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

protocol: Specifies a routing protocol.

inactive: Displays information about inactive routes. If you do not specify this keyword, the command displays information about both active and inactive routes.

verbose: Displays detailed routing table information. If you do not specify this keyword, the command displays brief routing information.

Examples

Display brief information about direct routes.

```
<Sysname> display ip routing-table protocol direct

Summary count : 9

Direct Routing table status : <Active>
Summary count : 9

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
0.0.0.0/32          Direct 0    0            127.0.0.1       InLoop0
2.2.2.0/24          Direct 0    0            2.2.2.1         Vlan2
2.2.2.0/32          Direct 0    0            2.2.2.1         Vlan2
2.2.2.2/32          Direct 0    0            127.0.0.1       InLoop0
2.2.2.255/32        Direct 0    0            2.2.2.1         Vlan2
127.0.0.0/8         Direct 0    0            127.0.0.1       InLoop0
127.0.0.0/32        Direct 0    0            127.0.0.1       InLoop0
127.0.0.1/32        Direct 0    0            127.0.0.1       InLoop0
127.255.255.255/32  Direct 0    0            127.0.0.1       InLoop0

Direct Routing table status : <Inactive>
Summary count : 0
```

Display brief information about static routes.

```
<Sysname> display ip routing-table protocol static
```

```
Summary count : 1

Static Routing table status : <Active>
Summary count : 0

Static Routing table status : <Inactive>
Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
1.2.3.0/24          Static 60   0            1.2.4.5         Vlan10
```

display ip routing-table statistics

Use **display ip routing-table statistics** to display IPv4 route statistics, including numbers of total routes, routes installed by the protocol, routes marked as deleted, and active routes.

Syntax

display ip routing-table [**all-routes**] **statistics**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all-routes: Displays IPv4 route statistics for all routes. If you do not specify this keyword, the command also displays IPv4 route statistics for all routes.

Examples

Display IPv4 route statistics for all routes.

```
<Sysname> display ip routing-table statistics

Total prefixes: 15        Active prefixes: 15

Proto      Routes      Active      Added       Deleted
DIRECT     12          12          30          18
STATIC     3           3           5           2
RIP        0           0           0           0
OSPF       0           0           0           0
Total      15          15          35          20
```

Display IPv4 route statistics for all routes.

```
<Sysname> display ip routing-table all-routes statistics

Total prefixes: 11        Active prefixes: 11

Proto      Routes      Active      Added       Deleted
DIRECT     8           8           8           0
STATIC     3           3           5           2
```

```
RIP        0           0           0           0
OSPF       0           0           0           0
Total      11          11          13          2
```

Table 3 Command output

Field	Description
Proto	Protocol that installed the route.
Routes	Number of routes installed by the protocol.
Active	Number of active routes.
Added	Number of routes added to the routing table after the router started up or the routing table was cleared most recently.
Deleted	Number of routes marked as deleted, which will be cleared after a period.
Total	Total number of routes.

display ip routing-table summary

Use **display ip routing-table summary** to display brief routing table information.

Syntax

display ip routing-table summary

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display brief routing table information.

```
<Sysname> display ip routing-table summary

Max ECMP: 1
Max Active Route: 1024
Remain Active Route: 1008
```

Table 4 Command output

Field	Description
Max ECMP	ECMP routes are not supported in the current software version. Maximum number of ECMP routes supported by the system.
Max Active Route	Maximum number of supported routes.
Remain Active Route	Number of the remaining inactive routes.

display ipv6 rib graceful-restart

Use **display ipv6 rib graceful-restart** to display IPv6 RIB GR state information.

Syntax

display ipv6 rib graceful-restart

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display IPv6 RIB GR state information.

```
<Sysname> display ipv6 rib graceful-restart
RIB GR state     : Phase2-calculation end
RCOM GR state    : Flush end
Protocol GR state:
 No.  Protocol   Lifetime FD   State    Start/End
-------------------------------------------------
 1    DIRECT     480      29   End      No/No
 2    STATIC     480      32   End      No/No
```

For command output, see Table 9.

display ipv6 rib nib

Use **display ipv6 rib nib** to display next hop information in the IPv6 RIB.

Syntax

display ipv6 rib nib [**self-originated**] [*nib-id*] [**verbose**]

display ipv6 rib nib protocol *protocol* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

self-originated: Displays information about next hops of self-originated routes in the IPv6 RIB.

nib-id: Specifies a NIB by its ID, a hexadecimal string in the range of 1 to ffffffff.

verbose: Displays detailed next hop information in the IPv6 RIB. If you do not specify this keyword, the command displays brief next hop information in the IPv6 RIB.

protocol *protocol*: Specifies a protocol by its name.

Examples

Display brief next hop information in the IPv6 RIB.

```
<Sysname> display ipv6 rib nib
Total number of nexthop(s): 151

      NibID: 0x20000000        Sequence: 0
```

```
       Type: 0x1                Flushed: Yes
   UserKey0: 0x0                VrfNthp: 0

```

For command output, see Table 10 and Table 11.

display ipv6 route-direct nib

Use **display ipv6 route-direct nib** to display next hop information for IPv6 direct routes.

Syntax

display ipv6 route-direct nib [*nib-id*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

nib-id: Specifies a NIB by its ID, a hexadecimal string in the range of 1 to ffffffff.

verbose: Displays detailed next hop information for IPv6 direct routes. If you do not specify this keyword, the command displays brief next hop information for IPv6 direct routes.

Examples

Display brief next hop information for IPv6 direct routes.

```
<Sysname> display ipv6 route-direct nib
Total number of nexthop(s): 115

       NibID: 0x20000000        Sequence: 0
        Type: 0x1                Flushed: Yes
   UserKey0: 0x0                 VrfNthp: 0
   UserKey1: 0x0                 Nexthop: ::
    IFIndex: 0x111             LocalAddr: ::
```

     Weight: 0

...
```

For command output, see Table 12 and Table 13.

display ipv6 routing-table

Use **display ipv6 routing-table** to display IPv6 routing table information.

Syntax

display ipv6 routing-table [**verbose**]

display ipv6 routing-table [**all-routes**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all-routes: Displays IPv6 routing table information for all active routes.

verbose: Displays detailed routing table information, including information about both active and inactive routes. If you do not specify this keyword, the command displays only brief information about active routes.

Usage guidelines

If you do not specify any parameters, the command displays only brief information about all active routes in the IPv6 routing table.

Examples

Display brief information about all active routes in the IPv6 routing table.

```
<Sysname> display ipv6 routing-table

Destinations : 2 Routes : 2

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0

Destination: FE80::/10                              Protocol  : Direct
NextHop    : ::                                     Preference: 0
Interface  : InLoop0                                Cost      : 0
```

Display brief information about all active routes in the IPv6 routing table.

```
<Sysname> display ipv6 routing-table all-routes

VPN instance: public instance
Destinations : 2 Routes : 2

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0

Destination: FE80::/10                              Protocol  : Direct
NextHop    : ::                                     Preference: 0
```

```
Interface  : InLoop0                                  Cost      : 0
```

Table 5 Command output

Field	Description
VPN instance	The IPv6 routing table belongs to the public network. This field displays **public instance**.
Destinations	Number of destination addresses.
Routes	Number of routes.
Destination	IPv6 address and prefix of the destination network or host.
NextHop	Next hop address of the route.
Preference	Preference of the route.
Interface	Output interface for packets to be forwarded along the route.
Protocol	Protocol that installed the route.
Cost	Cost of the route.
Summary count	Number of routes.

Display detailed information about all routes in the IPv6 routing table.

```
<Sysname> display ipv6 routing-table verbose

```

Table 6 Command output

Field	Description
Destination	IPv6 address and prefix of the destination network or host.
Protocol	Protocol that installed the route.
SubProtID	ID of the subprotocol for routing.
Age	Time for which the route has been in the routing table.
Cost	Cost of the route.
Preference	Preference of the route.
IpPre	IP precedence.
QosLocalID	Local QoS ID.
Tag	Tag of the route.
State	Route status: • **Active**—Active unicast route. • **Adv**—Route that can be advertised. • **Inactive**—Inactive route. • **NoAdv**—Route that the router must not advertise. • **Vrrp**—Routes generated by VRRP. • **Nat**—Routes generated by NAT. • **TunE**—Tunnel. This state is not supported in the current software version.
OrigTblID	Original routing table ID.
OrigVrf	This field is not supported in the current software version. Original VPN instance that the route belongs to. This field displays **default-vrf** if the route is on the public network.
TableID	ID of the routing table.
OrigAs	Original AS number.
NibID	ID of the next hop.
LastAs	Last AS number.
AttrID	Attribute ID.
Neighbor	Address of the neighbor determined by the routing protocol.

Field	Description
Flags	Flags of the route.
OrigNextHop	Next hop address of the route.
RealNextHop	Real next hop of the route.
BkLabel	Backup label.
BkNexthop	Backup next hop.
SRLabel	SR label.
BkSRLabel	Backup SR label.
Tunnel ID	This field is not supported in the current software version. Tunnel ID.
Interface	Output interface for packets to be forwarded along the route.
BkTunnel ID	This field is not supported in the current software version. Backup tunnel ID.
BkInterface	Backup output interface.
FtnIndex	Index of the FTN entry.
TrafficIndex	Traffic index in the range of 1 to 64. This field displays **N/A** when the value is invalid.
Connector	This field is not supported in the current software version. BGP connector attribute exchanged between BGP peers along with a VPN IPv4 route. The value of the attribute is the IP address of the remote PE device. The BGP connector attribute is used for MD VPN. This field displays **N/A** if BGP connector attribute is not supported.
Summary count	Number of routes.
PathID	This field is not supported in the current software version. Add-Path ID of the BGP route.

display ipv6 routing-table acl

Use **display ipv6 routing-table acl** to display routing information permitted by an IPv6 basic ACL.

Syntax

display ipv6 routing-table acl *ipv6-acl-number* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-acl-number: Specifies a basic IPv6 ACL by its number in the range of 2000 to 2999.

verbose: Displays detailed information about all routes permitted by the basic IPv6 ACL. If you do not specify this keyword, the command displays only brief information about active routes permitted by the basic IPv6 ACL.

Usage guidelines

If the specified IPv6 ACL does not exist or has no rules configured, the command displays information about all IPv6 routes.

Examples

Display brief information about active routes permitted by IPv6 ACL 2000.

```
<Sysname> display ipv6 routing-table acl 2000

Summary count : 6

```

For command output, see Table 6.

display ipv6 routing-table *ipv6-address*

Use **display ipv6 routing-table** *ipv6-address* to display information about routes to an IPv6 destination address.

Use **display ipv6 routing-table** *ipv6-address1* **to** *ipv6-address2* to display information about routes to a range of IPv6 destination addresses.

Syntax

display ipv6 routing-table *ipv6-address* [*prefix-length*] [**longer-match**] [**verbose**]

display ipv6 routing-table *ipv6-address1* **to** *ipv6-address2* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-address: Specifies a destination IPv6 address.

prefix-length: Specifies the prefix length in the range of 0 to 128.

longer-match: Displays the route entry with the longest prefix.

ipv6-address1 **to** *ipv6-address2*: Specifies a destination IPv6 address range.

verbose: Displays detailed routing table information, including information about both active and inactive routes. If you do not specify this keyword, the command displays only brief information about active routes.

Usage guidelines

Executing the command with different parameters yields different output.

- **display ipv6 routing-table** *ipv6-address*
  - The system ANDs the entered destination IPv6 address with the prefix length in each active route entry.

- The system ANDs the destination IPv6 address in each active route entry with the prefix length in the entry.

If the two operations yield the same result for an entry, the entry is displayed.

- **display ipv6 routing-table** *ipv6-address prefix-length*
  - The system ANDs the entered destination IPv6 address with the entered prefix length.
  - The system ANDs the destination IPv6 address in each active route entry with the entered prefix length.

  If the two operations yield the same result for an entry with a prefix length not greater than the entered prefix length, the entry is displayed.
- **display ipv6 routing-table** *ipv6-address* **longer-match**
  - The system ANDs the entered destination IPv6 address with the prefix length in each active route entry.
  - The system ANDs the destination IPv6 address in each active route entry with the prefix length in the entry.

  If the two operations yield the same result for multiple entries, the entry with the longest prefix length is displayed.
- **display ipv6 routing-table** *ipv6-address prefix-length* **longer-match**
  - The system ANDs the entered destination IPv6 address with the entered prefix length.
  - The system ANDs the destination IPv6 address in each active route entry with the entered prefix length.

  If the two operations yield the same result for multiple entries with a prefix length not greater than the entered prefix length, the entry with the longest prefix length is displayed.
- **display ipv6 routing-table** *ipv6-address1* **to** *ipv6-address2*

  The system displays route entries with destinations in the range of *ipv6-address1*/128 to *ipv6-address2*/128.

Examples

Display brief information about the routes to the destination IPv6 address 10::1 127.

```
<Sysname> display ipv6 routing-table 10::1 127

Summary count: 3

Destination: 10::/64                                  Protocol  : Static

```

For command output, see Table 5.

display ipv6 routing-table prefix-list

Use **display ipv6 routing-table prefix-list** to display information about IPv6 routes permitted by an IPv6 prefix list.

Syntax

display ipv6 routing-table prefix-list *prefix-list-name* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

prefix-list-name: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters.

verbose: Displays detailed information about all IPv6 routes permitted by the IPv6 prefix list. If you do not specify this keyword, the command displays brief information about active IPv6 routes permitted by the IPv6 prefix list.

Usage guidelines

If the specified IPv6 prefix list does not exist, the command displays information about all routes.

Examples

Create an IPv6 prefix list named test to permit the prefix ::1/128.

```
<Sysname> system-view
[Sysname] ipv6 prefix-list test permit ::1 128
```

Display brief information about the active IPv6 route permitted by the IPv6 prefix list.

```
[Sysname] display ipv6 routing-table prefix-list test

Summary count : 1

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0
```

For command output, see Table 5.

Display detailed information about all routes permitted by the IPv6 prefix list.

```
[Sysname] display ipv6 routing-table prefix-list test verbose

Summary count : 1

Destination: ::1/128
   Protocol: Direct
 Process ID: 0
  SubProtID: 0x0                    Age: 08h57m19s
       Cost: 0               Preference: 0
      IpPre: N/A             QosLocalID: N/A
        Tag: 0                    State: Active NoAdv
```

```
  OrigTblID: 0x0                OrigVrf: default-vrf
    TableID: 0xa                 OrigAs: 0
      NibID: 0x20000000          LastAs: 0
     AttrID: 0xffffffff        Neighbor: ::
      Flags: 0x10004        OrigNextHop: ::1
      Label: NULL           RealNextHop: ::1
    BkLabel: NULL             BkNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
  Tunnel ID: Invalid          Interface: InLoopBack0
BkTunnel ID: Invalid        BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
```

For command output, see Table 6.

display ipv6 routing-table protocol

Use **display ipv6 routing-table protocol** to display information about IPv6 routes installed by a protocol.

Syntax

display ipv6 routing-table protocol *protocol* [**inactive** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

protocol: Specifies a routing protocol.

inactive: Displays information about inactive routes. If you do not specify this keyword, the command displays information about both active and inactive routes.

verbose: Displays detailed routing table information. If you do not specify this keyword, the command displays brief routing information.

Examples

Display brief information about IPv6 direct routes.

```
<Sysname> display ipv6 routing-table protocol direct

Summary count : 3

Direct Routing table status : <Active>
Summary count : 3

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0

Destination: FE80::/10                              Protocol  : Direct
```

```
NextHop    : ::                                    Preference: 0
Interface  : InLoop0                               Cost      : 0

Destination: FF00::/8                              Protocol  : Direct
NextHop    : ::                                    Preference: 0
Interface  : NULL0                                 Cost      : 0

Direct Routing table status : <Inactive>
Summary count : 0
```

Display brief information about IPv6 static routes.

```
<Sysname> display ipv6 routing-table protocol static

Summary count : 3

Static Routing table status : <Active>
Summary count : 3

Destination: 2::2/128                              Protocol  : Static
NextHop    : fe80::2                               Preference: 60
Interface  : Vlan12                                Cost      : 0

Destination: 2::2/128                              Protocol  : Static
NextHop    : fe80::3                               Preference: 60
Interface  : Vlan12                                Cost      : 0

Destination: 3::3/128                              Protocol  : Static

Interface  : Vlan12                                Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

display ipv6 routing-table statistics

Use **display ipv6 routing-table statistics** to display IPv6 route statistics, including numbers of total routes, routes installed and deleted by the protocol, and active routes.

Syntax

display ipv6 routing-table [**all-routes**] **statistics**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all-routes: Displays IPv6 route statistics for all routes. If you do not specify this keyword, the command also displays IPv6 route statistics for all routes.

Examples

Display IPv6 route statistics.

```
<Sysname> display ipv6 routing-table statistics

Total prefixes: 8        Active prefixes: 8

Proto      Routes      Active      Added       Deleted
DIRECT     5           5           5           0
STATIC     3           3           3           0
RIPng      0           0           0           0
OSPFv3     0           0           0           0
Total      8           8           8           0
```

Display IPv6 route statistics.

```
<Sysname> display ipv6 routing-table all-routes statistics

Total prefixes: 6        Active prefixes: 6

Proto      Routes      Active      Added       Deleted
DIRECT     3           3           3           0
STATIC     3           3           5           2
RIPng      0           0           0           0
OSPFv3     0           0           0           0
Total      6           6           8           2
```

Table 7 Command output

Field	Description
Proto	Protocol that installed the route.
Routes	Number of routes installed by the protocol.
Active	Number of active routes.
Added	Number of routes added to the routing table after the router started up or the routing table was cleared most recently.
Deleted	Number of routes marked as deleted, which will be cleared after a period.
Total	Total number of routes.

display ipv6 routing-table summary

Use **display ipv6 routing-table summary** to display brief IPv6 routing table information.

Syntax

display ipv6 routing-table summary

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display brief IPv6 routing table information.

```
<Sysname> display ipv6 routing-table summary

Max ECMP: 1
Max Active Route: 256
Remain Active Route: 251
```

Table 8 Command output

Field	Description
Max ECMP	ECMP routes are not supported in the current software version. Maximum number of ECMP routes supported by the system.
Max Active Route	Maximum number of supported routes.
Remain Active Route	Number of the remaining inactive routes.

display rib graceful-restart

Use **`display rib graceful-restart`** to display RIB GR state information.

Syntax

`display rib graceful-restart`

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display RIB GR state information.

```
<Sysname> display rib graceful-restart
RIB GR state     : Phase2-calculation end
RCOM GR state    : Flush end
Protocol GR state:
 No.  Protocol   Lifetime FD   State    Start/End
-------------------------------------------------
 1    DIRECT     100      30   End      No/No
 2    STATIC     480      34   End      No/No
 3    OSPF       480      36   End      No/No
```

Table 9 Command output

Field	Description
RIB GR state	RIB GR status: • **Start**—GR starts. • **IGP end**—All IGP protocols complete GR. • **Routing protocol end**—All routing protocols complete GR. • **NSR-calculation unfinished**—NSR has not finished optimal route selection. • **Triggering start**—All triggered optimal route selection starts. • **Triggering end**—All triggered optimal route selection completes. • **Phase1-calculation end**—Optimal route selection phase 1 completes. • **All end**—All protocols complete GR. • **Phase2-calculation end**—Optimal route selection phase 2 completes.
RCOM GR state	RCOM GR status: • **Start**—GR starts. • **Routing protocol end**—All routing protocols complete GR. • **NSR-calculation unfinished**—NSR has not finished optimal route selection. • **Phase1-calculation end**—Optimal route selection phase 1 completes. • **Notification end**—All routes have been delivered to the route management module. • **Phase2-calculation end**—Optimal route selection phase 2 completes. • **Flush start**—Starts to flush routes to the FIB. • **Flush end**—Completes flushing routes to the FIB.
No.	Protocol number.
Lifetime	Lifetime (in seconds) of routes/labels in the RIB during GR.
FD	Handle between the protocol and the RIB.
State	Protocol GR state: • **Init**—Initialization state. • **Listen**—Listening state. • Idle. • Active. • **Start**—GR starts. • **End**—GR completes.
Start/End	Message sending state: • **No**—The message has not been sent. • **Yes**—The message has been sent.

display rib nib

Use **display rib nib** to display next hop information in the RIB.

Syntax

display rib nib [**self-originated**] [*nib-id*] [**verbose**]

display rib nib protocol *protocol* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

`self-originated`: Displays information about next hops of self-originated routes in the RIB.

`nib-id`: Specifies a NIB by its ID, a hexadecimal string in the range of 1 to ffffffff.

`verbose`: Displays detailed next hop information in the RIB. If you do not specify this keyword, the command displays brief next hop information in the RIB.

`protocol` *`protocol`*: Specifies a protocol by its name.

Examples

Display brief next hop information in the RIB.

```
<Sysname> display rib nib
Total number of nexthop(s): 176

      NibID: 0x10000000        Sequence: 0
       Type: 0x1                Flushed: Yes
   UserKey0: 0x0                VrfNthp: 0
   UserKey1: 0x0                Nexthop: 0.0.0.0
    IFIndex: 0x111             LocalAddr: 0.0.0.0
   TopoNthp: 0                  ExtType: 0x0

      NibID: 0x10000001        Sequence: 1
       Type: 0x1                Flushed: Yes
   UserKey0: 0x0                VrfNthp: 0
   UserKey1: 0x0                Nexthop: 127.0.0.1
    IFIndex: 0x112             LocalAddr: 127.0.0.1
   TopoNthp: 0                  ExtType: 0x0

      NibID: 0x10000002        Sequence: 2
       Type: 0x5                Flushed: Yes
   UserKey0: 0x0                VrfNthp: 0
   UserKey1: 0x0                Nexthop: 127.0.0.1
    IFIndex: 0x112             LocalAddr: 127.0.0.1
   TopoNthp: 0                  ExtType: 0x0

      NibID: 0x16000000        Sequence: 3

   UserKey0: 0x0                VrfNthp: 0
   UserKey1: 0x0                Nexthop: 12.1.1.2
    IFIndex: 0x0               LocalAddr: 0.0.0.0
   TopoNthp: 0                  ExtType: 0x0
   Instance: abc
```

...

Table 10 Command output

Field	Description
NibID	ID of the next hop.
Sequence	Sequence number of the next hop.
Type	Type of the next hop.
Flushed	Indicates whether the route with the next hop has been flushed to the FIB.
UserKey0	Reserved data 1.
UserKey1	Reserved data 2.
VrfNthp	This field is not supported in the current software version. Index of the VPN instance that the next hop belongs to. This field displays **0** if the next hop is on the public network.
Nexthop	Next hop address.
IFIndex	Interface index.
LocalAddr	Local interface address.
TopoNthp	This field is not supported in the current software version. Index of the topology that contains the next hop. This field displays **0** if the next hop is on the IPv4 public network. This field displays **Invalid** if the next hop is on an IPv6 network, because the router does not support multiple IPv6 topologies.
ExtType	Extension type of the next hop.
SubNibID	ID of the sub-next hop.
SubSeq	Sequence number of the sub-next hop.
NthpCnt	Number of sub-next hops.
Samed	Number of the same sub-next hops.
NthpType	Type of the sub-next hop: **IP**—IP forwarding.

Display detailed next hop information in the RIB.

```

Table 11 Command output

Field	Description
NibID	ID of the next hop.
Sequence	Sequence number of the next hop.
Type	Type of the next hop.
Flushed	Indicates whether the route with the next hop has been flushed to the FIB.
UserKey0	Reserved data 1.

Field	Description
UserKey1	Reserved data 2.
VrfNthp	This field is not supported in the current software version. Index of the VPN instance that the next hop belongs to. This field displays **0** if the next hop is on the public network.
Nexthop	Next hop address.
IFIndex	Interface index.
LocalAddr	Local interface address.
TopoNthp	This field is not supported in the current software version. Index of the topology that contains the next hop. This field displays **0** if the next hop is on the IPv4 public network. This field displays **Invalid** if the next hop is on an IPv6 network, because the router does not support multiple IPv6 topologies.
ExtType	Extension type of the next hop.
SubNibID	ID of the sub-next hop.
SubSeq	Sequence number of the sub-next hop.
NthpCnt	Number of sub-next hops.
Samed	Number of the same sub-next hops.
NthpType	Type of the sub-next hop: • **IP**—IP forwarding.
x nexthop (s)	Number of next hops.
PrefixIndex	Prefix index of the next hop for an ECMP route.
Vrf	This field is not supported in the current software version. VPN instance name. For the public network, this field displays **default-vrf**.
OrigNexthop	Original next hop.
RealNexthop	Real next hop.
Interface	Output interface.
LocalAddr	Local interface address.
RelyDepth	Recursion depth.
TunnelCnt	This field is not supported in the current software version. Number of tunnels after route recursion.
TunnelID	This field is not supported in the current software version. ID of the tunnel after route recursion.
Topology	This field is not supported in the current software version. Topology name. The topology name for the IPv4 public network is **base**. This field is blank for IPv6, because IPv6 does not support multiple topologies.
Weight	ECMP routes are not supported in the current software version. ECMP route weight. This field displays 0 for non-ECMP routes.
RefCnt	Reference count of the next hop.
FlushRefCnt	Reference count of the next hop that is flushed to the FIB.
Flag	Flag of the next hop.

Field	Description
Version	Version of the next hop.

display route-direct nib

Use **display route-direct nib** to display next hop information for direct routes.

Syntax

display route-direct nib [*nib-id*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

nib-id: Specifies a NIB by its ID, a hexadecimal string in the range of 1 to ffffffff.

verbose: Displays detailed next hop information for direct routes. If you do not specify this keyword, the command displays brief next hop information for direct routes.

Examples

Display brief next hop information for direct routes.

```
<Sysname> display route-direct nib
Total number of nexthop(s): 116

      NibID: 0x10000000        Sequence: 0
       Type: 0x1                 Flushed: Yes
   UserKey0: 0x0                 VrfNthp: 0
   UserKey1: 0x0                 Nexthop: 0.0.0.0
    IFIndex: 0x111             LocalAddr: 0.0.0.0

```

Table 12 Command output

Field	Description
NibID	ID of the NIB.
Sequence	Sequence number of the NIB.

Field	Description
Type	Type of the NIB.
Flushed	Indicates whether the route with the NIB has been flushed to the FIB.
UserKey0	Reserved data 1.
UserKey1	Reserved data 2.
VrfNthp	This field is not supported in the current software version. Index of the VPN instance that the next hop belongs to. This field displays **0** if the next hop is on the public network.
Nexthop	Next hop address.
IFIndex	Interface index.
LocalAddr	Local interface IP address.
TopoNthp	This field is not supported in the current software version. Index of the topology that contains the next hop. This field displays **0** if the next hop is on the IPv4 public network. This field displays **Invalid** if the next hop is on an IPv6 network, because the router does not support multiple IPv6 topologies.
ExtType	Extension type of the next hop.

Display detailed next hop information for direct routes.

```
<Sysname> display route-direct nib verbose
Total number of nexthop(s): 116

      NibID: 0x10000000        Sequence: 0

Table 13 Command output

Field	Description
NibID	ID of the next hop.
Sequence	Sequence number of the next hop.
Type	Type of the next hop.
Flushed	Indicates whether the route with the next hop has been flushed to the FIB.
UserKey0	Reserved data 1.
VrfNthp	This field is not supported in the current software version. Index of the VPN instance to which the next hop belongs. This field displays **0** if the next hop is on the public network.
UserKey1	Reserved data 2.
Nexthop	Next hop address.
IFIndex	Interface index.
LocalAddr	Local interface address.
TopoNthp	This field is not supported in the current software version. Index of the topology that contains the next hop. This field displays **0** if the next hop is on the IPv4 public network. This field displays **Invalid** if the next hop is on an IPv6 network, because the router does not support multiple IPv6 topologies.
ExtType	Extension type of the next hop.
RefCnt	Reference count of the next hop.
FlushRefCnt	Reference count of the next hop that is flushed to the FIB.
Flag	Flag of the next hop.
Version	Version of the next hop.
x nexthop(s)	Number of next hops.
PrefixIndex	Prefix index of the next hop for an ECMP route.
OrigNexthop	Original next hop.
RelyDepth	Recursion depth.
RealNexthop	Real next hop.
Interface	Output interface.
LocalAddr	Local interface address.
TunnelCnt	This field is not supported in the current software version. Number of tunnels after route recursion.

Field	Description
Vrf	This field is not supported in the current software version. VPN instance name. For the public network, this field displays **default-vrf**.
TunnelID	This field is not supported in the current software version. ID of the tunnel after route recursion.
Topology	This field is not supported in the current software version. Topology name. The topology name for the IPv4 public network is **base**. This field is blank for IPv6, because IPv6 does not support multiple topologies.
Weight	ECMP routes are not supported in the current software version. ECMP route weight. This field displays 0 for non-ECMP routes.

fib lifetime

Use **fib lifetime** to set the maximum lifetime for IPv4 or IPv6 routes in the FIB.

Use **undo fib lifetime** to restore the default.

Syntax

fib lifetime *seconds*

undo fib lifetime

Default

The maximum lifetime for IPv4 or IPv6 routes in the FIB is 600 seconds.

Views

RIB IPv4 address family view

RIB IPv6 address family view

Predefined user roles

network-admin

Parameters

seconds: Specifies the maximum lifetime for routes in the FIB, in the range of 0 to 6000 seconds. When this argument is set to 0, FIB entries immediately age out after a protocol or RIB process switchover.

Usage guidelines

When a protocol or RIB process switchover occurs and GR or NSR is not configured, FIB entries age out after the time specified in this command.

Examples

Set the maximum lifetime for IPv4 routes in the FIB to 60 seconds.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib] address-family ipv4
[Sysname-rib-ipv4] fib lifetime 60
```

inter-protocol fast-reroute

Use **inter-protocol fast-reroute** to enable IPv4 or IPv6 RIB inter-protocol FRR.

Use **undo inter-protocol fast-reroute** to disable IPv4 or IPv6 RIB inter-protocol FRR.

Syntax

inter-protocol fast-reroute

undo inter-protocol fast-reroute

Default

Inter-protocol FRR is disabled.

Views

RIB IPv4 address family view

RIB IPv6 address family view

Predefined user roles

network-admin

Usage guidelines

This command allows a device to perform fast rerouting between routes of different protocols. A backup next hop is automatically selected to reduce the service interruption time caused by unreachable next hops. When the next hop of the primary link fails, the traffic is redirected to the backup next hop.

This command uses the next hop of a route from a different protocol as the backup next hop for the faulty route, which might cause loops.

Inter-protocol FRR cannot select a backup next hop from routes in the RIB that have the same next hop, output interface, and destination as those of the faulty route.

Examples

Enable IPv4 RIB inter-protocol FRR.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib] address-family ipv4
[Sysname-rib-ipv4] inter-protocol fast-reroute
```

ip route fast-switchover enable

Use **ip route fast-switchover enable** to enable IPv4 route fast switchover.

Use **undo ip route fast-switchover enable** to disable IPv4 route fast switchover.

Syntax

ip route fast-switchover enable

undo ip route fast-switchover enable

Default

IPv4 route fast switchover is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use this command if a physical interface is the output interface for a large number of routes, including primary/secondary routes. When a link failure occurs on an interface, the device typically performs the following operations before switching the traffic to a valid route:

1. Deletes all ARP entries for the link.
2. Instructs the FIB to delete the associated FIB entries.

This process is time-consuming and interruptive if a large number of routes traverse the interface. Route fast switchover minimizes traffic interruption by instructing the FIB to delete the affected FIB entries immediately without having to wait for the ARP entries to be deleted.

Examples

Enable IPv4 route fast switchover.

```
<Sysname> system-view
[Sysname] ip route fast-switchover enable
```

ipv6 route fast-switchover enable

Use **ipv6 route fast-switchover enable** to enable IPv6 route fast switchover.

Use **undo ipv6 route fast-switchover enable** to disable IPv6 route fast switchover.

Syntax

ipv6 route fast-switchover enable

undo ipv6 route fast-switchover enable

Default

IPv6 route fast switchover is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use this command if a physical interface is the output interface for a large number of routes, including primary/secondary routes. When a link failure occurs on an interface, the device typically performs the following operations before switching the traffic to a valid route:

1. Deletes all ND entries for the link.
2. Instructs the FIB to delete the associated FIB entries.

This process is time-consuming and interruptive if a large number of routes traverse the interface. Route fast switchover minimizes traffic interruption by instructing the FIB to delete the affected FIB entries immediately without having to wait for the ND entries to be deleted.

Examples

Enable IPv6 route fast switchover.

```
<Sysname> system-view
[Sysname] ipv6 route fast-switchover enable
```

maintenance-probe enable

Use **maintenance-probe enable** to enable maintenance probe (MTP).

Use **undo maintenance-probe enable** to disable MTP.

Syntax

maintenance-probe enable

undo maintenance-probe enable

Default

MTP is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

MTP enables the device to automatically perform the following operations upon expiration of a neighbor's hold timer:

1. Ping the neighbor or trace the route to the neighbor.
2. Record the ping or tracert results.

To view fault information, use the **display** commands of routing protocols, for example, the **display ospf troubleshooting** command. To view detailed MTP information, use the **display logbuffer** command.

Examples

Enable MTP.

```
<Sysname> system-view
[Sysname] maintenance-probe enable
```

non-stop-routing

Use **non-stop-routing** to enable RIB NSR.

Use **undo non-stop-routing** to disable RIB NSR.

Syntax

non-stop-routing

undo non-stop-routing

Default

RIB NSR is disabled.

Views

RIB IPv4 address family view

RIB IPv6 address family view

Predefined user roles

network-admin

Examples

Enable NSR for the RIB IPv4 address family.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib] address-family ipv4
[Sysname-rib-ipv4] non-stop-routing
```

protocol lifetime

Use **protocol lifetime** to set the maximum lifetime for IPv4 or IPv6 routes and labels in the RIB.

Use **undo protocol lifetime** to restore the default.

Syntax

protocol *protocol* **lifetime** *seconds*

undo protocol *protocol* **lifetime**

Default

The maximum lifetime for IPv4 or IPv6 routes and labels in the RIB is 480 seconds.

Views

RIB IPv4 address family view

RIB IPv6 address family view

Predefined user roles

network-admin

Parameters

protocol: Specifies a routing protocol.

seconds: Specifies the maximum lifetime for routes and labels in the RIB, in the range of 1 to 6000 seconds.

Usage guidelines

When GR is enabled, make sure the protocol can complete GR and install all route entries to the RIB within the lifetime configured in this command.

Examples

Set the maximum lifetime for RIP routes and labels in the RIB to 60 seconds.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib] address-family ipv4
[Sysname-rib-ipv4] protocol rip lifetime 60
```

protocol nexthop recursive-lookup

Use **protocol nexthop recursive-lookup** to configure routing policy-based recursive lookup.

Use **undo protocol nexthop recursive-lookup** to remove the configuration.

Syntax

protocol *protocol* **nexthop recursive-lookup route-policy** *route-policy-name*

undo protocol *protocol* **nexthop recursive-lookup route-policy**

Default

Routing policy-based recursive lookup is not configured.

Views

RIB IPv4 address family view

Predefined user roles

network-admin

Parameters

protocol: Specifies a routing protocol, which can be **static** in RIB IPv4 address family view.

route-policy-name: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

Configure routing policy-based recursive lookup to control route recursion results. For example, when a route changes, the routing protocol has to perform a route recursion if the next hop is indirectly connected. The routing protocol might select an incorrect path, which can cause traffic loss. To resolve this issue, you can use a routing policy to filter out incorrect routes. The routes that pass the filtering of the routing policy will be used for route recursion.

The **apply** clauses in the specified routing policy cannot take effect.

Make sure a minimum of one related route can match the routing policy for correct traffic forwarding.

Examples

Configure recursive lookup based on routing policy **policy1** for static routes.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib] address-family ipv4
[Sysname-rib-ipv4] protocol static nexthop recursive-lookup route-policy policy1
```

reset ip routing-table statistics protocol

Use **reset ip routing-table statistics protocol** to clear IPv4 route statistics.

Syntax

reset ip routing-table statistics protocol { *protocol* | **all** }

reset ip routing-table [**all-routes**] **statistics protocol** { *protocol* | **all** }

Views

User view

Predefined user roles

network-admin

Parameters

all-routes: Clears route statistics for all IPv4 routes.

protocol: Clears route statistics for a routing protocol.

all: Clears route statistics for all IPv4 routing protocols.

Usage guidelines

This command clears IPv4 route statistics for all IPv4 routes of the specified routing protocols even if you do not specify the **all-routes** keyword.

This command clears only statistics of added and deleted routes for the specified routing protocols.

Examples

Clear all IPv4 route statistics.

```
<Sysname> reset ip routing-table statistics protocol all
```

reset ipv6 routing-table statistics protocol

Use **reset ipv6 routing-table statistics protocol** to clear IPv6 route statistics.

Syntax

reset ipv6 routing-table statistics protocol { *protocol* | **all** }

reset ipv6 routing-table [**all-routes**] **statistics protocol** { *protocol* | **all** }

Views

User view

Predefined user roles

network-admin

Parameters

all-routes: Clears route statistics for all IPv6 routes.

protocol: Clears route statistics for an IPv6 routing protocol.

all: Clears route statistics for all IPv6 routing protocols.

Usage guidelines

This command clears IPv6 route statistics for all IPv6 routes of the specified routing protocols even if you do not specify the **all-routes** keyword.

This command clears only statistics of added and deleted routes for the specified routing protocols.

Examples

Clear all IPv6 route statistics.

```
<Sysname> reset ipv6 routing-table statistics protocol all
```

rib

Use **rib** to enter RIB view.

Use **undo rib** to remove all configurations in RIB view.

Syntax

rib

undo rib

Views

System view

Predefined user roles

network-admin

Examples

Enter RIB view.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib]
```

routing-table limit

Use **routing-table limit** to set the maximum number of active IPv4/IPv6 routes supported by the device.

Use **undo routing-table limit** to restore the default.

Syntax

routing-table limit *number* **simply-alert**

undo routing-table limit

Default

The maximum number of active IPv4/IPv6 routes is not set for the device.

Views

RIB IPv4 address family view

RIB IPv6 address family view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of active IPv4/IPv6 routes supported by the device, in the range of 1 to 4294967295.

simply-alert: Enables the device to still accept active routes but generate a log message when the number of active IPv4/IPv6 routes exceeds the maximum number.

Usage guidelines

Configuration in RIB IPv4 address family view limits the number of active IPv4 routes.

Configuration in RIB IPv6 address family view limits the number of active IPv6 routes.

Examples

In RIB IPv4 address family view, set the maximum number of active IPv4 routes to 1000. The device still accepts new active routes but generates a system log message when the maximum number of active routes is exceeded.

```
<Sysname> system-view
[Sysname] rib
[Sysname-rib] address-family ipv4
[Sysname-rib-ipv4] routing-table limit 1000 simply-alert
```

Contents

Static routing commands

delete static-routes all

Use **delete static-routes all** to delete all static routes.

Syntax

delete static-routes all

Views

System view

Predefined user roles

network-admin

Usage guidelines

CAUTION:

This command might interrupt network communication and cause packet forwarding failure. Before executing the command, make sure you fully understand the potential impact on the network.

When you use this command, the system will prompt you to confirm the operation before deleting all the static routes.

To delete one static route, use the **undo ip route-static** command. To delete all static routes, including the default route, use the **delete static-routes all** command.

Examples

Delete all static routes.

```
<Sysname> system-view
[Sysname] delete static-routes all
This will erase all IPv4 static routes and their configurations, you must reconfigure all static routes.
Are you sure?[Y/N]:y
```

Related commands

ip route-static

display route-static nib

Use **display route-static nib** to display static route next hop information.

Syntax

display route-static nib [*nib-id*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

nib-id: Specifies a NIB by its ID, a hexadecimal string of 1 to ffffffff. If you do not specify this argument, the command displays all static route next hop information.

verbose: Displays detailed static route next hop information. If you do not specify this keyword, the command displays brief static route next hop information.

Examples

Displays brief static route next hop information.

```
<Sysname> display route-static nib
Total number of nexthop(s): 44

     NibID: 0x11000000       Sequence: 0
      Type: 0x21             Flushed: Yes

Table 2 Command output

Field	Description
x nexthop(s)	Number of next hops.
PrefixIndex	Prefix index of the next hop for an ECMP route.

Field	Description
OrigNexthop	Original next hop.
RelyDepth	Recursion depth.
RealNexthop	Real next hop.
Interface	Output interface.
localAddr	Local interface address.
TunnelCnt	This field is not supported in the current software version. Number of tunnels after route recursion.
Vrf	This field is not supported in the current software version. VPN instance name. For the IPv4 public network, this field displays **default-vrf**.
TunnelID	This field is not supported in the current software version. ID of the tunnel after route recursion.
Topology	This field is not supported in the current software version. Topology name. The topology name for the IPv4 public network is **base**.
Weight	ECMP routes are not supported in the current software version. ECMP route weight. This field displays 0 for non-ECMP routes.
RefCnt	Reference count of the next hop.
FlushRefCnt	Reference count of the next hop that is flushed to the FIB.
Flag	Flag of the next hop.
Version	Version of the next hop.
ExtType	NIB extension type.

display route-static routing-table

Use **display route-static routing-table** to display static routing table information.

Syntax

display route-static routing-table [*ip-address* { *mask-length* | *mask* }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip-address: Specifies the destination IP address in dotted decimal notation. If you do not specify this argument, the command displays all static routing table information.

mask-length: Specifies the mask length, an integer in the range of 0 to 32.

mask: Specifies the subnet mask in dotted decimal notation.

Examples

Display static routing table information.

```
<Sysname> display route-static routing-table
Total number of routes: 24

Status: * - valid

*Destination: 0.0.0.0/0
      NibID: 0x1100000a       NextHop: 2.2.2.10

Table 3 Command output

Field	Description
destination	Destination address/prefix.
NibID	ID of the NIB.
MainNibID	ID of the primary next hop for static route FRR.
BkNibID	ID of the backup next hop for static route FRR.
NextHop	Next hop address.
BkNextHop	Backup next hop address.
Interface	Output interface of the route.
BkInterface	Backup output interface.
TableID	ID of the table to which the route belongs.

Field	Description
Flag	Flag of the route.
DbIndex	Index of the database to which the route belongs.
Type	Route type: • Normal. • DHCP. • NAT. • IPsec.
BfdSrcIp	Source IP address of the indirect BFD session.
BfdIfIndex	Index of the interface where BFD is enabled.
BfdVrfIndex	This field is not supported in the current software version. Index of the VPN instance where BFD is enabled. This field displays **0** if BFD is enabled for the IPv4 public network.
BfdMode	BFD session mode: • **N/A**—No BFD session is configured. • **Ctrl**—Control packet mode • **Echo**—Echo packet mode.
TrackIndex	NQA Track index.
vrfIndexDst	This field is not supported in the current software version. Index of VPN instance that the destination belongs to. For the IPv4 public network, this field displays **0**.
vrfIndexNH	This field is not supported in the current software version. Index of the VPN instance that the next hop belongs to. For the IPv4 public network, this field displays **0**.
Permanent	Permanent static route flag. 1 indicates a permanent static route.

ip route-static

Use **ip route-static** to configure a static route.

Use **undo ip route-static** to delete a static route.

Syntax

ip route-static { *dest-address* { *mask-length* | *mask* } | **group** *group-name* } { *interface-type interface-number* [*next-hop-address* [**nexthop-index** *index-string*]] [**backup-interface** *interface-type interface-number* [**backup-nexthop** *backup-nexthop-address*] [**permanent**] | **bfd** { **control-packet** | **echo-packet** } | **permanent** | **track** *track-entry-number*] | *next-hop-address* [**nexthop-index** *index-string*] [**recursive-lookup host-route**] [**bfd control-packet bfd-source** *ip-address* | **permanent** | **track** *track-entry-number*] } [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

undo ip route-static { *dest-address* { *mask-length* | *mask* } | **group** *group-name* } [*interface-type interface-number* [*next-hop-address*] | *next-hop-address*] [**preference** *preference*]

Default

No static route is configured.

Views

System view

Predefined user roles

network-admin

Parameters

dest-address: Specifies the destination IP address of the static route, in dotted decimal notation.

mask-length: Specifies the mask length, an integer in the range of 0 to 32.

mask: Specifies the subnet mask in dotted decimal notation.

group *group-name*: Specifies a static route group by its name, a case-sensitive string of 1 to 31 characters.

interface-type interface-number: Specifies an output interface by its type and number. For more information, see *Layer 3—IP Routing Configuration Guide*.

next-hop-address: Specifies the IP address of the next hop, in dotted decimal notation. For more information, see *Layer 3—IP Routing Configuration Guide*.

nexthop-index *index-string*: Specifies the index of the next hop. The *index-string* argument represents the index, which is a case-insensitive string of 1 to 93 characters. If you do not specify an index for the next hop, the static route uses the output interface and the IP address of the next hop as the next hop index. Do not specify the same next hop index for routes to the same destination.

recursive-lookup host-route: Specifies only host routes for static route recursion.

backup-interface *interface-type interface-number*: Specifies a backup output interface by its type and number. If the backup output interface is an NBMA interface or broadcast interface and not a P2P interface, you must specify the backup next hop address.

backup-nexthop *backup-nexthop-address*: Specifies a backup next hop address.

bfd: Enables BFD to detect reachability of the static route's next hop. When the next hop is unreachable, the system immediately switches to the backup route.

control-packet: Specifies the BFD control packet mode.

bfd-source *ip-address*: Specifies the source IP address of BFD packets. As a best practice, specify the loopback interface address.

echo-packet: Specifies the BFD echo packet mode.

permanent: Specifies the route as a permanent static route. If the output interface is down, the permanent static route is still active.

track *track-entry-number*: Associates the static route with a track entry specified by its number in the range of 1 to 1024. For more information about Track, see *High Availability Configuration Guide*.

preference *preference*: Specifies a preference for the static route, in the range of 1 to 255. The default is 60.

tag *tag-value*: Sets a tag value for marking the static route, in the range of 1 to 4294967295. The default is 0. Tags of routes are used for route control in routing policies. For more information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

description *text*: Configures a description of 1 to 60 characters for the static route. The description can include special characters, such as the space, except the question mark (?).

Usage guidelines

If the destination IP address and the mask are both 0.0.0.0 (or 0), the configured route is a default route. The default route is used for forwarding a packet matching no entry in the routing table.

Implement different routing policies to configure different route preferences. For example, to enable backup for multiple routes to the same destination, assign different preferences to the routes.

Follow these guidelines when you specify the output interface or the next hop address of the static route:

- If the output interface is a Null 0 interface, no next hop address is required.
- If the output interface is a point-to-point interface, you can specify only the output interface. You do not need to change the configuration of the route even if the peer address is changed.
- NBMA or P2MP interfaces need IP address-to-link layer address mappings for successful packet delivery. As a best practice, specify the next hop address for the route at the same time if the output interface is an NBMA or P2MP interface.
- If the output interface is a broadcast interface, the device uses the next hop IP address to obtain the MAC address of the next hop. Therefore, you must specify both the output interface and next hop IP address, except for certain cases.

Follow these guidelines when you configure a static route:

- Enabling BFD for a flapping route could worsen the route flapping situation. Therefore, use it with caution. For more information about BFD, see *High Availability Configuration Guide*.
- If a static route needs route recursion, the associated track entry must monitor the next hop of the related route instead of that of the recursive static route. Otherwise, a valid route might be mistakenly considered invalid.
- Do not specify the **permanent** keyword together with the **bfd** or **track** keyword.

To specify the **recursive-lookup host-route** keyword, you must enable ARP direct route advertisement to advertise 32-bit host routes on the output interface corresponding to the next hop. To enable ARP direct route advertisement, use the **arp route-direct advertise** command.

If you specify a static route group, all prefixes in the static route group will be assigned the next hop and output interface specified by using this command.

Examples

Configure a static route, whose destination address is 1.1.1.1/24, next hop address is 2.2.2.2, tag value is 45, and description information is **for internet**.

```
<Sysname> system-view
[Sysname] ip route-static 1.1.1.1 24 2.2.2.2 tag 45 description for internet
```

Related commands

arp route-direct advertise (*Layer 3—IP Services Command Reference*)

display ip routing-table protocol

ip route-static-group

prefix

ip route-static arp-request

Use **ip route-static arp-request** to enable periodic sending of ARP requests to the next hops of static routes.

Use **undo ip route-static arp-request** to disable periodic sending of ARP requests to the next hops of static routes.

Syntax

ip route-static arp-request [**interval** *interval*]

undo ip route-static arp-request

Default

Periodic sending of ARP requests to the next hops of static routes is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies an ARP request sending interval in the range of 1 to 300 seconds. The default value is 5.

Usage guidelines

When the following conditions exist, a recursive static route becomes inactive:

- The static route uses a host route to reach its direct next hop.
- The host route is obtained either by specifying the **recursive-lookup host-route** keyword in the **ip route-static** command or by routing policy-based recursive lookup.
- The host route is unavailable because the direct next hop cannot send gratuitous ARP messages and consequently no ARP entry exists for that host route on the device.

To resolve this issue, you can use this command to enable the device to periodically send ARP requests to the direct next hop. When the device receives an ARP response from the direct next hop, it stops sending ARP requests and activates the recursive static route.

This command applies only to a recursive static route that meets the following requirements:

- The static route has no output interface specified.
- The static route fails the next-hop recursion.

Examples

Enable sending of ARP requests to the next hops of static routes and set the sending interval to 10 seconds.

```
<Sysname> system-view
[Sysname] ip route-static arp-request interval 10
```

ip route-static

protocol nexthop recursive-lookup

ip route-static default-preference

Use **ip route-static default-preference** to configure a default preference for static routes.

Use **undo ip route-static default-preference** to restore the default.

Syntax

ip route-static default-preference *default-preference*

undo ip route-static default-preference

Default

The default preference of static routes is 60.

Views

System view

Predefined user roles

network-admin

Parameters

default-preference: Specifies a default preference for static routes, in the range of 1 to 255.

Usage guidelines

If no preference is specified for a static route, the default preference applies.

When the default preference is reconfigured, it applies only to newly added static routes.

Examples

Set a default preference of 120 for static routes.

```
<Sysname> system-view
[Sysname] ip route-static default-preference 120
```

Related commands

display ip routing-table protocol

ip route-static fast-reroute auto

Use **ip route-static fast-reroute auto** to configure static route FRR to automatically select a backup next hop.

Use **undo ip route-static fast-reroute auto** to disable static route FRR from automatically selecting a backup next hop.

Syntax

ip route-static fast-reroute auto

undo ip route-static fast-reroute auto

Default

Static route FRR is disabled from automatically selecting a backup next hop.

Views

System view

Predefined user roles

network-admin

Examples

Configure static route FRR to automatically select a backup next hop.

```
<Sysname> system-view
[Sysname] ip route-static fast-reroute auto
```

ip route-static primary-path-detect bfd echo

Use **ip route-static primary-path-detect bfd echo** to enable BFD echo packet mode for static route FRR.

Use **undo ip route-static primary-path-detect bfd** to disable BFD echo packet mode for static route FRR.

Syntax

ip route-static primary-path-detect bfd echo

undo ip route-static primary-path-detect bfd

Default

BFD echo packet mode for static route FRR is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables static route FRR to use BFD echo packet mode for fast failure detection on the primary link.

Examples

Enable BFD echo packet mode for static route FRR.

```
<Sysname> system-view
[Sysname] ip route-static 1.1.1.1 32 vlan-interface 10 2.2.2.2 backup-interface
vlan-interface 11 backup-nexthop 3.3.3.3
[Sysname] ip route-static primary-path-detect bfd echo
```

ip route-static-group

Use **ip route-static-group** to create a static route group and enter its view, or enter the view of an existing static route group.

Use **undo ip route-static-group** to delete a static route group.

Syntax

ip route-static-group *group-name*

undo ip route-static-group *group-name*

Default

No static route groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-name: Specifies the static route group name, a case-sensitive string of 1 to 31 characters.

Examples

Create static route group **test** and enter its view.

```
<Sysname> system-view
[Sysname] ip route-static-group test
[Sysname-route-static-group-test]
```

Related commands

ip route-static

prefix

prefix

Use **prefix** to add a static route prefix to a static route group.

Use **undo prefix** to delete a static route prefix from a static route group.

Syntax

prefix *dest-address* { *mask-length* | *mask* }

undo prefix *dest-address* { *mask-length* | *mask* }

Default

No static route prefix is added to a static route group.

Views

Static route group view

Predefined user roles

network-admin

Parameters

dest-address: Specifies the destination IP address of the static route, in dotted decimal notation.

mask-length: Specifies the mask length, an integer in the range of 0 to 32.

mask: Specifies the subnet mask in dotted decimal notation.

Usage guidelines

Execute this command repeatedly to add multiple static route prefixes to a static route group.

After you add static route prefixes to a static route group, you can specify that group in the **ip route-static group** command to configure static routes with the prefixes. To configure more static routes, you only need to add new static route prefixes to the group.

Examples

Add static route prefix 1.1.1.1/32 to static route group **test**.

```
<Sysname> system-view
[Sysname] ip route-static-group test
[Sysname-route-static-group-test] prefix 1.1.1.1 32
```

RIP commands

The S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series do not support RIP.

checkzero

Use **checkzero** to enable zero field check on RIPv1 messages.

Use **undo checkzero** to disable zero field check.

Syntax

checkzero

undo checkzero

Default

The zero field check function is enabled.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

When the zero field check is enabled, the router discards RIPv1 messages in which zero fields contain non-zero values. If all messages are trustworthy, disable this feature to reduce the workload of the CPU.

Examples

Disable zero field check on RIPv1 messages for RIP process 1.

```
<Sysname> system-view
[Sysname] rip
[Sysname-rip-1] undo checkzero
```

default cost

Use **default cost** to configure a default metric for redistributed routes.

Use **undo default cost** to restore the default.

Syntax

default cost *cost-value*

undo default cost

Default

The default metric of redistributed routes is 0.

Views

RIP view

Predefined user roles

network-admin

Parameters

cost-value: Specifies a default metric for redistributed routes, in the range of 0 to 16.

Usage guidelines

When you use the **import-route** command to redistribute routes from another routing protocol without specifying a metric, the metric specified by the **default cost** command applies.

Examples

Configure a default metric of 3 for redistributed routes.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] default cost 3
```

Related commands

import-route

default-route

Use **default-route** to configure all interfaces running a RIP process to advertise a default route with a specified metric to RIP neighbors.

Use **undo default-route** to restore the default.

Syntax

default-route { **only** | **originate** } [**cost** *cost-value* | **route-policy** *route-policy-name*]*

undo default-route

Default

No default route is sent to RIP neighbors.

Views

RIP view

Predefined user roles

network-admin

Parameters

only: Advertises only a default route.

originate: Advertises both a default route and other routes.

cost-value: Specifies a cost for the default route, in the range of 1 to 15. The default is 1.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case sensitive string of 1 to 63 characters. If you specify this option, the command advertises a default route only when a route in the routing table matches the routing policy.

Usage guidelines

A RIP router configured with this feature does not receive any default route from RIP neighbors.

Examples

Configure all interfaces running RIP process 100 to send only a default route with a metric of 2 to RIP neighbors.

```
<Sysname> system-view
[Sysname] rip 100
```

```
[Sysname-rip-100] default-route only cost 2
```

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535. If no process is specified, the command displays state and configuration information for all RIP processes.

Examples

Display current state and configuration information for all RIP processes.

```
<Sysname> display rip
  Public VPN-instance name:
    RIP process: 1
       RIP version: 1
       Preference: 100
           Routing policy: abc
       Fast-reroute:
           Routing policy: frr
       Checkzero: Enabled
       Default cost: 0
       Summary: Enabled
       Host routes: Enabled
       Maximum number of load balanced routes: 1
       Update time   :   30 secs  Timeout time         :  180 secs
       Suppress time :  120 secs  Garbage-collect time :  120 secs
       Update output delay:   20(ms)  Output count:    3
       Graceful-restart interval:   60 secs
       Triggered Interval : 5 50 200
       Silent interfaces: None
       Default routes: Originate  Default routes cost: 3
       Verify-source: Enabled
       Networks:
           1.0.0.0
       Configured peers:
           197.168.6.2
       Triggered updates sent: 0
```

```
Number of routes changes: 1
Number of replies to queries: 0
```

Table 1 Command output

Field	Description
Public VPN-instance name	The RIP process runs on the public network.
RIP process	RIP process ID.
RIP version	RIP version 1 or 2.
Preference	RIP preference.
Checkzero	Indicates whether the zero field check is enabled for RIPv1 messages: **Enabled** or **Disabled**.
Default cost	Default cost of redistributed routes.
Summary	Indicates whether route summarization is enabled: **Enabled** or **Disabled**.
Host routes	Indicates whether to receive host routes: **Enabled** or **Disabled**.
Maximum number of load balanced routes	ECMP routes are not supported in the current software version. Maximum number of load-balanced routes.
Update time	RIP update interval, in seconds.
Timeout time	RIP timeout time, in seconds.
Suppress time	RIP suppress interval, in seconds.
Garbage-collect time	RIP garbage-collect interval, in seconds.
Update output delay	RIP packet sending interval, in seconds.
Output count	Maximum number of RIP packets sent at each interval.
Graceful-restart interval	GR interval, in seconds.
Triggered Interval	Triggered update sending interval.
Silent interfaces	Silent interfaces, which do not periodically send updates.
Default routes	Indicates whether a default route is sent to RIP neighbors. • **only**—Only a default route is advertised. • **originate**—A default route is advertised along with other routes. • **disable**—No default route is advertised.
Default routes cost	Metric for a default route.
Verify-source	Indicates whether the source IP address is checked for received RIP routing updates: **Enabled** or **Disabled**.
Networks	Networks enabled with RIP.
Configured peers	Configured neighbors.
Triggered updates sent	Number of triggered updates sent.
Number of routes changes	Number of route changes.

Field	Description
Number of replies to queries	Number of RIP responses.

display rip database

Use **display rip database** to display active routes for a RIP process.

Syntax

display rip *process-id* **database** [*ip-address* { *mask-length* | *mask* }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

ip-address { *mask-length* | *mask* }: Displays active routes for the specified IP address. If you do not specify this argument, the command displays all actives routes for a RIP process.

Examples

Display active routes for RIP process 100.

```
<Sysname> display rip 100 database
   1.0.0.0/8, auto-summary
       1.1.1.0/24, cost 16, interface summary
       1.1.1.0/24, cost 0, nexthop 1.1.1.1, RIP-interface
       1.1.2.0/24, cost 0, imported
   2.0.0.0/8, auto-summary
   2.0.0.0/8, cost 1, nexthop 1.1.1.2
```

Display active routes with destination IP address 1.1.1.0 and mask length 24 for RIP process 100.

```
<Sysname> display rip 100 database 1.1.1.0 24
   1.1.1.0/24, cost 16, interface summary
   1.1.1.0/24, cost 0, nexthop 1.1.1.1, RIP-interface
```

Table 2 Command output

Field	Description
cost	Cost of the route.
auto-summary	Indicates that the route is a RIP automatic summary route.
interface summary	Indicates that the route is a RIP interface summary route.
nexthop	Address of the next hop.
RIP-interface	Direct route on a RIP-enabled interface.
imported	Indicates that the route is redistributed from another routing protocol.

display rip graceful-restart

Use **display rip graceful-restart** to display the GR status for a RIP process.

Syntax

display rip [*process-id*] **graceful-restart**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays the GR status for all RIP processes.

Examples

Display the GR status for RIP process 1.

```
<Sysname> display rip 1 graceful-restart
 RIP process: 1
 Graceful Restart capability     : Enabled
 Current GR state                : Normal
 Graceful Restart period         : 60  seconds
 Graceful Restart remaining time : 0   seconds
```

Table 3 Command output

Field	Description
Graceful Restart capability	Indicates whether GR is enabled: **Enabled** or **Disabled**.
Current GR state	GR state: • **Under GR**—GR is in progress. • **Normal**—No GR is in progress or GR has completed.
Graceful Restart period	GR interval.

display rip interface

Use **display rip interface** to display RIP interface information for a RIP process.

Syntax

display rip *process-id* **interface** [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

interface-type interface-number: Specifies an interface by its type and number. If no interface is specified, the command displays information about all RIP interfaces for the RIP process.

Examples

Display information about all interfaces for RIP process 1.

```
<Sysname> display rip 1 interface
Total: 1

 Interface: Vlan-interface10
    Address/Mask: 1.1.1.1/24          Version: RIPv1
    MetricIn: 0                       MetricIn route policy: Not designated
    MetricOut: 1                      MetricOut route policy: Not designated
    Split-horizon/Poison-reverse: On/Off  Input/Output: On/On
    Default route: Off
    Update output delay:  20(ms)      Output count: 3
    Current number of packets/Maximum number of packets: 0/2000
```

Table 4 Command output

Field	Description
Total	Number of interfaces running RIP.
Interface	Name of an interface running RIP.
Address/Mask	IP address and mask of the interface.
Version	RIP version running on the interface.
MetricIn	Additional metric added to incoming routes.
MetricIn route policy	Name of the routing policy used to add an additional metric for incoming routes. If no routing policy is used, the field displays **Not designated**.
MetricOut	Additional metric added to outgoing routes.
MetricOut route policy	Name of the routing policy used to add an additional routing metric for outgoing routes. If no routing policy is used, the field displays **Not designated**.
Split-horizon	Indicates whether split horizon is enabled: • **on**—Enabled. • **off**—Disabled.
Poison-reverse	Indicates whether poison reverse is enabled: • **on**—Enabled. • **off**—Disabled.
Input/Output	Indicates whether the interface is enabled to receive and send RIP messages: • **on**—Enabled. • **off**—Disabled.
Default route	Indicates whether to send a default route to RIP neighbors: • **Only**—Advertises only a default route. • **Originate**—Advertises both a default route and other routes. • **No-originate**—Advertises only non-default routes.

Field	Description
	• **Off**—Advertises no default route.
Default route cost	Metric for a default route.
Update output delay	RIP packet sending interval.
Output count	Maximum number of RIP packets that can be sent at each interval.
Current number of packets /Maximum number of packets	Number of RIP packets to be sent/maximum number of RIP packets that can be sent within a certain interval.

display rip neighbor

Use **display rip neighbor** to display neighbor information for a RIP process.

Syntax

display rip *process-id* **neighbor** [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify this argument, the command displays all neighbor information for the RIP process.

Examples

Display neighbor information for RIP process 1.

```
<Sysname> display rip 1 neighbor
 Neighbor address: 197.168.2.3
     Interface  : Vlan-interface10
     Version    : RIPv2     Last update: 00h00m02s
     Relay nbr  : N/A       BFD session: N/A
     Bad packets: 0         Bad routes : 0
```

Table 5 Command output

Field	Description
Interface	Output interface that is connected to the neighbor.
Version	Version of RIP that the neighbor runs.
Last update	Time elapsed since the most recent update.
Relay nbr	Relay neighbor type.
BFD session	BFD session type.
Bad packets	Number of received bad packets.
Bad routes	Number of received bad routes.

display rip non-stop-routing

Use **display rip non-stop-routing** to display the NSR status for a RIP process.

Syntax

display rip [*process-id*] **non-stop-routing**

Views

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays the NSR status for all RIP processes.

Examples

Display the NSR status for RIP process 1.

```
<Sysname> display rip 1 non-stop-routing
RIP process: 1
 Nonstop Routing capability: Enabled
 Current NSR state         : Finish
```

Table 6 Command output

Field	Description
Nonstop Routing capability	Indicates whether NSR is enabled: **Enabled** or **Disabled**.
Current NSR state	NSR state: • Initialization. • **Smooth**—Upgrading data. • **Advertising**—Advertising routes. • **Redistribution**—Redistributing routes. • Finish.

display rip route

Use **display rip route** to display routing information for a RIP process.

Syntax

display rip *process-id* **route** [*ip-address* { *mask-length* | *mask* } [**verbose**] | **peer** *ip-address* | **statistics**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

ip-address { *mask-length* | *mask* }: Displays route information for the specified IP address.

verbose: Displays all routing information for the specified destination IP address. If you do not specify this keyword, the command displays only information about optimal routes with the specified destination IP address.

peer *ip-address*: Displays route information learned from the specified neighbor.

statistics: Displays route statistics, including the total number of routes and number of routes from each neighbor.

Usage guidelines

If no optional parameters are specified, the **display rip** *process-id* **route** command displays all routing information for a RIP process.

Examples

Display all routing information for RIP process 1.

```
<Sysname> display rip 1 route
 Route Flags: R - RIP, T - TRIP
              P - Permanent, A - Aging, S - Suppressed, G - Garbage-collect
              D - Direct, O - Optimal, F - Flush to RIB
------------------------------------------------------------------------------
 Peer 1.1.1.1 on Vlan-interface10
      Destination/Mask        Nexthop          Cost    Tag     Flags   Sec
      3.0.0.0/8               1.1.1.1          1       0       RAOF    24
 Local route
      Destination/Mask        Nexthop          Cost    Tag     Flags   Sec
      4.4.4.4/32              0.0.0.0          0       0       RDOF    -
      1.1.1.0/24              0.0.0.0          0       0       RDOF    -
```

Display specified routing information for RIP process 1.

```
<Sysname> display rip 1 route 3.0.0.0 8 verbose
 Route Flags: R - RIP, T - TRIP
              P - Permanent, A - Aging, S - Suppressed, G - Garbage-collect
              D - Direct, O - Optimal, F - Flush to RIB
------------------------------------------------------------------------------
 Peer 1.1.1.1 on Vlan-interface10
  Destination/Mask    OrigNexthop/RealNexthop          Cost  Tag   Flags Sec
  3.0.0.0/8           1.1.1.1/1.1.1.1                  1     0     RAOF  16
```

Table 7 Command output

Field	Description
Route Flags	• **R**—RIP route. • **P**—The route never ages out. • **A**—The route is aging. • **S**—The route is suppressed. • **G**—The route is in Garbage-collect state. • **D**—The route is a direct route. • **O**—The route is an optimal route. • **F**—The route has been flushed to the RIB.

Field	Description
Peer *X.X.X.X* on *interface-type interface-number*	Routing information learned from a neighbor on a RIP interface.
Local route	Locally generated direct routes.
Destination/Mask	Destination IP address and subnet mask.
Nexthop	Next hop of the route.
OrigNexthop/RealNexthop	If the route is from a directly connected neighbor, the original next hop is the real next hop. If the route is from an indirectly connected neighbor, the **RealNexthop** field displays the recursive next hop for the route. Otherwise, the field is blank.
Cost	Cost of the route.
Tag	Route tag.
Flags	Route state.
Sec	Remaining time of the timer corresponding to the route state.

Display routing statistics for RIP process 1.

```
<Sysname> display rip 1 route statistics
 Peer                    Optimal/Aging       Optimal/Permanent       Garbage
 1.1.1.1                 1/1                 0/0                     0
 Local                   2/0                 0/0                     0
 Total                   3/1                 0/0                     0
```

Table 8 Command output

Field	Description
Peer	IP address of a neighbor.
Optimal	Total number of optimal routes.
Aging	Total number of aging routes.
Permanent	Total number of routes that never age out.
Garbage	Total number of routes in the Garbage-collection state.
Local	Total number of locally generated direct routes.
Total	Total number of routes learned from all RIP neighbors.

dscp

Use **dscp** to set the DSCP value for outgoing RIP packets.

Use **undo dscp** to restore the default.

Syntax

dscp *dscp-value*

undo dscp

Default

The DSCP value for outgoing RIP packets is 48.

Views

RIP view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the range of 0 to 63.

Examples

Set the DSCP value for outgoing RIP packets to 63 in RIP process 1.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] dscp 63
```

fast-reroute

Use **fast-reroute** to configure RIP FRR.

Use **undo fast-reroute** to disable RIP FRR.

Syntax

fast-reroute route-policy *route-policy-name*

undo fast-reroute

Default

RIP FRR is disabled.

Views

RIP view

Predefined user roles

network-admin

Parameters

route-policy *route-policy-name*: Specifies a routing policy by its name, a case sensitive string of 1 to 63 characters. If you specify this option, the command designates a backup next hop for the routes that match the routing policy.

Usage guidelines

RIP FRR is available only when the state of primary link (with Layer 3 interfaces staying up) changes from bidirectional to unidirectional or down. A unidirectional link refers to the link through which packets are forwarded only from one end to the other.

RIP FRR is only effective for RIP routes that are learned from directly connected neighbors.

Examples

Enable RIP FRR and use routing policy **frr** to specify a backup next hop.

```
<Sysname> system-view
[Sysname] ip prefix-list abc index 10 permit 100.1.1.0 24
[Sysname] route-policy frr permit node 10
[Sysname-route-policy-frr-10] if-match ip address prefix-list abc
[Sysname-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface 1
backup-nexthop 193.1.1.8
[Sysname-route-policy-frr-10] quit
```

```
[Sysname] rip 100
[Sysname-rip-100] fast-reroute route-policy frr
```

filter-policy export

Use **filter-policy export** to configure RIP to filter redistributed routes.

Use **undo filter-policy export** to remove the filtering.

Syntax

filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*] | *interface-type interface-number*]

undo filter-policy export [*protocol* [*process-id*] | *interface-type interface-number*]

Default

RIP does not filter redistributed routes.

Views

RIP view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999 to filter redistributed routes.

prefix-list *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter redistributed routes.

protocol: Filters routes redistributed from the specified routing protocol.

process-id: Specifies the process ID of the specified routing protocol, in the range of 1 to 65535. Specify a process ID when the routing protocol is **rip** or **ospf**. If no process ID is specified, the default process ID is 1.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

You can configure only one filtering policy to filter routes redistributed from a routing protocol or an interface. Without any protocol or interface specified, the filtering policy applies globally. If you execute this command multiple times, the most recent configuration takes effect.

To remove the filtering policy configured for a protocol or an interface, use the **undo filter-policy export** command with the protocol or interface specified.

To reference an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following methods:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the route. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

Use basic ACL 2000 to filter redistributed routes.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule deny source 192.168.10.0 0.0.0.255
[Sysname-acl-ipv4-basic-2000] quit
[Sysname] rip 1
[Sysname-rip-1] filter-policy 2000 export
```

Use IP prefix list **abc** to filter redistributed routes.

```
<Sysname> system-view
[Sysname] ip prefix-list abc index 10 permit 11.0.0.0 8
[Sysname] rip 1
[Sysname-rip-1] filter-policy prefix-list abc export
```

Configure advanced ACL 3000 to permit only route 113.0.0.0/16 to pass. Use ACL 3000 to filter redistributed routes.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000] rule 10 permit ip source 113.0.0.0 0 destination 255.255.0.0
0
[Sysname-acl-ipv4-adv-3000] rule 100 deny ip
[Sysname-acl-ipv4-adv-3000] quit
[Sysname] rip 1
[Sysname-rip-1] filter-policy 3000 export
```

Related commands

acl (*ACL and QoS Command Reference*)

import-route

ip prefix-list

filter-policy import

Use **filter-policy import** to configure RIP to filter received routes.

Use **undo filter-policy import** to remove the filtering.

Syntax

filter-policy { *ipv4-acl-number* | **gateway** *prefix-list-name* | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] } **import** [*interface-type interface-number*]

undo filter-policy import [*interface-type interface-number*]

Default

RIP does not filter received routes.

Views

RIP view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999 to filter received routes.

prefix-list *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter received routes.

gateway *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter routes based on their next hops.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

You can configure only one filtering policy to filter routes received on an interface. Without any interface specified, the filtering policy applies globally. If you execute this command multiple times, the most recent configuration takes effect.

To remove the filtering policy configured for an interface, use the **undo filter-policy import** command with the interface specified.

To reference an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following methods:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the route. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

Use basic ACL 2000 to filter received RIP routes.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule deny source 192.168.10.0 0.0.0.255
[Sysname-acl-ipv4-basic-2000] quit
[Sysname] rip 1
[Sysname-rip-1] filter-policy 2000 import
```

Use IP prefix list **abc** to filter received RIP routes.

```
<Sysname> system-view
[Sysname] ip prefix-list abc index 10 permit 11.0.0.0 8
[Sysname] rip 1
[Sysname-rip-1] filter-policy prefix-list abc import
```

Configure advanced ACL 3000 to permit only route 113.0.0.0/16 to pass. Use ACL 3000 to filter received routes.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000] rule 10 permit ip source 113.0.0.0 0 destination 255.255.0.0
0
[Sysname-acl-ipv4-adv-3000] rule 100 deny ip
[Sysname-acl-ipv4-adv-3000] quit
[Sysname] rip 1
[Sysname-rip-1] filter-policy 3000 import
```

Related commands

acl (*ACL and QoS Command Reference*)

ip prefix-list

graceful-restart

Use **graceful-restart** to enable RIP GR.

Use **undo graceful-restart** to disable RIP GR.

Syntax

graceful-restart

undo graceful-restart

Default

RIP GR is disabled.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

The **graceful-restart** command and the **non-stop-routing** command are mutually exclusive.

Examples

Enable GR for RIP process 1.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] graceful-restart
```

graceful-restart interval

Use **graceful-restart interval** to set the GR interval.

Use **undo graceful-restart interval** to restore the default.

Syntax

graceful-restart interval *interval*

undo graceful-restart interval

Default

The GR interval is 60 seconds.

Views

RIP view

Predefined user roles

network-admin

Parameters

interval: Specifies the GR interval in the range of 5 to 360 seconds.

Examples

Set the GR interval to 200 seconds for RIP process 1.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] graceful-restart interval 200
```

host-route

Use **host-route** to enable host route reception.

Use **undo host-route** to disable host route reception.

Syntax

host-route

undo host-route

Default

RIP receives host routes.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

A router might receive many host routes from the same subnet. These routes are not helpful for routing and occupy a large number of resources. To solve this problem, use the **undo host-route** command to disable RIP from receiving host routes.

This command takes effect only for RIPv2 routes.

Examples

Disable RIP from receiving host routes.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] undo host-route
```

import-route

Use **import-route** to enable route redistribution.

Use **undo import-route** to remove redistributed routes.

Syntax

import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

undo import-route { **direct** | **static** }

import-route { **ospf** | **rip** } [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

undo import-route { **ospf** | **rip** } [*process-id* | **all-processes**]

Default

RIP does not redistribute any routes.

Views

RIP view

Predefined user roles

network-admin

Parameters

direct: Redistributes direct routes.

ospf: Redistributes OSPF routes.

rip: Redistributes RIP routes.

static: Redistributes static routes.

process-id: Specifies a process ID of OSPF or RIP, in the range of 1 to 65535. The default is 1.

all-processes: Enables route redistribution from all OSPF or RIP processes.

allow-direct: Redistributes the networks of the local interfaces enabled with the specified routing protocol. If you do not specify the **allow-direct** keyword, the networks of the local interfaces are not redistributed. If you specify both the **allow-direct** keyword and the **route-policy** *route-policy-name* option, make sure the **if-match** rule defined in the routing policy does not conflict with the **allow-direct** keyword. For example, if you specify the **allow-direct** keyword, do not configure the **if-match route-type** rule for the routing policy. Otherwise, the **allow-direct** keyword does not take effect.

cost *cost-value*: Specifies a cost for redistributed routes, in the range of 0 to 16. The default cost is 0.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

tag *tag*: Specifies a tag for marking redistributed routes, in the range of 0 to 65535. The default is 0.

Usage guidelines

This command redistributes only active routes. To view route state information, use the **display ip routing-table protocol** command.

When you execute the **undo** form of the command, per-process setting has higher priority than the all-processes setting. The **undo import-route** { **ospf** | **rip** } **all-processes** command cannot remove the setting configured for a process by using the **import-route** { **ospf** | **rip** } *process-id* command. To remove the setting for that process, you must specify the process ID in the **undo** form of the command.

Examples

Redistribute static routes into RIP, and set the cost of redistributed routes to 4.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] import-route static cost 4
```

Related commands

default cost

network

Use **network** to enable RIP on an interface attached to a specified network.

Use **undo network** to disable RIP on an interface attached to a specified network.

Syntax

network *network-address* [*wildcard-mask*]

undo network *network-address*

Default

RIP is disabled on an interface.

Views

RIP view

Predefined user roles

network-admin

Parameters

network-address: Specifies a subnet address where an interface resides.

wildcard-mask: Specifies an IP address wildcard mask. A wildcard mask can be thought of as a subnet mask, with 1s and 0s inverted. For example, a wildcard mask of 255.255.255.0 corresponds to a subnet mask of 0.0.0.255. If you do not specify this argument, the command uses the natural mask.

Usage guidelines

RIP runs only on an interface attached to the specified network, which can be configured with a wildcard mask. An interface not on the specified network does not receive or send RIP routes, or advertise its direct routes.

For a single RIP process, the **network** 0.0.0.0 command can enable RIP on all interfaces. If multiple RIP processes exist, the command is not applicable.

If a physical interface is attached to multiple networks, you cannot advertise these networks in different RIP processes.

Examples

Enable RIP process 100 on the interface attached to the network 129.102.0.0.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] network 129.102.0.0
```

Related commands

rip enable

non-stop-routing

Use **non-stop-routing** to enable RIP NSR.

Use **undo non-stop-routing** to disable RIP NSR.

Syntax

non-stop-routing

undo non-stop-routing

Default

RIP NSR is disabled.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

RIP NSR enabled for a RIP process takes effect only on that process. As a best practice, enable RIP NSR for each process if multiple RIP processes exist.

The **non-stop-routing** command and the **graceful-restart** command are mutually exclusive.

Examples

Enable NSR for RIP process 1.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] non-stop-routing
```

output-delay

Use **output-delay** to set the rate at which an interface sends RIP packets.

Use **undo output-delay** to restore the default.

Syntax

output-delay *time* **count** *count*

undo output-delay

Default

An interface sends up to three RIP packets every 20 milliseconds.

Views

RIP view

Predefined user roles

network-admin

Parameters

time: Specifies the sending interval in the range of 10 to 100 milliseconds.

count: Specifies the maximum number of RIP packets sent at each interval, in the range of 1 to 30.

Examples

Configure all interfaces running RIP process 1 to send up to 10 RIP packets every 60 milliseconds.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] output-delay 60 count 10
```

peer

Use **peer** to specify a RIP neighbor in the NBMA network, where routing updates destined for the neighbor are only unicasts and not multicast or broadcast.

Use **undo peer** to remove a RIP neighbor.

Syntax

peer *ip-address*

undo peer *ip-address*

Default

RIP does not unicast updates to any neighbor.

Views

RIP view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a RIP neighbor, in dotted decimal notation.

Usage guidelines

Do not use the **peer** *ip-address* command when the neighbor is directly connected. Otherwise, the neighbor might receive both unicast and multicast (or broadcast) messages with the same routing information.

This command must be executed together with the **undo validate-source-address** command, which disables source IP address check on inbound RIP routing updates.

Examples

Configure RIP to unicast updates to peer 202.38.165.1.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] peer 202.38.165.1
```

Related commands

validate-source-address

preference

Use **preference** to specify a preference for RIP routes.

Use **undo preference** to restore the default.

Syntax

preference { *preference* | **route-policy** *route-policy-name* } *

undo preference

Default

The preference of RIP routes is 100.

Views

RIP view

Predefined user roles

network-admin

Parameters

preference: Specifies a preference for RIP routes, in the range of 1 to 255. The smaller the value, the higher the preference.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can specify a routing policy by using the keyword **route-policy** to set a preference for matching RIP routes.

- The preference set by the routing policy applies to all matching RIP routes. The preference of other routes is set by the **preference** command.
- If no preference is set by the routing policy, the preference of all RIP routes is set by the **preference** command.

Examples

Set a preference of 120 for RIP routes.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] preference 120
```

reset rip process

Use **reset rip process** to reset a RIP process.

Syntax

reset rip *process-id* **process**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

Usage guidelines

After executing the command, you are prompted to confirm the operation.

Examples

Reset RIP process 100.

```
<Sysname> reset rip 100 process
Reset RIP process? [Y/N]:y
```

reset rip statistics

Use **reset rip statistics** to clear statistics for a RIP process.

Syntax

reset rip *process-id* **statistics**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

Examples

Clear statistics for RIP process 100.

```
<Sysname> reset rip 100 statistics
```

rip

Use **rip** to enable RIP and enter RIP view.

Use **undo rip** to disable RIP.

Syntax

rip [*process-id*]

undo rip [*process-id*]

Default

RIP is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535. The default is 1.

Usage guidelines

You must enable a RIP process before configuring global parameters for it. This restriction does not apply to configuring interface parameters.

If you disable a RIP process, the configured interface parameters become invalid.

Examples

Enable RIP process 1 and enter RIP view.

```
<Sysname> system-view
[Sysname] rip
[Sysname-rip-1]
```

rip authentication-mode

Use **rip authentication-mode** to configure RIPv2 authentication.

Use **undo rip authentication-mode** to restore the default.

Syntax

rip authentication-mode { **md5** { **rfc2082** { **cipher** | **plain** } *string key-id* | **rfc2453** { **cipher** | **plain** } *string* } | **simple** { **cipher** | **plain** } *string* }

undo rip authentication-mode

Default

RIPv2 authentication is not configured.

Views

Interface view

Predefined user roles

network-admin

Parameters

md5: Specifies the MD5 authentication.

rfc2082: Uses the message format defined in RFC 2082.

cipher: Specifies a password in encrypted form.

plain: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 33 to 53 characters.

key-id: Specifies the key ID in the range of 1 to 255.

rfc2453: Uses the message format defined in RFC 2453 (IETF standard).

simple: Specifies the simple authentication mode.

Usage guidelines

A newly configured key overwrites the old one, if any.

Although you can specify an authentication mode for RIPv1 in interface view, the configuration does not take effect because RIPv1 does not support authentication.

Examples

Configure MD5 authentication on VLAN-interface 10 and specify a plaintext key **rose** in the format defined in RFC 2453.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip version 2
[Sysname-Vlan-interface10] rip authentication-mode md5 rfc2453 plain rose
```

Related commands

rip version

rip bfd enable

Use **rip bfd enable** to enable BFD for RIP on an interface.

Use **undo rip bfd enable** to restore the default.

Syntax

rip bfd enable

undo rip bfd enable

Default

BFD for RIP is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

RIP supports BFD echo-mode detection for a directly connected neighbor, and BFD control-mode detection for an indirectly neighbor.

BFD echo-mode detection only applies to a RIP neighbor one hop away.

Using the **undo peer** command does not delete the neighbor relationship immediately and cannot bring down the BFD session immediately.

The **rip bfd enable** command and the **rip bfd enable destination** command are mutually exclusive and cannot be configured on a device at the same time.

Examples

Enable BFD for RIP on VLAN-interface 11.

```
<Sysname> system-view
[Sysname] interface vlan-interface 11
[Sysname-Vlan-interface11] rip bfd enable
```

rip bfd enable destination

Use **rip bfd enable destination** to enable BFD single-hop echo detection for a specific destination.

Use **undo rip bfd enable** to disable BFD single-hop echo detection for RIP.

Syntax

rip bfd enable destination *ip-address*

undo rip bfd enable

Default

BFD single-hop echo detection for a specific destination is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

When a link failure occurs between the local device and the specified neighbor, BFD can detect the failure. The local device will not receive or send any RIP packets through the interface connected to the neighbor.

The **rip bfd enable destination** command applies only to BFD echo-mode detection.

The **rip bfd enable destination** command and the **rip bfd enable** command are mutually exclusive and cannot be configured on a device at the same time.

Examples

Enable BFD on VLAN-interface 10 for a specific destination 202.38.165.1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip bfd enable destination 202.38.165.1
```

rip default-route

Use **rip default-route** to configure a RIP interface to advertise a default route with a specified metric.

Use **undo rip default-route** to disable a RIP interface from sending a default route.

Syntax

rip default-route { { **only** | **originate** } [**cost** *cost-value* | **route-policy** *route-policy-name*] * | **no-originate** }

undo rip default-route

Default

A RIP interface advertises a default route if the RIP process that the interface runs is enabled to advertise a default route.

Views

Interface view

Predefined user roles

network-admin

Parameters

only: Advertises only a default route.

originate: Advertises both a default route and other routes.

cost-value: Specifies a cost for the default route, in the range of 1 to 15. The default is 1.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case sensitive string of 1 to 63 characters. If you specify this option, the command advertises a default route only when a route in the routing table matches the routing policy.

no-originate: Advertises only non-default routes.

Usage guidelines

An interface that is enabled to advertise a default route does not receive any default route from RIP neighbors.

Examples

Configure VLAN-interface 10 to advertise only a default route with a metric of 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip default-route only cost 2
```

Configure VLAN-interface 10 to advertise a default route with a metric of 2 and other routes.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip default-route originate cost 2
```

Related commands

default-route

rip enable

Use **rip enable** to enable RIP on an interface.

Use **undo rip enable** to disable RIP on an interface.

Syntax

rip *process-id* **enable** [**exclude-subip**]

undo rip enable

Default

RIP is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

exclude-subip: Excludes secondary IP addresses from being enabled with RIP. If you do not specify this keyword, RIP is also enabled on secondary IP addresses of a RIP-enabled interface.

Usage guidelines

The **rip enable** command has a higher priority than the **network** command.

Examples

Enable RIP process 100 on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip 100 enable
```

Related commands

network

rip input

Use **rip input** to enable an interface to receive RIP messages.

Use **undo rip input** to disable an interface from receiving RIP messages.

Syntax

rip input

undo rip input

Default

An interface is enabled to receive RIP messages.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable VLAN-interface 10 from receiving RIP messages.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] undo rip input
```

rip max-packet-length

Use **rip max-packet-length** to set the maximum length of RIP packets.

Use **undo rip max-packet-length** to restore the default.

Syntax

rip max-packet-length *value*

undo rip max-packet-length

Default

The maximum length of RIP packets is 512 bytes.

Views

Interface view

Predefined user roles

network-admin

Parameters

value: Specifies the maximum length of RIP packets, in the range of 32 to 65535 bytes.

Usage guidelines

The supported maximum length of RIP packets varies by vendor. Use this feature with caution to avoid compatibility issues.

When authentication is enabled, follow these guidelines to ensure packet forwarding:

- For simple authentication, the maximum length of RIP packets must be no less than 52 bytes.
- For MD5 authentication (with packet format defined in RFC 2453), the maximum length of RIP packets must be no less than 56 bytes.
- For MD5 authentication (with packet format defined in RFC 2082), the maximum length of RIP packets must be no less than 72 bytes.

If the configured value in the **rip max-packet-length** command is greater than the MTU of an interface, the interface MTU value is used as the maximum length of RIP packets.

Examples

Set the maximum length of RIP packets on VLAN-interface 10 to 1024 bytes.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip max-packet-length 1024
```

rip metricin

Use **rip metricin** to configure an interface to add a metric to inbound routes.

Use **undo rip metricin** to restore the default.

Syntax

rip metricin [**route-policy** *route-policy-name*] *value*

undo rip metricin

Default

The additional metric of an inbound route is 0.

Views

Interface view

Predefined user roles

network-admin

Parameters

route-policy *route-policy-name*: Specifies a routing policy by its name, a case sensitive string of 1 to 63 characters. If you specify this option, the command adds an additional metric for the routes that match the routing policy.

value: Adds an additional metric to inbound routes, in the range of 0 to 16.

Usage guidelines

When a valid RIP route is received, the system adds a metric to it and then installs it into the routing table. The metric of the route received on the configured interface is then increased. If the sum of the additional metric and the original metric is greater than 16, the metric of the route will be 16.

If a routing policy is referenced with the **route-policy** keyword, the following operations can be performed:

- Routes matching the policy are added with the metric specified in the **apply cost** command configured in the policy. Routes not matching it are added with the metric specified in the **rip metricin** command. The **rip metricin** command does not support specifying the **+** or **–** keyword in the **apply cost** command to add or reduce a metric.
- If the **apply cost** command is not configured in the policy, all the inbound routes are added with the metric specified in the **rip metricin** command.

Examples

Configure VLAN-interface 10 to add a metric of 6 to the inbound route 1.0.0.0/8 and to add a metric of 2 to other inbound routes.

```
<Sysname> system-view
[Sysname] ip prefix-list 123 permit 1.0.0.0 8
[Sysname] route-policy abc permit node 10
[Sysname-route-policy-abc-10] if-match ip address prefix-list 123
[Sysname-route-policy-abc-10] apply cost 6
[Sysname-route-policy-abc-10] quit
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip metricin route-policy abc 2
```

Related commands

apply cost

rip metricout

Use **rip metricout** to configure an interface to add a metric to outbound routes.

Use **undo rip metricout** to restore the default.

Syntax

rip metricout [**route-policy** *route-policy-name*] *value*

undo rip metricout

Default

The additional metric for outbound routes is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

route-policy *route-policy-name*: Specifies a routing policy by its name, a case sensitive string of 1 to 63 characters. If you specify this option, the command adds an additional metric for the routes that match the routing policy.

value: Adds an additional metric to outbound routes, in the range of 1 to 16.

Usage guidelines

With the command configured on an interface, the metric of RIP routes sent on the interface will be increased.

If a routing policy is referenced with the **route-policy** keyword, the following operations can be performed:

- Routes matching the policy is added with the metric specified in the **apply cost** command configured in the policy. Routes not matching it are added with the metric specified in the **rip metricout** command. The **rip metricout** command does not support specifying the **+** or **–** keyword in the **apply cost** command to add or reduce a metric.
- If the **apply cost** command is not configured in the policy, all the outbound routes are added with the metric specified in the **rip metricout** command.

Examples

Configure VLAN-interface 10 to add a metric of 6 to the outbound route 1.0.0.0/8 and to add a metric of 2 to other outbound routes.

```
<Sysname> system-view
[Sysname] ip prefix-list 123 permit 1.0.0.0 8
[Sysname] route-policy abc permit node 10
[Sysname-route-policy-abc-10] if-match ip address prefix-list 123
[Sysname-route-policy-abc-10] apply cost 6
[Sysname-route-policy-abc-10] quit
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip metricout route-policy abc 2
```

Related commands

apply cost

rip mib-binding

Use **rip mib-binding** to bind a RIP process to MIB.

Use **undo rip mib-binding** to restore the default.

Syntax

rip mib-binding *process-id*

undo rip mib-binding

Default

MIB operation is bound to the RIP process with the smallest process ID.

Views

System view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

Usage guidelines

If the specified process ID does not exist, the MIB binding configuration does not take effect.

Deleting a RIP process bound to MIB operation deletes the MIB binding configuration. After the RIP process is deleted, MIB operation is bound to the RIP process with the smallest process ID.

Examples

Bind RIP process 100 to MIB.

```
<Sysname> system-view
[Sysname] rip mib-binding 100
```

rip output

Use **rip output** to enable an interface to send RIP messages.

Use **undo rip output** to disable an interface from sending RIP messages.

Syntax

rip output

undo rip output

Default

An interface sends RIP messages.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable VLAN-interface 10 from sending RIP messages.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] undo rip output
```

rip output-delay

Use **rip output-delay** to set the RIP packet sending interval for an interface and the maximum number of RIP packets that can be sent at each interval.

Use **undo rip output-delay** to restore the default.

Syntax

rip output-delay *time* **count** *count*

undo rip output-delay

Default

An interface uses the RIP packet sending rate set for the RIP process that the interface runs.

Views

Interface view

Predefined user roles

network-admin

Parameters

Time: Specifies the RIP packet sending interval in the range of 10 to 100 milliseconds.

count: Specifies the maximum number of RIP packets sent at each interval, in the range of 1 to 30.

Examples

Configure VLAN-interface 10 to send a maximum of six RIP packets every 30 milliseconds.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip output-delay 30 count 6
```

Related commands

output-delay

rip poison-reverse

Use **rip poison-reverse** to enable the poison reverse feature.

Use **undo rip poison-reverse** to disable the poison reverse feature.

Syntax

rip poison-reverse

undo rip poison-reverse

Default

The poison reverse feature is disabled.

Views

Interface view

Predefined user roles

network-admin

Examples

Enable the poison reverse feature on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip poison-reverse
```

rip primary-path-detect bfd echo

Use **rip primary-path-detect bfd echo** to enable BFD single-hop echo detection for RIP FRR.

Use **undo rip primary-path-detect bfd** to disable BFD single-hop echo detection for RIP FRR.

Syntax

rip primary-path-detect bfd echo

undo rip primary-path-detect bfd

Default

BFD single-hop echo detection for RIP FRR is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

For quicker RIP FRR, use BFD single-hop echo detection on the primary link of redundant links to detect link failure.

Examples

Enable BFD single-hop echo detection for RIP FRR on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] fast-reroute route-policy frr
[Sysname-rip-1] quit
[Sysname] bfd echo-source-ip 1.1.1.1
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip primary-path-detect bfd echo
```

rip split-horizon

Use **rip split-horizon** to enable the split horizon feature.

Use **undo rip split-horizon** to disable the split horizon feature.

Syntax

rip split-horizon

undo rip split-horizon

Default

The split horizon feature is enabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

- The split horizon feature prevents routing loops. If you want to disable the feature, make sure the operation is necessary.
- If both split horizon and poison reverse are enabled, only the poison reverse feature takes effect.

Examples

Enable the split horizon feature on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip split-horizon
```

rip summary-address

Use **rip summary-address** to configure a summary route on an interface.

Use **undo rip summary-address** to remove a summary route on an interface.

Syntax

rip summary-address *ip-address* { *mask-length* | *mask* }

undo rip summary-address *ip-address* { *mask-length* | *mask* }

Default

No summary route is configured on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the destination IP address of the summary route.

mask-length: Specifies the subnet mask length of the summary route, in the range of 0 to 32.

mask: Specifies the subnet mask of the summary route, in dotted decimal notation.

Usage guidelines

This command takes effect only when automatic route summarization is disabled.

Examples

Configure a summary route on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip summary-address 10.0.0.0 255.255.255.0
```

Related commands

summary

rip version

Use **rip version** to specify a RIP version on an interface.

Use **undo rip version** to restore the default.

Syntax

rip version { **1** | **2** [**broadcast** | **multicast**] }

undo rip version

Default

No RIP version is configured on an interface. The interface can send RIPv1 broadcasts, and receive RIPv1 broadcasts and unicasts, and RIPv2 broadcasts, multicasts, and unicasts.

Views

Interface view

Predefined user roles

network-admin

Parameters

1: Specifies the RIP version as RIPv1.

2: Specifies the RIP version as RIPv2.

[**broadcast** | **multicast**]: Sends RIPv2 messages in broadcast mode or multicast mode (default).

Usage guidelines

If an interface has no RIP version configured, it uses the global RIP version. Otherwise, it uses the RIP version configured on it.

An interface running RIPv1 can perform the following operations:

- Sends RIPv1 broadcast messages.
- Receives RIPv1 broadcast and unicast messages.

An interface running RIPv2 in broadcast mode can perform the following operations:

- Sends RIPv2 broadcast messages.
- Receives RIPv1 broadcast and unicast messages, and RIPv2 broadcast, multicast, and unicast messages.

An interface running RIPv2 in multicast mode can perform the following operations:

- Sends RIPv2 multicast messages.
- Receives RIPv2 broadcast, multicast, and unicast messages.

Examples

Configure RIPv2 in broadcast mode on VLAN-interface 10.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] rip version 2 broadcast
```

Related commands

version

silent-interface

Use **silent-interface** to disable interfaces from sending RIP messages. The interfaces can still receive RIP messages.

Use **undo silent-interface** to enable interfaces to send RIP messages.

Syntax

silent-interface { *interface-type interface-number* | **all** }

undo silent-interface { *interface-type interface-number* | **all** }

Default

All RIP interfaces can send RIP messages.

Views

RIP view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Disables a specified interface from sending RIP messages.

all: Disables all interfaces from sending RIP messages.

Examples

Disable all VLAN interfaces from sending RIP messages except VLAN-interface 10.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] silent-interface all
[Sysname-rip-100] undo silent-interface vlan-interface 10
[Sysname-rip-100] network 131.108.0.0
```

summary

Use **summary** to enable automatic RIPv2 route summarization. Natural masks are used to advertise summary routes to reduce the size of routing tables.

Use **undo summary** to disable automatic RIPv2 route summarization to advertise all subnet routes.

Syntax

summary

undo summary

Default

Automatic RIPv2 route summarization is enabled.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

Automatic RIPv2 route summarization can reduce the routing table size to enhance the scalability and efficiency for large networks.

Examples

Disable automatic RIPv2 route summarization.

```
<Sysname> system-view
[Sysname] rip
[Sysname-rip-1] undo summary
```

Related commands

rip summary-address

rip version

timer triggered

Use **timer triggered** to set the interval for sending triggered updates.

Use **undo timer triggered** to restore the default.

Syntax

timer triggered *maximum-interval* [*minimum-interval* [*incremental-interval*]]

undo timer triggered

Default

The maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Views

RIP view

Predefined user roles

network-admin

Parameters

maximum-interval: Specifies the maximum interval in the range of 1 to 5 seconds.

minimum-interval: Specifies the minimum interval in the range of 10 to 5000 milliseconds.

incremental-interval: Specifies the incremental interval in the range of 100 to 1000 milliseconds.

Usage guidelines

The *minimum-interval* and *incremental-interval* cannot be greater than the *maximum-interval*.

For a stable network, the *minimum-interval* setting is used. If network changes become frequent, the incremental interval *incremental-interval* is used to extend the triggered update sending interval until the *maximum-interval* is reached.

Examples

For RIP process 1, set the maximum interval, minimum interval, and incremental interval to 2 seconds, 100 milliseconds, and 100 milliseconds, respectively.

```
<Sysname> system-view
```

```
[Sysname] rip 1
[Sysname-rip-1] timer triggered 2 100 100
```

timers

Use **timers** to set RIP timers.

Use **undo timers** to restore the default.

Syntax

timers { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* } *

undo timers { **garbage-collect** | **suppress** | **timeout** | **update** } *

Default

The garbage-collect timer is 120 seconds, the suppress timer is 120 seconds, the timeout timer is 180 seconds, and the update timer is 30 seconds.

Views

RIP view

Predefined user roles

network-admin

Parameters

garbage-collect-value: Specifies the garbage-collect timer in the range of 1 to 3600 seconds.

suppress-value: Specifies the suppress timer in the range of 0 to 3600 seconds.

timeout-value: Specifies the timeout timer in the range of 1 to 3600 seconds.

update-value: Specifies the update timer in the range of 1 to 3600 seconds.

Usage guidelines

RIP uses the following timers:

- **Update timer**—Specifies the interval between routing updates.
- **Timeout timer**—Specifies the route aging time. If no update for a route is received before the timer expires, RIP sets the metric of the route to 16.
- **Suppress timer**—Specifies how long a RIP route stays in suppressed state. When the metric of a route becomes 16, the route enters the suppressed state. If RIP receives an update for the route with a metric less than 16 from the same neighbor, RIP uses this route to replace the suppressed route.
- **Garbage-collect timer**—Specifies the interval from when the metric of a route becomes 16 to when it is deleted from the routing table. During the garbage-collect timer length, RIP advertises the route with a metric of 16. If no update is announced for that route before the garbage-collect timer expires, RIP deletes the route from the routing table.

As a best practice, do not change the default values of these timers.

The timer lengths must be consistent on all routers on the network.

The timeout timer must be greater than the update timer.

Examples

Set the update, timeout, suppress, and garbage-collect timers to 5, 15, 15, and 30 seconds.

```
<Sysname> system-view
```

```
[Sysname] rip 100
[Sysname-rip-100] timers update 5 timeout 15 suppress 15 garbage-collect 30
```

validate-source-address

Use **validate-source-address** to enable source IP address check on inbound RIP routing updates.

Use **undo validate-source-address** to disable source IP address check on inbound RIP routing updates.

Syntax

validate-source-address

undo validate-source-address

Default

Source IP address check on inbound RIP routing updates is enabled.

Views

RIP view

Predefined user roles

network-admin

Examples

Disable source IP address check on inbound RIP routing updates.

```
<Sysname> system-view
[Sysname-rip] rip 100
[Sysname-rip-100] undo validate-source-address
```

version

Use **version** to specify a global RIP version.

Use **undo version** to restore the default.

Syntax

version { **1** | **2** }

undo version

Default

No global RIP version is configured. An RIP interface can send RIPv1 broadcasts and receive RIPv1 broadcasts and unicasts, and RIPv2 broadcasts, multicasts, and unicasts.

Views

RIP view

Predefined user roles

network-admin

Parameters

1: Specifies the RIP version as RIPv1.

2: Specifies the RIP version as RIPv2. RIPv2 messages are multicast.

Usage guidelines

An interface prefers the RIP version configured on it over the global RIP version.

If no RIP version is specified for the interface and the global version is RIPv1, the interface uses RIPv1 and can perform the following operations:

- Send RIPv1 broadcasts.
- Receive RIPv1 broadcasts and unicasts.

If no RIP version is specified for the interface and the global version is RIPv2, the interface uses RIPv2 multicast mode and can perform the following operations:

- Send RIPv2 multicasts.
- Receive RIPv2 broadcasts, multicasts, and unicasts.

Examples

Specify the global RIP version as RIPv2.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] version 2
```

Related commands

Contents

OSPF commands

The S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series do not support OSPF.

abr-summary (OSPF area view)

Use **abr-summary** to configure route summarization on an ABR.

Use **undo abr-summary** to remove the configuration.

Syntax

abr-summary *ip-address* { *mask-length* | *mask* } [**advertise** | **not-advertise**] [**cost** *cost-value*]

undo abr-summary *ip-address* { *mask-length* | *mask* }

Default

Route summarization is not configured on an ABR.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the destination IP address of the summary route in dotted decimal notation.

mask-length: Specifies the mask length in the range of 0 to 32.

mask: Specifies the mask of the IP address, in dotted decimal notation.

advertise | **not-advertise**: Advertises the summary route or not. By default, the command advertises the summary route.

cost *cost-value*: Specifies the cost of the summary route, in the range of 1 to 16777215. The default cost is the largest cost value among routes that are summarized.

Usage guidelines

This command applies only to an ABR to summarize multiple contiguous networks into one network.

To enable ABR to advertise specific routes that have been summarized, use the **undo abr-summary** command.

Examples

Summarize networks 36.42.10.0/24 and 36.42.110.0/24 in Area 1 into 36.42.0.0/16.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] network 36.42.10.0 0.0.0.255
[Sysname-ospf-100-area-0.0.0.1] network 36.42.110.0 0.0.0.255
[Sysname-ospf-100-area-0.0.0.1] abr-summary 36.42.0.0 255.255.0.0
```

area (OSPF view)

Use **area** to create an OSPF area and enter OSPF area view.

Use **undo area** to remove an OSPF area.

Syntax

area *area-id*

undo area *area-id*

Default

No OSPF areas exist.

Views

OSPF view

Predefined user roles

network-admin

Parameters

area-id: Specifies an area by its ID, an IP address or a decimal integer in the range of 0 to 4294967295 that is translated into the IP address format.

Examples

Create Area 0 and enter Area 0 view.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 0
[Sysname-ospf-100-area-0.0.0.0]
```

asbr-summary (OSPF view)

Use **asbr-summary** to configure route summarization on an ASBR.

Use **undo asbr-summary** to remove the configuration.

Syntax

asbr-summary *ip-address* { *mask-length* | *mask* } [**cost** *cost-value* | **not-advertise** | **nssa-only** | **tag** *tag*] *

undo asbr-summary *ip-address* { *mask-length* | *mask* }

Default

Route summarization is not configured on an ASBR.

Views

OSPF view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the destination IP address of the summary route.

mask-length: Specifies the mask length in the range of 0 to 32.

mask: Specifies the mask in dotted decimal notation.

cost *cost-value*: Specifies the cost of the summary route, in the range of 1 to 16777214. If you do not specify this option, the largest cost among the summarized routes applies. If the routes in Type-5 LSAs translated from Type-7 LSAs are Type-2 external routes, the largest cost among the summarized routes plus 1 applies.

not-advertise: Disables advertising the summary route. If you do not specify this keyword, the command advertises the route.

nssa-only: Limits the route advertisement to the NSSA area by setting the P-bit of Type-7 LSAs to 0. By default, the P-bit of Type-7 LSAs is set to 1. If the ASBR is also an ABR and **FULL** state neighbors exist in the backbone area, the P-bit of Type-7 LSAs originated by the ASBR is set to 0. This keyword applies to the NSSA ASBR.

tag *tag*: Specifies a tag for the summary route, in the range of 0 to 4294967295. The default is 1. The tag can be used by a routing policy to control summary route advertisement.

Usage guidelines

An ASBR can summarize routes in the following LSAs:

- Type-5 LSAs.
- Type-7 LSAs in an NSSA area.
- Type-5 LSAs translated by the ASBR (also an ABR) from Type-7 LSAs in an NSSA area.

  If the ASBR (ABR) is not a translator, it cannot summarize routes in Type-5 LSAs translated from Type-7 LSAs.

To enable ASBR to advertise specific routes that have been summarized, use the **undo asbr-summary** command.

Examples

Summarize redistributed static routes into a single route, and specify a tag value of 2 and a cost of 100 for the summary route.

```
<Sysname> system-view
[Sysname] ip route-static 10.2.1.0 24 null 0
[Sysname] ip route-static 10.2.2.0 24 null 0
[Sysname] ospf 100
[Sysname-ospf-100] import-route static
[Sysname-ospf-100] asbr-summary 10.2.0.0 255.255.0.0 tag 2 cost 100
```

authentication-mode

Use **authentication-mode** to specify an authentication mode for an OSPF area.

Use **undo authentication-mode** to remove the configuration.

Syntax

For MD5/HMAC-MD5 authentication:

authentication-mode { **hmac-md5** | **md5** } *key-id* { **cipher** | **plain** } *string*

undo authentication-mode [{ **hmac-md5** | **md5** } *key-id*]

For simple authentication:

authentication-mode simple { **cipher** | **plain** } *string*

undo authentication-mode

Default

No authentication is performed for an area.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

hmac-md5: Specifies the HMAC-MD5 authentication mode.

md5: Specifies the MD5 authentication mode.

simple: Specifies the simple authentication mode.

key-id: Specifies a key by its ID in the range of 0 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive.

- In simple authentication mode, the plaintext form of the key is a string of 1 to 8 characters. The encrypted form of the key is a string of 33 to 41 characters.
- In MD5/HMAC-MD5 authentication mode, the plaintext form of the key is a string of 1 to 16 characters. The encrypted form of the key is a string of 33 to 53 characters.

Usage guidelines

To establish or maintain adjacencies, routers in the same area must have the same authentication mode and key.

If MD5 or HMAC-MD5 authentication is configured, you can configure multiple keys, each having a unique key ID and key string. As a best practice to minimize the risk of key compromise, use only one key for an area and delete the old key after key replacement.

To replace the key used for MD5 or HMAC-MD5 authentication in an area, you must configure the new key before removing the old key from each router. OSPF uses the key rollover mechanism to ensure that the routers can pass authentication before the replacement is complete across the area. After you configure a new key on a router, the router sends copies of the same packet, each authenticated by a different key, including the new key and the keys in use. This practice continues until the router detects that all its neighbors have the new key.

Examples

Configure OSPF Area 0 to use the MD5 authentication mode, and set the key ID to 15 and the key to **abc** in plaintext form.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 0
[Sysname-ospf-100-area-0.0.0.0] authentication-mode md5 15 plain abc
```

Related commands

ospf authentication-mode

bandwidth-reference (OSPF view)

Use **bandwidth-reference** to set a reference bandwidth value for link cost calculation.

Use **undo bandwidth-reference** to restore the default value.

Syntax

bandwidth-reference *value*

undo bandwidth-reference

Default

The reference bandwidth value is 100 Mbps for link cost calculation.

Views

OSPF view

Predefined user roles

network-admin

Parameters

value: Specifies the reference bandwidth value for link cost calculation, in the range of 1 to 4294967 Mbps.

Usage guidelines

If no cost values are configured for links, OSPF calculates their cost values by using the following formula: Cost = Reference bandwidth value / Expected interface bandwidth. The expected bandwidth of an interface is configured with the **bandwidth** command (see *Interface Command Reference*). If the calculated cost is greater than 65535, the value of 65535 is used. If the calculated cost is less than 1, the value of 1 is used.

Examples

Set the reference bandwidth value to 1000 Mbps.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] bandwidth-reference 1000
```

Related commands

ospf cost

capability default-exclusion

Use **capability default-exclusion** to exclude interfaces in an OSPF area from the base topology.

Use **undo capability default-exclusion** to restore the default.

Syntax

capability default-exclusion

undo capability default-exclusion

Default

Interfaces in an OSPF area belong to the base topology.

Views

OSPF area view

Predefined user roles

network-admin

Usage guidelines

For correct neighbor relationship establishment, execute this command on both the local device and the neighbor device.

Examples

Exclude interfaces in Area 1 from the base topology.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] capability default-exclusion
```

database-filter peer (OSPF view)

Use **database-filter peer** to filter LSAs for the specified P2MP neighbor.

Use **undo database-filter peer** to restore the default.

Syntax

database-filter peer *ip-address* { **all** | { **ase** [**acl** *ipv4-acl-number*] | **nssa** [**acl** *ipv4-acl-number*] | **summary** [**acl** *ipv4-acl-number*] } * }

undo database-filter peer *ip-address*

Default

The LSAs for the specified P2MP neighbor are not filtered.

Views

OSPF view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a P2MP neighbor by its IP address.

all: Filters all LSAs except the Grace LSAs.

ase: Filters Type-5 LSAs.

nssa: Filters Type-7 LSAs.

summary: Filters Type-3 LSAs.

acl *ipv4-acl-number*: Specifies an IPv4 ACL by its number in the range of 2000 to 3999.

Usage guidelines

On an P2MP network, a router might have multiple OSPF neighbors with the P2MP type. Use this command to prevent the router from sending LSAs to the specified neighbor.

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following methods:

- To deny/permit LSAs with the specified link state ID, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit LSAs with the specified link state ID and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the link state ID of an LSA and the **destination** keyword specifies the subnet mask of the LSA. For the mask configuration to take effect, specify a contiguous subnet mask.

If the specified neighbor has already received an LSA, the LSA still exists in the LSDB of the neighbor after you execute the command.

Examples

Filter all LSAs (except the Grace LSAs) for the P2MP neighbor with the IP address 121.20.20.121.

```
<Sysname> system-view
[Sysname] ospf 1
[Sysname-ospf-1] database-filter peer 121.20.20.121 all
```

Configure advanced ACL 3000 to filter Type-3 LSAs for the P2MP neighbor with the IP address 121.20.20.121.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000] rule 10 deny ip source 121.20.0.0 0 destination 255.255.0.0
0
[Sysname-acl-ipv4-adv-3000] rule 100 permit ip
[Sysname-acl-ipv4-adv-3000] quit
[Sysname] ospf 1
[Sysname-ospf-1] database-filter peer 121.20.20.121 summary acl 3000
```

default (OSPF view)

Use **default** to configure default parameters for redistributed routes.

Use **undo default** to remove the configuration.

Syntax

default { **cost** *cost-value* | **tag** *tag* | **type** *type* } *

undo default { **cost** | **tag** | **type** } *

Default

The cost is 1, the tag is 1, and the route type is 2.

Views

OSPF view

Predefined user roles

network-admin

Parameters

cost *cost-value*: Specifies a default cost for redistributed routes, in the range of 0 to 16777214.

tag *tag*: Specifies a tag for redistributed routes, in the range of 0 to 4294967295.

type *type*: Specifies a type for redistributed routes: 1 or 2.

Examples

Set the default cost, tag, and type to 10, 100, and 2 for redistributed external routes.

```
<Sysname> system-view
```

```
[Sysname] ospf 100
[Sysname-ospf-100] default cost 10 tag 100 type 2
```

Related commands

import-route

default-cost (OSPF area view)

Use **default-cost** to set a cost for the default route advertised to the stub or NSSA area.

Use **undo default-cost** to restore the default value.

Syntax

default-cost *cost-value*

undo default-cost

Default

The cost is 1.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

cost-value: Specifies a cost for the default route advertised to the Stub or NSSA area, in the range of 0 to 16777214.

Usage guidelines

This command takes effect only on the ABR of a stub area or the ABR or ASBR of an NSSA area.

Examples

Configure Area 1 as a stub area, and set the cost of the default route advertised to the stub area to 20.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] stub
[Sysname-ospf-100-area-0.0.0.1] default-cost 20
```

Related commands

stub

default-route-advertise (OSPF view)

Use **default-route-advertise** to redistribute a default route into the OSPF routing domain.

Use **undo default-route-advertise** to restore the default.

Syntax

default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **type** *type*] *

undo default-route-advertise

Default

No default route is redistributed into the OSPF routing domain.

Views

OSPF view

Predefined user roles

network-admin

Parameters

always: Redistributes a default route in a Type-5 LSA into the OSPF routing domain regardless of whether a default route exists in the routing table. If you do not specify this keyword, the router redistributes a default route only when an active default route that does not belong to the current OSPF process exists in the IP routing table.

permit-calculate-other: Enables OSPF to calculate default routes received from other routers. If you do not specify this keyword, OSPF does not calculate default routes from other routers. If the router does not redistribute any default route in a Type-5 LSA into the OSPF routing domain, the router calculates default routes from other routers. It calculates these routes regardless of whether this keyword is specified.

cost *cost-value*: Specifies a cost for the default route, in the range of 0 to 16777214. If you do not specify this option, the default cost specified by the **default-cost** command applies.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters. When the routing policy is matched and one of the following conditions is met, the command redistributes a default route in a Type-5 LSA into the OSPF routing domain:

- A default route exists in the routing table.
- The **always** keyword is specified.

The routing policy modifies values in the Type-5 LSA.

type *type*: Specifies a type for the Type-5 LSA: 1 or 2. If you do not specify this option, the default type for the Type-5 LSA specified by the **default type** command applies.

Usage guidelines

This command redistributes a default route in a Type-5 LSA, which cannot be redistributed with the **import-route** command. If the local routing table has no default route, you must specify the **always** keyword for the command.

Examples

Redistribute a default route into the OSPF routing domain, regardless of whether the default route exists in the local routing table.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] default-route-advertise always
```

Related commands

import-route

description (OSPF/OSPF area view)

Use **description** to configure a description for an OSPF process or area.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for an OSPF process or area.

Views

OSPF view

OSPF area view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 80 characters.

Usage guidelines

The description specified by this command is used to identify an OSPF process or area.

Examples

Describe OSPF process 100 as **abc**.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] description abc
```

Describe OSPF Area 0 as **bone area**.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 0
[Sysname-ospf-100-area-0.0.0.0] description bone area
```

discard-route

Use **discard-route** to configure discard routes for summary networks.

Use **undo discard-route** to restore the default.

Syntax

discard-route { **external** { *preference* | **suppression** } | **internal** { *preference* | **suppression** } } *

undo discard-route [**external** | **internal**] *

Default

A device generates discard routes with preference 255 for summary networks.

Views

OSPF view

Predefined user roles

network-admin

Parameters

external: Specifies discard routes for redistributed summary networks on the ASBR. These discard routes are external discard routes.

preference: Specifies a preference for external discard routes, in the range of 1 to 255.

suppression: Disables the ASBR from generating external discard routes for summary networks.

internal: Specifies discard routes for summary networks on the ABR. These discard routes are internal discard routes.

preference: Specifies a preference for internal discard routes, in the range of 1 to 255.

suppression: Disables the ABR from generating internal discard routes for summary networks.

Examples

Generate external and internal discard routes with preference 100 and 200, respectively.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] discard-route external 100 internal 200
```

display ospf

Use **display ospf** to display OSPF process information.

Syntax

display ospf [*process-id*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about all OSPF processes.

verbose: Displays detailed OSPF process information. If you do not specify this keyword, the command displays brief OSPF process information.

Examples

Display detailed OSPF process information.

```
<Sysname> display ospf verbose

Table 1 Command output

Field	Description
OSPF Process 1 with Router ID 192.168.1.2	OSPF process ID and OSPF router ID.
RouterID	Router ID.
Router type	Router type: • ABR. • ASBR. • NSSA. • Null.
Route tag	Tag of redistributed routes.
Multi-VPN-Instance is not enabled	The OSPF process does not support multi-VPN-instance.
Ext-community type	OSPF extended community attribute type codes: • **Domain ID**—Domain ID code. • **Route Type**—Router type code. • **Router ID**—Router ID code.
Domain ID	OSPF domain ID (primary ID).
Opaque capable	Opaque LSA advertisement and reception capability is enabled.
Originating router-LSAs with maximum metric	The maximum cost value for router LSAs (excluding stub links) is used.
Condition	Status of the stub router: • Always. • On startup for *xxx* seconds, where *xxx* is specified by the user.
State	Whether the stub router is active.
SPF-schedule-interval	Interval for SPF calculations.
LSA generation interval	LSA generation interval.
LSA arrival interval	LSA arrival interval.
Transmit pacing	LSU packet transmit rate of the interface: • **Interval**—LSU transmit interval of the interface. • **Count**—Maximum number of LSU packets sent at each interval.
Default ASE parameters	Default ASE parameters: **Metric**, **Tag**, and **Type**.
Route preference	Internal route preference.
ASE route preference	External route preference.
SPF computation count	SPF computation count of the OSPF process.
RFC1583 compatible	Compatible with RFC 1583.

Graceful restart interval	GR interval.
SNMP trap rate limit interval	SNMP notification sending interval.
Count	Number of sent SNMP notifications.
ExChange/Loading neighbors	Neighbors in ExChange/Loading state.
Full neighbors	Neighbors in Full state.
Area0 full neighbors	Neighbors in Full state in the backbone area.
Calculation trigger type	Route calculation trigger type: • **Full**—Calculation of all routes is triggered. • **Area topology change**—Topology change in an area. • **Intra router change**—Incremental intra-area route change. • **ASBR change**—Incremental ASBR route change. • **7to5 translator**—Type-7-to-Type-5 LSA translator role change. • **Full IP prefix**—Calculation of all IP prefixes is triggered. • **Full intra AS**—Calculation of all intra-AS prefixes is triggered. • **Inc intra AS**—Calculation of incremental intra-AS prefixes is triggered. • **Full inter AS**—Calculation of all AS-external prefixes is triggered. • **Inc inter AS**—Calculation of incremental AS-external prefixes is triggered. • **N/A**—Route calculation is not triggered.
