About the configuration guides

The configuration guides describe the software features for the following switch series:

- S5120V2-LI.
- S3100V3-SI.
- S5110V2.
- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000E-X.
- S5000X-EI.
- S5130S-LI.
- S5120V3-LI.
- S5120V3-SI.
- MS4320V2.
- MS4320V3.
- MS4320.
- MS4300V2.
- MS4200.
- WS5810-WiNet.
- WS5820-WiNet.
- WAS6000.

The guides guide you through the software configuration procedures and provide configuration examples to help you apply the software features to different network scenarios.

Configuration guide	Content
Fundamentals Configuration Guide	Covers information about using the command line interface, logging in to and setting up the device, and using the basic management features. This guide includes: • CLI (command line interface overview and how to use the CLI). • RBAC. • Logging in to the device (login methods such as Telnet, and user interface configuration and access control). • FTP and TFTP. • File system management. • Configuration file management. • Software upgrade. • Device management. • Tcl. • Python. • Automatic configuration. • License management.
Virtual Technologies Configuration Guide	Covers Intelligent Resilient Framework (IRF) technology, which provides data center class availability and scalability.

Configuration guide	Content
	IRF creates a large virtual device from multiple devices. The IRF member devices work in 1:N redundancy and appear as one unit in the network. IRF improves management efficiency and streamlines network topology. It is suitable for highly reliable enterprise networks and data centers.
Layer 2—LAN Switching Configuration Guide	Covers Layer 2 technologies and features used on a LAN switched network, such as VLAN technology, port isolation, and spanning tree. You can use these features to divide broadcast domains, remove Layer 2 loops, isolate users within a VLAN, re-mark VLAN tags, or implement VLAN VPNs over the Internet. This guide includes: • Ethernet interface. • Loopback, null, and inloopback interfaces. • Bulk interface configuration. • MAC address table and MAC Information. • Ethernet link aggregation. • Port isolation. • Spanning tree. • Loop detection. • VLAN (including VLAN, private VLAN, and voice VLAN). • MVRP. • QinQ. • VLAN mapping. • LLDP. • L2PT. • PPPoE relay.
Layer 3—IP Services Configuration Guide	Covers IP addressing (including static and dynamic IPv4 and IPv6 address assignment), network performance optimization, and ARP. This guide includes: • ARP (including gratuitous ARP, proxy ARP, ARP snooping, and ARP direct route advertisement). • IP addressing. • DHCP (including DHCP overview, DHCP server, DHCP relay agent, DHCP client, DHCP snooping, and BOOTP client). • DNS. • Basic IP forwarding. • Fast forwarding. • IP performance optimization. • UDP helper. • IPv6 basics. • DHCPv6 (including DHCPv6 overview, DHCPv6 server, DHCPv6 relay agent, DHCPv6 client, and DHCPv6 snooping). • IPv6 fast forwarding. • HTTP redirect.
Layer 3—IP Routing Configuration Guide	Covers the routing technologies for IPv4 and IPv6 networks of different sizes, route filtering, route control, and policy-based routing. This guide includes: • Basic IP routing. • Static routing. • Default route. • RIP. • OSPF.

Configuration guide	Content
	• Policy-based routing. • IPv6 static routing. • RIPng. • OSPFv3. • IPv6 policy-based routing. • Routing policy.
IP Multicast Configuration Guide	Covers Layer 2 IPv4 multicast protocols (including IGMP snooping, PIM snooping, and multicast VLAN) and Layer 2 IPv6 multicast protocols (including MLD snooping, IPv6 PIM snooping, and IPv6 multicast VLAN). This guide includes: • Multicast overview. • IGMP snooping. • PIM snooping. • Multicast VLAN. • MLD snooping. • IPv6 PIM snooping. • IPv6 multicast VLAN.
ACL and QoS Configuration Guide	Covers information about classifying traffic with ACLs, and allocating network resources and managing congestions with QoS technologies to improve network performance and network use efficiency. You can use ACLs to help feature modules (such as QoS and IP routing) classify or filter traffic. This guide includes: • ACL. • QoS (including QoS overview, QoS policy, priority mapping, traffic policing, GTS and rate limit, congestion management, traffic filtering, priority marking, nesting, traffic redirecting, global CAR, class-based accounting, and appendixes). • Data buffer. • Time range.
Security Configuration Guide	Covers security features. The major security features available on the switch include: identity authentication (AAA and PKI), access security (802.1X, MAC authentication, and port security), secure management (SSH), SSL, and attack protection (IP source guard and ARP attack protection). This guide includes: • AAA. • 802.1X. • MAC authentication. • Portal authentication. • Web authentication. • Triple authentication. • Port security. • User profile. • Password control. • Public key management. • PKI. • IPsec (including IPsec, IKE, and IKEv2). • SSH. • SSL. • Attack detection and prevention.

Configuration guide	Content
	• TCP attack prevention. • IP source guard. • ARP attack protection. • ND attack defense. • SAVI. • MFF. • Crypto engine. • FIPS. • 802.1X client.
High Availability Configuration Guide	Covers high availability technologies and features available on the switch for failure detection and failover. Failure detection technologies focus on fault detection and isolation. Failover technologies focus on network recovery. This guide includes: • Ethernet OAM. • CFD. • DLDP. • RRPP. • ERPS. • Smart Link. • Monitor Link. • VRRP. • BFD. • Track. • Loopback MAC SWAP.
Network Management and Monitoring Configuration Guide	Covers features that help you manage and monitor your network, for example, manage system events, collect traffic statistics, sample packets, assess network performance, and test network connectivity. This guide includes: • System maintenance and debugging (ping, tracert, and system debugging). • NQA. • NTP and SNTP. • PoE. • SNMP. • RMON. • NETCONF. • CWMP. • EAA. • Process monitoring and maintenance. • Mirroring (including both port and traffic mirroring). • sFlow. • Information center. • VCF fabric. • Cloud connection. • SmartMC. • WiNet.
Telemetry Configuration Guide	Covers gRPC fundamentals and configuration.
OpenFlow Configuration Guide	Covers the application scenarios, fundamentals, and configuration of OpenFlow.

Configuration guide	Content
Acronyms	Lists the significant acronyms in the configuration guides.

Fundamentals Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

New H3C Technologies Co., Ltd.

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This configuration guide describes features and tasks that help you get started with the device, including:

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

Using the CLI

About the CLI

At the command-line interface (CLI), you can enter text commands to configure, manage, and monitor the device.

You can use different methods to log in to the CLI. For example, you can log in through the console port or Telnet. For more information about login methods, see "Login overview."

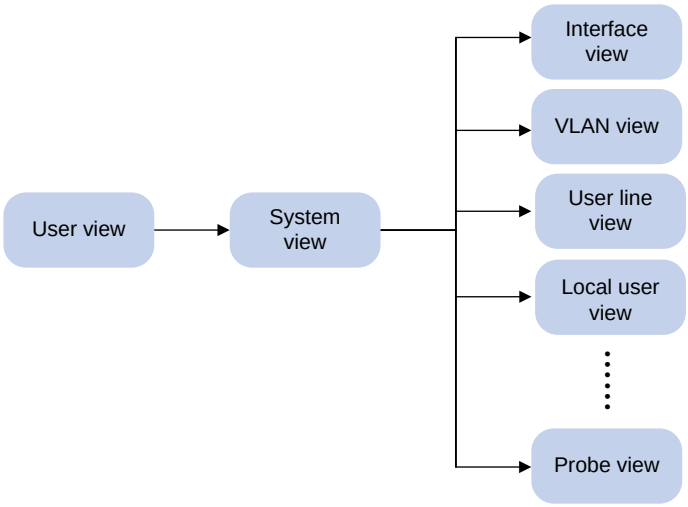
Using CLI views

About CLI views

Commands are grouped in different views by feature. To use a command, you must enter its view.

CLI views are hierarchically organized, as shown in Figure 1. Each view has a unique prompt, from which you can identify where you are and what you can do. For example, the prompt [Sysname-vlan100] shows that you are in VLAN 100 view and can configure attributes for that VLAN.

Figure 1 CLI views



You are placed in user view immediately after you log in to the CLI.

In user view, you can perform the following tasks:

- Perform basic operations including display, debug, file management, FTP, Telnet, clock setting, and reboot.
- Enter system view.

In system view, you can perform the following tasks:

- Configure settings that affect the device as a whole, such as the daylight saving time, banners, and hotkeys.
- Enter feature views.

  For example, you can perform the following tasks:
  - Enter interface view to configure interface parameters.

- Enter VLAN view to add ports to the VLAN.
- Enter user line view to configure login user attributes.

A feature view might have child views. For example, NQA operation view has the child view HTTP operation view.

- Enter probe view by using the **probe** command.

  The probe view provides display, debugging, and maintenance commands, which are mainly used by developers and testers for system fault diagnosis and system operation monitoring.

CAUTION:

Use the commands in probe view under the guidance of engineers to avoid system exceptions caused by incorrect operations.

For more information about the commands in probe view, see the probe commands manual for each feature.

To display all commands available in a view, enter a question mark (?) at the view prompt.

Entering system view from user view

To enter system view from user view, execute the following command:

system-view

Returning to the upper-level view from a view

Restrictions and guidelines

Executing the **quit** command in user view terminates your connection to the device.

To return from public key view to system view, you must use the **peer-public-key end** command.

Procedure

To return to the upper-level view from a view, execute the following command:

quit

Returning to user view

About returning to user view

This feature enables you to return to user view from any view by performing a single operation, eliminating the requirement to execute the **quit** command multiple times.

Procedure

To return directly to user view from any other view (except the Tcl configuration view and Python shell), use one of the following methods:

- Execute the **return** command in any view.
- Press **Ctrl+Z** in any view.

To return to user view from Tcl configuration view, execute the **tclquit** command in Tcl configuration view.

To return to user view from the Python shell, execute the **exit()** command in the Python shell.

Accessing the CLI online help

The CLI online help is context sensitive. Enter a question mark at any prompt or in any position of a command to display all available options.

To access the CLI online help, use one of the following methods:

- Enter a question mark at a view prompt to display the first keyword of every command available in the view. For example:

```
<Sysname> ?
User view commands:
  archive             Archive configuration
  arp                 Address Resolution Protocol (ARP) module
  backup              Backup the startup configuration file to a TFTP server
  boot-loader         Software image file management
...
```

- Enter a space and a question mark after a command keyword to display all available keywords and arguments.
  - If the question mark is in the place of a keyword, the CLI displays all possible keywords, each with a brief description. For example:

```
<Sysname> terminal ?
  debugging  Enable to display debugging logs on the current terminal
  logging    Display logs on the current terminal
  monitor    Enable to display logs on the current terminal
```

  - If the question mark is in the place of an argument, the CLI displays the description for the argument. For example:

```
<Sysname> system-view
[Sysname] interface vlan-interface ?
  <1-4094>  Vlan-interface interface number
[Sysname] interface vlan-interface 1 ?
  <cr>
[Sysname] interface vlan-interface 1
```

    <1-4094> is the value range for the argument. **<cr>** indicates that the command is complete and you can press **Enter** to execute the command.

- Enter an incomplete keyword string followed by a question mark to display all keywords starting with that string. The CLI also displays the descriptions for the keywords. For example:

```
<Sysname> f?
  fdisk    Partition a storage medium
  fixdisk   Check and repair a storage medium
  format    Format a storage medium
  free      Release a connection
  ftp       Open an FTP connection
<Sysname> display ftp?
  ftp         FTP module
  ftp-server  FTP server information
  ftp-user    FTP user information
```

Using the undo form of a command

Most configuration commands have an **undo** form for the following tasks:

- Canceling a configuration.
- Restoring the default.
- Disabling a feature.

For example, the **info-center enable** command enables the information center. The **undo info-center enable** command disables the information center.

Entering a command

When you enter a command, you can perform the following tasks:

- Use keys or hotkeys to edit the command line.
- Use abbreviated keywords or keyword aliases.

Editing a command line

To edit a command line, use the keys listed in Table 1 or the hotkeys listed in Table 4. When you are finished, you can press **Enter** to execute the command.

The command edit buffer can contain a maximum of 511 characters. If the total length of a command line exceeds the limit after you press **Tab** to complete the last keyword or argument, the system does not complete the keyword.

Table 1 Command line editing keys

Keys	Function
Common keys	If the edit buffer is not full, pressing a common key inserts a character at the cursor and moves the cursor to the right. The edit buffer can store up to 511 characters. Unless the buffer is full, all common characters that you enter before pressing **Enter** are saved in the edit buffer.
Backspace	Deletes the character to the left of the cursor and moves the cursor back one character.
Left arrow key (←)	Moves the cursor one character to the left.
Right arrow key (→)	Moves the cursor one character to the right.
Up arrow key (↑)	Displays the previous command in the command history buffer.
Down arrow key (↓)	Displays the next command in the command history buffer.
Tab	If you press **Tab** after typing part of a keyword, the system automatically completes the keyword. • If a unique match is found, the system displays the complete keyword. • If there is more than one match, press **Tab** multiple times to pick the keyword you want to enter. • If there is no match, the system does not modify what you entered but displays it again in the next line.

The device supports the following special commands:

- #—Used by the system in a configuration file as separators for adjacent sections.
- **version**—Used by the system in a configuration file to indicate the software version information. For example, **version 7.1. xxx**, **Release xxx**.

These commands are special because of the following reasons:

- These commands are not intended for you to use at the CLI.

- You can enter the **#** command in any view or the **version** command in system view, or enter any values for them. For example, you can enter **# abc** or **version abc**. However, the settings do not take effect.
- The device does not provide any online help information for these commands.

Entering a text or string type value for an argument

A text type argument value can contain any characters except question marks (?).

A string type argument value can contain any printable characters except question marks (?).

- To include a quotation mark (") or backward slash (\) in a string type argument value, prefix the character with an escape key (\), for example, \" and \\.
- To include a blank space in a string type argument value, enclose the value in quotation marks, for example, "my device".

A specific argument might have more requirements. For more information, see the relevant command reference.

To enter a printable character, you can enter the character or its ASCII code in the range of 32 to 126.

Entering an interface type

You can enter an interface type in one of the following formats:

- Full spelling of the interface type.
- An abbreviation that uniquely identifies the interface type.
- Acronym of the interface type.

For a command line, all interface types are case insensitive. Table 2 shows the full spellings and acronyms of interface types.

For example, to use the **interface** command to enter the view of interface GigabitEthernet 1/0/1, you can enter the command line in the following formats:

- **interface gigabitethernet 1/0/1**
- **interface g 1/0/1**
- **interface ge 1/0/1**

Spaces between the interface types and interfaces are not required.

Table 2 Full spellings and acronyms of interface types

Full spelling	Acronym
Bridge-Aggregation	BAGG
Ethernet	Eth
GigabitEthernet	GE
InLoopBack	InLoop
LoopBack	Loop
M-Ethernet	ME
NULL	NULL
Ten-GigabitEthernet	XGE
Vlan-interface	Vlan-int

Abbreviating commands

You can enter a command line quickly by entering incomplete keywords that uniquely identify the complete command. In user view, for example, commands starting with an **s** include **startup saved-configuration** and **system-view**. To enter the command **system-view**, you need to type only **sy**. To enter the command **startup saved-configuration**, type **st s**.

You can also press **Tab** to complete an incomplete keyword.

Configuring and using command aliases

About command aliases

You can configure one or more aliases for a command or the starting keywords of commands. Then, you can use the aliases to execute the command or commands. If the command or commands have **undo** forms, you can also use the aliases to execute the **undo** command or commands.

For example, if you configure the **shiprt** alias for **display ip routing-table**, you can enter **shiprt** to execute the **display ip routing-table** command. If you configure the **ship** alias for **display ip**, you can use **ship** to execute all commands starting with **display ip**, including:

- Enter **ship routing-table** to execute the **display ip routing-table** command.
- Enter **ship interface** to execute the **display ip interface** command.

The device provides a set of system-defined command aliases, as listed in Table 3.

Table 3 System-defined command aliases

Command alias	Command or command keyword
access-list	**acl**
end	**return**
erase	**delete**
exit	**quit**
hostname	**sysname**
logging	**info-center**
no	**undo**
show	**display**
write	**save**

Restrictions and guidelines

A command alias can be used only as the first keyword of a command or the second keyword of the **undo** form of a command.

After you successfully execute a command by using an alias, the system saves the command, instead of the alias, to the running configuration.

The command string can include up to nine parameters. Each parameter starts with the dollar sign ($) and a sequence number in the range of 1 to 9. For example, you can configure the alias **shinc** for the **display ip $1 | include $2** command. Then, to execute the **display ip routing-table | include Static** command, you need to enter only **shinc routing-table Static**.

To use an alias for a command that has parameters, you must specify a value for each parameter. If you fail to do so, the system informs you that the command is incomplete and displays the command string represented by the alias.

System-defined command aliases cannot be deleted.

Procedure

1. Enter system view.
   system-view
2. Configure a command alias.
   alias *alias command*
   By default, the device has a set of command aliases, as listed in Table 3.
3. (Optional.) Display command aliases.
   display alias [*alias*]
   This command is available in any view.

Configuring and using hotkeys

About hotkeys

The device supports a set of hotkeys. Pressing a hotkey executes the command or function assigned to the hotkey. Table 4 shows the hotkeys and their default definitions. You can configure all the hotkeys except **Ctrl+]**.

If a hotkey is also defined by the terminal software you are using to interact with the device, you can reconfigure the hotkey or remove the hotkey.

Restrictions and guidelines

A hotkey can correspond to only one command or function. If you assign multiple commands or functions to the same hotkey, the most recently assigned command or function takes effect.

A command or function can be assigned to multiple hotkeys. You can use any of the hotkeys to execute the command or function.

If a hotkey is also defined by the terminal software you are using to interact with the device, the terminal software definition takes effect.

Procedure

1. Enter system view.
   system-view
2. Assign a command to a hotkey.
   hotkey *hotkey* { *command* | **function** *function* | **none** }
   Table 4 shows the default definitions for the hotkeys.
3. (Optional.) Display hotkeys.
   display hotkey
   This command is available in any view.

Table 4 Default definitions for hotkeys

Hotkey	Function or command
Ctrl+A	**move_the_cursor_to_the_beginning_of_the_line**: Moves the cursor to the beginning of a line.
Ctrl+B	**move_the_cursor_one_character_to_the_left**: Moves the cursor one character to the left.

Hotkey	Function or command
Ctrl+C	**stop_the_current_command**: Stops the current command.
Ctrl+D	**erase_the_character_at_the_cursor**: Deletes the character at the cursor.
Ctrl+E	**move_the_cursor_to_the_end_of_the_line**: Moves the cursor to the end of a line.
Ctrl+F	**move_the_cursor_one_character_to_the_right**: Moves the cursor one character to the right.
Ctrl+G	**`display current-configuration`**: Display the running configuration.
Ctrl+H	**erase_the_character_to_the_left_of_the_cursor**: Deletes the character to the left of the cursor.
Ctrl+L	**`display ip routing-table`**: Display the IPv4 routing table information.
Ctrl+N	**display_the_next_command_in_the_history_buffer**: Displays the next command in the history buffer.
Ctrl+O	**`undo debugging all`**: Disable all debugging functions.
Ctrl+P	**display_the_previous_command_in_the_history_buffer**: Displays the previous command in the history buffer.
Ctrl+R	**redisplay_the_current_line**: Redisplays the current line.
Ctrl+T	N/A
Ctrl+U	N/A
Ctrl+W	**delete_the_word_to_the_left_of_the_cursor**: Deletes the word to the left of the cursor.
Ctrl+X	**delete_all_characters_from_the_beginning_of_the_line_to_the_cursor**: Deletes all characters to the left of the cursor.
Ctrl+Y	**delete_all_characters_from_the_cursor_to_the_end_of_the_line**: Deletes all characters from the cursor to the end of the line.
Ctrl+Z	**return_to_the_User_View**: Returns to user view.
Ctrl+]	**kill_incoming_connection_or_redirect_connection**: Terminates the current connection.
Esc+B	**move_the_cursor_back_one_word**: Moves the cursor back one word.
Esc+D	**delete_all_characters_from_the_cursor_to_the_end_of_the_word**: Deletes all characters from the cursor to the end of the word.
Esc+F	**move_the_cursor_forward_one_word**: Moves the cursor forward one word.

Enabling redisplaying entered-but-not-submitted commands

About redisplaying entered-but-not-submitted commands

Your input might be interrupted by system information output. If redisplaying entered-but-not-submitted commands is enabled, the system redisplays your input after finishing the output. You can then continue entering the command line.

Procedure

1. Enter system view.

   `system-view`
2. Enable redisplaying entered-but-not-submitted commands.

`info-center synchronous`

By default, the system does not redisplay entered-but-not-submitted commands.

For more information about this command, see *Network Management and Monitoring Command Reference*.

Understanding command-line syntax error messages

After you press **Enter** to submit a command, the command line interpreter examines the command syntax.

- If the command passes syntax check, the CLI executes the command.
- If the command fails syntax check, the CLI displays an error message.

Table 5 Common command-line syntax error messages

Syntax error message	Cause
% Unrecognized command found at '^' position.	The keyword in the marked position is invalid.
% Incomplete command found at '^' position.	One or more required keywords or arguments are missing.
% Ambiguous command found at '^' position.	The entered character sequence matches more than one command.
% Too many parameters found at '^' position.	The entered character sequence contains excessive keywords or arguments.
% Wrong parameter found at '^' position.	The argument in the marked position is invalid.

Using the command history feature

About command history buffers

The system automatically saves commands successfully executed by a login user to the following two command history buffers:

- Command history buffer for the user line.
- Command history buffer for all user lines.

Table 6 Comparison between the two types of command history buffers

Item	Command history buffer for a user line	Command history buffer for all user lines
Which commands are saved in the buffer?	Commands successfully executed by the current user of the user line.	Commands successfully executed by all login users.
Can commands in the buffer be displayed?	Yes.	Yes.
Can commands in the buffer be recalled?	Yes.	No.

Item	Command history buffer for a user line	Command history buffer for all user lines
Are buffered commands cleared when the user logs out?	Yes.	No.
Is the buffer size adjustable?	Yes.	No. The buffer size is fixed at 1024.

Command buffering rules

The system follows these rules when buffering commands:

- If you use incomplete keywords when entering a command, the system buffers the command in the exact form that you used.
- If you use an alias when entering a command, the system transforms the alias to the represented command or command keywords before buffering the command.
- If you enter a command in the same format multiple times in succession, the system buffers the command only once. If you enter a command in different formats multiple times, the system buffers each command format. For example, **`display cu`** and **`display current-configuration`** are buffered as two entries but successive repetitions of **`display cu`** create only one entry.
- To buffer a new command when a buffer is full, the system deletes the oldest command entry in the buffer.

Managing and using the command history buffers

Displaying the commands in command history buffers

To display the commands in command history buffers, execute the following commands in any view:

- Display the commands in command history buffers for a user line.
  `display history-command`
- Display the commands in command history buffers for all user lines.
  `display history-command all`

Recalling commands in the command history buffer for a user line

Use up and down arrow keys to navigate to the command and press **Enter**.

Setting the size of the command history buffer for a user line

Use the **`history-command max-size`** command in user line or user line class view. For more information, see *Fundamentals Command Reference*.

Repeating commands in the command history buffer for a user line

About repeating commands in the command history buffer for a user line

You can recall and execute commands in the command history buffer for the current user line multiple times.

Restrictions and guidelines

The **repeat** command is available in any view. However, to repeat a command, you must first enter the view for the command. To repeat multiple commands, you must first enter the view for the first command.

The **repeat** command executes commands in the order they were executed.

The system waits for your interaction when it repeats an interactive command.

Procedure

To repeat commands in the command history buffer for the current user line, execute the following command:

repeat [*number*] [**count** *times*] [**delay** *seconds*]

Controlling the CLI output

This section describes the CLI output control features that help you identify the desired output.

Pausing between screens of output

About pausing between screens of output

The device can automatically pause after displaying a specific number of lines if the output is too long to fit on one screen. At a pause, the device displays **----more----**. You can use the keys described in Table 7 to display more information or stop the display.

You can also disable pausing between screens of output for the current session. Then, all output is displayed at one time and the screen is refreshed continuously until the final screen is displayed.

Table 7 Output controlling keys

Keys	Function
Space	Displays the next screen.
Enter	Displays the next line.
Ctrl+C	Stops the display and cancels the command execution.
<PageUp>	Displays the previous page.
<PageDown>	Displays the next page.

Disabling pausing between screens of output

To disable pausing between screens of output, execute the following command in user view:

screen-length disable

The default depends on the settings of the **screen-length** command in user line view. The following are the default settings for the **screen-length** command:

- Pausing between screens of output is enabled.
- The maximum number of lines to be displayed at a time is 24.

For more information about the **screen-length** command, see *Fundamentals Command Reference*.

This command is a one-time command and takes effect only for the current CLI session.

Numbering each output line from a display command

About display command output line numbering

For easy identification, you can use the **| by-linenum** option to display a number for each output line from a **display** command.

Each line number is displayed as a 5-character string and might be followed by a colon (:) or hyphen (-). If you specify both **| by-linenum** and **| begin** *regular-expression* for a **display** command, a hyphen is displayed for all lines that do not match the regular expression.

Procedure

To number each output line from a **display** command, execute the following command in any view:

display *command* **| by-linenum**

Example

Display information about VLAN 999, numbering each output line.

```
<Sysname> display vlan 999 | by-linenum
    1:  VLAN ID: 999
    2:  VLAN type: Static
    3:  Route interface: Configured
    4:  IPv4 address: 192.168.2.1
    5:  IPv4 subnet mask: 255.255.255.0
    6:  Description: For LAN Access
    7:  Name: VLAN 0999
    8:  Tagged ports:   None
    9:  Untagged ports: None
```

Filtering the output from a display command

About display command output filtering

You can use the [**|** [**by-linenum**] { **begin** | **exclude** | **include** } *regular-expression*]&<1-128> option to filter the output from a **display** command.

- You can use the option to specify a maximum of 128 filter conditions. The system displays only output lines that meet all the conditions.
- **by-linenum**—Displays a number before each output line. You need to specify this keyword in only one filter condition.
- **begin**—Displays the first line matching the specified regular expression and all subsequent lines.
- **exclude**—Displays all lines not matching the specified regular expression.
- **include**—Displays all lines matching the specified regular expression.
- *regular-expression*—A case-sensitive string of 1 to 256 characters, which can contain the special characters described in Table 8.

Table 8 Special characters supported in a regular expression

Characters	Meaning	Examples
^	Matches the beginning of a line.	"^u" matches all lines beginning with "u". A line beginning with "Au" is not matched.
$	Matches the end of a line.	"u$" matches all lines ending with "u". A line

Characters	Meaning	Examples
		ending with "uA" is not matched.
. (period)	Matches any single character.	".s" matches "as" and "bs".
*	Matches the preceding character or string zero, one, or multiple times.	"zo*" matches "z" and "zoo", and "(zo)*" matches "zo" and "zozo".
+	Matches the preceding character or string one or multiple times.	"zo+" matches "zo" and "zoo", but not "z".
|	Matches the preceding or succeeding string.	"def|int" matches a line containing "def" or "int".
( )	Matches the string in the parentheses, usually used together with the plus sign (+) or asterisk sign (*).	"(123A)" matches "123A". "408(12)+" matches "40812" and "408121212", but not "408".
\N	Matches the preceding strings in parentheses, with the *Nth* string repeated once.	"(string)\1" matches a string containing "stringstring". "(string1)(string2)\2" matches a string containing "string1string2string2". "(string1)(string2)\1\2" matches a string containing " string1string2string1string2".
[ ]	Matches a single character in the brackets.	"[16A]" matches a string containing 1, 6, or A; "[1-36A]" matches a string containing 1, 2, 3, 6, or A (- is a hyphen). To match the character "]", put it immediately after "[", for example, []abc]. There is no such limit on "[".
[^]	Matches a single character that is not in the brackets.	"[^16A]" matches a string that contains one or more characters except for 1, 6, or A, such as "abc". A match can also contain 1, 6, or A (such as "m16"), but it cannot contain these three characters only (such as 1, 16, or 16A).
{n}	Matches the preceding character *n* times. The number *n* must be a nonnegative integer.	"o{2}" matches "food", but not "Bob".
{n,}	Matches the preceding character *n* times or more. The number *n* must be a nonnegative integer.	"o{2,}" matches "foooood", but not "Bob".
{n,m}	Matches the preceding character *n* to *m* times or more. The numbers *n* and *m* must be nonnegative integers and *n* cannot be greater than *m*.	" o{1,3}" matches "fod", "food", and "foooood", but not "fd".
\<	Matches a string that starts with the pattern following \<. A string that contains the pattern is also a match if the characters preceding the pattern are not digits, letters, or underscores.	"\<do" matches "domain" and "doa".
\>	Matches a string that ends with the pattern preceding \>. A string that contains the pattern is also a match if the characters following the pattern are not digits, letters, or underscores.	"do\>" matches "undo" and "cdo".
\b	Matches a word that starts with the pattern following \b or ends with the	"er\b" matches "never", but not "verb" or "erase".

Characters	Meaning	Examples
	pattern preceding \b.	"\ber" matches "erase", but not "verb" or "never".
\B	Matches a word that contains the pattern but does not start or end with the pattern.	"er\B" matches "verb", but not "never" or "erase".
\w	Same as [A-Za-z0-9_], matches a digit, letter, or underscore.	"v\w" matches "vlan" and "service".
\W	Same as [^A-Za-z0-9_], matches a character that is not a digit, letter, or underscore.	"\Wa" matches "-a", but not "2a" or "ba".
\	Escape character. If a special character listed in this table follows \, the specific meaning of the character is removed.	"\\" matches a string containing "\", "\^" matches a string containing "^", and "\\b" matches a string containing "\b".

Restrictions and guidelines

The required filtering time increases with the complexity of the regular expression. To abort the filtering process, press **Ctrl+C**.

Examples

Display the running configuration, starting from the first configuration line that contains **line**.

```
<Sysname> display current-configuration | begin line
line class aux
 user-role network-admin
#
line class vty
 user-role network-operator
#
line aux 0
 user-role network-admin
#
line vty 0 63
 authentication-mode none
 user-role network-admin
 user-role network-operator
#
...
```

Display brief information about interfaces in up state.

```
<Sysname> display interface brief | exclude DOWN
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP      Description
InLoop0              UP   UP(s)    --
NULL0                UP   UP(s)    --
Vlan1                UP   UP       192.168.1.83

Brief information on interfaces in bridge mode:
Link: ADM - administratively down; Stby - standby
```

```
Speed: (a) - auto
Duplex: (a)/A - auto; H - half; F - full
Type: A - access; T - trunk; H - hybrid
Interface            Link Speed    Duplex Type PVID Description
GE1/0/1              UP   1000M(a) F(a)  A    1
```

Display SNMP-related running configuration lines.

```
<Sysname> display current-configuration | include snmp
snmp-agent
 snmp-agent community write private
 snmp-agent community read public
 snmp-agent sys-info version all
 snmp-agent target-host trap address udp-domain 192.168.1.26 params securityname public
```

Display log entries in the log buffer that contain both **SHELL** and **VTY**.

```
<Sysname> display logbuffer | include SHELL | include VTY
%Sep  6 10:38:12:320 2018 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 169.254.100.171.
%Sep  6 10:52:32:576 2018 Sysname SHELL/5/SHELL_LOGOUT: VTY logged out from
169.254.100.171.
%Sep  6 16:03:27:100 2018 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 169.254.100.171.
%Sep  6 16:44:18:113 2018 Sysname SHELL/5/SHELL_LOGOUT: VTY logged out from
169.254.100.171.
```

Saving the output from a display command to a file

About display command output saving

A **display** command shows certain configuration and operation information of the device. Its output might vary over time or with user configuration or operation. You can save the output to a file for future retrieval or troubleshooting.

Use one of the following methods to save the output from a **display** command:

- Save the output to a separate file. Use this method if you want to use one file for a single **display** command.
- Append the output to the end of a file. Use this method if you want to use one file for multiple **display** commands.

Procedure

To save the output from a **display** command to a file, use one of the following commands in any view:

- Save the output from a **display** command to a separate file.

  display *command* **>** *filename*
- Append the output from a **display** command to the end of a file.

  display *command* **>>** *filename*

Examples

Save the VLAN 1 settings to a separate file named **vlan.txt**.

```
<Sysname> display vlan 1 > vlan.txt
```

Verify that the VLAN 1 settings are saved to the file **vlan.txt**.

```
<Sysname> more vlan.txt
VLAN ID: 1
 VLAN type: Static
```

```
 Route interface: Not configured
 Description: VLAN 0001
 Name: VLAN 0001
 Tagged ports:   None
 Untagged ports: None
```

Append the VLAN 999 settings to the end of the file **vlan.txt**.

```
<Sysname> display vlan 999 >> vlan.txt
```

Verify that the VLAN 999 settings are appended to the end of the file **vlan.txt**.

```
<Sysname> more vlan.txt
VLAN ID: 1
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0001
 Name: VLAN 0001
 Tagged ports:   None
 Untagged ports: None

 VLAN ID: 999
 VLAN type: Static
 Route interface: Configured
 IP address: 192.168.2.1
 Subnet mask: 255.255.255.0
 Description: For LAN Access
 Name: VLAN 0999
 Tagged ports:   None
 Untagged ports: None
```

Viewing and managing the output from a display command effectively

You can use the following methods in combination to filter and manage the output from a **`display`** command:

- Numbering each output line from a display command
- Filtering the output from a display command
- Saving the output from a display command to a file

Procedure

To use multiple measures to view and manage the output from a **`display`** command effectively, execute the following command in any view:

`display` *`command`* [**`|`** [**`by-linenum`**] { **`begin`** | **`exclude`** | **`include`** } *`regular-expression`*]&<1-128> [**`>`** *`filename`* | **`>>`** *`filename`*]

Examples

Save the running configuration to a separate file named **test.txt**, with each line numbered.

```
<Sysname> display current-configuration | by-linenum > test.txt
```

Append lines including **snmp** in the running configuration to the file **test.txt**.

```
<Sysname> display current-configuration | include snmp >> test.txt
```

Display the first line that begins with **user-group** in the running configuration and all the following lines.

```
<Sysname> display current-configuration | by-linenum begin user-group
  114:  user-group system
  115-  #
  116-  return
```

// The colon (:) following a line number indicates that the line contains the string user-group. The hyphen (-) following a line number indicates that the line does not contain the string **user-group**.

Contents

Configuring RBAC

About RBAC

Role-based access control (RBAC) controls access permissions of users based on user roles.

RBAC assigns access permissions to user roles that are created for different job functions. Users are given permission to access a set of items and resources based on the users' user roles. Separating permissions from users enables simple permission authorization management.

Permission assignment

Use the following methods to assign permissions to a user role:

- Define a set of rules to determine accessible or inaccessible items for the user role. (See "User role rules.")
- Configure resource access policies to specify which resources are accessible to the user role. (See "Resource access policies.")

To use a command related to a system resource, a user role must have access to both the command and the resource.

For example, a user role has access to the **vlan** command and access only to VLAN 10. When the user role is assigned, you can use the **vlan** command to create VLAN 10 and enter its view. However, you cannot create any other VLANs. If the user role has access to VLAN 10 but does not have access to the **vlan** command, you cannot use the command to enter the view of VLAN 10.

When a user logs in to the device with any user role and enters **<?>** in a view, help information is displayed for the system-defined command aliases in the view. However, the user might not have the permission to access the command aliases. Whether the user can access the command aliases depends on the user role's permission to the commands corresponding to the aliases. For information about command aliases, see "Using the CLI."

A user that logs in to the device with any user role has access to the **system-view**, **quit**, and **exit** commands.

User role rules

User role rules permit or deny access to the items, including commands, Web pages, XML elements, or MIB nodes. You can define the following types of rules for different access control granularities:

- **Command rule**—Controls access to a command or a set of commands that match a regular expression.
- **Feature rule**—Controls access to the commands of a feature by command type.
- **Feature group rule**—Controls access to the commands of features in a feature group by command type.
- **Web menu rule**—Controls access to Web pages used for configuring the device. These Web pages are called Web menus.
- **XML element rule**—Controls access to XML elements used for configuring the device.
- **OID rule**—Controls SNMP access to a MIB node and its child nodes. An OID is a dotted numeric string that uniquely identifies the path from the root node to a leaf node.

The items (commands, Web menus, XML elements, and MIB nodes) are controlled based on the following types:

- **Read**—Items that display configuration and maintenance information. For example, the **display** commands and the **dir** command.

- **Write**—Items that configure the features in the system. For example, the **info-center enable** command and the **debugging** command.
- **Execute**—Items that execute specific functions. For example, the **ping** command and the **ftp** command.

A user role can access the set of permitted items specified in the user role rules. The user role rules include predefined (identified by sys-*n*) and user-defined user role rules. For more information about the user role rule priority, see "Configuring user role rules."

Resource access policies

Resource access policies control access of a user role to system resources and include the following types:

- **Interface policy**—Controls access to interfaces.
- **VLAN policy**—Controls access to VLANs.

Resource access policies do not control access to the interface or VLAN options in the **display** commands. You can specify these options in the **display** commands if the options are permitted by any user role rule.

Predefined user roles

The system provides predefined user roles. These user roles have access to all system resources. However, their access permissions differ, as shown in Table 1.

Among all of the predefined user roles, only network-admin and level-15 can create, modify, and delete local users and local user groups. The other user roles can only modify their own passwords if they have permissions to configure local users and local user groups.

The access permissions of the level-0 to level-14 user roles can be modified through user role rules and resource access policies. However, you cannot make changes on the predefined access permissions of these user roles. For example, you cannot change the access permission of these user roles to the **display history-command all** command.

Table 1 Predefined roles and permissions matrix

User role name	Permissions
network-admin	Accesses all features and resources in the system, except for the **display security-logfile summary**, **info-center security-logfile directory**, and **security-logfile save** commands.
network-operator	• Accesses the **display** commands for features and resources in the system. To display all accessible commands of the user role, use the **display role** command. • Enables local authentication login users to change their own passwords. • Accesses the command used for entering XML view. • Accesses all read-type Web menu items. • Accesses all read-type XML elements. • Accesses all read-type MIB nodes.
level-*n* (*n* = 0 to 15)	• **level-0**—Has access to commands including **ping**, **tracert**, **ssh2**, **telnet**, and **super**. Level-0 access rights are configurable. • **level-1**—Has access to the **display** commands of features and resources in the system. The **level-1** user role also has all access rights of the level-0 user role. Level-1 access rights are configurable. • **level-2 to level-8, and level-10 to level-14**—Have no access rights by default. Access rights are configurable.

User role name	Permissions

	• **level-9**—Has access to most of the features and resources in the system. If you are logged in with a local user account that has a level-9 user role, you can change the password in the local user account. The following are the major features and commands that the level-9 user role cannot access:
	  ○ RBAC non-debugging commands.
	  ○ Local users.
	  ○ File management.
	  ○ Device management.
	  ○ The **`display history-command all`** command.
	• **level-15**—Has the same rights as network-admin.

security-audit	Security log manager. The user role has the following access rights to security log files: • Accesses the commands for displaying and maintaining security log files (for example, the **`dir`**, **`display security-logfile summary`**, and **`more`** commands). • Accesses the commands for managing security log files and security log file system (for example, the **`info-center security-logfile directory`**, **`mkdir`**, and **`security-logfile save`** commands). For more information about security log management, see *Network Management and Monitoring Configuration Guide*. For more information about file system management, see "Managing file systems." **IMPORTANT:** Only the security-audit user role has access to security log files. You cannot assign the security-audit user role to non-AAA authentication users.

User role assignment

You assign access rights to a user by assigning a minimum of one user role. The user can use the collection of items and resources accessible to all user roles assigned to the user. For example, you can access any interface to use the **`qos apply policy`** command if you are assigned the following user roles:

- User role A denies access to the **`qos apply policy`** command and permits access only to interface GigabitEthernet 1/0/1.
- User role B permits access to the **`qos apply policy`** command and all interfaces.

Depending on the authentication method, user role assignment has the following methods:

- **AAA authorization**—If scheme authentication is used, the AAA module handles user role assignment.
  - If the user passes local authorization, the device assigns the user roles specified in the local user account.
  - If the user passes remote authorization, the remote AAA server assigns the user roles specified on the server. The AAA server can be a RADIUS or HWTACACS server.
- **Non-AAA authorization**—When the user accesses the device without authentication or by passing password authentication on a user line, the device assigns user roles specified on the user line. This method also applies to SSH clients that use publickey or password-publickey authentication. User roles assigned to these SSH clients are specified in their respective device management user accounts.

For more information about AAA and SSH, see *Security Configuration Guide*. For more information about user lines, see "Login overview" and "Configuring CLI login."

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

RBAC tasks at a glance

To configure RBAC, perform the following tasks:

1. Creating a user role
2. Configuring user role rules
3. (Optional.) Configuring a feature group
4. Configuring resource access policies
   - Configuring the user role interface policy
   - Configuring the user role VLAN policy
5. Assigning user roles
   - Enabling the default user role feature
   - Assigning user roles to remote AAA authentication users
   - Assigning user roles to local AAA authentication users
   - Assigning user roles to non-AAA authentication users on user lines
6. Configuring temporary user role authorization
   a. Setting the authentication mode for temporary user role authorization
   b. Specifying the default target user role for temporary user role authorization
   c. Setting an authentication password for temporary user role authorization
   d. (Optional.) Automatically obtaining the login username for temporary user role authorization
   e. Obtaining temporary user role authorization

Creating a user role

About user role creation

In addition to the predefined user roles, you can create a maximum of 64 custom user roles for granular access control.

Procedure

1. Enter system view.
   `system-view`
2. Create a user role and enter its view.
   `role name` *`role-name`*
   By default, the system has the following predefined user roles:
   - network-admin.
   - network-operator.
   - level-*n* (where *n* equals an integer in the range of 0 to 15).
   - security-audit.

Among these user roles, only the permissions and descriptions of the level-0 to level-14 user roles are configurable.

3. (Optional.) Configure a description for the user role.

   description *text*

   By default, a user role does not have a description.

Configuring user role rules

About user role rules

You can configure user role rules to permit or deny the access of a user role to specific commands, Web pages, XML elements, and MIB nodes.

The following guidelines apply to non-OID rules:

- If two user-defined rules of the same type conflict, the rule with the higher ID takes effect. For example, a user role can use the **tracert** command but not the **ping** command if the user role contains rules configured by using the following commands:
  - **rule** *1* **permit command** *ping*
  - **rule** *2* **permit command** *tracert*
  - **rule** *3* **deny command** *ping*
- If a predefined user role rule and a user-defined user role rule conflict, the user-defined user role rule takes effect.

The following guidelines apply to OID rules:

- The system compares an OID with the OIDs specified in user role rules, and it uses the longest match principle to select a rule for the OID. For example, a user role cannot access the MIB node with OID 1.3.6.1.4.1.25506.141.3.0.1 if the user role contains rules configured by using the following commands:
  - **rule** *1* **permit read write oid** *1.3.6*
  - **rule** *2* **deny read write oid** *1.3.6.1.4.1*
  - **rule** *3* **permit read write oid** *1.3.6.1.4*
- If the same OID is specified in multiple rules, the rule with the higher ID takes effect. For example, a user role can access the MIB node with OID 1.3.6.1.4.1.25506.141.3.0.1 if the user role contains rules configured by using the following commands:
  - **rule** *1* **permit read write oid** *1.3.6*
  - **rule** *2* **deny read write oid** *1.3.6.1.4.1*
  - **rule** *3* **permit read write oid** *1.3.6.1.4.1*

Restrictions and guidelines

- Only the network-admin and level-15 user roles have access to the following commands:
  - The **display history-command all** command.
  - All commands that start with the **display role**, **reboot**, **startup saved-configuration**, and **undo startup saved-configuration** keywords.
  - All commands that start with the **role**, **undo role**, **super**, **undo super**, **password-recovery**, and **undo password-recovery** keywords in system view.
  - All commands that start with the **snmp-agent community**, **undo snmp-agent community**, **snmp-agent usm-user**, **undo snmp-agent usm-user**, **snmp-agent group**, and **undo snmp-agent group** keywords in system view.
  - All commands that start with the **user-role**, **undo user-role**, **authentication-mode**, **undo authentication-mode**, **set authentication**

password, and **undo set authentication password** keywords in user line view or user line class view.

- All commands that start with the **user-role** and **undo user-role** keywords in schedule view or in CLI-defined policy view.

- You can configure a maximum of 256 user-defined rules for a user role. The total number of user-defined user role rules cannot exceed 1024.
- Any rule modification, addition, or removal for a user role takes effect only on users who are logged in with the user role after the change.

Procedure

1. Enter system view.

   system-view
2. Enter user role view.

   role name *role-name*
3. Configure rules for the user role. Choose the options to configure as needed:
   - Configure a command rule.

     rule *number* { **deny** | **permit** } **command** *command-string*
   - Configure a feature rule.

     rule *number* { **deny** | **permit** } { **execute** | **read** | **write** } * **feature** [*feature-name*]
   - Configure a feature group rule.

     rule *number* { **deny** | **permit** } { **execute** | **read** | **write** } * **feature-group** *feature-group-name*

     A feature group rule takes effect only after the feature group is created.
   - Configure a Web menu rule.

     rule *number* { **deny** | **permit** } { **execute** | **read** | **write** } * **web-menu** [*web-string*]
   - Configure an XML element rule.

     rule *number* { **deny** | **permit** } { **execute** | **read** | **write** } * **xml-element** [*xml-string*]
   - Configure an OID rule.

     rule *number* { **deny** | **permit** } { **execute** | **read** | **write** } * **oid** *oid-string*

Configuring a feature group

About feature groups

Use feature groups to bulk assign command access permissions to sets of features. In addition to the predefined feature groups, you can create a maximum of 64 custom feature groups and assign a feature to multiple feature groups.

Procedure

1. Enter system view.

   system-view
2. Create a feature group and enter its view.

   role feature-group name *feature-group-name*

   By default, the system has the following predefined feature groups, which cannot be deleted or modified:

- **L2**—Includes all Layer 2 commands.
- **L3**—Includes all Layer 3 commands.

3. Add a feature to the feature group.

   feature *feature-name*

   By default, a feature group does not have any feature.

Configuring resource access policies

About resource access policies

Every user role has one interface policy and VLAN policy. By default, these policies permit a user role to access any system resources. You can configure the policies of a user-defined user role or a predefined level-*n* user role to limit its access to any resources.

Restrictions and guidelines for resource access policy configuration

The policy configuration takes effect only on users who are logged in with the user role after the configuration.

Configuring the user role interface policy

1. Enter system view.

   system-view

2. Enter user role view.

   role name *role-name*

3. Enter user role interface policy view.

   interface policy deny

   By default, the interface policy of the user role permits access to all interfaces.

CAUTION:

This command denies the access of the user role to any interfaces if you do not specify accessible interfaces by using the **permit interface** command.

4. (Optional.) Specify a list of interfaces accessible to the user role.

   permit interface *interface-list*

   By default, no accessible interfaces are configured in user role interface policy view.

   Repeat this step to add multiple accessible interfaces.

Configuring the user role VLAN policy

1. Enter system view.

   system-view

2. Enter user role view.

   role name *role-name*

3. Enter user role VLAN policy view.

vlan policy deny

By default, the VLAN policy of the user role permits access to all VLANs.

CAUTION:

This command denies the access of the user role to any VLANs if you do not specify accessible VLANs by using the **permit vlan** command.

4. (Optional.) Specify a list of VLANs accessible to the user role.

   permit vlan *vlan-id-list*

   By default, no accessible VLANs are configured in user role VLAN policy view.

   Repeat this step to add multiple accessible VLANs.

Assigning user roles

Restrictions and guidelines for user role assignment

To control user access to the system, you must assign a minimum of one user role. Make sure a minimum of one user role among the user roles assigned by the server exists on the device.

Enabling the default user role feature

About the default user role feature

The default user role feature assigns the default user role to AAA-authenticated users if the authentication server (local or remote) does not assign any user roles to the users. These users are allowed to access the system with the default user role.

You can specify any user role existing in the system as the default user role.

Procedure

1. Enter system view.

   system-view

2. Enable the default user role feature.

   role default-role enable [*role-name*]

   By default, the default user role feature is disabled.

   If you do not use the **authorization-attribute user role** command to assign user roles to local users, you must enable the default user role feature. For information about the **authorization-attribute user role** command, see AAA commands in *Security Command Reference*.

Assigning user roles to remote AAA authentication users

For remote AAA authentication users, user roles are configured on the remote authentication server. For information about configuring user roles for RADIUS users, see the RADIUS server documentation. For HWTACACS users, the role configuration must use the **roles="***role-1 role-2 … role-n***"** format, where user roles are space separated. For example, configure **roles="level-0 level-1 level-2"** to assign level-0, level-1, and level-2 to an HWTACACS user.

If the AAA server assigns the security-audit user role and other user roles to the same user, only the security-audit user role takes effect.

Assigning user roles to local AAA authentication users

About user role assignment to local AAA authentication users

Configure user roles for local AAA authentication users in their local user accounts. For information about AAA and local user configuration, see AAA configuration in *Security Configuration Guide*.

Restrictions and guidelines

- Every local user has a default user role. If this default user role is not suitable, remove it.
- If a local user is the only user with the security-audit user role, the user cannot be deleted.
- The security-audit user role is mutually exclusive with other user roles.
  - When you assign the security-audit user role to a local user, the system requests confirmation to remove all the other user roles from the user.
  - When you assign the other user roles to a local user who has the security-audit user role, the system requests confirmation to remove the security-audit role from the user.
- You can assign a maximum of 64 user roles to a local user.

Procedure

1. Enter system view.

   system-view
2. Create a local user and enter its view.

   local-user *user-name* **class** { **manage** | **network** }
3. Assign a user role to the local user.

   authorization-attribute user-role *role-name*

   By default, the network-operator user role is assigned to local users created by a network-admin or level-15 user.

Assigning user roles to non-AAA authentication users on user lines

About user role assignment to non-AAA authentication users

Specify user roles for the following two types of login users on the user lines:

- Non-SSH users that use password authentication or no authentication.
- SSH clients that use publickey or password-publickey authentication. User roles assigned to these SSH clients are specified in their respective device management user accounts.

For more information about user lines, see "Login overview" and "Configuring CLI login." For more information about SSH, see *Security Configuration Guide*.

Restrictions and guidelines

- You can assign a maximum of 64 user roles to a non-AAA authentication user on a user line.
- You cannot assign the security-audit user role to non-AAA authentication users on user lines.

Procedure

1. Enter system view.

   system-view
2. Enter user line view or user line class view.
   - Enter user line view.

line { *first-num1* [*last-num1*] | { **aux** | **vty** } *first-num2* [*last-num2*] }

- Enter user line class view.

  line class { **aux** | **vty** }

For information about the priority order and application scope of the settings in user line view and user line class view, see "Configuring CLI login."

3. Specify a user role on the user line.

   user-role *role-name*

   By default, the network-admin user role is specified on the AUX user line, and the network-operator user role is specified on any other user line.

Configuring temporary user role authorization

About temporary user role authorization

Temporary user role authorization allows you to obtain another user role without reconnecting to the device. This feature is useful when you want to use a user role temporarily to configure a feature.

Temporary user role authorization is effective only on the current login. This feature does not change the user role settings in the user account that you have been logged in with. The next time you are logged in with the user account, the original user role settings take effect.

To enable a user to obtain another user role without reconnecting to the device, you must configure user role authentication. Table 2 describes the available authentication modes and configuration requirements.

Table 2 User role authentication modes

Keywords	Authentication mode	Description
local	Local password authentication only (local-only)	The device uses the locally configured password for authentication. If no local password is configured for a user role in this mode, an AUX user can obtain the user role by either entering a string or not entering anything.
scheme	Remote AAA authentication through HWTACACS or RADIUS (remote-only)	The device sends the username and password to the HWTACACS or RADIUS server for remote authentication. To use this mode, you must perform the following configuration tasks: • Configure the required HWTACACS or RADIUS scheme, and configure the ISP domain to use the scheme for the user. For more information, see *Security Configuration Guide*. • Add the user account and password on the HWTACACS or RADIUS server.
local scheme	Local password authentication first, and then remote AAA authentication (local-then-remote)	Local password authentication is performed first. If no local password is configured for the user role in this mode: • The device performs remote AAA authentication for VTY users. • An AUX user can obtain another user role by either entering a string or not entering anything.

Keywords	Authentication mode	Description
scheme local	Remote AAA authentication first, and then local password authentication (remote-then-local)	Remote AAA authentication is performed first. Local password authentication is performed in either of the following situations: • The HWTACACS or RADIUS server does not respond. • The remote AAA configuration on the device is invalid.

Restrictions and guidelines for temporary user role authorization

If HWTACACS authentication is used, the following rules apply:

- If the device is not enabled to automatically obtain the login username as the authentication username, you must enter a username to request role authentication.
- The device sends the username to the server in the *username or username@domain-name* format. Whether the domain name is included in the username depends on the **user-name-format** command in the HWTACACS scheme.
- To obtain a level-*n* user role, the user account on the server must have the target user role level or a level higher than the target user role. A user account that obtains the level-*n* user role can obtain any user role among level-0 through level-*n*.
- To obtain a non-level-*n* user role, make sure the user account on the server meets the following requirements:
  - The account has a user privilege level.
  - The HWTACACS custom attribute is configured for the account in the form of **allowed-roles="***role***"**. The variable *role* represents the target user role.

If RADIUS authentication is used, the following rules apply:

- The device does not use the username you enter or the automatically obtained login username to request user role authentication. It uses a username in the **$enab*n*$** format. The variable *n* represents a user role level, and a domain name is not included in the username. You can always pass user role authentication when the password is correct.
- To obtain a level-*n* user role, you must create a user account for the level-*n* user role in the **$enabn$** format on the RADIUS server. The variable *n* represents the target user role level. For example, to obtain the level-3 user role, you can enter any username. The device uses the username **$enab3$** to request user role authentication from the server.
- To obtain a non-level-*n* user role, you must perform the following tasks:
  - Create a user account named **$enab0$** on the server.
  - Configure the cisco-av-pair attribute for the account in the form of **allowed-roles="***role***"**. The variable *role* represents the target user role.

The device selects an authentication domain for user role authentication in the following order:

1. The ISP domain included in the entered username.
2. The default ISP domain.

If you execute the **quit** command after obtaining user role authorization, you are logged out of the device.

Setting the authentication mode for temporary user role authorization

1. Enter system view.
   system-view
2. Set the authentication mode.
   super authentication-mode { **local** | **scheme** } *
   By default, local-only authentication applies.

Specifying the default target user role for temporary user role authorization

1. Enter system view.
   system-view
2. Specify the default target user role for temporary user role authorization.
   super default role *role-name*
   By default, the default target user role is network-admin.

Setting an authentication password for temporary user role authorization

About authentication passwords

Authentication passwords are required only for local password authentication.

Procedure

1. Enter system view.
   system-view
2. Set a local authentication password for a user role.
   In non-FIPS mode:
   super password [**role** *role-name*] [{ **hash** | **simple** } *string*]
   In FIPS mode:
   super password [**role** *role-name*]
   By default, no password is set.
   If you do not specify the **role** *role-name* option, the command sets a password for the default target user role.

Automatically obtaining the login username for temporary user role authorization

About automatic obtaining of the login username for temporary user role authorization

This feature is applicable only to the login from a user line that uses scheme authentication, which requires a username for login. This feature enables the device to automatically obtain the login username when the login user requests a temporary user role authorization from a remote authentication server.

Restrictions and guidelines

If the user was logged in from a user line that uses password authentication or no authentication, the device cannot obtain the login username. The request for temporary user role authorization from a remote authentication server will fail.

This feature does not take effect on local password authentication for temporary user role authorization.

Procedure

1. Enter system view.

   system-view

2. Enable the device to automatically obtain the login username when a login user requests temporary user role authorization from a remote authentication server.

   super use-login-username

   By default, the device prompts for a username when a login user requests temporary user role authorization from a remote authentication server.

Obtaining temporary user role authorization

Restrictions and guidelines

The operation of obtaining temporary user role authorization fails after three consecutive unsuccessful authentication attempts.

You might fail to switch to a non-level-*n* user role if both of the following conditions exist:

- User role switching authentication is performed in the same ISP domain as the current login user.
- User role switching authentication uses a different AAA method than the login authorization method configured for the ISP domain.

To resolve this issue, make sure the AAA methods configured by using the **authentication super** command are consistent with those configured by using the **authorization login** command for the ISP domain.

For more information about AAA, see *Security Configuration Guide*.

Prerequisites

Before you obtain temporary user role authorization, make sure the current user account has the permission to execute the **super** command to obtain temporary user role authorization.

Procedure

To obtain the temporary authorization to use a user role, execute the following command in user view:

super [*role-name*]

If you do not specify the *role-name* argument, you obtain the default target user role for temporary user role authorization.

Display and maintenance commands for RBAC

Execute **display** commands in any view.

Task	Command
Display user role information.	**display role** [**name** *role-name*]

Task	Command
Display user role feature information.	**display role feature** [**name** *feature-name* | **verbose**]
Display user role feature group information.	**display role feature-group** [**name** *feature-group-name*] [**verbose**]

RBAC configuration examples

Example: Configuring RBAC for local AAA authentication users

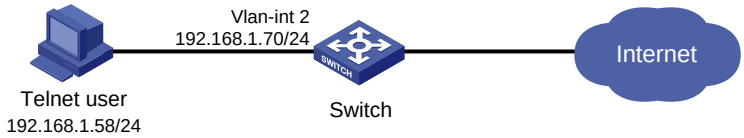
Network configuration

As shown in Figure 1, the switch performs local AAA authentication for the Telnet user. The user account for the Telnet user is **user1@bbb**, which is assigned user role **role1**.

Configure **role1** to have the following permissions:

- Execute the read commands of any feature.
- Access VLANs 10 to 20. Access to any other VLANs is denied.

Figure 1 Network diagram



Procedure

Assign an IP address to VLAN-interface 2 (the interface connected to the Telnet user).

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ip address 192.168.1.70 255.255.255.0
[Switch-Vlan-interface2] quit
```

Enable the Telnet server.

```
[Switch] telnet server enable
```

Enable scheme authentication on the user lines for Telnet users.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Enable local authentication and authorization for ISP domain **bbb**.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login local
[Switch-isp-bbb] authorization login local
[Switch-isp-bbb] quit
```

Create a user role named **role1**.

```
[Switch] role name role1
```

Configure rule 1 to permit the user role to access the read commands of all features.

```
[Switch-role-role1] rule 1 permit read feature
```

Configure rule 2 to permit the user role to create VLANs and access commands in VLAN view.

```
[Switch-role-role1] rule 2 permit command system-view ; vlan *
```

Change the VLAN policy to permit the user role to configure only VLANs 10 to 20.

```
[Switch-role-role1] vlan policy deny
[Switch-role-role1-vlanpolicy] permit vlan 10 to 20
[Switch-role-role1-vlanpolicy] quit
[Switch-role-role1] quit
```

Create a device management user named **user1** and enter local user view.

```
[Switch] local-user user1 class manage
```

Set a plaintext password of **123456TESTplat&!** for the user.

```
[Switch-luser-manage-user1] password simple 123456TESTplat&!
```

Set the service type to **Telnet**.

```
[Switch-luser-manage-user1] service-type telnet
```

Assign **role1** to the user.

```
[Switch-luser-manage-user1] authorization-attribute user-role role1
```

Remove the default user role (**network-operator**) from the user. This operation ensures that the user has only the permissions of **role1**.

```
[Switch-luser-manage-user1] undo authorization-attribute user-role network-operator
[Switch-luser-manage-user1] quit
```

Verifying the configuration

Telnet to the switch, and enter the username and password to access the switch. (Details not shown.)

Verify that you can create VLANs 10 to 20. This example uses VLAN 10.

```
<Switch> system-view
[Switch] vlan 10
[Switch-vlan10] quit
```

Verify that you cannot create any VLAN other than VLANs 10 to 20. This example uses VLAN 30.

```
[Switch] vlan 30
Permission denied.
```

Verify that you can use all read commands of any feature. This example uses **`display clock`**.

```
[Switch] display clock
09:31:56.258 UTC Sun 01/01/2017
[Switch] quit
```

Verify that you cannot use the write or execute commands of any feature.

```
<Switch> debugging role all
Permission denied.
<Switch> ping 192.168.1.58
Permission denied.
```

Example: Configuring RBAC for RADIUS authentication users

Network configuration

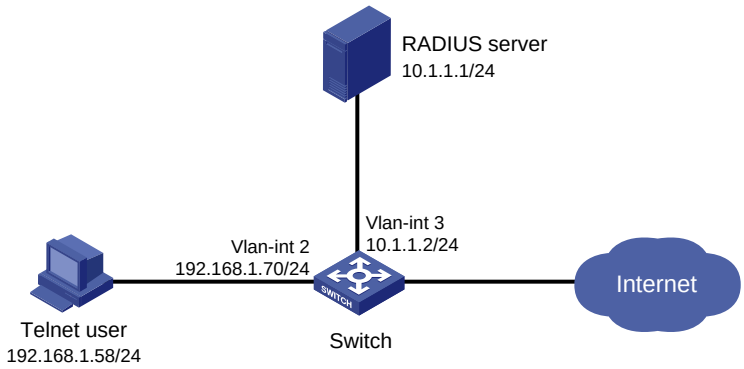
As shown in Figure 2, the switch uses the FreeRADIUS server to provide AAA service for login users, including the Telnet user. The user account for the Telnet user is **hello@bbb**, which is assigned user role **role2**.

User role **role2** has the following permissions:

- Use all commands in ISP domain view.
- Use the read and write commands of the **arp** and **radius** features.
- Cannot access the read commands of the **acl** feature.
- Configure VLANs 1 to 20 and interfaces GigabitEthernet 1/0/1 to GigabitEthernet 1/0/4. Access to any other VLANs and interfaces is denied.

The switch and the FreeRADIUS server use a shared key of **expert** and authentication port **1812**. The switch delivers usernames with their domain names to the server.

Figure 2 Network diagram



Procedure

Make sure the settings on the switch and the RADIUS server match.

1. Configure the switch:

Assign VLAN-interface 2 an IP address from the same subnet as the Telnet user.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ip address 192.168.1.70 255.255.255.0
[Switch-Vlan-interface2] quit
```

Assign VLAN-interface 3 an IP address from the same subnet as the RADIUS server.

```
[Switch] interface vlan-interface 3
[Switch-Vlan-interface3] ip address 10.1.1.2 255.255.255.0
[Switch-Vlan-interface3] quit
```

Enable the Telnet server.

```
[Switch] telnet server enable
```

Enable scheme authentication on the user lines for Telnet users.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Create RADIUS scheme **rad** and enter RADIUS scheme view.

```
[Switch] radius scheme rad
```

Specify the primary server address and the service port in the scheme.

```
[Switch-radius-rad] primary authentication 10.1.1.1 1812
```

Set the shared key to **expert** in the scheme for the switch to authenticate to the server.

```
[Switch-radius-rad] key authentication simple expert
[Switch-radius-rad] quit
```

Specify scheme **rad** as the authentication and authorization schemes for ISP domain **bbb**, and configure the ISP domain to not perform accounting for login users.

IMPORTANT:

Because RADIUS user authorization information is piggybacked in authentication responses, the authentication and authorization methods must use the same RADIUS scheme.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login radius-scheme rad
[Switch-isp-bbb] authorization login radius-scheme rad
[Switch-isp-bbb] accounting login none
[Switch-isp-bbb] quit
```

Create feature group **fgroup1**.

```
[Switch] role feature-group name fgroup1
```

Add the **arp** and **radius** features to the feature group.

```
[Switch-featuregrp-fgroup1] feature arp
[Switch-featuregrp-fgroup1] feature radius
[Switch-featuregrp-fgroup1] quit
```

Create user role **role2**.

```
[Switch] role name role2
```

Configure rule 1 to permit the user role to use all commands available in ISP domain view.

```
[Switch-role-role2] rule 1 permit command system-view ; domain *
```

Configure rule 2 to permit the user role to use the read and write commands of all features in **fgroup1**.

```
[Switch-role-role2] rule 2 permit read write feature-group fgroup1
```

Configure rule 3 to disable access to the read commands of the **acl** feature.

```
[Switch-role-role2] rule 3 deny read feature acl
```

Configure rule 4 to permit the user role to create VLANs and use all commands available in VLAN view.

```
[Switch-role-role2] rule 4 permit command system-view ; vlan *
```

Configure rule 5 to permit the user role to enter interface view and use all commands available in interface view.

```
[Switch-role-role2] rule 5 permit command system-view ; interface *
```

Configure the user role VLAN policy to disable configuration of any VLAN except VLANs 1 to 20.

```
[Switch-role-role2] vlan policy deny
[Switch-role-role2-vlanpolicy] permit vlan 1 to 20
[Switch-role-role2-vlanpolicy] quit
```

Configure the user role interface policy to disable configuration of any interface except GigabitEthernet 1/0/1 to GigabitEthernet 1/0/4.

```
[Switch-role-role2] interface policy deny
```

```
[Switch-role-role2-ifpolicy] permit interface gigabitethernet 1/0/1 to
gigabitethernet 1/0/4
[Switch-role-role2-ifpolicy] quit
[Switch-role-role2] quit
```

2. Configure the RADIUS server:

   # Add either of the user role attributes to the dictionary file of the FreeRADIUS server.

   ```
   Cisco-AVPair = "shell:roles=\"role2\""
   Cisco-AVPair = "shell:roles*\"role2\""
   ```

   # Configure the settings required for the FreeRADIUS server to communicate with the switch. (Details not shown.)

Verifying the configuration

Telnet to the switch, and enter the username and password to access the switch. (Details not shown.)

Verify that you can use all commands available in ISP domain view.

```
<Switch> system-view
[Switch] domain abc
[Switch-isp-abc] authentication login radius-scheme abc
[Switch-isp-abc] quit
```

Verify that you can use all read and write commands of the **radius** and **arp** features. This example uses **radius**.

```
[Switch] radius scheme rad
[Switch-radius-rad] primary authentication 2.2.2.2
[Switch-radius-rad] display radius scheme rad
...
```

Verify that you cannot configure any VLAN except VLANs 1 to 20. This example uses VLAN 10 and VLAN 30.

```
[Switch] vlan 10
[Switch-vlan10] quit
[Switch] vlan 30
Permission denied.
```

Verify that you cannot configure any interface except GigabitEthernet 1/0/1 to GigabitEthernet 1/0/4. This example uses GigabitEthernet 1/0/2 and GigabitEthernet 1/0/5.

```
[Switch] vlan 10
[Switch-vlan10] port gigabitethernet 1/0/2
[Switch-vlan10] port gigabitethernet 1/0/5
Permission denied.
```

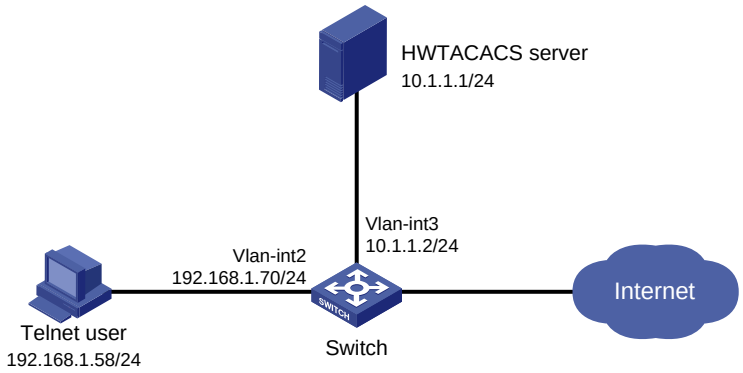
Example: Configuring RBAC temporary user role authorization (HWTACACS authentication)

Network configuration

As shown in Figure 3, the switch uses HWTACACS authentication for login users, including the Telnet user. The user account for the Telnet user is **test@bbb**, which is assigned user role **level-0**.

Configure the remote-then-local authentication mode for temporary user role authorization. The switch uses the HWTACACS server to provide authentication for changing the user role among **level-0** through **level-3** or changing the user role to **network-admin**. If the AAA configuration is invalid or the HWTACACS server does not respond, the switch performs local authentication.

Figure 3 Network diagram



Procedure

1. Configure the switch:

   # Assign an IP address to VLAN-interface 2 (the interface connected to the Telnet user).

   ```
   <Switch> system-view
   [Switch] interface vlan-interface 2
   [Switch-Vlan-interface2] ip address 192.168.1.70 255.255.255.0
   [Switch-Vlan-interface2] quit
   ```

   # Assign an IP address to VLAN-interface 3 (the interface connected to the HWTACACS server).

   ```
   [Switch] interface vlan-interface 3
   [Switch-Vlan-interface3] ip address 10.1.1.2 255.255.255.0
   [Switch-Vlan-interface3] quit
   ```

   # Enable the Telnet server.

   ```
   [Switch] telnet server enable
   ```

   # Enable scheme authentication on the user lines for Telnet users.

   ```
   [Switch] line vty 0 63
   [Switch-line-vty0-63] authentication-mode scheme
   [Switch-line-vty0-63] quit
   ```

   # Enable remote-then-local authentication for temporary user role authorization.

   ```
   [Switch] super authentication-mode scheme local
   ```

   # Create an HWTACACS scheme named **hwtac** and enter HWTACACS scheme view.

   ```
   [Switch] hwtacacs scheme hwtac
   ```

   # Specify the primary authentication server address and the service port in the scheme.

   ```
   [Switch-hwtacacs-hwtac] primary authentication 10.1.1.1 49
   ```

   # Specify the primary authorization server address and the service port in the scheme.

   ```
   [Switch-hwtacacs-hwtac] primary authorization 10.1.1.1 49
   ```

   # Set the shared key to **expert** in the scheme for the switch to authenticate to the authentication server.

   ```
   [Switch-hwtacacs-hwtac] key authentication simple expert
   ```

   # Set the shared key to **expert** in the scheme for the switch to authenticate to the authorization server.

   ```
   [Switch-hwtacacs-hwtac] key authorization simple expert
   ```

   # Exclude ISP domain names from the usernames sent to the HWTACACS server.

   ```
   [Switch-hwtacacs-hwtac] user-name-format without-domain
   [Switch-hwtacacs-hwtac] quit
   ```

Create ISP domain **bbb** and enter ISP domain view.

```
[Switch] domain bbb
```

Configure ISP domain **bbb** to use HWTACACS scheme **hwtac** for login user authentication.

```
[Switch-isp-bbb] authentication login hwtacacs-scheme hwtac
```

Configure ISP domain **bbb** to use HWTACACS scheme **hwtac** for login user authorization.

```
[Switch-isp-bbb] authorization login hwtacacs-scheme hwtac
```

Configure ISP domain **bbb** to not perform accounting for login users.

```
[Switch-isp-bbb] accounting login none
```

Apply HWTACACS scheme **hwtac** to the ISP domain for user role authentication.

```
[Switch-isp-bbb] authentication super hwtacacs-scheme hwtac
[Switch-isp-bbb] quit
```

Set the local authentication password to **654321TESTplat&!** for user role **level-3**.

```
[Switch] super password role level-3 simple 654321TESTplat&!
```

Set the local authentication password to **654321TESTplat&!** for user role **network-admin**.

```
[Switch] super password role network-admin simple 654321TESTplat&!
[Switch] quit
```

2. Configure the HWTACACS server:

This example uses ACSv4.0.

This example only provides the key configuration steps. For more information about configuring a HWTACACS server, see the server documentation.

a. Access the **User Setup** page.

b. Add a user account named **test** and set its password to **123456TESTplat&!**. (Details not shown.)

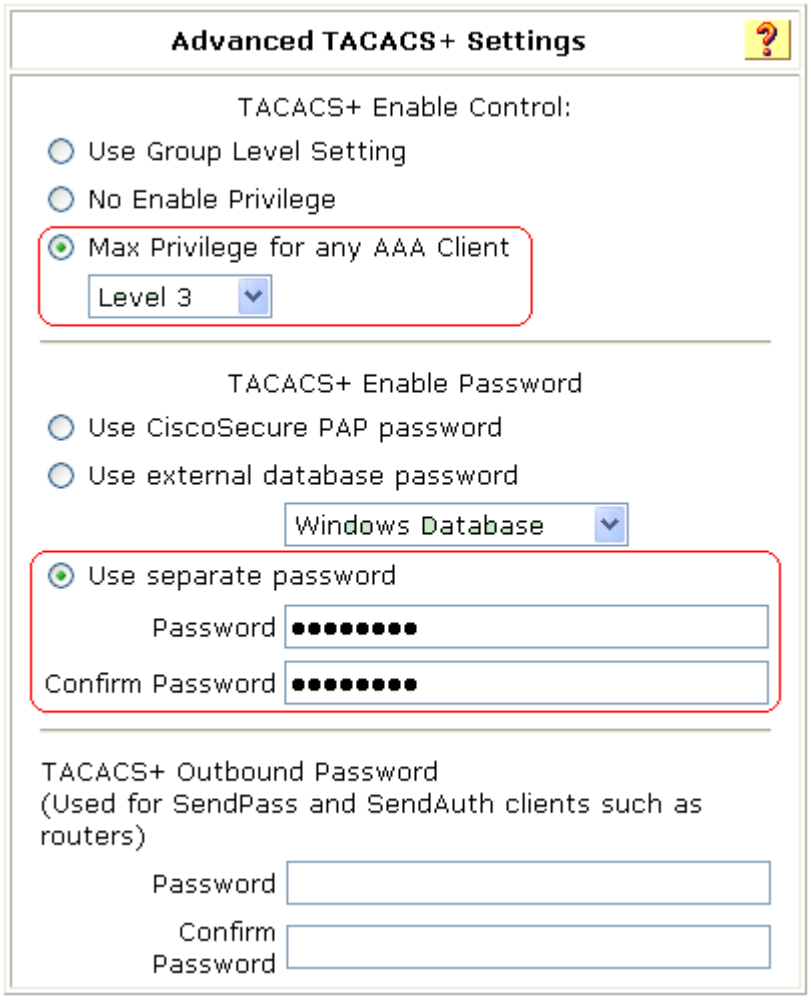
c. In the **Advanced TACACS+ Settings** area, configure the following parameters:

- Select **Level 3** for the **Max Privilege for any AAA Client** option.

  If the target user role is only **network-admin** for temporary user role authorization, you can select any level for the option.

- Select the **Use separate password** option, and specify **enabpass** as the password.

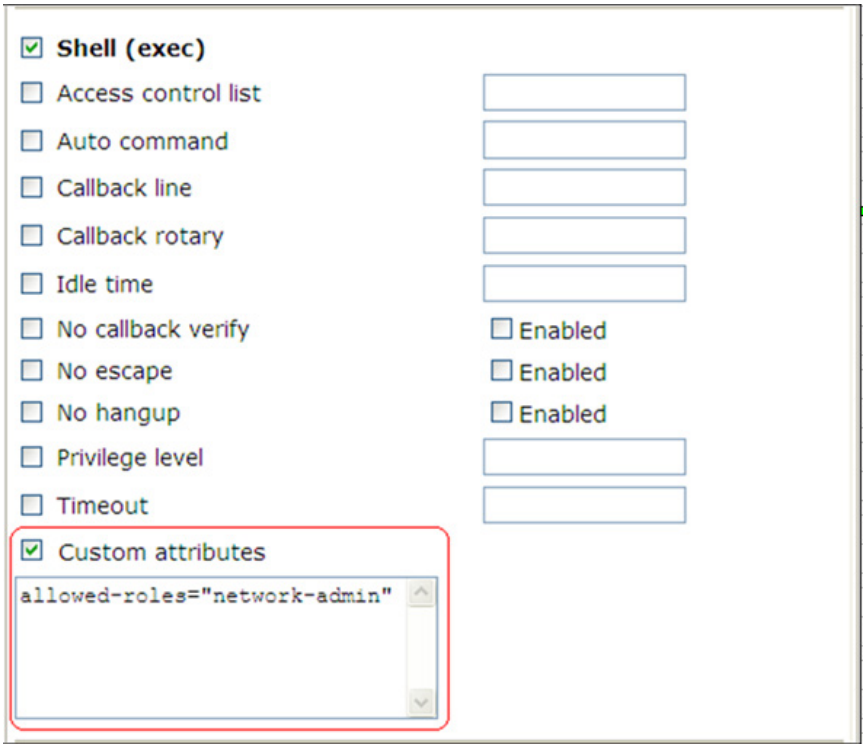
Figure 4 Configuring advanced TACACS+ settings



d. Select **Shell (exec)** and **Custom attributes**, and enter **allowed-roles="network-admin"** in the **Custom attributes** field.

Use a blank space to separate the allowed roles.

Figure 5 Configuring custom attributes for the Telnet user



Verifying the configuration

1. Telnet to the switch, and enter username **test@bbb** and password **123456TESTplat&!** to access the switch. Verify that you have access to diagnostic commands.

```
<Switch> telnet 192.168.1.70
Trying 192.168.1.70 ...
Press CTRL+K to abort
Connected to 192.168.1.70 ...

<Switch>
```

2. Verify that you can obtain the level-3 user role:

   # Use the super password to obtain the level-3 user role. When the system prompts for a username and password, enter username **test@bbb** and password **enabpass**.

   ```
   <Switch> super level-3
   Username: test@bbb
   Password:
   ```

   The following output shows that you have obtained the level-3 user role.

   ```
   User privilege role is level-3, and only those commands that authorized to the role can be used.
   ```

   # If the ACS server does not respond, enter local authentication password **654321TESTplat&!** at the prompt.

   ```
   Invalid configuration or no response from the authentication server.
   Change authentication mode to local.
   Password:
   User privilege role is level-3, and only those commands that authorized to the role can be used.
   ```

   The output shows that you have obtained the level-3 user role.

3. Use the method in step 2 to verify that you can obtain the level-0, level-1, level-2, and network-admin user roles. (Details not shown.)

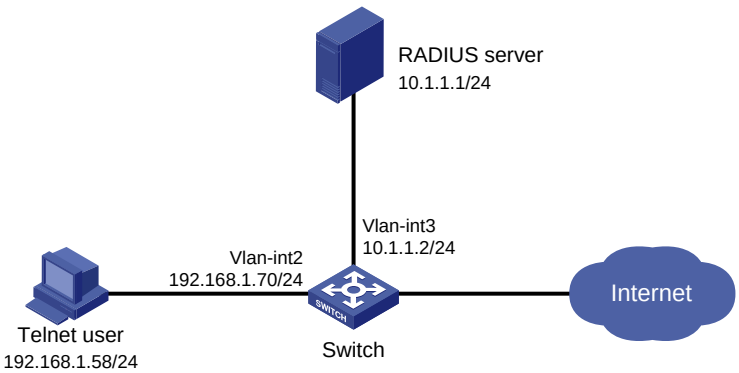
Example: Configuring RBAC temporary user role authorization (RADIUS authentication)

Network configuration

As shown in Figure 6, the switch uses RADIUS authentication for login users, including the Telnet user. The user account for the Telnet user is **test@bbb**, which is assigned user role **level-0**.

Configure the remote-then-local authentication mode for temporary user role authorization. The switch uses the RADIUS server to provide authentication for the **network-admin** user role. If the AAA configuration is invalid or the RADIUS server does not respond, the switch performs local authentication.

Figure 6 Network diagram



Procedure

1. Configure the switch:

   # Assign an IP address to VLAN-interface 2 (the interface connected to the Telnet user).

   ```
   <Switch> system-view
   [Switch] interface vlan-interface 2
   ```

```
[Switch-Vlan-interface2] ip address 192.168.1.70 255.255.255.0
[Switch-Vlan-interface2] quit
```

Assign an IP address to VLAN-interface 3 (the interface connected to the RADIUS server).

```
[Switch] interface vlan-interface 3
[Switch-Vlan-interface3] ip address 10.1.1.2 255.255.255.0
[Switch-Vlan-interface3] quit
```

Enable the Telnet server.

```
[Switch] telnet server enable
```

Enable scheme authentication on the user lines for Telnet users.

```
[Switch] line vty 0 15
[Switch-line-vty0-15] authentication-mode scheme
[Switch-line-vty0-15] quit
```

Enable remote-then-local authentication for temporary user role authorization.

```
[Switch] super authentication-mode scheme local
```

Create RADIUS scheme **radius** and enter RADIUS scheme view.

```
[Switch] radius scheme radius
```

Specify the primary authentication server address and the shared key in the scheme for secure communication between the switch and the server.

```
[Switch-radius-radius] primary authentication 10.1.1.1 key simple expert
```

Exclude ISP domain names from the usernames sent to the RADIUS server.

```
[Switch-radius-radius] user-name-format without-domain
[Switch-radius-radius] quit
```

Create ISP domain **bbb** and enter ISP domain view.

```
[Switch] domain bbb
```

Configure ISP domain **bbb** to use RADIUS scheme **radius** for login user authentication.

```
[Switch-isp-bbb] authentication login radius-scheme radius
```

Configure ISP domain **bbb** to use RADIUS scheme **radius** for login user authorization.

```
[Switch-isp-bbb] authorization login radius-scheme radius
```

Configure ISP domain **bbb** to not perform accounting for login users.

```
[Switch-isp-bbb] accounting login none
```

Apply RADIUS scheme **radius** to the ISP domain for user role authentication.

```
[Switch-isp-bbb] authentication super radius-scheme radius
[Switch-isp-bbb] quit
```

Set the local authentication password to **abcdef654321** for user role **network-admin**.

```
[Switch] super password role network-admin simple abcdef654321
[Switch] quit
```

2. Configure the RADIUS server:

This example uses ACSv4.2.

This example only provides the key configuration steps. For more information about configuring a RADIUS server, see the server documentation.

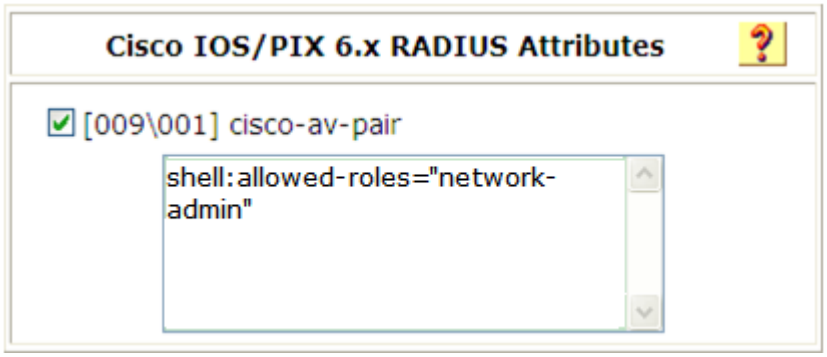
a. Add a Telnet user account for login authentication. Set the username to **test@bbb** and the password to **123456TESTplat&!**. (Details not shown.)

b. Add a user account for temporary user role authorization. Set the username to **$enab0$** and the password to **123456**. (Details not shown.)

c. Access the **Cisco IOS/PIX 6.x RADIUS Attributes** page.

d. Configure the **cisco-av-pair** attribute, as shown in Figure 7.

Figure 7 Configuring the cisco-av-pair attribute



Verifying the configuration

1. Telnet to the switch, and enter username **test@bbb** and password **123456TESTplat&!** to access the switch. Verify that you have access to diagnostic commands.

```
<Switch> telnet 192.168.1.70
Trying 192.168.1.70 ...
Press CTRL+K to abort
Connected to 192.168.1.70 ...
******************************************************************************
* Copyright (c) 2004-2017 New H3C Technologies Co., Ltd. All rights reserved.*
* Without the owner's prior written consent,                                 *
* no decompiling or reverse-engineering shall be allowed.                    *
******************************************************************************

login: test@bbb
Password:
<Switch>?
User view commands:
  ping         Ping function
  quit         Exit from current command view
  ssh2         Establish a secure shell client connection
  super        Switch to a user role
  system-view  Enter the System View
  telnet       Establish a telnet connection
  tracert      Tracert function

<switch>
```

2. Verify that you can obtain the network-admin user role:

   # Use the super password to obtain the network-admin user role. When the system prompts for a username and password, enter username **test@bbb** and password **123456**.

```
<Switch> super network-admin
Username: test@bbb
Password:
```

   The following output shows that you have obtained the network-admin user role.

```
User privilege role is network-admin, and only those commands that authorized to the role can be used.
```

If the ACS server does not respond, enter local authentication password **abcdef654321** at the prompt.

```
Invalid configuration or no response from the authentication server.
Change authentication mode to local.
Password:
User privilege role is network-admin, and only those commands that authorized to the role can be used.
```

The output shows that you have obtained the network-admin user role.

Troubleshooting RBAC

This section describes several typical RBAC issues and their solutions.

Local users have more access permissions than intended

Symptom

A local user can use more commands than should be permitted by the assigned user roles.

Analysis

The local user might have been assigned to user roles without your knowledge. For example, the local user is automatically assigned the default user role when you create the user.

Solution

To resolve the issue:

1. Use the **`display local-user`** command to examine the local user accounts for undesirable user roles, and remove them.
2. If the issue persists, contact H3C Support.

Login attempts by RADIUS users always fail

Symptom

Attempts by a RADIUS user to log in to the network access device always fail, even though the following conditions exist:

- The network access device and the RADIUS server can communicate with one another.
- All AAA settings are correct.

Analysis

RBAC requires that a login user have a minimum of one user role. If the RADIUS server does not authorize the login user to use any user role, the user cannot log in to the device.

Solution

To resolve the issue:

1. Use one of the following methods:
   - Configure the **`role default-role enable`** command. A RADIUS user can log in with the default user role when no user role is assigned by the RADIUS server.
   - Add the user role authorization attributes on the RADIUS server.
2. If the issue persists, contact H3C Support.

Contents

Login overview

The device supports the following types of login methods:

- **CLI login**—At the CLI, you can enter text commands to configure and manage the device.

  To log in to the CLI, you can use one of the following methods:

  - Connect to the console port.
  - Connect to the USB port.
  - Use Telnet.
  - Use SSH.
- **Web login**—Through the Web interface, you can configure and manage the device visually.
- **SNMP access**—You can run SNMP on an NMS to access the device MIB, and perform Get and Set operations to configure and manage the device.
- **RESTful access**—You can use RESTful API operations to configure and manage the device.

The first time you access the device, the available login methods vary by device model.

- For the following switch series, you can log in to the device through the console port or USB port, or the Web interface unless the device is automatically configured at startup:
  - S5000V3-EI.
  - S5000V5-EI.
  - S5000E-X.
  - S5000X-EI.
  - WS5810-WiNet.
  - WS5820-WiNet.
  - WAS6000.

  Before the first Web login, obtain the management IP address, username, and password on the device. Then, run a Web browser, enter the management IP address in the address bar, and press **Enter** to access the Web interface for device login.
- For the other switch series, you can only log in to the CLI through the console port or USB port unless the device is automatically configured at startup.

The default authentication mode for console login is as follows:

- On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the default setting varies by startup configuration.
  - If the device starts up with factory defaults, scheme authentication is enabled. The username and password are required, which can be obtained on the device.
  - If the device starts up with the initial configuration, authentication is disabled.
- On the other switch series, authentication is disabled.

For more information about the initial configuration and factory defaults, see "Managing configuration files."

After login, you can change console login parameters or configure other access methods.

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

Telnet, HTTP-based Web login, and HTTP-based RESTful access are not supported in FIPS mode.

Using the console port for the first device access

About using the console port for the first device access

Console login is the fundamental login method.

Prerequisites

To log in through the console port, prepare a console terminal, for example, a PC. Make sure the console terminal has a terminal emulation program, such as HyperTerminal or PuTTY. For information about how to use terminal emulation programs, see the programs' user guides.

Procedure

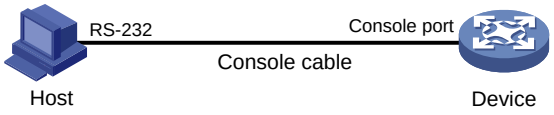
1. Turn off the PC.

   The serial ports on PCs do not support hot swapping. Before connecting a cable to or disconnecting a cable from a serial port on a PC, you must turn off the PC.
2. Find the console cable shipped with the device and connect the DB-9 female connector of the console cable to the serial port of the PC.
3. Identify the console port of the device carefully and connect the RJ-45 connector of the console cable to the console port.

IMPORTANT:

To connect a PC to an operating device, first connect the PC end. To disconnect a PC from an operating device, first disconnect the device end.

Figure 1 Connecting a terminal to the console port



4. Turn on the PC.
5. On the PC, launch the terminal emulation program, and create a connection that uses the serial port connected to the device. Set the port properties so the port properties match the following console port default settings:
   - **Bits per second**—9600 bps.
   - **Flow control**—None.
   - **Parity**—None.
   - **Stop bits**—1.
   - **Data bits**—8.
6. Power on the device. The method to enter the CLI varies by device model.
   - For the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, enter the username and password as prompted.
   - For the other switch series, press **Enter**.

   The user view prompt appears. You can enter commands to configure or manage the device. To get help, enter a question mark (?).

Configuring CLI login

About CLI login

The device uses user lines (also called user interfaces) to manage CLI sessions and monitor user behavior. For a user line, you can configure access control settings, including the login authentication method and user roles.

User lines

User line types

The device supports the types of user lines listed in Table 1. Different user lines require different login methods.

Table 1 CLI login method and user line matrix

User line	Login method
AUX line	Console port.
USB line	USB port.
Virtual type terminal (VTY) line	Telnet or SSH.

User line numbering

A user line has an absolute number and a relative number.

An absolute number uniquely identifies a user line among all user lines. The user lines are numbered starting from 0 and incrementing by 1, in the sequence of AUX, VTY, and USB lines. You can use the **`display line`** command without any parameters to view supported user lines and their absolute numbers.

A relative number uniquely identifies a user line among all user lines of the same type. The number format is *user line type* + *number*. All types of user lines are numbered starting from 0 and incrementing by 1. For example, the first VTY line is VTY 0.

User line assignment

The device assigns user lines to CLI login users depending on their login methods, as shown in Table 1. When a user logs in, the device checks the idle user lines for the login method, and assigns the lowest numbered user line to the user. For example, if VTY 0 and VTY 3 are idle when a user Telnets to the device, the device assigns VTY 0 to the user.

Each user line can be assigned only to one user at a time. If no user line is available, a CLI login attempt will be rejected.

Login authentication modes

You can configure login authentication to prevent illegal access to the device CLI.

In non-FIPS mode, the device supports the following login authentication modes:

- **None**—Disables authentication. This mode allows access without authentication and is insecure.
- **Password**—Requires password authentication. A user must provide the correct password at login.

- **Scheme**—Uses the AAA module to provide local or remote login authentication. A user must provide the correct username and password at login.

In FIPS mode, the device supports only the scheme authentication mode.

Different login authentication modes require different user line configurations, as shown in Table 2.

Table 2 Configuration required for different login authentication modes

Authentication mode	Configuration tasks
None	Set the authentication mode to none.
Password	**1.** Set the authentication mode to password. **2.** Set a password.
Scheme	**1.** Set the authentication mode to scheme. **2.** Configure login authentication methods in ISP domain view. For more information, see *Security Configuration Guide*.

User roles

A user is assigned user roles at login. The user roles control the commands available for the user. For more information about user roles, see "Configuring RBAC."

The device assigns user roles based on the login authentication mode and user type.

- In none or password authentication mode, the device assigns the user roles specified for the user line.
- In scheme authentication mode, the device uses the following rules to assign user roles:
  - For an SSH login user who uses publickey or password-publickey authentication, the device assigns the user roles specified for the local device management user with the same name.
  - For other users, the device assigns user roles according to the user role configuration of the AAA module. If the AAA server does not assign any user roles and the default user role feature is disabled, a remote AAA authentication user cannot log in.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

Telnet login is not supported in FIPS mode.

Restrictions and guidelines: CLI login configuration

For commands that are available in both user line view and user line class view, the following rules apply:

- A setting in user line view applies only to the user line. A setting in user line class view applies to all user lines of the class.
- A non-default setting in either view takes precedence over the default setting in the other view. A non-default setting in user line view takes precedence over the non-default setting in user line class view.
- A setting in user line class view takes effect only on users who log in after the setting is made. It does not affect users who are already online when the setting is made.

Configuring console or USB login

About console and USB login

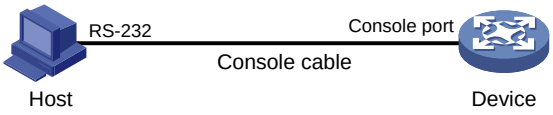
You can connect a terminal to the console port of the device to log in and manage the device, as shown in Figure 2. For information about the login procedure, see "Using the console port for the first device access."

You can also log in to the device through the USB port by completing the following tasks:

1. Connect a bluetooth modem to the USB port of the device.
2. Use a mobile terminal to establish a connection to the bluetooth modem.

After logging in to the device, you can use the application on the mobile terminal to manage the device.

Figure 2 Logging in through the console port



The default settings for console login is as follows:

- On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the default setting varies by startup configuration.
  - If the device starts up with factory defaults, scheme authentication is enabled.
  - If the device starts up with the initial configuration, authentication is disabled.

  The user role is network-admin for a console user.
- On the other switch series, authentication is disabled. The user role is network-admin for a console user.

For more information about the initial configuration and factory defaults, see "Managing configuration files."

By default, USB login is enabled and does not require authentication. The default user role is network-admin for a USB user.

To improve device security, configure password or scheme authentication immediately after you log in to the device for the first time.

Restrictions and guidelines

A console or USB login configuration change takes effect only for users who log in after the change is made. It does not affect users who are already online when the change is made.

In FIPS mode, the device supports only scheme authentication. You cannot disable authentication or configure password authentication.

Console and USB login configuration tasks at a glance

To configure console or USB login, perform the following tasks:

1. Configuring console or USB login authentication
   - Disabling authentication for console or USB login
   - Configuring password authentication for console or USB login
   - Configuring scheme authentication for console or USB login

2. (Optional.) Configuring common console or USB login settings

Configuring console or USB login authentication

Disabling authentication for console or USB login

1. Enter system view.
   system-view
2. Enter AUX/USB line view or class view.
   - Enter AUX or USB line view.
     line { **aux** | **usb** } *first-number* [*last-number*]
   - Enter AUX or USB line class view.
     line class { **aux** | **usb** }
3. Disable authentication.
   authentication-mode none

   The default authentication mode for console login is as follows:
   - On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the default setting varies by startup configuration.
     - If the device starts up with factory defaults, scheme authentication is enabled.
     - If the device starts up with the initial configuration, authentication is disabled.
   - On the other switch series, authentication is disabled.

   For more information about the initial configuration and factory defaults, see "Managing configuration files."

   CAUTION:
   When authentication is disabled, users can log in to the device through the line or line class without authentication. For security purpose, disable authentication with caution.
4. Assign a user role.
   user-role *role-name*

   By default, a console or USB user is assigned the **network-admin** user role.

Configuring password authentication for console or USB login

1. Enter system view.
   system-view
2. Enter AUX/USB line view or class view.
   - Enter AUX or USB line view.
     line { **aux** | **usb** } *first-number* [*last-number*]
   - Enter AUX or USB class view.
     line class { **aux** | **usb** }
3. Enable password authentication.
   authentication-mode password

   The default authentication mode for console login is as follows:
   - On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the default setting varies by startup configuration.
     - If the device starts up with factory defaults, scheme authentication is enabled.
     - If the device starts up with the initial configuration, authentication is disabled.

- On the other switch series, authentication is disabled.

For more information about the initial configuration and factory defaults, see "Managing configuration files."

4. Set a password.

   set authentication password { **hash** | **simple** } *password*

   By default, no password is set.

5. Assign a user role.

   user-role *role-name*

   By default, a console or USB user is assigned the **network-admin** user role.

Configuring scheme authentication for console or USB login

1. Enter system view.

   system-view

2. Enter AUX/USB line view or class view.
   - Enter AUX or USB line view.

     line { **aux** | **usb** } *first-number* [*last-number*]
   - Enter AUX or USB line class view.

     line class { **aux** | **usb** }

3. Enable scheme authentication.

   In non-FIPS mode:

   authentication-mode scheme

   The default authentication mode for console login is as follows:
   - On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the default setting varies by startup configuration.
     - If the device starts up with factory defaults, scheme authentication is enabled.
     - If the device starts up with the initial configuration, authentication is disabled.
   - On the other switch series, authentication is disabled.

   For more information about the initial configuration and factory defaults, see "Managing configuration files."

   In FIPS mode:

   authentication-mode scheme

   By default, scheme authentication is enabled.

CAUTION:

When you enable scheme authentication, make sure an authentication user account is available. If no authentication user account is available, you cannot log in to the device through the line or line class at the next time.

4. Configure user authentication parameters in ISP domain view.

   To use local authentication, configure a local user and set the relevant attributes. To use remote authentication, configure a RADIUS, LDAP, or HWTACACS scheme. For more information, see AAA in *Security Configuration Guide*.

Configuring common console or USB login settings

Restrictions and guidelines

Some common console or USB login settings take effect immediately and can interrupt the current session. Use a login method different from console or USB login to log in to the device before you change console or USB login settings.

After you change console or USB login settings, adjust the settings on the configuration terminal accordingly for a successful login.

Procedure

1. Enter system view.

   system-view

2. Enter AUX/USB line view or class view.
   - Enter AUX/USB line view.

     line { **aux** | **usb** } *first-number* [*last-number*]
   - Enter AUX or USB line class view.

     line class { **aux** | **usb** }

3. Configure transmission parameters.
   - Set the transmission rate.

     speed *speed-value*

     By default, the transmission rate is 9600 bps.

     This command is not available in user line class view.
   - Specify the parity mode.

     parity { **even** | **mark** | **none** | **odd** | **space** }

     By default, a user line does not use parity.

     This command is not available in user line class view.
   - Configure flow control.

     flow-control { **hardware** | **none** | **software** }

     By default, the device does not perform flow control.

     This command is not available in user line class view.
   - Specify the number of data bits for a character.

     databits { **5** | **6** | **7** | **8** }

     The default is 8.

     This command is not available in user line class view.

Parameter	Description
7	Uses standard ASCII characters.
8	Uses extended ASCII characters.
5 and **6**	Available only for modem dial-in.

   - Specify the number of stop bits for a character.

     stopbits { **1** | **1.5** | **2** }

     The default is 1.

     Stop bits indicate the end of a character. The more the stop bits, the slower the transmission.

This command is not available in user line class view.

4. Configure terminal attributes.
   - Enable the terminal service.

     shell

     Be default, the terminal service is enabled on all user lines.

     The **undo shell** command is not available in AUX line view.
   - Specify the terminal display type.

     terminal type { **ansi** | **vt100** }

     By default, the terminal display type is ANSI.

     The device supports ANSI and VT100 terminal display types. As a best practice, specify VT100 type on both the device and the configuration terminal. You can also specify the ANSI type for both sides, but a display problem might occur if a command line has more than 80 characters.
   - Set the maximum number of lines of command output to send to the terminal at a time.

     screen-length *screen-length*

     By default, the device sends a maximum of 24 lines to the terminal at a time.

     To disable pausing between screens of output, set the value to 0.
   - Set the size for the command history buffer.

     history-command max-size *value*

     By default, the buffer size is 10. The buffer for a user line can save a maximum of 10 history commands.
   - Set the CLI connection idle-timeout timer.

     idle-timeout *minutes* [*seconds*]

     By default, the CLI connection idle-timeout timer is 10 minutes.

     If no interaction occurs between the device and the user within the idle-timeout interval, the system automatically terminates the user connection on the user line.

     If you set the timeout timer to 0, the connection will not be aged out.
5. Specify the command to be automatically executed for login users on the lines.

   auto-execute command *command*

   By default, no command is specified for auto execution.

   CAUTION:

   Use this command with caution. If this command is used on a user line, users that log in to the device through this user line might fail to configure the system.

   The device will automatically execute the specified command when a user logs in through the user line, and close the user connection after the command is executed.

   This command is not available in AUX line view or AUX line class view.
6. Configure shortcut keys.
   - Specify the terminal session activation key.

     activation-key *character*

     By default, pressing **Enter** starts the terminal session.
   - Specify the escape key.

     escape-key { *character* | **default** }

     By default, pressing **Ctrl+C** terminates a command.
   - Set the user line locking key.

lock-key *key-string*

By default, no user line locking key is set.

Configuring Telnet login

About Telnet login

The device can act as a Telnet server to allow Telnet login, or as a Telnet client to Telnet to other devices.

Restrictions and guidelines

Telnet login is not supported in FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

A Telnet login configuration change takes effect only for users who log in after the change is made. It does not affect users who are already online when the change is made.

Configuring the device as a Telnet server

Telnet server configuration tasks at a glance

To configure the device as a Telnet server, perform the following tasks:

1. Enabling the Telnet server
2. Configuring Telnet login authentication
   - Disabling authentication for Telnet login
   - Configuring password authentication for Telnet login
   - Configuring scheme authentication for Telnet login
3. (Optional.) Configuring common Telnet server settings
4. (Optional.) Configuring common VTY line settings

Enabling the Telnet server

1. Enter system view.
   system-view
2. Enable the Telnet server.
   telnet server enable
   By default, the Telnet server is disabled.

Disabling authentication for Telnet login

1. Enter system view.
   system-view
2. Enter VTY line view or class view.
   - Enter VTY line view.
     line vty *first-number* [*last-number*]
   - Enter VTY line class view.
     line class vty
3. Disable authentication.
   authentication-mode none

By default, password authentication is enabled for Telnet login.

CAUTION:

When authentication is disabled, users can log in to the device through the line or line class without authentication. For security purpose, disable authentication with caution.

In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

4. (Optional.) Assign a user role.

   user-role *role-name*

   By default, a VTY line user is assigned the **network-operator** user role.

Configuring password authentication for Telnet login

1. Enter system view.

   system-view

2. Enter VTY line view or class view.
   - Enter VTY line view.

     line vty *first-number* [*last-number*]
   - Enter VTY line class view.

     line class vty

3. Enable password authentication.

   authentication-mode password

   By default, password authentication is enabled for Telnet login.

CAUTION:

When you enable password authentication, you must also configure an authentication password for the line or line class. If no authentication password is configured, you cannot log in to the device through the line or line class at the next time.

In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

4. Set a password.

   set authentication password { **hash** | **simple** } *password*

   By default, no password is set.

5. (Optional.) Assign a user role.

   user-role *role-name*

   By default, a VTY line user is assigned the **network-operator** user role.

Configuring scheme authentication for Telnet login

1. Enter system view.

   system-view

2. Enter VTY line view or class view.
   - Enter VTY line view.

     line vty *first-number* [*last-number*]
   - Enter VTY line class view.

     line class vty

3. Enable scheme authentication.

   authentication-mode scheme

   By default, password authentication is enabled for Telnet login.

   CAUTION:

   When you enable scheme authentication, make sure an authentication user account is available. If no authentication user account is available, you cannot log in to the device through the line or line class at the next time.

   In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

4. Configure user authentication parameters in ISP domain view.

   To use local authentication, configure a local user and set the relevant attributes.

   To use remote authentication, configure a RADIUS, LDAP, or HWTACACS scheme. For more information, see AAA in *Security Configuration Guide*.

Configuring common Telnet server settings

1. Enter system view.

   system-view

2. Set the DSCP value for outgoing Telnet packets.

   IPv4:

   telnet server dscp *dscp-value*

   IPv6:

   telnet server ipv6 dscp *dscp-value*

   By default, the DSCP value is 48.

3. Specify the Telnet service port number.

   IPv4:

   telnet server port *port-number*

   IPv6:

   telnet server ipv6 port *port-number*

   By default, the Telnet service port number is 23.

4. Set the maximum number of concurrent Telnet users.

   aaa session-limit telnet *max-sessions*

   By default, the maximum number of concurrent Telnet users is 32.

   Changing this setting does not affect users who are currently online. If the new limit is less than the number of online Telnet users, no additional users can Telnet in until the number drops below the new limit.

   For more information about this command, see *Security Command Reference*.

Configuring common VTY line settings

1. Enter system view.

   system-view

2. Enter VTY line view or class view.

   - Enter VTY line view.

     line vty *first-number* [*last-number*]

   - Enter VTY line class view.

line class vty

3. Configure VTY terminal attributes.
   - Enable the terminal service.

     shell

     By default, the terminal service is enabled on all user lines.
   - Specify the terminal display type.

     terminal type { **ansi** | **vt100** }

     By default, the terminal display type is ANSI.
   - Set the maximum number of lines of command output to send to the terminal at a time.

     screen-length *screen-length*

     By default, the device sends a maximum of 24 lines to the terminal at a time.

     To disable pausing between screens of output, set the value to 0.
   - Set the size for the command history buffer.

     history-command max-size *value*

     By default, the buffer size is 10. The buffer for a user line can save a maximum of 10 history commands.
   - Set the CLI connection idle-timeout timer.

     idle-timeout *minutes* [*seconds*]

     By default, the CLI connection idle-timeout timer is 10 minutes.

     If no interaction occurs between the device and the user within the idle-timeout interval, the system automatically terminates the user connection on the user line.

     If you set the timeout timer to 0, the connection will not be aged out.
4. Specify the supported protocols.

   protocol inbound { **all** | **ssh** | **telnet** }

   By default, Telnet and SSH are supported.

   A protocol change takes effect only on users who log in after the setting is made. It does not affect users who are already online when the setting is made.

   In VTY line view, this command is associated with the **authentication-mode** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.
5. Specify the command to be automatically executed for login users on the user lines.

   auto-execute command *command*

   By default, no command is specified for auto execution.

IMPORTANT:

Before you execute this command and save the configuration, make sure you can access the CLI to modify the configuration through other VTY lines or AUX lines.

For a VTY line, you can specify a command that is to be automatically executed when a user logs in. After executing the specified command, the system automatically disconnects the Telnet session.

6. Configure shortcut keys.
   - Specify the shortcut key for terminating a task.

     escape-key { *character* | **default** }

     The default setting is **Ctrl+C**.
   - Set the user line locking key.

lock-key *key-string*

By default, no user line locking key is set.

Using the device to log in to a Telnet server

About using the device to log in to a Telnet server

You can use the device as a Telnet client to log in to a Telnet server.

Figure 3 Telnetting from the device to a Telnet server

Prerequisites

Assign an IP address to the device and obtain the IP address of the Telnet server. If the device resides on a different subnet than the Telnet server, make sure the device and the Telnet server can reach each other.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Specify the source IPv4 address or source interface for outgoing Telnet packets.

   telnet client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

   By default, no source IPv4 address or source interface is specified. The device uses the primary IPv4 address of the output interface as the source address for outgoing Telnet packets.

3. Exit to user view.

   quit

4. Use the device to log in to a Telnet server.

   IPv4:

   telnet *remote-host* [*service-port*] [**source** { **interface** *interface-type interface-number* | **ip** *ip-address* } | **dscp** *dscp-value*] *

   IPv6:

   telnet ipv6 *remote-host* [**-i** *interface-type interface-number*] [*port-number*] [**source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* } | **dscp** *dscp-value*] *

Configuring SSH login

About SSH login

SSH offers a secure remote login method. By providing encryption and strong authentication, it protects devices against attacks such as IP spoofing and plaintext password interception. For more information, see *Security Configuration Guide*.

The device can act as an SSH server to allow Telnet login, or as an SSH client to log in to an SSH server.

Configuring the device as an SSH server

About SSH server configuration procedure

This section provides the SSH server configuration procedure used when the SSH client authentication method is password. For more information about SSH and publickey authentication configuration, see *Security Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Create local key pairs.

   In non-FIPS mode:

   public-key local create { **dsa** | **ecdsa** [**secp192r1** | **secp256r1** | **secp384r1** | **secp521r1**] | **rsa** } [**name** *key-name*]

   In FIPS mode:

   public-key local create { **dsa** | **ecdsa** [**secp256r1** | **secp384r1** | **secp521r1**] | **rsa** } [**name** *key-name*]

3. Enable the SSH server.

   ssh server enable

   By default, the SSH server is disabled.

4. (Optional.) Create an SSH user and specify the authentication mode.

   ssh user *username* **service-type stelnet authentication-type password**

5. Enter VTY line view or class view.

   - Enter VTY line view.

     line vty *first-number* [*last-number*]

   - Enter VTY line class view.

     line class vty

6. Enable scheme authentication.

   In non-FIPS mode:

   authentication-mode scheme

   By default, password authentication is enabled for VTY lines.

   In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

   In FIPS mode:

   authentication-mode scheme

   By default, scheme authentication is enabled for VTY lines.

   In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

   CAUTION:

   When you enable scheme authentication, make sure an authentication user account is available. If no authentication user account is available, you cannot log in to the device through the line or line class at the next time.

7. (Optional.) Specify the protocols for the user lines to support.

In non-FIPS mode:

protocol inbound { **all** | **ssh** | **telnet** }

By default, Telnet and SSH are supported.

A protocol change takes effect only on users who log in after the setting is made. It does not affect users who are already online when the setting is made.

In VTY line view, this command is associated with the **authentication-mode** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

In FIPS mode:

protocol inbound ssh

By default, SSH is supported.

A protocol change takes effect only on users who log in after the setting is made. It does not affect users who are already online when the setting is made.

In VTY line view, this command is associated with the **authentication-mode** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

8. (Optional.) Set the maximum number of concurrent SSH users.

   aaa session-limit ssh *max-sessions*

   By default, the maximum number of concurrent SSH users is 32.

   Changing this setting does not affect users who are currently online. If the new limit is less than the number of online SSH users, no additional SSH users can log in until the number drops below the new limit.

   For more information about this command, see *Security Command Reference*.

9. (Optional.) Configure common settings for VTY lines:

   a. Exit to system view.

      quit

   b. Configure common settings for VTY lines.

      See "Configuring common VTY line settings."

Using the device to log in to an SSH server

About using the device to log in to an SSH server

You can use the device as an SSH client to log in to an SSH server.

Figure 4 Logging in to an SSH server from the device

Prerequisites

Assign an IP address to the device and obtain the IP address of the SSH server. If the device resides on a different subnet than the SSH server, make sure the device and the SSH server can reach each other.

Procedure

To use the device to log in to an SSH server, execute one of the following commands in user view:

IPv4:

ssh2 *server*

IPv6:

ssh2 ipv6 *server*

To work with the SSH server, you might need to specify a set of parameters. For more information, see *Security Configuration Guide*.

Display and maintenance commands for CLI login

Execute **display** commands in any view.

Task	Command	Remarks
Display user line information.	**display line** [*num1* | { **aux** | **usb** | **vty** } *num2*] [**summary**]	N/A
Display the packet source setting for the Telnet client.	**display telnet client**	N/A
Display online CLI users.	**display users** [**all**]	N/A
Release a user line.	**free line** { *num1* | { **aux** | **usb** | **vty** } *num2* }	Multiple users can log in to the device to simultaneously configure the device. When necessary, you can execute this command to release some connections. You cannot use this command to release the connection you are using or a redirected Telnet connection. This command is available in user view.
Lock the current user line and set the password for unlocking the line.	**lock**	By default, the system does not lock any user lines. This command is not supported in FIPS mode. This command is available in user view.
Lock the current user line and enable unlocking authentication.	**lock reauthentication**	By default, the system does not lock any user lines or initiate reauthentication. To unlock the locked user line, you must press **Enter** and provide the login password to pass reauthentication. This command is available in any view.
Send messages to user lines.	**send** { **all** | *num1* | { **aux** | **usb** | **vty** } *num2* }	This command is available in user view.

Configuring Web login

About Web login

The device provides a built-in Web server that supports HTTP 1.0, HTTP 1.1, and HTTPS. You can use a Web browser to log in to and configure the device.

HTTPS uses SSL to ensure the integrity and security of data exchanged between the client and the server, and is more secure than HTTP. You can define a certificate-based access control policy to allow only legal clients to access the Web interface.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

HTTP is not supported in FIPS mode.

Restrictions and guidelines: Web login configuration

To improve device security, the system automatically enables the HTTPS service when you enable the HTTP service. When the HTTP service is enabled, you cannot disable the HTTPS service.

Web login configuration tasks at a glance

To configure Web login, perform the following tasks:

1. Configuring Web login
   - Configuring HTTP login
   - Configuring HTTPS login
2. Configuring a Web login local user
3. Managing Web connections
4. Enabling Web operation logging

Prerequisites for Web login

Before logging in to the Web interface of the device, log in to the device by using any other method and assign an IP address to the device. Make sure the configuration terminal and the device can communicate over the IP network.

Configuring HTTP login

1. (Optional.) Specify a fixed verification code for Web login.
   `web captcha` *`verification-code`*

By default, no fixed verification code is specified. A Web user must enter the verification code displayed on the login page at login.

Execute this command in user view.

2. Enter system view.

   system-view

3. Enable the HTTP service.

   ip http enable

   The default is as follows:

   - On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, WS5810-WiNet, WS5820-WiNet, and WAS6000 switch series, the default setting varies by startup configuration.
     - If the device starts up with factory defaults, the HTTP service is enabled.
     - If the device starts up with the initial configuration, the HTTP service is disabled.
   - On the other switch series, the HTTP service is disabled.

   For more information about the initial configuration and factory defaults, see "Managing configuration files."

4. (Optional.) Specify the HTTP service port number.

   ip http port *port-number*

   The default HTTP service port number is 80.

Configuring HTTPS login

About HTTPS login

The device supports the following HTTPS login modes:

- **Simplified mode**—The device uses a self-signed certificate (a certificate that is generated and signed by the device itself) and the default SSL settings. The device operates in simplified mode after you enable HTTPS service on the device.
- **Secure mode**—The device uses a certificate signed by a CA and a set of user-defined security protection settings to ensure security. For the device to operate in secure mode, you must perform the following tasks:
  - Enable HTTPS service on the device.
  - Specify an SSL server policy for the service.
  - Configure PKI domain-related parameters.

Simplified mode is easy to configure but it is insecure. Secure mode is secure but it is complicated to configure.

For more information about SSL and PKI, see *Security Configuration Guide*.

Restrictions and guidelines

- To associate a different SSL server policy with the HTTPS service, you must perform the following tasks:
  - Disable the HTTP service and HTTPS service before you associate the new SSL server policy.
  - Enable the HTTP service and HTTPS service again after the association.

  If you fail to complete the required tasks, the new SSL server policy does not take effect.
- For the HTTP service to use its self-signed certificate after you associate an SSL server policy with the HTTPS service, you must follow these steps:

  a. Disable the HTTP service and HTTPS service.

b. Execute the **undo ip https ssl-server-policy** command to remove the existing SSL server policy association.

c. Enable the HTTP service and HTTPS service again.

- Enabling the HTTPS service triggers the SSL handshake negotiation process.
  - If the device has a local certificate, the SSL handshake negotiation succeeds and the HTTPS service starts up.
  - If the device does not have a local certificate, the certificate application process starts. Because the certificate application process takes a long time, the SSL handshake negotiation might fail and the HTTPS service might not be started. To solve the problem, execute the **ip https enable** command again until the HTTPS service is enabled.
- To use a certificate-based access control policy to control HTTPS access, you must perform the following tasks:
  - Execute the **client-verify enable** command in the SSL server policy that is associated with the HTTPS service.
  - Configure a minimum of one **permit** rule in the certificate-based access control policy.

  If you fail to complete the required tasks, HTTPS clients cannot log in.

Procedure

1. (Optional.) Specify a fixed verification code for Web login.

web captcha *verification-code*

By default, no fixed verification code is configured. A Web user must enter the verification code displayed on the login page at login.

2. Enter system view.

system-view

3. (Optional.) Apply policies to the HTTPS service.

- Apply an SSL server policy.

  ip https ssl-server-policy *policy-name*

  By default, no SSL server policy is associated. The HTTP service uses a self-signed certificate.
- Apply a certificate-based access control policy to control HTTPS access.

  ip https certificate access-control-policy *policy-name*

  By default, no certificate-based access control policy is applied.

  For more information about certificate-based access control policies, see PKI in *Security Configuration Guide*.

4. Enable the HTTPS service.

ip https enable

The default is as follows:

- On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, WS5810-WiNet, WS5820-WiNet, and WAS6000 switch series, the default setting varies by startup configuration.
  - If the device starts up with factory defaults, the HTTPS service is enabled.
  - If the device starts up with the initial configuration, the HTTPS service is disabled.
- On the other switch series, the HTTPS service is disabled.

For more information about the initial configuration and factory defaults, see "Managing configuration files."

5. (Optional.) Specify the HTTPS service port number.

ip https port *port-number*

The default HTTPS service port number is 443.

6. (Optional.) Set the HTTPS login authentication mode.

   web https-authorization mode { **auto** | **manual** }

   By default, manual authentication mode is used for HTTPS login.

Configuring a Web login local user

1. Enter system view.

   system-view

2. Create a local user and enter local user view.

   local-user *user-name* [**class manage**]

3. (Optional.) Configure a password for the local user.

   In non-FIPS mode:

   password [{ **hash** | **simple** } *password*]

   By default, no password is configured for a local user. The local user can pass authentication after entering the correct username and passing attribute checks.

   In FIPS mode:

   password

   By default, no password is configured for a local user. The local user cannot pass authentication.

4. Configure user attributes.

   - Assign a user role to the local user.

     authorization-attribute user-role *user-role*

     The default user role is network-operator for a Web user.

   - Specify the service type for the local user.

     service-type { **http** | **https** }

     By default, no service type is specified for a local user.

Managing Web connections

Setting the Web connection idle-timeout timer

1. Enter system view.

   system-view

2. Set the Web connection idle-timeout timer.

   web idle-timeout *minutes*

   By default, the Web connection idle-timeout timer is 10 minutes.

Specifying the maximum number of online HTTP or HTTPS users

1. Enter system view.

   system-view

2. Specify the maximum number of online HTTP or HTTPS users.

   aaa session-limit { **http** | **https** } *max-sessions*

   By default, the device supports a maximum number of 32 online HTTP users and 32 online HTTPS users.

   Changing this setting does not affect users who are currently online. If the new setting is less than the number of online HTTP or HTTPS users, no additional HTTP or HTTPS users can log

in until the number drops below the new limit. For more information about this command, see *Security Command Reference*.

Logging off Web users

To log off Web users, execute the following command in user view:

free web users { **all** | **user-id** *user-id* | **user-name** *user-name* }

Enabling Web operation logging

1. Enter system view.
   system-view
2. Enable Web operation logging.
   webui log enable
   By default, Web operation logging is disabled.

Display and maintenance commands for Web login

Execute **display** commands in any view.

Task	Command
Display HTTP service configuration and status information.	**display ip http**
Display HTTPS service configuration and status information.	**display ip https**
Display Web interface navigation tree information.	**display web menu** [**chinese**]
Display online Web users.	**display web users**

Web login configuration examples

Example: Configuring HTTP login

Network configuration

As shown in Figure 5, the PC and the device can communicate over the IP network.

Configure the device to allow the PC to log in by using HTTP.

Figure 5 Network diagram

Procedure

Create a local user named **admin**. Set the password to **hello12345**, the service type to HTTP, and the user role to network-admin.

```
[Sysname] local-user admin
```

```
[Sysname-luser-manage-admin] service-type http
[Sysname-luser-manage-admin] authorization-attribute user-role network-admin
[Sysname-luser-manage-admin] password simple hello12345
[Sysname-luser-manage-admin] quit
```

Enable HTTP.

```
[Sysname] ip http enable
```

Verifying the configuration

1. On the PC, run a Web browser and enter the IP address of the device in the address bar.
2. On the login page, enter the username, password, and verification code. Select **English** and click **Login**.

   After you pass authentication, the homepage appears and you can configure the device.

Example: Configuring HTTPS login

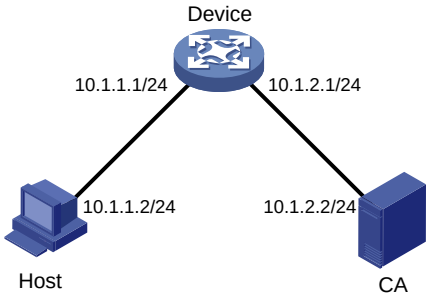
Network configuration

As shown in Figure 6, the host, device, and CA can communicate over the IP network.

Perform the following tasks to allow only authorized users to access the device's Web interface:

- Configure the device as the HTTPS server and request a certificate for the device.
- Configure the host as the HTTPS client and request a certificate for the host.

Figure 6 Network diagram



Procedure

In this example, the CA runs Windows Server and has the SCEP add-on installed.

1. Configure the device (HTTPS server):

   # Create PKI entity **en** and set entity parameters.

   ```
   <Device> system-view
   [Device] pki entity en
   [Device-pki-entity-en] common-name http-server1
   [Device-pki-entity-en] fqdn ssl.security.com
   [Device-pki-entity-en] quit
   ```

   # Create PKI domain **1** and set domain parameters.

   ```
   [Device] pki domain 1
   [Device-pki-domain-1] ca identifier new-ca
   [Device-pki-domain-1] certificate request url
   http://10.1.2.2/certsrv/mscep/mscep.dll
   [Device-pki-domain-1] certificate request from ra
   [Device-pki-domain-1] certificate request entity en
   ```

Configure the PKI domain to use the 1024-bit long RSA key pair **hostkey** for both signing and encryption.

```
[Device-pki-domain-1] public-key rsa general name hostkey length 1024
[Device-pki-domain-1] quit
```

Create RSA local key pairs.

```
[Device] public-key local create rsa
```

Retrieve the CA certificate.

```
[Device] pki retrieve-certificate domain 1 ca
```

Configure the device to request a local certificate through SCEP.

```
[Device] pki request-certificate domain 1
```

Create SSL server policy **myssl**. Specify PKI domain 1 for the SSL server policy, and enable certificate-based SSL client authentication.

```
[Device] ssl server-policy myssl
[Device-ssl-server-policy-myssl] pki-domain 1
[Device-ssl-server-policy-myssl] client-verify enable
[Device-ssl-server-policy-myssl] quit
```

Create certificate attribute group **mygroup1**. Configure a certificate attribute rule that matches statements with the **new-ca** string in the distinguished name of the subject name.

```
[Device] pki certificate attribute-group mygroup1
[Device-pki-cert-attribute-group-mygroup1] attribute 1 issuer-name dn ctn new-ca
[Device-pki-cert-attribute-group-mygroup1] quit
```

Create certificate-based access control policy **myacp**. Configure a certificate access control rule that uses the matching criteria in certificate attribute group **mygroup1**.

```
[Device] pki certificate access-control-policy myacp
[Device-pki-cert-acp-myacp] rule 1 permit mygroup1
[Device-pki-cert-acp-myacp] quit
```

Associate SSL server policy **myssl** with the HTTPS service.

```
[Device] ip https ssl-server-policy myssl
```

Use certificate-based access control policy **myacp** to control HTTPS access.

```
[Device] ip https certificate access-control-policy myacp
```

Enable the HTTPS service.

```
[Device] ip https enable
```

Create local user **usera**. Set the password to **hello12345**, the service type to HTTPS, and the user role to network-admin.

```
[Device] local-user usera
[Device-luser-usera] password simple hello12345
[Device-luser-usera] service-type https
[Device-luser-usera] authorization-attribute user-role network-admin
```

2. Configure the host (HTTPS client):

   # On the host, run a Web browser and enter **http://10.1.2.2/certsrv** in the address bar.

   # Request a certificate for the host as prompted.

Verifying the configuration

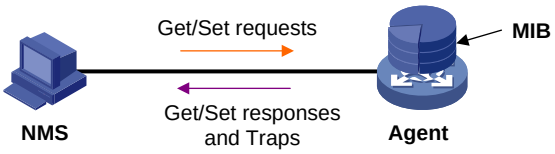
1. On the host, enter **https://10.1.1.1** in the Web browser's address bar, and select the certificate issued by **new-ca**.
2. When the Web login page appears, enter the username **usera** and password **hello12345** to log in to the Web interface.

For more information about PKI and SSL configuration commands and the **public-key local create rsa** command, see *Security Command Reference*.

Accessing the device through SNMP

You can run SNMP on an NMS to access the device MIB and perform Get and Set operations to configure and manage the device.

Figure 7 SNMP access diagram



For more information about SNMP, see *Network Management and Monitoring Configuration Guide*.

Configuring RESTful access

About RESTful access

The device provides the Representational State Transfer application programming interface (RESTful API). Based on this API, you can use programming languages such as Python, Ruby, or Java to write programs to perform the following tasks:

- Send RESTful requests to the device to pass authentication.
- Use RESTful API operations to configure and manage the device. RESTful API operations include Get, Put, Post, and Delete.

The device supports using HTTP or HTTPS to transfer RESTful packets.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

RESTful access over HTTP is not supported in FIPS mode.

Configuring RESTful access over HTTP

1. Enter system view.
   system-view
2. Enable RESTful access over HTTP.
   restful http enable
   By default, RESTful access over HTTP is disabled.
3. Create a local user and enter local user view.
   local-user *user-name* [**class manage**]
4. Configure a password for the local user.
   password [{ **hash** | **simple** } *password*]
5. (Optional.) Assign a user role to the local user.
   authorization-attribute user-role *user-role*
   The default user role is network-operator for a RESTful access user.
6. Specify the HTTP service for the local user.
   service-type http
   By default, no service type is specified for a local user.

Configuring RESTful access over HTTPS

1. Enter system view.
   system-view
2. Enable RESTful access over HTTPS.
   restful https enable

By default, RESTful access over HTTPS is disabled.

3. Create a local user and enter local user view.
   local-user *user-name* [**class manage**]
4. Configure a password for the local user.
   In non-FIPS mode:
   password [{ **hash** | **simple** } *password*]
   In FIPS mode:
   password
5. (Optional.) Assign a user role to the local user.
   authorization-attribute user-role *user-role*
   The default user role is network-operator for a RESTful access user.
6. Specify the HTTPS service for the local user.
   service-type https
   By default, no service type is specified for a local user.

Controlling user access to the device

About login user access control

Use ACLs to prevent unauthorized access, and configure command authorization and accounting to monitor and control user behavior.

If an applied ACL does not exist or does not have any rules, no user login restriction is applied. If the ACL exists and has rules, only users permitted by the ACL can access the device.

For more information about ACLs, see *ACL and QoS Configuration Guide.*

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

Telnet and HTTP are not supported in FIPS mode.

Controlling Telnet and SSH logins

Controlling Telnet logins

1. Enter system view.

   system-view

2. Apply an ACL to control Telnet logins.

   IPv4:

   telnet server acl { *advanced-acl-number* | *basic-acl-number* | **mac** *mac-acl-number* }

   IPv6:

   telnet server ipv6 acl { **ipv6** { *advanced-acl-number* | *basic-acl-number* } | **mac** *mac-acl-number* }

   By default, no ACL is used to control Telnet logins.

3. (Optional.) Enable logging for Telnet login attempts that are denied by the Telnet login control ACL.

   telnet server acl-deny-log enable

   By default, logging is disabled for Telnet login attempts that are denied by the Telnet login control ACL.

Controlling SSH logins

1. Enter system view.

   system-view

2. Apply an ACL to control SSH logins.

   IPv4:

ssh server acl { *advanced-acl-number* | *basic-acl-number* | **mac** *mac-acl-number* }

IPv6:

ssh server ipv6 acl { **ipv6** { *advanced-acl-number* | *basic-acl-number* } | **mac** *mac-acl-number* }

By default, no ACL is used to control SSH logins.

3. (Optional.) Enable logging for SSH login attempts that are denied by the SSH login control ACL.

   ssh server acl-deny-log enable

   By default, logging is disabled for SSH login attempts that are denied by the SSH login control ACL.

   For more information about **ssh** commands, see *Security Command Reference*.

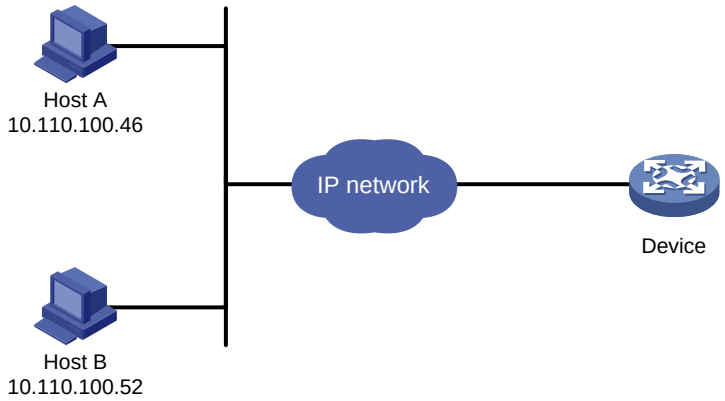
Example: Controlling Telnet login

Network configuration

As shown in Figure 8, the device is a Telnet server.

Configure the device to permit only Telnet packets sourced from Host A and Host B.

Figure 8 Network diagram



Procedure

Configure an ACL to permit packets sourced from Host A and Host B.

```
<Sysname> system-view
[Sysname] acl basic 2000 match-order config
[Sysname-acl-ipv4-basic-2000] rule 1 permit source 10.110.100.52 0
[Sysname-acl-ipv4-basic-2000] rule 2 permit source 10.110.100.46 0
[Sysname-acl-ipv4-basic-2000] quit
```

Apply the ACL to filter Telnet logins.

```
[Sysname] telnet server acl 2000
```

Controlling Web logins

Configuring source IP-based Web login control

1. Enter system view.

system-view

2. Apply a basic ACL to control Web logins.
   - Control HTTP logins.
     ip http acl { *acl-number* | **name** *acl-name* }
   - Control HTTPS logins.
     ip https acl { *acl-number* | **name** *acl-name* }

   By default, no ACL is applied to control Web logins.

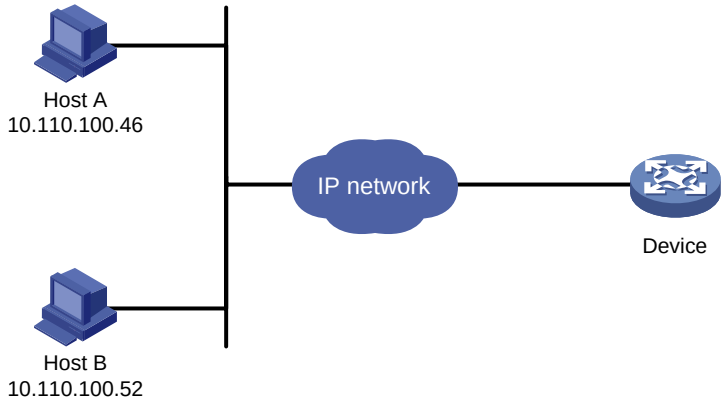
Example: Controlling Web login

Network configuration

As shown in Figure 9, the device is an HTTP server.

Configure the device to provide HTTP service only to Host B.

Figure 9 Network diagram



Procedure

Create an ACL and configure rule 1 to permit packets sourced from Host B.

```
<Sysname> system-view
[Sysname] acl basic 2030 match-order config
[Sysname-acl-ipv4-basic-2030] rule 1 permit source 10.110.100.52 0
```

Apply the ACL to the HTTP service so only a Web user on Host B can access the device.

```
[Sysname] ip http acl 2030
```

Controlling SNMP access

About SNMP access control

For information about SNMP access control, see SNMP in *Network Management and Monitoring Configuration Guide.*

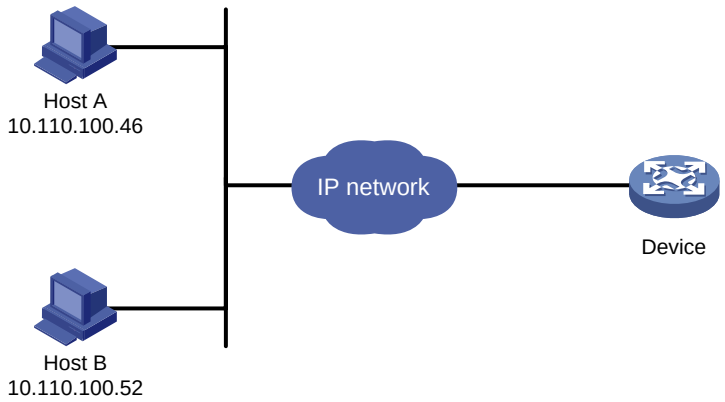
Example: Controlling SNMP access

Network configuration

As shown in Figure 10, the device is running SNMP.

Configure the device to allow Host A and Host B to access the device through SNMP.

Figure 10 Network diagram



Procedure

Create an ACL to permit packets sourced from Host A and Host B.

```
<Sysname> system-view
[Sysname] acl basic 2000 match-order config
[Sysname-acl-ipv4-basic-2000] rule 1 permit source 10.110.100.52 0
[Sysname-acl-ipv4-basic-2000] rule 2 permit source 10.110.100.46 0
[Sysname-acl-ipv4-basic-2000] quit
```

Associate the ACL with the SNMP community and the SNMP group.

```
[Sysname] snmp-agent community read aaa acl 2000
[Sysname] snmp-agent group v2c groupa acl 2000
[Sysname] snmp-agent usm-user v2c usera groupa acl 2000
```

Configuring command authorization

About command authorization

By default, commands available for a user depend only on the user's user roles. When the authentication mode is scheme, you can configure the command authorization feature to further control access to commands.

After you enable command authorization, a user can use only commands that are permitted by both the AAA scheme and user roles.

Restrictions and guidelines

The command authorization method can be different from the user login authorization method.

To make the command authorization feature take effect, you must configure a command authorization method in ISP domain view. For more information, see *Security Configuration Guide*.

Procedure

1. Enter system view.
   `system-view`

2. Enter user line view or user line class view.
   - Enter user line view.

     line { *first-number1* [*last-number1*] | { **aux** | **usb** | **vty** } *first-number2* [*last-number2*] }
   - Enter user line class view.

     line class { **aux** | **usb** | **vty** }

   A setting in user line view applies only to the user line. A setting in user line class view applies to all user lines of the class. A non-default setting in either view takes precedence over the default setting in the other view. A non-default setting in user line view takes precedence over the non-default setting in user line class view.

   A setting in user line class view takes effect only on users who log in after the setting is made. It does not affect users who are already online when the setting is made.
3. Enable scheme authentication.

   In non-FIPS mode:

   authentication-mode scheme

   By default, password authentication is enabled for VTY login.

   The default authentication mode for console login is as follows:
   - On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series:
     - If the device starts up with factory defaults, scheme authentication is enabled.
     - If the device starts up with the initial configuration, authentication is disabled.
   - On the other switch series, authentication is disabled.

   For more information about the initial configuration and factory defaults, see "Managing configuration files."

   In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

   In FIPS mode:

   authentication-mode scheme

   By default, scheme authentication is enabled.

   In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

CAUTION:

When you enable scheme authentication, make sure an authentication user account is available. If no authentication user account is available, you cannot log in to the device through the line or line class at the next time.

4. Enable command authorization.

   command authorization

   By default, command authorization is disabled, and the commands available for a user only depend on the user role.

   If the **command authorization** command is executed in user line class view, command authorization is enabled on all user lines in the class. You cannot execute the **undo command authorization** command in the view of a user line in the class.

Example: Configuring command authorization

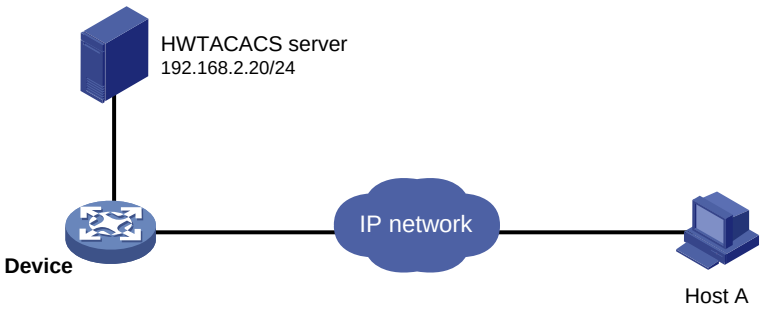
Network configuration

As shown in Figure 11, Host A needs to log in to the device to manage the device.

Configure the device to perform the following operations:

- Allow Host A to Telnet in after authentication.
- Use the HWTACACS server to control the commands that the user can execute.
- If the HWTACACS server is not available, use local authorization.

Figure 11 Network diagram



Procedure

Assign IP addresses to relevant interfaces. Make sure the device and the HWTACACS server can reach each other. Make sure the device and Host A can reach each other.

Enable the Telnet server.

```
<Device> system-view
[Device] telnet server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 4.

```
[Device] line vty 0 4
[Device-line-vty0-4] authentication-mode scheme
```

Enable command authorization for the user lines.

```
[Device-line-vty0-4] command authorization
[Device-line-vty0-4] quit
```

Create HWTACACS scheme **tac**.

```
[Device] hwtacacs scheme tac
```

Configure the scheme to use the HWTACACS server at 192.168.2.20:49 for authentication and authorization.

```
[Device-hwtacacs-tac] primary authentication 192.168.2.20 49
[Device-hwtacacs-tac] primary authorization 192.168.2.20 49
```

Set the shared keys to **expert**.

```
[Device-hwtacacs-tac] key authentication simple expert
[Device-hwtacacs-tac] key authorization simple expert
```

Remove domain names from usernames sent to the HWTACACS server.

```
[Device-hwtacacs-tac] user-name-format without-domain
[Device-hwtacacs-tac] quit
```

Configure the system-defined domain (**system**).

```
[Device] domain system
```

Use HWTACACS scheme **tac** for login user authentication and command authorization. Use local authentication and local authorization as the backup method.

```
[Device-isp-system] authentication login hwtacacs-scheme tac local
[Device-isp-system] authorization command hwtacacs-scheme tac local
[Device-isp-system] quit
```

Create local user **monitor**. Set the simple password to **hello12345**, the service type to Telnet, and the default user role to level-1.

```
[Device] local-user monitor
[Device-luser-manage-monitor] password simple hello12345
[Device-luser-manage-monitor] service-type telnet
[Device-luser-manage-monitor] authorization-attribute user-role level-1
```

Configuring command accounting

About command accounting

Command accounting uses the HWTACACS server to record all executed commands to monitor user behavior on the device.

If command accounting is enabled but command authorization is not, every executed command is recorded. If both command accounting and command authorization are enabled, only authorized commands that are executed are recorded.

Restrictions and guidelines

The command accounting method can be the same as or different from the command authorization method and user login authorization method.

To make the command accounting feature take effect, you must configure a command accounting method in ISP domain view. For more information, see *Security Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter user line view or user line class view.

   - Enter user line view.

     line { *first-number1* [*last-number1*] | { **aux** | **usb** |**vty** } *first-number2* [*last-number2*] }

   - Enter user line class view.

     line class { **aux** | **usb** |**vty** }

   A setting in user line view applies only to the user line. A setting in user line class view applies to all user lines of the class. A non-default setting in either view takes precedence over the default setting in the other view. A non-default setting in user line view takes precedence over the non-default setting in user line class view.

   A setting in user line class view takes effect only on users who log in after the setting is made. It does not affect users who are already online when the setting is made.

3. Enable scheme authentication.

   In non-FIPS mode:

   authentication-mode scheme

By default, password authentication is enabled for VTY login.

The default authentication mode for console login is as follows:

- On the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series:
  - If the device starts up with factory defaults, scheme authentication is enabled.
  - If the device starts up with the initial configuration, authentication is disabled.
- On the other switch series, authentication is disabled.

For more information about the initial configuration and factory defaults, see "Managing configuration files."

In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

In FIPS mode:

authentication-mode scheme

By default, scheme authentication is enabled.

In VTY line view, this command is associated with the **protocol inbound** command. If one command has a non-default setting in VTY line view, the other command uses its setting in VTY line view, regardless of its setting in VTY line class view.

CAUTION:

When you enable scheme authentication, make sure an authentication user account is available. If no authentication user account is available, you cannot log in to the device through the line or line class at the next time.

4. Enable command accounting.

   command accounting

   By default, command accounting is disabled. The accounting server does not record the commands executed by users.

   If the **command accounting** command is executed in user line class view, command accounting is enabled on all user lines in the class. You cannot execute the **undo command accounting** command in the view of a user line in the class.

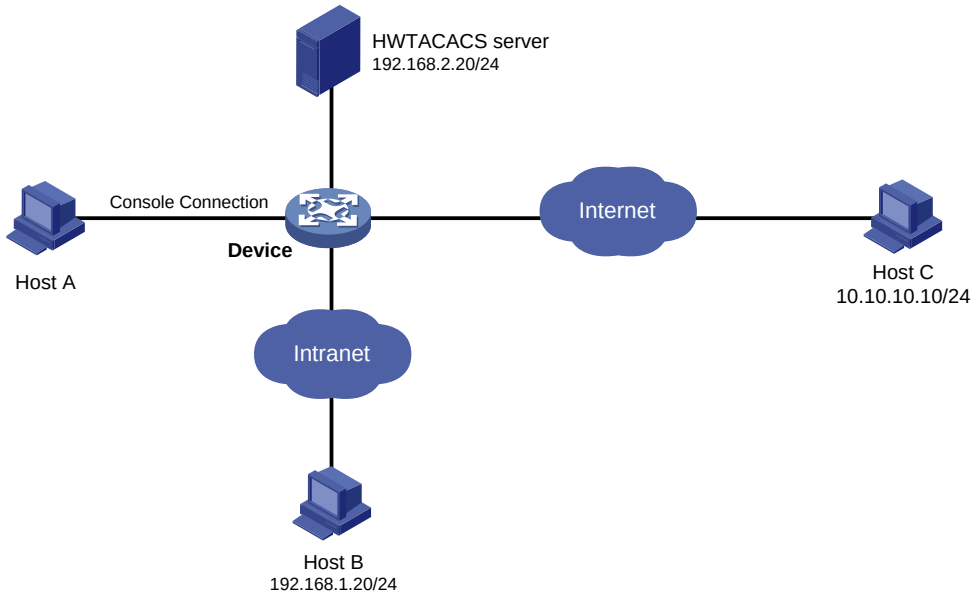
Example: Configuring command accounting

Network configuration

As shown in Figure 12, users need to log in to the device to manage the device.

Configure the device to send commands executed by users to the HWTACACS server to monitor and control user operations on the device.

Figure 12 Network diagram



Procedure

Enable the Telnet server.

```
<Device> system-view
[Device] telnet server enable
```

Enable command accounting for user line AUX 0.

```
[Device] line aux 0
[Device-line-aux0] command accounting
[Device-line-aux0] quit
```

Enable command accounting for user lines VTY 0 through VTY 63.

```
[Device] line vty 0 63
[Device-line-vty0-63] command accounting
[Device-line-vty0-63] quit
```

Create HWTACACS scheme **tac**.

```
[Device] hwtacacs scheme tac
```

Configure the scheme to use the HWTACACS server at 192.168.2.20:49 for accounting.

```
[Device-hwtacacs-tac] primary accounting 192.168.2.20 49
```

Set the shared key to **expert**.

```
[Device-hwtacacs-tac] key accounting simple expert
```

Remove domain names from usernames sent to the HWTACACS server.

```
[Device-hwtacacs-tac] user-name-format without-domain
[Device-hwtacacs-tac] quit
```

Configure the system-defined domain (**system**) to use the HWTACACS scheme for command accounting.

```
[Device] domain system
[Device-isp-system] accounting command hwtacacs-scheme tac
[Device-isp-system] quit
```

Contents

Configuring FTP

About FTP

File Transfer Protocol (FTP) is an application layer protocol for transferring files from one host to another over an IP network. It uses TCP port 20 to transfer data and TCP port 21 to transfer control commands.

FTP is based on the client/server model. The device can act as the FTP server or FTP client.

FTP file transfer modes

FTP supports the following transfer modes:

- **Binary mode**—Used to non-text files, such as **.app**, **.bin**, and **.btm** files.
- **ASCII mode**—Used to transfer text files, such as **.txt**, **.bat**, and **.cfg** files.

When the device acts as the FTP client, you can set the transfer mode (**binary** by default). When the device acts as the FTP server, the transfer mode is determined by the FTP client.

FTP operation modes

FTP can operate in either of the following modes:

- **Active mode (PORT)**—The FTP server initiates the TCP connection. This mode is not suitable when the FTP client is behind a firewall, for example, when the FTP client resides in a private network.
- **Passive mode (PASV)**—The FTP client initiates the TCP connection. This mode is not suitable when the server does not allow the client to use a random unprivileged port greater than 1024.

FTP operation mode varies depending on the FTP client program.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

FTP is not supported in FIPS mode.

Using the device as an FTP server

To use the device as an FTP server, you must enable the FTP server and configure authentication and authorization on the device. Other commands are optional.

FTP server configuration tasks at a glance

To use the device as an FTP server, perform the following tasks:

1. Enabling the FTP server
2. Configuring client authentication and authorization
3. (Optional.) Configuring FTP server access control

4. (Optional.) Setting connection management parameters
5. (Optional.) Specifying an SSL server policy for SFTP connections
6. (Optional.) Setting the DSCP value for outgoing FTP packets
7. (Optional.) Manually releasing FTP connections

Enabling the FTP server

1. Enter system view.
   ```
   system-view
   ```
2. Enable the FTP server.
   ```
   ftp server enable
   ```
   By default, the FTP server is disabled.

Configuring client authentication and authorization

Perform this task on the FTP server to authenticate FTP clients and set the authorized directories that authenticated clients can access.

The following authentication modes are available:

- **Local authentication**—The device looks up the client's username and password in the local user account database. If a match is found, authentication succeeds.
- **Remote authentication**—The device sends the client's username and password to a remote authentication server for authentication. The user account is configured on the remote authentication server rather than the device.

The following authorization modes are available:

- **Local authorization**—The device assigns authorized directories to FTP clients based on the locally configured authorization attributes.
- **Remote authorization**—A remote authorization server assigns authorized directories on the device to FTP clients.

For more information about configuring authentication and authorization, see AAA in *Security Configuration Guide*.

Configuring FTP server access control

About FTP server access control

Use ACLs to prevent unauthorized access. If an applied ACL does not exist or does not have any rules, no user login restriction is applied. If the ACL exists and has rules, only FTP clients permitted by the ACL can access the device.

Restrictions and guidelines

This configuration takes effect only for FTP connections to be established. It does not affect existing FTP connections.

If you configure FTP server access control multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Use an ACL to control access to the FTP server.

ftp server acl { *advanced-acl-number* | *basic-acl-number* | **ipv6** { *advanced-acl-number* | *basic-acl-number* } }

By default, no ACL is used for access control.

3. Enable logging for FTP login attempts that are denied by the FTP login control ACL.

ftp server acl-deny-log enable

By default, logging is disabled for FTP login attempts that are denied by the FTP login control ACL.

Setting connection management parameters

1. Enter system view.

system-view

2. Set the FTP connection idle-timeout timer.

ftp timeout *minutes*

By default, the FTP connection idle-timeout timer is 30 minutes.

If no data transfer occurs on an FTP connection before the idle-timeout timer expires, the FTP server closes the FTP connection.

3. Set the maximum number of concurrent FTP users.

aaa session-limit ftp *max-sessions*

By default, the maximum number of concurrent FTP users is 32.

Changing this setting does not affect users who are currently online. If the new limit is less than the number of online FTP users, no additional FTP users can log in until the number drops below the new limit. For more information about this command, see *Security Command Reference*.

Specifying an SSL server policy for SFTP connections

About specifying an SSL server policy for SFTP connections

After you associate an SSL server policy with the device, a client that supports SFTP will establish a secure connection to the device to ensure data security.

Procedure

1. Enter system view.

system-view

2. Associate an SSL server policy with the FTP server to ensure data security.

ftp server ssl-server-policy *policy-name*

By default, no SSL server policy is associated with the FTP server.

Setting the DSCP value for outgoing FTP packets

1. Enter system view.

system-view

2. Set the DSCP value for outgoing FTP packets.

IPv4:

ftp server dscp *dscp-value*

IPv6:

ftp server ipv6 dscp *dscp-value*

By default, the DSCP value is 0.

Manually releasing FTP connections

To manually release FTP connections, execute the following commands in user view:

- Release the FTP connection established by using a specific user account:
  free ftp user *username*
- Release the FTP connection to a specific IP address:
  free ftp user-ip [**ipv6**] *ip-address* [**port** *port*]

Display and maintenance commands for the FTP server

Execute **display** commands in any view.

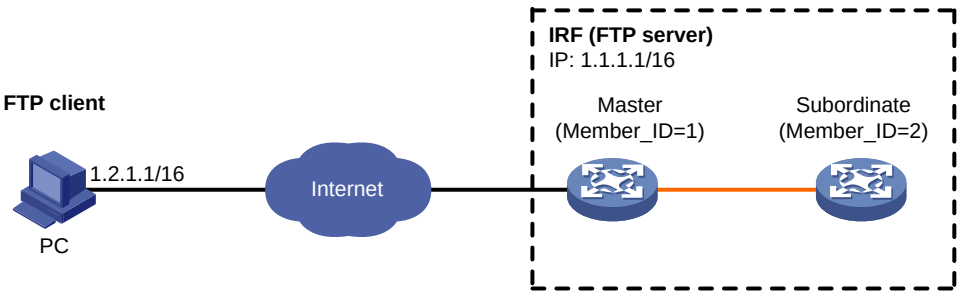
Task	Command
Display FTP server configuration and status information.	**display ftp-server**
Display detailed information about online FTP users.	**display ftp-user**

Example: Using the device as an FTP server

Network configuration

- Configure the IRF fabric as an FTP server.
- Create a local user account named **abc** on the FTP server. Set the password to **hello12345**.
- Use the user account to log in to the FTP server from the FTP client.
- Upload the **temp.bin** file from the FTP client to the FTP server.

Figure 1 Network diagram



Note: The orange line represents an IRF connection.

Procedure

1. Configure IP addresses as shown in Figure 1. Make sure the IRF fabric and the PC can reach each other. (Details not shown.)
2. Configure the FTP server:

   # Examine the storage space on the member devices. If the free space is insufficient, use the **delete/unreserved** *file* command to delete unused files. (Details not shown.)

   # Create a local user with username **abc** and password **hello12345**.

   ```
   <Sysname> system-view
   ```

```
[Sysname] local-user abc class manage
[Sysname-luser-manage-abc] password simple hello12345
```

Assign the **network-admin** user role to the user. Set the working directory to the root directory of the flash memory on the master. (To set the working directory to the root directory of the flash memory on the subordinate member, you must include the slot number in the directory path.)

```
[Sysname-luser-manage-abc] authorization-attribute user-role network-admin
work-directory flash:/
```

Assign the service type FTP to the user.

```
[Sysname-luser-manage-abc] service-type ftp
[Sysname-luser-manage-abc] quit
```

Enable the FTP server.

```
[Sysname] ftp server enable
[Sysname] quit
```

3. Perform FTP operations from the FTP client:

Log in to the FTP server at 1.1.1.1 using username **abc** and password **hello12345**.

```
c:\> ftp 1.1.1.1
Connected to 1.1.1.1.
220 FTP service ready.
User(1.1.1.1:(none)):abc
331 Password required for abc.
Password:
230 User logged in.
```

Use the ASCII mode to download configuration file **config.cfg** from the FTP server to the PC for backup.

```
ftp> ascii
200 TYPE is now ASCII
ftp> get config.cfg back-config.cfg
```

Use the binary mode to upload the **temp.bin** file from the PC to the root directory of the flash memory on the master.

```
ftp> binary
200 TYPE is now 8-bit binary
ftp> put temp.bin
```

Exit FTP.

```
ftp> bye
```

Using the device as an FTP client

FTP client configuration tasks at a glance

To use the device as an FTP server, perform the following tasks:

1. Establishing an FTP connection
2. (Optional.) Displaying command help information
3. (Optional.) Displaying directories and files on the FTP server
4. (Optional.) Managing directories on the FTP server
5. (Optional.) Working with files on the FTP server
6. (Optional.) Changing to another user account

7. (Optional.) Maintaining and troubleshooting the FTP connection
8. (Optional.) Terminating the FTP connection

Establishing an FTP connection

FTP connection establishment task list

To establish an FTP connection, perform the following tasks:

1. (Optional.) Specifying a source IP address for outgoing FTP packets
2. Establishing an FTP connection
3. Setting the FTP file transfer mode and operation mode

Restrictions and guidelines

The source IP address specified in the **ftp** command takes precedence over the one set by the **ftp client source** command.

The source IP address specified in the **ftp ipv6** command takes precedence over the one set by the **ftp client ipv6 source** command.

Specifying a source IP address for outgoing FTP packets

1. Enter system view.

   system-view

2. Specify a source IP address for outgoing FTP packets.

   IPv4:

   ftp client source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }

   By default, no source IP address is specified. The device uses the primary IP address of the output interface as the source IP address.

   IPv6:

   ftp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }

   By default, no source IPv6 address is specified. The source address is automatically selected as defined in RFC 3484.

Establishing an FTP connection

- Log in to the FTP server from user view.

  IPv4:

  ftp [*ftp-server* [*service-port*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ip** *source-ip-address* } | **-d**] *]

  IPv6:

  ftp ipv6 [*ftp-server* [*service-port*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* } | **-d**] * [**-i** *interface-type interface-number*]]

- Log in to the FTP server from FTP client view.

  a. Enter FTP client view.

     ftp [**ipv6**]

  b. Log in to the FTP server.

     open *server-address* [*service-port*]

Setting the FTP file transfer mode and operation mode

1. Enter FTP client view from user view.
   ftp
2. Set the file transfer mode.
   - Set the file transfer mode to ASCII.
     ascii
   - Set the file transfer mode to binary.
     binary

   The default file transfer mode is binary.
3. Change the FTP operation mode.
   passive

   The default FTP operation mode is passive.

Displaying command help information

1. Enter FTP client view from user view.
   ftp
2. Display command help information.
   - **help** [*command-name*]
   - **?** [*command-name*]

Displaying directories and files on the FTP server

1. Enter FTP client view from user view.
   ftp
2. Display directories and files on the FTP server.
   - **dir** [*remotefile* [*localfile*]]
   - **ls** [*remotefile* [*localfile*]]

Managing directories on the FTP server

Prerequisites

Use the **dir** or **ls** command to display the directories and files on the FTP server.

Procedure

1. Enter FTP client view from user view.
   ftp
2. Manage directories on the FTP server.
   - Display the working directory that is being accessed on the FTP server.
     pwd
   - Change the working directory on the FTP server.
     cd { *directory* | **..** | **/** }
   - Return to the upper level directory on the FTP server.
     cdup
   - Create a directory on the FTP server.

mkdir *directory*

- Delete a directory from the remote FTP server.
  rmdir *directory*

> **CAUTION:**
> Delete a directory from the FTP server with caution. When you delete a directory from the FTP server, make sure the directory is no longer in use.

Managing directories on the FTP client

1. Enter FTP client view from user view.
   ftp
2. Display or change the local working directory of the FTP client.
   lcd [*directory* | */*]
   To upload a file, use this command to change to the directory where the file resides. Downloaded files are saved in the working directory.

Working with files on the FTP server

Prerequisites

Use the **dir** or **ls** command to display the directories and files on the FTP server.

Procedure

1. Enter FTP client view from user view.
   ftp
2. Work with files on the FTP server.
   - Delete a file from the FTP server permanently.
     delete *remotefile*

> **CAUTION:**
> Delete a file from the FTP server permanently with caution. When you delete a file from the FTP server permanently, make sure the file is no longer in use.

   This command requires that you have the delete right.
   - Rename a file.
     rename [*oldfilename* [*newfilename*]]
   - Upload a file to the FTP server.
     put *localfile* [*remotefile*]
   - Download a file from the FTP server.
     get *remotefile* [*localfile*]
   - Add the content of a file on the FTP client to a file on the FTP server.
     append *localfile* [*remotefile*]
   - Specify the retransmit marker.
     restart *marker*
     Use this command together with the **put**, **get**, or **append** command.
   - Update a local file.

newer *remotefile*

- Get the missing part of a file.
  reget *remotefile* [*localfile*]

Changing to another user account

About changing to another user account

After you log in to the FTP server, you can initiate an FTP authentication to change to a new account. By changing to a new account, you can get a different privilege without re-establishing the FTP connection.

Restrictions and guidelines

For successful account change, you must enter the new username and password correctly. A wrong username or password can cause the FTP connection to be disconnected.

Procedure

1. Enter FTP client view from user view.
   ftp
2. Initiate an FTP authentication on the current FTP connection.
   user *username* [*password*]

Maintaining and troubleshooting the FTP connection

About maintaining and troubleshooting the FTP connection

After you use the device to establish an FTP connection to the FTP server, use the commands in this section to locate and troubleshoot problems about the FTP connection.

Procedure

1. Enter FTP client view from user view.
   ftp
2. Maintain and troubleshoot the FTP connection.
   - Display FTP commands supported by the FTP server.
     rhelp
   - Display help information about an FTP command that is supported by the FTP server.
     rhelp *protocol-command*
   - Display FTP server status.
     rstatus
   - Display detailed information about a directory or file on the FTP server.
     rstatus *remotefile*
   - Display FTP connection status.
     status
   - Display the system information of the FTP server.
     system
   - Enable or disable FTP operation information display.
     verbose

     By default, this function is enabled.
   - Enable FTP client debugging.

debug

By default, FTP client debugging is disabled.

- Clear the reply information in the buffer.

  reset

Terminating the FTP connection

1. Enter FTP client view from user view.

   ftp
2. Terminate the connection.
   - Terminate the connection to the FTP server without exiting FTP client view.

     disconnect

     close
   - Terminate the connection to the FTP server and return to user view.

     bye

     quit

Display and maintenance commands for the FTP client

Execute the **display** command in any view.

Task	Command
Display source IP address information on the FTP client.	**display ftp client source**

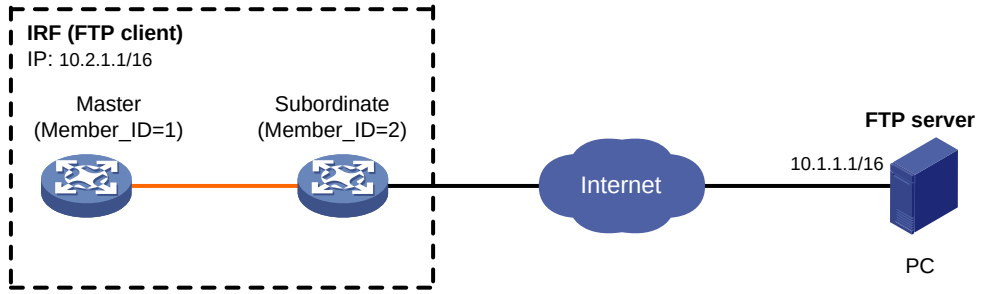
Example: Using the device as an FTP client

Network configuration

As shown in Figure 2, the PC is acting as an FTP server. A user account with username **abc** and password **hello12345** has been created on the PC.

- Use the IRF fabric as an FTP client to log in to the FTP server.
- Download the **temp.bin** file from the FTP server to the FTP client.

Figure 2 Network diagram



Note: The orange line represents an IRF connection.

Procedure

Configure IP addresses as shown in Figure 2. Make sure the IRF fabric and PC can reach each other. (Details not shown.)

Examine the storage space on the member devices. If the free space is insufficient, use the **delete/unreserved** *file* command to delete unused files. (Details not shown.)

Log in to the FTP server at 10.1.1.1 using username **abc** and password **hello12345**.

```
<Sysname> ftp 10.1.1.1
Press CTRL+C to abort.
Connected to 10.1.1.1 (10.1.1.1).
220 WFTPD 2.0 service (by Texas Imperial Software) ready for new user
User (10.1.1.1:(none)): abc
331 Give me your password, please
Password:
230 Logged in successfully
Remote system type is MSDOS.
ftp>
```

Set the file transfer mode to binary.

```
ftp> binary
200 TYPE is now 8-bit binary
```

Download the **temp.bin** file from the PC to the root directory of the flash memory on the master device.

```
ftp> get temp.bin
local: temp.bin remote: temp.bin
150 Connecting to port 47457
226 File successfully transferred
23951480 bytes received in 95.399 seconds (251.0 kbyte/s)
```

Download the **temp.bin** file from the PC to the root directory of the flash memory on the subordinate member (with member ID of 2).

```
ftp> get temp.bin slot2#flash:/temp.bin
```

Use the ASCII mode to upload configuration file **config.cfg** from the IRF fabric to the PC for backup.

```
ftp> ascii
200 TYPE is now ASCII
ftp> put config.cfg back-config.cfg
local: config.cfg remote: back-config.cfg
150 Connecting to port 47461
226 File successfully transferred
3494 bytes sent in 5.646 seconds (618.00 kbyte/s)
ftp> bye
221-Goodbye. You uploaded 2 and downloaded 2 kbytes.
221 Logout.
<Sysname>
```

Configuring TFTP

About TFTP

Trivial File Transfer Protocol (TFTP) is a simplified version of FTP for file transfer over secure reliable networks. TFTP uses UDP port 69 for data transmission. In contrast to TCP-based FTP, TFTP does not require authentication or complex message exchanges, and is easier to deploy. TFTP is suited for reliable network environments.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

TFTP is not supported in FIPS mode.

Restrictions and guidelines: TFTP configuration

You can upload a file from the device to the TFTP server or download a file from the TFTP server to the device.

As a best practice to download a file, specify a nonexistent file name as the destination file name. If you download a file with a file name that exists in the target directory, the device deletes the existing file and saves the new one. If file download fails due to network disconnection or other reasons, the original file cannot be restored.

The device can act only as a TFTP client.

Configuring and using the IPv4 TFTP client

1. Enter system view.

   system-view

2. (Optional.) Use an ACL to control the client's access to TFTP servers.

   tftp-server acl *acl-number*

   By default, no ACL is used for access control.

3. Specify the source IP address for TFTP packets sent by the TFTP client.

   tftp client source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }

   By default, no source IP address is specified. The device uses the primary IP address of the output interface as the source IP address.

4. Return to user view.

   quit

5. Download or upload a file in an IPv4 network.

   tftp *tftp-server* { **get** | **put** | **sget** } *source-filename* [*destination-filename*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ip** *source-ip-address* }] *

   The source IP address specified in this command takes precedence over the source IP address set by using the **tftp client source** command.

Configuring and using the IPv6 TFTP client

1. Enter system view.

   system-view

2. (Optional.) Use an ACL to control the client's access to TFTP servers.

   tftp-server ipv6 acl *ipv6-acl-number*

   By default, no ACL is used for access control.

3. Specify the source IPv6 address for TFTP packets sent by the TFTP client.

   tftp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }

   By default, no source IPv6 address is specified. The source address is automatically selected as defined in RFC 3484.

4. Return to user view.

   quit

5. Download or upload a file in an IPv6 network.

   tftp ipv6 *tftp-server* [**-i** *interface-type interface-number*] { **get** | **put** | **sget** } *source-filename* [*destination-filename*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }] *

   The source IP address specified in this command takes precedence over the one set by the **tftp client ipv6 source** command.

Contents

Managing file systems

This chapter describes how to manage file systems.

About file system management

Storage media and file systems

The device supports both fixed (the flash memory) and hot swappable (USB disk) storage media.

- The fixed storage medium has one file system.
- The hot swappable storage media can be partitioned. Each unpartitioned storage medium has one file system. On a partitioned storage medium, each partition has one file system.

Storage medium and file system naming conventions

The file system on the flash memory has the same name as the flash memory. The name has the following parts:

- Storage medium type **flash**.
- Colon (:).

A USB disk name and the file system names share the following parts:

- Storage medium type **usb**.
- Sequence number, a lower-case English letter such as a, b, or c.
- Partition number, a digit that starts at 0 and increments by 1. If the storage medium is not partitioned, the system determines that the storage medium has one partition. (The storage medium name does not contain a partition number.)
- Colon (:).

For example, the first USB disk is named **usba:**, and the file system on the first partition of the first USB disk is named **usba0:**.

IMPORTANT:

File system names are case sensitive and must be entered in lower case.

File system location

To identify a file system on the master device, you do not need to specify the file system location. To identify a file system on a subordinate member device, you must specify the file system location in the **slot***n***#** format. The *n* argument represents the IRF member ID of the member device. For example, the location is **slot2#** for a file system that resides on member device 2.

IMPORTANT:

The file system location string is case sensitive and must be entered in lower case.

Default file system

You are working with the default file system by default after you log in. To specify a file or directory on the default file system, you do not need to specify the file system name. For example, you do not need to specify any location information if you want to save the running configuration to the root directory of the default file system.

To change the default file system, use the Boot ROM menu. For more information, see the software release notes.

Directories

Directories in a file system are structured in a tree form.

Root directory

The root directory is represented by a forwarding slash (/). For example, **flash:/** represents the root directory of the flash memory.

Working directory

The working directory is also called the current directory.

Directory naming conventions

When you specify a name for a directory, follow these conventions:

- A directory name can contain letters, digits, and special characters except for asterisks (*), vertical bars (|), forward slashes (/), backward slashes (\), question marks (?), left angle brackets (<), right angle brackets (>), quotation marks ("), and colons (:).
- A directory whose name starts with a dot character (.) is a hidden directory. To prevent the system from hiding a directory, make sure the directory name does not start with a dot character.

Commonly used directories

The device has some factory-default directories. The system automatically creates directories during operation. These directories include:

- **diagfile**—Stores diagnostic information files.
- **logfile**—Stores log files.
- **seclog**—Stores security log files.
- **versionInfo**—Stores software version information files.

Files

File naming conventions

When you specify a name for a file, follow these conventions:

- A file name can contain letters, digits, and special characters except for asterisks (*), vertical bars (|), forward slashes (/), backward slashes (\), question marks (?), left angle brackets (<), right angle brackets (>), quotation marks ("), and colons (:).
- A file whose name starts with a dot character (.) is a hidden file. To prevent the system from hiding a file, make sure the file name does not start with a dot character.

Common file types

The device is shipped with some files. The system automatically creates files during operation. The types of these files include:

- **.ipe file**—Compressed software image package file.
- **.bin file**—Software image file.
- **.cfg file**—Configuration file.
- **.mdb file**—Binary configuration file.
- **.log file**—Log file.

Specifying a directory name or file name

Specifying a directory name

To specify a directory, you can use the absolute path or a relative path. For example, the working directory is **flash:/**. To specify the **test2** directory in Figure 1, you can use the following methods:

- **flash:/test/test1/test2** (absolute path)
- **flash:/test/test1/test2/** (absolute path)
- **test/test1/test2** (relative path)
- **test/test1/test2/** (relative path)

Figure 1 Sample directory hierarchy

Specifying a file name

To specify a file, use the following methods:

- Enter the absolute path of the file and the file name in the format of *filesystem*I*directory1*I*directory2*I…I*directoryn*I*filename*, where *directoryn* is the directory in which the file resides.
- Enter the relative path of the file and the file name.

For example, the working directory is **flash:/**. The **samplefile.cfg** file is in the **test2** directory shown in Figure 1. To specify the file, you can use the following methods:

- **flash:/test/test1/test2/samplefile.cfg**
- **test/test1/test2/samplefile.cfg**

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

Restrictions and guidelines: File system management

To avoid file system corruption, do not perform the following tasks during file system management:

- Install or remove storage media.
- Perform a master/subordinate switchover.

If you remove a storage medium while a directory or file on the medium is being accessed, the device might not recognize the medium when you reinstall it. To reinstall this kind of storage medium, perform one of the following tasks:

- If you were accessing a directory on the storage medium, change the working directory.
- If you were accessing a file on the storage medium, close the file.
- If another administrator was accessing the storage medium, unmount all partitions on the storage medium.

Make sure a USB disk is not write protected before an operation that requires the write right on the disk.

You cannot access a storage medium that is being partitioned, or a file system that is being formatted or repaired.

Before managing file systems, directories, and files, make sure you know the possible impact.

Managing storage media and file systems

Partitioning a storage medium

About partitioning a storage medium

A storage medium can be divided into logical devices called partitions. Operations on one partition do not affect the other partitions.

Restrictions and guidelines

IMPORTANT:

Partitioning a storage medium clears all data on the medium.

The flash memory does not support partitioning.

Before partitioning a storage medium, perform the following tasks:

- Make sure no other users are accessing the medium.
- To partition a USB disk, make sure the disk is not write protected. If the disk is write protected, the partition operation will fail. To restore access to the USB disk, you must reinstall the disk or remount the file systems on the disk.

A partition must have a minimum of 32 MB of storage space.

The actual partition size and the specified partition size might have a difference of less than 5% of the storage medium's total size.

Prerequisites

Back up the files in the storage medium.

Procedure

To partition a storage medium, execute the following command in user view:

fdisk *medium* [*partition-number*]

To partition a storage medium evenly, specify the *partition-number* argument. To customize the sizes of partitions, do not specify the *partition-number* argument. The command will require you to specify a size for each partition.

Mounting or unmounting a file system

Restrictions and guidelines

You can mount or unmount only a file system that is on a hot-swappable storage medium.

You can unmount a file system only when no other users are accessing the file system.

To prevent a USB disk and the USB interface from being damaged, make sure the following requirements are met before unmounting file systems on the USB disk:

- The system has recognized the USB disk.
- The USB disk LED is not blinking.

Mounting a file system

To mount a file system, execute the following command in user view:

mount *filesystem*

File systems on a hot-swappable storage medium are automatically mounted when the storage medium is connected to the device. If the system cannot recognize a file system, you must mount the file system before you can access it.

Unmounting a file system

To unmount a file system, execute the following command in user view:

umount *filesystem*

To remove a hot-swappable storage medium from the device, you must first unmount all file systems on the storage medium to disconnect the medium from the device. Removing a connected hot-swappable storage medium might damage files on the storage medium or even the storage medium itself.

Formatting a file system

Restrictions and guidelines

You can format a file system only when no other users are accessing the file system.

Procedure

To format a file system, execute the following command in user view:

format *filesystem*

△ **CAUTION:**

Formatting a file system permanently deletes all files and directories in the file system. You cannot restore the deleted files or directories. If a startup configuration file exists in the file system, back up the file if necessary.

Repairing a file system

Restrictions and guidelines

If part of a file system is inaccessible, use this task to examine and repair the file system.

You can repair a file system only when no other users are accessing the file system.

Procedure

To repair a file system, execute the following command in user view:

fixdisk *filesystem*

Managing files and directories

Setting the operation mode for files and directories

About file and directory operation modes

The device supports the following operation modes:

- **alert**—The system prompts for confirmation when your operation might cause problems such as file corruption or data loss. This mode provides an opportunity for you to cancel a disruptive operation.
- **quiet**—The system does not prompt for confirmation when you perform a file or directory operation except the recycle bin emptying operation.

Procedure

1. Enter system view.

   system-view
2. Set the operation mode for files and directories.

   file prompt { **alert** | **quiet** }

   The default mode is alert.

Displaying file and directory information

To display file and directory information, execute the following command in user view:

dir [**/all**] [*file* | *directory* | **/all-filesystems**]

If multiple users perform file operations (for example, creating or deleting files or directories) at the same time, the output from this command might be incorrect.

Displaying the contents of a text file

To display the contents of a text file, execute the following command in user view:

more *file*

Displaying the working directory

To display the working directory, execute the following command in user view:

pwd

Changing the working directory

About changing the working directory

The default working directory is the root directory of the default file system on the master device.

Procedure

To change the working directory, execute the following command in user view:

cd { *directory* | **..** }

Creating a directory

To create a directory, execute the following command in user view:

mkdir *directory*

Renaming a file or directory

To rename a file or directory, execute the following command in user view:

rename { *source-file* | *source-directory* } { *dest-file* | *dest-directory* }

Copying a file

To copy a file, execute the command in user view.

In non-FIPS mode:

copy *source-file* { *dest-file* | *dest-directory* } [**source interface** *interface-type interface-number*]

In FIPS mode:

copy *source-file* {*dest-file* |*dest-directory*}

Moving a file

To move a file, execute the following command in user view:

move *source-file* {*dest-file* | *dest-directory*}

Deleting and restoring files

About deleting and restoring a file

You can delete a file permanently or move it to the recycle bin of the file system. A file moved to the recycle bin can be restored, but a permanently deleted file cannot.

Each file system has a recycle bin. A recycle bin is a directory named **.trash** in the root directory of the file system.

Restrictions and guidelines

Files in the recycle bin occupy storage space. To release the occupied storage space, delete files from the recycle bin.

To delete files from the recycle bin, use the **reset recycle-bin** command. If you use the **delete** command, the recycle bin might not be able to operate correctly.

To display files in a recycle bin, use one of the following methods:

- Access the root directory of the file system and execute the **dir /all .trash** command.
- Access the recycle bin directory of the file system and execute the **dir** command.

Deleting a file

To delete a file, execute one of the following commands in user view:

- Delete a file by moving it to the recycle bin.
  delete *file*
- Delete a file permanently.
  delete /unreserved *file*

CAUTION:
The **delete /unreserved** *file* command deletes a file permanently. The file cannot be restored.

- Delete files from the recycle bin.
  reset recycle-bin [**/force**]

CAUTION:

The files in a recycle bin can be restored by using the **undelete** command. If you delete a file from the recycle bin, that file cannot be restored. Before you delete files from a recycle bin, make sure the files are no longer in use.

Restoring a file

To restore a file from the recycle bin, execute the following command in user view:

undelete *file*

Deleting a directory

To delete a directory, execute the following command in user view:

rmdir *directory*

CAUTION:

To delete a directory, you must first delete all files and subdirectories in the directory permanently or move them to the recycle bin. If you move them to the recycle bin, executing the **rmdir** command to delete the directory will delete them permanently. Before you use the **rmdir** command to delete a directory, you must make sure the directory and its files and subdirectories are no longer in use.

Archiving files and directories

About archiving files and directories

You can archive files and directories to a single file for purposes such as file backup. The original files and directories still exist.

When you archive files and directories, you can choose to compress the archive files so the archive files use less storage space.

Procedure

To archive files and directories, execute the following command in user view:

tar create [**gz**] **archive-file** *dest-file* [**verbose**] **source** { *source-file* | *source-directory* }&<1-5>

Extracting files and directories

About extracting files and directories

Use this feature to extract files and directories from archive files.

Restrictions and guidelines

To specify the **screen** keyword for the **tar extract** command, first use the **tar list** command to identify the types of the archived files. As a best practice, specify the keyword only if all archived files are text files. Displaying the content of an archived non-text file that contains terminal control characters might result in garbled characters and even cause the terminal unable to operate correctly. To use the terminal again, you must close the current connection and log in to the device again.

Procedure

To extract files and directories, execute the following commands in user view:

1. (Optional.) Display archived files and directories.

tar list archive-file *file*

2. Extract files and directories.
   tar extract archive-file *file* [**verbose**] [**screen** | **to** *directory*]

Compressing a file

To compress a file, execute the following command in user view:

gzip *file*

Decompressing a file

To decompress a file, execute the following command in user view:

gunzip *file*

Calculating the file digest

About file digests

File digests are used to verify file integrity.

Procedure

To calculate the digest of a file, execute one of the following commands in user view:

- Use the SHA-256 algorithm.
  sha256sum *file*
- Use the MD5 algorithm.
  md5sum *file*

Executing a batch file

About batch file and batch file execution

A batch file contains a set of commands. Executing a batch file executes the commands in the file one by one.

Restrictions and guidelines

To execute a batch file on the device, create a batch file on a PC and load the batch file to the device.

As a best practice, try every command on the device to make sure the command line can be executed correctly before adding the command to a batch file. If a command is invalid or a condition for executing the command is not met, the command fails and the system continues to execute the next command.

When executing an interactive command in a batch file, the system uses the default inputs.

Procedure

1. Enter system view.
   system-view
2. Execute a batch file.
   execute *filename*

Contents

Managing configuration files

About configuration file management

You can manage configuration files from the CLI or the BootWare menu. The following information explains how to manage configuration files from the CLI.

A configuration file saves a set of commands for configuring software features on the device. You can save any configuration to a configuration file so the configuration can survive a reboot. You can also back up configuration files to a host for future use.

Configuration types

Initial configuration

Initial configuration is the collection of initial default settings for the configuration commands in software.

The device starts up with the initial configuration if you access the BootWare menu and select the **Skip Current System Configuration** option. In this situation, the device might also be described as starting up with empty configuration.

No commands are available to display the initial configuration. To view the initial default settings for the configuration commands, see the Default sections in the command references.

Factory defaults

Factory defaults are custom basic settings that came with the device. Factory defaults vary by device models and might differ from the initial default settings for the commands.

The device starts up with the factory defaults if no next-startup configuration files are available.

To display the factory defaults, use the **`display default-configuration`** command.

Startup configuration

The device uses startup configuration to configure software features during startup. After the device starts up, you can specify the configuration file to be loaded at the next startup. This configuration file is called the next-startup configuration file. The configuration file that has been loaded is called the current startup configuration file.

You can display the startup configuration by using one of the following methods:

- To display the contents of the current startup configuration file, execute the **`display current-configuration`** command before changing the configuration after the device reboots.
- To display the contents of the next-startup configuration file, use the **`display saved-configuration`** command.
- Use the **`display startup`** command to display names of the current startup configuration file and next-startup configuration files. Then, you can use the **`more`** command to display the contents of the specified startup configuration file.

Running configuration

The running configuration includes unchanged startup settings and new settings. The running configuration is stored in memory and is cleared at a device reboot or power off. To use the running configuration after a power cycling or reboot, save it to a configuration file.

To display the running configuration, use the **`display current-configuration`** command.

Configuration file types and file selection process at startup

When you save the configuration, the system saves the settings to a .cfg configuration file and to an .mdb file.

- A .cfg configuration file is a human-readable text file and its contents can be displayed by using the **more** command. Configuration files you specify for saving the configuration must use the .cfg extension.
- An .mdb file is a user-inaccessible binary file that has the same name as the .cfg file. The device loads an .mdb file faster than loading a .cfg file.

At startup, the device uses the following procedure to identify the configuration file to load:

1. The device searches for a valid .cfg next-startup configuration file. For more information about the file selection rules, see "Next-startup configuration file redundancy."
2. If a valid .cfg next-startup configuration file is found, the device searches for an .mdb file that has the same name and checksum as the .cfg file.
3. If a matching .mdb file is found, the device starts up with the .mdb file. If none is found, the device starts up with the .cfg file.

If no .cfg next-startup configuration files are available, the device starts up with the factory defaults.

Unless otherwise stated, the term "configuration file" in this document refers to a .cfg configuration file.

Next-startup configuration file redundancy

You can specify one main next-startup configuration file and one backup next-startup configuration file for redundancy.

At startup, the device tries to select the .cfg startup configuration in the following order:

1. The main next-startup configuration file.
2. The backup next-startup configuration file if the main next-startup configuration file does not exist or is corrupt.

If no next-startup configuration files are available, the device starts up with the factory defaults.

Configuration file content organization and format

IMPORTANT:

To run on the device, a configuration file must meet the content and format requirements. To ensure a successful configuration load, rollback, or restoration, use a configuration file created on the device. If you edit the configuration file, make sure all edits are compliant with the requirements.

A configuration file must meet the following requirements:

- All commands are saved in their complete form.
- No command lines contain invalid characters.

IMPORTANT:

Some command lines (for example, the **sysname** command) cannot contain question marks (?) or horizontal tabs (\t). If the system loads a configuration file that contains the **sysname abc??** command line at startup, the system will ignore the command line and use the default system name. If the system uses that configuration file to roll back or restore the configuration, the system name will not be rolled back or restored.

- Commands are sorted into sections by different command views, including system view, interface views, protocol views, and user line views.
- Two adjacent sections are separated by a pound sign (#).
- The configuration file ends with the word **return**.

The following is a sample configuration file excerpt:

```
#
local-user root class manage
 password hash
$h$6$Twd73mLrN8O2vvD5$Cz1vgdpR4KoTiRQNE9pg33gU14Br2p1VguczLSVyJLO2huV5Syx/LfDIf8ROLtV
ErJ/C31oq2rFtmNuyZf4STw==
 service-type ssh telnet terminal
 authorization-attribute user-role network-admin
 authorization-attribute user-role network-operator
#
interface Vlan-interface1

```

Configuration rollback

Configuration rollback allows you to replace the running configuration with the configuration in a configuration file without rebooting the device. You can use this feature for the following purposes:

- Reverting to a previous configuration state.
- Adapting the running configuration to different network environments.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see *Security Configuration Guide*.

Enabling configuration encryption

About configuration encryption

Configuration encryption enables the device to encrypt a startup configuration file automatically when it saves the running configuration. All devices running Comware 7 software use the same private key or public key to encrypt configuration files.

Restrictions and guidelines

Any devices running Comware 7 software can decrypt the encrypted configuration files. To prevent an encrypted file from being decoded by unauthorized users, make sure the file is accessible only to authorized users.

You cannot use the **more** command to view the contents of an encrypted configuration file.

Procedure

1. Enter system view.

   system-view
2. Enable configuration encryption.

configuration encrypt { **private-key** | **public-key** }

By default, configuration encryption is disabled.

Disabling automatic system-wide next-startup configuration file operations

About automatic system-wide next-startup configuration file operations

By default, automatic system-wide next-startup configuration file operations are enabled. The system performs the following operations on all IRF subordinate devices in addition to the master device:

- Saves the running configuration to the next-startup configuration file on each member device when you execute the **save** [**safely**] [**backup** | **main**] [**force**] [**changed**] command.
- Deletes the next-startup configuration file on each member device when you execute the **reset saved-configuration** command.

If you disable automatic system-wide next-startup configuration file operations, the system saves the running configuration or deletes the next-startup configuration file only on the master device.

Automatic system-wide operations ensure start-up configuration file consistency between the master and subordinate devices. However, a system-wide operation takes more time than an operation performed only on the master device. In addition, the amount of time required to complete a system-wide configuration operation increases as the amount of configuration data grows.

If you are disabling automatic system-wide operations for faster configuration saving, be aware that the next-startup configuration files will be inconsistent between the master device and the subordinate devices.

Procedure

1. Enter system view.

   system-view

2. Disable automatic system-wide next-startup configuration file operations.

   undo standby auto-update config

   By default, next-startup configuration file operations are automatically synchronized across the entire system.

Saving the running configuration

About running configuration saving methods

When you save the running configuration to a .cfg configuration file, you can specify the file as a next-startup configuration file or not.

If you are specifying the file as a .cfg next-startup configuration file, use one of the following methods to save the configuration:

- **Fast mode**—Use the **save** command without the **safely** keyword. In this mode, the device directly overwrites the target next-startup configuration file. If a reboot or power failure occurs during this process, the next-startup configuration file is lost. You must specify a new startup configuration file after the device reboots (see "Specifying a next-startup configuration file").
- **Safe mode**—Use the **save** command with the **safely** keyword. Safe mode is slower than fast mode, but more secure. In safe mode, the system saves the configuration in a temporary file and starts overwriting the target next-startup configuration file after the save operation is complete. If a reboot or power failure occurs during the save operation, the next-startup

configuration file is still retained. Use the safe mode if the power source is not reliable or you are remotely configuring the device.

Restrictions and guidelines

To prevent the loss of next-startup configuration, make sure no one reboots or power cycles the device while the device is saving the running configuration.

When an IRF member device splits from the IRF fabric, its settings are retained in memory but removed from the running configuration on the IRF fabric. Saving the running configuration before the IRF fabric recovers will remove the member device's settings from the next-startup configuration file.

If you have saved the running configuration before the member device rejoins the IRF fabric, perform the following steps to restore the member device settings to the next-startup configuration file:

1. Resolve the split issue.
2. Reboot the member device to rejoin the IRF fabric.
3. After the member device rejoins the IRF fabric, execute the **display current-configuration** command to verify that the member device's settings have been restored from memory to the running configuration.
4. Save the running configuration to the next-startup configuration file on the IRF fabric.

IMPORTANT:

To ensure a successful configuration restoration, make sure the IRF fabric has not rebooted after the member device left.

By default, the **save** [**safely**] [**backup** | **main**] [**force**] [**changed**] command saves the configuration to all IRF member devices. To save the configuration only to the master device, disable automatic system-wide next-startup configuration file operations. For more information, see "Disabling automatic system-wide next-startup configuration file operations."

Procedure

To save the running configuration, perform one of the following tasks in any view:

- Save the running configuration to a configuration file without specifying the file as a next-startup configuration file.

  save *file-url* [**all** | **slot** *slot-number*]

- Save the running configuration to a configuration file in the root directory of the storage medium, and specify the file as a next-startup configuration file.

  save [**safely**] [**backup** | **main**] [**force**] [**changed**]

  As a best practice, specify the **safely** keyword for reliable configuration saving.

CAUTION:

Use the **save** command with caution. This command will overwrite the settings in the target configuration file. Carefully read the messages generated on the device when you use this command and make sure you fully understand the impact of this command when you execute it.

Comparing configurations for their differences

About configuration comparison

You can compare configuration files or compare a configuration file with the running configuration for their differences.

If you specify the next-startup configuration for a comparison, the system selects the next-startup configuration file to be compared with in the following order:

1. The main next-startup configuration file.
2. The backup next-startup configuration file if the main next-startup configuration file is unavailable.

If both configuration files are unavailable, the system displays a message indicating that no next-startup configuration files exist.

Procedure

To compare configurations for their differences, perform one of the following tasks in any view:

- Display the differences that a configuration file, the running configuration, or the next-startup configuration has as compared with the specified source configuration file.

  display diff configfile *file-name-s* { **configfile** *file-name-d* | **current-configuration** | **startup-configuration** }

- Display the differences that a configuration file or next-startup configuration has as compared with the running configuration.

  display diff current-configuration { **configfile** *file-name-d* | **startup-configuration** }

- Display the differences that a configuration file has as compared with the next-startup configuration.

  display diff startup-configuration configfile *file-name-d*

- Display the differences that the running configuration has as compared with the next-startup configuration.
  - Method 1:

    display diff startup-configuration current-configuration
  - Method 2:

    display current-configuration diff

Configuring configuration rollback

Configuration rollback tasks at a glance

To configure configuration rollback, perform the following tasks:

1. Setting configuration archive parameters
2. Archiving the running configuration
   - Enabling automatic configuration archiving
   - Manually archiving the running configuration
3. Rolling back configuration

Setting configuration archive parameters

About setting configuration archive parameters

Before archiving the running configuration, you must set a file directory and file name prefix for configuration archives.

The archive directory can be located on the local device or on a remote SCP server.

If you use local archiving, configuration archives are named in the format of *prefix_serial number***.cfg**, for example, **archive_1.cfg** and **archive_2.cfg**. The serial number is automatically assigned from 1 to 1000, increasing by 1. After the serial number reaches 1000, it restarts from 1.

If you change the file directory or file name prefix on the local device, the following events occur:

- The old configuration archives change to common configuration files.
- The configuration archive counter is reset. The serial number for new configuration archives starts at 1.
- The **display archive configuration** command no longer displays the old configuration archives.

The configuration archive counter does not restart when you delete configuration archives from the archive directory. However, if the device reboots after all configuration archives have been deleted, the configuration archive counter restarts. The serial number for new configuration archives starts at 1.

If you archive the running configuration to a remote SCP server, configuration archives are named in the format of *prefix_YYYYMMDD_HHMMSS***.cfg**, for example, **archive_20170526_203430.cfg**.

If you change the file directory or file name prefix on the remote SCP server, the **display archive configuration** command no longer displays the old configuration archives saved before the change.

Restrictions and guidelines for setting configuration archive parameters

Local archiving (the **archive configuration location** command) and remote archiving (the **archive configuration server** command) are mutually exclusive. You cannot use the two features at the same time.

IMPORTANT:

In FIPS mode, the device does not support archiving the running configuration to a remote SCP server.

With local configuration archiving, the system deletes the oldest archive to make room for the new archive after the maximum number of configuration archives is reached.

The maximum number of configuration archives on a remote SCP server depends on the SCP server setting and is not restricted by the **archive configuration max** command.

The **undo archive configuration location** command removes the local configuration archive directory and file name prefix settings, but it does not delete the configuration archives on the device. The command also performs the following operations:

- Disables both the manual and automatic configuration archiving features.
- Restores the default settings for the **archive configuration interval** and **archive configuration max** commands.
- Clears the configuration archive information displayed by using the **display archive configuration** command.

The **undo archive configuration server** command removes the remote configuration archive directory and file name prefix settings, but it does not delete the configuration archives on the server. The command also performs the following operations:

- Disables both the manual and automatic configuration archiving features.
- Restores the default setting for the **archive configuration interval** command.
- Clears the configuration archive information displayed by using the **display archive configuration** command.

Configuring local archiving parameters

1. Enter system view.

   system-view

2. Set the directory and file name prefix for archiving the running configuration to the local device.

   archive configuration location *directory* **filename-prefix** *filename-prefix*

   By default, no path or file name prefix is set for configuration archives on the device, and the system does not regularly save configuration.

   In an IRF fabric, the configuration archive directory must already exist on the master device and cannot include a member ID.

3. (Optional.) Set the maximum number of configuration archives.

   archive configuration max *file-number*

   The default number is 5.

   Change the setting depending on the amount of storage available on the device.

Configuring remote archiving parameters

1. Enter system view.

   system-view

2. Set the directory and file name prefix for archiving the running configuration on a remote SCP server.

   archive configuration server scp { *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**directory** *directory*] **filename-prefix** *filename-prefix*

   By default, no path or file name prefix is set for archiving the running configuration to a remote SCP server.

3. Configure the username and password for accessing the remote SCP server:

   a. Configure the username.

      archive configuration server user *user-name*

      By default, no username is configured for accessing the SCP server.

   b. Configure the password.

      archive configuration server password { **cipher** | **simple** } *string*

      By default, no password is configured for accessing the SCP server.

   Make sure the username and password are the same as the SCP account settings on the SCP server.

Archiving the running configuration

About archiving the running configuration

The following are methods for archiving the running configuration:

- **Automatic configuration archiving**—The system automatically archives the running configuration at intervals as configured.
- **Manual configuration archiving**—You can disable automatic configuration archiving and manually archive the running configuration if the configuration will not be changed very often. You can also use this method before performing complicated configuration tasks. If the configuration attempt fails, you can use the archive for configuration recovery.

Restrictions and guidelines for archiving the running configuration

If you use local archiving, the configuration archive feature saves the running configuration only on the master device. To make sure the system can archive the running configuration after a master/subordinate switchover, create the configuration archive directory on all IRF members.

If a local archiving has started based on the existing archive parameters when an archive parameter is changed, the archive will still be retained in the old directory. However, the **display archive configuration** command will not display the record about this archiving.

When you modify parameters (for example, the username or password) for remote archiving, make sure the changes are consistent between the device and the server. A manual or automatic remote archiving will fail if it has started before you change the device and the server settings to be consistent.

Enabling automatic configuration archiving

1. Enter system view.

   system-view

2. Enable automatic configuration archiving and set the archiving interval.

   archive configuration interval *interval*

   By default, automatic configuration archiving is disabled.

Manually archiving the running configuration

Manually archive the running configuration in user view.

archive configuration

Rolling back configuration

About configuration rollback

The configuration rollback feature compares the running configuration against the specified replacement configuration file and handles configuration differences as follows:

- If a command in the running configuration is not in the replacement file, the rollback feature executes the **undo** form of the command.
- If a command in the replacement file is not in the running configuration, the rollback feature adds the command to the running configuration.
- If a command has different settings in the running configuration and the replacement file, the rollback feature replaces the running command setting with the setting in the replacement file.

Restrictions and guidelines

To ensure a successful rollback, do not perform a master/subordinate switchover while the system is rolling back the configuration.

The configuration rollback feature might fail to reconfigure some commands in the running configuration for one of the following reasons:

- A command cannot be undone because prefixing the **undo** keyword to the command does not result in a valid **undo** command. For example, if the **undo** form designed for the **A** [**B**] **C** command is **undo A C**, the configuration rollback feature cannot undo the **A B C** command. This is because the system does not recognize the **undo A B C** command.
- A command (for example, a hardware-dependent command) cannot be deleted, overwritten, or undone due to system restrictions.
- The commands in different views are dependent on each other.
- Commands or command settings that the device does not support cannot be added to the running configuration.

Make sure the replacement configuration file is created by using the configuration archive feature or the **save** command on the local device. If the configuration file is not created on the local device, make sure the command lines in the configuration file are fully compatible with the local device.

If the replacement configuration file is encrypted, make sure the device can decrypt it.

Procedure

1. Enter system view.

   system-view

2. Roll the running configuration back to the configuration defined by a configuration file.

   configuration replace file *filename*

CAUTION:

The configuration rollback feature replaces the running configuration with the configuration in a configuration file without rebooting the device. This operation will cause settings not in the replacement configuration file to be lost, which might cause service interruption. When you perform configuration rollback, make sure you fully understand its impact on your network.

The specified configuration file must be saved on the local system.

Configuring configuration commit delay

About configuration commit delay

This feature enables the system to automatically remove the settings you made during a configuration commit delay interval if you have not manually committed them.

You specify the configuration commit delay interval by using the configuration commit delay timer. The system creates a rollback point to record the configuration status when you start the configuration commit delay timer. The settings you made during the configuration commit delay interval takes effect immediately. However, these settings will be removed automatically if you have not manually committed them before the configuration commit delay timer expires. Then, the system returns to the configuration status when the configuration commit delay timer started.

This feature prevents a misconfiguration from causing the inability to access the device and is especially useful when you configure the device remotely.

Restrictions and guidelines

When you use this feature, follow these restrictions and guidelines:

- In a multi-user context, make sure no one else is configuring the device.
- To avoid unexpected errors, do not perform any operations during the configuration rollback.
- You can reconfigure the configuration commit delay timer before it expires to shorten or extend the commit delay interval. However, the rollback point will not change.
- The configuration commit delay feature is a one-time setting. The feature is disabled with the rollback point removed when the commit delay timer expires or after a manual commit operation is performed. To use this feature again, you must restart the timer.

Procedure

1. Enter system view.

   system-view

2. Enable the configuration commit delay feature and start the commit delay timer.

   configuration commit delay *delay-time*

3. (Optional.) Commit the settings configured after the commit delay timer started.

   configuration commit

Specifying a next-startup configuration file

Restrictions and guidelines

CAUTION:
Using the **undo startup saved-configuration** command can cause an IRF split after the IRF fabric or an IRF member reboots. When you execute this command, make sure you understand its impact on your network.

As a best practice, specify different files as the main and backup next-startup configuration files.

The **undo startup saved-configuration** command changes the attribute of the main or backup next-startup configuration file to NULL instead of deleting the file.

Prerequisites

In an IRF fabric, make sure the specified configuration file is valid and has been saved to the root directory of a storage medium on each member device. In addition, make sure the storage media are the same type across all IRF member devices.

Procedure

1. Specify a next-startup configuration file. Choose one of the following methods:
   - Execute the following command in user view to specify a next-startup configuration file:
     startup saved-configuration *cfgfile* [**backup** | **main**]
     By default, no next-startup configuration files are specified.
   - Execute the following command in any view to save the running configuration to a file and specify the file as a next-startup configuration file:
     save [**safely**] [**backup** | **main**] [**force**]
     For more information about this command, see "Saving the running configuration."

   If you do not specify the **backup** or **main** keyword, this command specifies the configuration file as the main next-startup configuration file.
2. (Optional.) Verify the configuration. Use one of the following commands in any view:
   - Display the names of the configuration files for this startup and the next startup.
     display startup
   - Display the contents of the configuration file for the next system startup.
     display saved-configuration

Backing up and restoring the main next-startup configuration file

About backing up and restoring the main next-startup configuration file

You can back up the main next-startup configuration file to a TFTP server or restore the main next-startup configuration file from a TFTP server.

Restrictions and guidelines for configuration backup and restoration

Configuration backup and restoration are not supported in FIPS mode.

Prerequisites for configuration backup and restoration

Before you back up or restore the main next-startup configuration file, perform the following tasks:

- Make sure the following requirements are met:
  - The server is reachable.
  - The server is enabled with TFTP service.
  - You have read and write permissions to the server.
- For configuration backup, use the **display startup** command to verify that the main next-startup configuration file has been specified in user view. If no next-startup configuration file has been specified or the specified configuration file does not exist, the backup operation will fail.

Backing up the main next-startup configuration file to a TFTP server

To back up the main next-startup configuration file to a TFTP server, execute the following command in user view:

backup startup-configuration to { *ipv4-server* | **ipv6** *ipv6-server* } [*dest-filename*]

Restoring the main next-startup configuration file from a TFTP server

1. Restore the main next-startup configuration file from a TFTP server in user view.

   restore startup-configuration from { *ipv4-server* | **ipv6** *ipv6-server* } *src-filename*
2. (Optional.) Verify that the specified configuration file has been set as the main next-startup configuration file. Use one of the following commands in any view:
   - Display the names of the configuration files for this startup and the next startup.

     display startup
   - Display the contents of the configuration file for the next system startup.

     display saved-configuration

Deleting a next-startup configuration file

About deleting a next-startup configuration file

You can perform this task to delete a next-startup configuration file.

If both the main and backup next-startup configuration files are deleted, the device uses the factory defaults at the next startup.

To delete a file that is set as both main and backup next-startup configuration files, you must execute both the **reset saved-configuration backup** command and the **reset saved-configuration main** command. Using only one of the commands removes the specified file attribute instead of deleting the file.

For example, if the **reset saved-configuration backup** command is executed, the backup next-startup configuration file setting is set to NULL. However, the file is still used as the main file. To delete the file, you must also execute the **reset saved-configuration main** command.

Restrictions and guidelines

CAUTION:

By default, this task permanently deletes a next-startup configuration file from all IRF member devices. To delete the configuration file only from the master device, disable automatic system-wide next-startup configuration file operations. For more information, see "Disabling automatic system-wide next-startup configuration file operations."

If you do not specify the **backup** or **main** keyword when you perform this task, the main next-startup configuration is deleted.

Procedure

To delete a next-startup configuration file, execute the following command in user view:

reset saved-configuration [**backup** | **main**]

Display and maintenance commands for configuration files

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display configuration archive information.	**display archive configuration**
Display the running configuration.	**display current-configuration** [[**configuration** [*module-name*] | **interface** [*interface-type* [*interface-number*]]] [**all**] | **slot** *slot-number*]
Display the differences that the running configuration has as compared with the next-startup configuration.	**display current-configuration diff**
Display the factory defaults.	**display default-configuration**
Display the differences between configurations.	• **display diff configfile** *file-name-s* { **configfile** *file-name-d* | **current-configuration** | **startup-configuration** } • **display diff current-configuration** { **configfile** *file-name-d* | **startup-configuration** } • **display diff startup-configuration** { **configfile** *file-name-d* | **current-configuration** }

Task	Command
Display the contents of the configuration file for the next system startup.	**display saved-configuration**
Display the names of the configuration files for this startup and the next startup.	**display startup**
Display the valid configuration in the current view.	**display this** [**all**]
Delete next-startup configuration files.	**reset saved-configuration** [**backup** | **main**]

Contents

Upgrading software

About software upgrade

Software upgrade enables you to upgrade a software version, add new features, and fix software bugs. This chapter describes software types and release forms, compares software upgrade methods, and provides the procedures for upgrading software from the CLI.

Software types

The following software types are available:

- **BootWare image**—Also called the Boot ROM image. This image contains a basic segment and an extended segment.
  - The basic segment is the minimum code that bootstraps the system.
  - The extended segment enables hardware initialization and provides system management menus. When the device cannot start up correctly, you can use the menus to load software and the startup configuration file or manage files.

  Typically, the BootWare image is integrated into the Boot image to avoid software compatibility errors.
- **Comware image**—Includes the following image subcategories:
  - **Boot image**—A .bin file that contains the Linux operating system kernel. It provides process management, memory management, and file system management.
  - **System image**—A .bin file that contains the Comware kernel and standard features, including device management, interface management, configuration management, and routing.
  - **Feature image**—A .bin file that contains advanced or customized software features. You can purchase feature images as needed.
  - **Patch image**—A .bin file that is released for fixing bugs without rebooting the device. A patch image does not add or remove features.

    Patch images have the following types:

    - **Incremental patch images**—A new patch image can cover all, part, or none of the functions provided by an old patch image. A new patch image can coexist with an old patch image on the device only when the former covers none of the functions provided by the latter.
    - **Non-incremental patch images**—A new non-incremental patch image covers all functions provided by an old non-incremental patch image. Each boot, system, or feature image can have one non-incremental patch image, and these patch images can coexist on the device. The device uninstalls the old non-incremental patch image before installing a new non-incremental patch image.

    An incremental patch image and a non-incremental patch image can coexist on the device.

  Comware images that have been loaded are called current software images. Comware images specified to load at the next startup are called startup software images.

BootWare image, boot image, and system image are required for the device to operate.

You can install up to 32 .bin files on the device, including one boot image file, one system image file, and up to 30 feature and patch image files.

Software release forms

Software images are released in one of the following forms:

- Separate .bin files. You must verify compatibility between software images.
- As a whole in one .ipe package file. The images in an .ipe package file are compatible. The system decompresses the file automatically, loads the .bin images and sets them as startup software images.

NOTE:

Software image file names use the *model-comware version-im*age *type-release* format. This document uses **boot.bin** and **system.bin** as boot and system image file names.

Upgrade methods

Upgrade method	Software types	Remarks
Upgrading from the CLI by using the boot loader method	• BootWare image • Comware images (excluding incremental patches)	This method is disruptive. You must reboot the entire device to complete the upgrade.
Upgrading from the BootWare menu	• BootWare image • Comware images	Use this method when the device cannot start up correctly. To use this method, first connect to the console port and power cycle the device. Then, press **Ctrl+B** at prompt to access the BootWare menu. For more information about upgrading software from the BootWare menu, see the release notes for the software version. **IMPORTANT:** Use this method only when you do not have any other choice.

This chapter covers only upgrading software from the CLI by using the boot loader method.

Software image loading

Startup software images

To upgrade software, you must specify the upgrade files as the startup software images for the device to load at next startup. You can specify two lists of software images: one main and one backup. The device first loads the main startup software images. If the main startup software images are not available, the devices loads the backup startup software images.

Image loading process at startup

At startup, the device performs the following operations after loading and initializing BootWare:

1. Loads main images.
2. If any main image does not exist or is invalid, loads the backup images.
3. If any backup image does not exist or is invalid, the device cannot start up.

Restrictions and guidelines: Software upgrade

As a best practice, store the startup images in a fixed storage medium. If you store the startup images in a hot swappable storage medium, do not remove the hot swappable storage medium during the startup process.

Upgrading device software by using the boot loader method

Software upgrade tasks at a glance

To upgrade software, perform one of the following tasks:

1. Upgrade the IRF fabric:
   a. (Optional.) Preloading the BootWare image to BootWare

      If a BootWare upgrade is required, you can perform this task to shorten the subsequent upgrade time. This task helps reduce upgrade problems caused by unexpected power failure. If you skip this task, the device upgrades the BootWare automatically when it upgrades the startup software images.

   b. Specifying startup images and completing the upgrade
2. (Optional.) Synchronizing startup images from the master device to subordinate devices

   Perform this task when the startup images on subordinate devices are not the same version as those on the master device.

Prerequisites

1. Use the **display version** command to verify the current BootWare image version and startup software version.
2. Use the release notes for the upgrade software version to evaluate the upgrade impact on your network and verify the following items:
   - Software and hardware compatibility.
   - Version and size of the upgrade software.
   - Compatibility of the upgrade software with the current BootWare image and startup software image.
3. Use the **dir** command to verify that all IRF member devices have sufficient storage space for the upgrade images. If the storage space is not sufficient, delete unused files by using the **delete** command. For more information, see "Managing file systems."
4. Use FTP or TFTP to transfer the upgrade image file to the root directory of a file system. For more information about FTP and TFTP, see "Configuring FTP" or "Configuring TFTP." For more information about file systems, see "Managing file systems."

Preloading the BootWare image to BootWare

To load the upgrade BootWare image to the Normal area of BootWare, execute the following command in user view:

bootrom update file *file* **slot** *slot-number-list*

Specify the downloaded software image file for the *file* argument.

The new BootWare image takes effect at a reboot.

Specifying startup images and completing the upgrade

Perform the following steps in user view:

1. Specify main or backup startup images for all member devices.
   - Use an .ipe file:

     boot-loader file *ipe-filename* [**patch** *filename*&<1-16>] { **all** | **slot** *slot-number* } { **backup** | **main** }
   - Use .bin files:

     boot-loader file boot *filename* **system** *filename* [**feature** *filename*&<1-30>] [**patch** *filename*&<1-16>] { **all** | **slot** *slot-number* } { **backup** | **main** }

   As a best practice in a multichassis IRF fabric, specify the **all** keyword for the command. If you use the **slot** *slot-number* option to upgrade member devices one by one, version inconsistencies occur among the member devices during the upgrade.
2. Save the running configuration.

   save

   This step ensures that any configuration you have made can survive a reboot.
3. Reboot the IRF fabric.

   reboot
4. (Optional.) Verify the software image settings.

   display boot-loader [**slot** *slot-number*]

   Verify that the current software images are the same as the startup software images.

Synchronizing startup images from the master device to subordinate devices

About startup image synchronization

Perform this task when the startup images on subordinate devices are not the same version as those on the master device.

This task synchronizes startup images that are running on the master device to subordinate devices. If any of the startup images does not exist or is invalid, the synchronization fails.

The startup images synchronized to subordinate devices are set as main startup images, regardless of whether the source startup images are main or backup.

Restrictions and guidelines

If a patch installation has been performed on the master device, use the **install commit** command to update the set of main startup images on the master device before software synchronization. This command ensures startup image consistency between the master and subordinate devices.

Procedure

Perform the following steps in user view:

1. Synchronize startup images from the master to subordinate devices.

   boot-loader update { **all** | **slot** *slot-number* }
2. Reboot the subordinate devices.

   reboot slot *slot-number* [**force**]

Installing or uninstalling features and patches

About installing or uninstalling features and patches

You can install a new feature or patch image, or upgrade an existing feature image.

Restrictions and guidelines

To ensure a successful image installation or upgrade, do not reboot the device or perform a master/subordinate switchover during the image installation or upgrade.

After installing a feature image, you must log in to the device again to use the commands provided in the image.

Prerequisites

Use FTP or TFTP commands to transfer the image file to the default file system on the master device. You do not need to transfer or copy the image file to subordinate member devices. The system will automatically copy the image file to the subordinate members when you activate the images on them. For more information about FTP and TFTP, see "Configuring FTP" and "Configuring TFTP."

Installing or upgrading features

1. Activate features in the specified files.

   install activate feature *filename*&<1-30> **slot** *slot-number*

2. Commit the software change.

   install commit

   For the image changes to take effect after a reboot, you must perform a commit operation.

Installing patches

1. Activate patches in a file.

   install activate patch *filename* { **all** | **slot** *slot-number* }

   You can specify only one patch image file for this command at a time. However, you can execute this command multiple times to install multiple patch image files.

   The **install activate patch** *filename* **all** command installs the specified patch images on all hardware and the images can survive a reboot. You do not need to execute the **install commit** command for the installation.

2. Commit the software change.

   install commit

   Images run in memory immediately after they are activated. However, only patch images activated by using the **install activate patch** *filename* **all** command can survive a reboot. For other images to take effect after a reboot, you must execute this command to commit the software change.

Uninstalling features or patches

Restrictions and guidelines

After uninstalling a feature image, you must log in to the device again for the commands in the image to be removed.

Procedure

1. Deactivate the features or patches installed from an image file.

   install deactivate feature *filename*&<1-30> **slot** *slot-number*

   install deactivate patch *filename* { **all** | **slot** *slot-number* }

   You can specify only one patch image file for this command at a time. However, you can execute this command multiple times to deactivate multiple patch image files.

   Images deactivated by using the **install deactivate patch** *filename* **all** command do not run after a reboot. To prevent other deactivated images from running after a reboot, you must commit the software change by using the **install commit** command.

2. Commit the software change.

   install commit

   This step removes the image file from the startup image list but does not delete the image file from the default file system.

   The device will not load features and patches from the image files at startup.

Display and maintenance commands for software image settings

Execute **display** commands in any view.

Task	Command
Display current software images and startup software images.	**display boot-loader** [**slot** *slot-number*]

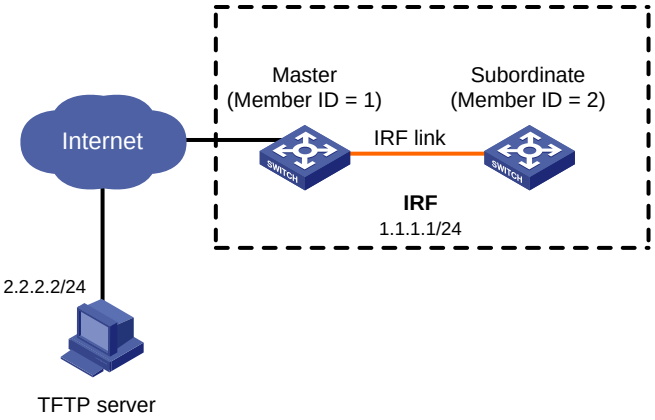
Software upgrade examples

Example: Upgrading device software

Network configuration

As shown in Figure 1, use the file **startup-a2105.ipe** to upgrade software images for the IRF fabric.

Figure 1 Network diagram



Procedure

Configure IP addresses and routes. Make sure the device and the TFTP server can reach each other. (Details not shown.)

Configure TFTP settings on both the device and the TFTP server. (Details not shown.)

Display information about the current software images.

```
<Sysname> display version
```

Back up the current software images.

```
<Sysname> copy boot.bin boot_backup.bin
<Sysname> copy system.bin system_backup.bin
```

Specify **boot_backup.bin** and **system_backup.bin** as the backup startup image files for all IRF member devices.

```
<Sysname> boot-loader file boot flash:/boot_backup.bin system flash:/system_backup.bin slot 1 backup
<Sysname> boot-loader file boot flash:/boot_backup.bin system flash:/system_backup.bin slot 2 backup
```

Use TFTP to download the **startup-a2105.ipe** image file from the TFTP server to the root directory of the flash memory on the master device.

```
<Sysname> tftp 2.2.2.2 get startup-a2105.ipe
```

Specify **startup-a2105.ipe** as the main startup image file for all IRF member devices.

```
<Sysname> boot-loader file flash:/startup-a2105.ipe slot 1 main
<Sysname> boot-loader file flash:/startup-a2105.ipe slot 2 main
```

Verify the startup image settings.

```
<Sysname> display boot-loader
```

Reboot the device to complete the upgrade.

```
<Sysname> reboot
```

Verify that the device is running the correct software.

```
<Sysname> display version
```

Contents

Managing the device

This chapter describes how to configure basic device parameters and manage the device.

Device management tasks at a glance

All device management tasks are optional. You can perform any of the tasks in any order.

- Configuring basic parameters
  - Configuring the device name
  - Configuring the system time
  - Enabling displaying the copyright statement
  - Configuring banners
- Configuring security parameters
  - Disabling password recovery capability
- Adjusting device capacities
  - Setting the port status detection timer
- Monitoring the device
  - Monitoring CPU usage
  - Setting memory alarm thresholds
  - Configuring disk usage monitoring
  - Setting the temperature alarm thresholds
- Managing resources
  - Configuring device poweroff alarming
  - Verifying and diagnosing transceiver modules
  - Configuring transceiver monitoring
  - Configuring transceiver anti-counterfeit
- Maintaining the device
  - Scheduling a task
  - Rebooting the device
  - Restoring the factory-default configuration

Configuring the device name

About the device name

A device name (also called hostname) identifies a device in a network and is used in CLI view prompts. For example, if the device name is **Sysname**, the user view prompt is <Sysname>.

Restrictions and guidelines

On an underlay network, the device uses the device name that you have configured for it. If you do not configure a device name for the device but automated underlay network deployment is enabled, the device uses the device name assigned by the VCF fabric feature. For more information about VCF fabric, see VCF fabric configuration in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Configure the device name.
   sysname *sysname*
   By default, the device name is **H3C**.

Configuring the system time

About the system time

Correct system time is essential to network management and communication. Configure the system time correctly before you run the device on the network.

The device can use one of the following methods to obtain the system time:

- Uses the locally set system time, and then uses the clock signals generated by its built-in crystal oscillator to maintain the system time.
- Periodically obtains the UTC time from an NTP source, and uses the UTC time, time zone, and daylight saving time to calculate the system time. For more information about NTP, see *Network Management and Monitoring Configuration Guide*.

The system time calculated by using the UTC time from a time source is more precise.

Restrictions and guidelines for configuring the system time

After you execute the **clock protocol none** command, the **clock datetime** command determines the system time, whether or not the time zone or daylight saving time has been configured.

If you configure or change the time zone or daylight saving time after the device obtains the system time, the device recalculates the system time. To view the system time, use the **display clock** command.

System time configuration tasks at a glance

To configure the system time, perform the following tasks:

1. Configuring the system time
   Choose one of the following tasks:
   - Setting the system time at the CLI
   - Obtaining the UTC time through a time protocol
2. (Optional.) Setting the time zone
   Make sure each network device uses the time zone of the place where the device resides.
3. (Optional.) Setting the daylight saving time
   Make sure each network device uses the daylight saving time parameters of the place where the device resides.

Setting the system time at the CLI

1. Enter system view.

system-view

2. Configure the device to use the local system time.

   clock protocol none

   By default, the device uses the NTP time source.

   If you execute the **clock protocol** command multiple times, the most recent configuration takes effect.

3. Return to user view.

   quit

4. Set the local system time.

   clock datetime *time date*

   By default, the system time is UTC time 00:00:00 01/01/2013.

CAUTION:

This command changes the system time, which affects the execution of system time-related features (for example, scheduled tasks) and collaborative operations of the device with other devices (for example, log reporting and statistics collection). Before executing this command, make sure you fully understand its impact on your live network.

Obtaining the UTC time through a time protocol

1. Enter system view.

   system-view

2. Specify the system time source.

   clock protocol ntp

   By default, the device uses the NTP time source.

   If you execute this command multiple times, the most recent configuration takes effect.

3. Configure time protocol parameters.

   For more information about NTP configuration, see *Network Management and Monitoring Configuration Guide*.

Setting the time zone

1. Enter system view.

   system-view

2. Set the time zone.

   clock timezone *zone-name* { **add** | **minus** } *zone-offset*

   By default, the system uses the UTC time zone.

Setting the daylight saving time

1. Enter system view.

   system-view

2. Set the daylight saving time.

   clock summer-time *name start-time start-date end-time end-date add-time*

   By default, the daylight saving time is not set.

Enabling displaying the copyright statement

About copyright statement displaying

This feature enables the device to display the copyright statement in the following situations:

- When a Telnet or SSH user logs in.
- When a console user quits user view. This is because the device automatically tries to restart the user session.

If you disable displaying the copyright statement, the device does not display the copyright statement in any situations.

Procedure

1. Enter system view.

   `system-view`

2. Enable displaying the copyright statement.

   `copyright-info enable`

   By default, displaying the copyright statement is enabled.

Configuring banners

About banners

Banners are messages that the system displays when a user logs in.

The system supports the following banners:

- **Legal banner**—Appears after the copyright statement. To continue login, the user must enter **Y** or press **Enter**. To quit the process, the user must enter **N**. **Y** and **N** are case insensitive.
- **Message of the Day (MOTD) banner**—Appears after the legal banner and before the login banner.
- **Login banner**—Appears only when password or scheme authentication is configured.
- **Shell banner**—Appears when a user accesses user view.

The system displays the banners in the following order: legal banner, MOTD banner, login banner, and shell banner.

Banner input methods

You can configure a banner by using one of the following methods:

- Input the entire command line in a single line.

  The banner cannot contain carriage returns. The entire command line, including the command keywords, the banner, and the delimiters, can have a maximum of 511 characters. The delimiters for the banner can be any printable character but must be the same. You cannot press **Enter** before you input the end delimiter.

  For example, you can configure the shell banner "Have a nice day." as follows:

  ```
  <System> system-view
  [System] header shell %Have a nice day.%
  ```

- Input the command line in multiple lines.

  The banner can contain carriage returns. A carriage return is counted as two characters.

  To input a banner configuration command line in multiple lines, use one of the following methods:

- Press **Enter** after the final command keyword, type the banner, and end the final line with the delimiter character %. The banner plus the delimiter can have a maximum of 1999 characters.

  For example, you can configure the banner "Have a nice day." as follows:

  ```
  <System> system-view
  [System] header shell
  Please input banner content, and quit with the character '%'.
  Have a nice day.%
  ```

- After you type the final command keyword, type any printable character as the start delimiter for the banner and press **Enter**. Then, type the banner and end the final line with the same delimiter. The banner plus the end delimiter can have a maximum of 1999 characters.

  For example, you can configure the banner "Have a nice day." as follows:

  ```
  <System> system-view
  [System] header shell A
  Please input banner content, and quit with the character 'A'.
  Have a nice day.A
  ```

- After you type the final command keyword, type the start delimiter and part of the banner. Make sure the final character of the final string is different from the start delimiter. Then, press **Enter**, type the rest of the banner, and end the final line with the same delimiter. The banner plus the start and end delimiters can have a maximum of 2002 characters.

  For example, you can configure the banner "Have a nice day." as follows:

  ```
  <System> system-view
  [System] header shell AHave a nice day.
  Please input banner content, and quit with the character 'A'.
  A
  ```

Procedure

1. Enter system view.
   system-view
2. Configure the legal banner.
   header legal *text*
3. Configure the MOTD banner.
   header motd *text*
4. Configure the login banner.
   header login *text*
5. Configure the shell banner.
   header shell *text*

Disabling password recovery capability

About password recovery capability

Password recovery capability controls console user access to the device configuration and SDRAM from BootWare menus. For more information about BootWare menus, see the release notes.

If password recovery capability is enabled, a console user can access the device configuration without authentication to configure a new password.

If password recovery capability is disabled, console users must restore the factory-default configuration before they can configure new passwords. Restoring the factory-default configuration deletes the next-startup configuration files.

To enhance system security, disable password recovery capability.

Restrictions and guidelines

Procedure

1. Enter system view.
   system-view
2. Disable password recovery capability.
   undo password-recovery enable
   By default, password recovery capability is enabled.

Setting the port status detection timer

About the port status detection timer

The device starts a port status detection timer when a port is shut down by a protocol. Once the timer expires, the device brings up the port so the port status reflects the port's physical status.

Procedure

1. Enter system view.
   system-view
2. Set the port status detection timer.
   shutdown-interval *time*
   The default setting is 30 seconds.

Monitoring CPU usage

About CPU usage monitoring

To monitor CPU usage, the device performs the following operations:

- Samples CPU usage at 1-minute intervals, and compares the samples with CPU usage thresholds to identify the CPU usage status and send alarms or notifications accordingly.
- Samples and saves CPU usage at a configurable interval if CPU usage tracking is enabled. You can use the **display cpu-usage history** command to display the historical CPU usage statistics in a coordinate system.

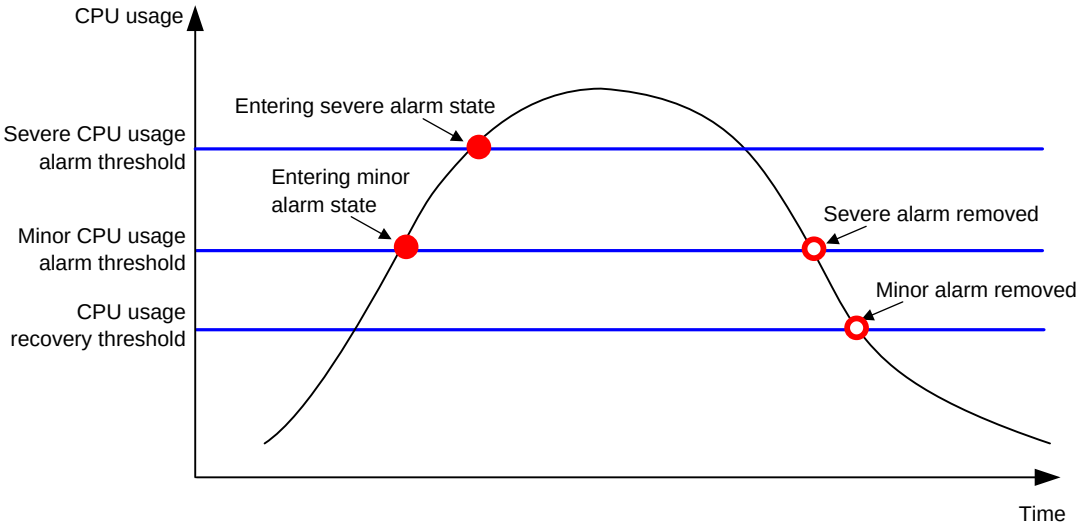
The device supports the following CPU usage thresholds:

- **Minor threshold**—If the CPU usage increases to or above the minor threshold but is less than the severe threshold, the CPU usage enters minor alarm state. The device sends minor alarms periodically until the CPU usage increases above the severe threshold or the minor alarm is removed.
- **Severe threshold**—If the CPU usage increases above the severe threshold, the CPU usage enters severe alarm state. The device sends severe alarms periodically until the severe alarm is removed.
- **Recovery threshold**—If the CPU usage decreases below the recovery threshold, the CPU usage enters recovered state. The device sends a recovery notification.

CPU usage alarms and notifications can be sent to NETCONF, SNMP, and the information center to be encapsulated as NETCONF events, SNMP traps and informs, and log messages. For more

information, see NETCONF, SNMP, and information center in *Network Management and Monitoring Configuration Guide*.

Figure 1 CPU alarms and alarm-removed notifications



Procedure

1. Enter system view.

   system-view

2. Set the CPU usage alarm thresholds.

   monitor cpu-usage threshold *severe-threshold* **minor-threshold** *minor-threshold* **recovery-threshold** *recovery-threshold* [**slot** *slot-number* [**cpu** *cpu-number*]]

   The default settings are as follows:

   - **Severe CPU usage alarm threshold**—99%.
   - **Minor CPU usage alarm threshold**—98%.
   - **CPU usage recovery threshold**—50%.

CAUTION:

If you set the severe CPU usage alarm threshold to a too low value, the device will reach the threshold easily. Normal services will be affected.

3. Set CPU usage alarm resending intervals.

   monitor resend cpu-usage { **minor-interval** *minor-interval* | **severe-interval** *severe-interval* } * [**slot** *slot-number* [**cpu** *cpu-number*]]

   By default, the minor alarm resending interval is 300 seconds and the severe alarm resending interval is 60 seconds.

4. Set the sampling interval for CPU usage tracking.

   monitor cpu-usage interval *interval* [**slot** *slot-number* [**cpu** *cpu-number*]]

   By default, the sampling interval for CPU usage tracking is 1 minute.

5. Enable CPU usage tracking.

   monitor cpu-usage enable [**slot** *slot-number* [**cpu** *cpu-number*]]

   By default, CPU usage tracking is enabled.

Setting memory alarm thresholds

About memory alarm thresholds

To ensure correct operation and improve memory efficiency, the system monitors the amount of free memory space in real time. If the amount of free memory space exceeds an alarm threshold, the system issues an alarm to affected service modules and processes.

(On devices that do not support low memory.) You can use the **display memory** command to display memory usage information.

(On devices that support low memory.) The system monitors only the amount of free low-memory space. You can use the **display memory** command to display memory usage information.

(On devices with slots that support low memory.) For slots that support low memory, the system monitors only the amount of free low-memory space. You can use the **display memory** command to display memory usage information. If the LowMem field is displayed for a slot, the slot supports low memory.

As shown in Table 1, the system supports the following free-memory thresholds:

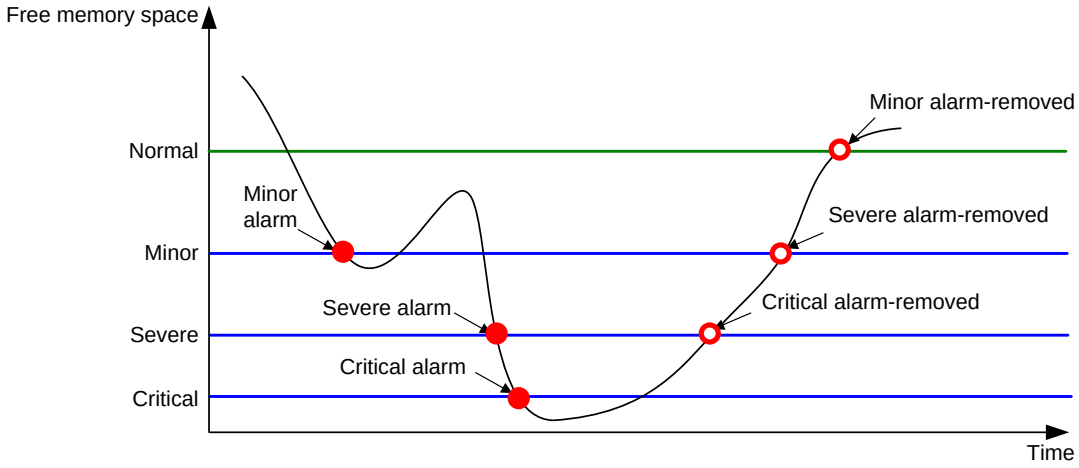
- Normal state threshold.
- Minor alarm threshold.
- Severe alarm threshold.
- Critical alarm threshold.

Table 1 Memory alarm notifications and memory alarm-removed notifications

Notification	Triggering condition	Remarks
Early-warning notification	The amount of free memory space decreases below the early-warning threshold.	After generating and sending an early-warning notification, the system does not generate and send any additional early-warning notifications until the early warning is removed.
Minor alarm notification	The amount of free memory space decreases below the minor alarm threshold.	After generating and sending a minor alarm notification, the system does not generate and send any additional minor alarm notifications until the minor alarm is removed.
Severe alarm notification	The amount of free memory space decreases below the severe alarm threshold.	After generating and sending a severe alarm notification, the system does not generate and send any additional severe alarm notifications until the severe alarm is removed.
Critical alarm notification	The amount of free memory space decreases below the critical alarm threshold.	After generating and sending a critical alarm notification, the system does not generate and send any additional critical alarm notifications until the critical alarm is removed.
Critical alarm-removed notification	The amount of free memory space increases above the severe alarm threshold.	N/A
Severe alarm-removed notification	The amount of free memory space increases above the minor alarm threshold.	N/A
Minor alarm-removed notification	The amount of free memory space increases above the	N/A

Notification	Triggering condition	Remarks
	normal state threshold.	
Early-warning-removed notification	The amount of free memory space increases above the sufficient-memory threshold.	N/A

Figure 2 Memory alarm notifications and alarm-removed notifications



Restrictions and guidelines

If a memory alarm occurs, delete unused configuration items or disable some features to increase the free memory space. Because the memory space is insufficient, some configuration items might not be able to be deleted.

Procedure

1. Enter system view.

   system-view

2. Set the memory usage threshold.

   memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]] **usage** *memory-threshold*

   By default, the memory usage threshold is 100%.

3. Set the free-memory thresholds.

   memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]] [**ratio**] **minor** *minor-value* **severe** *severe-value* **critical** *critical-value* **normal** *normal-value*

   The default settings are as follows:

   - **Minor alarm threshold**—60 MB.
   - **Severe alarm threshold**—56 MB.
   - **Critical alarm threshold**—52 MB.
   - **Normal state threshold**—64 MB.

4. Set memory depletion alarm resending intervals.

   monitor resend memory-threshold { **critical-interval** *critical-interval* | **minor-interval** *minor-interval* | **severe-interval** *severe-interval* } * [**slot** *slot-number* [**cpu** *cpu-number*]]

   The following are the default settings:

- **Minor alarm resending interval**—12 hours.
- **Severe alarm resending interval**—3 hours.
- **Critical alarm resending interval**—1 hour.

Configuring disk usage monitoring

About disk usage monitoring

This feature enables the device to periodically sample the usage of a disk and compare the usage with the threshold. If the disk usage exceeds the threshold, the device sends a high disk usage alarm to the NETCONF module. For more information about the NETCONF module, see *Network Management and Monitoring Configuration Guide*.

Software version and feature compatibility

This feature is available only Release 6348P01 and later.

Procedure

1. Enter system view.

   system-view
2. Set the disk usage sampling interval.

   monitor disk-usage interval *interval*

   By default, the disk usage sampling interval is 300 seconds.
3. Set the usage threshold for a disk.

   monitor disk-usage [**slot** *slot-number*] **disk** *disk-name* **threshold** *threshold-value*

   By default, the disk usage threshold is 95%.

Setting the temperature alarm thresholds

About temperature alarm thresholds

The device monitors its temperature based on the following thresholds:

- Low-temperature threshold.
- High-temperature warning threshold.
- High-temperature alarming threshold.

When the device temperature drops below the low-temperature threshold or reaches the high-temperature warning or alarming threshold, the device performs the following operations:

- Sends log messages and traps.
- Sets LEDs on the device panel.

Procedure

1. Enter system view.

   system-view
2. Configure the temperature alarm thresholds.

   temperature-limit slot *slot-number* **hotspot** *sensor-number lowlimit warninglimit* [*alarmlimit*]

   The defaults vary by temperature sensor model. To view the defaults, execute the **undo temperature-limit** and **display environment** commands in turn.

The high-temperature alarming threshold must be higher than the high-temperature warning threshold, and the high-temperature warning threshold must be higher than the low-temperature threshold.

Configuring device poweroff alarming

About device poweroff alarming

This feature enables the device to detect a device poweroff event and issue a poweroff alarm by sending SNMP notifications or log messages.

Hardware compatibility

This feature is supported only on the following devices:

- PoE devices and 52-port non-PoE devices.
- Devices that support hot-swappable power supplies.

Procedure

1. Enter system view.

   system-view

2. Specify the source interface for sending the poweroff alarm.

   dying-gasp source *interface-type* { *interface-number* | *interface-number.subnumber* }

   By default, no source interface is specified. On an IPv4 network, the device uses the primary IPv4 address of the output interface for the route to the destination host as the source address. On an IPv6 network, the device selects a source IPv6 address as defined in RFC 3484.

3. Configure SNMP notification destination host settings.

   dying-gasp host { *ip-address* | **ipv6** *ipv6-address* } **snmp-trap version** { **v1** | **v2c** } **securityname** *security-string*

   By default, no SNMP notification destination host settings are configured.

   You can configure the device to send poweroff alarm SNMP notifications to multiple destination hosts.

4. Configure log message destination host settings.

   dying-gasp host { *ip-address* | **ipv6** *ipv6-address* } **syslog**

   By default, no log message destination host settings are configured.

   You can configure the device to send the poweroff alarm log messages to multiple destination hosts.

Verifying and diagnosing transceiver modules

Verifying transceiver modules

About transceiver module verification

You can use one of the following methods to verify the genuineness of a transceiver module:

- Display the key parameters of a transceiver module, including its transceiver type, connector type, central wavelength of the transmit laser, transfer distance, and vendor name.
- Display its electronic label. The electronic label is a profile of the transceiver module and contains the permanent configuration, including the serial number, manufacturing date, and vendor name. The data was written to the transceiver module or the device's storage component during debugging or testing of the transceiver module or device.

The device regularly checks transceiver modules for their vendor names. If a transceiver module does not have a vendor name or the vendor name is not H3C, the device repeatedly outputs traps and log messages. For information about logging rules, see *Network Management and Monitoring Configuration Guide*.

Procedure

To verify transceiver modules, execute the following commands in any view:

- Display the key parameters of transceiver modules.
  display transceiver interface [*interface-type interface-number*]
- Display the electrical label information of transceiver modules.
  display transceiver manuinfo interface [*interface-type interface-number*]

Diagnosing transceiver modules

About transceiver module diagnosis

The device provides the alarm and digital diagnosis functions for transceiver modules. When a transceiver module fails or is not operating correctly, you can perform the following tasks:

- Check the alarms that exist on the transceiver module to identify the fault source.
- Examine the key parameters monitored by the digital diagnosis function, including the temperature, voltage, laser bias current, TX power, and RX power.

Procedure

To diagnose transceiver modules, execute the following commands in any view:

- Display transceiver alarms.
  display transceiver alarm interface [*interface-type interface-number*]
- Display the current values of the digital diagnosis parameters on transceiver modules.
  display transceiver diagnosis interface [*interface-type interface-number*]

Configuring transceiver monitoring

About transceiver monitoring

After transceiver monitoring is enabled, the device samples the parameters of transceiver modules periodically, including the input power and output power of transceiver modules. If a sampled value reaches the alarm threshold, the device generates a log to notify users.

Software version and feature compatibility

This feature is available only in Release 6343P08 and later.

Procedure

1. Enter system view.
   system-view
2. Set the transceiver monitoring interval.
   transceiver monitor interval *interval*
   By default, the transceiver monitoring interval is 600 seconds.
3. Enable transceiver monitoring.
   transceiver monitor enable

By default, transceiver monitoring is disabled.

Configuring transceiver anti-counterfeit

About transceiver anti-counterfeit

This feature automatically detects H3C transceiver modules.

- Upon detection of an H3C transceiver module, the system outputs a log that recommends the user to verify authenticity of the transceiver from the H3C official website www.h3c.com. Select **Support** > **H3C Product Anti-Counterfeit Query** from the website, and then enter the barcode of the transceiver module. To get the transceiver module barcode, see the label on the transceiver module or execute the **`display device manuinfo`** command.
- The system outputs a log upon detection of a possibly counterfeited H3C transceiver module to notify the user. The log contains information about which transceiver modules are possibly counterfeited. For an H3C transceiver counterfeit, the **`display transceiver diagnosis`** command does not display any information about it.

Software version and feature compatibility

This feature is supported only in Release 6342 and later.

Scheduling a task

About task scheduling

You can schedule the device to automatically execute a command or a set of commands without administrative interference.

You can configure a periodic schedule or a non-periodic schedule. A non-periodic schedule is not saved to the configuration file and is lost when the device reboots. A periodic schedule is saved to the startup configuration file and is automatically executed periodically.

Restrictions and guidelines

- The default system time is always restored at reboot. To make sure a task schedule can be executed as expected, reconfigure the system time or configure NTP after you reboot the device. For more information about NTP, see *Network Management and Monitoring Configuration Guide*.
- To assign a command (command A) to a job, you must first assign the job the command or commands for entering the view of command A.
- Make sure all commands in a schedule are compliant to the command syntax. The system does not check the syntax when you assign a command to a job.
- A schedule cannot contain any one of these commands: **`telnet`**, **`ftp`**, **`ssh2`**, and **`monitor process`**.
- A schedule does not support user interaction. If a command requires a yes or no answer, the system always assumes that a **Y** or **Yes** is entered. If a command requires a character string input, the system assumes that either the default character string (if any) or a null string is entered.
- A schedule is executed in the background, and no output (except for logs, traps, and debug information) is displayed for the schedule.

Procedure

1. Enter system view.
   system-view
2. Create a job.
   scheduler job *job-name*
3. Assign a command to the job.
   command *id command*

   By default, no command is assigned to a job.

   You can assign multiple commands to a job. A command with a smaller ID is executed first.
4. Exit to system view.
   quit
5. Create a schedule.
   scheduler schedule *schedule-name*
6. Assign a job to the schedule.
   job *job-name*

   By default, no job is assigned to a schedule.

   You can assign multiple jobs to a schedule. The jobs will be executed concurrently.
7. Assign user roles to the schedule.
   user-role *role-name*

   By default, a schedule has the user role of the schedule creator.

   You can assign a maximum of 64 user roles to a schedule. A command in a schedule can be executed if it is permitted by one or more user roles of the schedule.
8. Specify the execution time for the schedule.

   Choose one option as needed:

   - Execute the schedule at specific points of time.
     time at *time date*

     time once at *time* [**month-date** *month-day* | **week-day** *week-day*&<1-7>]
   - Execute the schedule after a period of time.
     time once delay *time*
   - Execute the schedule at the specified time on every specified day in a month or week.
     time repeating at *time* [**month-date** [*month-day* | **last**] | **week-day** *week-day*&<1-7>]
   - Execute the schedule periodically from the specified time on.
     time repeating [**at** *time* [*date*]] **interval** *interval*

   By default, no execution time is specified for a schedule.

   The **time** commands overwrite each other. The most recently executed command takes effect.
9. (Optional.) Set the schedule log file size limit.
   scheduler logfile size *value*

   By default, the schedule log file size limit is 16 KB.

   The schedule log file stores log messages for execution results of commands in jobs. After the limit is reached, the system deletes the oldest log messages to store the new log messages. If the remaining space of the log file is not enough for a single log message, the system truncates the message and does not store the extra part.

Example: Scheduling a task

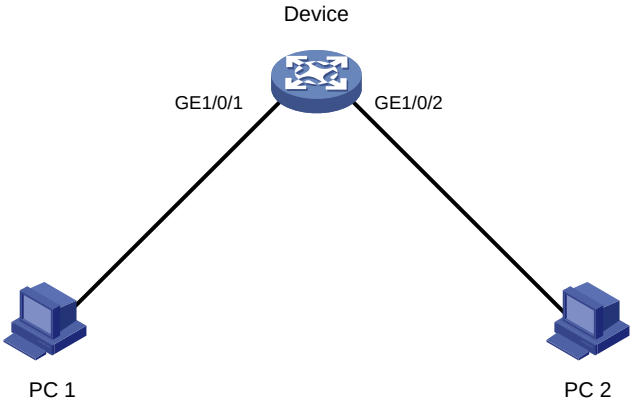
Network configuration

As shown in Figure 3, two interfaces of the device are connected to users.

To save energy, configure the device to perform the following operations:

- Enable the interfaces at 8:00 a.m. every Monday through Friday.
- Disable the interfaces at 18:00 every Monday through Friday.

Figure 3 Network diagram



Procedure

Enter system view.

```
<Sysname> system-view
```

Configure a job for disabling interface GigabitEthernet 1/0/1.

```
[Sysname] scheduler job shutdown-GigabitEthernet1/0/1
[Sysname-job-shutdown-GigabitEthernet1/0/1] command 1 system-view
[Sysname-job-shutdown-GigabitEthernet1/0/1] command 2 interface gigabitethernet 1/0/1
[Sysname-job-shutdown-GigabitEthernet1/0/1] command 3 shutdown
[Sysname-job-shutdown-GigabitEthernet1/0/1] quit
```

Configure a job for enabling interface GigabitEthernet 1/0/1.

```
[Sysname] scheduler job start-GigabitEthernet1/0/1
[Sysname-job-start-GigabitEthernet1/0/1] command 1 system-view
[Sysname-job-start-GigabitEthernet1/0/1] command 2 interface gigabitethernet 1/0/1
[Sysname-job-start-GigabitEthernet1/0/1] command 3 undo shutdown
[Sysname-job-start-GigabitEthernet1/0/1] quit
```

Configure a job for disabling interface GigabitEthernet 1/0/2.

```
[Sysname] scheduler job shutdown-GigabitEthernet1/0/2
[Sysname-job-shutdown-GigabitEthernet1/0/2] command 1 system-view
[Sysname-job-shutdown-GigabitEthernet1/0/2] command 2 interface gigabitethernet 1/0/2
[Sysname-job-shutdown-GigabitEthernet1/0/2] command 3 shutdown
[Sysname-job-shutdown-GigabitEthernet1/0/2] quit
```

Configure a job for enabling interface GigabitEthernet 1/0/2.

```
[Sysname] scheduler job start-GigabitEthernet1/0/2
[Sysname-job-start-GigabitEthernet1/0/2] command 1 system-view
[Sysname-job-start-GigabitEthernet1/0/2] command 2 interface gigabitethernet 1/0/2
```

```
[Sysname-job-start-GigabitEthernet1/0/2] command 3 undo shutdown
[Sysname-job-start-GigabitEthernet1/0/2] quit
```

Configure a periodic schedule for enabling the interfaces at 8:00 a.m. every Monday through Friday.

```
[Sysname] scheduler schedule START-pc1/pc2
[Sysname-schedule-START-pc1/pc2] job start-GigabitEthernet1/0/1
[Sysname-schedule-START-pc1/pc2] job start-GigabitEthernet1/0/2
[Sysname-schedule-START-pc1/pc2] time repeating at 8:00 week-day mon tue wed thu fri
[Sysname-schedule-START-pc1/pc2] quit
```

Configure a periodic schedule for disabling the interfaces at 18:00 every Monday through Friday.

```
[Sysname] scheduler schedule STOP-pc1/pc2
[Sysname-schedule-STOP-pc1/pc2] job shutdown-GigabitEthernet1/0/1
[Sysname-schedule-STOP-pc1/pc2] job shutdown-GigabitEthernet1/0/2
[Sysname-schedule-STOP-pc1/pc2] time repeating at 18:00 week-day mon tue wed thu fri
[Sysname-schedule-STOP-pc1/pc2] quit
```

Verifying the configuration

Display the configuration information of all jobs.

```
[Sysname] display scheduler job
Job name: shutdown-GigabitEthernet1/0/1
 system-view
 interface gigabitethernet 1/0/1
 shutdown

Job name: shutdown-GigabitEthernet1/0/2
 system-view
 interface gigabitethernet 1/0/2
 shutdown

Job name: start-GigabitEthernet1/0/1
 system-view
 interface gigabitethernet 1/0/1
 undo shutdown

Job name: start-GigabitEthernet1/0/2
 system-view
 interface gigabitethernet 1/0/2
 undo shutdown
```

Display the schedule information.

```
[Sysname] display scheduler schedule
Schedule name        : START-pc1/pc2
Schedule type        : Run on every Mon Tue Wed Thu Fri at 08:00:00
Start time           : Wed Sep 28 08:00:00 2011
Last execution time  : Wed Sep 28 08:00:00 2011
Last completion time : Wed Sep 28 08:00:03 2011
Execution counts     : 1
----------------------------------------------------------------------
Job name                                        Last execution status
```

```
start-GigabitEthernet1/0/1                                  Successful
start-GigabitEthernet1/0/2                                  Successful

Schedule name        : STOP-pc1/pc2
Schedule type        : Run on every Mon Tue Wed Thu Fri at 18:00:00
Start time           : Wed Sep 28 18:00:00 2011
Last execution time  : Wed Sep 28 18:00:00 2011
Last completion time : Wed Sep 28 18:00:01 2011
Execution counts     : 1
-------------------------------------------------------------------
Job name                                      Last execution status
shutdown-GigabitEthernet1/0/1                           Successful
shutdown-GigabitEthernet1/0/2                           Successful
```

Display schedule log information.

```
[Sysname] display scheduler logfile
Job name        : start-GigabitEthernet1/0/1
Schedule name   : START-pc1/pc2
Execution time  : Wed Sep 28 08:00:00 2011
Completion time : Wed Sep 28 08:00:02 2011
--------------------------------- Job output ---------------------------------
<Sysname>system-view
System View: return to User View with Ctrl+Z.
[Sysname]interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1]undo shutdown

Job name        : start-GigabitEthernet1/0/2
Schedule name   : START-pc1/pc2
Execution time  : Wed Sep 28 08:00:00 2011
Completion time : Wed Sep 28 08:00:02 2011
--------------------------------- Job output ---------------------------------
<Sysname>system-view
System View: return to User View with Ctrl+Z.
[Sysname]interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2]undo shutdown

Job name        : shutdown-GigabitEthernet1/0/1
Schedule name   : STOP-pc1/pc2
Execution time  : Wed Sep 28 18:00:00 2011
Completion time : Wed Sep 28 18:00:01 2011
--------------------------------- Job output ---------------------------------
<Sysname>system-view
System View: return to User View with Ctrl+Z.

Job name        : shutdown-GigabitEthernet1/0/2
Schedule name   : STOP-pc1/pc2
Execution time  : Wed Sep 28 18:00:00 2011
```

```
Completion time : Wed Sep 28 18:00:01 2011
--------------------------------- Job output ---------------------------------
<Sysname>system-view
System View: return to User View with Ctrl+Z.
[Sysname]interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2]shutdown
```

Rebooting the device

About device reboot

The following device reboot methods are available:

- Schedule a reboot at the CLI, so the device automatically reboots at the specified time or after the specified period of time.
- Immediately reboot the device at the CLI.

  This method allows you to reboot the device remotely.

  During the reboot process, the device performs the following operations:

  a. Resets all of its chips.

  b. Uses the BootWare to verify the startup software package, decompress the package, and load the images.

  c. Initializes the system.
- Power off and then power on the device. This method might cause data loss, and is the least-preferred method.

Using the CLI, you can reboot the device from a remote host.

Restrictions and guidelines for device reboot

For data security, the device does not reboot while it is performing file operations.

Rebooting the device immediately at the CLI

Prerequisites

Perform the following steps in any view:

1. Verify that the next-startup configuration file is correctly specified.

`display startup`

For more information about the **`display startup`** command, see *Fundamentals Command Reference*.

2. Verify that the startup image files are correctly specified.

`display boot-loader`

If one main startup image file is damaged or does not exist, you must specify another main startup image file before rebooting the device.

For more information about the **`display boot-loader`** command, see *Fundamentals Command Reference*.

3. Save the running configuration to the next-startup configuration file.

`save`

To avoid configuration loss, save the running configuration before a reboot.

For more information about the **save** command, see *Fundamentals Command Reference*.

Procedure

To reboot the device immediately at the CLI, execute the following command in user view:

reboot [**slot** *slot-number*] [**force**]

CAUTION:

- A device reboot might cause service interruption. Before executing this command, make sure you fully understand its impact on your live network.
- Use the **force** keyword to reboot the device only when the system is faulty or fails to start up normally. A forced device reboots might cause file system damage. Before using the **force** keyword to reboot the device, make sure you understand its impact.

Scheduling a device reboot

Restrictions and guidelines

The automatic reboot configuration takes effect on all member devices. It will be canceled if a master/subordinate switchover occurs.

The device supports only one device reboot schedule. If you execute the **scheduler reboot** command multiple times, the most recent configuration takes effect.

Procedure

To schedule a reboot, execute one of the following commands in user view:

- **scheduler reboot at** *time* [*date*]
- **scheduler reboot delay** *time*

By default, no device reboot time is specified.

CAUTION:

This task enables the device to reboot at a scheduled time, which causes service interruption. Before configuring this task, make sure you fully understand its impact on your live network.

Restoring the factory-default configuration

About restoring the factory-default configuration

If you want to use the device in a different scenario or you cannot troubleshoot the device by using other methods, use this task to restore the factory-default configuration.

This task does not delete **.bin** files.

Restrictions and guidelines

This feature is disruptive.

Procedure

1. Execute the following command in user view to restore the factory-default configuration for the device:

   restore factory-default

2. Reboot the device.

   reboot

When the command prompts you to choose whether to save the running configuration, enter **N**. If you choose to save the running configuration, the device loads the saved configuration at startup.

CAUTION:

This command restores the device to the factory default settings. Before using this command, make sure you fully understand its impact on your live network.

Display and maintenance commands for device management configuration

Execute **display** commands in any view. Execute the **reset scheduler logfile** command in user view. Execute the **reset version-update-record** command in system view.

Task	Command
Display the system time, date, time zone, and daylight saving time.	**display clock**
Display the copyright statement.	**display copyright**
Display CPU usage statistics.	**display cpu-usage** [**summary**] [**slot** *slot-number* [**cpu** *cpu-number* [**core** { *core-number* | **all** }]]]
Display CPU usage monitoring settings.	**display cpu-usage configuration** [**slot** *slot-number* [**cpu** *cpu-number*]]
Display the historical CPU usage statistics in a coordinate system.	**display cpu-usage history** [**job** *job-id*] [**slot** *slot-number* [**cpu** *cpu-number*]]
Display hardware information.	**display device** [**flash** | **usb**] [**slot** *slot-number* | **verbose**]
Display electronic label information for the device.	**display device manuinfo** [**slot** *slot-number*]
Display electronic label information for a power supply.	**display device manuinfo slot** *slot-number* **power** *power-id*
Display or save operating information for features and hardware modules.	**display diagnostic-information** [**hardware** | **infrastructure** | **l2** | **l3** | **service**] [**key-info**] [*filename*]
Display poweroff alarm destination host settings.	**display dying-gasp host**
Display device temperature information.	**display environment** [**slot** *slot-number*]
Display the operating states of fan trays.	**display fan** [**slot** *slot-number* [*fan-id*]]
Display memory usage statistics.	**display memory** [**summary**] [**slot** *slot-number* [**cpu** *cpu-number*]]
Display memory alarm thresholds and statistics.	**display memory-threshold** [**slot**

Task	Command
	slot-number [**cpu** *cpu-number*]]
Display power supply information.	**display power** [**slot** *slot-number* [*power-id*]]
Display job configuration information.	**display scheduler job** [*job-name*]
Display job execution log information.	**display scheduler logfile**
Display the automatic reboot schedule.	**display scheduler reboot**
Display schedule information.	**display scheduler schedule** [*schedule-name*]
Display system stability and status information.	**display system stable state**
Display system version information.	**display version**
Display startup software image upgrade records.	**display version-update-record**
Clear job execution log information.	**reset scheduler logfile**
Clear startup software image upgrade records.	**reset version-update-record**

Contents

Using Tcl

About Tcl

Comware V7 provides a built-in tool command language (Tcl) interpreter. From user view, you can use the **tclsh** command to enter Tcl configuration view to execute the following commands:

- Tcl 8.5 commands.
- Comware commands.

The Tcl configuration view is equivalent to the user view. You can use Comware commands in Tcl configuration view in the same way they are used in user view.

Restrictions and guidelines: Tcl

To return from a subview under Tcl configuration view to the upper-level view, use the **quit** command.

To return from a subview under Tcl configuration view to the Tcl configuration view, press **Ctrl+Z**.

Using Tcl commands to configure the device

Restrictions and guidelines

When you use Tcl to configure the device, follow these restrictions and guidelines:

- You can apply Tcl environment variables to Comware commands.
- No online help information is provided for Tcl commands.
- You cannot press **Tab** to complete an abbreviated Tcl command.
- Make sure the Tcl commands can be executed correctly.
- As a best practice, log in through Telnet or SSH. You cannot stop Tcl commands by using a shortcut key or a CLI command. If a problem occurs when the Tcl commands are being executed, you can terminate the process by closing the connection if you logged in through Telnet or SSH. If you logged in from the console port, you must perform one of the following tasks:
  - Restart the device.
  - Log in to the device by using a different method, and use the **free line** command to release the console or AUX line. For more information about the command, see *Fundamentals Command Reference*.
- You can press **Ctrl+D** to abort Tcl command **read stdin**.

Procedure

1. Enter Tcl configuration view from user view.
   tclsh
2. Execute a Tcl command.
   Tcl command
3. Return from Tcl configuration view to user view.

- **tclquit**
- **quit**

Executing Comware commands in Tcl configuration view

About executing Comware commands in Tcl configuration view

To execute a Comware command in Tcl configuration view, use one of the following methods:

- Enter the Comware command directly. If a Tcl command uses the same command string as the Comware command, the Tcl command is executed.
- Prefix the Comware command with the **cli** keyword. If a Tcl command uses the same command string as the Comware command, the Comware command is executed.

Restrictions and guidelines

Follow these restrictions and guidelines when you execute Comware commands in Tcl configuration view:

- To specify a string enclosed in quotation marks (") or braces ({ and }), you must use the escape character (\) before the quotation marks or braces. For example, to specify **"a"** as the description for an interface, you must enter **description \"a\"**. If you enter **description "a"**, the description is **a**.
- For Comware commands, you can enter **?** to obtain online help or press **Tab** to complete an abbreviated command. For more information, see "Using the CLI."
- The **cli** command is a Tcl command, so you cannot enter **?** to obtain online help or press **Tab** to complete an abbreviated command.
- Successfully executed Comware commands are saved to command history buffers. You can use the upper arrow or lower arrow key to obtain executed commands.
- To execute multiple Comware commands in one operation, use one of the following methods:
  - Enter multiple Comware commands separated by semi-colons to execute the commands in the order they are entered. For example, **vlan 2;description Tech**.
  - Specify multiple Comware commands for the **cli** command, quote them, and separate them by a space and a semicolon. For example, **cli "vlan 2 ;description Tech"**.
  - Specify one Comware command for each **cli** command and separate them by a space and a semicolon. For example, **cli vlan 2 ;cli description Tech**.

Procedure

1. Enter Tcl configuration view

   tclsh
2. Execute Comware commands.
   - Execute Comware commands directly.

     Command
   - Execute Comware commands by using the **cli** command.

     cli *command*

3. Return from Tcl configuration view to user view.
    - **`tclquit`**
    - **`quit`**

Contents

Using Python

About Python

Comware 7 provides a built-in Python interpreter. You can use Python to perform the following tasks:

- Execute Python scripts to implement automatic device configuration.
- Enter Python shell to configure the device by using the following items:
  - Python 2.7 commands.
  - Python 2.7 standard API.
  - Extended API. For more information about the extended API, see "Comware 7 extended Python API."

Executing a Python script

To execute a Python script, use the following command in user view:

python *filename*

Entering the Python shell

To enter the Python shell from user view, execute the following command:

python

Importing and using the extended Python API

To use the extended Python API, you must first import the API to Python.

Importing the entire extended API and using the API

Procedure

1. Enter the Python shell from user view.
   python
2. Import the entire extended API.
   import comware
3. Execute an extended API function.
   comware.*api*

Example

Use extended API function **Transfer** to download the **test.cfg** file from TFTP server 192.168.1.26.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
```

```
>>> comware.Transfer('tftp', '192.168.1.26', 'test.cfg', 'flash:/test.cfg', user='',
password='')
<comware.Transfer object at 0xb7eab0e0>
```

Importing an extended API function and using the function

Procedure

1. Enter the Python shell from user view.
   python
2. Import an extended API function.
   from comware import *api-name*
3. Execute an extended API function.
   api-function

Example

Use extended API function **Transfer** to download the **test.cfg** file from TFTP server 192.168.1.26.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> from comware import Transfer
>>> Transfer('tftp', '192.168.1.26', 'test.cfg', 'flash:/test.cfg', user='',
password='')
<comware.Transfer object at 0xb7e5e0e0>
```

Exiting the Python shell

To exit the Python shell, execute the following command in the Python shell.

exit()

Python usage examples

Example: Using a Python script for device configuration

Network configuration

Use a Python script to perform the following tasks:

- Download configuration files **main.cfg** and **backup.cfg** to the device.
- Configure the files as the main and backup configuration files for the next startup.

Figure 1 Network diagram

Procedure

Use a text editor on the PC to configure Python script **test.py** as follows:

```
#!usr/bin/python
import comware

comware.Transfer('tftp', '192.168.1.26', 'main.cfg', 'flash:/main.cfg')
comware.Transfer('tftp', '192.168.1.26', 'backup.cfg', 'flash:/backup.cfg')
comware.CLI('startup saved-configuration flash:/main.cfg main ;startup
saved-configuration flash:/backup.cfg backup')
```

Use TFTP to download the script to the device.

```
<Sysname> tftp 192.168.1.26 get test.py
```

Execute the script.

```
<Sysname> python flash:/test.py
<Sysname>startup saved-configuration flash:/main.cfg main
Please wait...... Done.
<Sysname>startup saved-configuration flash:/backup.cfg backup
Please wait...... Done.
```

Verifying the configuration

Display startup configuration files.

```
<Sysname> display startup
 Current startup saved-configuration file: flash:/startup.cfg
 Next main startup saved-configuration file: flash:/main.cfg
 Next backup startup saved-configuration file: flash:/backup.cfg
```

Comware 7 extended Python API

The Comware 7 extended Python API is compatible with the Python syntax.

CLI

Use **CLI** to execute Comware 7 CLI commands and create CLI objects.

Syntax

CLI(*command*='', *do_print*=True)

Parameters

command: Specifies the commands to be executed. To enter multiple commands, use a space and a semicolon (;) as the delimiter. To enter a command in a view other than user view, you must first enter the commands used to enter the view. For example, you must enter **'system-view ;local-user test class manage'** to execute the **local-user test class manage** command.

do_print: Specifies whether to output the execution result:

- **True**—Outputs the execution result. This value is the default.
- **False**—Does not output the execution result.

Usage guidelines

This API function supports only Comware commands. It does not support Linux, Python, or Tcl commands.

Returns

CLI objects

Examples

Add a local user named **test**.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
>>> comware.CLI('system-view ;local-user test class manage')
```

Sample output

```
<Sysname> system-view
System View: return to User View with Ctrl+Z.
[Sysname] local-user test class manage
New local user added.
<comware.CLI object at 0xb7f680a0>
```

get_error

Use **get_error** to get the error information from the download operation.

Syntax

`Transfer.get_error()`

Returns

Error information (if there is no error information, **None** is returned)

Examples

Download file **test.cfg** from TFTP server 1.1.1.1 and get the error information from the operation.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
>>> c = comware.Transfer('tftp', '1.1.1.1', 'test.cfg', 'flash:/test.cfg', user='',
password='')
>>> c.get_error()
```

Sample output

```
"Timeout was reached”
```

get_output

Use **`get_output`** to get the output from executed commands.

Syntax

`CLI.get_output()`

Returns

Output from executed commands

Examples

Add a local user and get the output from the command.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
>>> c = comware.CLI('system-view ;local-user test class manage', False)
>>> c.get_output()
```

Sample output

```
['<Sysname>system-view', 'System View: return to User View with Ctrl+Z.',
'[Sysname]local-user test class manage', 'New local user added.']
```

get_self_slot

Use **`get_self_slot`** to get the member ID of the master device.

Syntax

`get_self_slot()`

Returns

A list object in the format of [-1,*slot-number*]. The *slot-number* indicates the member ID of the master device.

Examples

Get the member ID of the master device.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
>>> comware.get_self_slot()
```

Sample output

```
[-1,0]
```

get_slot_info

Use **get_slot_info** to get information about a member device.

Syntax

get_slot_info()

Returns

A dictionary object in the format of {'Slot': *slot-number*, 'Status': '*status*', 'Chassis': *chassis-number*, 'Role': '*role*', 'Cpu': *CPU-number* }. The *slot-number* argument indicates the member ID of the device. The *status* argument indicates the status of the member device. The *chassis-number* and *CPU-number* arguments are fixed at 0. The *role* argument indicates the role of the member device.

Examples

Get information about the device or a member device.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
>>> comware.get_slot_info(1)
```

Sample output

```
{'Slot': 1, 'Status': 'Normal', 'Chassis': 0, 'Role': 'Master', 'Cpu': 0}
```

get_slot_range

Use **get_slot_range** to get the supported IRF member ID range.

Syntax

get_slot_range()

Returns

A dictionary object in the format of {'MaxSlot': *max-slot-number*, 'MinSlot': *min-slot-number* }. The *max-slot-number* argument indicates the maximum member ID. The *min-slot-number* argument indicates the minimum member ID.

Examples

Get the supported IRF member ID range.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
>>> comware.get_slot_range()
```

Sample output

```
{'MaxSlot': 10, 'MinSlot': 1}
```

get_standby_slot

Use **`get_standby_slot`** to get the member IDs of the subordinate devices.

Syntax

`get_standby_slot()`

Returns

A list object in one of the following formats:

- [ ]—The IRF fabric does not have a subordinate device.
- [[-1,*slot-number*]]—The IRF fabric has only one subordinate device.
- [[-1,*slot-number1*] , [-1,*slot-number2*] ,...]—The IRF fabric has multiple subordinate devices.

The *slot-number* arguments indicate the member IDs of the subordinate devices.

Examples

Get the member IDs of the subordinate devices.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
>>> comware.get_standby_slot()
```

Sample output

```
[[-1, 1], [-1, 2]]
```

Transfer

Use **`Transfer`** to download a file from a server.

Syntax

`Transfer`(*`protocol`*='', *`host`*='', *`source`*='', *`dest`*='',*`login_timeout`*=10, *`user`*='', *`password`*='')

Parameters

`protocol`: Specifies the protocol used to download a file:

- **`ftp`**—Uses FTP.

- **tftp**—Uses TFTP.
- **http**—Uses HTTP.

host: Specifies the IP address of the remote server.

source: Specifies the name of the file to be downloaded from the remote server.

dest: Specifies a name for the downloaded file.

login_timeout: Specifies the timeout for the operation, in seconds. The default is 10.

user: Specifies the username for logging in to the server.

password: Specifies the login password.

Returns

Transfer object

Examples

Download file **test.cfg** from TFTP server 192.168.1.26.

```
<Sysname> python
Python 2.7.3 (default)
[GCC 4.4.1] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> import comware
>>> comware.Transfer('tftp', '192.168.1.26', 'test.cfg', 'flash:/test.cfg', user='',
password='')
```

Sample output

```
<comware.Transfer object at 0xb7f700e0>
```

Contents

Using automatic configuration

About automatic configuration

When the device starts up without a valid next-startup configuration file, the device searches the root directory of its default file system for the autocfg.py, autocfg.tcl, and autocfg.cfg files. Only one of files might exist in the root directory. If any one of the files exists, the device loads the file. If none of the files exists, the device uses the automatic configuration feature to obtain a set of configuration settings.

With the automatic configuration feature, the device can automatically obtain a set of configuration settings at startup. This feature simplifies network configuration and maintenance.

Automatic configuration can be implemented by using the implementation methods in Table 1.

Table 1 Automatic configuration implementation methods

Implementation method	Configuration file location	Application scenarios
Server-based automatic configuration	File server	A number of geographically distributed devices need to be configured.

Using server-based automatic configuration

About server-based automatic configuration

With server-based automatic configuration, a device without a configuration file can run the DHCP client to obtain a configuration file from a file server at startup.

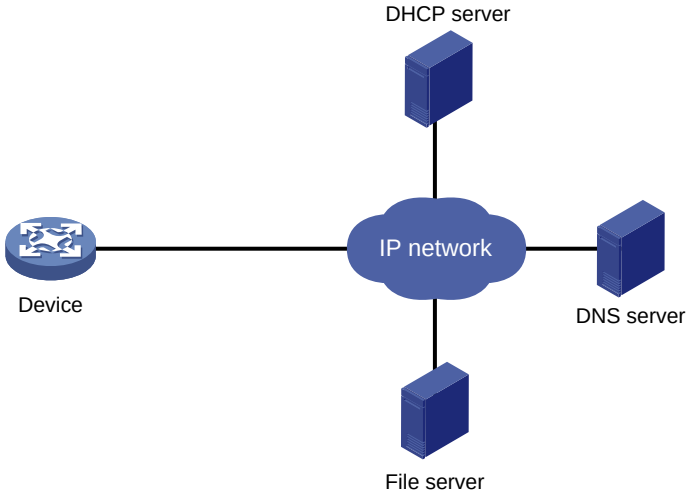
You can deploy server-based automatic configuration on both IPv4 and IPv6 networks by using the same method. This chapter describes the tasks for deploying server-based automatic configuration on an IPv4 network.

Typical server-based automatic configuration network

As shown in Figure 1, a typical server-based automatic configuration network consists of the following servers:

- DHCP server.
- File server (TFTP or HTTP server).
- (Optional.) DNS server.

Figure 1 Server-based automatic configuration network diagram



Server-based automatic configuration tasks at a glance

To configure server-based automatic configuration, perform the following tasks:

1. Configuring the file server
2. Prepare the files for automatic configuration:
   - Preparing configuration files
   - Preparing script files
3. Configuring the DHCP server
4. (Optional.) Configuring the DNS server
5. (Optional.) Configuring the gateway
6. Preparing the interface used for automatic configuration
7. Starting and completing automatic configuration

Configuring the file server

For devices to obtain configuration information from a TFTP server, start TFTP service on the file server.

For devices to obtain configuration information from an HTTP server, start HTTP service on the file server.

Preparing configuration files

Configuration file types

The device supports the configuration file types listed in Table 2.

Table 2 Configuration file types

Configuration file type	Application objects	File name requirements	Supported file server types
Dedicated configuration file	Devices that require different settings	*File name*.**cfg** For simple file name	• TFTP server • HTTP server

Configuration file type	Application objects	File name requirements	Supported file server types
		identification, use configuration file names that do not contain spaces.	
Common configuration file	Devices that share all or some settings	*File name*.**cfg**	• TFTP server • HTTP server
Default configuration file	Other devices. The file contains only common configurations that devices use to start up.	**device.cfg**	TFTP server

Identifying requirements for and preparing configuration files

1. Identify the requirements of the devices for configuration files.
2. For devices that require different configurations, prepare a configuration file for each of them and save the file to the file server.
3. For devices that share all or some configurations, save the common configurations to a .cfg file on the file server.
4. If a TFTP file server is used, you can save the common configurations that devices use to start up to the **device.cfg** file on the server. The file is assigned to a device only when the device does not have any other configuration file to use.

Preparing the host name file on the TFTP server

If a TFTP server is used and the DHCP server does not assign configuration file names, you can configure a host name file on the TFTP server. The host name file contains the host name-IP address mappings of the devices to be automatically configured.

To prepare the host name file:

1. Create a host name file named **network.cfg**.
2. Add each mapping entry in the **ip host** *host-name ip-address* format on a separate line. For example:

```
ip host host1 101.101.101.101
ip host host2 101.101.101.102
ip host client1 101.101.101.103
ip host client2 101.101.101.104
```

IMPORTANT:

The host name for a device must be the same as the name of the configuration file configured for the device.

Preparing script files

About script files

Script files can be used for automatic software upgrade and automatic configuration.

The device supports Python scripts (.py files) and Tcl scripts (.tcl files). For more information about Python and Tcl scripts, see "Using Python" and "Using Tcl."

The device supports dedicated script files and common dedicated script files. It does not support using a default script file. For information about dedicated script files and common dedicated script files, see Table 2.

When script files are used, you cannot use a host name file to provide the host name-IP address mappings for devices.

Restrictions and guidelines

To use a Tcl script, make sure all commands in the script are supported and correctly configured. Any error in a command causes the automatic configuration process to quit.

Procedure

- For devices that share all or some configurations, create a script file that contains the common configurations.
- For the other devices, create a separate script file for each of them.

Configuring the DHCP server

About the DHCP server

The DHCP server assigns the following items to devices that need to be automatically configured:

- IP addresses.
- Paths of the configuration or script files.

Restrictions and guidelines

When you configure the DHCP server, follow these guidelines:

- For devices for which you have prepared different configuration files, perform the following tasks for each of the devices on the DHCP server:
  - Create a DHCP address pool.
  - Configure a static address binding.
  - Specify a configuration file or script file.

  Because an address pool can use only one configuration file, you can specify only one static address binding for an address pool.
- For devices for which you have prepared the same configuration file, use either of the following methods:
  - Method 1:
    - Create a DHCP address pool for the devices.
    - Configure a static address binding for each of the devices in the address pool.
    - Specify the configuration file for the devices.
  - Method 2:
    - Create a DHCP address pool for the devices.
    - Specify the subnet for dynamic allocation.
    - Specify the TFTP server.
    - Specify the configuration file for the devices.
- If all devices on a subnet share the same configuration file or script file, perform the following tasks on the DHCP server:
  - Configure dynamic address allocation.
  - Specify the configuration file or script file for the devices.

  The configuration file can contain only the common settings for the devices. You can provide a method for the device administrators to change the configurations after their devices start up.

Configuring the DHCP server when an HTTP file server is used

1. Enter system view.

system-view

2. Enable DHCP.

   dhcp enable

   By default, DHCP is disabled.

3. Create a DHCP address pool and enter its view.

   dhcp server ip-pool *pool-name*

4. Configure the address pool.

   Choose the options to configure as needed:

   - Specify the primary subnet for the address pool:

     network *network-address* [*mask-length* | **mask** *mask*]

     By default, no primary subnet is specified.

   - Configure a static binding:

     static-bind ip-address *ip-address* [*mask-length* | **mask** *mask*] { **client-identifier** *client-identifier* | **hardware-address** *hardware-address* [**ethernet** | **token-ring**] }

     By default, no static binding is configured.

     You can configure multiple static bindings. However, one IP address can be bound to only one client. To change the binding for a DHCP client, you must remove the binding and reconfigure a binding.

5. Specify the URL of the configuration or script file.

   bootfile-name *url*

   By default, no configuration or script file URL is specified.

Configuring the DHCP server when a TFTP file server is used

1. Enter system view.

   system-view

2. Enable DHCP.

   dhcp enable

   By default, DHCP is disabled.

3. Create a DHCP address pool and enter its view.

   dhcp server ip-pool *pool-name*

4. Configure the address pool.

   Choose the options to configure as needed:

   - Specify the primary subnet for the address pool:

     network *network-address* [*mask-length* | **mask** *mask*]

     By default, no primary subnet is specified.

   - Configure a static binding:

     static-bind ip-address *ip-address* [*mask-length* | **mask** *mask*] { **client-identifier** *client-identifier* | **hardware-address** *hardware-address* [**ethernet** | **token-ring**] }

     By default, no static binding is configured.

     You can configure multiple static bindings. However, one IP address can be bound to only one client. To change the binding for a DHCP client, you must remove the binding and reconfigure a binding.

5. Specify a TFTP server.

   Choose one option as needed:

- Specify the IP address of the TFTP server:

  tftp-server ip-address *ip-address*

  By default, no TFTP server IP address is specified.
- Specify the name of the TFTP server:

  tftp-server domain-name *domain-name*

  By default, no TFTP server name is specified.

  If you specify a TFTP server by its name, a DNS server is required on the network.

6. Specify the name of the configuration or script file.

   bootfile-name *bootfile-name*

   By default, no configuration or script file name is specified.

Configuring the DNS server

A DNS server is required in the following situations:

- The TFTP server does not have a host name file.

  Devices need to provide the DNS server with their IP addresses to obtain their host names. Then, the devices can obtain configuration files named in the *host name***.cfg** format from the TFTP server.
- The DHCP server assigns the TFTP server domain name through the DHCP reply message. Devices must use the domain name to obtain the IP address of the TFTP server.

Configuring the gateway

If the devices to be automatically configured and the servers for automatic configuration reside in different network segments, you must perform the following tasks:

- Deploy a gateway and make sure the devices can communicate with the servers.
- Configure the DHCP relay agent feature on the gateway.
- Configure the UDP helper feature on the gateway.

  This task is required if devices send requests to a TFTP server by using broadcast packets. A device uses broadcast packets to send requests to a TFTP server in the following situations:
  - The DHCP reply does not contain the IP address or domain name of the TFTP server.
  - The IP address or domain name of the TFTP server is invalid.

  The UDP helper transforms a broadcast packet into a unicast packet and forwards the unicast packet to the file server. For more information about UDP helper, see *Layer 3—IP Services Configuration Guide*.

Preparing the interface used for automatic configuration

The device uses the following steps to select the interface for automatic configuration:

1. Identifies the status of the management Ethernet interface at Layer 2. If the status is up, the device uses the management Ethernet interface.
2. Identifies the status of Layer 2 Ethernet interfaces. If one or more Layer 2 Ethernet interfaces are in up state, the device uses the VLAN interface of the default VLAN.
3. If no Layer 2 Ethernet interfaces are in up state, the device waits 30 seconds and goes to step 1 to try again.

For fast automatic device configuration, connect only the management Ethernet interface on each device to the network.

Starting and completing automatic configuration

1. Power on the devices to be automatically configured.

   If a device does not find a next-start configuration file locally, it starts the automatic configuration process to obtain a configuration file.

   - If the device obtains a configuration file and executes the file successfully, the automatic configuration process ends.
   - If one attempt fails, the device tries again until the maximum number of attempts is reached. To stop the process, press **Ctrl+C** or **Ctrl+D**.

   If the device fails to obtain a configuration file, the device starts up without loading any configuration.

2. Save the running configuration.

   save

   The device does not save the obtained configuration file locally. If you do not save the running configuration, the device must use the automatic configuration feature again after a reboot.

   For more information about the **save** command, see *Fundamentals Command Reference*.

Server-based automatic configuration examples

Example: Using a TFTP server for automatic configuration

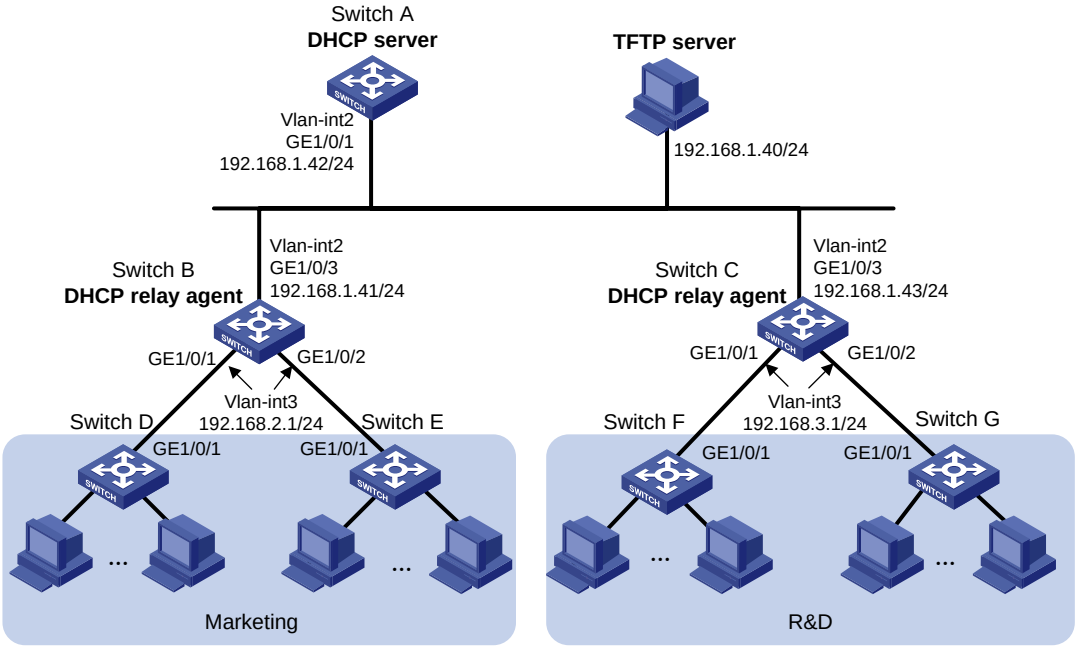
Network configuration

As shown in Figure 2, two departments of a company are connected to the network through gateways (Switch B and Switch C). Access devices Switch D, Switch E, Switch F, and Switch G do not have a configuration file.

Configure the servers and gateways so the access devices can obtain a configuration file to complete the following configuration tasks:

- Enable administrators of access devices to Telnet to and manage their respective access devices.
- Require administrators to enter their respective usernames and passwords at login.

Figure 2 Network diagram



Procedure

1. Configure the DHCP server:

Create a VLAN interface and assign an IP address to the interface.

```
<SwitchA> system-view
[SwitchA] vlan 2
[SwitchA-vlan2] port gigabitethernet 1/0/1
[SwitchA-vlan2] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 192.168.1.42 24
[SwitchA-Vlan-interface2] quit
```

Enable DHCP.

```
[SwitchA] dhcp enable
```

Enable the DHCP server on VLAN-interface 2.

```
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] dhcp select server
[SwitchA-Vlan-interface2] quit
```

Configure address pool **market** to assign IP addresses on the 192.168.2.0/24 subnet to clients in the Marketing department. Specify the TFTP server, gateway, and configuration file name for the clients.

```
[SwitchA] dhcp server ip-pool market
[SwitchA-dhcp-pool-market] network 192.168.2.0 24
[SwitchA-dhcp-pool-market] tftp-server ip-address 192.168.1.40
[SwitchA-dhcp-pool-market] gateway-list 192.168.2.1
[SwitchA-dhcp-pool-market] bootfile-name market.cfg
[SwitchA-dhcp-pool-market] quit
```

Configure address pool **rd** to assign IP addresses on the 192.168.3.0/24 subnet to clients in the R&D department. Specify the TFTP server, gateway, and configuration file name for the clients.

```
[SwitchA] dhcp server ip-pool rd
[SwitchA-dhcp-pool-rd] network 192.168.3.0 24
[SwitchA-dhcp-pool-rd] tftp-server ip-address 192.168.1.40
[SwitchA-dhcp-pool-rd] gateway-list 192.168.3.1
[SwitchA-dhcp-pool-rd] bootfile-name rd.cfg
[SwitchA-dhcp-pool-rd] quit
```

Configure static routes to the DHCP relay agents.

```
[SwitchA] ip route-static 192.168.2.0 24 192.168.1.41
[SwitchA] ip route-static 192.168.3.0 24 192.168.1.43
[SwitchA] quit
```

2. Configure the gateway Switch B:

Create VLAN interfaces and assign IP addresses to the interfaces.

```
<SwitchB> system-view
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/3
[SwitchB-vlan2] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 192.168.1.41 24
[SwitchB-Vlan-interface2] quit
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/1
[SwitchB-vlan3] port gigabitethernet 1/0/2
[SwitchB-vlan3] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ip address 192.168.2.1 24
[SwitchB-Vlan-interface3] quit
```

Enable DHCP.

```
[SwitchB] dhcp enable
```

Enable the DHCP relay agent on VLAN-interface 3.

```
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] dhcp select relay
```

Specify the DHCP server address.

```
[SwitchB-Vlan-interface3] dhcp relay server-address 192.168.1.42
```

3. Configure the gateway Switch C:

Create VLAN interfaces and assign IP addresses to the interfaces.

```
<SwitchC> system-view
[SwitchC] vlan 2
[SwitchC-vlan2] port gigabitethernet 1/0/3
[SwitchC-vlan2] quit
[SwitchC] interface vlan-interface 2
[SwitchC-Vlan-interface2] ip address 192.168.1.43 24
[SwitchC-Vlan-interface2] quit
[SwitchC] vlan 3
[SwitchC-vlan3] port gigabitethernet 1/0/1
[SwitchC-vlan3] port gigabitethernet 1/0/2
[SwitchC-vlan3] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ip address 192.168.3.1 24
```

```
[SwitchC-Vlan-interface3] quit
```

Enable DHCP.

```
[SwitchC] dhcp enable
```

Enable the DHCP relay agent on VLAN-interface 3.

```
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] dhcp select relay
```

Specify the DHCP server address.

```
[SwitchC-Vlan-interface3] dhcp relay server-address 192.168.1.42
```

4. Configure the TFTP server:

On the TFTP server, create a configuration file named **market.cfg**.

```
#
 sysname Market
#
 telnet server enable
#
vlan 3
#
local-user market
 password simple market
 service-type telnet
 quit
#
interface Vlan-interface3
 ip address dhcp-alloc
 quit
#
interface gigabitethernet 1/0/1
 port access vlan 3
 quit
#
user-interface vty 0 63
 authentication-mode scheme
 user-role network-admin
#
return
```

On the TFTP server, create a configuration file named **rd.cfg**.

```
#
 sysname RD
#
 telnet server enable
#
vlan 3
#
local-user rd
 password simple rd
 service-type telnet
 quit
#
```

```
interface Vlan-interface3
 ip address dhcp-alloc
 quit
#
interface gigabitethernet 1/0/1
 port access vlan 3
 quit
#
user-interface vty 0 63
 authentication-mode scheme
 user-role network-admin
#
return
```

Start TFTP service software, and specify the folder where the two configuration files reside as the working directory. (Details not shown.)

Verify that the TFTP server and DHCP relay agents can reach each other. (Details not shown.)

Verifying the configuration

1. Power on Switch D, Switch E, Switch F, and Switch G.
2. After the access devices start up, display assigned IP addresses on Switch A.

```
<SwitchA> display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration      Type
                 Hardware address
192.168.2.2      3030-3066-2e65-3233-  May 6 05:21:25 2013   Auto(C)
                 642e-3561-6633-2d56-
                 6c61-6e2d-696e-7465-
                 7266-6163-6533
192.168.2.3      3030-3066-2e65-3230-  May 6 05:22:50 2013   Auto(C)
                 302e-3232-3033-2d56-
                 6c61-6e2d-696e-7465-
                 7266-6163-6533
192.168.3.2      3030-6530-2e66-6330-  May 6 05:23:15 2013   Auto(C)
                 302e-3335-3131-2d56-
                 6c61-6e2d-696e-7465-
                 7266-6163-6531
192.168.3.3      3030-6530-2e66-6330-  May 6 05:24:10 2013   Auto(C)
                 302e-3335-3135-2d56-
                 6c61-6e2d-696e-7465-
                 7266-6163-6532
```

3. Telnet to 192.168.2.2 from Switch A.

```
<SwitchA> telnet 192.168.2.2
```

4. Enter username **market** and password **market** as prompted. (Details not shown.)

   You are logged in to Switch D or Switch E.

Example: Using an HTTP server and Tcl scripts for automatic configuration

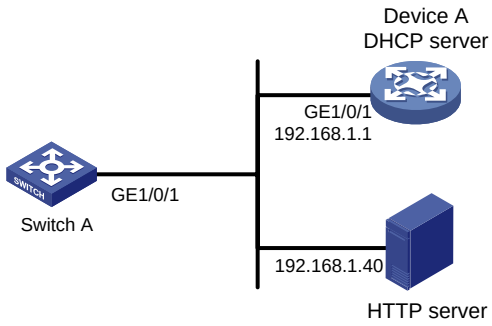
Network configuration

As shown in Figure 3, Switch A does not have a configuration file.

Configure the servers so Switch A can obtain a Tcl script to complete the following configuration tasks:

- Enable the administrator to Telnet to Switch A to manage Switch A.
- Require the administrator to enter the correct username and password at login.

Figure 3 Network diagram



Procedure

1. Configure the DHCP server:

   # Enable DHCP.

   ```
   <DeviceA> system-view
   [DeviceA] dhcp enable
   ```

   # Configure address pool **1** to assign IP addresses on the 192.168.1.0/24 subnet to clients.

   ```
   [DeviceA] dhcp server ip-pool 1
   [DeviceA-dhcp-pool-1] network 192.168.1.0 24
   ```

   # Specify the URL of the script file for the clients.

   ```
   [DeviceA-dhcp-pool-1] bootfile-name http://192.168.1.40/device.tcl
   ```

2. Configure the HTTP server:

   # Create a configuration file named **device.tcl** on the HTTP server.

   ```
   system-view
   telnet server enable
   local-user user
   password simple abcabc
   service-type telnet
   quit
   user-interface vty 0 63
   authentication-mode scheme
   user-role network-admin
   quit

   interface Vlan-interface 1
   ip address dhcp-alloc
   ```

```
return
```

Start HTTP service software and enable HTTP service. (Details not shown.)

Verifying the configuration

1. Power on Switch A.
2. After Switch A starts up, display assigned IP addresses on Device A.

```
<DeviceA> display dhcp server ip-in-use
IP address       Client identifier/    Lease expiration      Type
                 Hardware address
192.168.1.2      0030-3030-632e-3239-  Dec 12 17:41:15 2013  Auto(C)
                 3035-2e36-3736-622d-
                 4574-6830-2f30-2f32
```

3. Telnet to 192.168.1.2 from Device A.

```
<DeviceA> telnet 192.168.1.2
```

4. Enter username **user** and password **abcabc** as prompted. (Details not shown.)

   You are logged in to Switch A.

Example: Using an HTTP server and Python scripts for automatic configuration

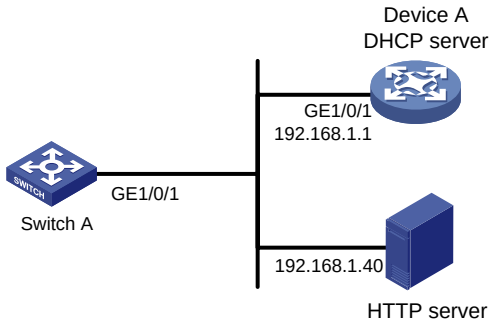
Network configuration

As shown in Figure 4, Switch A does not have a configuration file.

Configure the servers so Switch A can obtain a Python script to complete the following configuration tasks:

- Enable the administrator to Telnet to Switch A to manage Switch A.
- Require the administrator to enter the correct username and password at login.

Figure 4 Network diagram



Procedure

1. Configure the DHCP server:

   # Enable DHCP.

```
<DeviceA> system-view
[DeviceA] dhcp enable
```

   # Configure address pool **1** to assign IP addresses on the 192.168.1.0/24 subnet to clients.

```
[DeviceA] dhcp server ip-pool 1
[DeviceA-dhcp-pool-1] network 192.168.1.0 24
```

   # Specify the URL of the script file for the clients.

```
[DeviceA-dhcp-pool-1] bootfile-name http://192.168.1.40/device.py
```

2. Configure the HTTP server:

   # Create a configuration file named **device.py** on the HTTP server.

```
#!usr/bin/python

import comware
comware.CLI('system-view ;telnet server enable ;local-user user ;password simple
abcabc ;service-type telnet ;quit ;user-interface vty 0 63 ;authentication-mode
scheme ;user-role network-admin ;quit ;interface Vlan-interface 1 ;ip address
dhcp-alloc ;return')
```

   # Start HTTP service software and enable HTTP service. (Details not shown.)

Verifying the configuration

1. Power on Switch A.
2. After Switch A starts up, display assigned IP addresses on Device A.

```
<DeviceA> display dhcp server ip-in-use
IP address       Client identifier/    Lease expiration      Type
                 Hardware address
192.168.1.2      0030-3030-632e-3239-  Dec 12 17:41:15 2013  Auto(C)
                 3035-2e36-3736-622d-
                 4574-6830-2f30-2f32
```

3. Telnet to 192.168.1.2 from Device A.

```
<DeviceA> telnet 192.168.1.2
```

4. Enter username **user** and password **abcabc** as prompted. (Details not shown.)

   You are logged in to Switch A.

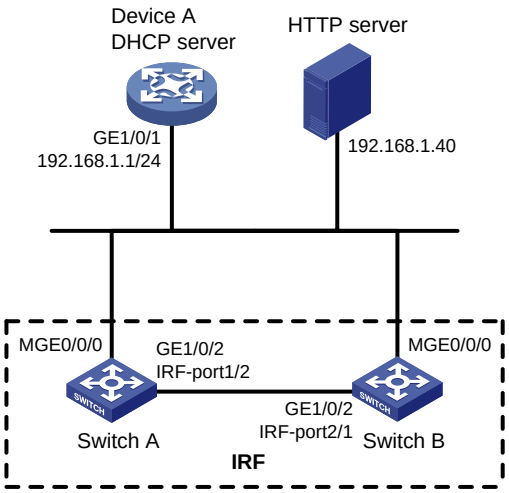
Example: Setting up an IRF fabric

Network configuration

As shown in Figure 5, Switch A and Switch B do not have a configuration file.

Configure the servers so the switches can obtain a Python script to complete their respective configurations and form an IRF fabric.

Figure 5 Network diagram



Procedure

1. Assign IP addresses to the interfaces. Make sure the devices can reach each other. (Details not shown.)
2. Configure the following files on the HTTP server:

File	Content	Remarks
.cfg configuration file	Commands required for IRF setup.	You can create a configuration file by copying and modifying the configuration file of an existing IRF fabric.
sn.txt	Serial numbers of the member switches.	Each SN uniquely identifies a switch. These SNs will be used for assigning a unique IRF member ID to each member switch.
(Optional.) .ipe or .bin software image file	Software images.	If the member switches are running different software versions, you must prepare the software image file used for software upgrade.
.py Python script file	Python commands that complete the following tasks: **a** (Optional.) Verify that the flash memory has sufficient space for the files to be downloaded. **b** Download the configuration file and **sn.txt**. **c** (Optional.) Download the software image file and specify it as the main startup image file. **d** Resolve **sn.txt** and assign a unique IRF member ID to each SN. **e** Specify the configuration file as the main next-startup configuration file. **f** Reboot the member switches.	For more information about Python script configuration, see "Using Python."

3. Configure Device A as the DHCP server:

   # Enable DHCP.

   ```
   <DeviceA> system-view
   [DeviceA] dhcp enable
   ```

   # Configure address pool **1** to assign IP addresses on the 192.168.1.0/24 subnet to clients.

   ```
   [DeviceA] dhcp server ip-pool 1
   [DeviceA-dhcp-pool-1] network 192.168.1.0 24
   ```

   # Specify the URL of the script file for the clients.

   ```
   [DeviceA-dhcp-pool-1] bootfile-name http://192.168.1.40/device.py
   [DeviceA-dhcp-pool-1] quit
   ```

   # Enable the DHCP server on GigabitEthernet 1/0/1.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] dhcp select server
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

4. Power on Switch A and Switch B.

Switch A and Switch B will obtain the Python script file from the DHCP server and execute the script. After completing the IRF configuration, Switch A and Switch B reboot.

5. After Switch A and Switch B start up again, use a cable to connect Switch A and Switch B through their IRF physical ports.

   Switch A and Switch B will elect a master member. The subordinate member will reboot to join the IRF fabric.

Verifying the configuration

On Switch A, display IRF member devices. You can also use the **`display irf`** command on Switch B to display IRF member devices.

```
<Switch A> display irf
MemberID  Slot  Role    Priority  CPU-Mac         Description
   1      1     Standby 1         00e0-fc0f-8c02  ---
 *+2      1     Master  30        00e0-fc0f-8c14  ---
-------------------------------------------------
 * indicates the device is the master.
 + indicates the device through which the user logs in.

 The Bridge MAC of the IRF is: 000c-1000-1111
 Auto upgrade                : yes
 Mac persistent              : always
 Domain ID                   : 0
 Auto merge                  : yes
```

The output shows that the switches have formed an IRF fabric.

Contents

Managing licenses

About licenses

To use license-based features, you must purchase licenses from H3C and install the licenses.

To obtain information about license-based features, their licensing status, and license availability, execute the **display license feature** command on the device. Then, you can purchase and install licenses as needed.

To install a formal license for a feature:

1. Purchase a software license certificate through an official channel.
2. Access the H3C license management platform at http://www.h3c.com/en/License, and then enter the license key in the certificate and the required device information to obtain an activation file.
3. Install the activation file on the device.

Basic concepts

The following information describes the basic concepts that you might encounter when you register, install, and manage licenses.

H3C license management platform

The H3C license management platform provides product licensing services for H3C customers. You can access this system to obtain an activation file.

The H3C license management platform is accessible at http://www.h3c.com/en/License/.

Software license certificate

A software license certificate allows users to use a license-based feature. It contains license key, license capacity, and other information.

License key

A license key uniquely identifies a license.

To obtain a formal license key, purchase a software license certificate. The authorization serial number in the software license certificate is the license key.

Device serial number

A device serial number (SN or S/N) is a barcode that uniquely identifies a device. It comes with the device and must be provided when you request a license on the H3C license management platform.

Device ID (DID) and DID file

A DID is a string of characters that uniquely identifies a hardware device. A DID file stores the DID and other information. The device comes with a DID or DID file. You must provide the DID or DID file when you request a license for the device on the H3C license management platform.

Activation file

To use a license-based feature on a system, you must perform the following tasks:

1. Use the license key and the system's SN and DID information to obtain an activation file from the H3C license management platform.
2. Install the activation file on the system.

Uninstall key and Uninstall file

When you uninstall a license, an Uninstall file that contains an Uninstall key is created. The Uninstall key is required for transferring the license.

License storage

License storage is a persistent storage of fixed size for storing licensing information. This information includes the licensing state, validity period, Uninstall key or Uninstall file, and other related information.

Data in the license storage persists through reboot. This ensures licensing accuracy and continuity.

Restrictions and guidelines: License management

Management operation restrictions

- Purchase licenses from H3C official channels.
- For licenses that have been installed on the device, execute the **`display license`** command to view the license validity period. To use a license-based feature continuously, install a new license for the feature before the old license expires.
- Licenses are typically device locked. To ensure a successful licensing, use the following licensing guidelines:
  a. When you purchase a license certificate, verify the following items:
    - Make sure the license is compatible with the target device.
    - Make sure its licensed functionality and capacity meet your requirements.
  b. When you obtain an activation file, make sure the provided license key and hardware information are correct.
  c. Install the activation file on the correct target device.
- Make sure no one else is performing license management tasks while you are managing licenses on the device.

File operation restrictions

When you manage DID files, activation files, or Uninstall files, follow these restrictions and guidelines:

- To avoid licensing error, do not modify the name of a DID file, activation file, or Uninstall file, or edit the file content.
- Before you install an activation file, download the activation file to the storage media of the device such as flash memory. When installing an activation file, the device automatically copies the activation file to the **license** folder in the root directory of the storage media. The **license** folder stores important files for licensing. For licensed features to function correctly, do not delete or modify the **license** folder or the files in this folder.

Configuring local licensing

About local licensing

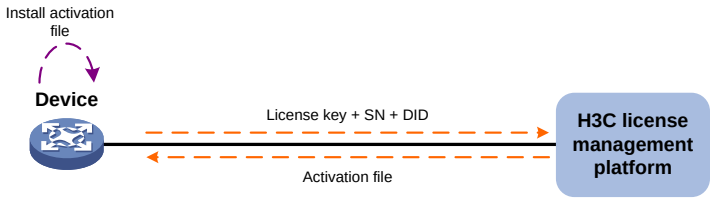
Local licensing requires license activation device by device. It is applicable to small-sized networks.

To install a license on a device:

1. Obtain the license key and the device SN and DID information of the device.
2. Access the H3C license management platform to apply for an activation file based on the license key and the device's SN and DID information.
3. Install the activation file on the device to activate the license.

The activation file for a license is device locked. You cannot install the activation file for one device to activate the license on another device.

Figure 1 Local licensing procedure



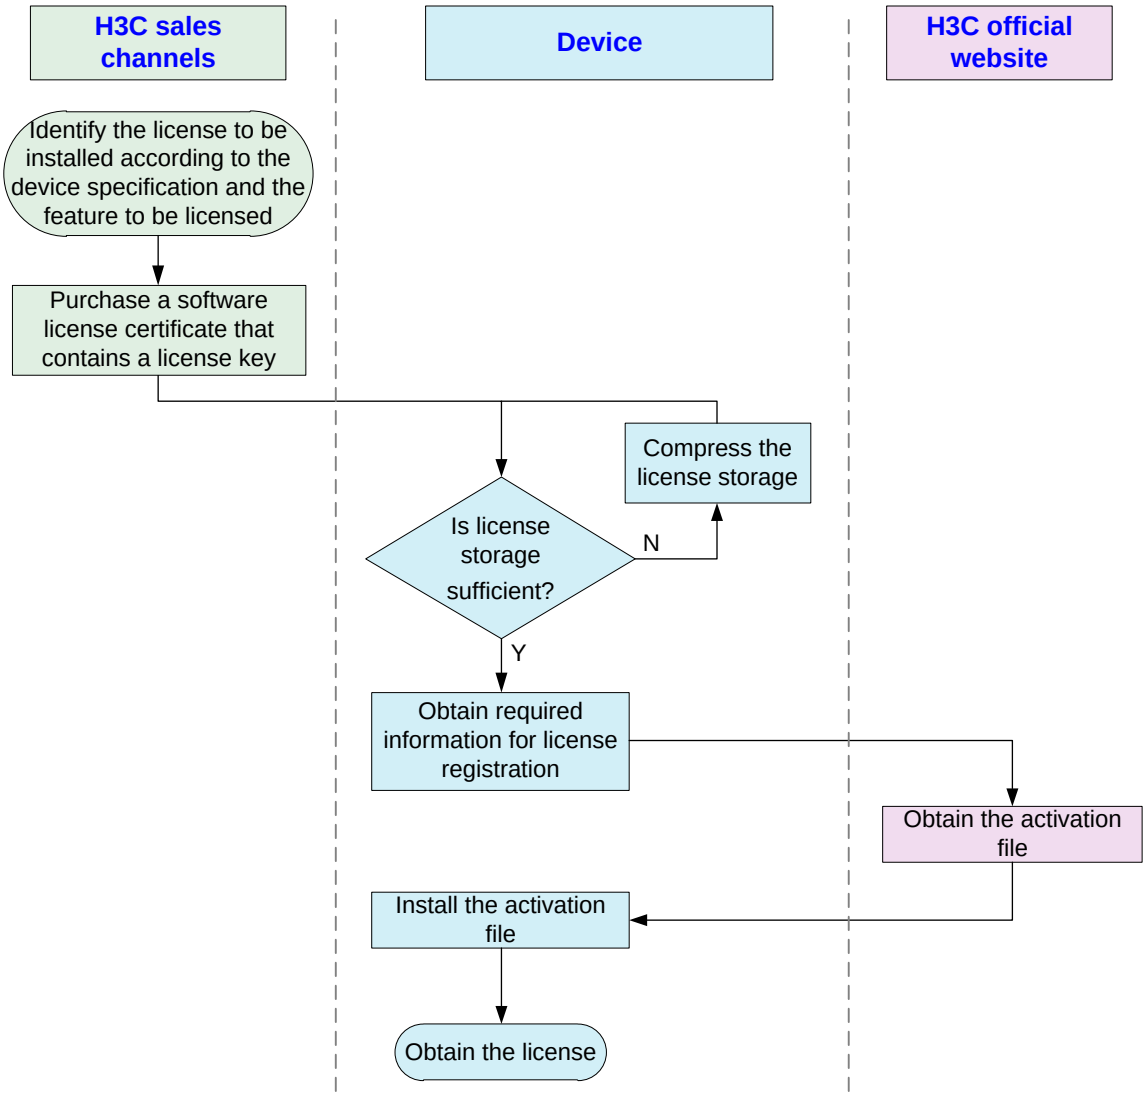
Registering and installing a license

License registration and installation workflow

Figure 2 shows the procedure for registering and installing a license.

This chapter only describes the operations performed on the device and H3C license management platform. For more information, see the licensing guide for the device.

Figure 2 License registration and installation workflow



Identifying the license storage

To identify the free space of the license storage, execute the following command in any view:

`display license feature`

From the command output, view the **Total** and **Usage** fields to examine whether the remaining license storage is sufficient for installing new licenses. If the remaining license storage is not sufficient, compress the license storage.

Compressing the license storage

About this task

The license storage stores licensing information and has a fixed size.

You can compress the license storage to delete expired and uninstalled license information to ensure sufficient storage space for installing new licenses.

If no licenses have been installed on the device, you do not need to compress the license storage.

Prerequisites

Back up the Uninstall keys or Uninstall files for the uninstalled licenses for subsequent license transferring or license uninstallation.

If uninstalled licenses or expired licenses exist on the device, the compression operation will make the DID or DID file change. You will be unable to install the activation file obtained by using the old DID or DID file on the device. As a best practice, install all activation files registered with the old DID or DID file before performing a compression.

If you have not installed an activation file registered with the old DID, take the following actions:

- If the license storage is sufficient, install the activation file on the device.
- If the license storage is insufficient and the activation file cannot be installed after the compression, contact H3C Support.

Procedure

1. Enter system view.

   system-view
2. Compress the license storage.

   license compress slot *slot-number*

Obtaining required information for license registration

To obtain the SN and DID information, execute the following command in any view:

display license device-id slot *slot-number*

Registering a license on the H3C license management platform

About registering a license

License registration has the following procedures:

- Registering licenses for the first time—Register a license for a device that has not previously been registered.
- Registering upgrade licenses—Register licenses for capacity expansion, feature enhancement, or a time extension. This procedure is also applicable to the scenario that you register a new license for a device that has expired or uninstalled licenses.

If you do not know which registration procedure should be used, select registering licenses for the first time. If the selection is not correct, the website will display messages for the correct registration choice after you enter the required information.

Restrictions and guidelines

If you cannot download the activation file due to issues such as operating system and browser errors, try to re-register the license. If the issue persists, contact H3C Support.

Registering licenses for the first time

1. Visit the H3C website at http://www.h3c.com/en/License/.
2. Select **Register the First Time**.
3. Enter the authorization serial number in the **Input the license key** field and click **Submit**.

   A dialog box opens, displaying product categories matching the license key.
4. In the dialog box, select a product category from the **Product category** dropdown list and click **OK**.

5. Enter the device SN.
6. Enter the DID or upload the DID file.
7. Enter the required contact information and verify code, select **I accept all terms of H3C Legal Statement**, and click **Get activation key or file**.
8. Download the activation file to the PC.

   A copy of the activation file will also be sent to the email address that you enter in the contact information.

Registering upgrade licenses

1. Visit the H3C website at http://www.h3c.com/en/License/.
2. Select **Register Upgrade Licenses**.
3. Enter the authorization serial number in the **Input the license key** field and click **Submit**.

   A dialog box opens, displaying product categories matching the license key.
4. In the dialog box, select a product category from the **Product category** dropdown list and click **OK**.
5. Enter the device SN.
6. Enter the DID or upload the DID file and click **Submit**.
7. Enter the required contact information and verify code, select **I accept all terms of H3C Legal Statement**, and click **Get activation key or file**.
8. Download the activation file to the PC.

   A copy of the activation file will also be sent to the email address that you enter in the contact information.

Installing an activation file

About this task

CAUTION:

Back up an activation file before you install it. If the activation file is inadvertently deleted or becomes unavailable for some other reason, you can use the backup activation file to restore the license.

To obtain a license, install an activation file for the license on the device.

Prerequisites

Use FTP or TFTP to upload the activation file to be installed to the device. If FTP is used to transfer the activation file, set it in binary mode.

Procedure

1. Enter system view.

   system-view
2. Install an activation file.

   license activation-file install *file-name* **slot** *slot-number*

   You can install a single .ak file or multiple .ak files through one operation. To install multiple .ak files, save all activation files in the same directory and specify the directory as the value of the *file-name* argument.

Transferring a license

About this task

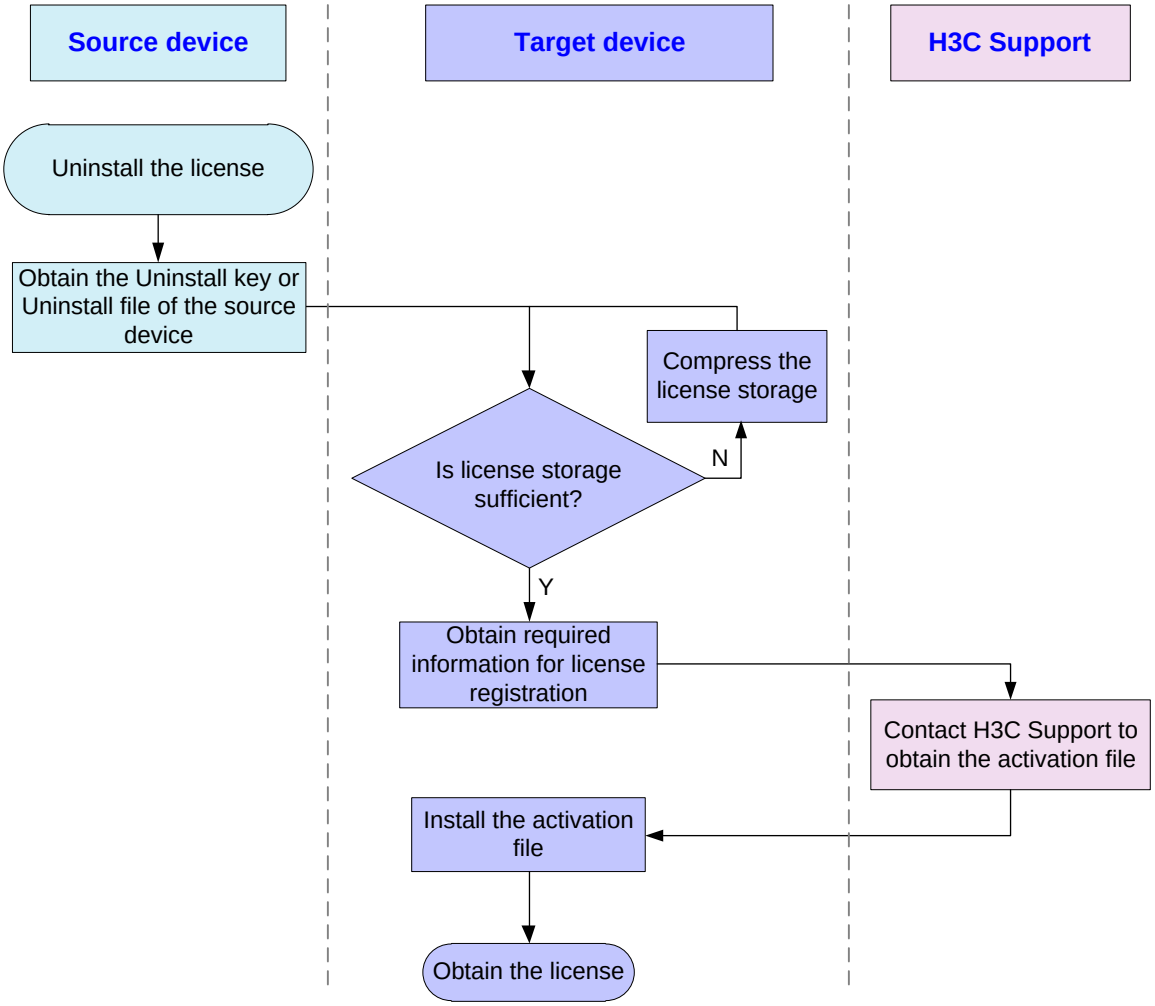
Perform this task to transfer a license that has not expired from one device to another in the same product series.

License transferring workflow

To transfer licenses from one device to another, use the workflow in Figure 3.

This chapter describes only the operations performed on the source device. For the operations performed on the target device, see "Registering and installing a license." For more information about license transferring, contact H3C Support.

Figure 3 License transferring workflow



Obtaining an Uninstall file

1. Execute the **`display license`** command to view the activation file to be uninstalled.
2. Enter system view.

system-view

3. Uninstall an activation file.

   license activation-file uninstall *license-file* **slot** *slot-number*

   You can uninstall a single .ak file or multiple .ak files through one operation. To uninstall multiple .ak files, save all activation files in the same directory and specify the directory as the value of the *license-file* argument.

Uninstalling a license

About license uninstallation

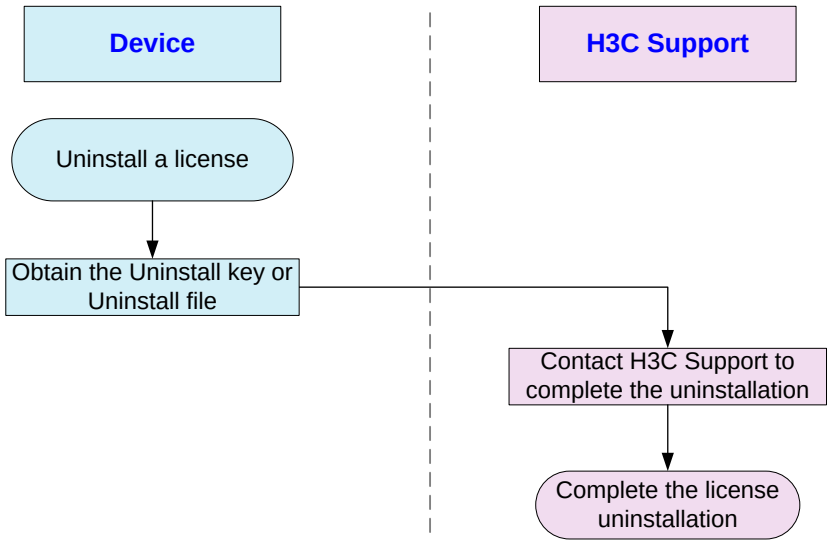
A license key is bound to a device once you activate the license key on the H3C license management platform. You cannot bind this license key to another device. To unbind a license key for a license that has not expired from a device, obtain the Uninstall key or Uninstall file for the license on the device. Then, contact H3C Support to complete the license uninstallation.

To restore the license on the local device or transfer the license to another device, you must contact H3C Support to obtain a new activation file for the license. Then, install the new activation file on the target device.

License uninstallation workflow

For information about obtaining the Uninstall file, see "Obtaining an Uninstall file." For more information about license uninstallation, contact H3C Support.

Figure 4 License uninstallation workflow



Recovering an activation file

If you mistakenly delete an activation file, use the following procedure to recover the activation file:

1. Use the **copy** command to copy the backup activation file to the **license** folder in the root directory of the storage media.
2. Use the **display license** command to verify that the state of the recovered activation file is **In use**.

3. Restart the device if the license state is **In use** but the licensed feature cannot function correctly.

Display and maintenance commands for license management

Execute **display** commands in any view.

Task	Command
Display detailed license information.	**display license** [**activation-file**] [**slot** *slot-number*]
Display the SN and DID information.	**display license device-id slot** *slot-number*
Display brief feature license information.	**display license feature**

Virtual Technologies Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

New H3C Technologies Co., Ltd.
http://www.h3c.com

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This configuration guide describes how to set up an IRF fabric of multiple switches, including:

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

Configuring an IRF fabric

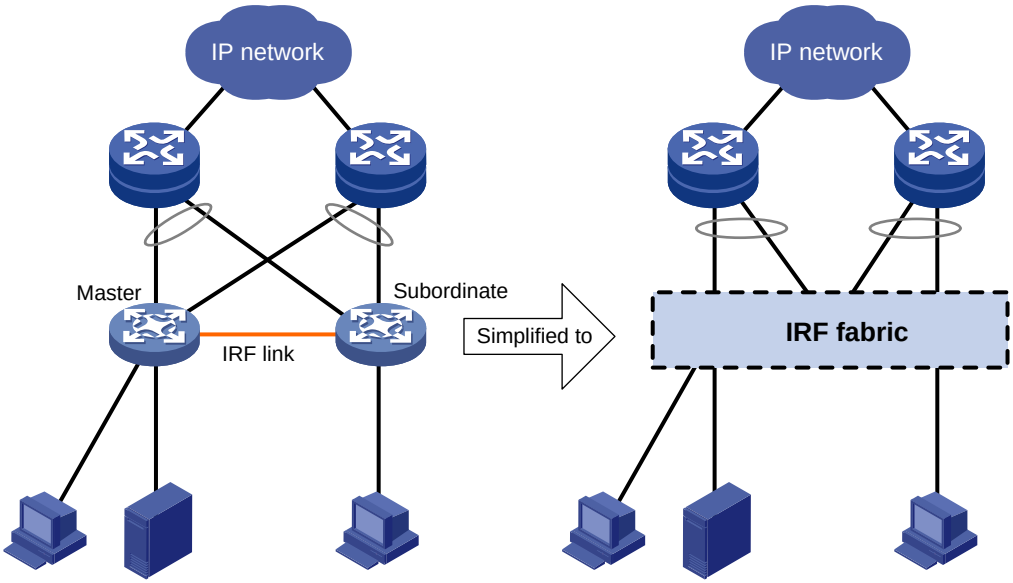
About IRF

The Intelligent Resilient Framework (IRF) technology virtualizes multiple physical devices at the same layer into one virtual fabric to provide data center class availability and scalability. IRF virtualization technology offers processing power, interaction, unified management, and uninterrupted maintenance of multiple devices.

IRF network model

Figure 1 shows an IRF fabric that has two devices, which appear as a single node to the upper-layer and lower-layer devices.

Figure 1 IRF application scenario



IRF benefits

IRF provides the following benefits:

- **Simplified topology and easy management**—An IRF fabric appears as one node and is accessible at a single IP address on the network. You can use this IP address to log in at any member device to manage all the members of the IRF fabric. In addition, you do not need to run the spanning tree feature among the IRF members.
- **1:N redundancy**—In an IRF fabric, one member acts as the master to manage and control the entire IRF fabric. All the other members process services while backing up the master. When the master fails, all the other member devices elect a new master from among them to take over without interrupting services.
- **IRF link aggregation**—You can assign several physical links between neighboring members to their IRF ports to create a load-balanced aggregate IRF connection with redundancy.
- **Multichassis link aggregation**—You can use the Ethernet link aggregation feature to aggregate the physical links between the IRF fabric and its upstream or downstream devices across the IRF members.

- **Network scalability and resiliency**—Processing capacity of an IRF fabric equals the total processing capacities of all the members. You can increase ports, network bandwidth, and processing capacity of an IRF fabric simply by adding member devices without changing the network topology.

Basic concepts

IRF member roles

IRF uses two member roles: master and standby (called subordinate throughout the documentation).

When devices form an IRF fabric, they elect a master to manage and control the IRF fabric, and all the other devices back up the master. When the master device fails, the other devices automatically elect a new master. For more information about master election, see "Master election."

IRF member ID

An IRF fabric uses member IDs to uniquely identify and manage its members. This member ID information is included as the first part of interface numbers and file paths to uniquely identify interfaces and files in an IRF fabric. Two devices cannot form an IRF fabric if they use the same member ID. A device cannot join an IRF fabric if its member ID has been used in the fabric.

Member priority

Member priority determines the possibility of a member device to be elected the master. A member with higher priority is more likely to be elected the master.

IRF port

An IRF port is a logical interface that connects IRF member devices. Every IRF-capable device has two IRF ports.

The IRF ports are named IRF-port *n*/1 and IRF-port *n*/2, where *n* is the member ID of the device. The two IRF ports are referred to as IRF-port 1 and IRF-port 2.

To use an IRF port, you must bind a minimum of one physical interface to it. The physical interfaces assigned to an IRF port automatically form an aggregate IRF link. An IRF port goes down when all its IRF physical interfaces are down.

IRF physical interface

IRF physical interfaces connect IRF member devices and must be bound to an IRF port. They forward traffic between member devices, including IRF protocol packets and data packets that must travel across IRF member devices.

IRF split

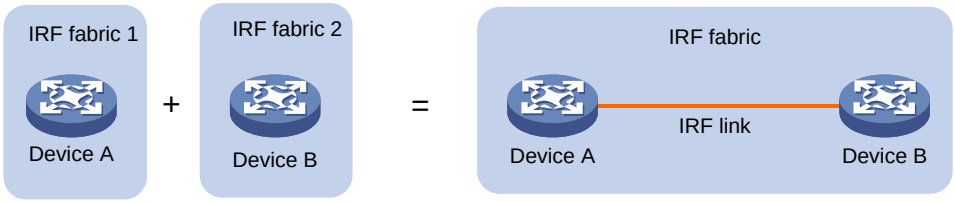
IRF split occurs when an IRF fabric breaks up into multiple IRF fabrics because of IRF link failures, as shown in Figure 2. The split IRF fabrics operate with the same IP address. IRF split causes routing and forwarding problems on the network. To quickly detect a multi-active collision, configure a minimum of one MAD mechanism (see "Configuring MAD").

Figure 2 IRF split

IRF merge

IRF merge occurs when two split IRF fabrics reunite or when two independent IRF fabrics are united, as shown in Figure 3.

Figure 3 IRF merge



MAD

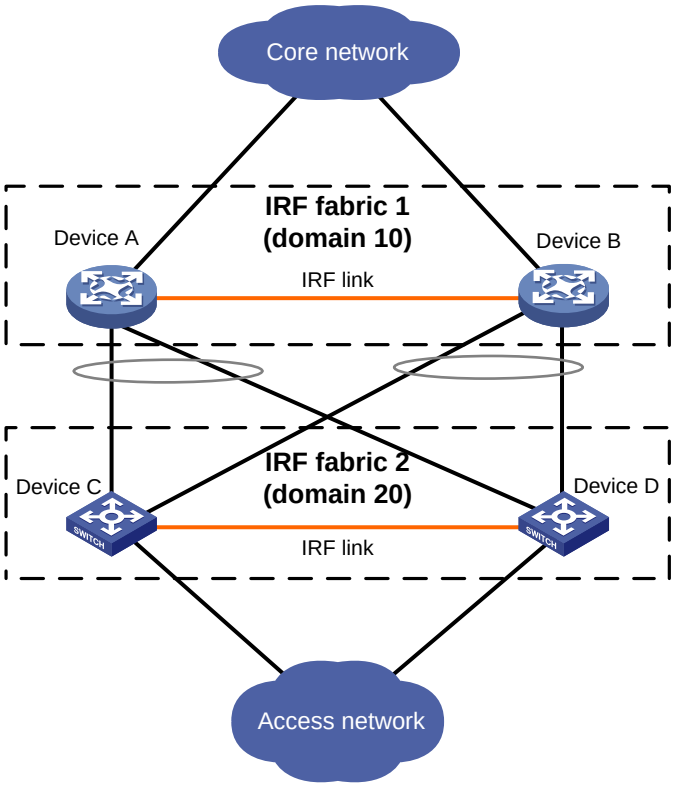
An IRF link failure causes an IRF fabric to split in two IRF fabrics operating with the same Layer 3 settings, including the same IP address. To avoid IP address collision and network problems, IRF uses multi-active detection (MAD) mechanisms to detect the presence of multiple identical IRF fabrics, handle collisions, and recover from faults.

IRF domain ID

One IRF fabric forms one IRF domain. IRF uses IRF domain IDs to uniquely identify IRF fabrics and prevent IRF fabrics from interfering with one another.

As shown in Figure 4, IRF fabric 1 contains Device A and Device B, and IRF fabric 2 contains Device C and Device D. Both fabrics use the LACP aggregate links between them for MAD. When a member device receives an extended LACPDU for MAD, it checks the domain ID to determine whether the packet is from the local IRF fabric. Then, the member device can handle the packet correctly.

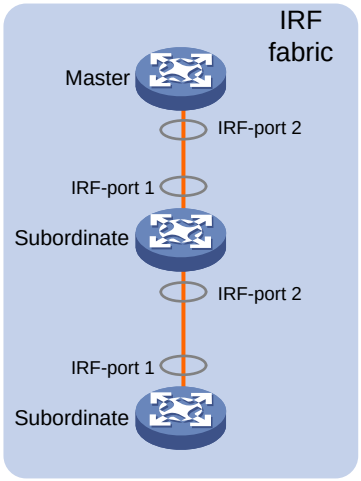
Figure 4 A network that contains two IRF domains



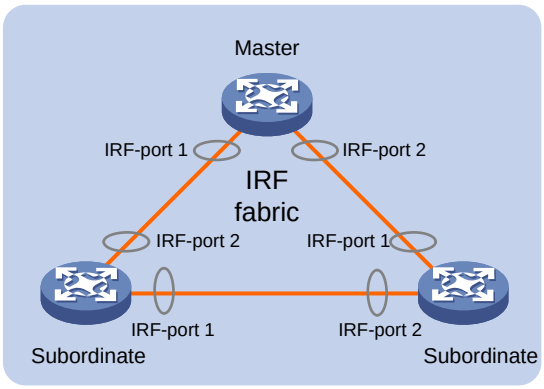
IRF network topology

An IRF fabric can use a daisy-chain or ring topology. As shown in Figure 5, a ring topology is more reliable. In ring topology, the failure of one IRF link does not cause the IRF fabric to split as in daisy-chain topology. Rather, the IRF fabric changes to a daisy-chain topology without interrupting network services.

Figure 5 Daisy-chain topology vs. ring topology



Daisy-chain topology



Ring topology

Master election

Master election occurs each time the IRF fabric topology changes in the following situations:

- The IRF fabric is established.
- The master device fails or is removed.
- The IRF fabric splits.
- Independent IRF fabrics merge.

NOTE:

Master election does not occur when split IRF fabrics merge. For information about the master device of the merged IRF fabric, see "Failure recovery."

Master election selects a master in descending order:

1. Current master, even if a new member has higher priority.

   When an IRF fabric is being formed, all members consider themselves as the master. This rule is skipped.
2. Member with higher priority.
3. Member with the longest system uptime.

   Two members are considered to start up at the same time if the difference between their startup times is equal to or less than 10 minutes. For these members, the next tiebreaker applies.
4. Member with the lowest CPU MAC address.

For the setup of a new IRF fabric, the subordinate devices must reboot to complete the setup after the master election.

For an IRF merge, devices must reboot if they are in the IRF fabric that fails the master election.

Interface naming conventions

A physical interface is numbered in the *chassis-number/slot-number/interface-index* format.

- ***chassis-number***—Member ID of the device. The default value for this argument is 1. Any change to the member ID takes effect after a reboot.
- ***slot-number***—Slot number of the interface. The slot number is fixed at 0.
- ***interface-index***—Interface index on the device. Interface index depends on the number of physical interfaces available on the device. To identify the index of a physical interface, examine its index mark on the chassis.

For example, GigabitEthernet 3/0/1 represents the first physical interface on member device 3. Set its link type to trunk, as follows:

```
<Sysname> system-view
[Sysname] interface gigabitethernet 3/0/1
[Sysname-GigabitEthernet3/0/1] port link-type trunk
```

File system naming conventions

On a single-chassis fabric, you can use its storage device name to access its file system.

On a multichassis IRF fabric, you can use the storage device name to access the file system of the master. To access the file system of any other member device, use the name in the **slot***member-ID#storage-device-name* format.

For more information about storage device naming conventions, see *Fundamentals Configuration Guide*.

For example:

- To create and access the **test** folder under the root directory of the flash memory on the master switch:

  ```
  <Master> mkdir test
  Creating directory flash:/test... Done.
  <Master> cd test
  <Master> dir
  Directory of flash:/test
  The directory is empty.

  251904 KB total (70964 KB free)
  ```

- To create and access the **test** folder under the root directory of the flash memory on member device 3:

  ```
  <Master> mkdir slot3#flash:/test
  Creating directory slot3#flash:/test... Done.
  <Master> cd slot3#flash:/test
  <Master> dir
  Directory of slot3#flash:/test
  The directory is empty.

  251904 KB total (70964 KB free)
  ```

Configuration synchronization

IRF uses a strict running-configuration synchronization mechanism. In an IRF fabric, all devices obtain and run the running configuration of the master. Configuration changes are automatically propagated from the master to the remaining devices. The configuration files of these devices are retained, but the files do not take effect. The devices use their own startup configuration files only after they are removed from the IRF fabric.

As a best practice, back up the next-startup configuration file on a device before adding the device to an IRF fabric as a subordinate.

A subordinate device's next-startup configuration file might be overwritten if the master and the subordinate use the same file name for their next-startup configuration files. You can use the backup file to restore the original configuration after removing the subordinate from the IRF fabric.

For more information about configuration management, see *Fundamentals Configuration Guide*.

Multi-active handling procedure

The multi-active handling procedure includes detection, collision handling, and failure recovery.

Detection

IRF provides MAD mechanisms by extending LACP, BFD, ARP, and IPv6 ND to detect multi-active collisions. As a best practice, configure a minimum of one MAD mechanism on an IRF fabric. For more information about the MAD mechanisms and their application scenarios, see "MAD mechanisms."

For information about LACP, see Ethernet link aggregation in *Layer 2—LAN Switching Configuration Guide*. For information about BFD, see *High Availability Configuration Guide*. For information about ARP, see *Layer 3—IP Services Configuration Guide*. For information about ND, see IPv6 basics in *Layer 3—IP Services Configuration Guide*.

Collision handling

When detecting a multi-active collision, MAD disables all IRF fabrics except one from forwarding data traffic by placing them in Recovery state. The IRF fabrics placed in Recovery state are called inactive IRF fabrics. The IRF fabric that continues to forward traffic is called the active IRF fabric.

LACP MAD and BFD MAD use the following process to handle a multi-active collision:

1. Compare the number of members in each fabric.
2. Set all fabrics to the Recovery state except the one that has the most members.
3. Compare the member IDs of the masters if all IRF fabrics have the same number of members.
4. Set all fabrics to the Recovery state except the one that has the lowest numbered master.
5. Shut down all common network interfaces in the Recovery-state fabrics except for the following interfaces:
   - Interfaces automatically excluded from being shut down by the system.
   - Interfaces specified by using the **`mad exclude interface`** command.

ARP MAD and ND MAD use the following process to handle a multi-active collision:

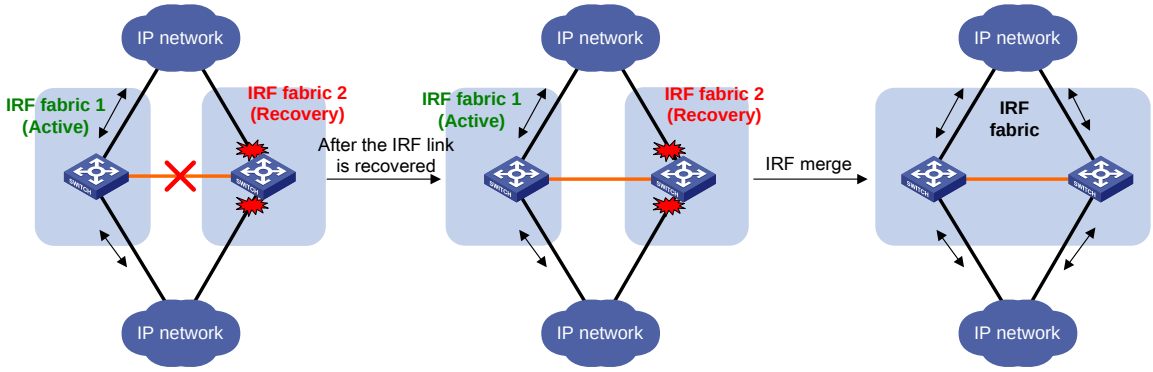
1. Compare the member IDs of the masters in the IRF fabrics.
2. Set all fabrics to the Recovery state except the one that has the lowest numbered master.
3. Take the same action as LACP MAD and BFD MAD on the network interfaces in Recovery-state fabrics.

Failure recovery

To merge two split IRF fabrics, first repair the failed IRF link and remove the IRF link failure.

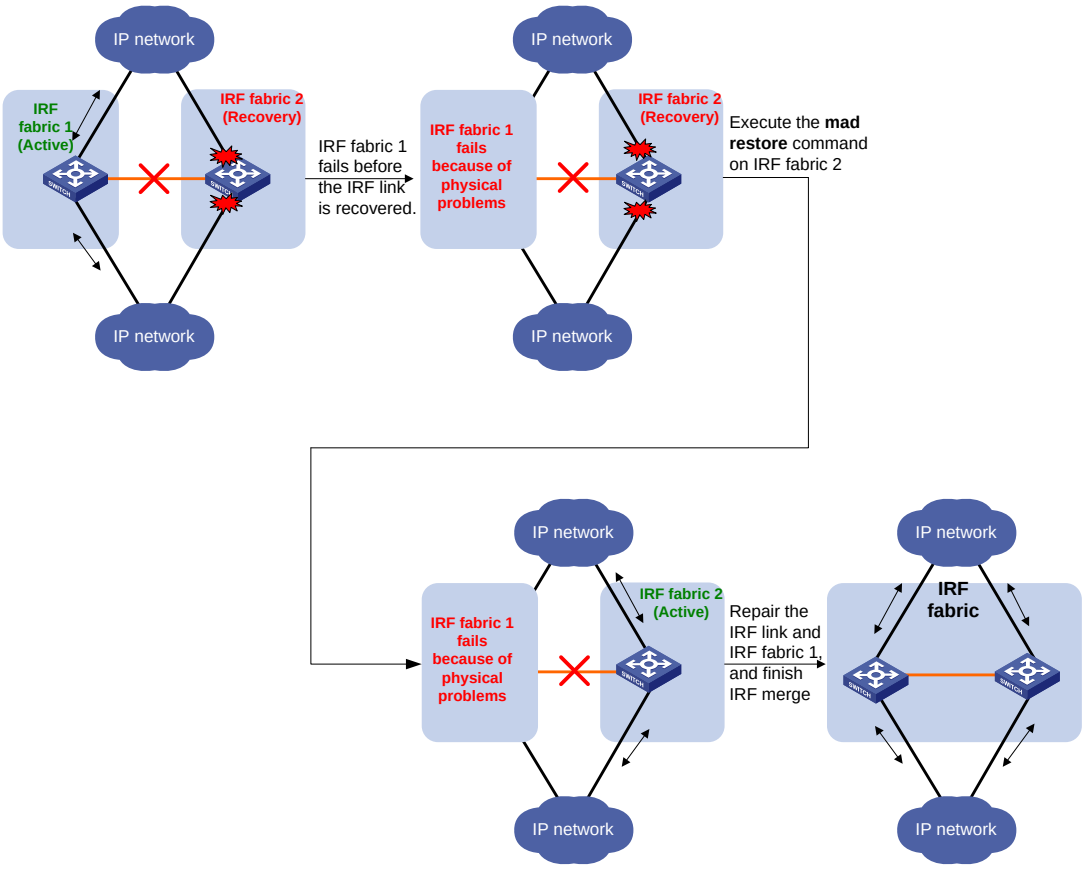
When the failed IRF link between two split IRF fabrics is recovered, all member devices in the inactive IRF fabric automatically reboot to join the active IRF fabric as subordinate members. The network interfaces that have been shut down by MAD automatically restore their original state, as shown in Figure 6.

Figure 6 Recovering the IRF fabric



If the active IRF fabric fails before the IRF link is recovered (see Figure 7), use the **`mad restore`** command on the inactive IRF fabric to recover the inactive IRF fabric. This command brings up all network interfaces that were shut down by MAD. After the IRF link is repaired, merge the two parts into a unified IRF fabric.

Figure 7 Active IRF fabric fails before the IRF link is recovered



MAD mechanisms

IRF provides MAD mechanisms by extending LACP, BFD, ARP, and IPv6 ND.

Table 1 compares the MAD mechanisms and their application scenarios.

Table 1 Comparison of MAD mechanisms

MAD mechanism	Advantages	Disadvantages	Application scenarios
LACP MAD	• Detection speed is fast. • Runs on existing aggregate links without requiring MAD-dedicated physical links or Layer 3 interfaces.	Requires an intermediate device that supports extended LACP for MAD.	Link aggregation is used between the IRF fabric and its upstream or downstream device.
BFD MAD	• Detection speed is fast. • Intermediate device, if used, can come from any vendor.	Requires MAD dedicated physical links and Layer 3 interfaces, which cannot be used for transmitting user traffic.	• No special requirements for network scenarios. • If no intermediate device is used, this mechanism is only suitable for IRF fabrics that have only two members that are geographically close to one another.
ARP MAD	• No intermediate device is required. • Intermediate device, if used, can come from any vendor. • Does not require MAD dedicated ports.	• Detection speed is slower than BFD MAD and LACP MAD. • The spanning tree feature must be enabled if common Ethernet ports are used for ARP MAD links.	Non-link aggregation IPv4 network scenarios. Spanning tree-enabled non-link aggregation IPv4 network scenarios if common Ethernet ports are used.
ND MAD	• No intermediate device is required. • Intermediate device, if used, can come from any vendor. • Does not require MAD dedicated ports.	• Detection speed is slower than BFD MAD and LACP MAD. • The spanning tree feature must be enabled if common Ethernet ports are used for ND MAD links.	Non-link aggregation IPv6 network scenarios. Spanning tree-enabled non-link aggregation IPv6 network scenarios if common Ethernet ports are used.

LACP MAD

As shown in Figure 8, LACP MAD has the following requirements:

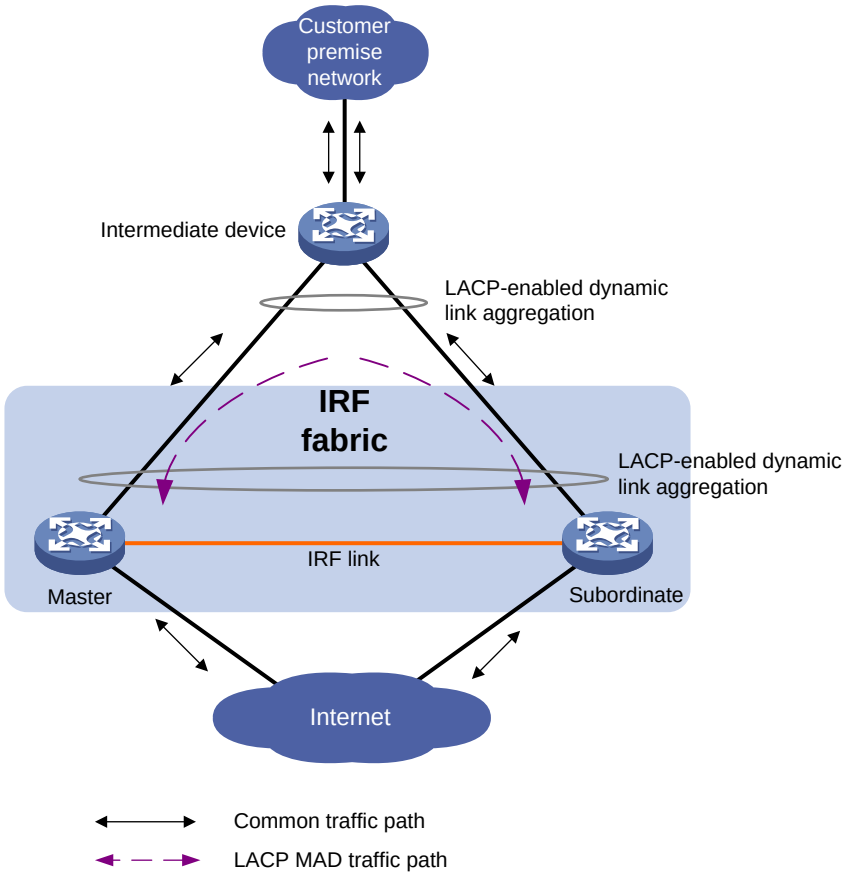
- Every IRF member must have a link with an intermediate device.
- All the links form a dynamic link aggregation group.
- The intermediate device must be a device that supports extended LACP for MAD.

The IRF member devices send extended LACPDUs that convey a domain ID and an active ID (the member ID of the master). The intermediate device transparently forwards the extended LACPDUs received from one member device to all the other member devices.

- If the domain IDs and active IDs sent by all the member devices are the same, the IRF fabric is integrated.

- If the extended LACPDUs convey the same domain ID but different active IDs, a split has occurred. LACP MAD handles this situation as described in "Collision handling."

Figure 8 LACP MAD scenario



BFD MAD

BFD MAD detects multi-active collisions by using BFD.

You can use common or management Ethernet ports for BFD MAD. To avoid data plane issues from affecting BFD MAD, use management Ethernet ports (if any) for BFD MAD as long as possible.

If management Ethernet ports are used, BFD MAD has the following requirements:

- An intermediate device is required and each IRF member device must have a BFD MAD link to the intermediate device.
- Each member device is assigned a MAD IP address on the master's management Ethernet port.

Follow these guidelines when you use management Ethernet ports for BFD MAD:

- As a best practice, use the management Ethernet ports for BFD MAD only if you will not access the device through the management Ethernet ports for out-of-band management.
- You can establish direct BFD links between management ports only if the IRF fabric has two member devices.
- If you directly connect the management ports on a two-member IRF fabric, you will be unable to access the device at the IP address of the management ports for out-of-band management. To access the device remotely, you must connect to the IP address of a common Layer 3 interface for in-band management.
- As a best practice, do not access the device at the IP address of the management ports after they are used for BFD MAD. Doing so might cause unexpected issues and interference with

BFD MAD. To access the device, connect to the IP address of a common Layer 3 interface for in-band management.

If common Ethernet ports are used, BFD MAD has the following requirements:

- If an intermediate device is used, each member device must have a BFD MAD link to the intermediate device. If no intermediate device is used, all member devices must have a BFD MAD link to each other. As a best practice, use an intermediate device to connect IRF member devices if the IRF fabric has more than two member devices. A full mesh of IRF members might cause broadcast loops.
- Ports on BFD MAD links are assigned to the same VLAN. Each member device is assigned a MAD IP address on the VLAN interface.

The BFD MAD links and BFD MAD VLAN must be dedicated. Do not use the BFD MAD links or BFD MAD VLAN for any other purposes.

NOTE:

- The MAD addresses identify the member devices and must belong to the same subnet.
- Of all management Ethernet ports on an IRF fabric, only the master's management Ethernet port is accessible.

Figure 9 shows a typical BFD MAD scenario that uses an intermediate device. On the intermediate device, assign the ports on the BFD MAD links to the same VLAN.

Figure 10 shows a typical BFD MAD scenario that does not use an intermediate device.

With BFD MAD, the master attempts to establish BFD sessions with other member devices by using its MAD IP address as the source IP address.

- If the IRF fabric is integrated, only the MAD IP address of the master takes effect. The master cannot establish a BFD session with any other member. If you execute the **`display bfd session`** command, the state of the BFD sessions is **Down**.
- When the IRF fabric splits, the IP addresses of the masters in the split IRF fabrics take effect. The masters can establish a BFD session. If you execute the **`display bfd session`** command, the state of the BFD session between the two devices is **Up**.

Figure 9 BFD MAD scenario with an intermediate device

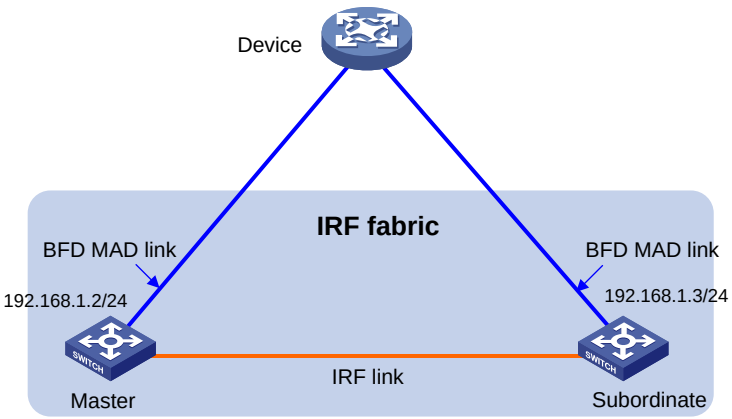


Figure 10 BFD MAD scenario without an intermediate device

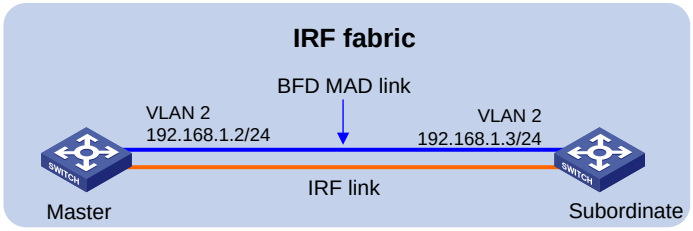


ARP MAD

ARP MAD detects multi-active collisions by using extended ARP packets that convey the IRF domain ID and the active ID.

You can use common or management Ethernet ports for ARP MAD.

If management Ethernet ports are used, ARP MAD must work with an intermediate device. Make sure the following requirements are met:

- Connect a management Ethernet port on each member device to the intermediate device.
- On the intermediate device, you must assign the ports used for ARP MAD to the same VLAN.

Follow these guidelines when you use management Ethernet ports for ARP MAD:

- As a best practice, use the management Ethernet ports for ARP MAD only if you will not access the device through the management Ethernet ports for out-of-band management.
- You can establish direct ARP MAD links between management ports only if the IRF fabric has two member devices.
- If you directly connect the management ports on a two-member IRF fabric, you will be unable to access the device at the IP address of the management ports for out-of-band management. To access the device remotely, you must connect to the IP address of a common Layer 3 interface for in-band management.
- As a best practice, do not access the device at the IP address of the management ports after they are used for ARP MAD. Doing so might cause unexpected issues and interference with ARP MAD. To access the device, connect to the IP address of a common Layer 3 interface for in-band management.

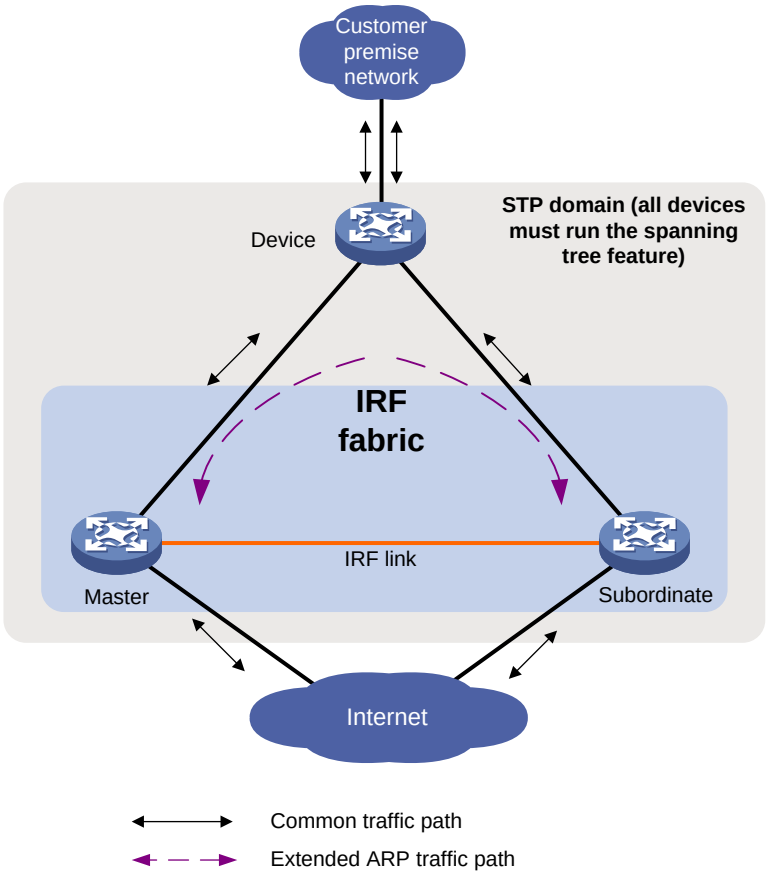
If common Ethernet ports are used, ARP MAD can work with or without an intermediate device. Make sure the following requirements are met:

- If an intermediate device is used, connect each IRF member device to the intermediate device, as shown in Figure 11. Run the spanning tree feature between the IRF fabric and the intermediate device. In this situation, data links can be used.
- If no intermediate device is used, connect each IRF member device to all other member devices. In this situation, IRF links cannot be used for ARP MAD.

Each IRF member compares the domain ID and the active ID (the member ID of the master) in incoming extended ARP packets with its domain ID and active ID.

- If the domain IDs are different, the extended ARP packet is from a different IRF fabric. The device does not continue to process the packet with the MAD mechanism.
- If the domain IDs are the same, the device compares the active IDs.
  - If the active IDs are different, the IRF fabric has split.
  - If the active IDs are the same, the IRF fabric is integrated.

Figure 11 ARP MAD scenario (common Ethernet ports)



ND MAD

ND MAD detects multi-active collisions by using NS packets to transmit the IRF domain ID and the active ID.

You can use common or management Ethernet ports for ND MAD.

If management Ethernet ports are used, ND MAD must work with an intermediate device. Make sure the following requirements are met:

- Connect a management Ethernet port on each member device to the intermediate device.
- On the intermediate device, you must assign the ports used for ND MAD to the same VLAN.

Follow these guidelines when you use management Ethernet ports for ND MAD:

- As a best practice, use the management Ethernet ports for ND MAD only if you will not access the device through the management Ethernet ports for out-of-band management.
- You can establish direct ND MAD links between management ports only if the IRF fabric has two member devices.
- If you directly connect the management ports on a two-member IRF fabric, you will be unable to access the device at the IP address of the management ports for out-of-band management. To access the device remotely, you must connect to the IP address of a common Layer 3 interface for in-band management.
- As a best practice, do not access the device at the IP address of the management ports after they are used for ND MAD. Doing so might cause unexpected issues and interference with ND MAD. To access the device, connect to the IP address of a common Layer 3 interface for in-band management.

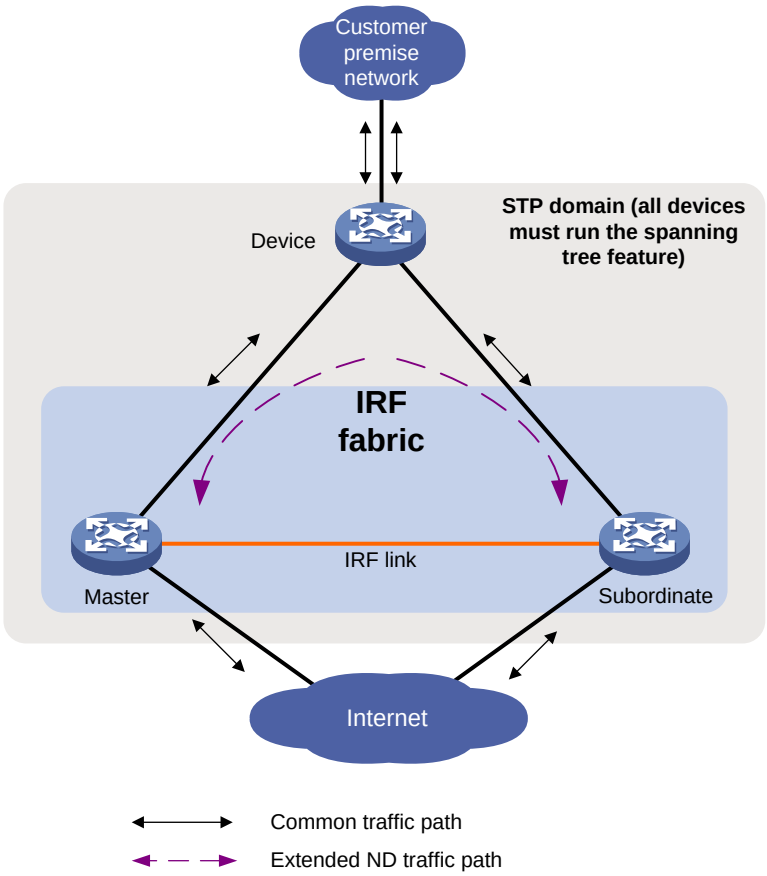
If common Ethernet ports are used, ND MAD can work with or without an intermediate device. Make sure the following requirements are met:

- If an intermediate device is used, connect each IRF member device to the intermediate device, as shown in Figure 12. Run the spanning tree feature between the IRF fabric and the intermediate device. In this situation, data links can be used.
- If no intermediate device is used, connect each IRF member device to all other member devices. In this situation, IRF links cannot be used for ND MAD.

Each IRF member device compares the domain ID and the active ID (the member ID of the master) in incoming NS packets with its domain ID and active ID.

- If the domain IDs are different, the NS packet is from a different IRF fabric. The device does not continue to process the packet with the MAD mechanism.
- If the domain IDs are the same, the device compares the active IDs.
  - If the active IDs are different, the IRF fabric has split.
  - If the active IDs are the same, the IRF fabric is integrated.

Figure 12 ND MAD scenario (common Ethernet ports)



Restrictions and guidelines: IRF configuration

Hardware compatibility with IRF

A switch from the following switch series can form an IRF fabric only with switches in the same series:

- S5110V2.

- S5110V2-SI.
- S5120V3-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000E-X.
- S5000X-EI.
- S5120V2-LI.
- S5130S-LI.
- S5120V3-LI.
- S3100V3-SI.
- MS4320V2.
- MS4320V3.
- MS4320.
- MS4200.
- MS4300V2.
- WS5810-WiNet.
- WS5820-WiNet.
- WAS6000.

Switches from different switch series cannot form an IRF fabric.

In addition, models in some of the switch series are grouped, as shown in Table 2. If a series has model groups, you can use only models in the same group to establish an IRF fabric.

Table 2 Model-grouped switch series

Switch series	Groups
S5120V3-LI	**Group 1**: S5120V3-LI switches with the following product codes: • LS-5120V3-20P-LI. • LS-5120V3-28P-LI. • LS-5120V3-52P-LI. • LS-5120V3-28P-PWR-LI. • LS-5120V3-52P-PWR-LI. **Group 2**: The S5120V3-LI switch models not listed in group 1.
S3100V3-SI	**Group 1**: S3100V3-SI switches with the following product codes: • LS-3100V3-28TP-SI-H1. • LS-3100V3_18TP_SI-H1. • LS-3100V3_52TP_SI-H1. • LS-3100V3_20TP_PWR_SI-H1. **Group 2**: The S3100V3-SI switch models not listed in group 1.
MS4320V2	**Group 1**: MS4320V2-28F. **Group 2**:

	• MS4320V2-28S-PWR. • MS4320V2-52S. • MS4320V2-28S.
MS4320V3	**Group 1**: MS4320V3 switches with the following product codes: • LS-MS4320V3-28P. • LS-MS4320V3-52P. **Group 2**: The MS4320V3 switch models not listed in group 1.
MS4320	**Group 1**: MS4320S-28F-H3. **Group 2**: • MS4320S-20P-PWR. • MS4320S-28P-PWR. • MS4320S-52P. • MS4320S-28P-H3.
MS4200	**Group 1**: MS4200 switches with the following product codes: • LS-MS4200-28TP-H1. • LS-MS4200_20TP_PWR-H1. • LS-MS4200_18TP-H1. **Group 2**: The MS4200 switch models not listed in group 1.
MS4300V2	**Group 1**: MS4300V2-10P. **Group 2**: • MS4300V2-28P. • MS4300V2-52P.
WS5810-WiNet	**Group 1**: WS5810-WiNet switches with product code WS5820-10P-WiNet. **Group 2**: WS5810-WiNet switch models not listed in group 1.
WS5820-WiNet	**Group 1**: WS5820-28P-POE-WiNet. **Group 2**: • WS5820-28P-WiNet. • WS5820-52X-WiNet. • WS5820-28X-WiNet. • WS5820-28X-POE-WiNet. • WS5820-28TP-POE-WiNet. • WS5820-52TP-WiNet.
WAS6000	**Group 1**: • WAS6108-HPWR. • WAS6108. • WAS6124-X **Group 2**: WAS6000 switch models not listed in group 1.

Software requirements for IRF

All IRF member devices must run the same software image version. Make sure the software auto-update feature is enabled on all member devices.

Candidate IRF physical interfaces

You can use 10G or 1G Ethernet ports as IRF physical interfaces, depending on the device model.

- The 10G or 1G Ethernet ports must operate at 10 Gbps or 1 Gbps, respectively, when they are used as IRF physical interfaces.
- The ports bound to an IRF port must belong to the same port group. However, ports in the same group can be bound to different IRF ports. To obtain the port group information, execute the **`debug port mapping`** command in probe view and view the **Unit** value for each port. Ports in one port group have the same **Unit** value.

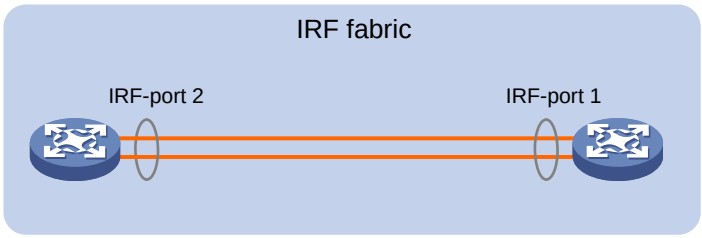
For more information about the ports that can be used as IRF physical interfaces, the port group information, and the available transceiver modules and cables, see IRF fabric setup in the switch installation guide.

IRF port connection

When you connect two neighboring IRF members, follow these restrictions and guidelines:

- You must connect the physical interfaces of IRF-port 1 on one member to the physical interfaces of IRF-port 2 on the other.
- For high availability, bind multiple physical interfaces to an IRF port. You can bind a maximum of eight physical interfaces to an IRF port. Due to hardware restrictions, you might be unable to bind as many as eight physical interfaces to an IRF port.

Figure 13 Connecting IRF physical interfaces



IRF physical interface configuration restrictions and guidelines

Command configuration restrictions

On a physical interface bound to an IRF port, you can execute only the following commands:

- Basic interface commands, including **`shutdown`** and **`description`**. For more information about these commands, see Ethernet interface commands in *Layer 2—LAN Switching Command Reference*.
- The **`flow-interval`** command, which sets the statistics polling interval on an interface. For more information about this command, see Ethernet interface commands in *Layer 2—LAN Switching Command Reference*.

- The **`port link-flap protect enable`** command, which enables link flapping protection on an interface. To prevent IRF link flapping from affecting system performance, link flapping protection acts differently on IRF physical interfaces than on common network interfaces, as follows:
  - Link flapping protection is enabled by default on IRF physical interfaces. This feature takes effect on an IRF physical interface as long as it is enabled on that interface, regardless of whether link flapping protection has been enabled globally.
  - If the number of link flappings on an IRF physical interface crosses the link flapping threshold during a flapping detection interval, the system displays event messages. However, the system does not shut down that IRF physical interface as it would do with a common network interface.

  For more information about this command, see Ethernet interface commands in *Layer 2—LAN Switching Command Reference*.
- The **`mirroring-group reflector-port`** command, which specifies the physical interface as a reflector port for remote mirroring. For more information about this command, see port mirroring in *Network Management and Monitoring Command Reference*.

IMPORTANT:

Do not execute the **`mirroring-group reflector-port`** command on an IRF physical interface if that interface is the only member interface of an IRF port. Doing so will split the IRF fabric, because this command also removes the binding of the physical interface and IRF port.

Suppressing SNMP notifications of packet drops on IRF physical interfaces

Before an IRF member device forwards a packet, it examines its forwarding path in the IRF fabric for a loop. If a loop exists, the device discards the packet on the source interface of the looped path. This loop elimination mechanism will drop a large number of broadcast packets on the IRF physical interfaces.

To suppress SNMP notifications of packet drops that do not require attention, do not monitor packet forwarding on the IRF physical interfaces.

Configuration rollback restrictions

The configuration rollback feature cannot roll back the following IRF settings:

- Member device description (set by using the **`irf member description`** command).
- Member device priority (set by using the **`irf member priority`** command).
- IRF physical interface and IRF port bindings (set by using the **`port group interface`** command).

For more information about the configuration rollback feature, see configuration file management in *Fundamentals Configuration Guide*.

IRF tasks at a glance

To configure IRF, perform the following tasks:

1. Setting up an IRF fabric
2. Configuring MAD

   Configure a minimum of one MAD mechanism on an IRF fabric. For the MAD compatibility, see "MAD mechanism compatibility."
   - Configuring LACP MAD
   - Configuring BFD MAD

- Configuring ARP MAD
- Configuring ND MAD
- Excluding interfaces from the shutdown action upon detection of multi-active collision

  This feature excludes an interface from the shutdown action for management or other special purposes when an IRF fabric transits to the Recovery state.
- Recovering an IRF fabric

3. (Optional.) Optimizing IRF settings for an IRF fabric
   - Configuring a member device description
   - Configuring IRF bridge MAC address settings
   - Enabling software auto-update for software image synchronization

     This feature automatically synchronizes the current software images of the master to devices that are attempting to join the IRF fabric.
   - Setting the IRF link status change report delay

Planning the IRF fabric setup

Consider the following items when you plan an IRF fabric:

- Hardware compatibility and restrictions.
- IRF fabric size.
- Master device.
- Member ID and priority assignment scheme.
- Fabric topology and cabling scheme.
- IRF physical interfaces.

Setting up an IRF fabric

IRF setup tasks at a glance

To set up an IRF fabric, perform the following tasks:

1. Configure member IDs, priorities, and IRF physical interfaces separately.
   a. Assigning a member ID to each IRF member device
   b. (Optional.) Specifying a priority for each member device
   c. Binding physical interfaces to IRF ports

   Skip these tasks if you configure member IDs, priorities, domain ID, and IRF physical interfaces in bulk.
2. Bulk-configuring basic IRF settings for a member device

   Skip this task if you configure member IDs, priorities, domain ID, and IRF physical interfaces separately.
3. Connecting IRF physical interfaces
4. Accessing the IRF fabric

Assigning a member ID to each IRF member device

Restrictions and guidelines

CAUTION:
An IRF member ID change can invalidate member ID-related settings and cause data loss. Make sure you fully understand its impact on your live network.

To create an IRF fabric, you must assign a unique IRF member ID to each member device.

The new member ID of a device takes effect at a reboot. After the device reboots, the settings on all member ID-related physical resources (including common physical network interfaces) are removed, regardless of whether you have saved the configuration.

Procedure

1. Enter system view.
   system-view
2. Assign a member ID to a member device.
   irf member *member-id* **renumber** *new-member-id*
   The default IRF member ID is 1.

   CAUTION:
   An IRF member ID change can invalidate member ID-related settings and cause data loss. Make sure you fully understand its impact on your live network.
3. (Optional.) Save the configuration.
   save
   If you have bound physical interfaces to IRF ports or assigned member priority, you must perform this step for these settings to take effect after the reboot.
4. Return to user view.
   quit
5. Reboot the device.
   reboot [**slot** *slot-number*] [**force**]

Specifying a priority for each member device

About specifying an IRF member priority

IRF member priority represents the possibility for a device to be elected the master in an IRF fabric. A larger priority value indicates a higher priority.

A change to member priority affects the election result at the next master election, but it does not cause an immediate master re-election.

Procedure

1. Enter system view.
   system-view
2. Specify a priority for the device.
   irf member *member-id* **priority** *priority*
   The default IRF member priority is 1.

Binding physical interfaces to IRF ports

Restrictions and guidelines

Select qualified physical interfaces as IRF physical interfaces as described in "Candidate IRF physical interfaces."

After binding physical interfaces to IRF ports for the first time, you must use the **irf-port-configuration active** command to activate the settings on the IRF ports.

The system activates the IRF port settings automatically only in the following situations:

- The configuration file that the device starts with contains IRF port bindings.
- You are adding physical interfaces to an IRF port (in UP state) after an IRF fabric is formed.

Procedure

1. Enter system view.

   system-view

2. Enter interface view or interface range view.
   - Enter interface view.

     interface *interface-type interface-number*
   - Enter interface range view. Choose one of the following commands:

     interface range { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>

     interface range name *name* [**interface** { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>]

   To shut down a range of IRF physical interfaces, enter interface range view.

   To shut down one IRF physical interface, enter its interface view.

3. Shut down the physical interfaces.

   shutdown

   By default, a physical interface is not administratively down.

4. Return to system view.

   quit

5. Enter IRF port view.

   irf-port *member-id/irf-port-number*

6. Bind each physical interface to the IRF port.

   port group interface *interface-type interface-number*

   By default, no physical interfaces are bound to an IRF port.

   Repeat this step to assign multiple physical interfaces to the IRF port.

7. Return to system view.

   quit

8. Enter interface view or interface range view.
   - Enter interface view.

     interface *interface-type interface-number*
   - Enter interface range view. Choose one of the following commands:

     interface range { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>

     interface range name *name* [**interface** { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>]

9. Bring up the physical interfaces.

   undo shutdown

10. Return to system view.

    quit

11. Save the configuration.

    save

    Activating IRF port configurations causes IRF merge and reboot. To avoid data loss, save the running configuration to the startup configuration file before you perform the operation.

12. Activate the IRF port settings.

    irf-port-configuration active

Bulk-configuring basic IRF settings for a member device

About easy IRF

Use the easy IRF feature to bulk-configure basic IRF settings for a member device, including the member ID, domain ID, priority, and IRF port bindings.

The easy IRF feature provides the following configuration methods:

- **Interactive method**—Enter the **easy-irf** command without parameters. The system will guide you to set the parameters step by step.
- **Non-interactive method**—Enter the **easy-irf** command with parameters.

As a best practice, use the interactive method if you are new to IRF.

Restrictions and guidelines

The member device reboots immediately after you specify a new member ID for it. Make sure you are aware of the impact on the network.

If you execute the **easy-irf** command multiple times, the following settings take effect:

- The most recent settings for the member ID, domain ID, and priority.
- IRF port bindings added through repeated executions of the command. To remove an IRF physical interface from an IRF port, you must use the **undo port group interface** command in IRF port view.

If you specify IRF physical interfaces by using the interactive method, you must also follow these restrictions and guidelines:

- Do not enter spaces between the interface type and interface number.
- Use a comma (,) to separate two physical interfaces. No spaces are allowed between interfaces.

Procedure

1. Enter system view.

   system-view

2. Bulk-configure basic IRF settings for the device.

   easy-irf [**member** *member-id* [**renumber** *new-member-id*] **domain** *domain-id* [**priority** *priority*] [**irf-port1** *interface-list1*] [**irf-port2** *interface-list2*]]

   Make sure the new member ID is unique in the IRF fabric to which the device will be added.

Connecting IRF physical interfaces

Follow the restrictions in "IRF port connection" to connect IRF physical interfaces as well as based on the topology and cabling scheme. The devices perform master election. The member devices that fail the master election automatically reboot to form an IRF fabric with the master device.

Accessing the IRF fabric

The IRF fabric appears as one device after it is formed. You configure and manage all IRF members at the CLI of the master. All settings you have made are automatically propagated to the IRF members.

The following methods are available for accessing an IRF fabric:

- **Local login**—Log in through the console port of any member device.
- **Remote login**—Log in at a Layer 3 interface on any member device by using methods including Telnet and SNMP.

When you log in to an IRF fabric, you are placed at the CLI of the master, regardless of at which member device you are logged in.

For more information, see login configuration in *Fundamentals Configuration Guide*.

Configuring MAD

Restrictions and guidelines for MAD configuration

Hardware compatibility with MAD

Some models do not have management Ethernet ports. They do not support configuring MAD on a management Ethernet port. For information about these models, see the installation guide.

MAD mechanism compatibility

As a best practice, configure a minimum of one MAD mechanism on an IRF fabric for prompt IRF split detection. Because MAD mechanisms use different collision handling processes, follow these restrictions and guidelines when you configure multiple MAD mechanisms on an IRF fabric:

- Do not configure LACP MAD together with ARP MAD or ND MAD.
- Do not configure BFD MAD together with ARP MAD or ND MAD.

Assigning IRF domain IDs

An IRF fabric has only one IRF domain ID. You can change the IRF domain ID by using the following commands: **`irf domain`**, **`mad enable`**, **`mad arp enable`**, or **`mad nd enable`**. The IRF domain IDs configured by using these commands overwrite each other.

If LACP MAD, ARP MAD, or ND MAD runs between two IRF fabrics, assign each fabric a unique IRF domain ID. (For BFD MAD, this task is optional.)

Actions on interfaces shut down by MAD

To prevent a multi-active collision from causing network issues, avoid using the **`undo shutdown`** command to bring up the interfaces shut down by a MAD mechanism on a Recovery-state IRF fabric.

Configuring LACP MAD

1. Enter system view.

system-view

2. Assign a domain ID to the IRF fabric.

   irf domain *domain-id*

   The default IRF domain ID is 0.

> **CAUTION:**
>
> Changing the IRF domain ID of an IRF member device will remove that member device from the IRF fabric. This member device will be unable to exchange IRF protocol packets with the remaining member devices in the IRF fabric.

3. Create a Layer 2 aggregate interface and enter its view.

   interface bridge-aggregation *interface-number*

   Perform this step also on the intermediate device.

4. Configure the aggregation group to operate in dynamic aggregation mode.

   link-aggregation mode dynamic

   By default, an aggregation group operates in static aggregation mode.

   LACP MAD takes effect only on dynamic aggregate interfaces.

   Perform this step also on the intermediate device.

5. Enable LACP MAD.

   mad enable

   By default, LACP MAD is disabled.

6. Return to system view.

   quit

7. Enter Ethernet interface view or interface range view.

   - Enter Ethernet interface view.

     interface *interface-type interface-number*

   - Enter interface range view. Choose one of the following commands:

     interface range { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>

     interface range name *name* [**interface** { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>]

   To assign a range of ports to the aggregation group, enter interface range view.

   To assign one port to the aggregation group, enter Ethernet interface view.

8. Assign the Ethernet port or the range of Ethernet ports to the specified aggregation group.

   port link-aggregation group *group-id*

   Multichassis link aggregation is allowed.

   Perform this step also on the intermediate device.

Configuring BFD MAD

Restrictions and guidelines for configuring BFD MAD

As a best practice, use the following procedure to set up BFD MAD:

1. Choose a BFD MAD link scheme as described in "BFD MAD."
2. Configure BFD MAD.
3. Connect the BFD MAD links.

When you configure BFD MAD on a VLAN interface, follow these restrictions and guidelines:

Category	Restrictions and guidelines

BFD MAD VLAN	• Do not enable BFD MAD on VLAN-interface 1.
	• If you are using an intermediate device, perform the following tasks:
	  ○ On the IRF fabric and the intermediate device, create a VLAN for BFD MAD.
	  ○ On the IRF fabric and the intermediate device, assign the ports of BFD MAD links to the BFD MAD VLAN.
	  ○ On the IRF fabric, create a VLAN interface for the BFD MAD VLAN.
	• Make sure the IRF fabrics on the network use different BFD MAD VLANs.
	• Make sure the BFD MAD VLAN contains only ports on the BFD MAD links. Exclude a port from the BFD MAD VLAN if that port is not on a BFD MAD link. If you have assigned that port to all VLANs by using the **`port trunk permit vlan all`** command, use the **`undo port trunk permit`** command to exclude that port from the BFD MAD VLAN.

BFD MAD VLAN and feature compatibility	Do not use the BFD MAD VLAN and its member ports for any purpose other than configuring BFD MAD. • Use only the **`mad bfd enable`** and **`mad ip address`** commands on the BFD MAD-enabled VLAN interface. If you configure other features, both BFD MAD and other features on the interface might run incorrectly. • Disable the spanning tree feature on any Layer 2 Ethernet ports in the BFD MAD VLAN. The MAD feature is mutually exclusive with the spanning tree feature.
MAD IP address	• To avoid network issues, only use the **`mad ip address`** command to configure IP addresses on the BFD MAD-enabled VLAN interface. Do not configure an IP address by using the **`ip address`** command or configure a VRRP virtual address on the BFD MAD-enabled VLAN interface. • Make sure all the MAD IP addresses are on the same subnet.

When you configure BFD MAD on a management Ethernet port, follow these restrictions and guidelines:

Category	Restrictions and guidelines
Management Ethernet ports for BFD MAD	Connect a management Ethernet port on each IRF member device to the common Ethernet ports on the intermediate device.
BFD MAD VLAN	• On the intermediate device, create a VLAN for BFD MAD, and assign the ports used for BFD MAD to the VLAN. On the IRF fabric, you do not need to assign the management Ethernet ports to the VLAN. • Make sure the IRF fabrics on the network use different BFD MAD VLANs. • Make sure the BFD MAD VLAN on the intermediate device contains only ports on the BFD MAD links.
MAD IP address	• Use the **`mad ip address`** command instead of the **`ip address`** command to configure MAD IP addresses on the BFD MAD-enabled management Ethernet ports. • Make sure all the MAD IP addresses are on the same subnet.

Configuring BFD MAD on a VLAN interface

1. Enter system view.

   `system-view`

2. (Optional.) Assign a domain ID to the IRF fabric.

   irf domain *domain-id*

   By default, the domain ID of an IRF fabric is 0.

CAUTION:

Changing the IRF domain ID of an IRF member device will remove that member device from the IRF fabric. This member device will be unable to exchange IRF protocol packets with the remaining member devices in the IRF fabric.

3. Create a VLAN dedicated to BFD MAD.

   vlan *vlan-id*

   By default, only VLAN 1 exists.

   Do not enable BFD MAD on VLAN-interface 1.

   Perform this step also on the intermediate device (if any).

4. Return to system view.

   quit

5. Enter Ethernet interface view or interface range view.

   - Enter Ethernet interface view.

     interface *interface-type interface-number*

   - Enter interface range view. Choose one of the following commands:

     interface range { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>

     interface range name *name* [**interface** { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>]

   To assign a range of ports to the BFD MAD VLAN, enter interface range view.

   To assign one port to the BFD MAD VLAN, enter Ethernet interface view.

6. Assign the port or the range of ports to the BFD MAD VLAN.

   - Assign the ports to the VLAN as access ports.

     port access vlan *vlan-id*

   - Assign the ports to the VLAN as trunk ports.

     port trunk permit vlan *vlan-id*

   - Assign the ports to the VLAN as hybrid ports.

     port hybrid vlan *vlan-id* { **tagged** | **untagged** }

   The link type of BFD MAD ports can be access, trunk, or hybrid.

   The default link type of a port is access.

   Perform this step also on the intermediate device (if any).

7. Return to system view.

   quit

8. Enter VLAN interface view.

   interface vlan-interface *vlan-interface-id*

9. Enable BFD MAD.

   mad bfd enable

   By default, BFD MAD is disabled.

10. Assign a MAD IP address to a member device on the VLAN interface.

    mad ip address *ip-address* { *mask* | *mask-length* } **member** *member-id*

By default, no MAD IP addresses are configured on any VLAN interfaces.

Repeat this step to assign a MAD IP address to each member device on the VLAN interface.

Configuring BFD MAD on a management Ethernet port

1. Enter system view.

   system-view

2. (Optional.) Assign a domain ID to the IRF fabric.

   irf domain *domain-id*

   By default, the domain ID of an IRF fabric is 0.

CAUTION:

Changing the IRF domain ID of an IRF member device will remove that member device from the IRF fabric. This member device will be unable to exchange IRF protocol packets with the remaining member devices in the IRF fabric.

3. Enter management Ethernet interface view.

   interface m-gigabitethernet *interface-number*

   Of all management Ethernet ports on an IRF fabric, only the master's management Ethernet port is accessible.

4. Enable BFD MAD.

   mad bfd enable

   By default, BFD MAD is disabled.

5. Assign a MAD IP address to each member device.

   mad ip address *ip-address* { *mask* | *mask-length* } **member** *member-id*

   By default, no MAD IP addresses are configured.

Configuring ARP MAD

Restrictions and guidelines for configuring ARP MAD

As a best practice, use the following procedure to set up ARP MAD:

1. Choose an ARP MAD link scheme as described in "ARP MAD."
2. Configure ARP MAD.
3. Connect the ARP MAD links if you are not using existing data links as ARP MAD links.

When you configure ARP MAD on a VLAN interface, follow these restrictions and guidelines:

Category	Restrictions and guidelines

ARP MAD VLAN	• Do not enable ARP MAD on VLAN-interface 1.
	• If you are using an intermediate device, perform the following tasks:
	  ○ On the IRF fabric and the intermediate device, create a VLAN for ARP MAD.
	  ○ On the IRF fabric and the intermediate device, assign the ports of ARP MAD links to the ARP MAD VLAN.
	  ○ On the IRF fabric, create a VLAN interface for the ARP MAD VLAN.
	• Do not use the ARP MAD VLAN for any other purposes.

ARP MAD and feature configuration	If an intermediate device is used, make sure the following requirements are met: • Run the spanning tree feature between the IRF fabric and the intermediate device to ensure that there is only one ARP MAD link in forwarding state. For more information about the spanning tree feature

Category	Restrictions and guidelines
	and its configuration, see *Layer 2—LAN Switching Configuration Guide*. • Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

When you configure ARP MAD on a management Ethernet port, follow these restrictions and guidelines:

Category	Restrictions and guidelines
Management Ethernet ports for ARP MAD	Connect a management Ethernet port on each member device to the common Ethernet ports on the intermediate device.
ARP MAD VLAN	On the intermediate device, create a VLAN for ARP MAD, and assign the ports used for ARP MAD to the VLAN. On the IRF fabric, you do not need to assign the management Ethernet ports to the VLAN.
ARP MAD and feature configuration	• Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

Configuring ARP MAD on a VLAN interface

1. Enter system view.

   `system-view`
2. Assign a domain ID to the IRF fabric.

   `irf domain` *`domain-id`*

   The default IRF domain ID is 0.

CAUTION:

Changing the IRF domain ID of an IRF member device will remove that member device from the IRF fabric. This member device will be unable to exchange IRF protocol packets with the remaining member devices in the IRF fabric.

3. Configure the IRF bridge MAC address to change as soon as the address owner leaves.

   `undo irf mac-address persistent`

   By default, the IRF bridge MAC address remains unchanged for 6 minutes after the address owner leaves.

CAUTION:

IRF bridge MAC address change will cause transient traffic disruption.

4. Create a VLAN dedicated to ARP MAD.

   `vlan` *`vlan-id`*

   By default, only VLAN 1 exists.

   Do not configure ARP MAD on VLAN-interface 1.

   Perform this task also on the intermediate device (if any).
5. Return to system view.

   `quit`
6. Enter Ethernet interface view or interface range view.

- Enter Ethernet interface view.

  interface *interface-type interface-number*
- Enter interface range view. Choose one of the following commands:

  interface range { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>

  interface range name *name* [**interface** { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>]

To assign a range of ports to the ARP MAD VLAN, enter interface range view.

To assign one port to the ARP MAD VLAN, enter Ethernet interface view.

7. Assign the port or the range of ports to the ARP MAD VLAN.

- Assign the ports to the VLAN as access ports.

  port access vlan *vlan-id*
- Assign the ports to the VLAN as trunk ports.

  port trunk permit vlan *vlan-id*
- Assign the ports to the VLAN as hybrid ports.

  port hybrid vlan *vlan-id* { **tagged** | **untagged** }

The link type of ARP MAD ports can be access, trunk, or hybrid.

The default link type of a port is access.

Perform this task also on the intermediate device (if any).

8. Return to system view.

quit

9. Enter VLAN interface view.

interface vlan-interface *vlan-interface-id*

10. Assign the interface an IP address.

ip address *ip-address* { *mask* | *mask-length* }

By default, no IP addresses are assigned to any VLAN interfaces.

11. Enable ARP MAD.

mad arp enable

By default, ARP MAD is disabled.

Configuring ARP MAD on a management Ethernet port

1. Enter system view.

system-view

2. Assign a domain ID to the IRF fabric.

irf domain *domain-id*

The default IRF domain ID is 0.

CAUTION:

Changing the IRF domain ID of an IRF member device will remove that member device from the IRF fabric. This member device will be unable to exchange IRF protocol packets with the remaining member devices in the IRF fabric.

3. Configure the IRF bridge MAC address to change as soon as the address owner leaves.

undo irf mac-address persistent

By default, the IRF bridge MAC address remains unchanged for 6 minutes after the address owner leaves.

CAUTION:
IRF bridge MAC address change will cause transient traffic disruption.

4. Enter management Ethernet interface view.
   interface m-gigabitethernet *interface-number*
   Of all management Ethernet ports on an IRF fabric, only the master's management Ethernet port is accessible.
5. Assign an IP address to the management Ethernet port.
   ip address ip-address { *mask* | *mask-length* }
   By default, no IP addresses are configured.
6. Enable ARP MAD.
   mad arp enable
   By default, ARP MAD is disabled.

Configuring ND MAD

Restrictions and guidelines for configuring ND MAD

As a best practice, use the following procedure to set up ND MAD:

1. Choose an ND MAD link scheme as described in "ND MAD."
2. Configure ND MAD.
3. Connect the ND MAD links if you are not using existing data links as ND MAD links.

When you configure ND MAD on a VLAN interface, follow these restrictions and guidelines:

Category	Restrictions and guidelines

ND MAD VLAN	• Do not enable ND MAD on VLAN-interface 1.
	• If you are using an intermediate device, perform the following tasks:
	  ○ On the IRF fabric and the intermediate device, create a VLAN for ND MAD.
	  ○ On the IRF fabric and the intermediate device, assign the ports of ND MAD links to the ND MAD VLAN.
	  ○ On the IRF fabric, create a VLAN interface for the ND MAD VLAN.
	• Do not use the ND MAD VLAN for any other purposes.

ND MAD and feature configuration	If an intermediate device is used, make sure the following requirements are met: • Run the spanning tree feature between the IRF fabric and the intermediate device to ensure that there is only one ND MAD link in forwarding state. For more information about the spanning tree feature and its configuration, see *Layer 2—LAN Switching Configuration Guide*. • Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

When you configure ND MAD on a management Ethernet port, follow these restrictions and guidelines:

Category	Restrictions and guidelines
Management Ethernet ports for ND MAD	Connect a management Ethernet port on each member device to the common Ethernet ports on the intermediate device.

Category	Restrictions and guidelines
ND MAD VLAN	On the intermediate device, create a VLAN for ND MAD, and assign the ports used for ND MAD to the VLAN. On the IRF fabric, you do not need to assign the management Ethernet ports to the VLAN.
ND MAD and feature configuration	• Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

Configuring ND MAD on a VLAN interface

1. Enter system view.

   system-view

2. Assign a domain ID to the IRF fabric.

   irf domain *domain-id*

   The default IRF domain ID is 0.

   CAUTION:

   Changing the IRF domain ID of an IRF member device will remove that member device from the IRF fabric. This member device will be unable to exchange IRF protocol packets with the remaining member devices in the IRF fabric.

3. Configure the IRF bridge MAC address to change as soon as the address owner leaves.

   undo irf mac-address persistent

   By default, the IRF bridge MAC address remains unchanged for 6 minutes after the address owner leaves the fabric.

   CAUTION:

   IRF bridge MAC address change will cause transient traffic disruption.

4. Create a VLAN dedicated to ND MAD.

   vlan *vlan-id*

   By default, only VLAN 1 exists.

   Do not configure ND MAD on VLAN-interface 1.

   Perform this task also on the intermediate device (if any).

5. Return to system view.

   quit

6. Enter Ethernet interface view or interface range view.

   - Enter Ethernet interface view.

     interface *interface-type interface-number*

   - Enter interface range view. Choose one of the following commands:

     interface range { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>

     interface range name *name* [**interface** { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>]

   To assign a range of ports to the ND MAD VLAN, enter interface range view.

   To assign one port to the ND MAD VLAN, enter Ethernet interface view.

7. Assign the port or the range of ports to the ND MAD VLAN.

- Assign the ports to the VLAN as access ports.
  port access vlan *vlan-id*
- Assign the ports to the VLAN as trunk ports.
  port trunk permit vlan *vlan-id*
- Assign the ports to the VLAN as hybrid ports.
  port hybrid vlan *vlan-id* { **tagged** | **untagged** }

The link type of ND MAD ports can be access, trunk, or hybrid.

The default link type of a port is access.

Perform this task also on the intermediate device (if any).

8. Return to system view.
   quit
9. Enter VLAN interface view.
   interface vlan-interface *interface-number*
10. Assign the interface an IPv6 address.
    ipv6 address { *ipv6-address/prefix-length* | *ipv6-address prefix-length* }

    By default, no IPv6 addresses are assigned to a VLAN interface.
11. Enable ND MAD.
    mad nd enable

    By default, ND MAD is disabled.

Configuring ND MAD on a management Ethernet port

1. Enter system view.
   system-view
2. Assign a domain ID to the IRF fabric.
   irf domain *domain-id*

   The default IRF domain ID is 0.

CAUTION:

Changing the IRF domain ID of an IRF member device will remove that member device from the IRF fabric. This member device will be unable to exchange IRF protocol packets with the remaining member devices in the IRF fabric.

3. Configure the IRF bridge MAC address to change as soon as the address owner leaves.
   undo irf mac-address persistent

   By default, the IRF bridge MAC address remains unchanged for 6 minutes after the address owner leaves the fabric.

CAUTION:

IRF bridge MAC address change will cause transient traffic disruption.

4. Enter management Ethernet interface view.
   interface m-gigabitethernet *interface-number*

   Of all management Ethernet ports on an IRF fabric, only the master's management Ethernet port is accessible.
5. Assign an IPv6 address to the management Ethernet port.
   ipv6 address { *ipv6-address/pre-length* | *ipv6 address pre-length* }

By default, no IPv6 addresses are assigned to a management Ethernet port.

6. Enable ND MAD.

   mad nd enable

   By default, ND MAD is disabled.

Excluding interfaces from the shutdown action upon detection of multi-active collision

About excluding interfaces from being shut down

When an IRF fabric transits to the Recovery state, the system automatically excludes the following network interfaces from being shut down:

- IRF physical interfaces.
- Interfaces used for BFD MAD.
- Member interfaces of an aggregate interface if the aggregate interface is excluded from being shut down.

You can exclude an interface from the shutdown action for management or other special purposes. For example:

- Exclude a port from the shutdown action so you can Telnet to the port for managing the device.
- Exclude a VLAN interface and its Layer 2 ports from the shutdown action so you can log in through the VLAN interface.

Restrictions and guidelines

If the Layer 2 ports of a VLAN interface are distributed on multiple member devices, the exclusion operation might introduce IP collision risks. The VLAN interface might be up on both active and inactive IRF fabrics.

Procedure

1. Enter system view.

   system-view

2. Configure an interface to not shut down when the IRF fabric transits to the Recovery state.

   mad exclude interface *interface-type interface-number*

   By default, all network interfaces on a Recovery-state IRF fabric are shut down, except for the network interfaces automatically excluded by the system.

Recovering an IRF fabric

About recovering an IRF fabric

If the active IRF fabric fails before the IRF link is recovered, perform this task on the inactive IRF fabric to recover the inactive IRF fabric for traffic forwarding. The manual recovery operation brings up all interfaces that were shut down by MAD on the inactive IRF fabric.

Procedure

1. Enter system view.

   system-view

2. Recover the inactive IRF fabric.

   mad restore

Optimizing IRF settings for an IRF fabric

Configuring a member device description

1. Enter system view.
   system-view
2. Configure a description for a member device.
   irf member *member-id* **description** *text*
   By default, no member device description is configured.

Configuring IRF bridge MAC address settings

About IRF bridge MAC address configuration

The bridge MAC address of a system must be unique on a switched LAN. IRF bridge MAC address identifies an IRF fabric by Layer 2 protocols (for example, LACP) on a switched LAN.

By default, an IRF fabric uses the bridge MAC address of the master as the IRF bridge MAC address. After the master leaves, the IRF bridge MAC address persists for a period of time or permanently depending on the IRF bridge MAC persistence setting. When the IRF bridge MAC persistence timer expires, the IRF fabric uses the bridge MAC address of the current master as the IRF bridge MAC address.

If IRF fabric merge occurs, IRF determines the IRF bridge MAC address of the merged IRF fabric as follows:

1. When IRF fabrics merge, IRF ignores the IRF bridge MAC addresses and checks the bridge MAC address of each member device in the IRF fabrics. IRF merge fails if any two member devices have the same bridge MAC address.
2. After IRF fabrics merge, the merged IRF fabric uses the bridge MAC address of the merging IRF fabric that won the master election as the IRF bridge MAC address.

Restrictions and guidelines for IRF bridge MAC address configuration

CAUTION:
Bridge MAC address change will cause transient traffic disruption.

When you configure IRF bridge MAC persistence, follow these restrictions and guidelines:

- If ARP MAD or ND MAD is used with the spanning tree feature, you must disable IRF bridge MAC persistence by using the **undo irf mac-address persistent** command.
- If the IRF fabric has multichassis aggregate links, do not use the **undo irf mac-address persistent** command. Use of this command might cause traffic disruption.

Configuring IRF bridge MAC persistence

1. Enter system view.
   system-view
2. Configure IRF bridge MAC persistence.
   - Retain the bridge MAC address permanently even if the address owner has left the fabric.
     irf mac-address persistent always
   - Retain the bridge MAC address for 6 minutes after the address owner leaves the fabric.
     irf mac-address persistent timer
   - Change the bridge MAC address as soon as the address owner leaves the fabric.

undo irf mac-address persistent

By default, the IRF bridge MAC address remains unchanged for 6 minutes after the address owner leaves the fabric.

The **irf mac-address persistent timer** command avoids unnecessary bridge MAC address changes caused by device reboot, transient link failure, or purposeful link disconnection.

Enabling software auto-update for software image synchronization

About IRF software auto-update

The software auto-update feature automatically synchronizes the current software images of the master to devices that are attempting to join the IRF fabric.

To join an IRF fabric, a device must use the same software images as the master in the fabric.

When you add a device to the IRF fabric, software auto-update compares the startup software images of the device with the current software images of the IRF master. If the two sets of images are different, the device automatically performs the following operations:

1. Downloads the current software images of the master.
2. Sets the downloaded images as its main startup software images.
3. Reboots with the new software images to rejoin the IRF fabric.

You must manually update the new device with the software images running on the IRF fabric if software auto-update is disabled.

Restrictions and guidelines

To ensure a successful software auto-update in a multi-user environment, prevent anyone from rebooting member devices during the auto-update process. To inform administrators of the auto-update status, configure the information center to output the status messages to configuration terminals (see *Network Management and Monitoring Configuration Guide*).

Make sure the device you are adding to the IRF fabric has sufficient storage space for the new software images.

If sufficient storage space is not available, the device automatically deletes the current software images. If the reclaimed space is still insufficient, the device cannot complete the auto-update. You must reboot the device, and then access the BootWare menu to delete files.

Procedure

1. Enter system view.

   system-view
2. Enable software auto-update.

   irf auto-update enable

   By default, software auto-update is enabled.

Setting the IRF link status change report delay

About IRF link status change report delay

To prevent frequent IRF splits and merges during link flapping, configure the IRF ports to delay reporting link status change events.

An IRF port does not report a link status change event to the IRF fabric immediately after its link changes from up to down or from down to up. If the IRF link state change persists when the delay is reached, the port reports the change to the IRF fabric.

The device delays reporting link status change events of an IRF port, but it does not delay reporting link status change events of an IRF physical interface.

Restrictions and guidelines

Make sure the IRF link status change report delay is shorter than the heartbeat or hello timeout settings of upper-layer protocols (for example, CFD and OSPF). If the report delay is longer than the timeout setting of a protocol, unnecessary recalculations might occur.

Set the delay to 0 seconds in the following situations:

- The IRF fabric requires a fast master/subordinate or IRF link switchover.
- The RRPP, BFD, or GR feature is used.
- You want to shut down an IRF physical interface or reboot an IRF member device. (After you complete the operation, reconfigure the delay depending on the network condition.)

Procedure

1. Enter system view.
   `system-view`
2. Set the IRF link status change report delay.
   `irf link-delay` *`interval`*
   The default IRF link status change report delay is 4 seconds.

Display and maintenance commands for IRF

Execute **`display`** commands in any view.

Task	Command
Display information about all IRF members.	**`display irf`**
Display the IRF fabric topology.	**`display irf topology`**
Display IRF link information.	**`display irf link`**
Display IRF configuration.	**`display irf configuration`**
Display MAD configuration.	**`display mad`** [**`verbose`**]

IRF configuration examples

The IRF configuration examples show how to set up IRF fabrics that use different MAD mechanisms.

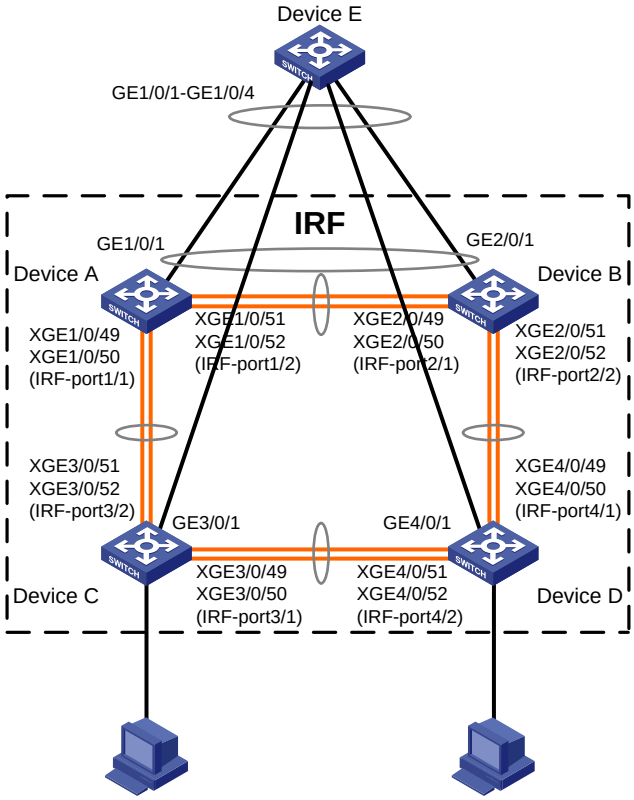
Example: Configuring an LACP MAD-enabled IRF fabric

Network configuration

As shown in Figure 14, set up a four-chassis IRF fabric at the access layer of the enterprise network.

Configure LACP MAD on the multichassis aggregation to Device E, which supports extended LACP.

Figure 14 Network diagram



Procedure

1. Configure Device A:

   # Shut down the physical interfaces used for IRF links. In this example, the physical interfaces are shut down in batch. For more information, see *Layer 2—LAN Switching Configuration Guide*.

   ```
   <Sysname> system-view
   [Sysname] interface range ten-gigabitethernet 1/0/49 to ten-gigabitethernet 1/0/52
   [Sysname-if-range] shutdown
   [Sysname-if-range] quit
   ```

   # Bind Ten-GigabitEthernet 1/0/49 and Ten-GigabitEthernet 1/0/50 to IRF-port 1/1.

   ```
   [Sysname] irf-port 1/1
   [Sysname-irf-port1/1] port group interface ten-gigabitethernet 1/0/49
   [Sysname-irf-port1/1] port group interface ten-gigabitethernet 1/0/50
   [Sysname-irf-port1/1] quit
   ```

   # Bind Ten-GigabitEthernet 1/0/51 and Ten-GigabitEthernet 1/0/52 to IRF-port 1/2.

   ```
   [Sysname] irf-port 1/2
   [Sysname-irf-port1/2] port group interface ten-gigabitethernet 1/0/51
   [Sysname-irf-port1/2] port group interface ten-gigabitethernet 1/0/52
   [Sysname-irf-port1/2] quit
   ```

   # Bring up the physical interfaces and save the configuration.

   ```
   [Sysname] interface range ten-gigabitethernet 1/0/49 to ten-gigabitethernet 1/0/52
   [Sysname-if-range] undo shutdown
   [Sysname-if-range] quit
   [Sysname] save
   ```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

2. Configure Device B:

Change the member ID of Device B to 2 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 2
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device B to Device A as shown in Figure 14, and log in to Device B. (Details not shown.)

Shut down the physical interfaces for IRF links.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 2/0/49 to ten-gigabitethernet 2/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 2/0/49 and Ten-GigabitEthernet 2/0/50 to IRF-port 2/1.

```
[Sysname] irf-port 2/1
[Sysname-irf-port2/1] port group interface ten-gigabitethernet 2/0/49
[Sysname-irf-port2/1] port group interface ten-gigabitethernet 2/0/50
[Sysname-irf-port2/1] quit
```

Bind Ten-GigabitEthernet 2/0/51 and Ten-GigabitEthernet 2/0/52 to IRF-port 2/2.

```
[Sysname] irf-port 2/2
[Sysname-irf-port2/2] port group interface ten-gigabitethernet 2/0/51
[Sysname-irf-port2/2] port group interface ten-gigabitethernet 2/0/52
[Sysname-irf-port2/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 2/0/49 to ten-gigabitethernet 2/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

The two devices perform master election, and the one that has lost the election reboots to form an IRF fabric with the master.

3. Configure Device C:

Change the member ID of Device C to 3 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 3
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device C to Device A as shown in Figure 14, and log in to Device C. (Details not shown.)

Shut down the physical interfaces for IRF links.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 3/0/49 to ten-gigabitethernet 3/0/52
[Sysname-if-range] shutdown
```

```
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 3/0/49 and Ten-GigabitEthernet 3/0/50 to IRF-port 3/1.

```
[Sysname] irf-port 3/1
[Sysname-irf-port3/1] port group interface ten-gigabitethernet 3/0/49
[Sysname-irf-port3/1] port group interface ten-gigabitethernet 3/0/50
[Sysname-irf-port3/1] quit
```

Bind Ten-GigabitEthernet 3/0/51 and Ten-GigabitEthernet 3/0/52 to IRF-port 3/2.

```
[Sysname] irf-port 3/2
[Sysname-irf-port3/2] port group interface ten-gigabitethernet 3/0/51
[Sysname-irf-port3/2] port group interface ten-gigabitethernet 3/0/52
[Sysname-irf-port3/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 3/0/49 to ten-gigabitethernet 3/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

Device C reboots to join the IRF fabric.

4. Configure Device D:

Change the member ID of Device D to 4 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 4
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device D to Device B and Device C as shown in Figure 14, and log in to Device D. (Details not shown.)

Shut down the physical interfaces.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 4/0/49 to ten-gigabitethernet 4/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 4/0/49 and Ten-GigabitEthernet 4/0/50 to IRF-port 4/1.

```
[Sysname] irf-port 4/1
[Sysname-irf-port4/1] port group interface ten-gigabitethernet 4/0/49
[Sysname-irf-port4/1] port group interface ten-gigabitethernet 4/0/50
[Sysname-irf-port4/1] quit
```

Bind Ten-GigabitEthernet 4/0/51 and Ten-GigabitEthernet 4/0/52 to IRF-port 4/2.

```
[Sysname] irf-port 4/2
[Sysname-irf-port4/2] port group interface ten-gigabitethernet 4/0/51
[Sysname-irf-port4/2] port group interface ten-gigabitethernet 4/0/52
[Sysname-irf-port4/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 4/0/49 to ten-gigabitethernet 4/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
```

```
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

Device D reboots to join the IRF fabric. A four-chassis IRF fabric is formed.

5. Configure LACP MAD on the IRF fabric:

Set the domain ID of the IRF fabric to 1.

```
<Sysname> system-view
[Sysname] irf domain 1
```

Create a dynamic aggregate interface and enable LACP MAD.

```
[Sysname] interface bridge-aggregation 2
[Sysname-Bridge-Aggregation2] link-aggregation mode dynamic
[Sysname-Bridge-Aggregation2] mad enable
You need to assign a domain ID (range: 0-4294967295)
[Current domain ID is: 1]:
The assigned domain ID is: 1
[Sysname-Bridge-Aggregation2] quit
```

Assign GigabitEthernet 1/0/1, GigabitEthernet 2/0/1, GigabitEthernet 3/0/1, and GigabitEthernet 4/0/1 to the aggregate interface.

```
[Sysname] interface range gigabitethernet 1/0/1 gigabitethernet 2/0/1
gigabitethernet 3/0/1 gigabitethernet 4/0/1
[Sysname-if-range] port link-aggregation group 2
[Sysname-if-range] quit
```

6. Configure Device E as the intermediate device:

CAUTION:

If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection. False detection causes IRF split.

Create a dynamic aggregate interface.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 2
[Sysname-Bridge-Aggregation2] link-aggregation mode dynamic
[Sysname-Bridge-Aggregation2] quit
```

Assign GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, GigabitEthernet 1/0/3, and GigabitEthernet 1/0/4 to the aggregate interface.

```
[Sysname] interface range gigabitethernet 1/0/1 to gigabitethernet 1/0/4
[Sysname-if-range] port link-aggregation group 2
[Sysname-if-range] quit
```

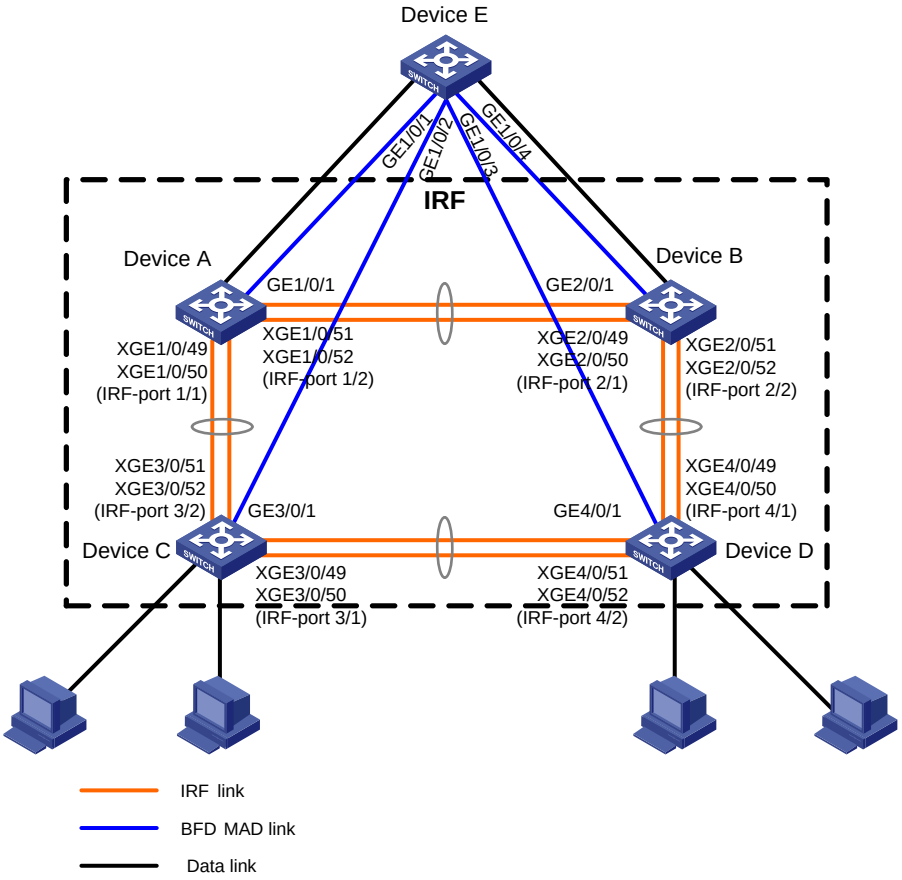
Example: Configuring a BFD MAD-enabled IRF fabric

Network configuration

As shown in Figure 15, set up a four-chassis IRF fabric at the distribution layer of the enterprise network.

- Configure BFD MAD on the IRF fabric and set up BFD MAD links between each member device and the intermediate device.
- Disable the spanning tree feature on the ports used for BFD MAD, because the two features conflict with each other.

Figure 15 Network diagram



Procedure

1. Configure Device A:

   # Shut down the physical interfaces used for IRF links.

   ```
   <Sysname> system-view
   [Sysname] interface range ten-gigabitethernet 1/0/49 to ten-gigabitethernet 1/0/52
   [Sysname-if-range] shutdown
   [Sysname-if-range] quit
   ```

   # Bind Ten-GigabitEthernet 1/0/49 and Ten-GigabitEthernet 1/0/50 to IRF-port 1/1.

   ```
   [Sysname] irf-port 1/1
   [Sysname-irf-port1/1] port group interface ten-gigabitethernet 1/0/49
   [Sysname-irf-port1/1] port group interface ten-gigabitethernet 1/0/50
   [Sysname-irf-port1/1] quit
   ```

   # Bind Ten-GigabitEthernet 1/0/51 and Ten-GigabitEthernet 1/0/52 to IRF-port 1/2.

   ```
   [Sysname] irf-port 1/2
   [Sysname-irf-port1/2] port group interface ten-gigabitethernet 1/0/51
   [Sysname-irf-port1/2] port group interface ten-gigabitethernet 1/0/52
   [Sysname-irf-port1/2] quit
   ```

   # Bring up the physical interfaces and save the configuration.

   ```
   [Sysname] interface range ten-gigabitethernet 1/0/49 to ten-gigabitethernet 1/0/52
   [Sysname-if-range] undo shutdown
   [Sysname-if-range] quit
   ```

```
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

2. Configure Device B:

Change the member ID of Device B to 2 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 2
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device B to Device A as shown in Figure 15, and log in to Device B. (Details not shown.)

Shut down the physical interfaces used for IRF links.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 2/0/49 to ten-gigabitethernet 2/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 2/0/49 and Ten-GigabitEthernet 2/0/50 to IRF-port 2/1.

```
[Sysname] irf-port 2/1
[Sysname-irf-port2/1] port group interface ten-gigabitethernet 2/0/49
[Sysname-irf-port2/1] port group interface ten-gigabitethernet 2/0/50
[Sysname-irf-port2/1] quit
```

Bind Ten-GigabitEthernet 2/0/51 and Ten-GigabitEthernet 2/0/52 to IRF-port 2/2.

```
[Sysname] irf-port 2/2
[Sysname-irf-port2/2] port group interface ten-gigabitethernet 2/0/51
[Sysname-irf-port2/2] port group interface ten-gigabitethernet 2/0/52
[Sysname-irf-port2/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 2/0/49 to ten-gigabitethernet 2/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

The two devices perform master election, and the one that has lost the election reboots to form an IRF fabric with the master.

3. Configure Device C:

Change the member ID of Device C to 3 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 3
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device C to Device A as shown in Figure 15, and log in to Device C. (Details not shown.)

Shut down the physical interfaces used for IRF links.

```
<Sysname> system-view
```

```
[Sysname] interface range ten-gigabitethernet 3/0/49 to ten-gigabitethernet 3/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 3/0/49 and Ten-GigabitEthernet 3/0/50 to IRF-port 3/1.

```
[Sysname] irf-port 3/1

[Sysname-irf-port3/1] port group interface ten-gigabitethernet 3/0/50
[Sysname-irf-port3/1] quit
```

Bind Ten-GigabitEthernet 3/0/51 and Ten-GigabitEthernet 3/0/52 to IRF-port 3/2.

```
[Sysname] irf-port 3/2
[Sysname-irf-port3/2] port group interface ten-gigabitethernet 3/0/51
[Sysname-irf-port3/2] port group interface ten-gigabitethernet 3/0/52
[Sysname-irf-port3/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 3/0/49 to ten-gigabitethernet 3/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

Device C reboots to join the IRF fabric.

4. Configure Device D:

Change the member ID of Device D to 4 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 4
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device D to Device B and Device C as shown in Figure 15, and log in to Device D. (Details not shown.)

Shut down the physical interfaces used for IRF links.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 4/0/49 to ten-gigabitethernet 4/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 4/0/49 and Ten-GigabitEthernet 4/0/50 to IRF-port 4/1.

```
[Sysname] irf-port 4/1
[Sysname-irf-port4/1] port group interface ten-gigabitethernet 4/0/49
[Sysname-irf-port4/1] port group interface ten-gigabitethernet 4/0/50
[Sysname-irf-port4/1] quit
```

Bind Ten-GigabitEthernet 4/0/51 and Ten-GigabitEthernet 4/0/52 to IRF-port 4/2.

```
[Sysname] irf-port 4/2
[Sysname-irf-port4/2] port group interface ten-gigabitethernet 4/0/51
[Sysname-irf-port4/2] port group interface ten-gigabitethernet 4/0/52
[Sysname-irf-port4/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 4/0/49 to ten-gigabitethernet 4/0/52
```

```
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

Device D reboots to join the IRF fabric. A four-chassis IRF fabric is formed.

5. Configure BFD MAD on the IRF fabric:

   # Create VLAN 3, and add GigabitEthernet 1/0/1, GigabitEthernet 2/0/1, GigabitEthernet 3/0/1, and GigabitEthernet 4/0/1 to VLAN 3.

```
[Sysname] vlan 3
[Sysname-vlan3] port gigabitethernet 1/0/1 gigabitethernet 2/0/1 gigabitethernet
3/0/1 gigabitethernet 4/0/1
[Sysname-vlan3] quit
```

   # Create VLAN-interface 3, and configure a MAD IP address for each member device on the VLAN interface.

```
[Sysname] interface vlan-interface 3
[Sysname-Vlan-interface3] mad bfd enable
[Sysname-Vlan-interface3] mad ip address 192.168.2.1 24 member 1
[Sysname-Vlan-interface3] mad ip address 192.168.2.2 24 member 2
[Sysname-Vlan-interface3] mad ip address 192.168.2.3 24 member 3
[Sysname-Vlan-interface3] mad ip address 192.168.2.4 24 member 4
[Sysname-Vlan-interface3] quit
```

   # Disable the spanning tree feature on GigabitEthernet 1/0/1, GigabitEthernet 2/0/1, GigabitEthernet 3/0/1, and GigabitEthernet 4/0/1.

```
[Sysname] interface range gigabitethernet 1/0/1 gigabitethernet 2/0/1
gigabitethernet 3/0/1 gigabitethernet 4/0/1
[Sysname-if-range] undo stp enable
[Sysname-if-range] quit
```

6. Configure Device E as the intermediate device:

   # Create VLAN 3, and assign GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, GigabitEthernet 1/0/3, and GigabitEthernet 1/0/4 to VLAN 3 for forwarding BFD MAD packets.

```
<DeviceE> system-view
[DeviceE] vlan 3
[DeviceE-vlan3] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
[DeviceE-vlan3] quit
```

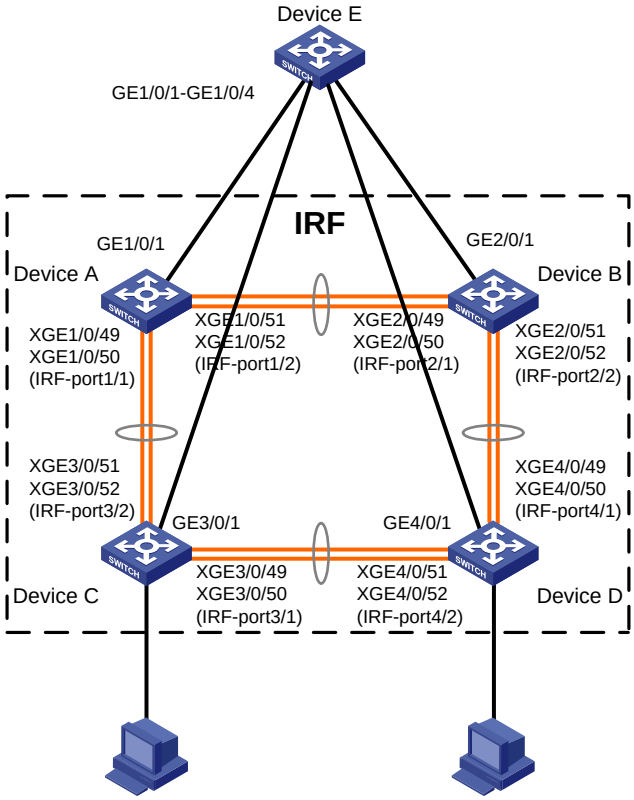
Example: Configuring an ARP MAD-enabled IRF fabric

Network configuration

As shown in Figure 16, set up a four-chassis IRF fabric in the enterprise network.

- Configure ARP MAD on the IRF fabric and use the links connected to Device E for transmitting ARP MAD packets.
- To prevent loops, run the spanning tree feature between Device E and the IRF fabric.

Figure 16 Network diagram



Procedure

1. Configure Device A:

   # Shut down the physical interfaces used for IRF links.

   ```
   <Sysname> system-view
   [Sysname] interface range ten-gigabitethernet 1/0/49 to ten-gigabitethernet 1/0/52
   [Sysname-if-range] shutdown
   [Sysname-if-range] quit
   ```

   # Bind Ten-GigabitEthernet 1/0/49 and Ten-GigabitEthernet 1/0/50 to IRF-port 1/1.

   ```

[Sysname-irf-port3/1] quit
```

Bind Ten-GigabitEthernet 3/0/51 and Ten-GigabitEthernet 3/0/52 to IRF-port 3/2.

```
[Sysname] irf-port 3/2
[Sysname-irf-port3/2] port group interface ten-gigabitethernet 3/0/51
[Sysname-irf-port3/2] port group interface ten-gigabitethernet 3/0/52
[Sysname-irf-port3/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 3/0/49 to ten-gigabitethernet 3/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

Device C reboots to join the IRF fabric.

4. Configure Device D:

Change the member ID of Device D to 4 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 4
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device D to Device B and Device C as shown in Figure 16, and log in to Device D. (Details not shown.)

Shut down the physical interfaces used for IRF links.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 4/0/49 to ten-gigabitethernet 4/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 4/0/49 and Ten-GigabitEthernet 4/0/50 to IRF-port 4/1.

```
[Sysname] irf-port 4/1
[Sysname-irf-port4/1] port group interface ten-gigabitethernet 4/0/49
[Sysname-irf-port4/1] port group interface ten-gigabitethernet 4/0/50
[Sysname-irf-port4/1] quit
```

Bind Ten-GigabitEthernet 4/0/51 and Ten-GigabitEthernet 4/0/52 to IRF-port 4/2.

```
[Sysname] irf-port 4/2
[Sysname-irf-port4/2] port group interface ten-gigabitethernet 4/0/51
[Sysname-irf-port4/2] port group interface ten-gigabitethernet 4/0/52
[Sysname-irf-port4/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 4/0/49 to ten-gigabitethernet 4/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

Device D reboots to join the IRF fabric. A four-chassis IRF fabric is formed.

5. Configure ARP MAD on the IRF fabric:

Enable the spanning tree feature globally. Map the ARP MAD VLAN to MSTI 1 in the MST region.

```
<Sysname> system-view
[Sysname] stp global enable
[Sysname] stp region-configuration
[Sysname-mst-region] region-name arpmad
[Sysname-mst-region] instance 1 vlan 3
[Sysname-mst-region] active region-configuration
[Sysname-mst-region] quit
```

Configure the IRF fabric to change its bridge MAC address as soon as the address owner leaves.

```
[Sysname] undo irf mac-address persistent
```

Set the domain ID of the IRF fabric to 1.

```
[Sysname] irf domain 1
```

Create VLAN 3, and assign GigabitEthernet 1/0/1, GigabitEthernet 2/0/1, GigabitEthernet 3/0/1, and GigabitEthernet 4/0/1 to VLAN 3.

```
[Sysname] vlan 3
[Sysname-vlan3] port gigabitethernet 1/0/1 gigabitethernet 2/0/1 gigabitethernet
3/0/1 gigabitethernet 4/0/1
[Sysname-vlan3] quit
```

Create VLAN-interface 3, assign it an IP address, and enable ARP MAD on the interface.

```
[Sysname] interface vlan-interface 3
[Sysname-Vlan-interface3] ip address 192.168.2.1 24
[Sysname-Vlan-interface3] mad arp enable
You need to assign a domain ID (range: 0-4294967295)
[Current domain is: 1]:
The assigned domain ID is: 1
```

6. Configure Device E as the intermediate device:

CAUTION:

If the intermediate device is also in an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection. False detection causes IRF split.

Enable the spanning tree feature globally. Map the ARP MAD VLAN to MSTI 1 in the MST region.

```
<DeviceE> system-view
[DeviceE] stp global enable
[DeviceE] stp region-configuration
[DeviceE-mst-region] region-name arpmad
[DeviceE-mst-region] instance 1 vlan 3
[DeviceE-mst-region] active region-configuration
[DeviceE-mst-region] quit
```

Create VLAN 3, and assign GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, GigabitEthernet 1/0/3, and GigabitEthernet 1/0/4 to VLAN 3 for forwarding ARP MAD packets.

```
[DeviceE] vlan 3
[DeviceE-vlan3] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

```
[DeviceE-vlan3] quit
```

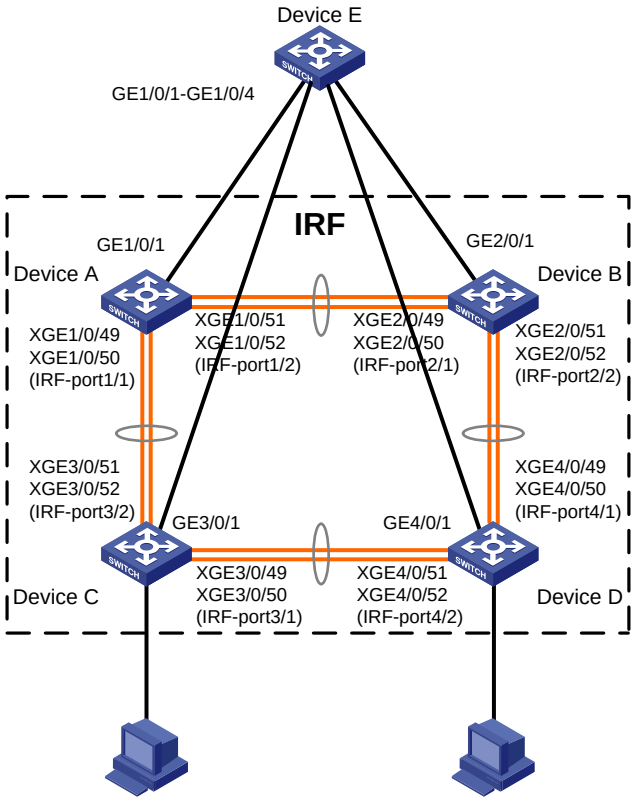
Example: Configuring an ND MAD-enabled IRF fabric

Network configuration

As shown in Figure 17, set up a four-chassis IRF fabric in the IPv6 enterprise network.

- Configure ND MAD on the IRF fabric and use the links connected to Device E for transmitting ND MAD packets.
- To prevent loops, run the spanning tree feature between Device E and the IRF fabric.

Figure 17 Network diagram



Procedure

1. Configure Device A:

   # Shut down the physical interfaces used for IRF links.

   ```
   <Sysname> system-view
   [Sysname] interface range ten-gigabitethernet 1/0/49 to ten-gigabitethernet 1/0/52
   [Sysname-if-range] shutdown
   [Sysname-if-range] quit
   ```

   # Bind Ten-GigabitEthernet 1/0/49 and Ten-GigabitEthernet 1/0/50 to IRF-port 1/1.

   ```
   [Sysname] irf-port 1/1
   [Sysname-irf-port1/1] port group interface ten-gigabitethernet 1/0/49
   [Sysname-irf-port1/1] port group interface ten-gigabitethernet 1/0/50
   [Sysname-irf-port1/1] quit
   ```

   # Bind Ten-GigabitEthernet 1/0/51 and Ten-GigabitEthernet 1/0/52 to IRF-port 1/2.

   ```
   [Sysname] irf-port 1/2
   ```

```
[Sysname-irf-port1/2] port group interface ten-gigabitethernet 1/0/51
[Sysname-irf-port1/2] port group interface ten-gigabitethernet 1/0/52
[Sysname-irf-port1/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 1/0/49 to ten-gigabitethernet 1/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

2. Configure Device B:

Change the member ID of Device B to 2 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 2
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device B to Device A as shown in Figure 17, and log in to Device B. (Details not shown.)

Shut down the physical interfaces used for IRF links.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 2/0/49 to ten-gigabitethernet 2/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 2/0/49 and Ten-GigabitEthernet 2/0/50 to IRF-port 2/1.

```
[Sysname] irf-port 2/1
[Sysname-irf-port2/1] port group interface ten-gigabitethernet 2/0/49
[Sysname-irf-port2/1] port group interface ten-gigabitethernet 2/0/50
[Sysname-irf-port2/1] quit
```

Bind Ten-GigabitEthernet 2/0/51 and Ten-GigabitEthernet 2/0/52 to IRF-port 2/2.

```
[Sysname] irf-port 2/2
[Sysname-irf-port2/2] port group interface ten-gigabitethernet 2/0/51
[Sysname-irf-port2/2] port group interface ten-gigabitethernet 2/0/52
[Sysname-irf-port2/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 2/0/49 to ten-gigabitethernet 2/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

The two devices perform master election, and the one that has lost the election reboots to form an IRF fabric with the master.

3. Configure Device C:

Change the member ID of Device C to 3 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 3
```

```
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device C to Device A as shown in Figure 17, and log in to Device C. (Details not shown.)

Shut down the physical interfaces used for IRF links.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 3/0/49 to ten-gigabitethernet 3/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 3/0/49 and Ten-GigabitEthernet 3/0/50 to IRF-port 3/1.

```
[Sysname] irf-port 3/1
[Sysname-irf-port3/1] port group interface ten-gigabitethernet 3/0/49
[Sysname-irf-port3/1] port group interface ten-gigabitethernet 3/0/50
[Sysname-irf-port3/1] quit
```

Bind Ten-GigabitEthernet 3/0/51 and Ten-GigabitEthernet 3/0/52 to IRF-port 3/2.

```
[Sysname] irf-port 3/2
[Sysname-irf-port3/2] port group interface ten-gigabitethernet 3/0/51
[Sysname-irf-port3/2] port group interface ten-gigabitethernet 3/0/52
[Sysname-irf-port3/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 3/0/49 to ten-gigabitethernet 3/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

Device C reboots to join the IRF fabric.

4. Configure Device D:

Change the member ID of Device D to 4 and reboot the device to have the change take effect.

```
<Sysname> system-view
[Sysname] irf member 1 renumber 4
Renumbering the member ID may result in configuration change or loss. Continue? [Y/N]:y
[Sysname] quit
<Sysname> reboot
```

Connect Device D to Device B and Device C as shown in Figure 17, and log in to Device D. (Details not shown.)

Shut down the physical interfaces used for IRF links.

```
<Sysname> system-view
[Sysname] interface range ten-gigabitethernet 4/0/49 to ten-gigabitethernet 4/0/52
[Sysname-if-range] shutdown
[Sysname-if-range] quit
```

Bind Ten-GigabitEthernet 4/0/49 and Ten-GigabitEthernet 4/0/50 to IRF-port 4/1.

```
[Sysname] irf-port 4/1
[Sysname-irf-port4/1] port group interface ten-gigabitethernet 4/0/49
[Sysname-irf-port4/1] port group interface ten-gigabitethernet 4/0/50
[Sysname-irf-port4/1] quit
```

Bind Ten-GigabitEthernet 4/0/51 and Ten-GigabitEthernet 4/0/52 to IRF-port 4/2.

```
[Sysname] irf-port 4/2
[Sysname-irf-port4/2] port group interface ten-gigabitethernet 4/0/51
[Sysname-irf-port4/2] port group interface ten-gigabitethernet 4/0/52
[Sysname-irf-port4/2] quit
```

Bring up the physical interfaces and save the configuration.

```
[Sysname] interface range ten-gigabitethernet 4/0/49 to ten-gigabitethernet 4/0/52
[Sysname-if-range] undo shutdown
[Sysname-if-range] quit
[Sysname] save
```

Activate the IRF port configuration.

```
[Sysname] irf-port-configuration active
```

Device D reboots to join the IRF fabric. A four-chassis IRF fabric is formed.

5. Configure ND MAD on the IRF fabric:

Enable the spanning tree feature globally. Map the ND MAD VLAN to MSTI 1 in the MST region.

```
<Sysname> system-view
[Sysname] stp global enable
[Sysname] stp region-configuration
[Sysname-mst-region] region-name ndmad
[Sysname-mst-region] instance 1 vlan 3
[Sysname-mst-region] active region-configuration
[Sysname-mst-region] quit
```

Configure the IRF fabric to change its bridge MAC address as soon as the address owner leaves.

```
[Sysname] undo irf mac-address persistent
```

Set the domain ID of the IRF fabric to 1.

```
[Sysname] irf domain 1
```

Create VLAN 3, and add GigabitEthernet 1/0/1, GigabitEthernet 2/0/1, GigabitEthernet 3/0/1, and GigabitEthernet 4/0/1 to VLAN 3.

```
[Sysname] vlan 3
[Sysname-vlan3] port gigabitethernet 1/0/1 gigabitethernet 2/0/1 gigabitethernet
3/0/1 gigabitethernet 4/0/1
[Sysname-vlan3] quit
```

Create VLAN-interface 3, assign it an IPv6 address, and enable ND MAD on the interface.

```
[Sysname] interface vlan-interface 3
[Sysname-Vlan-interface3] ipv6 address 2001::1 64
[Sysname-Vlan-interface3] mad nd enable
You need to assign a domain ID (range: 0-4294967295)
[Current domain is: 1]:
The assigned domain ID is: 1
```

6. Configure Device E as the intermediate device:

CAUTION:

If the intermediate device is also in an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection. False detection causes IRF split.

Enable the spanning tree feature globally. Map the ND MAD VLAN to MSTI 1 in the MST region.

```
<DeviceE> system-view
[DeviceE] stp global enable
[DeviceE] stp region-configuration
[DeviceE-mst-region] region-name ndmad
[DeviceE-mst-region] instance 1 vlan 3
[DeviceE-mst-region] active region-configuration
[DeviceE-mst-region] quit
```

Create VLAN 3, and add GigabitEthernet 1/0/1, GigabitEthernet1/0/2, GigabitEthernet 1/0/3, and GigabitEthernet 1/0/4 to VLAN 3 for forwarding ND MAD packets.

```
[DeviceE] vlan 3
[DeviceE-vlan3] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
[DeviceE-vlan3] quit
```

Layer 2—LAN Switching Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This configuration guide describes LAN switching fundamentals and configuration procedures. It describes how to configure a Layer 2 network in the following aspects:

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

Configuring Ethernet interfaces

About Ethernet interface

The Switch Series supports Ethernet interfaces and Console interfaces. For the interface types and the number of interfaces supported by a switch model, see the installation guide.

This chapter describes how to configure management Ethernet interfaces and Ethernet interfaces.

Ethernet interface naming conventions

The Ethernet interfaces are named in the format of **interface type A/B/C**. The letters that follow the interface type represent the following elements:

- **A**—IRF member ID. If the switch is not in an IRF fabric, A is 1 by default.
- **B**—Card slot number. **0** indicates the interface is a fixed interface of the switch.
- **C**—Port index.

Configuring common Ethernet interface settings

Configuring the physical type for a combo interface (single combo interface)

About combo interface

A combo interface is a logical interface that physically comprises one fiber combo port and one copper combo port. The two ports share one forwarding channel and one interface view. As a result, they cannot work simultaneously. When you activate one port, the other port is automatically disabled. If you execute the **`combo enable auto`** command on a combo interface, the interface automatically identifies the media inserted and activates the corresponding combo port. In the interface view, you can activate the fiber or copper combo port, and configure other port attributes such as the interface rate and duplex mode.

Configuration restrictions and guidelines

This feature is available only on devices that support combo interfaces.

Prerequisites

Before you configure combo interfaces, complete the following tasks:

- Determine the combo interfaces on your device. Identify the two physical interfaces that belong to each combo interface according to the marks on the device panel.
- Use the **`display interface`** command to determine which port (fiber or copper) of each combo interface is active:
  - If the copper port is active, the output includes "Media type is twisted pair."
  - If the fiber port is active, the output does not include this information.

Procedure

1. Enter system view.

   `system-view`
2. Enter Ethernet interface view.

interface *interface-type interface-number*

3. Activate the copper combo port or fiber combo port.

   combo enable { **auto** | **copper** | **fiber** }

   The default is **auto**.

Configuring basic settings of an Ethernet interface

About Ethernet interface basic settings

You can configure an Ethernet interface to operate in one of the following duplex modes:

- **Full-duplex mode**—The interface can send and receive packets simultaneously.
- **Half-duplex mode**—The interface can only send or receive packets at a given time.
- **Autonegotiation mode**—The interface negotiates a duplex mode with its peer.

You can set the speed of an Ethernet interface or enable it to automatically negotiate a speed with its peer. For a 100-Mbps or 1000-Mbps Layer 2 Ethernet interface, you can also set speed options for autonegotiation. The two ends can select a speed only from the available options. For more information, see "Setting speed options for autonegotiation on an Ethernet interface."

Restrictions and guidelines

The **shutdown** command cannot be configured on an interface in a loopback test.

Procedure

1. Enter system view.

   system-view

2. Enter Ethernet interface view.

   interface *interface-type interface-number*

3. Set the description for the Ethernet interface.

   description *text*

   The default setting is *interface-name* **Interface**. For example, **GigabitEthernet1/0/1 Interface**.

4. Set the duplex mode for the Ethernet interface.

   duplex { **auto** | **full** | **half** }

   By default, the duplex mode is **auto** for Ethernet interfaces.

   Ethernet copper ports that operate in 1000 Mbps or 10000 Mbps and fiber ports do not support the **half** keyword.

5. Set the speed for the Ethernet interface.

   speed { **10** | **100** | **1000** | **2500** | **5000** | **10000** | **auto** }

   By default, an Ethernet interface negotiates a speed with its peer.

6. Set the expected bandwidth for the Ethernet interface.

   bandwidth *bandwidth-value*

   By default, the expected bandwidth (in kbps) is the interface baud rate divided by 1000.

7. Bring up the Ethernet interface.

   undo shutdown

   By default, Ethernet interfaces are in up state.

Enabling automatic negotiation for speed downgrading

About automatic negotiation for speed downgrading

Perform this task to enable interfaces at two ends of a link to automatically negotiate about downgrading their speed when the following conditions exist:

- The interfaces automatically negotiate a speed of 1000 Mbps.
- The interfaces cannot operate at 1000 Mbps because of link restrictions.

Restrictions and guidelines

This feature is available only on GE interfaces.

Procedure

1. Enter system view.

   system-view
2. Enter Ethernet interface view.

   interface *interface-type interface-number*
3. Enable automatic negotiation for speed downgrading.

   speed auto downgrade

   By default, automatic negotiation for speed downgrading is enabled.

Configuring jumbo frame support

About jumbo frame

Jumbo frames are frames larger than 1522 bytes and are typically received by an Ethernet interface during high-throughput data exchanges, such as file transfers.

The Ethernet interface processes jumbo frames in the following ways:

- When the Ethernet interface is configured to deny jumbo frames (by using the **undo jumboframe enable** command), the Ethernet interface discards jumbo frames.
- When the Ethernet interface is configured with jumbo frame support, the Ethernet interface performs the following operations:
  - Processes jumbo frames within the specified length.
  - Discards jumbo frames that exceed the specified length.

Procedure

1. Enter system view.

   system-view
2. Enter Ethernet interface view.

   interface *interface-type interface-number*
3. Configure jumbo frame support.

   jumboframe enable [*size*]

   By default, the device allows jumbo frames within 10240 bytes to pass through.

   If you set the *size* argument multiple times, the most recent configuration takes effect.

Configuring physical state change suppression on an Ethernet interface

About physical state change suppression

The physical link state of an Ethernet interface is either up or down. Each time the physical link of an interface comes up or goes down, the interface immediately reports the change to the CPU. The CPU then performs the following operations:

- Notifies the upper-layer protocol modules (such as routing and forwarding modules) of the change for guiding packet forwarding.
- Automatically generates traps and logs to inform users to take the correct actions.

To prevent frequent physical link flapping from affecting system performance, configure physical state change suppression. You can configure this feature to suppress only link-down events, only link-up events, or both. If an event of the specified type still exists when the suppression interval expires, the system reports the event to the CPU.

Restrictions and guidelines

Do not enable this feature on an interface that has RRPP, spanning tree protocols, or Smart Link enabled. S5000E-X, S5000X-EI, S5110V2-SI, S5000V3-EI, S5000V5-EI, and WAS6000 switches do not support RRPP or Smart Link.

You can configure different suppression intervals for link-up and link-down events.

If you execute the **link-delay** command multiple times on an interface, the following rules apply:

- You can configure the suppression intervals for link-up and link-down events separately.
- If you configure the suppression interval multiple times for link-up or link-down events, the most recent configuration takes effect.

The **link-delay**, **dampening**, and **port link-flap protect enable** commands are mutually exclusive on an Ethernet interface.

Procedure

1. Enter system view.

   system-view
2. Enter Ethernet interface view.

   interface *interface-type interface-number*
3. Configure physical state change suppression.

   link-delay { **down** | **up** } [**msec**] *delay-time*

   By default, each time the physical link of an interface goes up or comes down, the interface immediately reports the change to the CPU.

Configuring dampening on an Ethernet interface

About dampening

The interface dampening feature uses an exponential decay mechanism to prevent excessive interface flapping events from adversely affecting routing protocols and routing tables in the network. Suppressing interface state change events protects the system resources.

If an interface is not dampened, its state changes are reported. For each state change, the system also generates an SNMP trap and log message.

After a flapping interface is dampened, it does not report its state changes to the CPU. For state change events, the interface only generates SNMP trap and log messages.

Parameters

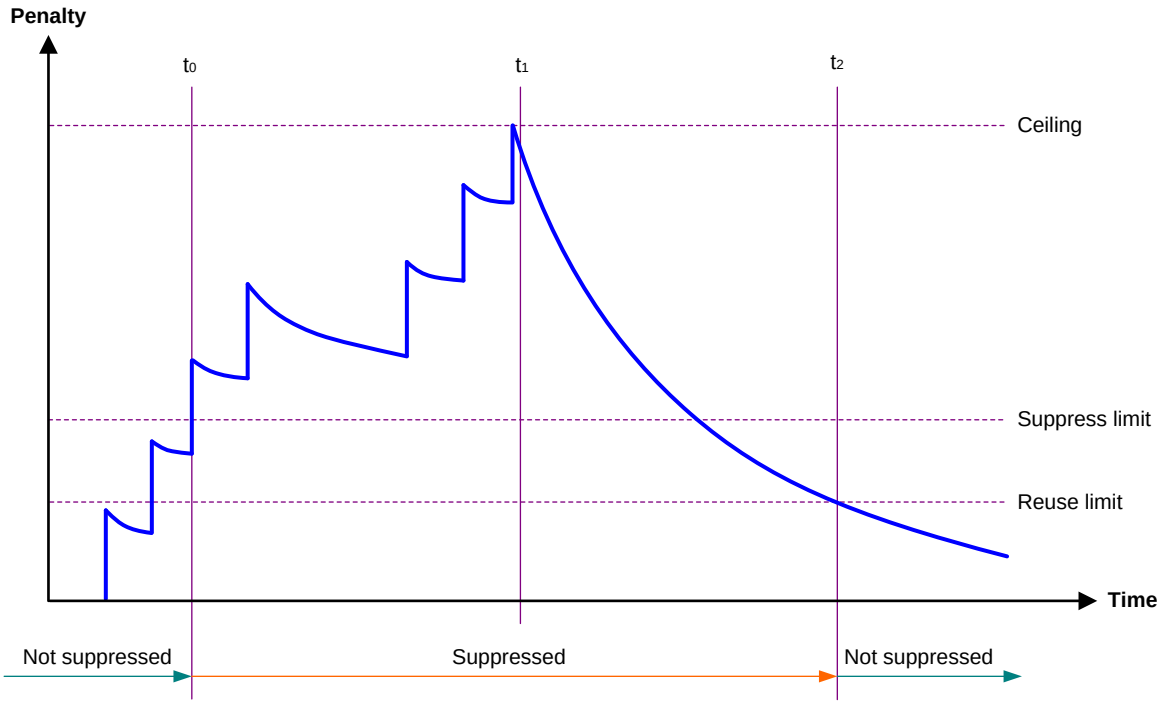
- **Penalty**—The interface has an initial penalty of 0. When the interface flaps, the penalty increases by 1000 for each down event until the ceiling is reached. It does not increase for up events. When the interface stops flapping, the penalty decreases by half each time the half-life timer expires until the penalty drops to the reuse threshold.
- **Ceiling**—The penalty stops increasing when it reaches the ceiling.
- **Suppress-limit**—The accumulated penalty that triggers the device to dampen the interface. In dampened state, the interface does not report its state changes to the CPU. For state change events, the interface only generates SNMP traps and log messages.
- **Reuse-limit**—When the accumulated penalty decreases to this reuse threshold, the interface is not dampened. Interface state changes are reported to the upper layers. For each state change, the system also generates an SNMP trap and log message.
- **Decay**—The amount of time (in seconds) after which a penalty is decreased.
- **Max-suppress-time**—The maximum amount of time the interface can be dampened. If the penalty is still higher than the reuse threshold when this timer expires, the penalty stops increasing for down events. The penalty starts to decrease until it drops below the reuse threshold.

When executing the **dampening** command, follow these rules to set the values mentioned above:

- The ceiling is equal to $2^{(\text{Max-suppress-time/Decay})}$ × reuse-limit. It is not user configurable.
- The configured suppress limit is lower than or equal to the ceiling.
- The ceiling is lower than or equal to the maximum suppress limit supported.

Figure 1 shows the change rule of the penalty value. The lines t_0 and t_2 indicate the start time and end time of the suppression, respectively. The period from t_0 to t_2 indicates the suppression period, t_0 to t_1 indicates the max-suppress-time, and t_1 to t_2 indicates the complete decay period.

Figure 1 Change rule of the penalty value



Restrictions and guidelines

- The **dampening**, **link-delay**, and **port link-flap protect enable** commands are mutually exclusive on an interface.

- The **dampening** command does not take effect on the administratively down events. When you execute the **shutdown** command, the penalty restores to 0, and the interface reports the down event to the upper-layer protocols.
- Do not enable the dampening feature on an interface with RRPP, MSTP, or Smart Link enabled. S5000E-X, S5000X-EI, S5110V2-SI, S5000V3-EI, S5000V5-EI, and WAS6000 switches do not support RRPP or Smart Link.

Procedure

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Enable dampening on the interface.
   dampening [*half-life reuse suppress max-suppress-time*]
   By default, interface dampening is disabled on Ethernet interfaces.

Enabling link flapping protection on an interface

About link flapping protection

Link flapping on an interface changes network topology and increases the system overhead. For example, in an active/standby link scenario, when interface status on the active link changes between **UP** and **DOWN**, traffic switches between active and standby links. To solve this problem, configure this feature on the interface.

With this feature enabled on an interface, when the interface goes down, the system enables link flapping detection. During the link flapping detection interval, if the number of detected flaps reaches or exceeds the link flapping detection threshold, the system shuts down the interface.

Restrictions and guidelines

This feature takes effect only if it is configured in both the system view and Ethernet interface view.

IRF system stability might be affected by IRF physical link flapping. For IRF system stability, this feature is enabled by default on IRF physical interfaces and the enabling status of this feature is not affected by the status of global link flapping protection. When the number of flaps detected on an IRF physical interface exceeds the threshold within the detection interval, the device outputs a log rather than shuts down the IRF physical interface.

The **dampening**, **link-delay**, and **port link-flap protect enable** commands are mutually exclusive on an Ethernet interface.

To bring up an interface that has been shut down by link flapping protection, execute the **undo shutdown** command.

In the **display interface** command output, the **Link-Flap DOWN** value of the **Current state** field indicates that the interface has been shut down by link flapping protection.

Procedure

1. Enter system view.
   system-view
2. Enable link flapping protection globally.
   link-flap protect enable
   By default, link flapping protection is disabled globally.
3. Enter Ethernet interface view.
   interface *interface-type interface-number*

4. Enable link flapping protection on the Ethernet interface.

   port link-flap protect enable [**interval** *interval* | **threshold** *threshold*] *

   By default, link flapping protection is disabled on an Ethernet interface.

Configuring storm suppression

About storm suppression

The storm suppression feature ensures that the size of a particular type of traffic (broadcast, multicast, or unknown unicast traffic) does not exceed the threshold on an interface. When the broadcast, multicast, or unknown unicast traffic on the interface exceeds this threshold, the system discards packets until the traffic drops below this threshold.

Both storm suppression and storm control can suppress storms on an interface. Storm suppression uses the chip to suppress traffic. Storm suppression has less impact on the device performance than storm control, which uses software to suppress traffic.

Restrictions and guidelines

- For the traffic suppression result to be determined, do not configure storm control together with storm suppression for the same type of traffic. For more information about storm control, see "Configuring storm control on an Ethernet interface."
- When you configure the suppression threshold in kbps, the actual suppression threshold might be different from the configured one as follows:
  - If the configured value is smaller than 64, the value of 64 takes effect.
  - If the configured value is greater than 64 but not an integer multiple of 64, the integer multiple of 64 that is greater than and closest to the configured value takes effect.

  For the suppression threshold that takes effect, see the prompt on the device.

Procedure

1. Enter system view.

   system-view

2. Enter Ethernet interface view.

   interface *interface-type interface-number*

3. Enable broadcast suppression and set the broadcast suppression threshold.

   broadcast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

   By default, broadcast suppression is disabled.

4. Enable multicast suppression and set the multicast suppression threshold.

   multicast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

   By default, multicast suppression is disabled.

5. Enable unknown unicast suppression and set the unknown unicast suppression threshold.

   unicast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

   By default, unknown unicast suppression is disabled.

Configuring generic flow control on an Ethernet interface

About generic flow control

To avoid dropping packets on a link, you can enable generic flow control at both ends of the link. When traffic congestion occurs at the receiving end, the receiving end sends a flow control (Pause)

frame to ask the sending end to suspend sending packets. Generic flow control includes the following types:

- **TxRx-mode generic flow control**—Enabled by using the **flow-control** command. With TxRx-mode generic flow control enabled, an interface can both send and receive flow control frames:
  - When congestion occurs, the interface sends a flow control frame to its peer.
  - When the interface receives a flow control frame from its peer, it suspends sending packets to its peer.
- **Rx-mode generic flow control**—Enabled by using the **flow-control receive enable** command. With Rx-mode generic flow control enabled, an interface can receive flow control frames, but it cannot send flow control frames:
  - When congestion occurs, the interface cannot send flow control frames to its peer.
  - When the interface receives a flow control frame from its peer, it suspends sending packets to its peer.

To handle unidirectional traffic congestion on a link, configure the **flow-control receive enable** command at one end and the **flow-control** command at the other end. To enable both ends of a link to handle traffic congestion, configure the **flow-control** command at both ends.

Procedure

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Enable generic flow control.
   - Enable TxRx-mode generic flow control.
     flow-control
   - Enable Rx-mode generic flow control.
     flow-control receive enable

   By default, generic flow control is disabled on an Ethernet interface.

Enabling energy saving features on an Ethernet interface

About energy saving features on an Ethernet interface

This feature contains auto power-down and Energy Efficient Ethernet (EEE) on an Ethernet interface.

When an Ethernet interface with auto power-down enabled has been down for a certain period of time, both of the following events occur:

- The device automatically stops supplying power to the Ethernet interface.
- The Ethernet interface enters the power save mode.

The time period depends on the chip specifications and is not configurable.

When the Ethernet interface comes up, both of the following events occur:

- The device automatically restores power supply to the Ethernet interface.
- The Ethernet interface restores to its normal state.

With Energy Efficient Ethernet (EEE) enabled, a link-up interface enters low power state if it has not received any packet for a period of time. The time period depends on the chip specifications and is not configurable. When a packet arrives later, the device automatically restores power supply to the interface and the interface restores to the normal state.

Restrictions and guidelines

Fiber ports do not support this feature.

Configuring auto power-down on an Ethernet interface

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Enable auto power-down on the Ethernet interface.
   port auto-power-down
   By default, auto power-down is disabled on an Ethernet interface.

Configuring EEE on an Ethernet interface

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Enable EEE on the Ethernet interface.
   eee enable
   By default, EEE is disabled on an Ethernet interface.

Setting the statistics polling interval

About statistics polling interval

To display the interface statistics collected in the last statistics polling interval, use the **display interface** command. To clear the interface statistics, use the **reset counters interface** command.

A device supports either the system view settings or the Ethernet interface view settings.

- The statistics polling interval configured in system view takes effect on all Ethernet interfaces.
- The statistics polling interval configured in Ethernet interface view takes effect only on the current interface.

For an Ethernet interface, the statistics polling interval configured in Ethernet interface view takes priority.

Restrictions and guidelines for setting the statistics polling interval

- Configuring the statistics polling interval in system view is supported in only Release 6328 and later.
- As a best practice, use the default setting when you set the statistics polling interval in system view. A short statistics polling interval might decrease the system performance and result in inaccurate statistics.

Setting the statistics polling interval in system view

1. Enter system view.
   system-view
2. Set the statistics polling interval.
   flow-interval *interval*
   The default setting is 300 seconds.

Setting the statistics polling interval in Ethernet interface view

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Set the statistics polling interval for the Ethernet interface.
   flow-interval *interval*
   By default, the statistics polling interval is 300 seconds.

Enabling loopback testing on an Ethernet interface

About loopback testing

Perform this task to determine whether an Ethernet link works correctly.

Loopback testing includes the following types:

- **Internal loopback testing**—Tests the device where the Ethernet interface resides. The Ethernet interface sends outgoing packets back to the local device. If the device fails to receive the packets, the device fails.
- **External loopback testing**—Tests the hardware function of the Ethernet interface. The Ethernet interface sends outgoing packets to the local device through a self-loop plug. If the device fails to receive the packets, the hardware function of the Ethernet interface fails.

Restrictions and guidelines

- After you enable this feature on an Ethernet interface, the interface does not forward data traffic.
- An Ethernet interface in a loopback test cannot correctly forward data packets.
- You cannot perform a loopback test on Ethernet interfaces manually brought down (displayed as in **ADM** or **Administratively DOWN** state).
- The **speed**, **duplex**, **mdix-mode**, and **shutdown** commands cannot be configured on an Ethernet interface in a loopback test.
- After you enable this feature on an Ethernet interface, the Ethernet interface switches to full duplex mode. After you disable this feature, the Ethernet interface restores to its duplex setting.
- The **shutdown**, **port up-mode**, and **loopback** commands are mutually exclusive.

Procedure

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Configure loopback testing on the Ethernet interface.
   - Enable loopback testing on the Ethernet interface.
     loopback{ **external** | **internal** }
     By default, loopback testing is disabled on an Ethernet interface.
   - Perform a loopback test.
     loopback-test{ **external** | **internal** }

     NOTE:
     This command is supported only in Release 6346 and later.

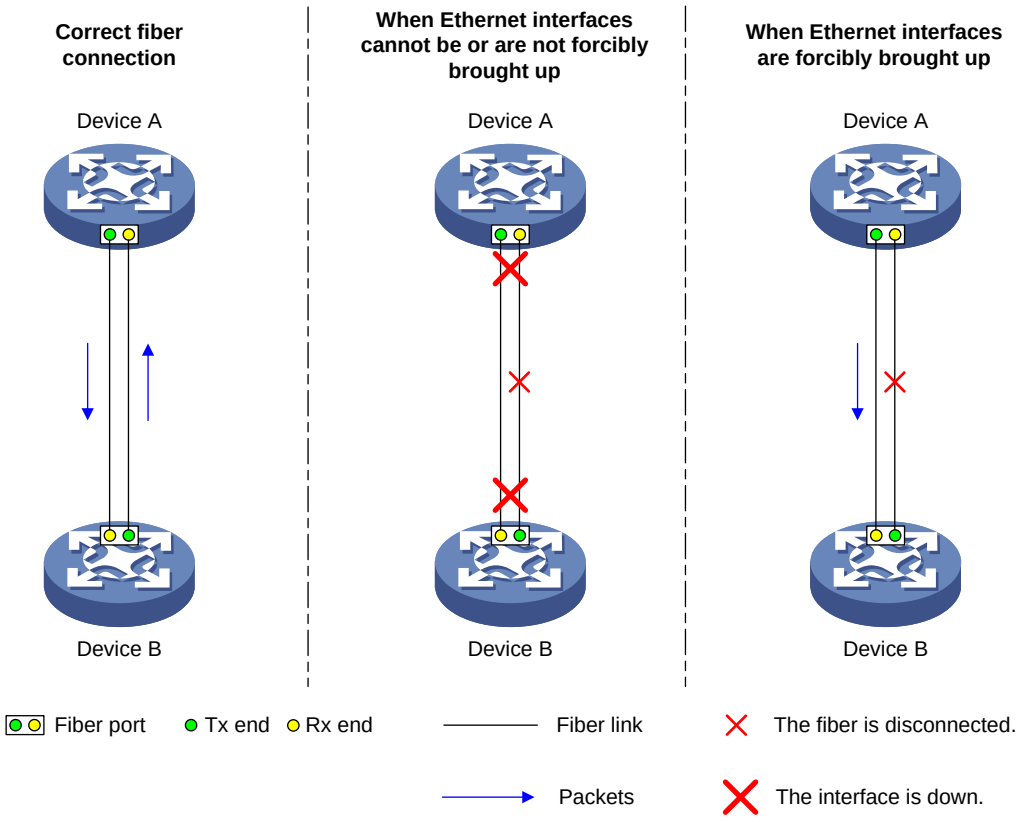
Forcibly bringing up a fiber port

About this task

As shown in Figure 2, a fiber port uses separate fibers for transmitting and receiving packets. The physical state of the fiber port is up only when both transmit and receive fibers are physically connected. If one of the fibers is disconnected, the fiber port does not work.

To enable a fiber port to forward traffic over a single link, you can use the **port up-mode** command. This command forcibly brings up a fiber port, even when no fiber links or transceiver modules are present for the fiber port. When one fiber link is present and up, the fiber port can forward packets over the link unidirectionally.

Figure 2 Forcibly bring up a fiber port



Restrictions and guidelines

Copper ports and combo interfaces do not support this feature. This feature is supported only in Release 6312 and later.

The **port up-mode**, **shutdown**, and **loopback** commands are mutually exclusive.

A fiber port does not support this feature if the port joins a Layer 2 aggregation group.

Procedure

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Forcibly bring up the fiber port.

port up-mode

By default, a fiber port is not forcibly brought up.

Configuring interface alarm functions

About this task

With the interface alarm functions enabled, when the number of error packets on an interface in normal state within the specified interval exceeds the upper threshold, the interface generates an upper threshold exceeding alarm and enters the alarm state. When the number of error packets on an interface in the alarm state within the specified interval drops below the lower threshold, the interface generates a recovery alarm and restores to the normal state.

Software and feature compatibility

This feature is supported only in Release 6342 and later.

Restrictions and guidelines

You can configure the error packet alarm parameters in system view and interface view.

- The configuration in system view takes effect on all interfaces of the specified slot. The configuration in interface view takes effect only on the current interface.
- For an interface, the configuration in interface view takes priority, and the configuration in system view is used only when no configuration is made in interface view.

An interface that is shut down because of error packet alarms cannot automatically recover. To bring up the interface, execute the **undo shutdown** command on the interface.

For the error packet statistics to be accurate, set the statistics collection and comparison interval to be greater than 7 seconds by using the **interval** *interval* keyword.

Enabling interface alarm functions

1. Enter system view.

   system-view

2. Enable alarm functions for the interface monitoring module.

   snmp-agent trap enable ifmonitor [**crc-error** | **input-error** | **output-error**] *

   By default, all alarm functions are enabled for interfaces.

Configuring CRC error packet parameters

1. Enter system view.

   system-view

2. Configure global CRC error packet alarm parameters.

   ifmonitor crc-error slot *slot-number* **high-threshold** *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

   By default, the upper threshold is 1000, the lower threshold is 100, and the statistics collection and comparison interval is 10 seconds for CRC error packets.

3. Enter Ethernet interface view.

   interface *interface-type interface-number*

4. Configure CRC error packet alarm parameters for the interface.

   port ifmonitor crc-error high-threshold *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

   By default, an interface uses the global CRC error packet alarm parameters.

Configuring input error packet alarm parameters

1. Enter system view.

   system-view

2. Configure global input error packet alarm parameters.

   ifmonitor input-error slot *slot-number* **high-threshold** *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

   By default, the upper threshold is 1000, the lower threshold is 100, and the statistics collection and comparison interval is 10 seconds for input error packets.

3. Enter Ethernet interface view.

   interface *interface-type interface-number*

4. Configure input error packet alarm parameters for the interface.

   port ifmonitor input-error high-threshold *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

   By default, an interface uses the global input error packet alarm parameters.

Configuring output error packet alarm parameters

1. Enter system view.

   system-view

2. Configure global output error packet alarm parameters.

   ifmonitor output-error slot *slot-number* **high-threshold** *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

   By default, the upper threshold is 1000, the lower threshold is 100, and the statistics collection and comparison interval is 10 seconds for output error packets.

3. Enter Ethernet interface view.

   interface *interface-type interface-number*

4. Configure output error packet alarm parameters.

   port ifmonitor output-error high-threshold *high-value* **low-threshold** *low-value* **interval** *interval* [**shutdown**]

   By default, an interface uses the global output error packet alarm parameters.

Restoring the default settings for an interface

Restrictions and guidelines

CAUTION:

This feature might interrupt ongoing network services. Make sure you are fully aware of the impacts of this feature when you use it in a live network.

This feature might fail to restore the default settings for some commands because of command dependencies or system restrictions. You can use the **display this** command in interface view to check for these commands and perform their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message to resolve the problem.

Procedure

1. Enter system view.

   system-view

2. Enter Ethernet interface view.

   interface *interface-type interface-number*

3. Restore the default settings for the interface.
   default

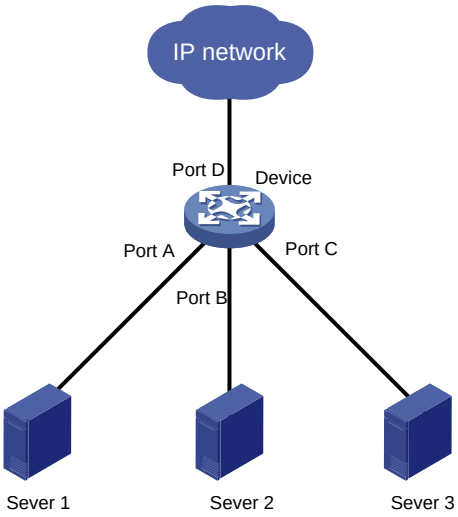
Configuring a Layer 2 Ethernet interface

Setting speed options for autonegotiation on an Ethernet interface

About speed options for autonegotiation

By default, speed autonegotiation enables an Ethernet interface to negotiate with its peer for the highest speed that both ends support. You can narrow down the speed option list for negotiation.

Figure 3 Speed autonegotiation application scenario



As shown in Figure 3:

- All interfaces on the device are operating in speed autonegotiation mode, with the highest speed of 1000 Mbps.
- Port D provides access to the Internet for the servers.

If the transmission rate of each server in the server cluster is 1000 Mbps, their total transmission rate exceeds the capability of Port D.

To avoid congestion on Port D, configure 100 Mbps as the only option available for speed negotiation on interfaces Port A, Port B, and Port C. As a result, the transmission rate on each interface connected to a server is limited to 100 Mbps.

Restrictions and guidelines

The **speed** and **speed auto** commands supersede each other, and whichever is configured last takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Set speed options for autonegotiation.

speed auto { **10** | **100** | **1000** } *

No speed options are set for autonegotiation.

Setting the MDIX mode of an Ethernet interface

IMPORTANT:

Fiber ports do not support the MDIX mode setting.

About MDIX mode

A physical Ethernet interface has eight pins, each of which plays a dedicated role. For example, pins 1 and 2 transmit signals, and pins 3 and 6 receive signals. You can use both crossover and straight-through Ethernet cables to connect copper Ethernet interfaces. To accommodate these types of cables, a copper Ethernet interface can operate in one of the following Medium Dependent Interface-Crossover (MDIX) modes:

- **MDIX mode**—Pins 1 and 2 are receive pins and pins 3 and 6 are transmit pins.
- **MDI mode**—Pins 1 and 2 are transmit pins and pins 3 and 6 are receive pins.
- **AutoMDIX mode**—The interface negotiates pin roles with its peer.

NOTE:

This feature does not take effect on pins 4, 5, 7, and 8 of physical Ethernet interfaces.

- Pins 4, 5, 7, and 8 of interfaces operating at 10 Mbps or 100 Mbps do not receive or transmit signals.
- Pins 4, 5, 7, and 8 of interfaces operating at 1000 Mbps or higher rates receive and transmit signals.

Restrictions and guidelines

To enable a copper Ethernet interface to communicate with its peer, set the MDIX mode of the interface by following these guidelines:

- Typically, set the MDIX mode of the interface to AutoMDIX. Set the MDIX mode of the interface to MDI or MDIX only when the device cannot determine the cable type.
- When a straight-through cable is used, configure the interface to operate in an MDIX mode different than its peer.
- When a crossover cable is used, perform one of the following tasks:
  - Configure the interface to operate in the same MDIX mode as its peer.
  - Configure either end to operate in AutoMDIX mode.

Procedure

1. Enter system view.

   system-view
2. Enter Ethernet interface view.

   interface *interface-type interface-number*
3. Set the MDIX mode of the Ethernet interface.

   mdix-mode { **automdix** | **mdi** | **mdix** }

   By default, a copper Ethernet interface operates in auto mode to negotiate pin roles with its peer.

Configuring storm control on an Ethernet interface

About storm control

Storm control compares broadcast, multicast and unknown unicast traffic regularly with their respective traffic thresholds on an Ethernet interface. For each type of traffic, storm control provides a lower threshold and an upper threshold.

Depending on your configuration, when a particular type of traffic exceeds its upper threshold, the interface performs either of the following operations:

- **Blocks this type of traffic and forwards other types of traffic**—Even though the interface does not forward the blocked traffic, it still counts the traffic. When the blocked traffic drops below the lower threshold, the interface begins to forward the traffic.
- **Goes down automatically**—The interface goes down automatically and stops forwarding any traffic. When the blocked traffic drops below the lower threshold, the interface does not automatically come up. To bring up the interface, use the **undo shutdown** command or disable the storm control feature.

You can configure an Ethernet interface to output threshold event traps and log messages when monitored traffic meets one of the following conditions:

- Exceeds the upper threshold.
- Drops below the lower threshold.

Both storm suppression and storm control can suppress storms on an interface. Storm suppression uses the chip to suppress traffic. Storm suppression has less impact on the device performance than storm control, which uses software to suppress traffic. For more information about storm suppression, see "Configuring storm suppression."

Storm control uses a complete polling cycle to collect traffic data, and analyzes the data in the next cycle. An interface takes one to two polling intervals to take a storm control action.

Restrictions and guidelines

For the traffic suppression result to be determined, do not configure storm control together with storm suppression for the same type of traffic.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Set the statistics polling interval of the storm control module.

   storm-constrain interval *interval*

   The default setting is 10 seconds.

   For network stability, use the default or set a longer statistics polling interval.

3. Enter Ethernet interface view.

   interface *interface-type interface-number*

4. Enable storm control, and set the lower and upper thresholds for broadcast, multicast, or unknown unicast traffic.

   storm-constrain { **broadcast** | **multicast** | **unicast** } { **pps** | **kbps** | **ratio** } *upperlimit lowerlimit*

   By default, storm control is disabled.

5. Set the control action to take when monitored traffic exceeds the upper threshold.

   storm-constrain control { **block** | **shutdown** }

   By default, storm control is disabled.

6. Enable the Ethernet interface to output log messages when it detects storm control threshold events.

   storm-constrain enable log

   By default, the Ethernet interface outputs log messages when monitored traffic exceeds the upper threshold or drops below the lower threshold from a value above the upper threshold.

7. Enable the Ethernet interface to send storm control threshold event traps.

   storm-constrain enable trap

   By default, the Ethernet interface sends traps when monitored traffic exceeds the upper threshold or drops below the lower threshold from the upper threshold from a value above the upper threshold.

Testing the cable connection of an Ethernet interface

IMPORTANT:

If the link of an Ethernet interface is up, testing its cable connection will cause the link to go down and then come up.

About testing the cable connection of an Ethernet interface

This feature tests the cable connection of an Ethernet interface and displays cable test result within 5 seconds. The test result includes the cable's status and some physical parameters. If any fault is detected, the test result shows the length from the local port to the faulty point.

Restrictions and guidelines

Fiber ports do not support this feature.

Procedure

1. Enter any view.
2. Perform a test for the cable connected to an Ethernet interface.

   virtual-cable-test interface [*interface-type interface-number* | *interface-name*]

   The **interface** [*interface-type interface-number* | *interface-name*] option is supported only in R6350 and later versions.

   Performing this operation on an Ethernet interface will automatically bring the link down and up once, if it is already up.

Enabling bridging on an Ethernet interface

About enabling bridging on an Ethernet interface

By default, the device drops packets whose outgoing interface and incoming interface are the same.

To enable the device to forward such packets rather than drop them, enable the bridging feature in Ethernet interface view.

Procedure

1. Enter system view.

   system-view

2. Enter Ethernet interface view.

   interface *interface-type interface-number*

3. Enable bridging on the Ethernet interface.

   port bridge enable

By default, bridging is disabled on an Ethernet interface.

Display and maintenance commands for Ethernet interfaces

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display interface traffic statistics.	**display counters** { **inbound** | **outbound** } **interface** [*interface-type* [*interface-number*]]
Display traffic rate statistics of interfaces in up state over the last statistics polling interval.	**display counters rate** { **inbound** | **outbound** } **interface** [*interface-type* [*interface-number*]]
Display the Ethernet module statistics.	**display ethernet statistics slot** *slot-number*
Display the operational and status information of the specified interfaces.	**display interface** [*interface-type* [*interface-number*]] [**brief** [**description** | **down**]]
Display information about link flapping protection on interfaces.	**display link-flap protection** [**interface** *interface-type* [*interface-number*]]
Display information about storm control on the specified interfaces.	**display storm-constrain** [**broadcast** | **multicast** | **unicast**] [**interface** *interface-type interface-number*]
Display test results for the cable connected to an Ethernet interface.	**display virtual-cable-test interface** [*interface-type interface-number* | *interface-name*]
Clear interface statistics.	**reset counters interface** [*interface-type* [*interface-number*]]
Clear the Ethernet module statistics.	**reset ethernet statistics** [**slot** *slot-number*]
Display the status and packet statistics of interfaces.	**display interface link-info**
Clear test results for the cable connected to an Ethernet interface.	**reset interface** [*interface-type interface-number* | *interface-name*] **virtual-cable-test**

Contents

Configuring loopback, null, and inloopback interfaces

This chapter describes how to configure a loopback interface, a null interface, and an inloopback interface.

About loopback, null, and inloopback interfaces

About loopback interfaces

A loopback interface is a virtual interface. The physical layer state of a loopback interface is always up unless the loopback interface is manually shut down. Because of this benefit, loopback interfaces are widely used in the following scenarios:

- **Configuring a loopback interface address as the source address of the IP packets that the device generates**—Because loopback interface addresses are stable unicast addresses, they are usually used as device identifications.

  When you configure a rule on an authentication or security server, you can configure it to permit or deny packets carrying the loopback interface address of a device. This simplifies your configuration and achieves the effect of permitting or denying packets that the device generates. To use a loopback interface address as the source address of IP packets, make sure the loopback interface is reachable from the peer by performing routing configuration. All data packets sent to the loopback interface are considered packets sent to the device itself, so the device does not forward these packets.
- **Using a loopback interface in dynamic routing protocols**—With no router ID configured for a dynamic routing protocol, the system selects the highest loopback interface IP address as the router ID.

About null interfaces

A null interface is a virtual interface and is always up, but you cannot use it to forward data packets or configure it with an IP address or link layer protocol. The null interface provides a simpler way to filter packets than ACL. You can filter undesired traffic by transmitting it to a null interface instead of applying an ACL. For example, if you specify a null interface as the next hop of a static route to a network segment, any packets routed to the network segment are dropped.

About inloopback interfaces

An inloopback interface is a virtual interface created by the system, which cannot be configured or deleted. The physical layer and link layer protocol states of an inloopback interface are always up. All IP packets sent to an inloopback interface are considered packets sent to the device itself and are not forwarded.

Configuring a loopback interface

1. Enter system view.

   system-view
2. Create a loopback interface and enter loopback interface view.

   interface loopback *interface-number*

3. Configure the interface description.

   description *text*

   The default setting is *interface name* **Interface** (for example, **LoopBack1 Interface**).
4. Configure the expected bandwidth of the loopback interface.

   bandwidth *bandwidth-value*

   By default, the expected bandwidth of a loopback interface is 0 kbps.
5. Bring up the loopback interface.

   undo shutdown

   By default, a loopback interface is up.

Configuring a null interface

1. Enter system view.

   system-view
2. Enter null interface view.

   interface null 0

   Interface Null 0 is the default null interface on the device and cannot be manually created or removed.

   Only one null interface, Null 0, is supported on the device. The null interface number is always 0.
3. Configure the interface description.

   description *text*

   The default setting is NULL0 Interface.

Restoring the default settings for an interface

Restrictions and guidelines

CAUTION:

This feature might interrupt ongoing network services. Make sure you are fully aware of the impact of this feature when you use it on a live network.

This feature might fail to restore the default settings for some commands because of command dependencies or system restrictions. You can use the **display this** command in interface view to check for these commands and perform their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message to resolve the problem.

Procedure

1. Enter system view.

   system-view
2. Enter loopback interface view or null interface view.
   - **interface loopback** *interface-number*
   - **interface null 0**
3. Restore the default settings for the interface.

   default

Display and maintenance commands for loopback, null, and inloopback interfaces

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about the inloopback interface.	**display interface** [**inloopback** [**0**]] [**brief** [**description** | **down**]]
Display information about the specified or all loopback interfaces.	**display interface** [**loopback** [*interface-number*]] [**brief** [**description** | **down**]]
Display information about the null interface.	**display interface** [**null** [**0**]] [**brief** [**description** | **down**]]
Clear the statistics on the specified or all loopback interfaces.	**reset counters interface** [**loopback** [*interface-number*]]
Clear the statistics on the null interface.	**reset counters interface** [**null** [**0**]]

Contents

Bulk configuring interfaces

About interface bulk configuration

You can enter interface range view to bulk configure multiple interfaces with the same feature instead of configuring them one by one. For example, you can execute the **shutdown** command in interface range view to shut down a range of interfaces.

To configure interfaces in bulk, you must configure an interface range and enter its view by using the **interface range** or **interface range name** command.

The interface range created by using the **interface range** command is not saved to the running configuration. You cannot use the interface range repeatedly. To create an interface range that can be used repeatedly, use the **interface range name** command.

Restrictions and guidelines: Bulk interface configuration

When you bulk configure interfaces in interface range view, follow these restrictions and guidelines:

- In interface range view, only the commands supported by the first interface in the specified interface list (alphabetically sorted) are available for configuration.
- Before you configure an interface as the first interface in an interface range, make sure you can enter the view of the interface by using the **interface** *interface-type interface-number* command.
- Do not assign both an aggregate interface and any of its member interfaces to an interface range. Some commands, after being executed on both an aggregate interface and its member interfaces, can break up the aggregation.
- Understand that the more interfaces you specify, the longer the command execution time.
- To guarantee bulk interface configuration performance, configure fewer than 1000 interface range names.

The device does not output prompt or alarm messages during the bulk interface configuration process. Make sure you are fully aware of the impacts of the bulk interface configuration.

- After a command is executed in interface range view, one of the following situations might occur:
  - The system displays an error message and stays in interface range view. This means that the execution failed on one or multiple member interfaces.
    - If the execution failed on the first member interface, the command is not executed on any member interfaces.
    - If the execution failed on a non-first member interface, the command takes effect on the remaining member interfaces.
  - The system returns to system view. This means that:
    - The command is supported in both system view and interface view.
    - The execution failed on a member interface in interface range view and succeeded in system view.
    - The command is not executed on the subsequent member interfaces.

You can use the **display this** command to verify the configuration in interface view of each member interface. In addition, if the configuration in system view is not needed, use the **undo** form of the command to remove the configuration.

Procedure

1. Enter system view.

   system-view
2. Create an interface range and enter interface range view.
   - Create an interface range without specifying a name.

     interface range { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>
   - Create a named interface range.

     interface range name *name* [**interface** { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-24>]
3. (Optional.) Display commands available for the first interface in the interface range.

   Enter a question mark (?) at the interface range prompt.
4. Use available commands to configure the interfaces.

   Available commands depend on the interface.
5. (Optional.) Verify the configuration.

   display this

Display and maintenance commands for bulk interface configuration

Execute the **display** command in any view.

Task	Command
Display information about the interface ranges created by using the **interface range name** command.	**display interface range** [**name** *name*]

Contents

Configuring the MAC address table

About the MAC address table

An Ethernet device uses a MAC address table to forward frames. A MAC address entry includes a destination MAC address, an outgoing interface, and a VLAN ID. When the device receives a frame, it uses the destination MAC address of the frame to look for a match in the MAC address table.

- The device forwards the frame out of the outgoing interface in the matching entry if a match is found.
- The device floods the frame in the VLAN of the frame if no match is found.

How a MAC address entry is created

The entries in the MAC address table include entries automatically learned by the device and entries manually added.

MAC address learning

The device can automatically populate its MAC address table by learning the source MAC addresses of incoming frames on each interface.

The device performs the following operations to learn the source MAC address of incoming packets:

1. Checks the source MAC address (for example, MAC-SOURCE) of the frame.
2. Looks up the source MAC address in the MAC address table.
    - The device updates the entry if an entry is found.
    - The device adds an entry for MAC-SOURCE and the incoming port if no entry is found.

When the device receives a frame destined for MAC-SOURCE after learning this source MAC address, the device performs the following operations:

1. Finds the MAC-SOURCE entry in the MAC address table.
2. Forwards the frame out of the port in the entry.

The device performs the learning process for each incoming frame with an unknown source MAC address until the table is fully populated.

Manually configuring MAC address entries

Dynamic MAC address learning does not distinguish between illegitimate and legitimate frames, which can invite security hazards. When Host A is connected to Port A, a MAC address entry will be learned for the MAC address of Host A (for example, MAC A). When an illegal user sends frames with MAC A as the source MAC address to Port B, the device performs the following operations:

1. Learns a new MAC address entry with Port B as the outgoing interface and overwrites the old entry for MAC A.
2. Forwards frames destined for MAC A out of Port B to the illegal user.

As a result, the illegal user obtains the data of Host A. To improve the security for Host A, manually configure a static entry to bind Host A to Port A. Then, the frames destined for Host A are always sent out of Port A. Other hosts using the forged MAC address of Host A cannot obtain the frames destined for Host A.

Types of MAC address entries

A MAC address table can contain the following types of entries:

- **Static entries**—A static entry is manually added to forward frames with a specific destination MAC address out of the associated interface, and it never ages out. A static entry has higher priority than a dynamically learned one.
- **Dynamic entries**—A dynamic entry can be manually configured or dynamically learned to forward frames with a specific destination MAC address out of the associated interface. A dynamic entry might age out. A manually configured dynamic entry has the same priority as a dynamically learned one.
- **Blackhole entries**—A blackhole entry is manually configured and never ages out. A blackhole entry is configured for filtering out frames with a specific source or destination MAC address. For example, to block all frames destined for or sourced from a user, you can configure the MAC address of the user as a blackhole MAC address entry. A blackhole entry has higher priority than a dynamically learned one.
- **Multiport unicast entries**—A multiport unicast entry is manually added to send frames with a specific unicast destination MAC address out of multiple ports, and it never ages out. A multiport unicast entry has higher priority than a dynamically learned one.

A static, blackhole, or multiport unicast MAC address entry can overwrite a dynamic MAC address entry, but not vice versa. A static entry, a blackhole entry, and a multiport unicast entry cannot overwrite one another.

This document does not cover the configuration of static multicast MAC address entries. For more information about configuring static multicast MAC address entries, see IGMP snooping in *IP Multicast Configuration Guide*.

MAC address table tasks at a glance

All MAC address table configuration tasks are optional.

To configure the MAC address table, perform the following tasks:

- Configuring MAC address entries
  - Adding or modifying a static or dynamic MAC address entry
  - Adding or modifying a blackhole MAC address entry
  - Adding or modifying a multiport unicast MAC address entry
- Setting the aging timer for dynamic MAC address entries
- Configuring MAC address learning
  - Disabling MAC address learning
  - Setting the MAC learning limit
  - Configuring the unknown frame forwarding rule after the MAC learning limit is reached
- Enabling MAC address synchronization
- Configuring MAC address move notifications and suppression
- Enabling ARP fast update for MAC address moves
- Setting the hash bucket size of the MAC address table
- Enabling MAC hashing conflict logging
- Disabling packet filter when the source MAC address is a multicast or broadcast MAC address
- Enabling SNMP notifications for the MAC address table

Configuring MAC address entries

About MAC address entry-based frame forwarding

A frame whose source MAC address matches different types of MAC address entries is processed differently.

Type	Description
Static MAC address entry	Forwards the frame according to the destination MAC address regardless of whether the frame's ingress interface is the same as that in the entry.
Multiport unicast MAC address entry	• Learns the MAC address of the frame and generates a dynamic MAC address entry, but the generated dynamic MAC address entry does not take effect. • Forwards the frame based on the multiport unicast MAC address entry.
Blackhole MAC address entry	Drops the frame.
Dynamic MAC address entry	• Learns the MAC address of the frames received on a different interface from that in the entry and overwrites the original entry. • Forwards the frame received on the same interface as that in the entry and updates the aging timer for the entry.

Restrictions and guidelines for MAC address entry configuration

A manually configured dynamic MAC address entry will overwrite a learned entry that already exists with a different outgoing interface for the MAC address.

The manually configured static, blackhole, and multiport unicast MAC address entries cannot survive a reboot if you do not save the configuration. The manually configured dynamic MAC address entries are lost upon reboot whether or not you save the configuration.

Do not configure the reserved MAC addresses of the device as static, dynamic, blackhole, or multiport unicast MAC addresses. The reserved MAC addresses of a device are MAC addresses from the bridge MAC address of the device to the bridge MAC address plus 95. For information about bridge MAC addresses, see IRF in *Virtual Technologies Configuration Guide*.

Prerequisites for MAC address entry configuration

Before manually configuring a MAC address entry for an interface, make sure the VLAN in the entry has been created.

Adding or modifying a static or dynamic MAC address entry

Adding or modifying a static or dynamic MAC address entry globally

1. Enter system view.

   system-view

2. Add or modify a static or dynamic MAC address entry.

   mac-address { **dynamic** | **static** } *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*

By default, no MAC address entry is configured globally.

Make sure you have assigned the interface to the VLAN.

Adding or modifying a static or dynamic MAC address entry on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Add or modify a static or dynamic MAC address entry.
   mac-address { **dynamic** | **static** } *mac-address* **vlan** *vlan-id*

   By default, no MAC address entry is configured on an interface.

   Make sure you have assigned the interface to the VLAN.

Adding or modifying a blackhole MAC address entry

1. Enter system view.
   system-view
2. Add or modify a blackhole MAC address entry.
   mac-address blackhole *mac-address* **vlan** *vlan-id*

   By default, no blackhole MAC address entry is configured.

Adding or modifying a multiport unicast MAC address entry

About multiport unicast MAC address entry configuration

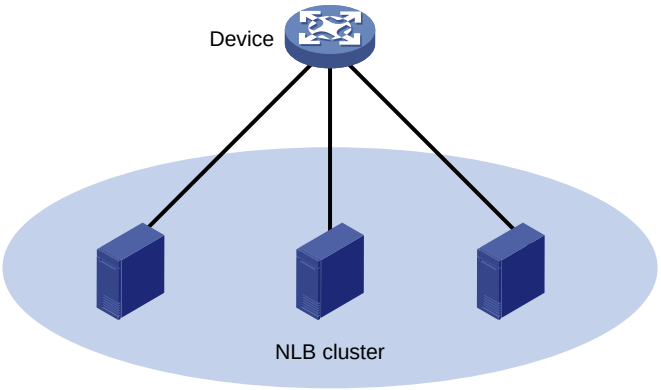
You can configure a multiport unicast MAC address entry to associate a unicast destination MAC address with multiple ports. The frame with a destination MAC address matching the entry is sent out of multiple ports.

For example, in NLB unicast mode (see Figure 1):

- All servers within a cluster uses the cluster's MAC address as their own address.
- Frames destined for the cluster are forwarded to every server in the group.

In this case, you can configure a multiport unicast MAC address entry on the device connected to the server group. Then, the device forwards the frame destined for the server group to every server through all ports connected to the servers within the cluster.

Figure 1 NLB cluster



You can configure a multiport unicast MAC address entry globally or on an interface.

Configuring a multiport unicast MAC address entry globally

1. Enter system view.
   system-view
2. Add or modify a multiport unicast MAC address entry.
   mac-address multiport *mac-address* **interface** *interface-list* **vlan** *vlan-id*
   By default, no multiport unicast MAC address entry is configured globally.
   Make sure you have assigned the interface to the VLAN.

Configuring a multiport unicast MAC address entry on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Add the interface to a multiport unicast MAC address entry.
   mac-address multiport *mac-address* **vlan** *vlan-id*
   By default, no multiport unicast MAC address entry is configured on an interface.
   Make sure you have assigned the interface to the VLAN.

Setting the aging timer for dynamic MAC address entries

About aging timer for dynamic MAC address entries

For security and efficient use of table space, the MAC address table uses an aging timer for each dynamic MAC address entry. If a dynamic MAC address entry is not updated before the aging timer expires, the device deletes the entry. This aging mechanism ensures that the MAC address table can promptly update to accommodate latest network topology changes.

A stable network requires a longer aging interval, and an unstable network requires a shorter aging interval.

An aging interval that is too long might cause the MAC address table to retain outdated entries. As a result, the MAC address table resources might be exhausted, and the MAC address table might fail to update its entries to accommodate the latest network changes.

An interval that is too short might result in removal of valid entries, which would cause unnecessary floods and possibly affect the device performance.

To reduce floods on a stable network, set a long aging timer or disable the timer to prevent dynamic entries from unnecessarily aging out. Reducing floods improves the network performance. Reducing flooding also improves the security because it reduces the chances for a data frame to reach unintended destinations.

Procedure

1. Enter system view.

   system-view
2. Set the aging timer for dynamic MAC address entries.

   mac-address timer { **aging** *seconds* | **no-aging** }

   By default, the aging timer is 300 seconds for dynamic MAC address entries.

Disabling MAC address learning

About disabling MAC address learning

MAC address learning is enabled by default. To prevent the MAC address table from being saturated when the device is experiencing attacks, disable MAC address learning. For example, you can disable MAC address learning to prevent the device from being attacked by a large amount of frames with different source MAC addresses.

After MAC address learning is disabled, the device immediately deletes existing dynamic MAC address entries.

Disabling global MAC address learning

Restrictions and guidelines

After you disable global MAC address learning, the device cannot learn MAC addresses on any interfaces.

Procedure

1. Enter system view.

   system-view
2. Disable global MAC address learning.

   undo mac-address mac-learning enable

   By default, global MAC address learning is enabled.

Disabling MAC address learning on an interface

About disabling MAC address learning on an interface

When global MAC address learning is enabled, you can disable MAC address learning on a single interface.

Procedure

1. Enter system view.

system-view

2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable MAC address learning on the interface.
   undo mac-address mac-learning enable
   By default, MAC address learning is enabled on an interface.

Disabling MAC address learning on a VLAN

About disabling MAC address learning on a VLAN

When global MAC address learning is enabled, you can disable MAC address learning on a per-VLAN basis.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Disable MAC address learning on the VLAN.
   undo mac-address mac-learning enable
   By default, MAC address learning on the VLAN is enabled.

Setting the MAC learning limit

About interface-based MAC learning limit

This feature limits the MAC address table size. A large MAC address table will degrade forwarding performance.

Restrictions and guidelines

The MAC learning limit does not control the number of MAC addresses learned in voice VLANs. For more information, see "Configuring voice VLANs."

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Set the MAC learning limit on the interface.
   mac-address max-mac-count *count*
   By default, no MAC learning limit is configured on an interface.

Configuring the unknown frame forwarding rule after the MAC learning limit is reached

In this document, unknown frames refer to frames whose source MAC addresses are not in the MAC address table.

About unknown frame forwarding rule configuration

You can enable or disable forwarding of unknown frames after the MAC learning limit is reached.

Procedure

1. Enter system view.
   `system-view`
2. Enter Layer 2 Ethernet interface view.
   `interface` *`interface-type interface-number`*
3. Configure the device to forward unknown frames received on the interface after the MAC learning limit on the interface is reached.
   `mac-address max-mac-count enable-forwarding`
   By default, the device can forward unknown frames received on an interface after the MAC learning limit on the interface is reached.

Enabling MAC address synchronization

About MAC address synchronization

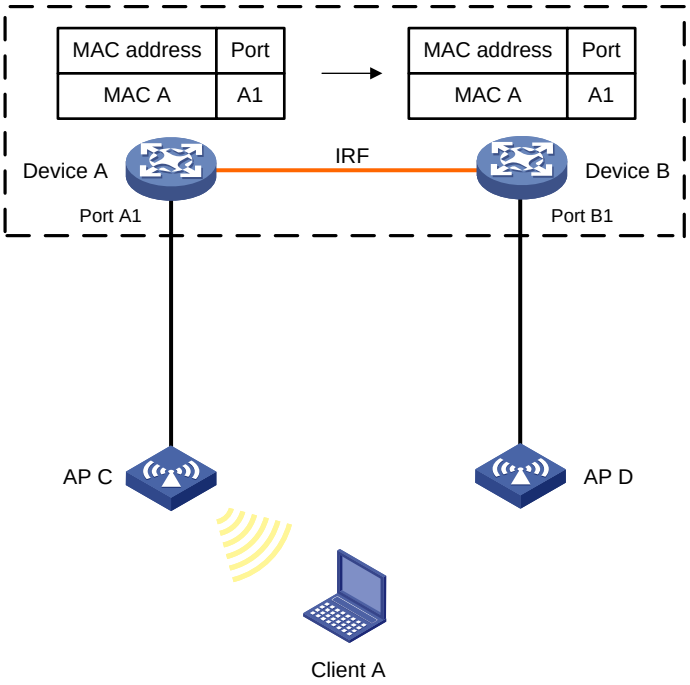
To avoid unnecessary floods and improve forwarding speed, make sure all member devices have the same MAC address table. After you enable MAC address synchronization, each member device advertises learned MAC address entries to other member devices.

As shown in Figure 2:

- Device A and Device B form an IRF fabric enabled with MAC address synchronization.
- Device A and Device B connect to AP C and AP D, respectively.

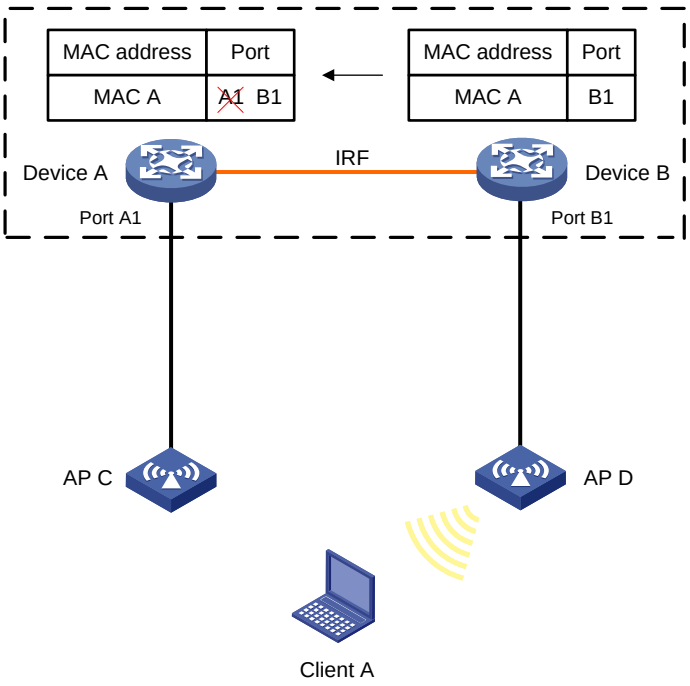
When Client A associates with AP C, Device A learns a MAC address entry for Client A and advertises it to Device B.

Figure 2 MAC address tables of devices when Client A accesses AP C



When Client A roams to AP D, Device B learns a MAC address entry for Client A. Device B advertises it to Device A to ensure service continuity for Client A, as shown in Figure 3.

Figure 3 MAC address tables of devices when Client A roams to AP D



Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable MAC address synchronization.

mac-address mac-roaming enable

By default, MAC address synchronization is disabled.

Configuring MAC address move notifications and suppression

About MAC address move notifications and suppression

The outgoing interface for a MAC address entry learned on interface A is changed to interface B when the following conditions exist:

- Interface B receives a packet with the MAC address as the source MAC address.
- Interface B belongs to the same VLAN as interface A.

In this case, the MAC address is moved from interface A to interface B, and a MAC address move occurs.

The MAC address move notifications feature enables the device to output MAC address move logs when MAC address moves are detected.

If a MAC address is continuously moved between the two interfaces, Layer 2 loops might occur. To detect and locate loops, you can view the MAC address move information. To display the MAC address move records after the device is started, use the **display mac-address mac-move** command.

If the system detects that MAC address moves occur frequently on an interface, you can configure MAC address move suppression to shut the interface down. The interface automatically goes up after a suppression interval. Or, you can manually bring up the interface.

Restrictions and guidelines

After you configure MAC address move notifications, the system sends only log messages to the information center module. If the device is also configured with the **snmp-agent trap enable mac-address** command, the system also sends SNMP notifications to the SNMP module.

Procedure

1. Enter system view.

   system-view

2. Enable MAC address move notifications and optionally specify a MAC move detection interval.

   mac-address notification mac-move [**interval** *interval*]

   By default, MAC address move notifications are disabled.

3. (Optional.) Set MAC address move suppression parameters.

   mac-address notification mac-move suppression { **interval** *interval* | **threshold** *threshold* }

   By default, the suppression interval is 30 seconds, and the suppression threshold is 3.

   For the MAC address move suppression parameters to take effect, enable the MAC address move suppression on a port.

4. Enter interface view.

   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*

   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*

5. Enable MAC address move suppression.

   mac-address notification mac-move suppression

By default, MAC address move suppression is disabled.

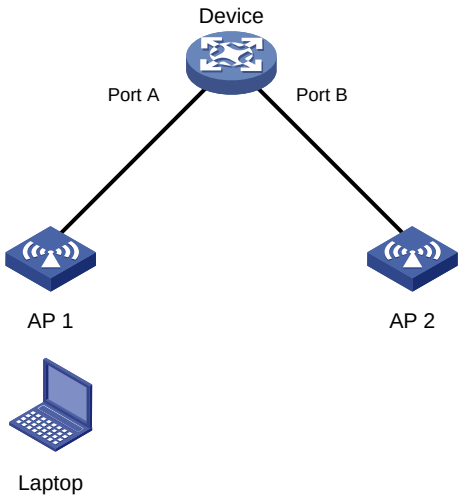
Enabling ARP fast update for MAC address moves

About ARP fast update for MAC address moves

ARP fast update for MAC address moves allows the device to update an ARP entry immediately after the outgoing interface for a MAC address changes. This feature ensures data connection without interruption.

As shown in Figure 4, a mobile user laptop accesses the network by connecting to AP 1 or AP 2. When the AP to which the user connects changes, the device updates the ARP entry for the user immediately after it detects a MAC address move.

Figure 4 ARP fast update application scenario



Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enable ARP fast update for MAC address moves.
   ```
   mac-address mac-move fast-update
   ```
   By default, ARP fast update for MAC address moves is disabled.

Setting the hash bucket size of the MAC address table

About the hash bucket size of the MAC address table

The device saves the MAC address table through hash chains. If multiple MAC addresses obtain the same key through hashing, MAC address hash conflicts occur, and the device cannot learn some of these MAC addresses. The device will broadcast the traffic destined for the unknown MAC addresses, which consumes bandwidth and resources.

You can increase the hash bucket size of the MAC address table to reduce MAC address hash conflicts. A larger hash bucket size requires more system resources. Please set the hash bucket size

appropriately depending on system resources. You can use the **display mac-address hash-bucket-size** command to view the current hash bucket size and the hash bucket size that will take effect at the next startup.

Restrictions and guidelines

The set hash bucket size takes effect at the next startup.

Procedure

1. Enter system view.
   system-view
2. Set the hash bucket size of the MAC address table.
   mac-address hash-bucket-size *size*
   By default, the hash bucket size of the MAC address table is 4.

Enabling MAC hashing conflict logging

About this task

MAC hashing conflict logging enables the device to generate log messages for the MAC hashing conflicts that occur in MAC address learning. You can use this feature to identify the MAC addresses that the device fails to learn because of hashing conflicts. To display the log messages generated for MAC hashing conflicts, execute the **display mac-address hash-conflict-record** command.

Software version and feature compatibility

This feature is supported only in Release 6328 and later.

Restrictions and guidelines

This feature consumes system resources. When you enable it on the device, make sure you are fully aware of the impact on device performance.

Procedure

1. Enter system view.
   system-view
2. Enable MAC hashing conflict logging.
   mac-address hash-conflict-record enable slot *slot-number*
   By default, MAC hashing conflict logging is disabled.

Disabling packet filter when the source MAC address is a multicast or broadcast MAC address

About this task

By default, the device will drop a frame whose source MAC address is a multicast or broadcast MAC address. To avoid the user traffic loss and ensure user trasffic to be forwarded correctly in this scenario, you can disable packet filter on the device where its source MAC address is a multicast or broadcast MAC address.

Procedure

1. Enter system view.
   system-view

2. Disable packet filter when the source MAC address is a multicast or broadcast MAC address.

   undo mac-address multicast-source packet-filter

   By default, packet filter is enabled on the device where its source MAC address is a multicast or broadcast MAC address.

Enabling SNMP notifications for the MAC address table

About SNMP notifications for the MAC address table

To report critical MAC address move events to an NMS, enable SNMP notifications for the MAC address table. For MAC address move event notifications to be sent correctly, you must also configure SNMP on the device.

When SNMP notifications are disabled for the MAC address table, the device sends the generated logs to the information center. To display the logs, configure the log destination and output rule configuration in the information center.

For more information about SNMP and information center configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for the MAC address table.

   snmp-agent trap enable mac-address [**mac-move**]

   By default, SNMP notifications are enabled for the MAC address table.

   When SNMP notifications are disabled for the MAC address table, syslog messages are sent to notify important events on the MAC address table module.

Display and maintenance commands for MAC address table

IMPORTANT:

The **display mac-address hash-conflict-record** command is supported only in Release 6328 and later.

Execute **display** commands in any view.

Task	Command
Display MAC address table information.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [[**dynamic** | **static**] [**interface** *interface-type interface-number*] | **blackhole** | **multiport**] [**vlan** *vlan-id*] [**count**]]
Display the aging timer for dynamic MAC address entries.	**display mac-address aging-time**
Display the hash bucket size of the	**display mac-address hash-bucket-size**

Task	Command
MAC address table.	
Display the log messages generated for MAC hashing conflicts.	**display mac-address hash-conflict-record slot** *slot-number*
Display the system or interface MAC address learning state.	**display mac-address mac-learning** [**interface** *interface-type interface-number*]
Display the MAC address move records.	**display mac-address mac-move** [**slot** *slot-number*]
Display MAC address statistics.	**display mac-address statistics**

MAC address table configuration examples

Example: Configuring the MAC address table

Network configuration

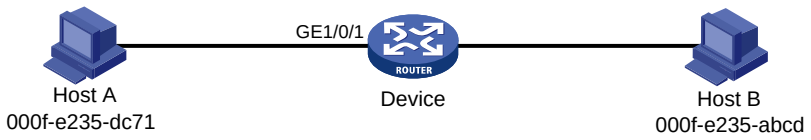
As shown in Figure 5:

- Host A at MAC address 000f-e235-dc71 is connected to GigabitEthernet 1/0/1 of Device and belongs to VLAN 1.
- Host B at MAC address 000f-e235-abcd, which behaved suspiciously on the network, also belongs to VLAN 1.

Configure the MAC address table as follows:

- To prevent MAC address spoofing, add a static entry for Host A in the MAC address table of Device.
- To drop all frames destined for Host B, add a blackhole MAC address entry for Host B.
- Set the aging timer to 500 seconds for dynamic MAC address entries.

Figure 5 Network diagram



Procedure

Add a static MAC address entry for MAC address 000f-e235-dc71 on GigabitEthernet 1/0/1 that belongs to VLAN 1.

```
<Device> system-view
[Device] mac-address static 000f-e235-dc71 interface gigabitethernet 1/0/1 vlan 1
```

Add a blackhole MAC address entry for MAC address 000f-e235-abcd that belongs to VLAN 1.

```
[Device] mac-address blackhole 000f-e235-abcd vlan 1
```

Set the aging timer to 500 seconds for dynamic MAC address entries.

```
[Device] mac-address timer aging 500
```

Verifying the configuration

Display the static MAC address entries for GigabitEthernet 1/0/1.

```
[Device] display mac-address static interface gigabitethernet 1/0/1
```

```
MAC Address      VLAN ID    State           Port/Nickname           Aging
000f-e235-dc71   1          Static          GE1/0/1                 N
```

Display the blackhole MAC address entries.

```
[Device] display mac-address blackhole
MAC Address      VLAN ID    State           Port/Nickname           Aging
000f-e235-abcd   1          Blackhole       N/A                     N
```

Display the aging time of dynamic MAC address entries.

```
[Device] display mac-address aging-time
MAC address aging time: 500s.
```

Configuring MAC Information

About MAC Information

The MAC Information feature can generate syslog messages or SNMP notifications when MAC address entries are learned or deleted. You can use these messages to monitor user's leaving or joining the network and analyze network traffic.

The MAC Information feature buffers the MAC change syslog messages or SNMP notifications in a queue. The device overwrites the oldest MAC address change written into the queue with the most recent MAC address change when the following conditions exist:

- The MAC change notification interval does not expire.
- The queue has been exhausted.

To send a syslog message or SNMP notification immediately after it is created, set the queue length to zero.

Enabling MAC Information

Restrictions and guidelines

For MAC Information to take effect, you must enable MAC Information both globally and on interfaces.

Procedure

1. Enter system view.
   `system-view`
2. Enable MAC Information globally.
   `mac-address information enable`
   By default, MAC Information is globally disabled.
3. Enter Layer 2 Ethernet interface view.
   `interface` *`interface-type interface-number`*
4. Enable MAC Information on the interface.
   `mac-address information enable` { **`added`** | **`deleted`** }
   By default, MAC Information is disabled on an interface.

Configuring the MAC Information mode

About MAC Information modes

The following MAC Information modes are available for sending MAC address changes:

- **Syslog**—The device sends syslog messages to notify MAC address changes. The device sends syslog messages to the information center, which then outputs them to the monitoring terminal. For more information about information center, see *Network Management and Monitoring Configuration Guide*.
- **Trap**—The device sends SNMP notifications to notify MAC address changes. The device sends SNMP notifications to the NMS. For more information about SNMP, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Configure the MAC Information mode.
   mac-address information mode { **syslog** | **trap** }
   The default setting is **trap**.

Setting the MAC change notification interval

About the MAC change notification interval

To prevent syslog messages or SNMP notifications from being sent too frequently, you can set the MAC change notification interval to a larger value.

Procedure

1. Enter system view.
   system-view
2. Set the MAC change notification interval.
   mac-address information interval *interval*
   The default setting is 1 second.

Setting the MAC Information queue length

About the MAC Information queue length

If the MAC Information queue length is 0, the device sends a syslog message or SNMP notification immediately after learning or deleting a MAC address.

If the MAC Information queue length is not 0, the device stores MAC changes in the queue:

- The device overwrites the oldest MAC change written into the queue with the most recent MAC change when the following conditions exist:
  - The MAC change notification interval does not expire.
  - The queue has been exhausted.
- The device sends syslog messages or SNMP notifications only if the MAC change notification interval expires.

Procedure

1. Enter system view.
   system-view
2. Set the MAC Information queue length.
   mac-address information queue-length *value*
   The default setting is 50.

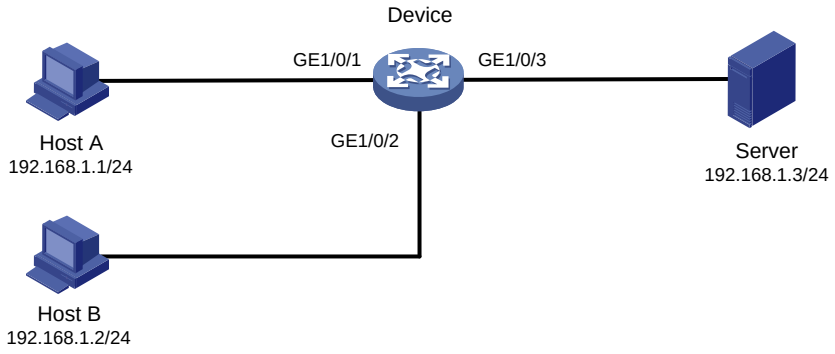
MAC Information configuration examples

Example: Configuring MAC Information

Network configuration

Enable MAC Information on GigabitEthernet 1/0/1 on Device in Figure 6 to send MAC address changes in syslog messages to the log host, Host B, through interface GigabitEthernet 1/0/2.

Figure 6 Network diagram



Restrictions and guidelines

When you edit file **/etc/syslog.conf**, follow these restrictions and guidelines:

- Comments must be on a separate line and must begin with a pound sign (#).
- No redundant spaces are allowed after the file name.

The logging facility name and the severity level specified in the **/etc/syslog.conf** file must be the same as those configured on the device. Otherwise, the log information might not be output correctly to the log host. The logging facility name and the severity level are configured by using the **`info-center loghost`** and **`info-center source`** commands, respectively.

Procedure

1. Configure Device to send syslog messages to Host B:

   # Enable the information center.

   ```
   <Device> system-view
   [Device] info-center enable
   ```

   # Specify the log host 192.168.1.2/24 and specify **local4** as the logging facility.

   ```
   [Device] info-center loghost 192.168.1.2 facility local4
   ```

   # Disable log output to the log host.

   ```
   [Device] info-center source default loghost deny
   ```

   To avoid output of unnecessary information, disable all modules from outputting logs to the specified destination (**loghost**, in this example) before you configure an output rule.

   # Configure an output rule to output to the log host MAC address logs that have a severity level no lower than **informational**.

   ```
   [Device] info-center source mac loghost level informational
   ```

2. Configure the log host, Host B:

   Configure Solaris as follows. Configure other UNIX operating systems in the same way Solaris is configured.

   a. Log in to the log host as a root user.

   b. Create a subdirectory named **Device** in directory **/var/log/**.

```
# mkdir /var/log/Device
```

c. Create file **info.log** in the **Device** directory to save logs from **Device**.

```
# touch /var/log/Device/info.log
```

d. Edit the file **syslog.conf** in directory **/etc/** and add the following contents:

```
# Device configuration messages
local4.info /var/log/Device/info.log
```

In this configuration, **local4** is the name of the logging facility that the log host uses to receive logs, and **info** is the informational level. The UNIX system records the log information that has a severity level no lower than **informational** to file **/var/log/Device/info.log**.

e. Display the process ID of **syslogd**, end the **syslogd** process, and then restart **syslogd** using the **–r** option to make the new configuration take effect.

```
# ps -ae | grep syslogd
147
# kill -HUP 147
# syslogd -r &
```

The device can output MAC address logs to the log host, which stores the logs to the specified file.

3. Enable MAC Information on Device:

Enable MAC Information globally.

```
[Device] mac-address information enable
```

Configure the MAC Information mode as syslog.

```
[Device] mac-address information mode syslog
```

Enable MAC Information on GigabitEthernet 1/0/1 to enable the port to record MAC address change information when the interface performs either of the following operations:

- Learns a new MAC address.
- Deletes an existing MAC address.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] mac-address information enable added
[Device-GigabitEthernet1/0/1] mac-address information enable deleted
[Device-GigabitEthernet1/0/1] quit
```

Set the MAC Information queue length to 100.

```
[Device] mac-address information queue-length 100
```

Set the MAC change notification interval to 20 seconds.

```
[Device] mac-address information interval 20
```

Contents

Configuring Ethernet link aggregation

About Ethernet link aggregation

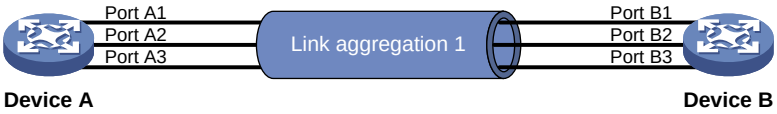
Ethernet link aggregation bundles multiple physical Ethernet links into one logical link (called an aggregate link). Link aggregation provides the following benefits:

- Increased bandwidth beyond the limits of a single individual link. In an aggregate link, traffic is distributed across the member ports.
- Improved link reliability. The member ports dynamically back up one another. When a member port fails, its traffic is automatically switched to other member ports.

Ethernet link aggregation application scenario

As shown in Figure 1, Device A and Device B are connected by three physical Ethernet links. These physical Ethernet links are combined into an aggregate link called link aggregation 1. The bandwidth of this aggregate link can reach up to the total bandwidth of the three physical Ethernet links. At the same time, the three Ethernet links back up one another. When a physical Ethernet link fails, the traffic transmitted on the failed link is switched to the other two links.

Figure 1 Ethernet link aggregation diagram



Aggregate interface, aggregation group, and member port

Each link aggregation is represented by a logical aggregate interface. Each aggregate interface has an automatically created aggregation group, which contains member ports to be used for aggregation. The type and number of an aggregation group are the same as its aggregate interface.

Supported aggregate interface types

The device supports Layer 2 aggregate interfaces. A Layer 2 aggregate interface is created manually. The member ports in a Layer 2 aggregation group can only be Layer 2 Ethernet interfaces.

The port rate of an aggregate interface equals the total rate of its Selected member ports. Its duplex mode is the same as that of the Selected member ports. For more information about Selected member ports, see "Aggregation states of member ports in an aggregation group."

Aggregation states of member ports in an aggregation group

A member port in an aggregation group can be in any of the following aggregation states:

- **Selected**—A Selected port can forward traffic.
- **Unselected**—An Unselected port cannot forward traffic.
- **Individual**—An Individual port can forward traffic as a normal physical port. This state is peculiar to the member ports of edge aggregate interfaces. A member port is placed in Individual state if it has not received LACPDUs before the first expiration of the LACP timeout timer after either of the following event occurs:
  - The aggregate interface is configured as an edge aggregate interface.
  - The member port goes down and then comes up after it is placed in Unselected or Selected state.

For more information about edge aggregate interfaces, see "Edge aggregate interface."

Operational key

When aggregating ports, the system automatically assigns each port an operational key based on port information, such as port rate and duplex mode. Any change to this information triggers a recalculation of the operational key.

In an aggregation group, all Selected ports have the same operational key.

Configuration types

Port configuration includes the attribute configuration and protocol configuration. Attribute configuration affects the aggregation state of the port but the protocol configuration does not.

Attribute configuration

To become a Selected port, a member port must have the same attribute configuration as the aggregate interface. Table 1 describes the attribute configuration.

Table 1 Attribute configuration

Feature	Attribute configuration
Port isolation	Membership of the port in an isolation group. Isolation group number.
QinQ	QinQ status (enabled/disabled), TPID for VLAN tags, and VLAN transparent transmission. For information about QinQ, see "Configuring QinQ."
VLAN mapping	VLAN mapping configured on the port. For more information about VLAN mapping, see "Configuring VLAN mapping."
VLAN	VLAN attribute settings: • Permitted VLAN IDs. • PVID. • Link type (trunk, hybrid, or access). • PVLAN port type (promiscuous, trunk promiscuous, host, or trunk secondary). • IP subnet-based VLAN configuration. • Protocol-based VLAN configuration. • VLAN tagging mode. For information about VLANs, see "Configuring VLANs."

Protocol configuration

Protocol configuration of a member port does not affect the aggregation state of the member port. MAC address learning and spanning tree settings are examples of the protocol configuration.

Link aggregation modes

An aggregation group operates in one of the following modes:

- **Static**—Static aggregation is stable. An aggregation group in static mode is called a static aggregation group. The aggregation states of the member ports in a static aggregation group are not affected by the peer ports.
- **Dynamic**—An aggregation group in dynamic mode is called a dynamic aggregation group. Dynamic aggregation is implemented through IEEE 802.3ad Link Aggregation Control Protocol

(LACP). The local system and the peer system automatically maintain the aggregation states of the member ports. Dynamic link aggregation reduces the administrators' workload.

How static link aggregation works

Reference port selection process

When setting the aggregation states of the ports in an aggregation group, the system automatically chooses a member port as the reference port. A Selected port must have the same operational key and attribute configurations as the reference port.

The system chooses a reference port from the member ports in up state.

The candidate reference ports are organized into different priority levels following these rules:

1. In descending order of port priority.
2. Full duplex.
3. In descending order of speed.
4. Half duplex.
5. In descending order of speed.

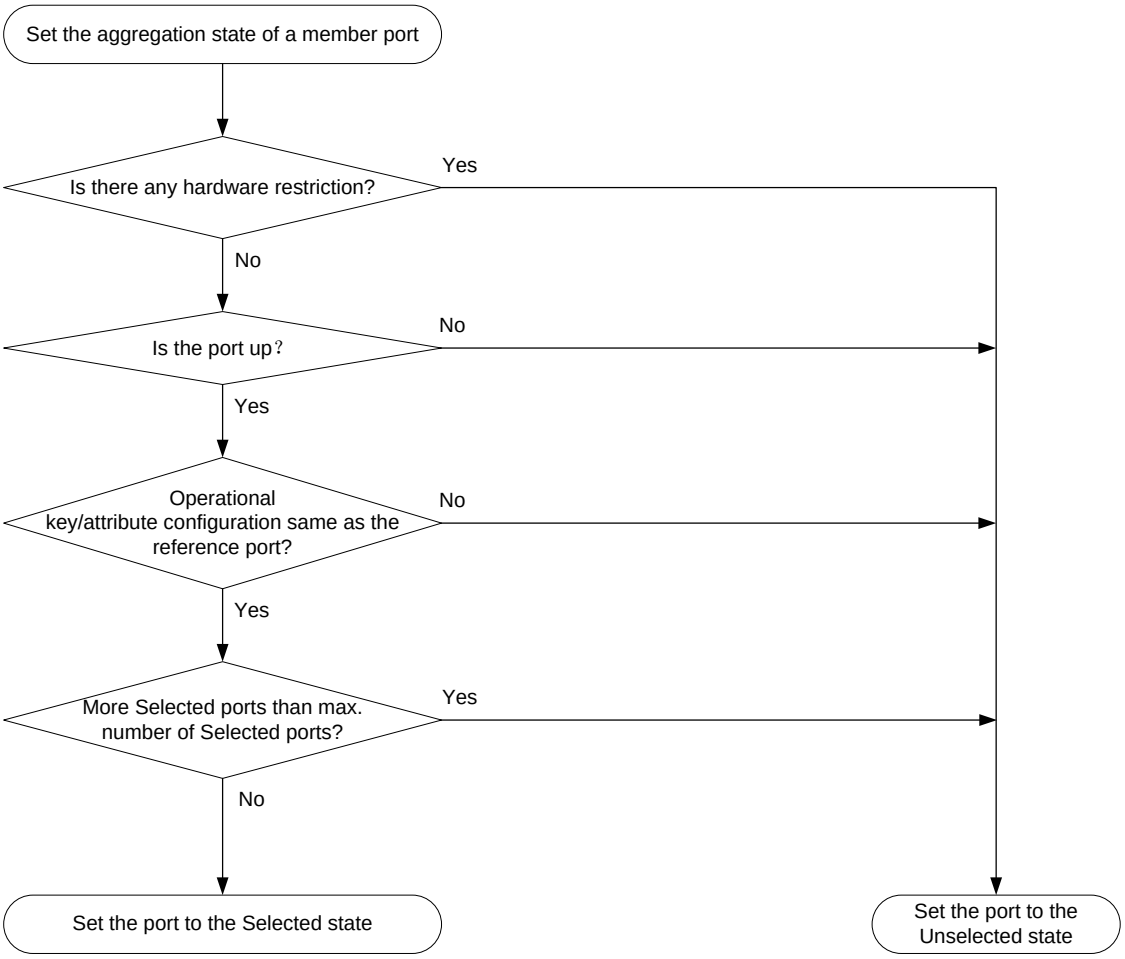
From the candidate ports with the same attribute configurations as the aggregate interface, the one with the highest priority level is chosen as the reference port.

- If multiple ports have the same priority level, the port that has been Selected (if any) is chosen. If multiple ports with the same priority level have been Selected, the one with the smallest port number is chosen.
- If multiple ports have the same priority level and none of them has been Selected, the port with the smallest port number is chosen.

Setting the aggregation state of each member port

After the reference port is chosen, the system sets the aggregation state of each member port in the static aggregation group.

Figure 2 Setting the aggregation state of a member port in a static aggregation group



After the limit on Selected ports is reached, the aggregation state of a new member port varies by following conditions:

- The port is placed in Unselected state if the port and the Selected ports have the same port priority. This mechanism prevents traffic interruption on the existing Selected ports. A device reboot can cause the device to recalculate the aggregation states of member ports.
- The port is placed in Selected state when the following conditions are met:
  - The port and the Selected ports have different port priorities, and the port has a higher port priority than a minimum of one Selected port.
  - The port has the same attribute configurations as the aggregate interface.

Any operational key or attribute configuration change might affect the aggregation states of link aggregation member ports.

Dynamic link aggregation

About LACP

Dynamic aggregation is implemented through IEEE 802.3ad Link Aggregation Control Protocol (LACP).

LACP uses LACPDUs to exchange aggregation information between LACP-enabled devices. Each member port in a dynamic aggregation group can exchange information with its peer. When a member port receives an LACPDU, it compares the received information with information received

on the other member ports. In this way, the two systems reach an agreement on which ports are placed in Selected state.

LACP functions

LACP offers basic LACP functions and extended LACP functions, as described in Table 2.

Table 2 Basic and extended LACP functions

Category	Description
Basic LACP functions	Implemented through the basic LACPDU fields, including the LACP system priority, system MAC address, port priority, port number, and operational key.
Extended LACP functions	Implemented by extending the LACPDU with new TLV fields. Extended LACP can implement LACP MAD for the IRF feature. The device can participate in LACP MAD as either an IRF member device or an intermediate device. For more information about IRF and the LACP MAD mechanism, see *Virtual Technologies Configuration Guide*.

LACP operating modes

LACP can operate in active or passive mode.

When LACP is operating in passive mode on a local member port and its peer port, both ports cannot send LACPDUs. When LACP is operating in active mode on either end of a link, both ports can send LACPDUs.

LACP priorities

LACP priorities include LACP system priority and port priority, as described in Table 3. The smaller the priority value, the higher the priority.

Table 3 LACP priorities

Type	Description
LACP system priority	Used by two peer devices (or systems) to determine which one is superior in link aggregation. In dynamic link aggregation, the system that has higher LACP system priority sets the Selected state of member ports on its side. The system that has lower priority sets the aggregation state of local member ports the same as their respective peer ports.
Port priority	Determines the likelihood of a member port to be a Selected port on a system. A port with a higher port priority is more likely to become Selected.

LACP timeout interval

The LACP timeout interval specifies how long a member port waits to receive LACPDUs from the peer port. If a local member port has not received LACPDUs from the peer within the LACP timeout interval plus 3 seconds, the member port considers the peer as failed.

The LACP timeout interval also determines the LACPDU sending rate of the peer. LACP timeout intervals include the following types:

- **Short timeout interval**—3 seconds. If you use the short timeout interval, the peer sends one LACPDU per second.
- **Long timeout interval**—90 seconds. If you use the long timeout interval, the peer sends one LACPDU every 30 seconds.

Methods to assign interfaces to a dynamic link aggregation group

You can use one of the following methods to assign interfaces to a dynamic link aggregation group:

- **Manual assignment**—Manually assign interfaces to the dynamic link aggregation group.
- **Automatic assignment**—Enable automatic assignment on interfaces to have them automatically join a dynamic link aggregation group depending on the peer information in the received LACPDUs.

NOTE:

When you use automatic assignment on one end, you must use manual assignment on the other end.

Alternatively, you can use automatic link aggregation for two devices to automatically create a dynamic link aggregation between them by using LLDP.

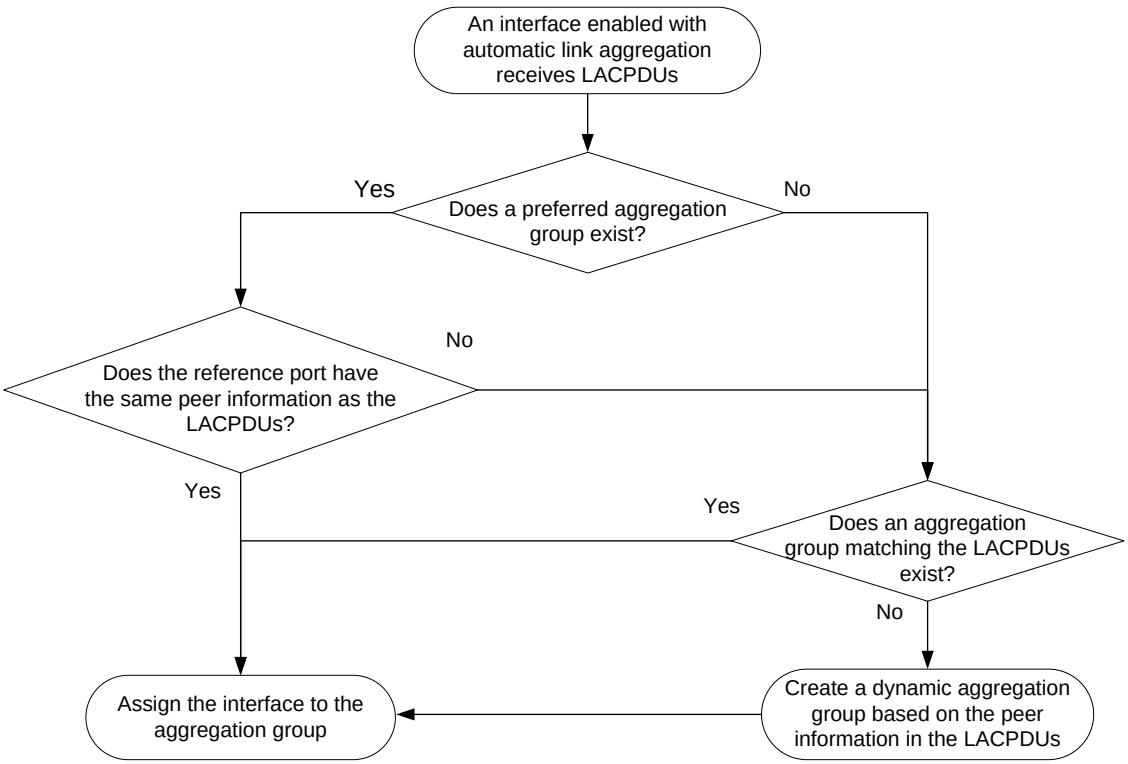
Automatic member port assignment

This feature automates the assignment of aggregation member ports to an aggregation group. You can use this feature when setting up an aggregate link to a server.

As shown in Figure 3, an interface enabled with automatic assignment joins a dynamic aggregation group based on the peer information in the LACPDUs received from the aggregation peer. If none of the existing dynamic aggregation groups is qualified, the device automatically creates a new dynamic aggregation group, Then, the device assigns the interface to that group and synchronizes the interface's attribute configurations to the aggregate interface.

A dynamic aggregation group that contains automatically assigned member ports selects a reference port and Selected ports as described in "How dynamic link aggregation works." The assignment methods of member ports do not change the processes of reference port selection and Selected port selection.

Figure 3 Automatic member port assignment process



Automatic link aggregation

Automatic link aggregation enables two devices to automatically create a dynamic link aggregation between them by using LLDP.

After you enable automatic link aggregation and LLDP on two connected devices, they automatically establish a dynamic link aggregation based on the information in incoming LLDP frames. The devices each automatically create a dynamic aggregate interface and assign the redundant ports connected to the peer to the aggregation group of that interface. When assigning the first member port to the aggregate group, the device synchronizes the member port's attribute configuration to the aggregate interface.

An automatically created dynamic aggregation group selects a reference port and Selected ports as described in "How dynamic link aggregation works." The aggregation group creation methods do not change the processes of reference port selection and Selected port selection.

IMPORTANT:

As a best practice to ensure correct operation of dynamic aggregation groups, do not use automatic link aggregation and automatic member port assignment together.

How dynamic link aggregation works

Choosing a reference port

The system chooses a reference port from the member ports in up state. A Selected port must have the same operational key and attribute configurations as the reference port.

The local system (the actor) and the peer system (the partner) negotiate a reference port by using the following workflow:

1. The two systems determine the system with the smaller system ID.

   A system ID contains the LACP system priority and the system MAC address.

   a. The two systems compare their LACP priority values.

      The lower the LACP priority, the smaller the system ID. If the LACP priority values are the same, the two systems proceed to step b.

   b. The two systems compare their MAC addresses.

      The lower the MAC address, the smaller the system ID.

2. The system with the smaller system ID chooses the port with the smallest port ID as the reference port.

   A port ID contains a port priority and a port number. The lower the port priority, the smaller the port ID.

   a. The system chooses the port with the lowest priority value as the reference port.

      If the ports have the same priority, the system proceeds to step b.

   b. The system compares their port numbers.

      The smaller the port number, the smaller the port ID.

      The port with the smallest port number and the same attribute configurations as the aggregate interface is chosen as the reference port.

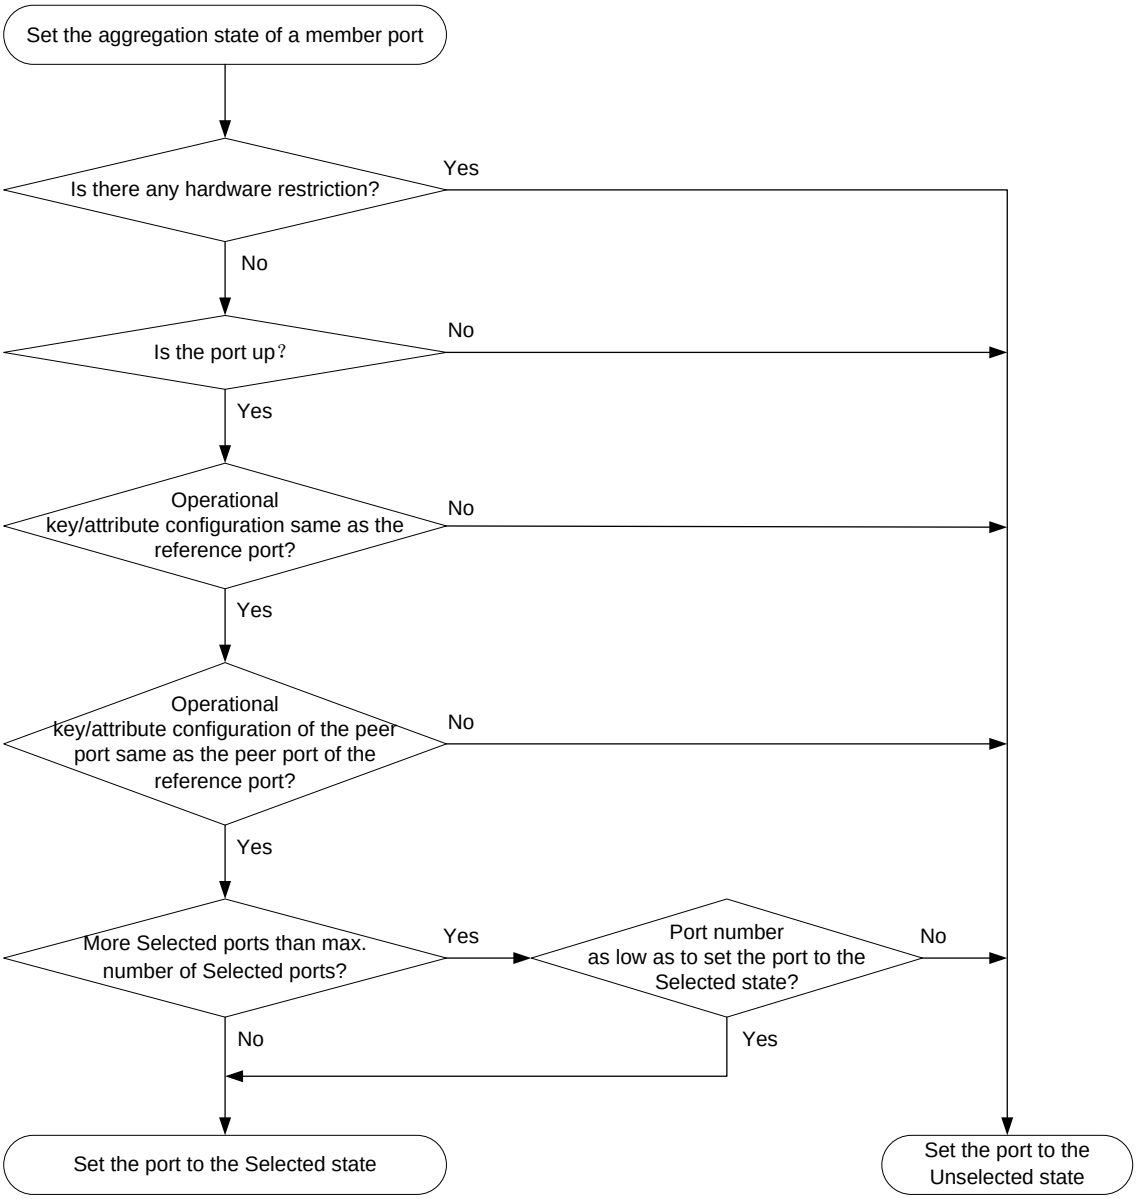
NOTE:

To identify the port numbers of aggregation member ports, execute the **`display link-aggregation verbose`** command and examine the **`Index`** field in the command output.

Setting the aggregation state of each member port

After the reference port is chosen, the system with the smaller system ID sets the state of each member port on its side.

Figure 4 Setting the state of a member port in a dynamic aggregation group



The system with the greater system ID can detect the aggregation state changes on the peer system. The system with the greater system ID sets the aggregation state of local member ports the same as their peer ports.

When you aggregate interfaces in dynamic mode, follow these guidelines:

- A dynamic link aggregation group chooses only full-duplex ports as the Selected ports.
- For stable aggregation and service continuity, do not change the operational key or attribute configurations on any member port.
- When a member port changes to the Selected or Unselected state, its peer port changes to the same aggregation state.
- After the Selected port limit is reached, a newly joining port becomes a Selected port if it is more eligible than a current Selected port.

Edge aggregate interface

Dynamic link aggregation fails on a server-facing aggregate interface if dynamic link aggregation is configured only on the device. The device forwards traffic by using only one of the physical ports that are connected to the server.

To improve link reliability, configure the aggregate interface as an edge aggregate interface. This feature enables all member ports of the aggregation group to forward traffic. When a member port fails, its traffic is automatically switched to other member ports.

After dynamic link aggregation is configured on the server, the device can receive LACPDUs from the server. Then, link aggregation between the device and the server operates correctly.

An edge aggregate interface takes effect only when it is configured on an aggregate interface corresponding to a dynamic aggregation group.

Load sharing modes for link aggregation groups

In a link aggregation group, traffic can be load shared across the Selected ports based on any of the following modes:

- **Per-flow load sharing**—Distributes traffic on a per-flow basis. The load sharing mode classifies packets into flows and forwards packets of the same flow on the same link. This mode can be one of or a combination of the following traffic classification criteria:
  - Ingress port.
  - Source or destination IP.
  - Source or destination MAC.
  - Source or destination port number.
- **Packet type-based load sharing**—Distributes traffic automatically based on packet types.

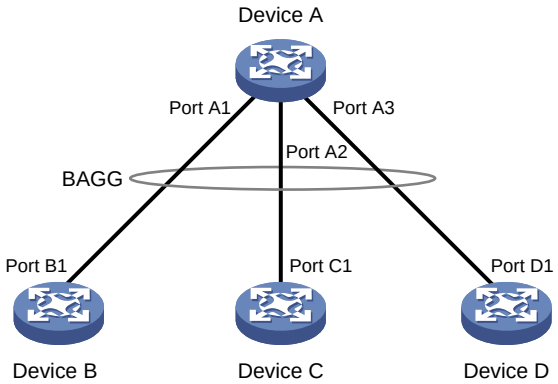
S-MLAG

Simple multichassis link aggregation (S-MLAG) enhances dynamic link aggregation to establish an aggregation that spans multiple devices to a remote device.

An S-MLAG multichassis aggregation connects one dynamic Layer 2 aggregate interface on each S-MLAG device to the remote device, as shown in Figure 5.

S-MLAG uses an S-MLAG group to manage the aggregate interfaces for each aggregation, and it runs LACP to maintain each aggregation as does dynamic link aggregation. To the remote device, the S-MLAG devices appear as one peer aggregation system.

Figure 5 S-MLAG application scenario



Restrictions and guidelines: Mixed use of manual and automatic link aggregation configuration

To avoid unexpected aggregation issues, do not use manual assignment, automatic assignment, and automatic link aggregation in any combination. If you use any two of these features in combination, an automatically assigned member port might move between aggregation groups or undesirably change from Selected to Unselected in some situations.

Ethernet link aggregation tasks at a glance

To configure Ethernet link aggregation, perform the following tasks:

1. Configuring link aggregation
   - Configuring a manual link aggregation
   - Configuring S-MLAG
2. (Optional.) Configuring an aggregate interface
   - Configuring the description of an aggregate interface
   - Configuring jumbo frame support
   - Setting the expected bandwidth for an aggregate interface
   - Configuring an edge aggregate interface

     An edge aggregate interface uses all member ports to forward traffic when the aggregation peer is not enabled with dynamic link aggregation.
   - Configuring physical state change suppression on an aggregate interface
   - Shutting down an aggregate interface
   - Restoring the default settings for an aggregate interface
3. (Optional.) Adjusting aggregation states of link aggregation member ports
   - Setting the minimum and maximum numbers of Selected ports for an aggregation group
   - Disabling the default action of selecting a Selected port for dynamic aggregation groups that have not received LACPDUs
   - Configuring a dynamic aggregation group to use port speed as the prioritized criterion for reference port selection
4. (Optional.) Configuring load sharing for link aggregation groups
   - Setting load sharing modes for link aggregation groups
   - Enabling local-first load sharing for link aggregation
5. (Optional.) Enabling link-aggregation traffic redirection

   This feature redirects traffic on an unavailable Selected port to the remaining available Selected ports of an aggregation group to avoid traffic interruption.
6. (Optional.) Enabling BFD for an aggregation group

Configuring a manual link aggregation

Restrictions and guidelines for aggregation group configuration

Layer 2 aggregation group restrictions

You cannot assign an interface to a Layer 2 aggregation group if any features in Table 4 are configured on that interface.

Table 4 Features incompatible with Layer 2 aggregation member ports

Feature on the interface	Reference
MAC authentication	MAC authentication in *Security Configuration Guide*
Port security	Port security in *Security Configuration Guide*
802.1X	802.1X in *Security Configuration Guide*

Aggregation member port restrictions

Deleting an aggregate interface also deletes its aggregation group and causes all member ports to leave the aggregation group.

An interface cannot join an aggregation group if it has different attribute configurations from the aggregate interface. After joining an aggregation group, an interface inherits the attribute configurations on the aggregate interface. You can modify the attribute configurations only on the aggregate interface.

Do not assign a reflector port for port mirroring to an aggregation group. For more information about reflector ports, see *Network Management and Monitoring Configuration Guide*.

Attribute and protocol configuration restrictions

For a link aggregation group, attribute configurations are configurable only on the aggregate interface and are automatically synchronized to all member ports. You cannot configure attribute configurations on a member port until it is removed from the link aggregation group. The configurations that have been synchronized from the aggregate interface are retained on the member ports even after the aggregate interface is deleted.

If an attribute setting on the aggregate interface fails to be synchronized to a Selected member port, the port might change to the Unselected state.

The protocol configurations for an aggregate interface take effect only on the current aggregate interface. The protocol configurations for a member port take effect only when the port leaves its aggregation group.

Configuration consistency requirements

You must configure the same aggregation mode at the two ends of an aggregate link.

- For a successful static aggregation, make sure the ports at both ends of each link are in the same aggregation state.
- For a successful dynamic aggregation:
  - Make sure the ports at both ends of a link are assigned to the correct aggregation group. The two ends can automatically negotiate the aggregation state of each member port.
  - If you use automatic interface assignment on one end, you must use manual assignment on the other end.

Configuring a Layer 2 aggregation group

Configuring a Layer 2 static aggregation group

1. Enter system view.

   system-view

2. Create a Layer 2 aggregate interface and enter Layer 2 aggregate interface view.

   interface bridge-aggregation *interface-number*

   When you create a Layer 2 aggregate interface, the system automatically creates a Layer 2 static aggregation group numbered the same as that interface.

3. Return to system view.

   quit

4. Assign an interface to the Layer 2 aggregation group:

   a. Enter Layer 2 Ethernet interface view.

      interface *interface-type interface-number*

   b. Assign the interface to the Layer 2 aggregation group.

      port link-aggregation group *group-id* [**force**]

   Repeat the substeps to assign more interfaces to the aggregation group.

   To synchronize the attribute configurations from the aggregate interface when the current interface joins the aggregation group, specify the **force** keyword.

5. (Optional.) Set the port priority of the interface.

   link-aggregation port-priority *priority*

   The default port priority of an interface is 32768.

Configuring a Layer 2 dynamic aggregation group

1. Enter system view.

   system-view

2. Set the LACP system priority.

   lacp system-priority *priority*

   By default, the LACP system priority is 32768.

   Changing the LACP system priority might affect the aggregation states of the ports in a dynamic aggregation group.

3. Create a Layer 2 aggregate interface and enter Layer 2 aggregate interface view.

   interface bridge-aggregation *interface-number*

   When you create a Layer 2 aggregate interface, the system automatically creates a Layer 2 static aggregation group numbered the same as that interface.

4. Configure the aggregation group to operate in dynamic mode.

   link-aggregation mode dynamic

   By default, an aggregation group operates in static mode.

5. Return to system view.

   quit

6. Assign an interface to the Layer 2 aggregation group:

   a. Enter Layer 2 Ethernet interface view.

      interface *interface-type interface-number*

   b. Assign the interface to the Layer 2 aggregation group or enable automatic assignment on that interface.

port link-aggregation group { *group-id* [**force**] | **auto** [*group-id*] }

Repeat these two substeps to assign more Layer 2 Ethernet interfaces to the aggregation group.

To synchronize the attribute configurations from the aggregate interface when the current interface joins the aggregation group, specify the **force** keyword.

To enable automatic assignment, specify the **auto** keyword. As a best practice, do not modify the configuration on an automatically created aggregate interface or its member ports.

7. Set the LACP operating mode for the interface.
   - Set the LACP operating mode to passive.
     lacp mode passive
   - Set the LACP operating mode to active.
     undo lacp mode

   By default, LACP is operating in active mode.
8. (Optional.) Set the port priority for the interface.
   link-aggregation port-priority *priority*

   The default setting is 32768.
9. (Optional.) Set the short LACP timeout interval (3 seconds) for the interface.
   lacp period short

   By default, the long LACP timeout interval (90 seconds) is used by the interface.

Configuring S-MLAG

Restrictions and guidelines

Use S-MLAG to set up link aggregations only with servers.

S-MLAG is intended for a non-IRF environment. Do not configure it on an IRF fabric. For more formation about IRF, see *Virtual Technologies Configuration Guide*.

Each S-MLAG group can contain only one aggregate interface on each device.

Do not configure the following settings on S-MLAG devices:

- LACP MAD.
- Link-aggregation traffic redirection.
- Maximum or minimum number of Selected ports.
- Automatic member port assignment.

As a best practice, maintain consistency across S-MLAG devices in service feature configuration.

Prerequisites

Configure the link aggregation settings other than S-MLAG settings on each S-MLAG device. Make sure the settings are consistent across the S-MLAG devices.

Procedure

1. Enter system view.
   system-view
2. Set the LACP system MAC address.
   lacp system-mac *mac-address*

   By default, the LACP system MAC address is the bridge MAC address of the device.

   All S-MLAG devices must use the same LACP system MAC address.

3. Set the LACP system priority.
   lacp system-priority *priority*
   By default, the LACP system priority is 32768.
   All S-MLAG devices must use the same LACP system priority.
4. Set the LACP system number.
   lacp system-number *number*
   By default, the LACP system number is not set.
   You must assign a unique LACP system number to each S-MLAG device.
5. Enter Layer 2 aggregate interface view.
   interface bridge-aggregation *interface-number*
6. Set the link aggregation mode to dynamic.
   link-aggregation mode dynamic
   By default, an aggregation group operates in static mode.
7. Assign the aggregate interface to an S-MLAG group.
   port s-mlag group *group-id*
   By default, an aggregate interface is not assigned to any S-MLAG group.

Configuring an aggregate interface

Most settings that can be made on Layer 2 Ethernet interfaces can also be made on Layer 2 aggregate interfaces.

Configuring the description of an aggregate interface

About the aggregate interface description

You can configure the description of an aggregate interface for administration purposes, for example, describing the purpose of the interface.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 aggregate interface view.
   interface bridge-aggregation *interface-number*
3. Configure the interface description.
   description *text*
   By default, the description of an interface is *interface-name* **Interface**.

Configuring jumbo frame support

About jumbo frames

An aggregate interface might receive frames larger than 1522 bytes during high-throughput data exchanges, such as file transfers. These frames are called jumbo frames.

How an aggregate interface processes jumbo frames depends on whether jumbo frame support is enabled on the interface.

- If configured to deny jumbo frames, the aggregate interface discards jumbo frames.

- If enabled with jumbo frame support, the aggregate interface performs the following operations:
  - Processes jumbo frames that are within the allowed length.
  - Discards jumbo frames that exceed the allowed length.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 aggregate interface view.
   interface bridge-aggregation *interface-number*
3. Allow jumbo frames.
   jumboframe enable [*size*]
   By default, an aggregate interface allows jumbo frames with a maximum length of 10240 bytes to pass through.
   If you execute this command multiple times, the most recent configuration takes effect.

Setting the expected bandwidth for an aggregate interface

About expected bandwidth

Expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by performing this task.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 aggregate interface view.
   interface bridge-aggregation *interface-number*
3. Set the expected bandwidth for the interface.
   bandwidth *bandwidth-value*
   By default, the expected bandwidth (in kbps) is the interface baud rate divided by 1000.

Configuring an edge aggregate interface

Restrictions and guidelines

You can only configure an aggregate interface in dynamic mode as an edge interface.

Configure only aggregate interfaces connected to endpoints such as servers as edge aggregate interfaces. Do not connect edge aggregate interfaces to network devices.

Link-aggregation traffic redirection cannot operate correctly on an edge aggregate interface. For more information about link-aggregation traffic redirection, see "Enabling link-aggregation traffic redirection."

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 aggregate interface view.
   interface bridge-aggregation *interface-number*
3. Configure the aggregate interface as an edge aggregate interface.
   lacp edge-port

By default, an aggregate interface does not operate as an edge aggregate interface.

Configuring physical state change suppression on an aggregate interface

About physical state change suppression

The physical link state of an aggregate interface is either up or down. Each time the physical link of an interface comes up or goes down, the system immediately reports the change to the CPU. The CPU then performs the following operations:

- Notifies the upper-layer protocol modules (such as routing and forwarding modules) of the change for guiding packet forwarding.
- Automatically generates traps and logs to inform users to take the correct actions.

To prevent frequent physical link flapping from affecting system performance, configure physical state change suppression. You can configure this feature to suppress link-down events, link-up events, or both. If an event of the specified type still exists when the suppression interval expires, the system reports the event to the CPU.

Restrictions and guidelines

Do not use this feature in combination with S-MLAG.

When you use this feature on an aggregate interface, make sure its peer is also an aggregate interface. In addition, you must set the physical state change suppression interval to the same value on those aggregate interfaces.

On an interface, you can configure different suppression intervals for link-up and link-down events. If you execute the **link-delay** command multiple times for an event type, the most recent configuration takes effect on that event type.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 aggregate interface view.

   interface bridge-aggregation *interface-number*
3. Configure physical state change suppression.

   link-delay { **down** | **up** } [**msec**] *delay-time*

   By default, each time the physical link of an aggregate interface goes up or comes down, the system immediately reports the change to the CPU.

Shutting down an aggregate interface

Restrictions and guidelines

CAUTION:

The **shutdown** command will disconnect all links established on an interface. Make sure you are fully aware of the impacts of this command when you use it on a live network.

Shutting down or bringing up an aggregate interface affects the aggregation states and link states of member ports in the corresponding aggregation group as follows:

- When an aggregate interface is shut down, all its Selected ports become Unselected and all member ports go down.

- When an aggregate interface is brought up, the aggregation states of all its member ports are recalculated.

When you shut down or bring up a Layer 3 aggregate interface, all its aggregate subinterfaces are also shut down or brought up. Shutting down or bringing up a Layer 3 aggregate subinterface does not affect the state of the main aggregate interface.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 aggregate interface view.
   interface bridge-aggregation *interface-number*
3. Shut down the interface.
   Shutdown

Restoring the default settings for an aggregate interface

Restrictions and guidelines

CAUTION:
The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impacts of this command when you execute it on a live network.

The **default** command might fail to restore the default settings for some commands for reasons such as command dependencies and system restrictions.

To resolve this issue:

1. Use the **display this** command in interface view to identify these commands.
2. Use their **undo** forms or follow the command reference to restore their default settings.
3. If the restoration attempt still fails, follow the error message instructions to resolve the issue.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 aggregate interface view.
   interface bridge-aggregation *interface-number*
3. Restore the default settings for the aggregate interface.
   Default

Setting the minimum and maximum numbers of Selected ports for an aggregation group

About the minimum and maximum numbers of Selected ports for an aggregation group

The bandwidth of an aggregate link increases as the number of Selected member ports increases. To avoid congestion, you can set the minimum number of Selected ports required for bringing up an aggregate interface.

This minimum threshold setting affects the aggregation states of aggregation member ports and the state of the aggregate interface.

- When the number of member ports eligible to be Selected ports is smaller than the minimum threshold, the following events occur:
  - The eligible member ports are placed in Unselected state.
  - The link layer state of the aggregate interface becomes down.
- When the number of member ports eligible to be Selected ports reaches or exceeds the minimum threshold, the following events occur:
  - The eligible member ports are placed in Selected state.
  - The link layer state of the aggregate interface becomes up.

The maximum number of Selected ports allowed in an aggregation group is limited by either manual configuration or hardware limitation, whichever value is smaller.

You can implement backup between two ports by performing the following tasks:

- Assigning two ports to an aggregation group.
- Setting the maximum number of Selected ports to 1 for the aggregation group.

Then, only one Selected port is allowed in the aggregation group, and the Unselected port acts as a backup port.

Restrictions and guidelines

IMPORTANT:

After you set the minimum percentage of Selected ports for an aggregation group, aggregate interface flapping might occur when ports join or leave an aggregation group. Make sure you are fully aware of the impacts of this setting when you configure it on a live network.

You can set either the minimum number or the minimum percentage of Selected ports for an aggregation group. If you configure both settings on an aggregate interface, the higher Selected port number limit takes effect.

The minimum and maximum numbers of Selected ports must be the same between the two ends of an aggregate link.

The minimum percentage of Selected ports must be the same between the two ends of an aggregate link.

For an aggregation group, the maximum number of Selected ports must be equal to or higher than the minimum number of Selected ports.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 aggregate interface view.

   interface bridge-aggregation *interface-number*
3. Set the minimum number of Selected ports for the aggregation group. Choose one of the following methods:
   - Set the minimum number of Selected ports.

     link-aggregation selected-port minimum *min-number*
   - Set the minimum percentage of Selected ports.

     link-aggregation selected-port minimum percentage *number*

   By default, the minimum number of Selected ports is not specified for an aggregation group.
4. Set the maximum number of Selected ports for the aggregation group.

   link-aggregation selected-port maximum *max-number*

   By default, an aggregation group can have a maximum of 8 Selected ports.

Disabling the default action of selecting a Selected port for dynamic aggregation groups that have not received LACPDUs

About the default port selection action

The default port selection action applies to dynamic aggregation groups.

This action automatically chooses the port with the lowest ID from among all up member ports as a Selected port if none of them has received LACPDUs before the LACP timeout interval expires.

After this action is disabled, a dynamic aggregation group will not have any Selected ports to forward traffic if it has not received LACPDUs before the LACP timeout interval expires.

Procedure

1. Enter system view.

   system-view

2. Disable the default port selection action.

   lacp default-selected-port disable

   By default, the default port selection action is enabled for dynamic aggregation groups.

Configuring a dynamic aggregation group to use port speed as the prioritized criterion for reference port selection

About prioritizing port speed in reference port selection

Perform this task to ensure that a dynamic aggregation group selects a high-speed member port as the reference port. After you perform this task, the reference port will be selected based on the criteria in order of device ID, port speed, and port ID.

Feature and software version compatibility

This feature is supported only in Release 6348P01 and later versions.

Restrictions and guidelines

Changing reference port selection criteria might cause transient traffic interruption. Make sure you understand the impact of this task on your network.

You must perform this task at both ends of the aggregate link so the peer aggregation systems use the same criteria for reference port selection.

As a best practice, shut down the peer aggregate interfaces before you execute this command and bring up the interfaces after this command is executed on both of them.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 aggregate interface view.

   interface bridge-aggregation *interface-number*

3. Specify port speed as the prioritized criterion for reference port selection.

lacp select speed

By default, port ID is the prioritized criterion for reference port selection of a dynamic aggregation group.

Configuring load sharing for link aggregation groups

Setting load sharing modes for link aggregation groups

About load sharing modes

You can set a global load sharing mode for all link aggregation groups.

Restrictions and guidelines

The following are global load sharing modes supported on the device:

- Load sharing mode automatically determined based on the packet type.
- Source IP.
- Destination IP.
- Source MAC.
- Destination MAC.
- Source port.
- Destination port.
- Ingress port.
- Any combinations of ingress port, source IP, source port, destination IP, and destination port.
- Any combinations of ingress port, source port, source MAC, destination port, and destination MAC.

Procedure

1. Enter system view.

   system-view

2. Set the global link-aggregation load sharing mode.

   link-aggregation global load-sharing mode { **destination-ip** | **destination-mac** | **destination-port** | **ingress-port** | **source-ip** | **source-mac** | **source-port** } *

   By default, packets are load shared based on the following information:

   - Source and destination IP addresses.
   - Source and destination MAC addresses.

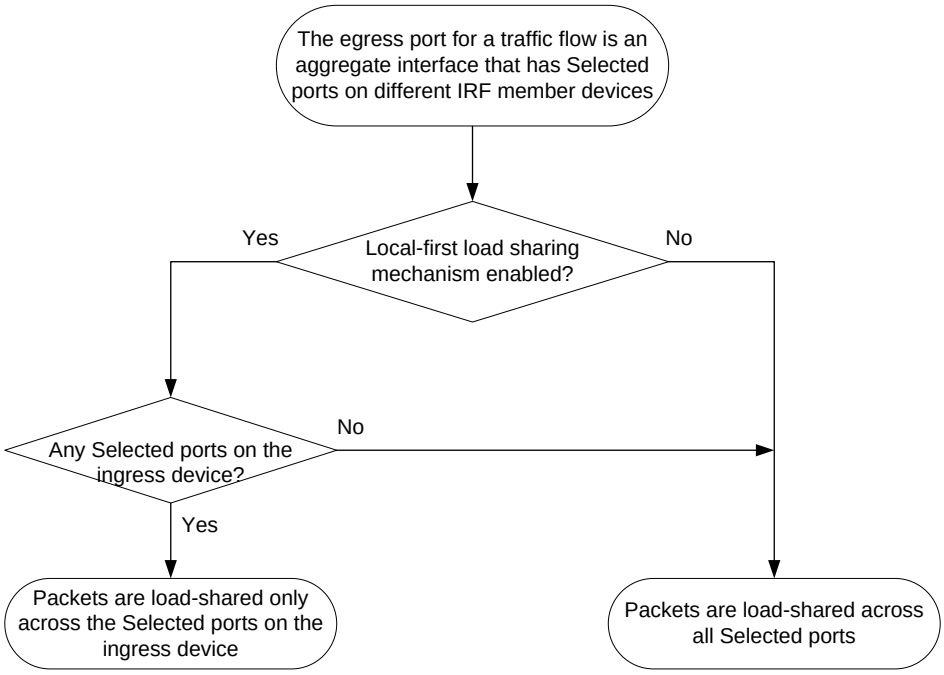
Enabling local-first load sharing for link aggregation

About local-first load sharing for link aggregation

Use local-first load sharing in a multidevice link aggregation scenario to distribute traffic preferentially across member ports on the ingress slot.

When you aggregate ports on different member devices in an IRF fabric, you can use local-first load sharing to reduce traffic on IRF links, as shown in Figure 6. For more information about IRF, see *Virtual Technologies Configuration Guide*.

Figure 6 Load sharing for multidevice link aggregation in an IRF fabric



Enabling local-first load sharing for link aggregation globally

1. Enter system view.
   `system-view`
2. Enable local-first load sharing for link aggregation globally.
   `link-aggregation load-sharing mode local-first`
   By default, local-first load sharing is enabled globally.

Enabling link-aggregation traffic redirection

About link-aggregation traffic redirection

This feature operates on dynamic link aggregation groups. It redirects traffic on a Selected port to the remaining available Selected ports of an aggregation group if one of the following events occurs:

- The port is shut down by using the **`shutdown`** command.
- The slot that hosts the port reboots, and the aggregation group spans multiple slots.

NOTE:

The device does not redirect traffic to member ports that become Selected during the traffic redirection process.

This feature ensures zero packet loss for known unicast traffic, but does not protect unknown unicast traffic.

You can enable link-aggregation traffic redirection globally or for an aggregation group. Global link-aggregation traffic redirection settings take effect on all aggregation groups. A link aggregation group preferentially uses the group-specific link-aggregation traffic redirection settings. If group-specific link-aggregation traffic redirection is not configured, the group uses the global link-aggregation traffic redirection settings.

Restrictions and guidelines for link-aggregation traffic redirection

Link-aggregation traffic redirection applies only to dynamic link aggregation groups.

As a best practice, enable link-aggregation traffic redirection on a per-interface basis. If you enable this feature globally, communication with a third-party peer device might be affected if the peer is not compatible with this feature.

To prevent traffic interruption, enable link-aggregation traffic redirection at both ends of the aggregate link.

To prevent packet loss that might occur at a slot reboot, do not enable the spanning tree feature together with link-aggregation traffic redirection.

Link-aggregation traffic redirection does not operate correctly on an edge aggregate interface.

Enabling link-aggregation traffic redirection globally

1. Enter system view.
   `system-view`
2. Enable link-aggregation traffic redirection globally.
   `link-aggregation lacp traffic-redirect-notification enable`
   By default, link-aggregation traffic redirection is disabled globally.

Enabling link-aggregation traffic redirection for an aggregation group

1. Enter system view.
   `system-view`
2. Enter Layer 2 aggregate interface view.
   `interface bridge-aggregation` *`interface-number`*
3. Enable link-aggregation traffic redirection for the aggregation group.
   `link-aggregation lacp traffic-redirect-notification enable`

By default, link-aggregation traffic redirection is disabled for an aggregation group.

Enabling BFD for an aggregation group

About BFD for Ethernet link aggregation

You can use BFD to monitor member link status in an aggregation group. After you enable BFD on an aggregate interface, each Selected port in the aggregation group establishes a BFD session with its peer port. BFD operates differently depending on the aggregation mode.

- **BFD on a static aggregation**—When BFD detects a link failure, BFD notifies the Ethernet link aggregation module that the peer port is unreachable. The local port is then placed in Unselected state. However, the BFD session between the local and peer ports remains, and the local port keeps sending BFD packets. When BFD on the local port receives packets from the peer port upon link recovery, BFD notifies the Ethernet link aggregation module that the peer port is reachable. Then, the local port is placed in Selected state again. This mechanism ensures that the local and peer ports of a static aggregate link have the same aggregation state.

- **BFD on a dynamic aggregation**—When BFD detects a link failure, BFD notifies the Ethernet link aggregation module that the peer port is unreachable. At the same time, BFD clears the session and stops sending BFD packets. When the local port is placed in Selected state again upon link recovery, the local port establishes a new session with the peer port and BFD notifies the Ethernet link aggregation module that the peer port is reachable. Because BFD provides fast failure detection, the local and peer systems of a dynamic aggregate link can negotiate the aggregation state of their member ports faster.

For more information about BFD, see *High Availability Configuration Guide*.

Restrictions and guidelines

When you enable BFD for an aggregation group, follow these restrictions and guidelines:

- Make sure the source and destination IP addresses are reversed between the two ends of an aggregate link. For example, if you execute **`link-aggregation bfd ipv4 source 1.1.1.1 destination 2.2.2.2`** at the local end, execute **`link-aggregation bfd ipv4 source 2.2.2.2 destination 1.1.1.1`** at the peer end. The source and destination IP addresses cannot be the same.
- The BFD parameters configured on an aggregate interface take effect on all BFD sessions established by the member ports in its aggregation group. BFD on an aggregate link supports only control packet mode for session establishment and maintenance. The two ends of an established BFD session can only operate in **Asynchronous** mode.
- As a best practice, do not configure BFD for any protocols on a BFD-enabled aggregate interface.
- Make sure the number of member ports in a BFD-enabled aggregation group is less than or identical to the number of BFD sessions supported by the device. If the aggregation group contains more member ports than the supported sessions, some Selected ports might change to the Unselected state.
- If the number of BFD sessions differs between the two ends of an aggregate link, check their settings for inconsistency in the maximum number of Selected ports. You must make sure the two ends have the same setting for the maximum number of Selected ports.

Procedure

1. Enter system view.
   `system-view`
2. Enter Layer 2 aggregate interface view.
   `interface bridge-aggregation` *`interface-number`*
3. Enable BFD for the aggregation group.
   `link-aggregation bfd ipv4 source` *`ip-address`* **`destination`** *`ip-address`*
   By default, BFD is disabled for an aggregation group.

Display and maintenance commands for Ethernet link aggregation

Execute **`display`** commands in any view and **`reset`** commands in user view.

Task	Command
Display information about aggregate interfaces.	**`display interface`** [**`bridge-aggregation`** [*`interface-number`*]] [**`brief`** [**`description`** | **`down`**]]
Display the local system ID.	**`display lacp system-id`**

Task	Command
Display the global or group-specific link-aggregation load sharing modes.	**display link-aggregation load-sharing mode** [**interface** [**bridge-aggregation** *interface-number*]]
Display detailed link aggregation information about link aggregation member ports.	**display link-aggregation member-port** [*interface-list* | **auto**]
Display summary information about all aggregation groups.	**display link-aggregation summary**
Display detailed information about the specified aggregation groups.	**display link-aggregation verbose** [**bridge-aggregation** [*interface-number*]]
Clear statistics for the specified aggregate interfaces.	**reset counters interface** [**bridge-aggregation** [*interface-number*]]
Clear LACP statistics for the specified link aggregation member ports.	**reset lacp statistics** [**interface** *interface-list*]

Ethernet link aggregation configuration examples

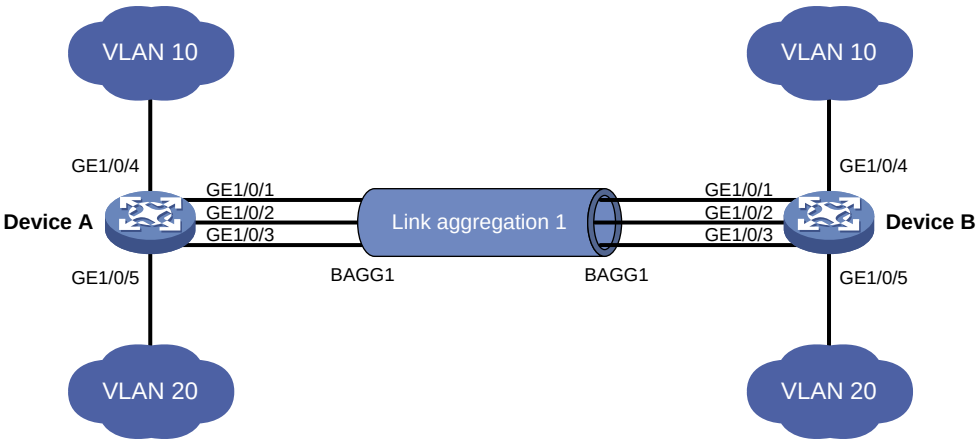
Example: Configuring a Layer 2 static aggregation group

Network configuration

On the network shown in Figure 7, perform the following tasks:

- Configure a Layer 2 static aggregation group on both Device A and Device B.
- Enable VLAN 10 at one end of the aggregate link to communicate with VLAN 10 at the other end.
- Enable VLAN 20 at one end of the aggregate link to communicate with VLAN 20 at the other end.

Figure 7 Network diagram



Procedure

1. Configure Device A:

Create VLAN 10, and assign port GigabitEthernet 1/0/4 to VLAN 10.

```
<DeviceA> system-view
[DeviceA] vlan 10
[DeviceA-vlan10] port gigabitethernet 1/0/4
[DeviceA-vlan10] quit
```

Create VLAN 20, and assign port GigabitEthernet 1/0/5 to VLAN 20.

```
[DeviceA] vlan 20
[DeviceA-vlan20] port gigabitethernet 1/0/5
[DeviceA-vlan20] quit
```

Create Layer 2 aggregate interface Bridge-Aggregation 1.

```
[DeviceA] interface bridge-aggregation 1
[DeviceA-Bridge-Aggregation1] quit
```

Assign ports GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to link aggregation group 1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port link-aggregation group 1
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] port link-aggregation group 1
[DeviceA-GigabitEthernet1/0/2] quit
[DeviceA] interface gigabitethernet 1/0/3
[DeviceA-GigabitEthernet1/0/3] port link-aggregation group 1
[DeviceA-GigabitEthernet1/0/3] quit
```

Configure Layer 2 aggregate interface Bridge-Aggregation 1 as a trunk port and assign it to VLANs 10 and 20.

```
[DeviceA] interface bridge-aggregation 1
[DeviceA-Bridge-Aggregation1] port link-type trunk
[DeviceA-Bridge-Aggregation1] port trunk permit vlan 10 20
[DeviceA-Bridge-Aggregation1] quit
```

2. Configure Device B in the same way Device A is configured. (Details not shown.)

Verifying the configuration

Display detailed information about all aggregation groups on Device A.

```
[DeviceA] display link-aggregation verbose
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Port Status: S -- Selected, U -- Unselected, I -- Individual
Port: A -- Auto port, M -- Management port, R -- Reference port
Flags:  A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
        D -- Synchronization, E -- Collecting, F -- Distributing,
        G -- Defaulted, H -- Expired

Aggregate Interface: Bridge-Aggregation1
Aggregation Mode: Static
Loadsharing Type: Shar
Management VLANs: None
  Port            Status  Priority Oper-Key
  GE1/0/1(R)      S       32768    1
  GE1/0/2         S       32768    1
  GE1/0/3         S       32768    1
```

The output shows that link aggregation group 1 is a Layer 2 static aggregation group that contains three Selected ports.

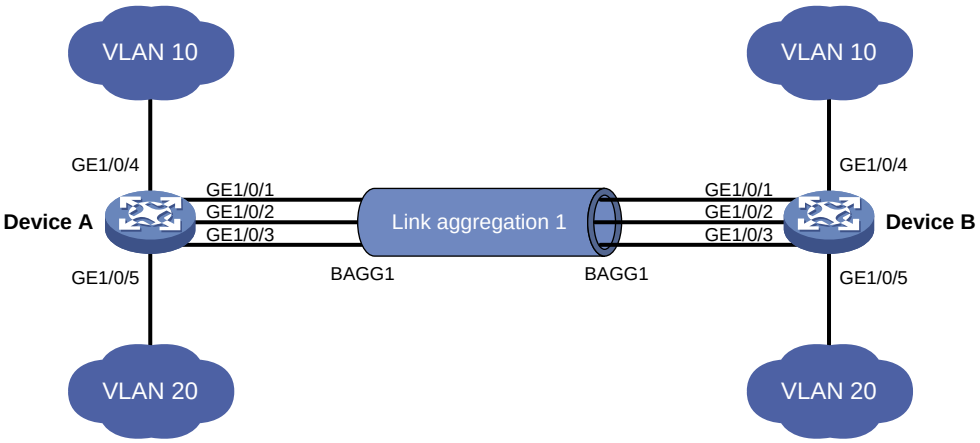
Example: Configuring a Layer 2 dynamic aggregation group

Network configuration

On the network shown in Figure 8, perform the following tasks:

- Configure a Layer 2 dynamic aggregation group on both Device A and Device B.
- Enable VLAN 10 at one end of the aggregate link to communicate with VLAN 10 at the other end.
- Enable VLAN 20 at one end of the aggregate link to communicate with VLAN 20 at the other end.

Figure 8 Network diagram



Procedure

1. Configure Device A:

Create VLAN 10, and assign the port GigabitEthernet 1/0/4 to VLAN 10.

```
<DeviceA> system-view
[DeviceA] vlan 10
[DeviceA-vlan10] port gigabitethernet 1/0/4
[DeviceA-vlan10] quit
```

Create VLAN 20, and assign the port GigabitEthernet 1/0/5 to VLAN 20.

```
[DeviceA] vlan 20
[DeviceA-vlan20] port gigabitethernet 1/0/5
[DeviceA-vlan20] quit
```

Create Layer 2 aggregate interface Bridge-Aggregation 1, and set the link aggregation mode to dynamic.

```
[DeviceA] interface bridge-aggregation 1
[DeviceA-Bridge-Aggregation1] link-aggregation mode dynamic
[DeviceA-Bridge-Aggregation1] quit
```

Assign ports GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to link aggregation group 1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port link-aggregation group 1
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
```

```
[DeviceA-GigabitEthernet1/0/2] port link-aggregation group 1
[DeviceA-GigabitEthernet1/0/2] quit
[DeviceA] interface gigabitethernet 1/0/3
[DeviceA-GigabitEthernet1/0/3] port link-aggregation group 1
[DeviceA-GigabitEthernet1/0/3] quit
```

Configure Layer 2 aggregate interface Bridge-Aggregation 1 as a trunk port and assign it to VLANs 10 and 20.

```
[DeviceA] interface bridge-aggregation 1
[DeviceA-Bridge-Aggregation1] port link-type trunk
[DeviceA-Bridge-Aggregation1] port trunk permit vlan 10 20
[DeviceA-Bridge-Aggregation1] quit
```

2. Configure Device B in the same way Device A is configured. (Details not shown.)

Verifying the configuration

Display detailed information about all aggregation groups on Device A.

```
[DeviceA] display link-aggregation verbose
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Port Status: S -- Selected, U -- Unselected, I -- Individual
Port: A -- Auto port, M -- Management port, R -- Reference port
Flags:  A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
        D -- Synchronization, E -- Collecting, F -- Distributing,
        G -- Defaulted, H -- Expired

Aggregate Interface: Bridge-Aggregation1
Creation Mode: Manual
Aggregation Mode: Dynamic
Loadsharing Type: Shar
Management VLANs: None
System ID: 0x8000, 000f-e267-6c6a
Local:
  Port                Status   Priority Index    Oper-Key               Flag
  GE1/0/1(R)          S        32768    11       1                      {ACDEF}
  GE1/0/2             S        32768    12       1                      {ACDEF}
  GE1/0/3             S        32768    13       1                      {ACDEF}
Remote:
  Actor               Priority Index    Oper-Key SystemID               Flag
  GE1/0/1             32768    81       1        0x8000, 000f-e267-57ad {ACDEF}
  GE1/0/2             32768    82       1        0x8000, 000f-e267-57ad {ACDEF}
  GE1/0/3             32768    83       1        0x8000, 000f-e267-57ad {ACDEF}
```

The output shows that link aggregation group 1 is a Layer 2 dynamic aggregation group that contains three Selected ports.

Example: Configuring a Layer 2 edge aggregate interface

Network configuration

As shown in Figure 9, a Layer 2 dynamic aggregation group is configured on the device. The server is not configured with dynamic link aggregation.

Configure an edge aggregate interface so that both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 can forward traffic to improve link reliability.

Figure 9 Network diagram

Procedure

Create Layer 2 aggregate interface Bridge-Aggregation 1, and set the link aggregation mode to dynamic.

```
<Device> system-view
[Device] interface bridge-aggregation 1
[Device-Bridge-Aggregation1] link-aggregation mode dynamic
```

Configure Layer 2 aggregate interface Bridge-Aggregation 1 as an edge aggregate interface.

```
[Device-Bridge-Aggregation1] lacp edge-port
[Device-Bridge-Aggregation1] quit
```

Assign ports GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to link aggregation group 1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] port link-aggregation group 1
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] port link-aggregation group 1
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Display detailed information about all aggregation groups on the device when the server is not configured with dynamic link aggregation.

```
[Device] display link-aggregation verbose
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Port Status: S -- Selected, U -- Unselected, I -- Individual
Port: A -- Auto port, M -- Management port, R -- Reference port
Flags:  A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
        D -- Synchronization, E -- Collecting, F -- Distributing,
        G -- Defaulted, H -- Expired

Aggregate Interface: Bridge-Aggregation1
Creation Mode: Manual
Aggregation Mode: Dynamic
Loadsharing Type: Shar
Management VLANs: None
System ID: 0x8000, 000f-e267-6c6a
Local:
  Port                Status   Priority Index    Oper-Key               Flag
  GE1/0/1             I        32768    11       1                      {AG}
  GE1/0/2             I        32768    12       1                      {AG}

Remote:
  Actor               Priority Index    Oper-Key SystemID               Flag
  GE1/0/1             32768    81       0        0x8000, 0000-0000-0000 {DEF}
```

```
GE1/0/2             32768    82       0        0x8000, 0000-0000-0000 {DEF}
```

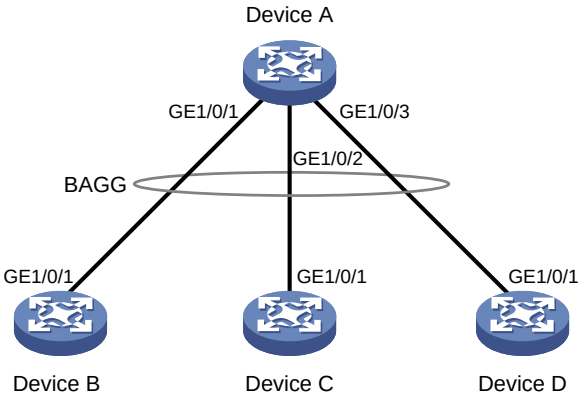
The output shows that GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are in Individual state when they do not receive LACPDUs from the server. Both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 can forward traffic. When one port fails, its traffic is automatically switched to the other port.

Example: Configuring S-MLAG

Network configuration

As shown in Figure 10, configure Device B, Device C, and Device D as S-MLAG devices to establish a multidevice aggregate link with Device A.

Figure 10 Network diagram



Procedure

1. Configure Device A:

   # Create Layer 2 aggregate interface Bridge-Aggregation 10, and set the link aggregation mode to dynamic.

   ```
   <DeviceA> system-view
   [DeviceA] interface bridge-aggregation 10
   [DeviceA-Bridge-Aggregation10] link-aggregation mode dynamic
   [DeviceA-Bridge-Aggregation10] quit
   ```

   # Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to aggregation group 10.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] port link-aggregation group 10
   [DeviceA-GigabitEthernet1/0/1] quit
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] port link-aggregation group 10
   [DeviceA-GigabitEthernet1/0/2] quit
   [DeviceA] interface gigabitethernet 1/0/3
   [DeviceA-GigabitEthernet1/0/3] port link-aggregation group 10
   [DeviceA-GigabitEthernet1/0/3] quit
   ```

2. Configure Device B:

   # Set the LACP system MAC address to 0001-0001-0001.

   ```
   <DeviceB> system-view
   [DeviceB] lacp system-mac 1-1-1
   ```

   # Set the LACP system priority to 123.

   ```
   [DeviceB] lacp system-priority 123
   ```

Set the LACP system number to 1.

```
[DeviceB] lacp system-number 1
```

Create Layer 2 aggregate interface Bridge-Aggregation 2, and set the link aggregation mode to dynamic.

```
[DeviceB] interface bridge-aggregation 2
[DeviceB-Bridge-Aggregation2] link-aggregation mode dynamic
```

Assign Bridge-Aggregation 2 to S-MLAG group 100.

```
[DeviceB-Bridge-Aggregation2] port s-mlag group 100
```

Assign GigabitEthernet 1/0/1 to aggregation group 2.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port link-aggregation group 2
[DeviceB-GigabitEthernet1/0/1] quit
```

3. Configure Device C:

Set the LACP system MAC address to 0001-0001-0001.

```
<DeviceC> system-view
[DeviceC] lacp system-mac 1-1-1
```

Set the LACP system priority to 123.

```
[DeviceC] lacp system-priority 123
```

Set the LACP system number to 2.

```
[DeviceC] lacp system-number 2
```

Create Layer 2 aggregate interface Bridge-Aggregation 3, and set the link aggregation mode to dynamic.

```
[DeviceC] interface bridge-aggregation 3
[DeviceC-Bridge-Aggregation3] link-aggregation mode dynamic
```

Assign Bridge-Aggregation 3 to S-MLAG group 100.

```
[DeviceC-Bridge-Aggregation3] port s-mlag group 100
```

Assign GigabitEthernet 1/0/1 to aggregation group 3.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] port link-aggregation group 3
[DeviceC-GigabitEthernet1/0/1] quit
```

4. Configure Device D:

Set the LACP system MAC address to 0001-0001-0001.

```
<DeviceD> system-view
[DeviceD] lacp system-mac 1-1-1
```

Set the LACP system priority to 123.

```
[DeviceD] lacp system-priority 123
```

Set the LACP system number to 3.

```
[DeviceD] lacp system-number 3
```

Create Layer 2 aggregate interface Bridge-Aggregation 4, and set the link aggregation mode to dynamic.

```
[DeviceD] interface bridge-aggregation 4
[DeviceD-Bridge-Aggregation4] link-aggregation mode dynamic
```

Assign Bridge-Aggregation 4 to S-MLAG group 100.

```
[DeviceD-Bridge-Aggregation4] port s-mlag group 100
```

Assign GigabitEthernet 1/0/1 to aggregation group 4.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] port link-aggregation group 4
```

```
[DeviceD-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify that GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 on Device A are Selected ports.

```
[DeviceA] display link-aggregation verbose
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing

Configuring port isolation

About port isolation

The port isolation feature isolates Layer 2 traffic for data privacy and security without using VLANs.

Ports in an isolation group cannot communicate with each other. However, they can communicate with ports outside the isolation group.

Assigning a port to an isolation group

About port assignment to an isolation group

The device supports multiple isolation groups, which can be configured manually. The number of ports assigned to an isolation group is not limited.

Restrictions and guidelines

- You can assign a port to only one isolation group. If you execute the **port-isolate enable group** command multiple times, the most recent configuration takes effect.
- The configuration in Layer 2 Ethernet interface view applies only to the interface.
- The configuration in Layer 2 aggregate interface view applies to the Layer 2 aggregate interface and its aggregation member ports. If the device fails to apply the configuration to the aggregate interface, it does not assign any aggregation member port to the isolation group. If the failure occurs on an aggregation member port, the device skips the port and continues to assign other aggregation member ports to the isolation group.

Procedure

1. Enter system view.
   system-view
2. Create an isolation group.
   port-isolate group *group-id*
3. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
4. Assign the port to the isolation group.
   port-isolate enable group *group-id*
   By default, the port is not in any isolation group.

Display and maintenance commands for port isolation

Execute **display** commands in any view.

Task	Command
Display isolation group information.	**display port-isolate group** [*group-id*]

Port isolation configuration examples

Example: Configuring port isolation

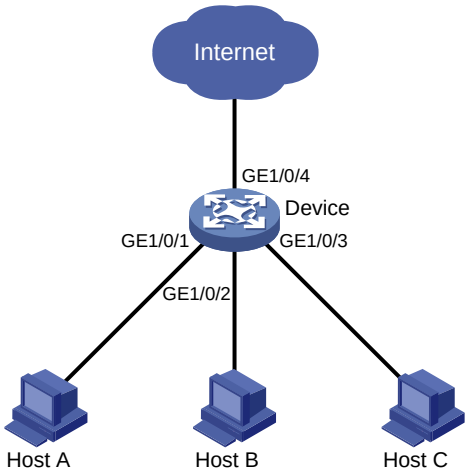
Network configuration

As shown in Figure 1:

- LAN users Host A, Host B, and Host C are connected to GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 on the device, respectively.
- The device connects to the Internet through GigabitEthernet 1/0/4.

Configure the device to provide Internet access for the hosts, and isolate them from one another at Layer 2.

Figure 1 Network diagram



Procedure

Create isolation group 2.

```
<Device> system-view
[Device] port-isolate group 2
```

Assign GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 to isolation group 2.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] port-isolate enable group 2
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] port-isolate enable group 2
[Device-GigabitEthernet1/0/2] quit
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] port-isolate enable group 2
[Device-GigabitEthernet1/0/3] quit
```

Verifying the configuration

Display information about isolation group 2.

```
[Device] display port-isolate group 2
 Port isolation group information:
 Group ID: 2
 Group members:
   GigabitEthernet1/0/1     GigabitEthernet1/0/2     GigabitEthernet1/0/3
```

The output shows that GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 are assigned to isolation group 2. As a result, Host A, Host B, and Host C are isolated from one another at layer 2.

Spanning tree protocol overview

Spanning tree protocols eliminate loops in a physical link-redundant network by selectively blocking redundant links and putting them in a standby state.

The recent versions of STP include the Rapid Spanning Tree Protocol (RSTP), the Per-VLAN Spanning Tree (PVST), and the Multiple Spanning Tree Protocol (MSTP).

About STP

STP was developed based on the 802.1d standard of IEEE to eliminate loops at the data link layer in a LAN. Networks often have redundant links as backups in case of failures, but loops are a very serious problem. Devices running STP detect loops in the network by exchanging information with one another. They eliminate loops by selectively blocking certain ports to prune the loop structure into a loop-free tree structure. This avoids proliferation and infinite cycling of packets that would occur in a loop network.

In a narrow sense, STP refers to IEEE 802.1d STP. In a broad sense, STP refers to the IEEE 802.1d STP and various enhanced spanning tree protocols derived from that protocol.

STP protocol frames

STP uses bridge protocol data units (BPDUs), also known as configuration messages, as its protocol frames. This chapter uses BPDUs to represent all types of spanning tree protocol frames.

STP-enabled devices exchange BPDUs to establish a spanning tree. BPDUs contain sufficient information for the devices to complete spanning tree calculation.

STP uses two types of BPDUs, configuration BPDUs and topology change notification (TCN) BPDUs.

Configuration BPDUs

Devices exchange configuration BPDUs to elect the root bridge and determine port roles. Figure 1 shows the configuration BPDU format.

Figure 1 Configuration BPDU format

DMA: Destination MAC address
SMA: Source MAC address
L/T: Frame length
LLC header: Logical link control header
Payload: BPDU data

Fields	Byte
Protocol ID	2
Protocol version ID	1
BPDU type	1
Flags	1
Root ID	8
Root path cost	4
Bridge ID	8
Port ID	2
Message age	2
Max age	2
Hello time	2
Forward delay	2

The payload of a configuration BPDU includes the following fields:

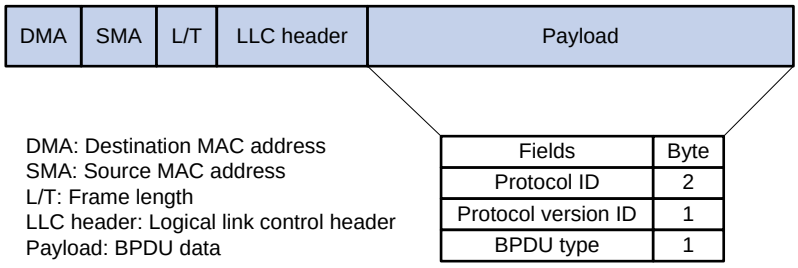
- **Protocol ID**—Fixed at 0x0000, which represents IEEE 802.1d.
- **Protocol version ID**—Spanning tree protocol version ID. The protocol version ID for STP is 0x00.
- **BPDU type**—Type of the BPDU. The value is 0x00 for a configuration BPDU.
- **Flags**—An 8-bit field indicates the purpose of the BPDU. The lowest bit is the Topology Change (TC) flag. The highest bit is the Topology Change Acknowledge (TCA) flag. All other bits are reserved.
- **Root ID**—Root bridge ID formed by the priority and MAC address of the root bridge.
- **Root path cost**—Cost of the path to the root bridge.
- **Bridge ID**—Designated bridge ID formed by the priority and MAC address of the designated bridge.
- **Port ID**—Designated port ID formed by the priority and global port number of the designated port.
- **Message age**—Age of the configuration BPDU while it propagates in the network.
- **Max age**—Maximum age of the configuration BPDU stored on the switch.
- **Hello time**—Configuration BPDU transmission interval.
- **Forward delay**—Delay for STP bridges to transit port state.

Devices use the root bridge ID, root path cost, designated bridge ID, designated port ID, message age, max age, hello time, and forward delay for spanning tree calculation.

TCN BPDUs

Devices use TCN BPDUs to announce changes in the network topology. Figure 2 shows the TCN BPDU format.

Figure 2 TCN BPDU format



The payload of a TCN BPDU includes the following fields:

- **Protocol ID**—Fixed at 0x0000, which represents IEEE 802.1d.
- **Protocol version ID**—Spanning tree protocol version ID. The protocol version ID for STP is 0x00.
- **BPDU type**—Type of the BPDU. The value is 0x80 for a TCN BPDU.

A non-root bridge sends TCN BPDUs when one of the following events occurs on the bridge:

- A port transits to the forwarding state, and the bridge has a minimum of one designated port.
- A port transits from the forwarding or learning state to the blocking state.

The non-root bridge uses TCN BPDUs to notify the root bridge once the network topology changes. The root bridge then sets the TC flag in its configuration BPDU and propagates it to other bridges.

Basic concepts in STP

Root bridge

A tree network must have a root bridge. The entire network contains only one root bridge, and all the other bridges in the network are called leaf nodes. The root bridge is not permanent, but can change with changes of the network topology.

Upon initialization of a network, each device generates and periodically sends configuration BPDUs, with itself as the root bridge. After network convergence, only the root bridge generates and periodically sends configuration BPDUs. The other devices only forward the BPDUs.

Root port

On a non-root bridge, the port nearest to the root bridge is the root port. The root port communicates with the root bridge. Each non-root bridge has only one root port. The root bridge has no root port.

Designated bridge and designated port

Classification	Designated bridge	Designated port
For a device	Device directly connected to the local device and responsible for forwarding BPDUs to the local device.	Port through which the designated bridge forwards BPDUs to this device.
For a LAN	Device responsible for forwarding BPDUs to this LAN segment.	Port through which the designated bridge forwards BPDUs to this LAN segment.

As shown in Figure 3, Device B and Device C are directly connected to a LAN.

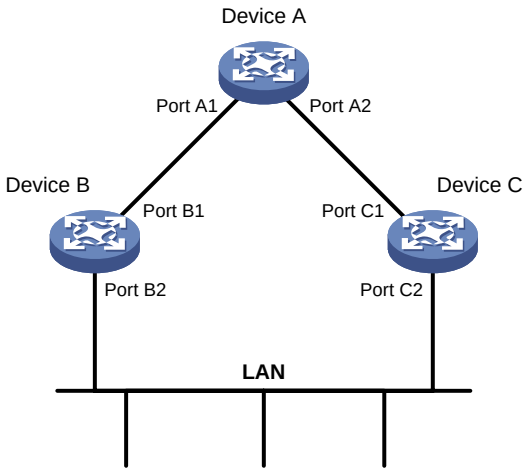
If Device A forwards BPDUs to Device B through port A1, the designated bridge and designated port are as follows:

- The designated bridge for Device B is Device A.
- The designated port for Device B is port A1 on Device A.

If Device B forwards BPDUs to the LAN, the designated bridge and designated port are as follows:

- The designated bridge for the LAN is Device B.
- The designated port for the LAN is port B2 on Device B.

Figure 3 Designated bridges and designated ports



Port states

Table 1 lists the port states in STP.

Table 1 STP port states

State	Receives/sends BPDUs	Learns MAC addresses	Forwards user data
Disabled	No	No	No
Listening	Yes	No	No
Learning	Yes	Yes	No
Forwarding	Yes	Yes	Yes
Blocking	Receive	No	No

Path cost

Path cost is a reference value used for link selection in STP. To prune the network into a loop-free tree, STP calculates path costs to select the most robust links and block redundant links that are less robust.

Calculation process of the STP algorithm

In STP calculation, a device compares the priorities of the received configuration BPDUs from different ports, and elects the root bridge, root ports and designated ports. When the spanning tree calculation is completed, a tree-shape topology forms.

The spanning tree calculation process described in the following sections is an example of a simplified process.

Network initialization

Upon initialization of a device, each port generates a BPDU with the following contents:

- The port as the designated port.
- The device as the root bridge.
- 0 as the root path cost.
- The device ID as the designated bridge ID.

Root bridge selection

The root bridge can be selected in the following methods:

- **Automatic election**—Initially, each STP-enabled device on the network assumes itself to be the root bridge, with its own device ID as the root bridge ID. By exchanging configuration BPDUs, the devices compare their root bridge IDs to elect the device with the smallest root bridge ID as the root bridge.
- **Manual assignment**—You can configure a device as the root bridge or a secondary root bridge of a spanning tree.
  - A spanning tree can have only one root bridge. If you configure multiple devices as the root bridge for a spanning tree, the device with the lowest MAC address is selected.
  - You can configure one or multiple secondary root bridges for a spanning tree. When the root bridge fails or is shut down, a secondary root bridge can take over. If multiple secondary root bridges are configured, the one with the lowest MAC address is selected. However, if a new root bridge is configured, the secondary root bridge is not selected.

Root port and designated ports selection on the non-root bridges

Step	Description
1	A non-root-bridge device regards the port on which it received the optimum configuration BPDU as the root port. Table 2 describes how the optimum configuration BPDU is selected.

Step	Description
2	Based on the configuration BPDU and the path cost of the root port, the device calculates a designated port configuration BPDU for each of the other ports. • The root bridge ID is replaced with that of the configuration BPDU of the root port. • The root path cost is replaced with that of the configuration BPDU of the root port plus the path cost of the root port. • The designated bridge ID is replaced with the ID of this device. • The designated port ID is replaced with the ID of this port.

3	The device compares the calculated configuration BPDU with the configuration BPDU on the port whose port role will be determined. Then, the device acts depending on the result of the comparison:
	• If the calculated configuration BPDU is superior, the device performs the following operations:
	  ○ Considers this port as the designated port.
	  ○ Replaces the configuration BPDU on the port with the calculated configuration BPDU.
	  ○ Periodically sends the calculated configuration BPDU.
	• If the configuration BPDU on the port is superior, the device blocks this port without updating its configuration BPDU. The blocked port can receive BPDUs, but cannot send BPDUs or forward data traffic.

When the network topology is stable, only the root port and designated ports forward user traffic. Other ports are all in the blocking state to receive BPDUs but not to forward BPDUs or user traffic.

Table 2 Selecting the optimum configuration BPDU

Step	Actions
1	Upon receiving a configuration BPDU on a port, the device compares the priority of the received configuration BPDU with that of the configuration BPDU generated by the port. • If the former priority is lower, the device discards the received configuration BPDU and keeps the configuration BPDU the port generated. • If the former priority is higher, the device replaces the content of the configuration BPDU generated by the port with the content of the received configuration BPDU.
2	The device compares the configuration BPDUs of all the ports and chooses the optimum configuration BPDU.

The following are the principles of configuration BPDU comparison:

1. The configuration BPDU with the lowest root bridge ID has the highest priority.
2. If configuration BPDUs have the same root bridge ID, their root path costs are compared. For example, the root path cost in a configuration BPDU plus the path cost of a receiving port is S. The configuration BPDU with the smallest S value has the highest priority.
3. If all configuration BPDUs have the same root bridge ID and S value, the following attributes are compared in sequence:
   a. Designated bridge IDs.
   b. Designated port IDs.
   c. IDs of the receiving ports.

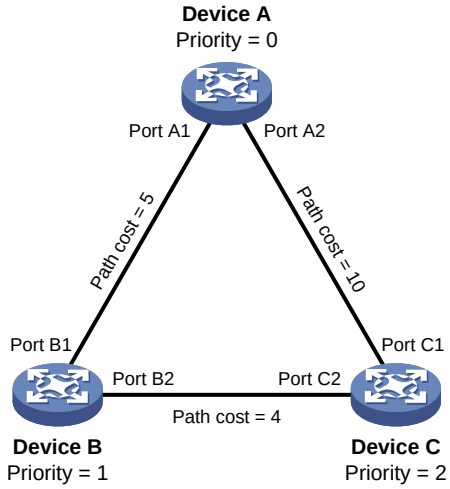
   The configuration BPDU that contains a smaller designated bridge ID, designated port ID, or receiving port ID is selected.

A tree-shape topology forms when the root bridge, root ports, and designated ports are selected.

Example of STP calculation

Figure 4 provides an example showing how the STP algorithm works.

Figure 4 The STP algorithm



As shown in Figure 4, the priority values of Device A, Device B, and Device C are 0, 1, and 2, respectively. The path costs of links among the three devices are 5, 10, and 4.

Device state initialization

In Table 3, each configuration BPDU contains the following fields: root bridge ID, root path cost, designated bridge ID, and designated port ID.

Table 3 Initial state of each device

Device	Port name	Configuration BPDU on the port
Device A	Port A1	{0, 0, 0, Port A1}
	Port A2	{0, 0, 0, Port A2}
Device B	Port B1	{1, 0, 1, Port B1}
	Port B2	{1, 0, 1, Port B2}
Device C	Port C1	{2, 0, 2, Port C1}
	Port C2	{2, 0, 2, Port C2}

Configuration BPDUs comparison on each device

In Table 4, each configuration BPDU contains the following fields: root bridge ID, root path cost, designated bridge ID, and designated port ID.

Table 4 Comparison process and result on each device

Device	Comparison process	Configuration BPDU on ports after comparison
Device A	Port A1 performs the following operations: **1.** Receives the configuration BPDU of Port B1 {1, 0, 1, Port B1}. **2.** Determines that its existing configuration BPDU {0, 0, 0, Port A1} is superior to the received configuration BPDU. **3.** Discards the received one. Port A2 performs the following operations: **1.** Receives the configuration BPDU of Port C1 {2, 0, 2, Port C1}. **2.** Determines that its existing configuration BPDU {0, 0, 0, Port A2} is superior to the received configuration BPDU. **3.** Discards the received one. Device A determines that it is both the root bridge and designated bridge in the configuration BPDUs of all its ports. It considers itself as the root bridge. It does not change the configuration BPDU of any port and starts to periodically send configuration BPDUs.	• Port A1: {0, 0, 0, Port A1} • Port A2: {0, 0, 0, Port A2}
Device B	Port B1 performs the following operations: **4.** Receives the configuration BPDU of Port A1 {0, 0, 0, Port A1}. **5.** Determines that the received configuration BPDU is superior to its existing configuration BPDU {1, 0, 1, Port B1}. **6.** Updates its configuration BPDU. Port B2 performs the following operations: **1.** Receives the configuration BPDU of Port C2 {2, 0, 2, Port C2}. **2.** Determines that its existing configuration BPDU {1, 0, 1, Port B2} is superior to the received configuration BPDU. **3.** Discards the received BPDU.	• Port B1: {0, 0, 0, Port A1} • Port B2: {1, 0, 1, Port B2}
	Device B performs the following operations: **1.** Compares the configuration BPDUs of all its ports. **2.** Decides that the configuration BPDU of Port B1 is the optimum. **3.** Selects Port B1 as the root port with the configuration BPDU unchanged. Based on the configuration BPDU and path cost of the root port, Device B calculates a designated port configuration BPDU for Port B2 {0, 5, 1, Port B2}. Device B compares it with the existing configuration BPDU of Port B2 {1, 0, 1, Port B2}. Device B determines that the calculated one is superior, and determines that Port B2 is the designated port. It replaces the configuration BPDU on Port B2 with the calculated one, and periodically sends the calculated configuration BPDU.	• Root port (Port B1): {0, 0, 0, Port A1} • Designated port (Port B2): {0, 5, 1, Port B2}
Device C	Port C1 performs the following operations: **1.** Receives the configuration BPDU of Port A2 {0, 0, 0, Port A2}. **2.** Determines that the received configuration BPDU is superior to its existing configuration BPDU {2, 0, 2,	• Port C1: {0, 0, 0, Port A2} • Port C2: {1, 0, 1, Port B2}

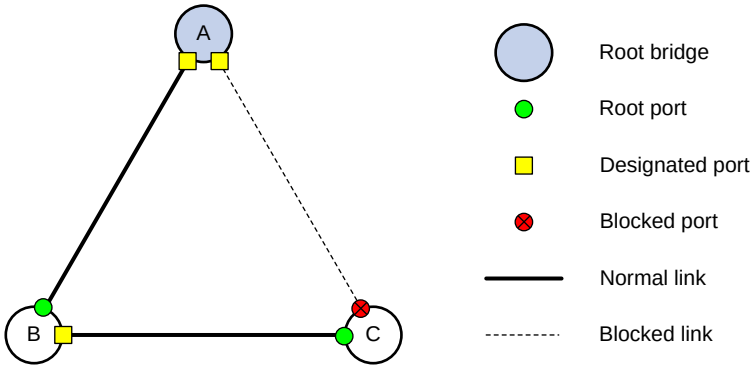
Device	Comparison process	Configuration BPDU on ports after comparison
	Port C1}. **3.** Updates its configuration BPDU. Port C2 performs the following operations: **1.** Receives the original configuration BPDU of Port B2 {1, 0, 1, Port B2}. **2.** Determines that the received configuration BPDU is superior to the existing configuration BPDU {2, 0, 2, Port C2}. **3.** Updates its configuration BPDU.	
	Device C performs the following operations: **1.** Compares the configuration BPDUs of all its ports. **2.** Decides that the configuration BPDU of Port C1 is the optimum. **3.** Selects Port C1 as the root port with the configuration BPDU unchanged. Based on the configuration BPDU and path cost of the root port, Device C calculates the configuration BPDU of Port C2 {0, 10, 2, Port C2}. Device C compares it with the existing configuration BPDU of Port C2 {1, 0, 1, Port B2}. Device C determines that the calculated configuration BPDU is superior to the existing one, selects Port C2 as the designated port, and replaces the configuration BPDU of Port C2 with the calculated one.	• Root port (Port C1): {0, 0, 0, Port A2} • Designated port (Port C2): {0, 10, 2, Port C2}
	Port C2 performs the following operations: **1.** Receives the updated configuration BPDU of Port B2 {0, 5, 1, Port B2}. **2.** Determines that the received configuration BPDU is superior to its existing configuration BPDU {0, 10, 2, Port C2}. **3.** Updates its configuration BPDU. Port C1 performs the following operations: **1.** Receives a periodic configuration BPDU {0, 0, 0, Port A2} from Port A2. **2.** Determines that it is the same as the existing configuration BPDU. **3.** Discards the received BPDU.	• Port C1: {0, 0, 0, Port A2} • Port C2: {0, 5, 1, Port B2}
	Device C determines that the root path cost of Port C1 is larger than that of Port C2. The root path cost of Port C1 is 10, root path cost of the received configuration BPDU (0) plus path cost of Port C1 (10). The root path cost of Port C2 is 9, root path cost of the received configuration BPDU (5) plus path cost of Port C2 (4). Device C determines that the configuration BPDU of Port C2 is the optimum, and selects Port C2 as the root port with the configuration BPDU unchanged. Based on the configuration BPDU and path cost of the root port, Device C performs the following operations: **1.** Calculates a designated port configuration BPDU for Port C1 {0, 9, 2, Port C1}. **2.** Compares it with the existing configuration BPDU of Port C1 {0, 0, 0, Port A2}. **3.** Determines that the existing configuration BPDU is superior to the calculated one and blocks Port C1 with the configuration BPDU unchanged. Port C1 does not forward data until a new event triggers a	• Blocked port (Port C1): {0, 0, 0, Port A2} • Root port (Port C2): {0, 5, 1, Port B2}

Device	Comparison process	Configuration BPDU on ports after comparison
	spanning tree calculation process: for example, the link between Device B and Device C is down.	

Final calculated spanning tree

After the comparison processes described in Table 4, a spanning tree with Device A as the root bridge is established, as shown in Figure 5.

Figure 5 The final calculated spanning tree



The configuration BPDU forwarding mechanism of STP

The configuration BPDUs of STP are forwarded according to these guidelines:

- Upon network initiation, every device regards itself as the root bridge and generates configuration BPDUs with itself as the root. Then it sends the configuration BPDUs at a regular hello interval.
- If the root port receives a configuration BPDU superior to the configuration BPDU of the port, the device performs the following operations:
  - Increases the message age carried in the configuration BPDU.
  - Starts a timer to time the configuration BPDU.
  - Sends this configuration BPDU through the designated port.
- If a designated port receives a configuration BPDU with a lower priority than its configuration BPDU, the port immediately responds with its configuration BPDU.
- If a path fails, the root port on this path no longer receives new configuration BPDUs and the old configuration BPDUs will be discarded due to timeout. The device generates a configuration BPDU with itself as the root and sends the BPDUs and TCN BPDUs. This triggers a new spanning tree calculation process to establish a new path to restore the network connectivity.

However, the newly calculated configuration BPDU cannot be propagated throughout the network immediately. As a result, the old root ports and designated ports that have not detected the topology change continue forwarding data along the old path. If the new root ports and designated ports begin to forward data as soon as they are elected, a temporary loop might occur.

STP timers

The most important timing parameters in STP calculation are forward delay, hello time, and max age.

- Forward delay

  Forward delay is the delay time for port state transition. By default, the forward delay is 15 seconds.

  A path failure can cause spanning tree re-calculation to adapt the spanning tree structure to the change. However, the resulting new configuration BPDU cannot propagate throughout the network immediately. If the newly elected root ports and designated ports start to forward data immediately, a temporary loop will likely occur.

  The newly elected root ports or designated ports must go through the listening and learning states before they transit to the forwarding state. This requires twice the forward delay time and allows the new configuration BPDU to propagate throughout the network.

- Hello time

  The device sends configuration BPDUs at the hello time interval to the neighboring devices to ensure that the paths are fault-free. By default, the hello time is 2 seconds. If the device does not receive configuration BPDUs within the timeout period, it recalculates the spanning tree. The formula for calculating the timeout period is timeout period = timeout factor × 3 × hello time.

- Max age

  The device uses the max age to determine whether a stored configuration BPDU has expired and discards it if the max age is exceeded. By default, the max age is 20 seconds. In the CIST of an MSTP network, the device uses the max age timer to determine whether a configuration BPDU received by a port has expired. If it is expired, a new spanning tree calculation process starts. The max age timer does not take effect on MSTIs.

If a port does not receive any configuration BPDUs within the timeout period, the port transits to the listening state. The device will recalculate the spanning tree. It takes the port 50 seconds to transit back to the forwarding state. This period includes 20 seconds for the max age, 15 seconds for the listening state, and 15 seconds for the learning state.

To ensure a fast topology convergence, make sure the timer settings meet the following formulas:

- 2 × (forward delay – 1 second) ≥ max age
- Max age ≥ 2 × (hello time + 1 second)

About RSTP

RSTP achieves rapid network convergence by allowing a newly elected root port or designated port to enter the forwarding state much faster than STP.

RSTP protocol frames

An RSTP BPDU uses the same format as an STP BPDU except that a Version1 length field is added to the payload of RSTP BPDUs. The differences between an RSTP BPDU and an STP BPDU are as follows:

- **Protocol version ID**—The value is 0x02 for RSTP.
- **BPDU type**—The value is 0x02 for RSTP BPDUs.
- **Flags**—All 8 bits are used.
- **Version1 length**—The value is 0x00, which means no version 1 protocol information is present.

RSTP does not use TCN BPDUs to advertise topology changes. RSTP floods BPDUs with the TC flag set in the network to advertise topology changes.

Basic concepts in RSTP

Port roles

In addition to root port and designated port, RSTP also uses the following port roles:

- **Alternate port**—Acts as the backup port for a root port. When the root port is blocked, the alternate port takes over.
- **Backup port**—Acts as the backup port of a designated port. When the designated port is invalid, the backup port becomes the new designated port. A loop occurs when two ports of the same spanning tree device are connected, so the device blocks one of the ports. The blocked port is the backup port.
- **Edge port**—Directly connects to a user host rather than a network device or network segment.

Port states

RSTP uses the discarding state to replace the disabled, blocking, and listening states in STP. Table 5 shows the differences between the port states in RSTP and STP.

Table 5 Port state differences between RSTP and STP

STP port state	RSTP port state	Sends BPDU	Learns MAC addresses	Forwards user data
Disabled	Discarding	No	No	No
Blocking	Discarding	No	No	No
Listening	Discarding	Yes	No	No
Learning	Learning	Yes	Yes	No
Forwarding	Forwarding	Yes	Yes	Yes

How RSTP works

During RSTP calculation, the following events occur:

- If a port in discarding state becomes an alternate port, it retains its state.
- If a port in discarding state is elected as the root port or designated port, it enters the learning state after the forward delay. The port learns MAC addresses, and enters the forwarding state after another forward delay.
  - A newly elected RSTP root port rapidly enters the forwarding state if the following requirements are met:
    - The old root port on the device has stopped forwarding data.
    - The upstream designated port has started forwarding data.
  - A newly elected RSTP designated port rapidly enters the forwarding state if one of the following requirements is met:
    - The designated port is configured as an edge port which directly connects to a user terminal.
    - The designated port connects to a point-to-point link and receives a handshake response from the directly connected device.

RSTP BPDU processing

In RSTP, a non-root bridge actively sends RSTP BPDUs at the hello time through designated ports without waiting for the root bridge to send RSTP BPDUs. This enables RSTP to quickly detect link

failures. If a device fails to receive any RSTP BPDUs on a port within triple the hello time, the device considers that a link failure has occurred. After the stored configuration BPDU expires, the device floods RSTP BPDUs with the TC flag set to initiate a new RSTP calculation.

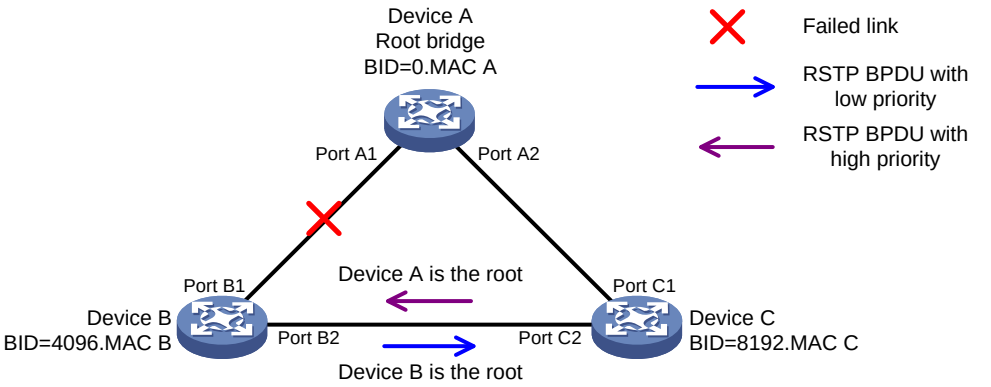
In RSTP, a port in blocking state can immediately respond to an RSTP BPDU with a lower priority than its own BPDU.

As shown in Figure 6, Device A is the root bridge. The priority of Device B is higher than the priority of Device C. Port C2 on Device C is blocked.

When the link between Device A and Device B fails, the following events occur:

1. Device B sends an RSTP BPDU with itself as the root bridge to Device C.
2. Device C compares the RSTP BPDU with its own BPDU.
3. Because the RSTP BPDU from Device B has a lower priority, Device C sends its own BPDU to Device B.
4. Device B considers that Port B2 is the root port and stops sending RSTP BPDUs to Device C.

Figure 6 BPDU processing in RSTP



About PVST

In an STP- or RSTP-enabled LAN, all bridges share one spanning tree. Traffic from all VLANs is forwarded along the spanning tree, and ports cannot be blocked on a per-VLAN basis to prune loops.

PVST allows every VLAN to have its own spanning tree, which increases usage of links and bandwidth. Because each VLAN runs RSTP independently, a spanning tree only serves its VLAN.

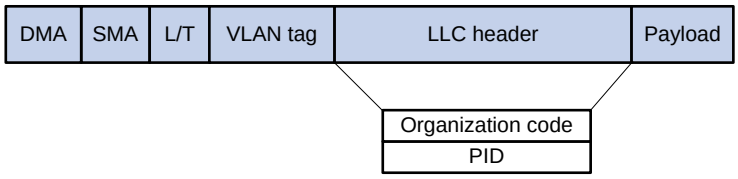
A PVST-enabled H3C device can communicate with a third-party device that is running Rapid PVST or PVST. The PVST-enabled H3C device supports fast network convergence like RSTP when connected to PVST-enabled H3C devices or third-party devices enabled with Rapid PVST.

PVST protocol frames

As shown in Figure 7, a PVST BPDU uses the same format as an RSTP BPDU except the following differences:

- The destination MAC address of a PVST BPDU is 01-00-0c-cc-cc-cd, which is a private MAC address.
- Each PVST BPDU carries a VLAN tag. The VLAN tag identifies the VLAN to which the PVST BPDU belongs.
- The organization code and PID fields are added to the LLC header of the PVST BPDU.

Figure 7 PVST BPDU format



A port's link type determines the type of BPDUs the port sends.

- An access port sends RSTP BPDUs.
- A trunk or hybrid port sends RSTP BPDUs in the default VLAN and sends PVST BPDUs in other VLANs.

How PVST works

PVST implements per-VLAN spanning tree calculation by mapping each VLAN to an MSTI. In PVST, each VLAN runs RSTP independently to maintain its own spanning tree without affecting the spanning trees of other VLANs. In this way, loops in each VLAN are eliminated and traffic of different VLANs is load shared over links. PVST uses RSTP BPDUs in the default VLAN and PVST BPDUs in other VLANs for spanning tree calculation.

PVST uses the same port roles and port states as RSTP for rapid transition. For more information, see "Basic concepts in RSTP."

About MSTP

MSTP features

Developed based on IEEE 802.1s, MSTP overcomes the limitations of STP, RSTP, and PVST. In addition to supporting rapid network convergence, it allows data flows of different VLANs to be forwarded along separate paths. This provides a better load sharing mechanism for redundant links.

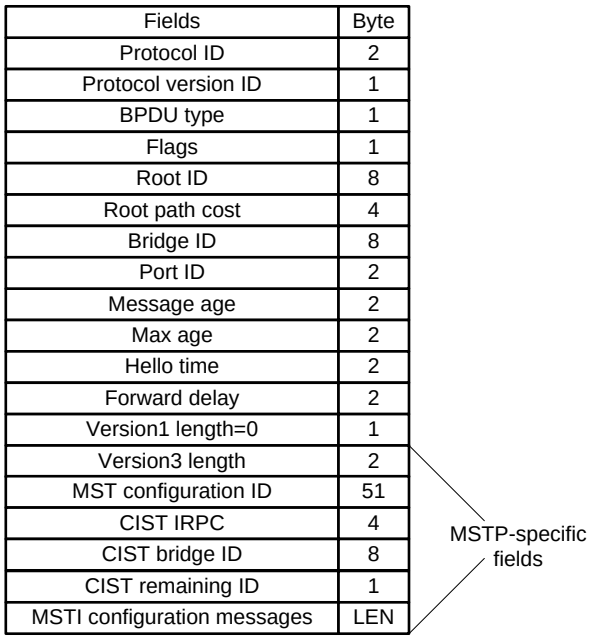
MSTP provides the following features:

- MSTP divides a switched network into multiple regions, each of which contains multiple spanning trees that are independent of one another.
- MSTP supports mapping VLANs to spanning tree instances by means of a VLAN-to-instance mapping table. MSTP can reduce communication overheads and resource usage by mapping multiple VLANs to one instance.
- MSTP prunes a loop network into a loop-free tree, which avoids proliferation and endless cycling of frames in a loop network. In addition, it supports load balancing of VLAN data by providing multiple redundant paths for data forwarding.
- MSTP is compatible with STP and RSTP, and partially compatible with PVST.

MSTP protocol frames

Figure 8 shows the format of an MSTP BPDU.

Figure 8 MSTP BPDU format



The first 13 fields of an MSTP BPDU are the same as an RSTP BPDU. The other six fields are unique to MSTP.

- **Protocol version ID**—The value is 0x03 for MSTP.
- **BPDU type**—The value is 0x02 for RSTP/MSTP BPDUs.
- **Root ID**—ID of the common root bridge.
- **Root path cost**—CIST external path cost.
- **Bridge ID**—ID of the regional root for the IST or an MSTI.
- **Port ID**—ID of the designated port in the CIST.
- **Version3 length**—Length of the MSTP-specific fields. Devices use this field for verification upon receiving an MSTP BPDU.
- **MST configuration ID**—Includes the format selector, configuration name, revision level, and configuration digest. The value for format selector is fixed at 0x00. The other parameters are used to identify the MST region for the originating bridge.
- **CIST IRPC**—Internal root path cost (IRPC) from the originating bridge to the root of the MST region.
- **CIST bridge ID**—ID of the bridge that sends the MSTP BPDU.
- **CIST remaining ID**—Remaining hop count. This field limits the scale of the MST region. The regional root sends a BPDU with the remaining hop count set to the maximum value. Each device that receives the BPDU decrements the hop count by one. When the hop count reaches zero, the BPDU is discarded. Devices beyond the maximum hops of the MST region cannot participate in spanning tree calculation. The default remaining hop count is 20.
- **MSTI configuration messages**—Contains MSTI configuration messages. Each MSTI configuration message is 16 bytes. This field can contain 0 to 64 MSTI configuration messages. The number of the MSTI configuration messages is determined by the number of MSTIs in the MST region.

Basic concepts in MSTP

Figure 9 shows a switched network that contains four MST regions, each MST region containing four MSTP devices. Figure 10 shows the networking topology of MST region 3.

Figure 9 Basic concepts in MSTP

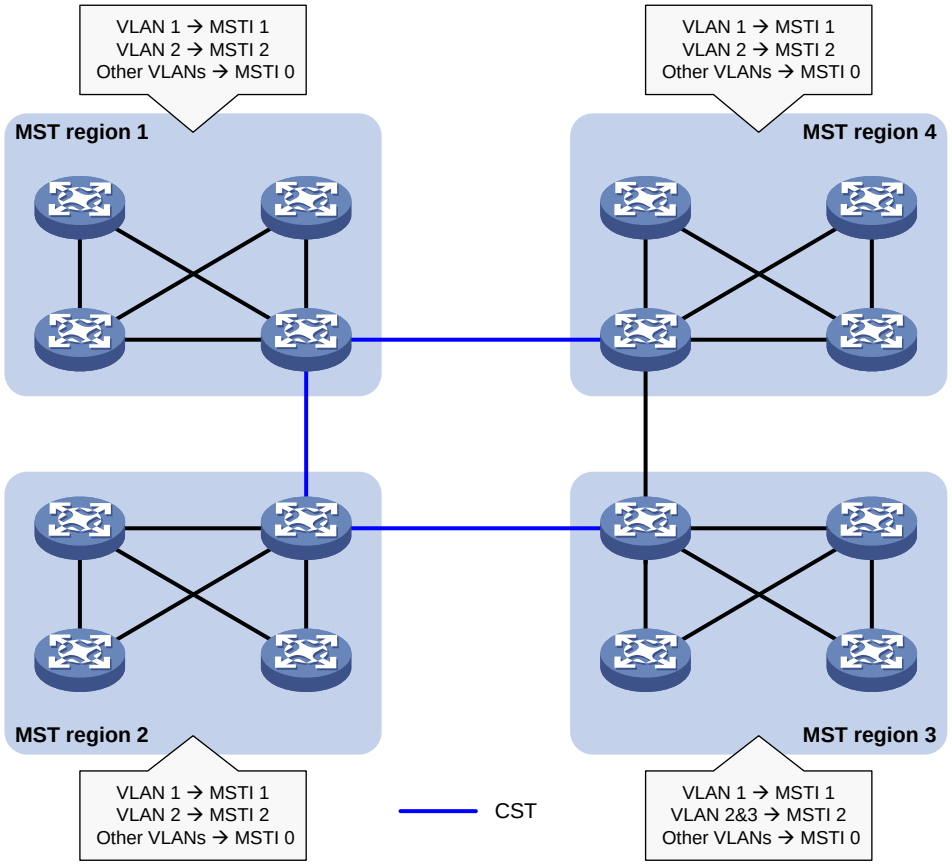


Figure 10 Network diagram and topology of MST region 3

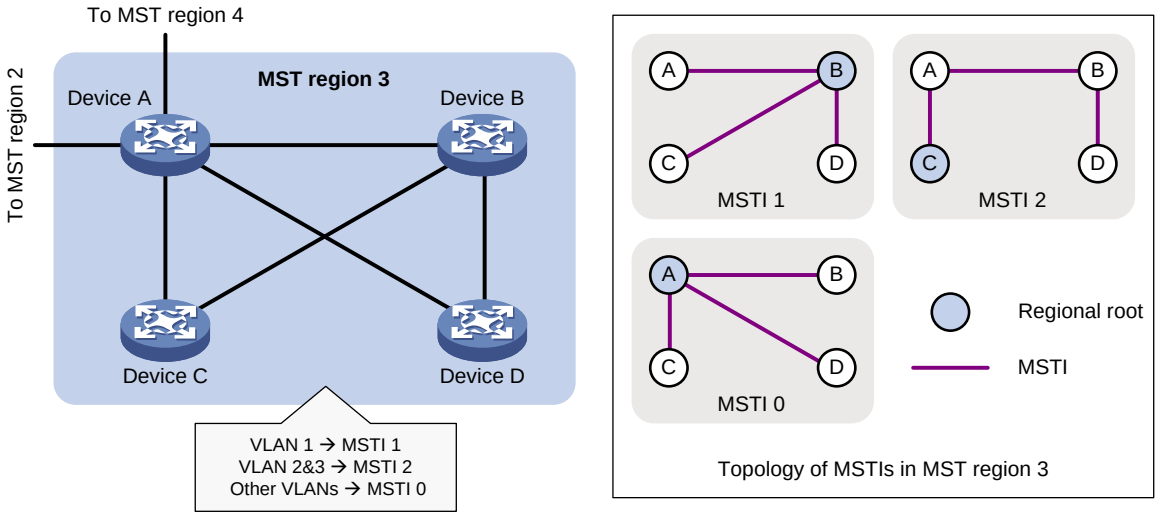


MST region

A multiple spanning tree region (MST region) consists of multiple devices in a switched network and the network segments among them. All these devices have the following characteristics:

- A spanning tree protocol enabled
- Same region name
- Same VLAN-to-instance mapping configuration
- Same MSTP revision level
- Physically linked together

Multiple MST regions can exist in a switched network. You can assign multiple devices to the same MST region, as shown in Figure 9.

- The switched network contains four MST regions, MST region 1 through MST region 4.
- All devices in each MST region have the same MST region configuration.

MSTI

MSTP can generate multiple independent spanning trees in an MST region, and each spanning tree is mapped to the specific VLANs. Each spanning tree is referred to as a multiple spanning tree instance (MSTI).

In Figure 10, MST region 3 contains three MSTIs, MSTI 1, MSTI 2, and MSTI 0.

VLAN-to-instance mapping table

As an attribute of an MST region, the VLAN-to-instance mapping table describes the mapping relationships between VLANs and MSTIs.

In Figure 10, the VLAN-to-instance mapping table of MST region 3 is as follows:

- VLAN 1 to MSTI 1.
- VLAN 2 and VLAN 3 to MSTI 2.
- Other VLANs to MSTI 0.

MSTP achieves load balancing by means of the VLAN-to-instance mapping table.

CST

The common spanning tree (CST) is a single spanning tree that connects all MST regions in a switched network. If you regard each MST region as a device, the CST is a spanning tree calculated by these devices through STP or RSTP.

The blue lines in Figure 9 represent the CST.

IST

An internal spanning tree (IST) is a spanning tree that runs in an MST region. It is also called MSTI 0, a special MSTI to which all VLANs are mapped by default.

In Figure 9, MSTI 0 is the IST in MST region 3.

CIST

The common and internal spanning tree (CIST) is a single spanning tree that connects all devices in a switched network. It consists of the ISTs in all MST regions and the CST.

In Figure 9, the ISTs (MSTI 0) in all MST regions plus the inter-region CST constitute the CIST of the entire network.

Regional root

The root bridge of the IST or an MSTI within an MST region is the regional root of the IST or MSTI. Based on the topology, different spanning trees in an MST region might have different regional roots, as shown in MST region 3 in Figure 10.

- The regional root of MSTI 1 is Device B.
- The regional root of MSTI 2 is Device C.
- The regional root of MSTI 0 (also known as the IST) is Device A.

Common root bridge

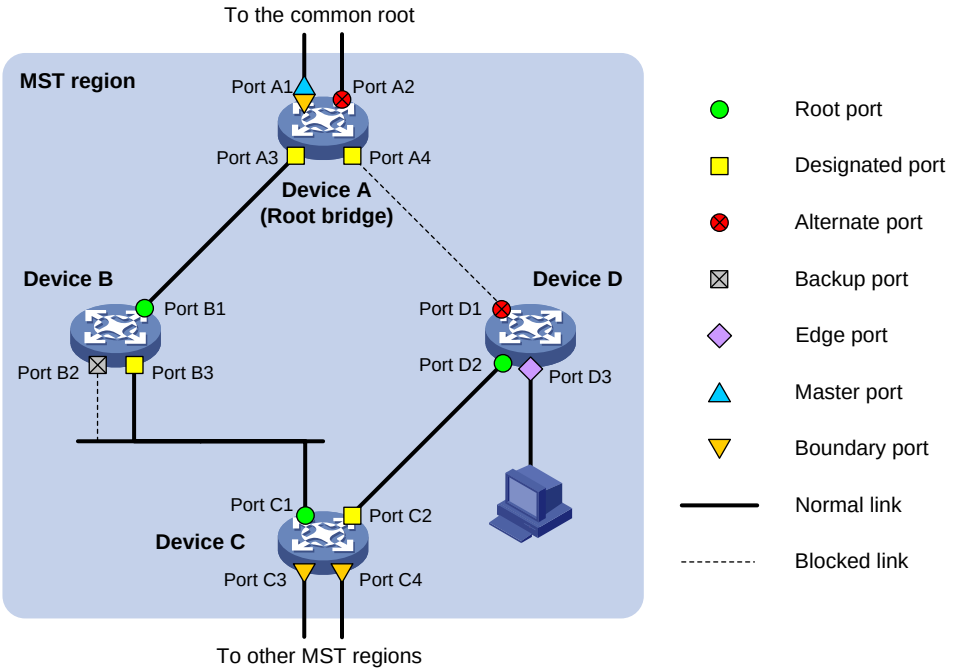
The common root bridge is the root bridge of the CIST.

In Figure 9, the common root bridge is a device in MST region 1.

Port roles

A port can play different roles in different MSTIs. As shown in Figure 11, an MST region contains Device A, Device B, Device C, and Device D. Port A1 and port A2 of Device A connect to the common root bridge. Port B2 and Port B3 of Device B form a loop. Port C3 and Port C4 of Device C connect to other MST regions. Port D3 of Device D directly connects to a host.

Figure 11 Port roles



MSTP calculation involves the following port roles:

- **Root port**—Forwards data for a non-root bridge to the root bridge. The root bridge does not have any root port.
- **Designated port**—Forwards data to the downstream network segment or device.
- **Alternate port**—Acts as the backup port for a root port or master port. When the root port or master port is blocked, the alternate port takes over.
- **Backup port**—Acts as the backup port of a designated port. When the designated port is invalid, the backup port becomes the new designated port. A loop occurs when two ports of the same spanning tree device are connected, so the device blocks one of the ports. The blocked port acts as the backup.
- **Edge port**—Directly connects to a user host rather than a network device or network segment.
- **Master port**—Acts as a port on the shortest path from the local MST region to the common root bridge. The master port is not always located on the regional root. It is a root port on the IST or CIST and still a master port on the other MSTIs.
- **Boundary port**—Connects an MST region to another MST region or to an STP/RSTP-running device. In MSTP calculation, a boundary port's role on an MSTI is consistent with its role on the

CIST. However, that is not true with master ports. A master port on MSTIs is a root port on the CIST.

Port states

In MSTP, a port can be in one of the following states:

- **Forwarding**—The port receives and sends BPDUs, learns MAC addresses, and forwards user traffic.
- **Learning**—The port receives and sends BPDUs, learns MAC addresses, but does not forward user traffic. Learning is an intermediate port state.
- **Discarding**—The port receives and sends BPDUs, but does not learn MAC addresses or forward user traffic.

NOTE:

When in different MSTIs, a port can be in different states.

A port state is not exclusively associated with a port role. Table 6 lists the port states that each port role supports. (A check mark [√] indicates that the port supports this state, while a dash [—] indicates that the port does not support this state.)

Table 6 Port states that different port roles support

Port role (right) Port state (below)	Root port/master port	Designated port	Alternate port	Backup port
Forwarding	√	√	—	—
Learning	√	√	—	—
Discarding	√	√	√	√

How MSTP works

MSTP divides an entire Layer 2 network into multiple MST regions, which are connected by a calculated CST. Inside an MST region, multiple spanning trees, called MSTIs, are calculated. Among these MSTIs, MSTI 0 is the IST.

Like STP, MSTP uses configuration BPDUs to calculate spanning trees. An important difference is that an MSTP BPDU carries the MSTP configuration of the bridge from which the BPDU is sent.

CIST calculation

During the CIST calculation, the following process takes place:

- The device with the highest priority is elected as the root bridge of the CIST.
- MSTP generates an IST within each MST region through calculation.
- MSTP regards each MST region as a single device and generates a CST among these MST regions through calculation.

The CST and ISTs constitute the CIST of the entire network.

MSTI calculation

Within an MST region, MSTP generates different MSTIs for different VLANs based on the VLAN-to-instance mappings. For each spanning tree, MSTP performs a separate calculation process similar to spanning tree calculation in STP. For more information, see "Calculation process of the STP algorithm."

In MSTP, a VLAN frame is forwarded along the following paths:

- Within an MST region, the frame is forwarded along the corresponding MSTI.
- Between two MST regions, the frame is forwarded along the CST.

MSTP implementation on devices

MSTP is compatible with STP and RSTP. Devices that are running MSTP and that are used for spanning tree calculation can identify STP and RSTP protocol frames.

In addition to basic MSTP features, the following features are provided for ease of management:

- Root bridge hold.
- Root bridge backup.
- Root guard.
- BPDU guard.
- Loop guard.
- TC-BPDU guard.
- Port role restriction.
- TC-BPDU transmission restriction.

Rapid transition mechanism

In STP, a port must wait twice the forward delay (30 seconds by default) before it transits from the blocking state to the forwarding state. The forward delay is related to the hello time and network diameter. If the forward delay is too short, loops might occur. This affects the stability of the network.

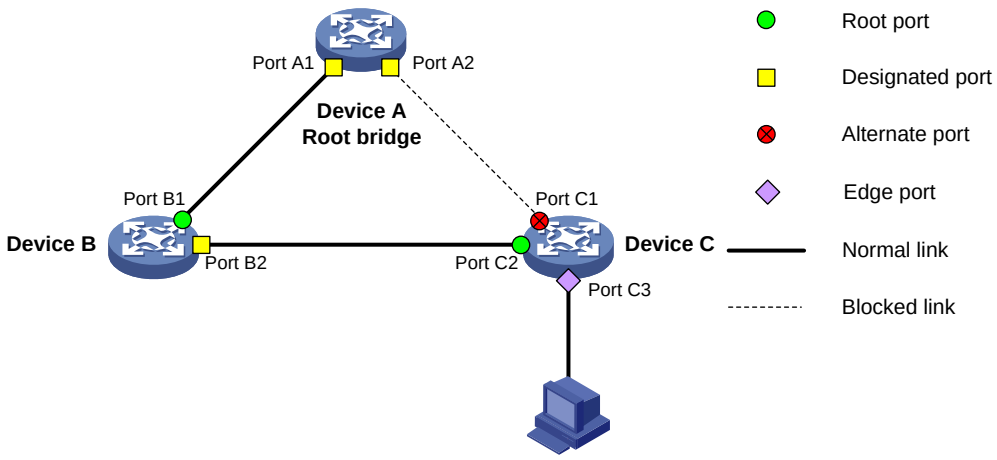
RSTP, PVST, and MSTP all use the rapid transition mechanism to speed up port state transition for edge ports, root ports, and designated ports. The rapid transition mechanism for designated ports is also known as the proposal/agreement (P/A)_transition.

Edge port rapid transition

As shown in Figure 12, Port C3 is an edge port connected to a host. When a network topology change occurs, the port can immediately transit from the blocking state to the forwarding state because no loop will be caused.

Because a device cannot determine whether a port is directly connected to a terminal, you must manually configure the port as an edge port.

Figure 12 Edge port rapid transition

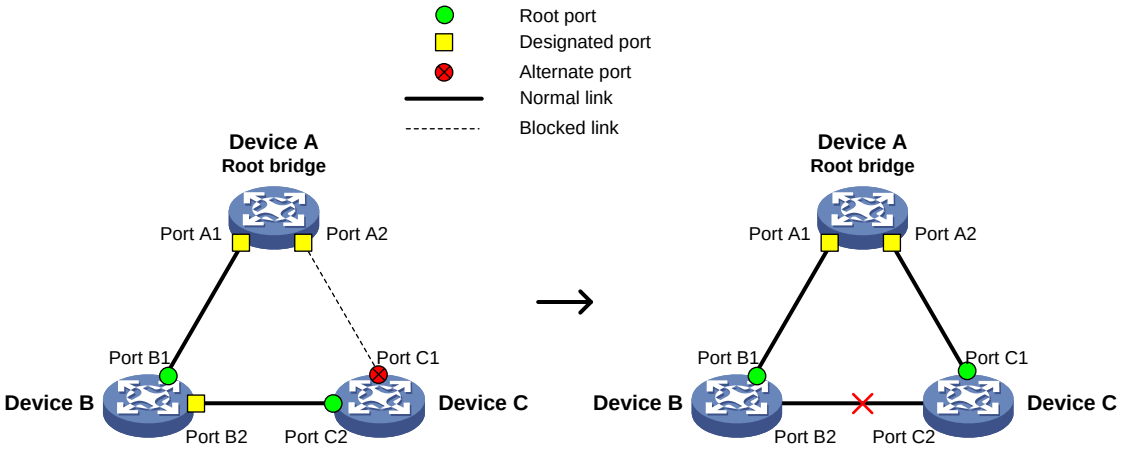


Root port rapid transition

When a root port is blocked, the bridge will elect the alternate port with the highest priority as the new root port. If the new root port's peer is in the forwarding state, the new root port immediately transits to the forwarding state.

As shown in Figure 13, Port C2 on Device C is a root port and Port C1 is an alternate port. When Port C2 transits to the blocking state, Port C1 is elected as the root port and immediately transits to the forwarding state.

Figure 13 Root port rapid transition



P/A transition

The P/A transition enables a designated port to rapidly transit to the forwarding state after a handshake with its peer. The P/A transition applies only to point-to-point links.

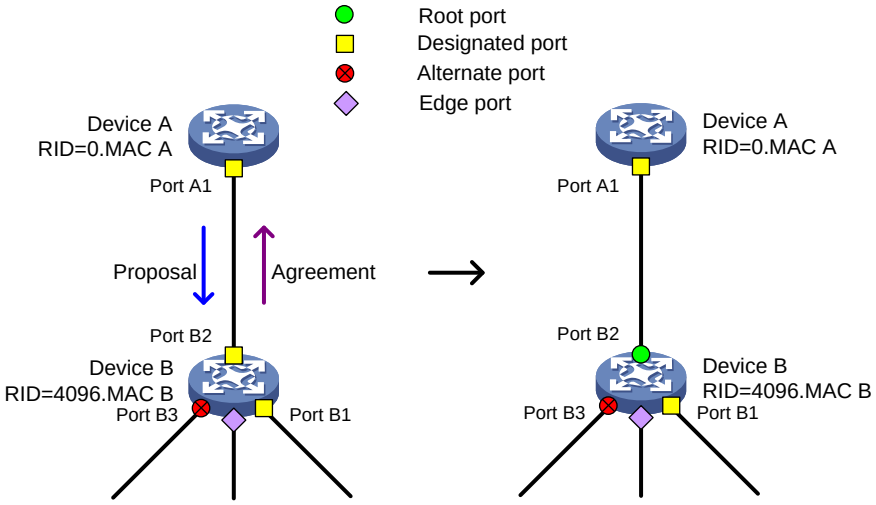
P/A transition for RSTP and PVST.

In RSTP or PVST, the ports on a new link or recovered link are designated ports in blocking state. When one of the designated ports transits to the discarding or learning state, it sets the proposal flag in its BPDU. Its peer bridge receives the BPDU and determines whether the receiving port is the root port. If it is the root port, the bridge blocks the other ports except edge ports. The bridge then replies an agreement BPDU to the designated port. The designated port immediately transits to the forwarding state upon receiving the agreement BPDU. If the designated port does not receive the agreement BPDU, it waits for twice the forward delay to transit to the forwarding state.

As shown in Figure 14, the P/A transition operates as follows:

1. Device A sends a proposal BPDU to Device B through Port A1.
2. Device B receives the proposal BPDU on Port B2. Port B2 is elected as the root port.
3. Device B blocks its designated port Port B1 and alternate port Port B3 to eliminate loops.
4. The root port Port B2 transits to the forwarding state and sends an agreement BPDU to Device A.
5. The designated port Port A1 on Device A immediately transits to the forwarding state after receiving the agreement BPDU.

Figure 14 P/A transition for RSTP and PVST



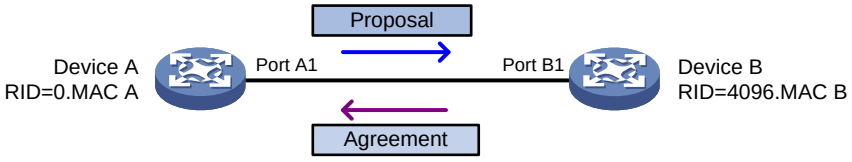
P/A transition for MSTP.

In MSTP, an upstream bridge sets both the proposal and agreement flags in its BPDU. If a downstream bridge receives the BPDU and its receiving port is elected as the root port, the bridge blocks all the other ports except edge ports. The downstream bridge then replies an agreement BPDU to the upstream bridge. The upstream port immediately transits to the forwarding state upon receiving the agreement BPDU. If the upstream port does not receive the agreement BPDU, it waits for twice the forward delay to transit to the forwarding state.

As shown in Figure 15, the P/A transition operates as follows:

1. Device A sets the proposal and agreement flags in its BPDU and sends it to Device B through Port A1.
2. Device B receives the BPDU. Port B1 of Device B is elected as the root port.
3. Device B then blocks all its ports except the edge ports.
4. The root port Port B1 of Device B transits to the forwarding state and sends an agreement BPDU to Device A.
5. Port A1 of Device A immediately transits to the forwarding state upon receiving the agreement BPDU.

Figure 15 P/A transition for MSTP



Protocols and standards

MSTP is documented in the following protocols and standards:

- IEEE 802.1d, *Media Access Control (MAC) Bridges*
- IEEE 802.1w, *Part 3: Media Access Control (MAC) Bridges—Amendment 2: Rapid Reconfiguration*
- IEEE 802.1s, *Virtual Bridged Local Area Networks—Amendment 3: Multiple Spanning Trees*

- IEEE 802.1Q-REV/D1.3, *Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks —Clause 13: Spanning tree Protocols*

Configuring spanning tree protocols

Restrictions and guidelines: spanning tree protocol configuration

Restrictions: Compatibility with other features

- If both MVRP and a spanning tree protocol are enabled on a device, MVRP packets are forwarded along MSTIs. To advertise a specific VLAN within the network through MVRP, make sure this VLAN is mapped to an MSTI when you configure the VLAN-to-instance mapping table. For more information about MVRP, see "Configuring MVRP."
- The spanning tree configurations are mutually exclusive with any of the following features on a port: RRPP, Smart Link, and L2PT. The S5000E-X, S5000X-EI, S5110V2-SI, S5000V3-EI, S5000V5-EI, and WAS6000 switch series do not support RRPP or Smart Link.

Restrictions: Interface configuration

- Some spanning tree features are supported in Layer 2 Ethernet interface view and Layer 2 aggregate interface view. Unless otherwise stated, these views are collectively referred to as interface view in this document. BPDU drop can be configured only in Layer 2 Ethernet interface view.
- Configurations made in system view take effect globally. Configurations made in Layer 2 Ethernet interface view take effect only on the interface. Configurations made in Layer 2 aggregate interface view take effect only on the aggregate interface. Configurations made on an aggregation member port can take effect only after the port is removed from the aggregation group.
- After you enable a spanning tree protocol on a Layer 2 aggregate interface, the system performs spanning tree calculation on the Layer 2 aggregate interface. It does not perform spanning tree calculation on the aggregation member ports. The spanning tree protocol enable state and forwarding state of each selected member port are consistent with those of the corresponding Layer 2 aggregate interface.
- The member ports of an aggregation group do not participate in spanning tree calculation. However, the ports still reserve their spanning tree configurations for participating in spanning tree calculation after leaving the aggregation group.

Spanning tree protocol tasks at a glance

STP tasks at a glance

Configuring the root bridge

To configure the root bridge in STP mode, perform the following tasks:

1. Setting the spanning tree mode

   Set the spanning tree mode to STP.
2. (Optional.) Configuring the root bridge or a secondary root bridge
3. (Optional.) Configuring the device priority
4. (Optional.) Configuring parameters that affects STP topology convergence

- Configuring the network diameter of a switched network
- Setting spanning tree timers
- Setting the timeout factor
- Configuring the BPDU transmission rate

5. (Optional.) Enabling outputting port state transition information
6. Enabling the spanning tree feature
7. (Optional.) Configuring advanced spanning tree features
   - Configuring TC Snooping
   - Configuring protection features
   - Disabling the device from reactivating edge ports shut down by BPDU guard
   - Enabling SNMP notifications for new-root election and topology change events

Configuring the leaf nodes

To configure the leaf nodes in STP mode, perform the following tasks:

1. Setting the spanning tree mode

   Set the spanning tree mode to STP.
2. (Optional.) Configuring the device priority
3. (Optional.) Configuring parameters that affects STP topology convergence
   - Setting the timeout factor
   - Configuring the BPDU transmission rate
   - Configuring path costs of ports
   - Configuring the port priority
4. (Optional.) Enabling outputting port state transition information
5. Enabling the spanning tree feature
6. (Optional.) Configuring advanced spanning tree features
   - Configuring TC Snooping
   - Configuring protection features
   - Disabling the device from reactivating edge ports shut down by BPDU guard
   - Enabling SNMP notifications for new-root election and topology change events

RSTP tasks at a glance

Configuring the root bridge

To configure the root bridge in RSTP mode, perform the following tasks:

1. Setting the spanning tree mode

   Set the spanning tree mode to RSTP.
2. (Optional.) Configuring the root bridge or a secondary root bridge
3. (Optional.) Configuring the device priority
4. (Optional.) Configuring parameters that affects RSTP topology convergence
   - Configuring the network diameter of a switched network
   - Setting spanning tree timers
   - Setting the timeout factor
   - Configuring the BPDU transmission rate
   - Configuring edge ports
   - Configuring the port link type

5. (Optional.) Enabling outputting port state transition information
6. Enabling the spanning tree feature
7. (Optional.) Configuring advanced spanning tree features
   - Performing mCheck
   - Configuring TC Snooping
   - Configuring protection features
   - Disabling the device from reactivating edge ports shut down by BPDU guard
   - Enabling SNMP notifications for new-root election and topology change events

Configuring the leaf nodes

To configure the leaf nodes in RSTP mode, perform the following tasks:

1. Setting the spanning tree mode

   Set the spanning tree mode to RSTP.
2. (Optional.) Configuring the device priority
3. (Optional.) Configuring parameters that affects RSTP topology convergence
   - Setting the timeout factor
   - Configuring the BPDU transmission rate
   - Configuring edge ports
   - Configuring path costs of ports
   - Configuring the port priority
   - Configuring the port link type
4. (Optional.) Enabling outputting port state transition information
5. Enabling the spanning tree feature
6. (Optional.) Configuring advanced spanning tree features
   - Performing mCheck
   - Configuring TC Snooping
   - Configuring protection features
   - Disabling the device from reactivating edge ports shut down by BPDU guard
   - Enabling SNMP notifications for new-root election and topology change events

PVST tasks at a glance

Configuring the root bridge

To configure the root bridge in PVST mode, perform the following tasks:

1. Setting the spanning tree mode

   Set the spanning tree mode to PVST.
2. (Optional.) Configuring the root bridge or a secondary root bridge
3. (Optional.) Configuring the device priority
4. (Optional.) Configuring parameters that affects PVST topology convergence
   - Configuring the network diameter of a switched network
   - Setting spanning tree timers
   - Setting the timeout factor
   - Configuring the BPDU transmission rate
   - Configuring edge ports
   - Configuring the port link type

5. (Optional.) Enabling outputting port state transition information
6. Enabling the spanning tree feature
7. (Optional.) Configuring advanced spanning tree features
   - Performing mCheck
   - Disabling inconsistent PVID protection
   - Configuring protection features
   - Enabling the device to log events of detecting or receiving TC BPDUs
   - Disabling the device from reactivating edge ports shut down by BPDU guard
   - Enabling SNMP notifications for new-root election and topology change events

Configuring the leaf nodes

To configure the leaf nodes in PVST mode, perform the following tasks:

1. Setting the spanning tree mode

   Set the spanning tree mode to PVST.
2. (Optional.) Configuring the device priority
3. (Optional.) Configuring parameters that affects PVST topology convergence
   - Setting the timeout factor
   - Configuring the BPDU transmission rate
   - Configuring edge ports
   - Configuring path costs of ports
   - Configuring the port priority
   - Configuring the port link type
4. (Optional.) Enabling outputting port state transition information
5. Enabling the spanning tree feature
6. (Optional.) Configuring advanced spanning tree features
   - Performing mCheck
   - Disabling inconsistent PVID protection
   - Configuring protection features
   - Enabling the device to log events of detecting or receiving TC BPDUs
   - Disabling the device from reactivating edge ports shut down by BPDU guard
   - Enabling SNMP notifications for new-root election and topology change events

MSTP tasks at a glance

Configuring the root bridge

To configure the root bridge in MSTP mode, perform the following tasks:

1. Setting the spanning tree mode

   Set the spanning tree mode to MSTP.
2. Configuring an MST region
3. (Optional.) Configuring the root bridge or a secondary root bridge
4. (Optional.) Configuring the device priority
5. (Optional.) Configuring parameters that affects MSTP topology convergence
   - Configuring the maximum hops of an MST region
   - Configuring the network diameter of a switched network
   - Setting spanning tree timers

- Setting the timeout factor
- Configuring the BPDU transmission rate
- Configuring edge ports
- Configuring the port link type

6. (Optional.) Configuring the mode a port uses to recognize and send MSTP frames
7. (Optional.) Enabling outputting port state transition information
8. Enabling the spanning tree feature
9. (Optional.) Configuring advanced spanning tree features
   - Performing mCheck
   - Configuring Digest Snooping
   - Configuring No Agreement Check
   - Configuring TC Snooping
   - Configuring protection features
   - Disabling the device from reactivating edge ports shut down by BPDU guard
   - Enabling SNMP notifications for new-root election and topology change events

Configuring the leaf nodes

To configure the leaf nodes in MSTP mode, perform the following tasks:

1. Setting the spanning tree mode

   Set the spanning tree mode to MSTP.
2. Configuring an MST region
3. (Optional.) Configuring the device priority
4. (Optional.) Configuring parameters that affects MSTP topology convergence
   - Setting the timeout factor
   - Configuring the BPDU transmission rate
   - Configuring edge ports
   - Configuring path costs of ports
   - Configuring the port priority
   - Configuring the port link type
5. (Optional.) Configuring the mode a port uses to recognize and send MSTP frames
6. (Optional.) Enabling outputting port state transition information
7. Enabling the spanning tree feature
8. (Optional.) Configuring advanced spanning tree features
   - Performing mCheck
   - Configuring Digest Snooping
   - Configuring No Agreement Check
   - Configuring TC Snooping
   - Configuring protection features
   - Disabling the device from reactivating edge ports shut down by BPDU guard
   - Enabling SNMP notifications for new-root election and topology change events

Setting the spanning tree mode

About spanning tree mode

The spanning tree modes include:

- **STP mode**—All ports of the device send STP BPDUs. Select this mode when the peer device of a port supports only STP.
- **RSTP mode**—All ports of the device send RSTP BPDUs. A port in this mode automatically transits to the STP mode when it receives STP BPDUs from the peer device. A port in this mode does not transit to the MSTP mode when it receives MSTP BPDUs from the peer device.
- **PVST mode**—All ports of the device send PVST BPDUs. Each VLAN maintains a spanning tree. In a network, the amount of spanning trees maintained by all devices equals the number of PVST-enabled VLANs multiplied by the number of PVST-enabled ports. If the amount of spanning trees exceeds the capacity of the network, device CPUs will be overloaded. Packet forwarding is interrupted, and the network becomes unstable. The device can maintain spanning trees for 128 VLANs.
- **MSTP mode**—All ports of the device send MSTP BPDUs. A port in this mode automatically transits to the STP mode when receiving STP BPDUs from the peer device. A port in this mode does not transit to the RSTP mode when receiving RSTP BPDUs from the peer device.

Restrictions and guidelines

The MSTP mode is compatible with the RSTP mode, and the RSTP mode is compatible with the STP mode.

Compatibility of the PVST mode depends on the link type of a port.

- On an access port, the PVST mode is compatible with other spanning tree modes in all VLANs.
- On a trunk port or hybrid port, the PVST mode is compatible with other spanning tree modes only in the default VLAN.

Procedure

1. Enter system view.

   system-view
2. Set the spanning tree mode.

   stp mode { **mstp** | **pvst** | **rstp** | **stp** }

   The default setting is the MSTP mode.

Configuring an MST region

About MST region

Spanning tree devices belong to the same MST region if they are both connected through a physical link and configured with the following details:

- Format selector (0 by default, not configurable).
- MST region name.
- MST region revision level.
- VLAN-to-instance mapping entries in the MST region.

The configuration of MST region-related parameters (especially the VLAN-to-instance mapping table) might cause MSTP to begin a new spanning tree calculation. To reduce the possibility of topology instability, the MST region configuration takes effect only after you activate it by doing one of the following:

- Use the **active region-configuration** command.

- Enable a spanning tree protocol by using the **stp global enable** command if the spanning tree protocol is disabled.

Restrictions and guidelines

In STP, RSTP, or PVST mode, MST region configurations do not take effect.

Procedure

1. Enter system view.
   system-view
2. Enter MST region view.
   stp region-configuration
3. Configure the MST region name.
   region-name *name*
   The default setting is the MAC address.
4. Configure the VLAN-to-instance mapping table. Choose one option as needed:
   - Map a list of VLANs to an MSTI.
     instance *instance-id* **vlan** *vlan-id-list*
   - Quickly create a VLAN-to-instance mapping table.
     vlan-mapping modulo *modulo*

   By default, all VLANs in an MST region are mapped to the CIST (or MSTI 0).
5. Configure the MSTP revision level of the MST region.
   revision-level *level*
   The default setting is 0.
6. (Optional.) Display the MST region configurations that are not activated yet.
   check region-configuration
7. Manually activate MST region configuration.
   active region-configuration

Configuring the root bridge or a secondary root bridge

Restrictions and guidelines

You can have the spanning tree protocol determine the root bridge of a spanning tree through calculation. You can also specify a device as the root bridge or as a secondary root bridge.

When you specify a device as the root bridge or as a secondary root bridge, follow these restrictions and guidelines:

- A device has independent roles in different spanning trees. It can act as the root bridge in one spanning tree and as a secondary root bridge in another. However, one device cannot be the root bridge and a secondary root bridge in the same spanning tree.
- If you specify the root bridge for a spanning tree, no new root bridge is elected according to the device priority settings. Once you specify a device as the root bridge or a secondary root bridge, you cannot change the priority of the device.
- You can configure a device as the root bridge by setting the device priority to 0. For the device priority configuration, see "Configuring the device priority."

Configuring the device as the root bridge of a spanning tree

1. Enter system view.
   system-view
2. Configure the device as the root bridge.
   - In STP/RSTP mode:
     stp root primary
   - In PVST mode:
     stp vlan *vlan-id-list* **root primary**
   - In MSTP mode:
     stp [**instance** *instance-list*] **root primary**

   By default, the device is not a root bridge.

Configuring the device as a secondary root bridge of a spanning tree

1. Enter system view.
   system-view
2. Configure the device as a secondary root bridge.
   - In STP/RSTP mode:
     stp root secondary
   - In PVST mode:
     stp vlan *vlan-id-list* **root secondary**
   - In MSTP mode:
     stp [**instance** *instance-list*] **root secondary**

   By default, the device is not a secondary root bridge.

Configuring the device priority

About device priority

Device priority is a factor in calculating the spanning tree. The priority of a device determines whether the device can be elected as the root bridge of a spanning tree. A lower value indicates a higher priority. You can set the priority of a device to a low value to specify the device as the root bridge of the spanning tree. A spanning tree device can have different priorities in different spanning trees.

During root bridge selection, if all devices in a spanning tree have the same priority, the one with the lowest MAC address is selected. You cannot change the priority of a device after it is configured as the root bridge or as a secondary root bridge.

Procedure

1. Enter system view.
   system-view
2. Configure the priority of the device.
   - In STP/RSTP mode:
     stp priority *priority*

- In PVST mode:
  stp vlan *vlan-id-list* **priority** *priority*
- In MSTP mode:
  stp [**instance** *instance-list*] **priority** *priority*

The default setting is 32768.

Configuring the maximum hops of an MST region

About the maximum hops of an MST region

Restrict the region size by setting the maximum hops of an MST region. The hop limit configured on the regional root bridge is used as the hop limit for the MST region.

Configuration BPDUs sent by the regional root bridge always have a hop count set to the maximum value. When a device receives this configuration BPDU, it decrements the hop count by one, and uses the new hop count in the BPDUs that it propagates. When the hop count of a BPDU reaches zero, it is discarded by the device that received it. Devices beyond the reach of the maximum hops can no longer participate in spanning tree calculations, so the size of the MST region is limited.

Restrictions and guidelines

Make this configuration only on the root bridge. All other devices in the MST region use the maximum hop value set for the root bridge.

You can configure the maximum hops of an MST region based on the STP network size. As a best practice, set the maximum hops to a value that is greater than the maximum hops of each edge device to the root bridge.

Procedure

1. Enter system view.
   system-view
2. Configure the maximum hops of the MST region.
   stp max-hops *hops*
   The default setting is 20.

Configuring the network diameter of a switched network

About network diameter

Any two terminal devices in a switched network can reach each other through a specific path, and there are a series of devices on the path. The switched network diameter is the maximum number of devices on the path for an edge device to reach another one in the switched network through the root bridge. The network diameter indicates the network size. The bigger the diameter, the larger the network size.

Based on the network diameter you configured, the system automatically sets an optimal hello time, forward delay, and max age for the device.

In STP, RSTP, or MSTP mode, each MST region is considered a device. The configured network diameter takes effect only on the CIST (or the common root bridge) but not on other MSTIs.

In PVST mode, the configured network diameter takes effect only on the root bridges of the specified VLANs.

Procedure

1. Enter system view.
   system-view
2. Configure the network diameter of the switched network.
   - In STP/RSTP/MSTP mode:
     stp bridge-diameter *diameter*
   - In PVST mode:
     stp vlan *vlan-id-list* **bridge-diameter** *diameter*

   The default setting is 7.

Setting spanning tree timers

About spanning tree timers

The following timers are used for spanning tree calculation:

- **Forward delay**—Delay time for port state transition. To prevent temporary loops on a network, the spanning tree feature sets an intermediate port state (the learning state) before it transits from the discarding state to the forwarding state. The feature also requires that the port transit its state after a forward delay timer. This ensures that the state transition of the local port stays synchronized with the peer.
- **Hello time**—Interval at which the device sends configuration BPDUs to detect link failures. If the device does not receive configuration BPDUs within the timeout period, it recalculates the spanning tree. The formula for calculating the timeout period is timeout period = timeout factor × 3 × hello time.
- **Max age**—In the CIST of an MSTP network, the device uses the max age timer to determine whether a configuration BPDU received by a port has expired. If it is expired, a new spanning tree calculation process starts. The max age timer does not take effect on MSTIs.

To ensure a fast topology convergence, make sure the timer settings meet the following formulas:

- 2 × (forward delay – 1 second) ≥ max age
- Max age ≥ 2 × (hello time + 1 second)

As a best practice, specify the network diameter and letting spanning tree protocols automatically calculate the timers based on the network diameter instead of manually setting the spanning tree timers. If the network diameter uses the default value, the timers also use their default values.

Set the timers only on the root bridge. The timer settings on the root bridge apply to all devices on the entire switched network.

Restrictions and guidelines

- The length of the forward delay is related to the network diameter of the switched network. The larger the network diameter is, the longer the forward delay time should be. As a best practice, use the automatically calculated value because inappropriate forward delay setting might cause temporary redundant paths or increase the network convergence time.
- An appropriate hello time setting enables the device to promptly detect link failures on the network without using excessive network resources. If the hello time is too long, the device mistakes packet loss for a link failure and triggers a new spanning tree calculation process. If the hello time is too short, the device frequently sends the same configuration BPDUs, which wastes device and network resources. As a best practice, use the automatically calculated value.
- If the max age timer is too short, the device frequently begins spanning tree calculations and might mistake network congestion as a link failure. If the max age timer is too long, the device might fail to promptly detect link failures and quickly launch spanning tree calculations, reducing

the auto-sensing capability of the network. As a best practice, use the automatically calculated value.

Procedure

1. Enter system view.
   system-view
2. Set the forward delay timer.
   - In STP/RSTP/MSTP mode:
     stp timer forward-delay *time*
   - In PVST mode:
     stp vlan *vlan-id-list* **timer forward-delay** *time*

   The default setting is 15 seconds.
3. Set the hello timer.
   - In STP/RSTP/MSTP mode:
     stp timer hello *time*
   - In PVST mode:
     stp vlan *vlan-id-list* **timer hello** *time*

   The default setting is 2 seconds.
4. Set the max age timer.
   - In STP/RSTP/MSTP mode:
     stp timer max-age *time*
   - In PVST mode:
     stp vlan *vlan-id-list* **timer max-age** *time*

     The default setting is 20 seconds.

Setting the timeout factor

About timeout factor

The timeout factor is a parameter used to decide the timeout period. The formula for calculating the timeout period is: *timeout period* = *timeout factor* × 3 × *hello time*.

In a stable network, each non-root-bridge device forwards configuration BPDUs to the downstream devices at the hello time interval to detect link failures. If a device does not receive a BPDU from the upstream device within nine times the hello time, it assumes that the upstream device has failed. Then, it starts a new spanning tree calculation process.

Restrictions and guidelines

As a best practice, set the timeout factor to 5, 6, or 7 in the following situations:

- To prevent undesired spanning tree calculations. An upstream device might be too busy to forward configuration BPDUs in time, for example, many Layer 2 interfaces are configured on the upstream device. In this case, the downstream device fails to receive a BPDU within the timeout period and then starts an undesired spanning tree calculation.
- To save network resources on a stable network.

Procedure

1. Enter system view.
   system-view
2. Set the timeout factor of the device.

stp timer-factor *factor*

The default setting is 3.

Configuring the BPDU transmission rate

About BPDU transmission rate

The maximum number of BPDUs a port can send within each hello time equals the BPDU transmission rate plus the hello timer value.

The higher the BPDU transmission rate, the more BPDUs are sent within each hello time, and the more system resources are used. By setting an appropriate BPDU transmission rate, you can limit the rate at which the port sends BPDUs. Setting an appropriate rate also prevents spanning tree protocols from using excessive network resources when the network topology changes.

Restrictions and guidelines

The BPDU transmission rate depends on the physical status of the port and the network structure. As a best practice, use the default setting.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the BPDU transmission rate of the ports.

   stp transmit-limit *limit*

   The default setting is 10.

Configuring edge ports

About edge port

If a port directly connects to a user terminal rather than another device or a shared LAN segment, this port is regarded as an edge port. When network topology change occurs, an edge port will not cause a temporary loop. Because a device does not determine whether a port is directly connected to a terminal, you must manually configure the port as an edge port. After that, the port can rapidly transit from the blocking state to the forwarding state.

Restrictions and guidelines

- If BPDU guard is disabled on a port configured as an edge port, the port becomes a non-edge port again if it receives a BPDU from another port. To restore the edge port, re-enable it.
- If a port directly connects to a user terminal, configure it as an edge port and enable BPDU guard for it. This enables the port to quickly transit to the forwarding state when ensuring network security.
- On a port, the loop guard feature and the edge port setting are mutually exclusive.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the port as an edge port.

`stp edged-port`

By default, all ports are non-edge ports.

Configuring path costs of ports

About path cost

Path cost is a parameter related to the link speed of a port. On a spanning tree device, a port can have different path costs in different MSTIs. Setting appropriate path costs allows VLAN traffic flows to be forwarded along different physical links, achieving VLAN-based load balancing.

You can have the device automatically calculate the default path cost, or you can configure the path cost for ports.

Specifying a standard for the default path cost calculation

About the standard for the default path cost calculation

You can specify a standard for the device to use in automatic calculation for the default path cost. The device supports the following standards:

- **dot1d-1998**—The device calculates the default path cost for ports based on IEEE 802.1d-1998.
- **dot1t**—The device calculates the default path cost for ports based on IEEE 802.1t.
- **legacy**—The device calculates the default path cost for ports based on a private standard.

Table 7 Mappings between the link speed (100M and below) and the path cost

Link speed	Port type	Path cost		
		IEEE 802.1d-1998	IEEE 802.1t	Private standard
0	N/A	65535	200000000	200000
10 Mbps	Single port	100	2000000	2000
	Aggregate interface containing two Selected ports		1000000	1800
	Aggregate interface containing three Selected ports		666666	1600
	Aggregate interface containing four Selected ports		500000	1400
100 Mbps	Single port	19	200000	200
	Aggregate interface containing two Selected ports		100000	180
	Aggregate interface containing three Selected ports		66666	160
	Aggregate interface containing four Selected ports		50000	140

Table 8 Mappings between the link speed (1000M) and the path cost

Link speed	Port type	Path cost		
		IEEE 802.1d-1998	IEEE 802.1t	Private standard
1000 Mbps	Single port	4	20000	20
	Aggregate interface containing two Selected ports		10000	18
	Aggregate interface containing three Selected ports		6666	16
	Aggregate interface containing four Selected ports		5000	14

Table 9 Mappings between the link speed (10G) and the path cost

Link speed	Port type	Path cost		
		IEEE 802.1d-1998	IEEE 802.1t	Private standard
10 Gbps	Single port	2	2000	2
	Aggregate interface containing two Selected ports		1000	1
	Aggregate interface containing three Selected ports		666	1
	Aggregate interface containing four Selected ports		500	1

Restrictions and guidelines

If you change the standard for the default path cost calculation, you restore the path costs to the default.

When the device calculates the path cost for an aggregate interface, IEEE 802.1t takes into account the number of Selected ports in its aggregation group. However, IEEE 802.1d-1998 does not take into account the number of Selected ports. The calculation formula of IEEE 802.1t is: Path cost = 200,000,000/link speed (in 100 kbps). The link speed is the sum of the link speed values of the Selected ports in the aggregation group.

Procedure

1. Enter system view.

   system-view

2. Specify a standard for the default path costs calculation.

   stp pathcost-standard { **dot1d-1998** | **dot1t** | **legacy** }

   By default, the device uses **legacy** to calculate the default path costs of its ports.

Configuring path costs of ports

Restrictions and guidelines

When the path cost of a port changes, the system recalculates the port role and initiates a state transition.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the path cost of the ports.
   - In STP/RSTP mode:
     stp cost *cost-value*
   - In PVST mode:
     stp vlan *vlan-id-list* **cost** *cost-value*
   - In MSTP mode:
     stp [**instance** *instance-list*] **cost** *cost-value*

   By default, the system automatically calculates the path cost of each port.

Configuring the port priority

About port priority

The priority of a port is a factor that determines whether the port can be elected as the root port of a device. If all other conditions are the same, the port with the highest priority is elected as the root port.

On a spanning tree device, a port can have different priorities and play different roles in different spanning trees. As a result, data of different VLANs can be propagated along different physical paths, implementing per-VLAN load balancing. You can set port priority values based on the actual networking requirements.

Restrictions and guidelines

When the priority of a port changes, the system recalculates the port role and initiates a state transition. Prepare for the network topology change before configuring the port priority.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the port priority.
   - In STP/RSTP mode:
     stp port priority *priority*
   - In PVST mode:
     stp vlan *vlan-id-list* **port priority** *priority*
   - In MSTP mode:
     stp [**instance** *instance-list*] **port priority** *priority*

The default setting is 128 for all ports.

Configuring the port link type

About port link type

A point-to-point link directly connects two devices. If two root ports or designated ports are connected over a point-to-point link, they can rapidly transit to the forwarding state after a proposal-agreement handshake process.

Restrictions and guidelines

- You can configure the link type as point-to-point for a Layer 2 aggregate interface or a port that operates in full duplex mode. As a best practice, use the default setting and let the device automatically detect the port link type.
- In PVST or MSTP mode, the **stp point-to-point force-false** or **stp point-to-point force-true** command configured on a port takes effect on all VLANs or all MSTIs.
- Before you set the link type of a port to point-to-point, make sure the port is connected to a point-to-point link. Otherwise, a temporary loop might occur.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the port link type.
   stp point-to-point { **auto** | **force-false** | **force-true** }
   By default, the link type is **auto** where the port automatically detects the link type.

Configuring the mode a port uses to recognize and send MSTP frames

About MSTP frame format

A port can receive and send MSTP frames in the following formats:

- **dot1s**—802.1s-compliant standard format
- **legacy**—Compatible format

By default, the frame format recognition mode of a port is **auto**. The port automatically distinguishes the two MSTP frame formats, and determines the format of frames that it will send based on the recognized format.

You can configure the MSTP frame format on a port. Then, the port sends only MSTP frames of the configured format to communicate with devices that send frames of the same format.

By default, a port in **auto** mode sends 802.1s MSTP frames. When the port receives an MSTP frame of a legacy format, the port starts to send frames only of the legacy format. This prevents the port from frequently changing the format of sent frames. To configure the port to send 802.1s MSTP frames, shut down and then bring up the port.

Restrictions and guidelines

When the number of existing MSTIs exceeds 48, the port can send only 802.1s MSTP frames.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the mode that the port uses to recognize/send MSTP frames.
   stp compliance { **auto** | **dot1s** | **legacy** }
   The default setting is **auto**.

Enabling outputting port state transition information

About outputting port state transition information

In a large-scale spanning tree network, you can enable devices to output the port state transition information. Then, you can monitor the port states in real time.

Procedure

1. Enter system view.
   system-view
2. Enable outputting port state transition information.
   - In STP/RSTP mode:
     stp port-log instance 0
   - In PVST mode:
     stp port-log vlan *vlan-id-list*
   - In MSTP mode:
     stp port-log { **all** | **instance** *instance-list* }
     The default differs depending on the software version, as shown below:

Hardware platform	Versions	Default setting
S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, WAS6000	All versions	Outputting port state transition information is disabled.
Other switch series	Versions earlier than Release 6350	Outputting port state transition information is disabled.
	Release 6350 and later	• If the device starts up with the initial configuration, outputting port state transition information is disabled. • If the device starts up with the factory defaults, outputting port state transition information is enabled.

For more information about initial configuration and factory defaults, see configuration file management in *Fundamentals Configuration Guide*.

Enabling the spanning tree feature

Restrictions and guidelines

You must enable the spanning tree feature for the device before any other spanning tree related configurations can take effect. In STP, RSTP, or MSTP mode, make sure the spanning tree feature is enabled globally and on the desired ports. In PVST mode, make sure the spanning tree feature is enabled globally, in the desired VLANs, and on the desired ports.

To exclude specific ports from spanning tree calculation and save CPU resources, disable the spanning tree feature for these ports with the **undo stp enable** command. Make sure no loops occur in the network after you disable the spanning tree feature on these ports.

Enabling the spanning tree feature in STP/RSTP/MSTP mode

1. Enter system view.

   system-view

2. Enable the spanning tree feature.

   stp global enable

   For the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the spanning tree feature is globally disabled by default.

   For other switch series:

   - When the device starts up with initial settings, the spanning tree feature is globally disabled by default.
   - When the device starts up with factory defaults, the spanning tree feature is globally enabled by default.

   For more information about the initial settings and factory defaults, see *Fundamentals Configuration Guide*.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable the spanning tree feature for the port.

   stp enable

   By default, the spanning tree feature is enabled on all ports.

Enabling the spanning tree feature in PVST mode

1. Enter system view.

   system-view

2. Enable the spanning tree feature.

   stp global enable

   For the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the spanning tree feature is globally disabled by default.

   For other switch series:

   - When the device starts up with initial settings, the spanning tree feature is globally disabled by default.

- When the device starts up with factory defaults, the spanning tree feature is globally enabled by default.

For more information about the initial settings and factory defaults, see *Fundamentals Configuration Guide*.

3. Enable the spanning tree feature in VLANs.

   stp vlan *vlan-id-list* **enable**

   By default, the spanning tree feature is enabled in VLANs.

4. Enter interface view.

   interface *interface-type interface-number*

5. Enable the spanning tree feature on the port.

   stp enable

   By default, the spanning tree feature is enabled on all ports.

Performing mCheck

About mCheck

The mCheck feature enables user intervention in the port state transition process.

When a port on an MSTP, RSTP, or PVST device connects to an STP device and receives STP BPDUs, the port automatically transits to the STP mode. However, the port cannot automatically transit back to the original mode when the following conditions exist:

- The peer STP device is shut down or removed.
- The port cannot detect the change.

To forcibly transit the port to operate in the original mode, you can perform an mCheck operation.

For example, Device A, Device B, and Device C are connected in sequence. Device A runs STP, Device B does not run any spanning tree protocol, and Device C runs RSTP, PVST, or MSTP. In this case, when Device C receives an STP BPDU transparently transmitted by Device B, the receiving port transits to the STP mode. If you configure Device B to run RSTP, PVST, or MSTP with Device C, you must perform mCheck operations on the ports interconnecting Device B and Device C.

Restrictions and guidelines

The mCheck operation takes effect on devices operating in MSTP, PVST, or RSTP mode.

Performing mCheck globally

1. Enter system view.

   system-view

2. Perform mCheck.

   stp global mcheck

Performing mCheck in interface view

1. Enter system view.

   system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Perform mCheck.

   stp mcheck

Disabling inconsistent PVID protection

About inconsistent PVID protection

In PVST, if two connected ports use different PVIDs, PVST calculation errors might occur. By default, inconsistent PVID protection is enabled to avoid PVST calculation errors. If PVID inconsistency is detected on a port, the system blocks the port.

Restrictions and guidelines

If different PVIDs are required on two connected ports, disable inconsistent PVID protection on the devices that host the ports. To avoid PVST calculation errors, make sure the following requirements are met:

- Make sure the VLANs on one device do not use the same ID as the PVID of its peer port (except the default VLAN) on another device.
- If the local port or its peer is a hybrid port, do not configure the local and peer ports as untagged members of the same VLAN.
- Disable inconsistent PVID protection on both the local device and the peer device.

This feature takes effect only when the device is operating in PVST mode.

Procedure

1. Enter system view.

   system-view

2. Disable the inconsistent PVID protection feature.

   stp ignore-pvid-inconsistency

   By default, the inconsistent PVID protection feature is enabled.

Configuring Digest Snooping

About Digest Snooping

As defined in IEEE 802.1s, connected devices are in the same region only when they have the same MST region-related configurations, including:

- Region name.
- Revision level.
- VLAN-to-instance mappings.

A spanning tree device identifies devices in the same MST region by determining the configuration ID in BPDUs. The configuration ID includes the region name, revision level, and configuration digest. It is 16-byte long and is the result calculated through the HMAC-MD5 algorithm based on VLAN-to-instance mappings.

Because spanning tree implementations vary by vendor, the configuration digests calculated through private keys are different. The devices of different vendors in the same MST region cannot communicate with each other.

To enable communication between an H3C device and a third-party device in the same MST region, enable Digest Snooping on the H3C device port connecting them.

Restrictions and guidelines

CAUTION:

Use caution with global Digest Snooping in the following situations:

- When you modify the VLAN-to-instance mappings.
- When you restore the default MST region configuration.

If the local device has different VLAN-to-instance mappings than its neighboring devices, loops or traffic interruption will occur.

- Before you enable Digest Snooping, make sure associated devices of different vendors are connected and run spanning tree protocols.
- With Digest Snooping enabled, in-the-same-region verification does not require comparison of configuration digest. The VLAN-to-instance mappings must be the same on associated ports.
- To make Digest Snooping take effect, you must enable Digest Snooping both globally and on associated ports. As a best practice, enable Digest Snooping on all associated ports first and then enable it globally. This will make the configuration take effect on all configured ports and reduce impact on the network.
- To prevent loops, do not enable Digest Snooping on MST region edge ports.
- As a best practice, enable Digest Snooping first and then enable the spanning tree feature. To avoid traffic interruption, do not configure Digest Snooping when the network is already working well.

Prerequisites

Before configuring Digest Snooping, you need to make sure your H3C device and the third-party device both run spanning tree protocols properly.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable Digest Snooping on the interface.
   `stp config-digest-snooping`
   By default, Digest Snooping is disabled on ports.
4. Return to system view.
   `quit`
5. Enable Digest Snooping globally.
   `stp global config-digest-snooping`
   By default, Digest Snooping is disabled globally.

Configuring No Agreement Check

About No Agreement Check

In RSTP and MSTP, the following types of messages are used for rapid state transition on designated ports:

- **Proposal**—Sent by designated ports to request rapid transition
- **Agreement**—Used to acknowledge rapid transition requests

Both RSTP and MSTP devices can perform rapid transition on a designated port only when the port receives an agreement packet from the downstream device. RSTP and MSTP devices have the following differences:

- For MSTP, the root port of the downstream device sends an agreement packet only after it receives an agreement packet from the upstream device.
- For RSTP, the downstream device sends an agreement packet whether or not an agreement packet from the upstream device is received.

Figure 16 Rapid state transition of an MSTP designated port

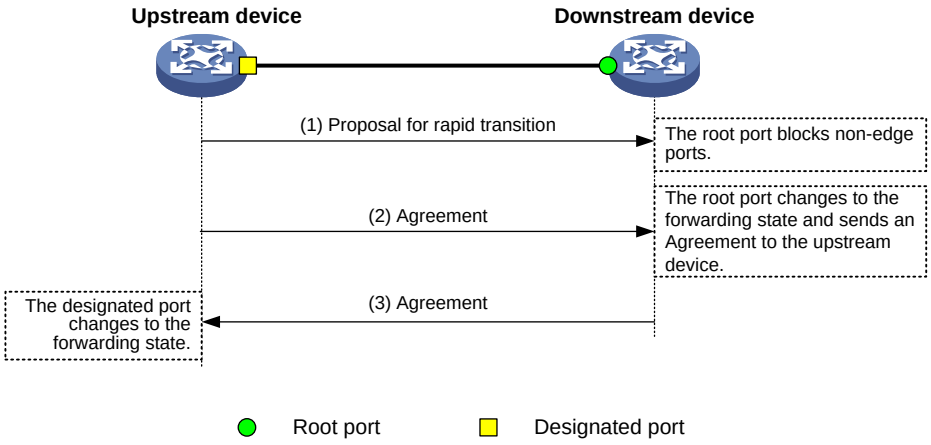


Figure 17 Rapid state transition of an RSTP designated port

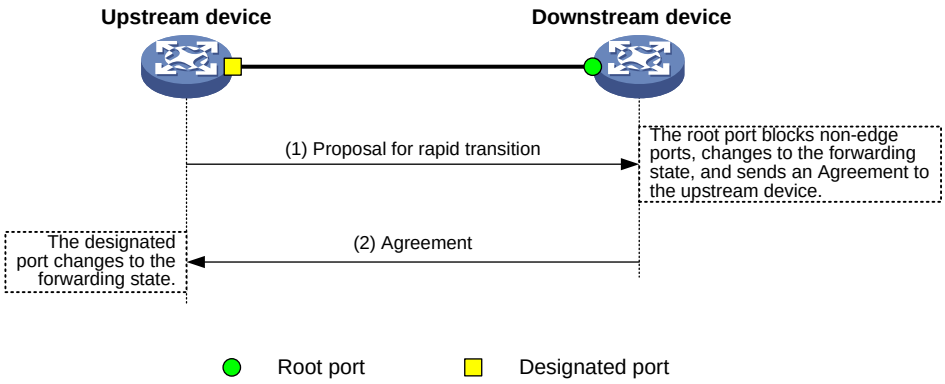


If the upstream device is a third-party device, the rapid state transition implementation might be limited as follows:

- The upstream device uses a rapid transition mechanism similar to that of RSTP.
- The downstream device runs MSTP and does not operate in RSTP mode.

In this case, the following occurs:

1. The root port on the downstream device receives no agreement from the upstream device.
2. It sends no agreement to the upstream device.

As a result, the designated port of the upstream device can transit to the forwarding state only after a period twice the forward delay.

To enable the designated port of the upstream device to transit its state rapidly, enable No Agreement Check on the downstream device's port.

Restrictions and guidelines

Configure No Agreement Check on the root port of your device, because this feature takes effect only if it's configured on root ports.

Prerequisites

Before you configure the No Agreement Check feature, complete the following tasks:

- Connect a device to a third-party upstream device that supports spanning tree protocols through a point-to-point link.
- Configure the same region name, revision level, and VLAN-to-instance mappings on the two devices.

Procedure

Enable the No Agreement Check feature on the root port.

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable No Agreement Check.
   `stp no-agreement-check`
   By default, No Agreement Check is disabled.

Configuring TC Snooping

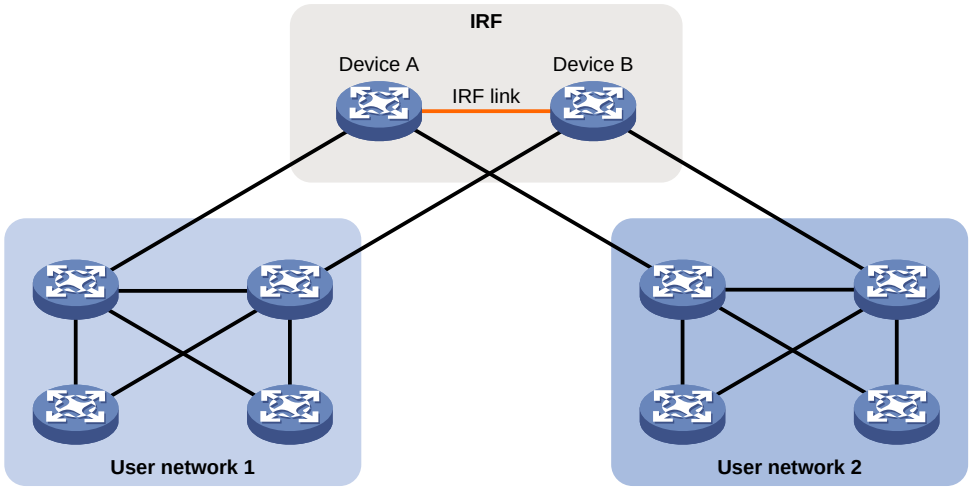
About TC Snooping

As shown in Figure 18, an IRF fabric connects to two user networks through double links.

- Device A and Device B form the IRF fabric.
- The spanning tree feature is disabled on Device A and Device B and enabled on all devices in user network 1 and user network 2.
- The IRF fabric transparently transmits BPDUs for both user networks and is not involved in the calculation of spanning trees.

When the network topology changes, it takes time for the IRF fabric to update its MAC address table and ARP table. During this period, traffic in the network might be interrupted.

Figure 18 TC Snooping application scenario



To avoid traffic interruption, you can enable TC Snooping on the IRF fabric. After receiving a TC-BPDU through a port, the IRF fabric updates MAC address table and ARP table entries associated with the port's VLAN. In this way, TC Snooping prevents topology change from interrupting traffic forwarding in the network. For more information about the MAC address table and the ARP table, see "Configuring the MAC address table" and *Layer 3—IP Services Configuration Guide*.

Restrictions and guidelines

- TC Snooping and the spanning tree feature are mutually exclusive. You must globally disable the spanning tree feature before enabling TC Snooping.
- The priority of BPDU tunneling is higher than that of TC Snooping. When BPDU tunneling is enabled on a port, the TC Snooping feature does not take effect on the port.
- TC Snooping does not support the PVST mode.

Procedure

1. Enter system view.

   `system-view`
2. Globally disable the spanning tree feature.

   `undo stp global enable`

   For the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series, the spanning tree feature is globally disabled by default.

   For other switch series:

   - When the device starts up with initial settings, the spanning tree feature is globally disabled by default.
   - When the device starts up with factory defaults, the spanning tree feature is globally enabled by default.

   For more information about the initial settings and factory defaults, see *Fundamentals Configuration Guide*.
3. Enable TC Snooping.

   `stp tc-snooping`

   By default, TC Snooping is disabled.

Configuring protection features

Spanning tree protection tasks at a glance

All spanning tree protection tasks are optional.

- Configuring BPDU guard
- Enabling root guard
- Enabling loop guard
- Configuring port role restriction
- Configuring TC-BPDU transmission restriction
- Enabling TC-BPDU guard
- Enabling BPDU drop
- Enabling PVST BPDU guard
- Disabling dispute guard

Configuring BPDU guard

About BPDU guard

For access layer devices, the access ports can directly connect to the user terminals (such as PCs) or file servers. The access ports are configured as edge ports to allow rapid transition. When these ports receive configuration BPDUs, the system automatically sets the ports as non-edge ports and starts a new spanning tree calculation process. This causes a change of network topology. Under normal conditions, these ports should not receive configuration BPDUs. However, if someone uses configuration BPDUs maliciously to attack the devices, the network will become unstable.

The spanning tree protocol provides the BPDU guard feature to protect the system against such attacks. When ports with BPDU guard enabled receive configuration BPDUs on a device, the device performs the following operations:

- Shuts down these ports.
- Notifies the NMS that these ports have been shut down by the spanning tree protocol.

The device reactivates the ports that have been shut down when the port status detection timer expires. You can set this timer by using the **shutdown-interval** command. For more information about this command, see device management commands in *Fundamentals Command Reference*.

Restrictions and guidelines

You can configure the BPDU guard feature in system view or on a per-port basis. A port preferentially uses the port-specific BPDU guard setting. If the port-specific BPDU guard setting is not available, the port uses the global BPDU guard setting.

The global BPDU guard setting takes effect only on the edge ports configured by using the **stp edged-port** command. For the BPDU guard setting to take effect on non-edge ports, you must configure the feature on a per-port basis. The port-specific BPDU guard setting takes effect on both edge and non-edge ports.

Configure BPDU guard on ports which directly connect to a user terminal rather than other device or shared LAN segment.

BPDU guard does not take effect on loopback-testing-enabled ports. For more information about loopback testing, see Ethernet interface configuration in *Interface Configuration Guide*.

Enabling BPDU guard in system view

1. Enter system view.
   system-view
2. Enable BPDU guard globally.
   stp bpdu-protection
   By default, BPDU guard is globally disabled.

Configuring BPDU guard in interface view

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure BPDU guard.
   stp port bpdu-protection { **enable** | **disable** }
   By default, the enabling status of BPDU guard on an interface is the same as that of global BPDU guard, and BPDU guard is not configured for non-edge ports.

Enabling root guard

About root guard

Configure root guard on a designated port.

The root bridge and secondary root bridge of a spanning tree should be located in the same MST region. Especially for the CIST, the root bridge and secondary root bridge are put in a high-bandwidth core region during network design. However, due to possible configuration errors or malicious attacks in the network, the legal root bridge might receive a configuration BPDU with a higher priority. Another device supersedes the current legal root bridge, causing an undesired change of the network topology. The traffic that should go over high-speed links is switched to low-speed links, resulting in network congestion.

To prevent this situation, MSTP provides the root guard feature. If root guard is enabled on a port of a root bridge, this port plays the role of designated port on all MSTIs. After this port receives a configuration BPDU with a higher priority from an MSTI, it performs the following operations:

- Immediately sets that port to the listening state in the MSTI.
- Does not forward the received user data.

This is equivalent to disconnecting the link connected to this port in the MSTI. If the port receives no BPDUs with a higher priority within twice the forwarding delay, it reverts to its original state.

Restrictions and guidelines

On a port, the loop guard feature and the root guard feature are mutually exclusive.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable the root guard feature.

   stp root-protection

   By default, root guard is disabled.

Enabling loop guard

About loop guard

Configure loop guard on the root port and alternate ports of a device.

By continuing to receive BPDUs from the upstream device, a device can maintain the state of the root port and blocked ports. However, link congestion or unidirectional link failures might cause these ports to fail to receive BPDUs from the upstream devices. In this situation, the device reselects the following port roles:

- Those ports in forwarding state that failed to receive upstream BPDUs become designated ports.
- The blocked ports transit to the forwarding state.

As a result, loops occur in the switched network. The loop guard feature can suppress the occurrence of such loops.

The initial state of a loop guard-enabled port is **discarding** in every MSTI. When the port receives BPDUs, it transits its state. Otherwise, it stays in the discarding state to prevent temporary loops.

Restrictions and guidelines

Do not enable loop guard on a port that connects user terminals. Otherwise, the port stays in the discarding state in all MSTIs because it cannot receive BPDUs.

On a port, the loop guard feature is mutually exclusive with the root guard feature or the edge port setting.

A loop guard-enabled interface can receive BPDUs and transit from the discarding state to the forwarding state after two forward delays if one of the following events occurs:

- The state of the interface changes from down to up.
- The spanning tree feature is enabled on the up interface.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the loop guard feature.
   stp loop-protection
   By default, loop guard is disabled.

Configuring port role restriction

About port role restriction

Make this configuration on the port that connects to the user access network.

The bridge ID change of a device in the user access network might cause a change to the spanning tree topology in the core network. To avoid this problem, you can enable port role restriction on a port. With this feature enabled, when the port receives a superior BPDU, it becomes an alternate port rather than a root port.

Restrictions and guidelines

Use this feature with caution, because enabling port role restriction on a port might affect the connectivity of the spanning tree topology.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable port role restriction.
   stp role-restriction
   By default, port role restriction is disabled.

Configuring TC-BPDU transmission restriction

About TC-BPDU transmission restriction

Make this configuration on the port that connects to the user access network.

The topology change to the user access network might cause the forwarding address changes to the core network. When the user access network topology is unstable, the user access network might affect the core network. To avoid this problem, you can enable TC-BPDU transmission restriction on

a port. With this feature enabled, when the port receives a TC-BPDU, it does not forward the TC-BPDU to other ports.

Restrictions and guidelines

Enabling TC-BPDU transmission restriction on a port might cause the previous forwarding address table to fail to be updated when the topology changes.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable TC-BPDU transmission restriction.
   stp tc-restriction
   By default, TC-BPDU transmission restriction is disabled.

Enabling TC-BPDU guard

About TC-BPDU guard

When a device receives topology change (TC) BPDUs (the BPDUs that notify devices of topology changes), it flushes its forwarding address entries. If someone uses TC-BPDUs to attack the device, the device will receive a large number of TC-BPDUs within a short time. Then, the device is busy with forwarding address entry flushing. This affects network stability.

TC-BPDU guard allows you to set the maximum number of immediate forwarding address entry flushes performed within 10 seconds after the device receives the first TC-BPDU. For TC-BPDUs received in excess of the limit, the device performs a forwarding address entry flush when the time period expires. This prevents frequent flushing of forwarding address entries.

Restrictions and guidelines

As a best practice, enable TC-BPDU guard.

Procedure

1. Enter system view.
   system-view
2. Enable the TC-BPDU guard feature.
   stp tc-protection
   By default, TC-BPDU guard is enabled.
3. (Optional.) Configure the maximum number of forwarding address entry flushes that the device can perform every 10 seconds.
   stp tc-protection threshold *number*
   The default setting is 6.

Enabling BPDU drop

About BPDU drop

In a spanning tree network, every BPDU arriving at the device triggers an STP calculation process and is then forwarded to other devices in the network. Malicious attackers might use the vulnerability to attack the network by forging BPDUs. By continuously sending forged BPDUs, they can make all devices in the network continue performing STP calculations. As a result, problems such as CPU overload and BPDU protocol status errors occur.

To avoid this problem, you can enable BPDU drop on ports. A BPDU drop-enabled port does not receive any BPDUs and is invulnerable to forged BPDU attacks.

Restrictions and guidelines

This feature allows the device to drop BPDUs of STP, RSTP, MSTP, PVST, LACP, and LLDP. Make sure you are fully aware of the impact of this feature when you use it on a live network.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Enable BPDU drop on the interface.
   bpdu-drop any
   By default, BPDU drop is disabled.

Enabling PVST BPDU guard

About PVST BPDU guard

This feature takes effect only when the device is operating in MSTP mode.

An MSTP-enabled device forwards PVST BPDUs as data traffic because it cannot recognize PVST BPDUs. If a PVST-enabled device in another independent network receives the PVST BPDUs, a PVST calculation error might occur. To avoid PVST calculation errors, enable PVST BPDU guard on the MSTP-enabled device. The device shuts down a port if the port receives PVST BPDUs.

Procedure

1. Enter system view.
   system-view
2. Enable PVST BPDU guard.
   stp pvst-bpdu-protection
   By default, PVST BPDU guard is disabled.

Disabling dispute guard

About dispute guard

Dispute guard can be triggered by unidirectional link failures. If an upstream port receives inferior BPDUs from a downstream designated port in forwarding or learning state because of a unidirectional link failure, a loop appears. Dispute guard blocks the upstream designated port to prevent the loop.

As shown in Figure 19, in normal conditions, the spanning tree calculation result is as follows:

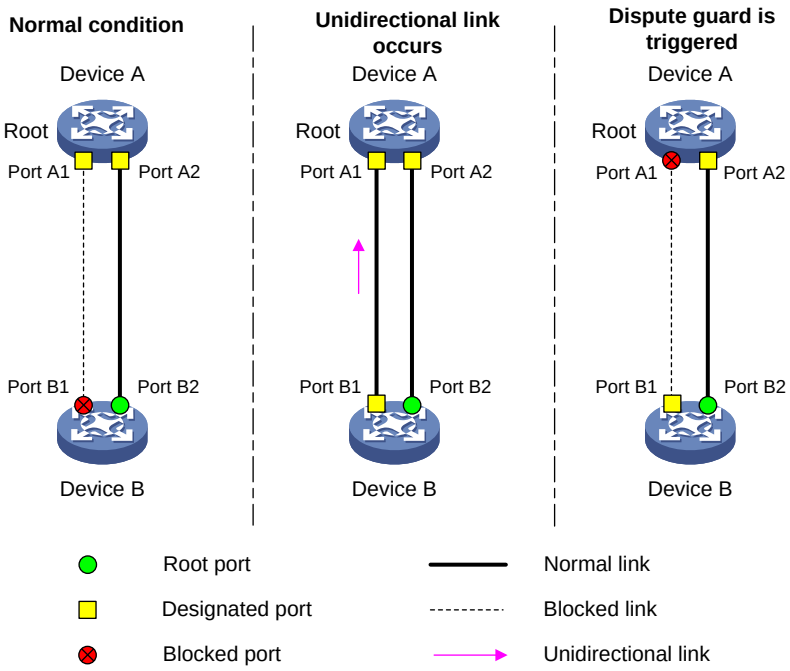
- Device A is the root bridge, and Port A1 is a designated port.
- Port B1 is blocked.

When the link between Port A1 and Port B1 fails in the direction of Port A1 to Port B1 and becomes unidirectional, the following events occur:

1. Port A1 can only receive BPDUs and cannot send BPDUs to Port B1.
2. Port B1 does not receive BPDUs from Port A1 for a certain period of time.
3. Device B determines itself as the root bridge.
4. Port B1 sends its BPDUs to Port A1.

5. Port A1 determines the received BPDUs are inferior to its own BPDUs. A dispute is detected.
6. Dispute guard is triggered and blocks Port A1 to prevent a loop.

Figure 19 Dispute guard triggering scenario

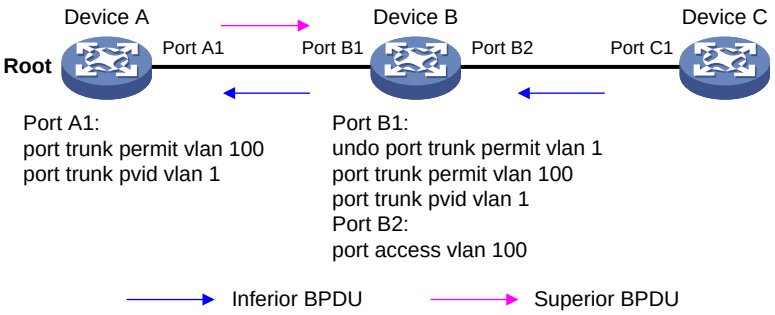


However, dispute guard might disrupt the network connectivity. You can disable dispute guard to avoid connectivity loss in VLAN networks. As shown in Figure 20, the spanning tree feature is disabled on Device B and enabled on Device A and device C. Device B transparently transmits BPDUs.

Device C cannot receive superior BPDUs of VLAN 1 from Device A because Port B1 of Device B is configured to deny packets of VLAN 1. Device C determines itself as the root bridge after a certain period of time. Then, Port C1 sends an inferior BPDU of VLAN 100 to Device A.

When Device A receives the inferior BPDU, dispute guard blocks Port A1, which causes traffic interruption. To ensure service continuity, you can disable dispute guard on Device A to prevent the link from being blocked.

Figure 20 Disabling dispute guard application scenario



Restrictions and guidelines

You can disable dispute guard if the network does not have unidirectional link failures.

Procedure

1. Enter system view.

system-view

2. Disable dispute guard.

   undo stp dispute-protection

   By default, dispute guard is enabled.

Enabling the device to log events of detecting or receiving TC BPDUs

About spanning tree TC BPDU event logging

This feature allows the device to generate logs when it detects or receives TC BPDUs. This feature applies only to PVST mode.

Procedure

1. Enter system view.

   system-view

2. Enable the device to log events of receiving or detecting TC BPDUs.

   stp log enable tc

   By default, the device does not generate logs when it detects or receives TC BPDUs.

Disabling the device from reactivating edge ports shut down by BPDU guard

About disabling the device from reactivating edge ports shut down by BPDU guard

BPDU guard shuts down edge ports that have received configuration BPDUs and notifies the NMS of the shutdown event.

The device reactivates the ports that have been shut down when the port status detection timer expires. You can set this timer by using the **shutdown-interval** command. For more information about this command, see device management commands in *Fundamentals Command Reference*.

Restrictions and guidelines

This feature prevents the device from reactivating edge ports shut down by BPDU guard after this feature is configured. The device does not bring up the shutdown ports if you execute the **undo stp port shutdown permanent** command. To bring up these ports, use the **undo shutdown** command.

Procedure

1. Enter system view.

   system-view

2. Disable the device from reactivating edge ports shut down by BPDU guard.

   stp port shutdown permanent

   By default, the device reactivates an edge port shut down by BPDU guard after the port status detection timer expires.

Enabling SNMP notifications for new-root election and topology change events

About spanning tree SNMP notifications

This task enables the device to generate logs and report new-root election events or spanning tree topology changes to SNMP. For the event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

When you use the **snmp-agent trap enable stp** [**new-root** | **tc**] command, follow these guidelines:

- The **new-root** keyword applies only to STP, MSTP, and RSTP modes.
- The **tc** keyword applies only to PVST mode.
- In STP, MSTP, or RSTP mode, the **snmp-agent trap enable stp** command enables SNMP notifications for new-root election events.
- In PVST mode, the **snmp-agent trap enable stp** command enables SNMP notifications for spanning tree topology changes.

Procedure

1. Enter system view.

   system-view
2. Enable SNMP notifications for new-root election and topology change events.

   snmp-agent trap enable stp [**new-root** | **tc**]

   The default settings are as follows:
   - SNMP notifications are disabled for new-root election events.
   - In MSTP mode, SNMP notifications are enabled in MSTI 0 and disabled in other MSTIs for spanning tree topology changes.
   - In PVST mode, SNMP notifications are disabled for spanning tree topology changes in all VLANs.

Display and maintenance commands for the spanning tree protocols

Execute **display** commands in any view and **reset** command in user view.

Task	Command
Display the spanning tree status and statistics.	**display stp** [**instance** *instance-list* | **vlan** *vlan-id-list*] [**interface** *interface-list* | **slot** *slot-number*] [**brief**]
Display the port role calculation history for the specified MSTI or all MSTIs.	**display stp** [**instance** *instance-list* | **vlan** *vlan-id-list*] **history** [**slot** *slot-number*]
Display the incoming and outgoing TC/TCN BPDU statistics by all ports in the specified MSTI or all MSTIs.	**display stp** [**instance** *instance-list* | **vlan** *vlan-id-list*] **tc** [**slot** *slot-number*]

Task	Command
Display history about ports blocked by spanning tree protection features.	**display stp abnormal-port**
Display BPDU statistics on ports.	**display stp bpdu-statistics** [**interface** *interface-type interface-number* [**instance** *instance-list*]]
Display information about ports shut down by spanning tree protection features.	**display stp down-port**
Display the MST region configuration information that has taken effect.	**display stp region-configuration**
Display the root bridge information of all MSTIs.	**display stp root**
Clear the spanning tree statistics.	**reset stp** [**interface** *interface-list*]

Spanning tree configuration examples

Example: Configuring MSTP

Network configuration

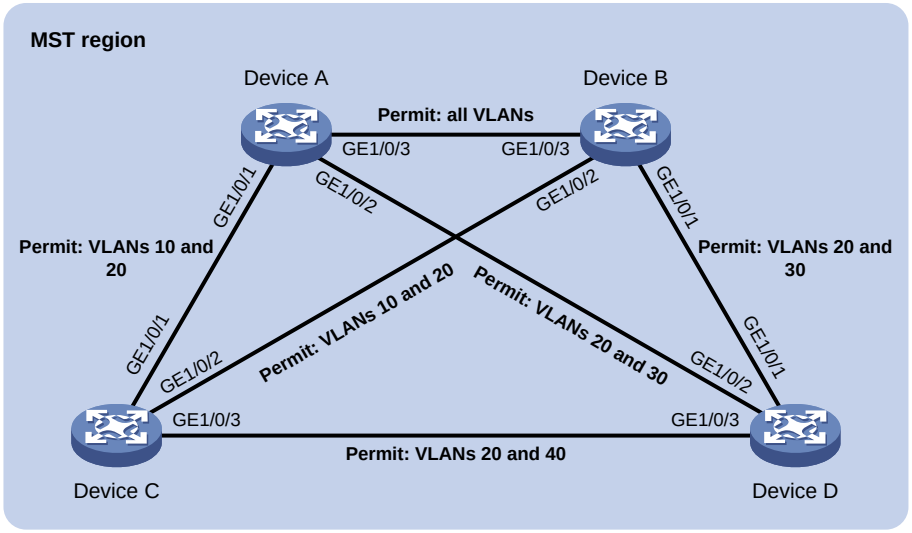
As shown in Figure 21, all devices on the network are in the same MST region. Device A and Device B work at the distribution layer. Device C and Device D work at the access layer.

Configure MSTP so that frames of different VLANs are forwarded along different spanning trees.

- VLAN 10 frames are forwarded along MSTI 1.
- VLAN 30 frames are forwarded along MSTI 3.
- VLAN 40 frames are forwarded along MSTI 4.
- VLAN 20 frames are forwarded along MSTI 0.

VLAN 10 and VLAN 30 are terminated on the distribution layer devices, and VLAN 40 is terminated on the access layer devices. The root bridges of MSTI 1 and MSTI 3 are Device A and Device B, respectively, and the root bridge of MSTI 4 is Device C.

Figure 21 Network diagram



Procedure

1. Configure VLANs and VLAN member ports. (Details not shown.)
   - Create VLAN 10, VLAN 20, and VLAN 30 on both Device A and Device B.
   - Create VLAN 10, VLAN 20, and VLAN 40 on Device C.
   - Create VLAN 20, VLAN 30, and VLAN 40 on Device D.
   - Configure the ports on these devices as trunk ports and assign them to related VLANs.
2. Configure Device A:

   # Enter MST region view, and configure the MST region name as **example**.

   ```
   <DeviceA> system-view
   [DeviceA] stp region-configuration
   [DeviceA-mst-region] region-name example
   ```

   # Map VLAN 10, VLAN 30, and VLAN 40 to MSTI 1, MSTI 3, and MSTI 4, respectively.

   ```
   [DeviceA-mst-region] instance 1 vlan 10
   [DeviceA-mst-region] instance 3 vlan 30
   [DeviceA-mst-region] instance 4 vlan 40
   ```

   # Configure the revision level of the MST region as 0.

   ```
   [DeviceA-mst-region] revision-level 0
   ```

   # Activate MST region configuration.

   ```
   [DeviceA-mst-region] active region-configuration
   [DeviceA-mst-region] quit
   ```

   # Configure the Device A as the root bridge of MSTI 1.

   ```
   [DeviceA] stp instance 1 root primary
   ```

   # Enable the spanning tree feature globally.

   ```
   [DeviceA] stp global enable
   ```

3. Configure Device B:

   # Enter MST region view, and configure the MST region name as **example**.

   ```
   <DeviceB> system-view
   [DeviceB] stp region-configuration
   [DeviceB-mst-region] region-name example
   ```

   # Map VLAN 10, VLAN 30, and VLAN 40 to MSTI 1, MSTI 3, and MSTI 4, respectively.

```
[DeviceB-mst-region] instance 1 vlan 10
[DeviceB-mst-region] instance 3 vlan 30
[DeviceB-mst-region] instance 4 vlan 40
```

Configure the revision level of the MST region as 0.

```
[DeviceB-mst-region] revision-level 0
```

Activate MST region configuration.

```
[DeviceB-mst-region] active region-configuration
[DeviceB-mst-region] quit
```

Configure Device B as the root bridge of MSTI 3.

```
[DeviceB] stp instance 3 root primary
```

Enable the spanning tree feature globally.

```
[DeviceB] stp global enable
```

4. Configure Device C:

Enter MST region view, and configure the MST region name as **example**.

```
<DeviceC> system-view
[DeviceC] stp region-configuration
[DeviceC-mst-region] region-name example
```

Map VLAN 10, VLAN 30, and VLAN 40 to MSTI 1, MSTI 3, and MSTI 4, respectively.

```
[DeviceC-mst-region] instance 1 vlan 10
[DeviceC-mst-region] instance 3 vlan 30
[DeviceC-mst-region] instance 4 vlan 40
```

Configure the revision level of the MST region as 0.

```
[DeviceC-mst-region] revision-level 0
```

Activate MST region configuration.

```
[DeviceC-mst-region] active region-configuration
[DeviceC-mst-region] quit
```

Configure the Device C as the root bridge of MSTI 4.

```
[DeviceC] stp instance 4 root primary
```

Enable the spanning tree feature globally.

```
[DeviceC] stp global enable
```

5. Configure Device D:

Enter MST region view, and configure the MST region name as **example**.

```
<DeviceD> system-view
[DeviceD] stp region-configuration
[DeviceD-mst-region] region-name example
```

Map VLAN 10, VLAN 30, and VLAN 40 to MSTI 1, MSTI 3, and MSTI 4, respectively.

```
[DeviceD-mst-region] instance 1 vlan 10
[DeviceD-mst-region] instance 3 vlan 30
[DeviceD-mst-region] instance 4 vlan 40
```

Configure the revision level of the MST region as 0.

```
[DeviceD-mst-region] revision-level 0
```

Activate MST region configuration.

```
[DeviceD-mst-region] active region-configuration
[DeviceD-mst-region] quit
```

Enable the spanning tree feature globally.

```
[DeviceD] stp global enable
```

Verifying the configuration

In this example, Device B has the lowest root bridge ID. As a result, Device B is elected as the root bridge in MSTI 0.

When the network is stable, you can use the **display stp brief** command to display brief spanning tree information on each device.

Display brief spanning tree information on Device A.

```
[DeviceA] display stp brief
 MST ID      Port                        Role  STP State     Protection
 0           GigabitEthernet1/0/1        ALTE  DISCARDING    NONE
 0           GigabitEthernet1/0/2        DESI  FORWARDING    NONE
 0           GigabitEthernet1/0/3        ROOT  FORWARDING    NONE
 1           GigabitEthernet1/0/1        DESI  FORWARDING    NONE
 1           GigabitEthernet1/0/3        DESI  FORWARDING    NONE
 3           GigabitEthernet1/0/2        DESI  FORWARDING    NONE
 3           GigabitEthernet1/0/3        ROOT  FORWARDING    NONE
```

Display brief spanning tree information on Device B.

```
[DeviceB] display stp brief
 MST ID      Port                        Role  STP State     Protection
 0           GigabitEthernet1/0/1        DESI  FORWARDING    NONE
 0           GigabitEthernet1/0/2        DESI  FORWARDING    NONE
 0           GigabitEthernet1/0/3        DESI  FORWARDING    NONE
 1           GigabitEthernet1/0/2        DESI  FORWARDING    NONE
 1           GigabitEthernet1/0/3        ROOT  FORWARDING    NONE
 3           GigabitEthernet1/0/1        DESI  FORWARDING    NONE
 3           GigabitEthernet1/0/3        DESI  FORWARDING    NONE
```

Display brief spanning tree information on Device C.

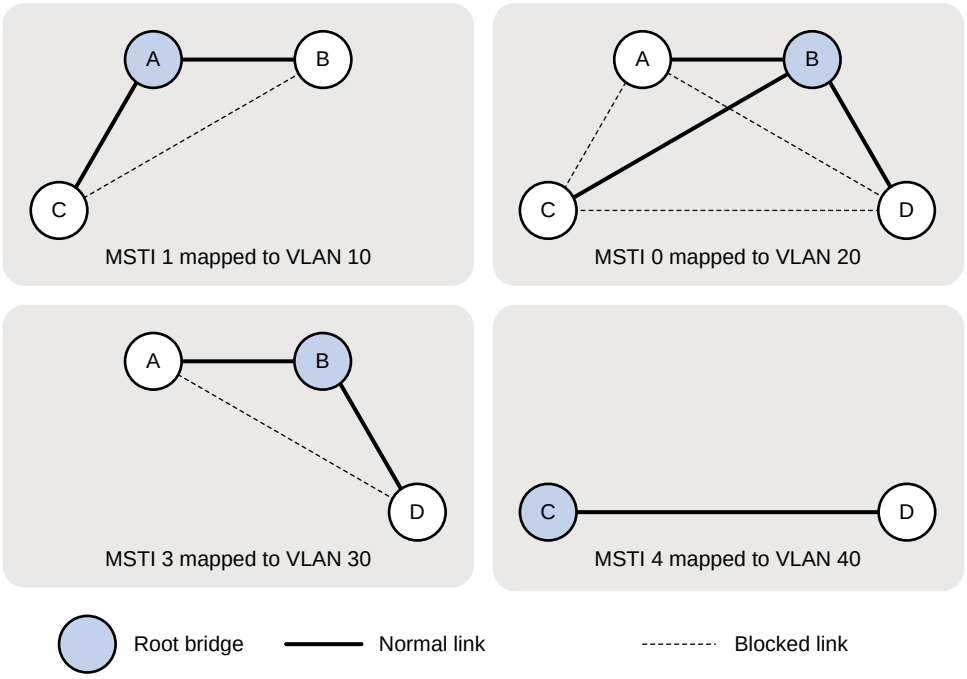
```
[DeviceC] display stp brief
 MST ID      Port                        Role  STP State     Protection
 0           GigabitEthernet1/0/1        DESI  FORWARDING    NONE
 0           GigabitEthernet1/0/2        ROOT  FORWARDING    NONE
 0           GigabitEthernet1/0/3        DESI  FORWARDING    NONE
 1           GigabitEthernet1/0/1        ROOT  FORWARDING    NONE
 1           GigabitEthernet1/0/2        ALTE  DISCARDING    NONE
 4           GigabitEthernet1/0/3        DESI  FORWARDING    NONE
```

Display brief spanning tree information on Device D.

```
[DeviceD] display stp brief
 MST ID      Port                        Role  STP State     Protection
 0           GigabitEthernet1/0/1        ROOT  FORWARDING    NONE
 0           GigabitEthernet1/0/2        ALTE  DISCARDING    NONE
 0           GigabitEthernet1/0/3        ALTE  DISCARDING    NONE
 3           GigabitEthernet1/0/1        ROOT  FORWARDING    NONE
 3           GigabitEthernet1/0/2        ALTE  DISCARDING    NONE
 4           GigabitEthernet1/0/3        ROOT  FORWARDING    NONE
```

Based on the output, you can draw each MSTI mapped to each VLAN, as shown in Figure 22.

Figure 22 MSTIs mapped to different VLANs



Example: Configuring PVST

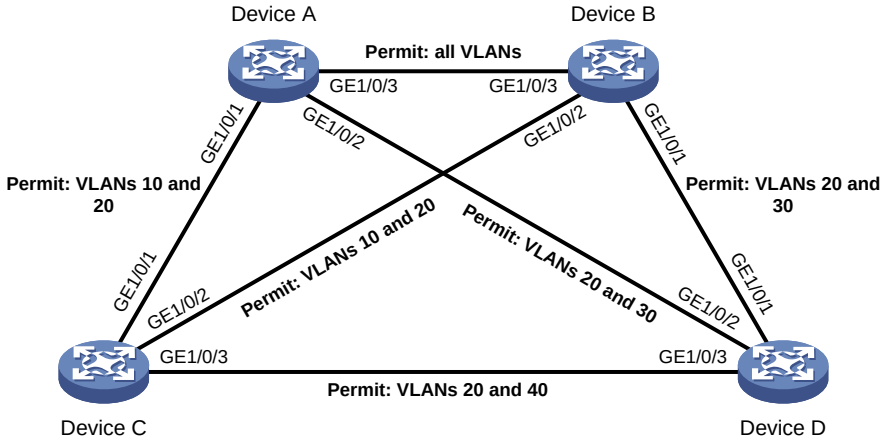
Network configuration

As shown in Figure 23, Device A and Device B work at the distribution layer, and Device C and Device D work at the access layer.

Configure PVST to meet the following requirements:

- Frames of a VLAN are forwarded along the spanning trees of the VLAN.
- VLAN 10, VLAN 20, and VLAN 30 are terminated on the distribution layer devices, and VLAN 40 is terminated on the access layer devices.
- The root bridge of VLAN 10 and VLAN 20 is Device A.
- The root bridge of VLAN 30 is Device B.
- The root bridge of VLAN 40 is Device C.

Figure 23 Network diagram



Procedure

1. Configure VLANs and VLAN member ports. (Details not shown.)
   - Create VLAN 10, VLAN 20, and VLAN 30 on both Device A and Device B.
   - Create VLAN 10, VLAN 20, and VLAN 40 on Device C.
   - Create VLAN 20, VLAN 30, and VLAN 40 on Device D.
   - Configure the ports on these devices as trunk ports and assign them to related VLANs.
2. Configure Device A:

   # Set the spanning tree mode to PVST.

   ```
   <DeviceA> system-view
   [DeviceA] stp mode pvst
   ```

   # Configure the device as the root bridge of VLAN 10 and VLAN 20.

   ```
   [DeviceA] stp vlan 10 20 root primary
   ```

   # Enable the spanning tree feature globally and in VLAN 10, VLAN 20, and VLAN 30.

   ```
   [DeviceA] stp global enable
   [DeviceA] stp vlan 10 20 30 enable
   ```
3. Configure Device B:

   # Set the spanning tree mode to PVST.

   ```
   <DeviceB> system-view
   [DeviceB] stp mode pvst
   ```

   # Configure the device as the root bridge of VLAN 30.

   ```
   [DeviceB] stp vlan 30 root primary
   ```

   # Enable the spanning tree feature globally and in VLAN 10, VLAN 20, and VLAN 30.

   ```
   [DeviceB] stp global enable
   [DeviceB] stp vlan 10 20 30 enable
   ```
4. Configure Device C:

   # Set the spanning tree mode to PVST.

   ```
   <DeviceC> system-view
   [DeviceC] stp mode pvst
   ```

   # Configure the device as the root bridge of VLAN 40.

   ```
   [DeviceC] stp vlan 40 root primary
   ```

   # Enable the spanning tree feature globally and in VLAN 10, VLAN 20, and VLAN 40.

   ```
   [DeviceC] stp global enable
   ```

```
[DeviceC] stp vlan 10 20 40 enable
```

5. Configure Device D:

Set the spanning tree mode to PVST.

```
<DeviceD> system-view
[DeviceD] stp mode pvst
```

Enable the spanning tree feature globally and in VLAN 20, VLAN 30, and VLAN 40.

```
[DeviceD] stp global enable
[DeviceD] stp vlan 20 30 40 enable
```

Verifying the configuration

When the network is stable, you can use the **`display stp brief`** command to display brief spanning tree information on each device.

Display brief spanning tree information on Device A.

```
[DeviceA] display stp brief
 VLAN ID     Port                          Role  STP State     Protection
 10          GigabitEthernet1/0/1          DESI  FORWARDING    NONE
 10          GigabitEthernet1/0/3          DESI  FORWARDING    NONE
 20          GigabitEthernet1/0/1          DESI  FORWARDING    NONE
 20          GigabitEthernet1/0/2          DESI  FORWARDING    NONE
 20          GigabitEthernet1/0/3          DESI  FORWARDING    NONE
 30          GigabitEthernet1/0/2          DESI  FORWARDING    NONE
 30          GigabitEthernet1/0/3          ROOT  FORWARDING    NONE
```

Display brief spanning tree information on Device B.

```
[DeviceB] display stp brief
 VLAN ID     Port                          Role  STP State     Protection
 10          GigabitEthernet1/0/2          DESI  FORWARDING    NONE
 10          GigabitEthernet1/0/3          ROOT  FORWARDING    NONE
 20          GigabitEthernet1/0/1          DESI  FORWARDING    NONE
 20          GigabitEthernet1/0/2          DESI  FORWARDING    NONE
 20          GigabitEthernet1/0/3          ROOT  FORWARDING    NONE
 30          GigabitEthernet1/0/1          DESI  FORWARDING    NONE
 30          GigabitEthernet1/0/3          DESI  FORWARDING    NONE
```

Display brief spanning tree information on Device C.

```
[DeviceC] display stp brief
 VLAN ID     Port                          Role  STP State     Protection
 10          GigabitEthernet1/0/1          ROOT  FORWARDING    NONE
 10          GigabitEthernet1/0/2          ALTE  DISCARDING    NONE
 20          GigabitEthernet1/0/1          ROOT  FORWARDING    NONE
 20          GigabitEthernet1/0/2          ALTE  DISCARDING    NONE
 20          GigabitEthernet1/0/3          DESI  FORWARDING    NONE
 40          GigabitEthernet1/0/3          DESI  FORWARDING    NONE
```

Display brief spanning tree information on Device D.

```
[DeviceD] display stp brief
 VLAN ID     Port                          Role  STP State     Protection
 20          GigabitEthernet1/0/1          ALTE  DISCARDING    NONE
 20          GigabitEthernet1/0/2          ROOT  FORWARDING    NONE
 20          GigabitEthernet1/0/3          ALTE  DISCARDING    NONE
 30          GigabitEthernet1/0/1          ROOT  FORWARDING    NONE
```

```
30          GigabitEthernet1/0/2          ALTE  DISCARDING    NONE
40          GigabitEthernet1/0/3          ROOT  FORWARDING    NONE
```

Based on the output, you can draw a topology for each VLAN spanning tree, as shown in Figure 24.

Configuring loop detection

About loop detection

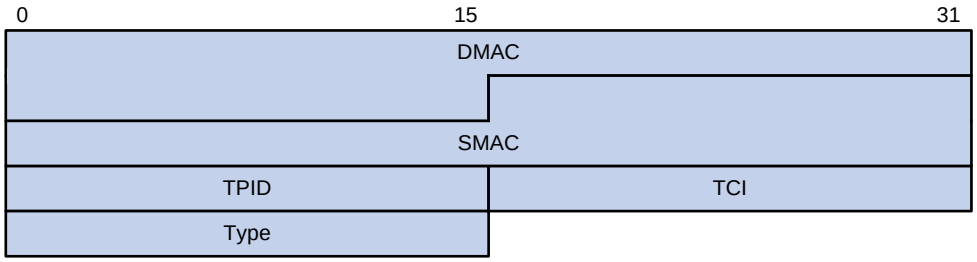
The loop detection mechanism performs periodic checking for Layer 2 loops. The mechanism immediately generates a log when a loop occurs so that you are promptly notified to adjust network connections and configurations. You can configure loop detection to shut down the looped port. Logs are maintained in the information center. For more information, see *Network Management and Monitoring Configuration Guide*.

Loop detection mechanism

The device detects loops by sending detection frames and then checking whether these frames return to any port on the device. If they do, the device considers that the port is on a looped link.

Loop detection usually works within a VLAN. If a detection frame is returned with a different VLAN tag than it was sent out with, an inter-VLAN loop has occurred. To remove the loop, examine the QinQ or VLAN mapping configuration for incorrect settings. For more information about QinQ and VLAN mapping, see "Configuring QinQ" and "Configuring VLAN mapping."

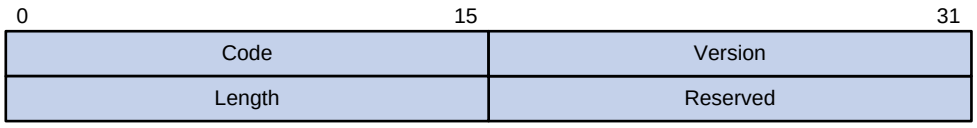
Figure 1 Ethernet frame header for loop detection



The Ethernet frame header of a loop detection packet contains the following fields:

- **DMAC**—Destination MAC address of the frame, which is the multicast MAC address 010f-e200-0007. When a loop detection-enabled device receives a frame with this destination MAC address, it performs the following operations:
  - Sends the frame to the CPU.
  - Floods the frame in the VLAN from which the frame was originally received.
- **SMAC**—Source MAC address of the frame, which is the bridge MAC address of the sending device.
- **TPID**—Type of the VLAN tag, with the value of 0x8100.
- **TCI**—Information of the VLAN tag, including the priority and VLAN ID.
- **Type**—Protocol type, with the value of 0x8918.

Figure 2 Inner frame header for loop detection



The inner frame header of a loop detection packet contains the following fields:

- **Code**—Protocol sub-type, which is 0x0001, indicating the loop detection protocol.

- **Version**—Protocol version, which is always 0x0000.
- **Length**—Length of the frame. The value includes the inner header, but excludes the Ethernet header.
- **Reserved**—This field is reserved.

Frames for loop detection are encapsulated as TLV triplets.

Table 1 TLVs supported by loop detection

TLV	Description	Remarks
End of PDU	End of a PDU.	Optional.
Device ID	Bridge MAC address of the sending device.	Required.
Port ID	ID of the PDU sending port.	Optional.
Port Name	Name of the PDU sending port.	Optional.
System Name	Device name.	Optional.
Chassis ID	Chassis ID of the sending port.	Optional.
Slot ID	Slot ID of the sending port.	Optional.
Sub Slot ID	Sub-slot ID of the sending port.	Optional.

Loop detection interval

Loop detection is a continuous process as the network changes. Loop detection frames are sent at the loop detection interval to determine whether loops occur on ports and whether loops are removed.

Loop protection actions

When the device detects a loop on a port, it generates a log but performs no action on the port by default. You can configure the device to take one of the following actions:

- **Block**—Disables the port from learning MAC addresses and blocks the port.
- **No-learning**—Disables the port from learning MAC addresses.
- **Shutdown**—Shuts down the port to disable it from receiving and sending any frames.

Port status auto recovery

When the device configured with the block or no-learning loop action detects a loop on a port, it performs the action and waits three loop detection intervals. If the device does not receive a loop detection frame within three loop detection intervals, it performs the following operations:

- Automatically sets the port to the forwarding state.
- Notifies the user of the event.

When the device configured with the shutdown action detects a loop on a port, the following events occur:

1. The device automatically shuts down the port.

2. The device automatically sets the port to the forwarding state after the detection timer set by using the **shutdown-interval** command expires. For more information about the **shutdown-interval** command, see *Fundamentals Command Reference*.
3. The device shuts down the port again if a loop is still detected on the port when the detection timer expires.

This process is repeated until the loop is removed.

NOTE:

Incorrect recovery can occur when loop detection frames are discarded to reduce the load. To avoid this, use the shutdown action, or manually remove the loop.

Loop detection tasks at a glance

To configure loop detection, perform the following tasks:

1. Enabling loop detection
   - Enabling loop detection globally
   - Enabling loop detection on a port
2. (Optional) Setting the loop protection action
   - Setting the global loop protection action
   - Setting the loop protection action on an interface
3. (Optional) Setting the loop detection interval
4. (Optional) Enabling LED flashing for loop detection

Enabling loop detection

Restrictions and guidelines for loop detection configuration

You can enable loop detection globally or on a per-port basis. When a port receives a detection frame in any VLAN, the loop protection action is triggered on that port, regardless of whether loop detection is enabled on it.

The loop detection feature is mutually exclusive with Layer 2 loop prevention features, including:

- The spanning tree feature.
- RRPP.
- ERPS.

To avoid unexpected network issues, do not use the loop detection feature and any of those Layer 2 loop prevention features together. For more information about the spanning tree feature, see "Configuring spanning tree protocols." For more information about RRPP and ERPS, see *High Availability Configuration Guide*.

Enabling loop detection globally

1. Enter system view.

   system-view
2. Globally enable loop detection.

   loopback-detection global enable vlan { *vlan-id--list* | **all** }

   By default, loop detection is globally disabled.

Enabling loop detection on a port

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
3. Enable loop detection on the port.
   loopback-detection enable vlan { *vlan-id--list* | **all** }
   By default, loop detection is disabled on ports.

Setting the loop protection action

Restrictions and guidelines for loop protection action configuration

You can set the loop protection action globally or on a per-port basis. The global action applies to all ports. The per-port action applies to the individual ports. The per-port action takes precedence over the global action.

Setting the global loop protection action

1. Enter system view.
   system-view
2. Set the global loop protection action.
   loopback-detection global action shutdown
   By default, the device generates a log but performs no action on the port on which a loop is detected.

Setting the loop protection action on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the loop protection action on the interface.
   loopback-detection action { **block** | **no-learning** | **shutdown** }
   By default, the device generates a log but performs no action on the port on which a loop is detected.
   Support for the keywords of this command varies by interface type. For more information, see *Layer 2—LAN Switching Command Reference*.

Setting the loop detection interval

About the loop detection interval

With loop detection enabled, the device sends loop detection frames at the loopback detection interval. A shorter interval offers more sensitive detection but consumes more resources. Consider the system performance and loop detection speed when you set the loop detection interval.

Procedure

1. Enter system view.
   system-view
2. Set the loop detection interval.
   loopback-detection interval-time *interval*
   The default setting is 30 seconds.

Enabling LED flashing for loop detection

About this task

If loop detection is enabled globally or on a per-port basis, LED flashing allows port LEDs in Link/Active mode to flash as follows when a loop is detected:

- The LED for a looped port turns to steady green.
- The LEDs for unlooped ports turn to flashing green.

Hardware and feature compatibility

This feature is supported only by the S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series.

Software version and feature compatibility

This feature is supported only in Release 6328 and later.

Restrictions and guidelines

The device flashes port LEDs for a loop only when LED flashing is enabled on all ports that form the loop on the device. As a best practice, enable LED flashing for loop detection on all physically up Layer 2 interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
3. Enable LED flashing for loop detection.
   loopback-detection led-flashing enable
   By default, LED flashing is disabled for loop detection.

Display and maintenance commands for loop detection

Execute **display** commands in any view.

Task	Command
Display the loop detection configuration and status.	**display loopback-detection**

Loop detection configuration examples

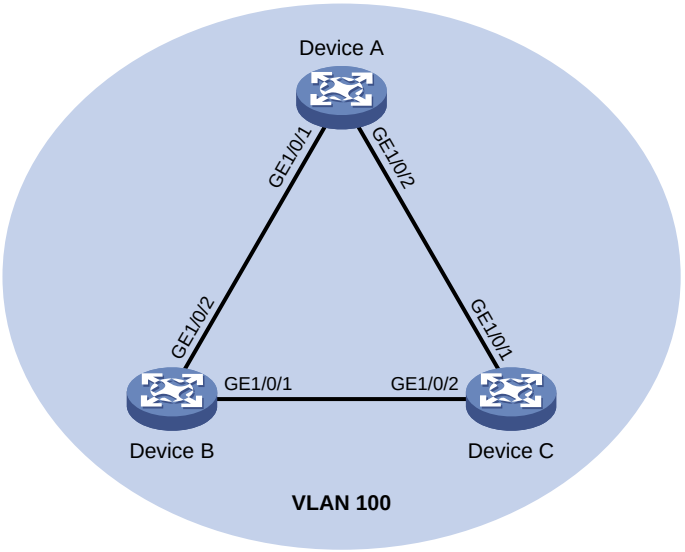
Example: Configuring basic loop detection functions

Network configuration

As shown in Figure 3, configure loop detection on Device A to meet the following requirements:

- Device A generates a log as a notification.
- Device A automatically shuts down the port on which a loop is detected.

Figure 3 Network diagram



Procedure

1. Configure Device A:

   # Create VLAN 100, and globally enable loop detection for the VLAN.

   ```
   <DeviceA> system-view
   [DeviceA] vlan 100
   [DeviceA-vlan100] quit
   [DeviceA] loopback-detection global enable vlan 100
   ```

   # Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 as trunk ports, and assign them to VLAN 100.

   ```
   [DeviceA] interface GigabitEthernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] port link-type trunk
   [DeviceA-GigabitEthernet1/0/1] port trunk permit vlan 100
   [DeviceA-GigabitEthernet1/0/1] quit
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] port link-type trunk
   [DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 100
   ```

```
[DeviceA-GigabitEthernet1/0/2] quit
```

Set the global loop protection action to shutdown.

```
[DeviceA] loopback-detection global action shutdown
```

Set the loop detection interval to 35 seconds.

```
[DeviceA] loopback-detection interval-time 35
```

2. Configure Device B:

Create VLAN 100.

```
<DeviceB> system-view
[DeviceB] vlan 100
[DeviceB–vlan100] quit
```

Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 as trunk ports, and assign them to VLAN 100.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 100
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan 100
[DeviceB-GigabitEthernet1/0/2] quit
```

3. Configure Device C:

Create VLAN 100.

```
<DeviceC> system-view
[DeviceC] vlan 100
[DeviceC–vlan100] quit
```

Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 as trunk ports, and assign them to VLAN 100.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] port link-type trunk
[DeviceC-GigabitEthernet1/0/1] port trunk permit vlan 100
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] port link-type trunk
[DeviceC-GigabitEthernet1/0/2] port trunk permit vlan 100
[DeviceC-GigabitEthernet1/0/2] quit
```

Verifying the configuration

View the system logs on devices, for example, Device A.

```
[DeviceA]
%Feb 24 15:04:29:663 2013 DeviceA LPDT/4/LPDT_LOOPED:  A loop was detected on
GigabitEthernet1/0/1.
%Feb 24 15:04:29:664 2013 DeviceA LPDT/4/LPDT_VLAN_LOOPED: A loop was detected on
GigabitEthernet1/0/1 in VLAN 100.
%Feb 24 15:04:29:667 2013 DeviceA LPDT/4/LPDT_LOOPED: A loop was detected on
GigabitEthernet1/0/2.
%Feb 24 15:04:29:668 2013 DeviceA LPDT/4/LPDT_VLAN_LOOPED: A loop was detected on
GigabitEthernet1/0/2 in VLAN 100.
%Feb 24 15:04:44:243 2013 DeviceA LPDT/5/LPDT_VLAN_RECOVERED: A loop was removed on
GigabitEthernet1/0/1 in VLAN 100.
```

```
%Feb 24 15:04:44:243 2013 DeviceA LPDT/5/LPDT_RECOVERED: All loops were removed on
GigabitEthernet1/0/1.
%Feb 24 15:04:44:248 2013 DeviceA LPDT/5/LPDT_VLAN_RECOVERED: A loop was removed on
GigabitEthernet1/0/2 in VLAN 100.
%Feb 24 15:04:44:248 2013 DeviceA LPDT/5/LPDT_RECOVERED: All loops were removed on
GigabitEthernet1/0/2.
```

The output shows the following information:

- Device A detected loops on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 within a loop detection interval.
- Loops on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 were removed.

Use the **`display loopback-detection`** command to display the loop detection configuration and status on devices, for example, Device A.

```
[DeviceA] display loopback-detection
Loop detection is enabled.
Loop detection interval is 35 second(s).
Loop is detected on following interfaces:
 Interface                     Action mode     VLANs
 GigabitEthernet1/0/1          Shutdown        100
 GigabitEthernet1/0/2          Shutdown        100
```

The output shows that the device has removed the loops from GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 according to the shutdown action.

Display the status of GigabitEthernet 1/0/1 on devices, for example, Device A.

```
[DeviceA] display interface gigabitethernet 1/0/1
GigabitEthernet1/0/1 current state: DOWN (Loop detection down)
...
```

The output shows that GigabitEthernet 1/0/1 is already shut down by the loop detection module.

Display the status of GigabitEthernet 1/0/2 on devices, for example, Device A.

```
[DeviceA] display interface gigabitethernet 1/0/2
GigabitEthernet1/0/2 current state: DOWN (Loop detection down)
...
```

The output shows that GigabitEthernet 1/0/2 is already shut down by the loop detection module.

Contents

Configuring VLANs

About VLANs

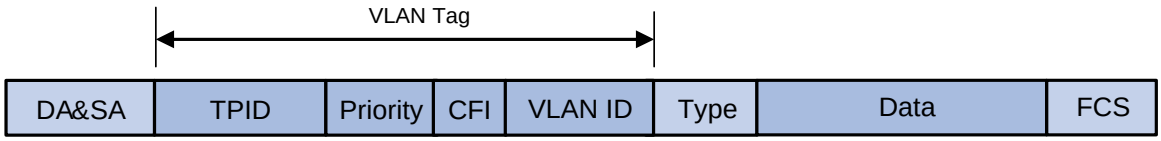
The Virtual Local Area Network (VLAN) technology divides a physical LAN into multiple logical LANs. It has the following benefits:

- **Security**—Hosts in the same VLAN can communicate with one another at Layer 2, but they are isolated from hosts in other VLANs at Layer 2.
- **Broadcast traffic isolation**—Each VLAN is a broadcast domain that limits the transmission of broadcast packets.
- **Flexibility**—A VLAN can be logically divided on a workgroup basis. Hosts in the same workgroup can be assigned to the same VLAN, regardless of their physical locations.

VLAN frame encapsulation

To identify Ethernet frames from different VLANs, IEEE 802.1Q inserts a four-byte VLAN tag between the destination and source MAC address (DA&SA) field and the Type field.

Figure 1 VLAN tag placement and format



A VLAN tag includes the following fields:

- **TPID**—16-bit tag protocol identifier that indicates whether a frame is VLAN-tagged. By default, the hexadecimal TPID value 8100 identifies a VLAN-tagged frame. A device vendor can set the TPID to a different value. For compatibility with a neighbor device, set the TPID value on the device to be the same as the neighbor device. For more information about setting the TPID value, see QinQ commands in *Layer 2—LAN Switching Command Reference*.
- **Priority**—3-bit long, identifies the 802.1p priority of the frame. For more information, see *ACL and QoS Configuration Guide*.
- **CFI**—1-bit long canonical format indicator that indicates whether the MAC addresses are encapsulated in the standard format when packets are transmitted across different media. Available values include:
  - **0 (default)**—The MAC addresses are encapsulated in the standard format.
  - **1**—The MAC addresses are encapsulated in a non-standard format.

  This field is always set to 0 for Ethernet.
- **VLAN ID**—12-bit long, identifies the VLAN to which the frame belongs. The VLAN ID range is 0 to 4095. VLAN IDs 0 and 4095 are reserved, and VLAN IDs 1 to 4094 are user configurable.

The way a network device handles an incoming frame depends on whether the frame has a VLAN tag and the value of the VLAN tag (if any).

Ethernet supports encapsulation formats Ethernet II, 802.3/802.2 LLC, 802.3/802.2 SNAP, and 802.3 raw. The Ethernet II encapsulation format is used here. For information about the VLAN tag fields in other frame encapsulation formats, see related protocols and standards.

For a frame that has multiple VLAN tags, the device handles it according to its outermost VLAN tag and transmits its inner VLAN tags as the payload.

VLAN types

The following VLAN types are available:

- Port-based VLAN.
- MAC-based VLAN.
- IP subnet-based VLAN.
- Protocol-based VLAN.

If all these types of VLANs are configured on a port, the port processes packets in the following descending order of priority by default:

- MAC-based VLAN.
- IP subnet-based VLAN.
- Protocol-based VLAN.
- Port-based VLAN.

Port-based VLANs

Port-based VLANs group VLAN members by port. A port forwards packets from a VLAN only after it is assigned to the VLAN.

Port link type

You can set the link type of a port to access, trunk, or hybrid. The port link type determines whether the port can be assigned to multiple VLANs. The link types use the following VLAN tag handling methods:

- **Access**—An access port can forward packets only from one VLAN and send these packets untagged. An access port is typically used in the following conditions:
  - Connecting to a terminal device that does not support VLAN packets.
  - In scenarios that do not distinguish VLANs.
- **Trunk**—A trunk port can forward packets from multiple VLANs. Except packets from the port VLAN ID (PVID), packets sent out of a trunk port are VLAN-tagged. Ports connecting network devices are typically configured as trunk ports.
- **Hybrid**—A hybrid port can forward packets from multiple VLANs. The tagging status of the packets forwarded by a hybrid port depends on the port configuration. In one-to-two VLAN mapping, hybrid ports are used to remove SVLAN tags for downlink traffic. For more information about one-to-two VLAN mapping, see "Configuring VLAN mapping."

PVID

The PVID identifies the default VLAN of a port. Untagged packets received on a port are considered as the packets from the port PVID.

An access port can join only one VLAN. The VLAN to which the access port belongs is the PVID of the port. A trunk or hybrid port supports multiple VLANs and the PVID configuration.

How ports of different link types handle frames

Actions	Access	Trunk	Hybrid
In the inbound direction for an untagged frame	Tags the frame with the PVID tag.	• If the PVID is permitted on the port, tags the frame with the PVID tag. • If not, drops the frame.	
In the inbound direction for a tagged frame	• Receives the frame if its VLAN ID is the same as	• Receives the frame if its VLAN is permitted on the port. • Drops the frame if its VLAN is not permitted on the port.	

Actions	Access	Trunk	Hybrid
	the PVID. • Drops the frame if its VLAN ID is different from the PVID.		
In the outbound direction	Removes the VLAN tag and sends the frame.	• Removes the tag and sends the frame if the frame carries the PVID tag and the port belongs to the PVID. • Sends the frame without removing the tag if its VLAN is carried on the port but is different from the PVID.	Sends the frame if its VLAN is permitted on the port. The tagging status of the frame depends on the **`port hybrid vlan`** command configuration.

MAC-based VLANs

The MAC-based VLAN feature assigns hosts to a VLAN based on their MAC addresses. This feature is also called user-based VLAN because VLAN configuration remains the same regardless of a user's physical location.

Static MAC-based VLAN assignment

Use static MAC-based VLAN assignment in networks that have a small number of VLAN users. To configure static MAC-based VLAN assignment on a port, perform the following tasks:

1. Create MAC-to-VLAN entries.
2. Enable the MAC-based VLAN feature on the port.
3. Assign the port to the MAC-based VLAN.

A port configured with static MAC-based VLAN assignment processes a received frame as follows before sending the frame out:

- For an untagged frame, the port determines its VLAN ID in the following workflow:
  a. The port first performs an exact match. It searches for MAC-to-VLAN entries whose masks are all Fs. If the source MAC address of the frame exactly matches the MAC address of a MAC-to-VLAN entry, the port tags the frame with the VLAN ID specific to this entry.
  b. If the exact match fails, the port performs a fuzzy as follows:
     – Searches for the MAC-to-VLAN entries whose masks are not all Fs.
     – Performs a logical AND operation on the source MAC address and each of these masks.

       If an AND operation result matches the MAC address in a MAC-to-VLAN entry, the port tags the frame with the VLAN ID specific to this entry.
  c. If no matching VLAN ID is found, the port determines the VLAN for the packet by using the following matching order:
     – IP subnet-based VLAN.
     – Protocol-based VLAN.
     – Port-based VLAN.

     When a match is found, the port tags the packet with the matching VLAN ID.
- For a tagged frame, the port determines whether the VLAN ID of the frame is permitted on the port.

- If the VLAN ID of the frame is permitted on the port, the port forwards the frame.
- If the VLAN ID of the frame is not permitted on the port, the port drops the frame.

Dynamic MAC-based VLAN assignment

When you cannot determine the target MAC-based VLANs of a port, use dynamic MAC-based VLAN assignment on the port. To use dynamic MAC-based VLAN assignment, perform the following tasks:

1. Create MAC-to-VLAN entries.
2. Enable the MAC-based VLAN feature on the port.
3. Enable dynamic MAC-based VLAN assignment on the port.

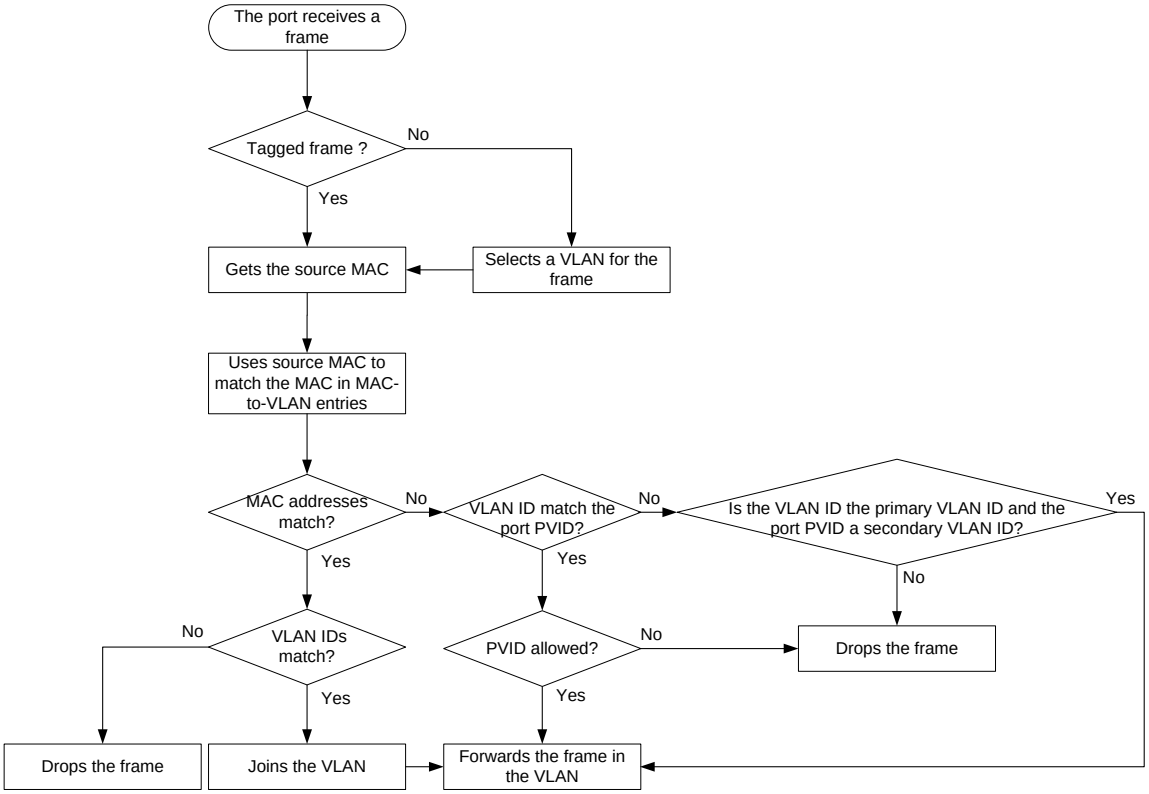
Dynamic MAC-based VLAN assignment uses the following workflow, as shown in Figure 2:

1. When a port receives a frame, it first determines whether the frame is tagged.
   - If the frame is tagged, the port gets the source MAC address of the frame.
   - If the frame is untagged, the port selects a VLAN for the frame by using the following matching order:
     - MAC-based VLAN (fuzzy and exact MAC address match).
     - IP subnet-based VLAN.
     - Protocol-based VLAN.
     - Port-based VLAN.

     After tagging the frame with the selected VLAN, the port gets the source MAC address of the frame.
2. The port uses the source MAC address and VLAN of the frame to match the MAC-to VLAN entries.
   - If the source MAC address of the frame exactly matches the MAC address in a MAC-to-VLAN entry, the port checks whether the VLAN ID of the frame matches the VLAN in the entry.
     - If the two VLAN IDs match, the port joins the VLAN and forwards the frame.
     - If the two VLAN IDs do not match, the port drops the frame.
   - If the source MAC address of the frame does not exactly match any MAC addresses in MAC-to-VLAN entries, the port checks whether the VLAN ID of the frame is its PVID.
     - If the VLAN ID of the frame is the PVID of the port, the port determines whether it allows the PVID.

       If the PVID is allowed, the port forwards the frame within the PVID. If the PVID is not allowed, the port drops the frame.
     - If the VLAN ID of the frame is not the PVID of the port, the port determines whether the VLAN ID is the primary VLAN ID and the port PVID is a secondary VLAN ID. If yes, the port forwards the frame. Otherwise, the port drops the frame.

Figure 2 Flowchart for processing a frame in dynamic MAC-based VLAN assignment



Server-assigned MAC-based VLAN

Use this feature with access authentication, such as MAC-based 802.1X authentication, to implement secure and flexible terminal access.

To implement server-assigned MAC-based VLAN, perform the following tasks:

1. Configure the server-assigned MAC-based VLAN feature on the access device.
2. Configure username-to-VLAN entries on the access authentication server.

When a user passes authentication of the access authentication server, the server assigns the authorization VLAN information for the user to the device. The device then performs the following operations:

1. Generates a MAC-to-VLAN entry by using the source MAC address of the user packet and the authorization VLAN information. The authorization VLAN is a MAC-based VLAN.

   The generated MAC-to-VLAN entry cannot conflict with the existing static MAC-to-VLAN entries. If a confliction exists, the dynamic MAC-to-VLAN entry cannot be generated.
2. Assigns the port that connects the user to the MAC-based VLAN.

When the user goes offline, the device automatically deletes the MAC-to-VLAN entry and removes the port from the MAC-based VLAN. For more information about 802.1X and MAC authentication, see *Security Configuration Guide*.

IP subnet-based VLANs

The IP subnet-based VLAN feature assigns untagged packets to VLANs based on their source IP addresses and subnet masks.

Use this feature when untagged packets from an IP subnet or IP address must be transmitted in a VLAN.

Protocol-based VLANs

The protocol-based VLAN feature assigns inbound packets to different VLANs based on their protocol types and encapsulation formats. The protocols available for VLAN assignment include IP, IPX, and AT. The encapsulation formats include Ethernet II, 802.3 raw, 802.2 LLC, and 802.2 SNAP.

This feature associates the available network service types with VLANs and facilitates network management and maintenance.

Layer 3 communication between VLANs

Hosts of different VLANs use VLAN interfaces to communicate at Layer 3. VLAN interfaces are virtual interfaces that do not exist as physical entities on devices. For each VLAN, you can create one VLAN interface and assign an IP address to it. The VLAN interface acts as the gateway of the VLAN to forward packets destined for another IP subnet at Layer 3.

Protocols and standards

IEEE 802.1Q, *IEEE Standard for Local and Metropolitan Area Networks: Virtual Bridged Local Area Networks*

Configuring a VLAN

Restrictions and guidelines

As the system default VLAN, VLAN 1 cannot be created or deleted.

Before you delete a dynamic VLAN or a VLAN locked by an application, you must first remove the configuration from the VLAN.

Creating VLANs

1. Enter system view.

   system-view

2. Create one or multiple VLANs.
   - Create a VLAN and enter its view.

     vlan *vlan-id*
   - Create multiple VLANs and enter VLAN view.

     Create VLANs.

     vlan { *vlan-id-list* | **all** }

     Enter VLAN view.

     vlan *vlan-id*

   By default, only the system default VLAN (VLAN 1) exists.

3. (Optional.) Set a name for the VLAN.

   name *text*

   By default, the name of a VLAN is **VLAN** *vlan-id.* The *vlan-id* argument specifies the VLAN ID in a four-digit format. If the VLAN ID has fewer than four digits, leading zeros are added. For example, the name of VLAN 100 is **VLAN 0100**.

4. (Optional.) Configure the description for the VLAN.

description *text*

By default, the description of a VLAN is **VLAN** *vlan-id.* The *vlan-id* argument specifies the VLAN ID in a four-digit format. If the VLAN ID has fewer than four digits, leading zeros are added. For example, the default description of VLAN 100 is **VLAN 0100**.

Configuring port-based VLANs

Restrictions and guidelines for port-based VLANs

- When you use the **undo vlan** command to delete the PVID of a port, either of the following events occurs depending on the port link type:
  - For an access port, the PVID of the port changes to VLAN 1.
  - For a hybrid or trunk port, the PVID setting of the port does not change.

  You can use a nonexistent VLAN as the PVID for a hybrid or trunk port, but not for an access port.
- As a best practice, set the same PVID for a local port and its peer.
- To prevent a port from dropping untagged packets or PVID-tagged packets, assign the port to its PVID.

Assigning an access port to a VLAN

About assigning an access port to a VLAN

You can assign an access port to a VLAN in VLAN view or interface view.

Assigning one or multiple access ports to a VLAN in VLAN view

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Assign one or multiple access ports to the VLAN.
   port *interface-list*

   By default, all ports belong to VLAN 1.

Assigning an access port to a VLAN in interface view

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the port link type to access.
   port link-type access

   By default, all ports are access ports.
4. Assign the access port to a VLAN.
   port access vlan *vlan-id*

By default, all access ports belong to VLAN 1.

Assigning a trunk port to a VLAN

About assigning a trunk port to a VLAN

A trunk port supports multiple VLANs. You can assign it to a VLAN in interface view.

Restrictions and guidelines

To change the link type of a port from trunk to hybrid, set the link type to access first.

To enable a trunk port to transmit packets from its PVID, you must assign the trunk port to the PVID by using the **port trunk permit vlan** command.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the port link type to trunk.
   port link-type trunk
   By default, all ports are access ports.
4. Assign the trunk port to the specified VLANs.
   port trunk permit vlan { *vlan-id-list* | **all** }
   By default, a trunk port permits only VLAN 1.
5. (Optional.) Set the PVID for the trunk port.
   port trunk pvid vlan *vlan-id*
   The default setting is VLAN 1.

Assigning a hybrid port to a VLAN

About assigning a hybrid port to a VLAN

A hybrid port supports multiple VLANs. You can assign it to the specified VLANs in interface view. Make sure the VLANs have been created.

Restrictions and guidelines

To change the link type of a port from trunk to hybrid, set the link type to access first.

To enable a hybrid port to transmit packets from its PVID, you must assign the hybrid port to the PVID by using the **port hybrid vlan** command.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*

- Enter Layer 2 aggregate interface view.
  interface bridge-aggregation *interface-number*

3. Set the port link type to hybrid.
   port link-type hybrid
   By default, all ports are access ports.
4. Assign the hybrid port to the specified VLANs.
   port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }
   By default, the hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.
5. (Optional.) Set the PVID for the hybrid port.
   port hybrid pvid vlan *vlan-id*
   By default, the PVID of a hybrid port is the ID of the VLAN to which the port belongs when its link type is **access**.

Configuring MAC-based VLANs

Restrictions and guidelines for MAC-based VLANs

- MAC-based VLANs are available only on hybrid ports.
- The MAC-based VLAN feature is mainly configured on downlink ports of user access devices. Do not use this feature with link aggregation.

Configuring static MAC-based VLAN assignment

1. Enter system view.
   system-view
2. Create a MAC-to-VLAN entry.
   mac-vlan mac-address *mac-address* [**mask** *mac-mask*] **vlan** *vlan-id* [**dot1p** *priority*]
   By default, no MAC-to-VLAN entries exist.
3. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
4. Set the port link type to hybrid.
   port link-type hybrid
   By default, all ports are access ports.
5. Assign the hybrid port to the MAC-based VLANs.
   port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }
   By default, a hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.
6. Enable the MAC-based VLAN feature.
   mac-vlan enable
   By default, this feature is disabled.
7. (Optional.) Configure the system to assign VLANs based on the MAC address preferentially.
   vlan precedence mac-vlan

By default, the system assigns VLANs based on the MAC address preferentially when both the MAC-based VLAN and IP subnet-based VLAN are configured on a port.

Configuring dynamic MAC-based VLAN assignment

About dynamic MAC-based VLAN assignment

For successful dynamic MAC-based VLAN assignment, use static VLANs when you create MAC-to-VLAN entries.

When a port joins a VLAN specified in the MAC-to-VLAN entry, one of the following events occurs depending on the port configuration:

- If the port has not been configured to allow packets from the VLAN to pass through, the port joins the VLAN as an untagged member.
- If the port has been configured to allow packets from the VLAN to pass through, the port configuration remains the same.

The 802.1p priority of the VLAN in a MAC-to-VLAN entry determines the transmission priority of the matching packets.

Restrictions and guidelines

- If you configure both static and dynamic MAC-based VLAN assignments on a port, dynamic MAC-based VLAN assignment takes effect.
- As a best practice to ensure correct operation of 802.1X and MAC authentication, do not use dynamic MAC-based VLAN assignment with 802.1X or MAC authentication.
- As a best practice, do not both configure dynamic MAC-based VLAN assignment and disable MAC address learning on a port. If the two features are configured together on a port, the port forwards only packets exactly matching the MAC-to-VLAN entries and drops inexactly matching packets.
- As a best practice, do not configure both dynamic MAC-based VLAN assignment and the MAC learning limit on a port.

  If the two features are configured together on a port and the port learns the configured maximum number of MAC address entries, the port processes packets as follows:
  - Forwards only packets matching the MAC address entries learnt by the port.
  - Drops unmatching packets.
- As a best practice, do not use dynamic MAC-based VLAN assignment with MSTP. In MSTP mode, if a port is blocked in the MSTI of its target VLAN, the port drops the received packets instead of delivering them to the CPU. As a result, the port will not be dynamically assigned to the target VLAN.
- As a best practice, do not use dynamic MAC-based VLAN assignment with PVST. In PVST mode, if the target VLAN of a port is not permitted on the port, the port is placed in blocked state. The port drops the received packets instead of delivering them to the CPU. As a result, the port will not be dynamically assigned to the target VLAN.
- As a best practice, do not configure both dynamic MAC-based VLAN assignment and automatic voice VLAN assignment mode on a port. They can have a negative impact on each other.

Procedure

1. Enter system view.

   system-view
2. Create a MAC-to-VLAN entry.

   mac-vlan mac-address *mac-address* **vlan** *vlan-id* [**dot1p** *priority*]

   By default, no MAC-to-VLAN entries exist.
3. Enter Layer 2 Ethernet interface view.

interface *interface-type interface-number*

4. Set the port link type to hybrid.

   port link-type hybrid

   By default, all ports are access ports.

5. Enable the MAC-based VLAN feature.

   mac-vlan enable

   By default, MAC-based VLAN is disabled.

6. Enable dynamic MAC-based VLAN assignment.

   mac-vlan trigger enable

   By default, dynamic MAC-based VLAN assignment is disabled.

   The VLAN assignment for a port is triggered only when the source MAC address of its receiving packet exactly matches the MAC address in a MAC-to-VLAN entry.

7. (Optional.) Configure the system to assign VLANs based on the MAC address preferentially.

   vlan precedence mac-vlan

   By default, the system assigns VLANs based on the MAC address preferentially when both the MAC-based VLAN and IP subnet-based VLAN are configured on a port.

8. (Optional.) Disable the port from forwarding packets that fail the exact MAC address match in its PVID.

   port pvid forbidden

   By default, when a port receives packets whose source MAC addresses fail the exact match, the port forwards them in its PVID.

Configuring server-assigned MAC-based VLAN

1. Enter system view.

   system-view

2. Enter Layer 2 Ethernet interface view.

   interface *interface-type interface-number*

3. Set the port link type to hybrid.

   port link-type hybrid

   By default, all ports are access ports.

4. Assign the hybrid port to the MAC-based VLANs.

   port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }

   By default, a hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.

5. Enable the MAC-based VLAN feature.

   mac-vlan enable

   By default, MAC-based VLAN is disabled.

6. Configure 802.1X or MAC authentication.

   For more information, see *Security Command Reference*.

Configuring IP subnet-based VLANs

Restrictions and guidelines

This feature is available only on hybrid ports, and it processes only untagged packets.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Associate the VLAN with an IP subnet or IP address.
   ip-subnet-vlan [*ip-subnet-index*] **ip** *ip-address* [*mask*]
   By default, a VLAN is not associated with an IP subnet or IP address.
   A multicast subnet or a multicast address cannot be associated with a VLAN.
4. Return to system view.
   quit
5. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
6. Set the port link type to hybrid.
   port link-type hybrid
   By default, all ports are access ports.
7. Assign the hybrid port to the specified IP subnet-based VLANs.
   port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }
   By default, a hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.
8. Associate the hybrid port with the specified IP subnet-based VLAN.
   port hybrid ip-subnet-vlan vlan *vlan-id*
   By default, a hybrid port is not associated with a subnet-based VLAN.

Configuring protocol-based VLANs

About protocol-based VLANs

A protocol-based VLAN has one or multiple protocol templates. A protocol template defines a protocol type and an encapsulation format as the match criteria to match inbound packets. Each protocol template has a unique index in the protocol-based VLAN. All protocol templates in a protocol-based VLAN have the same VLAN ID.

For a port to assign inbound packets to protocol-based VLANs, perform the following tasks:

- Assign the port to the protocol-based VLANs.
- Associate the port with the protocol templates of the protocol-based VLANs.

When an untagged packet arrives at the port, the port processes the packet as follows:

- If the protocol type and encapsulation format in the packet match a protocol template, the port tags the packet with the VLAN tag specific to the protocol template.
- If no protocol templates are matched, the port tags the packet with its PVID.

Hardware and feature compatibility

S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switches do not support protocol-based VLAN.

Restrictions and guidelines

The voice VLAN in automatic mode processes only tagged voice traffic. Do not configure a VLAN as both a protocol-based VLAN and a voice VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Associate the VLAN with a protocol template.
   protocol-vlan [*protocol-index*] { **at** | **ipv4** | **ipv6** | **ipx** { **ethernetii** | **llc** | **raw** | **snap** } | **mode** { **ethernetii etype** *etype-id* | **llc** { **dsap** *dsap-id* [**ssap** *ssap-id*] | **ssap** *ssap-id* } | **snap etype** *etype-id* } }
   By default, a VLAN is not associated with a protocol template.
4. Exit VLAN view.
   quit
5. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
6. Set the port link type to hybrid.
   port link-type hybrid
   By default, all ports are access ports.
7. Assign the hybrid port to the specified protocol-based VLANs.
   port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }
   By default, a hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.
8. Associate the hybrid port with the specified protocol-based VLAN.
   port hybrid protocol-vlan vlan *vlan-id* { *protocol-index* [**to** *protocol-end*] | **all** }
   By default, a hybrid port is not associated with a protocol-based VLAN.

Configuring a VLAN group

About a VLAN group

A VLAN group includes a set of VLANs.

On an authentication server, a VLAN group name represents a group of authorization VLANs. When an 802.1X or MAC authentication user passes authentication, the authentication server assigns a VLAN group name to the device. The device then uses the received VLAN group name to match the locally configured VLAN group names. If a match is found, the device selects a VLAN from the group and assigns the VLAN to the user. For more information about 802.1X and MAC authentication, see *Security Configuration Guide*.

Procedure

1. Enter system view.
   system-view

2. Create a VLAN group and enter its view.
   vlan-group *group-name*
3. Add VLANs to the VLAN group.
   vlan-list *vlan-id-list*
   By default, no VLANs exist in a VLAN group.
   You can add multiple VLAN lists to a VLAN group.

Configuring VLAN interfaces

Restrictions and guidelines

You cannot create VLAN interfaces for secondary VLANs that have the following characteristics:

- Associated with the same primary VLAN.
- Enabled with Layer 3 communication in VLAN interface view of the primary VLAN interface.

For more information about secondary VLANs, see "Configuring private VLAN."

VLAN interfaces configuration tasks at a glance

To configure VLAN interfaces, perform the following tasks:

1. Creating a VLAN interface
2. (Optional.) Restoring the default settings for the VLAN interface

Prerequisites

Before you create a VLAN interface for a VLAN, create the VLAN first.

Creating a VLAN interface

1. Enter system view.
   system-view
2. Create a VLAN interface and enter its view.
   interface vlan-interface *interface-number*
3. Assign an IP address to the VLAN interface.
   ip address *ip-address* { *mask* | *mask-length* } [**sub**]
   By default, no IP address is assigned to a VLAN interface.
4. (Optional.) Configure the description for the VLAN interface.
   description *text*
   The default setting is the VLAN interface name. For example, **Vlan-interface1 Interface**.
5. (Optional.) Set the MTU for the VLAN interface.
   mtu *size*
   By default, the MTU of a VLAN interface is 1500 bytes.
6. (Optional.) Set the expected bandwidth for the interface.
   bandwidth *bandwidth-value*
   By default, the expected bandwidth (in kbps) is the interface baud rate divided by 1000.
7. Bring up the VLAN interface.

undo shutdown

By default, a VLAN interface is not manually shut down. The status of the VLAN interface depends on the status of member ports of the VLAN.

Restoring the default settings for the VLAN interface

Restrictions and guidelines

This feature might fail to restore the default settings for some commands for reasons such as command dependencies or system restrictions. Use the **display this** command in interface view to identify these commands, and then use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Procedure

1. Enter system view.
   system-view
2. Enter a VLAN interface view.
   interface vlan-interface *interface-number*
3. Restore the default settings for the VLAN interface.
   default

CAUTION:

This feature might interrupt ongoing network services. Make sure you are fully aware of the impact of this feature when you use it on a live network.

Display and maintenance commands for VLANs

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display VLAN interface information.	**display interface** [**vlan-interface** [*interface-number*]] [**brief** [**description** | **down**]]
Display information about IP subnet-based VLANs that are associated with the specified ports.	**display ip-subnet-vlan interface** { *interface-type interface-number1* [**to** *interface-type interface-number2*] | **all** }
Display information about IP subnet-based VLANs.	**display ip-subnet-vlan vlan** { *vlan-id1* [**to** *vlan-id2*] | **all** }
Display MAC-to-VLAN entries.	**display mac-vlan** { **all** | **dynamic** | **mac-address** *mac-address* [**mask** *mac-mask*] | **static** | **vlan** *vlan-id* }
Display all ports that are enabled with the MAC-based VLAN feature.	**display mac-vlan interface**
Display hybrid ports or trunk ports on the device.	**display port** { **hybrid** | **trunk** }
Display information about protocol-based VLANs that are	**display protocol-vlan interface** { *interface-type interface-number1* [**to**

associated with the specified ports.	*interface-type interface-number2*] | **all** }
Display information about protocol-based VLANs.	**display protocol-vlan vlan** { *vlan-id1* [**to** *vlan-id2*] | **all** }
Display VLAN information.	**display vlan** [*vlan-id1* [**to** *vlan-id2*] | **all** | **dynamic** | **reserved** | **static**]
Display brief VLAN information.	**display vlan brief**
Display VLAN group information.	**display vlan-group** [*group-name*]
Clear statistics on a VLAN interface.	**reset counters interface** [**vlan-interface** [*interface-number*]]

VLAN configuration examples

Example: Configuring port-based VLANs

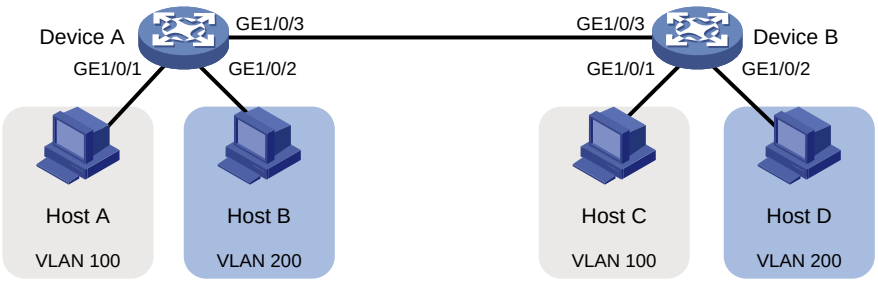
Network configuration

As shown in Figure 3:

- Host A and Host C belong to Department A. VLAN 100 is assigned to Department A.
- Host B and Host D belong to Department B. VLAN 200 is assigned to Department B.

Configure port-based VLANs so that only hosts in the same department can communicate with each other.

Figure 3 Network diagram



Procedure

1. Configure Device A:

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 to VLAN 100.

   ```
   <DeviceA> system-view
   [DeviceA] vlan 100
   [DeviceA-vlan100] port gigabitethernet 1/0/1
   [DeviceA-vlan100] quit
   ```

   # Create VLAN 200, and assign GigabitEthernet 1/0/2 to VLAN 200.

   ```
   [DeviceA] vlan 200
   [DeviceA-vlan200] port gigabitethernet 1/0/2
   [DeviceA-vlan200] quit
   ```

   # Configure GigabitEthernet 1/0/3 as a trunk port, and assign the port to VLANs 100 and 200.

   ```
   [DeviceA] interface gigabitethernet 1/0/3
   [DeviceA-GigabitEthernet1/0/3] port link-type trunk
   ```

```
[DeviceA-GigabitEthernet1/0/3] port trunk permit vlan 100 200
Please wait... Done.
```

2. Configure Device B in the same way Device A is configured. (Details not shown.)
3. Configure hosts:
   a. Configure Host A and Host C to be on the same IP subnet. For example, 192.168.100.0/24.
   b. Configure Host B and Host D to be on the same IP subnet. For example, 192.168.200.0/24.

Verifying the configuration

Verify that Host A and Host C can ping each other, but they both fail to ping Host B and Host D. (Details not shown.)

Verify that Host B and Host D can ping each other, but they both fail to ping Host A and Host C. (Details not shown.)

Verify that VLANs 100 and 200 are correctly configured on Device A.

```
[DeviceA-GigabitEthernet1/0/3] display vlan 100
 VLAN ID: 100
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0100
 Name: VLAN 0100
 Tagged ports:
    GigabitEthernet1/0/3
 Untagged ports:
    GigabitEthernet1/0/1
[DeviceA-GigabitEthernet1/0/3] display vlan 200
 VLAN ID: 200
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0200
 Name: VLAN 0200
 Tagged ports:
    GigabitEthernet1/0/3
 Untagged ports:
    GigabitEthernet1/0/2
```

Example: Configuring MAC-based VLANs

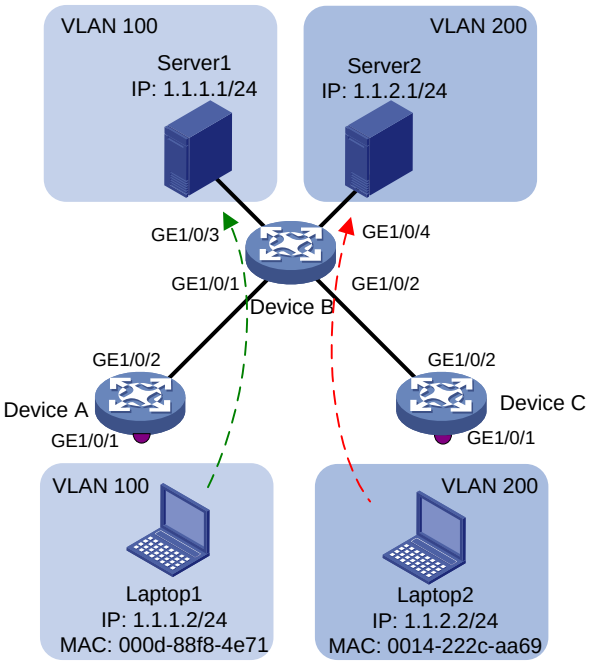
Network configuration

As shown in Figure 4:

- GigabitEthernet 1/0/1 of Device A and Device C are each connected to a meeting room. Laptop 1 and Laptop 2 are used for meetings and might be used in either of the two meeting rooms.
- One department uses VLAN 100 and owns Laptop 1. The other department uses VLAN 200 and owns Laptop 2.

Configure MAC-based VLANs, so that Laptop 1 and Laptop 2 can access Server 1 and Server 2, respectively, no matter which meeting room they are used in.

Figure 4 Network diagram



Procedure

1. Configure Device A:

   # Create VLANs 100 and 200.

   ```
   <DeviceA> system-view
   [DeviceA] vlan 100
   [DeviceA-vlan100] quit
   [DeviceA] vlan 200
   [DeviceA-vlan200] quit
   ```

   # Associate the MAC addresses of Laptop 1 and Laptop 2 with VLANs 100 and 200, respectively.

   ```
   [DeviceA] mac-vlan mac-address 000d-88f8-4e71 vlan 100
   [DeviceA] mac-vlan mac-address 0014-222c-aa69 vlan 200
   ```

   # Configure GigabitEthernet 1/0/1 as a hybrid port, and assign it to VLANs 100 and 200 as an untagged VLAN member.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] port link-type hybrid
   [DeviceA-GigabitEthernet1/0/1] port hybrid vlan 100 200 untagged
   ```

   # Enable the MAC-based VLAN feature on GigabitEthernet 1/0/1.

   ```
   [DeviceA-GigabitEthernet1/0/1] mac-vlan enable
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Configure the uplink port (GigabitEthernet 1/0/2) as a trunk port, and assign it to VLANs 100 and 200.

   ```
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] port link-type trunk
   [DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 100 200
   [DeviceA-GigabitEthernet1/0/2] quit
   ```

2. Configure Device B:

   # Create VLAN 100, and assign GigabitEthernet 1/0/3 to VLAN 100.

```
<DeviceB> system-view
[DeviceB] vlan 100
[DeviceB-vlan100] port gigabitethernet 1/0/3
[DeviceB-vlan100] quit
```

Create VLAN 200 and assign GigabitEthernet 1/0/4 to VLAN 200.

```
[DeviceB] vlan 200
[DeviceB-vlan200] port gigabitethernet 1/0/4
[DeviceB-vlan200] quit
```

Configure GigabitEthernet 1/0/1 as a trunk port, and assign the port to VLANs 100 and 200.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 100 200
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, and assign the port to VLANs 100 and 200.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan 100 200
[DeviceB-GigabitEthernet1/0/2] quit
```

3. Configure Device C in the same way as the Device A is configured. (Details not shown.)

Verifying the configuration

Verify that Laptop 1 can access only Server 1, and Laptop 2 can access only Server 2. (Details not shown.)

Verify the MAC-to-VLAN entries on Device A and Device C, for example, on Device A.

```
[DeviceA] display mac-vlan all
  The following MAC VLAN addresses exist:
  S:Static  D:Dynamic
  MAC address      Mask             VLAN ID   Dot1p      State
  000d-88f8-4e71   ffff-ffff-ffff   100       0          S
  0014-222c-aa69   ffff-ffff-ffff   200       0          S

  Total MAC VLAN address count: 2
```

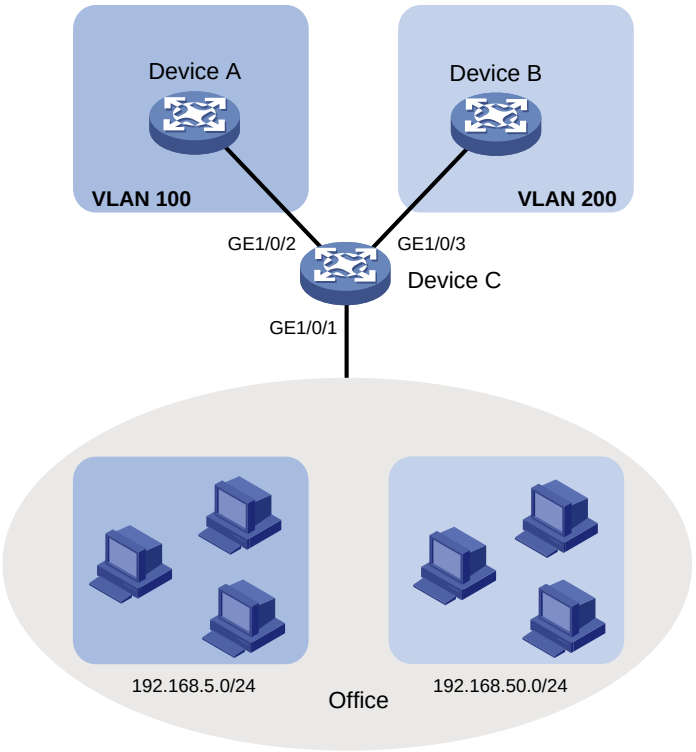
Example: Configuring IP subnet-based VLANs

Network configuration

As shown in Figure 5, the hosts in the office belong to different IP subnets.

Configure Device C to transmit packets from 192.168.5.0/24 and 192.168.50.0/24 in VLANs 100 and 200, respectively.

Figure 5 Network diagram



Procedure

1. Configure Device C:

   # Associate IP subnet 192.168.5.0/24 with VLAN 100.

   ```
   <DeviceC> system-view
   [DeviceC] vlan 100
   [DeviceC-vlan100] ip-subnet-vlan ip 192.168.5.0 255.255.255.0
   [DeviceC-vlan100] quit
   ```

   # Associate IP subnet 192.168.50.0/24 with VLAN 200.

   ```
   [DeviceC] vlan 200
   [DeviceC-vlan200] ip-subnet-vlan ip 192.168.50.0 255.255.255.0
   [DeviceC-vlan200] quit
   ```

   # Configure GigabitEthernet 1/0/2 as a hybrid port, and assign it to VLAN 100 as a tagged VLAN member.

   ```
   [DeviceC] interface gigabitethernet 1/0/2
   [DeviceC-GigabitEthernet1/0/2] port link-type hybrid
   [DeviceC-GigabitEthernet1/0/2] port hybrid vlan 100 tagged
   [DeviceC-GigabitEthernet1/0/2] quit
   ```

   # Configure GigabitEthernet 1/0/3 as a hybrid port, and assign it to VLAN 200 as a tagged VLAN member.

   ```
   [DeviceC] interface gigabitethernet 1/0/3
   [DeviceC-GigabitEthernet1/0/3] port link-type hybrid
   [DeviceC-GigabitEthernet1/0/3] port hybrid vlan 200 tagged
   [DeviceC-GigabitEthernet1/0/3] quit
   ```

   # Configure GigabitEthernet 1/0/1 as a hybrid port, and assign it to VLANs 100 and 200 as an untagged VLAN member.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] port link-type hybrid
[DeviceC-GigabitEthernet1/0/1] port hybrid vlan 100 200 untagged
```

Associate GigabitEthernet 1/0/1 with the IP subnet-based VLANs 100 and 200.

```
[DeviceC-GigabitEthernet1/0/1] port hybrid ip-subnet-vlan vlan 100
[DeviceC-GigabitEthernet1/0/1] port hybrid ip-subnet-vlan vlan 200
[DeviceC-GigabitEthernet1/0/1] quit
```

2. Configure Device A and Device B to forward packets from VLANs 100 and 200, respectively. (Details not shown.)

Verifying the configuration

Verify the IP subnet-based VLAN configuration on Device C.

```
[DeviceC] display ip-subnet-vlan vlan all
 VLAN ID: 100
  Subnet index      IP address      Subnet mask
  0                 192.168.5.0     255.255.255.0

 VLAN ID: 200
  Subnet index      IP address      Subnet mask
  0                 192.168.50.0    255.255.255.0
```

Verify the IP subnet-based VLAN configuration on GigabitEthernet 1/0/1 of Device C.

```
[DeviceC] display ip-subnet-vlan interface gigabitethernet 1/0/1
 Interface: GigabitEthernet1/0/1
  VLAN ID   Subnet index    IP address       Subnet mask       Status
  100       0               192.168.5.0      255.255.255.0     Active
  200       0               192.168.50.0     255.255.255.0     Active
```

Example: Configuring protocol-based VLANs

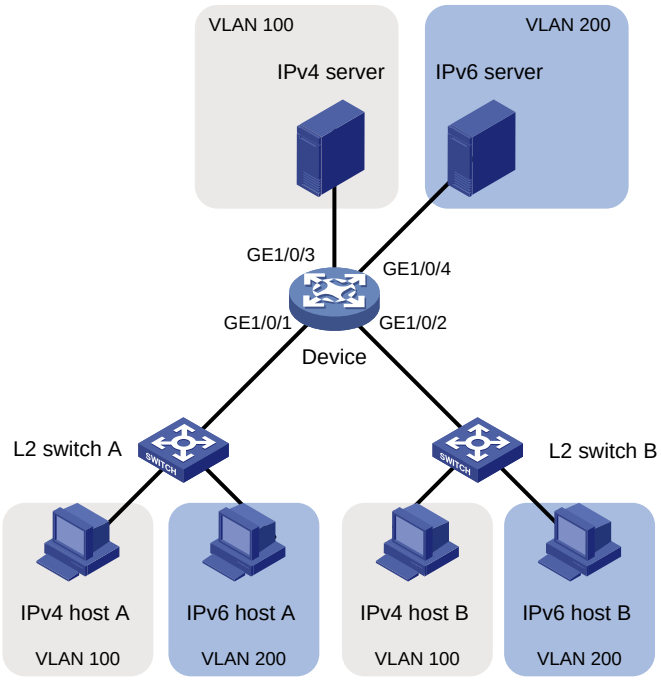
Network configuration

As shown in Figure 6:

- The majority of hosts in a lab environment run the IPv4 protocol.
- The other hosts run the IPv6 protocol for teaching purposes.

To isolate IPv4 and IPv6 traffic at Layer 2, configure protocol-based VLANs to associate the IPv4 and ARP protocols with VLAN 100, and associate the IPv6 protocol with VLAN 200.

Figure 6 Network diagram



Procedure

In this example, L2 Switch A and L2 Switch B use the factory configuration.

1. Configure Device:

   # Create VLAN 100, and configure the description for VLAN 100 as **protocol VLAN for IPv4**.

   ```
   <Device> system-view
   [Device] vlan 100
   [Device-vlan100] description protocol VLAN for IPv4
   ```

   # Assign GigabitEthernet 1/0/3 to VLAN 100.

   ```
   [Device-vlan100] port gigabitethernet 1/0/3
   [Device-vlan100] quit
   ```

   # Create VLAN 200, and configure the description for VLAN 200 as **protocol VLAN for IPv6**.

   ```
   [Device] vlan 200
   [Device-vlan200] description protocol VLAN for IPv6
   ```

   # Assign GigabitEthernet 1/0/4 to VLAN 200.

   ```
   [Device-vlan200] port gigabitethernet 1/0/4
   ```

   # Configure VLAN 200 as a protocol-based VLAN, and create an IPv6 protocol template with the index 1 for VLAN 200.

   ```
   [Device-vlan200] protocol-vlan 1 ipv6
   [Device-vlan200] quit
   ```

   # Configure VLAN 100 as a protocol-based VLAN. Create an IPv4 protocol template with the index 1, and create an ARP protocol template with the index 2. (In Ethernet II encapsulation, the protocol type ID for ARP is 0806 in hexadecimal notation.)

   ```
   [Device] vlan 100
   [Device-vlan100] protocol-vlan 1 ipv4
   [Device-vlan100] protocol-vlan 2 mode ethernetii etype 0806
   [Device-vlan100] quit
   ```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign it to VLANs 100 and 200 as an untagged VLAN member.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] port link-type hybrid
[Device-GigabitEthernet1/0/1] port hybrid vlan 100 200 untagged
```

Associate GigabitEthernet 1/0/1 with the IPv4 and ARP protocol templates of VLAN 100 and the IPv6 protocol template of VLAN 200.

```
[Device-GigabitEthernet1/0/1] port hybrid protocol-vlan vlan 100 1 to 2
[Device-GigabitEthernet1/0/1] port hybrid protocol-vlan vlan 200 1
[Device-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and assign it to VLANs 100 and 200 as an untagged VLAN member.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] port link-type hybrid
[Device-GigabitEthernet1/0/2] port hybrid vlan 100 200 untagged
```

Associate GigabitEthernet 1/0/2 with the IPv4 and ARP protocol templates of VLAN 100 and the IPv6 protocol template of VLAN 200.

```
[Device-GigabitEthernet1/0/2] port hybrid protocol-vlan vlan 100 1 to 2
[Device-GigabitEthernet1/0/2] port hybrid protocol-vlan vlan 200 1
[Device-GigabitEthernet1/0/2] quit
```

2. Configure hosts and servers:
   a. Configure IPv4 Host A, IPv4 Host B, and IPv4 server to be on the same network segment (192.168.100.0/24, for example). (Details not shown.)
   b. Configure IPv6 Host A, IPv6 Host B, and IPv6 server to be on the same network segment (2001::1/64, for example). (Details not shown.)

Verifying the configuration

1. Verify the following:
   - The hosts and the server in VLAN 100 can successfully ping one another. (Details not shown.)
   - The hosts and the server in VLAN 200 can successfully ping one another. (Details not shown.)
   - The hosts or the server in VLAN 100 cannot ping the hosts or server in VLAN 200. (Details not shown.)
2. Verify the protocol-based VLAN configuration:

Display protocol-based VLANs on Device.

```
[Device] display protocol-vlan vlan all
 VLAN ID: 100
  Protocol index  Protocol type
  1               IPv4
  2               Ethernet II Etype 0x0806

 VLAN ID: 200
  Protocol index  Protocol type
  1               IPv6
```

Display protocol-based VLANs on the ports of Device.

```
[Device] display protocol-vlan interface all
 Interface: GigabitEthernet1/0/1
  VLAN ID  Protocol index  Protocol type            Status
```

```
 100      1               IPv4                       Active
 100      2               Ethernet II Etype 0x0806   Active
 200      1               IPv6                       Active

Interface: GigabitEthernet 1/0/2
 VLAN ID  Protocol index  Protocol type              Status
 100      1               IPv4                       Active
 100      2               Ethernet II Etype 0x0806   Active
 200      1               IPv6                       Active
```

Configuring private VLAN

About private VLAN

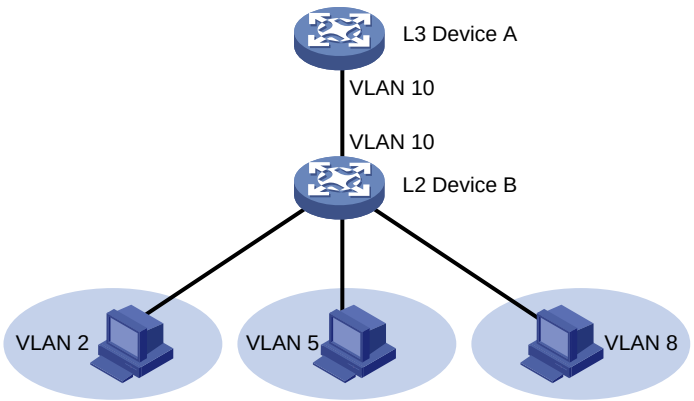
VLAN technology provides a method for isolating traffic from customers. At the access layer of a network, customer traffic must be isolated for security or accounting purposes. If VLANs are assigned on a per-user basis, a large number of VLANs will be required.

The private VLAN feature saves VLAN resources. It uses a two-tier VLAN structure as follows:

- **Primary VLAN**—Used for connecting the upstream device. A primary VLAN can be associated with multiple secondary VLANs. The upstream device identifies only the primary VLAN.
- **Secondary VLANs**—Used for connecting users. Secondary VLANs are isolated at Layer 2. To implement Layer 3 communication between secondary VLANs associated with the primary VLAN, enable local proxy ARP or ND on the upstream device (for example, L3 Device A in Figure 7).

As shown in Figure 7, the private VLAN feature is enabled on L2 Device B. VLAN 10 is the primary VLAN. VLANs 2, 5, and 8 are secondary VLANs that are associated with VLAN 10. L3 Device A is only aware of VLAN 10.

Figure 7 Private VLAN example



If the private VLAN feature is configured on a Layer 3 device, use one of the following methods on the Layer 3 device to enable Layer 3 communication. Layer 3 communication might be required between secondary VLANs that are associated with the same primary VLAN, or between secondary VLANs and other networks.

- Method 1:
  - **a.** Create VLAN interfaces for the secondary VLANs.
  - **b.** Assign IP addresses to the secondary VLAN interfaces.
- Method 2:
  - **a.** Enable Layer 3 communication between the secondary VLANs that are associated with the primary VLAN.
  - **b.** Create the VLAN interface for the primary VLAN and assign an IP address to it. (Do not create secondary VLAN interfaces if you use this method.)
  - **c.** Enable local proxy ARP or ND on the primary VLAN interface.

Restrictions: Hardware compatibility with private VLAN

S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switches do not support private VLAN.

Restrictions and guidelines: Private VLAN configuration

- Make sure the following requirements are met:
  - For a promiscuous port:
    - The primary VLAN is the PVID of the port.
    - The port is an untagged member of the primary VLAN and secondary VLANs.
  - For a host port:
    - The PVID of the port is a secondary VLAN.
    - The port is an untagged member of the primary VLAN and the secondary VLAN.
  - A trunk promiscuous or trunk secondary port must be a tagged member of the primary VLANs and the secondary VLANs.
- VLAN 1 (system default VLAN) does not support the private VLAN configuration.

Private VLAN tasks at a glance

To configure a private VLAN, perform the following tasks:

1. Creating a primary VLAN
2. Creating secondary VLANs
3. Associating the primary VLAN with secondary VLANs
4. Configuring the uplink port
5. Configuring a downlink port
6. (Optional.) Configuring Layer 3 communication for secondary VLANs

Creating a primary VLAN

1. Enter system view.
   system-view
2. Create a VLAN and enter VLAN view.
   vlan *vlan-id*
3. Configure the VLAN as a primary VLAN.
   private-vlan primary
   By default, a VLAN is not a primary VLAN.

Creating secondary VLANs

1. Enter system view.

system-view

2. Create one or multiple secondary VLANs.
   vlan { *vlan-id-list* | **all** }

Associating the primary VLAN with secondary VLANs

1. Enter system view.
   system-view
2. Create enter VLAN view of the primary VLAN.
   vlan *vlan-id*
3. Associate the primary VLAN with the secondary VLANs.
   private-vlan secondary *vlan-id-list*
   By default, a primary VLAN is not associated with any secondary VLANs.

Configuring the uplink port

About the uplink port

Configure the uplink port (for example, the port connecting L2 Device B to L3 Device A in Figure 7) as follows:

- If the port allows only one primary VLAN, configure the port as a promiscuous port of the primary VLAN. The promiscuous port can be automatically assigned to the primary VLAN and its associated secondary VLANs.
- If the port allows multiple primary VLANs, configure the port as a trunk promiscuous port of the primary VLANs. The trunk promiscuous port can be automatically assigned to the primary VLANs and their associated secondary VLANs.

Procedure

1. Enter system view.
   system-view
2. Enter interface view of the uplink port.
   interface *interface-type interface-number*
3. Configure the uplink port as a promiscuous or trunk promiscuous port of the specified VLANs.
   - Configure the uplink port as a promiscuous port of the specified VLAN.
     port private-vlan *vlan-id* **promiscuous**
   - Configure the uplink port as a trunk promiscuous port of the specified VLANs.
     port private-vlan *vlan-id-list* **trunk promiscuous**

   By default, a port is not a promiscuous or trunk promiscuous port of any VLANs.

Configuring a downlink port

About the downlink port

Configure a downlink port as follows:

- If a downlink port allows only one secondary VLAN (for example, the port connecting L2 Device B to a host in Figure 7), configure the port as a host port. The host port can be automatically assigned to the secondary VLAN and its associated primary VLAN.
- If a downlink port allows multiple secondary VLANs, configure the port as a trunk secondary port. The trunk secondary port can be automatically assigned to the secondary VLANs and their associated primary VLANs.

Procedure

1. Enter system view.
   system-view
2. Enter interface view of the downlink port.
   interface *interface-type interface-number*
3. Assign the downlink port to secondary VLANs.
   a. Set the link type of the port.
      port link-type { **access** | **hybrid | trunk** }
   b. Assign the access port to the specified VLAN.
      port access vlan *vlan-id*
   c. Assign the trunk port to the specified VLANs.
      port trunk permit vlan { *vlan-id-list* | **all** }
   d. Assign the hybrid port to the specified VLANs.
      port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }

   Select substep b, c, or d depending on the port link type.
4. Configure the downlink port as a host or trunk secondary port.
   - Configure the downlink port as a host port.
     port private-vlan host
   - Configure the downlink port as a trunk secondary port of the specified VLANs.
     port private-vlan *vlan-id-list* **trunk secondary**

   By default, a port is not a host or trunk secondary port.
5. Return to system view.
   quit
6. Enter VLAN view of a secondary VLAN.
   vlan *vlan-id*
7. (Optional.) Enable Layer 2 communication for ports in the same secondary VLAN. Choose one command as needed:
   undo private-vlan isolated
   private-vlan community

   By default, ports in the same secondary VLAN can communicate with each other at Layer 2.

Configuring Layer 3 communication for secondary VLANs

1. Enter system view.
   system-view
2. Enter VLAN interface view of the primary VLAN interface.
   interface vlan-interface *interface-number*

3. Enable Layer 3 communication between secondary VLANs that are associated with the primary VLAN.

   private-vlan secondary *vlan-id-list*

   By default, secondary VLANs cannot communicate with each other at Layer 3.
4. Assign an IP address to the primary VLAN interface.

   IPv4:

   ip address *ip-address* { *mask-length* | *mask* } [**sub**]

   IPv6:

   ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* }

   By default, no IP address is configured for a VLAN interface.
5. Enable local proxy ARP or ND.

   IPv4:

   local-proxy-arp enable

   By default, local proxy ARP is disabled.

   For more information about local proxy ARP, see *Layer 3—IP Services Configuration Guide*.

   IPv6:

   local-proxy-nd enable

   By default, local proxy ND is disabled.

   For more information about local proxy ND, see *Layer 3—IP Services Configuration Guide*.

Display and maintenance commands for the private VLAN

Execute **display** commands in any view.

Task	Command
Display information about primary VLANs and the secondary VLANs associated with each primary VLAN.	**display private-vlan** [*primary-vlan-id*]

Private VLAN configuration examples

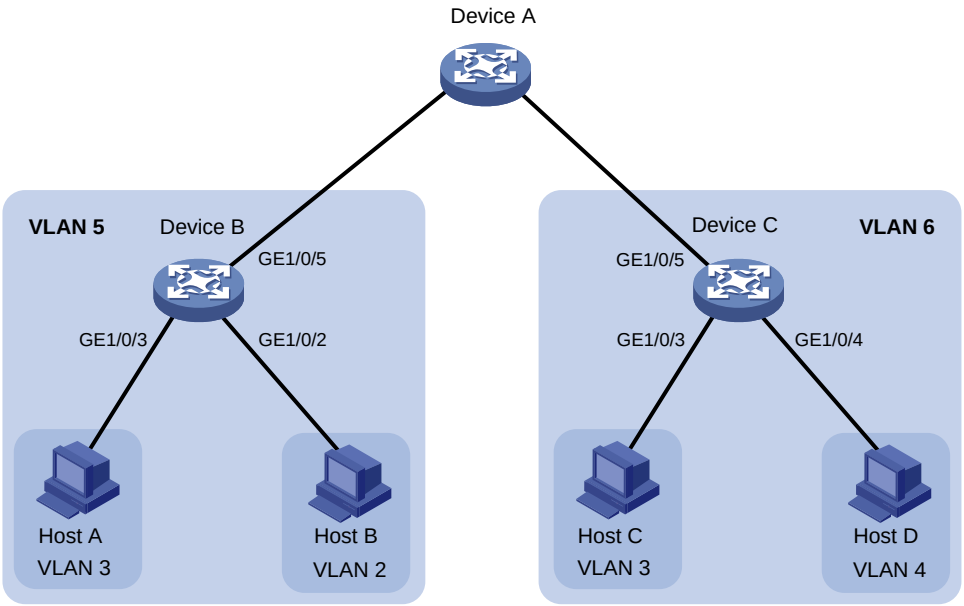
Example: Configuring promiscuous ports

Network configuration

As shown in Figure 8, configure the private VLAN feature to meet the following requirements:

- On Device B, VLAN 5 is a primary VLAN that is associated with secondary VLANs 2 and 3. GigabitEthernet 1/0/5 is in VLAN 5. GigabitEthernet 1/0/2 is in VLAN 2. GigabitEthernet 1/0/3 is in VLAN 3.
- On Device C, VLAN 6 is a primary VLAN that is associated with secondary VLANs 3 and 4. GigabitEthernet 1/0/5 is in VLAN 6. GigabitEthernet 1/0/3 is in VLAN 3. GigabitEthernet 1/0/4 is in VLAN 4.
- Device A is aware of only VLAN 5 on Device B and VLAN 6 on Device C.

Figure 8 Network diagram



Procedure

This example describes the configurations on Device B and Device C.

1. Configure Device B:

Configure VLAN 5 as a primary VLAN.

```
<DeviceB> system-view
[DeviceB] vlan 5
[DeviceB-vlan5] private-vlan primary
[DeviceB-vlan5] quit
```

Create VLANs 2 and 3.

```
[DeviceB] vlan 2 to 3
```

Associate secondary VLANs 2 and 3 with primary VLAN 5.

```
[DeviceB] vlan 5
[DeviceB-vlan5] private-vlan secondary 2 to 3
[DeviceB-vlan5] quit
```

Configure the uplink port (GigabitEthernet 1/0/5) as a promiscuous port of VLAN 5.

```
[DeviceB] interface gigabitethernet 1/0/5
[DeviceB-GigabitEthernet1/0/5] port private-vlan 5 promiscuous
[DeviceB-GigabitEthernet1/0/5] quit
```

Assign downlink port GigabitEthernet 1/0/2 to VLAN 2, and configure the port as a host port.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port access vlan 2
[DeviceB-GigabitEthernet1/0/2] port private-vlan host
[DeviceB-GigabitEthernet1/0/2] quit
```

Assign downlink port GigabitEthernet 1/0/3 to VLAN 3, and configure the port as a host port.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] port access vlan 3
[DeviceB-GigabitEthernet1/0/3] port private-vlan host
[DeviceB-GigabitEthernet1/0/3] quit
```

2. Configure Device C:

Configure VLAN 6 as a primary VLAN.

```
<DeviceC> system-view
[DeviceC] vlan 6
[DeviceC–vlan6] private-vlan primary
[DeviceC–vlan6] quit
```

Create VLANs 3 and 4.

```
[DeviceC] vlan 3 to 4
```

Associate secondary VLANs 3 and 4 with primary VLAN 6.

```
[DeviceC] vlan 6
[DeviceC-vlan6] private-vlan secondary 3 to 4
[DeviceC-vlan6] quit
```

Configure the uplink port (GigabitEthernet 1/0/5) as a promiscuous port of VLAN 6.

```
[DeviceC] interface gigabitethernet 1/0/5
[DeviceC-GigabitEthernet1/0/5] port private-vlan 6 promiscuous
[DeviceC-GigabitEthernet1/0/5] quit
```

Assign downlink port GigabitEthernet 1/0/3 to VLAN 3, and configure the port as a host port.

```
[DeviceC] interface gigabitethernet 1/0/3
[DeviceC-GigabitEthernet1/0/3] port access vlan 3
[DeviceC-GigabitEthernet1/0/3] port private-vlan host
[DeviceC-GigabitEthernet1/0/3] quit
```

Assign downlink port GigabitEthernet 1/0/4 to VLAN 4, and configure the port as a host port.

```
[DeviceC] interface gigabitethernet 1/0/4
[DeviceC-GigabitEthernet1/0/4] port access vlan 4
[DeviceC-GigabitEthernet1/0/4] port private-vlan host
[DeviceC-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Verify the private VLAN configurations on the devices, for example, on Device B.

```
[DeviceB] display private-vlan
 Primary VLAN ID: 5
 Secondary VLAN ID: 2-3

 VLAN ID: 5
 VLAN type: Static
 Private VLAN type: Primary
 Route interface: Not configured
 Description: VLAN 0005
 Name: VLAN 0005
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/2
    GigabitEthernet1/0/3
    GigabitEthernet1/0/5

 VLAN ID: 2
 VLAN type: Static
 Private VLAN type: Secondary
```

```
Route interface: Not configured
Description: VLAN 0002
Name: VLAN 0002
Tagged ports:   None
Untagged ports:
   GigabitEthernet1/0/2
   GigabitEthernet1/0/5

VLAN ID: 3
VLAN type: Static
Private VLAN type: Secondary
Route interface: Not configured
Description: VLAN 0003
Name: VLAN 0003
Tagged Ports:   None
Untagged Ports:
   GigabitEthernet1/0/3
   GigabitEthernet1/0/5
```

The output shows that:

- The promiscuous port (GigabitEthernet 1/0/5) is an untagged member of primary VLAN 5 and secondary VLANs 2 and 3.
- Host port GigabitEthernet 1/0/2 is an untagged member of primary VLAN 5 and secondary VLAN 2.
- Host port GigabitEthernet 1/0/3 is an untagged member of primary VLAN 5 and secondary VLAN 3.

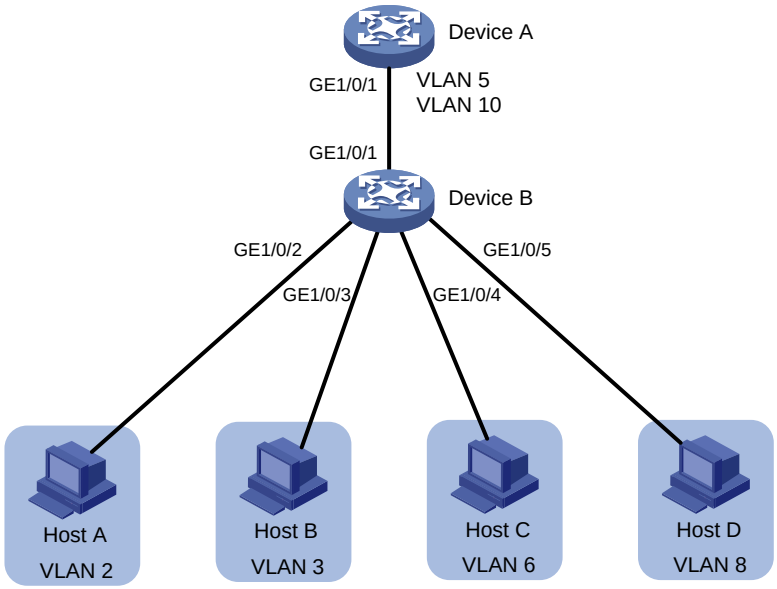
Example: Configuring trunk promiscuous ports

Network configuration

As shown in Figure 9, configure the private VLAN feature to meet the following requirements:

- VLANs 5 and 10 are primary VLANs on Device B. The uplink port (GigabitEthernet 1/0/1) on Device B permits the packets from VLANs 5 and 10 to pass through tagged.
- On Device B, downlink port GigabitEthernet 1/0/2 permits secondary VLAN 2. Downlink port GigabitEthernet 1/0/3 permits secondary VLAN 3. Secondary VLANs 2 and 3 are associated with primary VLAN 5.
- On Device B, downlink port GigabitEthernet 1/0/4 permits secondary VLAN 6. Downlink port GigabitEthernet 1/0/5 permits secondary VLAN 8. Secondary VLANs 6 and 8 are associated with primary VLAN 10.
- Device A is aware of only VLANs 5 and 10 on Device B.

Figure 9 Network diagram



Procedure

1. Configure Device B:

   # Configure VLANs 5 and 10 as primary VLANs.

```
<DeviceB> system-view
[DeviceB] vlan 5
[DeviceB-vlan5] private-vlan primary
[DeviceB-vlan5] quit
[DeviceB] vlan 10
[DeviceB-vlan10] private-vlan primary
[DeviceB-vlan10] quit
```

   # Create VLANs 2, 3, 6, and 8.

```
[DeviceB] vlan 2 to 3
[DeviceB] vlan 6
[DeviceB-vlan6] quit
[DeviceB] vlan 8
[DeviceB-vlan8] quit
```

   # Associate secondary VLANs 2 and 3 with primary VLAN 5.

```
[DeviceB] vlan 5
[DeviceB-vlan5] private-vlan secondary 2 to 3
[DeviceB-vlan5] quit
```

   # Associate secondary VLANs 6 and 8 with primary VLAN 10.

```
[DeviceB] vlan 10
[DeviceB-vlan10] private-vlan secondary 6 8
[DeviceB-vlan10] quit
```

   # Configure the uplink port (GigabitEthernet 1/0/1) as a trunk promiscuous port of VLANs 5 and 10.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port private-vlan 5 10 trunk promiscuous
[DeviceB-GigabitEthernet1/0/1] quit
```

Assign downlink port GigabitEthernet 1/0/2 to VLAN 2, and configure the port as a host port.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port access vlan 2
[DeviceB-GigabitEthernet1/0/2] port private-vlan host
[DeviceB-GigabitEthernet1/0/2] quit
```

Assign downlink port GigabitEthernet 1/0/3 to VLAN 3, and configure the port as a host port.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] port access vlan 3
[DeviceB-GigabitEthernet1/0/3] port private-vlan host
[DeviceB-GigabitEthernet1/0/3] quit
```

Assign downlink port GigabitEthernet 1/0/4 to VLAN 6, and configure the port as a host port.

```
[DeviceB] interface gigabitethernet 1/0/4
[DeviceB-GigabitEthernet1/0/4] port access vlan 6
[DeviceB-GigabitEthernet1/0/4] port private-vlan host
[DeviceB-GigabitEthernet1/0/4] quit
```

Assign downlink port GigabitEthernet 1/0/5 to VLAN 8, and configure the port as a host port.

```
[DeviceB] interface gigabitethernet 1/0/5
[DeviceB-GigabitEthernet1/0/5] port access vlan 8
[DeviceB-GigabitEthernet1/0/5] port private-vlan host
[DeviceB-GigabitEthernet1/0/5] quit
```

2. Configure Device A:

Create VLANs 5 and 10.

```
[DeviceA] vlan 5
[DeviceA-vlan5] quit
[DeviceA] vlan 10
[DeviceA-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign it to VLANs 5 and 10 as a tagged VLAN member.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port link-type hybrid
[DeviceA-GigabitEthernet1/0/1] port hybrid vlan 5 10 tagged
[DeviceA-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify the primary VLAN configurations on Device B. The following output uses primary VLAN 5 as an example.

```
[DeviceB] display private-vlan 5
 Primary VLAN ID: 5
 Secondary VLAN ID: 2-3

 VLAN ID: 5
 VLAN type: Static
 Private VLAN type: Primary
 Route interface: Not configured
 Description: VLAN 0005
 Name: VLAN 0005
 Tagged ports:
    GigabitEthernet1/0/1
 Untagged ports:
```

```
    GigabitEthernet1/0/2
    GigabitEthernet1/0/3

 VLAN ID: 2
 VLAN type: Static
 Private VLAN type: Secondary
 Route interface: Not configured
 Description: VLAN 0002
 Name: VLAN 0002
 Tagged ports:
    GigabitEthernet1/0/1
 Untagged ports:
    GigabitEthernet1/0/2

 VLAN ID: 3
 VLAN type: Static
 Private VLAN type: Secondary
 Route interface: Not configured
 Description: VLAN 0003
 Name: VLAN 0003
 Tagged ports:
    GigabitEthernet1/0/1
 Untagged ports:
    GigabitEthernet1/0/3
```

The output shows that:

- The trunk promiscuous port (GigabitEthernet 1/0/1) is a tagged member of primary VLAN 5 and secondary VLANs 2 and 3.
- Host port GigabitEthernet 1/0/2 is an untagged member of primary VLAN 5 and secondary VLAN 2.
- Host port GigabitEthernet 1/0/3 is an untagged member of primary VLAN 5 and secondary VLAN 3.

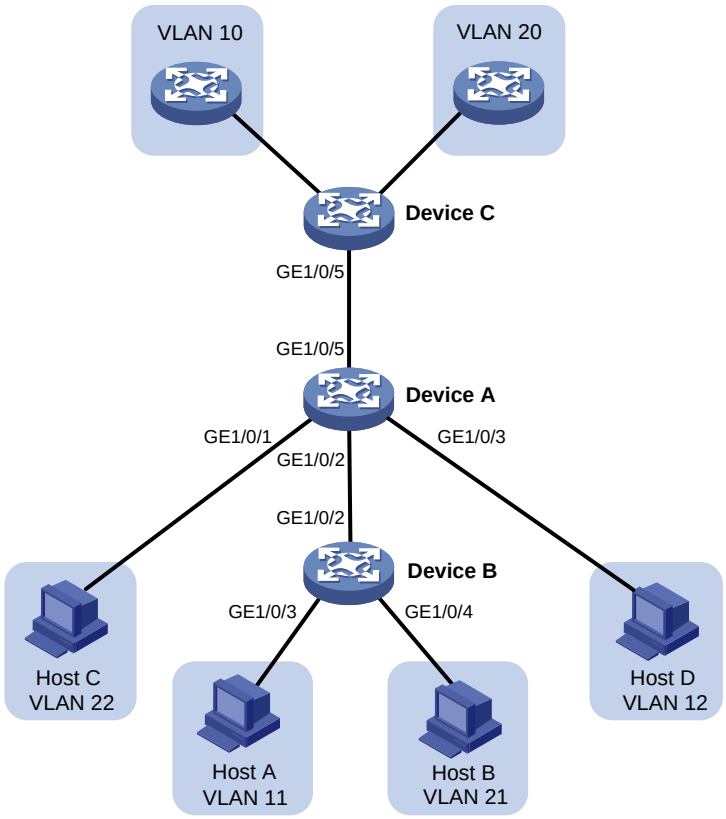
Example: Configuring trunk promiscuous and trunk secondary ports

Network configuration

As shown in Figure 10, configure the private VLAN feature to meet the following requirements:

- VLANs 10 and 20 are primary VLANs on Device A. The uplink port (GigabitEthernet 1/0/5) on Device A permits the packets from VLANs 10 and 20 to pass through tagged.
- VLANs 11, 12, 21, and 22 are secondary VLANs on Device A.
  - Downlink port GigabitEthernet 1/0/2 permits the packets from secondary VLANs 11 and 21 to pass through tagged.
  - Downlink port GigabitEthernet 1/0/1 permits secondary VLAN 22.
  - Downlink port GigabitEthernet 1/0/3 permits secondary VLAN 12.
- Secondary VLANs 11 and 12 are associated with primary VLAN 10.
- Secondary VLANs 21 and 22 are associated with primary VLAN 20.

Figure 10 Network diagram



Procedure

1. Configure Device A:

Configure VLANs 10 and 20 as primary VLANs.

```
<DeviceA> system-view
[DeviceA] vlan 10
[DeviceA-vlan10] private-vlan primary
[DeviceA-vlan10] quit
[DeviceA] vlan 20
[DeviceA-vlan20] private-vlan primary
[DeviceA-vlan20] quit
```

Create VLANs 11, 12, 21, and 22.

```
[DeviceA] vlan 11 to 12
[DeviceA] vlan 21 to 22
```

Associate secondary VLANs 11 and 12 with primary VLAN 10.

```
[DeviceA] vlan 10
[DeviceA-vlan10] private-vlan secondary 11 12
[DeviceA-vlan10] quit
```

Associate secondary VLANs 21 and 22 with primary VLAN 20.

```
[DeviceA] vlan 20
[DeviceA-vlan20] private-vlan secondary 21 22
[DeviceA-vlan20] quit
```

Configure the uplink port (GigabitEthernet 1/0/5) as a trunk promiscuous port of VLANs 10 and 20.

```
[DeviceA] interface gigabitethernet 1/0/5
[DeviceA-GigabitEthernet1/0/5] port private-vlan 10 20 trunk promiscuous
[DeviceA-GigabitEthernet1/0/5] quit
```

Assign downlink port GigabitEthernet 1/0/1 to VLAN 22 and configure the port as a host port.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port access vlan 22
[DeviceA-GigabitEthernet1/0/1] port private-vlan host
[DeviceA-GigabitEthernet1/0/1] quit
```

Assign downlink port GigabitEthernet 1/0/3 to VLAN 12 and configure the port as a host port.

```
[DeviceA] interface gigabitethernet 1/0/3
[DeviceA-GigabitEthernet1/0/3] port access vlan 12
[DeviceA-GigabitEthernet1/0/3] port private-vlan host
[DeviceA-GigabitEthernet1/0/3] quit
```

Configure downlink port GigabitEthernet 1/0/2 as a trunk secondary port of VLANs 11 and 21.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] port private-vlan 11 21 trunk secondary
[DeviceA-GigabitEthernet1/0/2] quit
```

2. Configure Device B:

Create VLANs 11 and 21.

```
<DeviceB> system-view
[DeviceB] vlan 11
[DeviceB-vlan11] quit
[DeviceB] vlan 21
[DeviceB-vlan21] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and assign it to VLANs 11 and 21 as a tagged VLAN member.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port link-type hybrid
[DeviceB-GigabitEthernet1/0/2] port hybrid vlan 11 21 tagged
[DeviceB-GigabitEthernet1/0/2] quit
```

Assign GigabitEthernet 1/0/3 to VLAN 11.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] port access vlan 11
[DeviceB-GigabitEthernet1/0/3] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 21.

```
[DeviceB] interface gigabitethernet 1/0/4
[DeviceB-GigabitEthernet1/0/4] port access vlan 21
[DeviceB-GigabitEthernet1/0/4] quit
```

3. Configure Device C:

Create VLANs 10 and 20.

```
<DeviceC> system-view
[DeviceC] vlan 10
[DeviceC-vlan10] quit
[DeviceC] vlan 20
[DeviceC-vlan20] quit
```

Configure GigabitEthernet 1/0/5 as a hybrid port, and assign it to VLANs 10 and 20 as a tagged VLAN member.

```
[DeviceC] interface gigabitethernet 1/0/5
```

```
[DeviceC-GigabitEthernet1/0/5] port link-type hybrid
[DeviceC-GigabitEthernet1/0/5] port hybrid vlan 10 20 tagged
[DeviceC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Verify the primary VLAN configurations on Device A. The following output uses primary VLAN 10 as an example.

```
[DeviceA] display private-vlan 10
 Primary VLAN ID: 10
 Secondary VLAN ID: 11-12

 VLAN ID: 10
 VLAN type: Static
 Private-vlan type: Primary
 Route interface: Not configured
 Description: VLAN 0010
 Name: VLAN 0010
 Tagged ports:
    GigabitEthernet1/0/2
    GigabitEthernet1/0/5
 Untagged ports:
    GigabitEthernet1/0/3

 VLAN ID: 11
 VLAN type: Static
 Private-vlan type: Secondary
 Route interface: Not configured
 Description: VLAN 0011
 Name: VLAN 0011
 Tagged ports:
    GigabitEthernet1/0/2
    GigabitEthernet1/0/5
 Untagged ports: None

 VLAN ID: 12
 VLAN type: Static
 Private-vlan type: Secondary
 Route interface: Not configured
 Description: VLAN 0012
 Name: VLAN 0012
 Tagged ports:
    GigabitEthernet1/0/5
 Untagged ports:
    GigabitEthernet1/0/3
```

The output shows that:

- The trunk promiscuous port (GigabitEthernet 1/0/5) is a tagged member of primary VLAN 10 and secondary VLANs 11 and 12.
- The trunk secondary port (GigabitEthernet 1/0/2) is a tagged member of primary VLAN 10 and secondary VLAN 11.

- The host port (GigabitEthernet 1/0/3) is an untagged member of primary VLAN 10 and secondary VLAN 12.

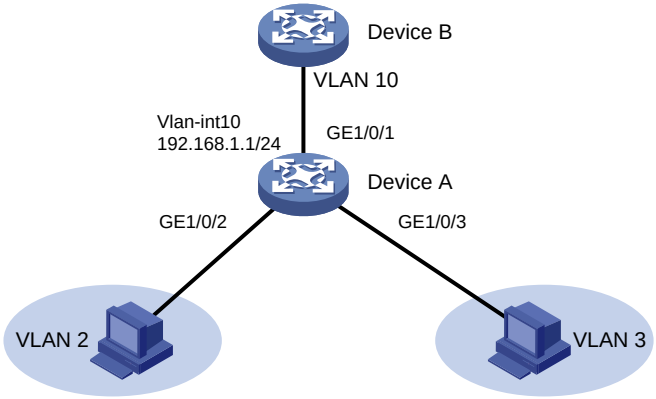
Example: Configuring Layer 3 communication for secondary VLANs

Network configuration

As shown in Figure 11, configure the private VLAN feature to meet the following requirements:

- Primary VLAN 10 on Device A is associated with secondary VLANs 2 and 3. The IP address of VLAN-interface 10 is 192.168.1.1/24.
- GigabitEthernet 1/0/1 belongs to VLAN 10. GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 belong to VLAN 2 and VLAN 3, respectively.
- Secondary VLANs are isolated at Layer 2 but interoperable at Layer 3.

Figure 11 Network diagram



Procedure

Create VLAN 10 and configure it as a primary VLAN.

```
<DeviceA> system-view
[DeviceA] vlan 10
[DeviceA-vlan10] private-vlan primary
[DeviceA-vlan10] quit
```

Create VLANs 2 and 3.

```
<DeviceA> system-view
[DeviceA] vlan 2 to 3
```

Associate primary VLAN 10 with secondary VLANs 2 and 3.

```
[DeviceA] vlan 10
[DeviceA-vlan10] private-vlan primary
[DeviceA-vlan10] private-vlan secondary 2 3
[DeviceA-vlan10] quit
```

Configure the uplink port (GigabitEthernet 1/0/1) as a promiscuous port of VLAN 10.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port private-vlan 10 promiscuous
[DeviceA-GigabitEthernet1/0/1] quit
```

Assign downlink port GigabitEthernet 1/0/2 to VLAN 2, and configure the port as a host port.

```
[DeviceA] interface gigabitethernet 1/0/2
```

```
[DeviceA-GigabitEthernet1/0/2] port access vlan 2
[DeviceA-GigabitEthernet1/0/2] port private-vlan host
[DeviceA-GigabitEthernet1/0/2] quit
```

Assign downlink port GigabitEthernet 1/0/3 to VLAN 3, and configure the port as a host port.

```
[DeviceA] interface gigabitethernet 1/0/3
[DeviceA-GigabitEthernet1/0/3] port access vlan 3
[DeviceA-GigabitEthernet1/0/3] port private-vlan host
[DeviceA-GigabitEthernet1/0/3] quit
```

Enable Layer 3 communication between secondary VLANs 2 and 3 that are associated with primary VLAN 10.

```
[DeviceA] interface vlan-interface 10
[DeviceA-Vlan-interface10] private-vlan secondary 2 3
```

Assign IP address 192.168.1.1/24 to VLAN-interface 10.

```
[DeviceA-Vlan-interface10] ip address 192.168.1.1 255.255.255.0
```

Enable local proxy ARP on VLAN-interface 10.

```
[DeviceA-Vlan-interface10] local-proxy-arp enable
[DeviceA-Vlan-interface10] quit
```

Verifying the configuration

Display the configuration of primary VLAN 10.

```
[DeviceA] display private-vlan 10
 Primary VLAN ID: 10
 Secondary VLAN ID: 2-3

 VLAN ID: 10
 VLAN type: Static
 Private VLAN type: Primary
 Route interface: Configured
 IPv4 address: 192.168.1.1
 IPv4 subnet mask: 255.255.255.0
 Description: VLAN 0010
 Name: VLAN 0010
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/1
    GigabitEthernet1/0/2
    GigabitEthernet1/0/3

 VLAN ID: 2
 VLAN type: Static
 Private VLAN type: Secondary
 Route interface: Configured
 IPv4 address: 192.168.1.1
 IPv4 subnet mask: 255.255.255.0
 Description: VLAN 0002
 Name: VLAN 0002
 Tagged ports:   None
 Untagged ports:
```

```
   GigabitEthernet1/0/1
   GigabitEthernet1/0/2

VLAN ID: 3
VLAN type: Static
Private VLAN type: Secondary
Route interface: Configured
IPv4 address: 192.168.1.1
IPv4 subnet mask: 255.255.255.0
Description: VLAN 0003
Name: VLAN 0003
Tagged ports:   None
Untagged ports:
   GigabitEthernet1/0/1
   GigabitEthernet1/0/3
```

The **Route interface** field in the output is **Configured**, indicating that secondary VLANs 2 and 3 are interoperable at Layer 3.

Configuring voice VLANs

About voice VLANs

A voice VLAN is used for transmitting voice traffic. The device can configure QoS parameters for voice packets to ensure higher transmission priority of the voice packets.

Common voice devices include IP phones and integrated access devices (IADs). This chapter uses IP phones as an example.

Working mechanism

When an IP phone accesses a device, the device performs the following operations:

1. Identifies the IP phone in the network and obtains the MAC address of the IP phone.
2. Advertises the voice VLAN information to the IP phone.

After receiving the voice VLAN information, the IP phone performs automatic configuration. Voice packets sent from the IP phone can then be transmitted within the voice VLAN.

Methods of identifying IP phones

Devices can use the OUI addresses or LLDP to identify IP phones.

Identifying IP phones through OUI addresses

A device identifies voice packets based on their source MAC addresses. A packet whose source MAC address complies with an Organizationally Unique Identifier (OUI) address of the device is regarded as a voice packet.

You can use system default OUI addresses (see Table 1) or configure OUI addresses for the device. You can manually remove or add the system default OUI addresses.

Table 1 Default OUI addresses

Number	OUI address	Vendor
1	0001-e300-0000	Siemens phone
2	0003-6b00-0000	Cisco phone
3	0004-0d00-0000	Avaya phone
4	000f-e200-0000	H3C Aolynk phone
5	0060-b900-0000	Philips/NEC phone
6	00d0-1e00-0000	Pingtel phone
7	00e0-7500-0000	Polycom phone
8	00e0-bb00-0000	3Com phone

Typically, an OUI address refers to the first 24 bits of a MAC address (in binary notation) and is a globally unique identifier that IEEE assigns to a vendor. However, OUI addresses in this chapter are addresses that the system uses to identify voice packets. They are the logical AND results of the *mac-address* and *oui-mask* arguments in the **voice-vlan mac-address** command.

Automatically identifying IP phones through LLDP

If IP phones support LLDP, configure LLDP for automatic IP phone discovery on the device. The device can then automatically discover the peer through LLDP, and exchange LLDP TLVs with the peer.

If the LLDP System Capabilities TLV received on a port indicates that the peer can act as a telephone, the device performs the following operations:

1. Sends an LLDP TLV with the voice VLAN configuration to the peer.
2. Assigns the receiving port to the voice VLAN.
3. Increases the transmission priority of the voice packets sent from the IP phone.
4. Adds the MAC address of the IP phone to the MAC address table to ensure that the IP phone can pass authentication.

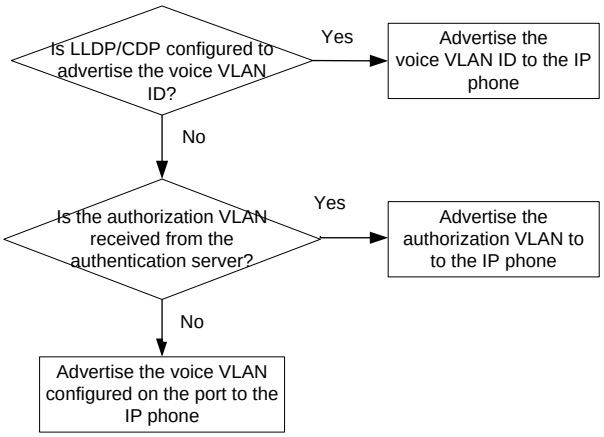
Use LLDP instead of the OUI list to identify IP phones if the network has more IP phone categories than the maximum number of OUI addresses supported on the device. LLDP has higher priority than the OUI list.

For more information about LLDP, see "Configuring LLDP."

Advertising the voice VLAN information to IP phones

Figure 12 shows the workflow of advertising the voice VLAN information to IP phones.

Figure 12 Workflow of advertising the voice VLAN information to IP phones



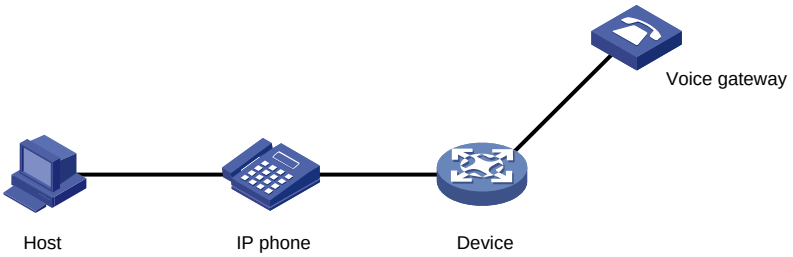
IP phone access methods

Connecting the host and the IP phone in series

As shown in Figure 13, the host is connected to the IP phone, and the IP phone is connected to the device. In this scenario, the following requirements must be met:

- The host and the IP phone use different VLANs.
- The IP phone is able to send out VLAN-tagged packets, so that the device can differentiate traffic from the host and the IP phone.
- The port connecting to the IP phone forwards packets from the voice VLAN and the PVID.

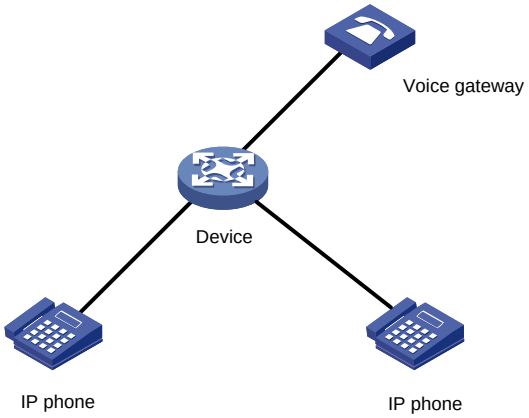
Figure 13 Connecting the host and IP phone in series



Connecting the IP phone to the device

As shown in Figure 14, IP phones are connected to the device without the presence of the host. Use this connection method when IP phones sends out untagged voice packets. In this scenario, you must configure the voice VLAN as the PVID of the access port of the IP phone, and configure the port to forward the packets from the PVID.

Figure 14 Connecting the IP phone to the device



Voice VLAN assignment modes

A port can be assigned to a voice VLAN automatically or manually.

Automatic mode

Use automatic mode when PCs and IP phones are connected in series to access the network through the device, as shown in Figure 13. Ports on the device transmit both voice traffic and data traffic.

When an IP phone is powered on, it sends out protocol packets. After receiving these protocol packets, the device uses the source MAC address of the protocol packets to match its OUI addresses. If the match succeeds, the device performs the following operations:

- Assigns the receiving port of the protocol packets to the voice VLAN.
- Issues ACL rules to set the packet precedence.
- Starts the voice VLAN aging timer.

If no voice packet is received from the port before the aging timer expires, the device will remove the port from the voice VLAN. The aging timer is also configurable.

When the IP phone reboots, the port is reassigned to the voice VLAN to ensure the correct operation of the existing voice connections. The reassignment occurs automatically without being triggered by voice traffic as long as the voice VLAN operates correctly.

Manual mode

Use manual mode when only IP phones access the network through the device, as shown in Figure 14. In this mode, ports are assigned to a voice VLAN that transmits voice traffic exclusively. No data traffic affects the voice traffic transmission.

You must manually assign the port that connects to the IP phone to a voice VLAN. The device uses the source MAC address of the received voice packets to match its OUI addresses. If the match succeeds, the device issues ACL rules to set the packet precedence.

To remove the port from the voice VLAN, you must manually remove it.

Cooperation of voice VLAN assignment modes and IP phones

Some IP phones send out VLAN-tagged packets, and others send out only untagged packets. For correct packet processing, ports of different link types must meet specific configuration requirements in different voice VLAN assignment modes.

If an IP phone sends out tagged voice traffic, and its access port is configured with 802.1X authentication, guest VLAN, Auth-Fail VLAN, or critical VLAN, VLAN IDs must be different for the following VLANs:

- Voice VLAN.
- PVID of the access port.
- 802.1X guest, Auth-Fail, or critical VLAN.

If an IP phone sends out untagged voice traffic, the PVID of the access port must be the voice VLAN. In this scenario, 802.1X authentication is not supported.

Access ports do not transmit tagged packets.

Configuration requirements for transmitting tagged voice traffic

Port link type	Voice VLAN assignment mode	Configuration requirements
Trunk	Automatic	The PVID of the port cannot be the voice VLAN.
	Manual	The PVID of the port cannot be the voice VLAN. The port must forward packets from the voice VLAN.
Hybrid	Automatic	The PVID of the port cannot be the voice VLAN.
	Manual	The PVID of the port cannot be the voice VLAN. The port must forward packets from the voice VLAN with VLAN tags.

Configuration requirements for transmitting untagged voice traffic

When IP phones send out untagged packets, you must set the voice VLAN assignment mode to manual.

Table 2 Configuration requirements for ports in manual mode to support untagged voice traffic

Port link type	Configuration requirements
Access	The voice VLAN must be the PVID of the port.
Trunk	The voice VLAN must be the PVID of the port.

Port link type	Configuration requirements
	The port must forward packets from the voice VLAN.
Hybrid	The voice VLAN must be the PVID of the port. The port must forward packets from the voice VLAN without VLAN tags.

Security mode and normal mode of voice VLANs

Depending on the filtering mechanisms to incoming packets, a voice VLAN-enabled port can operate in one of the following modes:

- **Normal mode**—The port receives voice-VLAN-tagged packets and forwards them in the voice VLAN without examining their MAC addresses. If the PVID of the port is the voice VLAN and the port operates in manual VLAN assignment mode, the port forwards all the received untagged packets in the voice VLAN.

  In this mode, voice VLANs are vulnerable to traffic attacks. Malicious users might send a large number of forged voice-VLAN-tagged or untagged packets to affect voice communication.
- **Security mode**—The port uses the source MAC addresses of voice packets to match the OUI addresses of the device. Packets that fail the match will be dropped.

In a safe network, you can configure the voice VLANs to operate in normal mode. This mode reduces system resource consumption in source MAC address checking.

In either mode, the device modifies the transmission priority only for voice VLAN packets whose source MAC addresses match OUI addresses of the device.

As a best practice, do not transmit both voice traffic and non-voice traffic in a voice VLAN. If you must transmit different traffic in a voice VLAN, make sure the voice VLAN security mode is disabled.

Table 3 Packet processing on a voice VLAN-enabled port in normal or security mode

Voice VLAN mode	Packet type	Packet processing
Normal	• Untagged packets • Packets with the voice VLAN tags	The port does not examine their source MAC addresses. Both voice traffic and non-voice traffic can be transmitted in the voice VLAN.
	Packets with other VLAN tags	The port forwards or drops them depending on whether the port permits packets from these VLANs to pass through.
Security	• Untagged packets • Packets with the voice VLAN tags	• If the source MAC address of a packet matches an OUI address on the device, the packet is forwarded in the voice VLAN. • If the source MAC address of a packet does not match an OUI address on the device, the packet is dropped.
	Packets with other VLAN tags	The port forwards or drops them depending on whether the port permits packets from these VLANs to pass through.

Restrictions: Hardware compatibility with voice VLAN

S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switches do not support voice VLAN.

Restrictions and guidelines: Voice VLAN configuration

The aging timer of a voice VLAN starts only when the dynamic MAC address entry of the voice VLAN ages out. The aging period for the voice VLAN equals the sum of the voice VLAN aging timer and the aging timer for its dynamic MAC address entry. For more information about the aging timer for dynamic MAC address entries, see "Configuring the MAC address table."

As a best practice, do not both configure voice VLAN and disable MAC address learning on a port. If the two features are configured together on a port, the port forwards only packets exactly matching the OUI addresses and drops inexactly matching packets.

As a best practice, do not configure both voice VLAN and the MAC learning limit on a port. If the two features are configured together on a port and the port learns the configured maximum number of MAC address entries, the port processes packets as follows:

- Forwards only packets matching the MAC address entries learnt by the port and OUI addresses.
- Drops unmatching packets.

Voice VLAN tasks at a glance

To configure a voice VLAN, perform the following tasks:

1. Configuring voice VLAN assignment modes for a port

   Use one of the following methods:

   - Configuring a port to operate in automatic voice VLAN assignment mode
   - Configuring a port to operate in manual voice VLAN assignment mode
2. (Optional.) Enabling LLDP for automatic IP phone discovery
3. (Optional.) Use one of the following methods:
   - Configuring LLDP to advertise a voice VLAN
   - Configuring CDP to advertise a voice VLAN

Configuring voice VLAN assignment modes for a port

Configuring a port to operate in automatic voice VLAN assignment mode

Restrictions and guidelines

- Do not configure a VLAN as both a voice VLAN and a protocol-based VLAN.
  - A voice VLAN in automatic mode on a hybrid port processes only tagged incoming voice traffic.
  - A protocol-based VLAN on a hybrid port processes only untagged incoming packets. For more information about protocol-based VLANs, see "Configuring protocol-based VLANs."
- As a best practice, do not use this mode with MSTP. In MSTP mode, if a port is blocked in the MSTI of the target voice VLAN, the port drops the received packets instead of delivering them to the CPU. As a result, the port will not be dynamically assigned to the voice VLAN.

- As a best practice, do not use this mode with PVST. In PVST mode, if the target voice VLAN is not permitted on a port, the port is placed in blocked state. The port drops the received packets instead of delivering them to the CPU. As a result, the port will not be dynamically assigned to the voice VLAN.
- As a best practice, do not configure both dynamic MAC-based VLAN assignment and automatic voice VLAN assignment mode on a port. They can have a negative impact on each other.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Set the voice VLAN aging timer.
   voice-vlan aging *minutes*
   By default, the aging timer of a voice VLAN is 1440 minutes.
   The voice VLAN aging timer takes effect only on ports in automatic voice VLAN assignment mode.
3. (Optional.) Enable the voice VLAN security mode.
   voice-vlan security enable
   By default, the voice VLAN security mode is enabled.
4. (Optional.) Add an OUI address for voice packet identification.
   voice-vlan mac-address *oui* **mask** *oui-mask* [**description** *text*]
   By default, system default OUI addresses exist. For more information, see Table 1.
5. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
6. Configure the link type of the port.
   - **port link-type trunk**
   - **port link-type hybrid**
7. Configure the port to operate in automatic voice VLAN assignment mode.
   voice-vlan mode auto
   By default, the automatic voice VLAN assignment mode is enabled.
8. Enable the voice VLAN feature on the port.
   voice-vlan *vlan-id* **enable**
   By default, the voice VLAN feature is disabled.
   Before you execute this command, make sure the specified VLAN already exists.

Configuring a port to operate in manual voice VLAN assignment mode

Restrictions and guidelines

- You can configure different voice VLANs for different ports on the same device. Make sure the following requirements are met:
  - One port can be configured with only one voice VLAN.
  - Voice VLANs must be existing static VLANs.
- Do not enable voice VLAN on the member ports of a link aggregation group. For more information about link aggregation, see "Configuring Ethernet link aggregation."
- To make a voice VLAN take effect on a port operating in manual mode, you must manually assign the port to the voice VLAN.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Enable the voice VLAN security mode.
   voice-vlan security enable
   By default, the voice VLAN security mode is enabled.
3. (Optional.) Add an OUI address for voice packet identification.
   voice-vlan mac-address *oui* **mask** *oui-mask* [**description** *text*]
   By default, system default OUI addresses exist. For more information, see Table 1.
4. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
5. Configure the port to operate in manual voice VLAN assignment mode.
   undo voice-vlan mode auto
   By default, a port operates in automatic voice VLAN assignment mode.
6. Assign the access, trunk, or hybrid port to the voice VLAN.
   - For the access port, see "Assigning an access port to a VLAN."
   - For the trunk port, see "Assigning a trunk port to a VLAN."
   - For the hybrid port, see "Assigning a hybrid port to a VLAN."

   After you assign an access port to the voice VLAN, the voice VLAN becomes the PVID of the port.
7. (Optional.) Configure the voice VLAN as the PVID of the trunk or hybrid port.
   - For the trunk port, see "Assigning a trunk port to a VLAN."
   - For the hybrid port, see "Assigning a hybrid port to a VLAN."

   This step is required for untagged incoming voice traffic and prohibited for tagged incoming voice traffic.
8. Enable the voice VLAN feature on the port.
   voice-vlan *vlan-id* **enable**
   By default, the voice VLAN feature is disabled.
   Before you execute this command, make sure the specified VLAN already exists.

Enabling LLDP for automatic IP phone discovery

Restrictions and guidelines

- Before you enable this feature, enable LLDP both globally and on access ports.
- Use this feature only with the automatic voice VLAN assignment mode.
- If you use this feature together with CDP compatibility, voice VLAN settings will be deleted when the CDP neighbors are deleted, which causes IP phones automatically discovered through LLDP to go offline. Do not use this feature together with CDP compatibility.
- After you enable this feature on the device, each port of the device can be connected to a maximum of five IP phones.

Procedure

1. Enter system view.
   system-view
2. Enable LLDP for automatic IP phone discovery.

voice-vlan track lldp

By default, this feature is disabled.

Configuring LLDP or CDP to advertise a voice VLAN

Configuring LLDP to advertise a voice VLAN

About configuring LLDP to advertise a voice VLAN

For IP phones that support LLDP, the device advertises the voice VLAN information to the IP phones through the LLDP-MED TLVs.

Prerequisites

Before you configure this feature, enable LLDP both globally and on access ports.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Configure an advertised voice VLAN ID.
   lldp tlv-enable med-tlv network-policy *vlan-id*

   By default, no advertised voice VLAN ID is configured.

   For more information about the command, see *Layer 2—LAN Switching Command Reference*.
4. (Optional.) Display the voice VLAN advertised by LLDP.
   display lldp local-information

   For more information about the command, see *Layer 2—LAN Switching Command Reference*.

Configuring CDP to advertise a voice VLAN

About configuring CDP to advertise a voice VLAN

If an IP phone supports CDP but does not support LLDP, it will send out CDP packets to the device to request the voice VLAN ID. If the IP phone does not receive the voice VLAN ID within a time period, it will send out untagged packets. The device cannot differentiate untagged voice packets from other types of packets.

You can configure CDP compatibility on the device to enable it to perform the following operations:

- Receive and identify CDP packets from the IP phone.
- Send CDP packets to the IP phone. The voice VLAN information is carried in the CDP packets.

After receiving the advertised VLAN information, the IP phone performs automatic voice VLAN configuration. Packets from the IP phone will be transmitted in the dedicated voice VLAN.

LLDP packets sent from the device carry the priority information. CDP packets sent from the device do not carry the priority information.

Prerequisites

Before you configure this feature, enable LLDP globally and on access ports.

Procedure

1. Enter system view.
   system-view
2. Enable CDP compatibility.
   lldp compliance cdp
   By default, CDP compatibility is disabled.
3. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
4. Configure CDP-compatible LLDP to operate in TxRx mode.
   lldp compliance admin-status cdp txrx
   By default, CDP-compatible LLDP operates in Disable mode.
5. Configure an advertised voice VLAN ID.
   cdp voice-vlan *vlan-id*
   By default, no advertised voice VLAN ID is configured.
   For more information about the command, see *Layer 2—LAN Switching Command Reference*.

Display and maintenance commands for voice VLANs

Execute **display** commands in any view.

Task	Command
Display OUI addresses on a device.	**display voice-vlan mac-address**
Display the voice VLAN state.	**display voice-vlan state**

Voice VLAN configuration examples

Example: Configuring automatic voice VLAN assignment mode

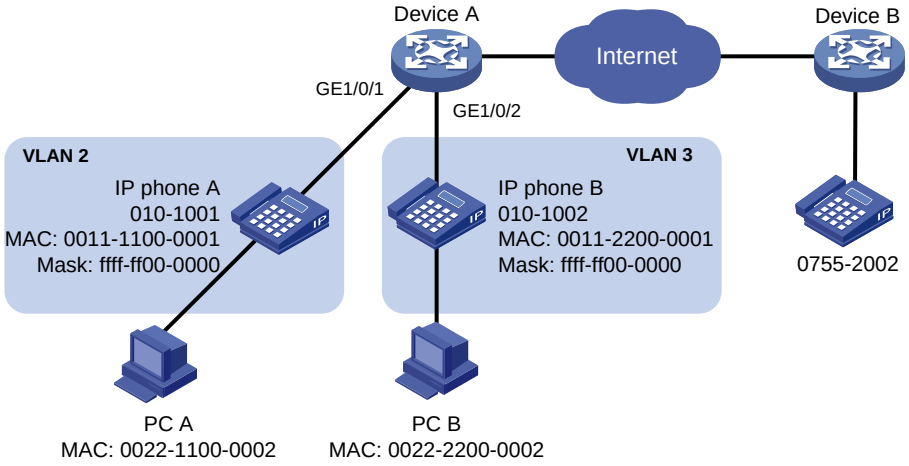
Network configuration

As shown in Figure 15, Device A transmits traffic from IP phones and hosts.

For correct voice traffic transmission, perform the following tasks on Device A:

- Configure voice VLANs 2 and 3 to transmit voice packets from IP phone A and IP phone B, respectively.
- Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to operate in automatic voice VLAN assignment mode.
- Add MAC addresses of IP phones A and B to the device for voice packet identification. The mask of the two MAC addresses is FFFF-FF00-0000.
- Set an aging timer for voice VLANs.

Figure 15 Network diagram



Procedure

1. Configure voice VLANs:

   # Create VLANs 2 and 3.

   ```
   <DeviceA> system-view
   [DeviceA] vlan 2 to 3
   ```

   # Set the voice VLAN aging timer to 30 minutes.

   ```
   [DeviceA] voice-vlan aging 30
   ```

   # Enable security mode for voice VLANs.

   ```
   [DeviceA] voice-vlan security enable
   ```

   # Add MAC addresses of IP phones A and B to the device with mask FFFF-FF00-0000.

   ```
   [DeviceA] voice-vlan mac-address 0011-1100-0001 mask ffff-ff00-0000 description IP phone A
   [DeviceA] voice-vlan mac-address 0011-2200-0001 mask ffff-ff00-0000 description IP phone B
   ```

2. Configure GigabitEthernet 1/0/1:

   # Configure GigabitEthernet 1/0/1 as a hybrid port.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] port link-type hybrid
   ```

   # Configure GigabitEthernet 1/0/1 to operate in automatic voice VLAN assignment mode.

   ```
   [DeviceA-GigabitEthernet1/0/1] voice-vlan mode auto
   ```

   # Enable voice VLAN on GigabitEthernet 1/0/1 and configure VLAN 2 as the voice VLAN for it.

   ```
   [DeviceA-GigabitEthernet1/0/1] voice-vlan 2 enable
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

3. Configure GigabitEthernet 1/0/2:

   # Configure GigabitEthernet 1/0/2 as a hybrid port.

   ```
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] port link-type hybrid
   ```

   # Configure GigabitEthernet 1/0/2 to operate in automatic voice VLAN assignment mode.

   ```
   [DeviceA-GigabitEthernet1/0/2] voice-vlan mode auto
   ```

   # Enable voice VLAN on GigabitEthernet 1/0/2 and configure VLAN 3 as the voice VLAN for it.

   ```
   [DeviceA-GigabitEthernet1/0/2] voice-vlan 3 enable
   [DeviceA-GigabitEthernet1/0/2] quit
   ```

Verifying the configuration

Display the OUI addresses supported on Device A.

```
[DeviceA] display voice-vlan mac-address
OUI Address     Mask            Description
0001-e300-0000  ffff-ff00-0000  Siemens phone
0003-6b00-0000  ffff-ff00-0000  Cisco phone
0004-0d00-0000  ffff-ff00-0000  Avaya phone
000f-e200-0000  ffff-ff00-0000  H3C Aolynk phone
0011-1100-0000  ffff-ff00-0000  IP phone A
0011-2200-0000  ffff-ff00-0000  IP phone B
0060-b900-0000  ffff-ff00-0000  Philips/NEC phone
00d0-1e00-0000  ffff-ff00-0000  Pingtel phone
00e0-7500-0000  ffff-ff00-0000  Polycom phone
00e0-bb00-0000  ffff-ff00-0000  3Com phone
```

Display the voice VLAN state.

```
[DeviceA] display voice-vlan state
 Current voice VLANs: 2
 Voice VLAN security mode: Security
 Voice VLAN aging time: 30 minutes
 Voice VLAN enabled ports and their modes:
 Port                      VLAN        Mode        CoS         DSCP
 GE1/0/1                   2           Auto        6           46
 GE1/0/2                   3           Auto        6           46
```

Example: Configuring manual voice VLAN assignment mode

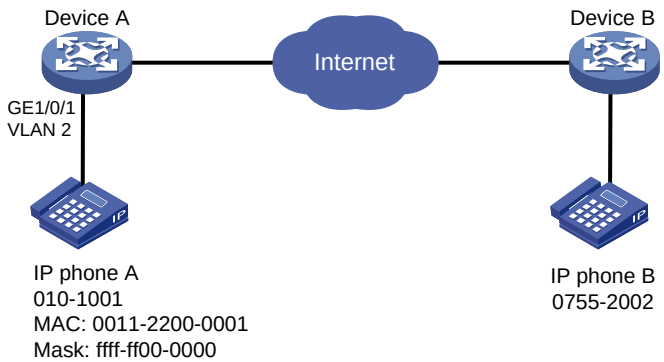
Network configuration

As shown in Figure 16, IP phone A send untagged voice traffic.

To enable GigabitEthernet 1/0/1 to transmit only voice packets, perform the following tasks on Device A:

- Create VLAN 2. This VLAN will be used as a voice VLAN.
- Configure GigabitEthernet 1/0/1 to operate in manual voice VLAN assignment mode and add it to VLAN 2.
- Add the OUI address of IP phone A to the OUI list of Device A.

Figure 16 Network diagram



Procedure

Enable security mode for voice VLANs.

```
<DeviceA> system-view
[DeviceA] voice-vlan security enable
```

Add MAC address 0011-2200-0001 with mask FFFF-FF00-0000.

```
[DeviceA] voice-vlan mac-address 0011-2200-0001 mask ffff-ff00-0000 description test
```

Create VLAN 2.

```
[DeviceA] vlan 2
[DeviceA-vlan2] quit
```

Configure GigabitEthernet 1/0/1 to operate in manual voice VLAN assignment mode.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] undo voice-vlan mode auto
```

Configure GigabitEthernet 1/0/1 as a hybrid port.

```
[DeviceA-GigabitEthernet1/0/1] port link-type hybrid
```

Set the PVID of GigabitEthernet 1/0/1 to VLAN 2.

```
[DeviceA-GigabitEthernet1/0/1] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/1 to VLAN 2 as an untagged VLAN member.

```
[DeviceA-GigabitEthernet1/0/1] port hybrid vlan 2 untagged
```

Enable voice VLAN and configure VLAN 2 as the voice VLAN on GigabitEthernet 1/0/1.

```
[DeviceA-GigabitEthernet1/0/1] voice-vlan 2 enable
[DeviceA-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Display the OUI addresses supported on Device A.

```
[DeviceA] display voice-vlan mac-address
OUI Address     Mask            Description
0001-e300-0000  ffff-ff00-0000  Siemens phone
0003-6b00-0000  ffff-ff00-0000  Cisco phone
0004-0d00-0000  ffff-ff00-0000  Avaya phone
000f-e200-0000  ffff-ff00-0000  H3C Aolynk phone
0011-2200-0000  ffff-ff00-0000  test
0060-b900-0000  ffff-ff00-0000  Philips/NEC phone
00d0-1e00-0000  ffff-ff00-0000  Pingtel phone
00e0-7500-0000  ffff-ff00-0000  Polycom phone
00e0-bb00-0000  ffff-ff00-0000  3Com phone
```

Display the voice VLAN state.

```
[DeviceA] display voice-vlan state
 Current voice VLANs: 1
 Voice VLAN security mode: Security

Contents

Configuring MVRP

About MVRP

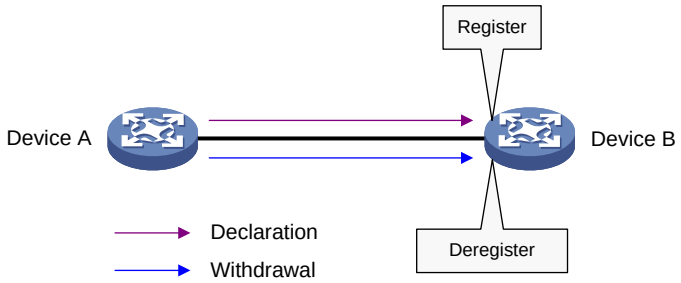
Multiple Registration Protocol (MRP) is an attribute registration protocol used to transmit attribute values. Multiple VLAN Registration Protocol (MVRP) is a typical MRP application. It synchronizes VLAN information among devices and greatly reduces the workload of network administrators.

MRP implementation

An MRP-enabled port is called an MRP participant. An MVRP-enabled port is called an MVRP participant.

As shown in Figure 1, an MRP participant sends declarations and withdrawals to notify other participants to register and deregister its attribute values. It also registers and deregisters the attribute values of other participants according to the received declarations and withdrawals. MRP rapidly propagates the configuration information of an MRP participant throughout the LAN.

Figure 1 MRP implementation



For example, MRP registers and deregisters VLAN attributes as follows:

- When a port receives a declaration for a VLAN, the port registers the VLAN and joins the VLAN.
- When a port receives a withdrawal for a VLAN, the port deregisters the VLAN and leaves the VLAN.

MRP allows devices in the same LAN to transmit attribute values on a per MSTI basis. Figure 1 shows a simple MRP implementation on an MSTI. In a network with multiple MSTIs, MRP performs attribute registration and deregistration on a per MSTI basis. For more information about MSTIs, see "Configuring spanning tree protocols."

MRP messages

MRP messages include the following types:

- **Declaration**—Includes Join and New messages.
- **Withdrawal**—Includes Leave and LeaveAll messages.

Join message

An MRP participant sends a Join message to request the peer participant to register attributes in the Join message.

When receiving a Join message from the peer participant, an MRP participant performs the following tasks:

- Registers the attributes in the Join message.

- Propagates the Join message to all other participants on the device.

After receiving the Join message, other participants send the Join message to their respective peer participants.

Join messages sent from a local participant to its peer participant include the following types:

- **JoinEmpty**—Declares an unregistered attribute. For example, when an MRP participant joins an unregistered static VLAN, it sends a JoinEmpty message.

  VLANs created manually and locally are called static VLANs. VLANs learned through MRP are called dynamic VLANs.
- **JoinIn**—Declares a registered attribute. A JoinIn message is used in one of the following situations:
  - An MRP participant joins an existing static VLAN and sends a JoinIn message after registering the VLAN.
  - The MRP participant receives a Join message propagated by another participant on the device and sends a JoinIn message after registering the VLAN.

New message

Similar to a Join message, a New message enables MRP participants to register attributes.

When the MSTP topology changes, an MRP participant sends a New message to the peer participant to declare the topology change.

Upon receiving a New message from the peer participant, an MRP participant performs the following tasks:

- Registers the attributes in the message.
- Propagates the New message to all other participants on the device.

After receiving the New message, other participants send the New message to their respective peer participants.

Leave message

An MRP participant sends a Leave message to the peer participant when it wants the peer participant to deregister attributes that it has deregistered.

When the peer participant receives the Leave message, it performs the following tasks:

- Deregisters the attribute in the Leave message.
- Propagates the Leave message to all other participants on the device.

After a participant on the device receives the Leave message, it determines whether to send the Leave message to its peer participant depending on the attribute status on the device.

- If the VLAN in the Leave message is a dynamic VLAN not registered by any participants on the device, both of the following events occur:
  - The VLAN is deleted on the device.
  - The participant sends the Leave message to its peer participant.
- If the VLAN in the Leave message is a static VLAN, the participant will not send the Leave message to its peer participant.

LeaveAll message

Each MRP participant starts its LeaveAll timer when starting up. When the timer expires, the MRP participant sends LeaveAll messages to the peer participant.

Upon sending or receiving a LeaveAll message, the local participant starts the Leave timer. The local participant determines whether to send a Join message depending on its attribute status. A participant can re-register the attributes in the received Join message before the Leave timer expires.

When the Leave timer expires, a participant deregisters all attributes that have not been re-registered to periodically clear useless attributes in the network.

MRP timers

MRP uses the following timers to control message transmission.

Periodic timer

The Periodic timer controls the transmission of MRP messages. An MRP participant starts its own Periodic timer upon startup, and stores MRP messages to be sent before the Periodic timer expires. When the Periodic timer expires, MRP sends stored MRP messages in as few MRP frames as possible and restarts the Periodic timer. This mechanism reduces the number of MRP frames sent.

You can enable or disable the Periodic timer. When the Periodic timer is disabled, MRP does not periodically send MRP messages. Instead, an MRP participant sends MRP messages when the LeaveAll timer expires or the participant receives a LeaveAll message from the peer participant.

Join timer

The Join timer controls the transmission of Join messages. An MRP participant starts the Join timer after sending a Join message to the peer participant. Before the Join timer expires, the participant does not resend the Join message when the following conditions exist:

- The participant receives a JoinIn message from the peer participant.
- The received JoinIn message has the same attributes as the sent Join message.

When both the Join timer and the Periodic timer expire, the participant resends the Join message.

Leave timer

The Leave timer controls the deregistration of attributes.

An MRP participant starts the Leave timer in one of the following conditions:

- The participant receives a Leave message from its peer participant.
- The participant receives or sends a LeaveAll message.

The MRP participant does not deregister the attributes in the Leave or LeaveAll message if the following conditions exist:

- The participant receives a Join message before the Leave timer expires.
- The Join message includes the attributes that have been encapsulated in the Leave or LeaveAll message.

If the participant does not receive a Join message for these attributes before the Leave timer expires, MRP deregisters the attributes.

LeaveAll timer

After startup, an MRP participant starts its own LeaveAll timer. When the LeaveAll timer expires, the MRP participant sends out a LeaveAll message and restarts the LeaveAll timer.

Upon receiving the LeaveAll message, other participants restart their LeaveAll timer. The value of the LeaveAll timer is randomly selected between the LeaveAll timer and 1.5 times the LeaveAll timer. This mechanism provides the following benefits:

- Effectively reduces the number of LeaveAll messages in the network.
- Prevents the LeaveAll timer of a particular participant from always expiring first.

MVRP registration modes

VLAN information propagated by MVRP includes dynamic VLAN information from other devices and local static VLAN information.

Based on how an MVRP participant handles registration of dynamic VLANs, MVRP has the following registration modes:

- **Normal**—An MVRP participant in normal registration mode registers and deregisters dynamic VLANs.
- **Fixed**—An MVRP participant in fixed registration mode disables deregistering dynamic VLANs and drops received MVRP frames. The MVRP participant does not deregister dynamic VLANs or register new dynamic VLANs.
- **Forbidden**—An MVRP participant in forbidden registration mode disables registering dynamic VLANs and drops received MVRP frames. When you set the forbidden registration mode for a port, VLAN 1 of the port retains and all dynamically registered VLANs of the port will be deleted.

Protocols and standards

IEEE 802.1ak, *IEEE Standard for Local and Metropolitan Area Networks: Virtual Bridged Local Area Networks – Amendment 07: Multiple Registration Protocol*

Restrictions and guidelines: MVRP configuration

When you configure MVRP, follow these restrictions and guidelines:

- MVRP can work with STP, RSTP, or MSTP. Ports blocked by STP, RSTP, or MSTP can receive and send MVRP frames. Do not configure MVRP with other link layer topology protocols, such as PVST, RRPP, and Smart Link.

  For more information about STP, RSTP, MSTP, and PVST, see "Configuring spanning tree protocols." For more information about RRPP and Smart Link, see *High Availability Configuration Guide*.
- Do not configure both MVRP and remote port mirroring on a port. Otherwise, MVRP might register the remote probe VLAN with incorrect ports, which would cause the monitor port to receive undesired copies. For more information about port mirroring, see *Network Management and Monitoring Configuration Guide*.
- Enabling MVRP on a Layer 2 aggregate interface takes effect on the aggregate interface and all Selected member ports in the link aggregation group.
- MVRP configuration made on an aggregation group member port takes effect only after the port is removed from the aggregation group.

MVRP tasks at a glance

To configure MVRP, perform the following tasks:

1. Enabling MVRP
2. Setting an MVRP registration mode
3. (Optional.) Setting MRP timers
4. (Optional.) Enabling GVRP compatibility

Prerequisites

Before you configure MVRP, complete the following tasks:

- Map each MSTI used by MVRP to an existing VLAN on each device in the network.
- Set the port link type of MVRP participants to trunk because MVRP takes effect only on trunk ports. For more information about trunk ports, see "Configuring VLANs."

Enabling MVRP

1. Enter system view.
   system-view
2. Enable MVRP globally.
   mvrp global enable
   By default, MVRP is globally disabled.
   For MVRP to take effect on a port, enable MVRP both on the port and globally.
3. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
4. Configure the port as a trunk port.
   port link-type trunk
   By default, each port is an access port. For more information about the **port link-type trunk** command, see *Layer 2—LAN Switching Command Reference*.
5. Configure the trunk port to permit the specified VLANs.
   port trunk permit vlan { *vlan-id-list* | **all** }
   By default, a trunk port permits only VLAN 1.
   Make sure the trunk port permits all registered VLANs.
   For more information about the **port trunk permit vlan** command, see *Layer 2—LAN Switching Command Reference*.
6. Enable MVRP on the port.
   mvrp enable
   By default, MVRP is disabled on a port.

Setting an MVRP registration mode

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
3. Set an MVRP registration mode for the port.
   mvrp registration { **fixed** | **forbidden** | **normal** }
   The default setting is normal registration mode.

Setting MRP timers

Restrictions and guidelines

When you set MVRP timers, follow these restrictions and guidelines:

- Follow the value range requirements for Join, Leave, and LeaveAll timers and their dependencies as described in Table 1. If you set a timer to a value beyond the allowed value range, your configuration fails. You can set a timer by tuning the value of any other timer. The value of each timer must be an integer multiple of 20 centiseconds.

Table 1 Dependencies of the Join, Leave, and LeaveAll timers

Timer	Lower limit	Upper limit
Join	20 centiseconds	Half the Leave timer
Leave	Twice the Join timer	LeaveAll timer
LeaveAll	Leave timer on each port	32760 centiseconds

- To avoid frequent VLAN registrations and deregistrations, use the same MRP timers throughout the network.
- Each port maintains its own Periodic, Join, and LeaveAll timers, and each attribute of a port maintains a Leave timer.
- As a best practice, restore the timers in the order of Join, Leave, and LeaveAll when you restore these timers to their default values.
- You can restore the Periodic timer to its default value at any time.

Procedure

1. Enter system view.
   `system-view`
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   `interface` *`interface-type interface-number`*
3. Set the LeaveAll timer.
   `mrp timer leaveall` *`timer-value`*
   The default setting is 1000 centiseconds.
4. Set the Join timer.
   `mrp timer join` *`timer-value`*
   The default setting is 20 centiseconds.
5. Set the Leave timer.
   `mrp timer leave` *`timer-value`*
   The default setting is 60 centiseconds.
6. Set the Periodic timer.
   `mrp timer periodic` *`timer-value`*
   The default setting is 100 centiseconds.

Enabling GVRP compatibility

About GVRP compatibility

Perform this task to enable the device to receive and send both MVRP and GVRP frames when the peer device supports GVRP. For more information about GVRP, see the IEEE 802.1Q standard.

Restrictions and guidelines

When you enable GVRP compatibility, follow these restrictions and guidelines:

- GVRP compatibility enables MVRP to work with STP or RSTP, but not MSTP.
- When the system is busy, disable the Period timer to prevent the participant from frequently registering or deregistering attributes.

Procedure

1. Enter system view.

system-view

2. Enable GVRP compatibility.

   mvrp gvrp-compliance enable

   By default, GVRP compatibility is disabled.

Display and maintenance commands for MVRP

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display MVRP running status.	**display mvrp running-status** [**interface** *interface-list*]
Display the MVRP state of a port in a VLAN.	**display mvrp state interface** *interface-type interface-number* **vlan** *vlan-id*
Display MVRP statistics.	**display mvrp statistics** [**interface** *interface-list*]
Clear MVRP statistics.	**reset mvrp statistics** [**interface** *interface-list*]

MVRP configuration examples

Example: Configuring basic MVRP functions

Network configuration

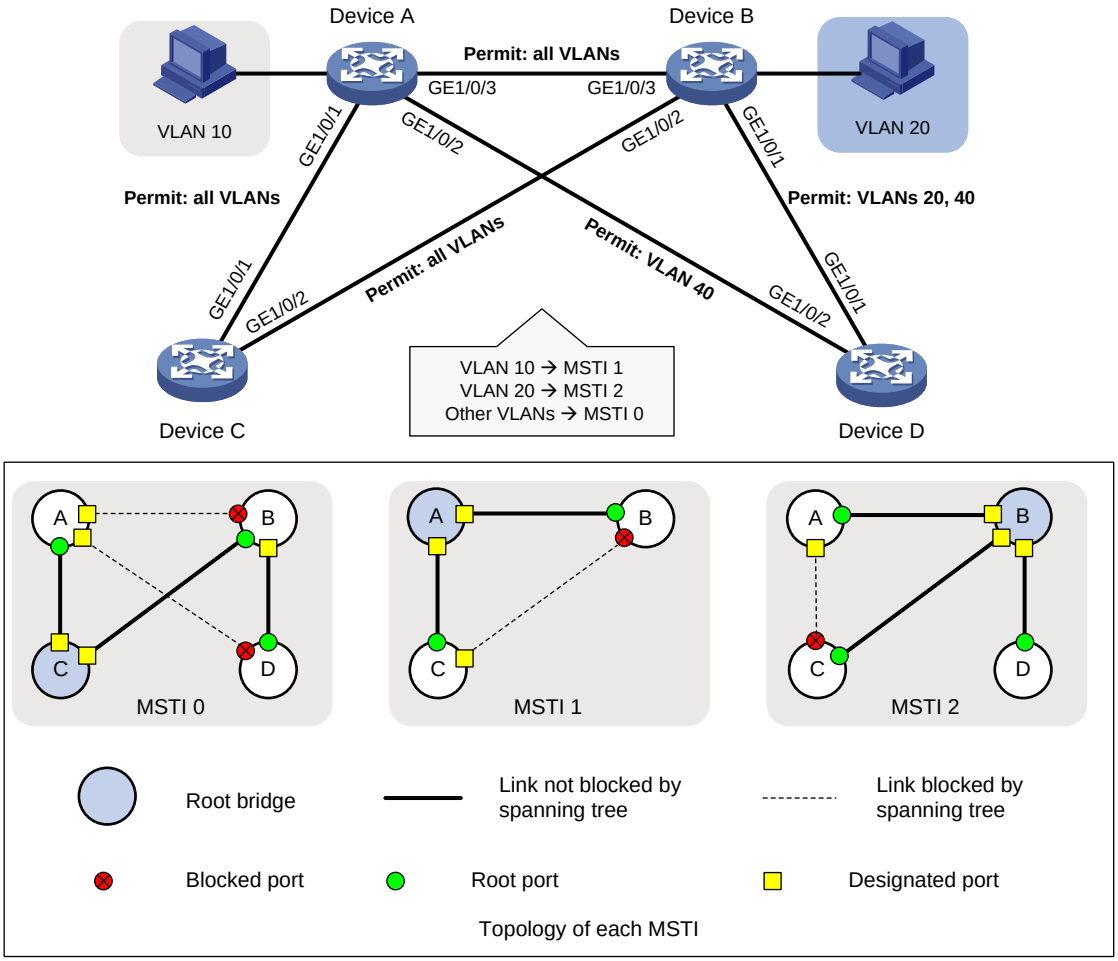
As shown in Figure 2:

- Create VLAN 10 on Device A and VLAN 20 on Device B.
- Configure MSTP, map VLAN 10 to MSTI 1, map VLAN 20 to MSTI 2, and map the other VLANs to MSTI 0.

Configure MVRP on Device A, Device B, Device C, and Device D to meet the following requirements:

- The devices can register and deregister dynamic VLANs.
- The devices can keep identical VLAN configurations for each MSTI.

Figure 2 Network diagram



Procedure

1. Configure Device A:

Enter MST region view.

```
<DeviceA> system-view
[DeviceA] stp region-configuration
```

Configure the MST region name, VLAN-to-instance mappings, and revision level.

```
[DeviceA-mst-region] region-name example
[DeviceA-mst-region] instance 1 vlan 10
[DeviceA-mst-region] instance 2 vlan 20
[DeviceA-mst-region] revision-level 0
```

Manually activate the MST region configuration.

```
[DeviceA-mst-region] active region-configuration
[DeviceA-mst-region] quit
```

Configure Device A as the primary root bridge of MSTI 1.

```
[DeviceA] stp instance 1 root primary
```

Globally enable the spanning tree feature.

```
[DeviceA] stp global enable
```

Globally enable MVRP.

```
[DeviceA] mvrp global enable
```

Configure GigabitEthernet 1/0/1 as a trunk port, and configure it to permit all VLANs.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port link-type trunk
[DeviceA-GigabitEthernet1/0/1] port trunk permit vlan all
```

Enable MVRP on GigabitEthernet 1/0/1.

```
[DeviceA-GigabitEthernet1/0/1] mvrp enable
[DeviceA-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, and configure it to permit VLAN 40.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] port link-type trunk
[DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 40
```

Enable MVRP on GigabitEthernet 1/0/2.

```
[DeviceA-GigabitEthernet1/0/2] mvrp enable
[DeviceA-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a trunk port, and configure it to permit all VLANs.

```
[DeviceA] interface gigabitethernet 1/0/3
[DeviceA-GigabitEthernet1/0/3] port link-type trunk
[DeviceA-GigabitEthernet1/0/3] port trunk permit vlan all
```

Enable MVRP on GigabitEthernet 1/0/3.

```
[DeviceA-GigabitEthernet1/0/3] mvrp enable
[DeviceA-GigabitEthernet1/0/3] quit
```

Create VLAN 10.

```
[DeviceA] vlan 10
[DeviceA-vlan10] quit
```

2. Configure Device B:

Enter MST region view.

```
<DeviceB> system-view
[DeviceB] stp region-configuration
```

Configure the MST region name, VLAN-to-instance mappings, and revision level.

```
[DeviceB-mst-region] region-name example
[DeviceB-mst-region] instance 1 vlan 10
[DeviceB-mst-region] instance 2 vlan 20
[DeviceB-mst-region] revision-level 0
```

Manually activate the MST region configuration.

```
[DeviceB-mst-region] active region-configuration
[DeviceB-mst-region] quit
```

Configure Device B as the primary root bridge of MSTI 2.

```
[DeviceB] stp instance 2 root primary
```

Globally enable the spanning tree feature.

```
[DeviceB] stp global enable
```

Globally enable MVRP.

```
[DeviceB] mvrp global enable
```

Configure GigabitEthernet 1/0/1 as a trunk port, and configure it to permit VLANs 20 and 40.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 20 40
```

Enable MVRP on GigabitEthernet 1/0/1.

```
[DeviceB-GigabitEthernet1/0/1] mvrp enable
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, and configure it to permit all VLANs.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan all
```

Enable MVRP on GigabitEthernet 1/0/2.

```
[DeviceB-GigabitEthernet1/0/2] mvrp enable
[DeviceB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a trunk port, and configure it to permit all VLANs.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] port link-type trunk
[DeviceB-GigabitEthernet1/0/3] port trunk permit vlan all
```

Enable MVRP on GigabitEthernet 1/0/3.

```
[DeviceB-GigabitEthernet1/0/3] mvrp enable
[DeviceB-GigabitEthernet1/0/3] quit
```

Create VLAN 20.

```
[DeviceB] vlan 20
[DeviceB-vlan20] quit
```

3. Configure Device C:

Enter MST region view.

```
<DeviceC> system-view
[DeviceC] stp region-configuration
```

Configure the MST region name, VLAN-to-instance mappings, and revision level.

```
[DeviceC-mst-region] region-name example
[DeviceC-mst-region] instance 1 vlan 10
[DeviceC-mst-region] instance 2 vlan 20
[DeviceC-mst-region] revision-level 0
```

Manually activate the MST region configuration.

```
[DeviceC-mst-region] active region-configuration
[DeviceC-mst-region] quit
```

Configure Device C as the root bridge of MSTI 0.

```
[DeviceC] stp instance 0 root primary
```

Globally enable the spanning tree feature.

```
[DeviceC] stp global enable
```

Globally enable MVRP.

```
[DeviceC] mvrp global enable
```

Configure GigabitEthernet 1/0/1 as a trunk port, and configure it to permit all VLANs.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] port link-type trunk
[DeviceC-GigabitEthernet1/0/1] port trunk permit vlan all
```

Enable MVRP on GigabitEthernet 1/0/1.

```
[DeviceC-GigabitEthernet1/0/1] mvrp enable
[DeviceC-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, and configure it to permit all VLANs.

```
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] port link-type trunk
```

```
[DeviceC-GigabitEthernet1/0/2] port trunk permit vlan all
```

Enable MVRP on GigabitEthernet 1/0/2.

```
[DeviceC-GigabitEthernet1/0/2] mvrp enable
[DeviceC-GigabitEthernet1/0/2] quit
```

4. Configure Device D:

Enter MST region view.

```
<DeviceD> system-view
[DeviceD] stp region-configuration
```

Configure the MST region name, VLAN-to-instance mappings, and revision level.

```
[DeviceD-mst-region] region-name example
[DeviceD-mst-region] instance 1 vlan 10
[DeviceD-mst-region] instance 2 vlan 20
[DeviceD-mst-region] revision-level 0
```

Manually activate the MST region configuration.

```
[DeviceD-mst-region] active region-configuration
[DeviceD-mst-region] quit
```

Globally enable the spanning tree feature.

```
[DeviceD] stp global enable
```

Globally enable MVRP.

```
[DeviceD] mvrp global enable
```

Configure GigabitEthernet 1/0/1 as a trunk port, and configure it to permit VLANs 20 and 40.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] port link-type trunk
[DeviceD-GigabitEthernet1/0/1] port trunk permit vlan 20 40
```

Enable MVRP on GigabitEthernet 1/0/1.

```
[DeviceD-GigabitEthernet1/0/1] mvrp enable
[DeviceD-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, and configure it to permit VLAN 40.

```
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] port link-type trunk
[DeviceD-GigabitEthernet1/0/2] port trunk permit vlan 40
```

Enable MVRP on GigabitEthernet 1/0/2.

```
[DeviceD-GigabitEthernet1/0/2] mvrp enable
[DeviceD-GigabitEthernet1/0/2] quit
```

Verifying the configuration

1. Verify the normal registration mode configuration.

Display local VLAN information on Device A.

```
[DeviceA] display mvrp running-status
 -------[MVRP Global Info]-------
 Global Status     : Enabled
 Compliance-GVRP   : False

 ----[GigabitEthernet1/0/1]----
 Config  Status                 : Enabled
 Running Status                 : Enabled

- GigabitEthernet 1/0/1 has registered VLAN 1, VLAN 10, and VLAN 20, declared VLAN 1, and propagated VLAN 1 and VLAN 10 through MVRP.
- GigabitEthernet 1/0/2 has registered VLAN 1 and VLAN 20, declared VLAN 1 and VLAN 10, and propagated VLAN 1 and VLAN 20 through MVRP.

Display local VLAN information on Device D.

```
[DeviceD] display mvrp running-status
 -------[MVRP Global Info]-------
```

```
Global Status     : Enabled
Compliance-GVRP   : False

----[GigabitEthernet1/0/1]----
Config  Status                 : Enabled
Running Status                 : Enabled
Join Timer                     : 20 (centiseconds)
Leave Timer                    : 60 (centiseconds)
Periodic Timer                 : 100 (centiseconds)
LeaveAll Timer                 : 1000 (centiseconds)
Registration Type              : Normal
Registered VLANs :
 1(default), 20
Declared VLANs :
 1(default)
Propagated VLANs :
 1(default), 20

----[GigabitEthernet1/0/2]----
Config  Status                 : Enabled
Running Status                 : Enabled
Join Timer                     : 20 (centiseconds)
Leave Timer                    : 60 (centiseconds)
Periodic Timer                 : 100 (centiseconds)
LeaveAll Timer                 : 1000 (centiseconds)
Registration Type              : Normal
Registered VLANs :
 1(default)
Declared  VLANs :
 None
Propagated VLANs :
 None
```

The output shows that the following events have occurred:

- GigabitEthernet 1/0/1 has registered and propagated VLAN 10 and VLAN 20, and declared VLAN 1 through MVRP.
- GigabitEthernet 1/0/2 has registered VLAN 1, and declared and propagated no VLANs through MVRP.

2. Verify the configuration after changing the registration mode.

When the network is stable, set the MVRP registration mode to **fixed** on the port of Device B connected to Device A. Then, verify that dynamic VLANs on the port will not be deregistered.

Set the MVRP registration mode to **fixed** on GigabitEthernet 1/0/3 of Device B.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] mvrp registration fixed
[DeviceB-GigabitEthernet1/0/3] quit
```

Display local MVRP VLAN information on GigabitEthernet 1/0/3.

```
[DeviceB] display mvrp running-status interface gigabitethernet 1/0/3
 -------[MVRP Global Info]-------
 Global Status     : Enabled
```

```
 Compliance-GVRP   : False

 ----[GigabitEthernet1/0/3]----
 Config  Status                 : Enabled
 Running Status                 : Enabled
 Join Timer                     : 20 (centiseconds)
 Leave Timer                    : 60 (centiseconds)
 Periodic Timer                 : 100 (centiseconds)
 LeaveAll Timer                 : 1000 (centiseconds)
 Registration Type              : Fixed
 Registered VLANs :
  1(default), 10
 Declared VLANs :
  20
 Propagated VLANs :
  10
```

The output shows that VLAN information on GigabitEthernet 1/0/3 is not changed after you set its MVRP registration mode to **fixed**.

Delete VLAN 10 on Device A.

```
[DeviceA] undo vlan 10
```

Display local MVRP VLAN information on GigabitEthernet 1/0/3 of Device B.

```
[DeviceB] display mvrp running-status interface gigabitethernet 1/0/3
 -------[MVRP Global Info]-------
 Global Status     : Enabled
 Compliance-GVRP   : False

 ----[GigabitEthernet1/0/3]----
 Config  Status                 : Enabled
 Running Status                 : Enabled
 Join Timer                     : 20 (centiseconds)
 Leave Timer                    : 60 (centiseconds)
 Periodic Timer                 : 100 (centiseconds)
 LeaveAll Timer                 : 1000 (centiseconds)
 Registration Type              : Fixed
 Registered VLANs :
  1(default), 10
 Declared VLANs :
  20
 Propagated VLANs :
  10
```

The output shows that dynamic VLAN information on GigabitEthernet 1/0/3 is not changed after you set its MVRP registration mode to **fixed**.

Contents

Configuring QinQ

This document uses the following terms:

- **CVLAN**—Customer network VLANs, also called inner VLANs, refer to VLANs that a customer uses on the private network.
- **SVLAN**—Service provider network VLANs, also called outer VLANs, refer to VLANs that a service provider uses to transmit VLAN tagged traffic for customers.

About QinQ

802.1Q-in-802.1Q (QinQ) adds an 802.1Q tag to 802.1Q tagged customer traffic. It enables a service provider to extend Layer 2 connections across an Ethernet network between customer sites.

QinQ benefits

QinQ provides the following benefits:

- Enables a service provider to use a single SVLAN to convey multiple CVLANs for a customer.
- Enables customers to plan CVLANs without conflicting with SVLANs.
- Enables customers to keep their VLAN assignment schemes unchanged when the service provider changes its VLAN assignment scheme.
- Allows different customers to use overlapping CVLAN IDs. Devices in the service provider network make forwarding decisions based on SVLAN IDs instead of CVLAN IDs.

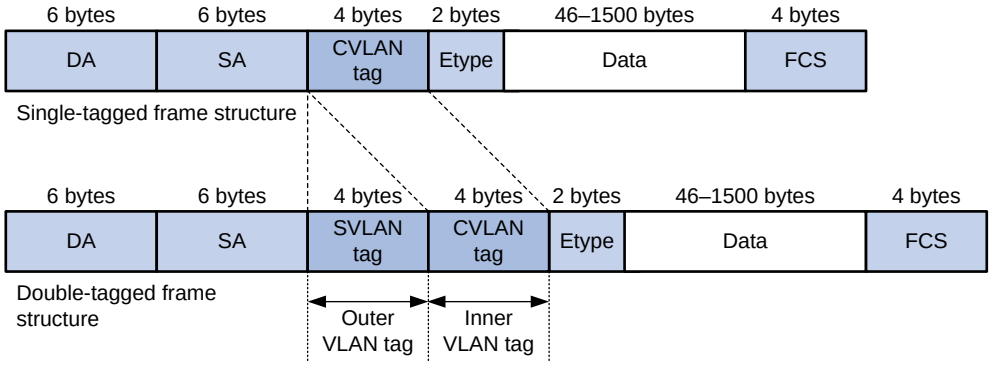
How QinQ works

As shown in Figure 1, a QinQ frame transmitted over the service provider network carries the following tags:

- **CVLAN tag**—Identifies the VLAN to which the frame belongs when it is transmitted in the customer network.
- **SVLAN tag**—Identifies the VLAN to which the QinQ frame belongs when it is transmitted in the service provider network. The service provider allocates the SVLAN tag to the customer.

The devices in the service provider network forward a tagged frame according to its SVLAN tag only. The CVLAN tag is transmitted as part of the frame's payload.

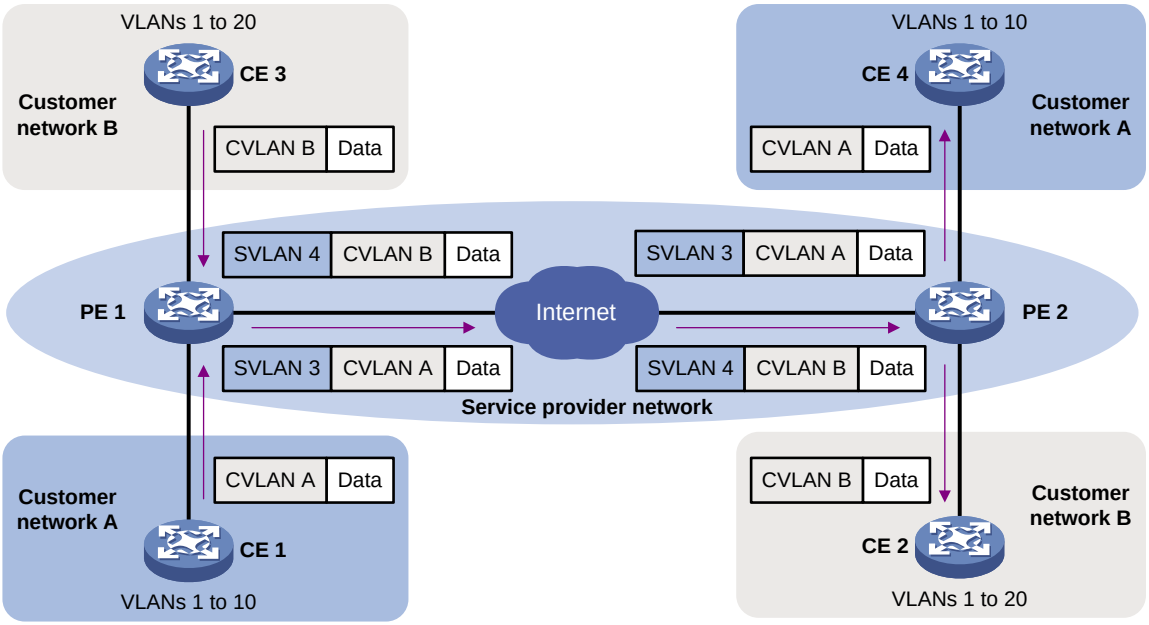
Figure 1 Single-tagged Ethernet frame header and double-tagged Ethernet frame header



As shown in Figure 2, customer A has remote sites CE 1 and CE 4. Customer B has remote sites CE 2 and CE 3. The CVLANs of the two customers overlap. The service provider assigns SVLANs 3 and 4 to customers A and B, respectively.

When a tagged Ethernet frame from CE 1 arrives at PE 1, the PE tags the frame with SVLAN 3. The double-tagged Ethernet frame travels over the service provider network until it arrives at PE 2. PE 2 removes the SVLAN tag of the frame, and then sends the frame to CE 4.

Figure 2 Typical QinQ application scenario



QinQ implementations

QinQ is enabled on a per-port basis. The link type of a QinQ-enabled port can be access, hybrid, or trunk. The QinQ tagging behaviors are the same across these types of ports.

A QinQ-enabled port tags all incoming frames (tagged or untagged) with the PVID tag.

- If an incoming frame already has one tag, it becomes a double-tagged frame.
- If the frame does not have any 802.1Q tags, it becomes a frame tagged with the PVID.

QinQ provides the most basic VLAN manipulation method to tag all incoming frames (tagged or untagged) with the PVID tag. To perform advanced VLAN manipulations, use VLAN mappings or QoS policies as follows:

- To add different SVLANs for different CVLAN tags, use one-to-two VLAN mappings.
- To use criteria other than the CVLAN ID to match packets for SVLAN tagging, use the QoS nest action. The QoS nest action can also be used with other actions in the same traffic behavior.

For more information about VLAN mappings, see "Configuring VLAN mapping." For more information about QoS, see *ACL and QoS Configuration Guide*.

Protocols and standards

- IEEE 802.1Q, *IEEE Standard for Local and Metropolitan Area Networks-Virtual Bridged Local Area Networks*
- IEEE 802.1ad, *IEEE Standard for Local and Metropolitan Area Networks-Virtual Bridged Local Area Networks-Amendment 4: Provider Bridges*

Restrictions: Hardware compatibility with QinQ

The S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series do not support QinQ.

Restrictions and guidelines: QinQ configuration

When you configure QinQ, follow these restrictions and guidelines:

- The inner 802.1Q tag of QinQ frames is treated as part of the payload. As a best practice to ensure correct transmission of QinQ frames, set the MTU to a minimum of 1504 bytes for each port on their forwarding path. This value is the sum of the default Ethernet interface MTU (1500 bytes) and the length (4 bytes) of a VLAN tag.
- You can use a VLAN mapping and QinQ on a port for VLAN tag manipulation. If their settings conflict, the VLAN mapping has higher priority.
- Do not enable QinQ and apply a QoS policy containing a nesting action on the same interface. Otherwise, QinQ or the QoS policy might not take effect.

Enabling QinQ

About enabling QinQ

Enable QinQ on customer-side ports of PEs. A QinQ-enabled port tags an incoming frame with its PVID.

Restrictions and guidelines

Before you enable or disable QinQ on a port, you must remove any VLAN mappings on the port. For more information about VLAN mapping, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.

   interface *interface-type interface-number*
3. Set the port link type.

   port link-type { **access** | **hybrid** | **trunk** }

   By default, the link type of a port is **access**.
4. Configure the port to allow packets from its PVID to pass through.
   - Assign the access port to the specified VLAN.

     port access vlan *vlan-id*

     By default, all access ports belong to VLAN 1.

     The PVID of an access port is the VLAN to which the port belongs. The port sends packets from the VLAN untagged.
   - Configure the hybrid port to send packets from its PVID untagged.

     port hybrid vlan *vlan-id-list* **untagged**

     By default, the hybrid port is an untagged member of the VLAN to which the port belongs when its link type is access.
   - Configure trunk port to allow packets from its PVID to pass through.

     port trunk permit vlan { *vlan-id-list* | **all** }

By default, a trunk port allows packets only from VLAN 1 to pass through.

5. Enable QinQ on the port.

   qinq enable

   By default, QinQ is disabled on the port.

Configuring transmission for transparent VLANs

About transparent VLAN

You can exclude a VLAN (for example, the management VLAN) from the QinQ tagging action on a customer-side port. This VLAN is called a transparent VLAN.

Restrictions and guidelines

- Do not configure any other VLAN manipulation actions for the transparent VLAN on the port.
- Make sure all ports on the traffic path permit the transparent VLAN to pass through.
- If you use both transparent VLANs and VLAN mappings on an interface, the transparent VLANs cannot be the following VLANs:
  - Original or translated VLANs of one-to-one, one-to-two, and many-to-one VLAN mappings.
  - Original or translated outer VLANs of two-to-two VLAN mappings.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.

   interface *interface-type interface-number*

3. Set the port link type.

   port link-type { **hybrid** | **trunk** }

   By default, the link type of a port is **access**.

4. Configure the port to allow packets from the transparent VLANs to pass through.
   - Configure the hybrid port to allow packets from the transparent VLANs to pass through.

     port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }

     By default, a hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.
   - Configure the trunk port to allow packets from the transparent VLANs to pass through.

     port trunk permit vlan { *vlan-id-list* | **all** }

     By default, a trunk port allows packets only from VLAN 1 to pass through.

5. Specify transparent VLANs for the port.

   qinq transparent-vlan *vlan-id-list*

   By default, transparent transmission is not configured for any VLANs.

Configuring the TPID for VLAN tags

About TPID

TPID identifies a frame as an 802.1Q tagged frame. The TPID value varies by vendor. On an H3C device, the TPID in the 802.1Q tag added on a QinQ-enabled port is 0x8100 by default, in

compliance with IEEE 802.1Q. In a multi-vendor network, make sure the TPID setting is the same between directly connected devices so 802.1Q tagged frames can be identified correctly.

TPID settings include CVLAN TPID and SVLAN TPID.

A QinQ-enabled port uses the CVLAN TPID to match incoming tagged frames. An incoming frame is handled as untagged if its TPID is different from the CVLAN TPID.

SVLAN TPIDs are configurable on a per-port basis. A service provider-side port uses the SVLAN TPID to replace the TPID in outgoing frames' SVLAN tags and match incoming tagged frames. An incoming frame is handled as untagged if the TPID in its outer VLAN tag is different from the SVLAN TPID.

For example, a PE device is connected to a customer device that uses the TPID 0x8200 and to a provider device that uses the TPID 0x9100. For correct packet processing, you must set the CVLAN TPID and SVLAN TPID to 0x8200 and 0x9100 on the PE, respectively.

The TPID field is at the same position as the EtherType field in an untagged Ethernet frame. To ensure correct packet type identification, do not set the TPID value to any of the values listed in Table 1.

Table 1 Reserved EtherType values

Protocol type	Value
ARP	0x0806
PUP	0x0200
RARP	0x8035
IP	0x0800
IPv6	0x86dd
PPPoE	0x8863/0x8864
MPLS	0x8847/0x8848
IPX/SPX	0x8137
IS-IS	0x8000
LACP	0x8809
LLDP	0x88cc
802.1X	0x888e
802.1ag	0x8902
Cluster	0x88a7
Reserved	0xfffd/0xfffe/0xffff

Restrictions and guidelines

The TPID value in CVLAN tags is typically configured on PEs. The TPID value in SVLAN tags is typically configured on the service provider-side ports of PEs.

Configuring the TPID for CVLAN tags

1. Enter system view.
   ```
   system-view
   ```
2. Set the TPID for CVLAN tags.

qinq ethernet-type customer-tag *hex-value*

By default, the TPID is 0x8100 for CVLAN tags.

Configuring the TPID for SVLAN tags

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
3. Set the TPID for SVLAN tags.
   qinq ethernet-type service-tag *hex-value*
   By default, the TPID is 0x8100 for SVLAN tags.

Display and maintenance commands for QinQ

Execute **display** commands in any view.

Task	Command
Display QinQ-enabled ports.	**display qinq** [**interface** *interface-type interface-number*]

QinQ configuration examples

Example: Configuring basic QinQ

Network configuration

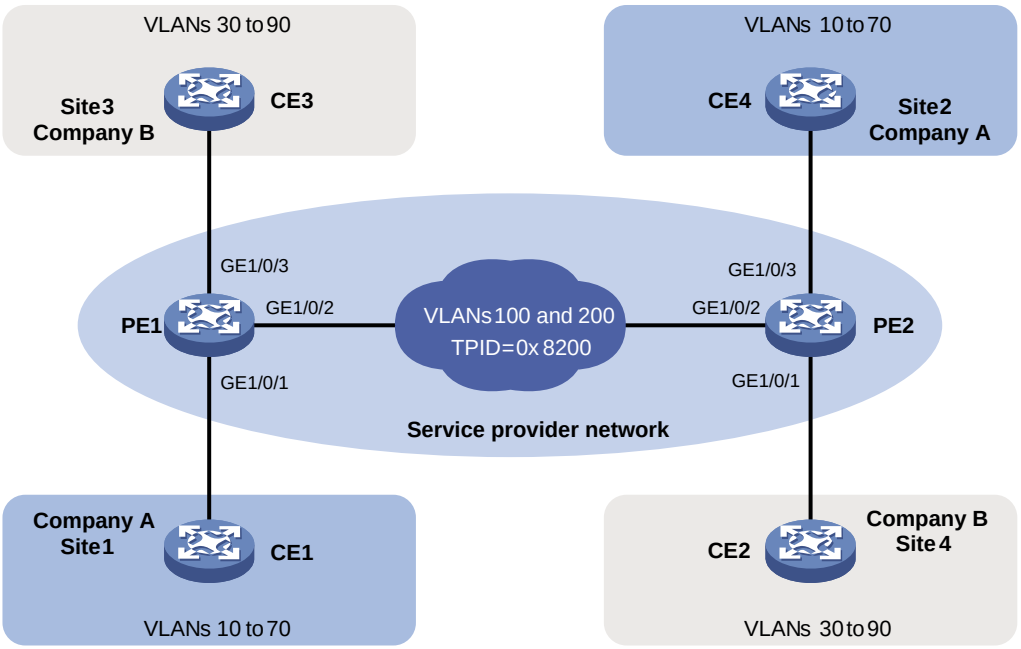
As shown in Figure 3:

- The service provider assigns VLAN 100 to Company A's VLANs 10 through 70.
- The service provider assigns VLAN 200 to Company B's VLANs 30 through 90.
- The devices between PE 1 and PE 2 in the service provider network use a TPID value of 0x8200.

Configure QinQ on PE 1 and PE 2 to transmit traffic in VLANs 100 and 200 for Company A and Company B, respectively.

For the QinQ frames to be identified correctly, set the SVLAN TPID to 0x8200 on the service provider-side ports of PE 1 and PE 2.

Figure 3 Network diagram



Procedure

1. Configure PE 1:

Configure GigabitEthernet 1/0/1 as a trunk port, and assign it to VLAN 100.

```
<PE1> system-view
[PE1] interface gigabitethernet 1/0/1
[PE1-GigabitEthernet1/0/1] port link-type trunk
[PE1-GigabitEthernet1/0/1] port trunk permit vlan 100
```

Set the PVID of GigabitEthernet 1/0/1 to VLAN 100.

```
[PE1-GigabitEthernet1/0/1] port trunk pvid vlan 100
```

Enable QinQ on GigabitEthernet 1/0/1.

```
[PE1-GigabitEthernet1/0/1] qinq enable
[PE1-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, and assign it to VLANs 100 and 200.

```
[PE1] interface gigabitethernet 1/0/2
[PE1-GigabitEthernet1/0/2] port link-type trunk
[PE1-GigabitEthernet1/0/2] port trunk permit vlan 100 200
```

Set the TPID value in the SVLAN tags to 0x8200 on GigabitEthernet 1/0/2.

```
[PE1-GigabitEthernet1/0/2] qinq ethernet-type service-tag 8200
[PE1-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a trunk port, and assign it to VLAN 200.

```
[PE1] interface gigabitethernet 1/0/3
[PE1-GigabitEthernet1/0/3] port link-type trunk
[PE1-GigabitEthernet1/0/3] port trunk permit vlan 200
```

Set the PVID of GigabitEthernet 1/0/3 to VLAN 200.

```
[PE1-GigabitEthernet1/0/3] port trunk pvid vlan 200
```

Enable QinQ on GigabitEthernet 1/0/3.

```
[PE1-GigabitEthernet1/0/3] qinq enable
```

```
[PE1-GigabitEthernet1/0/3] quit
```

2. Configure PE 2:

   # Configure GigabitEthernet 1/0/1 as a trunk port, and assign it to VLAN 200.

```
<PE2> system-view
[PE2] interface gigabitethernet 1/0/1
[PE2-GigabitEthernet1/0/1] port link-type trunk
[PE2-GigabitEthernet1/0/1] port trunk permit vlan 200
```

   # Set the PVID of GigabitEthernet 1/0/1 to VLAN 200.

```
[PE2-GigabitEthernet1/0/1] port trunk pvid vlan 200
```

   # Enable QinQ on GigabitEthernet 1/0/1.

```
[PE2-GigabitEthernet1/0/1] qinq enable
[PE2-GigabitEthernet1/0/1] quit
```

   # Configure GigabitEthernet 1/0/2 as a trunk port, and assign it to VLANs 100 and 200.

```
[PE2] interface gigabitethernet 1/0/2
[PE2-GigabitEthernet1/0/2] port link-type trunk
[PE2-GigabitEthernet1/0/2] port trunk permit vlan 100 200
```

   # Set the TPID value in the SVLAN tags to 0x8200 on GigabitEthernet 1/0/2.

```
[PE2-GigabitEthernet1/0/2] qinq ethernet-type service-tag 8200
[PE2-GigabitEthernet1/0/2] quit
```

   # Configure GigabitEthernet 1/0/3 as a trunk port, and assign it to VLAN 100.

```
[PE2] interface gigabitethernet 1/0/3
[PE2-GigabitEthernet1/0/3] port link-type trunk
[PE2-GigabitEthernet1/0/3] port trunk permit vlan 100
```

   # Set the PVID of GigabitEthernet 1/0/3 to VLAN 100.

```
[PE2-GigabitEthernet1/0/3] port trunk pvid vlan 100
```

   # Enable QinQ on GigabitEthernet 1/0/3.

```
[PE2-GigabitEthernet1/0/3] qinq enable
[PE2-GigabitEthernet1/0/3] quit
```

3. Configure the devices between PE 1 and PE 2:

   # Set the MTU to a minimum of 1504 bytes for each port on the path of QinQ frames. (Details not shown.)

   # Configure all ports on the forwarding path to allow frames from VLANs 100 and 200 to pass through without removing the VLAN tag. (Details not shown.)

Example: Configuring VLAN transparent transmission

Network configuration

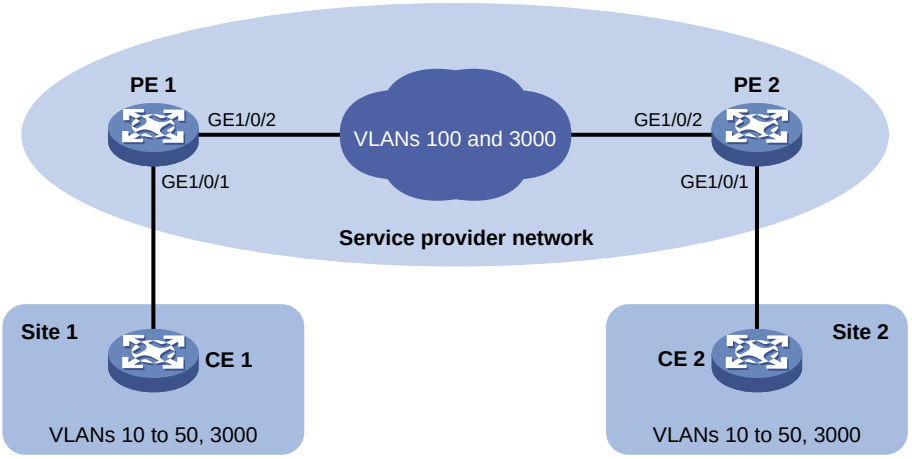
As shown in Figure 4:

- The service provider assigns VLAN 100 to a company's VLANs 10 through 50.
- VLAN 3000 is the dedicated VLAN of the company on the service provider network.

Configure QinQ on PE 1 and PE 2 to provide Layer 2 connectivity for CVLANs 10 through 50 over the service provider network.

Configure VLAN transparent transmission for VLAN 3000 on PE 1 and PE 2 to enable the hosts in VLAN 3000 to communicate without using an SVLAN.

Figure 4 Network diagram



Procedure

1. Configure PE 1:

Configure GigabitEthernet 1/0/1 as a trunk port, and assign it to VLAN 100 and VLAN 3000.

```
<PE1> system-view
[PE1] interface gigabitethernet 1/0/1
[PE1-GigabitEthernet1/0/1] port link-type trunk
[PE1-GigabitEthernet1/0/1] port trunk permit vlan 100 3000
```

Set the PVID of GigabitEthernet 1/0/1 to VLAN 100.

```
[PE1-GigabitEthernet1/0/1] port trunk pvid vlan 100
```

Enable QinQ on GigabitEthernet 1/0/1.

```
[PE1-GigabitEthernet1/0/1] qinq enable
```

Enable transparent transmission for VLAN 3000 on GigabitEthernet 1/0/1.

```
[PE1-GigabitEthernet1/0/1] qinq transparent-vlan 3000
[PE1-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, and assign it to VLANs 100 and 3000.

```
[PE1] interface gigabitethernet 1/0/2
[PE1-GigabitEthernet1/0/2] port link-type trunk
[PE1-GigabitEthernet1/0/2] port trunk permit vlan 100 3000
[PE1-GigabitEthernet1/0/2] quit
```

2. Configure PE 2:

Configure GigabitEthernet 1/0/1 as a trunk port, and assign it to VLAN 100 and VLAN 3000.

```
<PE2> system-view
[PE2] interface gigabitethernet 1/0/1
[PE2-GigabitEthernet1/0/1] port link-type trunk
[PE2-GigabitEthernet1/0/1] port trunk permit vlan 100 3000
```

Set the PVID of GigabitEthernet 1/0/1 to VLAN 100.

```
[PE1-GigabitEthernet1/0/1] port trunk pvid vlan 100
```

Enable QinQ on GigabitEthernet 1/0/1.

```
[PE2-GigabitEthernet1/0/1] qinq enable
```

Enable transparent transmission for VLAN 3000 on GigabitEthernet 1/0/1.

```
[PE2-GigabitEthernet1/0/1] qinq transparent-vlan 3000
[PE2-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, and assign it to VLANs 100 and 3000.

```
[PE2] interface gigabitethernet 1/0/2
[PE2-GigabitEthernet1/0/2] port link-type trunk
[PE2-GigabitEthernet1/0/2] port trunk permit vlan 100 3000
```

3. Configure the devices between PE 1 and PE 2:

Set the MTU to a minimum of 1504 bytes for each port on the path of QinQ frames. (Details not shown.)

Configure all ports on the forwarding path to allow frames from VLANs 100 and 3000 to pass through without removing the VLAN tag. (Details not shown.)

Contents

Configuring VLAN mapping

About VLAN mapping

VLAN mapping re-marks VLAN traffic with new VLAN IDs.

VLAN mapping types

H3C provides the following types of VLAN mapping:

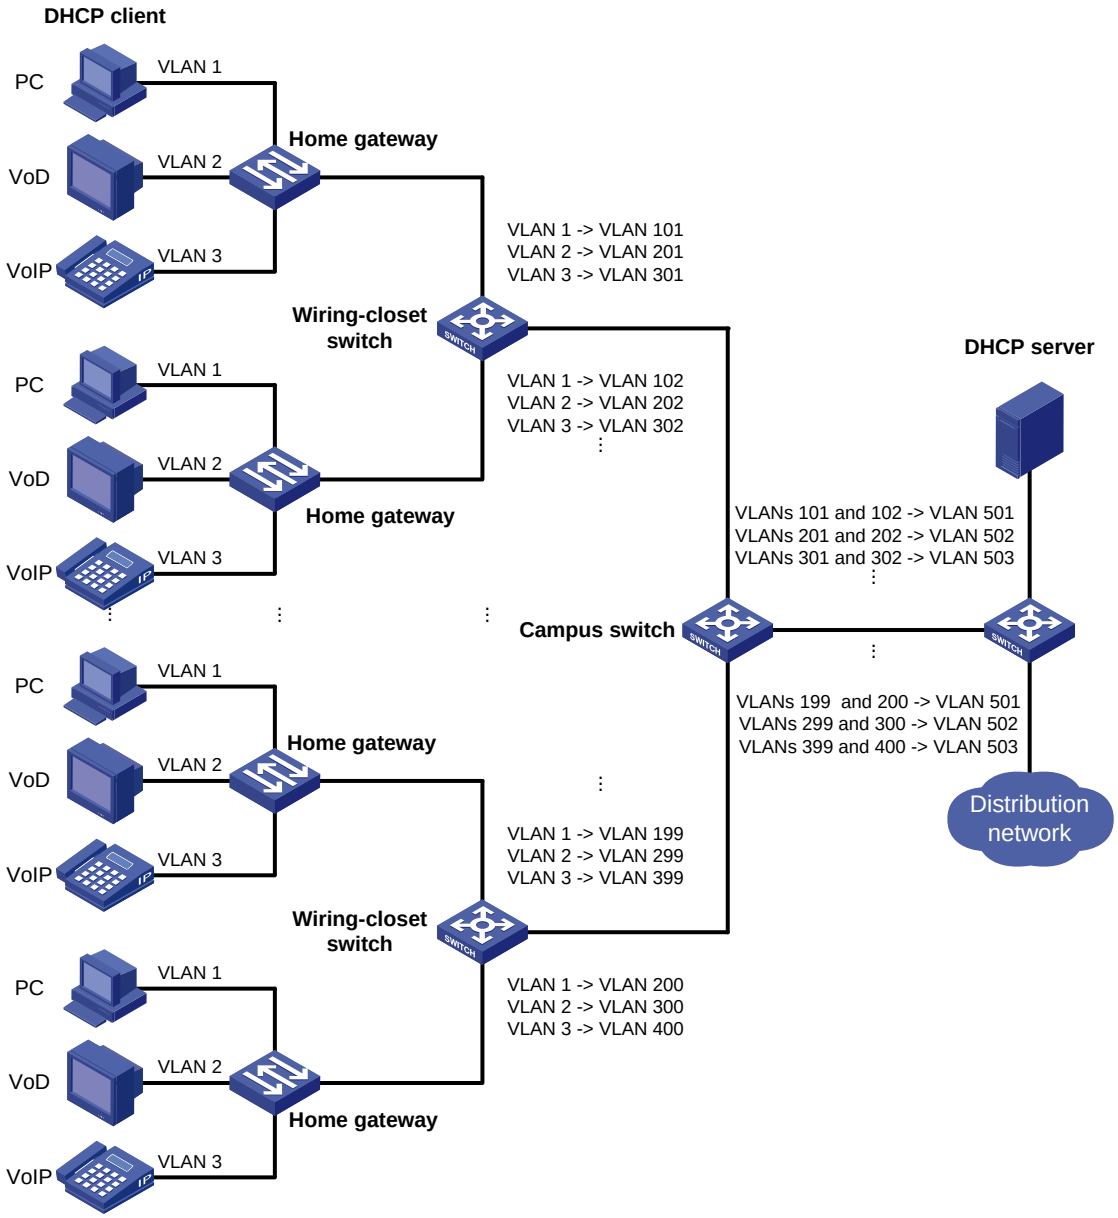
- **One-to-one VLAN mapping**—Replaces one VLAN tag with another.
- **Many-to-one VLAN mapping**—Replaces multiple VLAN tags with the same VLAN tag.
- **One-to-two VLAN mapping**—Tags single-tagged packets with an outer VLAN tag.

VLAN mapping application scenarios

One-to-one and many-to-one VLAN mapping

One-to-one and many-to-one VLAN mapping are typically used by a community for broadband Internet access, as shown in Figure 1.

Figure 1 Application scenario of one-to-one and many-to-one VLAN mapping



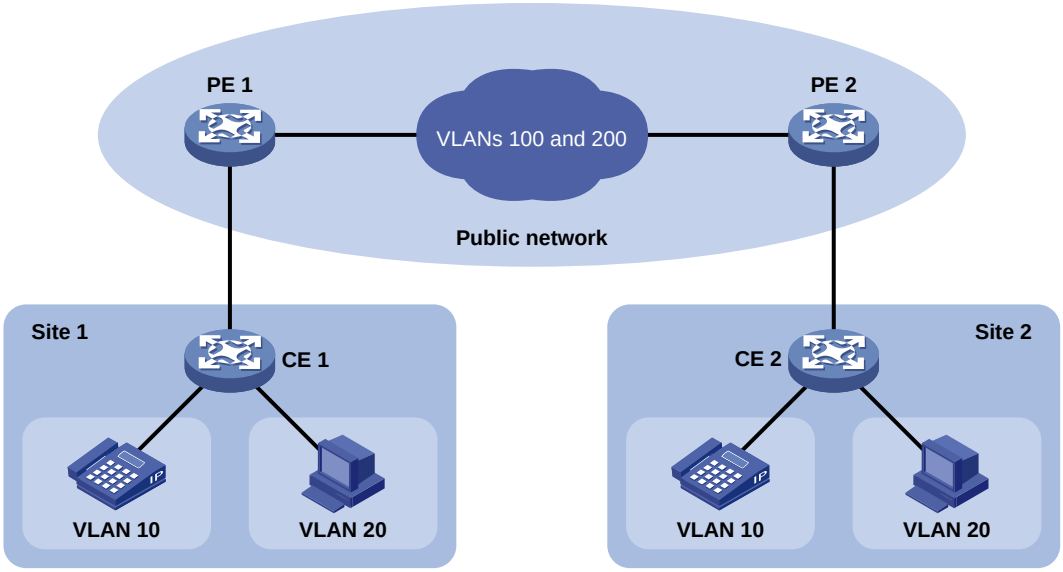
As shown in Figure 1, the network is implemented as follows:

- Each home gateway uses different VLANs to transmit the PC, VoD, and VoIP services.
- To further subclassify each type of traffic by customer, configure one-to-one VLAN mapping on the wiring-closet switches. This feature assigns a separate VLAN to each type of traffic from each customer. The required total number of VLANs in the network can be very large.
- To prevent the maximum number of VLANs from being exceeded on the distribution layer device, configure many-to-one VLAN mapping on the campus switch. This feature assigns the same VLAN to the same type of traffic from different customers.

One-to-two VLAN mapping

As shown in Figure 2, one-to-two VLAN mapping is used to transmit different types of CVLAN packets with different SVLAN tags over the service provider network.

Figure 2 Application scenario of one-to-two VLAN mapping



As shown in Figure 2, users of Site 1 and Site 2 are in VLAN 10 and VLAN 20. The service provider assigns VLAN 100 and VLAN 200 to the customer network. When packets from Site 1 arrive at PE 1, PE 1 adds an SVLAN tag to the packets based on the packet type.

One-to-two VLAN mapping enables the customer to plan CVLANs without conflicting with SVLANs. The service provider can distinguish traffic of the customer network with different SVLANs, and apply transmission policies to the customer traffic.

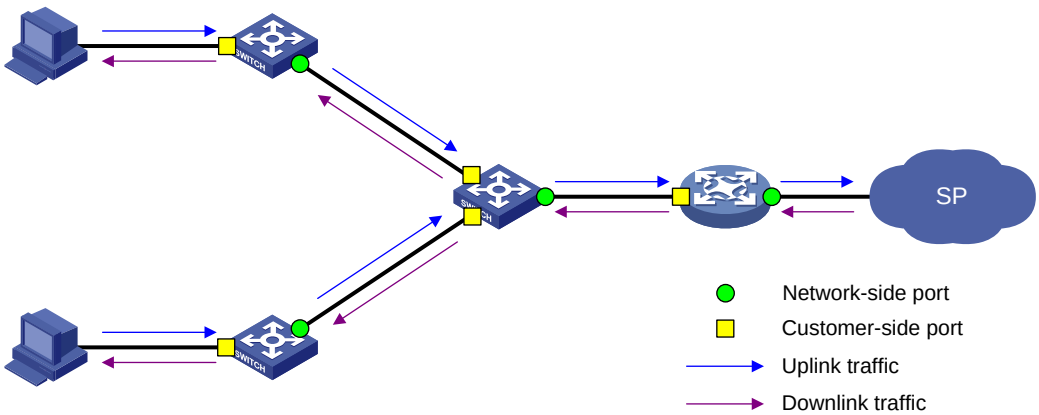
VLAN mapping implementations

Figure 3 shows a simplified network that illustrates basic VLAN mapping terms.

Basic VLAN mapping terms include the following:

- **Uplink traffic**—Traffic transmitted from the customer network to the service provider network.
- **Downlink traffic**—Traffic transmitted from the service provider network to the customer network.
- **Network-side port**—A port connected to or closer to the service provider network.
- **Customer-side port**—A port connected to or closer to the customer network.

Figure 3 Basic VLAN mapping terms

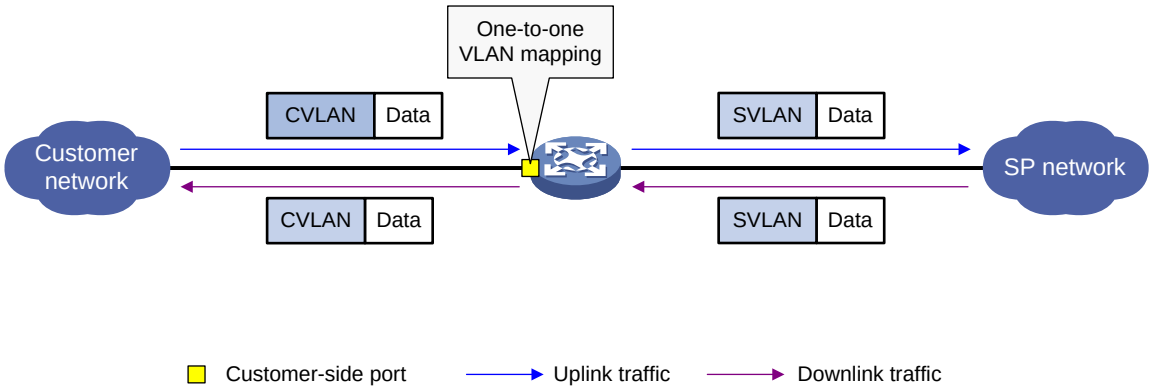


One-to-one VLAN mapping

As shown in Figure 4, one-to-one VLAN mapping is implemented on the customer-side port and replaces VLAN tags as follows:

- Replaces the CVLAN with the SVLAN for the uplink traffic.
- Replaces the SVLAN with the CVLAN for the downlink traffic.

Figure 4 One-to-one VLAN mapping implementation



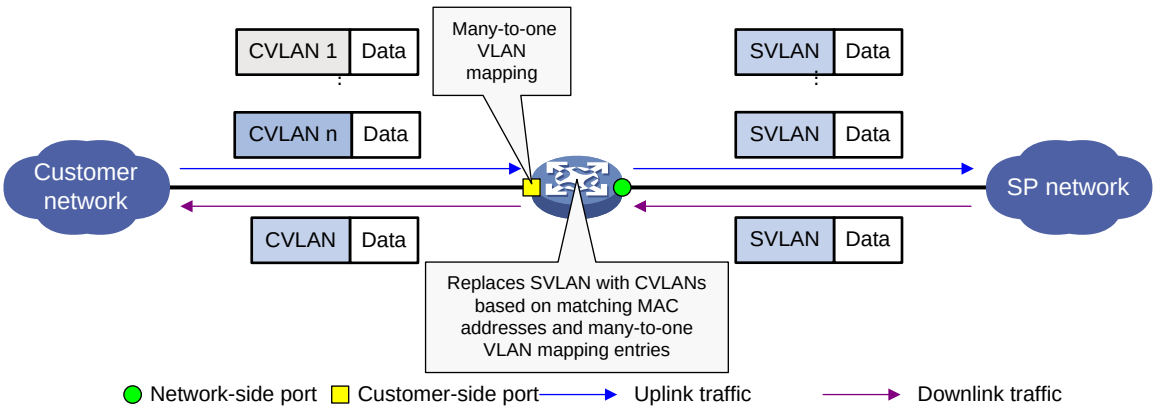
Many-to-one VLAN mapping

As shown in Figure 5, many-to-one VLAN mapping is implemented on both the customer-side and network-side ports, as follows:

- For the uplink traffic, the customer-side many-to-one VLAN mapping replaces multiple CVLANs with the same SVLAN.
- For the downlink traffic, the device performs the following operations:
  - **a.** Searches the MAC address table for an entry that matches the destination MAC address of the downlink packets.
  - **b.** Replaces the SVLAN tag with a CVLAN tag based on the matching many-to-one mapping entry.

For more information about the MAC address table, see "Configuring the MAC address table."

Figure 5 Many-to-one VLAN mapping implementation



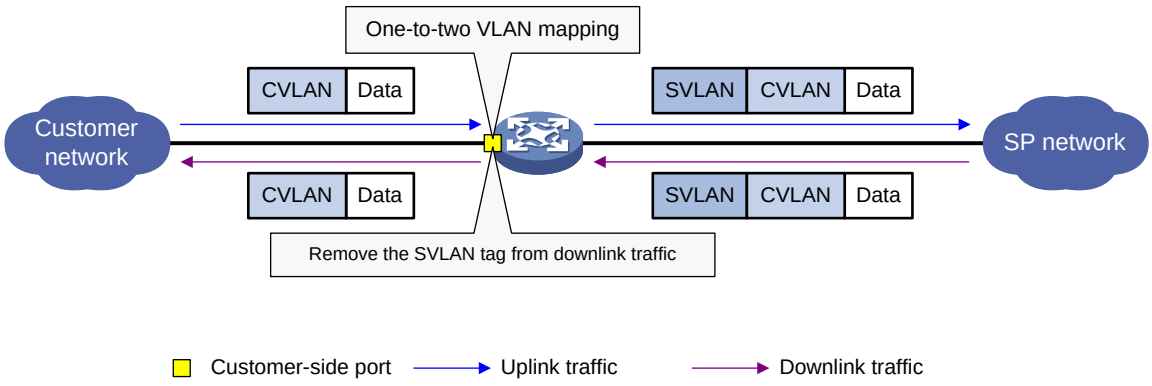
One-to-two VLAN mapping

As shown in Figure 6, one-to-two VLAN mapping is implemented on the customer-side port to add the SVLAN tag for the uplink traffic.

For the downlink traffic to be correctly sent to the customer network, make sure the SVLAN tag is removed on the customer-side port before transmission. Use one of the following methods to remove the SVLAN tag from the downlink traffic:

- Configure the customer-side port as a hybrid port and assign the port to the SVLAN as an untagged member.
- Configure the customer-side port as a trunk port and set the port PVID to the SVLAN.

Figure 6 One-to-two VLAN mapping implementation



Restrictions and guidelines: VLAN mapping configuration

To add VLAN tags to packets, you can configure both VLAN mapping and QinQ. VLAN mapping takes effect if a configuration conflict occurs. For more information about QinQ, see "Configuring QinQ."

To add or replace VLAN tags for packets, you can configure both VLAN mapping and a QoS policy. VLAN mapping takes effect if a configuration conflict occurs. For information about QoS policies, see *ACL and QoS Configuration Guide*.

VLAN mapping tasks at a glance

Use different VLAN mapping methods on the devices depending on their role and placement on the network.

To configure VLAN mapping, perform the following tasks:

- Configuring one-to-one VLAN mapping

  Configure one-to-one VLAN mapping on the wiring-closet switch, as shown in Figure 1.
- Configuring many-to-one VLAN mapping

  Configure many-to-one VLAN mapping on the campus switch, as shown in Figure 1.
- Configuring one-to-two VLAN mapping

  Configure one-to-two VLAN mapping on PE 1 and PE 4, as shown in Figure 2, through which traffic from customer networks enters the service provider networks.

Prerequisites

Before you configure VLAN mapping, create original and translated VLANs.

Configuring one-to-one VLAN mapping

About one-to-one VLAN mapping

Configure one-to-one VLAN mapping on the customer-side ports of wiring-closet switches (see Figure 1) to isolate traffic of the same service type from different homes.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the link type of the port.
   port link-type { **hybrid** | **trunk** }
   By default, the link type of a port is **access**.
4. Assign the port to the original VLAN and the translated VLAN.
   - Assign the trunk port to the original VLAN and the translated VLAN.
     port trunk permit vlan *vlan-id-list*
     By default, a trunk port is assigned to VLAN 1.
   - Assign the hybrid port to the original VLAN and the translated VLAN as a tagged member.
     port hybrid vlan *vlan-id-list* **tagged**
     By default, a hybrid port is an untagged member of the VLAN to which the port belongs when its link type is access.
5. Configure a one-to-one VLAN mapping.
   vlan mapping *vlan-id* **translated-vlan** *vlan-id*
   By default, no VLAN mapping is configured on an interface.

Configuring many-to-one VLAN mapping

About many-to-one VLAN mapping

To conserve VLAN resources, configure many-to-one VLAN mapping on campus switches (see Figure 1) to transmit the same type of traffic from different users in one VLAN.

Feature and software version compatibility

This feature is supported only in R6350 and higher versions.

Restrictions and guidelines for many-to-one VLAN mapping

To ensure correct traffic forwarding from the service provider network to the customer network, do not configure many-to-one VLAN mappings together with the following features:

- Disabling MAC address learning.
- Setting the MAC learning limit.

For more information about MAC address learning, see "Configuring the MAC address table."

To establish network connectivity successfully in a many-to-one VLAN mapping environment, make sure ARP requests are sent from the customer side to trigger connection to the network side.

Many-to-one VLAN mapping tasks at a glance

1. Configuring the customer-side port
2. Configuring the network-side port

Configuring the customer-side port

1. Enter system view.

   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Set the link type of the port to hybrid or trunk.

   port link-type { **hybrid** | **trunk** }

   By default, the link type of a port is **access**.
4. Assign the port to the original VLANs.
   - Assign the trunk port to the original VLANs.

     port trunk permit vlan *vlan-id-list*

     By default, a trunk port is assigned to VLAN 1.
   - Assign the hybrid port to the original VLANs as a tagged member.

     port hybrid vlan *vlan-id-list* **tagged**

     By default, a hybrid port is an untagged member of the VLAN to which the port belonged when its link type was access.
5. Configure a many-to-one VLAN mapping.

   vlan mapping uni { **range** *vlan-range-list* | **single** *vlan-id-list* } **translated-vlan** *vlan-id*

   By default, no VLAN mapping is configured on an interface.

Configuring the network-side port

1. Enter system view.

   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Set the link type of the port to hybrid or trunk.

   port link-type { **hybrid** | **trunk** }

   By default, the link type of a port is **access**.
4. Assign the port to the translated VLAN.
   - Assign the trunk port to the translated VLAN.

     port trunk permit vlan *vlan-id-list*

     By default, a trunk port is assigned to VLAN 1.
   - Assign the hybrid port to the translated VLAN as a tagged member.

     port hybrid vlan *vlan-id-list* **tagged**

By default, a hybrid port is an untagged member of the VLAN to which the port belonged when its link type was access.

Configuring one-to-two VLAN mapping

About one-to-two VLAN mapping

Configure one-to-two VLAN mapping on the customer-side ports of edge devices from which customer traffic enters SP networks, for example, on PEs 1 and 4 in Figure 2. One-to-two VLAN mapping enables the edge devices to add an SVLAN tag to each incoming packet.

Restrictions and guidelines

Only one SVLAN tag can be added to packets from the same CVLAN. To add different SVLAN tags to different CVLAN packets on a port, set the port link type to hybrid and configure multiple one-to-two VLAN mappings.

The MTU of an interface is 1500 bytes by default. After a VLAN tag is added to a packet, the packet length is added by 4 bytes. As a best practice, set the MTU to a minimum of 1504 bytes for ports on the forwarding path of the packet in the service provider network.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the link type of the port.
   port link-type { **hybrid** | **trunk** }
   By default, the link type of a port is **access**.
4. Configure the port to allow packets from the SVLAN to pass through untagged.
   - Configure the SVLAN as the PVID of the trunk port and assign the trunk port to the SVLAN.
     port trunk pvid vlan *vlan-id*
     port trunk permit vlan { *vlan-id-list* | **all** }
   - Assign the hybrid port to the SVLAN as an untagged member.
     port hybrid vlan *vlan-id-list* **untagged**
5. Configure a one-to-two VLAN mapping.
   vlan mapping nest { **range** *vlan-range-list* | **single** *vlan-id-list* } **nested-vlan** *vlan-id*
   By default, no VLAN mapping is configured on an interface.

Display and maintenance commands for VLAN mapping

Execute **display** commands in any view.

Task	Command
Display VLAN mapping information.	**display vlan mapping** [**interface** *interface-type interface-number*]

VLAN mapping configuration examples

Example: Configuring one-to-one VLAN mapping

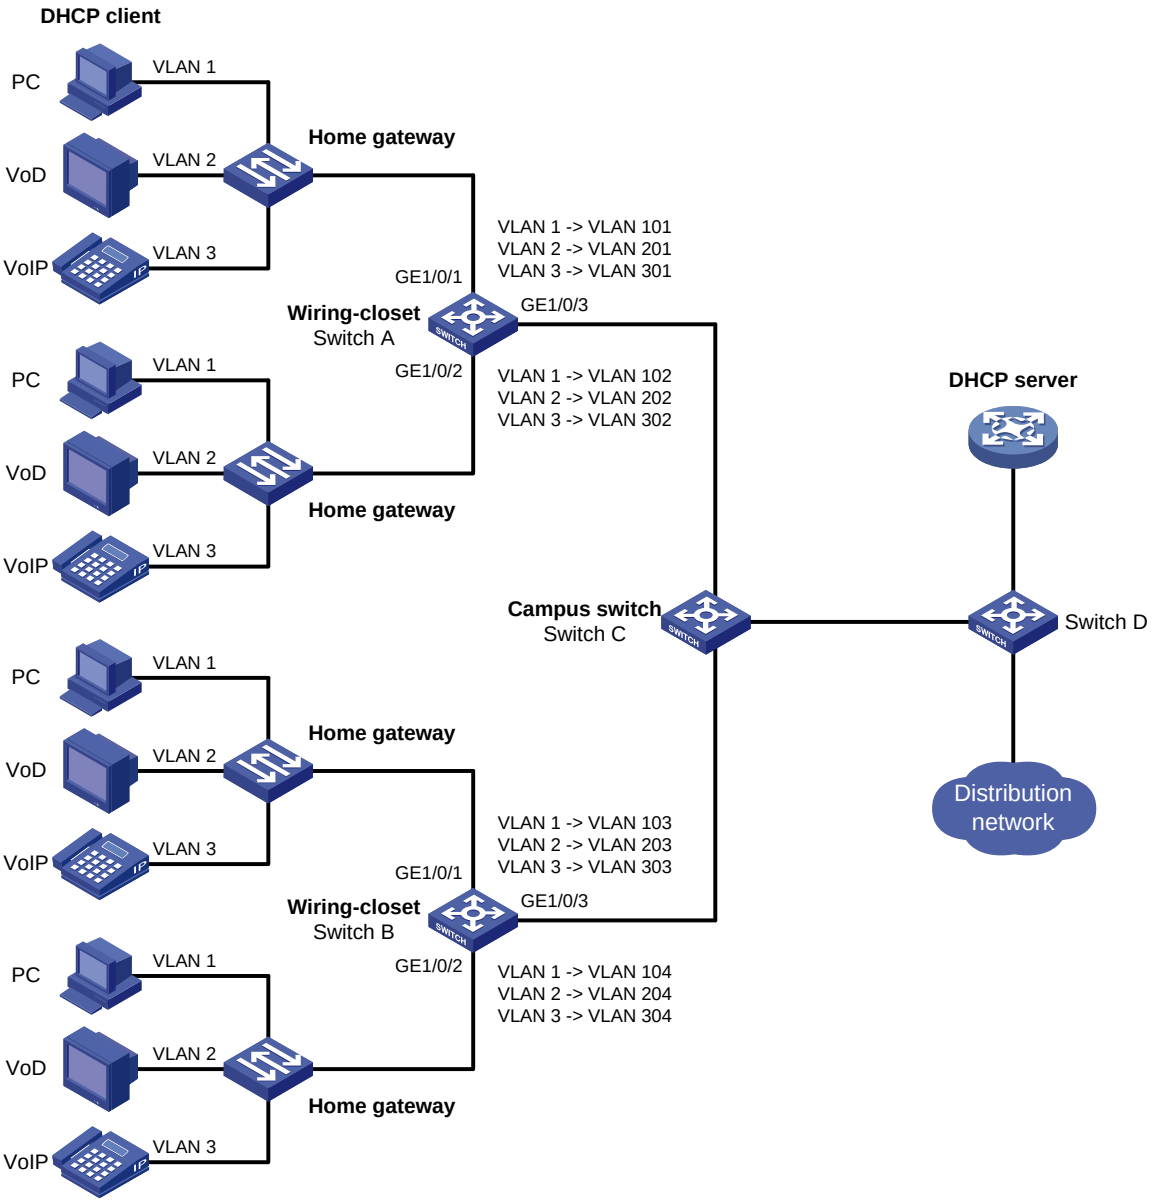
Network configuration

As shown in Figure 7:

- Each household subscribes to PC, VoD, and VoIP services.
- On the home gateways, VLANs 1, 2, and 3 are assigned to PC, VoD, and VoIP traffic, respectively.

To isolate traffic of the same service type from different households, configure one-to-one VLAN mappings on the wiring-closet switches. This feature assigns one VLAN to each type of traffic from each household.

Figure 7 Network diagram



Procedure

1. Configure Switch A:

   # Create the original VLANs.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 2 to 3
   ```

   # Create the translated VLANs.

   ```
   [SwitchA] vlan 101 to 102
   [SwitchA] vlan 201 to 202
   [SwitchA] vlan 301 to 302
   ```

   # Configure customer-side port GigabitEthernet 1/0/1 as a trunk port.

   ```
   <SwitchA> system-view
   [SwitchA] interface gigabitethernet 1/0/1
   [SwitchA-GigabitEthernet1/0/1] port link-type trunk
   ```

   # Assign GigabitEthernet 1/0/1 to all original VLANs and translated VLANs.

```
[SwitchA-GigabitEthernet1/0/1] port trunk permit vlan 1 2 3 101 201 301
```

Configure one-to-one VLAN mappings on GigabitEthernet 1/0/1 to map VLANs 1, 2, and 3 to VLANs 101, 201, and 301, respectively.

```
[SwitchA-GigabitEthernet1/0/1] vlan mapping 1 translated-vlan 101
[SwitchA-GigabitEthernet1/0/1] vlan mapping 2 translated-vlan 201
[SwitchA-GigabitEthernet1/0/1] vlan mapping 3 translated-vlan 301
[SwitchA-GigabitEthernet1/0/1] quit
```

Configure customer-side port GigabitEthernet 1/0/2 as a trunk port.

```
[SwitchA] interface gigabitethernet 1/0/2
[SwitchA-GigabitEthernet1/0/2] port link-type trunk
```

Assign GigabitEthernet 1/0/2 to all original VLANs and translated VLANs.

```
[SwitchA-GigabitEthernet1/0/2] port trunk permit vlan 1 2 3 102 202 302
```

Configure one-to-one VLAN mappings on GigabitEthernet 1/0/2 to map VLANs 1, 2, and 3 to VLANs 102, 202, and 302, respectively.

```
[SwitchA-GigabitEthernet1/0/2] vlan mapping 1 translated-vlan 102
[SwitchA-GigabitEthernet1/0/2] vlan mapping 2 translated-vlan 202
[SwitchA-GigabitEthernet1/0/2] vlan mapping 3 translated-vlan 302
[SwitchA-GigabitEthernet1/0/2] quit
```

Configure the network-side port (GigabitEthernet 1/0/3) as a trunk port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] port link-type trunk
```

Assign GigabitEthernet 1/0/3 to the translated VLANs.

```
[SwitchA-GigabitEthernet1/0/3] port trunk permit vlan 101 201 301 102 202 302
[SwitchA-GigabitEthernet1/0/3] quit
```

2. Configure Switch B in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Verify VLAN mapping information on the wiring-closet switches, for example, Switch A.

```
[SwitchA] display vlan mapping
Interface GigabitEthernet1/0/1:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  1             N/A           101                      N/A
  2             N/A           201                      N/A
  3             N/A           301                      N/A
Interface GigabitEthernet1/0/2:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  1             N/A           102                      N/A
  2             N/A           202                      N/A
  3             N/A           302                      N/A
```

Example: Configuring many-to-one VLAN mapping

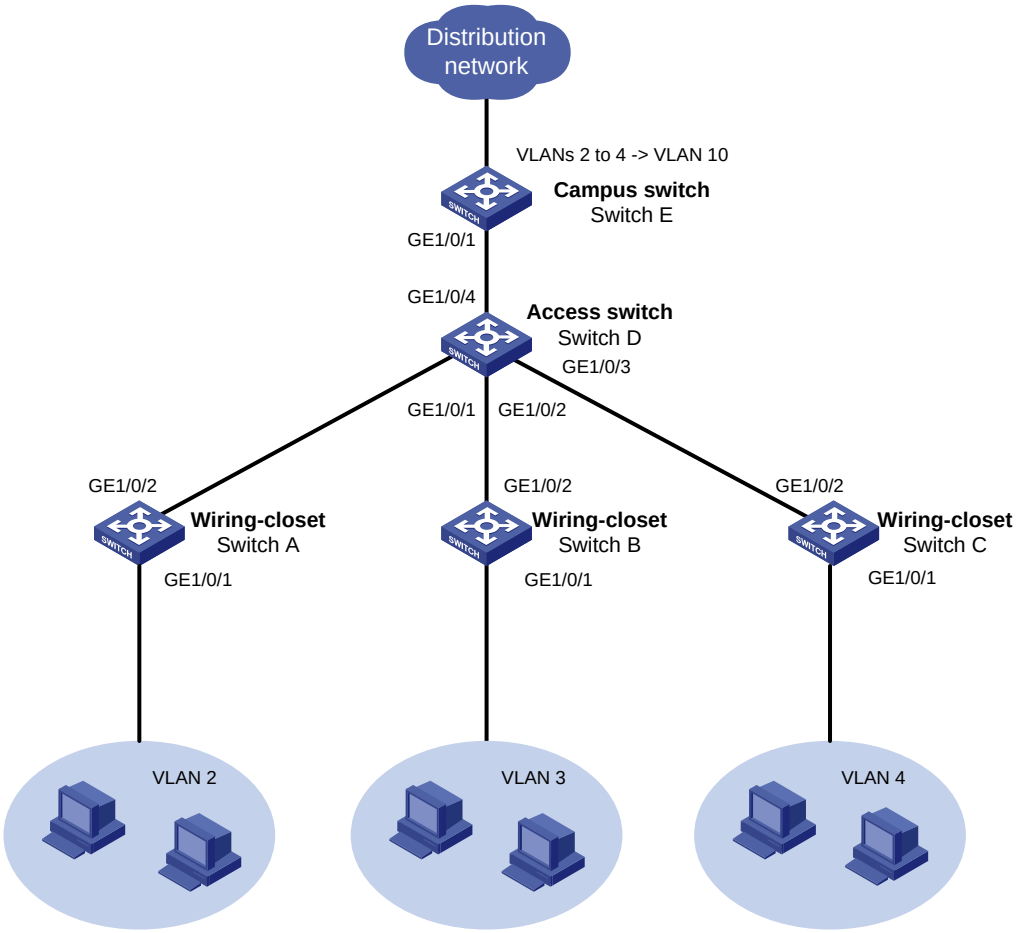
Network configuration

As shown in Figure 8:

- Create VLAN 2, VLAN 3, and VLAN 4 on the wiring-closet switches to isolate traffic of the same service type from different households.

- Configure many-to-one VLAN mappings on the campus switch to assigns one VLAN to transport all types of traffic from different households. In this example, map VLANs 2 through 4 to VLAN 10.

Figure 8 Network diagram



Procedure

1. Configure Switch A:

   # Create VLAN 2.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 2
   [SwitchA-vlan2] quit
   ```

   # Assign ports GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to VLAN 2.

   ```
   [SwitchA] interface range gigabitethernet 1/0/1 to gigabitethernet 1/0/2
   [SwitchA-if-range] port access vlan 2
   [SwitchA-if-range] quit
   ```

2. Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)
3. Configure Switch D:

   # Create VLANs 2, 3, and 4.

   ```
   <SwitchD> system-view
   [SwitchD] vlan 2 to 4
   ```

   # Assign ports GigabitEthernet 1/0/1 to VLAN 2, GigabitEthernet 1/0/2 to VLAN 3, and GigabitEthernet 1/0/3 to VLAN 4.

```
[SwitchD] interface gigabitethernet 1/0/1
[SwitchD-GigabitEthernet1/0/1] port access vlan 2
[SwitchD-GigabitEthernet1/0/1] quit
[SwitchD] interface gigabitethernet 1/0/2
[SwitchD-GigabitEthernet1/0/2] port access vlan 3
[SwitchD-GigabitEthernet1/0/2] quit
[SwitchD] interface gigabitethernet 1/0/3
[SwitchD-GigabitEthernet1/0/3] port access vlan 4
[SwitchD-GigabitEthernet1/0/3] quit
```

Configure port GigabitEthernet 1/0/4 as a trunk port.

```
[SwitchD] interface gigabitethernet 1/0/4
[SwitchD-GigabitEthernet1/0/4] port link-type trunk
```

Assign GigabitEthernet 1/0/4 to VLANs 2 through VLAN 4.

```
[SwitchD-GigabitEthernet1/0/4] port trunk permit vlan 2 to 4
[SwitchD-GigabitEthernet1/0/4] quit
```

4. Configure Switch E:

Create VLANs 2, 3, and 4 (the original VLANs in the VLAN mapping to be created).

```
<SwitchE> system-view
[SwitchE] vlan 2 to 4
```

Configure the customer-side port (GigabitEthernet 1/0/1) as a trunk port.

```
<SwitchE> system-view
[SwitchE] interface gigabitethernet 1/0/1
[SwitchE-GigabitEthernet1/0/1] port link-type trunk
```

Assign GigabitEthernet 1/0/1 to the original VLANs.

```
[SwitchE-GigabitEthernet1/0/1] port trunk permit vlan 2 to 4
```

Configure many-to-one VLAN mapping on GigabitEthernet 1/0/1, which replaces VLAN tag 2 through VLAN tag 4 with VLAN tag 10.

```
[SwitchE-GigabitEthernet1/0/1] vlan mapping uni range 2 to 4 translated-vlan 10
[SwitchE-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify VLAN mapping information on Switch E.

```
[SwitchE] display vlan mapping
Interface GigabitEthernet1/0/1:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  2-4           N/A           10                       N/A
```

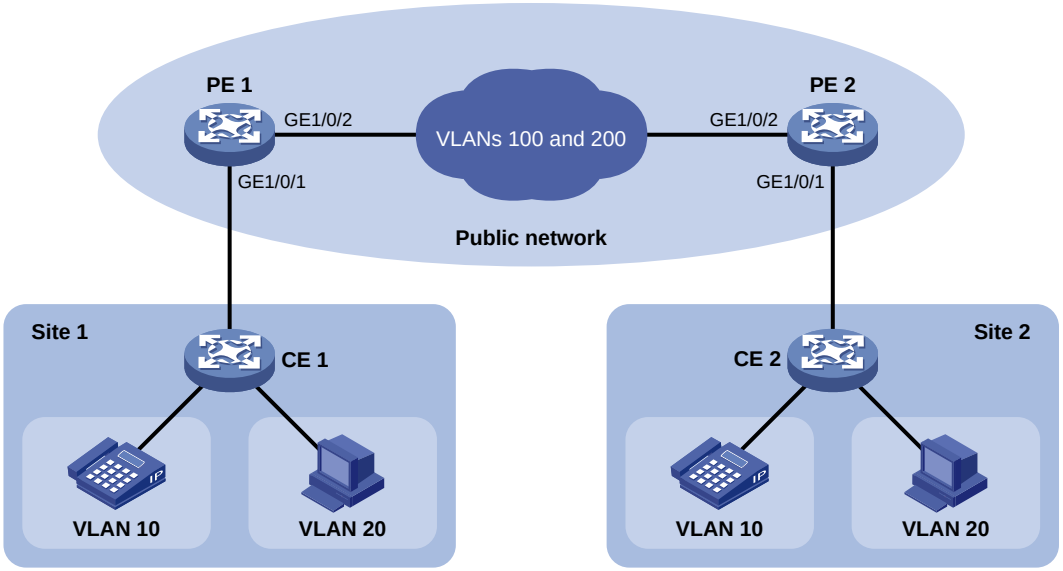
Example: Configuring one-to-two VLAN mapping

Network configuration

As shown in Figure 9, Site 1 and Site 2 of a company use VLAN 10 and VLAN 20 to transmit VoIP and PC traffic, respectively. The service provider assigns VLAN 100 and VLAN 200 to the customer network.

Configure one-to-two VLAN mappings to enable the service provider network to transmit VoIP and PC traffic with SVLAN 100 and SVLAN 200, respectively.

Figure 9 Network diagram



Procedure

1. Configure PE 1:

Create VLANs 10, 20, 100, and 200.

```
<PE1> system-view
[PE1] vlan 10
[PE1-vlan10] quit
[PE1] vlan 20
[PE1-vlan20] quit
[PE1] vlan 100
[PE1-vlan100] quit
[PE1] vlan 200
[PE1-vlan200] quit
```

Configure a one-to-two VLAN mapping on the customer-side port (GigabitEthernet 1/0/1) to add SVLAN tag 100 to packets from CVLAN 10.

```
[PE1] interface gigabitethernet 1/0/1
[PE1-GigabitEthernet1/0/1] vlan mapping nest single 10 nested-vlan 100
```

Configure a one-to-two VLAN mapping on GigabitEthernet 1/0/1 to add SVLAN tag 200 to packets from CVLAN 20.

```
[PE1-GigabitEthernet1/0/1] vlan mapping nest single 20 nested-vlan 200
```

Configure GigabitEthernet 1/0/1 as a hybrid port.

```
[PE1-GigabitEthernet1/0/1] port link-type hybrid
```

Assign GigabitEthernet 1/0/1 to VLANs 100 and 200 as an untagged member.

```
[PE1-GigabitEthernet1/0/1] port hybrid vlan 100 200 untagged
[PE1-GigabitEthernet1/0/1] quit
```

Configure the network-side port (GigabitEthernet 1/0/2) as a trunk port, and assign the port to VLANs 100 and 200.

```
[PE1] interface gigabitethernet 1/0/2
[PE1-GigabitEthernet1/0/2] port link-type trunk
[PE1-GigabitEthernet1/0/2] port trunk permit vlan 100 200
[PE1-GigabitEthernet1/0/2] quit
```

2. Configure PE 2 in the same way PE 1 is configured. (Details not shown.)

Verifying the configuration

Verify VLAN mapping information on PE 1.

```
[PE1] display vlan mapping
Interface GigabitEthernet1/0/1:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  10             N/A           100                      10
  20             N/A           200                      20
```

Verify VLAN mapping information on PE 2.

```
[PE2] display vlan mapping
Interface GigabitEthernet1/0/2:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  10             N/A           100                      10
  20             N/A           200                      20
```

Configuring LLDP

About LLDP

The Link Layer Discovery Protocol (LLDP) is a standard link layer protocol that allows network devices from different vendors to discover neighbors and exchange system and configuration information.

In an LLDP-enabled network, a device advertises local device information in LLDP Data Units (LLDPDUs) to the directly connected devices. The information distributed through LLDP is stored by its recipients in standard MIBs, making it possible for the information to be accessed by a Network Management System (NMS) through SNMP.

Information that can be distributed through LLDP includes (but is not limited to):

- Major capabilities of the system.
- Management IP address of the system.
- Device ID.
- Port ID.

LLDP agents and bridge modes

An LLDP agent is a mapping of a protocol entity that implements LLDP. Multiple LLDP agents can run on the same interface.

LLDP agents are classified into the following types:

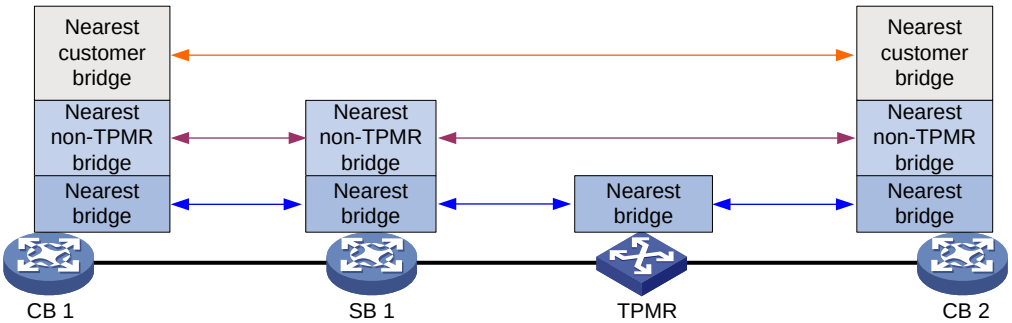
- Nearest bridge agent.
- Nearest customer bridge agent.
- Nearest non-TPMR bridge agent.

  A Two-port MAC Relay (TPMR) is a type of bridge that has only two externally-accessible bridge ports. It supports a subset of the features of a MAC bridge. A TPMR is transparent to all frame-based media-independent protocols except for the following protocols:

  - Protocols destined for the TPMR.
  - Protocols destined for reserved MAC addresses that the relay feature of the TPMR is configured not to forward.

LLDP exchanges packets between neighbor agents and creates and maintains neighbor information for them. Figure 1 shows the neighbor relationships for these LLDP agents.

Figure 1 LLDP neighbor relationships



The types of supported LLDP agents vary with the bridge mode in which LLDP operates. LLDP supports the following bridge modes: customer bridge (CB) and service bridge (SB).

- **Customer bridge mode**—LLDP supports nearest bridge agent, nearest non-TPMR bridge agent, and nearest customer bridge agent. LLDP processes the LLDP frames with destination MAC addresses for these agents and transparently transmits the LLDP frames with other destination MAC addresses in VLANs.
- **Service bridge mode**—LLDP supports nearest bridge agent and nearest non-TPMR bridge agent. LLDP processes the LLDP frames with destination MAC addresses for these agents and transparently transmits the LLDP frames with other destination MAC addresses in VLANs.

LLDP frame formats

LLDP sends device information in LLDP frames. LLDP frames are encapsulated in Ethernet II or Subnetwork Access Protocol (SNAP) format.

LLDP frame encapsulated in Ethernet II

Figure 2 Ethernet II-encapsulated LLDP frame

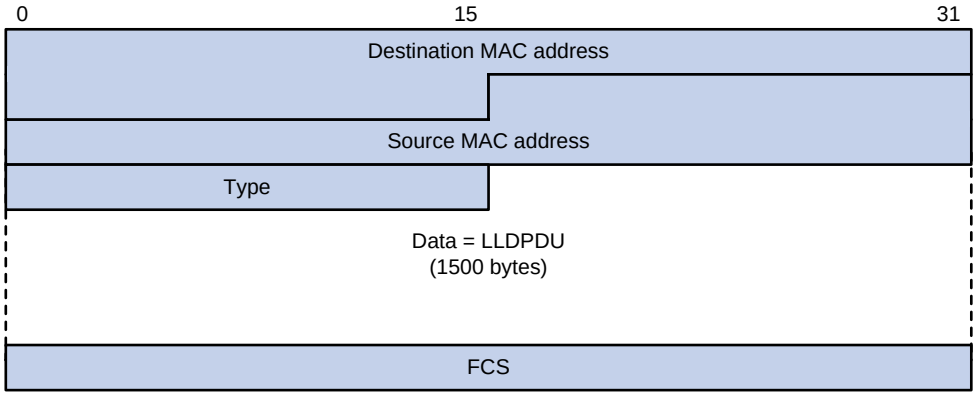


Table 1 Fields in an Ethernet II-encapsulated LLDP frame

Field	Description
Destination MAC address	MAC address to which the LLDP frame is advertised. LLDP specifies different multicast MAC addresses as destination MAC addresses for LLDP frames destined for agents of different types. This helps distinguish between LLDP frames sent and received by different agent types on the same interface. The destination MAC address is fixed to one of the following multicast MAC addresses: • 0x0180-c200-000E for LLDP frames destined for nearest bridge agents. • 0x0180-c200-0000 for LLDP frames destined for nearest customer bridge agents. • 0x0180-c200-0003 for LLDP frames destined for nearest non-TPMR bridge agents.
Source MAC address	MAC address of the sending port.
Type	Ethernet type for the upper-layer protocol. This field is 0x88CC for LLDP.
Data	LLDPDU.
FCS	Frame check sequence, a 32-bit CRC value used to determine the validity of the received Ethernet frame.

LLDP frame encapsulated in SNAP

Figure 3 SNAP-encapsulated LLDP frame

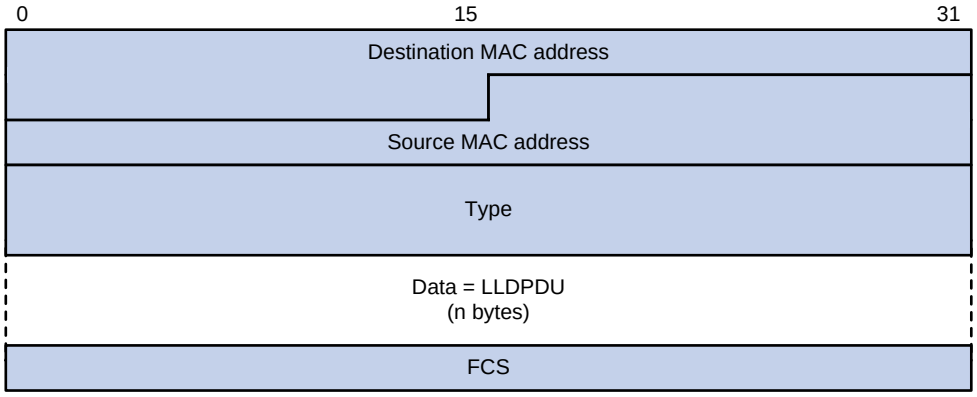

Table 2 Fields in a SNAP-encapsulated LLDP frame

Field	Description
Destination MAC address	MAC address to which the LLDP frame is advertised. It is the same as that for Ethernet II-encapsulated LLDP frames.
Source MAC address	MAC address of the sending port.
Type	SNAP type for the upper-layer protocol. This field is 0xAAAA-0300-0000-88CC for LLDP.
Data	LLDPDU.
FCS	Frame check sequence, a 32-bit CRC value used to determine the validity of the received Ethernet frame.

LLDPDUs

Each LLDP frame contains one LLDPDU. Each LLDPDU is a sequence of type-length-value (TLV) structures.

Figure 4 LLDPDU encapsulation format

As shown in Figure 4, each LLDPDU starts with the following mandatory TLVs: Chassis ID TLV, Port ID TLV, and Time to Live TLV. The mandatory TLVs are followed by a maxiumu of 29 optional TLVs.

TLVs

A TLV is an information element that contains the type, length, and value fields.

LLDPDU TLVs include the following categories:

- Basic management TLVs.
- Organizationally (IEEE 802.1 and IEEE 802.3) specific TLVs.
- LLDP-MED (media endpoint discovery) TLVs.

Basic management TLVs are essential to device management.

Organizationally specific TLVs and LLDP-MED TLVs are used for enhanced device management. They are defined by standardization or other organizations and are optional for LLDPDUs.

Basic management TLVs

Table 3 lists the basic management TLV types. Some of them are mandatory for LLDPDUs.

Table 3 Basic management TLVs

Type	Description	Remarks
Chassis ID	Specifies the bridge MAC address of the sending device.	Mandatory.
Port ID	Specifies the ID of the sending port: • If the LLDPDU carries LLDP-MED TLVs, the port ID TLV carries the MAC address of the sending port. • Otherwise, the port ID TLV carries the port name.	
Time to Live	Specifies the life of the transmitted information on the receiving device.	
End of LLDPDU	Marks the end of the TLV sequence in the LLDPDU.	
Port Description	Specifies the description for the sending port.	Optional.
System Name	Specifies the assigned name of the sending device.	
System Description	Specifies the description for the sending device.	
System Capabilities	Identifies the primary features of the sending device and the enabled primary features.	
Management Address	Specifies the following elements: • The management address of the local device. • The interface number and object identifier (OID) associated with the address.	

IEEE 802.1 organizationally specific TLVs

Table 4 lists the IEEE 802.1 organizationally specific TLVs.

The device can receive protocol identity TLVs and VID usage digest TLVs, but it cannot send these TLVs.

Table 4 IEEE 802.1 organizationally specific TLVs

Type	Description
Port VLAN ID (PVID)	Specifies the port PVID.
Port And Protocol VLAN ID (PPVID)	Indicates whether the device supports protocol VLANs and, if so, what VLAN IDs these protocols will be associated with.
VLAN Name	Specifies the textual name of any VLAN to which the port belongs.
Protocol Identity	Indicates protocols supported on the port.
DCBX	Data center bridging exchange protocol. DCBX TLVs are not supported in the current software version.
EVB module	Edge Virtual Bridging module, including EVB TLV and CDCP TLV. For more information, see *EVB Configuration Guide*. EVB module TLVs are not supported in the current software version.
Link Aggregation	Indicates whether the port supports link aggregation, and if yes, whether link aggregation is enabled.
Management VID	Management VLAN ID.

Type	Description
VID Usage Digest	VLAN ID usage digest.
ETS Configuration	Enhanced Transmission Selection configuration.
ETS Recommendation	ETS recommendation.
PFC	Priority-based Flow Control.
APP	Application protocol.
QCN	Quantized Congestion Notification. QCN TLVs are not supported in the current software version.

IEEE 802.3 organizationally specific TLVs

Table 5 shows the IEEE 802.3 organizationally specific TLVs.

The Power Stateful Control TLV is defined in IEEE P802.3at D1.0 and is not supported in later versions. The device sends this type of TLVs only after receiving them.

Table 5 IEEE 802.3 organizationally specific TLVs

Type	Description
MAC/PHY Configuration/Status	Contains the bit-rate and duplex capabilities of the port, support for autonegotiation, enabling status of autonegotiation, and the current rate and duplex mode.
Power Via MDI	Contains the power supply capabilities of the port: • Port class (PSE or PD). • Power supply mode. • Whether PSE power supply is supported. • Whether PSE power supply is enabled. • Whether pair selection can be controlled. • Power supply type. • Power source. • Power priority. • PD requested power. • PSE allocated power.
Maximum Frame Size	Indicates the supported maximum frame size.
Power Stateful Control	Indicates the power state control configured on the sending port, including the following: • Power supply mode of the PSE/PD. • PSE/PD priority. • PSE/PD power.
Energy-Efficient Ethernet	Indicates Energy Efficient Ethernet (EEE).

LLDP-MED TLVs

LLDP-MED TLVs provide multiple advanced applications for voice over IP (VoIP), such as basic configuration, network policy configuration, and address and directory management. LLDP-MED TLVs provide a cost-effective and easy-to-use solution for deploying voice devices in Ethernet. LLDP-MED TLVs are shown in Table 6.

If the MAC/PHY configuration/status TLV is not advertisable, none of the LLDP-MED TLVs will be advertised even if they are advertisable.

If the LLDP-MED capabilities TLV is not advertisable, the other LLDP-MED TLVs will not be advertised even if they are advertisable.

Table 6 LLDP-MED TLVs

Type	Description
LLDP-MED Capabilities	Allows a network device to advertise the LLDP-MED TLVs that it supports.
Network Policy	Allows a network device or terminal device to advertise the VLAN ID of a port, the VLAN type, and the Layer 2 and Layer 3 priorities for specific applications.
Extended Power-via-MDI	Allows a network device or terminal device to advertise power supply capability. This TLV is an extension of the Power Via MDI TLV.
Hardware Revision	Allows a terminal device to advertise its hardware version.
Firmware Revision	Allows a terminal device to advertise its firmware version.
Software Revision	Allows a terminal device to advertise its software version.
Serial Number	Allows a terminal device to advertise its serial number.
Manufacturer Name	Allows a terminal device to advertise its vendor name.
Model Name	Allows a terminal device to advertise its model name.
Asset ID	Allows a terminal device to advertise its asset ID. The typical case is that the user specifies the asset ID for the endpoint to facilitate directory management and asset tracking.
Location Identification	Allows a network device to advertise the appropriate location identifier information for a terminal device to use in the context of location-based applications.

H3C-proprietary TLVs

H3C-proprietary TLVs are used to meet specific transmission requirements on network management. Devices of other vendors cannot identify H3C-proprietary TLVs carried in LLDPDUS.

Only actual power TLVs are supported in the current software version. This type of TLVs provides PoE power information on an interface.

Management address

The network management system uses the management address of a device to identify and manage the device for topology maintenance and network management. The management address is encapsulated in the management address TLV.

LLDP operating modes

An LLDP agent can operate in one of the following modes:

- **TxRx mode**—An LLDP agent in this mode can send and receive LLDP frames.
- **Tx mode**—An LLDP agent in this mode can only send LLDP frames.
- **Rx mode**—An LLDP agent in this mode can only receive LLDP frames.
- **Disable mode**—An LLDP agent in this mode cannot send or receive LLDP frames.

Each time the operating mode of an LLDP agent changes, its LLDP protocol state machine reinitializes. A configurable reinitialization delay prevents frequent initializations caused by frequent changes to the operating mode. If you configure the reinitialization delay, an LLDP agent must wait the specified amount of time to initialize LLDP after the LLDP operating mode changes.

Transmitting and receiving LLDP frames

Transmitting LLDP frames

An LLDP agent operating in TxRx mode or Tx mode sends LLDP frames to its directly connected devices both periodically and when the local configuration changes. To prevent LLDP frames from overwhelming the network during times of frequent changes to local device information, LLDP uses the token bucket mechanism to rate limit LLDP frames. For more information about the token bucket mechanism, see *ACL and QoS Configuration Guide*.

LLDP automatically enables the fast LLDP frame transmission mechanism in either of the following cases:

- A new LLDP frame is received and carries device information new to the local device.
- The LLDP operating mode of the LLDP agent changes from Disable or Rx to TxRx or Tx.

The fast LLDP frame transmission mechanism successively sends the specified number of LLDP frames at a configurable fast LLDP frame transmission interval. The mechanism helps LLDP neighbors discover the local device as soon as possible. Then, the normal LLDP frame transmission interval resumes.

Receiving LLDP frames

An LLDP agent operating in TxRx mode or Rx mode confirms the validity of TLVs carried in every received LLDP frame. If the TLVs are valid, the LLDP agent saves the information and starts an aging timer. The initial value of the aging timer is equal to the TTL value in the Time To Live TLV carried in the LLDP frame. When the LLDP agent receives a new LLDP frame, the aging timer restarts. When the aging timer decreases to zero, all saved information ages out.

Collaboration with Track

You can configure a track entry and associate it with an LLDP interface. The LLDP module checks the neighbor availability of the LLDP interface and reports the check result to the Track module. The Track module changes the track entry status accordingly so the associated application module can take correct actions.

The Track module changes the track entry status based on the neighbor availability of a monitored LLDP interface as follows:

- If the neighbor of the LLDP interface is available, the Track module sets the track entry to Positive state.
- If the neighbor of the LLDP interface is unavailable, the Track module sets the track entry to Negative state.

For more information about collaboration between Track and LLDP, see the track configuration in *High Availability Configuration Guide.*

Protocols and standards

- IEEE 802.1AB-2005, *Station and Media Access Control Connectivity Discovery*
- IEEE 802.1AB-2009, *Station and Media Access Control Connectivity Discovery*
- ANSI/TIA-1057, *Link Layer Discovery Protocol for Media Endpoint Devices*

- IEEE Std 802.1Qaz-2011, *Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks-Amendment 18: Enhanced Transmission Selection for Bandwidth Sharing Between Traffic Classes*

Restrictions and guidelines: LLDP configuration

When you configure LLDP, follow these restrictions and guidelines:

- Some of the LLDP configuration tasks are available in different interface views (see Table 7).

  Table 7 Support of LLDP configuration tasks in different views

Tasks	Supported views
Enabling LLDP	Layer 2 Ethernet interface view Management Ethernet interface view Layer 2 aggregate interface view
Setting the LLDP operating mode	
Configuring the advertisable TLVs	
Configuring advertisement of the management address TLV	
Setting the encapsulation format for LLDP frames	
Enabling LLDP polling	
Configuring LLDP trapping and LLDP-MED trapping	

- To use LLDP together with OpenFlow, you must enable LLDP globally on OpenFlow switches. To prevent LLDP from affecting topology discovery of OpenFlow controllers, disable LLDP on ports of OpenFlow instances. For more information about OpenFlow, see *OpenFlow Configuration Guide*.

LLDP tasks at a glance

To configure LLDP, perform the following tasks:

1. Enabling LLDP
2. Setting the LLDP bridge mode
3. Setting the LLDP operating mode
4. (Optional.) Setting the LLDP reinitialization delay
5. (Optional.) Configuring LLDP packet-related settings
   - Configuring the advertisable TLVs
   - Configuring advertisement of the management address TLV
   - Setting the encapsulation format for LLDP frames
   - Setting LLDP frame transmission parameters
   - Configuring the type of port ID TLVs advertised by LLDP
6. (Optional.) Enabling displaying LLDP local information about all interfaces
7. (Optional.) Enabling LLDP polling
8. (Optional.) Disabling LLDP PVID inconsistency check
9. (Optional.) Configuring CDP compatibility
10. (Optional.) Configuring LLDP trapping and LLDP-MED trapping
11. (Optional.) Configuring MAC address learning for DCN
    - (Optional.) Setting the source MAC address of LLDP frames

- (Optional.) Enabling generation of ARP or ND entries for received management address TLVs

Enabling LLDP

Restrictions and guidelines

For LLDP to take effect on specific ports, you must enable LLDP both globally and on these ports.

Procedure

1. Enter system view.
   `system-view`
2. Enable LLDP globally.
   `lldp global enable`
   By default:
   - If the device starts up with the initial configuration, LLDP is disabled globally.
   - If the device starts up with the factory defaults, LLDP is enabled globally.

   For more information about device startup with the initial configuration or factory defaults, see *Fundamentals Configuration Guide*.
3. Enter interface view.
   `interface` *`interface-type interface-number`*
4. Enable LLDP.
   `lldp enable`
   By default, LLDP is enabled on a port.

Setting the LLDP bridge mode

1. Enter system view.
   `system-view`
2. Set the LLDP bridge mode.
   - Set the LLDP bridge mode to service bridge.
     `lldp mode service-bridge`
     By default, LLDP operates in customer bridge mode.
   - Set the LLDP bridge mode to customer bridge.
     `undo lldp mode`

   By default, LLDP operates in customer bridge mode.

Setting the LLDP operating mode

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Set the LLDP operating mode.
   - In Layer 2 Ethernet interface view or management Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **admin-status** { **disable** | **rx** | **tx** | **txrx** }

In Ethernet interface view, if you do not specify an agent type, the command sets the operating mode for the nearest bridge agent.

- In Layer 2 aggregate interface view:

  lldp agent { **nearest-customer** | **nearest-nontpmr** } **admin-status** { **disable** | **rx** | **tx** | **txrx** }

  In aggregate interface view, you can set the operating mode only for the nearest customer bridge agent and nearest non-TPMR bridge agent.

By default:

- The nearest bridge agent operates in TxRx mode.
- The nearest customer bridge agent and nearest non-TPMR bridge agent operate in Disable mode.

Setting the LLDP reinitialization delay

About LLDP reinitialization delay

When the LLDP operating mode changes on a port, the port initializes the protocol state machines after an LLDP reinitialization delay. By adjusting the delay, you can avoid frequent initializations caused by frequent changes to the LLDP operating mode on a port.

Procedure

1. Enter system view.

   system-view

2. Set the LLDP reinitialization delay.

   lldp timer reinit-delay *delay*

   The default LLDP reinitialization delay is 2 seconds.

Configuring the advertisable TLVs

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the advertisable TLVs.

   - In Layer 2 Ethernet interface view:

     lldp tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [**ipv6**] [*ip-address* | **interface loopback** *interface-number*] } | **dot1-tlv** { **all** | **port-vlan-id** | **link-aggregation** | **protocol-vlan-id** [*vlan-id*] | **vlan-name** [*vlan-id*] | **management-vid** [*mvlan-id*] } | **dot3-tlv** { **all** | **link-aggregation** | **mac-physic** | **max-frame-size** | **power** } | **med-tlv** { **all** | **capability** | **inventory** | **network-policy** [*vlan-id*] | **power-over-ethernet** | **location-id** { **civic-address** *device-type country-code* { *ca-type ca-value* }&<1-10> | **elin-address** *tel-number* } } }

     lldp tlv-enable private-tlv actual-power

Non-PoE devices do not support the **lldp tlv-enable private-tlv actual-power** command.

The **lldp tlv-enable private-tlv actual-power** command is available only in Release 6343P08 and later.

By default, the nearest bridge agent advertises all supported TLVs except the following TLVs:

- Location identification TLVs.
- Port and protocol VLAN ID TLVs.
- VLAN name TLVs.
- Management VLAN ID TLVs.

lldp agent nearest-nontpmr tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [**ipv6**] [*ip-address*] } | **dot1-tlv** { **all** | **port-vlan-id** | **link-aggregation** } | **dot3-tlv** { **all** | **link-aggregation** } }

lldp tlv-enable dot1-tlv { **protocol-vlan-id** [*vlan-id*] | **vlan-name** [*vlan-id*] | **management-vid** [*mvlan-id*] }

lldp agent nearest-nontpmr tlv-enable private-tlv actual-power

Non-PoE devices do not support the **lldp tlv-enable private-tlv actual-power** command.

The **lldp tlv-enable private-tlv actual-power** command is available only in Release 6343P08 and later.

By default, the nearest non-TPMR bridge agent does not advertise any TLVs.

lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [**ipv6**] [*ip-address*] } | **dot1-tlv** { **all** | **port-vlan-id** | **link-aggregation** } | **dot3-tlv** { **all** | **link-aggregation** } }

lldp tlv-enable dot1-tlv { **protocol-vlan-id** [*vlan-id*] | **vlan-name** [*vlan-id*] | **management-vid** [*mvlan-id*] }

lldp agent nearest-customer tlv-enable private-tlv actual-power

Non-PoE devices do not support the **lldp agent nearest-customer tlv-enable private-tlv actual-power** command.

The **lldp agent nearest-customer tlv-enable private-tlv actual-power** command is available only in Release 6343P08 and later.

By default, the nearest customer bridge agent advertises all the supported basic management TLVs and IEEE 802.1 organizationally specific TLVs.

- In management Ethernet interface view:

lldp tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [**ipv6**] [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } | **dot3-tlv** { **all** | **link-aggregation** | **mac-physic** | **max-frame-size** | **power** } | **med-tlv** { **all** | **capability** | **inventory** | **power-over-ethernet** | **location-id** { **civic-address** *device-type country-code* { *ca-type ca-value* }&<1-10> | **elin-address** *tel-number* } } }

By default, the nearest bridge agent advertises the following TLVs:

- Link aggregation TLVs in the 802.1 organizationally specific TLV set.
- All supported 802.3 organizationally specific TLVs.

- All supported LLDP-MED TLVs except the network policy TLVs.

lldp agent { **nearest-nontpmr** | **nearest-customer** } **tlv-enable** { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [**ipv6**] [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } | **dot3-tlv** { **all** | **link-aggregation** } }

By default:

- The nearest non-TPMR bridge agent does not advertise anyTLVs.
- The nearest customer bridge agent advertises all supported basic management TLVs and link aggregation TLVs in the IEEE 802.1 organizationally specific TLV set.

- In Layer 2 aggregate interface view:

lldp tlv-enable dot1-tlv { **protocol-vlan-id** [*vlan-id*] | **vlan-name** [*vlan-id*] | **management-vid** [*mvlan-id*]

lldp agent nearest-nontpmr tlv-enable { **basic-tlv** { **all** | **management-address-tlv** [**ipv6**] [*ip-address*] | **port-description** | **system-capability** | **system-description** | **system-name** } | **dot1-tlv** { **all** | **port-vlan-id** } }

By default, the nearest non-TPMR bridge agent does not advertise any TLVs.

lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **management-address-tlv** [**ipv6**] [*ip-address*] | **port-description** | **system-capability** | **system-description** | **system-name** } | **dot1-tlv** { **all** | **port-vlan-id** } }

By default, the nearest customer bridge agent advertises all supported basic management TLVs and the following IEEE 802.1 organizationally specific TLVs:

- Port and protocol VLAN ID TLVs.
- VLAN name TLVs.
- Management VLAN ID TLVs.

The nearest bridge agent is not supported.

Configuring advertisement of the management address TLV

About advertisement of the management address TLV

LLDP encodes management addresses in numeric or string format in management address TLVs.

If a neighbor encodes its management address in string format, set the encoding format of the management address to **string** on the connecting port. This guarantees normal communication with the neighbor.

You can configure advertisement of the management address TLV globally or on a per-interface basis. The device selects the management address TLV advertisement setting for an interface in the following order:

1. Interface-based setting, configured by using the **lldp tlv-enable** command with the **management-address-tlv** keyword.
2. Global setting, configured by using the **lldp global tlv-enable basic-tlv management-address-tlv** command.
3. Default setting for the interface.

   By default:

- The nearest bridge agent and nearest customer bridge agent advertise the management address TLV.
- The nearest non-TPMR bridge agent does not advertise the management address TLV.

Procedure

1. Enter system view.

   system-view

2. Enable advertisement of the management address TLV globally and set the management address to be advertised.

   lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **global tlv-enable basic-tlv management-address-tlv** [**ipv6**] { *ip-address* | **interface loopback** *interface-number* | **interface m-gigabitethernet** *interface-number* | **interface vlan-interface** *interface-number* }

   By default, advertisement of the management address TLV is disabled globally.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable advertisement of the management address TLV on the interface and set the management address to be advertised.

   - In Layer 2 Ethernet interface view or management Ethernet interface view:

     lldp tlv-enable basic-tlv management-address-tlv [**ipv6**] [*ip-address* | **interface loopback** *interface-number*]

     lldp agent { **nearest-customer** | **nearest-nontpmr** } **tlv-enable basic-tlv management-address-tlv** [**ipv6**] [*ip-address*]

   - In Layer 2 aggregate interface view:

     lldp agent { **nearest-customer** | **nearest-nontpmr** } **tlv-enable basic-tlv management-address-tlv** [**ipv6**] [*ip-address*]

   By default:

   - The nearest bridge agent and nearest customer bridge agent advertise the management address TLVs.
   - The nearest non-TPMR bridge agent does not advertise the management address TLV.

   The device supports only the numeric encoding format for IPv6 management addresses.

5. Set the encoding format of the management address to string.

   - In Layer 2 Ethernet interface view or management Ethernet interface view:

     lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **management-address-format string**

   - In Layer 2 aggregate interface view:

     lldp agent { **nearest-customer** | **nearest-nontpmr** } **management-address-format string**

   The default management address encoding format is numeric.

Setting the encapsulation format for LLDP frames

About setting the LLDP frame encapsulation format

Earlier versions of LLDP require the same encapsulation format on both ends to process LLDP frames. To successfully communicate with a neighboring device running an earlier version of LLDP, the local device must be set with the same encapsulation format.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the encapsulation format for LLDP frames to SNAP.
   - In Layer 2 Ethernet interface view or management Ethernet interface view:
     lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **encapsulation snap**
   - In Layer 2 aggregate interface view:
     lldp agent { **nearest-customer** | **nearest-nontpmr** } **encapsulation snap**

   By default, the Ethernet II encapsulation format is used.

Setting LLDP frame transmission parameters

About setting LLDP frame transmission parameters

The Time to Live TLV carried in an LLDPDU determines how long the device information carried in the LLDPDU can be saved on a recipient device.

By setting the TTL multiplier, you can configure the TTL of locally sent LLDPDUs. The TTL is expressed by using the following formula:

TTL = Min (65535, (TTL multiplier × LLDP frame transmission interval + 1))

As the expression shows, the TTL can be up to 65535 seconds. TTLs greater than 65535 will be rounded down to 65535 seconds.

Procedure

1. Enter system view.
   system-view
2. Set the TTL multiplier.
   lldp hold-multiplier *value*

   The default setting is 4.
3. Set the LLDP frame transmission interval.
   lldp timer tx-interval *interval*

   The default setting is 30 seconds.
4. Set the token bucket size for sending LLDP frames.
   lldp max-credit *credit-value*

   The default setting is 5.
5. Set the number of LLDP frames sent each time fast LLDP frame transmission is triggered.
   lldp fast-count *count*

   The default setting is 4.
6. Set the fast LLDP frame transmission interval.
   lldp timer fast-interval *interval*

   The default setting is 1 second.

Configuring the type of port ID TLVs advertised by LLDP

About this task

This task enables an H3C device to advertise only port ID TLVs that contain interface names. By default, an H3C device advertises port ID TLVs that contain interface MAC addresses or interface names. The media devices from some vendors can obtain interface information from H3C devices only through LLDP. For the media devices to obtain interface names, you must configure H3C devices to generate port ID TLVs based on interface names.

Software version and feature compatibility

This feature is supported only in Release 6331 and later.

Restrictions and guidelines

Perform this task only when LLDP neighbors must obtain interface names from LLDPDUs. Do not perform this task in any other scenarios.

You can configure the port ID TLV type in system view or interface view. The interface-specific setting takes precedence over the global setting.

Configuring the type of port ID TLVs advertised by LLDP globally

1. Enter system view.

   system-view

2. Configure the type of port ID TLVs advertised by LLDP.

   lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **global tlv-config basic-tlv port-id** *type-id*

   By default, an interface advertises port ID TLVs that contain interface MAC addresses if it receives LLDP-MED TLVs and advertises port ID TLVs that contain interface names if no LLDP-MED TLVs are received.

Configuring the type of port ID TLVs advertised by LLDP on an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the type of port ID TLVs advertised by LLDP.

   - In Layer 2 Ethernet interface view or management Ethernet interface view:

     lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **tlv-config basic-tlv port-id** *type-id*

   - In Layer 2 aggregate interface view:

     lldp agent { **nearest-customer** | **nearest-nontpmr** } **tlv-config basic-tlv port-id** *type-id*

   By default, the global port ID TLV type configuration takes effect.

Enabling displaying LLDP local information about all interfaces

About this task

This task enables the **display lldp local-information** command to display LLDP local information about all interfaces.

By default, the **display lldp local-information** command displays information about physically up interfaces. The media devices from some vendors can obtain interface information from H3C devices only through LLDP. For the media devices to obtain all interface information, enable the **display lldp local-information** command to display LLDP local information about all interfaces.

Software version and feature compatibility

This feature is supported only in Release 6331 and later.

Restrictions and guidelines

Perform this task only when LLDP neighbors can obtain interface information from the device through LLDP.

Procedure

1. Enter system view.

   system-view

2. Enable displaying LLDP local information about all interfaces.

   lldp local-information all-interface

   By default, the **display lldp local-information** command displays information about physically up interfaces.

Enabling LLDP polling

About LLDP polling

With LLDP polling enabled, a device periodically searches for local configuration changes. When the device detects a configuration change, it sends LLDP frames to inform neighboring devices of the change.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable LLDP polling and set the polling interval.

   - In Layer 2 Ethernet interface view or management Ethernet interface view:

     lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **check-change-interval** *interval*

   - In Layer 2 aggregate interface view:

     lldp agent { **nearest-customer** | **nearest-nontpmr** } **check-change-interval** *interval*

   By default, LLDP polling is disabled.

Disabling LLDP PVID inconsistency check

About LLDP PVID inconsistency check

By default, when the system receives an LLDP packet, it compares the PVID value contained in the packet with the PVID configured on the receiving interface. If the two PVIDs do not match, a log message will be printed to notify the user.

You can disable PVID inconsistency check if different PVIDs are required on a link.

Procedure

1. Enter system view.

   `system-view`

2. Disable LLDP PVID inconsistency check.

   `lldp ignore-pvid-inconsistency`

   By default, LLDP PVID inconsistency check is enabled.

Configuring CDP compatibility

About CDP compatibility

To enable your device to exchange information with a directly connected Cisco device that supports only CDP, you must enable CDP compatibility.

CDP compatibility enables your device to receive and recognize CDP packets from the neighboring CDP device and send CDP packets to the neighboring device. The CDP packets sent to the neighboring CDP device carry the following information:

- Device ID.
- ID of the port connecting to the neighboring device.
- Port IP address.
- TTL.

The port IP address is the primary IP address of a VLAN interface in up state. The VLAN ID of the VLAN interface must be the lowest among the VLANs permitted on the port. If no VLAN interfaces of the permitted VLANs are assigned an IP address or all VLAN interfaces are down, no port IP address will be advertised.

You can view the neighboring CDP device information that can be recognized by the device in the output of the **`display lldp neighbor-information`** command. For more information about the **`display lldp neighbor-information`** command, see LLDP commands in *Layer 2—LAN Switching Command Reference*.

To make your device work with Cisco IP phones, you must enable CDP compatibility.

If your LLDP-enabled device cannot recognize CDP packets, it does not respond to the requests of Cisco IP phones for the voice VLAN ID configured on the device. As a result, a requesting Cisco IP phone sends voice traffic without any tag to your device. Your device cannot differentiate the voice traffic from other types of traffic.

CDP compatibility enables your device to receive and recognize CDP packets from a Cisco IP phone and respond with CDP packets carrying TLVs with the configured voice VLAN. If no voice VLAN is configured for CDP packets, CDP packets carry the voice VLAN of the port or the voice VLAN assigned by the RADIUS server. The assigned voice VLAN has a higher priority. According to TLVs with the voice VLAN configuration, the IP phone automatically configures the voice VLAN. As a result, the voice traffic is confined in the configured voice VLAN and is differentiated from other types of traffic.

For more information about voice VLANs, see "Configuring voice VLANs."

When the device is connected to a Cisco IP phone that has a host attached to its data port, the host must access the network through the Cisco IP phone. If the data port goes down, the IP phone will send a CDP packet to the device so the device can log out the user.

CDP-compatible LLDP operates in one of the following modes:

- **TxRx**—CDP packets can be transmitted and received.
- **Rx**—CDP packets can be received but cannot be transmitted.
- **Disable**—CDP packets cannot be transmitted or received.

Restrictions and guidelines

Voice VLANs are not available on the S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series.

When you configure CDP compatibility for LLDP, follow these restrictions and guidelines:

- To make CDP-compatible LLDP take effect on a port, follow these steps:
  a. Enable CDP-compatible LLDP globally.
  b. Configure CDP-compatible LLDP to operate in TxRx mode on the port.
- The maximum TTL value that CDP allows is 255 seconds. To make CDP-compatible LLDP work correctly with Cisco IP phones, configure the LLDP frame transmission interval to be no more than 1/3 of the TTL value.

Prerequisites

Before you configure CDP compatibility, complete the following tasks:

- Globally enable LLDP.
- Enable LLDP on the port connecting to a CDP device.
- Configure LLDP to operate in TxRx mode on the port.

Procedure

1. Enter system view.
   `system-view`
2. Enable CDP compatibility globally.
   `lldp compliance cdp`
   By default, CDP compatibility is disabled globally.
3. Enter Layer 2 Ethernet interface view or management Ethernet interface view.
   `interface` *`interface-type interface-number`*
4. Configure CDP-compatible LLDP to operate in TxRx mode.
   `lldp compliance admin-status cdp txrx`
   By default, CDP-compatible LLDP operates in **`disable`** mode.
5. Set the voice VLAN ID carried in CDP packets.
   `cdp voice-vlan` *`vlan-id`*
   By default, no voice VLAN ID is configured to be carried in CDP packets.

Configuring LLDP trapping and LLDP-MED trapping

About LLDP trapping and LLDP-MED trapping

LLDP trapping or LLDP-MED trapping notifies the network management system of events such as newly detected neighboring devices and link failures.

To prevent excessive LLDP traps from being sent when the topology is unstable, set a trap transmission interval for LLDP.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable LLDP trapping.

   - In Layer 2 Ethernet interface view or management Ethernet interface view:

     lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **notification remote-change enable**

   - In Layer 2 aggregate interface view:

     lldp agent { **nearest-customer** | **nearest-nontpmr** } **notification remote-change enable**

   By default, LLDP trapping is disabled.

4. (In Layer 2 Ethernet interface view or management Ethernet interface view.) Enable LLDP-MED trapping.

   lldp notification med-topology-change enable

   By default, LLDP-MED trapping is disabled.

5. Return to system view.

   quit

6. (Optional.) Set the LLDP trap transmission interval.

   lldp timer notification-interval *interval*

   The default setting is 30 seconds.

Configuring MAC address learning for DCN

Setting the source MAC address of LLDP frames

About setting the source MAC address of LLDP frames

In Layer 2 Ethernet interface view, this feature must be configured with generation of ARP or ND entries for received management address TLVs to meet the following requirements:

- The source MAC address of outgoing LLDP frames is the MAC address of a VLAN interface instead of the MAC address of the egress interface.
- The neighbor device can generate correct ARP or ND entries for the local device.

In Layer 2 Ethernet interface view, this feature sets the source MAC address of outgoing LLDP frames to the MAC address of a VLAN interface to which the specified VLAN ID belongs. The source MAC address of outgoing LLDP frames is the MAC address of the Layer 2 Ethernet interface in the following situations:

- The specified VLAN or the corresponding VLAN interface does not exist.
- The VLAN interface to which the VLAN ID belongs is physically down.

Restrictions and guidelines

In Layer 2 Ethernet interface view, you must configure this feature so the interface can use the MAC address of a VLAN interface instead of its own MAC address as the source MAC address of LLDP

frames. This ensures that the neighbor device can generate correct ARP or ND entries for the local device.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 Ethernet interface view.

   interface *interface-type interface-number*

3. Set the source MAC address of LLDP frames to the MAC address of a VLAN interface.

   lldp source-mac vlan *vlan-id*

   By default, the source MAC address of LLDP frames is the MAC address of the egress interface.

Enabling generation of ARP or ND entries for received management address TLVs

About generation of ARP or ND entries for received management address TLVs

This feature enables the device to generate an ARP or ND entry after receiving an LLDP frame containing a management address TLV on an interface. The ARP or ND entry maps the advertised management address to the source MAC address of the frame.

You can enable generation of both ARP and ND entries on an interface. If the management address TLV contains an IPv4 address, the device generates an ARP entry. If the management address TLV contains an IPv6 address, the device generates an ND entry.

In Layer 2 Ethernet interface view, this feature sets the Layer 2 Ethernet interface to the output interface in the generated entries. The VLAN to which the entries belong is the VLAN specified by this feature. The device cannot generate ARP or ND entries in one of the following situations:

- The specified VLAN or the corresponding VLAN interface does not exist.
- The VLAN interface to which the VLAN ID belongs is physically down.

Restrictions and guidelines

In Layer 2 Ethernet interface view, you must configure the interface to use the MAC address of a VLAN interface instead of its own MAC address as the source MAC address of LLDP frames. This ensures that the neighbor device can generate correct ARP or ND entries.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 Ethernet interface view.

   interface *interface-type interface-number*

3. Enable generation of ARP or ND entries for management address TLVs received on the interface.

   lldp management-address { **arp-learning** | **nd-learning** } **vlan** *vlan-id*

   By default, generation of ARP or ND entries for received management address TLVs is disabled on an interface.

   In Layer 2 Ethernet interface view, the **vlan** *vlan-id* option specifies the ID of the VLAN to which the generated ARP or ND entry belongs. To prevent the ARP or ND entries from overwriting each other, do not specify the same VLAN ID for different Layer 2 Ethernet interfaces.

   You can enable generation of both ARP and ND entries on an interface.

Display and maintenance commands for LLDP

Execute **display** commands in any view.

Task	Command
Display local LLDP information.	**display lldp local-information** [**global** | **interface** *interface-type interface-number*]
Display the information contained in the LLDP TLVs sent from neighboring devices.	**display lldp neighbor-information** [[[**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }] [**verbose**]] | **list** [**system-name** *system-name*]]
Display LLDP statistics.	**display lldp statistics** [**global** | [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]]
Display LLDP status of a port.	**display lldp status** [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]
Display types of advertisable optional LLDP TLVs.	**display lldp tlv-config** [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]
Clear LLDP statistics on ports.	**reset lldp statistics** [**interface** *interface-type interface number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]

LLDP configuration examples

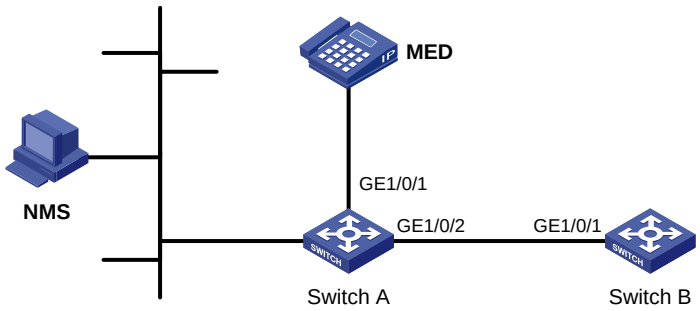
Example: Configuring basic LLDP functions

Network configuration

As shown in Figure 5, enable LLDP globally on Switch A and Switch B to perform the following tasks:

- Monitor the link between Switch A and Switch B on the NMS.
- Monitor the link between Switch A and the MED device on the NMS.

Figure 5 Network diagram



Procedure

1. Configure Switch A:

   # Enable LLDP globally.

   ```
   <SwitchA> system-view
   [SwitchA] lldp global enable
   ```

   # Enable LLDP on GigabitEthernet 1/0/1. By default, LLDP is enabled on ports.

   ```
   [SwitchA] interface gigabitethernet 1/0/1
   [SwitchA-GigabitEthernet1/0/1] lldp enable
   ```

   # Set the LLDP operating mode to Rx on GigabitEthernet 1/0/1.

   ```
   [SwitchA-GigabitEthernet1/0/1] lldp admin-status rx
   [SwitchA-GigabitEthernet1/0/1] quit
   ```

   # Enable LLDP on GigabitEthernet 1/0/2. By default, LLDP is enabled on ports.

   ```
   [SwitchA] interface gigabitethernet1/2
   [SwitchA-GigabitEthernet1/0/2] lldp enable
   ```

   # Set the LLDP operating mode to Rx on GigabitEthernet 1/0/2.

   ```
   [SwitchA-GigabitEthernet1/0/2] lldp admin-status rx
   [SwitchA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch B:

   # Enable LLDP globally.

   ```
   <SwitchB> system-view
   [SwitchB] lldp global enable
   ```

   # Enable LLDP on GigabitEthernet 1/0/1. By default, LLDP is enabled on ports.

   ```
   [SwitchB] interface gigabitethernet 1/0/1
   [SwitchB-GigabitEthernet1/0/1] lldp enable
   ```

   # Set the LLDP operating mode to Tx on GigabitEthernet 1/0/1.

   ```
   [SwitchB-GigabitEthernet1/0/1] lldp admin-status tx
   [SwitchB-GigabitEthernet1/0/1] quit
   ```

Verifying the configuration

Verify the following items:

- GigabitEthernet 1/0/1 of Switch A connects to a MED device.
- GigabitEthernet 1/0/2 of Switch A connects to a non-MED device.
- Both ports operate in Rx mode, and they can receive LLDP frames but cannot send LLDP frames.

```
[SwitchA] display lldp status
Global status of LLDP: Enable
Bridge mode of LLDP: customer-bridge
The current number of LLDP neighbors: 2
The current number of CDP neighbors: 0
LLDP neighbor information last changed time: 0 days, 0 hours, 4 minutes, 40 seconds

Example: Configuring CDP-compatible LLDP

IMPORTANT:

This example is not available on the S5000E-X, S5000X-EI, S5110V2-SI, S5000V3-EI, S5000V5-EI,

and WAS6000 switch series.

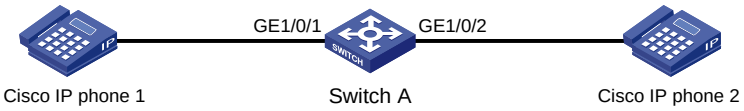
Network configuration

As shown in Figure 6, GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 of Switch A are each connected to a Cisco IP phone, which sends tagged voice traffic.

Configure voice VLAN 2 on Switch A. Enable CDP compatibility of LLDP on Switch A to allow the Cisco IP phones to automatically configure the voice VLAN. The voice VLAN feature performs the following operations:

- Confines the voice traffic to the voice VLAN.
- Isolates the voice traffic from other types of traffic.

Figure 6 Network diagram



Procedure

1. Configure a voice VLAN on Switch A:

Create VLAN 2.

```
<SwitchA> system-view
[SwitchA] vlan 2
[SwitchA-vlan2] quit
```

Set the link type of GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to trunk, and enable voice VLAN on them.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] port link-type trunk
[SwitchA-GigabitEthernet1/0/1] voice-vlan 2 enable
[SwitchA-GigabitEthernet1/0/1] quit
[SwitchA] interface gigabitethernet 1/0/2
[SwitchA-GigabitEthernet1/0/2] port link-type trunk
[SwitchA-GigabitEthernet1/0/2] voice-vlan 2 enable
[SwitchA-GigabitEthernet1/0/2] quit
```

2. Configure CDP-compatible LLDP on Switch A:

Enable LLDP globally, and enable CDP compatibility globally.

```
[SwitchA] lldp global enable
[SwitchA] lldp compliance cdp
```

Enable LLDP on GigabitEthernet 1/0/1. By default, LLDP is enabled on ports.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] lldp enable
```

Configure LLDP to operate in TxRx mode on GigabitEthernet 1/0/1.

```
[SwitchA-GigabitEthernet1/0/1] lldp admin-status txrx
```

Configure CDP-compatible LLDP to operate in TxRx mode on GigabitEthernet 1/0/1.

```
[SwitchA-GigabitEthernet1/0/1] lldp compliance admin-status cdp txrx
[SwitchA-GigabitEthernet1/0/1] quit
```

Enable LLDP on GigabitEthernet 1/0/2. By default, LLDP is enabled on ports.

```
[SwitchA] interface gigabitethernet 1/0/2
[SwitchA-GigabitEthernet1/0/2] lldp enable
```

Configure LLDP to operate in TxRx mode on GigabitEthernet 1/0/2.

```
[SwitchA-GigabitEthernet1/0/2] lldp admin-status txrx
```

Configure CDP-compatible LLDP to operate in TxRx mode on GigabitEthernet 1/0/2.

```
[SwitchA-GigabitEthernet1/0/2] lldp compliance admin-status cdp txrx
[SwitchA-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Verify that Switch A has completed the following operations:

- Discovering the IP phones connected to GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.
- Obtaining IP phone information.

```
[SwitchA] display lldp neighbor-information

CDP neighbor-information of port 1[GigabitEthernet1/0/1]:

Configuring L2PT

About L2PT

Layer 2 Protocol Tunneling (L2PT) can transparently send Layer 2 protocol packets from geographically dispersed customer networks across a service provider network or drop them.

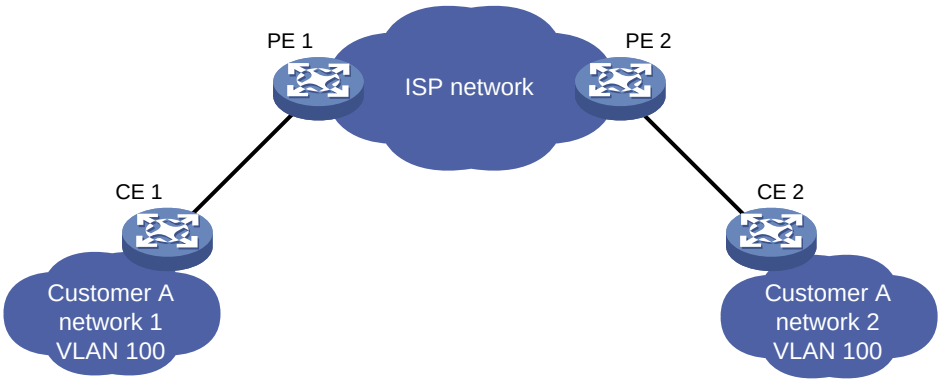
L2PT application scenario

Dedicated lines are used in a service provider network to build user-specific Layer 2 networks. As a result, a customer network contains sites located at different sides of the service provider network.

As shown in Figure 1, Customer A's network is divided into network 1 and network 2, which are connected by the service provider network. For Customer A's network to implement Layer 2 protocol calculations, the Layer 2 protocol packets must be transmitted across the service provider network.

Upon receiving a Layer 2 protocol packet, the PEs cannot determine whether the packet is from the customer network or the service provider network. They must deliver the packet to the CPU for processing. In this case, the Layer 2 protocol calculation in Customer A's network is mixed with the Layer 2 protocol calculation in the service provider network. Neither the customer network nor the service provider network can implement independent Layer 2 protocol calculations.

Figure 1 L2PT application scenario



L2PT is introduced to resolve the problem. L2PT provides the following functions:

- Multicasts Layer 2 protocol packets from a customer network in a VLAN. Dispersed customer networks can complete an independent Layer 2 protocol calculation, which is transparent to the service provider network.
- Isolates Layer 2 protocol packets from different customer networks through different VLANs.

Supported protocols

H3C devices support L2PT for the following protocols:

- CDP.
- CFD.
- DLDP.
- EOAM.
- GVRP.

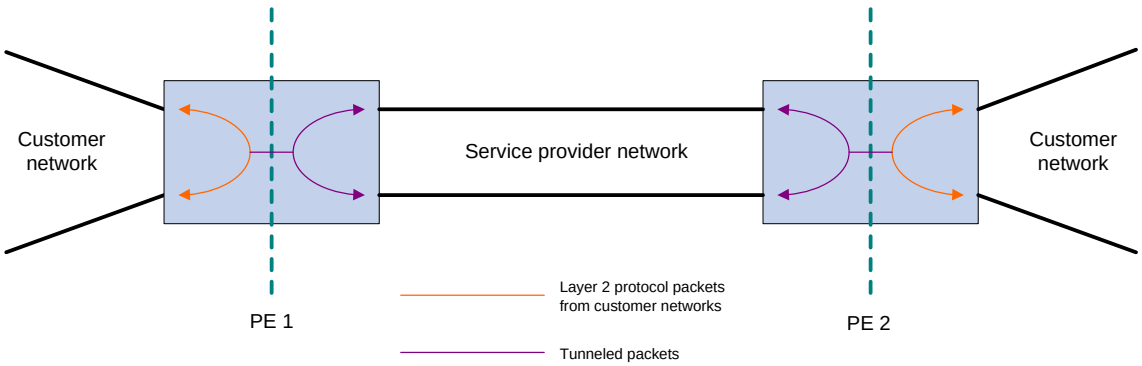
- LACP.
- LLDP.
- MVRP.
- PAgP.
- PVST.
- STP (including STP, RSTP, and MSTP).
- UDLD.
- VTP.

L2PT operating mechanism

As shown in Figure 2, L2PT operates as follows:

- When a port of PE 1 receives a Layer 2 protocol packet from the customer network in a VLAN, it performs the following operations:
  - Multicasts the packet out of all customer-facing ports in the VLAN except the receiving port.
  - Encapsulates the packet with a specified destination multicast address, and multicasts it out of all ISP-facing ports in the VLAN. The encapsulated packet is called the BPDU tunneled packet.
- When a port of PE 2 in the VLAN receives the tunneled packet from the service provider network, it performs the following operations:
  - Multicasts the packet out of all ISP-facing ports in the VLAN except the receiving port.
  - Decapsulates the packet and multicasts the decapsulated packet out of all customer-facing ports in the VLAN.

Figure 2 L2PT operating mechanism

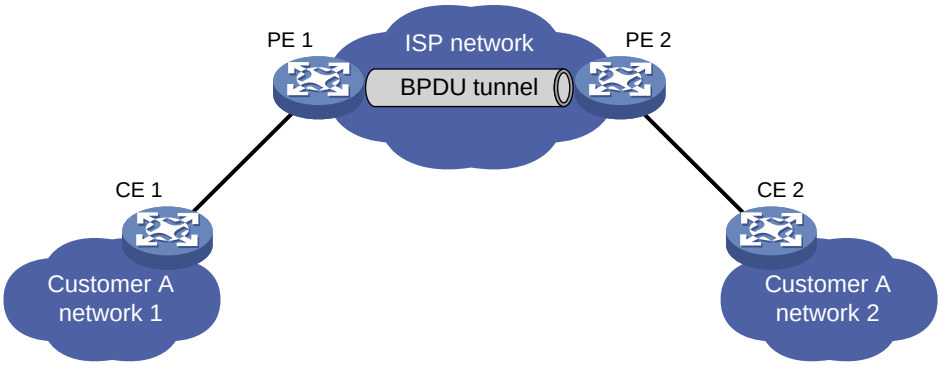


For example, as shown in Figure 3, PE 1 receives an STP packet (BPDU) from network 1 to network 2. CEs are the edge devices on the customer network, and PEs are the edge devices on the service provider network. L2PT processes the packet as follows:

1. PE 1 performs the following operations:
   a. Encapsulates the packet with a specified destination multicast MAC address (010f-e200-0003 by default).
   b. Sends the tunneled packet out of all ISP-facing ports in the packet's VLAN.
2. Upon receiving the tunneled packet, PE 2 decapsulates the packet and sends the BPDU to CE 2.

Through L2PT, both the ISP network and Customer A's network can perform independent spanning tree calculations.

Figure 3 L2PT network diagram



L2PT tasks at a glance

To configure L2PT, perform the following tasks:

1. Enabling L2PT

   This feature is applicable only to customer-facing ports.
2. (Optional.) Setting the destination multicast MAC address for tunneled packets

Enabling L2PT

Restrictions and guidelines for L2PT

- To enable L2PT for a Layer 2 protocol on a port, perform the following tasks:
  - Enable the protocol on the connected CE, and disable the protocol on the port.
  - When a PE establishes a connection to a network device within the service provider network through CDP, you must enable CDP compatibility for LLDP on the PE. CDP compatibility for LLDP can be enabled only globally, and cannot be disabled separately on customer-facing interfaces. As a result, the CDP packets from the CE cannot be transparently transmitted within the service provider network. In this case, as a best practice, do not enable L2PT for CDP on the PE. For L2PT to take effect on CDP on the PE, you must disable CDP compatibility for LLDP globally on the PE, which will cause the PE to fail to communicate with the network devices within the service provider network through CDP. Before you disable CDP compatibility for LLDP on the PE, make sure you know its influence on the network. For more information about CDP compatibility of LLDP, see "Configuring LLDP."
  - Disable the protocol (for example, STP) on the PE ports connecting to an aggregate interface on a CE when the following conditions exist:
    - The protocol is running on the aggregate interface on the CE.
    - The aggregate interface on the CE connects to an L2PT-enabled port on the PE.
  - Enable L2PT on PE ports connected to a customer network. If you enable L2PT on ports connected to the service provider network, L2PT determines that the ports are connected to a customer network.
  - Make sure the VLAN tags of Layer 2 protocol packets are not changed or deleted for the tunneled packets to be transmitted correctly across the service provider network.
- L2PT for LLDP supports LLDP packets from only nearest bridge agents.
- You can enable L2PT on a member port of a Layer 2 aggregation group, but the configuration does not take effect.

Enabling L2PT for a protocol in Layer 2 Ethernet interface view

Restrictions and guidelines

LACP and EOAM require point-to-point transmission. If you enable L2PT on a Layer 2 Ethernet interface for LACP or EOAM, L2PT multicasts LACP or EOAM packets out of customer-facing ports. As a result, the transmission between two CEs is not point-to-point. To ensure point-to-point transmission for the LACP or EOAM packets, you must configure other features (for example, VLAN).

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 Ethernet interface view.

   interface *interface-type interface-number*
3. Enable L2PT for a protocol.

   l2protocol { **cdp** | **cfd** | **dldp** | **dtp** | **eoam** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

   By default, L2PT is disabled for all protocols.

   The **dtp** and **cfd** keywords are supported only in Release 6331 and later.

Enabling L2PT for a protocol in Layer 2 aggregate interface view

1. Enter system view.

   system-view
2. Enter Layer 2 aggregate interface view.

   interface bridge-aggregation *interface-type interface-number*
3. Enable L2PT for a protocol.

   l2protocol { **cdp** | **cfd** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

   By default, L2PT is disabled for all protocols.

   The **cfd** keyword is supported only in Release 6331 and later.

Setting the destination multicast MAC address for tunneled packets

About the destination multicast MAC address for tunneled packets

The default destination multicast MAC address for tunneled packets is 010f-e200-0003. You can modify the destination multicast MAC address for tunneled packets of the specific protocol or all protocols.

Restrictions and guidelines

The **l2protocol tunnel-dmac** command sets the destination multicast MAC address for tunneled packets of all protocols. The **l2protocol type tunnel-dmac** command sets the

destination multicast MAC address for tunneled packets of the specified protocol. If both commands are executed, the **l2protocol type tunnel-dmac** command takes priority.

For tunneled packets to be recognized, set the same destination multicast MAC addresses for packets of the same protocol on PEs that are connected to the same customer network.

As a best practice, set different destination multicast MAC addresses on PEs connected to different customer networks. It prevents L2PT from sending packets of a customer network to another customer network.

Procedure

1. Enter system view.
   system-view
2. Perform at least one of the following tasks:
   - Set the destination multicast MAC address for tunneled packets of all protocols.
     l2protocol tunnel-dmac *mac-address*
   - Set the destination multicast MAC address for tunneled packets of the specified protocol.
     l2protocol type { **cdp** | **cfd** | **dldp** | **dtp** | **eoam** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel-dmac** *mac-address*
     This command is supported only in Release 6331 and later.

   By default, 010f-e200-0003 is used for tunneled packets.

Display and maintenance commands for L2PT

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display L2PT statistics.	**display l2protocol statistics** [**interface** *interface-type interface-number*]
Clear L2PT statistics.	**reset l2protocol statistics** [**interface** *interface-type interface-number*]

L2PT configuration examples

Example: Configuring L2PT for STP

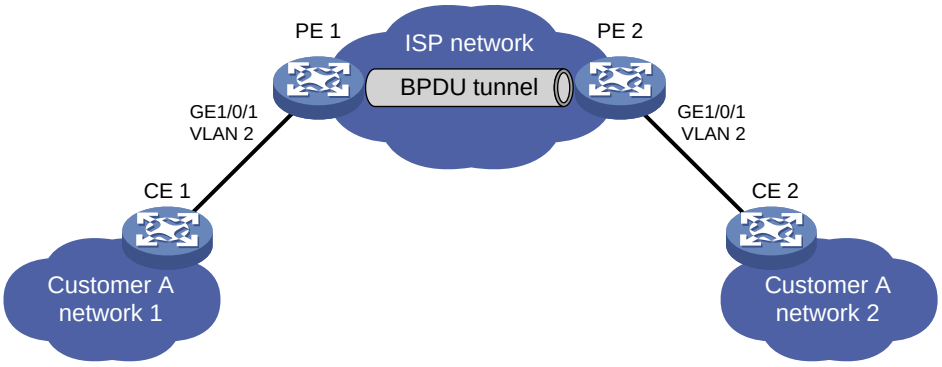
Network configuration

As shown in Figure 4, the MAC addresses of CE 1 and CE 2 are 00e0-fc02-5800 and 00e0-fc02-5802, respectively. MSTP is enabled in Customer A's network, and default MSTP settings are used.

Perform the following tasks on the PEs:

- Configure the ports that connect to CEs as access ports, and configure the ports in the service provider network as trunk ports. Configure ports in the service provider network to allow packets from any VLAN to pass.
- Enable L2PT for STP to enable Customer A's network to implement independent spanning tree calculation across the service provider network.
- Set the destination multicast MAC address to 0100-0ccd-cdd0 for tunneled packets.

Figure 4 Network diagram



Procedure

1. Configure PE 1:

   # Set the destination multicast address to 0100-0ccd-cdd0 for tunneled packets.

   ```
   <PE1> system-view
   [PE1] l2protocol tunnel-dmac 0100-0ccd-cdd0
   ```

   # Create VLAN 2.

   ```
   [PE1] vlan 2
   [PE1-vlan2] quit
   ```

   # Configure GigabitEthernet 1/0/1 as an access port and assign the port to VLAN 2.

   ```
   [PE1] interface gigabitethernet 1/0/1
   [PE1-GigabitEthernet1/0/1] port access vlan 2
   ```

   # Disable STP and enable L2PT for STP on GigabitEthernet 1/0/1.

   ```
   [PE1-GigabitEthernet1/0/1] undo stp enable
   [PE1-GigabitEthernet1/0/1] l2protocol stp tunnel dot1q
   [PE1-GigabitEthernet1/0/1] quit
   ```

   # Configure GigabitEthernet 1/0/2 connected to the service provider network as a trunk port, and assign the port to all VLANs.

   ```
   [PE1] interface gigabitethernet 1/0/2
   [PE1-GigabitEthernet1/0/2] port link-type trunk
   [PE1-GigabitEthernet1/0/2] port trunk permit vlan all
   [PE1-GigabitEthernet1/0/2] quit
   ```

2. Configure PE 2 in the same way PE 1 is configured. (Details not shown.)

Verifying the configuration

Verify that the root bridge of Customer A's network is CE 1.

```
<CE2> display stp root
 MST ID   Root Bridge ID       ExtPathCost IntPathCost Root Port
 0        32768.00e0-fc02-5800 0           0
```

Verify that the root bridge of the service provider network is not CE 1.

```
[PE1] display stp root
 MST ID   Root Bridge ID       ExtPathCost IntPathCost Root Port
 0        32768.0cda-41c5-ba50 0           0
```

Example: Configuring L2PT for LACP

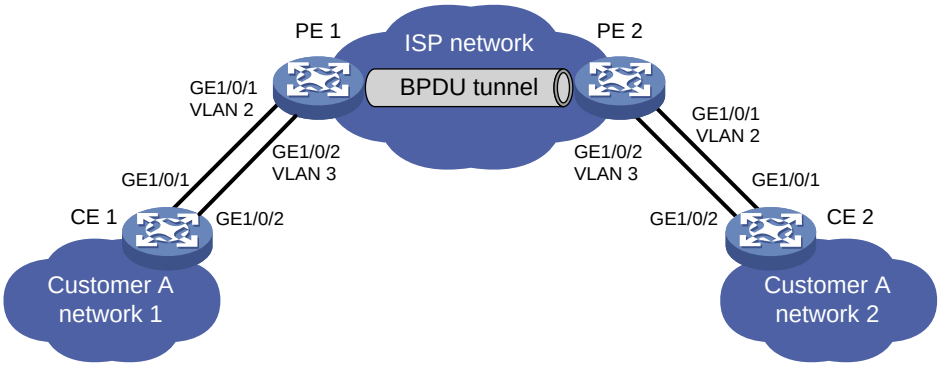
Network configuration

As shown in Figure 5, the MAC addresses of CE 1 and CE 2 are 0001-0000-0000 and 0004-0000-0000, respectively.

Perform the following tasks:

- Configure Ethernet link aggregation on CE 1 and CE 2.
- Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 on CE 1 to form aggregate links with GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 on CE 2, respectively.
- Enable L2PT for LACP to enable CE 1 and CE 2 to implement Ethernet link aggregation across the service provider network.

Figure 5 Network diagram



Requirements analysis

To meet the network requirements, perform the following tasks:

- For Ethernet link aggregation to operate correctly, configure VLANs on the PEs to ensure point-to-point transmission between CE 1 and CE 2 in an aggregation group.
  - Set the PVIDs to VLAN 2 and VLAN 3 for GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 on PE 1, respectively.
  - Configure PE 2 in the same way PE 1 is configured.
  - Configure ports that connect to the CEs as trunk ports.
- To retain the VLAN tag of the customer network, enable QinQ on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 on both PE 1 and PE 2.
- For packets from any VLAN to be transmitted, configure all ports in the service provider network as trunk ports.

Procedure

1. Configure CE 1:

Configure Layer 2 aggregation group Bridge-Aggregation 1 to operate in dynamic aggregation mode.

```
<CE1> system-view
[CE1] interface bridge-aggregation 1
[CE1-Bridge-Aggregation1] port link-type access
[CE1-Bridge-Aggregation1] link-aggregation mode dynamic
[CE1-Bridge-Aggregation1] quit
```

Assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to Bridge-Aggregation 1.

```
[CE1] interface gigabitethernet 1/0/1
```

```
[CE1-GigabitEthernet1/0/1] port link-aggregation group 1
[CE1-GigabitEthernet1/0/1] quit
[CE1] interface gigabitethernet 1/0/2
[CE1-GigabitEthernet1/0/2] port link-aggregation group 1
[CE1-GigabitEthernet1/0/2] quit
```

2. Configure CE 2 in the same way CE 1 is configured. (Details not shown.)

3. Configure PE 1:

Create VLANs 2 and 3.

```
<PE1> system-view
[PE1] vlan 2
[PE1-vlan2] quit
[PE1] vlan 3
[PE1-vlan3] quit
```

Configure GigabitEthernet 1/0/1 as a trunk port, assign the port to VLAN 2, and set the PVID to VLAN 2.

```
[PE1] interface gigabitethernet 1/0/1
[PE1-GigabitEthernet1/0/1] port link-mode bridge
[PE1-GigabitEthernet1/0/1] port link-type trunk
[PE1-GigabitEthernet1/0/1] port trunk permit vlan 2
[PE1-GigabitEthernet1/0/1] port trunk pvid vlan 2
```

Enable QinQ on GigabitEthernet 1/0/1.

```
[PE1-GigabitEthernet1/0/1] qinq enable
```

Enable L2PT for LACP on GigabitEthernet 1/0/1.

```
[PE1-GigabitEthernet1/0/1] l2protocol lacp tunnel dot1q
[PE1-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 as a trunk port, assign the port to VLAN 3, and set the PVID to VLAN 3.

```
[PE1] interface gigabitethernet 1/0/2
[PE1-GigabitEthernet1/0/2] port link-mode bridge
[PE1-GigabitEthernet1/0/2] port link-type trunk
[PE1-GigabitEthernet1/0/2] port trunk permit vlan 3
[PE1-GigabitEthernet1/0/2] port trunk pvid vlan 3
```

Enable QinQ on GigabitEthernet 1/0/2.

```
[PE1-GigabitEthernet1/0/2] qinq enable
```

Enable L2PT for LACP on GigabitEthernet 1/0/2.

```
[PE1-GigabitEthernet1/0/2] l2protocol lacp tunnel dot1q
[PE1-GigabitEthernet1/0/2] quit
```

4. Configure PE 2 in the same way PE 1 is configured. (Details not shown.)

Verifying the configuration

Verify that CE 1 and CE 2 have completed Ethernet link aggregation successfully.

```
[CE1] display link-aggregation member-port

Configuring PPPoE relay

About PPPoE

Point-to-Point Protocol over Ethernet (PPPoE) extends PPP by transporting PPP frames encapsulated in Ethernet over point-to-point links.

PPPoE specifies the methods for establishing PPPoE sessions and encapsulating PPP frames over Ethernet. PPPoE requires a point-to-point relationship between peers instead of a point-to-multipoint relationship as in multi-access environments such as Ethernet. PPPoE provides Internet access for the hosts in an Ethernet through a remote access device and implement access control, authentication, and accounting on a per-host basis. Integrating the low cost of Ethernet and scalability and management functions of PPP, PPPoE gained popularity in various application environments, such as residential access networks.

For more information about PPPoE, see RFC 2516.

PPPoE network structure

PPPoE uses the client/server model. The PPPoE client initiates a connection request to the PPPoE server. After session negotiation between them is complete, a session is established between them, and the PPPoE server provides access control, authentication, and accounting to the PPPoE client.

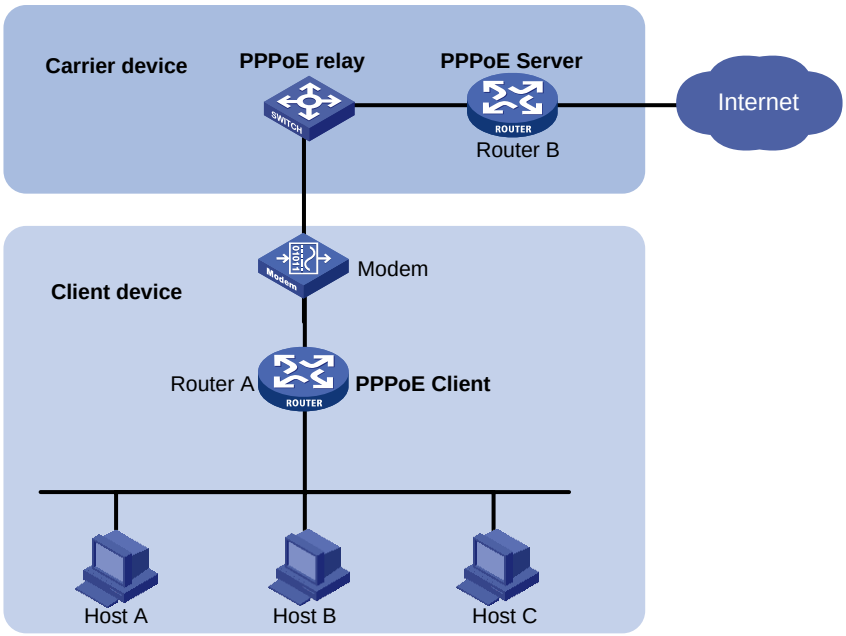
To granularly manage the PPPoE clients based on their location information, you can deploy a PPPoE relay between the PPPoE clients and PPPoE server.

PPPoE network structures are classified into router-initiated and host-initiated network structures depending on the starting point of the PPPoE session.

Router-initiated network structure

As shown in Figure 1, the PPPoE session is established between routers (Router A and Router B). All hosts share one PPPoE session for data transmission without being installed with PPPoE client software. This network structure is typically used by enterprises.

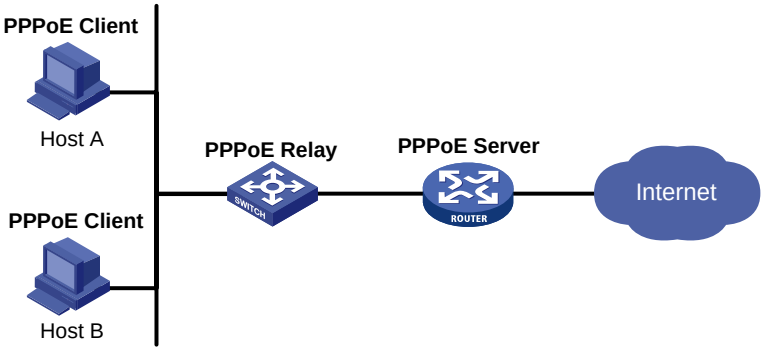
Figure 1 Router-initiated network structure



Host-initiated network structure

As shown in Figure 2, a PPPoE session is established between each host (PPPoE client) and the carrier router (PPPoE server). The service provider assigns an account to each host for billing and control. The host must be installed with PPPoE client software.

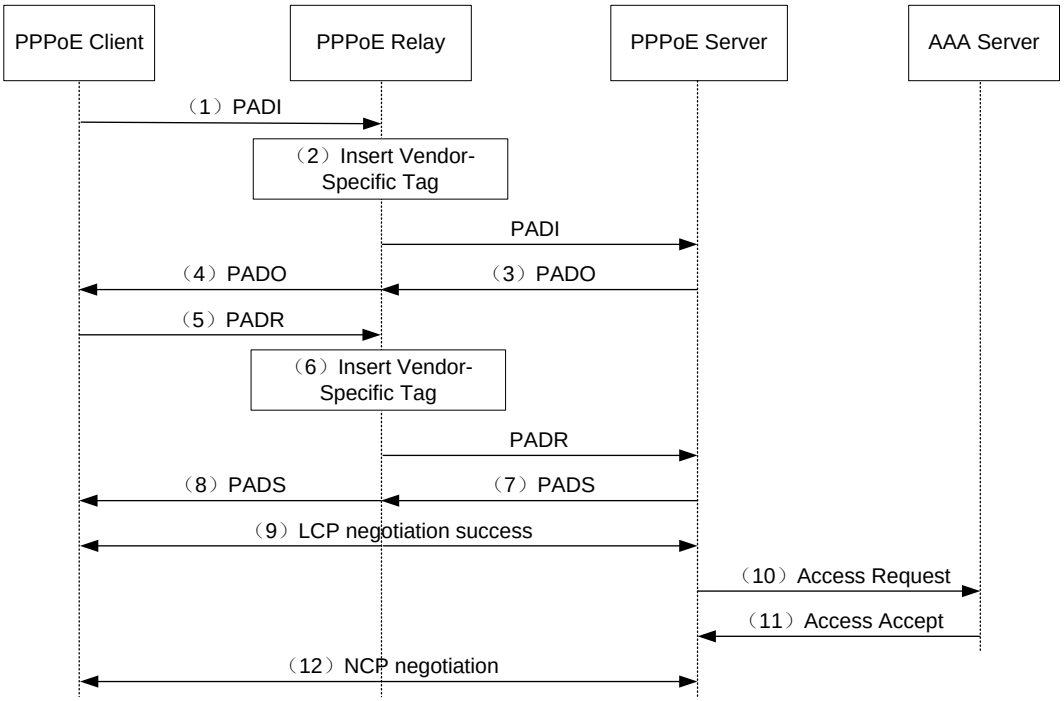
Figure 2 Host-initiated network structure



PPPoE relay fundamentals

The PPPoE relay controls protocol packet forwarding through monitoring the protocol packet exchange between the PPPoE client and the PPPoE server. Figure 3 shows the detailed process.

Figure 3 PPPoE client access procedure in a PPPoE relay network



1. The PPPoE client broadcasts a PADI packet.
2. When receiving the PADI packet, the PPPoE relay adds the vendor-specific tag field to the PADI packet and broadcasts the packet out of all trusted ports.

   The vendor-specific tag in a PPPoE packet identifies the location information (for example, the access port and VLANs) of a PPPoE client.
3. When receiving the PADI packets, the PPPoE server responds with a PADO packet to the PPPoE client.
4. When receiving the PADO packet, the PPPoE relay forwards the packet to the PPPoE client.
5. When receiving the PADO packet, the PPPoE client unicasts a PADR packet to the PPPoE server to apply for the PPPoE service.
6. When receiving the PADR packet, the PPPoE relay adds the vendor-specific tag to the packet and searches for an outgoing interface based on the destination MAC address of the PADR packet.
   - If the outgoing interface is a trusted port, the PPPoE relay forwards the packet out of the port.
   - If the outgoing interface is an untrusted port, the PPPoE relay drops the PADR packet.
7. When receiving the PADR packet, the PPPoE server assigns a session ID to the PPPoE client and binds the session ID to the vendor-specific tag. Then, the PPPoE server responds with a PADS packet to the PPPoE client.
8. When receiving the PADS packet, the PPPoE relay forwards the packet to the PPPoE client.
9. When receiving the PADS packet, the PPPoE client starts the LCP negotiation and authentication with the PPPoE server.
10. During the authentication phase, the PPPoE server will send the location information, username, and password of the PPPoE client to the RADIUS server for authentication.
11. The RADIUS server compares the location information, username, and password saved in the database with those of the PPPoE client. If they match, the PPPoE client passes the authentication.

12. After the PPPoE client passes authentication, the PPPoE client starts NCP negotiation with the PPPoE server. After the NCP negotiation succeeds, the PPPoE client successfully comes online.

Protocols and standards

RFC 2516: A Method for Transmitting PPP Over Ethernet (PPPoE)

Restrictions and guidelines for PPPoE

The switch series can act only as the PPPoE relay.

Configuring the PPPoE relay

PPPoE relay tasks at a glance

To configure the PPPoE relay, perform the following tasks:

1. Enabling the PPPoE relay function
2. Configuring PPPoE relay trusted ports
3. (Optional.) Enabling an interface to strip the vendor-specific tags of the PPPoE server-side packets
4. (Optional.) Configuring the circuit ID and remote ID padding formats for the client-side PPPoE packets on the PPPoE relay
5. (Optional.) Configuring the vendor-specific tag processing policy for the client-side PPPoE packets on the PPPoE relay

Enabling the PPPoE relay function

About the PPPoE relay function

For the PPPoE relay-related configurations to take effect, you must enable the PPPoE relay function.

Procedure

1. Enter system view.
   `system-view`
2. Enable the PPPoE relay function.
   `pppoe-relay enable`
   By default, the PPPoE relay function is disabled.

Configuring PPPoE relay trusted ports

About PPPoE relay trusted ports

A PPPoE relay-enabled device processes PPPoE protocol packets as follows:

- When receiving PADI, PADR, and PADT on untrusted ports, the device can forward the packets out of only the trusted ports.
- When receiving PADO and PADS packets on untrusted ports, the device directly drops the packets.

- When receiving PADO, PADS, and PADT packets on trusted ports, the device can forward the packets out of any port.
- When receiving PADI and PADR packets on trusted ports, the device can forward the packets out of only the trusted ports.

For a PPPoE relay to correctly forward and process PPPoE protocol packets, you must configure the PPPoE server-facing interfaces on the PPPoE relay as trusted ports, and configure the PPPoE client-facing interfaces on the PPPoE relay as untrusted ports.

Restrictions and guidelines

This command is not supported on Layer 2 aggregation group member ports. If a Layer 2 Ethernet interface is configured with this command before joining a Layer 2 aggregation group, the command is cleared on the member port after the member port joins the aggregation group.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 Ethernet interface view.

   interface *interface-type interface-number*
3. Configure the interface as a PPPoE relay trusted port.

   pppoe-relay trust

   By default, an interface is not configured as a PPPoE relay trusted port.

Enabling an interface to strip the vendor-specific tags of the PPPoE server-side packets

About stripping the vendor-specific tags of the PPPoE server-side packets

When the PPPoE relay receives PADO and PADS packets from the PPPoE server on a PPPoE relay trusted port with this feature enabled, the PPPoE relay strips the vendor-specific tags of the packets before forwarding the packets.

Restrictions and guidelines

This feature takes effect only on packets received on PPPoE relay trusted ports.

This command is not supported on Layer 2 aggregation group member ports. If a Layer 2 Ethernet interface is configured with this command before joining a Layer 2 aggregation group, the command is cleared on the member port after the member ports joins the aggregation group.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 Ethernet interface view.

   interface *interface-type interface-number*
3. Enable the interface to strip the vendor-specific tags of the PPPoE server-side packets.

   pppoe-relay server-information vendor-specific strip

   By default, the function of stripping vendor-specific tags of the PPPoE server-side packets is disabled.

Configuring the circuit ID and remote ID padding formats for the client-side PPPoE packets on the PPPoE relay

About the circuit ID and remote ID padding formats for the client-side PPPoE packets on the PPPoE relay

When the PPPoE relay receives PPPoE packets from the PPPoE client, the PPPoE relay pads the circuit ID and remote ID with the contents in the format configured by using this command.

Both the circuit ID and remote ID are of up to 63 characters. When the content to be padded exceeds 63 characters, the first 63 characters are padded.

Procedure

1. Enter system view.

   system-view

2. Configure the circuit ID and remote ID padding formats for the client-side PPPoE packets on the PPPoE relay.

   pppoe-relay client-information format { **circuit-id** | **remote-id** } { **ascii** | **hex** | **user-defined** *text* }

   By default, both the circuit ID padding format and the remote ID padding format for the client-side PPPoE packets are the ASCII string format on the PPPoE relay.

Configuring the vendor-specific tag processing policy for the client-side PPPoE packets on the PPPoE relay

About the vendor-specific tag processing policy for the client-side PPPoE packets on the PPPoE relay

When the PPPoE relay receives PADI or PADR packets, the PPPoE relay processes the packet according to whether the packets carry the vendor-specific tag and the configured vendor-specific tag processing policy. Then, the PPPoE relay sends the packets to the PPPoE server. Table 1 shows the detailed process.

Table 1 Vendor-specific tag processing policy on the PPPoE relay

Whether the received packets carry the vendor-specific tag	Vendor-specific tag processing policy	Processing for packets on the PPPoE relay
The received packets carry vendor-specific tag	Drop	Strips the vendor-specific tag and then forwards the packets.
	Keep	Keeps the vendor-specific tag unchanged and forwards the packets.
	Replace	Pads the vendor-specific tag in the configured format, replaces the original vendor-specific tag with the new vendor-specific tag, and forwards the packets.
The received packets do not carry vendor-specific tag	Drop	Directly forwards the packets.
	Keep	Directly forwards the packets.
	Replace	Pads the vendor-specific tag in the configured format, adds the new vendor-specific tag to the packets, and forwards the packets.

Restrictions and guidelines

This feature can be configured both in system view and in interface view. The configuration in system view takes effect on all interfaces. The configuration in interface view takes effect only on the current interface. The configuration in interface view takes precedence over the configuration in system view.

The processing policy takes effect only on incoming packets of interfaces.

This command is not supported on Layer 2 aggregation group member ports. If a Layer 2 Ethernet interface is configured with this command before joining a Layer 2 aggregation group, the command is cleared on the member port after the member ports joins the aggregation group.

Configuring the global vendor-specific tag processing policy for the client-side PADI and PADR packets on the PPPoE relay

1. Enter system view.

   system-view

2. Configure the global vendor-specific tag processing policy for the client-side PADI and PADR packets on the PPPoE relay.

   pppoe-relay client-information strategy { **drop** | **keep** | **replace** }

   By default, the global vendor-specific tag processing policy for the client-side PADI and PADR packets on the PPPoE relay is replace.

Configuring an interface-level vendor-specific tag processing policy for the client-side PADI and PADR packets on the PPPoE relay

1. Enter system view.

   system-view

2. Enter Layer 2 Ethernet interface view.

   interface *interface-type interface-number*

3. Configure the vendor-specific tag processing policy for the client-side PADI and PADR packets for the interface on the PPPoE relay.

   pppoe-relay client-information strategy { **drop** | **keep** | **replace** }

   By default, no vendor-specific tag processing policy for the client-side PADI and PADR packets is configured for an interface on the PPPoE relay.

Display and maintenance commands for PPPoE relay

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the vendor-specific tag processing configuration for client-side packets on the PPPoE relay.	**display pppoe-relay client-information** { **format** | **strategy** }
Display packet statistics for the PPPoE relay.	**display pppoe-relay statistics** [**interface** *interface-type interface-number*]
Clear packet statistics for the PPPoE relay.	**reset pppoe-relay statistics**

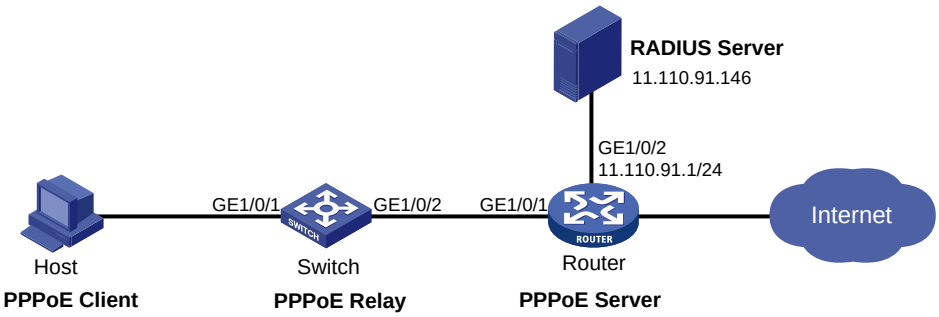
PPPoE configuration examples

Example: Configuring PPPoE relay

Network configuration

The host uses the PPPoE access method to connect to the router through the switch. The switch acts as the PPPoE relay. The router acts as the PPPoE server and assigns IPv4 addresses to the PPPoE client through a PPP address pool.

Figure 4 Network diagram



Procedure

1. Configure the switch as the PPPoE relay:

   # Enable the PPPoE relay function.

   ```
   <Switch> system-view
   [Switch] pppoe-relay enable
   ```

   # Configure the server-facing interface GigabitEthernet 1/0/2 as a PPPoE relay trusted port.

   ```
   [Switch] interface GigabitEthernet 1/0/2
   [Switch-GigabitEthernet1/0/2] pppoe-relay trust
   ```

2. Configure the router as a PPPoE server:

   # Create a PPPoE user.

   ```
   <Router> system-view
   [Router] local-user user1 class network
   [Router-luser-network-user1] password simple pass1
   [Router-luser-network-user1] service-type ppp
   [Router-luser-network-user1] quit
   ```

   # Configure Virtual-Template 1 to use CHAP for authentication and use a PPP address pool for IP address assignment. Set the DNS server IP address for the peer.

   ```
   [Router] interface virtual-template 1
   [Router-Virtual-Template1] ppp authentication-mode chap domain system
   [Router-Virtual-Template1] ppp chap user user1
   [Router-Virtual-Template1] remote address pool 1
   [Router-Virtual-Template1] ppp ipcp dns 8.8.8.8
   [Router-Virtual-Template1] quit
   ```

   # Configure a PPP address pool that contains nine assignable IP addresses, and configure a gateway address for the PPP address pool.

   ```
   [Router] ip pool 1 1.1.1.2 1.1.1.10
   [Router] ip pool 1 gateway 1.1.1.1
   ```

Enable the PPPoE server on GigabitEthernet 1/0/1, and bind the interface to Virtual-Template 1.

```
[Router] interface gigabitethernet 1/0/1
[Router-GigabitEthernet1/0/1] pppoe-server bind virtual-template 1
[Router-GigabitEthernet1/0/1] quit
```

Configure the default ISP domain (**system**) to use the RADIUS scheme for authentication, authorization, and accounting.

```
[Router] domain system
[Router-isp-system] authentication ppp radius-scheme rs1
[Router-isp-system] authorization ppp radius-scheme rs1
[Router-isp-system] accounting ppp radius-scheme rs1
[Router-isp-system] quit
```

Configure a RADIUS scheme, and specify the primary authentication server and the primary accounting server.

```
[Router] radius scheme rs1
[Router-radius-rs1] primary authentication 11.110.91.146
[Router-radius-rs1] primary accounting 11.110.91.146
```

Set the shared key for secure communication with the authentication and accounting servers to **expert** in plain text.

```
[Router-radius-rs1] key authentication simple expert
[Router-radius-rs1] key accounting simple expert
[Router-radius-rs1] quit
```

3. Configure the RADIUS server:
   a. Configure the authentication and accounting passwords as **expert**.
   b. Add a PPPoE user with username **user1** and password **123456**.

   For more information, see the user manual for the RADIUS server.

Verifying the configuration

Install the PPPoE client software and configure the username and password (**user1** and **pass1** in this example) on the hosts. Then, the hosts can use PPPoE to access the Internet through the router.

Layer 3—IP Services Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

New H3C Technologies Co., Ltd.

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This configuration guide describes the IP services fundamentals and configuration procedures.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring ARP

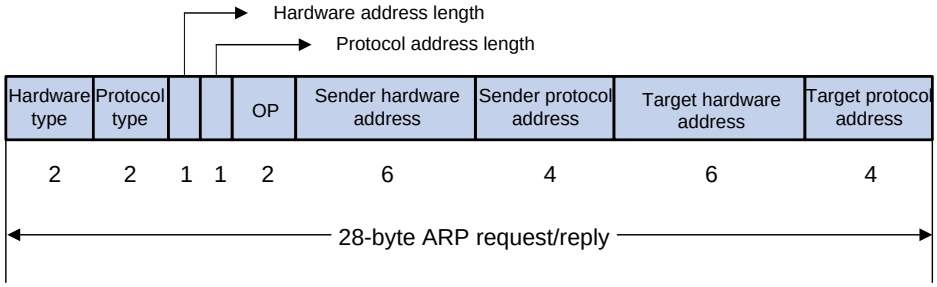
About ARP

ARP resolves IP addresses into MAC addresses on Ethernet networks.

ARP message format

ARP uses two types of messages: ARP request and ARP reply. Figure 1 shows the format of ARP request/reply messages. Numbers in the figure refer to field lengths.

Figure 1 ARP message format



- **Hardware type**—Hardware address type. The value 1 represents Ethernet.
- **Protocol type**—Type of the protocol address to be mapped. The hexadecimal value 0x0800 represents IP.
- **Hardware address length and protocol address length**—Length, in bytes, of a hardware address and a protocol address. For an Ethernet address, the value of the hardware address length field is 6. For an IPv4 address, the value of the protocol address length field is 4.
- **OP**—Operation code, which describes the type of ARP message. The value 1 represents an ARP request, and the value 2 represents an ARP reply.
- **Sender hardware address**—Hardware address of the device sending the message.
- **Sender protocol address**—Protocol address of the device sending the message.
- **Target hardware address**—Hardware address of the device to which the message is being sent.
- **Target protocol address**—Protocol address of the device to which the message is being sent.

ARP operating mechanism

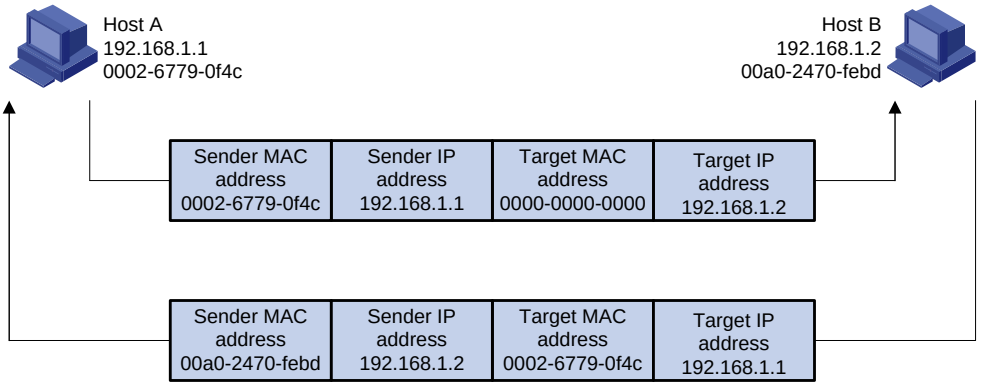
As shown in Figure 2, Host A and Host B are on the same subnet. Host A sends a packet to Host B as follows:

1. Host A looks through the ARP table for an ARP entry for Host B. If one entry is found, Host A uses the MAC address in the entry to encapsulate the IP packet into a data link layer frame. Then Host A sends the frame to Host B.
2. If Host A finds no entry for Host B, Host A buffers the packet and broadcasts an ARP request. The payload of the ARP request contains the following information:
   - **Sender IP address and sender MAC address**—Host A's IP address and MAC address.
   - **Target IP address**—Host B's IP address.
   - **Target MAC address**—An all-zero MAC address.

All hosts on this subnet can receive the broadcast request, but only the requested host (Host B) processes the request.

3. Host B compares its own IP address with the target IP address in the ARP request. If they are the same, Host B operates as follows:
   a. Adds the sender IP address and sender MAC address into its ARP table.
   b. Encapsulates its MAC address into an ARP reply.
   c. Unicasts the ARP reply to Host A.
4. After receiving the ARP reply, Host A operates as follows:
   a. Adds the MAC address of Host B into its ARP table.
   b. Encapsulates the MAC address into the packet and sends the packet to Host B.

Figure 2 ARP address resolution process



If Host A and Host B are on different subnets, Host A sends a packet to Host B as follows:

1. Host A broadcasts an ARP request where the target IP address is the IP address of the gateway.
2. The gateway responds with its MAC address in an ARP reply to Host A.
3. Host A uses the gateway's MAC address to encapsulate the packet, and then sends the packet to the gateway.
4. If the gateway has an ARP entry for Host B, it forwards the packet to Host B directly. If not, the gateway broadcasts an ARP request, in which the target IP address is the IP address of Host B.
5. After the gateway gets the MAC address of Host B, it sends the packet to Host B.

ARP entry types

An ARP table stores dynamic ARP entries, OpenFlow ARP entries, Rule ARP entries, and static ARP entries.

Dynamic ARP entry

ARP automatically creates and updates dynamic entries. A dynamic ARP entry is removed when its aging timer expires or the output interface goes down. In addition, a dynamic ARP entry can be overwritten by a static ARP entry.

Static ARP entry

A static ARP entry is manually configured and maintained. It does not age out and cannot be overwritten by any dynamic ARP entry.

Static ARP entries protect communication between devices because attack packets cannot modify the IP-to-MAC mapping in a static ARP entry.

The device supports the following types of static ARP entries:

- **Long static ARP entry**—It is directly used for forwarding packets. A long static ARP entry contains the IP address, MAC address, VLAN, and output interface.
- **Short static ARP entry**—It contains only the IP address and MAC address.

  If the output interface is a VLAN interface, the device sends an ARP request whose target IP address is the IP address in the short entry. If the sender IP and MAC addresses in the received ARP reply match the short static ARP entry, the device performs the following operations:
  - Adds the interface that received the ARP reply to the short static ARP entry.
  - Uses the resolved short static ARP entry to forward IP packets.
- **Multiport ARP entry**—It contains the IP address, MAC address, VLAN information.

  The device can use a multiport ARP entry that has the same MAC address, VLAN as a multicast or multiport unicast MAC address entry for packet forwarding. A multiport ARP entry is manually configured. It does not age out and cannot be overwritten by any dynamic ARP entry.

To communicate with a host by using a fixed IP-to-MAC mapping, configure a short static ARP entry on the device. To communicate with a host by using a fixed IP-to-MAC mapping through an interface in a VLAN, configure a long static ARP entry on the device.

OpenFlow ARP entry

ARP creates OpenFlow ARP entries by learning from the OpenFlow module. An OpenFlow ARP entry does not age out, and it cannot be updated. An OpenFlow ARP entry can be used directly to forward packets. For more information about OpenFlow, see *OpenFlow Configuration Guide*.

Rule ARP entry

Rule ARP entries can be directly used for packet forwarding. A Rule ARP entry does not age out, and it cannot be updated. It can be overwritten by a static ARP entry.

ARP creates Rule ARP entries by learning from the portal authentication module. For more information about portal authentication, see portal authentication configuration in *Security Configuration Guide.*

ARP tasks at a glance

All ARP tasks are optional.

- Configuring a static ARP entry
  - Configuring a short static ARP entry
  - Configuring a long static ARP entry
  - Configuring a multiport ARP entry
- Configuring features for dynamic ARP entries
  - Setting the dynamic ARP learning limit for a device
  - Setting the dynamic ARP learning limit for an interface
  - Setting the aging timer for dynamic ARP entries
  - Setting the maximum number of probes for dynamic ARP entries
  - Setting the interval for probing dynamic ARP entries
  - Enabling dynamic ARP entry check
- Synchronizing ARP entries across all member devices
- Enabling user information checking for ARP entries:
  - Enabling recording user IP address conflicts
  - Enabling interface consistency check between ARP and MAC address entries
  - Enabling recording user port migrations
- Enabling ARP logging

Configuring a static ARP entry

Static ARP entries are effective when the device functions correctly.

Configuring a short static ARP entry

Restrictions and guidelines

A resolved short static ARP entry becomes unresolved upon certain events, for example, when the resolved output interface goes down, or the corresponding VLAN or VLAN interface is deleted.

Procedure

1. Enter system view.
   system-view
2. Configure a short static ARP entry.
   arp static *ip-address mac-address*

Configuring a long static ARP entry

About long static ARP entries

Long static ARP entries can be effective or ineffective. Ineffective long static ARP entries cannot be used for packet forwarding. A long static ARP entry is ineffective when any of the following conditions exists:

- The IP address in the entry conflicts with a local IP address.
- No local interface has an IP address in the same subnet as the IP address in the ARP entry.

A long static ARP entry for a VLAN is deleted if the VLAN or VLAN interface is deleted.

Procedure

1. Enter system view.
   system-view
2. Configure a long static ARP entry.
   arp static *ip-address mac-address* [*vlan-id interface-type interface-number*]

Configuring a multiport ARP entry

About multiport ARP entries

A multiport ARP entry contains an IP address, MAC address, output interface, and VLAN ID information. The VLAN and output interfaces are specified by a multiport unicast MAC address entry or a multicast MAC address entry. For more information about multiport unicast MAC address entries, see *Layer—2 LAN Switching Configuration Guide*. For more information about multicast MAC address entries, see *IP Multicast Configuration Guide*.

A multiport ARP entry can overwrite a dynamic, short static or long static ARP entry. Conversely, a short static or long static ARP entry can overwrite a multiport ARP entry.

Restrictions and guidelines

For a multiport ARP entry to be effective for packet forwarding, make sure the following conditions are met:

- A multiport unicast MAC address entry or a multicast MAC address entry exists.

- The multiport ARP entry must have the same MAC address as the multiport unicast MAC address entry or the multicast MAC address entry.
- The IP address in the multiport ARP entry must reside on the same subnet as the VLAN interface of the specified VLAN.

If an aggregate interface is the output interface of an entry and its member ports reside on multiple IRF member devices, the device cannot use the entry to forward packets. To resolve this issue, set the global link-aggregation load sharing mode to a mode other than source or destination MAC address-based by using the **link-aggregation global load-sharing mode** command. For more information about this command, see Ethernet link aggregation in *Layer 2—LAN Switching Command Reference*.

Procedure

1. Enter system view.

   system-view
2. Configure a multiport unicast MAC address entry or a multicast MAC address entry.
   - In a common network, configure a multiport unicast MAC address entry.

     mac-address multiport *mac-address* **interface** *interface-list* **vlan** *vlan-id*
   - In a common network, configure a multicast MAC address entry.

     mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*
3. Configure a multiport ARP entry.

   arp multiport *ip-address mac-address vlan-id*

Configuring features for dynamic ARP entries

Setting the dynamic ARP learning limit for a device

About the dynamic ARP learning limit for a device

A device can dynamically learn ARP entries. To prevent a device from holding too many ARP entries, you can set the maximum number of dynamic ARP entries that the device can learn. When the limit is reached, the device stops ARP learning.

If you set a value lower than the number of existing dynamic ARP entries, the device does not delete the existing entries unless they age out. You can use the **reset arp dynamic** command to clear dynamic ARP entries.

Procedure

1. Enter system view.

   system-view
2. Set the dynamic ARP learning limit for the device.

   arp max-learning-number *max-number* **slot** *slot-number*

   The default setting varies by device model. For more information, see the command reference.

   To disable the device from dynamic ARP learning, set the value to 0.

Setting the dynamic ARP learning limit for an interface

About setting the dynamic ARP learning limit for an interface

An interface can dynamically learn ARP entries. To prevent an interface from holding too many ARP entries, you can set the maximum number of dynamic ARP entries that the interface can learn. When the limit is reached, the interface stops ARP learning.

You can set limits for both a Layer 2 interface and the VLAN interface for a permitted VLAN on the Layer 2 interface. The Layer 2 interface learns an ARP entry only when neither limit is reached.

The total dynamic ARP learning limit for all interfaces will not be higher than the dynamic ARP learning limit for the device.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the dynamic ARP learning limit for the interface.

   arp max-learning-num *max-number* [**alarm** *alarm-threshold*]

   The default setting varies by device model. For more information, see the command reference.

   To disable the interface from dynamic ARP learning, set the value to 0.

Setting the aging timer for dynamic ARP entries

About the aging timer for dynamic ARP entries

Each dynamic ARP entry in the ARP table has a limited lifetime, called an aging timer. The aging timer of a dynamic ARP entry is reset each time the dynamic ARP entry is updated. A dynamic ARP entry that is not updated before its aging timer expires is deleted from the ARP table.

You can set the aging timer for dynamic ARP entries in system view or in interface view. The aging timer set in interface view takes precedence over the aging timer set in system view.

Procedure

1. Enter system view.

   system-view
2. Set the aging timer for dynamic ARP entries.
   - Set the aging timer for dynamic ARP entries in system view.

     arp timer aging { *aging-minutes* | **second** *aging-seconds* }

     By default, the aging timer for dynamic ARP entries in system view is 20 minutes.
   - Execute the following commands in sequence to set the aging timer for dynamic ARP entries in interface view:

     interface *interface-type interface-number*

     arp timer aging { *aging-minutes* | **second** *aging-seconds* }

     By default, the aging timer for dynamic ARP entries in interface view is the aging timer set in system view.

Setting the maximum number of probes for dynamic ARP entries

About the maximum number of probes for dynamic ARP entries

This probe mechanism keeps legal dynamic ARP entries valid and avoids unnecessary ARP resolution during later traffic forwarding. It sends ARP requests for the IP address in a dynamic ARP entry.

- If the device receives an ARP reply before the entry aging timer expires, the device resets the aging timer.
- If the device does not receive any ARP reply after the maximum number of probes is made, the device deletes the entry when the entry aging timer expires.

You can set the maximum number of probes in system view or in interface view. The probe count set in interface view takes precedence over the probe count set in system view.

Procedure

1. Enter system view.

   system-view
2. Set the maximum number of probes for dynamic ARP entries.
   - Set the maximum number of probes for dynamic ARP entries in system view.

     arp timer aging probe-count *count*

     By default, the maximum number of probes in system view for dynamic ARP entries is 3.
   - Execute the following commands in sequence to set the maximum number of probes for dynamic ARP entries:

     interface *interface-type interface-number*

     arp timer aging probe-count *count*

     By default, the maximum number of probes in interface view for dynamic ARP entries is the maximum number of probes set in system view.

Setting the interval for probing dynamic ARP entries

About the interval for probing dynamic ARP entries

The probing feature keeps legal dynamic ARP entries valid and avoids unnecessary ARP resolution during later traffic forwarding.

Before a dynamic ARP entry is aged out, the device sends ARP requests for the IP address in the ARP entry.

- If the device receives an ARP reply during the probe interval, the device resets the aging timer.
- If the device does not receive any ARP reply during the probe interval, the device starts a new probe.
- If the maximum number probes are made, and still no ARP reply is received, the device deletes the entry.

You can set the probe interval in system view and in interface view. The probe interval in interface view takes precedence over the probe interval in system view.

Restrictions and guidelines

- If massive traffic exists in the network, set a long interval.
- During the dynamic ARP entry probing process, a dynamic ARP entry will not be deleted if its aging time expires. If a reply is received during the probe, the aging timer of the ARP entry is reset.

- For the device to perform the specified number of probes, make sure the following requirement is met:

  Aging time of the dynamic ARP entries > the maximum number of probes × probe interval

Procedure

1. Enter system view.

   system-view
2. Set the interval for probing dynamic ARP entries.
   - Set the interval for probing dynamic ARP entries in system view.

     arp timer aging probe-interval *interval*

     By default, the probe interval is 5 seconds.
   - Execute the following commands in sequence to set the interval for probing dynamic ARP entries:

     interface *interface-type interface-number*

     arp timer aging probe-interval *interval*

     By default, the probe interval depends on the setting in system view.

Enabling dynamic ARP entry check

About dynamic ARP entry check

The dynamic ARP entry check feature disables the device from supporting dynamic ARP entries that contain multicast MAC addresses. The device cannot learn dynamic ARP entries containing multicast MAC addresses. You cannot manually add static ARP entries containing multicast MAC addresses.

When dynamic ARP entry check is disabled, ARP entries containing multicast MAC addresses are supported. The device can learn dynamic ARP entries containing multicast MAC addresses obtained from the ARP packets sourced from a unicast MAC address. You can also manually add static ARP entries containing multicast MAC addresses.

Procedure

1. Enter system view.

   system-view
2. Enable dynamic ARP entry check.

   arp check enable

   By default, dynamic ARP entry check is enabled.

Synchronizing ARP entries across all member devices

About ARP entry synchronization

This task ensures that all IRF member devices in an IRF fabric have the same ARP entries.

Restrictions and guidelines

To synchronize ARP entries across all member devices in a timely manner, you can schedule the device to automatically execute the **arp smooth** command. For information about scheduling a task, see the device management configuration in *Fundamentals Configuration Guide*.

Procedure

To synchronize ARP entries from the master device to all subordinate devices, execute the following command in user view:

arp smooth

Enabling recording user IP address conflicts

About recording user IP address conflicts

This feature enables the device to detect and record user IP address conflicts. The device determines that a conflict occurs if an incoming non-gratuitous ARP packet has the same sender IP address as an existing ARP entry but a different sender MAC address. The device generates a user IP address conflict record, logs the conflict, and sends the log to the information center. For information about the log destination and output rule configuration in the information center, see the information center in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable recording user IP address conflicts.

   arp user-ip-conflict record enable

   The default differs depending on the software version, as shown below:

Versions	Default setting
Versions earlier than Release 6350	Recording user IP address conflicts is disabled.
Release 6350 and later	• If the device starts up with the initial configuration, recording user IP address conflicts is disabled. • If the device starts up with the factory defaults, recording user IP address conflicts is enabled.

Enabling interface consistency check between ARP and MAC address entries

About interface consistency check between ARP and MAC address entries

In an unstable network, the receiving interface for packets from a user might change. The interface in the MAC address entry can be updated immediately while the interface in the ARP entry cannot. In this case, the packets matching the ARP entry will be sent out of an incorrect interface. To solve this problem, you can use this feature to periodically check the interface consistency between the ARP and MAC address entry for a user. If the interfaces are not the same, ARP sends ARP requests in the VLAN of the ARP entry and updates the entry with the ARP reply receiving interface.

Use **display mac-address** to display MAC address entries. For more information about this command, see MAC address table in *Layer 2—LAN Switching Command Reference.*

Procedure

1. Enter system view.

   system-view

2. Enable interface consistency check between ARP and MAC address entries.

   arp mac-interface-consistency check enable

By default, interface consistency check between ARP and MAC address entries is disabled.

Enabling recording user port migrations

About recording user port migrations

This feature enables the device to detect and record user port migration events. A user port migrates if an incoming ARP packet has the same sender IP address and sender MAC address as an existing ARP entry but a different ingress port. The device generates a user port migration record, logs the migration event, sends the log to the information center, and updates the interface for the ARP entry. For information about the log destination and output rule configuration in the information center, see the information center in *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

To avoid device performance degradation, disable recording user port migrations if too many user port migration logs are generated.

Procedure

1. Enter system view.
   `system-view`
2. Enable recording user port migrations.
   `arp user-move record enable`
   By default, recording user port migrations is disabled.

Enabling ARP logging

About ARP logging

This feature enables a device to log ARP events when ARP cannot resolve IP addresses correctly. The log information helps administrators locate and solve problems. The device can log the following ARP events:

- On a proxy ARP-disabled interface, the target IP address of a received ARP packet is not one of the following IP addresses:
  - The IP address of the receiving interface.
  - The virtual IP address of the VRRP group.
- The sender IP address of a received ARP reply conflicts with one of the following IP addresses:
  - The IP address of the receiving interface.
  - The virtual IP address of the VRRP group.

The device sends ARP log messages to the information center. You can use the **`info-center source`** command to specify the log output rules for the information center. For more information about information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   `system-view`
2. Enable ARP logging.
   `arp check log enable`
   By default, ARP logging is disabled.

Display and maintenance commands for ARP

IMPORTANT:

Clearing ARP entries from the ARP table might cause communication failures. Make sure the entries to be cleared do not affect current communications.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display ARP entries.	**display arp** [[**all** | **dynamic** | **multiport** | **static**] [**slot** *slot-number*] | **vlan** *vlan-id* | **interface** *interface-type interface-number*] [**count** | **verbose**]
Display the maximum number of ARP entries that a device supports.	**display arp entry-limit**
Display the ARP entry for an IP address.	**display arp** *ip-address* [**slot** *slot-number*] [**verbose**]
Display the number of OpenFlow ARP entries.	**display arp openflow count** [**slot** *slot-number*]
Display the aging timer of dynamic ARP entries.	**display arp timer aging**
Display user IP address conflicts.	**display arp user-ip-conflict record** [**slot** *slot-number*]
Display user port migrations.	**display arp user-move record** [**slot** *slot-number*]
Clear ARP entries from the ARP table.	**reset arp** { **all** | **dynamic** | **interface** *interface-type interface-number* | **multiport** | **slot** *slot-number* | **static** }

ARP configuration examples

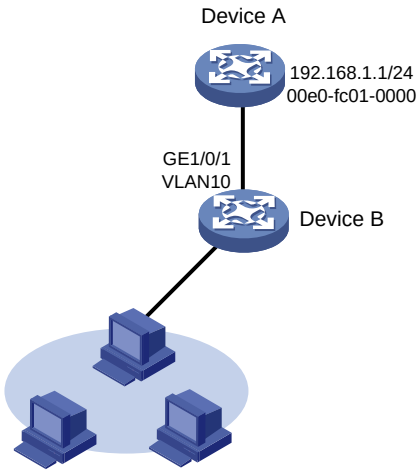
Example: Configuring a long static ARP entry

Network configuration

As shown in Figure 3, hosts are connected to Device B. Device B is connected to Device A through interface GigabitEthernet 1/0/1 in VLAN 10.

To ensure secure communications between Device A and Device B, configure a long static ARP entry for Device A on Device B.

Figure 3 Network diagram



Procedure

Create VLAN 10.

```
<DeviceB> system-view
[DeviceB] vlan 10
[DeviceB-vlan10] quit
```

Add interface GigabitEthernet 1/0/1 to VLAN 10.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port access vlan 10
[DeviceB-GigabitEthernet1/0/1] quit
```

Create VLAN-interface 10 and configure its IP address.

```
[DeviceB] interface vlan-interface 10
[DeviceB-vlan-interface10] ip address 192.168.1.2 8
[DeviceB-vlan-interface10] quit
```

Configure a long static ARP entry that has IP address 192.168.1.1, MAC address 00e0-fc01-0000, and output interface GigabitEthernet 1/0/1 in VLAN 10.

```
[DeviceB] arp static 192.168.1.1 00e0-fc01-0000 10 gigabitethernet 1/0/1
```

Verifying the configuration

Verify that Device B has a long static ARP entry for Device A.

```
[DeviceB] display arp static
  Type: S-Static   D-Dynamic   O-Openflow   R-Rule   M-Multiport  I-Invalid
IP address      MAC address    VLAN/VSI   Interface               Aging Type
192.168.1.1     00e0-fc01-0000 10         GE1/0/1                 --    S
```

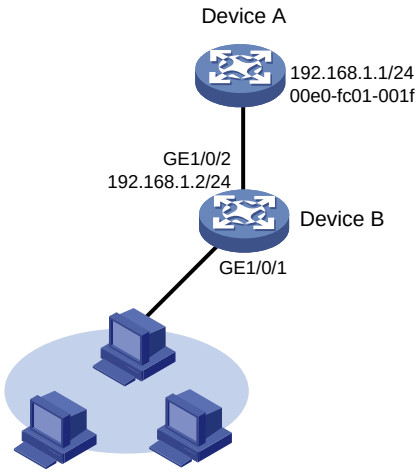
Example: Configuring a short static ARP entry

Network configuration

As shown in Figure 4, hosts are connected to Device B. Device B is connected to Device A through interface GigabitEthernet 1/0/2.

To ensure secure communications between Device A and Device B, configure a short static ARP entry for Device A on Device B.

Figure 4 Network diagram



Procedure

Configure an IP address for GigabitEthernet 1/0/2.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] ip address 192.168.1.2 24
[DeviceB-GigabitEthernet1/0/2] quit
```

Configure a short static ARP entry that has IP address 192.168.1.1 and MAC address 00e0-fc01-001f.

```
[DeviceB] arp static 192.168.1.1 00e0-fc01-001f
```

Verifying the configuration

Verify that Device B has a short static ARP entry for Device A

```
[DeviceB] display arp static
  Type: S-Static   D-Dynamic   O-Openflow   R-Rule   M-Multiport  I-Invalid
IP address      MAC address    VLAN/VSI   Interface               Aging Type
192.168.1.1     00e0-fc01-001f --         --                      --    S
```

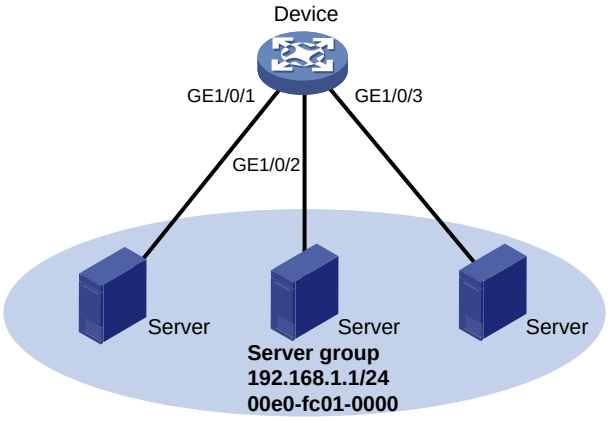
Example: Configuring a multiport ARP entry

Network configuration

As shown in Figure 5, a device connects to three servers through interfaces GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 in VLAN 10. The servers share the IP address 192.168.1.1/24 and MAC address 00e0-fc01-0000.

Configure a multiport ARP entry so that the device sends IP packets with the destination IP address 192.168.1.1 to the three servers.

Figure 5 Network diagram



Procedure

Create VLAN 10.

```
<Device> system-view
[Device] vlan 10
[Device-vlan10] quit
```

Add GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 to VLAN 10.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] port access vlan 10
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] port access vlan 10
[Device-GigabitEthernet1/0/2] quit
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] port access vlan 10
[Device-GigabitEthernet1/0/3] quit
```

Create VLAN-interface 10 and specify its IP address.

```
[Device] interface vlan-interface 10
[Device-vlan-interface10] ip address 192.168.1.2 24
[Device-vlan-interface10] quit
```

Configure a multiport unicast MAC address entry that has MAC address 00e0-fc01-0000, and output interfaces GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 in VLAN 10.

```
[Device] mac-address multiport 00e0-fc01-0000 interface gigabitethernet 1/0/1 to
gigabitethernet 1/0/3 vlan 10
```

Configure a multiport ARP entry with IP address 192.168.1.1 and MAC address 00e0-fc01-0000.

```
[Device] arp multiport 192.168.1.1 00e0-fc01-0000 10
```

Verifying the configuration

Verify that the device has a multiport ARP entry with IP address 192.168.1.1 and MAC address 00e0-fc01-0000.

```
[Device] display arp
  Type: S-Static   D-Dynamic   O-Openflow   R-Rule   M-Multiport  I-Invalid
IP address      MAC address    VLAN/VSI   Interface               Aging Type
192.168.1.1     00e0-fc01-0000 10         --                      --    M
```

Configuring gratuitous ARP

About gratuitous ARP

In a gratuitous ARP packet, the sender IP address and the target IP address are the IP address of the sending device.

A device sends a gratuitous ARP packet for either of the following purposes:

- Determine whether its IP address is already used by another device. If the IP address is already used, the device is informed of the conflict by an ARP reply.
- Inform other devices of a MAC address change.

IP conflict detection

When an interface obtains an IP address, the device broadcasts gratuitous ARP packets in the LAN where the interface resides. If the device receives an ARP reply, its IP address conflicts with the IP address of another device in the LAN. The device displays a log message about the conflict and informs the administrator to change the IP address. The device will not use the conflicting IP address. If no ARP reply is received, the device uses the IP address.

Gratuitous ARP packet learning

This feature enables a device to create or update ARP entries by using the sender IP and MAC addresses in received gratuitous ARP packets.

When this feature is disabled, the device uses received gratuitous ARP packets to update existing ARP entries only. ARP entries are not created based on the received gratuitous ARP packets, which saves ARP table space.

Periodic sending of gratuitous ARP packets

Periodic sending of gratuitous ARP packets helps downstream devices update ARP entries or MAC entries in a timely manner.

This feature can implement the following functions:

- Prevent gateway spoofing.

  Gateway spoofing occurs when an attacker uses the gateway address to send gratuitous ARP packets to the hosts on a network. The traffic destined for the gateway from the hosts is sent to the attacker instead. As a result, the hosts cannot access the external network.

  To prevent such gateway spoofing attacks, you can enable the gateway to send gratuitous ARP packets at intervals. Gratuitous ARP packets contain the primary IP address and manually configured secondary IP addresses of the gateway, so hosts can learn correct gateway information.
- Prevent ARP entries from aging out.

  If network traffic is heavy or if the host CPU usage is high, received ARP packets can be discarded or are not promptly processed. Eventually, the dynamic ARP entries on the receiving host age out. The traffic between the host and the corresponding devices is interrupted until the host re-creates the ARP entries.

  To prevent this problem, you can enable the gateway to send gratuitous ARP packets periodically. Gratuitous ARP packets contain the primary IP address and manually configured

secondary IP addresses of the gateway, so the receiving hosts can update ARP entries in a timely manner.

- Prevent the virtual IP address of a VRRP group from being used by a host.

  The master router of a VRRP group can periodically send gratuitous ARP packets to the hosts on the local network. The hosts can then update local ARP entries and avoid using the virtual IP address of the VRRP group. The sender MAC address in the gratuitous ARP packet is the virtual MAC address of the virtual router. For more information about VRRP, see *High Availability Configuration Guide*.

Gratuitous ARP tasks at a glance

All gratuitous ARP tasks are optional. If all of the following features are disabled, gratuitous ARP still provides the IP conflict detection function.

- Enabling IP conflict notification
- Enabling gratuitous ARP packet learning
- Enabling periodic sending of gratuitous ARP packets
- Enabling sending gratuitous ARP packets for ARP requests with sender IP address on a different subnet
- Configuring gratuitous ARP packet retransmission for the device MAC address change

Enabling IP conflict notification

About IP conflict notification

Upon detecting an IP conflict, the device will sends a gratuitous ARP request. By default, the device displays an error message only after it receives an ARP reply. You can enable this feature to allow the device to display an error message immediately upon detecting an IP conflict.

Procedure

1. Enter system view.

   `system-view`
2. Enable IP conflict notification.

   `arp ip-conflict log prompt`

   The default differs depending on the software version, as shown below:

Versions	Default setting
Versions earlier than Release 6350	IP conflict notification is disabled.
Release 6350 and later	• If the device starts up with the initial configuration, IP conflict notification is disabled. • If the device starts up with the factory defaults, IP conflict notification is enabled.

Enabling gratuitous ARP packet learning

1. Enter system view.

   `system-view`
2. Enable gratuitous ARP packet learning.

   `gratuitous-arp-learning enable`

By default, gratuitous ARP packet learning is enabled.

Enabling periodic sending of gratuitous ARP packets

Restrictions and guidelines

- You can enable periodic sending of gratuitous ARP packets on a maximum of 1024 interfaces.
- Periodic sending of gratuitous ARP packets takes effect on an interface only when the following conditions are met:
  - The data link layer state of the interface is up.
  - The interface has an IP address.
- If you change the sending interval for gratuitous ARP packets, the configuration takes effect at the next sending interval.
- The sending interval for gratuitous ARP packets might be much longer than the specified sending interval in any of the following circumstances:
  - This feature is enabled on multiple interfaces.
  - Each interface is configured with multiple secondary IP addresses.
  - A small sending interval is configured when the previous two conditions exist.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable periodic sending of gratuitous ARP packets.
   arp send-gratuitous-arp [**interval** *interval*]
   By default, periodic sending of gratuitous ARP packets is disabled.

Enabling sending gratuitous ARP packets for ARP requests with sender IP address on a different subnet

1. Enter system view.
   system-view
2. Enable the device to send gratuitous ARP packets upon receiving ARP requests whose sender IP address belongs to a different subnet.
   gratuitous-arp-sending enable
   By default, a device does not send gratuitous ARP packets upon receiving ARP requests whose sender IP address belongs to a different subnet.

Configuring gratuitous ARP packet retransmission for the device MAC address change

About gratuitous ARP packet retransmission for the device MAC address change

The device sends a gratuitous ARP packet to inform other devices of its MAC address change. However, the other devices might fail to receive the packet because the device sends the gratuitous ARP packet once only by default. Configure the gratuitous ARP packet retransmission feature to ensure that the other devices can receive the packet.

Procedure

1. Enter system view.

   system-view

2. Set the times and the interval for retransmitting a gratuitous ARP packet for the device MAC address change.

   gratuitous-arp mac-change retransmit *times* **interval** *seconds*

   By default, the device sends a gratuitous packet to inform its MAC address change once only.

Configuring proxy ARP

About proxy ARP

Proxy ARP enables a device on one network to answer ARP requests for an IP address on another network. With proxy ARP, hosts on different broadcast domains can communicate with each other as they would on the same broadcast domain.

Proxy ARP includes common proxy ARP and local proxy ARP.

- **Common proxy ARP**—Allows communication between hosts that connect to different Layer 3 interfaces and reside in different broadcast domains.
- **Local proxy ARP**—Allows communication between hosts that connect to the same Layer 3 interface and reside in different broadcast domains.

Enabling common proxy ARP

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   Only VLAN interfaces are supported.
3. Enable common proxy ARP.
   proxy-arp enable
   By default, common proxy ARP is disabled.

Enabling local proxy ARP

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   Only VLAN interfaces are supported.
3. Enable local proxy ARP.
   local-proxy-arp enable [**ip-range** *start-ip-address* **to** *end-ip-address*]
   By default, local proxy ARP is disabled.

Display and maintenance commands for proxy ARP

Execute **display** commands in any view.

Task	Command
Display common proxy ARP	**display proxy-arp** [**interface** *interface-type*

Task	Command
status.	*interface-number*]
Display local proxy ARP status.	**display local-proxy-arp** [**interface** *interface-type interface-number*]

Common proxy ARP configuration example

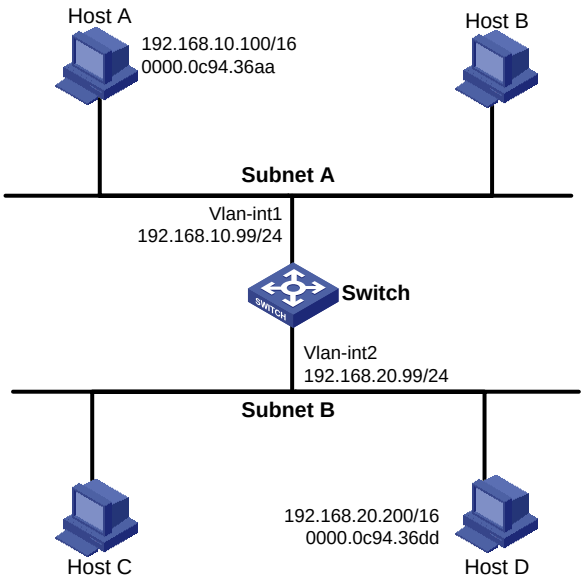
Example: Configuring common proxy ARP

Network configuration

As shown in Figure 6, Host A and Host D have the same IP prefix and mask, but they are located on different subnets separated by the switch. Host A belongs to VLAN 1, and Host D belongs to VLAN 2. No default gateway is configured on Host A and Host D.

Configure common proxy ARP on the switch to enable communication between the two hosts.

Figure 6 Network diagram



Procedure

Create VLAN 2.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] quit
```

Configure the IP address of VLAN-interface 1.

```
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] ip address 192.168.10.99 255.255.255.0
```

Enable common proxy ARP on VLAN-interface 1.

```
[Switch-Vlan-interface1] proxy-arp enable
[Switch-Vlan-interface1] quit
```

Configure the IP address of VLAN-interface 2.

```
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ip address 192.168.20.99 255.255.255.0
```

Enable common proxy ARP on VLAN-interface 2.

```
[Switch-Vlan-interface2] proxy-arp enable.
```

Verifying the configuration

Verify that Host A and Host D can ping each other.

Configuring ARP snooping

About ARP snooping

ARP snooping is used in Layer 2 switching networks. It creates ARP snooping entries by using information in ARP packets. MFF can use the ARP snooping entries. For more information about MFF, see *Security Configuration Guide*.

Creation of ARP snooping entries

If you enable ARP snooping for a VLAN, ARP packets received in the VLAN are redirected to the CPU. For the VLAN, the CPU uses the sender IP and MAC addresses of the ARP packets, and the receiving VLAN and port to create ARP snooping entries.

Aging of ARP snooping entries

The aging timer and valid period of an ARP snooping entry are 25 minutes and 15 minutes. If an ARP snooping entry is not updated in 12 minutes, the device sends an ARP request. The ARP request uses the IP address of the entry as the target IP address. If an ARP snooping entry is not updated in 15 minutes, it becomes invalid and cannot be used. After that, if an ARP packet matching the entry is received, the entry becomes valid, and its aging timer restarts.

If the aging timer of an ARP snooping entry expires, the entry is removed.

Protection for ARP snooping

An attack occurs if an ARP packet has the same sender IP address as a valid ARP snooping entry but a different sender MAC address. The ARP snooping entry becomes invalid, and it is removed in 1 minute.

Enabling ARP snooping for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable ARP snooping for the VLAN.
   arp snooping enable
   By default, ARP snooping is disabled for a VLAN.

Display and maintenance commands for ARP snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display ARP snooping entries.	**display arp snooping vlan** [*vlan-id*] [**slot** *slot-number*] [**count**] **display arp snooping vlan ip** *ip-address* [**slot** *slot-number*]
Delete ARP snooping entries.	**reset arp snooping vlan** [*vlan-id*] **reset arp snooping vlan ip** *ip-address*

Configuring ARP direct route advertisement

About ARP direct route advertisement

This feature generates host routes based on ARP entries for packet forwarding and route advertisement.

Enabling ARP direct route advertisement

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the ARP direct route advertisement feature.
   arp route-direct advertise
   By default, the ARP direct route advertisement feature is disabled.

Contents

Configuring IP addressing

About IP addressing

The IP addresses in this chapter refer to IPv4 addresses unless otherwise specified.

IP address representation and classes

IP addressing uses a 32-bit address to identify each host on an IPv4 network. To make addresses easier to read, they are written in dotted decimal notation, each address being four octets in length. For example, address 00001010000000010000000100000001 in binary is written as 10.1.1.1.

Each IP address breaks down into the following sections:

- **Net ID**—Identifies a network. The first several bits of a net ID, known as the class field or class bits, identify the class of the IP address.
- **Host ID**—Identifies a host on a network.

IP addresses are divided into five classes, as shown in Figure 1. The shaded areas represent the address class. The first three classes are most commonly used.

Figure 1 IP address classes

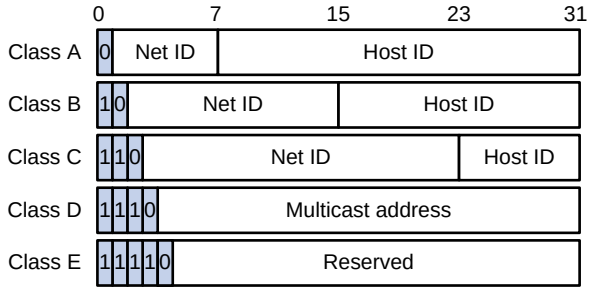


Table 1 IP address classes and ranges

Class	Address range	Remarks
A	0.0.0.0 to 127.255.255.255	The IP address 0.0.0.0 is used by a host at startup for temporary communication. This address is never a valid destination address. Addresses starting with 127 are reserved for loopback test. Packets destined to these addresses are processed locally as input packets rather than sent to the link.
B	128.0.0.0 to 191.255.255.255	N/A
C	192.0.0.0 to 223.255.255.255	N/A
D	224.0.0.0 to 239.255.255.255	Multicast addresses.
E	240.0.0.0 to 255.255.255.255	Reserved for future use, except for the broadcast address 255.255.255.255.

Special IP addresses

The following IP addresses are for special use and cannot be used as host IP addresses:

- **IP address with an all-zero net ID**—Identifies a host on the local network. For example, IP address 0.0.0.16 indicates the host with a host ID of 16 on the local network.
- **IP address with an all-zero host ID**—Identifies a network.
- **IP address with an all-one host ID**—Identifies a directed broadcast address. For example, a packet with the destination address of 192.168.1.255 will be broadcast to all the hosts on the network 192.168.1.0.

Subnetting and masking

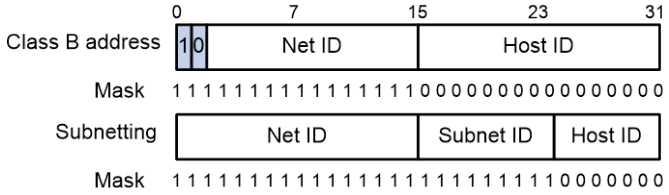
Subnetting divides a network into smaller networks called subnets by using some bits of the host ID to create a subnet ID.

Masking identifies the boundary between the host ID and the combination of net ID and subnet ID.

Each subnet mask comprises 32 bits that correspond to the bits in an IP address. In a subnet mask, consecutive ones represent the net ID and subnet ID, and consecutive zeros represent the host ID.

Before being subnetted, Class A, B, and C networks use these default masks (also called natural masks): 255.0.0.0, 255.255.0.0, and 255.255.255.0, respectively.

Figure 2 Subnetting a Class B network



Subnetting increases the number of addresses that cannot be assigned to hosts. Therefore, using subnets means accommodating fewer hosts.

For example, a Class B network without subnetting can accommodate 1022 more hosts than the same network subnetted into 512 subnets.

- **Without subnetting**—65534 (2^{16} – 2) hosts. (The two deducted addresses are the broadcast address, which has an all-one host ID, and the network address, which has an all-zero host ID.)
- **With subnetting**—Using the first nine bits of the host-id for subnetting provides 512 (2^{9}) subnets. However, only seven bits remain available for the host ID. This allows 126 (2^{7} – 2) hosts in each subnet, a total of 64512 (512 × 126) hosts.

IP address assignment

The following are methods available for assigning an IP address to an interface:

- Manual assignment. This chapter describes only manual IP address assignment for interfaces.
- BOOTP. For information about BOOTP, see "Configuring the BOOTP client."
- DHCP. For information about DHCP, see "Configuring the DHCP client."

These methods are mutually exclusive. If you change the IP address assignment method, the new IP address will overwrite the previous address.

Assigning an IP address to an interface

About manual IP address assignment

An interface can have one primary address and multiple secondary addresses.

Typically, you need to configure a primary IP address for an interface. If the interface connects to multiple subnets, configure primary and secondary IP addresses on the interface so the subnets can communicate with each other through the interface.

In an IRF fabric, you can assign an IP address to the management Ethernet port of each member in the management Ethernet port view of the master. Only the IP address assigned to the management Ethernet port of the master takes effect. After an IRF fabric split, the IP addresses assigned to the management Ethernet ports of the new masters (original subordinates) take effect. Then you can use these IP addresses to log in to the new masters for troubleshooting.

Restrictions and guidelines

- An interface can have only one primary IP address. If you execute the **ip address** command multiple times to specify different primary IP addresses on an interface, the most recent configuration takes effect.
- You cannot assign secondary IP addresses to an interface that obtains an IP address through IP unnumbered, BOOTP, or DHCP.
- The primary and secondary IP addresses assigned to the interface can be located on the same network segment. Different interfaces on your device must reside on different network segments.
- After an IRF split, the routing information on the original master might not be updated immediately. As a result, the management Ethernet port of the original master cannot be pinged from the master (original subordinate) in another IRF fabric. To resolve the problem, wait until route synchronization between the devices is completed or enable NSR for the routing protocol. For information about NSR, see *Layer 3—IP Routing Configuration Guide*.
- The following commands are mutually exclusive. You can configure only one of these commands to assign an IP address to the management Ethernet port of the IRF master.
  - The **ip address** command with the **irf-member** *member-id* option that specifies the master.
  - The **ip address** command that does not contain the **irf-member** *member-id* option.
  - The **ip address dhcp-alloc** command.
- You can assign interfaces IP addresses that have different masks but the same network address if ANDed with the shortest mask. For example, 1.1.1.1/16 and 1.1.2.1/24 have the same network address 1.1.0.0 if ANDed with 255.255.0.0. You can assign the IP addresses to two interfaces on the device. By default, users connected to the two interfaces cannot communicate with each other. For the users to communicate, you must configure common proxy ARP on the device. For more information, see "Configuring proxy ARP."

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Assign an IP address to the interface.

   ip address *ip-address* { *mask-length* | *mask* } [**irf-member** *member-id* | **sub**]

   By default, no IP address is assigned to the interface.

To assign an IP address to the management Ethernet port of an IRF member device, enter the master's management Ethernet port view and specify the **irf-member** *member-id* option.

Configuring IP unnumbered

About IP unnumbered

You can configure an interface to borrow an IP address from other interfaces. This is called IP unnumbered, and the interface borrowing the IP address is called IP unnumbered interface.

You can use IP unnumbered to save IP addresses when available IP addresses are inadequate or when an interface is used only occasionally.

Restrictions and guidelines

- Loopback interfaces cannot borrow IP addresses of other interfaces, but other interfaces can borrow IP addresses of loopback interfaces.
- An interface cannot borrow an IP address from an unnumbered interface.
- Multiple interfaces can use the same unnumbered IP address.
- If an interface has multiple manually configured IP addresses, only the manually configured primary IP address can be borrowed.
- A dynamic routing protocol cannot be enabled on the interface where IP unnumbered is configured. To enable the interface to communicate with other devices, configure a static route to the peer device on the interface.

Prerequisites

Assign an IP address to the interface from which you want to borrow the IP address. Alternatively, you can configure the interface to obtain one through BOOTP, or DHCP.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify the interface to borrow the IP address of the specified interface.
   ip address unnumbered interface *interface-type interface-number*
   By default, the interface does not borrow IP addresses from other interfaces.

Display and maintenance commands for IP addressing

Execute **display** commands in any view.

Task	Command
Display IP configuration and statistics for the specified or all Layer 3 interfaces.	**display ip interface** [*interface-type interface-number*]
Display brief IP configuration for Layer 3 interfaces.	**display ip interface** [*interface-type* [*interface-number*]] **brief** [**description**]

IP addressing configuration examples

Example: Manually specifying an IP address

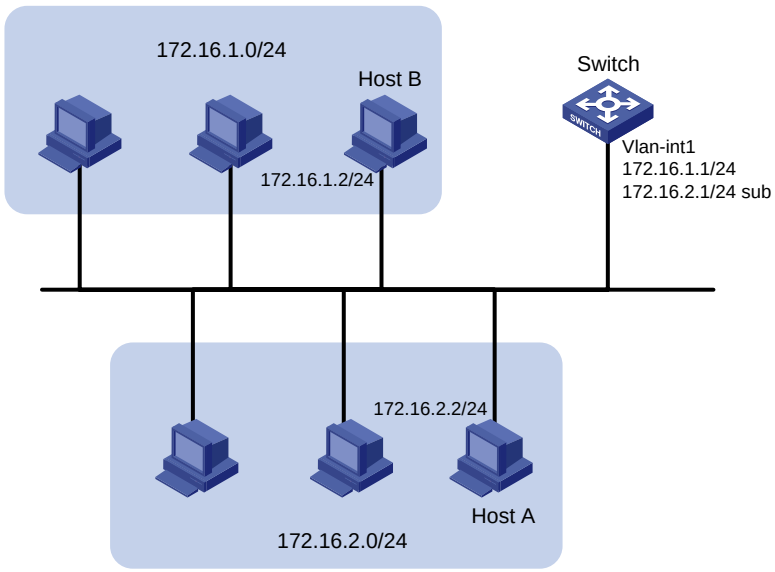
Network configuration

As shown in Figure 3, a port in VLAN 1 on a switch is connected to a LAN comprising two segments: 172.16.1.0/24 and 172.16.2.0/24.

To enable the hosts on the two network segments to communicate with the external network through the switch, and to enable the hosts on the LAN to communicate with each other:

- Assign a primary IP address and a secondary IP address to VLAN-interface 1 on the switch.
- Set the primary IP address of the switch as the gateway address of the PCs on subnet 172.16.1.0/24, and set the secondary IP address of the switch as the gateway address of the PCs on subnet 172.16.2.0/24.

Figure 3 Network diagram



Procedure

Assign a primary IP address and a secondary IP address to VLAN-interface 1.

```
<Switch> system-view
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] ip address 172.16.1.1 255.255.255.0
[Switch-Vlan-interface1] ip address 172.16.2.1 255.255.255.0 sub
```

Set the gateway address to 172.16.1.1 on the PCs attached to subnet 172.16.1.0/24, and to 172.16.2.1 on the PCs attached to subnet 172.16.2.0/24.

Verifying the configuration

Verify the connectivity between a host on subnet 172.16.1.0/24 and the switch.

```
<Switch> ping 172.16.1.2
Ping 172.16.1.2 (172.16.1.2): 56 data bytes, press CTRL_C to break
56 bytes from 172.16.1.2: icmp_seq=0 ttl=128 time=7.000 ms
56 bytes from 172.16.1.2: icmp_seq=1 ttl=128 time=2.000 ms
56 bytes from 172.16.1.2: icmp_seq=2 ttl=128 time=1.000 ms
```

```
56 bytes from 172.16.1.2: icmp_seq=3 ttl=128 time=1.000 ms
56 bytes from 172.16.1.2: icmp_seq=4 ttl=128 time=2.000 ms
--- Ping statistics for 172.16.1.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.000/2.600/7.000/2.245 ms
```

Verify the connectivity between a host on subnet 172.16.2.0/24 and the switch.

```
<Switch> ping 172.16.2.2
Ping 172.16.2.2 (172.16.2.2): 56 data bytes, press CTRL_C to break
56 bytes from 172.16.2.2: icmp_seq=0 ttl=128 time=2.000 ms
56 bytes from 172.16.2.2: icmp_seq=1 ttl=128 time=7.000 ms
56 bytes from 172.16.2.2: icmp_seq=2 ttl=128 time=1.000 ms
56 bytes from 172.16.2.2: icmp_seq=3 ttl=128 time=2.000 ms
56 bytes from 172.16.2.2: icmp_seq=4 ttl=128 time=1.000 ms
--- Ping statistics for 172.16.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.000/2.600/7.000/2.245 ms
```

Verify the connectivity between a host on subnet 172.16.1.0/24 and a host on subnet 172.16.2.0/24. The ping operation succeeds.

Contents

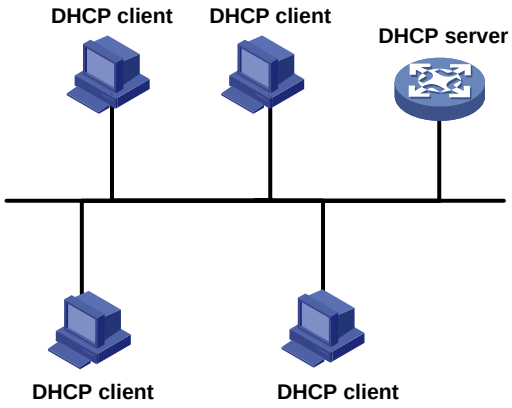
DHCP overview

DHCP network model

The Dynamic Host Configuration Protocol (DHCP) provides a framework to assign configuration information to network devices.

Figure 1 shows a typical DHCP application scenario where the DHCP clients and the DHCP server reside on the same subnet. The DHCP clients can also obtain configuration parameters from a DHCP server on another subnet through a DHCP relay agent. For more information about the DHCP relay agent, see "Configuring the DHCP relay agent."

Figure 1 A typical DHCP application



DHCP address allocation

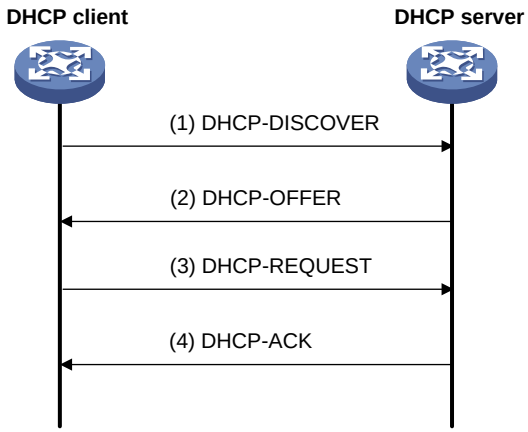
Allocation mechanisms

DHCP supports the following allocation mechanisms:

- **Static allocation**—The network administrator assigns an IP address to a client, such as a WWW server, and DHCP conveys the assigned address to the client.
- **Automatic allocation**—DHCP assigns a permanent IP address to a client.
- **Dynamic allocation**—DHCP assigns an IP address to a client for a limited period of time, which is called a lease. Most DHCP clients obtain their addresses in this way.

IP address allocation process

Figure 2 IP address allocation process



As shown in Figure 2, a DHCP server assigns an IP address to a DHCP client in the following process:

1. The client broadcasts a DHCP-DISCOVER message to locate a DHCP server.
2. Each DHCP server offers configuration parameters such as an IP address to the client in a DHCP-OFFER message. The sending mode of the DHCP-OFFER is determined by the flag field in the DHCP-DISCOVER message. For more information, see "DHCP message format."
3. If the client receives multiple offers, it accepts the first received offer, and broadcasts it in a DHCP-REQUEST message to formally request the IP address. (IP addresses offered by other DHCP servers can be assigned to other clients.)
4. All DHCP servers receive the DHCP-REQUEST message. However, only the server selected by the client does one of the following operations:
   - Returns a DHCP-ACK message to confirm that the IP address has been allocated to the client.
   - Returns a DHCP-NAK message to deny the IP address allocation.

After receiving the DHCP-ACK message, the client verifies the following details before using the assigned IP address:

- The assigned IP address is not in use. To verify this, the client broadcasts a gratuitous ARP packet. The assigned IP address is not in use if no response is received within the specified time.
- The assigned IP address is not on the same subnet as any IP address in use on the client.

Otherwise, the client sends a DHCP-DECLINE message to the server to request an IP address again.

IP address lease extension

A dynamically assigned IP address has a lease. When the lease expires, the IP address is reclaimed by the DHCP server. To continue using the IP address, the client must extend the lease duration.

When about half of the lease duration elapses, the DHCP client unicasts a DHCP-REQUEST to the DHCP server to extend the lease. Depending on the availability of the IP address, the DHCP server returns one of the following messages:

- A DHCP-ACK unicast confirming that the client's lease duration has been extended.
- A DHCP-NAK unicast denying the request.

If the client receives no reply, it broadcasts another DHCP-REQUEST message for lease extension when about seven-eighths of the lease duration elapses. Again, depending on the availability of the IP address, the DHCP server returns either a DHCP-ACK unicast or a DHCP-NAK unicast.

DHCP message format

Figure 3 shows the DHCP message format. DHCP uses some of the fields in significantly different ways. The numbers in parentheses indicate the size of each field in bytes.

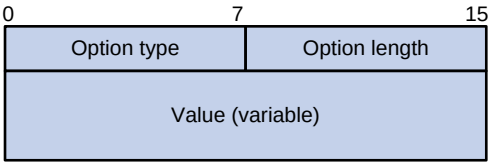
Figure 3 DHCP message format

- **op**—Message type defined in options field. 1 = REQUEST, 2 = REPLY
- **htype**, **hlen**—Hardware address type and length of the DHCP client.
- **hops**—Number of relay agents a request message traveled.
- **xid**—Transaction ID, a random number chosen by the client to identify an IP address allocation.
- **secs**—Filled in by the client, the number of seconds elapsed since the client began address acquisition or renewal process. This field is reserved and set to 0.
- **flags**—The leftmost bit is defined as the BROADCAST (B) flag. If this flag is set to 0, the DHCP server sent a reply back by unicast. If this flag is set to 1, the DHCP server sent a reply back by broadcast. The remaining bits of the flags field are reserved for future use.
- **ciaddr**—Client IP address if the client has an IP address that is valid and usable. Otherwise, set to zero. (The client does not use this field to request an IP address to lease.)
- **yiaddr**—Your IP address. It is an IP address assigned by the DHCP server to the DHCP client.
- **siaddr**—Server IP address, from which the client obtained configuration parameters.
- **giaddr**—Gateway IP address. It is the IP address of the first relay agent to which a request message travels.
- **chaddr**—Client hardware address.
- **sname**—Server host name, from which the client obtained configuration parameters.
- **file**—Boot file (also called system software image) name and path information, defined by the server to the client.
- **options**—Optional parameters field that is variable in length. Optional parameters include the message type, lease duration, subnet mask, domain name server IP address, and WINS IP address.

DHCP options

DHCP extends the message format as an extension to BOOTP for compatibility. DHCP uses the options field to carry information for dynamic address allocation and provide additional configuration information for clients.

Figure 4 DHCP option format



Common DHCP options

The following are common DHCP options:

- **Option 3**—Router option. It specifies the gateway address to be assigned to the clients.
- **Option 6**—DNS server option. It specifies the DNS server IP address to be assigned to the clients.
- **Option 33**—Static route option. It specifies a list of classful static routes (the destination addresses in these static routes are classful) that a client should add into its routing table. If both Option 33 and Option 121 exist, Option 33 is ignored.
- **Option 51**—IP address lease option.
- **Option 53**—DHCP message type option. It identifies the type of the DHCP message.
- **Option 55**—Parameter request list option. It is used by a DHCP client to request specified configuration parameters. The option includes values that correspond to the parameters requested by the client.
- **Option 60**—Vendor class identifier option. A DHCP client uses this option to identify its vendor. A DHCP server uses this option to distinguish DHCP clients, and assigns IP addresses to them.
- **Option 66**—TFTP server name option. It specifies the TFTP server domain name to be assigned to the clients.
- **Option 67**—Boot file name option. It specifies the boot file name to be assigned to the client.
- **Option 121**—Classless route option. It specifies a list of classless static routes (the destination addresses in these static routes are classless) that a client should add into its routing table. If both Option 33 and Option 121 exist, Option 33 is ignored.
- **Option 150**—TFTP server IP address option. It specifies the TFTP server IP address to be assigned to the clients.

For more information about DHCP options, see RFC 2132 and RFC 3442.

Custom DHCP options

Some options, such as Option 43, Option 82, and Option 184, have no standard definitions in RFC 2132.

Vendor-specific option (Option 43)

Option 43 function

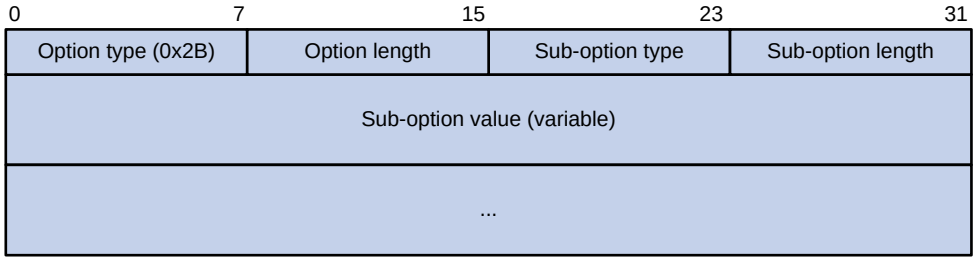
DHCP servers and clients use Option 43 to exchange vendor-specific configuration information.

The DHCP client can obtain the following information through Option 43:

- ACS parameters, including the ACS URL, username, and password.
- Service provider identifier, which is acquired by the CPE from the DHCP server and sent to the ACS for selecting vender-specific configurations and parameters. For more information about CPE and ACS, see *Network Management and Monitoring Configuration Guide*.
- PXE server address, which is used to obtain the boot file or other control information from the PXE server.

Option 43 format

Figure 5 Option 43 format



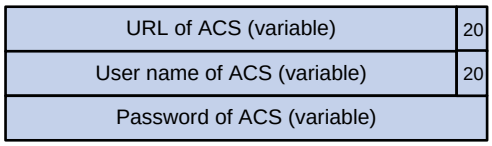
Network configuration parameters are carried in different sub-options of Option 43 as shown in Figure 5.

- **Sub-option type**—The field value can be 0x01 (ACS parameter sub-option), 0x02 (service provider identifier sub-option), or 0x80 (PXE server address sub-option).
- **Sub-option length**—Excludes the sub-option type and sub-option length fields.
- **Sub-option value**—The value format varies by sub-option.

Sub-option value field format

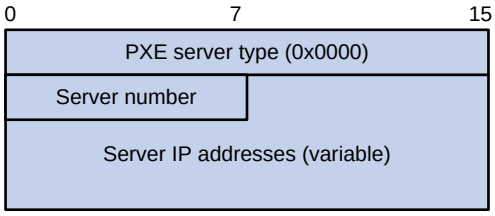
- **ACS parameter sub-option value field**—Includes the ACS URL, username, and password separated by spaces (hexadecimal number 20) as shown in Figure 6.

  Figure 6 ACS parameter sub-option value field

- **Service provider identifier sub-option value field**—Includes the service provider identifier.
- **PXE server address sub-option value field**—Includes the PXE server type that can only be 0, the server number that indicates the number of PXE servers contained in the sub-option, and server IP addresses, as shown in Figure 7.

Figure 7 PXE server address sub-option value field



Relay agent option (Option 82)

Option 82 is the relay agent option. It records the location information about the DHCP client. When a DHCP relay agent or DHCP snooping device receives a client's request, it adds Option 82 to the request and sends it to the server.

The administrator can use Option 82 to locate the DHCP client and further implement security control and accounting. The DHCP server can use Option 82 to provide individual configuration policies for the clients.

Option 82 can include a maximum of 255 sub-options and must include a minimum of one sub-option. Option 82 supports the following sub-options: sub-option 1 (Circuit ID), sub-option 2 (Remote ID), sub-option 5 (Link Selection), and sub-option 9 (Vendor-Specific). Option 82 has no standard definition. Its padding formats vary by vendor.

- Circuit ID has the following padding modes:
  - **String padding mode**—Includes a character string specified by the user.
  - **Normal padding mode**—Includes the VLAN ID and interface number of the interface that receives the client's request.
  - **Verbose padding mode**—Includes the access node identifier specified by the user, and the VLAN ID, interface number and interface type of the interface that receives the client's request.
- Remote ID has the following padding modes:
  - **String padding mode**—Includes a character string specified by the user.
  - **Normal padding mode**—Includes the MAC address of the DHCP relay agent interface or the MAC address of the DHCP snooping device that receives the client's request.
  - **Sysname padding mode**—Includes the name of the device. To set the device name, use the **sysname** command in system view.
- The Link Selection sub-option carries the IP address in the **giaddr** field or the IP address of a relay interface. If you use the **dhcp relay source-address** { *ip-address* | **interface** *interface-type interface-number* } command, you must enable the DHCP relay agent to support Option 82. This sub-option will then be included in Option 82.
- The Vendor-Specific sub-option supports only the bas padding mode. The padding content includes the user-configured access node identifier and the VLAN ID, interface number, and interface type of the interface that receives the client's request. This sub-option is supported only on DHCP snooping devices.

Option 184

Option 184 is a reserved option. You can define the parameters in the option as needed. The device supports Option 184 carrying voice related parameters, so a DHCP client with voice functions can get voice parameters from the DHCP server.

Option 184 has the following sub-options:

- **Sub-option 1**—Specifies the IP address of the primary network calling processor. The primary processor acts as the network calling control source and provides program download services. For Option 184, you must define sub-option 1 to make other sub-options take effect.
- **Sub-option 2**—Specifies the IP address of the backup network calling processor. DHCP clients contact the backup processor when the primary one is unreachable.
- **Sub-option 3**—Specifies the voice VLAN ID and the result whether the DHCP client takes this VLAN as the voice VLAN.
- **Sub-option 4**—Specifies the failover route that includes the IP address and the number of the target user. A SIP VoIP user uses this IP address and number to directly establish a connection to the target SIP user when both the primary and backup calling processors are unreachable.

Protocols and standards

- RFC 3442, *The Classless Static Route Option for Dynamic Host Configuration Protocol (DHCP) version 4*

Configuring the DHCP server

About DHCP server

A DHCP server manages a pool of IP addresses and client configuration parameters. It selects an IP address and configuration parameters from the address pool and allocates them to a requesting DHCP client.

DHCP address assignment mechanisms

Configure the following address assignment mechanisms as needed:

- **Static address allocation**—Manually bind the MAC address or ID of a client to an IP address in a DHCP address pool. When the client requests an IP address, the DHCP server assigns the IP address in the static binding to the client.
- **Dynamic address allocation**—Specify IP address ranges in a DHCP address pool. Upon receiving a DHCP request, the DHCP server dynamically selects an IP address from the matching IP address range in the address pool.

You can specify IP address ranges in an address pool by using either of the following methods:

- **Method 1**—A primary subnet being divided into multiple address ranges in an address pool
- **Method 2**—A primary subnet and multiple secondary subnets in an address pool

A primary subnet being divided into multiple address ranges in an address pool

An address range includes a common IP address range and IP address ranges for DHCP user classes.

Upon receiving a DHCP request, the DHCP server finds a user class matching the client and selects an IP address in the address range of the user class for the client. A user class can include multiple matching rules, and a client matches the user class as long as it matches any of the rules. In address pool view, you can specify different address ranges for different user classes.

The DHCP server selects an IP address for a client by performing the following steps:

1. DHCP server compares the client against DHCP user classes in the order they are configured.
2. If the client matches a user class, the DHCP server selects an IP address from the address range of the user class.
3. If the matching user class has no assignable addresses, the DHCP server compares the client against the next user class. If all the matching user classes have no assignable addresses, the DHCP server selects an IP address from the common address range.
4. If the DHCP client does not match any DHCP user class, the DHCP server selects an address in the IP address range specified by the **`address range`** command. If the address range has no assignable IP addresses or it is not configured, the address allocation fails.

NOTE:

All address ranges must belong to the primary subnet. If an address range does not reside on the primary subnet, DHCP cannot assign the addresses in the address range.

A primary subnet and multiple secondary subnets in an address pool

The DHCP server selects an IP address from the primary subnet first. If there is no assignable IP address on the primary subnet, the DHCP server selects an IP address from secondary subnets in the order they are configured.

Principles for selecting an address pool

The DHCP server observes the following principles to select an address pool for a client:

1. If there is an address pool where an IP address is statically bound to the MAC address or ID of the client, the DHCP server selects this address pool and assigns the statically bound IP address and other configuration parameters to the client.
2. If the receiving interface has a DHCP policy and the DHCP client matches a user class, the DHCP server selects the address pool that is bound to the matching user class. If no matching user class is found, the server assigns an IP address and other parameters from the default DHCP address pool. If no default address pool is specified or the default address pool does not have assignable IP addresses, the address assignment fails.
3. If the receiving interface has an address pool applied, the DHCP server selects an IP address and other configuration parameters from this address pool.
4. If the above conditions are not met, the DHCP server selects an address pool depending on the client location.
    - **Client on the same subnet as the server**—The DHCP server compares the IP address of the receiving interface with the primary subnets of all address pools.
        - If a match is found, the server selects the address pool with the longest-matching primary subnet.
        - If no match is found, the DHCP server compares the IP address with the secondary subnets of all address pools. The server selects the address pool with the longest-matching secondary subnet.
    - **Client on a different subnet than the server**—The DHCP server compares the IP address in the **giaddr** field of the DHCP request with the primary subnets of all address pools.
        - If a match is found, the server selects the address pool with the longest-matching primary subnet.
        - If no match is found, the DHCP server compares the IP address with the secondary subnets of all address pools. The server selects the address pool with the longest-matching secondary subnet.

For example, two address pools 1.1.1.0/24 and 1.1.1.0/25 are configured but not applied to any DHCP server's interfaces.

- If the IP address of the receiving interface is 1.1.1.1/25, the DHCP server selects the address pool 1.1.1.0/25. If the address pool has no available IP addresses, the DHCP server will not select the other pool and the address allocation will fail.
- If the IP address of the receiving interface is 1.1.1.130/25, the DHCP server selects the address pool 1.1.1.0/24.

To ensure correct address allocation, keep the IP addresses used for dynamic allocation on one of the subnets:

- **Clients on the same subnet as the server**—Subnet where the DHCP server receiving interface resides.
- **Clients on a different subnet than the server**—Subnet where the first DHCP relay interface that faces the clients resides.

NOTE:

As a best practice, configure a minimum of one matching primary subnet in your network. Otherwise, the DHCP server selects only the first matching secondary subnet for address allocation. If the network has more DHCP clients than the assignable IP addresses in the secondary subnet, not all DHCP clients can obtain IP addresses.

IP address allocation sequence

The DHCP server selects an IP address for a client in the following sequence:

1. IP address statically bound to the client's MAC address or ID.
2. IP address that was ever assigned to the client.
3. IP address designated by the Option 50 field in the DHCP-DISCOVER message sent by the client.

   Option 50 is the Requested IP Address option. The client uses this option to specify the wanted IP address in a DHCP-DISCOVER message. The content of Option 50 is user defined.
4. First assignable IP address found in the way discussed in "DHCP address assignment mechanisms" and "Principles for selecting an address pool."
5. IP address that was a conflict or passed its lease duration. If no IP address is assignable, the server does not respond.

NOTE:

- If a client moves to another subnet, the DHCP server selects an IP address in the address pool matching the new subnet. It does not assign the IP address that was once assigned to the client.
- Conflicted IP addresses can be assigned to other DHCP clients only after the addresses are in conflict for an hour.

Restrictions: Hardware compatibility with DHCP server

S5110V2-SI, S5000V3-EI, S5000E-X, S5000X-EI, and WAS6000 do not support the DHCP server functionality.

S5000V5-EI supports the DHCP server functionality as from Release 6328P02 and Release 6337.

DHCP server tasks at a glance

To configure the DHCP server, perform the following tasks:

1. (Optional.) Creating a DHCP user class
2. Configuring an address pool on the DHCP server
3. (Optional.) Modifying the address pool selection method on the DHCP server
   - Applying an address pool to an interface
   - Configuring a DHCP policy for dynamic assignment
4. Enabling DHCP
5. Enabling the DHCP server on an interface
6. (Optional.) Configuring advanced DHCP features
   - Configuring IP address conflict detection
   - Enabling handling of Option 82
   - Configuring the DHCP server security features
   - Configuring DHCP server compatibility
   - Setting the DSCP value for DHCP packets sent by the DHCP server
   - Configuring DHCP binding auto backup
   - Enabling client offline detection on the DHCP server

7. (Optional.) Configuring SNMP notification and logging
   - Configuring address pool usage alarming
   - Enabling DHCP logging on the DHCP server

Creating a DHCP user class

About DHCP user class

The DHCP server classifies DHCP users into different user classes according to the hardware address, option information, or the **giaddr** field in the received DHCP requests. The server allocates IP addresses and configuration parameters to DHCP clients in different user classes.

Procedure

1. Enter system view.

   system-view
2. Create a DHCP user class and enter DHCP user class view.

   dhcp class *class-name*
3. Configure a match rule for the DHCP user class.

   if-match rule *rule-number* { **hardware-address** *hardware-address* **mask** *hardware-address-mask* | **option** *option-code* [**ascii** *ascii-string* [**offset** *offset* | **partial**] | **hex** *hex-string* [**mask** *mask* | **offset** *offset* **length** *length* | **partial**]] | **relay-agent** *gateway-address* }

   By default, no match rule is configured for a DHCP user class.

Configuring an address pool on the DHCP server

DHCP address pool tasks at a glance

To configure a DHCP address pool, perform the following tasks:

1. Creating a DHCP address pool
2. Specifying IP address ranges in a DHCP address pool

   In one DHCP address pool, the two dynamic allocation methods cannot be both configured, but static and dynamic address allocations can be both implemented.
   - Specifying a primary subnet and multiple address ranges in a DHCP address pool
   - Specifying a primary subnet and multiple secondary subnets in a DHCP address pool
   - Configuring a static binding in a DHCP address pool
3. Specifying other configuration parameters to be assigned to DHCP clients
   - Specifying gateways for DHCP clients
   - Specifying a domain name suffix for DHCP clients
   - Specifying DNS servers for DHCP clients
   - Specifying WINS servers and NetBIOS node type for DHCP clients
   - Specifying BIMS server for DHCP clients
   - Specifying the configuration file for DHCP client automatic configuration
   - Specifying a server for DHCP clients
   - Configuring Option 184 parameters for DHCP clients
   - Customizing DHCP options
4. (Optional.) Configuring the DHCP user class whitelist

Creating a DHCP address pool

1. Enter system view.
   system-view
2. Create a DHCP address pool and enter its view.
   dhcp server ip-pool *pool-name*

Specifying a primary subnet and multiple address ranges in a DHCP address pool

About a primary subnet and multiple address ranges in a DHCP address pool

Some scenarios need to classify DHCP clients on the same subnet into different address groups. To meet this need, you can configure DHCP user classes and specify different address ranges for the classes. The clients matching a user class can then get the IP addresses of an address range. In addition, you can specify a common address range for the clients that do not match any user class. If no common address range is specified, such clients fail to obtain IP addresses.

If there is no need to classify clients, you do not need to configure DHCP user classes or their address ranges.

Restrictions and guidelines

- If you execute the **network** or **address range** command multiple times for the same address pool, the most recent configuration takes effect.
- If you execute the **forbidden-ip** command multiple times, you exclude multiple address ranges from dynamic allocation.
- IP addresses specified by the **forbidden-ip** command are not assignable in the current address pool, but are assignable in other address pools. IP addresses specified by the **dhcp server forbidden-ip** command are not assignable in any address pool.
- You can use **class range** to modify an existing address range, and the new address range can include IP addresses that are being used by clients. Upon receiving a lease extension request for such an IP address, the DHCP server allocates a new IP address to the requesting client. But the original lease continues aging in the address pool, and will be released when the lease duration is reached. To release such lease without waiting for its timeout, execute the **reset dhcp server ip-in-use** command.

Procedure

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*
3. Specify the primary subnet in the address pool.
   network *network-address* [*mask-length* | **mask** *mask*]
   By default, no primary subnet is specified.
4. (Optional.) Specify the common address range.
   address range *start-ip-address end-ip-address*
   By default, no IP address range is specified.
5. (Optional.) Specify an IP address range for a DHCP user class.
   class *class-name* **range** *start-ip-address end-ip-address*
   By default, no IP address range is specified for a user class.

The DHCP user class must already be created by using the **dhcp class** command.

6. (Optional.) Set the address lease duration.

   expired { **day** *day* [**hour** *hour* [**minute** *minute* [**second** *second*]]] | **unlimited** }

   The default setting is 1 day.

7. (Optional.) Exclude the specified IP addresses in the address pool from dynamic allocation.

   forbidden-ip *ip-address*&<1-8>

   By default, all IP addresses in the DHCP address pool are assignable.

8. (Optional.) Exclude the specified IP addresses from automatic allocation in system view.

   a. Return to system view.

      quit

   b. Exclude the specified IP addresses from automatic allocation globally.

      dhcp server forbidden-ip *start-ip-address* [*end-ip-address*]

      By default, except for the IP address of the DHCP server interface, IP addresses in all address pools are assignable.

Specifying a primary subnet and multiple secondary subnets in a DHCP address pool

About a primary subnet and multiple secondary subnets in a DHCP address pool

If an address pool has a primary subnet and multiple secondary subnets, the server assigns IP addresses on a secondary subnet when the primary subnet has no assignable IP addresses.

Restrictions and guidelines

IP addresses specified by the **forbidden-ip** command are not assignable in the current address pool, but are assignable in other address pools. IP addresses specified by the **dhcp server forbidden-ip** command are not assignable in any address pool.

Specifying a primary subnet and multiple secondary subnets

1. Enter system view.

   system-view

2. Enter DHCP address pool view.

   dhcp server ip-pool *pool-name*

3. Specify the primary subnet.

   network *network-address* [*mask-length* | **mask** *mask*]

   By default, no primary subnet is specified.

   You can specify only one primary subnet in each address pool. If you execute the **network** command multiple times, the most recent configuration takes effect.

4. (Optional.) Specify a secondary subnet.

   network *network-address* [*mask-length* | **mask** *mask*] **secondary**

   By default, no secondary subnet is specified.

   You can specify a maximum of 32 secondary subnets in one address pool.

5. (Optional.) Return to address pool view.

   quit

Setting the lease duration for dynamically allocation IP addresses

1. Enter system view.

system-view

2. Enter DHCP address pool view.

   dhcp server ip-pool *pool-name*

3. Set the address lease duration.

   expired { **day** *day* [**hour** *hour* [**minute** *minute* [**second** *second*]]] | **unlimited** }

   The default setting is 1 day.

Excluding IP addresses from dynamic allocation

1. Enter system view.

   system-view

2. Enter DHCP address pool view.

   dhcp server ip-pool *pool-name*

3. Exclude the specified IP addresses from dynamic allocation.

   forbidden-ip *ip-address*&<1-8>

   By default, all IP addresses in the DHCP address pool are assignable.

   To exclude multiple address ranges from the address pool, repeat this step.

4. (Optional.) Exclude the specified IP addresses from dynamic allocation in system view.

   a. Return to system view.

      quit

   b. Exclude the specified IP addresses from dynamic allocation globally.

      dhcp server forbidden-ip *start-ip-address* [*end-ip-address*]

      By default, except for the IP address of the DHCP server interface, IP addresses in all address pools are assignable.

      To exclude multiple address ranges globally, repeat this step.

Configuring a static binding in a DHCP address pool

About static binding in a DHCP address pool

Some DHCP clients, such as a WWW server, need fixed IP addresses. To provide a fixed IP address for a client, you can statically bind the MAC address or ID of the client to an IP address in a DHCP address pool. When the client requests an IP address, the DHCP server assigns the IP address in the static binding to the client.

Restrictions and guidelines

- The IP address of a static binding cannot be the address of the DHCP server interface. Otherwise, an IP address conflict occurs and the bound client cannot obtain an IP address correctly.
- Multiple interfaces on the same device might all use DHCP to request a static IP address. In this case, use client IDs rather than the device's MAC address to identify the interfaces. Otherwise, IP address allocation will fail.

Procedure

1. Enter system view.

   system-view

2. Enter DHCP address pool view.

   dhcp server ip-pool *pool-name*

3. Configure a static binding.

static-bind ip-address *ip-address* [*mask-length* | **mask** *mask*] { **client-identifier** *client-identifier* | **hardware-address** *hardware-address* [**ethernet** | **token-ring**] }

By default, no static binding is configured.

One IP address can be bound to only one client MAC or client ID. You cannot modify bindings that have been created. To change the binding for a DHCP client, you must delete the existing binding first.

4. (Optional.) Set the lease duration for the IP address.

   expired { **day** *day* [**hour** *hour* [**minute** *minute* [**second** *second*]]] | **unlimited** }

   By default, the lease duration is 1 day.

Specifying gateways for DHCP clients

About gateways for DHCP clients

DHCP clients send packets destined for other networks to a gateway. The DHCP server can assign the gateway address to the DHCP clients.

Restrictions and guidelines

You can specify gateway addresses in each address pool on the DHCP server. A maximum of 64 gateways can be specified in DHCP address pool view or secondary subnet view.

The DHCP server assigns gateway addresses to clients on a secondary subnet in the following ways:

- If gateways are specified in both address pool view and secondary subnet view, DHCP assigns those specified in the secondary subnet view.
- If gateways are specified in address pool view but not in secondary subnet view, DHCP assigns those specified in address pool view.

Procedure

1. Enter system view.

   system-view

2. Enter DHCP address pool view.

   dhcp server ip-pool *pool-name*

3. Specify gateways.

   gateway-list *ip-address*&<1-64>

   By default, no gateway is specified.

4. (Optional.) Specify gateways in secondary subnet view.

   a. Enter secondary subnet view.

      network *network-address* [*mask-length* | **mask** *mask*] **secondary**

   b. Specify gateways.

      gateway-list *ip-address*&<1-64>

      By default, no gateway is specified.

Specifying a domain name suffix for DHCP clients

About domain name suffix for DHCP clients

You can specify a domain name suffix in a DHCP address pool on the DHCP server. With this suffix assigned, the client only needs to input part of a domain name, and the system adds the domain name suffix for name resolution. For more information about DNS, see "Configuring DNS."

Procedure

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*
3. Specify a domain name suffix.
   domain-name *domain-name*
   By default, no domain name is specified.

Specifying DNS servers for DHCP clients

About DNS servers for DHCP clients

To access hosts on the Internet through domain names, a DHCP client must contact a DNS server to resolve names. You can specify up to eight DNS servers in a DHCP address pool.

Procedure

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*
3. Specify DNS servers.
   dns-list *ip-address*&<1-8>
   By default, no DNS server is specified.

Specifying WINS servers and NetBIOS node type for DHCP clients

About WINS servers and NetBIOS node type for DHCP clients

A Microsoft DHCP client using NetBIOS protocol must contact a WINS server for name resolution.

In addition, you must specify one of the following NetBIOS node types to approach name resolution:

- **b (broadcast)-node**—A b-node client sends the destination name in a broadcast message. The destination returns its IP address to the client after receiving the message.
- **p (peer-to-peer)-node**—A p-node client sends the destination name in a unicast message to the WINS server. The WINS server returns the destination IP address.
- **m (mixed)-node**—An m-node client broadcasts the destination name. If it receives no response, it unicasts the destination name to the WINS server to get the destination IP address.
- **h (hybrid)-node**—An h-node client unicasts the destination name to the WINS server. If it receives no response, it broadcasts the destination name to get the destination IP address.

Procedure

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*
   By default, no DHCP address pool exists.
3. Specify WINS servers.
   nbns-list *ip-address*&<1-8>
   By default, no WINS server is specified.
   This step is optional for b-node. You can specify a maximum of eight WINS servers for such clients in one DHCP address pool.
4. Specify the NetBIOS node type.
   netbios-type { **b-node** | **h-node** | **m-node** | **p-node** }
   By default, no NetBIOS node type is specified.

Specifying BIMS server for DHCP clients

About BIMS server for DHCP clients

Perform this task to provide the BIMS server IP address, port number, and shared key for the clients. The DHCP clients contact the BIMS server to get configuration files and perform software upgrade and backup.

Procedure

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*
3. Specify the BIMS server IP address, port number, and shared key.
   bims-server ip *ip-address* [**port** *port-number*] **sharekey** { **cipher** | **simple** } *string*
   By default, no BIMS server information is specified.

Specifying the configuration file for DHCP client automatic configuration

About configuration file for DHCP client automatic configuration

Automatic configuration enables a device to automatically obtain a set of configuration settings at startup. The server-based automatic configuration requires the cooperation of the DHCP server and file server (TFTP or HTTP server). The device uses the obtained parameters to contact the file server to get the configuration file. For more information about automatic configuration, see *Fundamentals Configuration Guide*.

Specifying the configuration file on a TFTP file server

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*

By default, no DHCP address pool exists.

3. Specify the IP address or the name of a TFTP server.
   - Specify the IP address of the TFTP server.
     tftp-server ip-address *ip-address*
     By default, no TFTP server IP address is specified.
   - Specify the name of the TFTP server.
     tftp-server domain-name *domain-name*
     By default, no TFTP server name is specified.
4. Specify the configuration file name.
   bootfile-name *bootfile-name*
   By default, no configuration file name is specified.

Specifying the URL of the configuration file on an HTTP file server

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*
3. Specify the URL of the configuration file.
   bootfile-name *url*
   By default, no configuration file URL is specified.

Specifying a server for DHCP clients

About a server for DHCP clients

Some DHCP clients need to obtain configuration information from a server, such as a TFTP server. You can specify the IP address of that server. The DHCP server sends the server's IP address to DHCP clients along with other configuration information.

Procedure

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*
3. Specify the IP address of a server.
   next-server *ip-address*
   By default, no server is specified.

Configuring Option 184 parameters for DHCP clients

About Option 184 parameters for DHCP clients

To assign calling parameters to DHCP clients with voice service, you must configure Option 184 on the DHCP server. For more information about Option 184, see "Option 184."

Procedure

1. Enter system view.
   system-view
2. Enter DHCP address pool view.

dhcp server ip-pool *pool-name*

3. Specify the IP address of the primary network calling processor.
   voice-config ncp-ip *ip-address*
   By default, no primary network calling processor is specified.
   After you configure this command, the other Option 184 parameters take effect.
4. (Optional.) Specify the IP address of the backup server.
   voice-config as-ip *ip-address*
   By default, no backup network calling processor is specified.
5. (Optional.) Configure the voice VLAN.
   voice-config voice-vlan *vlan-id* { **disable** | **enable** }
   By default, no voice VLAN is configured.
6. (Optional.) Specify the failover IP address and dialer string.
   voice-config fail-over *ip-address dialer-string*
   By default, no failover IP address or dialer string is specified.

Customizing DHCP options

DHCP option customization applications

You can customize DHCP options for the following purposes:

- Add newly released options.
- Add options for which the vendor defines the contents, for example, Option 43.
- Add options for which the CLI does not provide a dedicated configuration command. For example, you can use the **option 4 ip-address 1.1.1.1** command to define the time server address 1.1.1.1 for DHCP clients.
- Add all option values if the actual requirement exceeds the limit for a dedicated option configuration command. For example, the **dns-list** command can specify up to eight DNS servers. To specify more than eight DNS servers, you must use the **option 6** command to define all DNS servers.

Common DHCP options

Table 1 lists common DHCP options and their parameters.

Table 1 Common DHCP options

Option	Option name	Corresponding command	Recommended parameter in the option command
3	Router Option	**gateway-list**	**ip-address**
6	Domain Name Server Option	**dns-list**	**ip-address**
15	Domain Name	**domain-name**	**ascii**
44	NetBIOS over TCP/IP Name Server Option	**nbns-list**	**ip-address**
46	NetBIOS over TCP/IP Node Type Option	**netbios-type**	**hex**
66	TFTP server name	**tftp-server**	**ascii**
67	Boot file name	**bootfile-name**	**ascii**

Option	Option name	Corresponding command	Recommended parameter in the option command
43	Vendor Specific Information	N/A	**hex**

Restrictions and guidelines

Use caution when customizing DHCP options because the configuration might affect DHCP operation.

You can customize a DHCP option in a DHCP address pool

You can customize a DHCP option in a DHCP option group, and specify the option group for a user class in an address pool. A DHCP client in the user class will obtain the option configuration.

Customizing a DHCP option in a DHCP address pool

1. Enter system view.

   system-view

2. Enter DHCP address pool view.

   dhcp server ip-pool *pool-name*

3. Customize a DHCP option.

   option *code* { **ascii** *ascii-string* | **hex** *hex-string* | **ip-address** *ip-address*&<1-8> }

   By default, no DHCP option is customized in a DHCP address pool.

   DHCP options specified in DHCP option groups take precedence over those specified in DHCP address pools.

Customizing a DHCP option in a DHCP option group

1. Enter system view.

   system-view

2. Create a DHCP option group and enter DHCP option group view.

   dhcp option-group *option-group-number*

3. Customize a DHCP option.

   option *code* { **ascii** *ascii-string* | **hex** *hex-string* | **ip-address** *ip-address*&<1-8> }

   By default, no DHCP option is customized in a DHCP option group.

   If multiple DHCP option groups have the same option, the server selects the option in the DHCP option group first matching the user class.

4. Return to system view.

   quit

5. Enter DHCP address pool view.

   dhcp server ip-pool *pool-name*

6. Specify the DHCP option group for the DHCP user class.

   class *class-name* **option-group** *option-group-number*

   By default, no DHCP option group is specified for a DHCP user class.

Configuring the DHCP user class whitelist

About DHCP user class whitelist

The DHCP user class whitelist allows the DHCP server to process requests only from clients on the DHCP user class whitelist.

Restrictions and guidelines

The whitelist does not take effect on clients who request static IP addresses, and the server always processes their requests.

Procedure

1. Enter system view.

   system-view

2. Enter DHCP address pool view.

   dhcp server ip-pool *pool-name*

3. Enable the DHCP user class whitelist.

   verify class

   By default, the DHCP user class whitelist is disabled.

4. Add DHCP user classes to the DHCP user class whitelist.

   valid class *class-name*&<1-8>

   By default, no DHCP user class is on the DHCP user class whitelist.

Applying an address pool to an interface

About applying an address pool to an interface

Perform this task to apply a DHCP address pool to an interface.

Upon receiving a DHCP request from the interface, the DHCP server performs address allocation in the following ways:

- If a static binding is found for the client, the server assigns the static IP address and configuration parameters from the address pool that contains the static binding.
- If no static binding is found for the client, the server uses the address pool applied to the interface for address and configuration parameter allocation.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Apply an address pool to the interface.

   dhcp server apply ip-pool *pool-name*

   By default, no address pool is applied to an interface.

   If the applied address pool does not exist, the DHCP server fails to perform dynamic address allocation.

Configuring a DHCP policy for dynamic assignment

About a DHCP policy for dynamic assignment

In a DHCP policy, each DHCP user class has a bound DHCP address pool. Clients matching different user classes obtain IP addresses and other parameters from different address pools. The DHCP policy must be applied to the interface that acts as the DHCP server. When receiving a DHCP request, the DHCP server compares the packet against the user classes in the order that they are configured.

- If a matching user class is found and the bound address pool has assignable IP addresses, the server assigns an IP address and other parameters from the address pool. If the address pool does not have assignable IP addresses, the address assignment fails.
- If no match is found, the server assigns an IP address and other parameters from the default DHCP address pool. If no default address pool is specified or the default address pool does not have assignable IP addresses, the address assignment fails.

For successful address assignment, make sure the applied DHCP policy and the bound address pools exist.

Restrictions and guidelines

A DHCP policy take effect only after it is applied to an interface.

Procedure

1. Enter system view.
   system-view
2. Create a DHCP policy and enter DHCP policy view.
   dhcp policy *policy-name*
3. Specify a DHCP address pool for a DHCP user class.
   class *class-name* **ip-pool** *pool-name*
   By default, no address pool is specified for a user class.
4. Specify the default DHCP address pool.
   default ip-pool *pool-name*
   By default, no default address pool is specified.
5. Return to system view.
   quit
6. Enter interface view.
   interface *interface-type interface-number*
7. Apply the DHCP policy to the interface.
   dhcp apply-policy *policy-name*
   By default, no DHCP policy is applied to an interface.

Enabling DHCP

Restrictions and guideline

You must enable DHCP to make other DHCP configurations take effect.

Procedure

1. Enter system view.
   system-view
2. Enable DHCP.
   dhcp enable
   By default, DHCP is disabled.

Enabling the DHCP server on an interface

About enabling the DHCP server on an interface

Perform this task to enable the DHCP server on an interface. Upon receiving a DHCP request on the interface, the DHCP server assigns the client an IP address and other configuration parameters from a DHCP address pool.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the DHCP server on the interface.
   dhcp select server
   By default, the DHCP server is enabled on the interface.

Configuring IP address conflict detection

About IP address conflict detection

Before assigning an IP address, the DHCP server pings that IP address.

- If the server receives a response within the specified period, it selects and pings another IP address.
- If it receives no response, the server continues to ping the IP address until the maximum number of ping packets are sent. If still no response is received, the server assigns the IP address to the requesting client. The DHCP client uses gratuitous ARP to perform IP address conflict detection.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Set the maximum number of ping packets to be sent for conflict detection.
   dhcp server ping packets *number*
   The default setting is one.
   To disable IP address conflict detection, set the value to **0**.
3. (Optional.) Set the ping timeout time.
   dhcp server ping timeout *milliseconds*
   The default setting is 500 ms.
   To disable IP address conflict detection, set the value to **0**.

Enabling handling of Option 82

About handling of Option 82

Perform this task to enable the DHCP server to handle Option 82. Upon receiving a DHCP request that contains Option 82, the DHCP server adds Option 82 into the DHCP response.

If you disable the DHCP to handle Option 82, it does not add Option 82 into the response message.

You must enable handling of Option 82 on both the DHCP server and the DHCP relay agent to ensure correct processing for Option 82. For information about enabling handling of Option 82 on the DHCP relay agent, see "Configuring DHCP relay agent support for Option 82."

Procedure

1. Enter system view.

   `system-view`
2. Enable the server to handle Option 82.

   `dhcp server relay information enable`

   By default, handling of Option 82 is enabled.

Configuring the DHCP server security features

Restrictions and guidelines

The DHCP server security features are not applicable if a DHCP relay agent exists in the network. This is because the MAC address of the DHCP relay agent is encapsulated as the source MAC address in the DHCP request received by the DHCP server. In this case, you must configure the DHCP relay agent security features. For more information, see "Configuring the DHCP relay agent security features."

Configuring DHCP starvation attack protection

About DHCP starvation attack protection

A DHCP starvation attack occurs when an attacker constantly sends forged DHCP requests using different MAC addresses in the **chaddr** field to a DHCP server. This exhausts the IP address resources of the DHCP server so legitimate DHCP clients cannot obtain IP addresses. The DHCP server might also fail to work because of exhaustion of system resources. For information about the fields in the DHCP messages, see "DHCP message format."

The following methods are available to relieve or prevent such attacks.

- To relieve a DHCP starvation attack that uses DHCP packets encapsulated with different source MAC addresses, perform the following configuration on an interface:
  - Execute the **`mac-address max-mac-count`** command to set the MAC learning limit. For more information about this command, see *Layer 2—LAN Switching Command Reference*.
  - Disable unknown frame forwarding when the MAC learning limit is reached.
- To prevent a DHCP starvation attack that uses DHCP requests encapsulated with the same source MAC address, you can enable MAC address check on the DHCP server. The DHCP server compares the **chaddr** field of a received DHCP request with the source MAC address in the frame header. If they are the same, the DHCP server verifies this request as legal and processes it. If they are not the same, the server discards the DHCP request.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable MAC address check.
   dhcp server check mac-address
   By default, MAC address check is disabled.

Configuring DHCP server compatibility

Perform this task to enable the DHCP server to support DHCP clients that are incompliant with RFC.

Configuring the DHCP server to always broadcast responses

About configuring the DHCP server to always broadcast responses

By default, the DHCP server broadcasts a response only when the broadcast flag in the DHCP request is set to 1. You can configure the DHCP server to ignore the broadcast flag and always broadcast a response. This feature is useful when some clients set the broadcast flag to 0 but do not accept unicast responses.

The DHCP server always unicasts a response in the following situations, regardless of whether this feature is configured or not:

- The DHCP request is from a DHCP client that has an IP address (the **ciaddr** field is not 0).
- The DHCP request is forwarded by a DHCP relay agent from a DHCP client (the **giaddr** field is not 0).

Procedure

1. Enter system view.
   system-view
2. Enable the DHCP server to always broadcast all responses.
   dhcp server always-broadcast
   By default, the DHCP server reads the broadcast flag to decide whether to broadcast or unicast a response.

Returning a DHCP-NAK message upon client notions of incorrect IP addresses

About returning a DHCP-NAK message upon client notions of incorrect IP addresses

A DHCP client can send a DHCP-REQUEST message directly or upon receiving a DHCP-OFFER message. Upon receiving the request, the DHCP server will check if the client notion of its IP address is correct. If the requested IP address is different from the allocated one or has no matching lease record, the DHCP server remains silent by default. After the allocated IP address lease for the client expires, the DHCP server will make response to request from the client.

This feature enables the DHCP server to return DHCP-NAK messages if the client notions of their IP addresses are incorrect. After receiving the DHCP-NAK message, the DHCP client will request an IP address again.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable the DHCP server to return a DHCP-NAK message if the client notions of their IP addresses are incorrect.

   ```
   dhcp server request-ip-address check
   ```

   By default, the DHCP server does not return a DHCP-NAK message if the client notions of their IP addresses are incorrect.

Configuring the DHCP server to ignore BOOTP requests

About configuring the DHCP server to ignore BOOTP requests

The lease duration of the IP addresses obtained by the BOOTP clients is unlimited. For some scenarios that do not allow unlimited leases, you can configure the DHCP server to ignore BOOTP requests.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Configure the DHCP server to ignore BOOTP requests.

   ```
   dhcp server bootp ignore
   ```

   By default, the DHCP server processes BOOTP requests.

Configuring the DHCP server to send BOOTP responses in RFC 1048 format

About configuring the DHCP server to send BOOTP responses in RFC 1048 format

Not all BOOTP clients can send requests that are compatible with RFC 1048. By default, the DHCP server does not process the Vend field of RFC 1048-incompliant requests but copies the Vend field into responses.

This feature enables the DHCP server to fill the Vend field in RFC 1048-compliant format in DHCP responses to RFC 1048-incompliant requests sent by BOOTP clients.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable the DHCP server to send BOOTP responses in RFC 1048 format to the RFC 1048-incompliant BOOTP requests.

   ```
   dhcp server bootp reply-rfc-1048
   ```

   By default, the DHCP server directly copies the Vend field of such requests into the responses.

Setting the DSCP value for DHCP packets sent by the DHCP server

About DSCP value for DHCP packets

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet.

Procedure

1. Enter system view.

   system-view

2. Set the DSCP value for DHCP packets sent by the DHCP server.

   dhcp dscp *dscp-value*

   By default, the DSCP value in DHCP packets sent by the DHCP server is 56.

Configuring DHCP binding auto backup

About DHCP binding auto backup

The auto backup feature saves bindings to a backup file and allows the DHCP server to download the bindings from the backup file at the server reboot. The bindings include the lease bindings and conflicted IP addresses. They cannot survive a reboot on the DHCP server.

The DHCP server does not provide services during the download process. If a connection error occurs during the process and cannot be repaired in a short amount of time, you can terminate the download operation. Manual interruption allows the DHCP server to provide services without waiting for the connection to be repaired.

Procedure

1. Enter system view.

   system-view

2. Configure the DHCP server to back up the bindings to a file.

   dhcp server database filename { *filename* | **url** *url* [**username** *username* [**password** { **cipher** | **simple** } *string*]] }

   By default, the DHCP server does not back up the DHCP bindings.

   With this command executed, the DHCP server backs up its bindings immediately and runs auto backup.

3. (Optional.) Manually save the DHCP bindings to the backup file.

   dhcp server database update now

4. (Optional.) Set the waiting time after a DHCP binding change for the DHCP server to update the backup file.

   dhcp server database update interval *interval*

   By default, the DHCP server waits 300 seconds to update the backup file after a DHCP binding change. If no DHCP binding changes, the backup file is not updated.

5. (Optional.) Terminate the download of DHCP bindings from the backup file.

   dhcp server database update stop

   This command only triggers one termination.

Enabling client offline detection on the DHCP server

About client offline detection on the DHCP server

The client offline detection feature reclaims an assigned IP address and deletes the binding entry when the ARP entry for the IP address ages out.

Restrictions and guidelines

The feature does not function if an ARP entry is manually deleted.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable client offline detection.
   dhcp client-detect
   By default, client offline detection is disabled on the DHCP server.

Configuring address pool usage alarming

About address pool usage alarming

Perform this task to set the threshold for address pool usage alarming. When the threshold is exceeded, the system sends log messages to the information center. According to the log information, you can optimize the address pool configuration. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter DHCP address pool view.
   dhcp server ip-pool *pool-name*
3. (Optional.) Set the threshold for address pool usage alarming.
   ip-in-use threshold *threshold-value*
   The default threshold is 100%.

Enabling DHCP logging on the DHCP server

About DHCP logging on the DHCP server

The DHCP logging feature enables the DHCP server to generate DHCP logs and send them to the information center. The information helps administrators locate and solve problems. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

As a best practice, disable this feature if the log generation affects the device performance or reduces the address allocation efficiency. For example, this situation might occur when a large number of clients frequently come online or go offline.

Procedure

1. Enter system view.
   system-view
2. Enable DHCP logging.
   dhcp log enable
   By default, DHCP logging is disabled.

Display and maintenance commands for DHCP server

IMPORTANT:

A restart of the DHCP server or execution of the **reset dhcp server ip-in-use** command deletes all lease information. The DHCP server denies any DHCP request for lease extension, and the client must request an IP address again.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IP address conflicts.	**display dhcp server conflict** [**ip** *ip-address*]
Display information about DHCP binding auto backup.	**display dhcp server database**
Display information about lease-expired IP addresses.	**display dhcp server expired** [**ip** *ip-address* | **pool** *pool-name*]
Display information about assignable IP addresses.	**display dhcp server free-ip** [**pool** *pool-name*]
Display information about assigned IP addresses.	**display dhcp server ip-in-use** [**ip** *ip-address* | **pool** *pool-name*]
Display information about DHCP address pools.	**display dhcp server pool** [*pool-name*]
Display DHCP server statistics.	**display dhcp server statistics** [**pool** *pool-name*]
Clear information about IP address conflicts.	**reset dhcp server conflict** [**ip** *ip-address*]
Clear information about lease-expired IP addresses.	**reset dhcp server expired** [**ip** *ip-address* | **pool** *pool-name*]
Clear information about assigned IP addresses.	**reset dhcp server ip-in-use** [**ip** *ip-address* | **pool** *pool-name*]
Clear DHCP server statistics.	**reset dhcp server statistics**

DHCP server configuration examples

Example: Configuring static IP address assignment

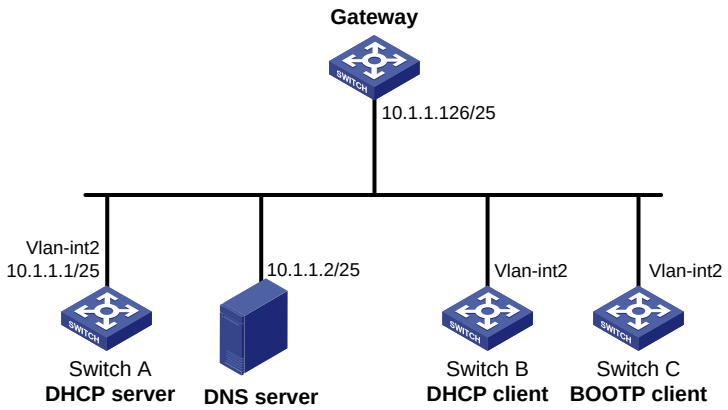
Network configuration

As shown in Figure 8, Switch B (DHCP client) and Switch C (BOOTP client) obtain the IP address, DNS server address, and gateway address from Switch A (DHCP server).

The client ID of VLAN-interface 2 on Switch B is 0030-3030-662e-6532-3030-2e30-3030-322d-4574-6865-726e-6574.

The MAC address of VLAN-interface 2 on Switch C is 000f-e200-01c0.

Figure 8 Network diagram



Procedure

1. Specify an IP address for VLAN-interface 2 on Switch A.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 10.1.1.1 25
[SwitchA-Vlan-interface2] quit
```

2. Configure the DHCP server:

Create DHCP address pool 0.

```
[SwitchA] dhcp server ip-pool 0
```

Configure a static binding for Switch B.

```
[SwitchA-dhcp-pool-0] static-bind ip-address 10.1.1.5 25 client-identifier
0030-3030-662e-6532-3030-2e30-3030-322d-4574-6865-726e-6574
```

Configure a static binding for Switch C.

```
[SwitchA-dhcp-pool-0] static-bind ip-address 10.1.1.6 25 hardware-address
000f-e200-01c0
```

Specify the DNS server address and the gateway address.

```
[SwitchA-dhcp-pool-0] dns-list 10.1.1.2
[SwitchA-dhcp-pool-0] gateway-list 10.1.1.126
[SwitchA-dhcp-pool-0] quit
[SwitchA]
```

Enable DHCP.

```
[SwitchA] dhcp enable
```

Enable the DHCP server on VLAN-interface 2.

```
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] dhcp select server
[SwitchA-Vlan-interface2] quit
```

Verifying the configuration

Verify that Switch B can obtain IP address 10.1.1.5 and all other network parameters from Switch A. (Details not shown.)

Verify that Switch C can obtain IP address 10.1.1.6 and all other network parameters from Switch A. (Details not shown.)

On the DHCP server, display the IP addresses assigned to the clients.

```
[SwitchA] display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration      Type
                 Hardware address
10.1.1.5         0030-3030-662e-6532-  Jan 21 14:27:27 2014  Static(C)
                 3030-2e30-3030-322d-
                 4574-6865-726e-6574
10.1.1.6         000f-e200-01c0        Unlimited             Static(C)
```

Example: Configuring dynamic IP address assignment

Network configuration

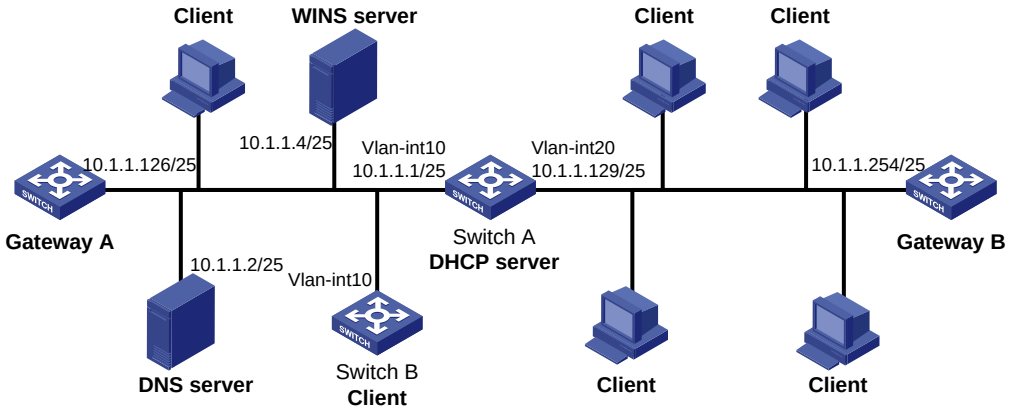
As shown in Figure 9, the DHCP server (Switch A) assigns IP addresses to clients on subnet 10.1.1.0/24, which is subnetted into 10.1.1.0/25 and 10.1.1.128/25.

Configure DHCP server on Switch A to implement the following assignment scheme.

Table 2 Assignment scheme

DHCP clients	IP address	Lease	Other configuration parameters
Clients connected to VLAN-interface 10	IP addresses on subnet 10.1.1.0/25	10 days and 12 hours	• Gateway: 10.1.1.126/25 • DNS server: 10.1.1.2/25 • Domain name: aabbcc.com • WINS server: 10.1.1.4/25
Clients connected to VLAN-interface 20	IP addresses on subnet 10.1.1.128/25	Five days	• Gateway: 10.1.1.254/25 • DNS server: 10.1.1.2/25 • Domain name: aabbcc.com

Figure 9 Network diagram



Procedure

1. Specify IP addresses for the VLAN interfaces. (Details not shown.)
2. Configure the DHCP server:

   # Exclude the DNS server address, WINS server address, and gateway addresses from dynamic allocation.

   ```
   <SwitchA> system-view
   [SwitchA] dhcp server forbidden-ip 10.1.1.2
   [SwitchA] dhcp server forbidden-ip 10.1.1.4
   [SwitchA] dhcp server forbidden-ip 10.1.1.126
   [SwitchA] dhcp server forbidden-ip 10.1.1.254
   ```

   # Configure DHCP address pool 1 to assign IP addresses and other configuration parameters to clients on subnet 10.1.1.0/25.

   ```
   [SwitchA] dhcp server ip-pool 1
   [SwitchA-dhcp-pool-1] network 10.1.1.0 mask 255.255.255.128
   [SwitchA-dhcp-pool-1] expired day 10 hour 12
   [SwitchA-dhcp-pool-1] domain-name aabbcc.com
   [SwitchA-dhcp-pool-1] dns-list 10.1.1.2
   [SwitchA-dhcp-pool-1] gateway-list 10.1.1.126
   [SwitchA-dhcp-pool-1] nbns-list 10.1.1.4
   [SwitchA-dhcp-pool-1] quit
   ```

   # Configure DHCP address pool 2 to assign IP addresses and other configuration parameters to clients on subnet 10.1.1.128/25.

   ```
   [SwitchA] dhcp server ip-pool 2
   [SwitchA-dhcp-pool-2] network 10.1.1.128 mask 255.255.255.128
   [SwitchA-dhcp-pool-2] expired day 5
   [SwitchA-dhcp-pool-2] domain-name aabbcc.com
   [SwitchA-dhcp-pool-2] dns-list 10.1.1.2
   [SwitchA-dhcp-pool-2] gateway-list 10.1.1.254
   [SwitchA-dhcp-pool-2] quit
   ```

   # Enable DHCP.

   ```
   [SwitchA] dhcp enable
   ```

   # Enable the DHCP server on VLAN-interface 10 and VLAN-interface 20.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] dhcp select server
   ```

```
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] dhcp select server
[SwitchA-Vlan-interface20] quit
```

Verifying the configuration

Verify that clients on subnets 10.1.1.0/25 and 10.1.1.128/25 can obtain correct IP addresses and all other network parameters from Switch A. (Details not shown.)

On the DHCP server, display the IP addresses assigned to the clients.

```
[SwitchA] display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration      Type
                 Hardware address
10.1.1.3         0031-3865-392e-6262-  Jan 14 22:25:03 2015  Auto(C)
                 3363-2e30-3230-352d-
                 4745-302f-30

```

Example: Configuring DHCP user class

Network requirement

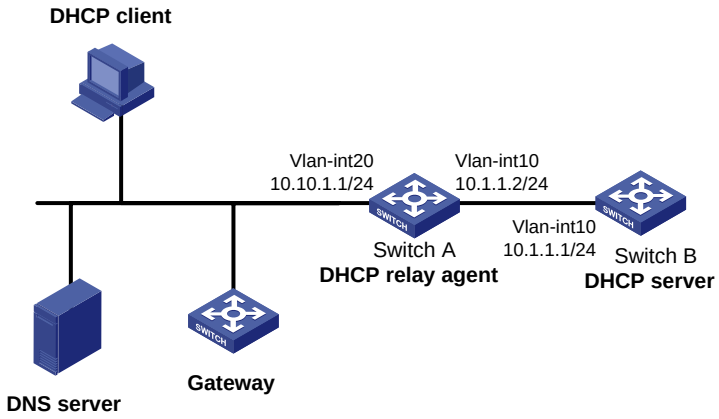
As shown in Figure 10, the DHCP relay agent (Switch A) forwards DHCP packets between DHCP clients and the DHCP server (Switch B). Enable switch A to support Option 82 so that switch A can add Option 82 in the DHCP requests sent by the DHCP clients.

Configure the address allocation scheme as follows:

Assign IP addresses	To clients
10.10.1.2 to 10.10.1.10	The DHCP request contains Option 82.
10.10.1.11 to 10.10.1.26	The hardware address in the request is six bytes long and begins with **aabb-aabb-aab**.

For clients on subnet 10.10.1.0/24, the DNS server address is 10.10.1.20/24 and the gateway address is 10.10.1.254/24.

Figure 10 Network diagram



Procedure

1. Specify IP addresses for interfaces on the DHCP server and the DHCP relay agent. (Details not shown.)
2. Configure DHCP services:

   # Create DHCP user class **tt** and configure a match rule to match client requests with Option 82.

   ```
   <SwitchB> system-view
   [SwitchB] dhcp class tt
   [SwitchB-dhcp-class-tt] if-match rule 1 option 82
   [SwitchB-dhcp-class-tt] quit
   ```

   # Create DHCP user class **ss** and configure a match rule to match DHCP requests in which the hardware address is six bytes long and begins with **aabb-aabb-aab**.

   ```
   [SwitchB] dhcp class ss
   [SwitchB-dhcp-class-ss] if-match rule 1 hardware-address aabb-aabb-aab0 mask
   ffff-ffff-fff0
   [SwitchB-dhcp-class-ss] quit
   ```

   # Create DHCP address pool **aa**.

   ```
   [SwitchB] dhcp server ip-pool aa
   ```

   # Specify the subnet for dynamic allocation.

   ```
   [SwitchB-dhcp-pool-aa] network 10.10.1.0 mask 255.255.255.0
   ```

   # Specify the address range for dynamic allocation.

   ```
   [SwitchB-dhcp-pool-aa] address range 10.10.1.2 10.10.1.100
   ```

   # Specify the address range for user class **tt**.

   ```
   [SwitchB-dhcp-pool-aa] class tt range 10.10.1.2 10.10.1.10
   ```

   # Specify the address range for user class **ss**.

   ```
   [SwitchB-dhcp-pool-aa] class ss range 10.10.1.11 10.10.1.26
   ```

   # Specify the gateway address and the DNS server address.

   ```
   [SwitchB-dhcp-pool-aa] gateway-list 10.10.1.254
   [SwitchB-dhcp-pool-aa] dns-list 10.10.1.20
   [SwitchB-dhcp-pool-aa] quit
   ```

   # Enable DHCP and configure the DHCP server to handle Option 82.

   ```
   [SwitchB] dhcp enable
   [SwitchB] dhcp server relay information enable
   ```

   # Enable DHCP server on VLAN-interface 10.

```
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] dhcp select server
[SwitchB-Vlan-interface10] quit
```

Verifying the configuration

Verify that clients matching the user classes can obtain IP addresses in the specified ranges and all other configuration parameters from the DHCP server. (Details not shown.)

Display the IP address assigned by the DHCP server.

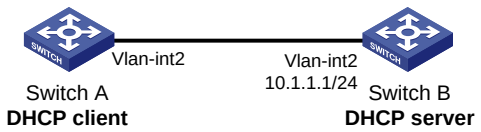
```
[SwitchB] display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration      Type
                 Hardware address
10.10.1.2        0031-3865-392e-6262-  Jan 14 22:25:03 2015  Auto(C)
                 3363-2e30-3230-352d-
                 4745-302f-30
10.10.1.11       aabb-aabb-aab1        Jan 14 22:25:03 2015  Auto(C)
```

Example: Configuring DHCP user class whitelist

Network configuration

As shown in Figure 11, configure the DHCP user class whitelist to allow the DHCP server to assign IP addresses to clients whose hardware addresses are six bytes long and begin with **aabb-aabb**.

Figure 11 Network diagram



Procedure

1. Specify IP addresses for the interfaces on the DHCP server. (Details not shown.)
2. Configure DHCP:

   # Create DHCP user class **ss** and configure a match rule to match DHCP requests in which the hardware address is six bytes long and begins with **aabb-aabb**.

   ```
   <SwitchB> system-view
   [SwitchB] dhcp class ss
   [SwitchB-dhcp-class-ss] if-match rule 1 hardware-address aabb-aabb-0000 mask
   ffff-ffff-0000
   [SwitchB-dhcp-class-ss] quit
   ```

   # Create DHCP address pool **aa**.

   ```
   [SwitchB] dhcp server ip-pool aa
   ```

   # Specify the subnet for dynamic allocation.

   ```
   [SwitchB-dhcp-pool-aa] network 10.1.1.0 mask 255.255.255.0
   ```

   # Enable the DHCP user class whitelist.

   ```
   [SwitchB-dhcp-pool-aa] verify class
   ```

   # Add DHCP user class **ss** to the DHCP user class whitelist.

   ```
   [SwitchB-dhcp-pool-aa] valid class ss
   [SwitchB-dhcp-pool-aa] quit
   ```

   # Enable DHCP.

   ```
   [SwitchB] dhcp enable
   ```

Enable DHCP server on VLAN-interface 2.

```
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] dhcp select server
[SwitchB-Vlan-interface2] quit
```

Verifying the configuration

Verify that clients matching the DHCP user class can obtain IP addresses on subnet 10.1.1.0/24 from the DHCP server. (Details not shown.)

On the DHCP server, display the IP addresses assigned to the clients.

```
[SwitchB] display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration      Type
                 Hardware address
10.1.1.2         aabb-aabb-ab01        Jan 14 22:25:03 2015  Auto(C)
```

Example: Configuring primary and secondary subnets

Network configuration

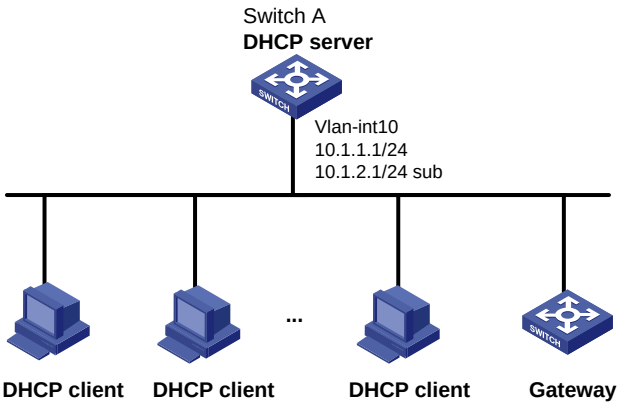
As shown in Figure 12, the DHCP server (Switch A) dynamically assigns IP addresses to clients in the LAN.

Configure two subnets in the address pool on the DHCP server: 10.1.1.0/24 as the primary subnet and 10.1.2.0/24 as the secondary subnet. The DHCP server selects IP addresses from the secondary subnet when the primary subnet has no assignable addresses.

Switch A assigns the following parameters:

- The default gateway 10.1.1.254/24 to clients on subnet 10.1.1.0/24.
- The default gateway 10.1.2.254/24 to clients on subnet 10.1.2.0/24.

Figure 12 Network diagram



Procedure

Create DHCP address pool **aa**.

```
<SwitchA> system-view
[SwitchA] dhcp server ip-pool aa
```

Specify the primary subnet and the gateway address for dynamic allocation.

```
[SwitchA-dhcp-pool-aa] network 10.1.1.0 mask 255.255.255.0
[SwitchA-dhcp-pool-aa] gateway-list 10.1.1.254
```

Specify the secondary subnet and the gateway address for dynamic allocation.

```
[SwitchA-dhcp-pool-aa] network 10.1.2.0 mask 255.255.255.0 secondary
```

```
[SwitchA-dhcp-pool-aa-secondary] gateway-list 10.1.2.254
[SwitchA-dhcp-pool-aa-secondary] quit
[SwitchA-dhcp-pool-aa] quit
```

Enable DHCP.

```
[SwitchA] dhcp enable
```

Configure the primary and secondary IP addresses of VLAN-interface 10.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 10.1.1.1 24
[SwitchA-Vlan-interface10] ip address 10.1.2.1 24 sub
```

Enable the DHCP server on VLAN-interface 10.

```
[SwitchA-Vlan-interface10] dhcp select server
[SwitchA-Vlan-interface10] quit
```

Verifying the configuration

Verify that the DHCP server assigns clients IP addresses and gateway address from the secondary subnet when no address is available from the primary subnet. (Details not shown.)

Display the primary and secondary subnet IP addresses the DHCP server has assigned. The following is part of the command output.

```
[SwitchA] display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration      Type
                 Hardware address
10.1.1.2         0031-3865-392e-6262-  Jan 14 22:25:03 2015  Auto(C)
                 3363-2e30-3230-352d-
                 4745-302f-30
10.1.2.2         3030-3030-2e30-3030-  Jan 14 22:25:03 2015  Auto(C)
                 662e-3030-3033-2d45-
                 7568-6572-1e
```

Example: Customizing DHCP option

Network configuration

As shown in Figure 13, DHCP clients obtain IP addresses and PXE server addresses from the DHCP server (Switch A). The subnet for address allocation is 10.1.1.0/24.

Configure the address allocation scheme as follows:

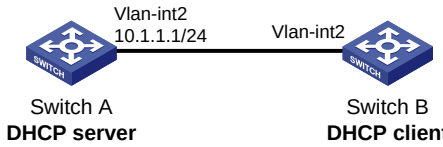
Assign PXE addresses	To clients
2.3.4.5 and 3.3.3.3	The hardware address in the request is six bytes long and begins with **aabb-aabb**.
1.2.3.4 and 2.2.2.2.	Other clients.

The DHCP server assigns PXE server addresses to DHCP clients through Option 43, a customized option. The format of Option 43 and that of the PXE server address sub-option are shown in Figure 5 and Figure 7. For example, the value of Option 43 configured in the DHCP address pool is 80 0B 00 00 02 01 02 03 04 02 02 02 02.

- The number 80 is the value of the sub-option type.
- The number 0B is the value of the sub-option length.
- The numbers 00 00 are the value of the PXE server type.
- The number 02 indicates the number of servers.

- The numbers 01 02 03 04 02 02 02 02 indicate that the PXE server addresses are 1.2.3.4 and 2.2.2.2.

Figure 13 Network diagram



Procedure

1. Specify IP addresses for the interfaces. (Details not shown.)
2. Configure the DHCP server:

   # Create DHCP user class **ss** and configure a match rule to match DHCP requests in which the hardware address is six bytes long and begins with **aabb-aabb**.

```
<SwitchA> system-view
[SwitchA] dhcp class ss
[SwitchA-dhcp-class-ss] if-match rule 1 hardware-address aabb-aabb-0000 mask
ffff-ffff-0000
[SwitchA-dhcp-class-ss] quit
```

   # Create DHCP option group 1 and customize Option 43.

```
[SwitchA] dhcp option-group 1
[SwitchA-dhcp-option-group-1] option 43 hex 800B000002020304050303030303
```

   # Enable the DHCP server on VLAN-interface 2.

```
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] dhcp select server
[SwitchA-Vlan-interface2] quit
```

   # Create DHCP address pool 0.

```
[SwitchA] dhcp server ip-pool 0
```

   # Specify the subnet for dynamic address allocation.

```
[SwitchA-dhcp-pool-0] network 10.1.1.0 mask 255.255.255.0
```

   # Customize Option 43.

```
[SwitchA-dhcp-pool-0] option 43 hex 800B000002010203040202020202
```

   # Associate DHCP user class **ss** with option group 1.

```
[SwitchA-dhcp-pool-0] class ss option-group 1
[SwitchA-dhcp-pool-0] quit
```

   # Enable DHCP.

```
[SwitchA] dhcp enable
```

Verifying the configuration

Verify that Switch B can obtain an IP address on subnet 10.1.1.0/24 and the corresponding PXE server addresses from Switch A. (Details not shown.)

On the DHCP server, display the IP addresses assigned to the clients.

```
[SwitchA] display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration      Type
                 Hardware address
10.1.1.2         aabb-aabb-ab01        Jan 14 22:25:03 2015  Auto(C)
```

Troubleshooting DHCP server configuration

Failure to obtain a non-conflicting IP address

Symptom

A client's IP address obtained from the DHCP server conflicts with an IP address of another host.

Solution

Another host on the subnet might have the same IP address.

To resolve the problem:

1. Disable the client's network adapter or disconnect the client's network cable. Ping the IP address of the client from another host to check whether there is a host using the same IP address.
2. If a ping response is received, the IP address has been manually configured on a host. Execute the **`dhcp server forbidden-ip`** command on the DHCP server to exclude the IP address from dynamic allocation.
3. Enable the network adapter or connect the network cable, release the IP address, and obtain another one on the client. For example, to release the IP address and obtain another one on a Windows XP DHCP client:
   a. In Windows environment, execute the **`cmd`** command to enter the DOS environment.
   b. Enter **`ipconfig /release`** to relinquish the IP address.
   c. Enter **`ipconfig /renew`** to obtain another IP address.

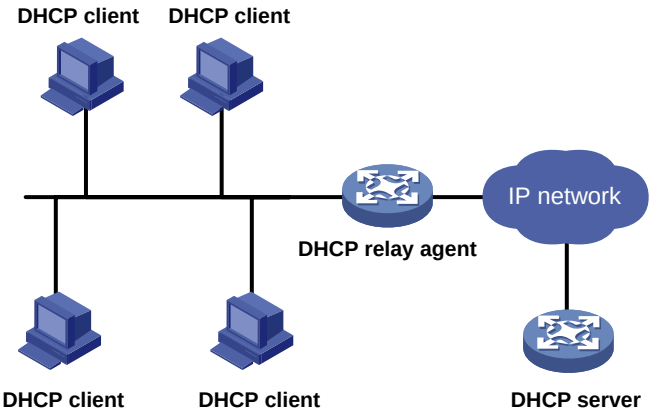
Configuring the DHCP relay agent

About DHCP relay agent

The DHCP relay agent enables clients to get IP addresses and configuration parameters from a DHCP server on another subnet.

Figure 14 shows a typical application of the DHCP relay agent.

Figure 14 DHCP relay agent application

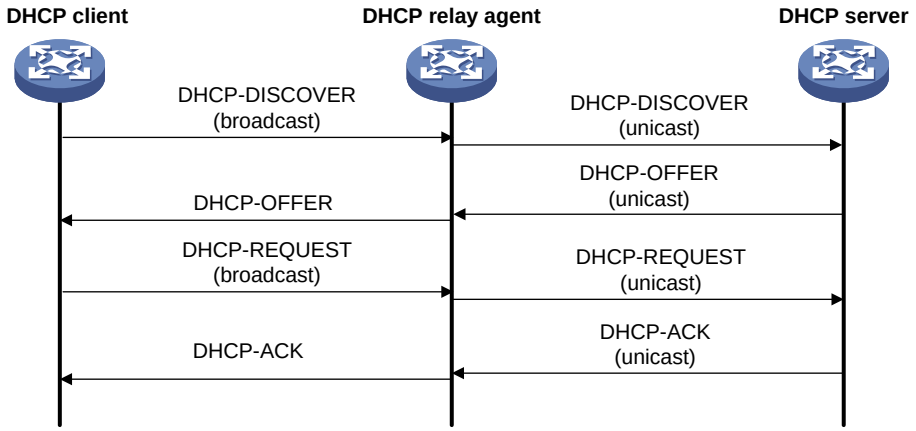


DHCP relay agent operation

The DHCP server and client interact with each other in the same way regardless of whether the relay agent exists. For the interaction details, see "IP address allocation process." The following only describes steps related to the DHCP relay agent:

1. After receiving a DHCP-DISCOVER or DHCP-REQUEST broadcast message from a DHCP client, the DHCP relay agent processes the message as follows:
   a. Fills the **giaddr** field of the message with its IP address.
   b. Unicasts the message to the designated DHCP server.
2. Based on the **giaddr** field, the DHCP server returns an IP address and other configuration parameters in a response.
3. The relay agent conveys the response to the client.

Figure 15 DHCP relay agent operation



DHCP relay agent support for Option 82

Option 82 records the location information about the DHCP client. It enables the administrator to perform the following tasks:

- Locate the DHCP client for security and accounting purposes.
- Assign IP addresses in a specific range to clients.

For more information about Option 82, see "Relay agent option (Option 82)."

If the DHCP relay agent supports Option 82, it handles DHCP requests by following the strategies described in Table 3.

If a response returned by the DHCP server contains Option 82, the DHCP relay agent removes the Option 82 before forwarding the response to the client.

Table 3 Handling strategies of the DHCP relay agent

If a DHCP request has…	Handling strategy	The DHCP relay agent…
Option 82	Drop	Drops the message.
	Keep	Forwards the message without changing Option 82.
	Replace	Forwards the message after replacing the original Option 82 with the Option 82 padded according to the configured padding format, padding content, and code type.
No Option 82	N/A	Forwards the message after adding Option 82 padded according to the configured padding format, padding content, and code type.

DHCP relay agent tasks at a glance

To configure a DHCP relay agent, perform the following tasks:

1. Enabling DHCP
2. Enabling the DHCP relay agent on an interface
3. Specifying DHCP servers
4. (Optional.) Configuring advanced features:
   - Specifying a DHCP relay address pool for DHCP clients

Enabling DHCP

Restrictions and guidelines

You must enable DHCP to make other DHCP relay agent settings take effect.

Procedure

1. Enter system view.
   `system-view`
2. Enable DHCP.
   `dhcp enable`
   By default, DHCP is disabled.

Enabling the DHCP relay agent on an interface

About enabling the DHCP relay agent on an interface

With the DHCP relay agent enabled, an interface forwards incoming DHCP requests to a DHCP server.

An IP address pool that contains the IP address of the DHCP relay interface must be configured on the DHCP server. Otherwise, the DHCP clients connected to the relay agent cannot obtain correct IP addresses.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable the DHCP relay agent.
   `dhcp select relay`
   By default, when DHCP is enabled, an interface operates in the DHCP server mode.

Specifying DHCP servers

Specifying DHCP servers on a relay agent

About specifying DHCP servers on a relay agent

To improve availability, you can specify several DHCP servers on the DHCP relay agent. When the interface receives request messages from clients, the relay agent forwards them to all DHCP servers.

Restrictions and guidelines

The IP address of any specified DHCP server must not reside on the same subnet as the IP address of the relay interface. Otherwise, the clients might fail to obtain IP addresses.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify a DHCP server address on the relay agent.
   dhcp relay server-address *ip-address* [**class** *class-name*]
   By default, no DHCP server address is specified on the relay agent.
   To specify multiple DHCP server addresses, repeat this step. You can specify a maximum of eight DHCP servers.

Specifying DHCP servers in a DHCP relay address pool

About specifying DHCP servers in a DHCP relay address pool

DHCP address pools created on a DHCP relay agent are called DHCP relay address pools. You can create a relay address pool and specify DHCP servers in this address pool. This feature allows DHCP clients of the same type to obtain IP addresses and other configuration parameters from the DHCP servers specified in the matching DHCP relay address pool.

It applies to scenarios where the DHCP relay agent connects to clients of the same access type but classified into different types by their locations. In this case, the relay interface typically has no IP address configured. You can use the **gateway-list** command to specify gateway addresses for clients matching the same DHCP relay address pool and bind the gateway addresses to the device's MAC address.

Upon receiving a DHCP DISCOVER or REQUEST from a client that matches a DHCP relay address pool, the relay agent processes the packet as follows:

- Fills the **giaddr** field of the packet with a specified gateway address.
- Forwards the packet to all DHCP servers in the matching DHCP relay address pool.

The DHCP servers select a DHCP relay address pool according to the gateway address.

Procedure

1. Enter system view.
   system-view
2. Create a DHCP relay address pool and enter its view.
   dhcp server ip-pool *pool-name*
3. Specify gateways in the DHCP relay address pool.
   gateway-list *ip-address*&<1-64>
   By default, no gateway address is specified.
4. Specify DHCP servers in the DHCP relay address pool.
   remote-server *ip-address*&<1-8>
   By default, no DHCP server is specified in the DHCP relay address pool.
   You can specify a maximum of eight DHCP servers in one DHCP relay address pool for high availability.

Specifying the DHCP server selecting algorithm

About DHCP server selecting algorithm

The DHCP relay agent supports the **polling** and **master-backup** DHCP server selecting algorithms.

By default, the DHCP relay agent uses the **polling** algorithm. It forwards DHCP requests to all DHCP servers. The DHCP clients select the DHCP server from which the first received DHCP reply comes.

If the DHCP relay agent uses the **master-backup** algorithm, it forwards DHCP requests to the master DHCP server first. If the master DHCP server is not available, the relay agent forwards the subsequent DHCP requests to a backup DHCP server. If the backup DHCP server is not available, the relay agent selects the next backup DHCP server, and so on. If no backup DHCP server is available, it repeats the process starting from the master DHCP server.

The master DHCP server is determined in one of the following ways:

- In a common network where multiple DHCP server addresses are specified on the DHCP relay interface, the first specified DHCP server is the master. The other DHCP servers are backup.
- In a network where DHCP relay address pools are configured on the DHCP relay agent, the first specified DHCP server in a DHCP relay address pool is the master. The other DHCP servers in the DHCP relay address pool are backup.

DHCP server selection supports the following functions:

- **DHCP server response timeout time**—The DHCP relay agent determines that a DHCP server is not available if it does not receive any response from the server within the DHCP server response timeout time. The DHCP server response timeout time is configurable and the default is 30 seconds.
- **DHCP server switchback**—If the DHCP relay agent selects a backup DHCP server, it does not switch back to the master DHCP server by default. You can configure the DHCP relay agent to switch back to the master DHCP server after a delay. If the master DHCP server is available, the DHCP relay agent forwards DHCP requests to the master DHCP server. If the master DHCP server is not available, the DHCP relay agent still uses the backup DHCP server.

Specifying the DHCP server selecting algorithm in interface view

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify the DHCP server selecting algorithm.
   dhcp relay server-address algorithm { **master-backup** | **polling** }
   By default, the **polling** algorithm is used. The DHCP relay agent forwards DHCP requests to all DHCP servers.
4. (Optional.) Set the DHCP server response timeout time for DHCP server switchover.
   dhcp relay dhcp-server timeout *time*
   By default, the DHCP server response timeout time is 30 seconds.
5. (Optional.) Enable the switchback to the master DHCP server and set the delay time.
   dhcp relay master-server switch-delay *delay-time*
   By default, the DHCP relay agent does not switch back to the master DHCP server.

Specifying the DHCP server selecting algorithm in DHCP relay address pool view

1. Enter system view.
   system-view
2. Enter DHCP relay address pool view.

dhcp server ip-pool *pool-name*

3. Specify the DHCP server selecting algorithm.

   dhcp relay server-address algorithm { **master-backup** | **polling** }

   By default, the **polling** algorithm is used. The DHCP relay agent forwards DHCP requests to all DHCP servers.

4. (Optional.) Set the DHCP server response timeout time for DHCP server switchover.

   dhcp-server timeout *time*

   By default, the DHCP server response timeout time is 30 seconds.

5. (Optional.) Enable the switchback to the master DHCP server and set the delay time.

   master-server switch-delay *delay-time*

   By default, the DHCP relay agent does not switch back to the master DHCP server.

Specifying a DHCP relay address pool for DHCP clients

About specifying a DHCP relay address pool for DHCP clients

After you configure multiple DHCP relay address pools on a DHCP relay agent, you can specify these pools on an interface. To match DHCP clients based on options, you can define option settings when you specify the relay address pools.

If you specify multiple DHCP relay address pools on an interface, the relay agent selects a DHCP relay address pool for a DHCP client as follows:

1. Compares option values in the DHCP request in descending order against option values in DHCP relay address pools.
   - If a match (other than 60) is found, the matching process stops and the relay agent selects that matching relay address pool.
   - If the matching option value is 60, the relay agent continues to compare the Option 60 content in the request and the Option 60 string in the relay address pool:
     - If the Option 60 content matches the string, the relay address pool is selected.
     - If the Option 60 content does not match the string, the relay address pool is not selected. If another relay address pool is specified to match Option 60 but has no Option 60 string defined, the relay agent selects that relay address pool.
2. If still no DHCP relay address pool is matched, the relay agent selects the DHCP relay address pool with no options specified.

Restrictions and guidelines

If you specify DHCP servers by configuring both of the following methods on an interface, the DHCP relay address pool setting takes effect.

- Specify DHCP relay address pools by using the **dhcp relay pool** command.
- Specify DHCP servers directly on an interface by using the **dhcp relay server-address** command.

When you specify a DHCP relay address pool on an interface to define the DHCP servers, make sure the **remote-server** command is configured in the DHCP relay address pool. Otherwise, the relay agent drops DHCP requests. The DHCP requests are not forwarded to any DHCP server even if the **dhcp relay server-address** command is configured.

Procedure

1. Enter system view.

system-view

2. Create a DHCP relay address pool and enter its view.
   dhcp server ip-pool *pool-name*
   By default, no DHCP relay address pools exist.
3. Specify DHCP servers in the DHCP relay address pool.
   remote-server *ip-address*&<1-8>
   By default, no DHCP server is specified in the DHCP relay address pool.
4. Specify gateway addresses for the clients matching the DHCP relay address pool.
   gateway-list *ip-address*&<1-64>
   By default, no gateway address is specified.
5. Specify the DHCP server selecting algorithm.
   remote-server algorithm { **master-backup** | **polling** }
   By default, the **polling** algorithm is used. The DHCP relay agent forwards DHCP requests to all DHCP servers at the same time.
6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Specify a DHCP relay address pool for DHCP clients.
   dhcp relay pool *pool-name* [**option** { 60 [*option-text*] | *code* }]
   By default, no DHCP relay address pool is specified for DHCP clients.

Configuring the DHCP relay agent security features

Enabling the DHCP relay agent to record relay entries

About enabling the DHCP relay agent to record relay entries

Perform this task to enable the DHCP relay agent to automatically record clients' IP-to-MAC bindings (relay entries) after they obtain IP addresses through DHCP.

Some security features use the relay entries to check incoming packets and block packets that do not match any entry. In this way, illegal hosts are not able to access external networks through the relay agent. Examples of the security features are ARP address check, authorized ARP, and IP source guard.

Restrictions and guidelines

The DHCP relay agent does not record IP-to-MAC bindings for DHCP clients running on synchronous/asynchronous serial interfaces.

Procedure

1. Enter system view.
   system-view
2. Enable the relay agent to record relay entries.
   dhcp relay client-information record
   By default, the relay agent does not record relay entries.

Enabling periodic refresh of dynamic relay entries

About enabling periodic refresh of dynamic relay entries

A DHCP client unicasts a DHCP-RELEASE message to the DHCP server to release its IP address. The DHCP relay agent conveys the message to the DHCP server and does not remove the IP-to-MAC entry of the client.

With this feature, the DHCP relay agent uses the IP address of a relay entry to periodically send a DHCP-REQUEST message to the DHCP server.

The relay agent maintains the relay entries depending on what it receives from the DHCP server:

- If the server returns a DHCP-ACK message or does not return any message within an interval, the DHCP relay agent removes the relay entry. In addition, upon receiving the DHCP-ACK message, the relay agent sends a DHCP-RELEASE message to release the IP address.
- If the server returns a DHCP-NAK message, the relay agent keeps the relay entry.

Procedure

1. Enter system view.

   system-view
2. Enable periodic refresh of dynamic relay entries.

   dhcp relay client-information refresh enable

   By default, periodic refresh of dynamic relay entries is enabled.
3. (Optional.) Set the refresh interval.

   dhcp relay client-information refresh [**auto** | **interval** *interval*]

   By default, the refresh interval is **auto**, which is calculated based on the number of total relay entries.

Enabling DHCP starvation attack protection

About DHCP starvation attack protection

A DHCP starvation attack occurs when an attacker constantly sends forged DHCP requests using different MAC addresses in the **chaddr** field to a DHCP server. This exhausts the IP address resources of the DHCP server so legitimate DHCP clients cannot obtain IP addresses. The DHCP server might also fail to work because of exhaustion of system resources. The following methods are available to relieve or prevent such attacks.

- To relieve a DHCP starvation attack that uses DHCP packets encapsulated with different source MAC addresses, you can use one of the following methods:
  - Limit the number of ARP entries that a Layer 3 interface can learn.
  - Set the MAC learning limit for a Layer 2 port, and disable unknown frame forwarding when the MAC learning limit is reached.
- To prevent a DHCP starvation attack that uses DHCP requests encapsulated with the same source MAC address, you can enable MAC address check on the DHCP relay agent. The DHCP relay agent compares the **chaddr** field of a received DHCP request with the source MAC address in the frame header. If they are the same, the DHCP relay agent forwards the request to the DHCP server. If not, the relay agent discards the request.

Enable MAC address check only on the DHCP relay agent directly connected to the DHCP clients. A DHCP relay agent changes the source MAC address of DHCP packets before sending them.

A MAC address check entry has an aging time. When the aging time expires, both of the following occur:

- The entry ages out.

- The DHCP relay agent rechecks the validity of DHCP requests sent from the MAC address in the entry.

Procedure

1. Enter system view.
   system-view
2. Set the aging time for MAC address check entries.
   dhcp relay check mac-address aging-time *time*
   The default aging time is 30 seconds.
   This command takes effect only after you execute the **dhcp relay check mac-address** command.
3. Enter the interface view.
   interface *interface-type interface-number*
4. Enable MAC address check.
   dhcp relay check mac-address
   By default, MAC address check is disabled.

Enabling DHCP server proxy on the DHCP relay agent

About enabling DHCP server proxy on the DHCP relay agent

The DHCP server proxy feature isolates DHCP servers from DHCP clients and protects DHCP servers against attacks.

Upon receiving a response from the server, the DHCP server proxy modifies the server's IP address as the relay interface's IP address before sending out the response. The DHCP client takes the DHCP relay agent as the DHCP server.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable DHCP relay agent and DHCP server proxy on the interface.
   dhcp select relay proxy
   By default, the interface operates in DHCP server mode after DHCP is enabled.

Enabling client offline detection on the DHCP relay agent

About client offline detection on the DHCP relay agent

The client offline detection on the DHCP relay agent detects the user online status based on the ARP entry aging. When an ARP entry ages out, the DHCP client offline detection feature deletes the relay entry for the IP address and sends a RELEASE message to the DHCP server.

If DHCP relay agent and DHCP snooping are configured on the same device, the DHCP snooping module deletes its DHCP snooping entries after it obtains the RELEASE messages from the relay agent module.

Restrictions and guidelines

The feature does not function if an ARP entry is manually deleted.

Procedure

1. Enter system view.
   system-view
2. Enable the relay agent to record relay entries.
   dhcp relay client-information record
   By default, the relay agent does not record relay entries.
   Without relay entries, client offline detection cannot function correctly.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable the DHCP relay agent.
   dhcp select relay
   By default, when DHCP is enabled, an interface operates in the DHCP server mode.
5. Enable client offline detection.
   dhcp client-detect
   By default, client offline detection is disabled on the DHCP relay agent.

Configuring the DHCP relay agent to release an IP address

About configuring the DHCP relay agent to release an IP address

Configure the relay agent to release the IP address for a relay entry. The relay agent sends a DHCP-RELEASE message to the server and meanwhile deletes the relay entry. Upon receiving the DHCP-RELEASE message, the DHCP server releases the IP address.

This command can release only the IP addresses in the recorded relay entries.

Procedure

1. Enter system view.
   system-view
2. Configure the DHCP relay agent to release an IP address.
   dhcp relay release ip *ip-address*

Configuring DHCP relay agent support for Option 82

To support Option 82, you must perform related configuration on both the DHCP server and relay agent. For DHCP server Option 82 configuration, see "Enabling handling of Option 82."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the relay agent to handle Option 82.
   dhcp relay information enable

By default, handling of Option 82 is disabled.

4. (Optional.) Configure the strategy for handling DHCP requests that contain Option 82.

   dhcp relay information strategy { **drop** | **keep** | **replace** }

   By default, the handling strategy is **replace**.

   If the handling strategy is **replace**, configure a padding mode and a padding format for Option 82. If the handling strategy is **keep** or **drop**, you do not need to configure a padding mode or padding format for Option 82.

5. (Optional.) Configure the padding mode and padding format for the Circuit ID sub-option.

   dhcp relay information circuit-id { **bas** | **string** *circuit-id* | { **normal** | **verbose** [**node-identifier** { **mac** | **sysname** | **user-defined** *node-identifier* }] [**interface**] } [**format** { **ascii** | **hex** }] }

   By default, the padding mode for Circuit ID sub-option is **normal**, and the padding format is **hex**.

   The device name (**sysname**) must not include spaces if it is configured as the padding content for sub-option 1. Otherwise, the DHCP relay agent will fail to add or replace Option 82.

6. (Optional.) Configure the padding mode and padding format for the Remote ID sub-option.

   dhcp relay information remote-id { **normal** [**format** { **ascii** | **hex** }] | **string** *remote-id* | **sysname** }

   By default, the padding mode for the Remote ID sub-option is **normal**, and the padding format is **hex**.

Setting the DSCP value for DHCP packets sent by the DHCP relay agent

About the DSCP value for DHCP packets sent by the DHCP relay agent

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet.

Procedure

1. Enter system view.

   system-view

2. Set the DSCP value for DHCP packets sent by the DHCP relay agent.

   dhcp dscp *dscp-value*

   By default, the DSCP value in DHCP packets sent by the DHCP relay agent is 56.

Specifying the DHCP relay agent address for the **giaddr** field

Manually specifying the DHCP relay agent address for the **giaddr** field

About manually specifying the DHCP relay agent address for the giaddr field

This task allows you to specify the IP addresses to be encapsulated to the **giaddr** field of the DHCP requests. If you do not specify any DHCP relay agent address, the primary IP address of the DHCP relay interface is encapsulated to the **giaddr** field of DHCP requests.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enter interface view.
   ```
   interface interface-type interface-number
   ```
3. Specify the DHCP relay agent address to be encapsulated in relayed DHCP requests.
   ```
   dhcp relay gateway ip-address
   ```
   By default, the primary IP address of the DHCP relay interface is encapsulated in the relayed DHCP requests.

Configuring smart relay to specify the DHCP relay agent address for the **giaddr** field

About smart relay

By default, the relay agent only encapsulates the primary IP address to the **giaddr** field of all requests before relaying them to the DHCP server. The DHCP server then selects an IP address on the same subnet as the address in the **giaddr** filed. If no assignable addresses on the subnet are available, the DHCP server does not assign any IP address. The DHCP smart relay feature is introduced to allow the DHCP relay agent to encapsulate secondary IP addresses when the DHCP server does not send back a DHCP-OFFER message.

The relay agent initially encapsulates its primary IP address to the **giaddr** field before forwarding a request to the DHCP server. If no DHCP-OFFER is received, the relay agent allows the client to send a maximum of two requests to the DHCP server by using the primary IP address. If no DHCP-OFFER is returned after two retries, the relay agent switches to a secondary IP address. If the DHCP server still does not respond, the next secondary IP address is used. After the secondary IP addresses are all tried and the DHCP server does not respond, the relay agent repeats the process by starting from the primary IP address.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enable the DHCP smart relay feature.
   ```
   dhcp smart-relay enable
   ```
   By default, the DHCP smart relay feature is disabled.

Specifying the source IP address for relayed DHCP requests

About specifying the source IP address for relayed DHCP requests

This task is required if multiple relay interfaces share the same IP address or if a relay interface does not have routes to DHCP servers. You can specify an IP address or the IP address of another interface, typically the loopback interface, on the DHCP relay agent as the source IP address for DHCP requests. The relay interface inserts the source IP address in the source IP address field as well as the **giaddr** field in DHCP requests.

If multiple relay interfaces share the same IP address, you must also configure the relay interface to support Option 82. Upon receiving a DHCP request, the relay interface inserts the subnet information in sub-option 5 in Option 82. The DHCP server assigns an IP address according to

sub-option 5. The DHCP relay agent looks up the output interface in the MAC address table to forward the DHCP reply.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify the source IP address for DHCP requests.

   dhcp relay source-address { *ip-address* | **interface** *interface-type interface-number* }

   By default, the DHCP relay agent uses the primary IP address of the interface that connects to the DHCP server as the source IP address for relayed DHCP requests. If this interface does not have an IP address, the DHCP relay agent uses an IP address that shares the same subnet with the DHCP server.

   You can specify only one source IP address for DHCP requests on an interface.

Display and maintenance commands for DHCP relay agent

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display MAC address check entries on the DHCP relay agent.	**display dhcp relay check mac-address**
Display relay entries on the DHCP relay agent.	**display dhcp relay client-information** [**interface** *interface-type interface-number* | **ip** *ip-address*]
Display Option 82 configuration information on the DHCP relay agent.	**display dhcp relay information** [**interface** *interface-type interface-number*]
Display information about DHCP servers on an interface.	**display dhcp relay server-address** [**interface** *interface-type interface-number*]
Display packet statistics on the DHCP relay agent.	**display dhcp relay statistics** [**interface** *interface-type interface-number*]
Clear relay entries on the DHCP relay agent.	**reset dhcp relay client-information** [**interface** *interface-type interface-number* | **ip** *ip-address*]
Clear packet statistics on the DHCP relay agent.	**reset dhcp relay statistics** [**interface** *interface-type interface-number*]

DHCP relay agent configuration examples

Example: Configuring basic DHCP relay agent

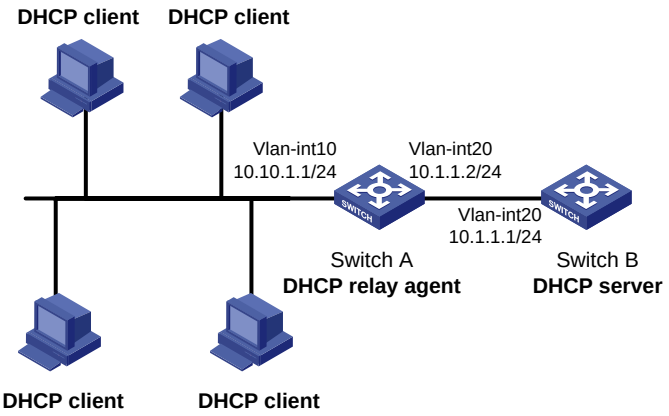
Network configuration

As shown in Figure 16, configure the DHCP relay agent on Switch A. The DHCP relay agent enables DHCP clients to obtain IP addresses and other configuration parameters from the DHCP server on another subnet.

The DHCP relay agent and server are on different subnets. Configure static or dynamic routing to make them reachable to each other.

Perform the configuration on the DHCP server to guarantee the client-server communication. For DHCP server configuration information, see "DHCP server configuration examples."

Figure 16 Network diagram



Procedure

Specify IP addresses for the interfaces. (Details not shown.)

Enable DHCP.

```
<SwitchA> system-view
[SwitchA] dhcp enable
```

Enable the DHCP relay agent on VLAN-interface 10.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] dhcp select relay
```

Specify the IP address of the DHCP server on the relay agent.

```
[SwitchA-Vlan-interface10] dhcp relay server-address 10.1.1.1
```

Verifying the configuration

Verify that DHCP clients can obtain IP addresses and all other network parameters from the DHCP server through the DHCP relay agent. (Details not shown.)

Display the statistics of DHCP packets forwarded by the DHCP relay agent.

```
[SwitchA] display dhcp relay statistics
```

Display relay entries if you have enabled relay entry recording on the DHCP relay agent.

```
[SwitchA] display dhcp relay client-information
```

Example: Configuring Option 82

Network configuration

As shown in Figure 16, the DHCP relay agent (Switch A) replaces Option 82 in DHCP requests before forwarding them to the DHCP server (Switch B).

- The Circuit ID sub-option is **company001.**
- The Remote ID sub-option is **device001**.

To use Option 82, you must also enable the DHCP server to handle Option 82.

Procedure

Specify IP addresses for the interfaces. (Details not shown.)

Enable DHCP.

```
<SwitchA> system-view
[SwitchA] dhcp enable
```

Enable the DHCP relay agent on VLAN-interface 10.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] dhcp select relay
```

Specify the IP address of the DHCP server.

```
[SwitchA-Vlan-interface10] dhcp relay server-address 10.1.1.1
```

Configure the handling strategies and padding content of Option 82.

```
[SwitchA-Vlan-interface10] dhcp relay information enable
[SwitchA-Vlan-interface10] dhcp relay information strategy replace
[SwitchA-Vlan-interface10] dhcp relay information circuit-id string company001
[SwitchA-Vlan-interface10] dhcp relay information remote-id string device001
```

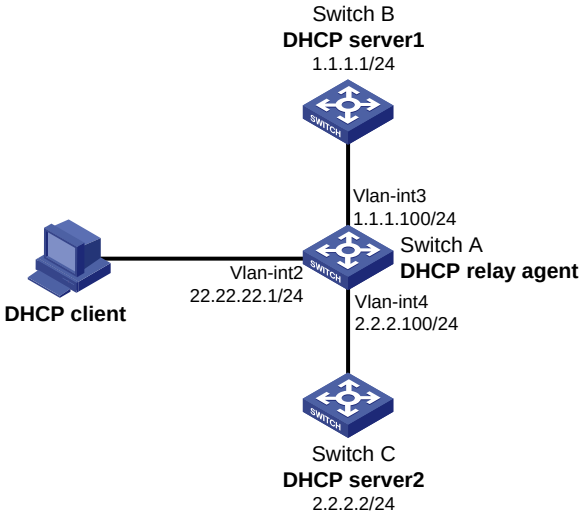
Example: Configuring DHCP server selection

Network configuration

As shown in Figure 17, the DHCP client and the DHCP servers are in different subnets. DHCP server 1 and DHCP server 2 both have a DHCP address pool that contains IP addresses in subnet 22.22.22.0/24, but neither has DHCP enabled.

Configure the DHCP relay agent for the DHCP client to obtain an IP address in subnet 22.22.22.0/24 and other configuration parameters from a DHCP server. The DHCP relay agent is connected to the DHCP client through VLAN-interface 2, to DHCP server 1 through VLAN-interface 3, and to DHCP server 2 through VLAN-interface 4.

Figure 17 Network diagram



Procedure

1. Assign IP addresses to interfaces on the switches. (Details not shown.)
2. Configure Switch B and Switch C as DHCP servers. (Details not shown.)
3. Configure the DHCP relay agent on Switch A:

   # Enable DHCP.

   ```
   <SwitchA> system-view
   [SwitchA] dhcp enable
   ```

   # Enable the DHCP relay agent on VLAN-interface 2.

   ```
   [SwitchA] interface vlan-interface 2
   [SwitchA-Vlan-interface2] dhcp select relay
   ```

   # Specify the IP addresses of the DHCP servers.

   ```
   [SwitchA-Vlan-interface2] dhcp relay server-address 1.1.1.1
   [SwitchA-Vlan-interface2] dhcp relay server-address 2.2.2.2
   ```

   # Specify the DHCP server selecting algorithm as **master-backup**.

   ```
   [SwitchA-Vlan-interface2] dhcp relay server-address algorithm master-backup
   ```

   # Configure the DHCP relay agent to switch back to the master DHCP server 3 minutes after it switches to the backup DHCP server.

   ```
   [SwitchA-Vlan-interface2] dhcp relay master-server switch-delay 3
   ```

Verifying the configuration

Verify that the DHCP client cannot obtain an IP address and that the following log is output in about 30 seconds.

```
DHCPR/3/DHCPR_SERVERCHANGE:
 Switched to the server at 2.2.2.2 because the current server did not respond.
```

Enable DHCP on the DHCP server at 1.1.1.1. (Details not shown.)

Verify that the DHCP client cannot obtain an IP address and that the following log is output in about 3 minutes.

```
DHCPR/3/DHCPR_SWITCHMASTER:
 Switched to the master DHCP server at 1.1.1.1.
```

Verify that the DHCP client obtains an IP address. (Details not shown.)

Troubleshooting DHCP relay agent configuration

Failure of DHCP clients to obtain configuration parameters through the DHCP relay agent

Symptom

DHCP clients cannot obtain configuration parameters through the DHCP relay agent.

Solution

Some problems might occur with the DHCP relay agent or server configuration.

To locate the problem, enable debugging and execute the **`display`** command on the DHCP relay agent to view the debugging information and interface state information.

Check that:

- DHCP is enabled on the DHCP server and relay agent.
- The DHCP server has an address pool on the same subnet as the DHCP clients.
- The DHCP server and DHCP relay agent can reach each other.
- The DHCP server address specified on the DHCP relay interface connected to the DHCP clients is correct.

Configuring the DHCP client

About DHCP client

With DHCP client enabled, an interface uses DHCP to obtain configuration parameters from the DHCP server, for example, an IP address.

Restrictions and guidelines: DHCP client configuration

The DHCP client configuration is supported only on VLAN interfaces.

DHCP client tasks at a glance

To configure a DHCP client, perform the following tasks:

1. Enabling the DHCP client on an interface
2. Configuring a DHCP client ID for an interface

   Perform this task if the DHCP client uses the client ID to obtain IP addresses.
3. (Optional.) Enabling duplicated address detection
4. (Optional.) Setting the DSCP value for DHCP packets sent by the DHCP client
5. (Optional.) Configuring Option 60 for DHCP requests

Enabling the DHCP client on an interface

Restrictions and guidelines

- If the number of IP address request failures reaches the system-defined amount, the DHCP client-enabled interface uses a default IP address.
- An interface can be configured to acquire an IP address in multiple ways. The new configuration overwrites the old.
- Secondary IP addresses cannot be configured on an interface that is enabled with the DHCP client.
- If the interface obtains an IP address on the same segment as another interface on the device, the interface does not use the assigned address. Instead, it requests a new IP address from the DHCP server.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure an interface to use DHCP for IP address acquisition.

   ip address dhcp-alloc

   The default setting varies as follows:

- For the S3100V3-SI switch series, MS4320V2 switch series, MS4320 switch series, MS4200 switch series, and MS4300V2 switch series, an interface does not use DHCP for IP address acquisition.
- For the S5110V2 switch series, S5110V2-SI switch series, S5130S-LI switch series, S5130S-SI switch series, S5000V3-EI switch series, S5000E-X switch series, WS5810-WiNet switch series, WS5820-WiNet switch series, and WAS6100 switch series:
  - If the switch starts with initial configuration, an interface does not use DHCP for IP address acquisition.
  - If the switch starts with factory defaults, VLAN-interface 1 obtains an IP address through DHCP.

For more information about initial configuration and factory defaults, see configuration file management configuration in *Fundamentals Configuration Guide*.

Configuring a DHCP client ID for an interface

About DHCP client ID

A DHCP client ID is added to the DHCP option 61 to uniquely identify a DHCP client. A DHCP server can assign IP addresses to clients based on their DHCP client IDs.

DHCP client ID includes an ID type and a type value. Each ID type has a fixed type value. You can specify a DHCP client ID by using one of the following methods:

- Use an ASCII string as the client ID. If an ASCII string is used, the type value is 00.
- Use a hexadecimal number as the client ID. If a hexadecimal number is used, the type value is the first two characters in the number.
- Use the MAC address of an interface to generate a client ID. If this method is used, the type value is 01.

The type value of a DHCP client ID can be displayed by the **display dhcp server ip-in-use** or **display dhcp client** command.

Restrictions and guidelines

Make sure the ID for each DHCP client is unique.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure a DHCP client ID for the interface.

   dhcp client identifier { **ascii** *ascii-string* | **hex** *hex-string* | **mac** *interface-type interface-number* }

   By default, an interface generates the DHCP client ID based on its MAC address. If the interface has no MAC address, it uses the MAC address of the first Ethernet interface to generate its client ID.

Enabling duplicated address detection

About duplicated address detection

DHCP client detects IP address conflict through ARP packets. An attacker can act as the IP address owner to send an ARP reply. The spoofing attack makes the client unable to use the IP address

assigned by the server. As a best practice, disable duplicate address detection when ARP attacks exist on the network.

Procedure

1. Enter system view.
   system-view
2. Enable duplicate address detection.
   dhcp client dad enable
   By default, the duplicate address detection feature is enabled on an interface.

Setting the DSCP value for DHCP packets sent by the DHCP client

About setting the DSCP value for DHCP packets sent by the DHCP client

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet.

Procedure

1. Enter system view.
   system-view
2. Set the DSCP value for DHCP packets sent by the DHCP client.
   dhcp client dscp *dscp-value*
   By default, the DSCP value in DHCP packets sent by the DHCP client is 56.

Configuring Option 60 for DHCP requests

About this task

Option 60 acts as a vendor class identifier (VCI). You can configure a DHCP client to send a request with Option 60 for the DHCP server to make class-based IP address assignment. When the DHCP server receives a request with Option 60 from a client, the server identifies the user class of the client. Then, the server assigns the client an IP address from the IP range specified for the user class.

By default, Option 60 contains the vendor name and the product name. To define this option for DHCP requests, perform this task.

Software version and feature compatibility

This feature is supported only in Release 6340 and later.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure Option 60 for DHCP requests.
   dhcp client class-id { **ascii** *ascii-string* | **hex** *hex-string* }
   By default, Option 60 contains the vendor name and the product name.

Display and maintenance commands for DHCP client

Execute **display** command in any view.

Task	Command
Display DHCP client information.	**display dhcp client** [**verbose**] [**interface** *interface-type interface-number*]

DHCP client configuration examples

Example: Configuring DHCP client

Network configuration

As shown in Figure 19, on a LAN, Switch B contacts the DHCP server through VLAN-interface 2 to obtain an IP address, a DNS server address, and static route information. The DHCP client's IP address resides on subnet 10.1.1.0/24. The DNS server address is 20.1.1.1. The next hop of the static route to subnet 20.1.1.0/24 is 10.1.1.2.

The DHCP server uses Option 121 to assign static route information to DHCP clients. Figure 18 shows the Option 121 format. The destination descriptor field contains the following parts: subnet mask length and destination network address, both in hexadecimal notation. In this example, the destination descriptor is 18 14 01 01 (the subnet mask length is 24 and the network address is 20.1.1.0 in dotted decimal notation). The next hop address is 0A 01 01 02 (10.1.1.2 in dotted decimal notation).

Figure 18 Option 121 format

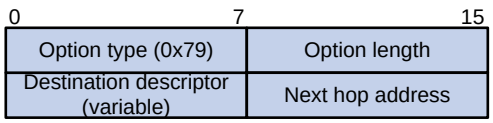


Figure 19 Network diagram

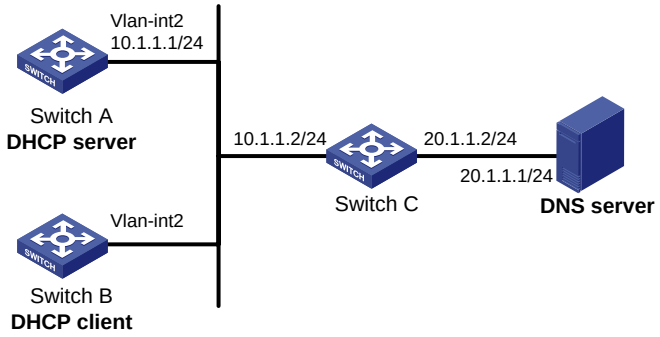

Procedure

1. Configure Switch A:

   # Specify an IP address for VLAN-interface 2.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 10.1.1.1 24
[SwitchA-Vlan-interface2] quit
```

Exclude an IP address from dynamic allocation.

```
[SwitchA] dhcp server forbidden-ip 10.1.1.2
```

Configure DHCP address pool 0. Specify the subnet, lease duration, DNS server address, and a static route to subnet 20.1.1.0/24.

```
[SwitchA] dhcp server ip-pool 0
[SwitchA-dhcp-pool-0] network 10.1.1.0 mask 255.255.255.0
[SwitchA-dhcp-pool-0] expired day 10
[SwitchA-dhcp-pool-0] dns-list 20.1.1.1
[SwitchA-dhcp-pool-0] option 121 hex 18 14 01 01 0A 01 01 02
[SwitchA-dhcp-pool-0] quit
```

Enable DHCP.

```
[SwitchA] dhcp enable
```

2. Configure Switch B:

Configure VLAN-interface 2 to use DHCP for IP address acquisition.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address dhcp-alloc
[SwitchB-Vlan-interface2] quit
```

Verifying the configuration

Display the IP address and other network parameters assigned to Switch B.

```
[SwitchB-Vlan-interface2] display dhcp client verbose
Vlan-interface2 DHCP client information:
 Current state: BOUND
 Allocated IP: 10.1.1.3 255.255.255.0
 Allocated lease: 864000 seconds, T1: 331858 seconds, T2: 756000 seconds
 Lease from May 21 19:00:29 2012   to   May 31 19:00:29 2012
 DHCP server: 10.1.1.1
 Transaction ID: 0xcde72232
 Classless static routes:
   Destination: 20.1.1.0, Mask: 255.255.255.0, NextHop: 10.1.1.2
 DNS servers: 20.1.1.1
 Client ID type: acsii(type value=00)
 Client ID value: 000c.29d3.8659-Vlan2
 Client ID (with type) hex: 0030-3030-632e-3239-
                            6433-2e38-3635-392d-
                            4574-6830-2f30-2f32
 T1 will timeout in 3 days 19 hours 48 minutes 43 seconds
```

Display the route information on Switch B. The output shows that a static route to subnet 20.1.1.0/24 is added to the routing table.

```
[SwitchB] display ip routing-table
Destinations : 11        Routes : 11
Destination/Mask    Proto  Pre  Cost         NextHop         Interface
10.1.1.0/24         Direct 0    0            10.1.1.3        Vlan2
10.1.1.3/32         Direct 0    0            127.0.0.1       InLoop0
```

```

```

Configuring DHCP snooping

About DHCP snooping

DHCP snooping is a security feature for DHCP.

DHCP snooping works between the DHCP client and server, or between the DHCP client and DHCP relay agent. It guarantees that DHCP clients obtain IP addresses from authorized DHCP servers. Also, it records IP-to-MAC bindings of DHCP clients (called DHCP snooping entries) for security purposes.

DHCP snooping defines trusted and untrusted ports to make sure clients obtain IP addresses only from authorized DHCP servers.

- **Trusted**—A trusted port can forward DHCP messages correctly to make sure the clients get IP addresses from authorized DHCP servers.
- **Untrusted**—An untrusted port cannot forward DHCP requests to the DHCP server. It discards received DHCP-ACK and DHCP-OFFER messages to prevent unauthorized servers from assigning IP addresses.

DHCP snooping reads DHCP-ACK messages received from trusted ports and DHCP-REQUEST messages to create DHCP snooping entries. A DHCP snooping entry includes the MAC and IP addresses of a client, the port that connects to the DHCP client, and the VLAN.

The following features need to use DHCP snooping entries:

- **ARP attack detection**—Uses DHCP snooping entries to filter ARP packets from unauthorized clients. For more information, see *Security Configuration Guide*.
- **MAC-forced forwarding (MFF)**—Auto-mode MFF performs the following tasks:
  - Intercepts ARP requests from clients.
  - Uses DHCP snooping entries to find the gateway address.
  - Returns the gateway MAC address to the clients.

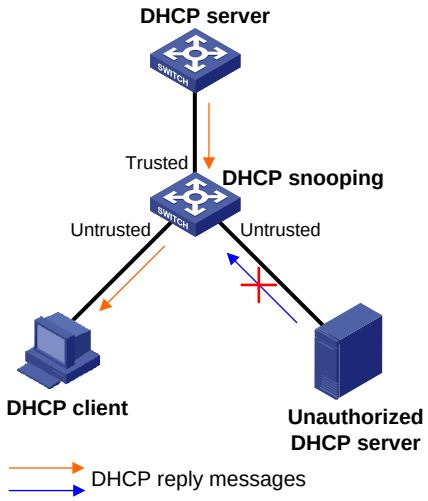
  This feature forces the client to send all traffic to the gateway so that the gateway can monitor client traffic to prevent malicious attacks among clients. For more information, see *Security Configuration Guide*.
- **IP source guard**—Uses DHCP snooping entries to filter illegal packets on a per-port basis. For more information, see *Security Configuration Guide*.
- **VLAN mapping**—Uses DHCP snooping entries to replace service provider VLAN in packets with customer VLAN before sending the packets to clients. For more information, see *Layer 2—LAN Switching Configuration Guide*.

Application of trusted and untrusted ports

Configure ports facing the DHCP server as trusted ports, and configure other ports as untrusted ports.

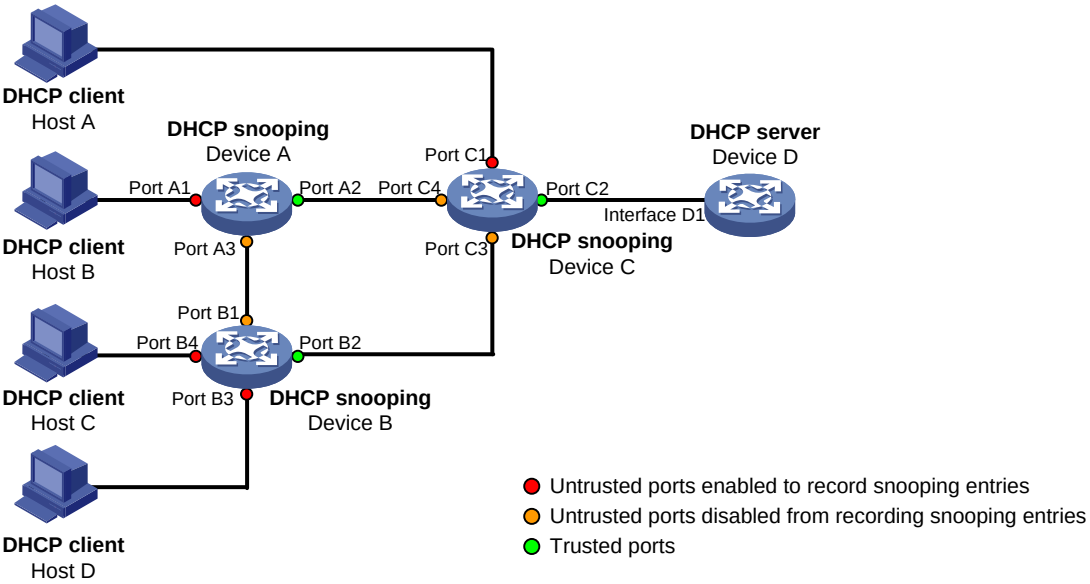
As shown in Figure 20, configure the DHCP snooping device's port that is connected to the DHCP server as a trusted port. The trusted port forwards response messages from the DHCP server to the client. The untrusted port connected to the unauthorized DHCP server discards incoming DHCP response messages.

Figure 20 Trusted and untrusted ports



In a cascaded network as shown in Figure 21, configure the DHCP snooping devices' ports facing the DHCP server as trusted ports. To save system resources, you can enable only the untrusted ports directly connected to the DHCP clients to record DHCP snooping entries.

Figure 21 Trusted and untrusted ports in a cascaded network



DHCP snooping support for Option 82

Option 82 records the location information about the DHCP client so the administrator can locate the DHCP client for security and accounting purposes. For more information about Option 82, see "Relay agent option (Option 82)."

Sub-option 9 (Vendor-Specific) in Option 82 is supported only on DHCP snooping devices. Each DHCP snooping device with the **append** Option 82 handling strategy adds the following information to the sub-option in the received DHCP request:

- Node identifier of the current DHCP snooping device.
- Information about the client-side interface.

- VLAN of the DHCP client.

After the management device receives the DHCP request, it can determine the network topology that the request has travelled and locate the DHCP client.

DHCP snooping uses the same strategies as the DHCP relay agent to handle Option 82 for DHCP request messages, as shown in Table 4. If a response returned by the DHCP server contains Option 82, DHCP snooping removes Option 82 before forwarding the response to the client. If the response contains no Option 82, DHCP snooping forwards it directly.

Table 4 Handling strategies

If a DHCP request has…	Handling strategy	DHCP snooping…
Option 82	Append	• Forwards the message after padding the Vendor-Specific sub-option with the content specified in the **dhcp snooping information vendor-specific** command. • Forwards the message without changing Option 82 if the **dhcp snooping information vendor-specific** command is not configured.
	Drop	Drops the message.
	Keep	Forwards the message without changing Option 82.
	Replace	Forwards the message after replacing the original Option 82 with the Option 82 padded according to the configured padding format, padding content, and code type.
No Option 82	N/A	Forwards the message after adding the Option 82 padded according to the configured padding format, padding content, and code type.

Restrictions and guidelines: DHCP snooping configuration

- The DHCP snooping configuration does not take effect on a Layer 2 Ethernet interface that is an aggregation member port. The configuration takes effect when the interface leaves the aggregation group.
- Specify the ports connected to authorized DHCP servers as trusted ports to make sure that DHCP clients can obtain valid IP addresses. The trusted ports and the ports connected to DHCP clients must be in the same VLAN.
- You can specify the following interfaces as trusted ports: Layer 2 Ethernet interfaces and Layer 2 aggregate interfaces. For more information about aggregate interfaces, see Ethernet link aggregation in *Layer 2—LAN Switching Configuration Guide*.

DHCP snooping tasks at a glance

To configure DHCP snooping, perform the following tasks:

1. Configuring basic DHCP snooping features
2. (Optional.) Configuring DHCP snooping support for Option 82
3. (Optional.) Configuring DHCP snooping entry auto backup
4. (Optional.) Setting the maximum number of DHCP snooping entries
5. (Optional.) Configuring DHCP packet rate limit

6. (Optional.) Configuring DHCP snooping security features
7. (Optional.) Enabling DHCP snooping logging
8. (Optional.) Disabling DHCP snooping on an interface

Configuring basic DHCP snooping features

Configuring basic DHCP snooping features in a common network

About basic DHCP snooping features in a common network

Basic DHCP snooping features refer to the following:

- Enabling DHCP snooping.
- Configuring DHCP snooping trusted ports.
- Enabling recording client information in DHCP snooping entries.

If you enable DHCP snooping globally, DHCP snooping is enabled on all interfaces on the device.

You can also enable DHCP snooping for specific VLANs. After enabling DHCP snooping for a VLAN, you can configure the other basic DHCP snooping features in the VLAN.

Restrictions and guidelines

If the basic DHCP snooping features are configured globally, you can only use the undo form of the global configuration commands to disable the settings globally. The VLAN-specific configuration commands cannot disable the settings.

If the basic DHCP snooping features are configured in a VLAN, you can only use the undo form of the VLAN-specific configuration commands to disable the settings in the VLAN. The global configuration command cannot disable the settings.

Configuring basic DHCP snooping features globally

1. Enter system view.
   `system-view`
2. Enable DHCP snooping globally.
   `dhcp snooping enable`
   By default, DHCP snooping is disabled globally.
3. Enter interface view.
   `interface` *`interface-type interface-number`*
   This interface must connect to the DHCP server.
4. Specify the port as a trusted port.
   `dhcp snooping trust`
   By default, all ports are untrusted ports after DHCP snooping is enabled.
5. (Optional.) Enable the recording of DHCP snooping entries.
   a. Return to system view.
      `quit`
   b. Enter interface view.
      `interface` *`interface-type interface-number`*
      This interface must connect to the DHCP client.
   c. Enable the recording of DHCP snooping entries.

dhcp snooping binding record

By default, the recording of DHCP snooping entries is disabled.

Configuring basic DHCP snooping features for VLANs

1. Enter system view.
   system-view
2. Enable DHCP snooping for VLANs.
   dhcp snooping enable vlan *vlan-id-list*
   By default, DHCP snooping is disabled for all VLANs.
3. Enter VLAN view
   vlan *vlan-id*
   Make sure DHCP snooping is enabled for the VLAN.
4. Configure an interface in the VLAN as a trusted port.
   dhcp snooping trust interface *interface-type interface-number*
   By default, all interfaces in the VLAN are untrusted ports.
5. (Optional.) Enable recording of client information in DHCP snooping entries.
   dhcp snooping binding record
   By default, recording of client information in DHCP snooping entries is disabled.

Configuring DHCP snooping support for Option 82

Restrictions and guidelines

- The Option 82 configuration on a Layer 2 Ethernet interface that has been added to an aggregation group does not take effect unless the interface leaves the aggregation group.
- To support Option 82, you must configure Option 82 on both the DHCP server and the DHCP snooping device. For information about configuring Option 82 on the DHCP server, see "Enabling handling of Option 82."
- If Option 82 contains the device name, the device name must contain no spaces. Otherwise, DHCP snooping drops the message. You can use the **sysname** command to specify the device name. For more information about this command, see *Fundamentals Command Reference*.
- DHCP snooping uses "outer VLAN tag.inner VLAN tag" to fill the VLAN ID field of sub-option 1 in verbose padding format if either of the following conditions exists:
  - DHCP snooping and QinQ work together.
  - DHCP snooping receives a DHCP packet with two VLAN tags.

  For example, if the outer VLAN tag is 10 and the inner VLAN tag is 20, the VLAN ID field is 000a.0014. The hexadecimal digit **a** represents the outer VLAN tag 10, and the hexadecimal digit **14** represents the inner VLAN tag 20.

Procedure

1. Enter system view.
   system-view
2. Enter interface view or VLAN view.
   - Enter interface view.
     interface *interface-type interface-number*
   - Enter VLAN view.
     vlan *vlan-id*

NOTE:

VLAN view is supported only in Release 6348P01 and later.

3. Enable DHCP snooping to support Option 82.

   dhcp snooping information enable

   By default, DHCP snooping does not support Option 82.

4. (Optional.) Configure a handling strategy for DHCP requests that contain Option 82.

   dhcp snooping information strategy { **append** | **drop** | **keep** | **replace** }

   By default, the handling strategy is **replace**.

   If the handling strategy is **append** or **replace**, configure a padding mode and padding format for Option 82. If the handling strategy is **keep** or **drop**, you do not need to configure any padding mode or padding format for Option 82.

5. (Optional.) Configure the padding mode and padding format for the Circuit ID sub-option.

   dhcp snooping information circuit-id { **normal-extended** | [**vlan** *vlan-id*] **string** *circuit-id* | { **normal** | **verbose** [**node-identifier** { **mac** | **sysname** | **user-defined** *node-identifier* }] } [**format** { **ascii** | **hex** }] }

   By default, the padding mode is **normal** and the padding format is **hex** for the Circuit ID sub-option.

   If the device name (**sysname**) is configured as the padding content for sub-option 1, make sure the device name does not include spaces. Otherwise, the DHCP snooping device will fail to add or replace Option 82.

   When you use this command in VLAN view, the **vlan** *vlan-id* option is not supported.

   The **normal-extended** keyword is supported only in Release 6328 and later.

6. (Optional.) Configure the padding mode and padding format for the Remote ID sub-option.

   dhcp snooping information remote-id { **normal** [**format** { **ascii** | **hex** }] | [**vlan** *vlan-id*] **string** *remote-id* | **sysname** }

   By default, the padding mode is **normal** and the padding format is **hex** for the Remote ID sub-option.

   When you use this command in VLAN view, the **vlan** *vlan-id* option is not supported.

   This command is supported only in Release 6348P01 and later.

7. (Optional.) Configure the padding mode for the Vendor-Specific sub-option.

   dhcp snooping information vendor-specific [**vlan** *vlan-id*] **bas** [**node-identifier** { **mac** | **sysname** | **user-defined** *string* }]

   By default, the device does not pad the Vendor-Specific sub-option.

   When you use this command in VLAN view, the **vlan** *vlan-id* option is not supported.

Configuring DHCP snooping entry auto backup

About DHCP snooping entry auto backup

The auto backup feature saves DHCP snooping entries to a backup file, and allows the DHCP snooping device to download the entries from the backup file at device reboot. The entries on the DHCP snooping device cannot survive a reboot. The auto backup helps the security features provide services if these features (such as IP source guard) must use DHCP snooping entries for user authentication.

Restrictions and guidelines

If you disable DHCP snooping with the **undo dhcp snooping enable** command, the device deletes all DHCP snooping entries, but entries stored in the backup file still exist. They are deleted next time the device updates the backup file.

Procedure

1. Enter system view.

   system-view

2. Configure the DHCP snooping device to back up DHCP snooping entries to a file.

   dhcp snooping binding database filename { *filename* | **url** *url* [**username** *username* [**password** { **cipher** | **simple** } *string*]] }

   By default, the DHCP snooping device does not back up DHCP snooping entries.

   With this command executed, the DHCP snooping device backs up DHCP snooping entries immediately and runs auto backup.

   This command automatically creates the file if you specify a non-existent file.

3. (Optional.) Manually save DHCP snooping entries to the backup file.

   dhcp snooping binding database update now

4. (Optional.) Set the waiting time after a DHCP snooping entry change for the DHCP snooping device to update the backup file.

   dhcp snooping binding database update interval *interval*

   By default, the DHCP snooping device waits 300 seconds to update the backup file after a DHCP snooping entry change. If no DHCP snooping entry changes, the backup file is not updated.

Setting the maximum number of DHCP snooping entries

About setting the maximum number of DHCP snooping entries

Perform this task to prevent the system resources from being overused.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the maximum number of DHCP snooping entries for the interface to learn.

   dhcp snooping max-learning-num *max-number*

   By default, the number of DHCP snooping entries for an interface to learn is unlimited.

Configuring DHCP packet rate limit

About DHCP packet rate limit

Perform this task to set the maximum rate at which an interface can receive DHCP packets. This feature discards exceeding DHCP packets to prevent attacks that send large number of DHCP packets.

Restrictions and guidelines

The rate set on the Layer 2 aggregate interface applies to all members of the aggregate interface. If a member interface leaves the aggregation group, it uses the rate set in its Ethernet interface view.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable DHCP snooping packet rate limit on an interface and set the limit value.
   dhcp snooping rate-limit *rate*
   By default, the DHCP snooping packet rate limit is disabled on an interface.

Configuring DHCP snooping security features

Enabling DHCP starvation attack protection

About DHCP starvation attack protection

A DHCP starvation attack occurs when an attacker constantly sends forged DHCP requests that contain identical or different sender MAC addresses in the **chaddr** field to a DHCP server. This attack exhausts the IP address resources of the DHCP server so legitimate DHCP clients cannot obtain IP addresses. The DHCP server might also fail to work because of exhaustion of system resources. For information about the fields of DHCP packet, see "DHCP message format."

You can prevent DHCP starvation attacks in the following ways:

- If the forged DHCP requests contain different sender MAC addresses, use the **mac-address max-mac-count** command to set the MAC learning limit on a Layer 2 port. For more information about the command, see *Layer 2—LAN Switching Command Reference*.
- If the forged DHCP requests contain the same sender MAC address, perform this task to enable MAC address check for DHCP snooping. This feature compares the **chaddr** field of a received DHCP request with the source MAC address field in the frame header. If they are the same, the request is considered valid and forwarded to the DHCP server. If not, the request is discarded.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable MAC address check.
   dhcp snooping check mac-address
   By default, MAC address check is disabled.

Enabling DHCP-REQUEST attack protection

About DHCP-REQUEST attack protection

DHCP-REQUEST messages include DHCP lease renewal packets, DHCP-DECLINE packets, and DHCP-RELEASE packets. This feature prevents the unauthorized clients that forge the DHCP-REQUEST messages from attacking the DHCP server.

Attackers can forge DHCP lease renewal packets to renew leases for legitimate DHCP clients that no longer need the IP addresses. These forged messages disable the victim DHCP server from releasing the IP addresses.

Attackers can also forge DHCP-DECLINE or DHCP-RELEASE packets to terminate leases for legitimate DHCP clients that still need the IP addresses.

To prevent such attacks, you can enable DHCP-REQUEST check. This feature uses DHCP snooping entries to check incoming DHCP-REQUEST messages.

- If a matching entry is found for a message, this feature compares the entry with the message information.
  - If they are consistent, the message is considered as valid and forwarded to the DHCP server.
  - If they are different, the message is considered as a forged message and is discarded.
- If no matching entry is found, the message is considered valid and forwarded to the DHCP server.

Procedure

1. Enter system view.

   `system-view`
2. Enter interface view.

   `interface` *`interface-type interface-number`*
3. Enable DHCP-REQUEST check.

   `dhcp snooping check request-message`

   By default, DHCP-REQUEST check is disabled.

Configuring a DHCP packet blocking port

About DHCP packet blocking port

Perform this task to configure a port as a DHCP packet blocking port. This blocking port drops all incoming DHCP requests.

Procedure

1. Enter system view.

   `system-view`
2. Enter interface view.

   `interface` *`interface-type interface-number`*
3. Configure the port to block DHCP requests.

   `dhcp snooping deny`

   By default, the port does not block DHCP requests.

CAUTION:

To avoid IP address acquisition failure, configure a port to block DHCP packets only if no DHCP clients are attached to it.

Enabling DHCP snooping logging

About DHCP snooping logging

The DHCP snooping logging feature enables the DHCP snooping device to generate DHCP snooping logs and send them to the information center. The information helps administrators locate and solve problems. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

As a best practice, disable this feature if the log generation affects the device performance.

Procedure

1. Enter system view.
   `system-view`
2. Enable DHCP snooping logging.
   `dhcp snooping log enable`
   By default, DHCP snooping logging is disabled.

Disabling DHCP snooping on an interface

About disabling DHCP snooping on an interface

This feature allows you to narrow down the interface range where DHCP snooping takes effect. For example, to enable DHCP snooping globally except for a specific interface, you can enable DHCP snooping globally and disable DHCP snooping on the target interface.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Disable DHCP snooping on the interface.
   `dhcp snooping disable`
   By default:
   - If you enable DHCP snooping globally or for a VLAN, DHCP snooping is enabled on all interfaces on the device or on all interfaces in the VLAN.
   - If you do not enable DHCP snooping globally or for a VLAN, DHCP snooping is disabled on all interfaces on the device or on all interfaces in the VLAN.

Display and maintenance commands for DHCP snooping

Execute **`display`** commands in any view, and **`reset`** commands in user view.

Task	Command
Display DHCP snooping entries.	**`display dhcp snooping binding`** [**`ip`** *`ip-address`* [**`vlan`** *`vlan-id`*]] [**`verbose`**]

Task	Command
Display information about the file that stores DHCP snooping entries.	**display dhcp snooping binding database**
Display Option 82 configuration information on the DHCP snooping device.	**display dhcp snooping information** { **all** | **interface** *interface-type interface-number* }
Display DHCP packet statistics on the DHCP snooping device.	**display dhcp snooping packet statistics** [**slot** *slot-number*]
Display information about trusted ports.	**display dhcp snooping trust**
Clear DHCP snooping entries.	**reset dhcp snooping binding** { **all** | **ip** *ip-address* [**vlan** *vlan-id*] }
Clear DHCP packet statistics on the DHCP snooping device.	**reset dhcp snooping packet statistics** [**slot** *slot-number*]

DHCP snooping configuration examples

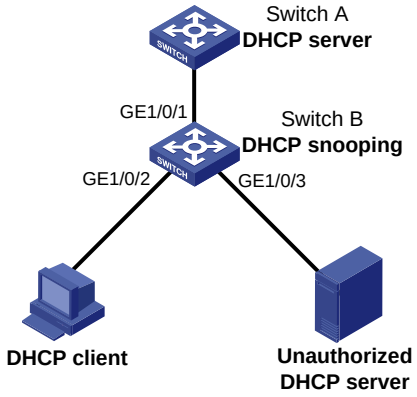
Example: Configuring basic DHCP snooping features globally

Network configuration

As shown in Figure 22, Switch B is connected to the authorized DHCP server through GigabitEthernet 1/0/1, to the unauthorized DHCP server through GigabitEthernet 1/0/3, and to the DHCP client through GigabitEthernet 1/0/2.

Configure only the port connected to the authorized DHCP server to forward the responses from the DHCP server. Enable the DHCP snooping device to record clients' IP-to-MAC bindings by reading DHCP-ACK messages received from the trusted port and the DHCP-REQUEST messages.

Figure 22 Network diagram



Procedure

Enable DHCP snooping globally.

```
<SwitchB> system-view
[SwitchB] dhcp snooping enable
```

Configure GigabitEthernet 1/0/1 as a trusted port.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] dhcp snooping trust
[SwitchB-GigabitEthernet1/0/1] quit
```

Enable recording clients' IP-to-MAC bindings on GigabitEthernet 1/0/2.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] dhcp snooping binding record
[SwitchB-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Verify that the DHCP client can obtain an IP address and other configuration parameters only from the authorized DHCP server. (Details not shown.)

Display the DHCP snooping entry recorded for the client.

```
[SwitchB] display dhcp snooping binding
```

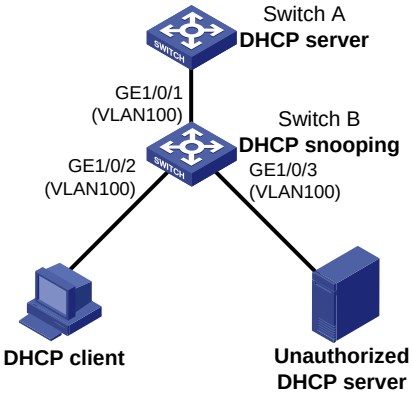
Example: Configuring basic DHCP snooping features for a VLAN

Network configuration

As shown in Figure 23, Switch B is connected to the authorized DHCP server through GigabitEthernet 1/0/1, to the unauthorized DHCP server through GigabitEthernet 1/0/3, and to the DHCP client through GigabitEthernet 1/0/2.

Configure only the port in VLAN 100 connected to the authorized DHCP server to forward the responses from the DHCP server. Enable the port in VLAN 100 to record clients' IP-to-MAC bindings by reading DHCP-ACK messages received from the trusted port and the DHCP-REQUEST messages.

Figure 23 Network diagram



Procedure

Assign GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 to VLAN 100.

```
<SwitchB> system-view
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
[SwitchB-vlan100] quit
```

Enable DHCP snooping for VLAN 100.

```
[SwitchB] dhcp snooping enable vlan 100
```

Configure GigabitEthernet 1/0/1 as DHCP snooping trusted port.

```
[SwitchB] vlan 100
[SwitchB-vlan100] dhcp snooping trust interface gigabitethernet 1/0/1
```

Enable recording clients' IP-to-MAC bindings in VLAN 100.

```
[SwitchB-vlan100] dhcp snooping binding record
[SwitchB-vlan100] quit
```

Verifying the configuration

Verify that the DHCP client can obtain an IP address and other configuration parameters only from the authorized DHCP server. (Details not shown.)

Display the DHCP snooping entry recorded for the client.

```
[SwitchB] display dhcp snooping binding
```

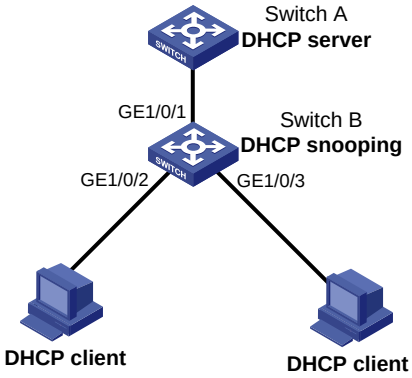
Example: Configuring DHCP snooping support for Option 82

Network configuration

As shown in Figure 24, enable DHCP snooping and configure Option 82 on Switch B as follows:

- Configure the handling strategy for DHCP requests that contain Option 82 as **`replace`**.
- On GigabitEthernet 1/0/2, configure the padding content for the Circuit ID sub-option as **`company001`** and for the Remote ID sub-option as **`device001`**.
- On GigabitEthernet 1/0/3, configure the padding mode for the Circuit ID sub-option as **`verbose`**, access node identifier as **`sysname`**, and padding format as **`ascii`**. Configure the padding content for the Remote ID sub-option as **`device001`**.

Figure 24 Network diagram



Procedure

Enable DHCP snooping.

```
<SwitchB> system-view
[SwitchB] dhcp snooping enable
```

Configure GigabitEthernet 1/0/1 as a trusted port.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] dhcp snooping trust
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure Option 82 on GigabitEthernet 1/0/2.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] dhcp snooping information enable
[SwitchB-GigabitEthernet1/0/2] dhcp snooping information strategy replace
[SwitchB-GigabitEthernet1/0/2] dhcp snooping information circuit-id string company001
[SwitchB-GigabitEthernet1/0/2] dhcp snooping information remote-id string device001
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure Option 82 on GigabitEthernet 1/0/3.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] dhcp snooping information enable
[SwitchB-GigabitEthernet1/0/3] dhcp snooping information strategy replace
[SwitchB-GigabitEthernet1/0/3] dhcp snooping information circuit-id verbose
node-identifier sysname format ascii
[SwitchB-GigabitEthernet1/0/3] dhcp snooping information remote-id string device001
```

Verifying the configuration

Display Option 82 configuration information on GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 on the DHCP snooping device.

```
[SwitchB] display dhcp snooping information
```

Configuring the BOOTP client

About BOOTP client

BOOTP client application

An interface that acts as a BOOTP client can use BOOTP to obtain information (such as IP address) from the BOOTP server.

To use BOOTP, an administrator must configure a BOOTP parameter file for each BOOTP client on the BOOTP server. The parameter file contains information such as MAC address and IP address of a BOOTP client. When a BOOTP client sends a request to the BOOTP server, the BOOTP server searches for the BOOTP parameter file and returns the corresponding configuration information.

BOOTP is usually used in relatively stable environments. In network environments that change frequently, DHCP is more suitable.

Because a DHCP server can interact with a BOOTP client, you can use the DHCP server to assign an IP address to the BOOTP client. You do not need to configure a BOOTP server. The DHCP server will assign an IP address to the BOOTP client based on the IP address allocation sequence.

Obtaining an IP address dynamically

A BOOTP client dynamically obtains an IP address from a BOOTP server as follows:

1. The BOOTP client broadcasts a BOOTP request, which contains its own MAC address.
2. Upon receiving the request, the BOOTP server searches the configuration file for the IP address and other information according to the BOOTP client's MAC address.
3. The BOOTP server returns a BOOTP response to the BOOTP client.
4. The BOOTP client obtains the IP address from the received response.

A DHCP server can take the place of the BOOTP server in the following dynamic IP address acquisition.

Protocols and standards

- RFC 951, *Bootstrap Protocol (BOOTP)*
- RFC 2132, *DHCP Options and BOOTP Vendor Extensions*
- RFC 1542, *Clarifications and Extensions for the Bootstrap Protocol*

Configuring an interface to use BOOTP for IP address acquisition

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   BOOTP client configuration applies only to VLAN interfaces.
3. Configure an interface to use BOOTP for IP address acquisition.

ip address bootp-alloc

By default, an interface does not use BOOTP for IP address acquisition.

Display and maintenance commands for BOOTP client

Execute **display** command in any view.

Task	Command
Display BOOTP client information.	**display bootp client** [**interface** *interface-type interface-number*]

BOOTP client configuration examples

Example: Configuring BOOTP client

Network configuration

As shown in Figure 9, Switch B's port belonging to VLAN 10 is connected to the LAN. VLAN-interface 10 obtains an IP address from the DHCP server by using BOOTP.

To make the BOOTP client obtain an IP address from the DHCP server, you must perform configuration on the DHCP server. For more information, see "DHCP server configuration examples."

Procedure

The following describes the configuration on Switch B, which acts as a client.

Configure VLAN-interface 10 to dynamically obtain an IP address from the DHCP server.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ip address bootp-alloc
```

Verifying the configuration

Display the IP address assigned to the BOOTP client.

```
[SwitchB] display bootp client
```

Contents

Configuring DNS

About DNS

Domain Name System (DNS) is a distributed database used by TCP/IP applications to translate domain names into IP addresses. The domain name-to-IP address mapping is called a DNS entry.

Types of DNS services

DNS services can be static or dynamic. After a user specifies a name, the device checks the static name resolution table for an IP address. If no IP address is available, it contacts the DNS server for dynamic name resolution, which takes more time than static name resolution. To improve efficiency, you can put frequently queried name-to-IP address mappings in the local static name resolution table.

Static domain name resolution

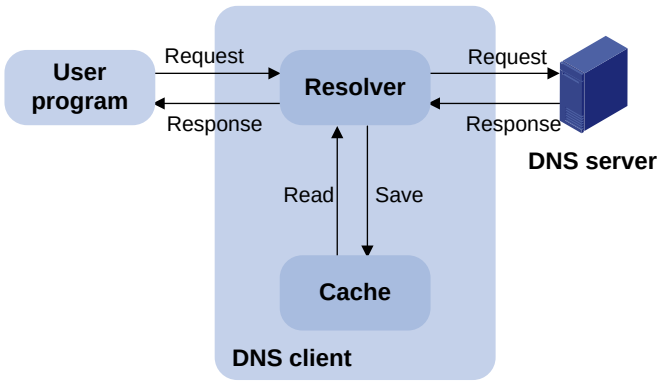
Static domain name resolution means manually creating mappings between domain names and IP addresses. For example, you can create a static DNS mapping for a device so that you can Telnet to the device by using the domain name.

Dynamic domain name resolution

Architecture

Figure 1 shows the relationship between the user program, DNS client, and DNS server. The DNS client includes the resolver and cache. The user program and DNS client can run on the same device or different devices. The DNS server and the DNS client usually run on different devices.

Figure 1 Dynamic domain name resolution



The device can function as a DNS client, but not a DNS server.

If an alias is configured for a domain name on the DNS server, the device can resolve the alias into the IP address of the host.

Resolution process

The dynamic domain name resolution process is as follows:

1. A user program sends a name query to the resolver of the DNS client.

2. The DNS resolver looks up the local domain name cache for a match. If the resolver finds a match, it sends the corresponding IP address back. If not, it sends a query to the DNS server.
3. The DNS server looks up the corresponding IP address of the domain name in its DNS database. If no match is found, the server sends a query to other DNS servers. This process continues until a result, whether successful or not, is returned.
4. After receiving a response from the DNS server, the DNS client returns the resolution result to the user program.

Caching

Dynamic domain name resolution allows the DNS client to store latest DNS entries in the DNS cache. The DNS client does not need to send a request to the DNS server for a repeated query within the aging time. To make sure the entries from the DNS server are up to date, a DNS entry is removed when its aging timer expires. The DNS server determines how long a mapping is valid, and the DNS client obtains the aging information from DNS responses.

DNS suffixes

You can configure a domain name suffix list so that the resolver can use the list to supply the missing part of an incomplete name.

For example, you can configure **com** as the suffix for aabbcc.com. The user only needs to enter **aabbcc** to obtain the IP address of aabbcc.com. The resolver adds the suffix and delimiter before passing the name to the DNS server.

The name resolver handles the queries based on the domain names that the user enters:

- If the user enters a domain name without a dot (.) (for example, aabbcc), the resolver considers the domain name to be a host name. It adds a DNS suffix to the host name before performing the query operation. If no match is found for any host name and suffix combination, the resolver uses the user-entered domain name (for example, aabbcc) for the IP address query.
- If the user enters a domain name with a dot (.) among the letters (for example, www.aabbcc), the resolver directly uses this domain name for the query operation. If the query fails, the resolver adds a DNS suffix for another query operation.
- If the user enters a domain name with a dot (.) at the end (for example, aabbcc.com.), the resolver considers the domain name an FQDN and returns the successful or failed query result. The dot at the end of the domain name is considered a terminating symbol.

DNS proxy

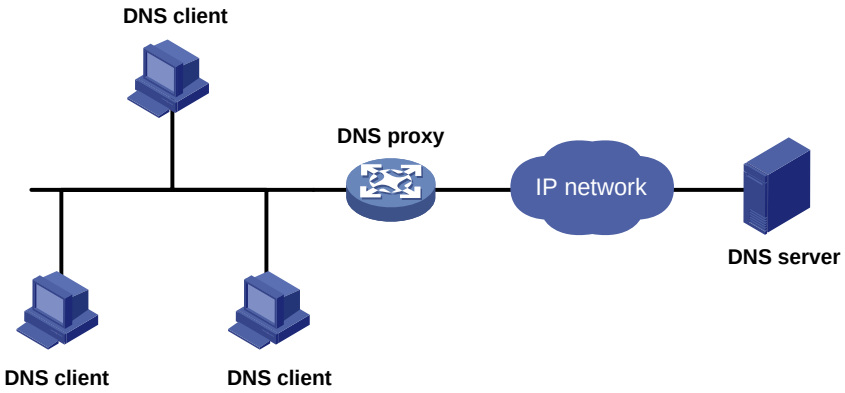
The DNS proxy performs the following functions:

- Forwards the request from the DNS client to the designated DNS server.
- Conveys the reply from the DNS server to the client.

The DNS proxy simplifies network management. When the DNS server address is changed, you can change the configuration only on the DNS proxy instead of on each DNS client.

Figure 2 shows the typical DNS proxy application.

Figure 2 DNS proxy application



A DNS proxy operates as follows:

1. A DNS client considers the DNS proxy as the DNS server, and sends a DNS request to the DNS proxy. The destination address of the request is the IP address of the DNS proxy.
2. The DNS proxy searches the local static domain name resolution table and dynamic domain name resolution cache after receiving the request. If the requested information is found, the DNS proxy returns a DNS reply to the client.
3. If the requested information is not found, the DNS proxy sends the request to the designated DNS server for domain name resolution.
4. After receiving a reply from the DNS server, the DNS proxy records the IP address-to-domain name mapping and forwards the reply to the DNS client.

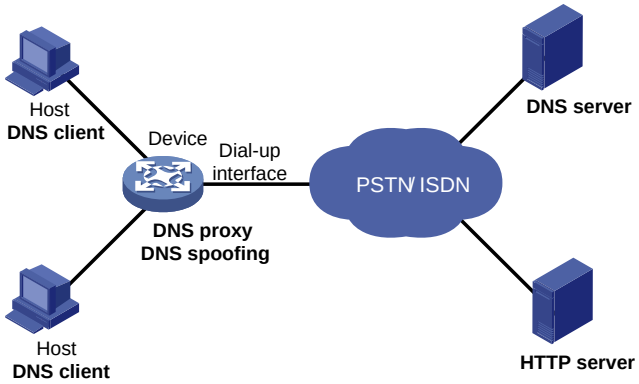
If no DNS server is designated or no route is available to the designated DNS server, the DNS proxy does not forward DNS requests.

DNS spoofing

As shown in Figure 3, DNS spoofing is applied to the dial-up network.

- The device connects to a PSTN/ISDN network through a dial-up interface. The device triggers the establishment of a dial-up connection only when packets are to be forwarded through the dial-up interface.
- The device acts as a DNS proxy and is specified as a DNS server on the hosts. After the dial-up connection is established, the device dynamically obtains the DNS server address through DHCP or another autoconfiguration mechanism.

Figure 3 DNS spoofing application



The DNS proxy does not have the DNS server address or cannot reach the DNS server after startup. A host accesses the HTTP server in the following steps:

1. The host sends a DNS request to the device to resolve the domain name of the HTTP server into an IP address.
2. Upon receiving the request, the device searches the local static and dynamic DNS entries for a match. Because no match is found, the device spoofs the host by replying a configured IP address. The device must have a route to the IP address with the dial-up interface as the output interface.

   The IP address configured for DNS spoofing is not the actual IP address of the requested domain name. Therefore, the TTL field is set to 0 in the DNS reply. When the DNS client receives the reply, it creates a DNS entry and ages it out immediately.
3. Upon receiving the reply, the host sends an HTTP request to the replied IP address.
4. When forwarding the HTTP request through the dial-up interface, the device performs the following operations:
   - Establishes a dial-up connection with the network.
   - Dynamically obtains the DNS server address through DHCP or another autoconfiguration mechanism.
5. Because the DNS entry ages out immediately upon creation, the host sends another DNS request to the device to resolve the HTTP server domain name.
6. The device operates the same as a DNS proxy. For more information, see "DNS proxy."
7. After obtaining the IP address of the HTTP server, the host can access the HTTP server.

Without DNS spoofing, the device forwards the DNS requests from the host to the DNS server if it cannot find a matching local DNS entry. However, the device cannot obtain the DNS server address, because no dial-up connection is established. Therefore, the device cannot forward or answer the requests from the client. DNS resolution fails, and the client cannot access the HTTP server.

DNS tasks at a glance

To configure DNS, perform the following tasks:

1. Configuring the DNS client

   Choose the following tasks as needed:
   - Configuring static domain name resolution
   - Configuring dynamic domain name resolution
2. (Optional.) Configuring the DNS proxy
3. (Optional.) Configuring DNS spoofing

   This feature is applied to the dial-up network.
4. (Optional.) Specifying the source interface for DNS packets
5. (Optional.) Configuring the DNS trusted interface
6. (Optional.) Setting the DSCP value for outgoing DNS packets

Configuring the DNS client

Configuring static domain name resolution

Restrictions and guidelines

Each host name maps to only one IPv4 address and one IPv6 address.

A maximum of 2048 DNS entries can be configured.

Procedure

1. Enter system view.

   system-view

2. Configure a host name-to-address mapping. Choose the options to configure as needed:

   IPv4:

   ip host *host-name ip-address*

   IPv6:

   ipv6 host *host-name ipv6-address*

Configuring dynamic domain name resolution

Restrictions and guidelines

- The limit on the number of DNS servers on the device is as follows:
  - In system view, you can specify a maximum of six DNS server IPv4 addresses.
  - In system view, you can specify a maximum of six DNS server IPv6 addresses.
  - In interface view, you can specify a maximum of six DNS server IPv4 addresses.
- A DNS server address is required so that DNS queries can be sent to a correct server for resolution. If you specify both an IPv4 address and an IPv6 address, the device performs the following operations:
  - Sends an IPv4 DNS query first to the DNS server IPv4 addresses. If the query fails, the device turns to the DNS server IPv6 addresses.
  - Sends an IPv6 DNS query first to the DNS server IPv6 addresses. If the query fails, the devices turns to the DNS server IPv4 addresses.
- A DNS server address specified in system view takes priority over a DNS server address specified in interface view. A DNS server address specified earlier has a higher priority. A DNS server address manually specified takes priority over a DNS server address dynamically obtained, for example, through DHCP. The device first sends a DNS query to the DNS server address of the highest priority. If the first query fails, it sends the DNS query to the DNS server address of the second highest priority, and so on.
- You can configure a DNS suffix that the system automatically adds to the incomplete domain name that a user enters.
  - You can configure a maximum of 16 DNS suffixes.
  - A DNS suffix manually configured takes priority over a DNS suffix dynamically obtained, for example, through DHCP. A DNS suffix configured earlier has a higher priority. The device first uses the suffix that has the highest priority. If the query fails, the device uses the suffix that has the second highest priority, and so on.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Configure a DNS suffix.

   dns domain *domain-name*

   By default, no DNS suffix is configured and only the domain name that a user enters is resolved.

3. Specify a DNS server address.

   IPv4:

   dns server *ip-address*

   IPv6:

ipv6 dns server *ipv6-address* [*interface-type interface-number*]

In versions earlier than Release 6348P01, in the factory-default settings, no DNS server address is specified.

In Release 6348P01 and later:

- In the initial configuration, no DNS server address is specified.
- In the factory-default settings, a DNS server with IP address 114.114.114.114 is specified.

For more information about the initial configuration and factory-default settings, see configuration file management in *Fundamentals Configuration Guide*.

Configuring the DNS proxy

Restrictions and guidelines

You can specify multiple DNS servers. The DNS proxy forwards a request to the DNS server that has the highest priority. If having not received a reply, it forwards the request to a DNS server that has the second highest priority, and so on.

You can specify both an IPv4 address and an IPv6 address.

- A DNS proxy forwards an IPv4 name query first to IPv4 DNS servers. If no reply is received, it forwards the request to IPv6 DNS servers.
- A DNS proxy forwards an IPv6 name query first to IPv6 DNS servers. If no reply is received, it forwards the request to IPv4 DNS servers.

Procedure

1. Enter system view.

   system-view
2. Enable DNS proxy.

   dns proxy enable

   By default, DNS proxy is disabled.
3. Specify a DNS server address.

   IPv4:

   dns server *ip-address*

   IPv6:

   ipv6 dns server *ipv6-address* [*interface-type interface-number*]

   By default, no DNS server address is specified.

Configuring DNS spoofing

Restrictions and guidelines

- You can configure only one replied IPv4 address and one replied IPv6 address. If you execute the command multiple times, the most recent configuration takes effect.
- After DNS spoofing takes effect, the device spoofs a DNS request even though a matching static DNS entry exists.

Prerequisites

The DNS proxy is enabled on the device.

No DNS server or route to any DNS server is specified on the device.

Procedure

1. Enter system view.

   system-view

2. Enable DNS proxy.

   dns proxy enable

   By default, DNS proxy is disabled.

3. Enable DNS spoofing and specify the IP address used to spoof DNS requests. Choose one option as needed:

   IPv4:

   dns spoofing *ip-address*

   IPv6:

   ipv6 dns spoofing *ipv6-address*

   By default, DNS spoofing is disabled.

Specifying the source interface for DNS packets

About the source interface for DNS packets

This task enables the device to always use the primary IP address of the specified source interface as the source IP address of outgoing DNS packets. This feature applies to scenarios in which the DNS server responds only to DNS requests sourced from a specific IP address. If no IP address is configured on the source interface, no DNS packets can be sent out.

Restrictions and guidelines

When sending an IPv6 DNS request, the device follows the method defined in RFC 3484 to select an IPv6 address of the source interface.

You can configure only one source interface.

Procedure

1. Enter system view.

   system-view

2. Specify the source interface for DNS packets.

   dns source-interface *interface-type interface-number*

   By default, no source interface for DNS packets is specified.

Configuring the DNS trusted interface

About DNS trusted interface

This task enables the device to use only the DNS suffix and domain name server information obtained through the trusted interface. The device can then obtain the correct resolved IP address. This feature protects the device against attackers that act as the DHCP server to assign incorrect DNS suffix and domain name server address.

Restrictions and guidelines

You can configure a maximum of 128 DNS trusted interfaces.

Procedure

1. Enter system view.

   system-view

2. Specify the DNS trusted interface.

   dns trust-interface *interface-type interface-number*

   By default, no DNS trusted interface is specified.

Setting the DSCP value for outgoing DNS packets

About the DSCP value for outgoing DNS packets

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Set the DSCP value for DNS packets sent by a DNS client or a DNS proxy.

   IPv4:

   dns dscp *dscp-value*

   By default, the DSCP value is 0 in IPv4 DNS packets sent by a DNS client or a DNS proxy.

   IPv6:

   ipv6 dns dscp *dscp-value*

   By default, the DSCP value is 0 in IPv6 DNS packets sent by a DNS client or a DNS proxy.

Display and maintenance commands for DNS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display DNS suffixes.	**display dns domain** [**dynamic**]
Display the domain name resolution table.	**display dns host** [**ip** | **ipv6**]
Display IPv4 DNS server information.	**display dns server** [**dynamic**]
Display IPv6 DNS server information.	**display ipv6 dns server** [**dynamic**]
Clear dynamic DNS entries.	**reset dns host** [**ip** | **ipv6**]

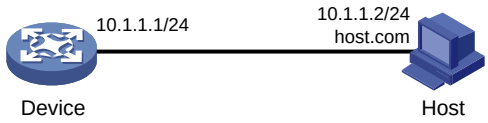
IPv4 DNS configuration examples

Example: Configuring static domain name resolution

Network configuration

As shown in Figure 4, the host at 10.1.1.2 is named **host.com**. Configure static IPv4 DNS on the device so that the device can use the easy-to-remember domain name rather than the IP address to access the host.

Figure 4 Network diagram



Procedure

Configure a mapping between host name **host.com** and IP address 10.1.1.2.

```
<Sysname> system-view
[Sysname] ip host host.com 10.1.1.2
```

Verify that the device can use static domain name resolution to resolve domain name **host.com** into IP address 10.1.1.2.

```
[Sysname] ping host.com
Ping host.com (10.1.1.2): 56 data bytes, press CTRL_C to break
56 bytes from 10.1.1.2: icmp_seq=0 ttl=255 time=1.000 ms
56 bytes from 10.1.1.2: icmp_seq=1 ttl=255 time=1.000 ms
56 bytes from 10.1.1.2: icmp_seq=2 ttl=255 time=1.000 ms
56 bytes from 10.1.1.2: icmp_seq=3 ttl=255 time=1.000 ms
56 bytes from 10.1.1.2: icmp_seq=4 ttl=255 time=2.000 ms

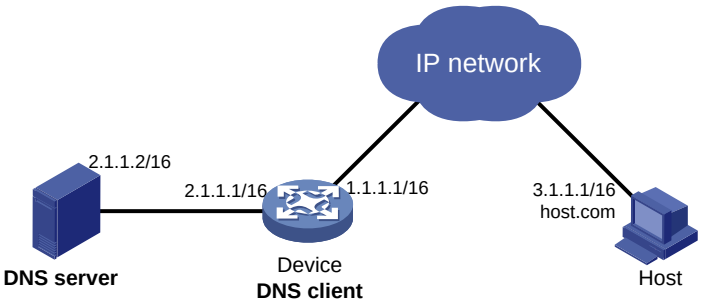
--- Ping statistics for host.com ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.000/1.200/2.000/0.400 ms
```

Example: Configuring dynamic domain name resolution

Network configuration

As shown in Figure 5, configure the DNS server to store the mapping between the host's domain name **host** and IPv4 address 3.1.1.1/16 in the **com** domain. Configure dynamic IPv4 DNS and DNS suffix **com** on the device so that the device can use domain name **host** to access the host.

Figure 5 Network diagram



Procedure

Before performing the following configuration, make sure that:

- The device and the host can reach each other.
- The IP addresses of the interfaces are configured as shown in Figure 5.

1. Configure the DNS server:

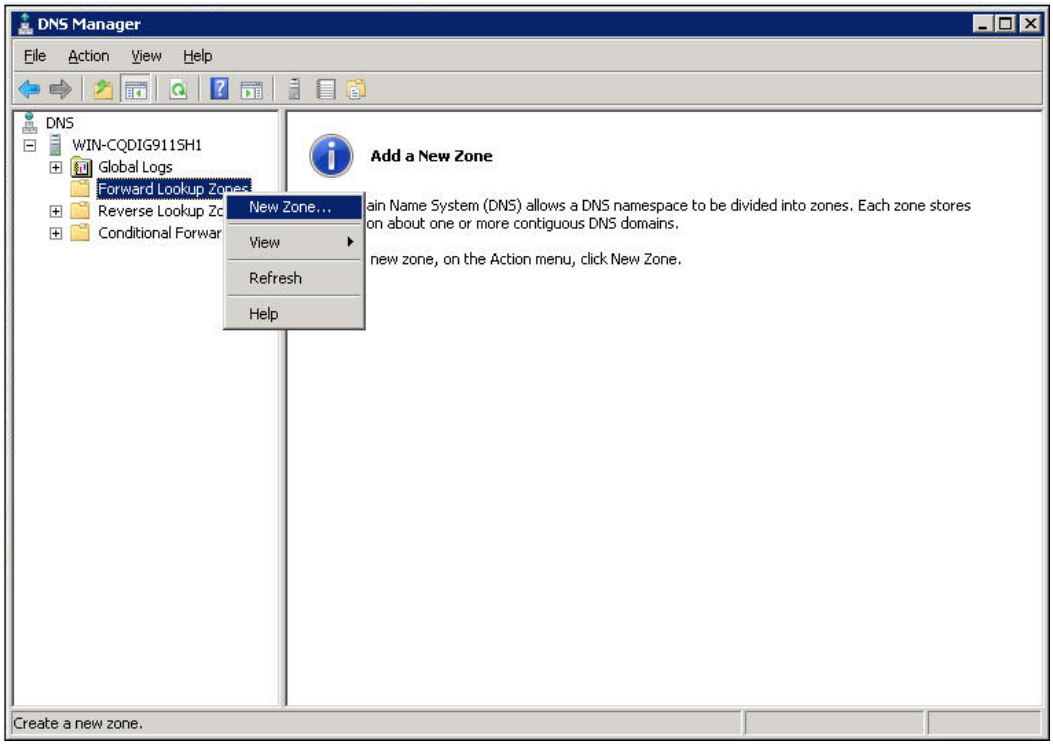
The configuration might vary by DNS server. The following configuration is performed on a PC running Windows Server 2008 R2.

a. Select **Start** > **Programs** > **Administrative Tools** > **DNS**.

The DNS server configuration page appears, as shown in Figure 6.

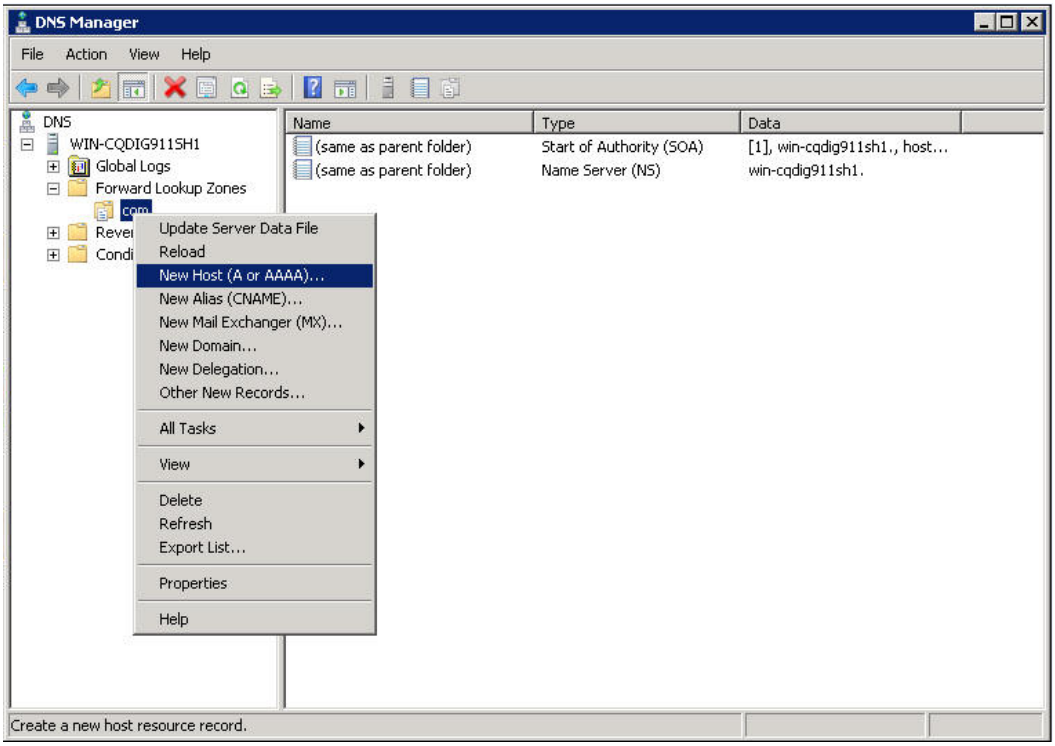
b. Right-click **Forward Lookup Zones**, select **New Zone**, and then follow the wizard to create a new zone named **com**.

Figure 6 Creating a zone



c. On the DNS server configuration page, right-click zone **com** and select **New Host**.

Figure 7 Adding a host

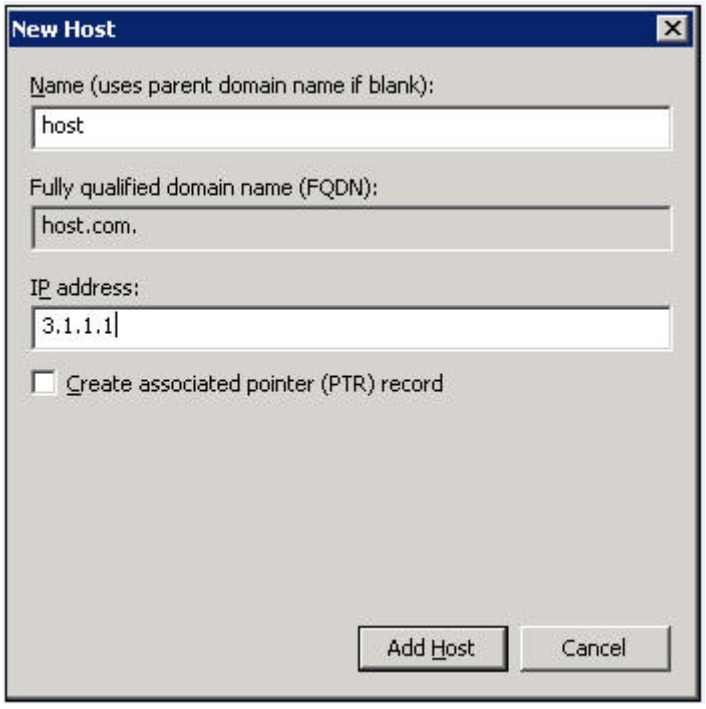


d. On the page that appears, enter host name **host** and IP address **3.1.1.1**.

e. Click **Add Host**.

The mapping between the IP address and host name is created.

Figure 8 Adding a mapping between domain name and IP address



2. Configure the DNS client:

Specify the DNS server 2.1.1.2.

```
<Sysname> system-view
[Sysname] dns server 2.1.1.2
```

Specify **com** as the name suffix.

```
[Sysname] dns domain com
```

Verifying the configuration

Verify that the device can use the dynamic domain name resolution to resolve domain name **host.com** into IP address 3.1.1.1.

```
[Sysname] ping host
Ping host.com (3.1.1.1): 56 data bytes, press CTRL_C to break
56 bytes from 3.1.1.1: icmp_seq=0 ttl=255 time=1.000 ms
56 bytes from 3.1.1.1: icmp_seq=1 ttl=255 time=1.000 ms
56 bytes from 3.1.1.1: icmp_seq=2 ttl=255 time=1.000 ms
56 bytes from 3.1.1.1: icmp_seq=3 ttl=255 time=1.000 ms
56 bytes from 3.1.1.1: icmp_seq=4 ttl=255 time=2.000 ms

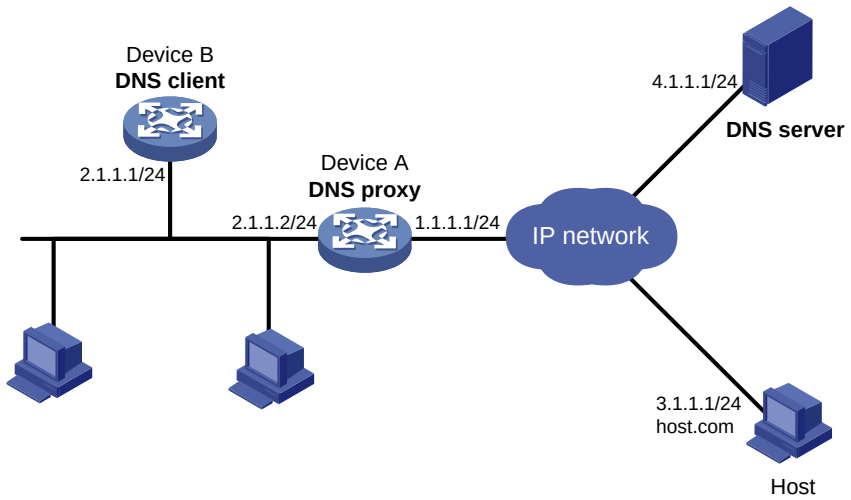
--- Ping statistics for host ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.000/1.200/2.000/0.400 ms
```

Example: Configuring DNS proxy

Network configuration

As shown in Figure 9, configure Device A as the DNS proxy to forward DNS packets between the DNS client (Device B) and the DNS server at 4.1.1.1.

Figure 9 Network diagram



Procedure

Before performing the following configuration, make sure that:

- Device A, the DNS server, and the host can reach each other.
- The IP addresses of the interfaces are configured as shown in Figure 9.

1. Configure the DNS server:

The configuration might vary by DNS server. When a PC running Windows Server 2008 R2 acts as the DNS server, see "Example: Configuring dynamic domain name resolution" for configuration information.

2. Configure the DNS proxy:

   # Specify the DNS server 4.1.1.1.

   ```
   <DeviceA> system-view
   [DeviceA] dns server 4.1.1.1
   ```

   # Enable DNS proxy.

   ```
   [DeviceA] dns proxy enable
   ```

3. Configure the DNS client:

   ```
   <DeviceB> system-view
   ```

   # Specify the DNS server 2.1.1.2.

   ```
   [DeviceB] dns server 2.1.1.2
   ```

Verifying the configuration

Verify that DNS proxy on Device A functions.

```
[DeviceB] ping host.com
Ping host.com (3.1.1.1): 56 data bytes, press CTRL_C to break
56 bytes from 3.1.1.1: icmp_seq=0 ttl=255 time=1.000 ms
56 bytes from 3.1.1.1: icmp_seq=1 ttl=255 time=1.000 ms
56 bytes from 3.1.1.1: icmp_seq=2 ttl=255 time=1.000 ms
56 bytes from 3.1.1.1: icmp_seq=3 ttl=255 time=1.000 ms
56 bytes from 3.1.1.1: icmp_seq=4 ttl=255 time=2.000 ms

--- Ping statistics for host.com ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.000/1.200/2.000/0.400 ms
```

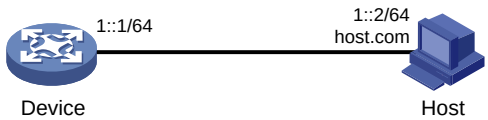
IPv6 DNS configuration examples

Example: Configuring static domain name resolution

Network configuration

As shown in Figure 10, the host at 1::2 is named **host.com**. Configure static IPv6 DNS on the device so that the device can use the easy-to-remember domain name rather than the IPv6 address to access the host.

Figure 10 Network diagram



Procedure

Configure a mapping between host name **host.com** and IPv6 address 1::2.

```
<Device> system-view
[Device] ipv6 host host.com 1::2
```

Verify that the device can use static domain name resolution to resolve domain name **host.com** into IPv6 address 1::2.

```
[Sysname] ping ipv6 host.com
Ping6(56 data bytes) 1::1 --> 1::2, press CTRL_C to break
56 bytes from 1::2, icmp_seq=0 hlim=128 time=1.000 ms
56 bytes from 1::2, icmp_seq=1 hlim=128 time=0.000 ms
56 bytes from 1::2, icmp_seq=2 hlim=128 time=1.000 ms
56 bytes from 1::2, icmp_seq=3 hlim=128 time=1.000 ms
56 bytes from 1::2, icmp_seq=4 hlim=128 time=0.000 ms

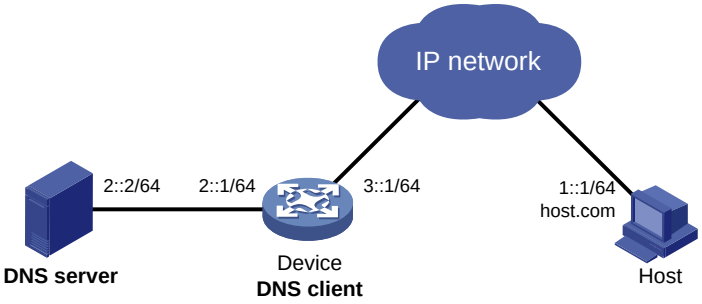
--- Ping6 statistics for host.com ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/0.600/1.000/0.490 ms
```

Example: Configuring dynamic domain name resolution

Network configuration

As shown in Figure 11, configure the DNS server to store the mapping between the host's domain name **host** and IPv6 address 1::1/64 in the **com** domain. Configure dynamic IPv6 DNS and DNS suffix **com** on the device so that the device can use domain name **host** to access the host.

Figure 11 Network diagram



Procedure

Before performing the following configuration, make sure that:

- The device and the host can reach each other.
- The IPv6 addresses of the interfaces are configured as shown in Figure 11.

1. Configure the DNS server:

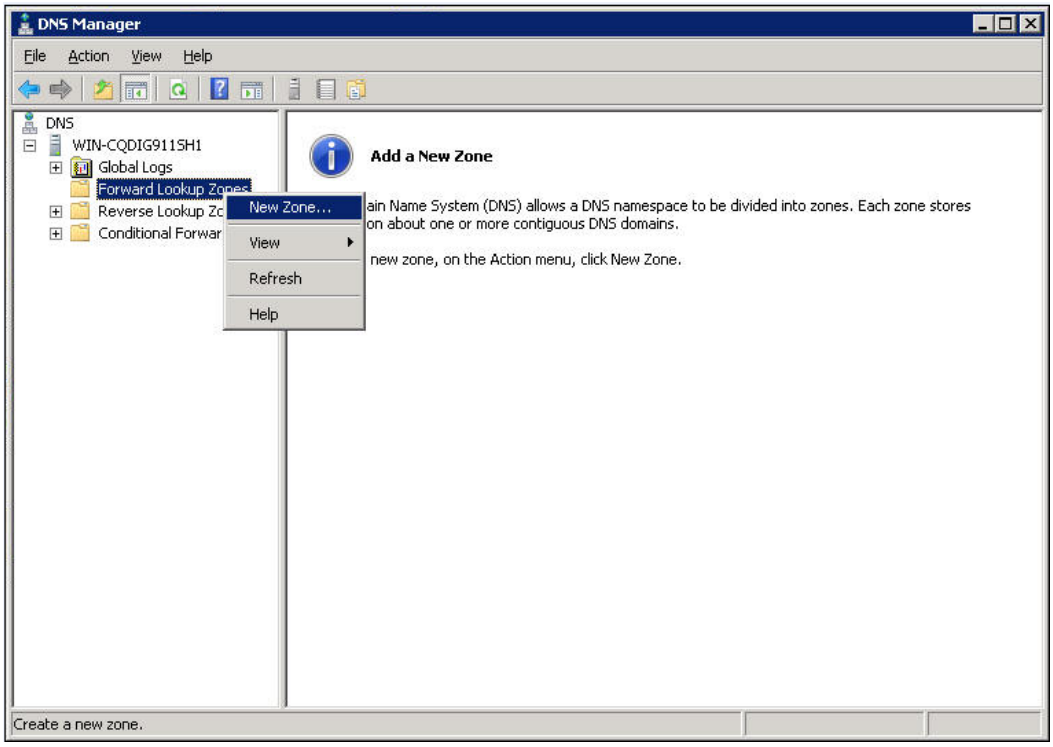
   The configuration might vary by DNS server. The following configuration is performed on a PC running Windows Server 2008 R2. Make sure that the DNS server supports IPv6 DNS so that the server can process IPv6 DNS packets and its interfaces can forward IPv6 packets.

   a. Select **Start** > **Programs** > **Administrative Tools** > **DNS**.

      The DNS server configuration page appears, as shown in Figure 12.

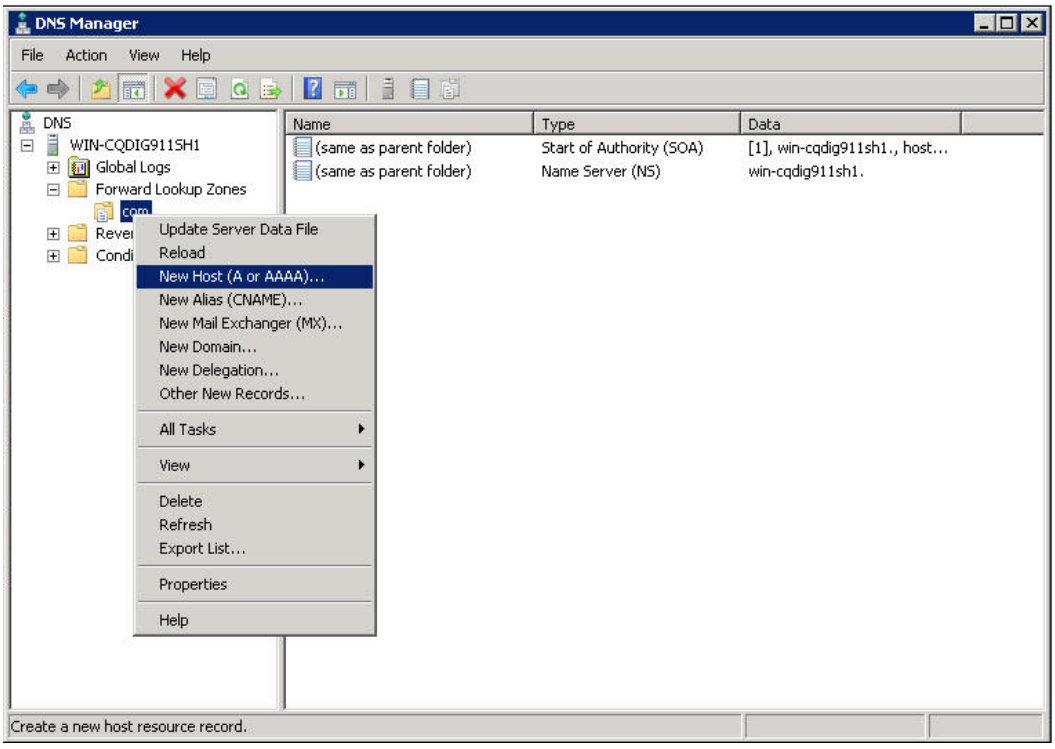
   b. Right-click **Forward Lookup Zones**, select **New Zone**, and then follow the wizard to create a new zone named **com**.

Figure 12 Creating a zone



c. On the DNS server configuration page, right-click zone **com** and select **New Host**.

Figure 13 Adding a host

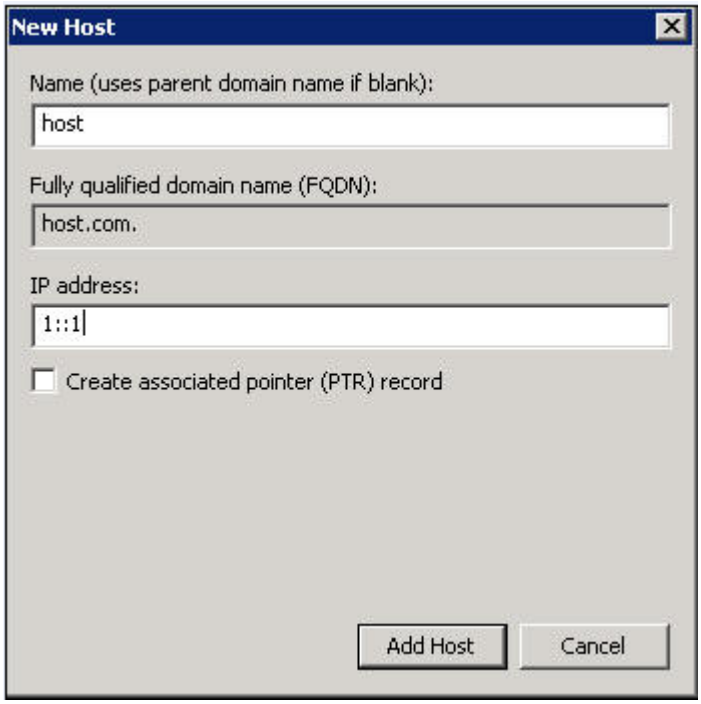


d. On the page that appears, enter host name **host** and IPv6 address **1::1**.

e. Click **Add Host**.

The mapping between the IPv6 address and host name is created.

Figure 14 Adding a mapping between domain name and IPv6 address



2. Configure the DNS client:

   # Specify the DNS server 2::2.

   ```
   <Device> system-view
   [Device] ipv6 dns server 2::2
   ```

   # Configure **com** as the DNS suffix.

   ```
   [Device] dns domain com
   ```

Verifying the configuration

Verify that the device can use the dynamic domain name resolution to resolve the domain name **host.com** into the IP address 1::1.

```
[Device] ping ipv6 host
Ping6(56 data bytes) 3::1 --> 1::1, press CTRL_C to break
56 bytes from 1::1, icmp_seq=0 hlim=128 time=1.000 ms
56 bytes from 1::1, icmp_seq=1 hlim=128 time=0.000 ms
56 bytes from 1::1, icmp_seq=2 hlim=128 time=1.000 ms
56 bytes from 1::1, icmp_seq=3 hlim=128 time=1.000 ms
56 bytes from 1::1, icmp_seq=4 hlim=128 time=0.000 ms

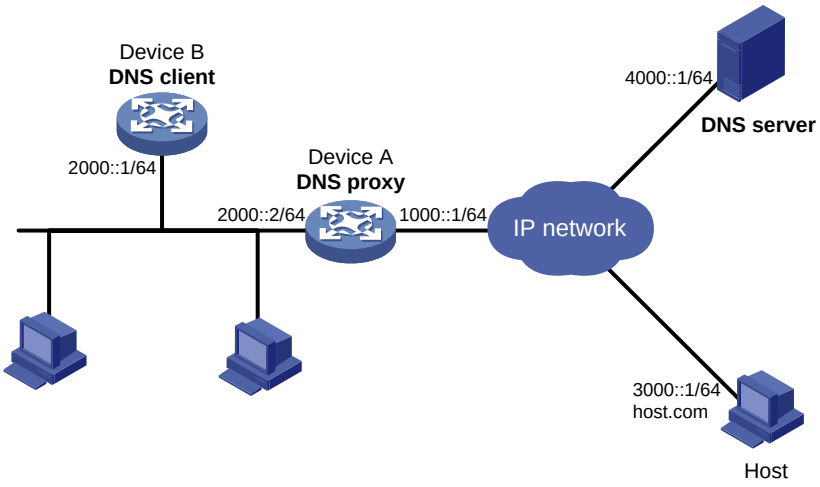
--- Ping6 statistics for host ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/0.600/1.000/0.490 ms
```

Example: Configuring DNS proxy

Network configuration

As shown in Figure 15, configure Device A as the DNS proxy to forward DNS packets between the DNS client (Device B) and the DNS server at 4000::1.

Figure 15 Network diagram



Procedure

Before performing the following configuration, make sure that:

- Device A, the DNS server, and the host are reachable to each other.
- The IPv6 addresses of the interfaces are configured as shown in Figure 15.

1. Configure the DNS server:

   This configuration might vary by DNS server. When a PC running Windows Server 2008 R2 acts as the DNS server, see "Example: Configuring dynamic domain name resolution" for configuration information.

2. Configure the DNS proxy:

   # Specify the DNS server 4000::1.

   ```
   <DeviceA> system-view
   [DeviceA] ipv6 dns server 4000::1
   ```

   # Enable DNS proxy.

   ```
   [DeviceA] dns proxy enable
   ```

3. Configure the DNS client:

   # Specify the DNS server 2000::2.

   ```
   <DeviceB> system-view
   [DeviceB] ipv6 dns server 2000::2
   ```

Verifying the configuration

Verify that DNS proxy on Device A functions.

```
[DeviceB] ping host.com
Ping6(56 data bytes) 2000::1 --> 3000::1, press CTRL_C to break
56 bytes from 3000::1, icmp_seq=0 hlim=128 time=1.000 ms
56 bytes from 3000::1, icmp_seq=1 hlim=128 time=0.000 ms
56 bytes from 3000::1, icmp_seq=2 hlim=128 time=1.000 ms
56 bytes from 3000::1, icmp_seq=3 hlim=128 time=1.000 ms
56 bytes from 3000::1, icmp_seq=4 hlim=128 time=0.000 ms

--- Ping6 statistics for host.com ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/0.600/1.000/0.490 ms
```

Troubleshooting DNS configuration

Failure to resolve IPv4 addresses

Symptom

After enabling dynamic domain name resolution, the user cannot get the correct IP address.

Solution

To resolve the problem:

1. Use the **`display dns host ip`** command to verify that the specified domain name is in the cache.
2. If the specified domain name does not exist, check that the DNS client can communicate with the DNS server.
3. If the specified domain name is in the cache, but the IP address is incorrect, check that the DNS client has the correct IP address of the DNS server.
4. Verify that the mapping between the domain name and IP address is correct on the DNS server.

Failure to resolve IPv6 addresses

Symptom

After enabling dynamic domain name resolution, the user cannot get the correct IPv6 address.

Solution

To resolve the problem:

1. Use the **`display dns host ipv6`** command to verify that the specified domain name is in the cache.
2. If the specified domain name does not exist, check that dynamic domain name resolution is enabled, and that the DNS client can communicate with the DNS server.
3. If the specified domain name is in the cache, but the IPv6 address is incorrect, check that the DNS client has the correct IPv6 address of the DNS server.
4. Verify that the mapping between the domain name and IPv6 address is correct on the DNS server.

Contents

Configuring IP forwarding basic settings

About FIB table

A device uses the FIB table to make packet forwarding decisions.

A device selects optimal routes from the routing table, and puts them into the FIB table. Each FIB entry specifies the next hop IP address and output interface for packets destined for a specific subnet or host.

For more information about the routing table, see *Layer 3—IP Routing Configuration Guide*.

Use the **display fib** command to display the FIB table. The following example displays the entire FIB table.

```
<Sysname> display fib

Destination count: 8 FIB entry count: 8

Flag:
  U:Usable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Relay     F:FRR

Destination/Mask   Nexthop         Flag     OutInterface/Token       Label
0.0.0.0/32         127.0.0.1       UH       InLoop0                  Null
127.0.0.0/8        127.0.0.1       U        InLoop0                  Null
127.0.0.0/32       127.0.0.1       UH       InLoop0                  Null
127.0.0.1/32       127.0.0.1       UH       InLoop0                  Null
127.255.255.255/32 127.0.0.1       UH       InLoop0                  Null
224.0.0.0/4        0.0.0.0         UB       NULL0                    Null
224.0.0.0/24       0.0.0.0         UB       NULL0                    Null
255.255.255.255/32 127.0.0.1       UH       InLoop0                  Null
```

A FIB entry includes the following items:

- **Destination**—Destination IP address.
- **Mask**—Network mask. The mask and the destination address identify the destination network. A logical AND operation between the destination address and the network mask yields the address of the destination network. For example, if the destination address is 192.168.1.40 and the mask 255.255.255.0, the address of the destination network is 192.168.1.0. A network mask includes a certain number of consecutive 1s. It can be expressed in dotted decimal format or by the number of the 1s.
- **Nexthop**—IP address of the next hop.
- **Flag**—Route flag.
- **OutInterface**—Output interface.
- **Token**—MPLS Label Switched Path index number.
- **Label**—Inner label.

Saving the IP forwarding entries to a file

Restrictions and guidelines

The feature automatically creates the file if you specify a nonexistent file. If the file already exists, this feature overwrites the file content.

This feature triggers one-time saving of the IP forwarding entries.

To automatically save the IP forwarding entries periodically, configure a schedule for the device to automatically run the **ip forwarding-table save** command. For information about scheduling a task, see *Fundamentals Configuration Guide*.

Procedure

To save the IP forwarding entries to a file, execute the following command in any view:

ip forwarding-table save filename *filename*

Display and maintenance commands for FIB table

Execute **display** commands in any view.

Task	Command
Display FIB entries.	**display fib** [*ip-address* [*mask* | *mask-length*]]

Contents

Configuring fast forwarding

About fast forwarding

Fast forwarding reduces route lookup time and improves packet forwarding efficiency by using a high-speed cache and data-flow-based technology. It identifies a data flow by using the following fields: source IP address, source port number, destination IP address, destination port number, and protocol number. After a flow's first packet is forwarded through the routing table, fast forwarding creates an entry and uses the entry to forward subsequent packets of the flow.

Restrictions and guidelines: Fast forwarding configuration

Fast forwarding can process fragmented IP packets, but it does not fragment IP packets.

Configuring the aging time for fast forwarding entries

About aging time for fast forwarding entries

The fast forwarding table uses an aging timer for each forwarding entry. If an entry is not updated before the timer expires, the device deletes the entry. If an entry has a hit within the aging time, the aging timer restarts.

Procedure

1. Enter system view.
   `system-view`
2. Configure the aging time for fast forwarding entries.
   `ip fast-forwarding aging-time` *`aging-time`*
   By default, the aging time is 30 seconds.

Configuring fast forwarding load sharing

About fast forwarding load sharing

Fast forwarding load sharing enables the device to identify a data flow by using the packet information.

If fast forwarding load sharing is disabled, the device identifies a data flow by the packet information and the input interface.

Procedure

1. Enter system view.
   `system-view`
2. Configure fast forwarding load sharing. Choose one option as needed:
   - Enable fast forwarding load sharing.
     `ip fast-forwarding load-sharing`

- Disable fast forwarding load sharing.
  undo ip fast-forwarding load-sharing

By default, fast forwarding load sharing is enabled.

Display and maintenance commands for fast forwarding

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the aging time of fast forwarding entries.	**display ip fast-forwarding aging-time**
Display fast forwarding entries.	**display ip fast-forwarding cache** [*ip-address*] [**slot** *slot-number*]
Display fast forwarding entries about fragmented packets.	**display ip fast-forwarding fragcache** [*ip-address*] [**slot** *slot-number*]
Clear the fast forwarding table.	**reset ip fast-forwarding cache** [**slot** *slot-number*]

Contents

Optimizing IP performance

IP performance optimization tasks at a glance

All IP performance optimization tasks are optional.

1. Configuring features for IP packets
   - Enabling an interface to forward directed broadcasts destined for the directly connected network
   - Setting the interface MTU for IPv4 packets
   - Enabling IPv4 local fragment reassembly

     This feature is applicable in IRF networks.
2. Configuring features for ICMP messages
   - Enabling sending ICMP error messages
   - Configuring rate limit for ICMP error messages
   - Disabling forwarding ICMP fragments
   - Specifying the source address for ICMP packets
   - Disabling sending a specific type of ICMP messages
   - Disabling receiving a specific type of ICMP messages
3. Configuring features for TCP packets
   - Setting TCP MSS for an interface
   - Configuring TCP path MTU discovery
   - Enabling SYN Cookie
   - Setting the TCP buffer size
   - Setting TCP timers
   - Enabling the Timestamps option encapsulation in outgoing TCP packets

Enabling an interface to forward directed broadcasts destined for the directly connected network

About forwarding broadcasts destined for the directly connected network

A directed broadcast packet is destined for all hosts on a specific network. In the destination IP address of the directed broadcast, the network ID identifies the target network, and the host ID is made up of all ones.

If an interface is allowed to forward directed broadcasts destined for the directly connected network, hackers can exploit this vulnerability to attack the target network. In some scenarios, however, an interface must send such directed broadcast packets to support the following features:

- **UDP helper**—Converts the directed broadcasts to unicasts and forwards them to a specific server.
- **Wake on LAN**—Sends the directed broadcasts to wake up the hosts on the target network.

You can configure this function to enable the interface to forward directed broadcast packets that are destined for directly connected network.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to forward directed broadcasts destined for the directly connected network.

   ip forward-broadcast [**acl** *acl-number*]

   By default, an interface cannot forward directed broadcasts destined for the directly connected network.

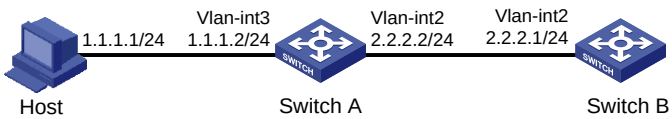
Example: Enabling an interface to forward directed broadcasts destined for the directly connected network

Network configuration

As shown in Figure 1, the default gateway of the host is the IP address 1.1.1.2/24 of VLAN-interface 3 of Switch A.

Switch B can receive directed broadcasts from the host to IP address 2.2.2.255.

Figure 1 Network diagram



Procedure

1. Configure Switch A:

   # Specify IP addresses for VLAN-interface 3 and VLAN-interface 2.

   ```
   <SwitchA> system-view
   [SwitchA] interface vlan-interface 3
   [SwitchA-Vlan-interface3] ip address 1.1.1.2 24
   [SwitchA-Vlan-interface3] quit
   [SwitchA] interface vlan-interface 2
   [SwitchA-Vlan-interface2] ip address 2.2.2.2 24
   ```

   # Enable VLAN-interface 2 to forward directed broadcasts directed for the directly connected network.

   ```
   [SwitchA-Vlan-interface2] ip forward-broadcast
   ```

2. Configure Switch B:

   # Configure a static route to the host.

   ```
   <SwitchB> system-view
   [SwitchB] ip route-static 1.1.1.1 24 2.2.2.2
   ```

   # Specify an IP address for VLAN-interface 2.

   ```
   [SwitchB] interface vlan-interface 2
   [SwitchB-Vlan-interface2] ip address 2.2.2.1 24
   ```

Verifying the configuration

After the configurations are completed, if you ping the subnet-directed broadcast address 2.2.2.255 on the host, VLAN-interface 2 of Switch B can receive the ping packets. If you delete the **ip forward-broadcast** configuration on any switch, the interface cannot receive the ping packets.

Setting the interface MTU for IPv4 packets

About setting the interface MTU for IPv4 packets

The interface MTU for IPv4 packets defines the largest size of an IPv4 packet that an interface can transmit without fragmentation. When a packet exceeds the MTU of the sending interface, the device processes the packet in one of the following ways:

- If the packet disallows fragmentation, the device discards it.
- If the packet allows fragmentation, the device fragments it and forwards the fragments.

Fragmentation and reassembling consume system resources, so set the MTU based on the network environment to avoid fragmentation.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the interface MTU for IPv4 packets.
   ip mtu *mtu-size*
   By default, the interface MTU is not set.

Enabling IPv4 local fragment reassembly

About IPv4 local fragment reassembly

Use this feature on a multichassis IRF fabric to improve fragment reassembly efficiency. This feature enables a subordinate to reassemble the IPv4 fragments of a packet if all the fragments arrive at it. If this feature is disabled, all IPv4 fragments are delivered to the master device for reassembly. The feature applies only to fragments destined for the same subordinate.

Procedure

1. Enter system view.
   system-view
2. Enable IPv4 local fragment reassembly.
   ip reassemble local enable
   By default, IPv4 local fragment reassembly is disabled.

Enabling sending ICMP error messages

About sending ICMP error messages

ICMP messages are used by network layer and transport layer protocols to communicate updates and errors with other devices, facilitating network management.

Sending excessive ICMP messages increases network traffic. The device performance degrades if it receives a lot of malicious ICMP messages that cause it to respond with ICMP error messages. To prevent such problems, the sending of ICMP error messages is disabled by default. You can enable sending ICMP error messages of different types as needed.

ICMP error messages include redirect messages, time exceeded messages, and destination unreachable messages.

Enabling sending ICMP redirect messages

About ICMP redirect messages

A host that has only one default route sends all packets to the default gateway. The default gateway sends an ICMP redirect message to inform the host of a correct next hop by following these rules:

- The receiving and sending interfaces are the same.
- The packet source IP address and the IP address of the packet receiving interface are on the same segment.
- There is no source route option in the received packet.

ICMP redirect messages simplify host management and enable hosts to gradually optimize their routing table.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable sending ICMP redirect messages.

   ```
   ip redirects enable
   ```

   By default, the sending of ICMP redirect messages is disabled.

Enabling sending ICMP time exceeded messages

About ICMP time exceeded messages

A device sends ICMP time exceeded messages by following these rules:

- The device sends the source an ICMP TTL exceeded in transit message when the following conditions are met:
  - The received packet is not destined for the device.
  - The TTL field of the packet is 1.
- When the device receives the first fragment of an IP datagram destined for it, it starts a timer. If the timer expires before all the fragments of the datagram are received, the device sends an ICMP fragment reassembly time exceeded message to the source.

Restrictions and guidelines

If the ICMP time exceeded message sending is disabled, the device does not send ICMP TTL exceeded in transit messages. However, it can still send ICMP fragment reassembly time exceeded messages.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable sending ICMP time exceeded messages.

   ```
   ip ttl-expires enable
   ```

   By default, the sending of ICMP time exceeded messages is disabled.

Enable sending ICMP destination unreachable messages

About ICMP destination unreachable messages

A device sends ICMP destination unreachable messages by following these rules:

- The device sends the source an ICMP network unreachable message when the following conditions are met:
  - The packet does not match any route.
  - No default route exists in the routing table.
- The device sends the source an ICMP protocol unreachable message when the following conditions are met:
  - The packet is destined for the device.
  - The transport layer protocol of the packet is not supported by the device.
- The device sends the source an ICMP port unreachable message when the following conditions are met:
  - The UDP packet is destined for the device.
  - The packet's port number does not match the corresponding process.
- The device sends the source an ICMP source route failed message when the following conditions are met:
  - The source uses Strict Source Routing to send packets.
  - The intermediate device finds that the next hop specified by the source is not directly connected.
- The device sends the source an ICMP fragmentation needed and DF set message when the following conditions are met:
  - The MTU of the sending interface is smaller than the packet.
  - The packet has DF set.

Restrictions and guidelines

If a DHCP-enabled device receives an ICMP echo reply without sending any ICMP echo requests, the device does not send any ICMP protocol unreachable messages to the source. For more information about DHCP, see *Layer 3—IP Services Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`
2. Enable sending ICMP destination unreachable messages.

   `ip unreachables enable`

   By default, the sending of ICMP destination unreachable messages is disabled.

Configuring rate limit for ICMP error messages

About the token bucket algorithm

To avoid sending excessive ICMP error messages within a short period that might cause network congestion, you can limit the rate at which ICMP error messages are sent. A token bucket algorithm is used with one token representing one ICMP error message.

A token is placed in the bucket at intervals until the maximum number of tokens that the bucket can hold is reached.

A token is removed from the bucket when an ICMP error message is sent. When the bucket is empty, ICMP error messages are not sent until a new token is placed in the bucket.

Procedure

1. Enter system view.

   system-view

2. Set the interval for tokens to arrive in the bucket and the bucket size for ICMP error messages.

   ip icmp error-interval *interval* [*bucketsize*]

   By default, a token is placed in the bucket at intervals of 100 milliseconds and the bucket allows a maximum of 10 tokens.

   To disable the ICMP rate limit, set the interval to 0 milliseconds.

Disabling forwarding ICMP fragments

Restrictions and guidelines

Disabling forwarding ICMP fragments can protect your device from ICMP fragment attacks.

Procedure

1. Enter system view.

   system-view

2. Disable forwarding ICMP fragments.

   ip icmp fragment discarding

   By default, forwarding ICMP fragments is enabled.

Specifying the source address for ICMP packets

About specifying source address for ICMP packets

Specifying the source IP address for outgoing ping echo requests and ICMP error messages helps users to locate the sending device easily. As a best practice, specify the IP address of the loopback interface as the source IP address.

Restrictions and guidelines

If you specify an IP address in the **ping** command, ping echo requests use the specified address as the source IP address rather than the IP address specified by the **ip icmp source** command.

Procedure

1. Enter system view.

   system-view

2. Specify the source address for outgoing ICMP packets.

   ip icmp source *ip-address*

   By default, no source address is specified for outgoing ICMP packets. No source address is specified for outgoing ICMP packets. The default source IP addresses for different types of ICMP packets vary as follows:

   - For an ICMP error message, the source IP address is the IP address of the receiving interface of the packet that triggers the ICMP error message. ICMP error messages include Time Exceeded, Port Unreachable, and Parameter Problem messages.
   - For an ICMP echo request, the source IP address is the IP address of the sending interface.
   - For an ICMP echo reply, the source IP address is the destination IP address of the ICMP echo request specific to this reply.

Disabling sending a specific type of ICMP messages

About this task

By default, the device sends all types of ICMP messages except Destination Unreachable, Time Exceeded, and Redirect messages. Attackers might obtain information from specific types of ICMP messages, causing security issues.

For security purposes, you can perform this task disable sending ICMP messages of specific types.

Software version and feature compatibility

This feature is supported only in R6348P01 and later.

Restrictions and guidelines

Disabling sending ICMP messages of a specific type might affect network operation. Please use this feature with caution.

To enable sending Destination Unreachable, Time Exceeded, or Redirect messages, you can perform one of the following tasks:

- Execute the **ip icmp send enable** command.
- Execute one of the following commands as needed:
  - **ip unreachables enable**
  - **ip ttl-expires enable**
  - **ip redirects enable**

Procedure

1. Enter system view.

   system-view

2. Disable the device from sending a specific type of ICMP messages.

   undo ip icmp { **name** *icmp-name* | **type** *icmp-type* **code** *icmp-code* } **send enable**

   By default, the device sends all types of ICMP messages except Destination Unreachable, Time Exceeded, and Redirect messages.

Disabling receiving a specific type of ICMP messages

About this task

By default, the device receives all types of ICMP messages. Such a setting might affect device performance if a large number of ICMP responses are received within a short time. To resolve this issue, you can perform this task to disable the device from receiving a specific type of ICMP messages.

Software version and feature compatibility

This feature is supported only in R6348P01 and later.

Restrictions and guidelines

Disabling receiving ICMP messages of a specific type might affect network operation. Please use this feature with caution.

Procedure

1. Enter system view.

   system-view

2. Disable the device from receiving a specific type of ICMP messages.

   undo ip icmp { **name** *icmp-name* | **type** *icmp-type* **code** *icmp-code* } **receive enable**

   By default, the device receives all types of ICMP messages.

Setting TCP MSS for an interface

About TCP MSS

The maximum segment size (MSS) option informs the receiver of the largest segment that the sender can accept. Each end announces its MSS during TCP connection establishment. If the size of a TCP segment is smaller than the MSS of the receiver, TCP sends the TCP segment without fragmentation. If not, it fragments the segment according to the receiver's MSS.

Restrictions and guidelines

- If you set the TCP MSS on an interface, the size of each TCP segment received or sent on the interface cannot exceed the MSS value.
- This configuration takes effect only for TCP connections established after the configuration rather than the TCP connections that already exist.
- This configuration is effective only for IP packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the TCP MSS for the interface.

   tcp mss *value*

   By default, the TCP MSS is not set.

Configuring TCP path MTU discovery

About TCP path MTU discovery

TCP path MTU discovery (in RFC 1191) discovers the path MTU between the source and destination ends of a TCP connection. The device uses the path MTU to calculate the MSS to avoid IP fragmentation. The path MTU uses an aging mechanism to ensure that the source device can increase the path MTU when the minimum link MTU on the path increases.

TCP path MTU discovery works as follows:

1. A TCP source device sends a packet with the Don't Fragment (DF) bit set.
2. A router discards the packet that exceeds the MTU of the outgoing interface and returns an ICMP error message. The error message contains the MTU of the outgoing interface.
3. Upon receiving the ICMP message, the TCP source device calculates the current path MTU of the TCP connection.
4. The TCP source device sends subsequent TCP segments that each are smaller than the MSS (MSS = path MTU – IP header length – TCP header length).

If the TCP source device still receives ICMP error messages when the MSS is smaller than 32 bytes, the TCP source device will fragment packets.

An ICMP error message received from a router that does not support RFC 1191 has the MTU of the outgoing interface set to 0. Upon receiving the ICMP message, the TCP source device selects the path MTU smaller than the current path MTU from the MTU table as described in RFC 1191. Based on the selected path MTU, the TCP source device calculates the TCP MSS. The MTU table contains MTUs of 68, 296, 508, 1006, 1280, 1492, 2002, 4352, 8166, 17914, 32000, and 65535 bytes. Because the minimum TCP MSS specified by the system is 32 bytes, the actual minimum MTU is 72 bytes.

The aging mechanism of the path MTU is as follows:

- When the TCP source device receives an ICMP error message, it reduces the path MTU and starts an aging timer for the path MTU.
- After the aging timer expires, the source device uses a larger MSS in the MTU table, as described in RFC 1191.
- If no ICMP error message is received within two minutes, the source device increases the MSS again until the MSS negotiated during TCP three-way handshake is reached.

Prerequisites

Make sure all devices on a TCP connection are enabled to send ICMP error messages by using the **ip unreachables enable** command.

Procedure

1. Enter system view.

   system-view

2. Enable TCP path MTU discovery.

   tcp path-mtu-discovery [**aging** *age-time* | **no-aging**]

   By default, TCP path MTU discovery is disabled.

Enabling SYN Cookie

About SYN Cookie

A TCP connection is established through a three-way handshake. An attacker can exploit this mechanism to mount SYN Flood attacks. The attacker sends a large number of SYN packets, but does not respond to the SYN ACK packets from the server. As a result, the server establishes a large number of TCP semi-connections and can no longer handle normal services.

SYN Cookie can protect the server from SYN Flood attacks. When the server receives a SYN packet, it responds with a SYN ACK packet without establishing a TCP semi-connection. The server establishes a TCP connection and enters ESTABLISHED state only when it receives an ACK packet from the client.

Procedure

1. Enter system view.

   system-view

2. Enable SYN Cookie.

   tcp syn-cookie enable

   By default, SYN Cookie is disabled.

Setting the TCP buffer size

1. Enter system view.

   system-view
2. Set the size of TCP receive/send buffer.

   tcp window *window-size*

   The default buffer size is 63 KB.

Setting TCP timers

About TCP timers

You can set the following TCP timers:

- **SYN wait timer**—TCP starts the SYN wait timer after sending a SYN packet. Within the SYN wait timer if no response is received or the upper limit on TCP connection tries is reached, TCP fails to establish the connection.
- **FIN wait timer**—TCP starts the FIN wait timer when TCP changes the connection state to FIN_WAIT_2. If no FIN packet is received within the timer interval, TCP terminates the connection. If a FIN packet is received, TCP changes the connection state to TIME_WAIT. If a non-FIN packet is received, TCP restarts the timer, and tears down the connection when the timer expires.

Procedure

1. Enter system view.

   system-view
2. Set the TCP SYN wait timer.

   tcp timer syn-timeout *time-value*

   By default, the TCP SYN wait timer is 75 seconds.
3. Set the TCP FIN wait timer.

   tcp timer fin-timeout *time-value*

   By default, the TCP FIN wait timer is 675 seconds.

Enabling the Timestamps option encapsulation in outgoing TCP packets

About the Timestamps option encapsulation in outgoing TCP packets

Devices at each end of the TCP connection can calculate the RTT value by using the TCP Timestamps option carried in TCP packets. For security purpose in some networks, you can disable this feature at one end of the TCP connection to prevent intermediate devices from obtaining the Timestamps option information.

Procedure

1. Enter system view.

   system-view
2. Enable the device to encapsulate the TCP Timestamps option in outgoing TCP packets.

   tcp timestamps enable

   By default, the TCP timestamps option is encapsulated in outgoing TCP packets.

Display and maintenance commands for IP performance optimization

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display ICMP statistics.	**display icmp statistics** [**slot** *slot-number*]
Display IP packet statistics.	**display ip statistics** [**slot** *slot-number*]
Display brief information about RawIP connections.	**display rawip** [**slot** *slot-number*]
Display detailed information about RawIP connections.	**display rawip verbose** [**slot** *slot-number* [**pcb** *pcb-index*]]
Display brief information about TCP connections.	**display tcp** [**slot** *slot-number*]
Display TCP traffic statistics.	**display tcp statistics** [**slot** *slot-number*]
Display detailed information about TCP connections.	**display tcp verbose** [**slot** *slot-number* [**pcb** *pcb-index*]]
Display brief information about UDP connections.	**display udp** [**slot** *slot-number*]
Display UDP traffic statistics.	**display udp statistics** [**slot** *slot-number*]
Display detailed information about UDP connections.	**display udp verbose** [**slot** *slot-number* [**pcb** *pcb-index*]]
Clear IP packet statistics.	**reset ip statistics** [**slot** *slot-number*]
Clear TCP traffic statistics.	**reset tcp statistics**
Clear UDP traffic statistics.	**reset udp statistics**

Configuring UDP helper

About UDP helper

UDP helper can provide the following packet conversion services for packets with specific UDP destination port numbers:

- Convert broadcast to unicast, and forward the unicast packets to specific destinations.
- Convert broadcast to multicast, and forward the multicast packets.

Restrictions: Hardware compatibility with UDP helper

The following switch series do not support UDP helper:

- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000E-X.
- S5000X-EI.
- WAS6000.

Configuring UDP helper to convert broadcast to unicast

About broadcast to unicast conversion

You can configure UDP helper to convert broadcast packets with specific UDP port numbers to unicast packets.

Upon receiving a UDP broadcast packet, UDP helper uses the configured UDP ports to match the UDP destination port number of the packet.

- If a match is found, UDP helper duplicates the packet and modifies the destination IP address of the copy to the configured unicast address. Then UDP helper forwards the unicast packet to the unicast address.
- If no match is found, UDP helper does not process the packet.

Procedure

1. Enter system view.

   `system-view`
2. Enable UDP helper.

   `udp-helper enable`

   By default, UDP helper is disabled.
3. Specify a UDP port number for UDP helper.

   `udp-helper port` { *`port-number`* | **`dns`** | **`netbios-ds`** | **`netbios-ns`** | **`tacacs`** | **`tftp`** | **`time`** }

By default, no UDP port numbers are specified for UDP helper.

Do not set UDP ports 67 and 68 for UDP helper, because UDP helper cannot forward DHCP broadcast packets.

You can specify a maximum of 256 UDP ports for UDP helper.

4. Enter interface view.

   interface *interface-type interface-number*

5. Specify a destination server for UDP helper to convert broadcast to unicast.

   udp-helper server *ip-address*

   By default, no destination servers are specified.

   Use this command on the interface that receives broadcast packets.

   You can specify a maximum of 20 unicast and multicast addresses for UDP helper to convert broadcast packets on an interface.

Configuring UDP helper to convert broadcast to multicast

About broadcast to multicast conversion

You can configure UDP helper to convert broadcast packets with specific UDP port numbers to multicast packets.

Upon receiving a UDP broadcast packet, UDP helper uses the configured UDP ports to match the UDP destination port number of the packet.

- If a match is found, UDP helper duplicates the packet and modifies the destination IP address of the copy to the configured multicast address. Then UDP helper forwards the packet to the multicast group.
- If no match is found, UDP helper does not process the packet.

Procedure

1. Enter system view.

   system-view

2. Enable UDP helper.

   udp-helper enable

   By default, UDP helper is disabled.

3. Specify a UDP port number for UDP helper.

   udp-helper port { *port-number* | **dns** | **netbios-ds** | **netbios-ns** | **tacacs** | **tftp** | **time** }

   By default, no UDP port numbers are specified for UDP helper.

   Do not set UDP ports 67 and 68 for UDP helper, because UDP helper cannot forward DHCP broadcast packets.

   You can specify a maximum of 256 UDP ports for UDP helper.

4. Enter interface view.

   interface *interface-type interface-number*

5. Specify a destination multicast address for UDP helper to convert broadcast to multicast.

   udp-helper broadcast-map *multicast-address* [**acl** *acl-number*]

   By default, no destination multicast addresses are specified for UDP helper.

   Use this command on the interface that receives broadcast packets.

You can specify a maximum of 20 unicast and multicast addresses for UDP helper to convert broadcast packets on an interface.

Display and maintenance commands for UDP helper

Execute **display** command in any view and **reset** commands in user view.

Task	Command
Display information about broadcast to unicast conversion by UDP helper on an interface.	**display udp-helper interface** *interface-type interface-number*
Clear packet statistics for UDP helper.	**reset udp-helper statistics**

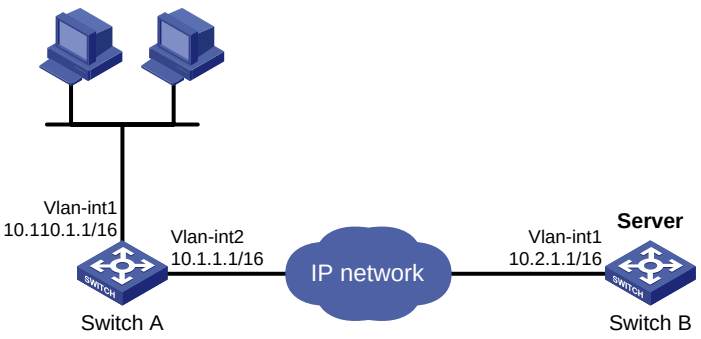
UDP helper configuration examples

Example: Configuring UDP helper to convert broadcast to unicast

Network configuration

As shown in Figure 1, configure UDP helper to convert broadcast to unicast on VLAN-interface 1 of Switch A. This feature enables Switch A to forward broadcast packets with UDP destination port number 55 to the destination server 10.2.1.1/16.

Figure 1 Network diagram



Procedure

Make sure Switch A can reach the subnet 10.2.0.0/16.

Enable UDP helper.

```
[SwitchA] System-view
[SwitchA] udp-helper enable
```

Enable the UDP port 55 for UDP helper.

```
[SwitchA] udp-helper port 55
```

Specify the destination server 10.2.1.1 for UDP helper to convert broadcast to unicast on VLAN-interface 1.

```
[SwitchA] interface vlan-interface 1
```

```
[SwitchA-Vlan-interface1] ip address 10.110.1.1 16
[SwitchA-Vlan-interface1] udp-helper server 10.2.1.1
```

Verifying the configuration

Display information about broadcast to unicast conversion by UDP helper on VLAN-interface 1.

```
[SwitchA-Vlan-interface1] display udp-helper interface vlan-interface 1
Interface               Server VPN instance          Server address Packets sent
Vlan-interface1         N/A                          10.2.1.1       5
```

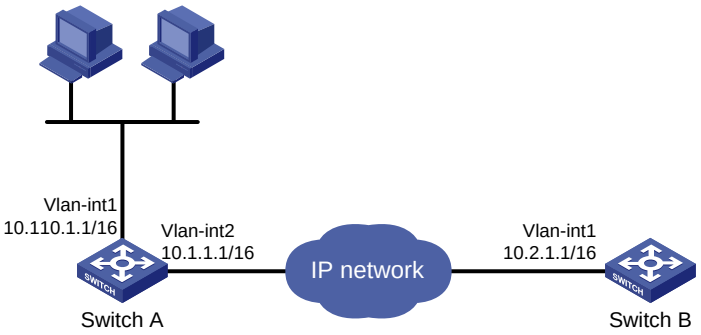
Example: Configuring UDP helper to convert broadcast to multicast

Network configuration

As shown in Figure 2, VLAN-interface 1 of Switch B can receive multicast packets destined to 225.1.1.1.

Configure UDP helper to convert broadcast to multicast on VLAN-interface 1 of Switch A. This feature enables Switch A to forward broadcast packets with UDP destination port number 55 to the multicast group 225.1.1.1.

Figure 2 Network diagram



Procedure

Make sure Switch A can reach the subnet 10.2.0.0/16.

1. Configure Switch A:

Enable UDP helper.

```
<SwitchA> system-view
[SwitchA] udp-helper enable
```

Enable the UDP port 55 for UDP helper.

```
[SwitchA] udp-helper port 55
```

Configure UDP helper to convert broadcast packets to multicast packets destined for 225.1.1.1.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ip address 10.110.1.1 16
[SwitchA-Vlan-interface1] udp-helper broadcast-map 225.1.1.1
[SwitchA-Vlan-interface1] quit
```

Enable IP multicast routing globally.

```
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-DM on VLAN-interface 1.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] pim dm
[SwitchA-Vlan-interface1] quit
```

Enable PIM-DM and IGMP on VLAN-interface 2.

```
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] pim dm
[SwitchA-Vlan-interface2] igmp enable
```

Configure VLAN-interface 2 as a static member of multicast group 225.1.1.1.

```
[SwitchA-Vlan-interface2] igmp static-group 225.1.1.1
```

2. Configure Switch B:

Enable IP multicast routing globally.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
```

Enable PIM-DM and IGMP on VLAN-interface 1.

```
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] pim dm
[SwitchB-Vlan-interface1] igmp enable
```

Configure VLAN-interface 1 as a static member of multicast group 225.1.1.1.

```
[SwitchB-Vlan-interface1] igmp static-group 225.1.1.1
```

Verifying the configuration

Verify that you can capture multicast packets from Switch A on Switch B.

Contents

Configuring basic IPv6 settings

About IPv6

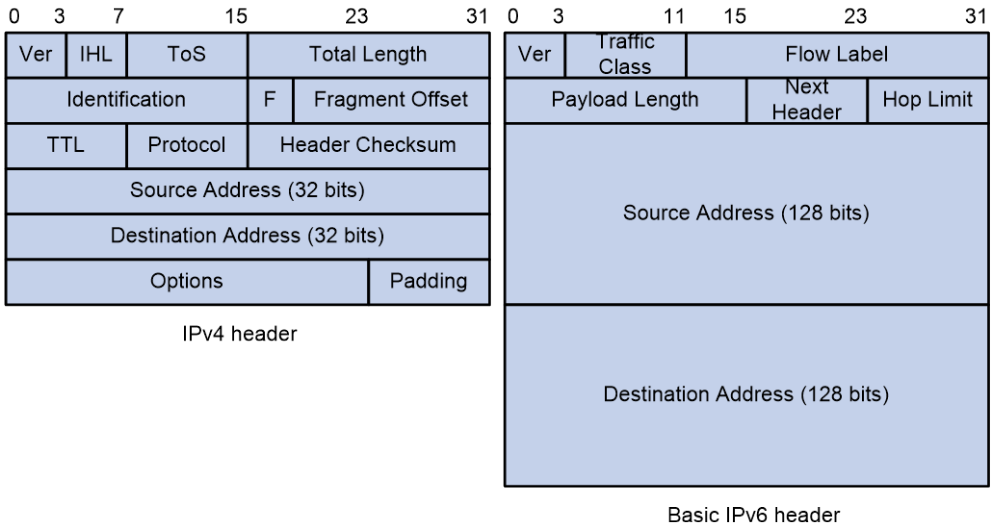
IPv6, also called IP next generation (IPng), was designed by the IETF as the successor to IPv4. One significant difference between IPv6 and IPv4 is that IPv6 increases the IP address size from 32 bits to 128 bits.

IPv6 features

Simplified header format

IPv6 removes several IPv4 header fields or moves them to the IPv6 extension headers to reduce the length of the basic IPv6 packet header. The basic IPv6 packet header has a fixed length of 40 bytes to simplify IPv6 packet handling and improve forwarding efficiency. Although the IPv6 address size is four times the IPv4 address size, the basic IPv6 packet header size is only twice the size of the option-less IPv4 packet header.

Figure 1 IPv4 packet header format and basic IPv6 packet header format



Larger address space

IPv6 can provide 3.4 x 10^{38} addresses to meet the requirements of hierarchical address assignment for both public and private networks.

Hierarchical address structure

IPv6 uses a hierarchical address structure to speed up route lookup and reduce the IPv6 routing table size through route aggregation.

Address autoconfiguration

To simplify host configuration, IPv6 supports stateful and stateless address autoconfiguration.

- Stateful address autoconfiguration enables a host to acquire an IPv6 address and other configuration information from a server (for example, a DHCPv6 server). For more information about DHCPv6 server, see "Configuring the DHCPv6 server."

- Stateless address autoconfiguration enables a host to automatically generate an IPv6 address and other configuration information by using its link-layer address and the prefix information advertised by a router.

To communicate with other hosts on the same link, a host automatically generates a link-local address based on its link-layer address and the link-local address prefix (FE80::/10).

Built-in security

IPv6 defines extension headers to support IPsec. IPsec provides end-to-end security and enhances interoperability among different IPv6 applications.

QoS support

The Flow Label field in the IPv6 header allows the device to label the packets of a specific flow for special handling.

Enhanced neighbor discovery mechanism

The IPv6 neighbor discovery protocol uses a group of ICMPv6 messages to manage information exchange among neighboring nodes on the same link. The group of ICMPv6 messages replaces ARP messages, ICMPv4 router discovery messages, and ICMPv4 redirect messages and provides a series of other functions.

Flexible extension headers

IPv6 eliminates the Options field in the header and introduces optional extension headers to provide scalability and improve efficiency. The Options field in the IPv4 packet header contains a maximum of 40 bytes, whereas the IPv6 extension headers are restricted to the maximum size of IPv6 packets.

IPv6 addresses

IPv6 address format

An IPv6 address is represented as a set of 16-bit hexadecimals separated by colons (:). An IPv6 address is divided into eight groups, and each 16-bit group is represented by four hexadecimal numbers, for example, 2001:0000:130F:0000:0000:09C0:876A:130B.

To simplify the representation of IPv6 addresses, you can handle zeros in IPv6 addresses by using the following methods:

- The leading zeros in each group can be removed. For example, the above address can be represented in a shorter format as 2001:0:130F:0:0:9C0:876A:130B.
- If an IPv6 address contains one or more consecutive groups of zeros, they can be replaced by a double colon (::). For example, the above address can be represented in the shortest format as 2001:0:130F::9C0:876A:130B.

IMPORTANT:

A double colon can appear once or not at all in an IPv6 address. This limit allows the device to determine how many zeros the double colon represents and correctly convert it to zeros to restore a 128-bit IPv6 address.

An IPv6 address consists of an address prefix and an interface ID, which are equivalent to the network ID and the host ID of an IPv4 address.

An IPv6 address prefix is written in IPv6-address/prefix-length notation. The prefix-length is a decimal number indicating how many leftmost bits of the IPv6 address are in the address prefix.

IPv6 address types

IPv6 addresses include the following types:

- **Unicast address**—An identifier for a single interface, similar to an IPv4 unicast address. A packet sent to a unicast address is delivered to the interface identified by that address.

- **Multicast address**—An identifier for a set of interfaces (typically belonging to different nodes), similar to an IPv4 multicast address. A packet sent to a multicast address is delivered to all interfaces identified by that address.

  Broadcast addresses are replaced by multicast addresses in IPv6.
- **Anycast address**—An identifier for a set of interfaces (typically belonging to different nodes). A packet sent to an anycast address is delivered to the nearest interface among the interfaces identified by that address. The nearest interface is chosen according to the routing protocol's measure of distance.

The type of an IPv6 address is designated by the first several bits, called the format prefix.

Table 1 Mappings between address types and format prefixes

Type		Format prefix (binary)	IPv6 prefix ID
Unicast address	Unspecified address	00...0 (128 bits)	::/128
	Loopback address	00...1 (128 bits)	::1/128
	Link-local address	1111111010	FE80::/10
	Global unicast address	Other forms	N/A
Multicast address		11111111	FF00::/8
Anycast address		Anycast addresses use the unicast address space and have the identical structure of unicast addresses.	

Unicast addresses

Unicast addresses include global unicast addresses, link-local unicast addresses, the loopback address, and the unspecified address.

- **Global unicast addresses**—Equivalent to public IPv4 addresses, global unicast addresses are provided for Internet service providers. This type of address allows for prefix aggregation to restrict the number of global routing entries.
- **Link-local addresses**—Used for communication among link-local nodes for neighbor discovery and stateless autoconfiguration. Packets with link-local source or destination addresses are not forwarded to other links.
- **A loopback address**—0:0:0:0:0:0:0:1 (or ::1). It has the same function as the loopback address in IPv4. It cannot be assigned to any physical interface. A node uses this address to send an IPv6 packet to itself.
- **An unspecified address**—0:0:0:0:0:0:0:0 (or ::). It cannot be assigned to any node. Before acquiring a valid IPv6 address, a node fills this address in the source address field of IPv6 packets. The unspecified address cannot be used as a destination IPv6 address.

Multicast addresses

IPv6 multicast addresses listed in Table 2 are reserved for special purposes.

Table 2 Reserved IPv6 multicast addresses

Address	Application
FF01::1	Node-local scope all-nodes multicast address.
FF02::1	Link-local scope all-nodes multicast address.
FF01::2	Node-local scope all-routers multicast address.
FF02::2	Link-local scope all-routers multicast address.

Multicast addresses also include solicited-node addresses. A node uses a solicited-node multicast address to acquire the link-layer address of a neighboring node on the same link and to detect

duplicate addresses. Each IPv6 unicast or anycast address has a corresponding solicited-node address. The format of a solicited-node multicast address is FF02:0:0:0:0:1:FFXX:XXXX. FF02:0:0:0:0:1:FF is fixed and consists of 104 bits, and XX:XXXX is the last 24 bits of an IPv6 unicast address or anycast address.

EUI-64 address-based interface identifiers

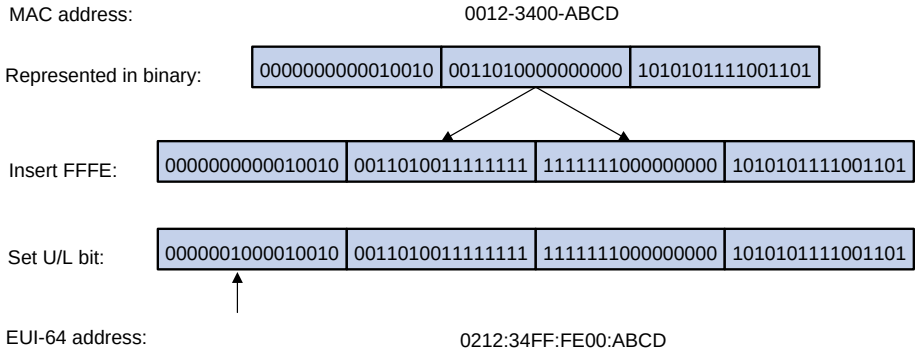
An interface identifier is 64 bits long and uniquely identifies an interface on a link.

On an IEEE 802 interface (such as a VLAN interface), the interface identifier is derived from the link-layer address (typically a MAC address) of the interface. The MAC address is 48 bits long.

To obtain an EUI-64 address-based interface identifier, follow these steps:

1. Insert the 16-bit binary number 1111111111111110 (hexadecimal value of FFFE) behind the 24th high-order bit of the MAC address.
2. Invert the universal/local (U/L) bit (the seventh high-order bit). This operation makes the interface identifier have the same local or global significance as the MAC address.

Figure 2 Converting a MAC address into an EUI-64 address-based interface identifier



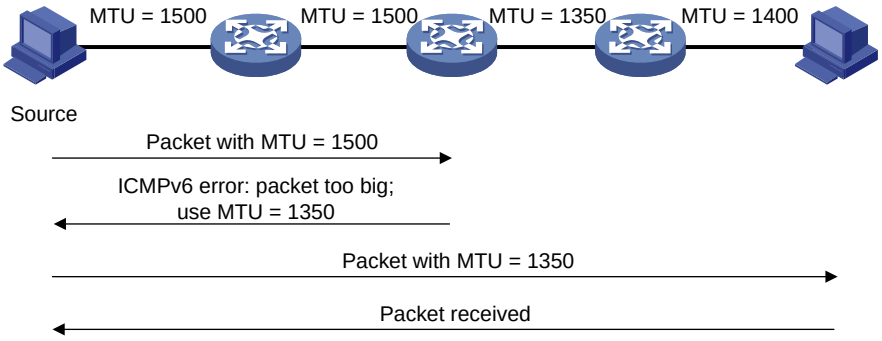
IPv6 path MTU discovery

The links that a packet passes from a source to a destination can have different MTUs, among which the minimum MTU is the path MTU. If a packet exceeds the path MTU, the source end fragments the packet to reduce the processing pressure on intermediate devices and to use network resources effectively.

A source end uses path MTU discovery to find the path MTU to a destination, as shown in Figure 3.

1. The source host sends a packet no larger than its MTU to the destination host.
2. If the MTU of an intermediate device's output interface is smaller than the packet, the device performs the following operations:
   - Discards the packet.
   - Returns an ICMPv6 error message containing the interface MTU to the source host.
3. Upon receiving the ICMPv6 error message, the source host performs the following operations:
   - Uses the returned MTU to limit the packet size.
   - Performs fragmentation.
   - Sends the fragments to the destination host.
4. Step 2 and step 3 are repeated until the destination host receives the packet. In this way, the source host finds the minimum MTU of all links in the path to the destination host.

Figure 3 Path MTU discovery process



IPv6 transition technologies

IPv6 transition technologies enable communication between IPv4 and IPv6 networks.

Dual stack

Dual stack is the most direct transition approach. A network node that supports both IPv4 and IPv6 is a dual-stack node. A dual-stack node configured with an IPv4 address and an IPv6 address can forward both IPv4 and IPv6 packets. An application that supports both IPv4 and IPv6 prefers IPv6 at the network layer.

Dual stack is suitable for communication between IPv4 nodes or between IPv6 nodes. It is the basis of all transition technologies. However, it does not solve the IPv4 address depletion issue because each dual-stack node must have a globally unique IPv4 address.

NAT-PT

Network Address Translation – Protocol Translation (NAT-PT) enables communication between IPv4 and IPv6 nodes by translating between IPv4 and IPv6 packets. It performs IP address translation, and according to different protocols, performs semantic translation for packets. This technology is only suitable for communication between a pure IPv4 node and a pure IPv6 node.

Protocols and standards

IPv6 basics tasks at a glance

To configure basic IPv6 settings, perform the following tasks:

1. Configuring an IPv6 address

   Choose the following tasks as needed:

   - Configuring an IPv6 global unicast address
   - Configuring an IPv6 link-local address
   - Configuring an IPv6 anycast address
2. (Optional.) Configuring path MTU discovery
   - Setting the interface MTU for IPv6 packets
   - Setting a static path MTU for an IPv6 address
   - Setting the aging time for dynamic path MTUs
3. (Optional.) Controlling sending ICMPv6 messages
   - Configuring the rate limit for ICMPv6 error messages
   - Enabling replying to multicast echo requests
   - Enabling sending ICMPv6 destination unreachable messages
   - Enabling sending ICMPv6 time exceeded messages
   - Enabling sending ICMPv6 redirect messages
4. (Optional.) Enabling IPv6 local fragment reassembly

Configuring an IPv6 global unicast address

About IPv6 global unicast address

Use one of the following methods to configure an IPv6 global unicast address for an interface:

- **EUI-64 IPv6 address**—The IPv6 address prefix of the interface is manually configured, and the interface ID is generated automatically by the interface.
- **Manual configuration**—The IPv6 global unicast address is manually configured.
- **Stateless address autoconfiguration**—The IPv6 global unicast address is generated automatically based on the address prefix information contained in the RA message.
- **Prefix-specific address autoconfiguration**—The IPv6 global unicast address is generated automatically based on the prefix specified by its ID. The prefix can be manually configured or obtained through DHCPv6.

You can configure multiple IPv6 global unicast addresses on an interface.

Manually configured global unicast addresses (including EUI-64 IPv6 addresses) take precedence over automatically generated ones. If you manually configure a global unicast address with the same address prefix as an existing global unicast address on an interface, the manually configured one takes effect. However, it does not overwrite the automatically generated address. If you delete the manually configured global unicast address, the device uses the automatically generated one.

Generating an EUI-64 IPv6 address

1. Enter system view.

   `system-view`
2. Enter interface view.

interface *interface-type interface-number*

3. Configure an EUI-64 IPv6 address on the interface.

   ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* } **eui-64**

   By default, no EUI-64 IPv6 address is configured on an interface.

Manually assigning an IPv6 global unicast address

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Assign an IPv6 global unicast address to the interface.

   ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* }

   By default, no IPv6 global unicast address is configured on an interface.

Stateless address autoconfiguration

About stateless address autoconfiguration and temporary address

Stateless address autoconfiguration enables an interface to automatically generate an IPv6 global unicast address by using the address prefix in the received RA message and the interface ID. On an IEEE 802 interface (such as an Ethernet interface or a VLAN interface), the interface ID is generated based on the interface's MAC address and is globally unique. An attacker can exploit this rule to identify the sending device easily.

To fix the vulnerability, you can configure the temporary address feature. With this feature, an IEEE 802 interface generates the following addresses:

- **Public IPv6 address**—Includes the address prefix in the RA message and a fixed interface ID generated based on the MAC address of the interface.
- **Temporary IPv6 address**—Includes the address prefix in the RA message and a random interface ID generated through MD5.

You can also configure the interface to preferentially use the temporary IPv6 address as the source address of sent packets. When the valid lifetime of the temporary IPv6 address expires, the interface deletes the address and generates a new one. This feature enables the system to send packets with different source addresses through the same interface. If the temporary IPv6 address cannot be used because of a DAD conflict, the public IPv6 address is used.

The preferred lifetime and valid lifetime for a temporary IPv6 address are determined as follows:

- The preferred lifetime of a temporary IPv6 address takes the smaller of the following values:
  - The preferred lifetime of the address prefix in the RA message.
  - The preferred lifetime configured for temporary IPv6 addresses minus DESYNC_FACTOR (a random number in the range of 0 to 600 seconds).
- The valid lifetime of a temporary IPv6 address takes the smaller of the following values:
  - The valid lifetime of the address prefix.
  - The valid lifetime configured for temporary IPv6 addresses.

Restrictions and guidelines

If the IPv6 prefix in the RA message is not 64 bits long, stateless address autoconfiguration fails to generate an IPv6 global unicast address.

To generate a temporary address, an interface must be enabled with stateless address autoconfiguration. Temporary IPv6 addresses do not overwrite public IPv6 addresses, so an interface can have multiple IPv6 addresses with the same address prefix but different interface IDs.

If an interface fails to generate a public IPv6 address because of a prefix conflict or other reasons, it does not generate any temporary IPv6 address.

Executing the **undo ipv6 address auto** command on an interface deletes all IPv6 global unicast addresses and link-local addresses that are automatically generated on the interface.

Enabling stateless address autoconfiguration

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable stateless address autoconfiguration on an interface, so that the interface can automatically generate a global unicast address.

   ipv6 address auto

   By default, the stateless address autoconfiguration feature is disabled on an interface.

Configuring the temporary address feature and preferentially using the temporary IPv6 address as the source address of outgoing packets

1. Enter system view.

   system-view
2. Enable the temporary IPv6 address feature.

   ipv6 temporary-address [*valid-lifetime preferred-lifetime*]

   By default, the temporary IPv6 address feature is disabled.
3. Enable the system to preferentially use the temporary IPv6 address as the source address of the outgoing packets.

   ipv6 prefer temporary-address

   By default, the system does not preferentially use the temporary IPv6 address as the source address of the outgoing packets.

Configuring prefix-specific address autoconfiguration

1. Enter system view.

   system-view
2. Configure an IPv6 prefix.

   Choose one option as needed:

   - Configure a static IPv6 prefix.

     ipv6 prefix *prefix-number ipv6-prefix*/*prefix-length*

     By default, no static IPv6 prefixes exist.
   - Use DHCPv6 to obtain a dynamic IPv6 prefix.

     For more information about IPv6 prefix acquisition, see "Configuring the DHCPv6 client."
3. Enter interface view.

   interface *interface-type interface-number*
4. Specify an IPv6 prefix for an interface to automatically generate an IPv6 global unicast address and advertise the prefix.

   ipv6 address *prefix-number sub-prefix/prefix-length*

By default, no IPv6 prefix is specified for the interface to automatically generate an IPv6 global unicast address.

Configuring an IPv6 link-local address

About IPv6 link-local address

Configure IPv6 link-local addresses using one of the following methods:

- **Automatic generation**—The device automatically generates a link-local address for an interface according to the link-local address prefix (FE80::/10) and the link-layer address of the interface.
- **Manual assignment**—Manually configure an IPv6 link-local address for an interface.

Restrictions and guidelines

After you configure an IPv6 global unicast address for an interface, the interface automatically generates a link-local address. This link-local address is the same as the one generated by using the **ipv6 address auto link-local** command. If a link-local address is manually assigned to an interface, this manual assigned link-local address takes effect. If the manually assigned link-local address is deleted, the automatically generated link-local address takes effect.

Using the **undo ipv6 address auto link-local** command on an interface deletes only the link-local address generated by the **ipv6 address auto link-local** command. If the interface has an IPv6 global unicast address, it still has a link-local address. If the interface has no IPv6 global unicast address, it has no link-local address.

An interface can have only one link-local address. As a best practice, use the automatic generation method to avoid link-local address conflicts. If both the automatic generation and manual assignment methods are used, the manual assignment takes precedence.

- If you first use automatic generation and then manual assignment, the manually assigned link-local address overwrites the automatically generated one.
- If you first use manual assignment and then automatic generation, both of the following occur:
  - The link-local address is still the manually assigned one.
  - The automatically generated link-local address does not take effect. If you delete the manually assigned address, the automatically generated link-local address takes effect.

Configuring automatic generation of an IPv6 link-local address for an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the interface to automatically generate an IPv6 link-local address.

   ipv6 address auto link-local

   By default, no link-local address is configured on an interface.

   After an IPv6 global unicast address is configured on the interface, a link-local address is generated automatically.

Manually assigning an IPv6 link-local address to an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Manually assign an IPv6 link-local address to the interface.
   ipv6 address { *ipv6-address* [*prefix-length*] | *ipv6-address/prefix-length* } **link-local**
   By default, no link-local address is configured on an interface.

Configuring an IPv6 anycast address

4. Enter system view.
   system-view
5. Enter interface view.
   interface *interface-type interface-number*
6. Configure an IPv6 anycast address.
   ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* } **anycast**
   By default, no IPv6 anycast address is configured on an interface.

Configuring path MTU discovery

Setting the interface MTU for IPv6 packets

About interface MTU for IPv6 packets

If the size of a packet exceeds the MTU of the sending interface, the device discards the packet. If the device is an intermediate device, it also sends the source host an ICMPv6 Packet Too Big message with the MTU of the sending interface. The source host fragments the packets according to the MTU. To avoid this situation, set a proper interface MTU.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the interface MTU for IPv6 packets.
   ipv6 mtu *size*
   By default, no interface MTU is set.

Setting a static path MTU for an IPv6 address

About static path MTU for an IPv6 address

You can set a static path MTU for an IPv6 address. Before sending a packet to the IPv6 address, the device compares the output interface MTU with the static path MTU. If the packet size exceeds the

smaller one of the two values, the device fragments the packet according to the smaller value. After sending the fragmented packets, the device dynamically finds the path MTU to a destination host (see "IPv6 path MTU discovery").

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Set a static path MTU for an IPv6 address.
   ```
   ipv6 pathmtu ipv6-address value
   ```
   By default, no path MTU is set for any IPv6 address.

Setting the aging time for dynamic path MTUs

About the aging time for dynamic path MTUs

After the device dynamically discovers the path MTU to a destination host (see "IPv6 path MTU discovery"), it performs the following operations:

- Sends packets to the destination host based on this path MTU.
- Starts the aging timer for this path MTU.

When the aging timer expires, the device removes the dynamic path MTU and discovers the path MTU again.

Restrictions and guidelines

The aging time is invalid for a static path MTU.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Set the aging time for dynamic path MTUs.
   ```
   ipv6 pathmtu age age-time
   ```
   The default setting is 10 minutes.

Controlling sending ICMPv6 messages

Configuring the rate limit for ICMPv6 error messages

About the rate limit for ICMPv6 error messages

To avoid sending excessive ICMPv6 error messages within a short period that might cause network congestion, you can limit the rate at which ICMPv6 error messages are sent. A token bucket algorithm is used with one token representing one ICMPv6 error message.

A token is placed in the bucket at intervals until the maximum number of tokens that the bucket can hold is reached.

A token is removed from the bucket when an ICMPv6 error message is sent. When the bucket is empty, ICMPv6 error messages are not sent until a new token is placed in the bucket.

Procedure

1. Enter system view.
   ```
   system-view
   ```

2. Set the bucket size and the interval for tokens to arrive in the bucket for ICMPv6 error messages.

   ipv6 icmpv6 error-interval *interval* [*bucketsize*]

   By default, the bucket allows a maximum of 10 tokens. A token is placed in the bucket at an interval of 100 milliseconds.

   To disable the ICMPv6 rate limit, set the interval to 0 milliseconds.

Enabling replying to multicast echo requests

1. Enter system view.

   system-view

2. Enable replying to multicast echo requests.

   ipv6 icmpv6 multicast-echo-reply enable

   By default, this feature is disabled.

Enabling sending ICMPv6 destination unreachable messages

About sending ICMPv6 destination unreachable messages

The device sends the source the following ICMPv6 destination unreachable messages:

- **ICMPv6 No Route to Destination message**—A packet to be forwarded does not match any route.
- **ICMPv6 Communication with Destination Administratively Prohibited message**—An administrative prohibition is preventing successful communication with the destination. This is typically caused by a firewall or an ACL on the device.
- **ICMPv6 Beyond Scope of Source Address message**—The destination is beyond the scope of the source IPv6 address. For example, a packet's source IPv6 address is a link-local address, and its destination IPv6 address is a global unicast address.
- **ICMPv6 Address Unreachable message**—The device fails to resolve the link layer address for the destination IPv6 address of a packet.
- **ICMPv6 Port Unreachable message**—No port process on the destination device exists for a received UDP packet.

Restrictions and guidelines

An ICMPv6 destination unreachable message indicates that the destination is not reachable from the source device. Attackers can launch malicious attacks to make the device generate incorrect ICMPv6 destination unreachable messages, which will affect the function of the network. To protect the network from malicious attacks and decrease unnecessary network traffic, you can disable the sending of ICMPv6 destination unreachable messages.

Procedure

1. Enter system view.

   system-view

2. Enable sending ICMPv6 destination unreachable messages.

   ipv6 unreachables enable

   By default, this feature is disabled.

Enabling sending ICMPv6 time exceeded messages

About sending ICMPv6 time exceeded messages

The device sends the source ICMPv6 time exceeded messages as follows:

- If a received packet is not destined for the device and its hop limit is 1, the device sends an ICMPv6 hop limit exceeded in transit message to the source.
- Upon receiving the first fragment of an IPv6 datagram destined for the device, the device starts a timer. If the timer expires before all fragments arrive, the device sends an ICMPv6 fragment reassembly time exceeded message to the source.

Restrictions and guidelines

If the device receives large numbers of malicious packets, its performance degrades greatly because it must send back ICMP time exceeded messages. To prevent such attacks, disable sending ICMPv6 time exceeded messages.

Procedure

1. Enter system view.

   `system-view`
2. Enable sending ICMPv6 time exceeded messages.

   `ipv6 hoplimit-expires enable`

   By default, sending ICMPv6 time exceeded messages is enabled.

Enabling sending ICMPv6 redirect messages

About sending ICMPv6 redirect messages

Upon receiving a packet from a host, the device sends an ICMPv6 redirect message to inform the host of a better next hop when the following conditions are met:

- The interface receiving the packet is the interface forwarding the packet.
- The selected route is not created or modified by any ICMPv6 redirect messages.
- The selected route is not a default route.
- The forwarded packet does not contain the routing extension header.

The ICMPv6 redirect feature simplifies host management by enabling hosts that hold few routes to optimize their routing table gradually. However, to avoid adding too many routes on hosts, this feature is disabled by default.

Procedure

1. Enter system view.

   `system-view`
2. Enable sending ICMPv6 redirect messages.

   `ipv6 redirects enable`

   By default, sending ICMPv6 redirect messages is disabled.

Specifying the source IPv6 address for unsolicited ICMPv6 packets

About specifying the source IPv6 address for unsolicited ICMPv6 packets

Perform this task to specify the source IPv6 address for outgoing ping echo requests and ICMPv6 error messages. It is a good practice to specify the IPv6 address of a loopback interface as the source IPv6 address. This feature helps users easily locate the sending device.

Restrictions and guidelines

For ICMPv6 echo requests, the source IPv6 address specified in the **ping ipv6** command has higher priority than the source IPv6 address specified in the **ipv6 icmpv6 source** command.

Procedure

1. Enter system view.
   system-view
2. Specify a source IPv6 address for unsolicited ICMPv6 packets.
   ipv6 icmpv6 source *ipv6-address*
   By default, no source address is specified for unsolicited ICMPv6 packets.

Enabling IPv6 local fragment reassembly

About IPv6 local fragment reassembly

Use this feature on a multichassis IRF fabric to improve fragment reassembly efficiency. This feature enables a subordinate to reassemble the IPv6 fragments of a packet if all the fragments arrive at it. If this feature is disabled, all IPv6 fragments are delivered to the master device for reassembly.

Restrictions and guidelines

The IPv6 local fragment reassembly feature applies only to fragments destined for the same subordinate.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 local fragment reassembly.
   ipv6 reassemble local enable
   By default, IPv6 local fragment reassembly is disabled.

Display and maintenance commands for IPv6 basics

Execute **display** commands in any view and **reset** commands in user view.

For information about the **display tcp statistics**, **display udp statistics**, **reset tcp statistics**, and **reset udp statistics** command, see the IP performance commands in *Layer 3—IP Services Command Reference*.

Task	Command
Display IPv6 FIB entries.	**display ipv6 fib** [*ipv6-address*

Task	Command
	[*prefix-length*]]
Display ICMPv6 traffic statistics.	**display ipv6 icmp statistics** [**slot** *slot-number*]
Display IPv6 information about the interface.	**display ipv6 interface** [*interface-type* [*interface-number*]] [**brief**]
Display IPv6 prefix information about the interface.	**display ipv6 interface** *interface-type interface-number* **prefix**
Display the IPv6 path MTU information.	**display ipv6 pathmtu** { *ipv6-address* | { **all** | **dynamic** | **static** } [**count**] }
Display the IPv6 prefix information.	**display ipv6 prefix** [*prefix-number*]
Display brief information about IPv6 RawIP connections.	**display ipv6 rawip** [**slot** *slot-number*]
Display detailed information about IPv6 RawIP connections.	**display ipv6 rawip verbose** [**slot** *slot-number* [**pcb** *pcb-index*]]
Display IPv6 and ICMPv6 packet statistics.	**display ipv6 statistics** [**slot** *slot-number*]
Display brief information about IPv6 TCP connections.	**display ipv6 tcp** [**slot** *slot-number*]
Display detailed information about IPv6 TCP connections.	**display ipv6 tcp verbose** [**slot** *slot-number* [**pcb** *pcb-index*]]
Display brief information about IPv6 UDP connections.	**display ipv6 udp** [**slot** *slot-number*]
Display detailed information about IPv6 UDP connections.	**display ipv6 udp verbose** [**slot** *slot-number* [**pcb** *pcb-index*]]
Display IPv6 TCP traffic statistics.	**display tcp statistics** [**slot** *slot-number*]
Display IPv6 UDP traffic statistics.	**display udp statistics** [**slot** *slot-number*]
Clear path MTUs.	**reset ipv6 pathmtu** { **all** | **dynamic** | **static** }
Clear IPv6 and ICMPv6 packet statistics.	**reset ipv6 statistics** [**slot** *slot-number*]
Clear IPv6 TCP traffic statistics.	**reset tcp statistics**
Clear IPv6 UDP traffic statistics.	**reset udp statistics**

Basic IPv6 settings configuration examples

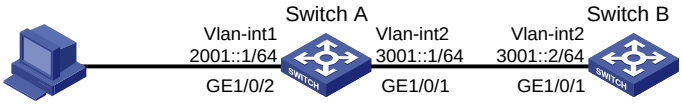
Example: Configuring basic IPv6 settings

Network configuration

As shown in Figure 4, a host, Switch A, and Switch B are connected through Ethernet ports. Add the Ethernet ports to corresponding VLANs. Configure IPv6 addresses for the VLAN interfaces and verify that they are connected. Switch B can reach the host.

Enable IPv6 on the host to automatically obtain an IPv6 address through IPv6 ND.

Figure 4 Network diagram



Procedure

This example assumes that the VLAN interfaces have been created on the switches.

1. Configure Switch A:

   # Specify a global unicast address for VLAN-interface 2.

   ```
   <SwitchA> system-view
   [SwitchA] interface vlan-interface 2
   [SwitchA-Vlan-interface2] ipv6 address 3001::1/64
   [SwitchA-Vlan-interface2] quit
   ```

   # Specify a global unicast address for VLAN-interface 1, and allow it to advertise RA messages (no interface advertises RA messages by default).

   ```
   [SwitchA] interface vlan-interface 1
   [SwitchA-Vlan-interface1] ipv6 address 2001::1/64
   [SwitchA-Vlan-interface1] undo ipv6 nd ra halt
   [SwitchA-Vlan-interface1] quit
   ```

2. Configure Switch B:

   # Configure a global unicast address for VLAN-interface 2.

   ```
   <SwitchB> system-view
   [SwitchB] interface vlan-interface 2
   [SwitchB-Vlan-interface2] ipv6 address 3001::2/64
   [SwitchB-Vlan-interface2] quit
   ```

   # Configure an IPv6 static route with destination IPv6 address 2001::/64 and next hop address 3001::1.

   ```
   [SwitchB] ipv6 route-static 2001:: 64 3001::1
   ```

3. Configure the host:

   Enable IPv6 for the host to automatically obtain an IPv6 address through IPv6 ND.

   # Display neighbor information for GigabitEthernet 1/0/2 on Switch A.

   ```
   [SwitchA] display ipv6 neighbors interface gigabitethernet 1/0/2
   Type: S-Static    D-Dynamic    O-Openflow     R-Rule    IS-Invalid static
   IPv6 address              MAC address    VID  Interface           State T  Aging
   FE80::215:E9FF:FEA6:7D14  0015-e9a6-7d14 1    GE1/0/2             STALE D  1238
   2001::15B:E0EA:3524:E791  0015-e9a6-7d14 1    GE1/0/2             STALE D  1248
   ```

   The output shows that the IPv6 global unicast address that Host obtained is 2001::15B:E0EA:3524:E791.

Verifying the configuration

Display the IPv6 interface settings on Switch A. All IPv6 global unicast addresses configured on the interface are displayed.

```
[SwitchA] display ipv6 interface vlan-interface 2
Vlan-interface2 current state: UP
Line protocol current state: UP
IPv6 is enabled, link-local address is FE80::20F:E2FF:FE00:2
  Global unicast address(es):
    3001::1, subnet is 3001::/64
```

```
  Joined group address(es):
    FF02::1
    FF02::2
    FF02::1:FF00:1
    FF02::1:FF00:2
  MTU is 1500 bytes
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND retransmit interval is 1000 milliseconds
  Hosts use stateless autoconfig for addresses

```

Ping Switch A and Switch B on the host, and ping Switch A and the host on Switch B to verify that they are connected.

NOTE:

When you ping a link-local address, use the **-i** parameter to specify an interface for the link-local address.

```
[SwitchB] ping ipv6 -c 1 3001::1
Ping6(56 data bytes) 3001::2 --> 3001::1, press CTRL_C to break
56 bytes from 3001::1, icmp_seq=0 hlim=64 time=4.404 ms

--- Ping6 statistics for 3001::1 ---
1 packet(s) transmitted, 1 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.404/4.404/4.404/0.000 ms
[SwitchB] ping ipv6 -c 1 2001::15B:E0EA:3524:E791
Ping6(56 data bytes) 3001::2 --> 2001::15B:E0EA:3524:E791, press CTRL_C to break
56 bytes from 2001::15B:E0EA:3524:E791, icmp_seq=0 hlim=64 time=5.404 ms

--- Ping6 statistics for 2001::15B:E0EA:3524:E791 ---
```

```
1 packet(s) transmitted, 1 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 5.404/5.404/5.404/0.000 ms
```

The output shows that Switch B can ping Switch A and the host. The host can also ping Switch B and Switch A.

Configuring IPv6 neighbor discovery

About IPv6 neighbor discovery

ICMPv6 messages used by IPv6 neighbor discovery

The IPv6 neighbor discovery (ND) process uses ICMP messages for address resolution, neighbor reachability verification, and neighboring device tracking.

Table 3 describes the ICMPv6 messages used by the IPv6 ND protocol.

Table 3 ICMPv6 messages used by ND

ICMPv6 message	Type	Function
Neighbor Solicitation (NS)	135	Acquires the link-layer address of a neighbor on the local link.
		Verifies the reachability of a neighbor.
		Detects duplicate addresses.
Neighbor Advertisement (NA)	136	Responds to an NS message.
		Notifies the neighboring nodes of link layer changes.
Router Solicitation (RS)	133	Requests an address prefix and other configuration information for autoconfiguration after startup.
Router Advertisement (RA)	134	Responds to an RS message.
		Advertises information, such as the Prefix Information options and flag bits.
Redirect	137	Informs the source host of a better next hop on the path to a particular destination when certain conditions are met.

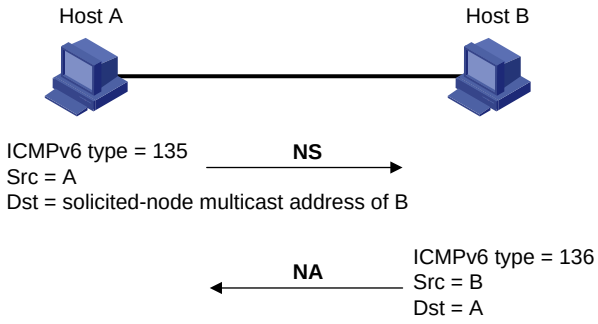
Address resolution

This function is similar to ARP in IPv4. An IPv6 node acquires the link-layer addresses of neighboring nodes on the same link through NS and NA messages.

Figure 5 shows how Host A acquires the link-layer address of Host B on the same link. The address resolution procedure is as follows:

1. Host A multicasts an NS message. The source address of the NS message is the IPv6 address of the sending interface of Host A. The destination address is the solicited-node multicast address of Host B. The NS message body contains the link-layer address of Host A and the target IPv6 address.
2. After receiving the NS message, Host B determines whether the target address of the packet is its IPv6 address. If it is, Host B learns the link-layer address of Host A, and then unicasts an NA message containing its link-layer address.
3. Host A acquires the link-layer address of Host B from the NA message.

Figure 5 Address resolution



Neighbor reachability detection

After Host A acquires the link-layer address of its neighbor Host B, Host A can use NS and NA messages to test the reachability of Host B as follows:

1. Host A sends an NS message whose destination address is the IPv6 address of Host B.
2. If Host A receives an NA message from Host B, Host A decides that Host B is reachable. Otherwise, Host B is unreachable.

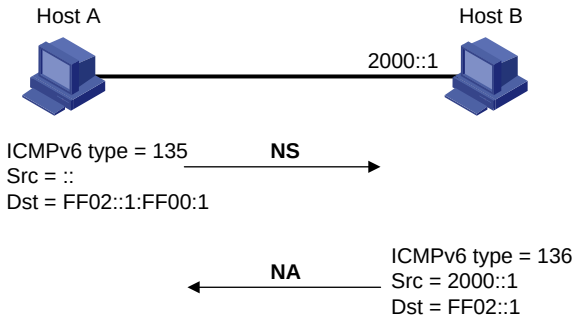
Duplicate address detection

After Host A acquires an IPv6 address, it performs Duplicate Address Detection (DAD) to check whether the address is being used by any other node. This is similar to gratuitous ARP in IPv4. DAD is accomplished through NS and NA messages.

The DAD procedure is as follows:

1. Host A sends an NS message. The source address is the unspecified address and the destination address is the corresponding solicited-node multicast address of the IPv6 address to be detected. The NS message body contains the detected IPv6 address.
2. If Host B uses this IPv6 address, Host B returns an NA message that contains its IPv6 address.
3. Host A knows that the IPv6 address is being used by Host B after receiving the NA message from Host B. If receiving no NA message, Host A decides that the IPv6 address is not in use and uses this address.

Figure 6 Duplicate address detection



Router/prefix discovery and stateless address autoconfiguration

Router/prefix discovery allows an IPv6 node to find the neighboring routers and learn the prefix and network configuration parameters of the network from receiving RA messages.

Stateless address autoconfiguration allows an IPv6 node to automatically generate an IPv6 address based on the information learned through router/prefix discovery.

A node performs router/prefix discovery and stateless address autoconfiguration as follows:

1. At startup, a node sends an RS message to request configuration information from a router.
2. The router returns an RA message containing the Prefix Information option and other configuration information. (The router also periodically sends an RA message.)
3. The node automatically generates an IPv6 address and other configuration parameters according to the configuration information in the RA message.

The Prefix Information option contains an address prefix and the preferred lifetime and valid lifetime of the address prefix. A node updates the preferred lifetime and valid lifetime upon receiving a periodic RA message.

The generated IPv6 address is valid within the valid lifetime and becomes invalid when the valid lifetime expires.

After the preferred lifetime expires, the node cannot use the generated IPv6 address to establish new connections, but can receive packets destined for the IPv6 address. The preferred lifetime cannot be greater than the valid lifetime.

Redirection

Upon receiving a packet from a host, the gateway sends an ICMPv6 redirect message to inform the host of a better next hop when the following conditions are met:

- The interface receiving the packet is the same as the interface forwarding the packet.
- The selected route is not created or modified by an ICMPv6 redirect message.
- The selected route is not a default route on the device.
- The forwarded IPv6 packet does not contain the routing extension header.

Protocols and standards

- RFC 4861, *Neighbor Discovery for IP Version 6 (IPv6)*
- RFC 4862, *IPv6 Stateless Address Autoconfiguration*
- RFC 8106, *IPv6 Router Advertisement Options for DNS Configuration*

IPv6 neighbor discovery tasks at a glance

All IPv6 neighbor discovery tasks are optional.

- Configuring ND entry related features
  - Configuring a static neighbor entry
  - Setting the dynamic neighbor learning limit on an interface
  - Setting the aging timer for ND entries in stale state
  - Minimizing link-local ND entries
- Setting the hop limit

- Configuring RA message sending and parameters
- Setting the maximum number of attempts to send an NS message for DAD
- Configuring ND snooping
  - Configuring ND snooping in a VLAN
- Enabling ND proxy
- Configuring user information recording
  - Enabling recording user IPv6 address conflicts
  - Enabling recording user port migrations
  - Enabling ND logging for user online and offline events

Configuring a static neighbor entry

About static neighbor entries

A neighbor entry stores information about a link-local node. The entry can be created dynamically through NS and NA messages, or configured statically.

The device uniquely identifies a static neighbor entry by using the neighbor's IPv6 address and the number of the Layer 3 interface that connects to the neighbor. You can configure a static neighbor entry by using one of the following methods:

- **Method 1**—Associate a neighbor's IPv6 address and link-layer address with the local Layer 3 interface.
- **Method 2**—Associate a neighbor's IPv6 address and link-layer address with a Layer 2 port in a VLAN.

Restrictions and guidelines

You can use either of the methods to configure a static neighbor entry for a VLAN interface.

- If you use Method 1, the device is required to resolve the Layer 2 port in the related VLAN.
- If you use Method 2, make sure the Layer 2 port belongs to the specified VLAN and the corresponding VLAN interface already exists. After the configuration, the device associates the VLAN interface with the neighbor IPv6 address to identify the static neighbor entry.

Procedure

1. Enter system view.

   system-view

2. Configure a static neighbor entry.

   ipv6 neighbor *ipv6-address mac-address* { *vlan-id port-type port-number* | **interface** *interface-type interface-number* }

   By default, no static neighbor entries exist.

Setting the dynamic neighbor learning limit on an interface

About the dynamic neighbor learning limit on an interface

The device can dynamically acquire the link-layer address of a neighboring node through NS and NA messages and add it into the neighbor table. When the number of dynamic neighbor entries reaches the limit, the interface stops learning neighbor information.

This feature limits the neighbor table size. A large neighbor table will degrade the forwarding performance.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the dynamic neighbor learning limit on the interface.

   ipv6 neighbors max-learning-num *max-number*

   The default setting varies by device model. For more information about the default values for the *max-number* argument, see this command in the command reference.

Setting the aging timer for ND entries in stale state

About the aging timer for ND entries in stale state

ND entries in stale state have an aging timer. If an ND entry in stale state is not refreshed before the timer expires, the ND entry changes to the delay state. If it is still not refreshed in 5 seconds, the ND entry changes to the probe state, and the device sends an NS message three times. If no response is received, the device deletes the ND entry.

Restrictions and guidelines

You can set the aging timer for ND entries in stale state in system view and interface view. For ND entries in stale state on an interface, the aging timer in interface view has higher priority than the aging timer in system view.

Procedure

1. Enter system view.

   system-view

2. Set the aging timer for ND entries in stale state.
   - Set the aging timer for ND entries in stale state in system view.

     ipv6 neighbor stale-aging *aging-time*

     The default setting is 240 minutes.
   - Execute the following commands in sequence to set the aging timer in interface view.

     interface *interface-type interface-number*

     ipv6 neighbor timer stale-aging *aging-time*

     By default, the aging timer of ND entries in stale state is not configured on an interface. The aging timer is determined by the configuration of the **ipv6 neighbor stale-aging** command in system view.

Minimizing link-local ND entries

About minimizing link-local ND entries

Perform this task to minimize link-local ND entries assigned to the hardware. Link-local ND entries refer to ND entries that contain link-local addresses.

By default, the device assigns all ND entries to the hardware. With this feature enabled, the newly learned link-local ND entries are not assigned to the hardware if the link-local addresses of the entries are not the next hops of any routes. This feature saves hardware resources.

This feature takes effect only on newly learned link-local ND entries.

Procedure

1. Enter system view.
   system-view
2. Minimize link-local ND entries.
   ipv6 neighbor link-local minimize
   By default, the device assigns all ND entries to the hardware.

Setting the hop limit

About hop limit

You can set the hop limit value to fill in the Hop Limit field for IPv6 packets to be sent.

Procedure

1. Enter system view.
   system-view
2. Set the value for the Hop Limit field in the IP header.
   ipv6 hop-limit *value*
   The default setting is 64.

Configuring RA message sending and parameters

About RA message parameters

You can enable an interface to send RA messages, and configure the interval for sending RA messages and parameters in RA messages. After receiving an RA message, a host can use these parameters to perform corresponding operations. Table 4 describes the configurable parameters in an RA message.

Table 4 Parameters in an RA message and their descriptions

Parameter	Description
Hop Limit	Maximum number of hops in RA messages. A host receiving the RA message fills the value in the Hop Limit field of sent IPv6 packets.
Prefix information	After receiving the prefix information, the hosts on the same link can perform stateless autoconfiguration.
MTU	Guarantees that all nodes on the link use the same MTU.
Boot file URL	Specifies the URL address for downloading the boot file in RA messages. The device can use the ND protocol to obtain both the IPv6 address and the boot file URL for automatic configuration instead of using DHCPv6.
M flag	Determines whether a host uses stateful autoconfiguration to obtain an IPv6 address. If the M flag is set to 1, the host uses stateful autoconfiguration (for example, from a DHCPv6 server) to obtain an IPv6 address. Otherwise, the host uses stateless autoconfiguration to generate an IPv6 address according to its link-layer address and the prefix information in the RA message.
O flag	Determines whether a host uses stateful autoconfiguration to obtain configuration information other than the IPv6 address.

Parameter	Description
	If the O flag is set to 1, the host uses stateful autoconfiguration (for example, from a DHCPv6 server) to obtain configuration information other than the IPv6 address. Otherwise, the host uses stateless autoconfiguration.
Router Lifetime	Tells the receiving hosts how long the advertising router can live. If the lifetime of a router is 0, the router cannot be used as the default gateway.
Retrans Timer	If the device does not receive a response message within the specified time after sending an NS message, it retransmits the NS message.
Reachable Time	If the neighbor reachability detection shows that a neighbor is reachable, the device considers the neighbor reachable within the specified reachable time. If the device needs to send a packet to the neighbor after the specified reachable time expires, the device reconfirms whether the neighbor is reachable.
Router Preference	Specifies the router preference in an RA message. A host selects a router as the default gateway according to the router preference. If router preferences are the same, the host selects the router from which the first RA message is received.
DNS server option	DNS server information for IPv6 hosts. Hosts can obtain DNS server information from received RA messages instead of using DHCPv6.
DNS suffix information in DNS Search List (DNSSL) option	DNS suffix information for IPv6 hosts. Hosts can obtain DNS suffix information from received RA messages instead of using DHCPv6.

Restrictions and guidelines

The maximum interval for sending RA messages should be less than (or equal to) the router lifetime in RA messages. In this way, the router can be updated by an RA message before expiration.

The values of the NS retransmission timer and the reachable time configured for an interface are sent in RA messages to hosts. This interface sends NS messages at the interval of the NS retransmission timer and considers a neighbor reachable within the reachable time.

Enabling the sending of RA messages

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable the sending of RA messages.

   undo ipv6 nd ra halt

   The default setting is disabled.
4. Set the maximum and minimum intervals for sending RA messages.

   ipv6 nd ra interval *max-interval min-interval*

   By default, the maximum interval for sending RA messages is 600 seconds, and the minimum interval is 200 seconds.

   The device sends RA messages at random intervals between the maximum interval and the minimum interval.

   The minimum interval should be less than or equal to 0.75 times the maximum interval.

Configuring parameters for RA messages

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the prefix information in RA messages.

   ipv6 nd ra prefix { *ipv6-prefix prefix-length* | *ipv6-prefix*/*prefix-length* } [*valid-lifetime preferred-lifetime* [**no-autoconfig** | **off-link** | **prefix-preference** *level*] * | **no-advertise**]

   By default, no prefix information is configured for RA messages, and the IPv6 address of the interface sending RA messages is used as the prefix information. If the IPv6 address is manually configured, the prefix uses a fixed valid lifetime of 2592000 seconds (30 days) and a preferred lifetime of 604800 seconds (7 days). If the IPv6 address is automatically obtained, the prefix uses the valid lifetime and preferred lifetime configured for the IPv6 address.

4. Configure the default settings for prefixes advertised in RA messages.

   ipv6 nd ra prefix default [*valid-lifetime preferred-lifetime* [**no-autoconfig** | **off-link**] * | **no-advertise**]

   By default, no default settings are configured for prefixes advertised in RA messages.

5. Turn off the MTU option in RA messages.

   ipv6 nd ra no-advlinkmtu

   By default, RA messages contain the MTU option.

6. Specify unlimited hops in RA messages.

   ipv6 nd ra hop-limit unspecified

   By default, the maximum number of hops in RA messages is 64.

7. Specify the URL of the boot file in RA messages.

   ipv6 nd ra boot-file-url *url-string*

   By default, RA messages do not carry the URL of the boot file.

8. Set the M flag bit to 1.

   ipv6 nd autoconfig managed-address-flag

   By default, the M flag bit is set to 0 in RA advertisements. Hosts receiving the advertisements will obtain IPv6 addresses through stateless autoconfiguration.

9. Set the O flag bit to 1.

   ipv6 nd autoconfig other-flag

   By default, the O flag bit is set to 0 in RA advertisements. Hosts receiving the advertisements will acquire other configuration information through stateless autoconfiguration.

10. Set the router lifetime in RA messages.

    ipv6 nd ra router-lifetime *time*

    By default, the router lifetime is three times as long as the maximum interval for advertising RA messages.

11. Set the NS retransmission timer.

    ipv6 nd ns retrans-timer *value*

    By default, an interface sends NS messages every 1000 milliseconds, and the value of the Retrans Timer field in RA messages is 0.

12. Set the router preference in RA messages.

ipv6 nd router-preference { **high** | **low** | **medium** }

By default, the router preference is medium.

13. Set the reachable time.

ipv6 nd nud reachable-time *time*

By default, the neighbor reachable time is 1200000 milliseconds, and the value of the Reachable Time field in sent RA messages is 0.

Specifying DNS server information in RA messages

About specifying DNS server information in RA messages

The DNS server options in RA messages provide DNS server information for IPv6 hosts. The RA messages allow hosts to obtain their IPv6 addresses and the DNS server through stateless autoconfiguration. This method is useful in a network where DHCPv6 infrastructure is not provided.

One DNS server option contains one DNS server. All DNS server options are sorted in ascending order of the DNS server sequence number.

After you execute the **ipv6 nd ra dns server** command, the device immediately sends an RA message with the existing and newly specified DNS server information.

After you execute the **undo ipv6 nd ra dns server** command, the device immediately sends two RA messages.

- The first RA message carries information about all DNS servers, including the DNS servers specified in the **undo** command with their lifetime set to 0 seconds.
- The second RA message carries information about remaining DNS servers.

Each time the device sends an RA message from an interface, it immediately refreshes the RA message advertisement interval for that interface.

Restrictions and guidelines

You can configure a maximum of eight DNS servers on an interface.

The default lifetime of a DNS server is three times the maximum interval for advertising RA messages. To set the maximum interval, use the **ipv6 nd ra interval** command.

Procedure

1. Enter system view.

system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Specify DNS server information to be advertised in RA messages.

ipv6 nd ra dns server *ipv6-address* [*seconds* | **infinite**] **sequence** *seqno*

By default, no DNS server information is specified and RA messages do not carry DNS server options.

Specifying DNS suffix information in RA messages

About specifying DNS suffix information in RA messages

The DNSSL option in RA messages provides suffix information for IPv6 hosts. The RA messages allow hosts to obtain their IPv6 addresses and the DNS suffix through stateless autoconfiguration. This method is useful in a network where DHCPv6 infrastructure is not provided.

One DNSSL option contains one DNS suffix. All DNSSL options are sorted in ascending order of the sequence number of the DNS suffix.

After you execute the **ipv6 nd ra dns search-list** command, the device immediately sends an RA message with the existing and newly specified DNS suffix information.

After you execute the **undo ipv6 nd ra dns search-list** command, the device immediately sends two RA messages.

- The first RA message carries information about all DNS suffixes, including DNS suffixes specified in the **undo** command with their lifetime set to 0 seconds.
- The second RA message carries information about remaining DNS suffixes.

Each time the device sends an RA message from an interface, it immediately refreshes the RA message advertisement interval for that interface.

Restrictions and guidelines

You can configure a maximum of eight DNS suffixes on an interface.

The default lifetime of a DNS suffix is three times the maximum interval for advertising RA messages. To set the maximum interval, use the **ipv6 nd ra interval** command.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Specify DNS suffix information to be advertised in RA messages.

   ipv6 nd ra dns search-list *domain-name* [*seconds* | **infinite**] **sequence** *seqno*

   By default, no DNS suffix information is specified and RA messages do not carry DNS suffix options.

Suppressing advertising DNS information in RA messages

About suppressing advertising DNS information in RA messages

Perform this task to suppress the device from advertising information about DNS server addresses and DNS suffixes in RA messages.

Whether enabling this feature on an interface will trigger sending RA message immediately for DNS server update depends on the interface configuration:

- If the interface has been configured with DNS server information or has obtained an AAA-authorized DNS server address, the device immediately sends two RA messages. In the first message, the lifetime for DNS server addresses is 0 seconds. The second RA message does not carry any DNS server options.
- If the interface has no DNS server information specified or no AAA-authorized DNS server address assigned, no RA messages are triggered.
- If you specify a new DNS server or remove a DNS server, the device immediately sends an RA message without any DNS server address options.

Whether disabling this feature on an interface will trigger sending RA message immediately for DNS server update depends on the interface configuration:

- If the interface has been configured with the DNS server information or has obtained an AAA-authorized DNS server address, the device immediately sends an RA message carrying the DNS server information.

- If the interface has no DNS server information specified or no AAA-authorized DNS server address assigned, no RA messages are triggered.

Each time the device sends an RA message from an interface, it immediately refreshes the RA message advertisement interval for that interface.

The same suppression mechanism applies when you enable or disable DNS suffix suppression in RA messages.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable DNS server suppression in RA messages.
   ipv6 nd ra dns server suppress
   By default, DNS server suppression in RA messages is disabled.
4. Enable DNS suffix suppression in RA messages.
   ipv6 nd ra dns search-list suppress
   By default, DNS suffix suppression in RA messages is disabled.

Setting the maximum number of attempts to send an NS message for DAD

About the maximum number of attempts to send an NS message for DAD

An interface sends an NS message for DAD for an obtained IPv6 address. The interface resends the NS message if it does not receive a response within the time specified by the **ipv6 nd ns retrans-timer** command. If the interface receives no response after making the maximum attempts specified by the **ipv6 nd dad attempts** command, the interface uses the IPv6 address.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the number of attempts to send an NS message for DAD.
   ipv6 nd dad attempts *times*
   The default setting is 1. When the *times* argument is set to 0, DAD is disabled.

Configuring ND snooping in a VLAN

About ND snooping in a VLAN

The ND snooping feature is used in Layer 2 switching networks. It learns the source MAC addresses, source IPv6 addresses, input interfaces, and VLANs of arriving ND messages and data packets to build the ND snooping table.

ND snooping entries can be used by ND detection to prevent spoofing attacks.

ND detection processes the ND messages received on ND trusted and untrusted interfaces as follows:

- ND detection forwards all ND messages received on an ND trusted interface.
- ND detection compares all ND messages received on an ND untrusted interface with the ND snooping entries except for RA and redirect messages.

You can use the **ipv6 nd detection trust** command to specify a Layer 2 Ethernet or aggregate port as an ND trusted interface. For more information about the **ipv6 nd detection trust** command, see *Security Command Reference*.

ND snooping entries can be used by IPv6 source guard to prevent spoofing attacks. For more information about IPv6 source guard, see *Security Configuration Guide*.

ND snooping provides device liveness tracking so that the ND snooping table can be updated in a timely manner. After ND snooping is enabled for a VLAN, the device uses the following mechanisms to create, update, and delete ND snooping entries. The following example uses ND messages for illustration.

Creation of ND snooping entries

Upon receiving an ND message or data packet from an unknown source, the device creates an ND snooping entry in INVALID status and performs DAD for the source IPv6 address. The device sends NS messages out of the ND trusted interfaces in the receiving VLAN twice. The sending interval is set by the **ipv6 nd snooping dad retrans-timer** command.

- If the device does not receive an NA message within the invalid entry lifetime (set by the **ipv6 nd snooping lifetime invalid** command), the entry becomes valid.
- If the device receives an NA message within the invalid entry lifetime, it deletes this entry.

Updating of ND snooping entries

When the ND untrusted interface that receives an ND message is different from that in the entry for an IPv6 address, the device performs DAD for the entry. It sends NS messages twice. The sending interval is set by the **ipv6 nd snooping dad retrans-timer** command.

- If the device does not receive an NA message within the invalid entry lifetime, it updates the entry with the new receiving interface.
- If the device receives an NA message within the invalid entry lifetime, the ND snooping entry remains unchanged.

Deletion of ND snooping entries

- When an ND trusted interface in the VLAN receives an ND message from the IPv6 address in a learned ND snooping entry, it performs DAD for the entry. The device sends NS messages twice. The sending interval is set by the **ipv6 nd snooping dad retrans-timer** command.
  - If the device does not receive an NA message within the invalid entry lifetime, it deletes the entry.
  - If the device receives an NA message within the invalid entry lifetime, the ND snooping entry remains unchanged.
- If an ND snooping entry has no matching ND messages within the valid entry lifetime (set by the **ipv6 nd snooping lifetime valid** command), the entry becomes invalid. The device then performs DAD for the entry by sending NS messages out of the interface in the entry twice. The sending interval is set by the **ipv6 nd snooping dad retrans-timer** command.
  - If the device does not receive an NA message within the invalid entry lifetime, it deletes the entry.
  - If the device receives an NA message within the invalid entry lifetime, the ND snooping entry remains unchanged and becomes valid.

Enabling ND snooping

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable ND snooping for IPv6 addresses. Choose the options to configure as needed:
   - Enable ND snooping for global unicast addresses.
     ipv6 nd snooping enable global
   - Enable ND snooping for link-local addresses.
     ipv6 nd snooping enable link-local

   By default, ND snooping is disabled for IPv6 global unicast addresses and link-local addresses.
4. (Optional.) Enable ND snooping for data packets from unknown sources.
   ipv6 nd snooping glean source

   By default, ND snooping is disabled for data packets from unknown sources.

   Before executing this command for a VLAN, you must configure IPv6 source guard on all untrusted interfaces in the same VLAN. This operation ensures correct forwarding of the data packets received by all these interfaces.
5. Return to system view.
   quit

Setting the maximum number of ND snooping entries

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
3. (Optional.) Set the maximum number of ND snooping entries that an interface can learn.
   ipv6 nd snooping max-learning-num *max-number*

   By default, an interface can learn a maximum of 1024 ND snooping entries.

Configuring ND snooping entry related parameters

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
3. (Optional.) Configure the port as an ND snooping uplink port. The ND snooping uplink port cannot learn ND snooping entries.
   ipv6 nd snooping uplink

   By default, the port is not an ND snooping uplink port. After ND snooping is enabled, the port can learn ND snooping entries.
4. Return to system view.
   quit
5. (Optional.) Set timeout timers for ND snooping entries.

ipv6 nd snooping lifetime { **invalid** *invalid-lifetime* | **valid** *valid-lifetime* }

The default settings are as follows:

- The timeout timer for ND snooping entries in INVALID status (TENTATIVE, TESTING_TPLT, or TESTING_VP) is 500 milliseconds.
- The timeout timer for ND snooping entries in VALID status is 300 seconds.

6. (Optional.) Set the interval for retransmitting an NS message for DAD.

   ipv6 nd snooping dad retrans-timer *interval*

   The default value is 250 milliseconds.

Enabling ND proxy

About ND proxy

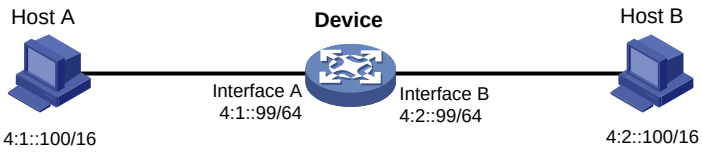
ND proxy enables a device to answer an NS message requesting the hardware address of a host on another network. With ND proxy, hosts in different broadcast domains can communicate with each other as they would on the same network.

ND proxy includes common ND proxy and local ND proxy.

Common ND proxy

As shown in Figure 7, Interface A with IPv6 address 4:1::99/64 and Interface B with IPv6 address 4:2::99/64 belong to different subnets. Host A and Host B reside on the same network but in different broadcast domains.

Figure 7 Application environment of ND proxy



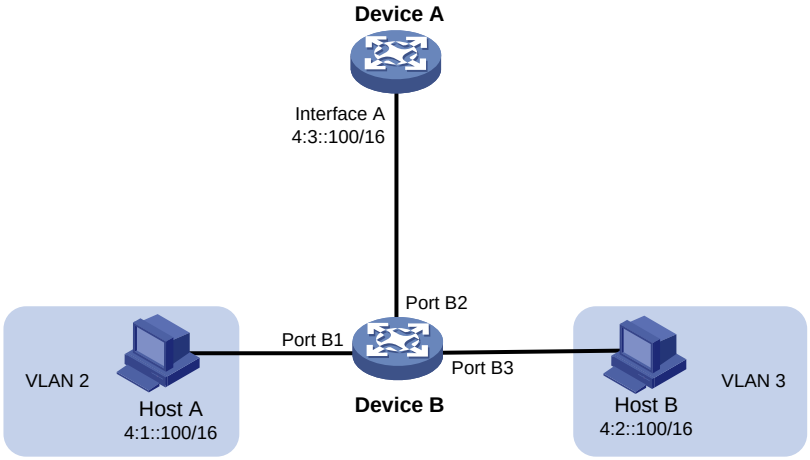
Because Host A's IPv6 address is on the same subnet as Host B's, Host A directly sends an NS message to obtain Host B's MAC address. However, Host B cannot receive the NS message because they belong to different broadcast domains.

To solve this problem, enable common ND proxy on Interface A and Interface B of the device. The device replies to the NS message from Host A, and forwards packets from other hosts to Host B.

Local ND proxy

As shown in Figure 8, Host A belongs to VLAN 2 and Host B belongs to VLAN 3. Host A and Host B connect to Port B1 and Port B3, respectively.

Figure 8 Application environment of local ND proxy



Because Host A's IPv6 address is on the same subnet as Host B's, Host A directly sends an NS message to obtain Host B's MAC address. However, Host B cannot receive the NS message because they belong to different VLANs.

To solve this problem, enable local ND proxy on Interface A of Device A so that Device A can forward messages between Host A and Host B.

Local ND proxy implements Layer 3 communication for two hosts in the following cases:

- The two hosts connect to ports of the same device and the ports must be in different VLANs.
- The two hosts connect to isolated Layer 2 ports in the same isolation group of a VLAN.
- If Private VLAN is used, the two hosts must belong to different secondary VLANs.

Enabling common ND proxy

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable common ND proxy.
   `proxy-nd enable`
   By default, common ND proxy is disabled.

Enabling local ND proxy

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable local ND proxy.
   `local-proxy-nd enable`
   By default, local ND proxy is disabled.

Enabling recording user IPv6 address conflicts

About recording user IPv6 address conflicts

This feature detects and records user IPv6 address conflicts. A conflict occurs if an incoming NA packet has the same source IP address as an existing ND entry but a different source MAC address. The device generates a user IPv6 address conflict record, logs the conflict, and sends the log to the information center. For information about the log destination and output rule configuration in the information center, see the information center in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enable recording user IPv6 address conflicts.
   ```
   ipv6 nd user-ip-conflict record enable
   ```
   By default, recording user IPv6 address conflicts is disabled.

Enabling recording user port migrations

About recording user port migrations

This feature enables the device to detect and record user port migrations. A user port migrates if an incoming NA packet has the same source IPv6 address and source MAC address as an existing ND entry but a different ingress port. The device generates a user port migration record, logs the migration event, and sends the log to the information center. For information about the log destination and output rule configuration in the information center, see the information center in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enable recording user port migrations.
   ```
   ipv6 nd user-move record enable
   ```
   By default, recording user port migrations is disabled.

Enabling ND logging for user online and offline events

About ND logging for user online and offline events

This feature enables the device to generate user online or offline logs upon such events and send these logs to the information center. For information about the log destination and output rule configuration in the information center, see the information center in *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

A higher log output rate consumes more CPU resources. Adjust the log output rate based the CPU performance and usage.

Procedure

1. Enter system view.

system-view

2. Enable ND logging for user online and offline events.
   ipv6 nd online-offline-log enable [**rate** *rate*]
   By default, ND logging for user online and offline events is disabled.

Display and maintenance commands for IPv6 ND

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the number of IPv6 ND snooping entries in VLANs.	**display ipv6 nd snooping count vlan** [**interface** *interface-type interface-number*]
Display IPv6 ND snooping entries in VLANs.	**display ipv6 nd snooping vlan** [[*vlan-id* | **interface** *interface-type interface-number*] [**global** | **link-local**] | *ipv6-address*] [**verbose**]
Display user IPv6 address conflict records.	**display ipv6 nd user-ip-conflict record** [**slot** *slot-number*]
Display user port migration records.	**display ipv6 nd user-move record** [**slot** *slot-number*]
Display the total number of neighbor entries.	**display ipv6 neighbors** { { **all** | **dynamic** | **static** } [**slot** *slot-number*] | **interface** *interface-type interface-number* | **vlan** *vlan-id* } **count**
Display neighbor information.	**display ipv6 neighbors** { { *ipv6-address* | **all** | **dynamic** | **static** } [**slot** *slot-number*] | **interface** *interface-type interface-number* | **vlan** *vlan-id* } [**verbose**]
Display the maximum number of ND entries that a device supports.	**display ipv6 neighbors entry-limit**
Clear IPv6 ND snooping entries in a VLAN.	**reset ipv6 nd snooping vlan** { [*vlan-id*] [**global** | **link-local**] | *vlan-id ipv6-address* }
Clear IPv6 neighbor information.	**reset ipv6 neighbors** { **all** | **dynamic** | **interface** *interface-type interface-number* | **slot** *slot-number* | **static** }

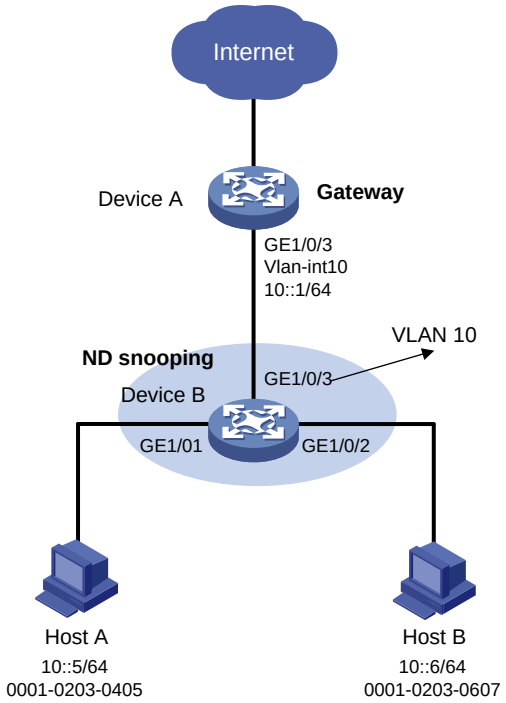
IPv6 ND configuration examples

Example: Configuring ND snooping

Network configuration

As shown in Figure 9, Host A and Host B are connected to the gateway through Device B. Enable ND snooping on Device B to learn ND snooping entries about Host A and Host B.

Figure 9 Network diagram



Procedure

1. Configure Device A:

   # Create VLAN 10.

   ```
   <DeviceA> system-view
   [DeviceA] vlan 10
   [DeviceA-vlan10] quit
   ```

   # Configure GigabitEthernet 1/0/3 to trunk VLAN 10.

   ```
   [DeviceA] interface gigabitethernet 1/0/3
   [DeviceA-GigabitEthernet1/0/3] port link-type trunk
   [DeviceA-GigabitEthernet1/0/3] port trunk permit vlan 10
   [DeviceA-GigabitEthernet1/0/3] quit
   ```

   # Assign IPv6 address 10::1/64 to VLAN-interface 10.

   ```
   [DeviceA] interface vlan-interface 10
   [DeviceA-Vlan-interface10] ipv6 address 10::1/64
   [DeviceA-Vlan-interface10] quit
   ```

2. Configure Device B:

   # Create VLAN 10.

   ```
   [DeviceB] vlan 10
   [DeviceB-vlan10] quit
   ```

   # Configure GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 to trunk VLAN 10.

   ```
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] port link-type access
   [DeviceB-GigabitEthernet1/0/1] port access vlan 10
   [DeviceB-GigabitEthernet1/0/1] quit
   [DeviceB] interface gigabitethernet 1/0/2
   ```

```
[DeviceB-GigabitEthernet1/0/2] port link-type access
[DeviceB-GigabitEthernet1/0/2] port access vlan 10
[DeviceB-GigabitEthernet1/0/2] quit
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] port link-type trunk
[DeviceB-GigabitEthernet1/0/3] port trunk permit vlan 10
[DeviceB-GigabitEthernet1/0/3] quit
```

Enable ND snooping for global unicast addresses and link-local addresses in VLAN 10.

```
[DeviceB] vlan 10
[DeviceB-vlan10] ipv6 nd snooping enable global
[DeviceB-vlan10] ipv6 nd snooping enable link-local
```

Enable ND snooping for data packets from unknown sources in VLAN 10.

```
[DeviceB-vlan10] ipv6 nd snooping glean source
[DeviceB-vlan10] quit
```

Configure GigabitEthernet 1/0/3 as ND trusted interface.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] ipv6 nd detection trust
[DeviceB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/1 to learn a maximum number of 200 ND snooping entries.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipv6 nd snooping max-learning-num 200
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 to learn a maximum number of 200 ND snooping entries.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] ipv6 nd snooping max-learning-num 200
[DeviceB-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Verify that Device B has learned ND snooping entries for Host A and Host B.

```
[DeviceB] display ipv6 nd snooping vlan 10
IPv6 address              MAC address     VID  Interface     Status       Age
10::5                     0001-0203-0405  10   GE1/0/1       VALID        157
10::6                     0001-0203-0607  10   GE1/0/2       VALID        105
```

Contents

DHCPv6 overview

DHCPv6 provides a framework to assign IPv6 prefixes, IPv6 addresses, and other configuration parameters to hosts.

DHCPv6 address/prefix assignment

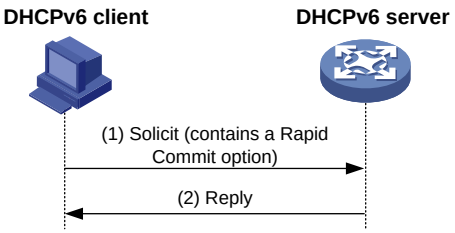
An address/prefix assignment process involves two or four messages.

Rapid assignment involving two messages

As shown in Figure 1, rapid assignment operates in the following steps:

1. The DHCPv6 client sends to the DHCPv6 server a Solicit message that contains a Rapid Commit option to prefer rapid assignment.
2. If the DHCPv6 server supports rapid assignment, it responds with a Reply message containing the assigned IPv6 address/prefix and other configuration parameters. If the DHCPv6 server does not support rapid assignment, Assignment involving four messages is performed.

Figure 1 Rapid assignment involving two messages

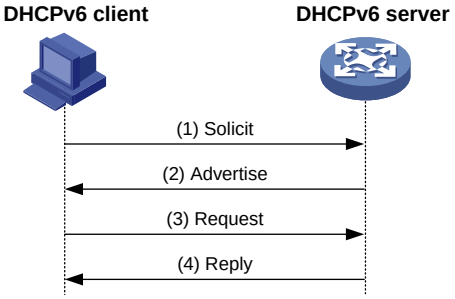


Assignment involving four messages

As shown in Figure 2, four-message assignment operates using the following steps:

1. The DHCPv6 client sends a Solicit message to request an IPv6 address/prefix and other configuration parameters.
2. The DHCPv6 server responds with an Advertise message that contains the assignable address/prefix and other configuration parameters if either of the following conditions exists:
   - The Solicit message does not contain a Rapid Commit option.
   - The DHCPv6 server does not support rapid assignment even though the Solicit message contains a Rapid Commit option.
3. The DHCPv6 client might receive multiple Advertise messages offered by different DHCPv6 servers. It selects an offer according to the receiving sequence and server priority, and sends a Request message to the selected server for confirmation.
4. The DHCPv6 server sends a Reply message to the client, confirming that the address/prefix and other configuration parameters are assigned to the client.

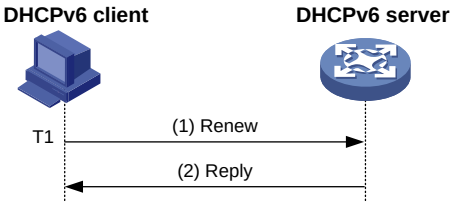
Figure 2 Assignment involving four messages



Address/prefix lease renewal

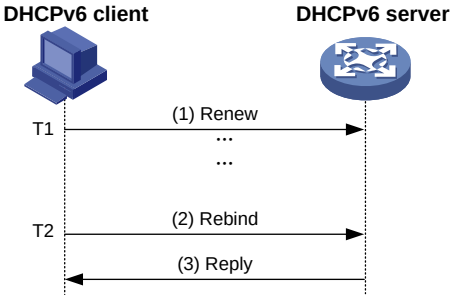
An IPv6 address/prefix assigned by a DHCPv6 server has a valid lifetime. After the valid lifetime expires, the DHCPv6 client cannot use the IPv6 address/prefix. To use the IPv6 address/prefix, the DHCPv6 client must renew the lease time.

Figure 3 Using the Renew message for address/prefix lease renewal



As shown in Figure 3, at T1, the DHCPv6 client sends a Renew message to the DHCPv6 server. The recommended value of T1 is half the preferred lifetime. The DHCPv6 server responds with a Reply message, informing the client whether the lease is renewed.

Figure 4 Using the Rebind message for address/prefix lease renewal



As shown in Figure 4:

- If the DHCPv6 client does not receive a response from the DHCPv6 server after sending a Renew message at T1, it multicasts a Rebind message to all DHCPv6 servers at T2. Typically, the value of T2 is 0.8 times the preferred lifetime.
- The DHCPv6 server responds with a Reply message, informing the client whether the lease is renewed.
- If the DHCPv6 client does not receive a response from any DHCPv6 server before the valid lifetime expires, the client stops using the address/prefix.

For more information about the valid lifetime and the preferred lifetime, see "Configuring basic IPv6 settings."

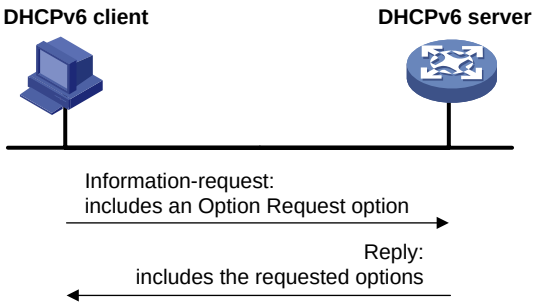
Stateless DHCPv6

Stateless DHCPv6 enables a device that has obtained an IPv6 address/prefix to get other configuration parameters from a DHCPv6 server.

The device performs stateless DHCPv6 if an RA message with the following flags is received from the router during stateless address autoconfiguration:

- The managed address configuration flag (M flag) is set to 0.
- The other stateful configuration flag (O flag) is set to 1.

Figure 5 Stateless DHCPv6 operation



As shown in Figure 5, stateless DHCPv6 operates in the following steps:

1. The DHCPv6 client sends an Information-request message to the multicast address of all DHCPv6 servers and DHCPv6 relay agents. The Information-request message contains an Option Request option that specifies the requested configuration parameters.
2. The DHCPv6 server returns to the client a Reply message containing the requested configuration parameters.
3. The client checks the Reply message. If the obtained configuration parameters match those requested in the Information-request message, the client uses these parameters to complete configuration. If not, the client ignores the configuration parameters. If the client receives multiple replies with configuration parameters matching those requested in the Information-request message, it uses the first received reply.

DHCPv6 options

Option 18

Option 18, also called the interface-ID option, is used by the DHCPv6 relay agent to determine the interface to use to forward RELAY-REPLY message.

The DHCPv6 snooping device adds Option 18 to the received DHCPv6 request message before forwarding it to the DHCPv6 server. The server then assigns IP address to the client based on the client information in Option 18.

Figure 6 Option 18 format

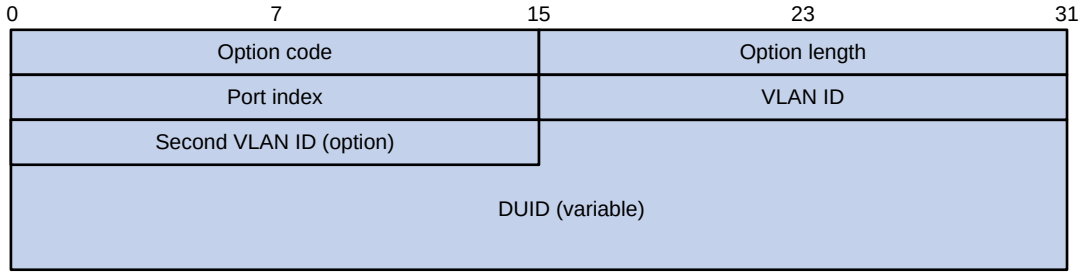


Figure 6 shows the Option 18 format, which includes the following fields:

- **Option code**—Option code. The value is 18.
- **Option length**—Size of the option data.
- **Port index**—Port that receives the DHCPv6 request from the client.
- **VLAN ID**—ID of the outer VLAN.
- **Second VLAN ID**—ID of the inner VLAN. This field is optional. If the received DHCPv6 request does not contain a second VLAN, Option 18 also does not contain it.
- **DUID**—DUID of the DHCPv6 client.

Option 37

Option 37, also called the remote-ID option, is used to identify the client.

The DHCPv6 snooping device adds Option 37 to the received DHCPv6 request message before forwarding it to the DHCPv6 server. This option provides client information about address allocation.

Figure 7 Option 37 format

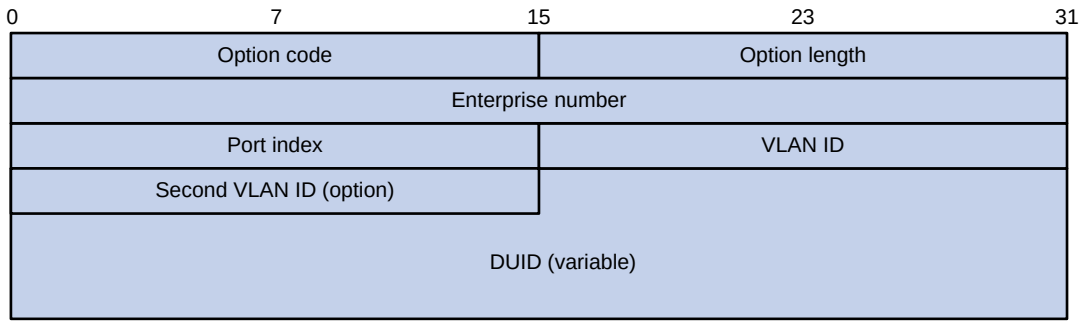

Figure 7 shows the Option 37 format, which includes the following fields:

- **Option code**—Option code. The value is 37.
- **Option length**—Size of the option data.
- **Enterprise number**—Enterprise number.
- **Port index**—Port that receives the DHCPv6 request from the client.
- **VLAN ID**—ID of the outer VLAN.
- **Second VLAN ID**—ID of the inner VLAN. This field is optional. If the received DHCPv6 request does not contain a second VLAN, Option 37 also does not contain it.
- **DUID**—DUID of the DHCPv6 client.

Option 79

Option 79, also called the client link-layer address option, is used to record the MAC address of the DHCPv6 client. The first relay agent that a DHCPv6 request passes learns the MAC address of the client and encapsulates this address into Option 79 in the Relay-Forward message for the request. The DHCPv6 server verifies the client or assigns IPv6 address/prefix to the client based on the MAC address of the client.

Figure 8 Option 79 format

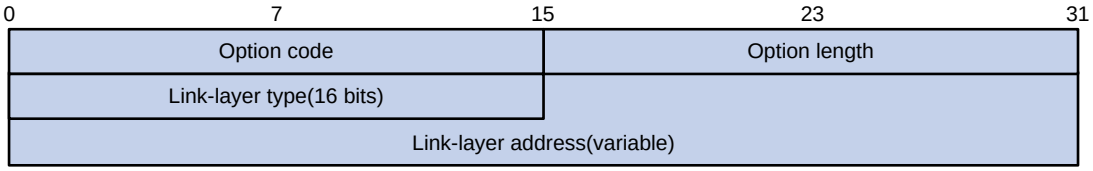

Figure 8 shows the Option 79 format, which includes the following fields:

- **Option code**—Option code. The value is 79.
- **Option length**—Size of the option data.
- **Link-layer type**—Link-layer address type of the client.
- **Link-layer address**—Link-layer address of the client.

Protocols and standards

- RFC 3736, *Stateless Dynamic Host Configuration Protocol (DHCP) Service for IPv6*
- RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*
- RFC 2462, *IPv6 Stateless Address Autoconfiguration*
- RFC 3633, *IPv6 Prefix Options for Dynamic Host Configuration Protocol (DHCP) version 6*
- RFC 6939, *Client Link-Layer Address Option in DHCPv6*

Configuring the DHCPv6 server

About DHCPv6 server

A DHCPv6 server can assign IPv6 addresses, IPv6 prefixes, and other configuration parameters to DHCPv6 clients.

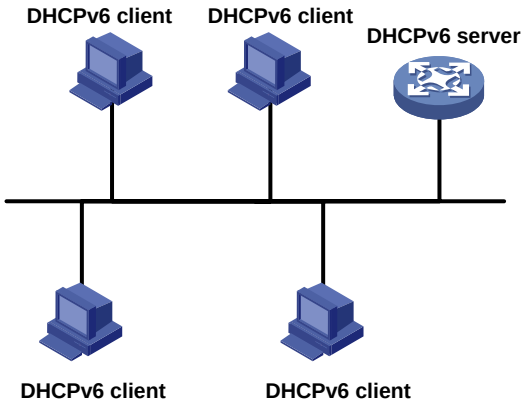
IPv6 address assignment

As shown in Figure 9, the DHCPv6 server assigns IPv6 addresses, domain name suffixes, DNS server addresses, and other configuration parameters to DHCPv6 clients.

The IPv6 addresses assigned to the clients include the following types:

- **Temporary IPv6 addresses**—Frequently changed without lease renewal.
- **Non-temporary IPv6 addresses**—Correctly used by DHCPv6 clients, with lease renewal.

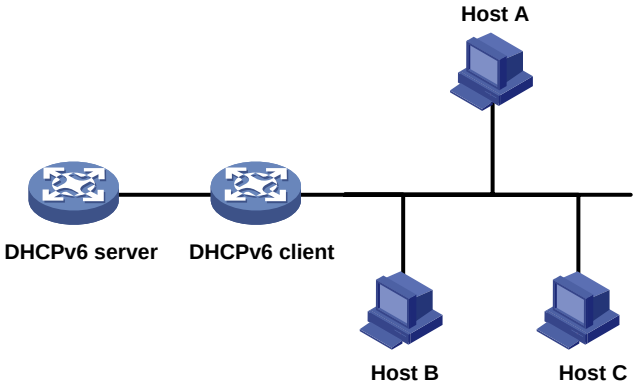
Figure 9 IPv6 address assignment



IPv6 prefix assignment

As shown in Figure 10, the DHCPv6 server assigns an IPv6 prefix to the DHCPv6 client. The client advertises the prefix information in a multicast RA message so that hosts on the subnet can automatically configure their IPv6 addresses by using the prefix.

Figure 10 IPv6 prefix assignment



Concepts

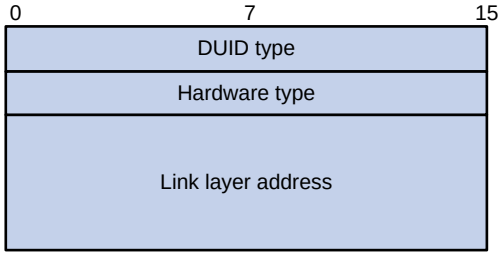
Multicast addresses used by DHCPv6

DHCPv6 uses the multicast address FF05::1:3 to identify all site-local DHCPv6 servers. It uses the multicast address FF02::1:2 to identify all link-local DHCPv6 servers and relay agents.

DUID

A DHCP unique identifier (DUID) uniquely identifies a DHCPv6 device (DHCPv6 client, server, or relay agent). A DHCPv6 device adds its DUID in a sent packet.

Figure 11 DUID-LL format



The device supports the DUID format based on link-layer address (DUID-LL) defined in RFC 3315. Figure 11 shows the DUID-LL format, which includes the following fields:

- **DUID type**—The device supports the DUID type of DUID-LL with the value of 0x0003.
- **Hardware type**—The device supports the hardware type of Ethernet with the value of 0x0001.
- **Link layer address**—Takes the value of the bridge MAC address of the device.

IA

Identified by an IAID, an identity association (IA) provides a construct through which a client manages the obtained addresses, prefixes, and other configuration parameters. A client can have multiple IAs, for example, one for each of its interfaces.

IAID

An IAID uniquely identifies an IA. It is chosen by the client and must be unique on the client.

PD

The DHCPv6 server creates a prefix delegation (PD) for each assigned prefix to record the following details:

- IPv6 prefix.
- Client DUID.
- IAID.
- Valid lifetime.
- Preferred lifetime.
- Lease expiration time.
- IPv6 address of the requesting client.

DHCPv6 address pool

The DHCP server selects IPv6 addresses, IPv6 prefixes, and other parameters from an address pool, and assigns them to the DHCP clients.

Address allocation mechanisms

DHCPv6 supports the following address allocation mechanisms:

- **Static address allocation**—To implement static address allocation for a client, create a DHCPv6 address pool, and manually bind the DUID and IAID of the client to an IPv6 address in the DHCPv6 address pool. When the client requests an IPv6 address, the DHCPv6 server assigns the IPv6 address in the static binding to the client.
- **Dynamic address allocation**—To implement dynamic address allocation for clients, create a DHCPv6 address pool, specify a subnet for the pool, and divide the subnet into temporary and non-temporary IPv6 address ranges. Upon receiving a DHCP request, the DHCPv6 server selects an IPv6 address from the temporary or non-temporary IPv6 address range based on the address type in the client request.

Prefix allocation mechanisms

DHCPv6 supports the following prefix allocation mechanisms:

- **Static prefix allocation**—To implement static prefix allocation for a client, create a DHCPv6 address pool, and manually bind the DUID and IAID of the client to an IPv6 prefix in the DHCPv6 address pool. When the client requests an IPv6 prefix, the DHCPv6 server assigns the IPv6 prefix in the static binding to the client.
- **Dynamic prefix allocation**—To implement dynamic prefix allocation for clients, create a DHCPv6 address pool and a prefix pool, specify a subnet for the address pool, and apply the prefix pool to the address pool. Upon receiving a DHCP request, the DHCPv6 server dynamically selects an IPv6 prefix from the prefix pool in the address pool.

Address pool selection

The DHCPv6 server observes the following principles when selecting an IPv6 address or prefix for a client:

1. If there is an address pool where an IPv6 address is statically bound to the DUID or IAID of the client, the DHCPv6 server selects this address pool. It assigns the statically bound IPv6 address or prefix and other configuration parameters to the client.
2. If the receiving interface has a DHCP policy and the DHCP client matches a user class, the DHCP server selects the address pool that is bound to the matching user class. If no matching user class is found, the server assigns an IP address and other parameters from the default DHCP address pool. If no default address pool is specified or the default address pool does not have assignable IP addresses, the address assignment fails.
3. If the receiving interface has an address pool applied, the DHCP server selects an IPv6 address or prefix and other configuration parameters from this address pool.
4. If the above conditions are not met, the DHCPv6 server selects an address pool depending on the client location.
    - **Client on the same subnet as the server**—The DHCPv6 server compares the IPv6 address of the receiving interface with the subnets of all address pools. It selects the address pool with the longest-matching subnet.
    - **Client on a different subnet than the server**—The DHCPv6 server compares the IPv6 address of the DHCPv6 relay agent interface closest to the client with the subnets of all address pools. It also selects the address pool with the longest-matching subnet.

    To make sure IPv6 address allocation functions correctly, keep the subnet used for dynamic assignment consistent with the subnet where the interface of the DHCPv6 server or DHCPv6 relay agent resides.

IPv6 address/prefix allocation sequence

The DHCPv6 server selects an IPv6 address/prefix for a client in the following sequence:

1. IPv6 address/prefix statically bound to the client's DUID and IAID and expected by the client.

2. IPv6 address/prefix statically bound to the client's DUID and IAID.
3. IPv6 address/prefix statically bound to the client's DUID and expected by the client.
4. IPv6 address/prefix statically bound to the client's DUID.
5. EUI-64 IPv6 address generated based on the client MAC address if EUI-64 address allocation is enabled.
6. Assignable IPv6 address/prefix in the address pool/prefix pool expected by the client.
7. IPv6 address/prefix that was ever assigned to the client.
8. Assignable IPv6 address/prefix in the address pool/prefix pool.
9. IPv6 address/prefix that was a conflict or passed its lease duration. If no IPv6 address/prefix is assignable, the server does not respond.

If a client moves to another subnet, the DHCPv6 server selects an IPv6 address/prefix from the address pool that matches the new subnet.

Conflicted IPv6 addresses can be assigned to other DHCPv6 clients only after the addresses are in conflict for one hour.

Restrictions: Hardware compatibility with DHCPv6 server

S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 do not support the DHCPv6 server functionality.

DHCPv6 server tasks at a glance

To configure the DHCPv6 server, perform the following tasks:

1. Configuring the DHCPv6 server to assign IPv6 prefixes, IPv6 addresses, and other network parameters

   Choose the following tasks as needed:

   - Configuring IPv6 prefix assignment
   - Configuring IPv6 address assignment
   - Configuring network parameters assignment
2. Modifying the address pool selection method on the DHCPv6 server

   Choose the following tasks as needed:

   - Configuring the DHCPv6 server on an interface
   - Configuring a DHCPv6 policy for IPv6 address and prefix assignment
3. (Optional.) Setting the DSCP value for DHCPv6 packets sent by the DHCPv6 server
4. (Optional.) Configuring DHCPv6 binding auto backup
5. (Optional.) Enabling the DHCPv6 server to advertise IPv6 prefixes
6. (Optional.) Enabling DHCPv6 logging on the DHCPv6 server

Configuring IPv6 prefix assignment

About IPv6 prefix assignment

Use the following methods to configure IPv6 prefix assignment:

- **Configure a static IPv6 prefix binding in an address pool**—If you bind a DUID and an IAID to an IPv6 prefix, the DUID and IAID in a request must match those in the binding before the

DHCPv6 server can assign the IPv6 prefix to the DHCPv6 client. If you only bind a DUID to an IPv6 prefix, the DUID in the request must match the DUID in the binding before the DHCPv6 server can assign the IPv6 prefix to the DHCPv6 client.

- **Apply a prefix pool to an address pool**—The DHCPv6 server dynamically assigns an IPv6 prefix from the prefix pool in the address pool to a DHCPv6 client.

Restrictions and guidelines

When you configure IPv6 prefix assignment, follow these restrictions and guidelines:

- An IPv6 prefix can be bound to only one DHCPv6 client. You cannot modify bindings that have been created. To change the binding for a DHCPv6 client, you must delete the existing binding first.
- One address pool can have only one prefix pool applied. You cannot modify prefix pools that have been applied. To change the prefix pool for an address pool, you must remove the prefix pool application first.
- You can apply a prefix pool that has not been created to an address pool. The setting takes effect after the prefix pool is created.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Specify the IPv6 prefixes excluded from dynamic assignment.

   ipv6 dhcp server forbidden-prefix *start-prefix*/*prefix-len* [*end-prefix*/*prefix-len*]

   By default, no IPv6 prefixes in the prefix pool are excluded from dynamic assignment.

   If the excluded IPv6 prefix is in a static binding, the prefix still can be assigned to the client.

3. Create a prefix pool.

   ipv6 dhcp prefix-pool *prefix-pool-number* **prefix** { *prefix-number* | *prefix*/*prefix-len* } **assign-len** *assign-len*

   This step is required for dynamic prefix assignment.

   If you specify an IPv6 prefix by its ID, make sure the IPv6 prefix is in effect. Otherwise, the configuration does not take effect.

4. Enter DHCP address pool view.

   ipv6 dhcp pool *pool-name*

5. Specify an IPv6 subnet for dynamic assignment.

   network { *prefix/prefix-length* | **prefix** *prefix-number* [*sub-prefix/sub-prefix-length*] } [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

   By default, no IPv6 subnet is specified for dynamic assignment.

   The IPv6 subnets cannot be the same in different address pools.

   If you specify an IPv6 prefix by its ID, make sure the IPv6 prefix is in effect. Otherwise, the configuration does not take effect.

6. Configure the prefix assignment. Choose the options to configure as needed:

   - Configure a static prefix binding:

     static-bind prefix *prefix*/*prefix-len* **duid** *duid* [**iaid** *iaid*] [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

     By default, no static prefix binding is configured.

     To add multiple static IPv6 prefix bindings, repeat this step.

   - Apply the prefix pool to the address pool:

prefix-pool *prefix-pool-number* [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

By default, static or dynamic prefix assignment is not configured for an address pool.

Configuring IPv6 address assignment

About IPv6 address assignment

Use one of the following methods to configure IPv6 address assignment:

- Configure a static IPv6 address binding in an address pool.

  If you bind a DUID and an IAID to an IPv6 address, the DUID and IAID in a request must match those in the binding before the DHCPv6 server can assign the IPv6 address to the requesting client. If you only bind a DUID to an IPv6 address, the DUID in a request must match the DUID in the binding before the DHCPv6 server can assign the IPv6 address to the requesting client.
- Specify a subnet and address ranges in an address pool.
  - **Non-temporary address assignment**—The server selects addresses from the non-temporary address range specified by the **address range** command. If no non-temporary address range is specified, the server selects addresses on the subnet specified by the **network** command.
  - **Temporary address assignment**—The server selects addresses from the temporary address range specified by the **temporary address range** command. If no temporary address range is specified in the address pool, the DHCPv6 server cannot assign temporary addresses to clients.

Restrictions and guidelines

- You can specify only one non-temporary address range and one temporary address range in an address pool.
- The address ranges specified by the **address range** and **temporary address range** commands must be on the subnet specified by the **network** command. Otherwise, the addresses are unassignable.
- An IPv6 address can be bound to only one DHCPv6 client. You cannot modify bindings that have been created. To change the binding for a DHCPv6 client, you must delete the existing binding first.
- Only one subnet can be specified in an address pool. If you use the **network** command multiple times in a DHCPv6 address pool, the most recent configuration takes effect. If you use this command to specify only new lifetimes, the settings do not affect existing leases. The IPv6 addresses assigned after the modification will use the new lifetimes.

Procedure

1. Enter system view.

   system-view
2. (Optional.) Specify the IPv6 addresses excluded from dynamic assignment.

   ipv6 dhcp server forbidden-address *start-ipv6-address* [*end-ipv6-address*]

   By default, all IPv6 addresses except for the DHCPv6 server's IP address in a DHCPv6 address pool are assignable.

   If the excluded IPv6 address is in a static binding, the address still can be assigned to the client.
3. Enter DHCPv6 address pool view.

   ipv6 dhcp pool *pool-name*
4. Specify an IPv6 subnet for dynamic assignment.

network { *prefix/prefix-length* | **prefix** *prefix-number* [*sub-prefix/sub-prefix-length*] } [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

By default, no IPv6 address subnet is specified.

The IPv6 subnets cannot be the same in different address pools.

If you specify an IPv6 prefix by its ID, make sure the IPv6 prefix is in effect. Otherwise, the configuration does not take effect.

5. (Optional.) Specify a non-temporary IPv6 address range.

   address range *start-ipv6-address end-ipv6-address* [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

   By default, no non-temporary IPv6 address range is specified, and all unicast addresses on the subnet are assignable.

6. (Optional.) Specify a temporary IPv6 address range.

   temporary address range *start-ipv6-address end-ipv6-address* [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

   By default, no temporary IPv6 address range is specified, and the DHCPv6 server cannot assign temporary IPv6 addresses.

7. (Optional.) Enable EUI-64 address allocation mode.

   address-alloc-mode eui-64

   By default, EUI-64 address allocation mode is disabled.

   This feature enables the DHCPv6 server to obtain the client MAC address in the DHCP request and generates an EUI-64 IPv6 address to assign to the client.

8. (Optional.) Create a static binding.

   static-bind address *ipv6-address*/*addr-prefix-length* **duid** *duid* [**iaid** *iaid*] [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]

   By default, no static binding is configured.

   To add more static bindings, repeat this step.

Configuring network parameters assignment

About network parameters assignment

In addition to IPv6 prefixes and IPv6 addresses, you can configure the following network parameters in an address pool:

- A maximum of eight DNS server addresses.
- One domain name.
- A maximum of eight SIP server addresses.
- A maximum of eight SIP server domain names.

You can configure network parameters on a DHCPv6 server by using one of the following methods:

- Configure network parameters in a DHCPv6 address pool.
- Configure network parameters in a DHCPv6 option group, and specify the option group for a DHCPv6 address pool.

Network parameters configured in a DHCPv6 address pool take precedence over those configured in a DHCPv6 option group.

Configuring network parameters in a DHCPv6 address pool

1. Enter system view.
   system-view
2. Enter DHCPv6 address pool view.
   ipv6 dhcp pool *pool-name*
3. Specify an IPv6 subnet for dynamic assignment.
   network { *prefix/prefix-length* | **prefix** *prefix-number* [*sub-prefix/sub-prefix-length*] } [**preferred-lifetime** *preferred-lifetime* **valid-lifetime** *valid-lifetime*]
   By default, no IPv6 subnet is specified.
   The IPv6 subnets cannot be the same in different address pools.
   If you specify an IPv6 prefix by its ID, make sure the IPv6 prefix is in effect. Otherwise, the configuration does not take effect.
4. Specify a DNS server address.
   dns-server *ipv6-address*
   By default, no DNS server address is specified.
5. Specify a domain name.
   domain-name *domain-name*
   By default, no domain name is specified.
6. Specify a SIP server address or domain name.
   sip-server { **address** *ipv6-address* | **domain-name** *domain-name* }
   By default, no SIP server address or domain name is specified.
7. Configure a self-defined DHCPv6 option.
   option *code* **hex** *hex-string*
   By default, no self-defined DHCPv6 option is configured.

Configuring network parameters in a DHCPv6 option group

About network parameters assignment in a DHCPv6 option group

A DHCPv6 option group can be created by using the following methods:

- Create a static DHCPv6 option group by using the **ipv6 dhcp option-group** command. The static DHCPv6 option group takes precedence over the dynamic DHCPv6 option group.
- When the device acts as a DHCPv6 client, it automatically creates a dynamic DHCPv6 option group for saving the obtained parameters. For more information about creating a dynamic DHCPv6 option group, see "Configuring the DHCPv6 client."

Procedure

1. Enter system view.
   system-view
2. Create a static DHCPv6 option group and enter its view.
   ipv6 dhcp option-group *option-group-number*
3. Specify a DNS server address.
   dns-server *ipv6-address*
   By default, no DNS server address is specified.
4. Specify a domain name suffix.

domain-name *domain-name*

By default, no domain name suffix is specified.

5. Specify a SIP server address or domain name.

   sip-server { **address** *ipv6-address* | **domain-name** *domain-name* }

   By default, no SIP server address or domain name is specified.

6. Configure a self-defined DHCPv6 option.

   option *code* **hex** *hex-string*

   By default, no self-defined DHCPv6 option is configured.

7. Return to system view.

   quit

8. Enter DHCPv6 address pool view.

   ipv6 dhcp pool *pool-name*

9. Specify a DHCPv6 option group.

   option-group *option-group-number*

   By default, no DHCPv6 option group is specified.

Configuring the DHCPv6 server on an interface

About configuring the DHCPv6 server on an interface

Enable the DHCP server and configure one of the following address/prefix assignment methods on an interface:

- **Apply an address pool on the interface**—The DHCPv6 server selects an IPv6 address/prefix from the applied address pool for a requesting client. If there is no assignable IPv6 address/prefix in the address pool, the DHCPv6 server cannot assign an IPv6 address/prefix to a client.
- **Configure global address assignment on the interface**—The DHCPv6 server selects an IPv6 address/prefix in the global DHCPv6 address pool that matches the server interface address or the DHCPv6 relay agent address for a requesting client.

If you configure both methods on an interface, the DHCPv6 server uses the specified address pool for address assignment without performing global address assignment.

Restrictions and guidelines

- An interface cannot act as a DHCPv6 server and DHCPv6 relay agent at the same time.
- Do not enable DHCPv6 server and DHCPv6 client on the same interface.
- You can apply an address pool that has not been created to an interface. The setting takes effect after the address pool is created.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the DHCPv6 server on the interface.

   ipv6 dhcp select server

   By default, the interface does not act as a DHCP server or a DHCP relay agent, and discards DHCPv6 packets from DHCPv6 clients.

4. Configure an assignment method.

- Configure global address assignment.

  ipv6 dhcp server { **allow-hint** | **preference** *preference-value* | **rapid-commit** } *

  By default, desired address/prefix assignment and rapid assignment are disabled, and the default preference is 0.
- Apply a DHCPv6 address pool to the interface.

  ipv6 dhcp server apply pool *pool-name* [**allow-hint** | **preference** *preference-value* | **rapid-commit**] *

Configuring a DHCPv6 policy for IPv6 address and prefix assignment

About DHCPv6 policy for IPv6 address and prefix assignment

In a DHCPv6 policy, each DHCPv6 user class has a bound DHCPv6 address pool. Clients matching different user classes obtain IPv6 addresses, IPv6 prefixes, and other parameters from different address pools. When receiving a DHCPv6 request, the DHCPv6 server compares the packet against the user classes in the order that they are configured.

If a match is found and the bound address pool has assignable IPv6 addresses or prefixes, the server uses the address pool for assignment. If the bound address pool does not have assignable IPv6 addresses or prefixes, the assignment fails.

If no match is found, the server uses the default DHCPv6 address pool for assignment. If no default address pool is specified or the default address pool does not have assignable IPv6 addresses or prefixes, the assignment fails.

For successful assignment, make sure the applied DHCPv6 policy and the bound address pools exist.

A match rule cannot match an option added by the DHCPv6 device, for example, Option 18 or Option 37.

Procedure

1. Enter system view.

   system-view
2. Create a DHCPv6 user class and enter DHCPv6 user class view.

   ipv6 dhcp class *class-name*
3. Configure a match rule for the DHCPv6 user class.

   if-match rule *rule-number* { **option** *option-code* [**ascii** *ascii-string* [**offset** *offset* | **partial**] | **hex** *hex-string* [**mask** *mask* | **offset** *offset* **length** *length* | **partial**]] | **relay-agent** *gateway-ipv6-address* }

   By default, no match rule is configured for a DHCPv6 user class.
4. Return to system view.

   quit
5. Create a DHCPv6 policy and enter DHCPv6 policy view.

   ipv6 dhcp policy *policy-name*

   The DHCPv6 policy takes effect only after it is applied to the interface that acts as the DHCPv6 server.
6. Specify a DHCPv6 address pool for a DHCPv6 user class.

   class *class-name* **pool** *pool-name*

   By default, no address pool is specified for a user class.

7. (Optional.) Specify the default DHCPv6 address pool.

   default pool *pool-name*

   By default, the default address pool is not specified.
8. Return to system view.

   quit
9. Enter interface view.

   interface *interface-type interface-number*
10. Apply the DHCPv6 policy to the interface.

    ipv6 dhcp apply-policy *policy-name*

    By default, no DHCPv6 policy is applied to an interface.

Setting the DSCP value for DHCPv6 packets sent by the DHCPv6 server

About setting the DSCP value for DHCPv6 packets sent by the DHCPv6 server

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet.

Procedure

1. Enter system view.

   system-view
2. Set the DSCP value for DHCPv6 packets sent by the DHCPv6 server.

   ipv6 dhcp dscp *dscp-value*

   By default, the DSCP value in DHCPv6 packets sent by the DHCPv6 server is 56.

Configuring DHCPv6 binding auto backup

About DHCPv6 binding auto backup

The auto backup feature saves DHCPv6 bindings to a backup file, and allows the DHCPv6 server to download the bindings from the backup file at the server reboot. The bindings include the lease bindings and conflicted IPv6 addresses. They cannot survive a reboot on the DHCPv6 server.

The DHCPv6 server does not provide services during the download process. If a connection error occurs during the process and cannot be repaired in a short amount of time, you can terminate the download operation. Manual interruption allows the DHCPv6 server to provide services without waiting for the connection to be repaired.

Procedure

1. Enter system view.

   system-view
2. Configure the DHCPv6 server to back up the bindings to a file.

   ipv6 dhcp server database filename { *filename* | **url** *url* [**username** *username* [**password** { **cipher** | **simple** } *string*]] }

   By default, the DHCPv6 server does not back up the DHCPv6 bindings.

   With this command executed, the DHCPv6 server backs up its bindings immediately and runs auto backup.
3. (Optional.) Manually save the DHCPv6 bindings to the backup file.

ipv6 dhcp server database update now

4. (Optional.) Set the waiting time after a DHCPv6 binding change for the DHCPv6 server to update the backup file.

   ipv6 dhcp server database update interval *interval*

   By default, the DHCP server waits 300 seconds to update the backup file after a DHCP binding change. If no DHCP binding changes, the backup file is not updated.

5. (Optional.) Terminate the download of DHCPv6 bindings from the backup file.

   ipv6 dhcp server database update stop

   This command only triggers one termination.

Enabling the DHCPv6 server to advertise IPv6 prefixes

About IPv6 prefixes advertisement

A DHCPv6 client can obtain an IPv6 prefix through DHCPv6 and use this IPv6 prefix to assign IPv6 addresses for clients in a downstream network. If the IPv6 prefix is in a different subnet than the IPv6 address of the DHCPv6 client's upstream interface, the clients in the downstream network cannot access the external network. If the DHCPv6 server is on the same link as the DHCPv6 client, enable the DHCPv6 server to advertise the IPv6 prefix.

Procedure

1. Enter system view.

   system-view

2. Enable the DHCPv6 server to advertise IPv6 prefixes.

   ipv6 dhcp advertise pd-route

   By default, the DHCPv6 server does not advertise IPv6 prefixes.

Enabling DHCPv6 logging on the DHCPv6 server

About DHCPv6 server logging

The DHCPv6 logging feature enables the DHCPv6 server to generate DHCPv6 logs and send them to the information center. The information helps administrators locate and solve problems. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

As a best practice, disable this feature if the log generation affects the device performance or reduces the address and prefix allocation efficiency. For example, this situation might occur when a large number of clients frequently come online or go offline.

Procedure

1. Enter system view.

   system-view

2. Enable DHCPv6 logging.

   ipv6 dhcp log enable

   By default, DHCPv6 logging is disabled.

Display and maintenance commands for DHCPv6 server

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the DUID of the local device.	**display ipv6 dhcp duid**
Display information about a DHCPv6 option group.	**display ipv6 dhcp option-group** [*option-group-number*]
Display DHCPv6 address pool information.	**display ipv6 dhcp pool** [*pool-name*]
Display prefix pool information.	**display ipv6 dhcp prefix-pool** [*prefix-pool-number*]
Display DHCPv6 server information on an interface.	**display ipv6 dhcp server** [**interface** *interface-type interface-number*]
Display information about IPv6 address conflicts.	**display ipv6 dhcp server conflict** [**address** *ipv6-address*]
Display information about DHCPv6 binding auto backup	**display ipv6 dhcp server database**
Display information about expired IPv6 addresses.	**display ipv6 dhcp server expired** [**address** *ipv6-address* | **pool** *pool-name*]
Display information about IPv6 address bindings.	**display ipv6 dhcp server ip-in-use** [**address** *ipv6-address* | **pool** *pool-name*]
Display information about IPv6 prefix bindings.	**display ipv6 dhcp server pd-in-use** [**pool** *pool-name* | [**prefix** *prefix/prefix-len*]]
Display packet statistics on the DHCPv6 server.	**display ipv6 dhcp server statistics** [**pool** *pool-name*]
Clear information about IPv6 address conflicts.	**reset ipv6 dhcp server conflict** [**address** *ipv6-address*]
Clear information about expired IPv6 address bindings.	**reset ipv6 dhcp server expired** [**address** *ipv6-address* | **pool** *pool-name*]
Clear information about IPv6 address bindings.	**reset ipv6 dhcp server ip-in-use** [**address** *ipv6-address* | **pool** *pool-name*]
Clear information about IPv6 prefix bindings.	**reset ipv6 dhcp server pd-in-use** [**pool** *pool-name* | **prefix** *prefix/prefix-len*]
Clear packets statistics on the DHCPv6 server.	**reset ipv6 dhcp server statistics**

DHCPv6 server configuration examples

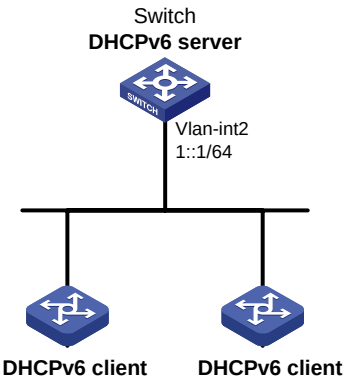
Example: Configuring dynamic IPv6 prefix assignment

Network configuration

As shown in Figure 12, the switch acts as a DHCPv6 server to assign an IPv6 prefix, a DNS server address, a domain name, a SIP server address, and a SIP server name to each DHCPv6 client.

The switch assigns prefix 2001:0410:0201::/48 to the client whose DUID is 00030001CA0006A40000, and assigns prefixes in the range of 2001:0410::/48 to 2001:0410:FFFF::/48 (excluding 2001:0410:0201::/48) to other clients. The DNS server address is 2::2:3. The DHCPv6 clients reside in the domain **aaa.com**. The SIP server address is 2:2::4, and the SIP server name is **bbb.com**.

Figure 12 Network diagram



Procedure

Specify an IPv6 address for VLAN-interface 2.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ipv6 address 1::1/64
```

Disable RA message suppression on VLAN-interface 2.

```
[Switch-Vlan-interface2] undo ipv6 nd ra halt
```

Set the M flag to 1 in RA advertisements to be sent on VLAN-interface 2. Hosts that receive the RA advertisements will obtain IPv6 addresses through DHCPv6.

```
[Switch-Vlan-interface2] ipv6 nd autoconfig managed-address-flag
```

Set the O flag to 1 in RA advertisements to be sent on VLAN-interface 2. Hosts that receive the RA advertisements will obtain information other than IPv6 address through DHCPv6.

```
[Switch-Vlan-interface2] ipv6 nd autoconfig other-flag
[Switch-Vlan-interface2] quit
```

Create prefix pool 1, and specify the prefix 2001:0410::/32 with the assigned prefix length 48.

```
[Switch] ipv6 dhcp prefix-pool 1 prefix 2001:0410::/32 assign-len 48
```

Create address pool 1.

```
[Switch] ipv6 dhcp pool 1
```

In address pool 1, configure subnet 1::/64 where VLAN interface-2 resides.

```
[Switch-dhcp6-pool-1] network 1::/64
```

Apply prefix pool 1 to address pool 1, and set the preferred lifetime to one day, and the valid lifetime to three days.

```
[Switch-dhcp6-pool-1] prefix-pool 1 preferred-lifetime 86400 valid-lifetime 259200
```

In address pool 1, bind prefix 2001:0410:0201::/48 to the client DUID 00030001CA0006A40000, and set the preferred lifetime to one day, and the valid lifetime to three days.

```
[Switch-dhcp6-pool-1] static-bind prefix 2001:0410:0201::/48 duid 00030001CA0006A40000
preferred-lifetime 86400 valid-lifetime 259200
```

Configure the DNS server address 2:2::3.

```
[Switch-dhcp6-pool-1] dns-server 2:2::3
```

Configure the domain name as aaa.com.

```
[Switch-dhcp6-pool-1] domain-name aaa.com
```

Configure the SIP server address as 2:2::4, and the SIP server name as bbb.com.

```
[Switch-dhcp6-pool-1] sip-server address 2:2::4
[Switch-dhcp6-pool-1] sip-server domain-name bbb.com
[Switch-dhcp6-pool-1] quit
```

Enable the DHCPv6 server on VLAN-interface 2, enable desired prefix assignment and rapid prefix assignment, and set the preference to the highest.

```
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ipv6 dhcp select server
[Switch-Vlan-interface2] ipv6 dhcp server allow-hint preference 255 rapid-commit
```

Verifying the configuration

Display DHCPv6 server configuration on VLAN-interface 2.

```
[Switch-Vlan-interface2] display ipv6 dhcp server interface vlan-interface 2
Using pool: global
Preference value: 255
Allow-hint: Enabled
Rapid-commit: Enabled
```

Display information about address pool 1.

```
[Switch-Vlan-interface2] display ipv6 dhcp pool 1
DHCPv6 pool: 1
  Network: 1::/64
    Preferred lifetime 604800 seconds, valid lifetime 2592000 seconds
  Prefix pool: 1
    Preferred lifetime 86400 seconds, valid lifetime 259200 seconds
  Static bindings:
    DUID: 00030001ca0006a40000
    IAID: Not configured
    Prefix: 2001:410:201::/48
      Preferred lifetime 86400 seconds, valid lifetime 259200 seconds
  DNS server addresses:
    2:2::3
  Domain name:
    aaa.com
  SIP server addresses:
    2:2::4
  SIP server domain names:
    bbb.com
```

Display information about prefix pool 1.

```
[Switch-Vlan-interface2] display ipv6 dhcp prefix-pool 1
Prefix: 2001:410::/32
Assigned length: 48
Total prefix number: 65536
Available: 65535
In-use: 0
Static: 1
```

After the client with the DUID 00030001CA0006A40000 obtains an IPv6 prefix, display the binding information on the DHCPv6 server.

```
[Switch-Vlan-interface2] display ipv6 dhcp server pd-in-use
Pool: 1
 IPv6 prefix                              Type      Lease expiration
 2001:410:201::/48                        Static(C) Jul 10 19:45:01 2009
```

After the other client obtains an IPv6 prefix, display binding information on the DHCPv6 server.

```
[Switch-Vlan-interface2] display ipv6 dhcp server pd-in-use
Pool: 1
 IPv6 prefix                              Type      Lease expiration
 2001:410:201::/48                        Static(C) Jul 10 19:45:01 2009
 2001:410::/48                            Auto(C)   Jul 10 20:44:05 2009
```

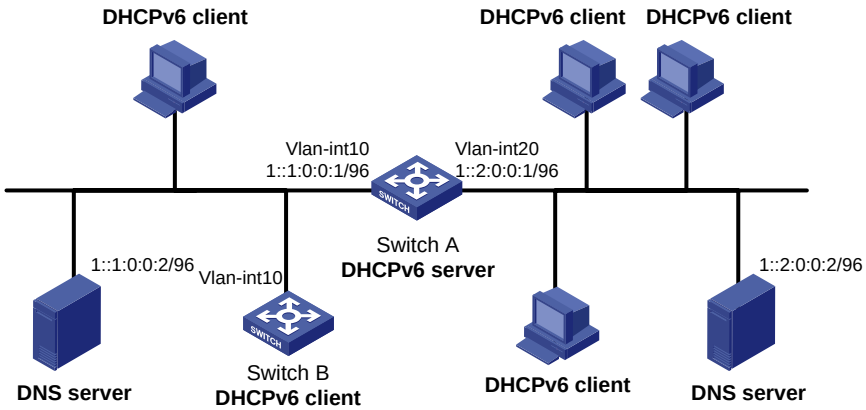
Example: Configuring dynamic IPv6 address assignment

Network configuration

As shown in Figure 13, Switch A acts as a DHCPv6 server to assign IPv6 addresses to the clients on subnets 1::1:0:0:0/96 and 1::2:0:0:0/96.

On Switch A, configure the IPv6 address 1::1:0:0:1/96 for VLAN-interface 10 and 1::2:0:0:1/96 for VLAN-interface 20. The lease duration of the addresses on subnet 1::1:0:0:0/96 is 172800 seconds (two days), the valid time is 345600 seconds (four days), the domain name suffix is aabbcc.com, and the DNS server address is 1::1:0:0:2/96. The lease duration of the addresses on subnet 1::2:0:0:0/96 is 432000 seconds (five days), the valid time is 864000 seconds (ten days), the domain name is aabbcc.com, and the DNS server address is 1::2:0:0:2/96.

Figure 13 Network diagram



Procedure

1. Configure the interfaces on the DHCPv6 server:

Specify an IPv6 address for VLAN-interface 10.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 1::1:0:0:1/96
```

Disable RA message suppression on VLAN-interface 10.

```
[SwitchA-Vlan-interface10] undo ipv6 nd ra halt
```

Set the M flag to 1 in RA advertisements to be sent on VLAN-interface 10. Hosts that receive the RA advertisements will obtain IPv6 addresses through DHCPv6.

```
[SwitchA-Vlan-interface10] ipv6 nd autoconfig managed-address-flag
```

Set the O flag to 1 in RA advertisements to be sent on VLAN-interface 10. Hosts that receive the RA advertisements will obtain information other than IPv6 address through DHCPv6.

```
[SwitchA-Vlan-interface10] ipv6 nd autoconfig other-flag
[SwitchA-Vlan-interface10] quit
```

Specify an IPv6 address for VLAN-interface 20.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 1::2:0:0:1/96
```

Disable RA message suppression on VLAN-interface 20.

```
[SwitchA-Vlan-interface20] undo ipv6 nd ra halt
```

Set the M flag to 1 in RA advertisements to be sent on VLAN-interface 20. Hosts that receive the RA advertisements will obtain IPv6 addresses through DHCPv6.

```
[SwitchA-Vlan-interface20] ipv6 nd autoconfig managed-address-flag
```

Set the O flag to 1 in RA advertisements to be sent on VLAN-interface 20. Hosts that receive the RA advertisements will obtain information other than IPv6 address through DHCPv6.

```
[SwitchA-Vlan-interface20] ipv6 nd autoconfig other-flag
[SwitchA-Vlan-interface20] quit
```

2. Enable DHCPv6:

Enable DHCPv6 server on VLAN-interface 10 and VLAN-interface 20.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 dhcp select server
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 dhcp select server
[SwitchA-Vlan-interface20] quit
```

Exclude the DNS server addresses from dynamic assignment.

```
[SwitchA] ipv6 dhcp server forbidden-address 1::1:0:0:2
[SwitchA] ipv6 dhcp server forbidden-address 1::2:0:0:2
```

Configure the DHCPv6 address pool 1 to assign IPv6 addresses and other configuration parameters to clients on subnet 1::1:0:0:0/96.

```
[SwitchA] ipv6 dhcp pool 1
[SwitchA-dhcp6-pool-1] network 1::1:0:0:0/96 preferred-lifetime 172800
valid-lifetime 345600
[SwitchA-dhcp6-pool-1] domain-name aabbcc.com
[SwitchA-dhcp6-pool-1] dns-server 1::1:0:0:2
[SwitchA-dhcp6-pool-1] quit
```

Configure the DHCPv6 address pool 2 to assign IPv6 addresses and other configuration parameters to clients on subnet 1::2:0:0:0/96.

```
[SwitchA] ipv6 dhcp pool 2
[SwitchA-dhcp6-pool-2] network 1::2:0:0:0/96 preferred-lifetime 432000
valid-lifetime 864000
```

```
[SwitchA-dhcp6-pool-2] domain-name aabbcc.com
[SwitchA-dhcp6-pool-2] dns-server 1::2:0:0:2
[SwitchA-dhcp6-pool-2] quit
```

Verifying the configuration

Verify that the clients on subnets 1::1:0:0:0/96 and 1::2:0:0:0/96 can obtain IPv6 addresses and all other configuration parameters from the DHCPv6 server (Switch A). (Details not shown.)

On the DHCPv6 server, display IPv6 addresses assigned to the DHCPv6 clients.

```
[SwitchA] display ipv6 dhcp server ip-in-use
```

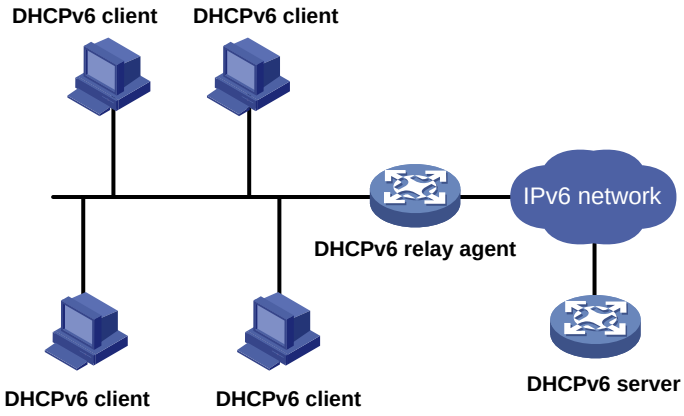
Configuring the DHCPv6 relay agent

About DHCPv6 relay agent

Typical application

A DHCPv6 client usually uses a multicast address to contact the DHCPv6 server on the local link to obtain an IPv6 address and other configuration parameters. As shown in Figure 14, if the DHCPv6 server resides on another subnet, the DHCPv6 clients need a DHCPv6 relay agent to contact the server. The relay agent feature avoids deploying a DHCPv6 server on each subnet.

Figure 14 Typical DHCPv6 relay agent application

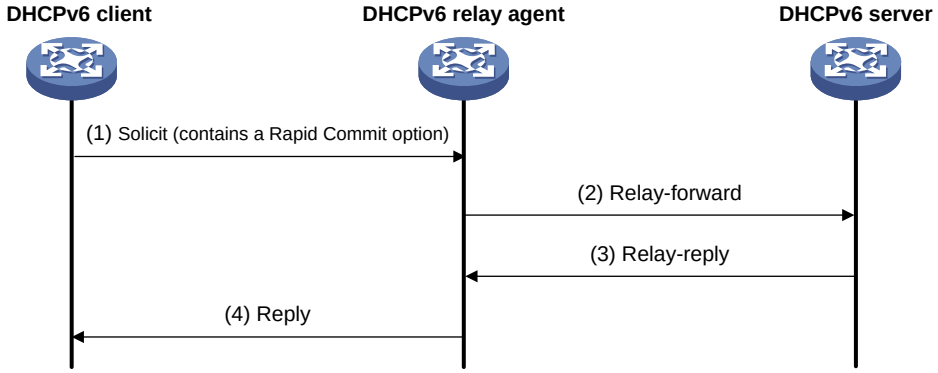


DHCPv6 relay agent operating process

As shown in Figure 15, a DHCPv6 client obtains an IPv6 address and other network configuration parameters from a DHCPv6 server through a DHCPv6 relay agent. The following example uses rapid assignment to describe the process:

- The DHCPv6 client sends a Solicit message containing the Rapid Commit option to the multicast address FF02::1:2 of all the DHCPv6 servers and relay agents.
- After receiving the Solicit message, the DHCPv6 relay agent encapsulates the message into the Relay Message option of a Relay-forward message, and sends the message to the DHCPv6 server.
- After obtaining the Solicit message from the Relay-forward message, the DHCPv6 server performs the following tasks:
  - Selects an IPv6 address and other required parameters.
  - Adds them to a reply that is encapsulated within the Relay Message option of a Relay-reply message.
  - Sends the Relay-reply message to the DHCPv6 relay agent.
- The DHCPv6 relay agent obtains the reply from the Relay-reply message and sends the reply to the DHCPv6 client.
- The DHCPv6 client uses the IPv6 address and other network parameters assigned by the DHCPv6 server to complete network configuration.

Figure 15 Operating process of a DHCPv6 relay agent



DHCPv6 relay agent tasks at a glance

To configure a DHCPv6 relay agent, perform the following tasks:

1. Enabling the DHCPv6 relay agent on an interface
2. Specifying DHCPv6 servers on the relay agent
3. (Optional.) Specifying a gateway address for DHCPv6 clients
4. (Optional.) Setting the DSCP value for DHCPv6 packets sent by the DHCPv6 relay agent
5. (Optional.) Specifying a padding mode for the Interface-ID option
6. (Optional.) Enabling the DHCPv6 relay agent to support Option 79
7. (Optional.) Enabling the DHCPv6 relay agent to advertise IPv6 prefixes
8. (Optional.) Enabling the DHCPv6 relay agent to advertise host routes for assigned IPv6 addresses
9. (Optional.) Specifying the source IPv6 address for relayed DHCPv6 requests

Enabling the DHCPv6 relay agent on an interface

Restrictions and guidelines

As a best practice, do not enable DHCPv6 relay agent and DHCPv6 client on the same interface.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable DHCPv6 relay agent on the interface.
   `ipv6 dhcp select relay`
   By default, the DHCPv6 relay agent is disabled on the interface.

Specifying DHCPv6 servers on the relay agent

Specifying DHCPv6 server IP addresses

Restrictions and guidelines

- You can use the **ipv6 dhcp relay server-address** command to specify a maximum of eight DHCPv6 servers on the DHCPv6 relay agent interface. The DHCPv6 relay agent forwards DHCP requests to all the specified DHCPv6 servers.
- If a DHCPv6 server address is a link-local address or multicast address, you must specify an outgoing interface by using the **interface** keyword in this command. Otherwise, DHCPv6 packets might fail to reach the DHCPv6 server.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Specify a DHCPv6 server.

   ipv6 dhcp relay server-address *ipv6-address* [**interface** *interface-type interface-number*]

   By default, no DHCPv6 server is specified.

Specifying DHCPv6 servers for a DHCPv6 address pool on the DHCPv6 relay agent

About specifying DHCPv6 servers for a DHCPv6 address pool on the DHCPv6 relay agent

This feature allows DHCPv6 clients of the same type to obtain IPv6 addresses, IPv6 prefixes, and other configuration parameters from the DHCPv6 servers in the matching DHCPv6 address pool.

It applies to scenarios where the DHCPv6 relay agent connects to clients of the same access type but classified into different types by their locations. In this case, the relay interface typically has no IPv6 address configured. You can use the **gateway-list** command to specify the gateway addresses for clients matching the same DHCPv6 address pool.

Upon receiving a DHCPv6 Solicit or Request from a client that matches a DHCPv6 address pool, the relay agent processes the packet as follows:

- Fills the **link-address** field of the packet with a specified gateway address.
- Forwards the packet to all DHCPv6 servers in the matching DHCPv6 address pool.

The DHCPv6 servers select a DHCPv6 address pool according to the gateway address.

Restrictions and guidelines

- You can specify a maximum of eight DHCPv6 servers for one DHCPv6 address pool for high availability. The relay agent forwards DHCPv6 Solicit and Request packets to all DHCPv6 servers in the DHCPv6 address pool.
- If this feature is used in the PPPoE scenario, execute the **ipv6 dhcp relay client-information record** command to enable the DHCPv6 relay agent to record relay entries. When a PPPoE user gets offline, the DHCPv6 relay agent locates the matching relay entry and sends a Release message to the DHCPv6 server.

- If this feature is used in the PPPoE scenario, you do not need to execute the **ipv6 dhcp select relay** command. This is because the **remote-server** command is a must in this configuration task and it implies that this device is a relay device.

Procedure

1. Enter system view.
   system-view
2. Create a DHCPv6 address pool and enter its view.
   ipv6 dhcp pool *pool-name*
3. Specify gateway addresses for the clients matching the DHCPv6 address pool.
   gateway-list *ipv6-address*&<1-8>
   By default, no gateway address is specified.
4. Specify DHCPv6 servers for the DHCPv6 address pool.
   remote-server *ipv6-address* [**interface** *interface-type interface-number*]
   By default, no DHCPv6 server is specified for the DHCPv6 address pool.

Specifying a gateway address for DHCPv6 clients

About specifying a gateway address for DHCPv6 client

By default, the DHCPv6 relay agent fills the **link-address** field of DHCPv6 Solicit and Request packets with the first IPv6 address of the relay interface. You can specify a gateway address on the relay agent for DHCPv6 clients. The DHCPv6 relay agent uses the specified gateway address to fill the **link-address** field of DHCPv6 Solicit and Request packets.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify a gateway address for DHCPv6 clients.
   ipv6 dhcp relay gateway *ipv6-address*
   By default, the DHCPv6 relay agent uses the first IPv6 address of the relay interface as the clients' gateway address.

Setting the DSCP value for DHCPv6 packets sent by the DHCPv6 relay agent

About setting the DSCP value for DHCPv6 packets

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet.

Procedure

1. Enter system view.
   system-view
2. Set the DSCP value for DHCPv6 packets sent by the DHCPv6 relay agent.
   ipv6 dhcp dscp *dscp-value*

The default DSCP value is 56.

Specifying a padding mode for the Interface-ID option

About specifying a padding mode for the Interface-ID option

This feature enables the relay agent to fill the Interface-ID option in the specified mode. When receiving a DHCPv6 packet from a client, the relay agent fills the Interface-ID option in the mode and then forwards the packet to the DHCPv6 server.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify a padding mode for the Interface-ID option.
   ipv6 dhcp relay interface-id { **bas** | **interface** }
   By default, the relay agent fills the Interface-ID option with the interface index of the interface.

Enabling the DHCPv6 relay agent to support Option 79

About enabling the DHCPv6 relay agent to support Option 79

If DHCPv6 relay agents exist in the network, the DHCPv6 server needs the MAC address of the DHCPv6 client for authentication or for IPv6 address or prefix assignment. To meet the requirement, enable the DHCPv6 relay agent that the client first passes to support Option 79. This feature allows the DHCPv6 relay agent to learn the MAC address in the client request. When the relay agent generates a Relay-Forward packet for the request, it fills the MAC address of the client in Option 79. The Relay-Forward packet is then forwarded to the DHCPv6 server.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the DHCPv6 relay agent to support Option 79.
   ipv6 dhcp relay client-link-address enable
   By default, the DHCPv6 relay agent does not support Option 79.

Enabling the DHCPv6 relay agent to advertise IPv6 prefixes

About enabling the DHCPv6 relay agent to advertise IPv6 prefixes

A DHCPv6 client can obtain an IPv6 prefix through DHCPv6 and use this IPv6 prefix to assign IPv6 address to clients in a downstream network. If the IPv6 prefix is in a different subnet than the IPv6

address of the DHCPv6 client's upstream interface, the clients in the downstream network cannot access the external network. You can enable the DHCPv6 relay agent that is on the same link as the DHCPv6 client to advertise the IPv6 prefix.

Procedure

1. Enter system view.

   `system-view`

2. Enable the DHCPv6 relay agent to advertise IPv6 prefixes.

   `ipv6 dhcp advertise pd-route`

   By default, the DHCPv6 relay agent does not advertise IPv6 prefixes.

   Before using this command, make sure the DHCPv6 relay agent is enabled to record DHCPv6 relay entries.

Enabling the DHCPv6 relay agent to advertise host routes for assigned IPv6 addresses

About enabling the DHCPv6 relay agent to advertise host routes for assigned IPv6 addresses

In a network where ND cannot resolve global unicast addresses, network devices cannot generate ND entries for all global unicast addresses. If a DHCPv6 client obtains a global unicast address, the neighboring devices do not have the ND entries for this global unicast address, thus cannot forward the packets destined for the client. To resolve this problem, enable the DHCPv6 relay agent to advertise host routes for assigned IPv6 addresses in DHCPv6 replies. The advertised route information is as follows:

- The destination IP address is the assigned IPv6 address.
- The next hop is the link-local address of the DHCPv6 client.
- The output interface is the interface that forwards the reply.

After the relay agent receives a packet destined for the assigned IPv6 address, the relay agent looks up the routing table for the next hop. ND resolution can succeed because the next hop is the link-local address of the client. The relay agent searches the ND table for the MAC address of the client based on the next hop and then forwards the packet.

Restrictions and guidelines

Before using this feature on the DHCPv6 relay agent, enable the DHCPv6 relay agent to record DHCPv6 relay entries first.

Procedure

1. Enter system view.

   `system-view`

2. Enable the DHCPv6 relay agent to advertise host routes for IPv6 addresses assigned to DHCPv6 clients.

   `ipv6 dhcp advertise address-route`

   By default, the DHCPv6 relay agent does not advertise host routes for IPv6 addresses assigned to DHCPv6 clients.

Specifying the source IPv6 address for relayed DHCPv6 requests

About specifying the source IPv6 address for relayed DHCPv6 requests

This task is required if a relay interface does not have routes to DHCPv6 servers. You can specify a global unicast address or the IPv6 address of another interface (typically the loopback interface) as the source IPv6 address for DHCPv6 requests. The relay interface inserts the source IPv6 address in the source IPv6 address field of DHCPv6 requests.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify the source IPv6 address for relayed DHCPv6 requests.

   ipv6 dhcp relay source-address { *ipv6-address* | **interface** *interface-type interface-number* }

   By default, the DHCPv6 relay agent uses the IPv6 global unicast address of the interface that connects to the DHCPv6 server as the source IPv6 address for relayed DHCPv6 requests.

   If the specified interface does not have an IPv6 global unicast address, the IPv6 address of the output interface is used as the source address for relayed DHCPv6 requests.

Display and maintenance commands for DHCPv6 relay agent

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the DUID of the local device.	**display ipv6 dhcp duid**
Display DHCPv6 relay entries that record clients' IPv6 address information.	**display ipv6 dhcp relay client-information address** [**interface** *interface-type interface-number* | **ipv6** *ipv6-address*]
Display DHCPv6 relay entries that record clients' IPv6 prefix information.	**display ipv6 dhcp relay client-information pd** [**interface** *interface-type interface-number* | **prefix** *prefix/prefix-len*]
Display DHCPv6 server addresses specified on the DHCPv6 relay agent.	**display ipv6 dhcp relay server-address** [**interface** *interface-type interface-number*]
Display packet statistics on the DHCPv6 relay agent.	**display ipv6 dhcp relay statistics** [**interface** *interface-type interface-number*]
Clear DHCPv6 relay entries that record clients' IPv6 address information.	**reset ipv6 dhcp relay client-information address** [**interface** *interface-type*

Task	Command
	interface-number | **ipv6** *ipv6-address*]
Clear DHCPv6 relay entries that record clients' IPv6 prefix information.	**reset ipv6 dhcp relay client-information pd** [**interface** *interface-type interface-number* | **prefix** *prefix/prefix-len*]
Clear packets statistics on the DHCPv6 relay agent.	**reset ipv6 dhcp relay statistics** [**interface** *interface-type interface-number*]

DHCPv6 relay agent configuration examples

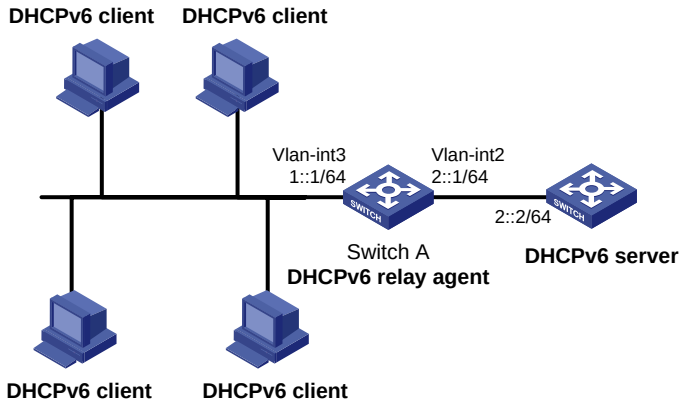
Example: Configuring DHCPv6 relay agent

Network configuration

As shown in Figure 16, configure the DHCPv6 relay agent on Switch A to relay DHCPv6 packets between DHCPv6 clients and the DHCPv6 server.

Switch A acts as the gateway of network 1::/64. It sends RA messages to notify the hosts to obtain IPv6 addresses and other configuration parameters through DHCPv6. For more information about RA messages, see "Configuring basic IPv6 settings."

Figure 16 Network diagram



Procedure

Specify IPv6 addresses for VLAN-interface 2 and VLAN-interface 3.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ipv6 address 2::1 64
[SwitchA-Vlan-interface2] quit
[SwitchA] interface vlan-interface 3
[SwitchA-Vlan-interface3] ipv6 address 1::1 64
```

Disable RA message suppression on VLAN-interface 3.

```
[SwitchA-Vlan-interface3] undo ipv6 nd ra halt
```

Set the M flag to 1 in RA advertisements to be sent on VLAN-interface 3. Hosts that receive the RA advertisements will obtain IPv6 addresses through DHCPv6.

```
[SwitchA-Vlan-interface3] ipv6 nd autoconfig managed-address-flag
```

Set the O flag to 1 in RA advertisements to be sent on VLAN-interface 3. Hosts that receive the RA advertisements will obtain information other than IPv6 address through DHCPv6.

```
[SwitchA-Vlan-interface3] ipv6 nd autoconfig other-flag
```

Enable the DHCPv6 relay agent on VLAN-interface 3 and specify the DHCPv6 server on the relay agent.

```
[SwitchA-Vlan-interface3] ipv6 dhcp select relay
[SwitchA-Vlan-interface3] ipv6 dhcp relay server-address 2::2
```

Verifying the configuration

Display DHCPv6 server address information on Switch A.

```
[SwitchA-Vlan-interface3] display ipv6 dhcp relay server-address
Interface: Vlan-interface3
 Server address      Outgoing Interface         Public/VRF name
 2::2                                           --/--
```

Display packet statistics on the DHCPv6 relay agent.

```
[SwitchA-Vlan-interface3] display ipv6 dhcp relay statistics
Packets dropped               :  0
Packets received              :  14
    Solicit                   :  0
    Request                   :  0
    Confirm                   :  0
    Renew                     :  0
    Rebind                    :  0
    Release                   :  0
    Decline                   :  0
    Information-request       :  7
    Relay-forward             :  0
    Relay-reply               :  7
Packets sent                  :  14
    Advertise                 :  0
    Reconfigure               :  0
    Reply                     :  7
    Relay-forward             :  7
    Relay-reply               :  0
```

Configuring the DHCPv6 client

About the DHCPv6 client

With DHCPv6 client configured, an interface can obtain configuration parameters from the DHCPv6 server.

A DHCPv6 client can use DHCPv6 to complete the following functions:

- Obtain an IPv6 address, an IPv6 prefix, or both, and obtain other configuration parameters. If DHCPv6 server is enabled on the device, the client can automatically save the obtained parameters to a DHCPv6 option group. With the obtained IPv6 prefix, the client can generate its global unicast address.
- Support stateless DHCPv6 to obtain configuration parameters except IPv6 address and IPv6 prefix. The client obtains an IPv6 address through stateless IPv6 address autoconfiguration. If the client receives an RA message with the M flag set to 0 and the O flag set to 1 during address acquisition, stateless DHCPv6 starts.

Restrictions and guidelines: DHCPv6 client configuration

Do not configure the DHCPv6 client on the same interface as the DHCPv6 server or the DHCPv6 relay agent.

DHCPv6 client tasks at a glance

To configure a DHCPv6 client, perform the following tasks:

1. (Optional.) Configuring the DHCPv6 client DUID
2. Configuring the DHCPv6 client to obtain IPv6 addresses, IPv6 prefixes and other network parameters

   Choose the following tasks as needed:

   - Configuring IPv6 address acquisition
   - Configuring IPv6 prefix acquisition
   - Configuring IPv6 address and prefix acquisition
   - Configuring acquisition of configuration parameters except IP addresses and prefixes
3. (Optional.) Setting the DSCP value for DHCPv6 packets sent by the DHCPv6 client

Configuring the DHCPv6 client DUID

About the DHCPv6 client DUID

The DUID of a DHCPv6 client is the globally unique identifier of the client. The client pads its DUID into Option 1 of the DHCPv6 packet that it sends to the DHCPv6 server. The DHCPv6 server can assign specific IPv6 addresses or prefixes to DHCPv6 clients with specific DUIDs.

Restrictions and guidelines

Make sure the DUID that you configure is unique.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the DHCPv6 client DUID.
   ipv6 dhcp client duid { **ascii** *ascii-string* | **hex** *hex-string* | **mac** *interface-type interface-number* }
   By default, the interface uses the device bridge MAC address to generate its DHCPv6 client DUID.

Configuring IPv6 address acquisition

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface to use DHCPv6 to obtain IPv6 addresses and other network settings.
   ipv6 address dhcp-alloc [**option-group** *group-number* | **rapid-commit**] *
   In a version earlier than R6348P01, an interface does not use DHCPv6 to obtain IPv6 addresses and other network settings by default.
   In R6348P01 or later, the default setting of this command varies by device startup method as follows:
   - When the device starts up with the initial configuration, an interface uses the default settings of software features and does not use DHCPv6 to obtain IPv6 addresses and other network settings.
   - When the device starts up with the factory defaults, only VLAN-interface 1 supports using DHCPv6 to obtain IPv6 addresses and other network settings. Other interfaces do not use DHCPv6 to obtain IPv6 addresses and other network settings.

   For more information about initial configuration and factory defaults, see configuration file management in *Fundamentals Configuration Guide*.

Configuring IPv6 prefix acquisition

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface to use DHCPv6 to obtain an IPv6 prefix and other configuration parameters.
   ipv6 dhcp client pd *prefix-number* [**option-group** *group-number* | **rapid-commit**] *
   By default, the interface does not use DHCPv6 for IPv6 prefix acquisition.

Configuring IPv6 address and prefix acquisition

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the interface to use DHCPv6 to obtain an IPv6 address, an IPv6 prefix, and other configuration parameters.

   ipv6 dhcp client stateful prefix *prefix-number* [**option-group** *option-group-number* | **rapid-commit**] *

   By default, the interface does not use DHCPv6 for IPv6 address and prefix acquisition.

Configuring acquisition of configuration parameters except IP addresses and prefixes

About acquisition of configuration parameters except IP addresses and prefixes

When a DHCPv6 client has obtained an IPv6 address and prefix, you can configure the following methods for the client to obtain other network configuration parameters:

- Execute the **ipv6 address auto** command to enable an interface to automatically generate an IPv6 global unicast address and a link-local address. Then stateless DHCPv6 will be triggered when the M flag is set to 0 and the O flag is set to 1 in a received RA message. For more information about the commands, see *Layer 3—IP services Command Reference*.
- Executing the **ipv6 dhcp client stateless enable** command on an interface to enable the interface to act as a DHCPv6 client to obtain configuration parameters from a DHCPv6 server.

If you execute both the **ip address auto** and **ipv6 dhcp client stateless enable** commands, the interface acts as follows:

- Generate a global unicast address and a link-local address.
- Obtain other configuration parameters from a DHCPv6 server.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the interface to support stateless DHCPv6. Choose the options to configure as needed:

   - Enable stateless IPv6 address autoconfiguration:

     ipv6 address auto

   - Configure the client to obtain network parameters from DHCPv6 servers:

     ipv6 dhcp client stateless enable

   By default, the interface does not support stateless DHCPv6.

Setting the DSCP value for DHCPv6 packets sent by the DHCPv6 client

About setting the DSCP value for DHCPv6 packets

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet.

Procedure

1. Enter system view.
   system-view
2. Set the DSCP value for DHCPv6 packets sent by the DHCPv6 client.
   ipv6 dhcp client dscp *dscp-value*
   By default, the DSCP value in DHCPv6 packets sent by the DHCPv6 client is 56.

Display and maintenance commands for DHCPv6 client

Execute the **display** commands in any view, and execute the **reset** command in user view.

Task	Command
Display the DHCPv6 client information.	**display ipv6 dhcp client** [**interface** *interface-type interface-number*]
Display the DHCPv6 client statistics.	**display ipv6 dhcp client statistics** [**interface** *interface-type interface-number*]
Clear the DHCPv6 client statistics.	**reset ipv6 dhcp client statistics** [**interface** *interface-type interface-number*]

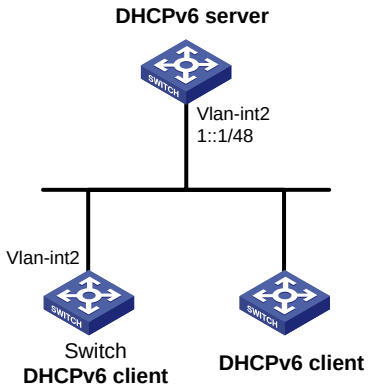
DHCPv6 client configuration examples

Example: Configuring IPv6 address acquisition

Network configuration

As shown in Figure 17, configure the switch to use DHCPv6 to obtain configuration parameters from the DHCPv6 server. The parameters include IPv6 address, DNS server address, domain name suffix, SIP server address, and SIP server domain name.

Figure 17 Network diagram



Procedure

You must configure the DHCPv6 server first before configuring the DHCPv6 client. For information about configuring DHCPv6 server, see "Configuring the DHCPv6 server."

Configure VLAN-interface 2 as a DHCPv6 client for IPv6 address acquisition. Configure the DHCPv6 client to support DHCPv6 rapid address assignment. Configure the DHCPv6 client to create a dynamic DHCPv6 option group for saving configuration parameters.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ipv6 address dhcp-alloc rapid-commit option-group 1
[Switch-Vlan-interface2] quit
```

Verifying the configuration

Verify that the client has obtained an IPv6 address and other configuration parameters from the server.

```
[Switch] display ipv6 dhcp client
Vlan-interface2:
  Type: Stateful client requesting address
    State: OPEN
    Client DUID: 0003000100e002000000
    Preferred server:
      Reachable via address: FE80::2E0:1FF:FE00:18
      Server DUID: 0003000100e001000000
    IA_NA: IAID 0x00000642, T1 50 sec, T2 80 sec
      Address: 1:1::2/128
       Preferred lifetime 100 sec, valid lifetime 200 sec
       Will expire on Mar 27 2014 at 08:06:57 (198 seconds left)
    DNS server addresses:
      2000::FF
    Domain name:
      example.com
    SIP server addresses:
      2:2::4
    SIP server domain names:
      bbb.com
```

After DHCPv6 server is enabled on the device, verify that configuration parameters are saved in a dynamic DHCPv6 option group.

```
[Switch] display ipv6 dhcp option-group 1
DHCPv6 option group: 1
  DNS server addresses:
    Type: Dynamic (DHCPv6 address allocation)
    Interface: Vlan-interface2
    2000::FF
  Domain name:
    Type: Dynamic (DHCPv6 address allocation)
    Interface: Vlan-interface2
    example.com
  SIP server addresses:
    Type: Dynamic (DHCPv6 address allocation)
    Interface: Vlan-interface2
    2:2::4
  SIP server domain names:
    Type: Dynamic (DHCPv6 address allocation)
    Interface: Vlan-interface2
    bbb.com
```

Verify that the DHCPv6 client has obtained an IPv6 address..

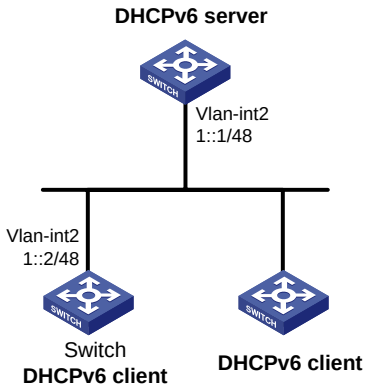
```
[Switch] display ipv6 interface brief
*down: administratively down
(s): spoofing
Interface                          Physical   Protocol   IPv6 Address
Vlan-interface2                    up         up         1:1::2
```

Example: Configuring IPv6 prefix acquisition

Network configuration

As shown in Figure 18, configure the switch to use DHCPv6 to obtain configuration parameters from the DHCPv6 server. The parameters include IPv6 prefix, DNS server address, domain name suffix, SIP server address, and SIP server domain name.

Figure 18 Network diagram



Procedure

You must configure the DHCPv6 server first before configuring the DHCPv6 client. For information about configuring DHCPv6 server, see "Configuring the DHCPv6 server."

Configure an IPv6 address for VLAN-interface 2 that is connected to the DHCPv6 server.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ipv6 address 1::2/48
```

Configure VLAN-interface 2 as a DHCPv6 client for IPv6 prefix acquisition. Configure the DHCPv6 client to support DHCPv6 rapid prefix assignment. Configure the DHCPv6 client to assign an ID to the obtained IPv6 prefix and create a dynamic DHCPv6 option group for saving configuration parameters.

```
[Switch-Vlan-interface2] ipv6 dhcp client pd 1 rapid-commit option-group 1
[Switch-Vlan-interface2] quit
```

Verifying the configuration

Verify that the DHCPv6 client has obtained an IPv6 prefix and other configuration parameters from the DHCPv6 server.

```
[Switch] display ipv6 dhcp client
Vlan-interface2:
  Type: Stateful client requesting prefix
    State: OPEN
    Client DUID: 0003000100e002000000
    Preferred server:
      Reachable via address: FE80::2E0:1FF:FE00:18
      Server DUID: 0003000100e001000000
    IA_PD: IAID 0x00000642, T1 50 sec, T2 80 sec
      Prefix: 12:34::/48
        Preferred lifetime 100 sec, valid lifetime 200 sec
        Will expire on Feb 4 2014 at 15:37:20(80 seconds left)
    DNS server addresses:
      2000::FF
    Domain name:
      example.com
    SIP server addresses:
      2:2::4
    SIP server domain names:
      bbb.com
```

Verify that the client has obtained an IPv6 prefix.

```
[Switch] display ipv6 prefix 1
Number: 1
Type  : Dynamic
Prefix: 12:34::/48
Preferred lifetime 100 sec, valid lifetime 200 sec
```

After DHCPv6 server is enabled on the device, verify that configuration parameters are saved in a dynamic DHCPv6 option group.

```
[Switch] display ipv6 dhcp option-group 1
DHCPv6 option group: 1
  DNS server addresses:
    Type: Dynamic (DHCPv6 prefix allocation)
    Interface: Vlan-interface2
    2000::FF
  Domain name:
```

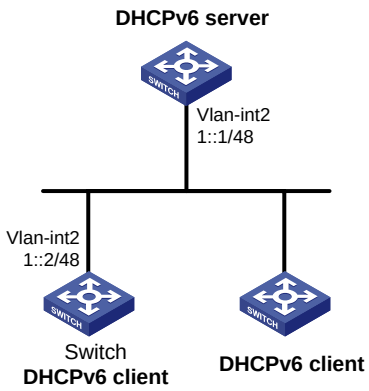
```
  Type: Dynamic (DHCPv6 prefix allocation)
  Interface: Vlan-interface2
  example.com
SIP server addresses:
  Type: Dynamic (DHCPv6 prefix allocation)
  Interface: Vlan-interface2
  2:2::4
SIP server domain names:
  Type: Dynamic (DHCPv6 prefix allocation)
  Interface: Vlan-interface2
  bbb.com
```

Example: Configuring IPv6 address and prefix acquisition

Network configuration

As shown in Figure 19, configure the switch to use DHCPv6 to obtain configuration parameters from the DHCPv6 server. The parameters include IPv6 address, IPv6 prefix, DNS server address, domain name suffix, SIP server address, and SIP server domain name.

Figure 19 Network diagram



Procedure

You must configure the DHCPv6 server before configuring the DHCPv6 client. For information about configuring the DHCPv6 server, see "Configuring the DHCPv6 server."

Configure an IPv6 address for VLAN-interface 2 that is connected to the DHCPv6 server.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ipv6 address 1::2/48
```

Configure VLAN-interface 2 as a DHCPv6 client for IPv6 address and prefix acquisition. Specify IDs for the dynamic IPv6 prefix and dynamic DHCPv6 option group, and configure the client to support rapid address and prefix assignment.

```
[Switch-Vlan-interface2] ipv6 dhcp client stateful prefix 1 rapid-commit option-group 1
[Switch-Vlan-interface2] quit
```

Verifying the configuration

Verify that the DHCPv6 client has obtained an IPv6 address, an IPv6 prefix, and other configuration parameters from the DHCPv6 server.

```
[Switch] display ipv6 dhcp client
```

```
Vlan-interface2:
  Type: Stateful client requesting address and prefix
    State: OPEN
    Client DUID: 0003000100e002000000
    Preferred server:
      Reachable via address: FE80::2E0:1FF:FE00:18
      Server DUID: 0003000100e001000000
    IA_NA: IAID 0x00000642, T1 50 sec, T2 80 sec
      Address: 1:1::2/128
        Preferred lifetime 100 sec, valid lifetime 200 sec
        Will expire on Mar 27 2014 at 08:02:00 (199 seconds left)
    IA_PD: IAID 0x00000642, T1 50 sec, T2 80 sec
      Prefix: 12:34::/48
        Preferred lifetime 100 sec, valid lifetime 200 sec
        Will expire on Mar 27 2014 at 08:02:00 (199 seconds left)
    DNS server addresses:
      2000::FF
    Domain name:
      example.com
    SIP server addresses:
      2:2::4
    SIP server domain names:
      bbb.com
```

Verify that the DHCPv6 client has obtained an IPv6 address.

```
[Switch] display ipv6 interface brief
*down: administratively down
(s): spoofing
Interface                              Physical   Protocol   IPv6 Address
Vlan-interface2                        up         up         1:1::2
```

Verify that the client has obtained an IPv6 prefix.

```
[Switch] display ipv6 prefix 1
Number: 1
Type  : Dynamic
Prefix: 12:34::/48
Preferred lifetime 100 sec, valid lifetime 200 sec
```

After DHCPv6 server is enabled on the device, verify that configuration parameters are saved in a dynamic DHCPv6 option group.

```
[Switch] display ipv6 dhcp option-group 1
DNS server addresses:
    Type: Dynamic (DHCPv6 address and prefix allocation)
    Interface: Vlan-interface2
    2000::FF
  Domain name:
    Type: Dynamic (DHCPv6 address and prefix allocation)
    Interface: Vlan-interface2
    example.com
  SIP server addresses:
    Type: Dynamic (DHCPv6 address and prefix allocation)
```

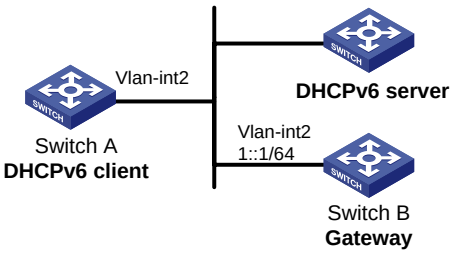
```
  Interface: Vlan-interface2
  2:2::4
SIP server domain names:
  Type: Dynamic (DHCPv6 address and prefix allocation)
  Interface: Vlan-interface2
  bbb.com
```

Example: Configuring stateless DHCPv6

Network configuration

As shown in Figure 20, configure Switch A to use stateless DHCPv6 to obtain configuration parameters except IPv6 address and IPv6 prefix. Switch B acts as the gateway and advertises RA messages periodically.

Figure 20 Network diagram



Procedure

You must configure the DHCPv6 server first before configuring the DHCPv6 client. For information about configuring DHCPv6 server, see "Configuring the DHCPv6 server."

1. Configure the gateway Switch B.

   # Configure an IPv6 address for VLAN-interface 2.

   ```
   <SwitchB> system-view
   [SwitchB] interface vlan-interface 2
   [SwitchB-Vlan-interface2] ipv6 address 1::1 64
   ```

   # Set the O flag to 1 in RA advertisements to be sent on VLAN-interface 2. Hosts that receive the RA advertisements will obtain information other than IPv6 address through DHCPv6.

   ```
   [SwitchB-Vlan-interface2] ipv6 nd autoconfig other-flag
   ```

   # Disable RA message suppression on VLAN-interface 2.

   ```
   [SwitchB-Vlan-interface2] undo ipv6 nd ra halt
   ```

2. Configure the DHCPv6 client Switch A.

   # Enable stateless IPv6 address autoconfiguration on VLAN-interface 2.

   ```
   <SwitchA> system-view
   [SwitchA] interface vlan-interface 2
   [SwitchA-Vlan-interface2] ipv6 address auto
   ```

   With stateless IPv6 address autoconfiguration enabled, but no IPv6 address configured for VLAN-interface 2, Switch A automatically generates a link-local address. It sends an RS message to Switch B to request configuration information for IPv6 address generation. Upon receiving the RS message, Switch B sends back an RA message. After receiving an RA message with the M flag set to 0 and the O flag set to 1, Switch A performs stateless DHCPv6 to get other configuration parameters.

Verifying the configuration

Display the DHCPv6 client information.

```
[SwitchA-Vlan-interface2] display ipv6 dhcp client interface vlan-interface 2
Vlan-interface2:
 Type: Stateless client
    State: OPEN
    Client DUID: 00030001000fe2ff0000
    Preferred server:
      Reachable via address: FE80::213:7FFF:FEF6:C818
      Server DUID: 0003000100137ff6c818
    DNS server addresses:
      1:2:4::5
      1:2:4::7
    Domain name:
      abc.com
```

Display the DHCPv6 client statistics.

```
[SwitchA-Vlan-interface2] display ipv6 dhcp client statistics
Interface                    :  Vlan-interface2
Packets received             :  1
        Reply                :  1
        Advertise            :  0
        Reconfigure          :  0
        Invalid              :  0
Packets sent                 :  5
        Solicit              :  0
        Request              :  0
        Renew                :  0
        Rebind               :  0
        Information-request  :  5
        Release              :  0
        Decline              :  0
```

Configuring DHCPv6 snooping

About DHCPv6 snooping

It guarantees that DHCPv6 clients obtain IPv6 addresses or prefixes from authorized DHCPv6 servers. Also, it records IP-to-MAC bindings of DHCPv6 clients (called DHCPv6 snooping address entries) and prefix-to-port bindings of DHCPv6 clients (called DHCPv6 snooping prefix entries) for security purposes.

DHCPv6 snooping defines trusted and untrusted ports to make sure that clients obtain IPv6 addresses only from authorized DHCPv6 servers.

- **Trusted**—A trusted port can forward DHCPv6 messages correctly to make sure the clients get IPv6 addresses from authorized DHCPv6 servers.
- **Untrusted**—An untrusted port discards received messages sent by DHCPv6 servers to prevent unauthorized servers from assigning IPv6 addresses.

DHCPv6 snooping reads DHCP-ACK messages received from trusted ports and DHCP-REQUEST messages to create DHCPv6 snooping entries. A DHCPv6 snooping entry can be an address entry or a prefix entry.

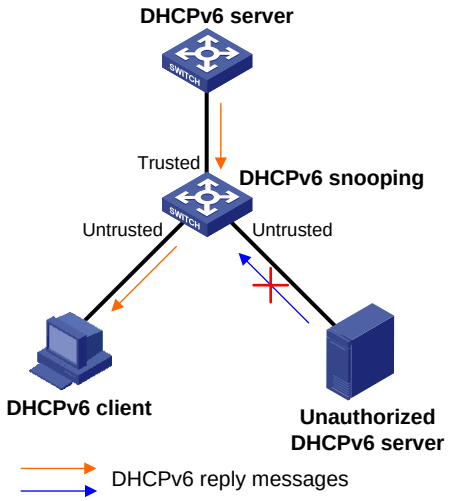
- A DHCPv6 address entry includes the MAC and IP addresses of a client, the port that connects to the DHCPv6 client, and the VLAN. You can use the **`display ipv6 dhcp snooping binding`** command to display the IP addresses of users for management.
- A DHCPv6 prefix entry includes the prefix and lease information assigned to the client, the port that connects to the DHCPv6 client, and the VLAN. You can use the **`display ipv6 dhcp snooping pd binding`** command to display the prefixes of the users for management.

Application of trusted and untrusted ports

Configure ports facing the DHCPv6 server as trusted ports, and configure other ports as untrusted ports.

As shown in Figure 21, configure the DHCPv6 snooping device's port that is connected to the DHCPv6 server as a trusted port. The trusted port forwards response messages from the DHCPv6 server to the client. The untrusted port connected to the unauthorized DHCPv6 server discards incoming DHCPv6 response messages.

Figure 21 Trusted and untrusted ports



Restrictions and guidelines: DHCPv6 snooping configuration

DHCPv6 snooping works between the DHCPv6 client and server, or between the DHCPv6 client and DHCPv6 relay agent.

DHCPv6 snooping does not work between the DHCPv6 server and DHCPv6 relay agent.

To make sure DHCPv6 clients can obtain valid IPv6 addresses, specify the ports connected to authorized DHCPv6 servers as trusted ports. The trusted ports and the ports connected to DHCPv6 clients must be in the same VLAN.

If you configure DHCPv6 snooping settings on a Layer 2 Ethernet interface that is a member port of a Layer 2 aggregate interface, the settings do not take effect unless the interface is removed from the aggregation group.

DHCPv6 snooping tasks at a glance

To configure DHCPv6 snooping, perform the following tasks:

1. Configuring basic DHCPv6 snooping features
2. (Optional.) Configuring DHCP snooping support for Option 18
3. (Optional.) Configuring DHCP snooping support for Option 37
4. (Optional.) Configuring DHCPv6 snooping entry auto backup
5. (Optional.) Setting the maximum number of DHCPv6 snooping entries
6. (Optional.) Configuring DHCPv6 packet rate limit
7. (Optional.) Configuring DHCPv6 snooping security features
8. (Optional.) Enabling DHCPv6 snooping logging and alarm
9. (Optional.) Disabling DHCPv6 snooping on an interface

Configuring basic DHCPv6 snooping features

Configuring basic DHCPv6 snooping features in a common network

About basic DHCPv6 snooping features in a common network

Basic DHCPv6 snooping features include enabling DHCPv6 snooping, configuring trusted ports, and enabling recording DHCPv6 snooping entries.

When you enable DHCPv6 snooping globally on a device, DHCPv6 snooping is also enabled in all VLANs on the device. Enable snooping in specific VLANs if you do not need to enable DHCPv6 snooping globally in some networks. You can also other basic DHCP snooping features in these VLANs.

Restrictions and guidelines

If the basic DHCPv6 snooping features are configured globally, you can only use the undo form of the global configuration commands to disable the settings globally. The VLAN-specific configuration commands cannot disable the settings.

If the basic DHCPv6 snooping features are configured in a VLAN, you can only use the undo form of the VLAN-specific configuration commands to disable the settings in the VLAN. The global configuration command cannot disable the settings.

Configuring basic DHCPv6 snooping features globally

1. Enter system view.
   system-view
2. Enable DHCPv6 snooping globally.
   ipv6 dhcp snooping enable
   By default, DHCPv6 snooping is disabled globally.
3. Enter interface view.
   interface *interface-type interface-number*
   This interface must connect to the DHCPv6 server.
4. Specify the port as a trusted port.
   ipv6 dhcp snooping trust
   By default, all ports are untrusted ports after DHCPv6 snooping is enabled.
5. Enable recording DHCPv6 snooping entries.
   a. Return to system view.
      quit
   b. Enter interface view.
      interface *interface-type interface-number*
      This interface must connect to the DHCPv6 client.
   c. Enable recording DHCPv6 snooping entries. Choose the following tasks as needed:
      - Enable recording DHCPv6 snooping address entries.
        ipv6 dhcp snooping binding record
        By default, recording of DHCPv6 snooping address entries is disabled.
      - Enable recording DHCPv6 snooping prefix entries.
        ipv6 dhcp snooping pd binding record
        By default, recording of DHCPv6 snooping prefix entries is disabled.

Configuring basic DHCPv6 snooping features for VLANs

1. Enter system view.
   system-view
2. Enable DHCPv6 snooping for VLANs.
   ipv6 dhcp snooping enable vlan *vlan-id-list*
   By default, DHCPv6 snooping is disabled in all VLANs.
3. Enter VLAN view.
   vlan *vlan-id*
   Make sure DHCP snooping is enabled for the VLAN.
4. Specify a port as a trusted port.
   ipv6 dhcp snooping trust interface *interface-type interface-number*
   By default, all ports are untrusted ports after DHCPv6 snooping is enabled.
5. (Optional.) Enable recording DHCPv6 snooping entries in the VLAN. Choose the following tasks as needed:
   - Enable recording DHCPv6 snooping address entries.
     ipv6 dhcp snooping binding record
     By default, recording of DHCPv6 snooping address entries is disabled in a VLAN.
   - Enable recording DHCPv6 snooping prefix entries.
     ipv6 dhcp snooping pd binding record
     By default, recording of DHCPv6 snooping prefix entries is disabled in a VLAN.

Configuring DHCP snooping support for Option 18

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable DHCP snooping support for Option 18.
   ipv6 dhcp snooping option interface-id enable
   By default, DHCP snooping support for Option 18 is disabled.
4. (Optional.) Specify the content as the interface ID.
   ipv6 dhcp snooping option interface-id [**vlan** *vlan-id*] **string** *interface-id*
   By default, the DHCPv6 snooping device uses its DUID as the content for Option 18.

Configuring DHCP snooping support for Option 37

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable DHCP snooping support for Option 37.
   ipv6 dhcp snooping option remote-id enable
   By default, DHCP snooping support for Option 37 is disabled.

4. (Optional.) Specify the content as the remote ID.

   ipv6 dhcp snooping option remote-id [**vlan** *vlan-id*] **string** *remote-id*

   By default, the DHCPv6 snooping device uses its DUID as the content for Option 37.

Configuring DHCPv6 snooping entry auto backup

About DHCPv6 snooping entry auto backup

The auto backup feature saves DHCPv6 snooping entries to a backup file, and allows the DHCPv6 snooping device to download the entries from the backup file at reboot. The entries on the DHCPv6 snooping device cannot survive a reboot. The auto backup helps the security features provide services if these features (such as IP source guard) must use DHCPv6 snooping entries for user authentication.

Restrictions and guidelines

- If you disable DHCPv6 snooping with the **undo ipv6 dhcp snooping enable** command, the device deletes all DHCPv6 snooping entries, including those stored in the backup file.
- If you execute the **ipv6 dhcp snooping binding database filename** command, the DHCPv6 snooping device backs up DHCPv6 snooping entries immediately and runs auto backup. This command automatically creates the file if you specify a non-existent file.
- The waiting period starts when a DHCPv6 snooping entry is learned, updated, or removed. The DHCPv6 snooping device updates the backup file when the specified waiting period is reached. All changed entries during the period will be saved to the backup file. If no DHCPv6 snooping entry changes, the backup file is not updated.

Procedure

1. Enter system view.

   system-view

2. Configure the DHCPv6 snooping device to back up DHCPv6 snooping entries to a file.

   ipv6 dhcp snooping binding database filename { *filename* | **url** *url* [**username** *username* [**password** { **cipher** | **simple** } *string*]] }

   By default, the DHCPv6 snooping device does not back up the DHCPv6 snooping entries.

3. (Optional.) Manually save DHCPv6 snooping entries to the backup file.

   ipv6 dhcp snooping binding database update now

4. (Optional.) Set the waiting time after a DHCPv6 snooping entry change for the DHCPv6 snooping device to update the backup file.

   ipv6 dhcp snooping binding database update interval *interval*

   By default, the DHCP snooping device waits 300 seconds to update the backup file after a DHCP snooping entry change. If no DHCP snooping entry changes, the backup file is not updated.

Setting the maximum number of DHCPv6 snooping entries

About setting the maximum number of DHCPv6 snooping entries

Perform this task to prevent the system resources from being overused.

Procedure

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Set the maximum number of DHCPv6 snooping entries for the interface to learn.
   ipv6 dhcp snooping max-learning-num *max-number*
   By default, the number of DHCPv6 snooping entries for an interface to learn is not limited.

Configuring DHCPv6 packet rate limit

About DHCPv6 packet rate limit

This DHCPv6 packet rate limit feature discards exceeding DHCPv6 packets to prevent attacks that send large numbers of DHCPv6 packets.

Restrictions and guidelines

The rate set on the Layer 2 aggregate interface applies to all members of the aggregate interface. If a member interface leaves the aggregation group, it uses the rate set in its Ethernet interface view.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the maximum rate at which an interface can receive DHCPv6 packets.
   ipv6 dhcp snooping rate-limit *rate*
   By default, incoming DHCPv6 packets on an interface are not rate limited.

Configuring DHCPv6 snooping security features

Enabling DHCPv6-REQUEST check

About DHCPv6-REQUEST check

Perform this task to use the DHCPv6-REQUEST check feature to protect the DHCPv6 server against DHCPv6 client spoofing attacks. Attackers can forge DHCPv6-RENEW messages to renew leases for legitimate DHCPv6 clients that no longer need the IP addresses. The forged messages disable the victim DHCPv6 server from releasing the IP addresses. Attackers can also forge DHCPv6-DECLINE or DHCPv6-RELEASE messages to terminate leases for legitimate DHCPv6 clients that still need the IP addresses.

The DHCPv6-REQUEST check feature enables the DHCPv6 snooping device to check every received DHCPv6-RENEW, DHCPv6-DECLINE, or DHCPv6-RELEASE message against DHCPv6 snooping entries.

- If any criterion in an entry is matched, the device compares the entry with the message information.
  - If they are consistent, the device considers the message valid and forwards it to the DHCPv6 server.
  - If they are different, the device considers the message forged and discards it.
- If no matching entry is found, the device forwards the message to the DHCPv6 server.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable DHCPv6-REQUEST check.
   ipv6 dhcp snooping check request-message
   By default, DHCPv6-REQUEST check is disabled.

Configuring a DHCPv6 packet blocking port

About DHCPv6 packet blocking port

Perform this task to configure a port as a DHCPv6 packet blocking port. The DHCPv6 packet blocking port drops all incoming DHCP requests.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the port to block DHCPv6 requests.
   ipv6 dhcp snooping deny
   By default, the port does not block DHCPv6 requests.

CAUTION:
To avoid IPv6 address and prefix acquisition failure, configure a port to block DHCPv6 packets only if no DHCPv6 clients are connected to it.

Enabling DHCPv6 snooping logging and alarm

Enabling DHCPv6 snooping logging

About DHCPv6 snooping logging

The DHCPv6 snooping logging feature enables the DHCPv6 snooping device to generate DHCPv6 snooping logs and send them to the information center. The information helps administrators locate and solve problems. For information about the log destination and output rule configuration in the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

As a best practice, disable this feature if the log generation affects the device performance.

Procedure

1. Enter system view.
   system-view
2. Enable DHCPv6 snooping logging.
   ipv6 dhcp snooping log enable
   By default, DHCPv6 snooping logging is disabled.

Disabling DHCPv6 snooping on an interface

About disabling DHCPv6 snooping on an interface

This feature allows you to narrow down the interface range where DHCPv6 snooping takes effect. For example, to enable DHCP snooping globally except for a specific interface, you can enable DHCPv6 snooping globally and disable DHCPv6 snooping on the target interface.

Procedure

1. Enter system view.
   system-view
2. Enter interface view
   interface *interface-type interface-number*
3. Disable DHCPv6 snooping on the interface.
   ipv6 dhcp snooping disable
   By default:
   - If you enable DHCPv6 snooping globally or for a VLAN, DHCPv6 snooping is enabled on all interfaces on the device or on all interfaces in the VLAN.
   - If you do not enable DHCPv6 snooping globally or for a VLAN, DHCPv6 snooping is disabled on all interfaces on the device or on all interfaces in the VLAN.

Display and maintenance commands for DHCPv6 snooping

Execute **display** commands in any view, and **reset** commands in user view.

Task	Command
Display DHCPv6 snooping address entries.	**display ipv6 dhcp snooping binding** [**address** *ipv6-address* [**vlan** *vlan-id*]]
Display information about the file that stores DHCPv6 snooping entries.	**display ipv6 dhcp snooping binding database**
Display DHCPv6 packet statistics for DHCPv6 snooping.	**display ipv6 dhcp snooping packet statistics** [**slot** *slot-number*]
Display DHCPv6 snooping prefix entries.	**display ipv6 dhcp snooping pd binding** [**prefix** *prefix/prefix-length* [**vlan** *vlan-id*]]
Display information about trusted ports.	**display ipv6 dhcp snooping trust**

Task	Command
Clear DHCPv6 snooping address entries.	**reset ipv6 dhcp snooping binding** { **all** | **address** *ipv6-address* [**vlan** *vlan-id*] }
Clear DHCPv6 packet statistics for DHCPv6 snooping.	**reset ipv6 dhcp snooping packet statistics** [**slot** *slot-number*]
Clear DHCPv6 snooping prefix entries.	**reset ipv6 dhcp snooping pd binding** { **all** | **prefix** *prefix/prefix-length* [**vlan** *vlan-id*] }

DHCPv6 snooping configuration examples

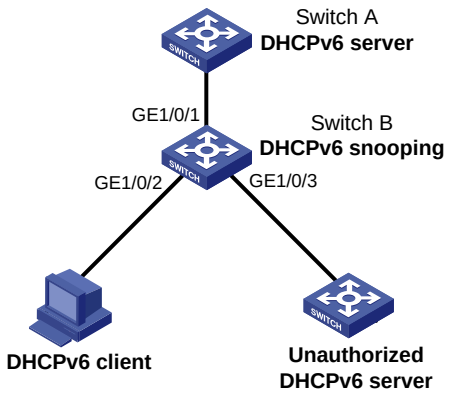
Example: Configuring DHCPv6 snooping globally

Network configuration

As shown in Figure 22, Switch B is connected to the authorized DHCPv6 server through GigabitEthernet 1/0/1, to the unauthorized DHCPv6 server through GigabitEthernet 1/0/3, and to the DHCPv6 client through GigabitEthernet 1/0/2.

Configure only the port connected to the authorized DHCPv6 server to forward the responses from the DHCPv6 server. Enable the DHCPv6 snooping device to record DHCPv6 snooping address entries.

Figure 22 Network diagram



Procedure

Enable DHCPv6 snooping.

```
<SwitchB> system-view
[SwitchB] ipv6 dhcp snooping enable
```

Specify GigabitEthernet 1/0/1 as a trusted port.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] ipv6 dhcp snooping trust
[SwitchB-GigabitEthernet1/0/1] quit
```

Enable recording DHCPv6 snooping address entries on GigabitEthernet 1/0/2.

```
[SwitchB]interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] ipv6 dhcp snooping binding record
[SwitchB-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Verify that the DHCPv6 client obtains an IPv6 address and all other configuration parameters only from the authorized DHCPv6 server. (Details not shown.)

Display DHCPv6 snooping address entries on the DHCPv6 snooping device.

```
[SwitchB] display ipv6 dhcp snooping binding
```

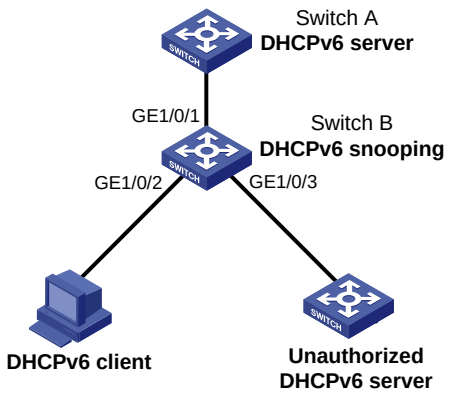
Example: Configuring DHCPv6 snooping for a VLAN

Network configuration

As shown in Figure 23, Switch B is connected to the authorized DHCPv6 server through GigabitEthernet 1/0/1, to the unauthorized DHCPv6 server through GigabitEthernet 1/0/3, and to the DHCPv6 client through GigabitEthernet 1/0/2.

In VLAN 100, configure only the port connected to the authorized DHCPv6 server to forward the responses from the DHCPv6 server. Enable the DHCPv6 snooping device to record DHCPv6 snooping address entries.

Figure 23 Network diagram



Procedure

Assign access ports GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 to VLAN 100.

```
<SwitchB> system-view
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
[SwitchB-vlan100] quit
```

Enable DHCPv6 snooping for VLAN 100.

```
[SwitchB] ipv6 dhcp snooping enable vlan 100
```

Configure GigabitEthernet 1/0/1 as a trusted port in VLAN 100.

```
[SwitchB] vlan 100
```

```
[SwitchB-vlan100] ipv6 dhcp snooping trust interface gigabitethernet 1/0/1
```

Enable recording DHCPv6 snooping entries in VLAN 100.

```
[SwitchB-vlan100] ipv6 dhcp snooping binding record
[SwitchB-vlan100] quit
```

Verifying the configuration

Verify that the DHCPv6 client obtains an IPv6 address and all other configuration parameters only from the authorized DHCPv6 server. (Details not shown.)

Display DHCPv6 snooping address entries on the DHCPv6 snooping device.

```
[SwitchB] display ipv6 dhcp snooping binding
```

Configuring DHCPv6 guard

About DHCPv6 guard

The DHCPv6 guard feature filters DHCPv6 Advertise and Reply messages by using DHCPv6 guard policies to make sure DHCPv6 clients obtain addresses/prefixes from authorized DHCPv6 servers. To provide finer level of filtering granularity, you can specify the following parameters for a DHCPv6 guard policy:

- Device role of the device that attached to the target interface or VLAN. The interface or VLAN to which the DHCPv6 guard policy is applied is called the target interface or VLAN.
- DHCPv6 server match criterion.
- Match criterion for IPv6 addresses/prefixes assigned by DHCPv6 servers.
- Allowed DHCPv6 server preference range.

To meet requirements of DHCPv6 clients in different locations, apply DHCPv6 guard policies to different interfaces or VLANs on the same device.

DHCPv6 guard operating mechanism

Upon receiving a DHCPv6 Solicit or Request message, the DHCPv6 guard device forwards the message without performing the DHCPv6 guard policy check.

When receiving a DHCPv6 reply, the DHCPv6 guard device performs the DHCPv6 guard policy check in the following order:

1. Examines whether the receiving port is a trusted port. The device forwards the message if the message is from the a trusted port.

   Configure trusted ports in a DHCPv6 guard policy only in one of the following conditions:

   - The port to which the DHCPv6 guard policy applies is connected to an authorized server.
   - All ports in the VLAN to which the DHCPv6 guard policy applies are connected to authorized servers.

2. Examines the message based on the device role:

   - If the message is received from the device with the DHCPv6 client device role, the device drops the message.

     If the interface to which the DHCPv6 guard policy applies is not connected to any authorized DHCPv6 servers, set the device role to **client** for the policy, as shown in Figure 24.

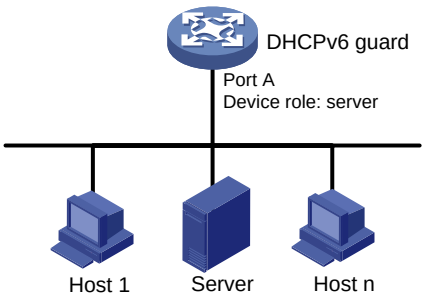
     Figure 24 Setting the device role to client

     
   - If the message is received from the device with the DHCPv6 server device role, the device examines the message as follows:

- For an Advertise message, the message passes the policy check if the source IP address in the message is permitted by the ACL and the server preference is in the match range.
- For a Reply message, the message passes the policy check if the assigned IPv6 addresses/prefixes in the message are permitted by the ACL.

If the interface to which the DHCPv6 guard policy applies is connected to an authorized DHCPv6 server, set the device role to **server** for the policy, as shown in Figure 25.

Figure 25 Setting the device role to server



The device forwards the reply after the message passes the DHCPv6 guard policy check.

Restrictions and guidelines: DHCPv6 guard configuration

The DHCPv6 guard feature operates correctly only when the device is located between the DHCPv6 client and the DHCPv6 server or between the DHCPv6 client and the DHCPv6 relay agent. If the device is located between the DHCPv6 server and the DHCPv6 relay agent, the DHCPv6 guard feature cannot operate correctly.

When the DHCPv6 guard feature is configured on a DHCPv6 snooping device, both features can take effect. The device forwards DHCPv6 reply packets received on a DHCPv6 snooping trusted port only if they pass the DHCPv6 guard check. These packets are dropped if they fail the DHCPv6 guard check.

DHCPv6 guard tasks at a glance

To configure DHCPv6 guard, perform the following tasks:

1. Configuring a DHCPv6 guard policy
2. Applying the DHCPv6 guard policy

   Choose the following tasks as needed:

   - Applying a DHCPv6 guard policy to an interface
   - Applying a DHCPv6 guard policy to a VLAN

   If DHCPv6 guard polices are applied to both an interface and the VLAN of the interface, the interface-specific policy is used on the interface.

Configuring a DHCPv6 guard policy

1. Enter system view.

   ```
   system-view
   ```

2. Create a DHCPv6 guard policy and enter its view.
   ipv6 dhcp guard policy *policy-name*
3. Specify the role of the device attached to the target interface or VLAN.
   device-role { **client** | **server** }
   By default, the device role is DHCPv6 client for the device attached to the target interface or VLAN.
4. Configure a DHCPv6 guard policy.
   - Configure a DHCPv6 server match criterion.
     if-match server acl { *acl-number* | **name** *acl-name* }
     By default, no DHCPv6 server match criterion is configured, and all DHCPv6 servers are authorized.
   - Configure a match criterion for the assigned IPv6 addresses/prefixes.
     if-match reply acl { *acl-number* | **name** *acl-name* }
     By default, no match criterion is configured for the assigned IPv6 addresses/prefixes, and all assigned IPv6 addresses/prefixes can pass the address/prefix check.
   - Configure an allowed DHCPv6 server preference range.
     preference { **max** *max-value* | **min** *min-value* } *
     By default, no DHCPv6 server preference range is configured, and DHCPv6 servers with preferences 1 to 255 can pass the preference check.
   - Configure the port to which the policy applies as a trusted port for the policy.
     trust port
     By default, no trusted port is configured for a DHCPv6 guard policy.

Applying a DHCPv6 guard policy to an interface

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   interface *interface-type interface-number*
3. Apply a DHCPv6 guard policy to the interface.
   ipv6 dhcp guard apply policy *policy-name*
   By default, no DHCPv6 guard policy is applied to the interface.

Applying a DHCPv6 guard policy to a VLAN

1. Enter system view.
   system-view
2. Create a VLAN and enter its view.
   vlan *vlan-number*
3. Apply a DHCPv6 guard policy to the VLAN.
   ipv6 dhcp guard apply policy *policy-name*
   By default, no DHCPv6 guard policy is applied to the VLAN.

Display and maintenance commands for DHCPv6 guard

Execute **display** commands in any view.

Task	Command
Display information about DHCPv6 guard policies.	**display ipv6 dhcp guard policy** [*policy-name*]

DHCPv6 guard configuration examples

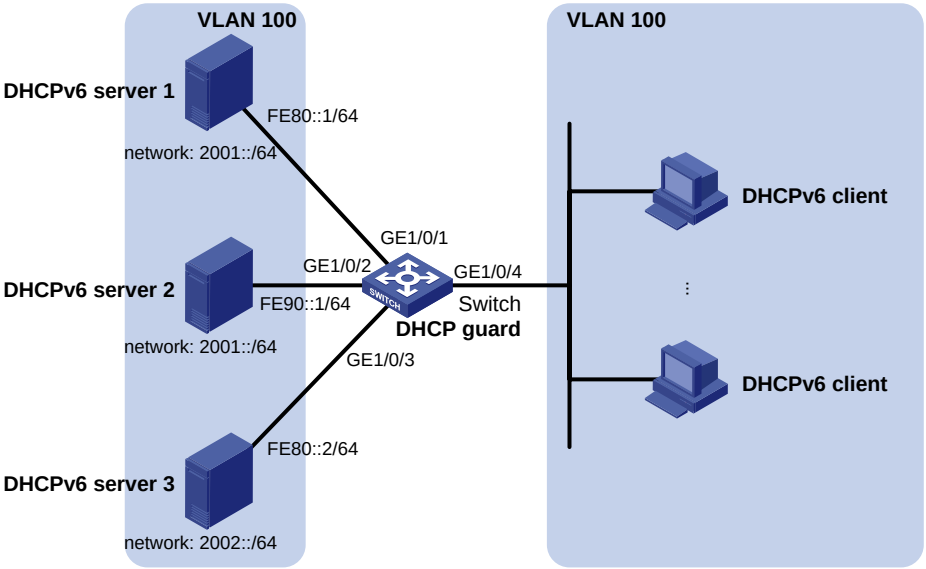
Example: Configuring DHCPv6 guard

Network configuration

As shown in Figure 26, all DHCPv6 servers and clients are in VLAN 100. The assignable IPv6 address ranges on the DHCPv6 server 1, server 2, and server 3 are 2001::/64, 2001::/64, and 2002::/64, respectively.

Configure DHCPv6 guard on the switch, so that the switch forwards only DHCPv6 replies with the source IPv6 address in the range of FE80::/12 and assigned prefixes in the range of 2001::/16.

Figure 26 Network diagram



Procedure

Before you configure DHCPv6 guard, complete the configuration on DHCPv6 servers.

Create VLAN 100, and assign GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, GigabitEthernet 1/0/3, and GigabitEthernet 1/0/4 to VLAN 100.

```
<Switch> system-view
[Switch] vlan 100
[Switch-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
[Switch-vlan100] quit
```

Create an IPv6 basic ACL numbered 2001.

```
[Switch] acl ipv6 number 2001
```

Create rule **1** to permit only packets with source IPv6 addresses in the range of FE80::/12.

```
[Switch-acl-ipv6-basic-2001] rule 1 permit source fe80:: 12
[Switch-acl-ipv6-basic-2001] quit
```

Create an IPv6 basic ACL numbered 2002.

```
[Switch] acl ipv6 number 2002
```

Create rule **1** to permit only packets with source IPv6 addresses in the range of 2001::/16.

```
[Switch-acl-ipv6-basic-2002] rule 1 permit source 2001:: 16
[Switch-acl-ipv6-basic-2002] quit
```

Create DHCPv6 guard policy named **p1**.

```
[Switch] ipv6 dhcp guard policy p1
```

Set the device role to the DHCPv6 server for the device attached to the target VLAN.

```
[Switch-dhcp6-guard-policy-p1] device-role server
```

Specify ACL 2001 to match DHCPv6 servers.

```
[Switch-dhcp6-guard-policy-p1] if-match server acl 2001
```

Specify ACL 2002 to match IPv6 addresses/prefixes assigned by DHCPv6 servers.

```
[Switch-dhcp6-guard-policy-p1] if-match reply acl 2002
[Switch-dhcp6-guard-policy-p1] quit
```

Create DHCPv6 guard policy named **p2**.

```
[Switch] ipv6 dhcp guard policy p2
```

Set the device role to the DHCPv6 client for the device attached to the target interface.

```
[Switch-dhcp6-guard-policy-p2] device-role client
[Switch-dhcp6-guard-policy-p2] quit
```

Apply DHCPv6 guard policy **p1** to VLAN 100.

```
[Switch] vlan 100
[Switch-vlan100] ipv6 dhcp guard apply policy p1
[Switch-vlan100] quit
```

Apply DHCPv6 guard policy **p2** to GigabitEthernet 1/0/4.

```
[Switch]interface gigabitethernet 1/0/4
[Switch-GigabitEthernet1/0/4] ipv6 dhcp guard apply policy p2
[Switch-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Verify that the switch forwards DHCPv6 replies with the source IPv6 address in the range of FE80::/12 and the assigned IPv6 prefixes in the range of 2001::/16. The switch forwards DHCPv6 replies from the DHCPv6 server 1 and drops replies from DHCPv6 server 2 and server 3.

Contents

Configuring IPv6 fast forwarding

About IPv6 fast forwarding

Fast forwarding reduces route lookup time and improves packet forwarding efficiency by using a high-speed cache and data-flow-based technology. It identifies a data flow by using the following fields:

- Source IPv6 address.
- Destination IPv6 address.
- Source port number.
- Destination port number.
- Protocol number.

After a flow's first packet is forwarded through the routing table, fast forwarding creates an entry and uses the entry to forward subsequent packets of the flow.

Configuring the aging time for IPv6 fast forwarding entries

About aging time for IPv6 fast forwarding entries

The IPv6 fast forwarding table uses an aging timer for each forwarding entry. If an entry is not updated before the timer expires, the device deletes the entry. If an entry has a hit within the aging time, the aging timer restarts.

Procedure

1. Enter system view.
   `system-view`
2. Set the aging time for IPv6 fast forwarding entries.
   `ipv6 fast-forwarding aging-time` *`aging-time`*
   By default, the aging time is 30 seconds.

Configuring IPv6 fast forwarding load sharing

About IPv6 fast forwarding load sharing

IPv6 fast forwarding load sharing enables the device to identify a data flow by using the packet information.

If IPv6 fast forwarding load sharing is disabled, the device identifies a data flow by the packet information and the input interface.

Procedure

1. Enter system view.
   `system-view`
2. Configure IPv6 fast forwarding load sharing. Choose one option as needed:
   - Enable IPv6 fast forwarding load sharing.
     `Ipv6 fast-forwarding load-sharing`

- Disable IPv6 fast forwarding load sharing.
  undo ipv6 fast-forwarding load-sharing

By default, IPv6 fast forwarding load sharing is enabled.

Display and maintenance commands for IPv6 fast forwarding

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the aging time of the IPv6 fast forwarding entries.	**display ipv6 fast-forwarding aging-time**
Display IPv6 fast forwarding entries.	**display ipv6 fast-forwarding cache** [*ipv6-address*] [**slot** *slot-number*]
Clear the IPv6 fast forwarding table.	**reset ipv6 fast-forwarding cache** [**slot** *slot-number*]

Contents

Configuring HTTP redirect

About HTTP redirect

HTTP redirect is a method to redirect users' HTTP or HTTPS requests to a specific URL. It is used in the following features:

- Redirect URL assignment in 802.1X authentication, MAC authentication, Web authentication, and port security.
- EAD assistant URL redirection in 802.1X authentication.
- URL redirection services in portal.

Restrictions and guidelines: HTTP redirect configuration

For URL redirection to function correctly in 802.1X authentication, MAC authentication, Web authentication, port security, and EAD assistant, make sure the packet incoming VLANs have Layer 3 interfaces (VLAN interfaces) configured. Otherwise, redirection of HTTPS requests will fail.

HTTP redirect tasks at a glance

No configuration is required to redirect HTTP requests.

To redirect HTTPS requests, perform the following tasks:

1. Specifying the HTTPS redirect listening port number
2. (Optional.) Associating an SSL server policy with the HTTPS redirect service

Specifying the HTTPS redirect listening port number

About the HTTPS redirect listening port number

The device can redirect HTTPS requests only after you specify the TCP port number on which the HTTPS redirect service listens for HTTPS requests.

Restrictions and guidelines

To avoid service unavailability caused by port conflict, do not specify a TCP port number used by a well-known protocol or used by any other TCP-based service. To display TCP port numbers that have been used by services, use the **`display tcp`** command. For more information about this command, see IP performance optimization commands in *Layer 3—IP Services Command Reference*.

If you perform this task multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.

   `system-view`
2. Specify the HTTPS redirect listening port number.

http-redirect https-port *port-number*

By default, the HTTPS redirect listening port number is 6654.

Associating an SSL server policy with the HTTPS redirect service

About associating an SSL server policy with the HTTPS redirect service

To improve the security of HTTPS redirect, you can associate an SSL server policy with the HTTPS redirect service. For more information about the SSL server policy configuration, see SSL in *Security Configuration Guide*.

Restrictions and guidelines

HTTPS redirect is unavailable if the associated SSL server policy does not exist. You can first associate a nonexistent SSL server policy with the HTTPS redirect service and then configure the SSL server policy.

If you change the SSL server policy associated with the HTTPS redirect service, the new policy takes effect immediately.

If you perform this task multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.

   system-view

2. Associate an SSL server policy with the HTTPS redirect service.

   http-redirect ssl-server-policy *policy-name*

   By default, no SSL server policy is associated with the HTTPS redirect service. The HTTPS redirect service uses the self-assigned certificate and the default SSL parameters.

Contents

NAT overview

Network Address Translation (NAT) translates an IP address in the IP packet header to another IP address. Typically, NAT is configured on gateways to enable private hosts to access external networks and external hosts to access private network resources such as a Web server.

Basic NAT concepts

The following describes basic NAT concepts:

- **NAT device**—A device configured with NAT. Typically, NAT is configured on the edge device that connects the internal and external networks.
- **NAT interface**—An interface configured with NAT.
- **NAT address**—A public IP address used for address translation, and this address is reachable from the external network.
- **NAT entry**—Stores the mapping between a private IP address and a public IP address.

Basic NAT operating mechanism

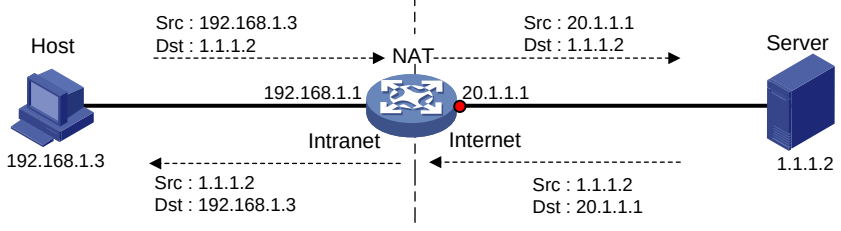
Figure 1 shows the basic NAT operating mechanism.

1. Upon receiving a request from the host to the server, NAT translates the private source address 192.168.1.3 to the public address 20.1.1.1 and forwards the NATed packet. NAT adds a mapping for the two addresses to its NAT table.
2. Upon receiving a response from the server, NAT translates the destination public address to the private address, and forwards the packet to the host.

The NAT operation is transparent to the terminals (the host and the server). NAT hides the private network from the external users and shows that the IP address of the internal host is 20.1.1.1.

Figure 1 Basic NAT operation

Direction	Before NAT	After NAT
Outbound	192.168.1.3	20.1.1.1
Inbound	20.1.1.1	192.168.1.3



Restrictions: Software version compatibility with NAT

The NAT feature is supported only in Release 6328 and later.

Configuring outbound one-to-one static NAT

About this task

Static NAT creates a fixed mapping between a private address and a public address. It supports connections initiated from internal users to the external network and from external users to the internal network. Static NAT applies to regular communications.

For address translation from a private IP address to a public IP address, configure outbound one-to-one static NAT on the interface connected to the external network.

- When the source IP address of an outgoing packet matches the *local-ip*, the source IP address is translated into the *global-ip*.
- When the destination IP address of an incoming packet matches the *global-ip*, the destination IP address is translated into the *local-ip*.

Restrictions and guidelines

If you configure modular QoS configuration (MQC) on a device enabled with static NAT, packets that match an ACL rule are sent to the CPU. If the packet IP addresses match a NAT rule, the device generates NAT sessions and performs forwarding in software, which might cause packet loss of established NAT sessions.

Procedure

1. Enter system view.
   system-view
2. Configure a one-to-one mapping for outbound static NAT.
   nat static outbound *local-ip global-ip*
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable static NAT on the interface.
   nat static enable
   By default, static NAT is disabled.

Display and maintenance commands for NAT

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display NAT sessions.	**display nat session** [{ **source-ip** *source-ip* | **destination-ip** *destination-ip* } *] [**slot** *slot-number*] [**verbose**]
Display static NAT mappings.	**display nat static**
Clear NAT sessions.	**reset nat session**

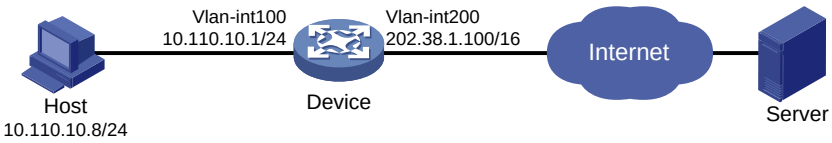
NAT configuration examples

Example: Configuring outbound one-to-one static NAT

Network configuration

Configure static NAT to allow the host at 10.110.10.8/24 to access the Internet.

Figure 2 Network diagram



Procedure

Specify IP addresses for the interfaces on the device. (Details not shown.)

Configure a one-to-one static NAT mapping between the private address 10.110.10.8 and the public address 202.38.1.100.

```
<Device> system-view
[Device] nat static outbound 10.110.10.8 202.38.1.100
```

Enable static NAT on VLAN-interface 200.

```
[Device] interface vlan-interface 200
[Device-Vlan-interface200] nat static enable
[Device-Vlan-interface200] quit
```

Verifying the configuration

Verify that the host at 10.110.10.8/24 can access the server on the Internet. (Details not shown.)

Display static NAT configuration.

```
[Device] display nat static
Static NAT mappings:
  Totally 1 outbound static NAT mappings.
  IP-to-IP:
    Local IP     : 10.110.10.8
    Global IP    : 202.38.1.100
    Config status: Active

Interfaces enabled with static NAT:
  Totally 1 interfaces enabled with static NAT.
  Interface: Vlan-interface200
    Service card : ---
    Config status: Active
```

Display NAT session information.

```
[Device] display nat session verbose
Initiator:
  Source      IP/port: 10.110.10.8/42496
  Destination IP/port: 202.38.1.111/2048
  DS-Lite tunnel peer: -
  VPN instance/VLAN ID/VLL ID: -/-/-
```

```
  Protocol: ICMP(1)
  Inbound interface: Vlan-interface100
Responder:
  Source      IP/port: 202.38.1.111/42496
  Destination IP/port: 202.38.1.100/0
  DS-Lite tunnel peer: -
  VPN instance/VLAN ID/VLL ID: -/-/-
  Protocol: ICMP(1)
  Inbound interface: Vlan-interface200
State: ICMP_REPLY
Application: INVALID
Start time: 2021-04-13 09:30:49  TTL: 27s
Initiator->Responder:            5 packets        420 bytes
Responder->Initiator:            5 packets        420 bytes

Total sessions found: 1
```

Layer 3—IP Routing Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

New H3C Technologies Co., Ltd.
http://www.h3c.com

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This configuration guide describes the routing fundamentals and configuration procedures. It covers the mainstream routing protocols for IPv4 and IPv6 networks, and describes how to use policies to filter routes and affect routing decisions.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** >

Convention	Description
	Folder.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
ⓘ **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring basic IP routing

This chapter focuses on unicast routing protocols. For more information about multicast routing protocols, see *IP Multicast Configuration Guide*.

About IP routing

IP routing directs IP packet forwarding on routers. Based on the destination IP address in the packet, a router looks up a route for the packet in a routing table and forwards the packet to the next hop. Routes are path information used to direct IP packets.

Routing table

A RIB contains the global routing information and related information, including route recursion, route redistribution, and route extension information. The router selects optimal routes from the routing table and puts them into the FIB table. It uses the FIB table to forward packets. For more information about the FIB table, see *Layer 3—IP Services Configuration Guide*.

Route categories

Table 1 categorizes routes by different criteria.

Table 1 Route categories

Criterion	Categories
Origin	• **Direct route**—A direct route is discovered by the data link protocol on an interface, and is also called an interface route. • **Static route**—A static route is manually configured by an administrator. • **Dynamic route**—A dynamic route is dynamically discovered by a routing protocol.
Destination	• **Network route**—The destination is a network. The subnet mask is less than 32 bits. • **Host route**—The destination is a host. The subnet mask is 32 bits.
Whether the destination is directly connected	• **Direct route**—The destination is directly connected. • **Indirect route**—The destination is indirectly connected.

Dynamic routing protocols

Static routes work well in small, stable networks. They are easy to configure and require fewer system resources. However, in networks where topology changes occur frequently, a typical practice is to configure a dynamic routing protocol. Compared with static routing, a dynamic routing protocol is complicated to configure, requires more router resources, and consumes more network resources.

Dynamic routing protocols dynamically collect and report reachability information to adapt to topology changes. They are suitable for large networks.

Dynamic routing protocols can be classified by different criteria, as shown in Table 2.

Table 2 Categories of dynamic routing protocols

Criterion	Categories
Operation scope	• **IGPs**—Work within an AS. Examples include RIP, OSPF, and IS-IS. • **EGPs**—Work between ASs. The most popular EGP is BGP.
Routing algorithm	• **Distance-vector protocols**—Examples include RIP and BGP. BGP is also considered a path-vector protocol. • **Link-state protocols**—Examples include OSPF and IS-IS.
Destination address type	• **Unicast routing protocols**—Examples include RIP, OSPF, BGP, and IS-IS. • **Multicast routing protocols**—Examples include PIM-SM and PIM-DM.
IP version	• **IPv4 routing protocols**—Examples include RIP, OSPF, BGP, and IS-IS. • **IPv6 routing protocols**—Examples include RIPng, OSPFv3, IPv6 BGP, and IPv6 IS-IS.

An AS refers to a group of routers that use the same routing policy and work under the same administration.

Route preference

Routing protocols, including static and direct routing, each by default have a preference. If they find multiple routes to the same destination, the router selects the route with the highest preference as the optimal route.

The preference of a direct route is always 0 and cannot be changed. You can configure a preference for each static route and each dynamic routing protocol. The following table lists the route types and default preferences. The smaller the value, the higher the preference.

Table 3 Route types and default route preferences

Route type	Preference
Direct route	0
Multicast static route	1
OSPF	10
IS-IS	15
Unicast static route	60
RIP	100
OSPF ASE	150
OSPF NSSA	150
IBGP	255
EBGP	255
Unknown (route from an untrusted source)	256

Route backup

Route backup can improve network availability. Among multiple routes to the same destination, the route with the highest priority is the primary route and others are secondary routes.

The router forwards matching packets through the primary route. When the primary route fails, the route with the highest preference among the secondary routes is selected to forward packets. When the primary route recovers, the router uses it to forward packets.

Route recursion

To use a BGP, static, or RIP route that has an indirectly connected next hop, a router must perform route recursion to find the output interface to reach the next hop.

Link-state routing protocols, such as OSPF and IS-IS, do not need route recursion, because they obtain directly connected next hops through route calculation.

The RIB records and saves route recursion information, including brief information about related routes, recursive paths, and recursion depth.

Route redistribution

Route redistribution enables routing protocols to learn routing information from each other. A dynamic routing protocol can redistribute routes from other routing protocols, including direct and static routing. For more information, see the respective chapters on those routing protocols in this configuration guide.

The RIB records redistribution relationships of routing protocols.

Extension attribute redistribution

Extension attribute redistribution enables routing protocols to learn route extension attributes from each other, including BGP extended community attributes, OSPF area IDs, route types, and router IDs.

The RIB records extended attributes of each routing protocol and redistribution relationships of different routing protocol extended attributes.

Setting the maximum lifetime for routes and labels in the RIB

About setting the maximum lifetime for routes and labels in the RIB

Perform this task to prevent routes of a certain protocol from being aged out due to slow protocol convergence resulting from a large number of route entries or long GR period.

Restrictions and guidelines

The configuration takes effect at the next protocol or RIB process switchover.

Procedure (IPv4)

1. Enter system view.
   system-view
2. Enter RIB view.
   rib
3. Create the RIB IPv4 address family and enter its view.
   address-family ipv4
4. Set the maximum lifetime for IPv4 routes and labels in the RIB.
   protocol *protocol* [**instance** *instance-name*] **lifetime** *seconds*

By default, the maximum lifetime for routes and labels in the RIB is 480 seconds.

Procedure (IPv6)

1. Enter system view.
   system-view
2. Enter RIB view.
   rib
3. Create the RIB IPv6 address family and enter its view.
   address-family ipv6
4. Set the maximum lifetime for IPv6 routes and labels in the RIB.
   protocol *protocol* [**instance** *instance-name*] **lifetime** *seconds*
   By default, the maximum lifetime for routes and labels in the RIB is 480 seconds.

Setting the maximum lifetime for routes in the FIB

About setting the maximum lifetime for routes in the FIB

When GR or NSR is disabled, FIB entries must be retained for some time after a protocol process switchover or RIB process switchover. When GR or NSR is enabled, FIB entries must be removed immediately after a protocol or RIB process switchover to avoid routing issues. Perform this task to meet such requirements.

Procedure (IPv4)

1. Enter system view.
   system-view
2. Enter RIB view.
   rib
3. Create the RIB IPv4 address family and enter its view.
   address-family ipv4
4. Set the maximum lifetime for IPv4 routes in the FIB.
   fib lifetime *seconds*
   By default, the maximum lifetime for routes in the FIB is 600 seconds.

Procedure (IPv6)

1. Enter system view.
   system-view
2. Enter RIB view.
   rib
3. Create the RIB IPv6 address family and enter its view.
   address-family ipv6
4. Set the maximum lifetime for IPv6 routes in the FIB.
   fib lifetime *seconds*
   By default, the maximum lifetime for routes in the FIB is 600 seconds.

Configuring RIB NSR

About RIB NSR

When an active/standby switchover occurs, nonstop routing (NSR) backs up routing information from the active process to the standby process to avoid routing flapping and ensure forwarding continuity.

RIB NSR provides faster route convergence than protocol NSR during an active/standby switchover.

Restrictions and guidelines

Use this feature with protocol GR or NSR to avoid route timeouts and traffic interruption.

Procedure (IPv4)

1. Enter system view.
   `system-view`
2. Enter RIB view.
   `rib`
3. Create the RIB IPv4 address family and enter its view.
   `address-family ipv4`
4. Enable IPv4 RIB NSR.
   `non-stop-routing`
   By default, RIB NSR is disabled.

Procedure (IPv6)

1. Enter system view.
   `system-view`
2. Enter RIB view.
   `rib`
3. Create the RIB IPv6 address family and enter its view.
   `address-family ipv6`
4. Enable IPv6 RIB NSR.
   `non-stop-routing`
   By default, RIB NSR is disabled.

Configuring inter-protocol FRR

About inter-protocol FRR

Inter-protocol fast reroute (FRR) enables fast rerouting between routes of different protocols. A backup next hop is automatically selected to reduce the service interruption time caused by unreachable next hops. When the next hop of the primary link fails, the traffic is redirected to the backup next hop.

Among the routes to the same destination in the RIB, a router adds the route with the highest preference to the FIB table. For example, if a static route and an OSPF route in the RIB have the same destination, the router adds the OSPF route to the FIB table by default. The next hop of the static route is selected as the backup next hop for the OSPF route. When the next hop of the OSPF route is unreachable, the backup next hop is used.

Restrictions and guidelines

This feature uses the next hop of a route from a different protocol as the backup next hop, which might cause loops.

Procedure (IPv4)

1. Enter system view.
   system-view
2. Enter RIB view.
   rib
3. Create the RIB IPv4 address family and enter its view.
   address-family ipv4
4. Enable IPv4 RIB inter-protocol FRR.
   inter-protocol fast-reroute
   By default, inter-protocol FRR is disabled.

Procedure (IPv6)

1. Enter system view.
   system-view
2. Enter RIB view.
   rib
3. Create the RIB IPv6 address family and enter its view.
   address-family ipv6
4. Enable IPv6 RIB inter-protocol FRR.
   inter-protocol fast-reroute
   By default, inter-protocol FRR is disabled.

Enabling route fast switchover

About enabling route fast switchover

This feature applies to a device that provides the same physical output interface for large numbers of routes, including primary/secondary routes. When a link failure occurs on the interface, the device must perform the following tasks before switching the traffic to another route:

1. Deletes all ARP or ND entries for the link.
2. Instructs the FIB to delete the associated FIB entries.

This procedure is time consuming and interrupts traffic for a long time. To resolve this problem, you can enable route fast switchover. This feature allows the device to instruct the FIB to delete the invalid FIB entries for route switchover first.

Procedure (IPv4)

1. Enter system view.
   system-view
2. Enable IPv4 route fast switchover.
   ip route fast-switchover enable
   By default, IPv4 route fast switchover is disabled.

Procedure (IPv6)

1. Enter system view.

system-view

2. Enable IPv6 route fast switchover.

   ipv6 route fast-switchover enable

   By default, IPv6 route fast switchover is disabled.

Configuring routing policy-based recursive lookup

About routing policy-based recursive lookup

Configure routing policy-based recursive lookup to control route recursion results. For example, when a route changes, the routing protocol has to perform a route recursion if the next hop is indirectly connected. The routing protocol might select an incorrect path, which can cause traffic loss. To resolve this issue, you can use a routing policy to filter out incorrect routes. The routes that pass the filtering of the routing policy will be used for route recursion.

Restrictions and guidelines

The **apply** clauses in the specified routing policy cannot take effect.

Make sure a minimum of one related route can match the routing policy for correct traffic forwarding.

Procedure

1. Enter system view.

   system-view

2. Enter RIB view.

   rib

3. Create the RIB IPv4 address family and enter its view.

   address-family ipv4

4. Configure routing policy-based recursive lookup.

   protocol *protocol* **nexthop recursive-lookup route-policy** *route-policy-name*

   By default, routing policy-based recursive lookup is not configured.

Setting the maximum number of active routes supported by the device

About setting the maximum number of active routes supported by the device

The feature allows you to set the maximum number of active IPv4/IPv6 routes supported by the device. When the maximum number of active IPv4/IPv6 routes is exceeded, the device still accepts new active routes but generates a system log message. You can take relevant actions based on the message to save system resources.

Procedure (IPv4)

1. Enter system view.

   system-view

2. Enter RIB view.

   rib

3. Create the RIB IPv4 address family and enter its view.

   address-family ipv4

4. Set the maximum number of active IPv4 routes supported by the device.

routing-table limit *number* **simply-alert**

By default, the maximum number of active IPv4 routes is not set for the device.

Configuration in RIB IPv4 address family view limits the number of active IPv4 routes for the public network.

Procedure (IPv6)

1. Enter system view.
   system-view
2. Enter RIB view.
   rib
3. Create the RIB IPv6 address family and enter its view.
   address-family ipv6
4. Set the maximum number of active IPv6 routes supported by the device.
   routing-table limit *number* **simply-alert**

   By default, the maximum number of active IPv6 routes is not set for the device.

   Configuration in RIB IPv6 address family view limits the number of active IPv6 routes for the public network.

Enabling MTP

About this task

Use maintenance probe (MTP) to locate faults for routing protocols depending on your network maintenance requirements. MTP enables the device to automatically perform the following operations upon expiration of a neighbor's hold timer:

1. Ping the neighbor or trace the route to the neighbor.
2. Record the ping or tracert results.

To view fault information, use the **display** commands of routing protocols, for example, the **display ospf troubleshooting** command. To view detailed MTP information, use the **display logbuffer** command.

Procedure

1. Enter system view.
   system-view
2. Enable MTP.
   maintenance-probe enable

   By default, MTP is disabled.

Display and maintenance commands for basic IP routing

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display routing table information.	**display ip routing-table** [**verbose**] **display ip routing-table** [**all-routes**]

Task	Command
Display information about routes permitted by an IPv4 basic ACL.	**display ip routing-table acl** *ipv4-acl-number* [**verbose**]
Display information about routes to a specific destination address.	**display ip routing-table** *ip-address* [*mask-length* | *mask*] [**longer-match**] [**verbose**]
Display information about routes to a range of destination addresses.	**display ip routing-table** *ip-address1* **to** *ip-address2* [**verbose**]
Display information about routes permitted by an IP prefix list.	**display ip routing-table prefix-list** *prefix-list-name* [**verbose**]
Display information about routes installed by a protocol.	**display ip routing-table protocol** *protocol* [**inactive** | **verbose**]
Display IPv4 route statistics.	**display ip routing-table** [**all-routes**] **statistics**
Display brief IPv4 routing table information.	**display ip routing-table summary**
Display IPv6 RIB GR state information.	**display ipv6 rib graceful-restart**
Display next hop information in the IPv6 RIB.	**display ipv6 rib nib** [**self-originated**] [*nib-id*] [**verbose**] **display ipv6 rib nib protocol** *protocol* [**verbose**]
Display next hop information for IPv6 direct routes.	**display ipv6 route-direct nib** [*nib-id*] [**verbose**]
Display IPv6 routing table information.	**display ipv6 routing-table** [**verbose**] **display ipv6 routing-table** [**all-routes**]
Display information about routes permitted by an IPv6 basic ACL.	**display ipv6 routing-table acl** *ipv6-acl-number* [**verbose**]
Display information about routes to an IPv6 destination address.	**display ipv6 routing-table** *ipv6-address* [*prefix-length*] [**longer-match**] [**verbose**]
Display information about routes to a range of IPv6 destination addresses.	**display ipv6 routing-table** *ipv6-address1* **to** *ipv6-address2* [**verbose**]
Display information about routes permitted by an IPv6 prefix list.	**display ipv6 routing-table prefix-list** *prefix-list-name* [**verbose**]
Display information about routes installed by an IPv6 protocol.	**display ipv6 routing-table protocol** *protocol* [**inactive** | **verbose**]
Display IPv6 route statistics.	**display ipv6 routing-table** [**all-routes**] **statistics**
Display brief IPv6 routing table information.	**display ipv6 routing-table summary**
Display RIB GR state information.	**display rib graceful-restart**

Task	Command
Display next hop information in the RIB.	**display rib nib** [**self-originated**] [*nib-id*] [**verbose**] **display rib nib protocol** *protocol* [**verbose**]
Display next hop information for direct routes.	**display route-direct nib** [*nib-id*] [**verbose**]
Clear IPv4 route statistics.	**reset ip routing-table statistics protocol** { *protocol* | **all** } **reset ip routing-table** [**all-routes**] **statistics protocol** { *protocol* | **all** }
Clear IPv6 route statistics.	**reset ipv6 routing-table statistics protocol** { *protocol* | **all** } **reset ipv6 routing-table** [**all-routes**] **statistics protocol** { **protocol** | **all** }

Contents

Configuring static routing

About static routes

Static routes are manually configured. If a network's topology is simple, you only need to configure static routes for the network to work correctly.

Static routes cannot adapt to network topology changes. If a fault or a topological change occurs in the network, the network administrator must modify the static routes manually.

Configuring a static route

1. Enter system view.

   system-view

2. Configure a static route.

   ip route-static *dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address* [**nexthop-index** *index-string*]] | *next-hop-address* [**nexthop-index** *index-string*] [**recursive-lookup host-route**] } [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, no static route is configured.

   You can associate Track with a static route to monitor the reachability of the next hops. For more information about Track, see *High Availability Configuration Guide*.

3. (Optional.) Enable periodic sending of ARP requests to the next hops of static routes.

   ip route-static arp-request interval *interval*

   By default, the device does not send ARP requests to the next hops of static routes.

4. (Optional.) Configure the default preference for static routes.

   ip route-static default-preference *default-preference*

   The default setting is 60.

Configuring a static route group

About static route groups

This task allows you to batch create static routes with different prefixes but the same output interface and next hop.

You can create a static route group, and specify the static group in the **ip route-static** command. All prefixes in the static route group will be assigned the next hop and output interface specified in the **ip route-static** command.

Procedure

1. Enter system view.

   system-view

2. Create a static route group and enter its view.

   ip route-static-group *group-name*

   By default, no static route group is configured.

3. Add a static route prefix to the static route group.

prefix *dest-address* { *mask-length* | *mask* }

By default, no static route prefix is added to the static route group.

4. Return to system view.

   quit

5. Configure a static route.

   ip route-static group *group-name* { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**recursive-lookup host-route**] } [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, no static route is configured.

Deleting static routes

About deleting static routes

To delete a static route, use the **undo ip route-static** command. To delete all static routes including the default route, use the **delete static-routes all** command.

Procedure

1. Enter system view.

   system-view

2. Delete all static routes.

   delete static-routes all

CAUTION:

This command might interrupt network communication and cause packet forwarding failure. Before executing the command, make sure you fully understand the potential impact on the network.

Configuring BFD for static routes

IMPORTANT:

Enabling BFD for a flapping route could worsen the situation.

About BFD

BFD provides a general-purpose, standard, medium-, and protocol-independent fast failure detection mechanism. It can uniformly and quickly detect the failures of the bidirectional forwarding paths between two routers for protocols, such as routing protocols.

For more information about BFD, see *High Availability Configuration Guide*.

Configuring BFD control packet mode

About BFD control packet mode

This mode uses BFD control packets to detect the status of a link bidirectionally at a millisecond level.

BFD control packet mode can be applied to static routes with a direct next hop or with an indirect next hop.

Restrictions and guidelines for BFD control packet mode

If you use BFD control packet mode at the local end, you must use this mode also at the peer end.

Configuring BFD control packet mode for a static route (direct next hop)

1. Enter system view.

   system-view

2. Configure BFD control packet mode for a static route.

   ip route-static *dest-address* { *mask-length* | *mask* } *interface-type interface-number next-hop-address* **bfd control-packet** [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD control packet mode for a static route is not configured.

Configuring BFD control packet mode for a static route (indirect next hop)

1. Enter system view.

   system-view

2. Configure BFD control packet mode for a static route.

   ip route-static *dest-address* { *mask-length* | *mask* } { *next-hop-address* **bfd control-packet bfd-source** *ip-address* [**preference** *preference*] [**tag tag-value**] [**description** *text*]

   By default, BFD control packet mode for a static route is not configured.

Configuring BFD echo packet mode

About BFD echo packet mode

With BFD echo packet mode enabled for a static route, the output interface sends BFD echo packets to the destination device, which loops the packets back to test the link reachability.

Restrictions and guidelines

You do not need to configure BFD echo packet mode at the peer end.

Do not use BFD for a static route with the output interface in spoofing state.

Procedure

1. Enter system view.

   system-view

2. Configure the source address of echo packets.

   bfd echo-source-ip *ip-address*

   By default, the source address of echo packets is not configured.

   For more information about this command, see *High Availability Command Reference*.

3. Configure BFD echo packet mode for a static route.

   ip route-static *dest-address* { *mask-length* | *mask* } *interface-type interface-number next-hop-address* **bfd echo-packet** [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

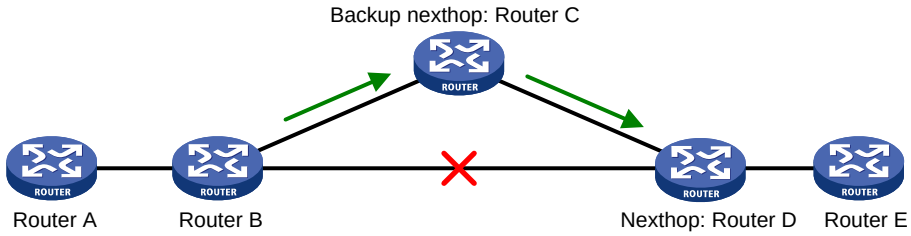
   By default, BFD echo packet mode for a static route is not configured.

Configuring static route FRR

About static route FRR

A link or router failure on a path can cause packet loss. Static route fast reroute (FRR) enables fast rerouting to minimize the impact of link or node failures.

Figure 1 Network diagram



As shown in Figure 1, upon a link failure, packets are directed to the backup next hop to avoid traffic interruption. You can either specify a backup next hop for FRR or enable FRR to automatically select a backup next hop (which must be configured in advance).

Restrictions and guidelines for static route FRR

- Do not use static route FRR and BFD (for a static route) at the same time.
- In addition to the configured static route for FRR, the device must have another route to reach the destination.

  When the state of the primary link (with Layer 3 interfaces staying up) changes from bidirectional to unidirectional or down, static route FRR quickly redirects traffic to the backup next hop. When the Layer 3 interfaces of the primary link are down, static route FRR temporarily redirects traffic to the backup next hop. In addition, the device searches for another route to reach the destination and redirects traffic to the new path if a route is found. If no route is found, traffic interruption occurs.

Configuring static route FRR by specifying a backup next hop

Restrictions and guidelines

A static route does not take effect when the backup output interface is unavailable.

To change the backup output interface or next hop, you must first remove the current setting. The backup output interface and next hop must be different from the primary output interface and next hop.

Procedure

1. Enter system view.

   system-view

2. Configure static route FRR.

   ip route-static *dest-address* { *mask-length* | *mask* } *interface-type interface-number* [*next-hop-address* [**backup-interface** *interface-type interface-number* [**backup-nexthop** *backup-nexthop-address*]]] [**permanent**] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, static route FRR is disabled.

Configuring static route FRR to automatically select a backup next hop

1. Enter system view.
   system-view
2. Configure static route FRR to automatically select a backup next hop.
   ip route-static fast-reroute auto
   By default, static route FRR is disabled from automatically selecting a backup next hop.

Enabling BFD echo packet mode for static route FRR

About BFD echo packet mode

By default, static route FRR uses ARP to detect primary link failures. Perform this task to enable static route FRR to use BFD echo packet mode for fast failure detection on the primary link.

Procedure

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source IP address of BFD echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interface's IP address.
   For more information about this command, see *High Availability Command Reference*.
3. Enable BFD echo packet mode for static route FRR.
   ip route-static primary-path-detect bfd echo
   By default, BFD echo packet mode for static route FRR is disabled.

Display and maintenance commands for static routing

Execute **display** commands in any view.

Task	Command
Display static route information.	**display ip routing-table protocol static** [**inactive** | **verbose**]
Display static route next hop information.	**display route-static nib** [*nib-id*] [**verbose**]
Display static routing table information.	**display route-static routing-table** [*ip-address* { *mask-length* | *mask* }]

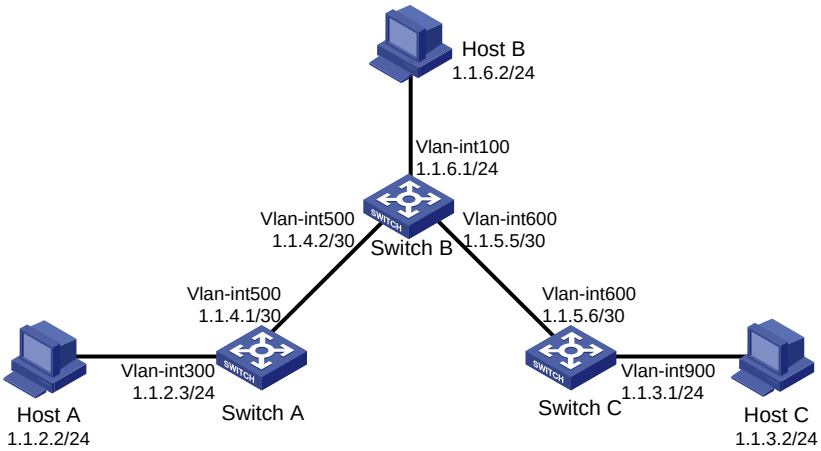
Static route configuration examples

Example: Configuring basic static routes

Network configuration

As shown in Figure 2, configure static routes on the switches for interconnections between any two hosts.

Figure 2 Network diagram



Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure static routes:

   # Configure a default route on Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ip route-static 0.0.0.0 0.0.0.0 1.1.4.2
   ```

   # Configure two static routes on Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ip route-static 1.1.2.0 255.255.255.0 1.1.4.1
   [SwitchB] ip route-static 1.1.3.0 255.255.255.0 1.1.5.6
   ```

   # Configure a default route on Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ip route-static 0.0.0.0 0.0.0.0 1.1.5.5
   ```

3. Configure the default gateways of Host A, Host B, and Host C as 1.1.2.3, 1.1.6.1, and 1.1.3.1. (Details not shown.)

Verifying the configuration

Display static routes on Switch A.

```
[SwitchA] display ip routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1
```

```
Destination/Mask    Proto  Pre  Cost         NextHop         Interface
0.0.0.0/0           Static 60   0            1.1.4.2         Vlan500

Static Routing table status : <Inactive>
Summary count : 0
```

Display static routes on Switch B.

```
[SwitchB] display ip routing-table protocol static

Summary count : 2

Static Routing table status : <Active>
Summary count : 2

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
1.1.2.0/24          Static 60   0            1.1.4.1         Vlan500

Static Routing table status : <Inactive>
Summary count : 0
```

Use the **`ping`** command on Host B to test the reachability of Host A (Windows XP runs on the two hosts).

```
C:\Documents and Settings\Administrator>ping 1.1.2.2

Pinging 1.1.2.2 with 32 bytes of data:

Reply from 1.1.2.2: bytes=32 time=1ms TTL=126
Reply from 1.1.2.2: bytes=32 time=1ms TTL=126
Reply from 1.1.2.2: bytes=32 time=1ms TTL=126
Reply from 1.1.2.2: bytes=32 time=1ms TTL=126

Ping statistics for 1.1.2.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 1ms, Average = 1ms
```

Use the **`tracert`** command on Host B to test the reachability of Host A.

```
C:\Documents and Settings\Administrator>tracert 1.1.2.2

Tracing route to 1.1.2.2 over a maximum of 30 hops

  1    <1 ms    <1 ms    <1 ms  1.1.6.1
  2    <1 ms    <1 ms    <1 ms  1.1.4.1
  3     1 ms    <1 ms    <1 ms  1.1.2.2

Trace complete.
```

Example: Configuring BFD for static routes (direct next hop)

Network configuration

Configure the following, as shown in Figure 3:

- Configure a static route to subnet 120.1.1.0/24 on Switch A.
- Configure a static route to subnet 121.1.1.0/24 on Switch B.
- Enable BFD for both routes.
- Configure a static route to subnet 120.1.1.0/24 and a static route to subnet 121.1.1.0/24 on Switch C.

When the link between Switch A and Switch B through the Layer 2 switch fails, BFD can detect the failure immediately. Switch A then communicates with Switch B through Switch C.

Figure 3 Network diagram

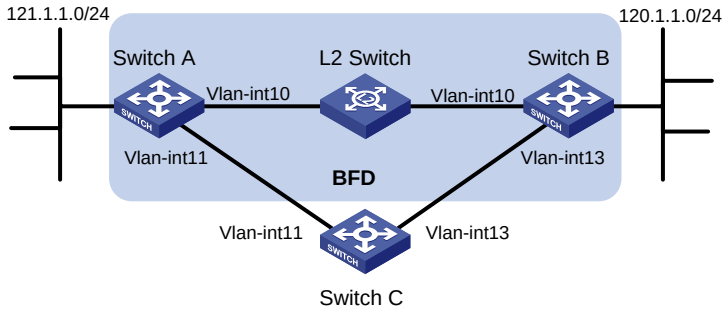


Table 1 Interface and IP address assignment

Device	Interface	IP address
Switch A	VLAN-interface 10	12.1.1.1/24
Switch A	VLAN-interface 11	10.1.1.102/24
Switch B	VLAN-interface 10	12.1.1.2/24
Switch B	VLAN-interface 13	13.1.1.1/24
Switch C	VLAN-interface 11	10.1.1.100/24
Switch C	VLAN-interface 13	13.1.1.2/24

Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure static routes and BFD:

   # Configure static routes on Switch A and enable BFD control packet mode for the static route that traverses the Layer 2 switch.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 10
[SwitchA-vlan-interface10] bfd min-transmit-interval 500
[SwitchA-vlan-interface10] bfd min-receive-interval 500
[SwitchA-vlan-interface10] bfd detect-multiplier 9
[SwitchA-vlan-interface10] quit
[SwitchA] ip route-static 120.1.1.0 24 vlan-interface 10 12.1.1.2 bfd control-packet
[SwitchA] ip route-static 120.1.1.0 24 vlan-interface 11 10.1.1.100 preference 65
```

```
[SwitchA] quit
```

Configure static routes on Switch B and enable BFD control packet mode for the static route that traverses the Layer 2 switch.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 10
[SwitchB-vlan-interface10] bfd min-transmit-interval 500
[SwitchB-vlan-interface10] bfd min-receive-interval 500
[SwitchB-vlan-interface10] bfd detect-multiplier 9
[SwitchB-vlan-interface10] quit
[SwitchB] ip route-static 121.1.1.0 24 vlan-interface 10 12.1.1.1 bfd control-packet
[SwitchB] ip route-static 121.1.1.0 24 vlan-interface 13 13.1.1.2 preference 65
[SwitchB] quit
```

Configure static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ip route-static 120.1.1.0 24 13.1.1.1
[SwitchC] ip route-static 121.1.1.0 24 10.1.1.102
```

Verifying the configuration

Display BFD sessions on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 Session Working Under Ctrl Mode:

 LD/RD          SourceAddr      DestAddr        State    Holdtime    Interface
 4/7            12.1.1.1        12.1.1.2        Up       2000ms      Vlan10
```

The output shows that the BFD session has been created.

Display the static routes on Switch A.

```
<SwitchA> display ip routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
120.1.1.0/24        Static 60   0            12.1.1.2        Vlan10

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 10. Then the link over VLAN-interface 10 fails.

Display static routes on Switch A.

```
<SwitchA> display ip routing-table protocol static

Summary count : 1
```

```
Static Routing table status : <Active>
Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
120.1.1.0/24        Static 65   0            10.1.1.100      Vlan11

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring BFD for static routes (indirect next hop)

Network configuration

Figure 4 shows the network topology as follows:

- Switch A has a route to interface Loopback 1 (2.2.2.9/32) on Switch B, with the output interface VLAN-interface 10.
- Switch B has a route to interface Loopback 1 (1.1.1.9/32) on Switch A, with the output interface VLAN-interface 12.
- Switch D has a route to 1.1.1.9/32, with the output interface VLAN-interface 10, and a route to 2.2.2.9/32, with the output interface VLAN-interface 12.

Configure the following:

- Configure a static route to subnet 120.1.1.0/24 on Switch A.
- Configure a static route to subnet 121.1.1.0/24 on Switch B.
- Enable BFD for both routes.
- Configure a static route to subnet 120.1.1.0/24 and a static route to subnet 121.1.1.0/24 on both Switch C and Switch D.

When the link between Switch A and Switch B through Switch D fails, BFD can detect the failure immediately. Switch A then communicates with Switch B through Switch C.

Figure 4 Network diagram

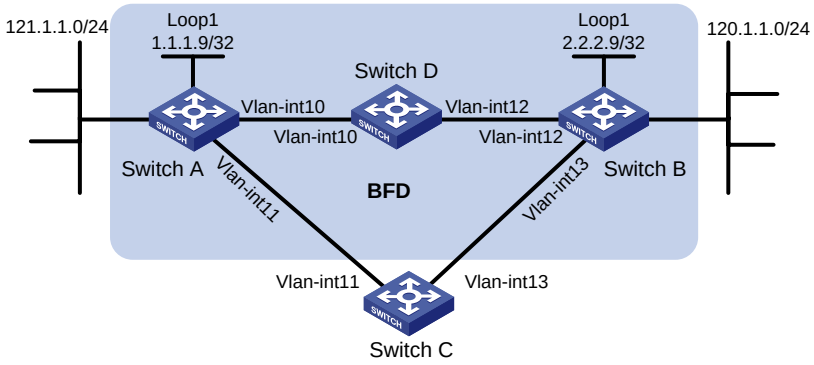

Table 2 Interface and IP address assignment

Device	Interface	IP address
Switch A	VLAN-interface 10	12.1.1.1/24

Device	Interface	IP address
Switch A	VLAN-interface 11	10.1.1.102/24
Switch A	Loopback 1	1.1.1.9/32
Switch B	VLAN-interface 12	11.1.1.1/24
Switch B	VLAN-interface 13	13.1.1.1/24
Switch B	Loopback 1	2.2.2.9/32
Switch C	VLAN-interface 11	10.1.1.100/24
Switch C	VLAN-interface 13	13.1.1.2/24
Switch D	VLAN-interface 10	12.1.1.2/24
Switch D	VLAN-interface 12	11.1.1.2/24

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure static routes and BFD:

   # Configure static routes on Switch A and enable BFD control packet mode for the static route that traverses Switch D.

   ```
   <SwitchA> system-view
   [SwitchA] bfd multi-hop min-transmit-interval 500
   [SwitchA] bfd multi-hop min-receive-interval 500
   [SwitchA] bfd multi-hop detect-multiplier 9
   [SwitchA] ip route-static 120.1.1.0 24 2.2.2.9 bfd control-packet bfd-source 1.1.1.9
   [SwitchA] ip route-static 120.1.1.0 24 vlan-interface 11 10.1.1.100 preference 65
   [SwitchA] quit
   ```

   # Configure static routes on Switch B and enable BFD control packet mode for the static route that traverses Switch D.

   ```
   <SwitchB> system-view
   [SwitchB] bfd multi-hop min-transmit-interval 500
   [SwitchB] bfd multi-hop min-receive-interval 500
   [SwitchB] bfd multi-hop detect-multiplier 9
   [SwitchB] ip route-static 121.1.1.0 24 1.1.1.9 bfd control-packet bfd-source 2.2.2.9
   [SwitchB] ip route-static 121.1.1.0 24 vlan-interface 13 13.1.1.2 preference 65
   [SwitchB] quit
   ```

   # Configure static routes on Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ip route-static 120.1.1.0 24 13.1.1.1
   [SwitchC] ip route-static 121.1.1.0 24 10.1.1.102
   ```

   # Configure static routes on Switch D.

   ```
   <SwitchD> system-view
   [SwitchD] ip route-static 120.1.1.0 24 11.1.1.1
   [SwitchD] ip route-static 121.1.1.0 24 12.1.1.1
   ```

Verifying the configuration

Display BFD sessions on Switch A.

```
<SwitchA> display bfd session
```

```
Total Session Num: 1     Up Session Num: 1     Init Mode: Active

IPv4 Session Working Under Ctrl Mode:

LD/RD          SourceAddr      DestAddr        State    Holdtime    Interface
4/7            1.1.1.9         2.2.2.9         Up       2000ms      N/A
```

The output shows that the BFD session has been created.

Display the static routes on Switch A.

```
<SwitchA> display ip routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
120.1.1.0/24        Static 60   0            12.1.1.2        Vlan10

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 10. Then the link over VLAN-interface 10 fails.

Display static routes on Switch A.

```
<SwitchA> display ip routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
120.1.1.0/24        Static 65   0            10.1.1.100      Vlan11

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring static route FRR

Network configuration

As shown in Figure 5, configure static routes on Switch A, Switch B, and Switch C, and configure static route FRR. When Link A becomes unidirectional, traffic can be switched to Link B immediately.

Figure 5 Network diagram

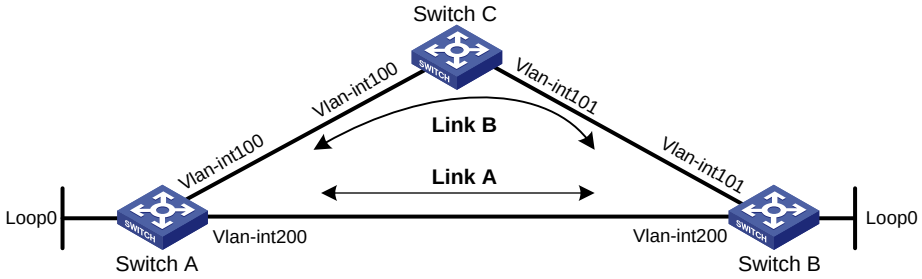

Table 3 Interface and IP address assignment

Device	Interface	IP address
Switch A	VLAN-interface 100	12.12.12.1/24
Switch A	VLAN-interface 200	13.13.13.1/24
Switch A	Loopback 0	1.1.1.1/32
Switch B	VLAN-interface 101	24.24.24.4/24
Switch B	VLAN-interface 200	13.13.13.2/24
Switch B	Loopback 0	4.4.4.4/32
Switch C	VLAN-interface 100	12.12.12.2/24
Switch C	VLAN-interface 101	24.24.24.2/24

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure static route FRR on link A by using one of the following methods:
   - (Method 1.) Specify a backup next hop for static route FRR:

     # Configure a static route on Switch A, and specify VLAN-interface 100 as the backup output interface and 12.12.12.2 as the backup next hop.

     ```
     <SwitchA> system-view
     [SwitchA] ip route-static 4.4.4.4 32 vlan-interface 200 13.13.13.2
     backup-interface vlan-interface 100 backup-nexthop 12.12.12.2
     ```

     # Configure a static route on Switch B, and specify VLAN-interface 101 as the backup output interface and 24.24.24.2 as the backup next hop.

     ```
     <SwitchB> system-view
     [SwitchB] ip route-static 1.1.1.1 32 vlan-interface 200 13.13.13.1
     backup-interface vlan-interface 101 backup-nexthop 24.24.24.2
     ```

   - (Method 2.) Configure static route FRR to automatically select a backup next hop:

     # Configure static routes on Switch A, and enable static route FRR.

     ```
     <SwitchA> system-view
     [SwitchA] ip route-static 4.4.4.4 32 vlan-interface 200 13.13.13.2
     [SwitchA] ip route-static 4.4.4.4 32 vlan-interface 100 12.12.12.2 preference 70
     [SwitchA] ip route-static fast-reroute auto
     ```

     # Configure static routes on Switch B, and enable static route FRR.

     ```
     <SwitchB> system-view
     [SwitchB] ip route-static 1.1.1.1 32 vlan-interface 200 13.13.13.1
     [SwitchB] ip route-static 1.1.1.1 32 vlan-interface 101 24.24.24.2 preference 70
     ```

```
[SwitchB] ip route-static fast-reroute auto
```

3. Configure static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ip route-static 4.4.4.4 32 vlan-interface 101 24.24.24.4
[SwitchC] ip route-static 1.1.1.1 32 vlan-interface 100 12.12.12.1
```

Verifying the configuration

Display route 4.4.4.4/32 on Switch A to view the backup next hop information.

```
[SwitchA] display ip routing-table 4.4.4.4 verbose

Summary count : 1

Destination: 4.4.4.4/32
   Protocol: Static
 Process ID: 0
  SubProtID: 0x0                  Age: 04h20m37s

  Connector: N/A                 PathID: 0x0
```

Configuring a default route

A default route is used to forward packets that do not match any specific routing entry in the routing table. Without a default route, packets that do not match any routing entries are discarded and an ICMP destination-unreachable packet is sent to the source.

A default route can be configured in either of the following ways:

- The network administrator can configure a default route with both destination and mask being 0.0.0.0. For more information, see "Configuring static routing."
- Some dynamic routing protocols (such as OSPF and RIP) can generate a default route. For example, an upstream router running OSPF can generate a default route and advertise it to other routers. These routers install the default route with the next hop being the upstream router. For more information, see the respective chapters on these routing protocols in this configuration guide.

Contents

Configuring RIP

About RIP

Routing Information Protocol (RIP) is a distance-vector IGP suited to small-sized networks. It employs UDP to exchange route information through port 520.

RIP routing metrics

RIP uses a hop count to measure the distance to a destination. The hop count from a router to a directly connected network is 0. The hop count from a router to a directly connected router is 1. To limit convergence time, RIP restricts the value range of the metric from 0 to 15. A destination with a metric value of 16 (or greater) is considered unreachable. For this reason, RIP is not suitable for large-sized networks.

RIP route entries

RIP stores routing entries in a database. Each routing entry contains the following elements:

- **Destination address**—IP address of a destination host or a network.
- **Next hop**—IP address of the next hop.
- **Egress interface**—Egress interface of the route.
- **Metric**—Cost from the local router to the destination.
- **Route time**—Time elapsed since the last update. The time is reset to 0 when the routing entry is updated.
- **Route tag**—Used for route control. For more information, see "Configuring routing policies."

RIP operation

RIP works as follows:

1. RIP sends request messages to neighboring routers. Neighboring routers return response messages that contain their routing tables.
2. RIP uses the received responses to update the local routing table and sends triggered update messages to its neighbors. All RIP routers on the network do this to learn latest routing information.
3. RIP periodically sends the local routing table to its neighbors. After a RIP neighbor receives the message, it updates its routing table, selects optimal routes, and sends an update to other neighbors. RIP ages routes to keep only valid routes.

Routing loop prevention

RIP uses the following mechanisms to prevent routing loops:

- **Counting to infinity**—A destination with a metric value of 16 is considered unreachable. When a routing loop occurs, the metric value of a route will increment to 16 to avoid endless looping.
- **Triggered updates**—RIP immediately advertises triggered updates for topology changes to reduce the possibility of routing loops and to speed up convergence.
- **Split horizon**—Disables RIP from sending routes through the interface where the routes were learned to prevent routing loops and save bandwidth.

- **Poison reverse**—Enables RIP to set the metric of routes received from a neighbor to 16 and sends these routes back to the neighbor. The neighbor can delete such information from its routing table to prevent routing loops.

RIP versions

There are two RIP versions, RIPv1 and RIPv2.

RIPv1 is a classful routing protocol. It advertises messages only through broadcast. RIPv1 messages do not carry mask information, so RIPv1 can only recognize natural networks such as Class A, B, and C. For this reason, RIPv1 does not support discontiguous subnets.

RIPv2 is a classless routing protocol. It has the following advantages over RIPv1:

- Supports route tags to implement flexible route control through routing policies.
- Supports masks, route summarization, and CIDR.
- Supports designated next hops to select the best ones on broadcast networks.
- Supports multicasting route updates so only RIPv2 routers can receive these updates to reduce resource consumption.
- Supports plain text authentication and MD5 authentication to enhance security.

RIPv2 supports two transmission modes: broadcast and multicast. Multicast is the default mode using 224.0.0.9 as the multicast address. An interface operating in RIPv2 broadcast mode can also receive RIPv1 messages.

Protocols and standards

- RFC 1058, *Routing Information Protocol*
- RFC 1723, *RIP Version 2 - Carrying Additional Information*
- RFC 1721, *RIP Version 2 Protocol Analysis*
- RFC 1722, *RIP Version 2 Protocol Applicability Statement*
- RFC 1724, *RIP Version 2 MIB Extension*
- RFC 2082, *RIPv2 MD5 Authentication*
- RFC 2091, *Triggered Extensions to RIP to Support Demand Circuits*
- RFC 2453, *RIP Version 2*

Restrictions: Hardware compatibility with RIP

The S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series do not support RIP.

RIP tasks at a glance

To configure RIP, perform the following tasks:

1. Configuring basic RIP
   a. Enabling RIP
   b. (Optional.) Controlling RIP reception and advertisement on interfaces
   c. (Optional.) Configuring a RIP version
   d. Specifying a RIP neighbor

To enable RIP on a link that does not support broadcast or multicast, you must manually specify a RIP neighbor.

2. (Optional.) Configuring RIP route control
   - Configuring an additional routing metric
   - Configuring RIPv2 route summarization
   - Disabling host route reception
   - Advertising a default route
   - Configuring received/redistributed route filtering
   - Setting a preference for RIP
   - Configuring RIP route redistribution
3. (Optional.) Tuning and optimizing RIP networks
   - Setting RIP timers
   - Enabling split horizon and poison reverse
   - Setting the RIP triggered update interval
   - Configuring the RIP packet sending rate
   - Setting the maximum length of RIP packets
   - Setting the DSCP value for outgoing RIP packets
4. (Optional.) Configuring RIP network management
5. Enhancing RIP availability
   - Configuring RIP GR
   - Enabling RIP NSR
   - Configuring BFD for RIP
   - Configuring RIP FRR
6. (Optional.) Enhancing RIP security
   - Enabling zero field check for incoming RIPv1 messages
   - Enabling source IP address check for incoming RIP updates
   - Configuring RIPv2 message authentication

Configuring basic RIP

Restrictions and guidelines for configuring basic RIP

To enable multiple RIP processes on a router, you must specify an ID for each process. A RIP process ID has only local significance. Two RIP routers having different process IDs can also exchange RIP packets.

Enabling RIP

About enabling RIP

You can enable RIP on a network and specify a wildcard mask for the network. After that, only the interface attached to the network runs RIP.

Restrictions and guidelines

If you configure RIP settings in interface view before enabling RIP, the settings do not take effect until RIP is enabled.

If a physical interface is attached to multiple networks, you cannot advertise these networks in different RIP processes.

You cannot enable multiple RIP processes on a physical interface.

The **rip enable** command takes precedence over the **network** command.

Enabling RIP on a network

1. Enter system view.
   system-view
2. Enable RIP and enter RIP view.
   rip [*process-id*]
   By default, RIP is disabled.
3. Enable RIP on a network.
   network *network-address* [*wildcard-mask*]
   By default, RIP is disabled on a network.
   The **network** 0.0.0.0 command can enable RIP on all interfaces in a single process, but does not apply to multiple RIP processes.

Enabling RIP on an interface

1. Enter system view.
   system-view
2. Enable RIP and enter RIP view.
   rip [*process-id*]
   By default, RIP is disabled.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable RIP on the interface.
   rip *process-id* **enable** [**exclude-subip**]
   By default, RIP is disabled on an interface.

Controlling RIP reception and advertisement on interfaces

About RIP reception and advertisement control on interfaces

You can perform this task to configure the following features:

- Suppressing an interface. The suppressed interface can receive RIP messages but cannot send RIP messages.
- Disabling an interface from sending RIP messages.
- Disabling an interface from receiving RIP messages.

Restrictions and guidelines for RIP reception and advertisement control on interfaces

An interface suppressed by using the **silent-interface** command can only receive RIP messages. It cannot send RIP messages. You can use the **silent-interface all** command to suppress all interfaces. The **silent-interface** command takes precedence over the **rip input** and **rip output** commands.

Suppressing an interface

1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Suppress an interface.
   silent-interface { *interface-type interface-number* | **all** }
   By default, all RIP-enabled interfaces can send RIP messages.
   The suppressed interface can still receive RIP messages and respond to unicast requests containing unknown ports.

Disabling an interface from receiving RIP messages

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Disable an interface from receiving RIP messages.
   undo rip input
   By default, a RIP-enabled interface can receive RIP messages.

Disabling an interface from sending RIP messages

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Disable an interface from sending RIP messages.
   undo rip output
   By default, a RIP-enabled interface can send RIP messages.

Configuring a RIP version

About RIP version configuration

You can configure a global RIP version in RIP view or an interface-specific RIP version in interface view.

An interface preferentially uses the interface-specific RIP version. If no interface-specific version is specified, the interface uses the global RIP version. If neither a global nor interface-specific RIP version is configured, the interface sends RIPv1 broadcasts and can receive the following:

- RIPv1 broadcasts and unicasts.
- RIPv2 broadcasts, multicasts, and unicasts.

Procedure

1. Enter system view.
   system-view
2. Specify a RIP version.
   - Execute the following commands in sequence to specify a global RIP version:
     rip [*process-id*]

version { **1** | **2** }

By default, no global version is specified. An interface sends RIPv1 broadcasts, and can receive RIPv1 broadcasts and unicasts, and RIPv2 broadcasts, multicasts, and unicasts.

- Execute the following commands in sequence to specify a RIP version on an interface:

  interface *interface-type interface-number*

  rip version { **1** | **2** [**broadcast** | **multicast**] }

  By default, no interface-specific RIP version is specified. The interface sends RIPv1 broadcasts, and can receive RIPv1 broadcasts and unicasts, and RIPv2 broadcasts, multicasts, and unicasts.

Specifying a RIP neighbor

About RIP neighbors

Typically RIP messages are sent in broadcast or multicast. To enable RIP on a link that does not support broadcast or multicast, you must manually specify a RIP neighbor.

Restrictions and guidelines

As a best practice, do not use the **peer** *ip-address* command to specify a directly connected neighbor. The neighbor might receive a route update in both unicast and multicast (or broadcast) messages from the device.

Procedure

1. Enter system view.

   system-view

2. Enter RIP view.

   rip [*process-id*]

3. Specify a RIP neighbor.

   peer *ip-address*

   By default, RIP does not unicast updates to any peer.

4. Disable source IP address check on inbound RIP updates.

   undo validate-source-address

   By default, source IP address check is enabled on inbound RIP updates.

   If the specified neighbor is not directly connected, disable source address check on incoming updates.

Configuring RIP route control

Configuring an additional routing metric

About additional routing metrics

An additional routing metric (hop count) can be added to the metric of an inbound or outbound RIP route.

- An outbound additional metric is added to the metric of a sent route, and it does not change the route's metric in the routing table.
- An inbound additional metric is added to the metric of a received route before the route is added into the routing table, and the route's metric is changed. If the sum of the additional metric and the original metric is greater than 16, the metric of the route is 16.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an inbound additional routing metric.
   rip metricin [**route-policy** *route-policy-name*] *value*
   By default, the additional metric of an inbound route is 0.
4. Specify an outbound additional routing metric.
   rip metricout [**route-policy** *route-policy-name*] *value*
   By default, the additional metric of an outbound route is 1.

Configuring RIPv2 route summarization

About RIPv2 route summarization

Perform this task to summarize contiguous subnets into a summary network and sends the network to neighbors. The smallest metric among all summarized routes is used as the metric of the summary route.

You can use the following methods to summarize routes in RIPv2:

- **Automatic summarization**—Configure RIPv2 to generate a natural network for contiguous subnets. For example, suppose there are three subnet routes 10.1.1.0/24, 10.1.2.0/24, and 10.1.3.0/24. Automatic summarization automatically creates and advertises a summary route 10.0.0.0/8 instead of the more specific routes.
- **Manual summarization**—Manually configure a summary route. RIPv2 advertises the summary route rather than more specific routes. For example, suppose contiguous subnets routes 10.1.1.0/24, 10.1.2.0/24, and 10.1.3.0/24 exist in the routing table. You can create a summary route 10.1.0.0/16 on GigabitEthernet 1/0/1 to advertise the summary route instead of the more specific routes. By default, natural masks are used to advertise summary routes. To manually configure a summary route on an interface, you must first disable RIPv2 automatic route summarization.

Restrictions and guidelines

To prevent loops caused by route summarization, create a black hole route by specifying interface NULL 0 as the output interface of the summary route. Packets that match the black hole route are dropped.

Enabling RIPv2 automatic route summarization

1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Enable RIPv2 automatic route summarization.
   summary
   By default, RIPv2 automatic route summarization is enabled.
   If subnets in the routing table are not contiguous, disable automatic route summarization to advertise more specific routes.

Advertising a summary route

1. Enter system view.

system-view

2. Enter RIP view.
   rip [*process-id*]
3. Disable RIPv2 automatic route summarization.
   undo summary
   By default, RIPv2 automatic route summarization is enabled.
4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Configure a summary route.
   rip summary-address *ip-address* { *mask-length* | *mask* }
   By default, no summary route is configured.

Disabling host route reception

About disabling host route reception

This task disables RIPv2 from receiving host routes from the same network to save network resources. This feature does not apply to RIPv1.

Procedure

1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Disable RIP from receiving host routes.
   undo host-route
   By default, RIP receives host routes.

Advertising a default route

About default route advertisement

You can advertise a default route on all RIP interfaces in RIP view or on a specific RIP interface in interface view. The interface view setting takes precedence over the RIP view settings.

To disable an interface from advertising a default route, use the **rip default-route no-originate** command on the interface.

The router enabled to advertise a default route does not accept default routes from RIP neighbors.

Procedure

1. Enter system view.
   system-view
2. Advertise a default route.
   - Execute the following commands in sequence to configure RIP to advertise a default route:
     rip [*process-id*]
     default-route { **only** | **originate** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *

By default, RIP does not advertise a default route.

- Execute the following commands in sequence to configure a RIP interface to advertise a default route:

  interface *interface-type interface-number*

  rip default-route { { **only** | **originate** } [**cost** *cost-value* | **route-policy** *route-policy-name*] * | **no-originate** }

  By default, a RIP interface can advertise a default route if the RIP process is enabled to advertise a default route.

Configuring received/redistributed route filtering

About received/redistributed route filtering

This task allows you to create a policy to filter received or redistributed routes that match specific criteria such as an ACL or IP prefix list.

Procedure

1. Enter system view.

   system-view

2. Enter RIP view.

   rip [*process-id*]

3. Configure the filtering of received routes.

   filter-policy { *ipv4-acl-number* | **gateway** *prefix-list-name* | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] } **import** [*interface-type interface-number*]

   By default, the filtering of received routes is not configured.

   This command filters received routes. Filtered routes are not installed into the routing table or advertised to neighbors.

4. Configure the filtering of redistributed routes.

   filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*] | *interface-type interface-number*]

   By default, the filtering of redistributed routes is not configured.

   This command filters redistributed routes, including routes redistributed with the **import-route** command.

Setting a preference for RIP

About setting a preference for RIP

If multiple IGPs find routes to the same destination, the route found by the IGP that has the highest priority is selected as the optimal route. Perform this task to assign a preference to RIP. The smaller the preference value, the higher the priority.

Procedure

1. Enter system view.

   system-view

2. Enter RIP view.

   rip [*process-id*]

3. Set a preference for RIP.

   preference { *preference* | **route-policy** *route-policy-name* } *

The default preference for RIP is 100.

Configuring RIP route redistribution

About RIP route redistribution

Perform this task to configure RIP to redistribute routes from other routing protocols, including OSPF, static, and direct.

Procedure

1. Enter system view.

   system-view
2. Enter RIP view.

   rip [*process-id*]
3. Redistribute routes from another routing protocol.
   - Redistribute direct or static routes.

     import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *
   - Redistribute routes from OSPF or other RIP processes.

     import-route { **ospf** | **rip** } [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, RIP route redistribution is disabled.

   This command can redistribute only active routes. To view active routes, use the **display ip routing-table protocol** command.
4. (Optional.) Set a default cost for redistributed routes.

   default cost *cost-value*

   The default cost for redistributed routes is 0.

Tuning and optimizing RIP networks

Setting RIP timers

About RIP timers

You can change the RIP network convergence speed by adjusting the following RIP timers:

- **Update timer**—Specifies the interval between route updates.
- **Timeout timer**—Specifies the route aging time. If no update for a route is received within the aging time, the metric of the route is set to 16.
- **Suppress timer**—Specifies how long a RIP route stays in suppressed state. When the metric of a route is 16, the route enters the suppressed state. A suppressed route can be replaced by an updated route that is received from the same neighbor before the suppress timer expires and has a metric less than 16.
- **Garbage-collect timer**—Specifies the interval from when the metric of a route becomes 16 to when it is deleted from the routing table. RIP advertises the route with a metric of 16. If no update is announced for that route before the garbage-collect timer expires, the route is deleted from the routing table.

Restrictions and guidelines

To avoid unnecessary traffic or route flapping, configure identical RIP timer settings on RIP routers.

Procedure

1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Set RIP timers.
   timers { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* } *
   The default settings are as follows:
   - The garbage-collect timer is 120 seconds.
   - The suppress timer is 120 seconds.
   - The timeout timer is 180 seconds.
   - The update timer is 30 seconds.

Enabling split horizon and poison reverse

About split horizon and poison reverse

The split horizon and poison reverse features can prevent routing loops.

- Split horizon disables RIP from sending routes through the interface where the routes were learned to prevent routing loops between adjacent routers.
- Poison reverse allows RIP to send routes through the interface where the routes were learned. The metric of these routes is always set to 16 (unreachable) to avoid routing loops between neighbors.

Restrictions and guidelines

If both split horizon and poison reverse are configured, only the poison reverse feature takes effect.

Enabling split horizon

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable split horizon.
   rip split-horizon
   By default, split horizon is enabled.

Enabling poison reverse

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable poison reverse.
   rip poison-reverse
   By default, poison reverse is disabled.

Setting the RIP triggered update interval

About RIP triggered update interval

Perform this task to avoid network overhead and reduce system resource consumption caused by frequent RIP triggered updates.

You can use the **timer triggered** command to set the maximum interval, minimum interval, and incremental interval for sending RIP triggered updates.

- For a stable network, the *minimum-interval* is used.
- If network changes become frequent, the incremental interval *incremental-interval* is used to extend the triggered update sending interval until the *maximum-interval* is reached.

Procedure

1. Enter system view.

   system-view
2. Enter RIP view.

   rip [*process-id*]
3. Set the RIP triggered update interval.

   timer triggered *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   The default settings are as follows:

   - The maximum interval is 5 seconds.
   - The minimum interval is 50 milliseconds.
   - The incremental interval is 200 milliseconds.

Configuring the RIP packet sending rate

About RIP packet sending rate configuration

Perform this task to set the interval for sending RIP packets and the maximum number of RIP packets that can be sent at each interval. This feature can avoid excessive RIP packets from affecting system performance and consuming too much bandwidth.

Procedure

1. Enter system view.

   system-view
2. Configure the RIP packet sending rate.

   - Execute the following commands in sequence to configure the RIP packet sending rate for all interfaces:

     rip [*process-id*]

     output-delay *time* **count** *count*

     By default, an interface sends up to three RIP packets every 20 milliseconds.
   - Execute the following commands in sequence to configure the RIP packet sending rate for an interface:

     interface *interface-type interface-number*

     rip output-delay *time* **count** *count*

     By default, the interface uses the RIP packet sending rate configured for the RIP process that the interface runs.

Setting the maximum length of RIP packets

About setting the maximum length of RIP packets

The packet length of RIP packets determines how many routes can be carried in a RIP packet. Set the maximum length of RIP packets to make good use of link bandwidth.

When authentication is enabled, follow these guidelines to ensure packet forwarding:

- For simple authentication, the maximum length of RIP packets must be no less than 52 bytes.
- For MD5 authentication (with packet format defined in RFC 2453), the maximum length of RIP packets must be no less than 56 bytes.
- For MD5 authentication (with packet format defined in RFC 2082), the maximum length of RIP packets must be no less than 72 bytes.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the maximum length of RIP packets.
   rip max-packet-length *value*
   By default, the maximum length of RIP packets is 512 bytes.

Setting the DSCP value for outgoing RIP packets

About the DSCP value

The DSCP value specifies the precedence of outgoing packets.

Procedure

1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Set the DSCP value for outgoing RIP packets.
   dscp *dscp-value*
   By default, the DSCP value for outgoing RIP packets is 48.

Configuring RIP network management

About RIP network management

You can use network management software to manage the RIP process to which MIB is bound.

Procedure

1. Enter system view.
   system-view
2. Bind MIB to a RIP process.
   rip mib-binding *process-id*
   By default, MIB is bound to the RIP process with the smallest process ID.

Configuring RIP GR

About RIP GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must have GR capability.
- **GR helper**—A neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

After RIP restarts on a router, the router must learn RIP routes again and update its FIB table, which causes network disconnections and route reconvergence.

With the GR feature, the restarting router (known as the GR restarter) can notify the event to its GR capable neighbors. GR capable neighbors (known as GR helpers) maintain their adjacencies with the router within a GR interval. During this process, the FIB table of the router does not change. After the restart, the router contacts its neighbors to retrieve its FIB.

By default, a RIP-enabled device acts as the GR helper. Perform this task on the GR restarter.

Restrictions and guidelines

You cannot enable RIP NSR on a device that acts as GR restarter.

Procedure

1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Enable GR for RIP.
   graceful-restart
   By default, RIP GR is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 60 seconds.

Enabling RIP NSR

About RIP NSR

Nonstop Routing (NSR) allows the device to back up the routing information from the active RIP process to the standby RIP process. After an active/standby switchover, NSR can complete route regeneration without tearing down adjacencies or impacting forwarding services.

NSR does not require the cooperation of neighboring devices to recover routing information, and it is typically used more often than GR.

Restrictions and guidelines

A device that has RIP NSR enabled cannot act as GR restarter.

Procedure

1. Enter system view.
   system-view

2. Enter RIP view.

   rip [*process-id*]

3. Enable RIP NSR.

   non-stop-routing

   By default, RIP NSR is disabled.

   RIP NSR enabled for a RIP process takes effect only on that process. As a best practice, enable RIP NSR for each process if multiple RIP processes exist.

Configuring BFD for RIP

About BFD for RIP

RIP detects route failures by periodically sending requests. If it receives no response for a route within a certain time, RIP considers the route unreachable. To speed up convergence, perform this task to enable BFD for RIP. For more information about BFD, see *High Availability Configuration Guide*.

RIP supports the following BFD detection modes:

- **Single-hop echo detection**—Detection mode for a directly connected neighbor. In this mode, a BFD session is established only when the directly connected neighbor has route information to send.
- **Single-hop echo detection for a specific destination**—Detection mode for a directly connected neighbor. In this mode, a BFD session is established to the specified RIP neighbor when RIP is enabled on the local interface. When BFD detects a unidirectional link, the local device will not receive or send any RIP packets through the interface to improve convergence speed. When the link recovers, the interface can send RIP packets again.
- **Bidirectional control detection**—Detection mode for indirectly connected neighbors. In this mode, a BFD session is established only when both ends have routes to send and BFD is enabled on the receiving interface.

Restrictions and guidelines

The **rip bfd enable** and **rip bfd enable destination** commands are mutually exclusive.

Configuring single-hop echo detection (for a directly connected RIP neighbor)

1. Enter system view.

   system-view

2. Configure the source IP address of BFD echo packets.

   bfd echo-source-ip *ip-address*

   By default, the source IP address of BFD echo packets is not configured.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable BFD for RIP.

   rip bfd enable

   By default, BFD for RIP is disabled.

Configuring single-hop echo detection (for a specific destination)

Restrictions and guidelines

This feature applies only to RIP neighbors that are directly connected.

Procedure

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, no source IP address is configured for BFD echo packets.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD for RIP.
   rip bfd enable destination *ip-address*
   By default, BFD for RIP is disabled.

Configuring bidirectional control detection

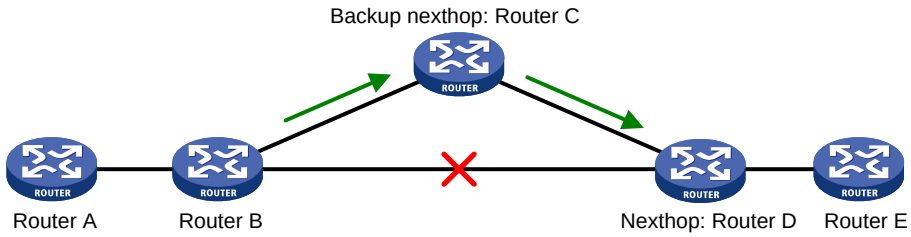
1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Specify a RIP neighbor.
   peer *ip-address*
   By default, RIP does not unicast updates to any peer.
   Because the **undo peer** command does not remove the neighbor relationship immediately, executing the command cannot bring down the BFD session immediately.
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable BFD for RIP.
   rip bfd enable
   By default, BFD for RIP is disabled.

Configuring RIP FRR

About RIP FRR

A link or router failure on a path can cause packet loss and even routing loop until RIP completes routing convergence based on the new network topology. FRR enables fast rerouting to minimize the impact of link or node failures.

Figure 1 Network diagram for RIP FRR



As shown in Figure 1, configure FRR on Router B by using a routing policy to specify a backup next hop. When the primary link fails, RIP directs packets to the backup next hop. At the same time, RIP calculates the shortest path based on the new network topology, and forwards packets over that path after network convergence.

Restrictions and guidelines for RIP FRR

RIP FRR takes effect only for RIP routes learned from directly connected neighbors.

RIP FRR is available only when the state of primary link (with Layer 3 interfaces staying up) changes from bidirectional to unidirectional or down.

Enabling RIP FRR

1. Enter system view.
   `system-view`
2. Configure a routing policy for FRR.
   You must specify a next hop by using the **`apply fast-reroute backup-interface`** command in the routing policy.
   For more information about routing policy configuration, see "Configuring routing policies."
3. Enter RIP view.
   `rip` [*`process-id`*]
4. Enable RIP FRR.
   `fast-reroute route-policy` *`route-policy-name`*
   By default, RIP FRR is disabled.

Enabling BFD for RIP FRR

About BFD single-hop echo detection

By default, RIP FRR does not use BFD to detect primary link failures. For quicker RIP FRR, use BFD single-hop echo detection on the primary link of redundant links to detect link failure.

Procedure

1. Enter system view.
   `system-view`
2. Configure the source IP address of BFD echo packets.
   `bfd echo-source-ip` *`ip-address`*
   By default, the source IP address of BFD echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interfaces.
   For more information about this command, see *High Availability Command Reference*.

3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD for RIP FRR.
   rip primary-path-detect bfd echo
   By default, BFD for RIP FRR is disabled.

Enhancing RIP security

Enabling zero field check for incoming RIPv1 messages

About zero field check for incoming RIPv1 messages

Some fields in the RIPv1 message must be set to zero. These fields are called "zero fields." You can enable zero field check for incoming RIPv1 messages. If a zero field of a message contains a non-zero value, RIP does not process the message. If you are certain that all messages are trustworthy, disable zero field check to save CPU resources.

This feature does not apply to RIPv2 packets, because they have no zero fields.

Procedure

1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Enable zero field check for incoming RIPv1 messages.
   checkzero
   By default, zero field check is disabled for incoming RIPv1 messages.

Enabling source IP address check for incoming RIP updates

About source IP address check for incoming RIP updates

Perform this task to enable source IP address check for incoming RIP updates.

- Upon receiving a message on an Ethernet interface, RIP compares the source IP address of the message with the IP address of the interface. If they are not in the same network segment, RIP discards the message.
- Upon receiving a message on a PPP interface, RIP checks whether the source address of the message is the IP address of the peer interface. If not, RIP discards the message.

Procedure

1. Enter system view.
   system-view
2. Enter RIP view.
   rip [*process-id*]
3. Enable source IP address check for incoming RIP messages.
   validate-source-address
   By default, source IP address check is disabled for incoming RIP updates.

Configuring RIPv2 message authentication

About RIPv2 message authentication

Perform this task to enable authentication on RIPv2 messages.

RIPv2 supports simple authentication and MD5 authentication.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure RIPv2 authentication.

   rip authentication-mode { **md5** { **rfc2082** { **cipher** | **plain** } *string key-id* | **rfc2453** { **cipher** | **plain** } *string* } | **simple** { **cipher** | **plain** } *string* }

   By default, RIPv2 authentication is not configured.

   RIPv1 does not support authentication. Although you can specify an authentication mode for RIPv1 in interface view, the configuration does not take effect.

Display and maintenance commands for RIP

Execute **display** commands in any view and execute **reset** commands in user view.

Task	Command
Display RIP current status and configuration information.	**display rip** [*process-id*]
Display RIP GR information.	**display rip** [*process-id*] **graceful-restart**
Display RIP NSR information.	**display rip** [*process-id*] **non-stop-routing**
Display active routes in the RIP database.	**display rip** *process-id* **database** [*ip-address* { *mask-length* | *mask* }]
Display RIP interface information.	**display rip** *process-id* **interface** [*interface-type interface-number*]
Display neighbor information for a RIP process.	**display rip** *process-id* **neighbor** [*interface-type interface-number*]
Display routing information for a RIP process.	**display rip** *process-id* **route** [*ip-address* { *mask-length* | *mask* } [**verbose**] | **peer** *ip-address* | **statistics**]
Reset a RIP process.	**reset rip** *process-id* **process**
Clear the statistics for a RIP process.	**reset rip** *process-id* **statistics**

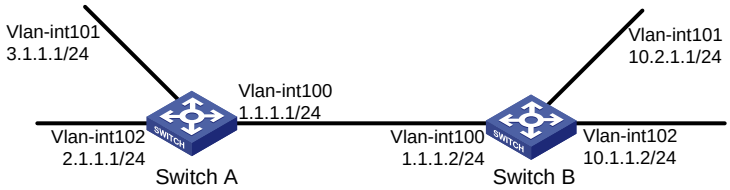
RIP configuration examples

Example: Configuring basic RIP

Network configuration

As shown in Figure 2, enable RIPv2 on all interfaces on Switch A and Switch B. Configure Switch B to not advertise route 10.2.1.0/24 to Switch A, and to accept only route 2.1.1.0/24 from Switch A.

Figure 2 Network diagram



Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Enable RIP.

   # Enable RIP on the specified networks on Switch A.

```
<SwitchA> system-view
[SwitchA] rip
[SwitchA-rip-1] network 1.0.0.0
[SwitchA-rip-1] network 2.0.0.0
[SwitchA-rip-1] network 3.0.0.0
[SwitchA-rip-1] quit
```

   # Enable RIP on the specified interfaces on Switch B.

```
<SwitchB> system-view
[SwitchB] rip
[SwitchB-rip-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] rip 1 enable
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] rip 1 enable
[SwitchB-Vlan-interface101] quit
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] rip 1 enable
[SwitchB-Vlan-interface102] quit
```

   # Display the RIP routing table of Switch A.

```
[SwitchA] display rip 1 route
 Route Flags: R - RIP, T - TRIP
              P - Permanent, A - Aging, S - Suppressed, G - Garbage-collect
              D - Direct, O - Optimal, F - Flush to RIB
------------------------------------------------------------------------------
 Peer 1.1.1.2 on Vlan-interface100
      Destination/Mask        Nexthop          Cost    Tag     Flags   Sec
      10.0.0.0/8              1.1.1.2          1       0       RAOF    11
```

```
 Local route
      Destination/Mask        Nexthop           Cost    Tag     Flags   Sec
      1.1.1.0/24              0.0.0.0           0       0       RDOF    -
      2.1.1.0/24              0.0.0.0           0       0       RDOF    -
      3.1.1.0/24              0.0.0.0           0       0       RDOF    -
```

The output shows that RIPv1 uses a natural mask.

3. Configure a RIP version:

Configure RIPv2 on Switch A.

```
[SwitchA] rip
[SwitchA-rip-1] version 2
[SwitchA-rip-1] undo summary
[SwitchA-rip-1] quit
```

Configure RIPv2 on Switch B.

```
[SwitchB] rip
[SwitchB-rip-1] version 2
[SwitchB-rip-1] undo summary
[SwitchB-rip-1] quit
```

Display the RIP routing table on Switch A.

```
[SwitchA] display rip 1 route
 Route Flags: R - RIP, T - TRIP
              P - Permanent, A - Aging, S - Suppressed, G - Garbage-collect
              D - Direct, O - Optimal, F - Flush to RIB
------------------------------------------------------------------------------

 Peer 1.1.1.2 on Vlan-interface100
      Destination/Mask        Nexthop           Cost    Tag     Flags   Sec
      10.0.0.0/8              1.1.1.2           1       0       RAOF    50
      10.2.1.0/24             1.1.1.2           1       0       RAOF    16
      10.1.1.0/24             1.1.1.2           1       0       RAOF    16
 Local route
      Destination/Mask        Nexthop           Cost    Tag     Flags   Sec
      1.1.1.0/24              0.0.0.0           0       0       RDOF    -
      2.1.1.0/24              0.0.0.0           0       0       RDOF    -
      3.1.1.0/24              0.0.0.0           0       0       RDOF    -
```

The output shows that RIPv2 uses classless subnet masks.

NOTE:

After RIPv2 is configured, RIPv1 routes might still exist in the routing table until they are aged out.

Display the RIP routing table on Switch B.

```
[SwitchB] display rip 1 route
 Route Flags: R - RIP, T - TRIP
              P - Permanent, A - Aging, S - Suppressed, G - Garbage-collect
              D - Direct, O - Optimal, F - Flush to RIB
------------------------------------------------------------------------------
 Peer 1.1.1.1 on Vlan-interface100
      Destination/Mask        Nexthop           Cost    Tag     Flags   Sec
```

```
     2.1.1.0/24              1.1.1.1           1       0       RAOF    19
     3.1.1.0/24              1.1.1.1           1       0       RAOF    19
 Local route
     Destination/Mask        Nexthop           Cost    Tag     Flags   Sec
     1.1.1.0/24              0.0.0.0           0       0       RDOF    -
     10.1.1.0/24             0.0.0.0           0       0       RDOF    -
     10.2.1.0/24             0.0.0.0           0       0       RDOF    -
```

4. Configure route filtering:

Reference IP prefix lists on Switch B to filter received and redistributed routes.

```
[SwitchB] ip prefix-list aaa index 10 permit 2.1.1.0 24
[SwitchB] ip prefix-list bbb index 10 deny 10.2.1.0 24
[SwitchB] ip prefix-list bbb index 11 permit 0.0.0.0 0 less-equal 32
[SwitchB] rip 1
[SwitchB-rip-1] filter-policy prefix-list aaa import
[SwitchB-rip-1] filter-policy prefix-list bbb export
[SwitchB-rip-1] quit
```

Display the RIP routing table on Switch A.

```
[SwitchA] display rip 100 route

```

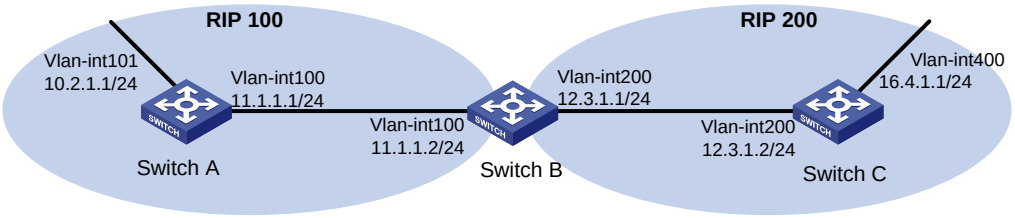
Example: Configuring RIP route redistribution

Network configuration

As shown in Figure 3, Switch B communicates with Switch A through RIP 100 and with Switch C through RIP 200.

Configure RIP 200 to redistribute direct routes and routes from RIP 100 on Switch B so Switch C can learn routes destined for 10.2.1.0/24 and 11.1.1.0/24. Switch A cannot learn routes destined for 12.3.1.0/24 and 16.4.1.0/24.

Figure 3 Network diagram



Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings:

   # Enable RIP 100, and configure RIPv2 on Switch A.

```
<SwitchA> system-view
[SwitchA] rip 100
[SwitchA-rip-100] network 10.0.0.0
[SwitchA-rip-100] network 11.0.0.0
[SwitchA-rip-100] version 2
[SwitchA-rip-100] undo summary
[SwitchA-rip-100] quit
```

   # Enable RIP 100 and RIP 200, and configure RIPv2 on Switch B.

```
<SwitchB> system-view
[SwitchB] rip 100
[SwitchB-rip-100] network 11.0.0.0
[SwitchB-rip-100] version 2
[SwitchB-rip-100] undo summary
[SwitchB-rip-100] quit
[SwitchB] rip 200
[SwitchB-rip-200] network 12.0.0.0
[SwitchB-rip-200] version 2
[SwitchB-rip-200] undo summary
[SwitchB-rip-200] quit
```

   # Enable RIP 200, and configure RIPv2 on Switch C.

```
<SwitchC> system-view
[SwitchC] rip 200
[SwitchC-rip-200] network 12.0.0.0
[SwitchC-rip-200] network 16.0.0.0
[SwitchC-rip-200] version 2
[SwitchC-rip-200] undo summary
[SwitchC-rip-200] quit
```

Display the IP routing table on Switch C.

```
[SwitchC] display ip routing-table

Destinations : 13        Routes : 13

127.0.0.1/32        Direct 0    0            127.0.0.1       InLoop0
127.255.255.255/32  Direct 0    0            127.0.0.1       InLoop0
```

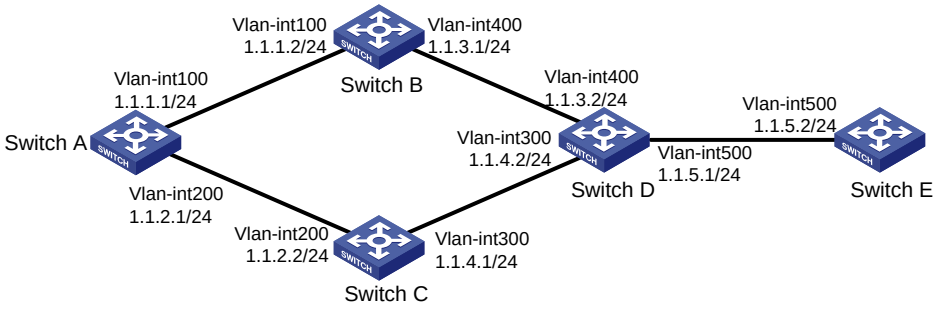
Example: Configuring an additional metric for a RIP interface

Network configuration

As shown in Figure 4, run RIPv2 on all the interfaces of Switch A, Switch B, Switch C, Switch D, and Switch E.

Switch A has two links to Switch D. The link from Switch B to Switch D is more stable than that from Switch C to Switch D. Configure an additional metric for RIP routes received from VLAN-interface 200 on Switch A so Switch A prefers route 1.1.5.0/24 learned from Switch B.

Figure 4 Network diagram



Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] rip 1
   [SwitchA-rip-1] network 1.0.0.0
   [SwitchA-rip-1] version 2
   [SwitchA-rip-1] undo summary
   [SwitchA-rip-1] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] rip 1
   [SwitchB-rip-1] network 1.0.0.0
   [SwitchB-rip-1] version 2
   [SwitchB-rip-1] undo summary
   ```

   # Configure Switch C.

   ```
   <SwitchC> system-view
   [SwitchB] rip 1
   [SwitchC-rip-1] network 1.0.0.0
   [SwitchC-rip-1] version 2
   [SwitchC-rip-1] undo summary
   ```

   # Configure Switch D.

   ```
   <SwitchD> system-view
   [SwitchD] rip 1
   [SwitchD-rip-1] network 1.0.0.0
   [SwitchD-rip-1] version 2
   [SwitchD-rip-1] undo summary
   ```

Configure Switch E.

```
<SwitchE> system-view
[SwitchE] rip 1
[SwitchE-rip-1] network 1.0.0.0
[SwitchE-rip-1] version 2
[SwitchE-rip-1] undo summary
```

Display all active routes in the RIP database on Switch A.

```
[SwitchA] display rip 1 database
   1.0.0.0/8, auto-summary
       1.1.1.0/24, cost 0, nexthop 1.1.1.1, RIP-interface
       1.1.2.0/24, cost 0, nexthop 1.1.2.1, RIP-interface
       1.1.3.0/24, cost 1, nexthop 1.1.1.2
       1.1.4.0/24, cost 1, nexthop 1.1.2.2
       1.1.5.0/24, cost 2, nexthop 1.1.1.2
       1.1.5.0/24, cost 2, nexthop 1.1.2.2
```

The output shows two RIP routes destined for network 1.1.5.0/24, with the next hops as Switch B (1.1.1.2) and Switch C (1.1.2.2), and with the same cost of 2.

3. Configure an additional metric for a RIP interface:

Configure an inbound additional metric of 3 for RIP-enabled interface VLAN-interface 200 on Switch A.

```
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] rip metricin 3
```

Display all active routes in the RIP database on Switch A.

```
[SwitchA-Vlan-interface200] display rip 1 database
   1.0.0.0/8, auto-summary
       1.1.1.0/24, cost 0, nexthop 1.1.1.1, RIP-interface
       1.1.2.0/24, cost 0, nexthop 1.1.2.1, RIP-interface
       1.1.3.0/24, cost 1, nexthop 1.1.1.2
       1.1.4.0/24, cost 2, nexthop 1.1.1.2
       1.1.5.0/24, cost 2, nexthop 1.1.1.2
```

The output shows that only one RIP route reaches network 1.1.5.0/24, with the next hop as Switch B (1.1.1.2) and a cost of 2.

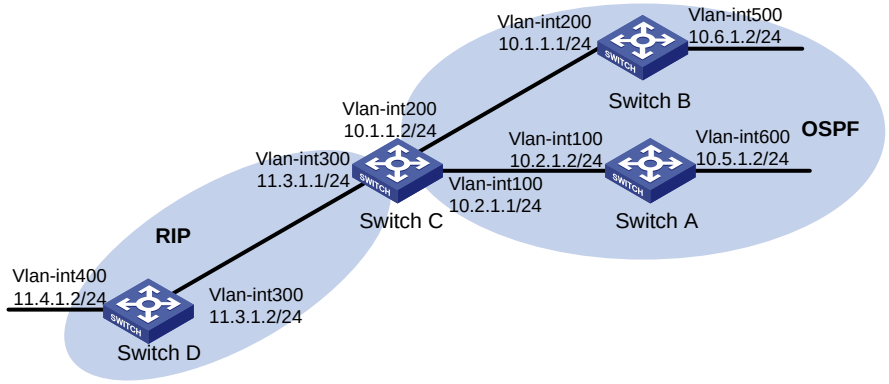
Example: Configuring RIP to advertise a summary route

Network configuration

As shown in Figure 5, Switch A and Switch B run OSPF, Switch D runs RIP, and Switch C runs OSPF and RIP. Configure RIP to redistribute OSPF routes on Switch C so Switch D can learn routes destined for networks 10.1.1.0/24, 10.2.1.0/24, 10.5.1.0/24, and 10.6.1.0/24.

To reduce the routing table size of Switch D, configure route summarization on Switch C to advertise only the summary route 10.0.0.0/8 to Switch D.

Figure 5 Network diagram



Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic OSPF settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ospf
   [SwitchA-ospf-1] area 0
   [SwitchA-ospf-1-area-0.0.0.0] network 10.5.1.0 0.0.0.255
   [SwitchA-ospf-1-area-0.0.0.0] network 10.2.1.0 0.0.0.255
   [SwitchA-ospf-1-area-0.0.0.0] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ospf
   [SwitchB-ospf-1] area 0
   [SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
   [SwitchB-ospf-1-area-0.0.0.0] network 10.6.1.0 0.0.0.255
   [SwitchB-ospf-1-area-0.0.0.0] quit
   ```

   # Configure Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ospf
   [SwitchC-ospf-1] area 0
   [SwitchC-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
   [SwitchC-ospf-1-area-0.0.0.0] network 10.2.1.0 0.0.0.255
   [SwitchC-ospf-1-area-0.0.0.0] quit
   [SwitchC-ospf-1] quit
   ```

3. Configure basic RIP settings:

   # Configure Switch C.

   ```
   [SwitchC] rip 1
   [SwitchC-rip-1] network 11.3.1.0
   [SwitchC-rip-1] version 2
   [SwitchC-rip-1] undo summary
   ```

   # Configure Switch D.

   ```
   <SwitchD> system-view
   [SwitchD] rip 1
   ```

```
[SwitchD-rip-1] network 11.0.0.0
[SwitchD-rip-1] version 2
[SwitchD-rip-1] undo summary
[SwitchD-rip-1] quit
```

Configure RIP to redistribute routes from OSPF process 1 and direct routes on Switch C.

```
[SwitchC-rip-1] import-route direct
[SwitchC-rip-1] import-route ospf 1
[SwitchC-rip-1] quit
```

Display the IP routing table on Switch D.

```
[SwitchD] display ip routing-table

Destinations : 15        Routes : 15

```

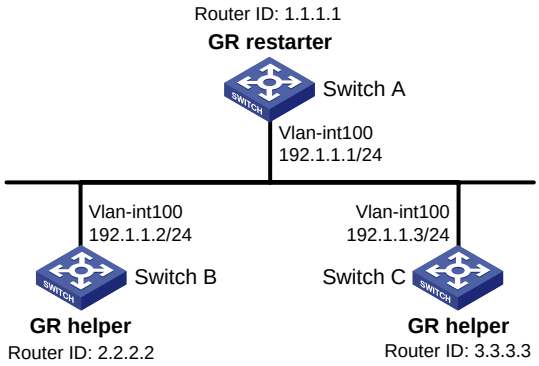
Example: Configuring RIP GR

Network configuration

As shown in Figure 6, Switch A, Switch B, and Switch C all run RIPv2.

- Enable GR on Switch A. Switch A acts as the GR restarter.
- Switch B and Switch C act as GR helpers to synchronize their routing tables with Switch A by using GR.

Figure 6 Network diagram



Procedure

1. Configure IP addresses and subnet masks for the interfaces on the switches. (Details not shown.)
2. Configure RIPv2 on the switches to ensure the following: (Details not shown.)
   - Switch A, Switch B, and Switch C can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPv2.
3. Enable RIP GR on Switch A.

```
<SwitchA> system-view
[SwitchA] rip
[SwitchA-rip-1] graceful-restart
```

Verifying the configuration

Restart RIP or trigger an active/standby switchover, and then display GR status on Switch A.

```
<SwitchA> display rip graceful-restart
 RIP process: 1
 Graceful Restart capability     : Enabled
 Current GR state                : Normal
 Graceful Restart period         : 60  seconds
 Graceful Restart remaining time : 0   seconds
```

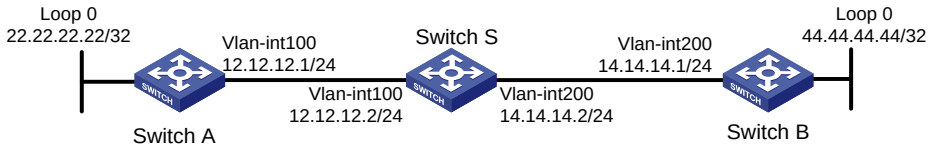
Example: Configuring RIP NSR

Network configuration

As shown in Figure 7, Switch A, Switch B, and Switch S all run RIPv2.

Enable RIP NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 7 Network diagram



Procedure

1. Configure IP addresses and subnet masks for the interfaces on the switches. (Details not shown.)
2. Configure RIPv2 on the switches to ensure the following: (Details not shown.)
   - Switch A, Switch B, and Switch S can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPv2.
3. Enable RIP NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] rip 100
[SwitchS-rip-100] non-stop-routing
[SwitchS-rip-100] quit
```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```

```

The output shows that the neighbor and route information on Switch A and Switch B keep unchanged during the active/standby switchover on Switch S. The traffic from Switch A to Switch B has not been impacted.

Example: Configuring BFD for RIP (single-hop echo detection for a directly connected neighbor)

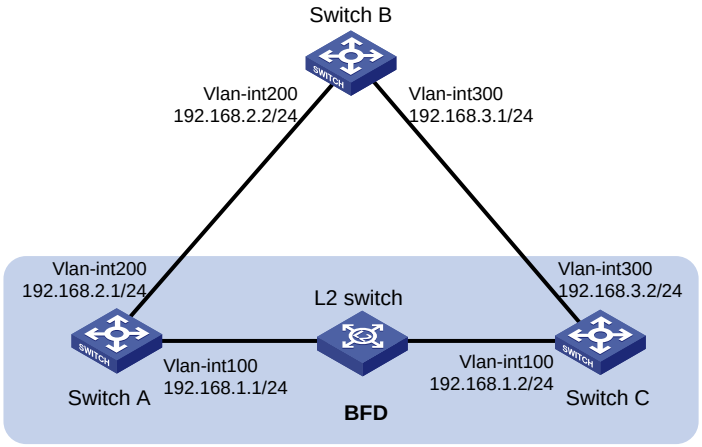
Network configuration

As shown in Figure 8, VLAN-interface 100 of Switch A and Switch C runs RIP process 1. VLAN-interface 200 of Switch A runs RIP process 2. VLAN-interface 300 of Switch C and VLAN-interface 200 and VLAN-interface 300 of Switch B run RIP process 1.

- Configure a static route destined for 100.1.1.1/24 and enable static route redistribution into RIP on Switch C. This allows Switch A to learn two routes destined for 100.1.1.1/24 through VLAN-interface 100 and VLAN-interface 200 respectively, and uses the one through VLAN-interface 100.

- Enable BFD for RIP on VLAN-interface 100 of Switch A. When the link over VLAN-interface 100 fails, BFD can quickly detect the failure and notify RIP. RIP deletes the neighbor relationship and route information learned on VLAN-interface 100, and uses the route destined for 100.1.1.1 24 through VLAN-interface 200.

Figure 8 Network diagram



Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] rip 1
[SwitchA-rip-1] version 2
[SwitchA-rip-1] undo summary
[SwitchA-rip-1] network 192.168.1.0
[SwitchA-rip-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] rip bfd enable
[SwitchA-Vlan-interface100] quit
[SwitchA] rip 2
[SwitchA-rip-2] version 2
[SwitchA-rip-2] undo summary
[SwitchA-rip-2] network 192.168.2.0
[SwitchA-rip-2] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] rip 1
[SwitchB-rip-1] version 2
[SwitchB-rip-1] undo summary
[SwitchB-rip-1] network 192.168.2.0
[SwitchB-rip-1] network 192.168.3.0
[SwitchB-rip-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] rip 1
```

```
[SwitchC-rip-1] version 2
[SwitchC-rip-1] undo summary
[SwitchC-rip-1] network 192.168.1.0
[SwitchC-rip-1] network 192.168.3.0
[SwitchC-rip-1] import-route static
[SwitchC-rip-1] quit
```

3. Configure BFD parameters on VLAN-interface 100 of Switch A.

```
[SwitchA] bfd echo-source-ip 11.11.11.11
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] bfd min-echo-receive-interval 500
[SwitchA-Vlan-interface100] bfd detect-multiplier 7
[SwitchA-Vlan-interface100] quit
[SwitchA] quit
```

4. Configure a static route on Switch C.

```
[SwitchC] ip route-static 120.1.1.1 24 null 0
```

Verifying the configuration

Display the BFD session information on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 Session Working Under Echo Mode:

 LD           SourceAddr      DestAddr        State    Holdtime    Interface
 4             192.168.1.1     192.168.1.2     Up       2000ms      Vlan100
```

Display RIP routes destined for 120.1.1.0/24 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.0 24

Summary count : 1

Destination/Mask   Proto   Pre Cost        NextHop         Interface
120.1.1.0/24       RIP     100 1           192.168.1.2     Vlan-interface100
```

The output shows that Switch A communicates with Switch C through VLAN-interface 100. Then the link over VLAN-interface 100 fails.

Display RIP routes destined for 120.1.1.0/24 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.0 24

Summary count : 1

Destination/Mask   Proto   Pre Cost        NextHop         Interface
120.1.1.0/24       RIP     100 1           192.168.2.2     Vlan-interface200
```

The output shows that Switch A communicates with Switch C through VLAN-interface 200.

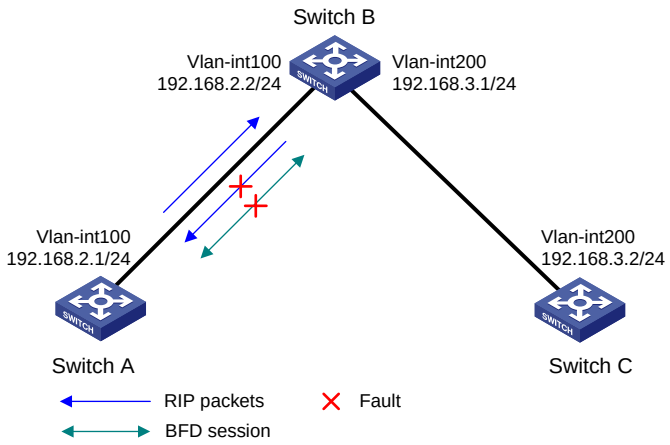
Example: Configuring BFD for RIP (single hop echo detection for a specific destination)

Network configuration

As shown in Figure 9, VLAN-interface 100 of Switch A and Switch B runs RIP process 1. VLAN-interface 200 of Switch B and Switch C runs RIP process 1.

- Configure a static route destined for 100.1.1.0/24 and enable static route redistribution into RIP on both Switch A and Switch C. This allows Switch B to learn two routes destined for 100.1.1.0/24 through VLAN-interface 100 and VLAN-interface 200. The route redistributed from Switch A has a smaller cost than that redistributed from Switch C, so Switch B uses the route through VLAN-interface 200.
- Enable BFD for RIP on VLAN-interface 100 of Switch A, and specify VLAN-interface 100 of Switch B as the destination. When a unidirectional link occurs between Switch A and Switch B, BFD can quickly detect the link failure and notify RIP. Switch B then deletes the neighbor relationship and the route information learned on VLAN-interface 100. It does not receive or send any packets from VLAN-interface 100. When the route learned from Switch A ages out, Switch B uses the route destined for 100.1.1.1 24 through VLAN-interface 200.

Figure 9 Network diagram



Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings and enable BFD on the interfaces:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] rip 1
[SwitchA-rip-1] network 192.168.2.0
[SwitchA-rip-1] import-route static
[SwitchA-rip-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] rip bfd enable destination 192.168.2.2
[SwitchA-Vlan-interface100] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] rip 1
[SwitchB-rip-1] network 192.168.2.0
```

```
[SwitchB-rip-1] network 192.168.3.0
[SwitchB-rip-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] rip 1
[SwitchC-rip-1] network 192.168.3.0
[SwitchC-rip-1] import-route static cost 3
[SwitchC-rip-1] quit
```

3. Configure BFD parameters on VLAN-interface 100 of Switch A.

```
[SwitchA] bfd echo-source-ip 11.11.11.11
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] bfd min-echo-receive-interval 500
[SwitchA-Vlan-interface100] return
```

4. Configure static routes:

Configure a static route on Switch A.

```
[SwitchA] ip route-static 100.1.1.0 24 null 0
```

Configure a static route on Switch C.

```
[SwitchA] ip route-static 100.1.1.0 24 null 0
```

Verifying the configuration

Display BFD session information on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 session working under Echo mode:

 LD              SourceAddr      DestAddr        State    Holdtime    Interface
 3               192.168.2.1     192.168.2.2     Up       2000ms      vlan100
```

Display routes destined for 100.1.1.0/24 on Switch B.

```
<SwitchB> display ip routing-table 100.1.1.0 24 verbose

Summary Count : 1

Destination: 100.1.1.0/24

```

Example: Configuring BFD for RIP (bidirectional detection in BFD control packet mode)

Network configuration

As shown in Figure 10, VLAN-interface 100 of Switch A and VLAN-interface 200 of Switch C run RIP process 1.

VLAN-interface 300 of Switch A runs RIP process 2. VLAN-interface 400 of Switch C, and VLAN-interface 300 and VLAN-interface 400 of Switch D run RIP process 1.

- Configure a static route destined for 100.1.1.0/24 on Switch A.
- Configure a static route destined for 101.1.1.0/24 on Switch C.
- Enable static route redistribution into RIP on Switch A and Switch C. This allows Switch A to learn two routes destined for 100.1.1.0/24 through VLAN-interface 100 and VLAN-interface 300. It uses the route through VLAN-interface 100.
- Enable BFD on VLAN-interface 100 of Switch A and VLAN-interface 200 of Switch C.

When the link over VLAN-interface 100 fails, BFD can quickly detect the link failure and notify RIP. RIP deletes the neighbor relationship and the route information received learned on VLAN-interface 100. It uses the route destined for 100.1.1.0/24 through VLAN-interface 300.

Figure 10 Network diagram

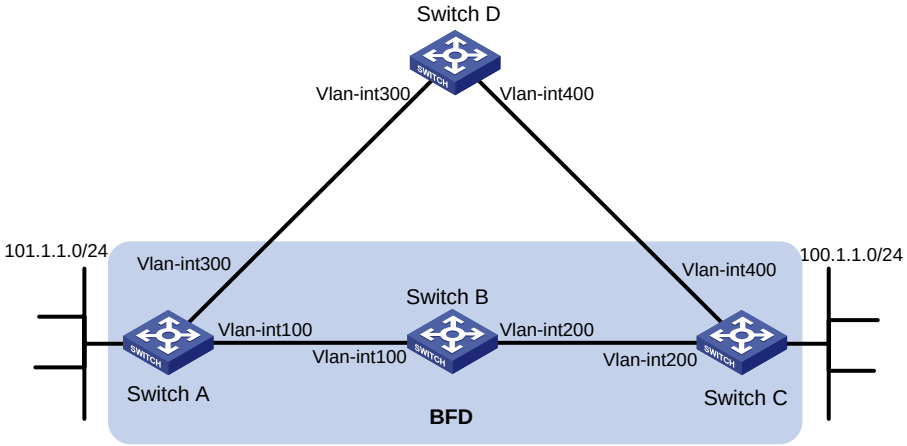

Table 1 Interface and IP address assignment

Device	Interface	IP address
Switch A	VLAN-interface 300	192.168.3.1/24
Switch A	VLAN-interface 100	192.168.1.1/24
Switch B	VLAN-interface 100	192.168.1.2/24
Switch B	VLAN-interface 200	192.168.2.1/24
Switch C	VLAN-interface 200	192.168.2.2/24
Switch C	VLAN-interface 400	192.168.4.2/24
Switch D	VLAN-interface 300	192.168.3.2/24
Switch D	VLAN-interface 400	192.168.4.1/24

Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings and enable static route redistribution into RIP so Switch A and Switch C have routes to send to each other:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] rip 1
[SwitchA-rip-1] version 2
[SwitchA-rip-1] undo summary
[SwitchA-rip-1] network 192.168.1.0
[SwitchA-rip-1] network 101.1.1.0
[SwitchA-rip-1] peer 192.168.2.2
[SwitchA-rip-1] undo validate-source-address
[SwitchA-rip-1] import-route static
[SwitchA-rip-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] rip bfd enable
```

```
[SwitchA-Vlan-interface100] quit
[SwitchA] rip 2
[SwitchA-rip-2] version 2
[SwitchA-rip-2] undo summary
[SwitchA-rip-2] network 192.168.3.0
[SwitchA-rip-2] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] rip 1
[SwitchC-rip-1] version 2
[SwitchC-rip-1] undo summary
[SwitchC-rip-1] network 192.168.2.0
[SwitchC-rip-1] network 192.168.4.0
[SwitchC-rip-1] network 100.1.1.0
[SwitchC-rip-1] peer 192.168.1.1
[SwitchC-rip-1] undo validate-source-address
[SwitchC-rip-1] import-route static
[SwitchC-rip-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] rip bfd enable
[SwitchC-Vlan-interface200] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] rip 1
[SwitchD-rip-1] version 2
[SwitchD-rip-1] undo summary
[SwitchD-rip-1] network 192.168.3.0
[SwitchD-rip-1] network 192.168.4.0
```

3. Configure BFD parameters:

Configure Switch A.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] bfd min-transmit-interval 500
[SwitchA-Vlan-interface100] bfd min-receive-interval 500
[SwitchA-Vlan-interface100] bfd detect-multiplier 7
[SwitchA-Vlan-interface100] quit
```

Configure Switch C.

```
[SwitchC] bfd session init-mode active
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] bfd min-transmit-interval 500
[SwitchC-Vlan-interface200] bfd min-receive-interval 500
[SwitchC-Vlan-interface200] bfd detect-multiplier 7
[SwitchC-Vlan-interface200] quit
```

4. Configure static routes:

Configure a static route to Switch C on Switch A.

```
[SwitchA] ip route-static 192.168.2.0 24 vlan-interface 100 192.168.1.2
[SwitchA] quit
```

Configure a static route to Switch A on Switch C.

```
[SwitchC] ip route-static 192.168.1.0 24 vlan-interface 200 192.168.2.1
```

Verifying the configuration

Display the BFD session information on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 session working under Ctrl mode:

 LD/RD              SourceAddr      DestAddr        State    Holdtime    Interface
 513/513            192.168.1.1     192.168.2.2     Up       1700ms      vlan100
```

Display RIP routes destined for 100.1.1.0/24 on Switch A.

```
<SwitchA> display ip routing-table 100.1.1.0 24

Summary count : 1

Destination/Mask   Proto   Pre Cost        NextHop         Interface
100.1.1.0/24       RIP     100 1           192.168.2.2     vlan-interface 100
```

The output shows that Switch A communicates with Switch C through VLAN-interface 100. Then the link over VLAN-interface 100 fails.

Display RIP routes destined for 100.1.1.0/24 on Switch A.

```
<SwitchA> display ip routing-table 100.1.1.0 24

Summary count : 1

Destination/Mask   Proto   Pre Cost        NextHop         Interface
100.1.1.0/24       RIP     100 2           192.168.3.2     vlan-interface 300
```

The output shows that Switch A communicates with Switch C through VLAN-interface 300.

Example: Configuring RIP FRR

Network configuration

As shown in Figure 11, Switch A, Switch B, and Switch C run RIPv2. Configure RIP FRR so that when Link A becomes unidirectional, services can be switched to Link B immediately.

Figure 11 Network diagram

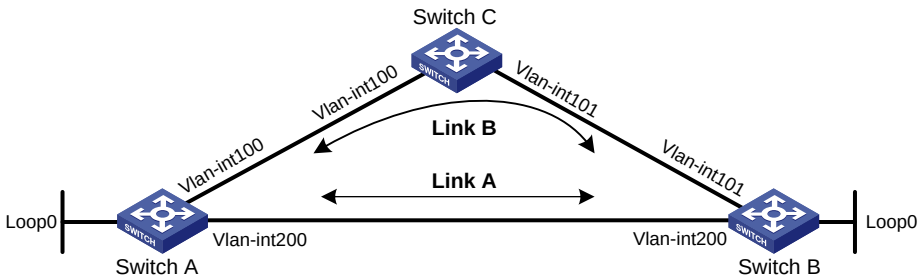

Table 2 Interface and IP address assignment

Device	Interface	IP address
Switch A	VLAN-interface 100	12.12.12.1/24
Switch A	VLAN-interface 200	13.13.13.1/24
Switch A	Loopback 0	1.1.1.1/32
Switch B	VLAN-interface 101	24.24.24.4/24
Switch B	VLAN-interface 200	13.13.13.2/24
Switch B	Loopback 0	4.4.4.4/32
Switch C	VLAN-interface 100	12.12.12.2/24
Switch C	VLAN-interface 101	24.24.24.2/24

Procedure

1. Configure IP addresses and subnet masks for the interfaces on the switches. (Details not shown.)
2. Configure RIPv2 on the switches to make sure Switch A, Switch B, and Switch C can communicate with each other at Layer 3. (Details not shown.)
3. Configure RIP FRR:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ip prefix-list abc index 10 permit 4.4.4.4 32
[SwitchA] route-policy frr permit node 10
[SwitchA-route-policy-frr-10] if-match ip address prefix-list abc
[SwitchA-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
100 backup-nexthop 12.12.12.2
[SwitchA-route-policy-frr-10] quit
[SwitchA] rip 1
[SwitchA-rip-1] fast-reroute route-policy frr
[SwitchA-rip-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ip prefix-list abc index 10 permit 1.1.1.1 32
[SwitchB] route-policy frr permit node 10
[SwitchB-route-policy-frr-10] if-match ip address prefix-list abc
[SwitchB-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
101 backup-nexthop 24.24.24.2
[SwitchB-route-policy-frr-10] quit
[SwitchB] rip 1
[SwitchB-rip-1] fast-reroute route-policy frr
[SwitchB-rip-1] quit
```

Verifying the configuration

Display route 4.4.4.4/32 on Switch A to view the backup next hop information.

```
[SwitchA] display ip routing-table 4.4.4.4 verbose

Summary Count : 1
```

```
Destination: 4.4.4.4/32

Configuring OSPF

About OSPF

Open Shortest Path First (OSPF) is a link-state IGP developed by the OSPF working group of the IETF. OSPF version 2 is used for IPv4. OSPF refers to OSPFv2 throughout this chapter.

OSPF features

OSPF has the following features:

- **Wide scope**—Supports multiple network sizes and several hundred routers in an OSPF routing domain.
- **Fast convergence**—Advertises routing updates instantly upon network topology changes.
- **Loop free**—Computes routes with the SPF algorithm to avoid routing loops.
- **Area-based network partition**—Splits an AS into multiple areas to facilitate management. This feature reduces the LSDB size on routers to save memory and CPU resources, and reduces route updates transmitted between areas to save bandwidth.
- **Routing hierarchy**—Supports a 4-level routing hierarchy that prioritizes routes into intra-area, inter-area, external Type-1, and external Type-2 routes.
- **Authentication**—Supports area- and interface-based packet authentication to ensure secure packet exchange.
- **Support for multicasting**—Multicasts protocol packets on some types of links to avoid impacting other devices.

OSPF packets

OSPF messages are carried directly over IP. The protocol number is 89.

OSPF uses the following packet types:

- **Hello**—Periodically sent to find and maintain neighbors, containing timer values, information about the DR, BDR, and known neighbors.
- **Database description (DD)**—Describes the digest of each LSA in the LSDB, exchanged between two routers for data synchronization.
- **Link state request (LSR)**—Requests needed LSAs from a neighbor. After exchanging the DD packets, the two routers know which LSAs of the neighbor are missing from their LSDBs. They then exchange LSR packets requesting the missing LSAs. LSR packets contain the digest of the missing LSAs.
- **Link state update (LSU)**—Transmits the requested LSAs to the neighbor.
- **Link state acknowledgment (LSAck)**—Acknowledges received LSU packets. It contains the headers of received LSAs (an LSAck packet can acknowledge multiple LSAs).

LSA types

OSPF advertises routing information in Link State Advertisements (LSAs). The following LSAs are commonly used:

- **Router LSA**—Type-1 LSA, originated by all routers and flooded throughout a single area only. This LSA describes the collected states of the router's interfaces to an area.

- **Network LSA**—Type-2 LSA, originated for broadcast and NBMA networks by the designated router, and flooded throughout a single area only. This LSA contains the list of routers connected to the network.
- **Network Summary LSA**—Type-3 LSA, originated by Area Border Routers (ABRs), and flooded throughout the LSA's associated area. Each summary-LSA describes a route to a destination outside the area, yet still inside the AS (an inter-area route).
- **ASBR Summary LSA**—Type-4 LSA, originated by ABRs and flooded throughout the LSA's associated area. Type 4 summary-LSAs describe routes to Autonomous System Boundary Router (ASBR).
- **AS External LSA**—Type-5 LSA, originated by ASBRs, and flooded throughout the AS (except stub and NSSA areas). Each AS-external-LSA describes a route to another AS.
- **NSSA LSA**—Type-7 LSA, as defined in RFC 1587, originated by ASBRs in NSSAs and flooded throughout a single NSSA. NSSA LSAs describe routes to other ASs.
- **Opaque LSA**—LSA for OSPF extensions. Its format consists of a standard LSA header and application specific information. The opaque LSA includes Type 9, Type 10, and Type 11. The Type 9 opaque LSA is flooded into the local subnet. Grace LSA, used by graceful restart, is Type 9 LSA. The Type 10 is flooded into the local area. The Type 11 is flooded throughout the AS.

OSPF areas

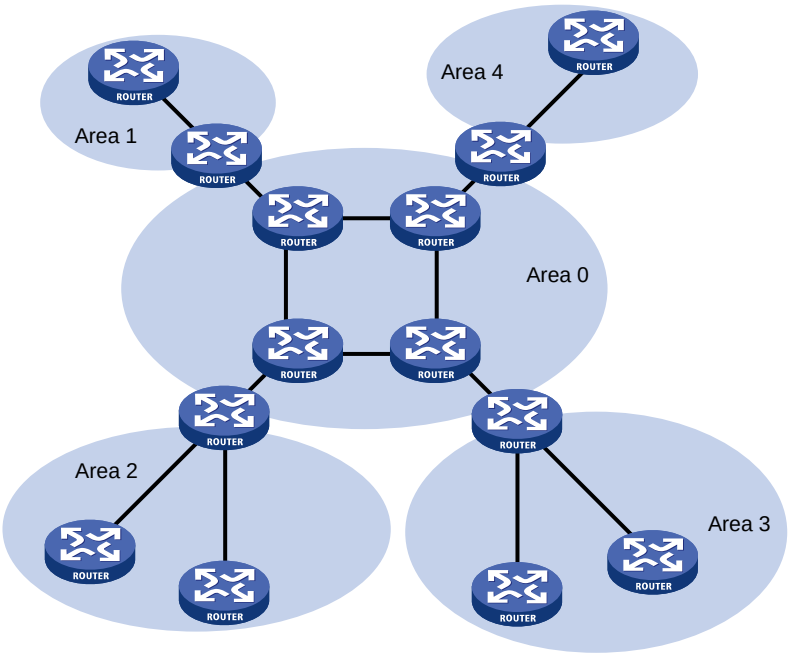
Area-based OSPF network partition

In large OSPF routing domains, SPF route computations consume too many storage and CPU resources, and enormous OSPF packets generated for route synchronization occupy excessive bandwidth.

To resolve these issues, OSPF splits an AS into multiple areas. Each area is identified by an area ID. The boundaries between areas are routers rather than links. A network segment (or a link) can only reside in one area as shown in Figure 1.

You can configure route summarization on ABRs to reduce the number of LSAs advertised to other areas and minimize the effect of topology changes.

Figure 1 Area-based OSPF network partition



Backbone area

Each AS has a backbone area that distributes routing information between non-backbone areas. Routing information between non-backbone areas must be forwarded by the backbone area. OSPF has the following requirements:

- All non-backbone areas must maintain connectivity to the backbone area.
- The backbone area must maintain connectivity within itself.

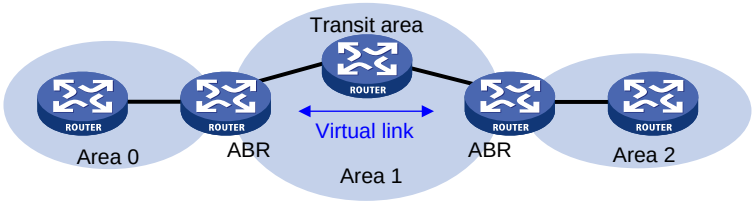
In practice, these requirements might not be met due to lack of physical links. OSPF virtual links can solve this issue.

Virtual links

A virtual link is established between two ABRs through a non-backbone area. It must be configured on both ABRs to take effect. The non-backbone area is called a transit area.

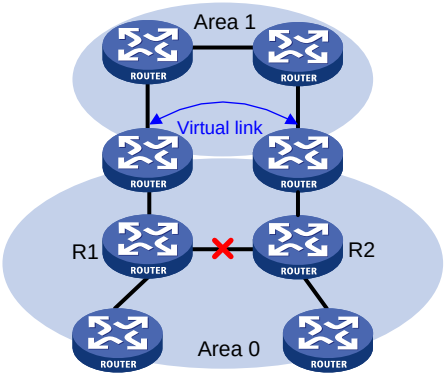
As shown in Figure 2, Area 2 has no direct physical link to the backbone Area 0. You can configure a virtual link between the two ABRs to connect Area 2 to the backbone area.

Figure 2 Virtual link application 1



Virtual links can also be used as redundant links. If a physical link failure breaks the internal connectivity of the backbone area, you can configure a virtual link to replace the failed physical link, as shown in Figure 3.

Figure 3 Virtual link application 2



The virtual link between the two ABRs acts as a point-to-point connection. You can configure interface parameters, such as hello interval, on the virtual link as they are configured on a physical interface.

The two ABRs on the virtual link unicast OSPF packets to each other, and the OSPF routers in between convey these OSPF packets as normal IP packets.

Stub area and totally stub area

A stub area does not distribute Type-5 LSAs to reduce the routing table size and LSAs advertised within the area. The ABR of the stub area advertises a default route in a Type-3 LSA so that the routers in the area can reach external networks through the default route.

To further reduce the routing table size and advertised LSAs, you can configure the stub area as a totally stub area. The ABR of a totally stub area does not advertise inter-area routes or external

routes. It advertises a default route in a Type-3 LSA so that the routers in the area can reach external networks through the default route.

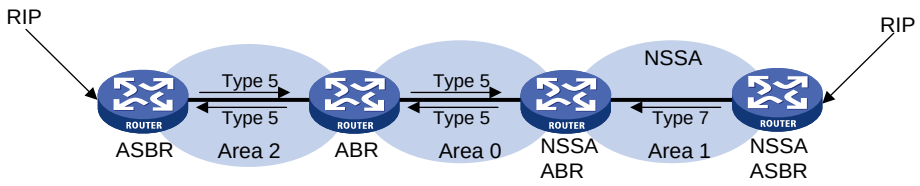
NSSA area and totally NSSA area

An NSSA area does not import AS external LSAs (Type-5 LSAs) but can import Type-7 LSAs generated by the NSSA ASBR. The NSSA ABR translates Type-7 LSAs into Type-5 LSAs and advertises the Type-5 LSAs to other areas.

As shown in Figure 4, the OSPF AS contains Area 1, Area 2, and Area 0. The other two ASs run RIP. Area 1 is an NSSA area where the ASBR redistributes RIP routes in Type-7 LSAs into Area 1. Upon receiving the Type-7 LSAs, the NSSA ABR translates them to Type-5 LSAs, and advertises the Type-5 LSAs to Area 0.

The ASBR of Area 2 redistributes RIP routes in Type-5 LSAs into the OSPF routing domain. However, Area 1 does not receive Type-5 LSAs because it is an NSSA area.

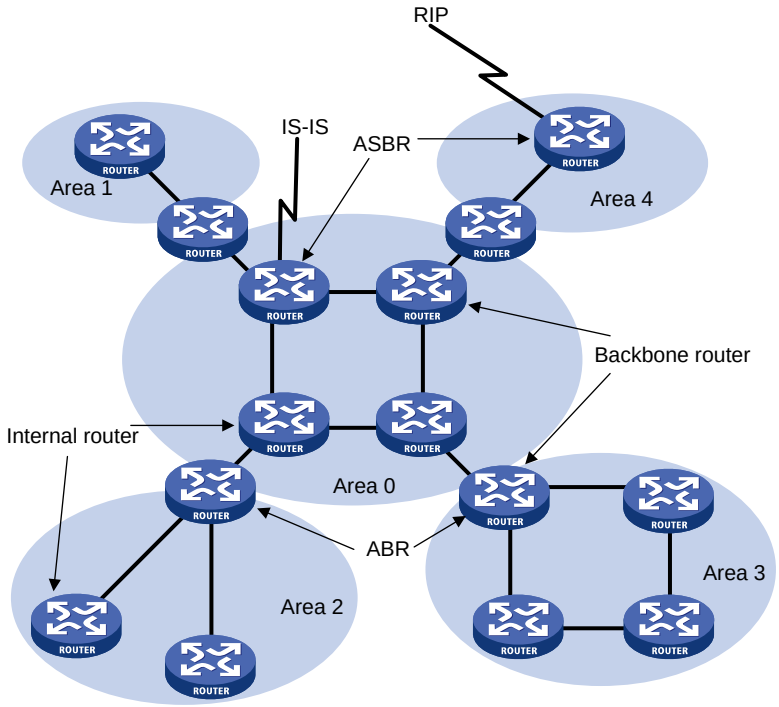
Figure 4 NSSA area



Router types

As shown in Figure 5, OSPF routers are classified into different types, including internal routers, ABRs, backbone routers, and ASBRs.

Figure 5 OSPF router types



Internal router

All interfaces on an internal router belong to one OSPF area.

ABR

An ABR belongs to more than two areas, one of which must be the backbone area. ABR connects the backbone area to a non-backbone area. An ABR and the backbone area can be connected through a physical or logical link.

Backbone router

No less than one interface of a backbone router must reside in the backbone area. All ABRs and internal routers in Area 0 are backbone routers.

ASBR

An ASBR exchanges routing information with another AS. An ASBR might not reside on the border of the AS. It can be an internal router or an ABR.

Route types

OSPF prioritizes routes into the following route levels:

- Intra-area route.
- Inter-area route.
- Type-1 external route.
- Type-2 external route.

The intra-area and inter-area routes describe the network topology of the AS. The external routes describe routes to external ASs.

A Type-1 external route has high credibility. The cost of a Type-1 external route = the cost from the router to the corresponding ASBR + the cost from the ASBR to the destination of the external route.

A Type-2 external route has low credibility. OSPF considers that the cost from the ASBR to the destination of a Type-2 external route is much greater than the cost from the ASBR to an OSPF internal router. The cost of a Type-2 external route = the cost from the ASBR to the destination of the Type-2 external route. If two Type-2 routes to the same destination have the same cost, OSPF takes the cost from the router to the ASBR into consideration to determine the best route.

Router ID

A router ID uniquely identifies a router in an AS. For a router to run OSPF, it must have a router ID. You can choose to manually specify a router ID or use the global router ID for an OSPF process.

Manual configuration

When you create an OSPF process, you can manually specify a router ID. To make sure the router ID is unique in the AS, you can specify the IP address of an interface on the router as the router ID.

Using the global router ID

If you do not specify a router ID when creating an OSPF process, the global router ID is used. As a best practice, manually specify a router ID or enable the OSPF process to automatically obtain a router ID when you create the OSPF process.

Route calculation

OSPF computes routes in an area as follows:

- Each router generates LSAs based on the network topology around itself, and sends them to other routers in update packets.

- Each OSPF router collects LSAs from other routers to compose an LSDB. An LSA describes the network topology around a router, and the LSDB describes the entire network topology of the area.
- Each router transforms the LSDB to a weighted directed graph that shows the topology of the area. All the routers within the area have the same graph.
- Each router uses the SPF algorithm to compute a shortest path tree that shows the routes to the nodes in the area. The router itself is the root of the tree.

OSPF network types

OSPF classifies networks into the following types, depending on different link layer protocols:

- **Broadcast**—If the link layer protocol is Ethernet or FDDI, OSPF considers the network type as broadcast by default. On a broadcast network, hello, LSU, and LSAck packets are multicast to 224.0.0.5 that identifies all OSPF routers or to 224.0.0.6 that identifies the DR and BDR. DD packets and LSR packets are unicast.
- **NBMA**—If the link layer protocol is Frame Relay, ATM, or X.25, OSPF considers the network type as NBMA by default. OSPF packets are unicast on an NBMA network.
- **P2MP**—No link is P2MP type by default. P2MP must be a conversion from other network types such as NBMA. On a P2MP network, OSPF packets are multicast to 224.0.0.5.
- **P2P**—If the link layer protocol is PPP or HDLC, OSPF considers the network type as P2P. On a P2P network, OSPF packets are multicast to 224.0.0.5.

The following are the differences between NBMA and P2MP networks:

- NBMA networks are fully meshed. P2MP networks are not required to be fully meshed.
- NBMA networks require DR and BDR election. P2MP networks do not have DR or BDR.
- On an NBMA network, OSPF packets are unicast, and neighbors are manually configured. On a P2MP network, OSPF packets are multicast by default, and you can configure OSPF to unicast protocol packets.

DR and BDR

DR and BDR mechanism

On a broadcast or NBMA network, any two routers must establish an adjacency to exchange routing information with each other. If n routers are present on the network, n(n-1)/2 adjacencies are established. Any topology change on the network results in an increase in traffic for route synchronization, which consumes a large amount of system and bandwidth resources.

Using the DR and BDR mechanisms can solve this problem.

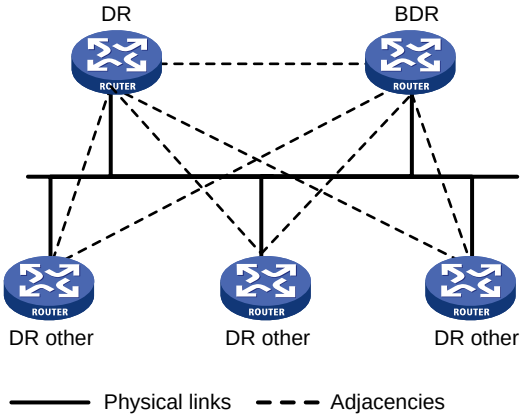
- **DR**—Elected to advertise routing information among other routers. If the DR fails, routers on the network must elect another DR and synchronize information with the new DR. Using this mechanism without BDR is time-consuming and is prone to route calculation errors.
- **BDR**—Elected along with the DR to establish adjacencies with all other routers. If the DR fails, the BDR immediately becomes the new DR, and other routers elect a new BDR.

Routers other than the DR and BDR are called DR Others. They do not establish adjacencies with one another, so the number of adjacencies is reduced.

The role of a router is subnet (or interface) specific. It might be a DR on one interface and a BDR or DR Other on another interface.

As shown in Figure 6, solid lines are Ethernet physical links, and dashed lines represent OSPF adjacencies. With the DR and BDR, only seven adjacencies are established.

Figure 6 DR and BDR in a network



NOTE:

In OSPF, neighbor and adjacency are different concepts. After startup, OSPF sends a hello packet on each OSPF interface. A receiving router checks parameters in the packet. If the parameters match its own, the receiving router considers the sending router an OSPF neighbor. Two OSPF neighbors establish an adjacency relationship after they synchronize their LSDBs through exchange of DD packets and LSAs.

DR and BDR election

DR election is performed on broadcast or NBMA networks but not on P2P and P2MP networks.

Routers in a broadcast or NBMA network elect the DR and BDR by router priority and ID. Routers with a router priority value higher than 0 are candidates for DR and BDR election.

The election votes are hello packets. Each router sends the DR elected by itself in a hello packet to all the other routers. If two routers on the network declare themselves as the DR, the router with the higher router priority wins. If router priorities are the same, the router with the higher router ID wins.

If a router with a higher router priority becomes active after DR and BDR election, the router cannot replace the DR or BDR until a new election is performed. Therefore, the DR of a network might not be the router with the highest priority, and the BDR might not be the router with the second highest priority.

- RFC 5613, *OSPF Link-Local Signaling*
- RFC 5642, *Dynamic Hostname Exchange Mechanism for OSPF*
- RFC 5709, *OSPFv2 HMAC-SHA Cryptographic Authentication*
- RFC 5786, *Advertising a Router's Local Addresses in OSPF Traffic Engineering (TE) Extensions*
- RFC 6571, *Loop-Free Alternate (LFA) Applicability in Service Provider (SP) Networks*
- RFC 6860, *Hiding Transit-Only Networks in OSPF*
- RFC 6987, *OSPF Stub Router Advertisement*

Restrictions: Hardware compatibility with OSPF

The S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series do not support OSPF.

Restrictions and guidelines: OSPF configuration

To run OSPF, you must first enable OSPF on the router. Make a proper configuration plan to avoid incorrect settings that can result in route blocking and routing loops.

OSPF tasks at a glance

To configure OSPF, perform the following tasks:

1. Configuring basic OSPF functions
   - Enabling an OSPF process
   - Creating an OSPF area
   - Enabling OSPF
2. (Optional.) Configuring OSPF stub and NSSA areas
   - Configuring a stub area
   - Configuring an NSSA area
   - Configuring a virtual link
3. (Optional.) Configuring OSPF network types
   - Configuring the broadcast network type for an interface
   - Configuring the NBMA network type for an interface
   - Configuring the P2MP network type for an interface
   - Configuring the P2P network type for an interface
4. (Optional.) Configuring OSPF route control
   - Configuring OSPF inter-area route summarization
   - Configuring redistributed route summarization
   - Configuring received OSPF route filtering
   - Configuring Type-3 LSA filtering

- Setting an OSPF cost for an interface
- Setting OSPF preference
- Configuring discard routes for summary networks
- Redistributing routes from another routing protocol
- Redistributing a default route
- Advertising a host route

5. (Optional.) Setting OSPF timers
   - Configuring OSPF packet timers
   - Setting LSA transmission delay
   - Setting SPF calculation interval
   - Setting the minimum LSA arrival interval
   - Setting the LSA generation interval
   - Setting OSPF exit overflow interval
6. (Optional.) Configuring OSPF packet parameters
   - Disabling interfaces from receiving and sending OSPF packets
   - Adding the interface MTU into DD packets
   - Setting the DSCP value for outgoing OSPF packets
   - Setting the maximum length of OSPF packets that can be sent by an interface
   - Setting the LSU transmit rate
7. (Optional.) Controlling LSA generation, advertisement, and reception
   - Setting the maximum number of external LSAs in LSDB
   - Filtering outbound LSAs on an interface
   - Filtering LSAs for the specified neighbor
8. (Optional.) Accelerating OSPF convergence speed
   - Enabling OSPF ISPF
   - Configuring prefix suppression
   - Configuring prefix prioritization
   - Configuring OSPF PIC
9. (Optional.) Configuring advanced OSPF features
   - Configuring stub routers
   - Enabling compatibility with RFC 1583
10. (Optional.) Enhancing OSPF availability
    - Configuring OSPF GR
    - Configuring OSPF NSR
    - Configuring BFD for OSPF
    - Configuring OSPF FRR
11. (Optional.) Configuring OSPF security features
    - Configuring OSPF authentication
    - Configuring GTSM for OSPF
12. (Optional.) Configuring OSPF logging and SNMP notifications
    - Logging neighbor state changes
    - Configuring the OSPF logging feature
    - Configuring OSPF network management
    - Setting the maximum number of OSPF neighbor relationship troubleshooting entries

Configuring basic OSPF functions

Enabling an OSPF process

1. Enter system view.
   system-view
2. (Optional.) Configure a global router ID.
   router id *router-id*
   By default, no global router ID is configured.
   If no global router ID is configured, the highest loopback interface IP address, if any, is used as the router ID. If no loopback interface IP address is available, the highest physical interface IP address is used, regardless of the interface status (up or down).
3. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
   By default, OSPF is disabled.
4. (Optional.) Configure a description for the OSPF process.
   description *text*
   By default, no description is configured for the OSPF process.
   As a best practice, configure a description for each OSPF process.

Creating an OSPF area

1. Enter system view.
   system-view
2. (Optional.) Configure a global router ID.
   router id *router-id*
   By default, no global router ID is configured.
3. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
   By default, OSPF is disabled.
4. (Optional.) Configure a description for the OSPF process.
   description *text*
   By default, no description is configured for the OSPF process.
   As a best practice, configure a description for each OSPF process.
5. Create an OSPF area, and enter OSPF area view.
   area *area-id*
6. (Optional.) Configure a description for the area.
   description *text*
   By default, no description is configured for the area.
   As a best practice, configure a description for each OSPF area.
7. (Optional.) Exclude interfaces in the OSPF area from the base topology:
   capability default-exclusion
   By default, interfaces in an OSPF area belong to the base topology.

For correct neighbor relationship establishment, perform this task on both the local device and the neighbor device.

Enabling OSPF

About multiple processes and VPNs

To enable OSPF on a router, you must perform the following tasks:

1. Create an OSPF process.
2. Create an OSPF area for the process.
3. Specify a network in the area.

The interface attached to the network will run the OSPF process in the area. OSPF advertises direct routes of the interface.

OSPF supports multiple processes. To run multiple OSPF processes, you must specify an ID for each process. The process IDs take effect locally and has no influence on packet exchange between routers. Two routers with different process IDs can exchange packets.

Restrictions and guidelines for enabling OSPF

When you configure OSPF on an interface, follow these restrictions and guidelines:

- You can enable OSPF on the network where the interface resides or directly enable OSPF on that interface. If you configure both, the latter takes precedence.
- If the specified OSPF process and area do not exist, the operation creates an OSPF process and area for the interface. Disabling an OSPF process on an interface does not delete the OSPF process or the area.

Enabling OSPF on a network

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *
3. Enter OSPF area view.

   area *area-id*
4. Specify a network to enable the interface attached to the network to run the OSPF process in the area.

   network *ip-address wildcard-mask*

   By default, no network is specified to enable OSPF on the interface attached to the network.

   A network can be added to only one area.

Enabling OSPF on an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable an OSPF process on the interface.

   ospf *process-id* **area** *area-id* [**exclude-subip**]

   By default, OSPF is disabled on an interface.

Configuring OSPF stub and NSSA areas

About OSPF stub and NSSA area configuration

This task allows you to configure an OSPF area as a stub area or NSSA area. It also allows you to create a virtual link if no connectivity can be achieved between a non-backbone area and backbone area, or in the backbone area.

Configuring a stub area

About stub area configuration

You can configure a non-backbone area at an AS edge as a stub area. To do so, execute the **stub** command on all routers attached to the area. The routing table size is reduced because Type-5 LSAs will not be flooded within the stub area. The ABR generates a default route into the stub area so all packets destined outside of the AS are sent through the default route.

To further reduce the routing table size and routing information exchanged in the stub area, configure a totally stub area by using the **stub no-summary** command on the ABR. AS external routes and inter-area routes will not be distributed into the area. All the packets destined for outside of the AS or area will be sent to the ABR for forwarding.

A stub or totally stub area cannot have an ASBR because external routes cannot be distributed into the area.

Restrictions and guidelines

Do not configure the backbone area as a stub area or totally stub area.

To configure an area as a stub area, execute the **stub** command on all routers attached to the area.

To configure an area as a totally stub area, execute the **stub** command on all routers attached to the area, and execute the **stub no-summary** command on the ABR.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enter area view.
   area *area-id*
4. Configure the area as a stub area.
   stub [**default-route-advertise-always** | **no-summary**] *
   By default, no stub area is configured.
5. (Optional.) Set a cost for the default route advertised to the stub area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the stub area is 1.
   This command takes effect only on the ABR of a stub area or totally stub area.

Configuring an NSSA area

About NSSA area configuration

A stub area cannot import external routes, but an NSSA area can import external routes into the OSPF routing domain while retaining other stub area characteristics.

To configure an area as a totally NSSA area, use the **nssa no-summary** command. The ABR of the area does not advertise inter-area routes into the area.

Restrictions and guidelines

Do not configure the backbone area as an NSSA area or totally NSSA area.

To configure an NSSA area, configure the **nssa** command on all the routers attached to the area.

To configure a totally NSSA area, configure the **nssa** command on all the routers attached to the area and configure the **nssa no-summary** command on the ABR.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enter area view.
   area *area-id*
4. Configure the area as an NSSA area.
   nssa [**default-route-advertise** [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **type** *type*] * | **no-import-route** | **no-summary** | **suppress-fa** | [[[**translate-always**] [**translate-ignore-checking-backbone**]] | **translate-never**] | **translator-stability-interval** *value*] *
   By default, no area is configured as an NSSA area.
5. (Optional.) Set a cost for the default route advertised to the NSSA area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the NSSA area is 1.
   This command takes effect only on the ABR/ASBR on an NSSA area or totally NSSA area.

Configuring a virtual link

About virtual link configuration

You can configure a virtual link to maintain connectivity between a non-backbone area and the backbone, or in the backbone itself.

Restrictions and guidelines

A virtual link cannot traverse a stub area, totally stub area, NSSA area, or totally NSSA area.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *

3. Enter OSPF area view.

   area *area-id*

4. Configure a virtual link.

   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | { { **hmac-md5** | **md5** } *key-id* { **cipher** | **plain** } *string* | **simple** { **cipher** | **plain** } *string* } | **retransmit** *seconds* | **trans-delay** *seconds*] *

   Configure this command on both ends of a virtual link. The **hello** and **dead** intervals must be identical on both ends of the virtual link.

Configuring OSPF network types

Based on the link layer protocol, OSPF classifies networks into different types, including broadcast, NBMA, P2MP, and P2P.

Restrictions and guidelines for configuring OSPF network types

If any routers in a broadcast network do not support multicasting, change the network type to NBMA.

If only two routers running OSPF exist on a network segment, you can change the network type to P2P to save costs.

Two broadcast-, NBMA-, and P2MP-interfaces can establish a neighbor relationship only when they are on the same network segment.

Configuring the broadcast network type for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as broadcast.

   ospf network-type broadcast

   By default, the network type of an interface is broadcast.

4. (Optional.) Set a router priority for the interface.

   ospf dr-priority *priority*

   The default router priority is 1.

Configuring the NBMA network type for an interface

Restrictions and guidelines

After you configure the network type as NBMA, you must specify neighbors and their router priorities because NBMA interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as NBMA.
   ospf network-type nbma
   By default, the network type of an interface is broadcast.
4. (Optional.) Set a router priority for the interface.
   ospf dr-priority *priority*
   The default router priority for an interface is 1.
   The router priority configured with this command is for DR election.
5. Return to system view.
   quit
6. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
7. Specify an NBMA neighbor.
   peer *ip-address* [**dr-priority** *priority*]
   By default, no neighbor is specified.
   The priority configured with this command indicates whether a neighbor has the election right or not. If you configure the router priority for a neighbor as 0, the local router determines the neighbor has no election right. It does not send hello packets to this neighbor. However, if the local router is the DR or BDR, it still sends hello packets to the neighbor for neighbor relationship establishment.

Configuring the P2MP network type for an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the OSPF network type for the interface as P2MP.
   ospf network-type p2mp [**unicast**]
   By default, the network type of an interface is broadcast.
4. Return to system view.
   quit
5. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
6. Specify a P2MP neighbor.
   peer *ip-address* [**cost** *cost-value*]
   By default, no neighbor is specified
   This step is required if the interface network type is P2MP unicast.

Configuring the P2P network type for an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as P2P.

   ospf network-type p2p [**peer-address-check**]

   By default, the network type of an interface is broadcast.

Configuring OSPF route control

This section describes how to control the advertisement and reception of OSPF routing information, as well as route redistribution from other protocols.

Configuring OSPF inter-area route summarization

About OSPF inter-area route summarization

OSPF inter-area route summarization reduces the routing information exchanged between areas and the size of routing tables, and improves routing performance.

OSPF inter-area route summarization enables an ABR to summarize contiguous networks into a single network and advertise the network to other areas. For example, three internal networks 19.1.1.0/24, 19.1.2.0/24, and 19.1.3.0/24 are available within an area. You can configure the ABR to summarize the three networks into network 19.1.0.0/16, and advertise the summary network to other areas in a Type-3 LSA. This configuration reduces the scale of LSDBs on routers in other areas and the influence of topology changes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Enter OSPF area view.

   area *area-id*

4. Configure ABR route summarization.

   abr-summary *ip-address* { *mask-length* | *mask* } [**advertise** | **not-advertise**] [**cost** *cost-value*]

   By default, route summarization is not configured on an ABR.

Configuring redistributed route summarization

About redistributed route summarization

Perform this task to enable an ASBR to summarize external routes within the specified address range into a single route. The ASBR advertises only Type-5 LSAs to reduce the number of LSAs in the LSDB.

An ASBR can summarize routes in the following LSAs:

- Type-5 LSAs.
- Type-7 LSAs in an NSSA area.

Restrictions and guidelines

If an ASBR (also an ABR) is a translator in an NSSA area, it summarizes routes in Type-5 LSAs translated from Type-7 LSAs. If it is not a translator, it does not summarize routes in in Type-5 LSAs translated from Type-7 LSAs.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Configure ASBR route summarization.
   asbr-summary *ip-address* { *mask-length* | *mask* } [**cost** *cost-value* | **not-advertise** | **nssa-only** | **tag** *tag*] *
   By default, route summarization is not configured on an ASBR.

Configuring received OSPF route filtering

About filtering methods

Perform this task to filter routes calculated using received LSAs.

The following filtering methods are available:

- Use an ACL or IP prefix list to filter routing information by destination address.
- Use the **gateway** *prefix-list-name* option to filter routing information by next hop.
- Use an ACL or IP prefix list to filter routing information by destination address. At the same time use the **gateway** *prefix-list-name* option to filter routing information by next hop.
- Use the **route-policy** *route-policy-name* option to filter routing information.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Configure OSPF to filter routes calculated using received LSAs.
   filter-policy { *ipv4-acl-number* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **route-policy** *route-policy-name* } **import**
   By default, OSPF accepts all routes calculated by using received LSAs.

Configuring Type-3 LSA filtering

About Type-3 LSA filtering

Perform this task to filter Type-3 LSAs advertised into the local area or other areas on an ABR.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enter OSPF area view.
   area *area-id*
4. Configure Type-3 LSA filtering.

filter { *ipv4-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }

By default, the ABR does not filter Type-3 LSAs.

Setting an OSPF cost for an interface

About setting an OSPF cost for an interface

Set an OSPF cost for an interface by using either of the following methods:

- Set the cost value in interface view.
- Set a bandwidth reference value for the interface. OSPF computes the cost with this formula: Interface OSPF cost = Bandwidth reference value (100 Mbps) / Expected interface bandwidth (Mbps). The expected bandwidth of an interface is configured with the **bandwidth** command (see *Interface Command Reference*).
  - If the calculated cost is greater than 65535, the value of 65535 is used. If the calculated cost is less than 1, the value of 1 is used.
  - If no cost or bandwidth reference value is configured for an interface, OSPF computes the interface cost based on the interface bandwidth and default bandwidth reference value.

Setting an OSPF cost for an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set an OSPF cost for the interface.

   ospf cost *cost-value*

   By default, the OSPF cost is calculated according to the interface bandwidth. For a loopback interface, the OSPF cost is 0 by default.

Setting a bandwidth reference value

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *
3. Set a bandwidth reference value.

   bandwidth-reference *value*

   The default setting is 100 Mbps.

Setting OSPF preference

About OSPF preference

A router can run multiple routing protocols, and each protocol is assigned a preference. If multiple routes are available to the same destination, the one with the highest protocol preference is selected as the best route.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

ospf [*process-id* | **router-id** *router-id*] *

3. Set a preference for OSPF.

   preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *

   By default, the preference of OSPF internal routes is 10 and the preference of OSPF external routes is 150.

Configuring discard routes for summary networks

About discarding routes for summary networks

Perform this task on an ABR or ASBR to specify whether to generate discard routes for summary networks. You can also specify a preference for the discard routes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Configure discard routes for summary networks.

   discard-route { **external** { *preference* | **suppression** } | **internal** { *preference* | **suppression** } } *

   By default, the ABR or ASBR generates discard routes for summary networks and the default preference of discard routes is 255.

Redistributing routes from another routing protocol

About redistributing routes from another routing protocol

On a router running OSPF and other routing protocols, you can configure OSPF to redistribute routes from other protocols. OSPF advertises the routes in Type-5 LSAs or Type-7 LSAs. In addition, you can configure OSPF to filter redistributed routes so that OSPF advertises only permitted routes.

Restrictions and guidelines

OSPF redistributes only active routes. To view route status information, use the **display ip routing-table protocol** command.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Configure OSPF to redistribute routes from another routing protocol.

   import-route { **direct** | **static** } [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **ospf** | **rip** } [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no route redistribution is configured.

4. (Optional.) Configure OSPF to filter redistributed routes.

   filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*]]

By default, OSPF accepts all redistributed routes.

5. Configure the default parameters for redistributed routes (cost, tag, and type).
   default { **cost** *cost-value* | **tag** *tag* | **type** *type* } *
   By default, the cost is 1, the tag is 1, and the route type is 2

Redistributing a default route

About default route redistribution

The **import-route** command cannot redistribute a default external route. Perform this task to redistribute a default route.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Redistribute a default route.
   default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **type** *type*] *
   By default, no default route is redistributed.
4. Configure the default parameters for redistributed routes (cost, tag, and type).
   default { **cost** *cost-value* | **tag** *tag* | **type** *type* } *
   By default, the cost is 1, the tag is 1, and the route type is 2

Advertising a host route

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enter area view.
   area *area-id*
4. Advertise a host route.
   host-advertise *ip-address cost*
   By default, OSPF does not advertise host routes that are not in the area.

Setting OSPF timers

About setting OSPF timers

This task allows you to change OSPF packet timers to adjust the convergence speed and network load and tune the delay time for sending LSAs on low-speed links.

Configuring OSPF packet timers

About OSPF packet timers

An OSPF interface includes the following timers:

- **Hello timer**—Interval for sending hello packets. It must be identical on OSPF neighbors.
- **Poll timer**—Interval for sending hello packets to a neighbor that is down on the NBMA network.
- **Dead timer**—Interval within which if the interface does not receive any hello packet from the neighbor, it declares the neighbor is down.
- **LSA retransmission timer**—Interval within which if the interface does not receive any acknowledgment packets after sending an LSA to the neighbor, it retransmits the LSA.

Restrictions and guidelines

The default value for the hello interval and neighbor dead interval depends on the network type. When the network type for an interface is changed, the default hello interval and neighbor dead interval are restored. Make sure two neighboring interfaces are configured with the same hello interval and neighbor dead interval. Inconsistent settings will affect the OSPF neighbor relationship establishment.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the hello interval.

   ospf timer hello *seconds*

   The default hello interval on P2P and broadcast interfaces is 10 seconds. The default hello interval on P2MP and NBMA interfaces is 30 seconds.

4. Set the poll interval.

   ospf timer poll *seconds*

   The default setting is 120 seconds.

   The poll interval is a minimum of four times the hello interval.

5. Set the dead interval.

   ospf timer dead *seconds*

   The default dead interval on P2P and broadcast interfaces is 40 seconds. The default dead interval on P2MP and NBMA interfaces is 120 seconds.

   The dead interval must be a minimum of four times the hello interval on an interface.

6. Set the retransmission interval.

   ospf timer retransmit *interval*

   The default retransmission interval is 5 seconds.

   A retransmission interval setting that is too small can cause unnecessary LSA retransmissions. Typically set a bigger interval than the round-trip time of a packet between two neighbors.

Setting LSA transmission delay

About setting LSA transmission delay

To avoid LSAs from aging out during transmission, set an LSA retransmission delay especially for low speed links.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the LSA transmission delay.
   ospf trans-delay *seconds*
   The default LSA transmission delay is 1 second.

Setting SPF calculation interval

About setting SPF calculation interval

LSDB changes result in SPF calculations. When the topology changes frequently, a large amount of network and router resources are occupied by SPF calculation. You can adjust the SPF calculation interval to reduce the impact.

For a stable network, the minimum interval is used. If network changes become frequent, the SPF calculation interval increases by the incremental interval × 2^{n-2} for each calculation until the maximum interval is reached. The value *n* is the number of calculation times.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Set the SPF calculation interval.
   spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]
   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the minimum LSA arrival interval

About setting the minimum LSA arrival interval

OSPF drops any duplicate LSAs (with the same LSA type, LS ID, and router ID) within the minimum LSA arrival interval. This helps avoid overuse of bandwidth and router resources due to frequent network changes.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Set the minimum LSA arrival interval.
   lsa-arrival-interval *interval*
   By default, the minimum LSA arrival interval is 1000 milliseconds.

Setting the LSA generation interval

About setting the LSA generation interval

Adjust the LSA generation interval to protect network resources and routers from being overwhelmed by LSAs at the time of frequent network changes.

For a stable network, the minimum interval is used. If network changes become frequent, the LSA generation interval is incremented by the incremental interval × 2^{n-2} for each generation until the maximum interval is reached. The value *n* is the number of generation times.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Set the LSA generation interval.

   lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting OSPF exit overflow interval

About setting OSPF exit overflow interval

When the number of LSAs in the LSDB exceeds the upper limit, the LSDB is in an overflow state. In this state, OSPF does not receive any external LSAs and deletes the external LSAs generated by itself to save system resources.

This task allows you to configure the interval that OSPF exits overflow state.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Set the interval that OSPF exits overflow state.

   lsdb-overflow-interval *interval*

   By default, the OSPF exit overflow interval is 300 seconds. An interval of 0 means that OSPF does not exit overflow state.

Configuring OSPF packet parameters

Disabling interfaces from receiving and sending OSPF packets

About disabling interfaces from receiving and sending OSPF packets

To enhance OSPF adaptability and reduce resource consumption, you can set an OSPF interface to "silent." A silent OSPF interface blocks OSPF packets and cannot establish any OSPF neighbor

relationship. However, other interfaces on the router can still advertise direct routes of the interface in Router LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Disable interfaces from receiving and sending OSPF packets.

   silent-interface { *interface-type interface-number* | **all** }

   By default, an OSPF interface can receive and send OSPF packets.

   This command disables only the interfaces associated with the current process rather than other processes. Multiple OSPF processes can disable the same interface from receiving and sending OSPF packets.

Adding the interface MTU into DD packets

About adding the interface MTU into DD packets

By default, an OSPF interface adds a value of 0 into the interface MTU field of a DD packet rather than the actual interface MTU. You can enable an interface to add its MTU into DD packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to add its MTU into DD packets.

   ospf mtu-enable

   By default, the interface adds an MTU value of 0 into DD packets.

Setting the DSCP value for outgoing OSPF packets

About DSCP value

The DSCP value specifies the precedence of outgoing packets.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Set the DSCP value for outgoing OSPF packets.

   dscp *dscp-value*

   By default, the DSCP value for outgoing OSPF packets is 48.

Setting the maximum length of OSPF packets that can be sent by an interface

About setting the maximum length of OSPF packets that can be sent by an interface

This task allows you to limit the length of OSPF packets sent over an interface.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the maximum length of OSPF packets that can be sent by an interface.

   ospf packet-size *value*

   By default, the maximum length of OSPF packets that an interface can send equals the interface's MTU.

Setting the LSU transmit rate

About LSU transmit rate configuration

During LSDB synchronization, if the local router has multiple neighbors, it must send many LSUs to each neighbor. When a neighbor receives excessive LSUs within a short time period, the following events might occur:

- The neighbor experiences degraded performance because it uses too many system resources to process the received LSU packets.
- The neighbor drops hello packets used for maintaining the neighbor relationship because it is busy dealing with the LSUs. As a result, the neighbor relationship is torn down. To reestablish a relationship to the neighbor, the local router must send more LSUs to the neighbor. This exacerbates the performance degradation.

This task allows you to limit the LSU transmit rate by setting the LSU transmit interval and the maximum number of LSUs that can be sent at each interval.

Procedure

1. Enter system view.

   system-view

2. Enable OSPF to limit the LSU transmit rate.

   ospf lsu-flood-control [*interval count*]

   By default, OSPF does not limit the LSU transmit rate.

   Inappropriate use of this command might cause abnormal routing. As a best practice, execute this command with the default values.

3. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

4. (Optional.) Set the LSU transmit interval and the maximum number of LSUs that can be sent at each interval.

   transmit-pacing interval *interval* **count** *count*

   By default, an OSPF interface sends a maximum of three LSU packets every 20 milliseconds.

Controlling LSA generation, advertisement, and reception

Setting the maximum number of external LSAs in LSDB

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Set the maximum number of external LSAs in the LSDB.
   lsdb-overflow-limit *number*
   By default, the maximum number of external LSAs in the LSDB is not limited.

Filtering outbound LSAs on an interface

About filtering outbound LSAs on an interface

To reduce the LSDB size for the neighbor and save bandwidth, you can perform this task on an interface to filter LSAs to be sent to the neighbor.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Filter outbound LSAs on the interface.
   ospf database-filter { **all** | { **ase** [**acl** *ipv4-acl-number*] | **nssa** [**acl** *ipv4-acl-number*] | **summary** [**acl** *ipv4-acl-number*] } * }
   By default, the outbound LSAs are not filtered on the interface.

Filtering LSAs for the specified neighbor

About filtering LSAs for the specified neighbor

On a P2MP network, a router might have multiple P2MP type OSPF neighbors. Perform this task to prevent the router from sending LSAs to the specified P2MP neighbor.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Filter LSAs for the specified P2MP neighbor.
   database-filter peer *ip-address* { **all** | { **ase** [**acl** *ipv4-acl-number*] | **nssa** [**acl** *ipv4-acl-number*] | **summary** [**acl** *ipv4-acl-number*] } * }
   By default, the LSAs for the specified P2MP neighbor are not filtered.

Accelerating OSPF convergence speed

Enabling OSPF ISPF

About ISPF

When the topology changes, Incremental Shortest Path First (ISPF) computes only the affected part of the SPT, instead of the entire SPT.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable OSPF ISPF.
   ispf enable
   By default, OSPF ISPF is enabled.

Configuring prefix suppression

About prefix suppression

By default, an OSPF interface advertises all of its prefixes in LSAs. To speed up OSPF convergence, you can suppress interfaces from advertising all of their prefixes. This feature helps improve network security by preventing IP routing to the suppressed networks.

When prefix suppression is enabled:

- On P2P and P2MP networks, OSPF does not advertise Type-3 links in Type-1 LSAs. Other routing information can still be advertised to ensure traffic forwarding.
- On broadcast and NBMA networks, the DR generates Type-2 LSAs with a mask length of 32 to suppress network routes. Other routing information can still be advertised to ensure traffic forwarding. If no neighbors exist, the DR does not advertise Type-3 links in Type-1 LSAs.

Restrictions and guidelines for prefix suppression

As a best practice, configure prefix suppression on all OSPF routers if you want to use prefix suppression.

Configuring prefix suppression for an OSPF process

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable prefix suppression for the OSPF process.
   prefix-suppression
   By default, prefix suppression is disabled for an OSPF process.
   This feature does not suppress the prefixes of secondary IP addresses, loopback interfaces, and passive interfaces.

Configuring prefix suppression for an interface

1. Enter system view.
   system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Enable prefix suppression for the interface.
   ospf prefix-suppression [**disable**]
   By default, prefix suppression is disabled on an interface.
   This feature does not suppress prefixes of secondary IP addresses.

Configuring prefix prioritization

About prefix prioritization

This feature enables the device to install prefixes in descending priority order: critical, high, medium, and low. The prefix priorities are assigned through routing policies. When a route is assigned multiple prefix priorities, the route uses the highest priority.

By default, the 32-bit OSPF host routes have a medium priority and other routes have a low priority.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable prefix prioritization.
   prefix-priority route-policy *route-policy-name*
   By default, prefix prioritization is disabled.

Configuring OSPF PIC

About PIC

Prefix Independent Convergence (PIC) enables the device to speed up network convergence by ignoring the number of prefixes.

Restrictions and guidelines for OSPF PIC

When both OSPF PIC and OSPF FRR are configured, OSPF FRR takes effect.

OSPF PIC applies only to inter-area routes and external routes.

Enabling OSPF PIC

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable PIC for OSPF.
   pic [**additional-path-always**]
   By default, OSPF PIC is enabled.

Configuring BFD control packet mode for OSPF PIC

1. Enter system view.
   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. Enable BFD control packet mode for OSPF PIC.
   ospf primary-path-detect bfd ctrl
   By default, BFD control packet mode is disabled for OSPF PIC.
   This mode requires BFD configuration on both OSPF routers on the link.

Configuring BFD echo packet mode for OSPF PIC

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source IP address of BFD echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interfaces.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD echo packet mode for OSPF PIC.
   ospf primary-path-detect bfd echo
   By default, BFD echo packet mode is disabled for OSPF PIC.
   This mode requires BFD configuration on one OSPF router on the link.

Configuring advanced OSPF features

Configuring stub routers

About stub routers

A stub router is used for traffic control. It reports its status as a stub router to neighboring OSPF routers. The neighboring routers can have a route to the stub router, but they do not use the stub router to forward data.

Router LSAs from the stub router might contain different link type values. A value of 3 means a link to a stub network, and the cost of the link will not be changed by default. To set the cost of the link to 65535, specify the **include-stub** keyword in the **stub-router** command. A value of 1, 2 or 4 means a point-to-point link, a link to a transit network, or a virtual link. On such links, a maximum cost value of 65535 is used. Neighbors do not send packets to the stub router as long as they have a route with a smaller cost.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Configure the router as a stub router.
   stub-router [**external-lsa** [*max-metric-value*] | **include-stub** | **on-startup** *seconds* | **summary-lsa** [*max-metric-value*]] *
   By default, the router is not configured as a stub router.
   A stub router is not related to a stub area.

Enabling compatibility with RFC 1583

About compatibility with RFC 1583

RFC 1583 specifies a different method than RFC 2328 for selecting the optimal route to a destination in another AS. When multiple routes are available to the ASBR, OSPF selects the optimal route by using the following procedure:

1. Selects the route with the highest preference.
   - If RFC 2328 is compatible with RFC 1583, all these routes have equal preference.
   - If RFC 2328 is not compatible with RFC 1583, the intra-area route in a non-backbone area is preferred to reduce the burden of the backbone area. The inter-area route and intra-area route in the backbone area have equal preference.
2. Selects the route with the lower cost if two routes have equal preference.
3. Selects the route with the larger originating area ID if two routes have equal cost.

Restrictions and guidelines

To avoid routing loops, set identical RFC 1583-compatibility on all routers in a routing domain.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *
3. Enable compatibility with RFC 1583.

   rfc1583 compatible

   By default, compatibility with RFC 1583 is enabled.

Configuring OSPF GR

About OSPF GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must have GR capability.
- **GR helper**—A neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

OSPF GR has the following types:

- **IETF GR**—Uses Opaque LSAs to implement GR.
- **Non-IETF GR**—Uses link local signaling (LLS) to advertise GR capability and uses out of band synchronization to synchronize the LSDB.

A device can act as a GR restarter and GR helper at the same time.

Restrictions and guidelines for OSPF GR

You cannot enable OSPF NSR on a device that acts as GR restarter.

Configuring OSPF GR restarter

Configuring the IETF OSPF GR restarter

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable opaque LSA reception and advertisement capability.
   opaque-capability enable
   By default, opaque LSA reception and advertisement capability is enabled.
4. Enable the IETF GR.
   graceful-restart ietf [**global** | **planned-only**] *
   By default, the IETF GR capability is disabled.
5. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring the non-IETF OSPF GR restarter

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable the link-local signaling capability.
   enable link-local-signaling
   By default, the link-local signaling capability is disabled.
4. Enable the out-of-band re-synchronization capability.
   enable out-of-band-resynchronization
   By default, the out-of-band re-synchronization capability is disabled.
5. Enable non-IETF GR.
   graceful-restart [**nonstandard**] [**global** | **planned-only**] *
   By default, non-IETF GR capability is disabled.
6. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring OSPF GR helper

Configuring the IETF OSPF GR helper

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable opaque LSA reception and advertisement capability.
   opaque-capability enable

By default, opaque LSA reception and advertisement capability is enabled.

4. Enable GR helper capability.

   graceful-restart helper enable [**planned-only**]

   By default, GR helper capability is enabled.

5. (Optional.) Enable strict LSA checking for the GR helper.

   graceful-restart helper strict-lsa-checking

   By default, strict LSA checking for the GR helper is disabled.

   When an LSA change on the GR helper is detected, the GR helper device exits the GR helper mode.

Configuring the non-IETF OSPF GR helper

1. Enter system view.

   system-view

2. Enable OSPF and enter its view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Enable the link-local signaling capability.

   enable link-local-signaling

   By default, the link-local signaling capability is disabled.

4. Enable the out-of-band re-synchronization capability.

   enable out-of-band-resynchronization

   By default, the out-of-band re-synchronization capability is disabled.

5. Enable GR helper.

   graceful-restart helper enable

   By default, GR helper is enabled.

6. (Optional.) Enable strict LSA checking for the GR helper.

   graceful-restart helper strict-lsa-checking

   By default, strict LSA checking for the GR helper is disabled.

   When an LSA change on the GR helper is detected, the GR helper device exits the GR helper mode.

Triggering OSPF GR

About triggering OSPF GR

You can trigger OSPF GR by performing an active/standby switchover or using the **reset ospf process** command.

Procedure

To trigger OSPF GR, execute the **reset ospf** [*process-id*] **process graceful-restart** command in user view.

Configuring OSPF NSR

About OSPF NSR

Nonstop routing (NSR) backs up OSPF link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without tearing down adjacencies or impacting forwarding services.

NSR does not require the cooperation of neighboring devices to recover routing information, and it is typically used more often than GR.

Restrictions and guidelines

A device that has OSPF NSR enabled cannot act as GR restarter.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable OSPF NSR.
   non-stop-routing
   By default, OSPF NSR is disabled.
   This command takes effect only for the current process. As a best practice, enable OSPF NSR for each process if multiple OSPF processes exist.

Configuring BFD for OSPF

About BFD for OSPF

BFD provides a single mechanism to quickly detect and monitor the connectivity of links between OSPF neighbors, which improves the network convergence speed. For more information about BFD, see *High Availability Configuration Guide*.

OSPF supports the following BFD detection modes:

- **Bidirectional control detection**—Requires BFD configuration to be made on both OSPF routers on the link.
- **Single-hop echo detection**—Requires BFD configuration to be made on one OSPF router on the link.

Configuring bidirectional control detection

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD bidirectional control detection.
   ospf bfd enable
   By default, BFD bidirectional control detection is disabled.
   Both ends of a BFD session must be on the same network segment and in the same area.

Configuring single-hop echo detection

1. Enter system view.
   system-view
2. Configure the source address of echo packets.
   bfd echo-source-ip *ip-address*

By default, the source address of echo packets is not configured.

The source IP address cannot be on the same network segment as any local interfaces.

For more information about this command, see *High Availability Command Reference*.

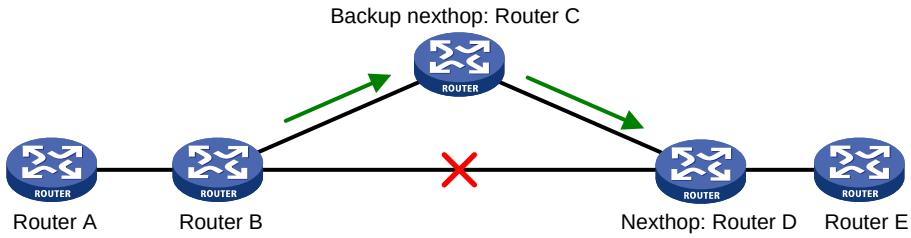
3. Enter interface view.
   `interface` *`interface-type interface-number`*
4. Enable BFD single-hop echo detection.
   `ospf bfd enable echo`
   By default, BFD single-hop echo detection is disabled.

Configuring OSPF FRR

About OSPF FRR

A link or router failure on a path can cause packet loss until OSPF completes routing convergence based on the new network topology. FRR enables fast rerouting to minimize the impact of link or node failures.

Figure 7 Network diagram for OSPF FRR



As shown in Figure 7, configure FRR on Router B by using a routing policy to specify a backup next hop. When the primary link fails, OSPF directs packets to the backup next hop. At the same time, OSPF calculates the shortest path based on the new network topology. It forwards packets over the path after network convergence.

You can configure OSPF FRR to calculate a backup next hop by using the loop free alternate (LFA) algorithm, or specify a backup next hop by using a routing policy.

Restrictions and guidelines for OSPF FRR

When both OSPF PIC and OSPF FRR are configured, OSPF FRR takes effect.

Configuring OSPF FRR to use the LFA algorithm to calculate a backup next hop

Restrictions and guidelines

Do not use the **`fast-reroute lfa`** command together with the **`vlink-peer`** command.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*

3. (Optional.) Enable LFA on an interface.
   ospf fast-reroute lfa-backup
   By default, the interface is enabled with LFA and it can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
6. Enable OSPF FRR to use the LFA algorithm to calculate a backup next hop.
   fast-reroute lfa [**abr-only**]
   By default, OSPF FRR is disabled.
   If **abr-only** is specified, the route to the ABR is selected as the backup path.

Configuring OSPF FRR to use a backup next hop specified in a routing policy

About specifying a backup next hop in a routing policy

Before you perform this task, use the **apply fast-reroute backup-interface** command to specify a backup next hop in a routing policy for OSPF FRR. For more information about the **apply fast-reroute backup-interface** command and routing policy configuration, see "Configuring routing policies."

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable OSPF FRR to use a backup next hop specified in a routing policy.
   fast-reroute route-policy *route-policy-name*
   By default, OSPF FRR is disabled.

Configuring BFD control packet mode for OSPF FRR

About BFD control packet mode for OSPF FRR

By default, OSPF FRR does not use BFD to detect primary link failures. To speed up OSPF convergence, enable BFD control packet mode for OSPF FRR to detect primary link failures. This mode requires BFD configuration on both OSPF routers on the link.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for OSPF FRR.
   ospf primary-path-detect bfd ctrl
   By default, BFD control packet mode is disabled for OSPF FRR.

Configuring BFD echo packet mode for OSPF FRR

About BFD echo packet mode for OSPF FRR

By default, OSPF FRR does not use BFD to detect primary link failures. To speed up OSPF convergence, enable BFD echo packet mode for OSPF FRR to detect primary link failures. This mode requires BFD configuration on one OSPF router on the link.

Procedure

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source IP address of BFD echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interface's IP address.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD echo packet mode for OSPF FRR.
   ospf primary-path-detect bfd echo
   By default, BFD echo packet mode is disabled for OSPF FRR.

Configuring OSPF authentication

About OSPF area and interface authentication

Perform this task to configure OSPF area and interface authentication.

OSPF adds the configured key into sent packets, and uses the key to authenticate received packets. Only packets that pass the authentication can be received. If a packet fails the authentication, the OSPF neighbor relationship cannot be established.

If you configure OSPF authentication for both an area and an interface in that area, the interface uses the OSPF authentication configured on it.

Restrictions and guidelines for configuring OSPF authentication

OSPF supports the MD5 and HMAC-MD5 authentication algorithms.

The ID of keys used for authentication can only be in the range of 0 to 255.

Configuring OSPF area authentication

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enter area view.

area *area-id*

4. Configure area authentication mode.
   - Configure HMAC-MD5/MD5 authentication.
     authentication-mode { **hmac-md5** | **md5** } *key-id* { **cipher** | **plain** } *string*
   - Configure simple authentication.
     authentication-mode simple { **cipher** | **plain** } *string*

   By default, no authentication is configured.

   You must configure the same authentication mode and key on all the routers in an area.

Configuring OSPF interface authentication

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure interface authentication mode.
   - Configure simple authentication.
     ospf authentication-mode simple { **cipher** | **plain** } *string*
   - Configure HMAC-MD5/MD5 authentication.
     ospf authentication-mode { **hmac-md5** | **md5** } *key-id* { **cipher** | **plain** } *string*

   By default, no authentication is configured.

   You must configure the same authentication mode and key on both the local interface and its peer interface.

Configuring GTSM for OSPF

About GTSM

The Generalized TTL Security Mechanism (GTSM) protects the device by comparing the TTL value in the IP header of incoming OSPF packets against a valid TTL range. If the TTL value is within the valid TTL range, the packet is accepted. If not, the packet is discarded.

The valid TTL range is from 255 – the configured hop count + 1 to 255.

When GTSM is configured, the OSPF packets sent by the device have a TTL of 255.

GTSM checks OSPF packets from common neighbors and virtual link neighbors. It does not check OSPF packets from sham link neighbors. For information about GTSM for OSPF sham links, see *MPLS Configuration Guide*.

You can configure GTSM in OSPF area view or interface view.

- The configuration in OSPF area view applies to all OSPF interfaces in the area.
- The configuration in interface view takes precedence over OSPF area view.

Restrictions and guidelines for GTSM

To use GTSM, you must configure GTSM on both the local and peer devices. You can specify different *hop-count* values for them.

Configuring GTSM in OSPF area view

Restrictions and guidelines

GTSM in OSPF area view applies to all OSPF interfaces in the area. GTSM checks OSPF packets from common neighbors and virtual link neighbors.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enter OSPF area view.
   area *area-id*
4. Enable GTSM for the OSPF area.
   ttl-security [**hops** *hop-count*]
   By default, GTSM is disabled for the OSPF area.

Configuring GTSM in interface view

Restrictions and guidelines

GTSM in interface view applies only to the current interface. GTSM checks OSPF packets from common neighbors and virtual link neighbors.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable GTSM for the interface.
   ospf ttl-security [**hops** *hop-count* | **disable**]
   By default, GTSM is disabled for the interface.

Configuring OSPF logging and SNMP notifications

Logging neighbor state changes

About logging neighbor state changes

Perform this task to enable output of neighbor state change logs to the information center. The information center processes the logs according to user-defined output rules (whether and where to output logs). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Enable the logging of neighbor state changes.

   log-peer-change

   By default, this feature of logging neighbor state changes is enabled.

Configuring the OSPF logging feature

About OSPF logs

OSPF logs include hello packet logs, route calculation logs, neighbor logs, OSPF route logs, and self-originated and received LSA logs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

3. Set the number of OSPF logs.

   event-log { **hello** { **received** [**abnormal** | **dropped**] | **sent** [**abnormal** | **failed**] } | **lsa-flush** | **peer** | **spf** } **size** *count*

   By default, the device can generate a maximum of 100 OSPF logs for each type.

Configuring OSPF network management

About OSPF network management

This task involves the following configurations:

- Bind an OSPF process to MIB so that you can use network management software to manage the specified OSPF process.
- Enable SNMP notifications for OSPF to report important events.
- Configure the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

To report critical OSPF events to an NMS, enable SNMP notifications for OSPF. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.

   system-view

2. Bind MIB to an OSPF process.

   ospf mib-binding *process-id*

   By default, MIB is bound to the process with the smallest process ID.

3. Enable SNMP notifications for OSPF.

   snmp-agent trap enable ospf [**authentication-failure** | **bad-packet** | **config-error** | **grhelper-status-change** | **grrestarter-status-change** | **if-state-change** | **lsa-maxage** | **lsa-originate** | **lsdb-approaching-overflow** | **lsdb-overflow** | **neighbor-state-change** | **nssatranslator-status-change** | **retransmit** |

virt-authentication-failure | **virt-bad-packet** | **virt-config-error** | **virt-retransmit** | **virtgrhelper-status-change** | **virtif-state-change** | **virtneighbor-state-change**] *

By default, SNMP notifications for OSPF are enabled.

4. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id*] *

5. Configure the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

   snmp trap rate-limit interval *trap-interval* **count** *trap-number*

   By default, OSPF outputs a maximum of seven SNMP notifications within 10 seconds.

Setting the maximum number of OSPF neighbor relationship troubleshooting entries

About this task

Perform this task to set the maximum number of neighbor relationship troubleshooting entries that OSPF can record.

Software version and feature compatibility

This feature is supported only in Release 6342 and later.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of neighbor relationship troubleshooting entries that OSPF can record.

   ospf troubleshooting max-number *number*

   By default, OSPF can record a maximum of 100 neighbor relationship troubleshooting entries.

Display and maintenance commands for OSPF

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display OSPF log information about received or sent hello packets.	**display ospf** [*process-id*] **event-log hello** { **received** [**abnormal**	**dropped**]	**sent** } [*neighbor-id*] **display ospf** [*process-id*] **event-log hello sent** { **abnormal**	**failed** } [*neighbor-address*]
Display summary route information on the OSPF ABR.	**display ospf** [*process-id*] [**area** *area-id*] **abr-summary** [*ip-address* { *mask-length*	*mask* }] [**verbose**]
Display OSPF FRR backup next hop information.	**display ospf** [*process-id*] [**area** *area-id*] **fast-reroute lfa-candidate**
Display OSPF topology information.	**display ospf** [*process-id*] [**area** *area-id*] **spf-tree** [**verbose**]
Display OSPF process information.	**display ospf** [*process-id*] [**verbose**]

Task	Command
Display OSPF ABR and ASBR information.	**display ospf** [*process-id*] **abr-asbr** [**verbose**]
Display OSPF ASBR route summarization information.	**display ospf** [*process-id*] **asbr-summary** [*ip-address* { *mask-length* | *mask* }]
Display OSPF log information.	**display ospf** [*process-id*] **event-log** { **lsa-flush** | **peer** | **spf** }
Display OSPF GR information.	**display ospf** [*process-id*] **graceful-restart** [**verbose**]
Display OSPF interface information.	**display ospf** [*process-id*] **interface** [*interface-type interface-number* | **verbose**]
Display information about hello packets sent by OSPF interfaces.	**display ospf** [*process-id*] **interface** [*interface-type interface-number*] **hello**
Display OSPF LSDB information.	**display ospf** [*process-id*] [**area** *area-id*] **lsdb** { **asbr** | **network** | **nssa** | **opaque-area** | **opaque-link** | **router** | **summary** } [*link-state-id*] [**originate-router** *advertising-router-id* | **self-originate**] **display ospf** [*process-id*] **lsdb** [**brief** | **originate-router** *advertising-router-id* | **self-originate**] **display ospf** [*process-id*] **lsdb** { **ase** | **opaque-as ase** } [*link-state-id*] [**originate-router** *advertising-router-id* | **self-originate**]
Display OSPF next hop information.	**display ospf** [*process-id*] **nexthop**
Display OSPF NSR information.	**display ospf** [*process-id*] **non-stop-routing status**
Display OSPF neighbor information.	**display ospf** [*process-id*] **peer** [**hello** | **verbose**] [*interface-type interface-number*] [*neighbor-id*]
Display neighbor statistics for OSPF areas.	**display ospf** [*process-id*] **peer statistics**
Display OSPF request queue information.	**display ospf** [*process-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPF retransmission queue information.	**display ospf** [*process-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPF routing table information.	**display ospf** [*process-id*] **routing** [*ip-address* { *mask-length* | *mask* }] [**interface** *interface-type interface-number*] [**nexthop** *nexthop-address*] [**verbose**]
Display OSPF statistics.	**display ospf** [*process-id*] **statistics** [**error** | **packet hello** | [*interface-type interface-number*]]

Task	Command
Display OSPF neighbor relationship troubleshooting information.	**display ospf troubleshooting**
Display OSPF virtual link information.	**display ospf** [*process-id*] **vlink**
Display the global route ID.	**display router id**
Clear OSPF log information.	**reset ospf** [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]
Clear OSPF log information about received or sent hello packets.	**reset ospf** [*process-id*] **event-log hello** { **received** [**abnormal** | **dropped**] | **sent** [**abnormal** | **failed**] }
Restart an OSPF process.	**reset ospf** [*process-id*] **process** [**graceful-restart**]
Re-enable OSPF route redistribution.	**reset ospf** [*process-id*] **redistribution**
Clear OSPF statistics.	**reset ospf** [*process-id*] **statistics**
Clear OSPF neighbor relationship troubleshooting information.	**reset ospf troubleshooting**

OSPF configuration examples

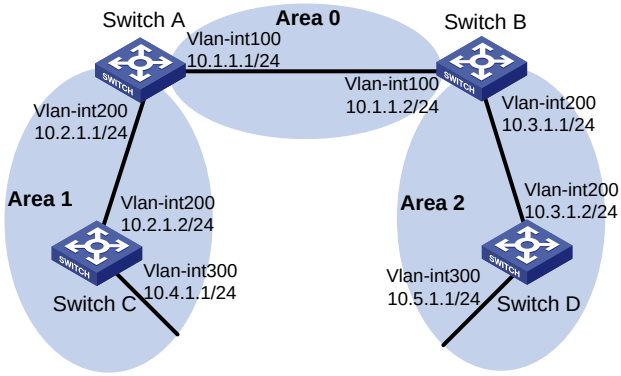
Example: Configuring basic OSPF

Network configuration

As shown in Figure 8:

- Enable OSPF on all switches, and split the AS into three areas.
- Configure Switch A and Switch B as ABRs.

Figure 8 Network diagram



Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] router id 10.2.1.1
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] router id 10.3.1.1
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] area 2
[SwitchB-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.2] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] router id 10.4.1.1
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.1] network 10.4.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] router id 10.5.1.1
[SwitchD] ospf
[SwitchD-ospf-1] area 2
[SwitchD-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] network 10.5.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] quit
[SwitchD-ospf-1] quit
```

Verifying the configuration

Display information about neighbors on Switch A.

```
[SwitchA] display ospf peer verbose

          OSPF Process 1 with Router ID 10.2.1.1
                  Neighbors

 Area 0.0.0.0 interface 10.1.1.1(Vlan-interface100)'s neighbors

--- Ping statistics for 10.4.1.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.779/1.408/1.702/0.323 ms
```

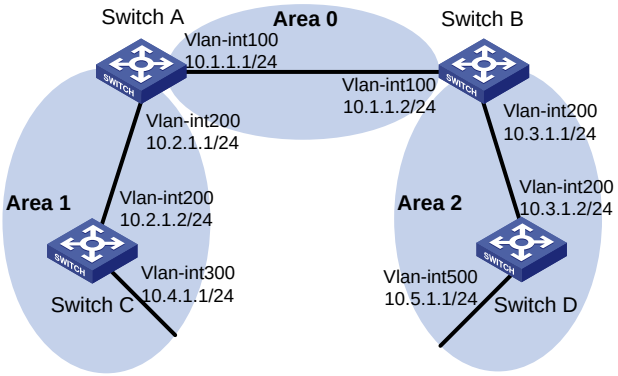
Example: Configuring OSPF route redistribution

Network configuration

As shown in Figure 9:

- Enable OSPF on all the switches.
- Split the AS into three areas.
- Configure Switch A and Switch B as ABRs.
- Configure Switch C as an ASBR to redistribute external routes (static routes).

Figure 9 Network diagram



Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF (see "Example: Configuring basic OSPF").
3. Configure OSPF to redistribute routes:

   # On Switch C, configure a static route destined for network 3.1.2.0/24.

   ```
   <SwitchC> system-view
   ```

```
[SwitchC] ip route-static 3.1.2.1 24 10.4.1.2
```

On Switch C, configure OSPF to redistribute static routes.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] import-route static
```

Verifying the configuration

Display the ABR/ASBR information on Switch D.

```
<SwitchD> display ospf abr-asbr

          OSPF Process 1 with Router ID 10.5.1.1

```

Example: Configuring OSPF route summarization on an ASBR

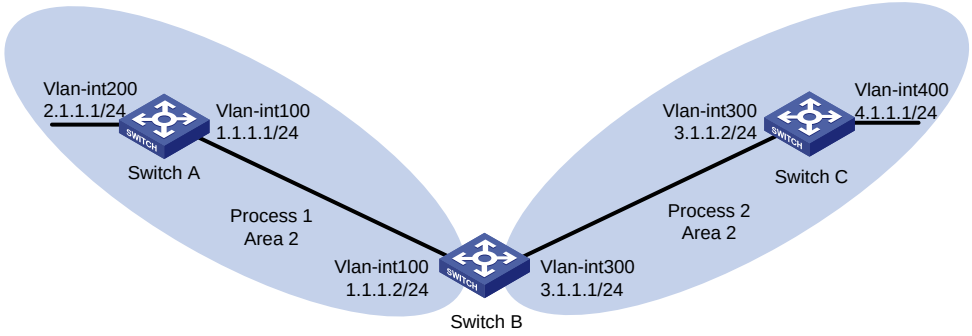
Network configuration

As shown in Figure 10:

- Configure OSPF on Switch A, Switch B, and Switch C in Area 2.

- Enable OSPF process 1 and process 2 on Switch B. Switch B uses OSPF process 1 to exchange routing information with Switch A, and uses OSPF process 2 to exchange routing information with Switch C.
- Assign IP addresses 2.1.2.1/24, 2.1.3.1/24, and 2.1.4.1/24 to VLAN-interface 200 of Switch A. To enable Switch C to learn routes destined for 2.1.2.0/24, 2.1.3.0/24, 2.1.4.0/24, configure OSPF process 2 on Switch B to redistribute routes from process 1 and direct routes.
- To minimize the size of the routing table on Switch C, configure ASBR route summarization on Switch B. Switch B advertises only the summary route 2.0.0.0/8.

Figure 10 Network diagram



Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure OSPF:

   # Enable OSPF process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] router id 11.2.1.1
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ip address 2.1.2.1 24
[SwitchA-Vlan-interface200] ip address 2.1.3.1 24 sub
[SwitchA-Vlan-interface200] ip address 2.1.4.1 24 sub
[SwitchA-Vlan-interface200] quit
[SwitchA] ospf 1
[SwitchA-ospf-1] area 2
[SwitchA-ospf-1-area-0.0.0.2] network 1.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.2] network 2.1.0.0 0.0.255.255
[SwitchA-ospf-1-area-0.0.0.2] quit
[SwitchA-ospf-1] quit
```

   # Enable OSPF process 1 and process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] router id 11.2.1.2
[SwitchB] ospf 1
[SwitchB-ospf-1] area 2
[SwitchB-ospf-1-area-0.0.0.2] network 1.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.2] quit
[SwitchB-ospf-1] quit
[SwitchB] ospf 2
[SwitchB-ospf-2] area 2
[SwitchB-ospf-2-area-0.0.0.2] network 3.1.1.0 0.0.0.255
```

```
[SwitchB-ospf-2-area-0.0.0.2] quit
[SwitchB-ospf-2] quit
```

Enable OSPF process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] router id 11.1.1.2
[SwitchC] ospf 2
[SwitchC-ospf-2] area 2
[SwitchC-ospf-2-area-0.0.0.2] network 3.1.1.0 0.0.0.255
[SwitchC-ospf-2-area-0.0.0.2] network 4.1.0.0 0.0.255.255
[SwitchC-ospf-2-area-0.0.0.2] quit
[SwitchC-ospf-2] quit
```

3. Configure OSPF to redistribute routes:

Configure OSPF process 2 on Switch B to redistribute routes from OSPF process 1 and direct routes.

```
[SwitchB] ospf 2
[SwitchB-ospf-2]import-route direct
[SwitchB-ospf-2]import-route ospf 1
```

Display routing table information on Switch C.

```
[SwitchC] display ip routing-table

Destinations : 28       Routes : 28

```

Example: Configuring OSPF stub area

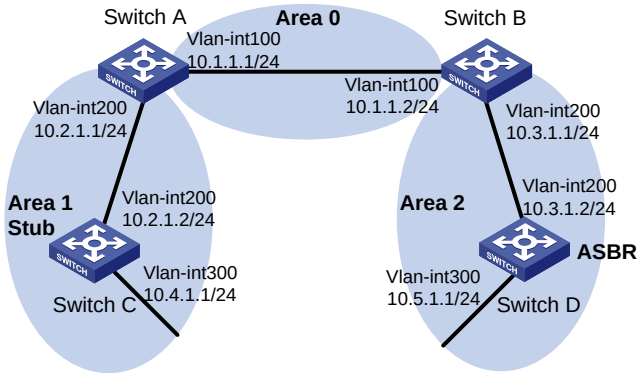
Network configuration

As shown in Figure 11:

- Enable OSPF on all switches, and split the AS into three areas.
- Configure Switch A and Switch B as ABRs to forward routing information between areas.

- Configure Switch D as the ASBR to redistribute static routes.
- Configure Area 1 as a stub area to reduce advertised LSAs without influencing reachability.

Figure 11 Network diagram



Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF (see "Example: Configuring basic OSPF").
3. Configure route redistribution:

   # Configure Switch D to redistribute static routes.

```
<SwitchD> system-view
[SwitchD] ip route-static 3.1.2.1 24 10.5.1.2
[SwitchD] ospf
[SwitchD-ospf-1] import-route static
[SwitchD-ospf-1] quit
```

   # Display ABR/ASBR information on Switch C.

```
<SwitchC> display ospf abr-asbr

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table to ABR and ASBR

                Topology base (MTID 0)

 Inter       10.5.1.1        0.0.0.1         7     10.2.1.1        ASBR
```

   # Display OSPF routing table on Switch C.

```
<SwitchC> display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 10.2.1.0/24        3        Transit 0.0.0.0         10.2.1.1        0.0.0.1
 10.3.1.0/24        7        Inter   10.2.1.1        10.2.1.1        0.0.0.1
```

```
10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1
10.5.1.0/24        17       Inter   10.2.1.1        10.2.1.1        0.0.0.1
10.1.1.0/24        5        Inter   10.2.1.1        10.2.1.1        0.0.0.1

Routing for ASEs
Destination        Cost     Type    Tag         NextHop         AdvRouter
3.1.2.0/24         1        Type2   1           10.2.1.1        10.5.1.1

Total nets: 6
Intra area: 2  Inter area: 3  ASE: 1  NSSA: 0
```

The output shows that Switch C's routing table contains an AS external route.

4. Configure Area 1 as a stub area:

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] stub
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] stub
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Display OSPF routing information on Switch C

```
[SwitchC] display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table

                Topology base (MTID 0)

Routing for network
Destination        Cost     Type    NextHop         AdvRouter       Area
0.0.0.0/0          4        Inter   10.2.1.1        10.2.1.1        0.0.0.1
10.2.1.0/24        3        Transit 0.0.0.0         10.2.1.1        0.0.0.1
10.3.1.0/24        7        Inter   10.2.1.1        10.2.1.1        0.0.0.1
10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1
10.5.1.0/24        17       Inter   10.2.1.1        10.2.1.1        0.0.0.1
10.1.1.0/24        5        Inter   10.2.1.1        10.2.1.1        0.0.0.1

Total nets: 6
Intra area: 2  Inter area: 4  ASE: 0  NSSA: 0
```

The output shows that a default route replaces the AS external route.

Configure Area 1 as a totally stub area.

```
[SwitchA] ospf
```

```
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] stub no-summary
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

Display OSPF routing information on Switch C.

```
[SwitchC] display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 0.0.0.0/0          4        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.2.1.0/24        3        Transit 0.0.0.0         10.4.1.1        0.0.0.1
 10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1

 Total nets: 3
 Intra area: 2  Inter area: 1  ASE: 0  NSSA: 0
```

The output shows that inter-area routes are removed, and only one external route (a default route) exists on Switch C.

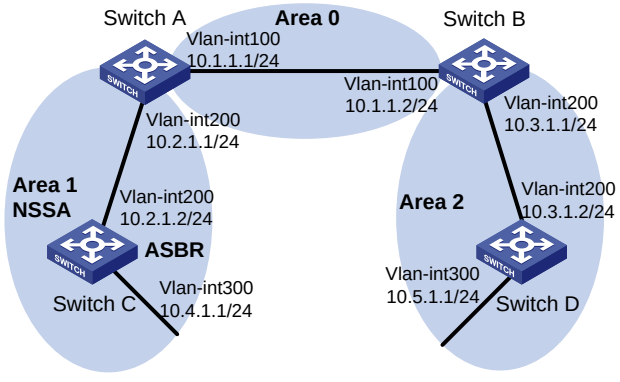
Example: Configuring OSPF NSSA area

Network configuration

As shown in Figure 12:

- Configure OSPF on all switches and split AS into three areas.
- Configure Switch A and Switch B as ABRs to forward routing information between areas.
- Configure Area 1 as an NSSA area and configure Switch C as an ASBR to redistribute static routes into the AS.

Figure 12 Network diagram



Procedure

1. Configure IP addresses for interfaces.
2. Enable OSPF (see "Example: Configuring basic OSPF").

3. Configure Area 1 as an NSSA area:

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] nssa
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] nssa
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Display OSPF routing information on Switch C.

```
[SwitchC] display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1

10.1.1.0/24        12       Inter   10.3.1.1        10.3.1.1        0.0.0.2

Routing for ASEs
Destination        Cost     Type    Tag         NextHop         AdvRouter
3.1.3.0/24         1        Type2   1           10.3.1.1        10.2.1.1

Total nets: 6
Intra area: 2  Inter area: 3  ASE: 1  NSSA: 0
```

The output shows that an external route imported from the NSSA area exists on Switch D.

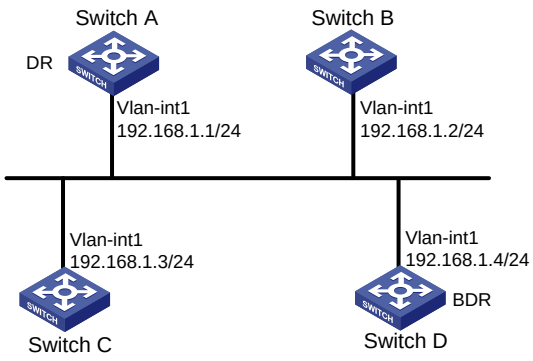
Example: Configuring OSPF DR election

Network configuration

As shown in Figure 13:

- Enable OSPF on Switches A, B, C, and D on the same network.
- Configure Switch D as the DR, and configure Switch C as the BDR.
- Change the router priorities on the interfaces to configure Switch A as the DR and Switch C as the BDR.

Figure 13 Network diagram



Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure basic OSPF settings on all switches. (Details not shown.)

   For more information, see "Example: Configuring basic OSPF."
3. Display OSPF neighbor information on Switch A.

```
[SwitchA] display ospf peer verbose

          OSPF Process 1 with Router ID 1.1.1.1
                  Neighbors

 Area 0.0.0.0 interface 192.168.1.1(Vlan-interface1)'s neighbors
 Router ID: 2.2.2.2          Address: 192.168.1.2      GR State: Normal
```

```
  State: 2-Way  Mode: None  Priority: 1
  DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
  Options is 0x02 (-|-|-|-|-|-|E|-)
  Dead timer due in 38  sec
  Neighbor is up for 00:01:31
  Authentication Sequence: [ 0 ]
  Neighbor state change count: 6
  BFD status: Disabled

 Router ID: 3.3.3.3          Address: 192.168.1.3      GR State: Normal
  State: Full  Mode: Nbr is master  Priority: 1
  DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
  Options is 0x02 (-|-|-|-|-|-|E|-)
  Dead timer due in 31  sec
  Neighbor is up for 00:01:28
  Authentication Sequence: [ 0 ]
  Neighbor state change count: 6
  BFD status: Disabled

 Router ID: 4.4.4.4          Address: 192.168.1.4      GR State: Normal
  State: Full  Mode: Nbr is master  Priority: 1
  DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
  Options is 0x02 (-|-|-|-|-|-|E|-)
  Dead timer due in 31  sec
  Neighbor is up for 00:01:28
  Authentication Sequence: [ 0 ]
  Neighbor state change count: 6
  BFD status: Disabled
```

The output shows that Switch D is the DR and Switch C is the BDR.

4. Configure router priorities on interfaces:

Configure Switch A.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ospf dr-priority 100
[SwitchA-Vlan-interface1] quit
```

Configure Switch B.

```
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ospf dr-priority 0
[SwitchB-Vlan-interface1] quit
```

Configure Switch C.

```
[SwitchC] interface vlan-interface 1
[SwitchC-Vlan-interface1] ospf dr-priority 2
[SwitchC-Vlan-interface1] quit
```

Display neighbor information on Switch D.

```
<SwitchD> display ospf peer verbose

          OSPF Process 1 with Router ID 4.4.4.4
                  Neighbors
```

```
 Area 0.0.0.0 interface 192.168.1.4(Vlan-interface1)'s neighbors
 Router ID: 1.1.1.1      Address: 192.168.1.1      GR State: Normal
   State: Full  Mode:Nbr is  slave  Priority: 100
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 31  sec
   Neighbor is up for 00:11:17
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 2.2.2.2      Address: 192.168.1.2      GR State: Normal
   State: Full  Mode:Nbr is  slave  Priority: 0
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 35  sec
   Neighbor is up for 00:11:19
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 3.3.3.3      Address: 192.168.1.3      GR State: Normal
   State: Full  Mode:Nbr is  slave  Priority: 2
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 33  sec
   Neighbor is up for 00:11:15
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled
```

The output shows that the DR and BDR are not changed, because the priority settings do not take effect immediately.

5. Restart OSPF processes:

Restart the OSPF process of Switch A.

```
<SwitchA> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch B.

```
<SwitchB> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch C.

```
<SwitchC> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch D.

```
<SwitchD> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Display neighbor information on Switch D.

```
<SwitchD> display ospf peer verbose
```

```
          OSPF Process 1 with Router ID 4.4.4.4
                  Neighbors

 Area 0.0.0.0 interface 192.168.1.4(Vlan-interface1)'s neighbors
 Router ID: 1.1.1.1          Address: 192.168.1.1      GR State: Normal
   State: Full  Mode: Nbr is slave  Priority: 100
   DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 39  sec
   Neighbor is up for 00:01:40
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 2.2.2.2          Address: 192.168.1.2      GR State: Normal
   State: 2-Way  Mode: None  Priority: 0
   DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 35  sec
   Neighbor is up for 00:01:44
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 3.3.3.3          Address: 192.168.1.3      GR State: Normal
   State: Full  Mode: Nbr is slave  Priority: 2
   DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 39  sec
   Neighbor is up for 00:01:41
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled
```

The output shows that Switch A becomes the DR and Switch C becomes the BDR.

If the neighbor state is *full,* Switch D has established an adjacency with the neighbor. If the neighbor state is *2-way*, the two switches are not the DR or the BDR, and they do not exchange LSAs.

Display OSPF interface information.

```
<SwitchA> display ospf interface

          OSPF Process 1 with Router ID 1.1.1.1
                  Interfaces

 Area: 0.0.0.0
 IP Address      Type      State   Cost  Pri   DR             BDR
 192.168.1.1     Broadcast DR      1     100   192.168.1.1    192.168.1.3

<SwitchB> display ospf interface
```

```
          OSPF Process 1 with Router ID 2.2.2.2
                  Interfaces

Area: 0.0.0.0
IP Address      Type       State     Cost  Pri   DR            BDR
192.168.1.2     Broadcast  DROther   1     0     192.168.1.1   192.168.1.3
```

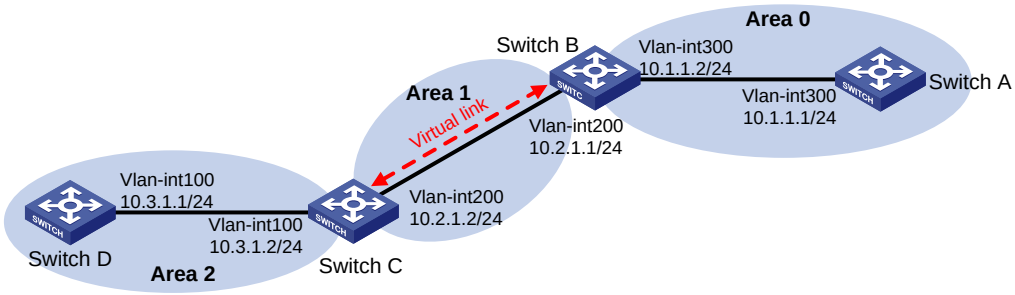
The interface state *DROther* means the interface is not the DR or BDR.

Example: Configuring OSPF virtual link

Network configuration

As shown in Figure 14, configure a virtual link between Switch B and Switch C to connect Area 2 to the backbone area. After configuration, Switch B can learn routes to Area 2.

Figure 14 Network diagram



Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf 1 router-id 1.1.1.1
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ospf 1 router-id 2.2.2.2
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] area 1
[SwitchB–ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchB–ospf-1-area-0.0.0.1] quit
[SwitchB-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
```

```
[SwitchC] ospf 1 router-id 3.3.3.3
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] area 2
[SwitchC–ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchC–ospf-1-area-0.0.0.2] quit
[SwitchC-ospf-1] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] ospf 1 router-id 4.4.4.4
[SwitchD-ospf-1] area 2
[SwitchD-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] quit
[SwitchD-ospf-1] quit
```

Display the OSPF routing table on Switch B.

```
[SwitchB] display ospf routing

          OSPF Process 1 with Router ID 2.2.2.2
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 10.2.1.0/24        2        Transit 10.2.1.1        3.3.3.3         0.0.0.1
 10.1.1.0/24        2        Transit 10.1.1.2        2.2.2.2         0.0.0.0
 Total nets: 2
 Intra area: 2  Inter area: 0  ASE: 0  NSSA: 0
```

The output shows that Switch B does not have routes to Area 2 because Area 0 is not directly connected to Area 2.

3. Configure a virtual link:

Configure Switch B.

```
[SwitchB] ospf
[SwitchB-ospf-1] area 1
[SwitchB-ospf-1-area-0.0.0.1] vlink-peer 3.3.3.3
[SwitchB-ospf-1-area-0.0.0.1] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] vlink-peer 2.2.2.2
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Display the OSPF routing table on Switch B.

```
[SwitchB] display ospf routing

          OSPF Process 1 with Router ID 2.2.2.2
```

```
                    Routing Table

                 Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 10.2.1.0/24        2        Transit 10.2.1.1        3.3.3.3         0.0.0.1
 10.3.1.0/24        5        Inter   10.2.1.2        3.3.3.3         0.0.0.0
 10.1.1.0/24        2        Transit 10.1.1.2        2.2.2.2         0.0.0.0

 Total nets: 3
 Intra area: 2  Inter area: 1  ASE: 0  NSSA: 0
```

The output shows that Switch B has learned the route 10.3.1.0/24 to Area 2.

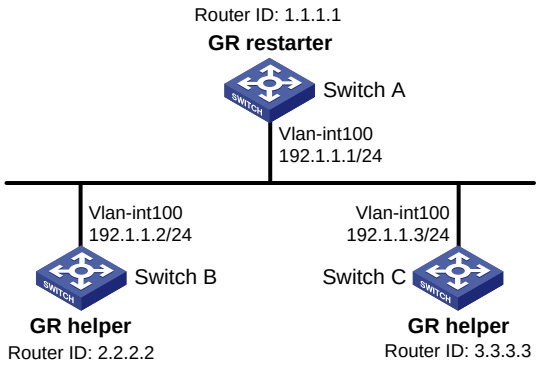
Example: Configuring OSPF GR

Network configuration

As shown in Figure 15:

- Switch A, Switch B, and Switch C that belong to the same AS and the same OSPF routing domain are GR capable.
- Switch A acts as the non-IETF GR restarter. Switch B and Switch C are the GR helpers, and synchronize their LSDBs with Switch A through OOB communication of GR.

Figure 15 Network diagram



Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
SwitchA> system-view
[SwitchA] router id 1.1.1.1
[SwitchA] ospf 100
[SwitchA-ospf-100] area 0
[SwitchA-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchA-ospf-100-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
```

```
[SwitchB] router id 2.2.2.2
[SwitchB] ospf 100
[SwitchB-ospf-100] area 0
[SwitchB-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchB-ospf-100-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] router id 3.3.3.3
[SwitchC] ospf 100
[SwitchC-ospf-100] area 0
[SwitchC-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchC-ospf-100-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

3. Configure OSPF GR:

Configure Switch A as the non-IETF OSPF GR restarter: enable the link-local signaling capability, the out-of-band re-synchronization capability, and non-IETF GR capability for OSPF process 100.

```
[SwitchA-ospf-100] enable link-local-signaling
[SwitchA-ospf-100] enable out-of-band-resynchronization
[SwitchA-ospf-100] graceful-restart
[SwitchA-ospf-100] quit
```

Configure Switch B as the GR helper: enable the link-local signaling capability and the out-of-band re-synchronization capability for OSPF process 100.

```
[SwitchB-ospf-100] enable link-local-signaling
[SwitchB-ospf-100] enable out-of-band-resynchronization
```

Configure Switch C as the GR helper: enable the link-local signaling capability and the out-of-band re-synchronization capability for OSPF process 100.

```
[SwitchC-ospf-100] enable link-local-signaling
[SwitchC-ospf-100] enable out-of-band-resynchronization
```

Verifying the configuration

Enable OSPF GR event debugging and restart the OSPF process by using GR on Switch A.

```
<SwitchA> debugging ospf event graceful-restart
<SwitchA> terminal monitor
<SwitchA> terminal logging level 7
<SwitchA> reset ospf 100 process graceful-restart
Reset OSPF process? [Y/N]:y
%Oct 21 15:29:28:727 2011 SwitchA OSPF/5/OSPF_NBR_CHG: OSPF 100 Neighbor

192.1.1.2(Vlan-interface100) from Loading to Full.
```

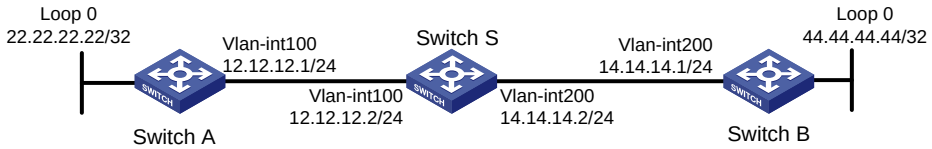
The output shows that Switch A completes GR.

Example: Configuring OSPF NSR

Network configuration

As shown in Figure 16, Switch S, Switch A, and Switch B belong to the same OSPF routing domain. Enable OSPF NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 16 Network diagram



Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPF on the switches to ensure the following: (Details not shown.)
   - Switch S, Switch A, and Switch B can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with OSPF.
3. Enable OSPF NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] ospf 100
```

```
[SwitchS-ospf-100] non-stop-routing
[SwitchS-ospf-100] quit
```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```
[SwitchS] placement reoptimize
Predicted changes to the placement
Program                          Current location       New location
-------------------------------------------------------------------
rib                              0/0                    0/0
staticroute                      0/0                    0/0
ospf                             0/0                    1/0
Continue? [y/n]:y
Re-optimization of the placement start. You will be notified on completion.
Re-optimization of the placement complete. Use 'display placement' to view the new
placement.
```

During the switchover period, display OSPF neighbors on Switch A to verify the neighbor relationship between Switch A and Switch S.

```
<SwitchA> display ospf peer

 Total nets: 4
 Intra area: 4  Inter area: 0  ASE: 0  NSSA: 0
```

The output shows the following when an active/standby switchover occurs on Switch S:

- The neighbor relationships and routing information on Switch A and Switch B have not changed.
- The traffic from Switch A to Switch B has not been impacted.

Example: Configuring BFD for OSPF

Network configuration

As shown in Figure 17, run OSPF on Switch A, Switch B, and Switch C so that they are reachable to each other at the network layer.

- When the link over which Switch A and Switch B communicate through a Layer 2 switch fails, BFD can quickly detect the failure and notify OSPF of the failure.
- Switch A and Switch B then communicate through Switch C.

Figure 17 Network diagram

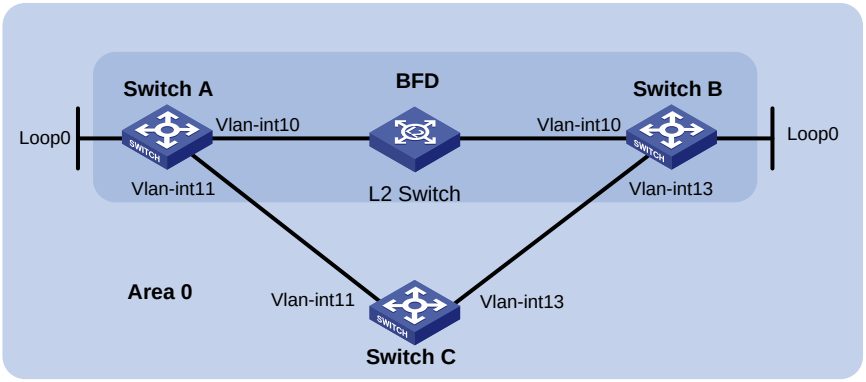

Table 1 Interface and IP address assignment

Device	Interface	IP address
Switch A	Vlan-int10	192.168.0.102/24
Switch A	Vlan-int11	10.1.1.102/24

Switch B	Loop0	120.1.1.1/32
Switch C	Vlan-int11	10.1.1.100/24
Switch C	Vlan-int13	13.1.1.2/24

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 121.1.1.1 0.0.0.0
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 13.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 120.1.1.1 0.0.0.0
[SwitchB-ospf-1-area-0.0.0.0] quit
```

```
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 0
[SwitchC-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 13.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

3. Configure BFD:

Enable BFD on Switch A and configure BFD parameters.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospf bfd enable
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] quit
```

Enable BFD on Switch B and configure BFD parameters.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospf bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
[SwitchB-Vlan-interface10] quit
```

Verifying the configuration

Display the BFD information on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 session working in control packet mode:

 LD/RD          SourceAddr      DestAddr        State    Holdtime    Interface
 3/1            192.168.0.102   192.168.0.100   Up       1700ms      Vlan10
```

Display routes destined for 120.1.1.1/32 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.1 verbose

Summary Count : 1

Destination: 120.1.1.1/32
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 1              Preference: 10
      IpPre: N/A             QosLocalID: N/A
```

```
        Tag: 0                   State: Active Adv
  OrigTblID: 0x0               OrigVrf: default-vrf
    TableID: 0x2                OrigAs: 0
      NibID: 0x26000002         LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c       OrigNextHop: 192.168.0.100
      Label: NULL          RealNextHop: 192.168.0.100
    BkLabel: NULL            BkNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
  Tunnel ID: Invalid         Interface: Vlan-interface10
BkTunnel ID: Invalid       BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 10. Then the link over VLAN-interface 10 fails.

Display routes destined for 120.1.1.1/32 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.1 verbose

Summary Count : 1

Destination: 120.1.1.1/32
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 2              Preference: 10
      IpPre: N/A             QosLocalID: N/A
        Tag: 0                   State: Active Adv
  OrigTblID: 0x0               OrigVrf: default-vrf
    TableID: 0x2                OrigAs: 0
      NibID: 0x26000002         LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c       OrigNextHop: 10.1.1.100
      Label: NULL          RealNextHop: 10.1.1.100
    BkLabel: NULL            BkNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
  Tunnel ID: Invalid         Interface: Vlan-interface11
BkTunnel ID: Invalid       BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring OSPF FRR

Network configuration

As shown in Figure 18, Switch A, Switch B, and Switch C reside in the same OSPF domain. Configure OSPF FRR so that when the link between Switch A and Switch B fails, traffic is immediately switched to Link B.

Figure 18 Network diagram

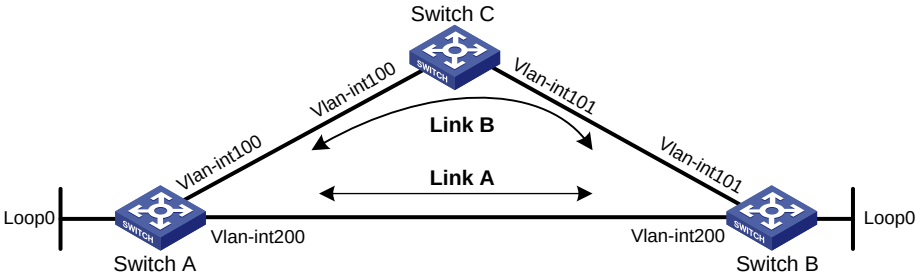

Table 2 Interface and IP address assignment

Device	Interface	IP address
Switch A	Vlan-int100	12.12.12.1/24
Switch A	Vlan-int200	13.13.13.1/24
Switch A	Loop0	1.1.1.1/32
Switch B	Vlan-int101	24.24.24.4/24
Switch B	Vlan-int200	13.13.13.2/24
Switch B	Loop0	4.4.4.4/32
Switch C	Vlan-int100	12.12.12.2/24
Switch C	Vlan-int101	24.24.24.2/24

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPF on the switches to ensure that Switch A, Switch B, and Switch C can communicate with each other at the network layer. (Details not shown.)
3. Configure OSPF FRR to automatically calculate the backup next hop:

   You can enable OSPF FRR to either calculate a backup next hop by using the LFA algorithm, or specify a backup next hop by using a routing policy.

   - (Method 1.) Enable OSPF FRR to calculate the backup next hop by using the LFA algorithm:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ospf 1
     [SwitchA-ospf-1] fast-reroute lfa
     [SwitchA-ospf-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ospf 1
     [SwitchB-ospf-1] fast-reroute lfa
     [SwitchB-ospf-1] quit
     ```

   - (Method 2.) Enable OSPF FRR to designate a backup next hop by using a routing policy.

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ip prefix-list abc index 10 permit 4.4.4.4 32
     [SwitchA] route-policy frr permit node 10
     [SwitchA-route-policy-frr-10] if-match ip address prefix-list abc
     ```

```
[SwitchA-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
100 backup-nexthop 12.12.12.2
[SwitchA-route-policy-frr-10] quit
[SwitchA] ospf 1
[SwitchA-ospf-1] fast-reroute route-policy frr
[SwitchA-ospf-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ip prefix-list abc index 10 permit 1.1.1.1 32
[SwitchB] route-policy frr permit node 10
[SwitchB-route-policy-frr-10] if-match ip address prefix-list abc
[SwitchB-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
101 backup-nexthop 24.24.24.2
[SwitchB-route-policy-frr-10] quit
[SwitchB] ospf 1
[SwitchB-ospf-1] fast-reroute route-policy frr
[SwitchB-ospf-1] quit
```

Verifying the configuration

Display route 4.4.4.4/32 on Switch A to view the backup next hop information.

```
[SwitchA] display ip routing-table 4.4.4.4 verbose

Summary Count : 1

Destination: 4.4.4.4/32
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 1              Preference: 10
      IpPre: N/A            QosLocalID: N/A
        Tag: 0                   State: Active Adv
  OrigTblID: 0x0               OrigVrf: default-vrf
    TableID: 0x2                OrigAs: 0
      NibID: 0x26000002         LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c        OrigNextHop: 13.13.13.2
      Label: NULL           RealNextHop: 13.13.13.2
    BkLabel: NULL             BkNextHop: 12.12.12.2
    SRLabel: NULL             BkSRLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface200
BkTunnel ID: Invalid        BkInterface: Vlan-interface100
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
```

Display route 1.1.1.1/32 on Switch B to view the backup next hop information.

```
[SwitchB] display ip routing-table 1.1.1.1 verbose

Summary Count : 1

Destination: 1.1.1.1/32
```

```
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 1              Preference: 10
      IpPre: N/A            QosLocalID: N/A
        Tag: 0                   State: Active Adv
  OrigTblID: 0x0               OrigVrf: default-vrf
    TableID: 0x2                OrigAs: 0
      NibID: 0x26000002         LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c        OrigNextHop: 13.13.13.1
      Label: NULL           RealNextHop: 13.13.13.1
    BkLabel: NULL             BkNextHop: 24.24.24.2
    SRLabel: NULL             BkSRLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface200
BkTunnel ID: Invalid        BkInterface: Vlan-interface101
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
```

Troubleshooting OSPF configuration

No OSPF neighbor relationship established

Symptom

No OSPF neighbor relationship can be established.

Analysis

If the physical link and lower layer protocols work correctly, verify OSPF parameters configured on interfaces. Two neighbors must have the same parameters, such as the area ID, network segment, and mask. (A P2P or virtual link can have different network segments and masks.)

Solution

To resolve the problem:

1. Use the **`display ospf peer`** command to verify OSPF neighbor information.
2. Use the **`display ospf interface`** command to verify OSPF interface information.
3. Ping the neighbor router's IP address to verify that the connectivity is normal.
4. Verify OSPF timers. The dead interval on an interface must be a minimum of four times the hello interval.
5. On an NBMA network, use the **`peer ip-address`** command to manually specify the neighbor.
6. A minimum of one interface must have a router priority higher than 0 on an NBMA or a broadcast network.
7. If the problem persists, contact H3C Support.

Incorrect routing information

Symptom

OSPF cannot find routes to other areas.

Analysis

The backbone area must maintain connectivity to all other areas. If a router connects to more than one area, a minimum of one area must be connected to the backbone. The backbone cannot be configured as a stub area.

In a stub area, all routers cannot receive external routes, and all interfaces connected to the stub area must belong to the stub area.

Solution

To resolve the problem:

1. Use the **display ospf peer** command to verify neighbor information.
2. Use the **display ospf interface** command to verify OSPF interface information.
3. Use the **display ospf lsdb** command to verify the LSDB.
4. Use the **display current-configuration configuration ospf** command to verify area configuration. If more than two areas are configured, a minimum of one area is connected to the backbone.
5. In a stub area, all routers attached are configured with the **stub** command. In an NSSA area, all routers attached are configured with the **nssa** command.
6. If a virtual link is configured, use the **display ospf vlink** command to verify the state of the virtual link.
7. If the problem persists, contact H3C Support.

Contents

Configuring PBR

About PBR

Policy-based routing (PBR) uses user-defined policies to route packets. A policy can specify parameters for packets that match specific criteria such as ACLs. The parameters include the next hop.

Packet forwarding process

The device forwards received packets using the following process:

1. The device uses PBR to forward matching packets.
2. If one of the following events occurs, the device searches for a route (except the default route) in the routing table to forward packets:
   - The packets do not match the PBR policy.
   - The PBR-based forwarding fails.
3. If the forwarding fails, the device uses the default route to forward packets.

PBR types

PBR includes the following types:

- **Local PBR**—Guides the forwarding of locally generated packets, such as ICMP packets generated by using the **`ping`** command.
- **Interface PBR**—Guides the forwarding of packets received on an interface.

Policy

A policy includes match criteria and actions to be taken on the matching packets. A policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.
- A node has a match mode of **permit** or **deny**.

A policy compares packets with nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup.

Relationship between if-match clauses

PBR supports only the **`if-match acl`** clause to set an ACL match criterion. On a node, you can specify only one **`if-match`** clause.

Relationship between apply clauses

PBR supports only the **`apply next-hop`** clause to set next hops.

Relationship between the match mode and clauses on the node

Does a packet match all the if-match clauses on the node?	Match mode	
	Permit	**Deny**
Yes.	• If the node contains **`apply`** clauses, PBR executes the **`apply`** clauses on the node. ○ If PBR-based forwarding succeeds, PBR does not compare the packet with the next node. • If the node does not contain **`apply`** clauses, the device performs a routing table lookup for the packet.	The device performs a routing table lookup for the packet.
No.	PBR compares the packet with the next node.	PBR compares the packet with the next node.

NOTE:

A node that has no **`if-match`** clauses matches any packet.

PBR and Track

PBR can work with the Track feature to dynamically adapt the availability status of an **`apply`** clause to the link status of a tracked object. The tracked object can be a next hop.

- When the track entry associated with an object changes to **Negative**, the **`apply`** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **`apply`** clause is valid.

For more information about Track and PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: PBR configuration

If the device performs forwarding in software, PBR does not process IP packets destined for the local device.

If the device performs forwarding in hardware and a packet destined for it matches a PBR policy, PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure a PBR policy, be careful to avoid this situation.

PBR tasks at a glance

To configure PBR, perform the following tasks:

1. Configuring a policy
   a. Creating a node
   b. Setting match criteria for a node
   c. Configuring actions for a node
2. Specifying a policy for PBR

   Choose the following tasks as needed:

Configuring a policy

Creating a node

1. Enter system view.
   system-view
2. Create a node for a policy, and enter its view.
   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. (Optional.) Configure a description for the policy node.
   description *text*
   By default, no description is configured for a policy node.

Setting match criteria for a node

Procedure

1. Enter system view.
   system-view
2. Enter policy node view.
   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set match criteria.
   - Set an ACL match criterion.
     if-match acl { *acl-number* | **name** *acl-name* }
     By default, no ACL match criterion is set.
     The ACL match criterion cannot match Layer 2 information.
     When using the ACL to match packets, PBR ignores the action (**permit** or **deny**) and time range settings in the ACL.

Configuring actions for a node

About apply clauses

You can use the **apply next-hop** clause set next hops for matching packets on a node.

Restrictions and guidelines

If you specify a next hop or default next hop, PBR periodically performs a lookup in the FIB table to determine its availability. Temporary service interruption might occur if PBR does not update the route immediately after its availability status changes.

Configuring actions to direct packet forwarding

1. Enter system view.
   system-view
2. Enter policy node view.
   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Configure actions.

- Set next hops.

  apply next-hop { *ip-address* [**direct**] [**track** *track-entry-number*] }&<1-2>

  By default, no next hop is specified.

  On a node, you can specify a maximum of two next hops for backup in one command line or by executing this command multiple times.

Specifying a policy for PBR

Specifying a policy for local PBR

About local PBR

Perform this task to specify a policy for local PBR to guide the forwarding of locally generated packets.

Restrictions and guidelines

You can specify only one policy for local PBR and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy.

Local PBR might affect local services such as ping and Telnet. When you use local PBR, make sure you fully understand its impact on local services of the device.

Procedure

1. Enter system view.

   system-view

2. Specify a policy for local PBR.

   ip local policy-based-route *policy-name*

   By default, local PBR is not enabled.

Specifying a policy for interface PBR

About interface PBR

Perform this task to apply a policy to an interface to guide the forwarding of packets received on the interface.

Restrictions and guidelines

You can apply only one policy to an interface and must make sure the specified policy already exists. Before you can apply a new interface PBR policy to an interface, you must first remove the current policy from the interface.

You can apply a policy to multiple interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify a policy for interface PBR.

   ip policy-based-route *policy-name*

   By default, no interface policy is applied to an interface.

Display and maintenance commands for PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display PBR policy information.	**display ip policy-based-route** [**policy** *policy-name*]
Display interface PBR configuration and statistics.	**display ip policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display local PBR configuration and statistics.	**display ip policy-based-route local** [**slot** *slot-number*]
Display PBR configuration.	**display ip policy-based-route setup**
Clear PBR statistics.	**reset ip policy-based-route statistics** [**policy** *policy-name*]

PBR configuration examples

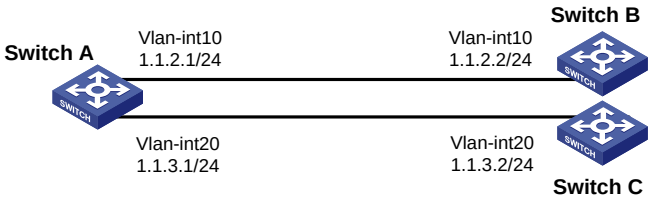
Example: Configuring packet type-based local PBR

Network configuration

As shown in Figure 1, Switch B and Switch C do not have a route to reach each other.

Configure PBR on Switch A to forward all TCP packets to the next hop 1.1.2.2 (Switch B).

Figure 1 Network diagram



Procedure

1. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

```
<SwitchA> system-view
[SwitchA] vlan 10
[SwitchA-vlan10] quit
[SwitchA] vlan 20
[SwitchA-vlan20] quit
```

   # Configure the IP addresses of VLAN-interface 10 and VLAN-interface 20.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 1.1.2.1 24
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ip address 1.1.3.1 24
[SwitchA-Vlan-interface20] quit
```

   # Configure ACL 3101 to match TCP packets.

```
[SwitchA] acl advanced 3101
[SwitchA-acl-ipv4-adv-3101] rule permit tcp
[SwitchA-acl-ipv4-adv-3101] quit
```

   # Configure Node 5 for the policy **aaa** to forward TCP packets to next hop 1.1.2.2.

```
[SwitchA] policy-based-route aaa permit node 5
[SwitchA-pbr-aaa-5] if-match acl 3101
[SwitchA-pbr-aaa-5] apply next-hop 1.1.2.2
[SwitchA-pbr-aaa-5] quit
```

   # Configure local PBR by applying the policy **aaa** to Switch A.

```
[SwitchA] ip local policy-based-route aaa
```

2. Configure Switch B:

   # Create VLAN 10.

```
<SwitchB> system-view
[SwitchB] vlan 10
[SwitchB-vlan10] quit
```

   # Configure the IP address of VLAN-interface 10.

```
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ip address 1.1.2.2 24
```

3. Configure Switch C:

   # Create VLAN 20.

```
<SwitchC> system-view
[SwitchC] vlan 20
[SwitchC-vlan20] quit
```

   # Configure the IP address of VLAN-interface 20.

```
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ip address 1.1.3.2 24
```

Verifying the configuration

1. Perform telnet operations to verify that local PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1.1.2.2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Switch A successfully. (Details not shown.)

Verify that you cannot telnet to Switch C from Switch A. (Details not shown.)

2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Switch A. (Details not shown.)

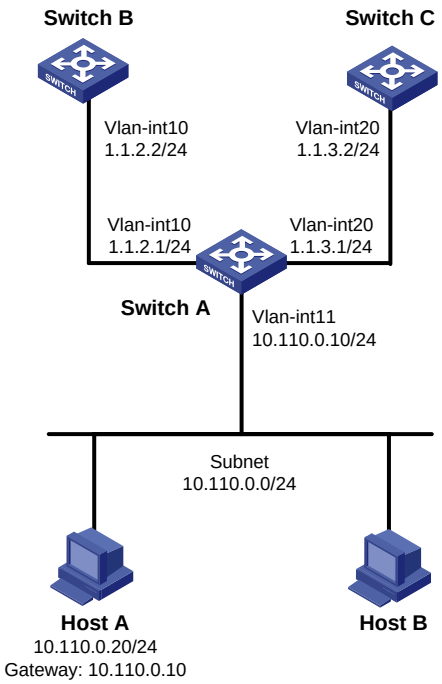
Example: Configuring packet type-based interface PBR

Network configuration

As shown in Figure 2, Switch B and Switch C do not have a route to reach each other.

Configure PBR on Switch A to forward all TCP packets received on VLAN-interface 11 to the next hop 1.1.2.2 (Switch B).

Figure 2 Network diagram



Procedure

1. Make sure Switch B and Switch C can reach Host A. (Details not shown.)
2. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

```
<SwitchA> system-view
[SwitchA] vlan 10
[SwitchA-vlan10] quit
[SwitchA] vlan 20
[SwitchA-vlan20] quit
```

   # Configure the IP addresses of VLAN-interface 10 and VLAN-interface 20.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 1.1.2.1 24
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ip address 1.1.3.1 24
[SwitchA-Vlan-interface20] quit
```

Configure ACL 3101 to match TCP packets.

```
[SwitchA] acl advanced 3101
[SwitchA-acl-ipv4-adv-3101] rule permit tcp
[SwitchA-acl-ipv4-adv-3101] quit
```

Configure Node 5 for the policy **aaa** to forward TCP packets to next hop 1.1.2.2.

```
[SwitchA] policy-based-route aaa permit node 5
[SwitchA-pbr-aaa-5] if-match acl 3101
[SwitchA-pbr-aaa-5] apply next-hop 1.1.2.2
[SwitchA-pbr-aaa-5] quit
```

Configure interface PBR by applying the policy **aaa** to VLAN-interface 11.

```
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] ip address 10.110.0.10 24
[SwitchA-Vlan-interface11] ip policy-based-route aaa
[SwitchA-Vlan-interface11] quit
```

Verifying the configuration

1. Perform telnet operations to verify that interface PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1.1.2.2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Host A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Host A. (Details not shown.)
2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Host A. (Details not shown.)

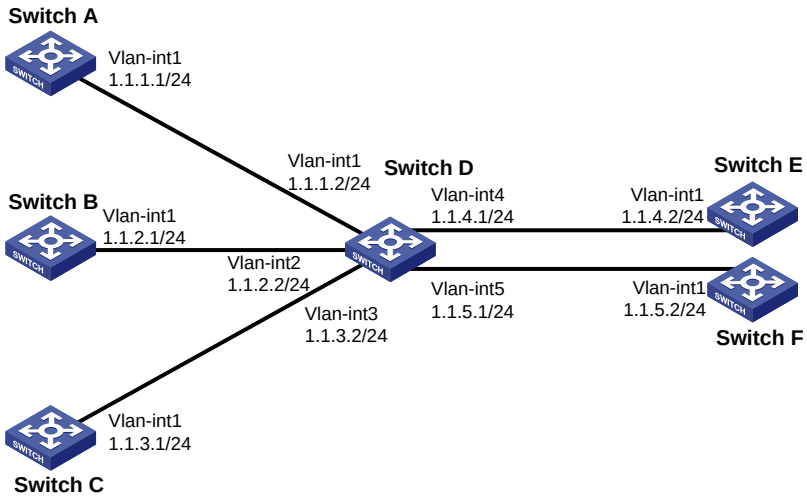
Example: Configuring packet type-based global PBR

Network configuration

As shown in Figure 3, Switch E and Switch F do not have a route to reach each other.

Configure global PBR on Switch D to forward TCP packets to the next hop 1.1.4.2 (Switch E).

Figure 3 Network diagram



Procedure

1. Configure IP addresses for the interfaces. Make sure Switch A, B and C can communicate with Switch E and Switch F, respectively. (Details not shown.)
2. Configure Switch D:

Configure ACL 3101 to match TCP packets sourced from networks 1.1.1.0/24, 1.1.2.0/24, and 1.1.3.0/24.

```
<SwitchD> system-view
[SwitchD] acl advanced 3101
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.1.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.2.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.3.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] quit
```

Configure node 5 in PBR policy **aaa** to forward TCP packets that match ACL 3101 to next hop 1.1.4.2.

```
[SwitchD] policy-based-route aaa permit node 5
[SwitchD-pbr-aaa-5] if-match acl 3101
[SwitchD-pbr-aaa-5] apply next-hop 1.1.4.2
[SwitchD-pbr-aaa-5] quit
```

Specify PBR policy **aaa** as the global PBR policy.

```
[SwitchD] ip global policy-based-route aaa
```

Verifying the configuration

1. Perform telnet operations to verify that global PBR on Switch D operates as configured to forward the matching TCP packets to the next hop 1.1.4.2 (Switch E), as follows:

   # Verify that you can telnet to Switch E from Switch A, Switch B, and Switch C successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch F from Switch A, Switch B, or Switch C. (Details not shown.)

2. Verify that Switch D forwards packets other than TCP packets as long as a route is available. For example, verify that you can ping Switch F from Switch A, Switch B, and Switch C. (Details not shown.)

Contents

Configuring IPv6 static routing

About IPv6 static routing

Static routes are manually configured and cannot adapt to network topology changes. If a fault or a topological change occurs in the network, the network administrator must modify the static routes manually. IPv6 static routing works well in a simple IPv6 network.

Configuring an IPv6 static route

1. Enter system view.

   system-view

2. Configure an IPv6 static route.

   ipv6 route-static *ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* } [**permanent**] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, no IPv6 static route is configured.

3. (Optional.) Set the default preference for IPv6 static routes.

   ipv6 route-static default-preference *default-preference*

   The default setting is 60.

Deleting IPv6 static routes

About deleting IPv6 static routes

To delete an IPv6 static route, use the **undo ipv6 route-static** command. To delete all IPv6 static routes including the default route, use the **delete ipv6 static-routes all** command.

Procedure

1. Enter system view.

   system-view

2. Delete all IPv6 static routes, including the default route.

   delete ipv6 static-routes all

CAUTION:

This command might interrupt network communication and cause packet forwarding failure. Before executing the command, make sure you fully understand the potential impact on the network.

Configuring BFD for IPv6 static routes

About BFD for IPv6 static routes

BFD provides a general purpose, standard, and medium- and protocol-independent fast failure detection mechanism. It can uniformly and quickly detect the failures of the bidirectional forwarding paths between two routers for protocols, such as routing protocols. BFD for IPv6 static routes tests

the reachability of the next hop for each IPv6 static route. If a next hop is unreachable, BFD deletes the associated IPv6 static route.

For more information about BFD, see *High Availability Configuration Guide*.

Restrictions and guidelines for BFD

When you configure BFD for IPv6 static routes, follow these restrictions and guidelines:

- If you specify a source IPv6 address for BFD packets on the local device, you must specify that IPv6 address as the next hop IPv6 address on the peer device.
- If you specify a non-P2P output interface and a direct next hop, specify the **bfd-source** *ipv6-address* option as a best practice. Make sure the source IPv6 address of BFD packets meets the following requirements:
  - The address is the same as the IPv6 address of the output interface.
  - The address is on the same network segment as the next hop IPv6 address of the same type.

    For example, if the next hop IPv6 address is a link-local address, the source IPv6 address of BFD packets must also be a link-local address.
- Enabling BFD for a flapping route could worsen the situation.

Configuring BFD control packet mode

About BFD control packet mode

This mode uses BFD control packets to detect the status of a link bidirectionally at a millisecond level.

BFD control packet mode can be applied to IPv6 static routes with a direct next hop or with an indirect next hop.

Restrictions and guidelines for BFD control packet mode

If you configure BFD control packet mode at the local end, you must also configure this mode at the peer end.

Configuring BFD control packet mode for an IPv6 static route (direct next hop)

1. Enter system view.

   system-view
2. Configure BFD control packet mode for an IPv6 static route.

   ipv6 route-static *ipv6-address prefix-length interface-type interface-number next-hop-address* **bfd control-packet** [**bfd-source** *ipv6-address*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD control packet mode for an IPv6 static route is not configured.

Configuring BFD control packet mode for an IPv6 static route (indirect next hop)

1. Enter system view.

   system-view
2. Configure BFD control packet mode for an IPv6 static route.

   ipv6 route-static *ipv6-address prefix-length* { *next-hop-address* **bfd control-packet bfd-source** *ipv6-address* } [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD control packet mode for an IPv6 static route is not configured.

Configuring BFD echo packet mode

About single-hop echo packet mode

With BFD echo packet mode enabled for a static route, the output interface sends BFD echo packets to the destination device, which loops the packets back to test the link reachability.

Restrictions and guidelines

You do not need to configure BFD echo packet mode at the peer end.

Do not use BFD for a static route with the output interface in spoofing state.

Procedure

1. Enter system view.

   system-view

2. Configure the source address of echo packets.

   bfd echo-source-ipv6 *ipv6-address*

   By default, the source address of echo packets is not configured.

   The source address of echo packets must be a global unicast address.

   For more information about this command, see *High Availability Command Reference*.

3. Configure BFD echo packet mode for an IPv6 static route.

   ipv6 route-static *ipv6-address prefix-length interface-type interface-number next-hop-address* **bfd echo-packet** [**bfd-source** *ipv6-address*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD echo packet mode for an IPv6 static route is not configured.

   The next hop IPv6 address must be a global unicast address.

Display and maintenance commands for IPv6 static routing

Execute **display** commands in any view.

Task	Command
Display IPv6 static route next hop information.	**display ipv6 route-static nib** [*nib-id*] [**verbose**]
Display IPv6 static routing table information.	**display ipv6 route-static routing-table** [*ipv6-address prefix-length*]
Display IPv6 static route information.	**display ipv6 routing-table protocol static** [**inactive** | **verbose**]

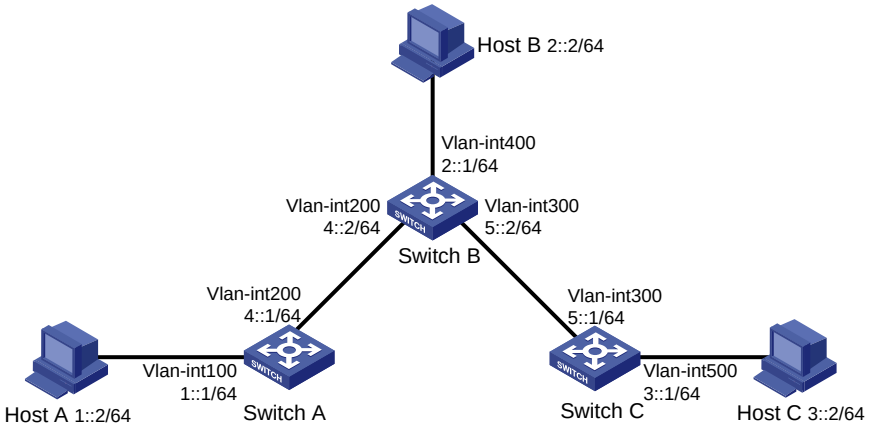
IPv6 static routing configuration examples

Example: Configuring basic IPv6 static route

Network configuration

As shown in Figure 1, configure IPv6 static routes so that hosts can reach one another.

Figure 1 Network diagram



Procedure

1. Configure the IPv6 addresses for all VLAN interfaces. (Details not shown.)
2. Configure IPv6 static routes:

   # Configure a default IPv6 static route on Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 route-static :: 0 4::2
   ```

   # Configure two IPv6 static routes on Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 route-static 1:: 64 4::1
   [SwitchB] ipv6 route-static 3:: 64 5::1
   ```

   # Configure a default IPv6 static route on Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ipv6 route-static :: 0 5::2
   ```
3. Configure the IPv6 addresses for all the hosts and configure the default gateway of Host A, Host B, and Host C as 1::1, 2::1, and 3::1.

Verifying the configuration

Display the IPv6 static route information on Switch A.

```
[SwitchA] display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: ::/0                                   Protocol  : Static
NextHop    : 4::2                                   Preference: 60
```

```
Interface  : Vlan200                                  Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

Display the IPv6 static route information on Switch B.

```
[SwitchB] display ipv6 routing-table protocol static

Summary count : 2

Static Routing table status : <Active>
Summary count : 2

Destination: 1::/64                                  Protocol  : Static
NextHop    : 4::1                                    Preference: 60
Interface  : Vlan200                                 Cost      : 0

Destination: 3::/64                                  Protocol  : Static
NextHop    : 5::1                                    Preference: 60
Interface  : Vlan300                                 Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

Use the **ping** command to test the reachability.

```
[SwitchA] ping ipv6 3::1
Ping6(56 data bytes) 4::1 --> 3::1, press CTRL_C to break
56 bytes from 3::1, icmp_seq=0 hlim=62 time=0.700 ms
56 bytes from 3::1, icmp_seq=1 hlim=62 time=0.351 ms
56 bytes from 3::1, icmp_seq=2 hlim=62 time=0.338 ms
56 bytes from 3::1, icmp_seq=3 hlim=62 time=0.373 ms
56 bytes from 3::1, icmp_seq=4 hlim=62 time=0.316 ms

--- Ping6 statistics for 3::1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.316/0.416/0.700/0.143 ms
```

Example: Configuring BFD for IPv6 static routes (direct next hop)

Network configuration

As shown in Figure 2:

- Configure an IPv6 static route to subnet 120::/64 on Switch A.
- Configure an IPv6 static route to subnet 121::/64 on Switch B.
- Enable BFD for both routes.
- Configure an IPv6 static route to subnet 120::/64 and an IPv6 static route to subnet 121::/64 on Switch C.

When the link between Switch A and Switch B through the Layer 2 switch fails, BFD can detect the failure immediately, and Switch A and Switch B can communicate through Switch C.

Figure 2 Network diagram

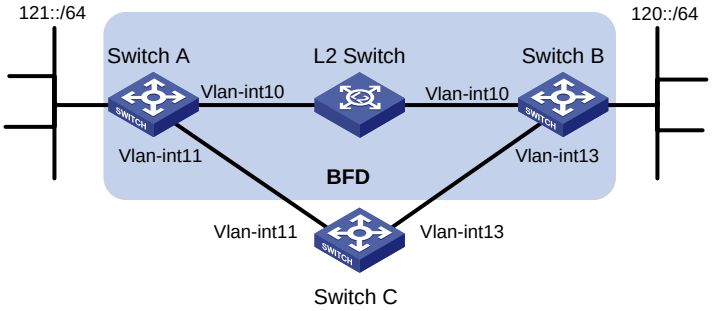


Table 1 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	12::1/64
Switch A	Vlan-int11	10::102/64
Switch B	Vlan-int10	12::2/64
Switch B	Vlan-int13	13::1/64
Switch C	Vlan-int11	10::100/64
Switch C	Vlan-int13	13::2/64

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure IPv6 static routes and BFD:

   # Configure IPv6 static routes on Switch A and enable BFD control packet mode for the static route that traverses the Layer 2 switch.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 10
[SwitchA-vlan-interface10] bfd min-transmit-interval 500
[SwitchA-vlan-interface10] bfd min-receive-interval 500
[SwitchA-vlan-interface10] bfd detect-multiplier 9
[SwitchA-vlan-interface10] quit
[SwitchA] ipv6 route-static 120:: 64 vlan-interface 10 12::2 bfd control-packet
[SwitchA] ipv6 route-static 120:: 64 10::100 preference 65
[SwitchA] quit
```

   # Configure IPv6 static routes on Switch B and enable BFD control packet mode for the static route that traverses the Layer 2 switch.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 10
[SwitchB-vlan-interface10] bfd min-transmit-interval 500
[SwitchB-vlan-interface10] bfd min-receive-interval 500
[SwitchB-vlan-interface10] bfd detect-multiplier 9
[SwitchB-vlan-interface10] quit
[SwitchB] ipv6 route-static 121:: 64 vlan-interface 10 12::1 bfd control-packet
[SwitchB] ipv6 route-static 121:: 64 vlan-interface 13 13::2 preference 65
[SwitchB] quit
```

   # Configure IPv6 static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ipv6 route-static 120:: 64 13::1
[SwitchC] ipv6 route-static 121:: 64 10::102
```

Verifying the configuration

Display the BFD sessions on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv6 Session Working Under Ctrl Mode:

       Local Discr: 513                Remote Discr: 33
         Source IP: 12::1
    Destination IP: 12::2
     Session State: Up                      Interface: Vlan10
         Hold Time: 2012ms
```

The output shows that the BFD session has been created.

Display IPv6 static routes on Switch A.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                  Protocol  : Static
NextHop    : 12::2                                     Preference: 60
Interface  : Vlan10                                    Cost      : 0

Direct Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display IPv6 static routes on Switch A again.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                  Protocol  : Static
NextHop    : 10::100                                   Preference: 65
Interface  : Vlan11                                    Cost      : 0

Static Routing table status : < Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring BFD for IPv6 static routes (indirect next hop)

Network configuration

As shown in Figure 3:

- Switch A has a route to interface Loopback 1 (2::9/128) on Switch B, and the output interface is VLAN-interface 10.
- Switch B has a route to interface Loopback 1 (1::9/128) on Switch A, and the output interface is VLAN-interface 12.
- Switch D has a route to 1::9/128, and the output interface is VLAN-interface 10. It also has a route to 2::9/128, and the output interface is VLAN-interface 12.

Configure the following:

- Configure an IPv6 static route to subnet 120::/64 on Switch A.
- Configure an IPv6 static route to subnet 121::/64 on Switch B.
- Enable BFD for both routes.
- Configure an IPv6 static route to subnet 120::/64 and an IPv6 static route to subnet 121::/64 on both Switch C and Switch D.

When the link between Switch A and Switch B through Switch D fails, BFD can detect the failure immediately and Switch A and Switch B can communicate through Switch C.

Figure 3 Network diagram

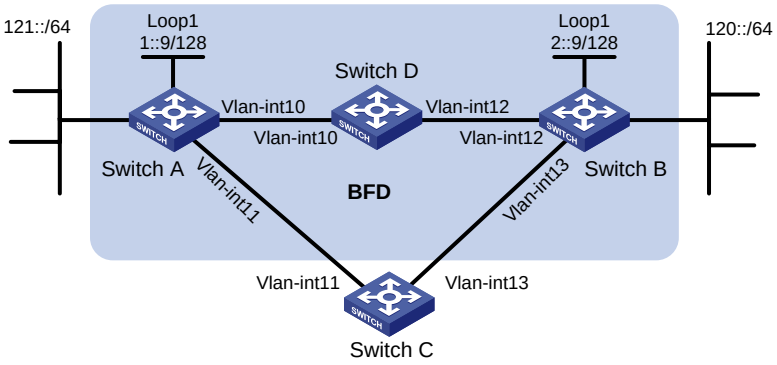

Table 2 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	12::1/64
Switch A	Vlan-int11	10::102/64
Switch A	Loop1	1::9/128
Switch B	Vlan-int12	11::2/64
Switch B	Vlan-int13	13::1/64
Switch B	Loop1	2::9/128
Switch C	Vlan-int11	10::100/64
Switch C	Vlan-int13	13::2/64

Device	Interface	IPv6 address
Switch D	Vlan-int10	12::2/64
Switch D	Vlan-int12	11::1/64

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure IPv6 static routes and BFD:

   # Configure IPv6 static routes on Switch A and enable BFD control packet mode for the IPv6 static route that traverses Switch D.

```
<SwitchA> system-view
[SwitchA] bfd multi-hop min-transmit-interval 500
[SwitchA] bfd multi-hop min-receive-interval 500
[SwitchA] bfd multi-hop detect-multiplier 9
[SwitchA] ipv6 route-static 120:: 64 2::9 bfd control-packet bfd-source 1::9
[SwitchA] ipv6 route-static 120:: 64 10::100 preference 65
[SwitchA] ipv6 route-static 2::9 128 12::2
[SwitchA] quit
```

   # Configure IPv6 static routes on Switch B and enable BFD control packet mode for the static route that traverses Switch D.

```
<SwitchB> system-view
[SwitchB] bfd multi-hop min-transmit-interval 500
[SwitchB] bfd multi-hop min-receive-interval 500
[SwitchB] bfd multi-hop detect-multiplier 9
[SwitchB] ipv6 route-static 121:: 64 1::9 bfd control-packet bfd-source 2::9
[SwitchB] ipv6 route-static 121:: 64 13::2 preference 65
[SwitchB] ipv6 route-static 1::9 128 11::1
[SwitchB] quit
```

   # Configure IPv6 static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ipv6 route-static 120:: 64 13::1
[SwitchC] ipv6 route-static 121:: 64 10::102
```

   # Configure IPv6 static routes on Switch D.

```
<SwitchD> system-view
[SwitchD] ipv6 route-static 120:: 64 11::2
[SwitchD] ipv6 route-static 121:: 64 12::1
[SwitchD] ipv6 route-static 2::9 128 11::2
[SwitchD] ipv6 route-static 1::9 128 12::1
```

Verifying the configuration

Display the BFD sessions on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv6 Session Working Under Ctrl Mode:

       Local Discr: 513                Remote Discr: 33
         Source IP: 1::9
```

```
    Destination IP: 2::9
     Session State: Up                        Interface: N/A
         Hold Time: 2012ms
```

The output shows that the BFD session has been created.

Display the IPv6 static routes on Switch A.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                  Protocol  : Static
NextHop    : 2::9                                      Preference: 60
Interface  : Vlan10                                    Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display IPv6 static routes on Switch A again.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                  Protocol  : Static
NextHop    : 10::100                                   Preference: 65
Interface  : Vlan11                                    Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Configuring an IPv6 default route

A default IPv6 route is used to forward packets that match no entry in the routing table.

A default IPv6 route can be configured in either of the following ways:

- The network administrator can configure a default route with a destination prefix of **::/0**. For more information, see "Configuring IPv6 static routing."
- Some dynamic routing protocols (such as OSPFv3 and RIPng) can generate a default IPv6 route. For example, an upstream router running OSPFv3 can generate a default IPv6 route and advertise it to other routers. These routers install the default IPv6 route with the next hop being the upstream router. For more information, see the respective chapters on those routing protocols in this configuration guide.

Contents

Configuring RIPng

About RIPng

RIP next generation (RIPng), as an extension of RIP-2 for support of IPv6, is a distance vector routing protocol. It employs UDP to exchange route information through port 521. Most RIP concepts are applicable to RIPng.

RIPng routing metrics

RIPng uses a hop count to measure the distance to a destination. The hop count is the metric or cost. The hop count from a router to a directly connected network is 0. The hop count between two directly connected routers is 1. When the hop count is greater than or equal to 16, the destination network or host is unreachable.

RIPng route entries

RIPng stores route entries in a database. Each route entry contains the following elements:

- **Destination address**—IPv6 address of a destination host or a network.
- **Next hop address**—IPv6 address of the next hop.
- **Egress interface**—Egress interface of the route.
- **Metric**—Cost from the local router to the destination.
- **Route time**—Time elapsed since the most recent update. The time is reset to 0 every time the route entry is updated.
- **Route tag**—Used for route control. For more information, see "Configuring routing policies."

RIPng packets and advertisement

RIPng multicasts request and response packets to exchange routing information. It uses FF02::9 as the destination address and link-local address FE80::/10 as the source address. RIPng exchanges routing information as follows:

1. When RIPng starts or needs to update some route entries, it sends a multicast request packet to neighbors.
2. When a RIPng neighbor receives the request packet, it sends back a response packet that contains the local routing table. RIPng can also advertise route updates in response packets periodically or advertise a triggered update caused by a route change.
3. After RIPng receives the response, it checks the validity of the response before adding routes to its routing table, including the following details:
   - Whether the source IPv6 address is the link-local address.
   - Whether the port number is correct.
4. A response packet that fails the check is discarded.

Protocols and standards

- RFC 2080, *RIPng for IPv6*
- RFC 2081, *RIPng Protocol Applicability Statement*

Restrictions: Hardware compatibility with RIPng

The S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series do not support RIPng.

RIPng tasks at a glance

To configure RIPng, perform the following tasks:

1. Configuring basic RIPng
2. (Optional.) Configuring RIPng route control
   - Configuring an additional routing metric
   - Configuring RIPng route summarization
   - Advertising a default route
   - Configuring received/redistributed route filtering
   - Setting a preference for RIPng
   - Configuring RIPng route redistribution
3. (Optional.) Tuning and optimizing the RIPng network
   - Setting RIPng timers
   - Configuring split horizon and poison reverse
   - Configuring the RIPng packet sending rate
   - Setting the interval for sending triggered updates
4. (Optional.) Enhancing RIPng availability
   - Configuring RIPng GR
   - Configuring RIPng NSR
   - Configuring RIPng FRR
5. (Optional.) Enhancing RIPng security
   - Configuring zero field check for RIPng packets
   - Applying an IPsec profile

Configuring basic RIPng

1. Enter system view.
   system-view
2. Enable RIPng and enter its view.
   ripng [*process-id*]
   By default, RIPng is disabled.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable RIPng on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled on the interface.
   If RIPng is not enabled on an interface, the interface does not send or receive any RIPng route.

Configuring RIPng route control

Configuring an additional routing metric

About additional routing metrics

An additional routing metric (hop count) can be added to the metric of an inbound or outbound RIPng route.

- An outbound additional metric is added to the metric of a sent route, and it does not change the route's metric in the routing table.
- An inbound additional metric is added to the metric of a received route before the route is added into the routing table, and the route's metric is changed.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Specify an inbound additional routing metric.

   ripng metricin *value*

   The default additional metric of an inbound route is 0.
4. Specify an outbound additional routing metric.

   ripng metricout *value*

   The default additional metric of an outbound route is 1.

Configuring RIPng route summarization

About RIPng route summarization

RIPng route summarization is interface-based. RIPng advertises a summary route based on the longest match.

RIPng route summarization improves network scalability, reduces routing table size, and increases routing table lookup efficiency.

RIPng advertises a summary route with the smallest metric of all the specific routes.

For example, RIPng has two specific routes to be advertised through an interface: 1:11:11::24 with a metric of a 2 and 1:11:12::34 with a metric of 3. Configure route summarization on the interface, so RIPng advertises a single route 11::0/16 with a metric of 2.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Advertise a summary IPv6 prefix.

   ripng summary-address *ipv6-address prefix-length*

   By default, no summary IPv6 prefix is configured on the interface.

Advertising a default route

About default route advertisement

You can configure RIPng to advertise a default route with the specified cost to its neighbors.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure RIPng to advertise a default route.

   ripng default-route { **only** | **originate** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, RIPng does not advertise a default route.

   This command advertises a default route on the current interface regardless of whether the default route exists in the local IPv6 routing table.

Configuring received/redistributed route filtering

About received/redistributed route filtering

Perform this task to filter received or redistributed routes by using an IPv6 ACL or IPv6 prefix list. You can also configure RIPng to filter routes redistributed from other routing protocols and routes from a specified neighbor.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*]

3. Configure a filter policy to filter received routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **import**

   By default, RIPng does not filter received routes.

4. Configure a filter policy to filter redistributed routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*]]

   By default, RIPng does not filter redistributed routes.

Setting a preference for RIPng

About preference for RIPng

Routing protocols each have a preference. When they find routes to the same destination, the route found by the routing protocol with the highest preference is selected as the optimal route. You can manually set a preference for RIPng. The smaller the value, the higher the preference.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.
   ripng [*process-id*]
3. Set a preference for RIPng.
   preference { *preference* | **route-policy** *route-policy-name* } *
   By default, the preference of RIPng is 100.

Configuring RIPng route redistribution

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*]
3. Redistribute routes from other routing protocols.
   - Redistribute direct or static routes.
     import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *
   - Redistribute routes from OSPFv3 or other RIPng processes.
     import-route { **ospfv3** | **ripng** } [*process-id*] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, RIPng does not redistribute routes from other routing protocols.
4. (Optional.) Set a default routing metric for redistributed routes.
   default cost *cost-value*
   The default metric of redistributed routes is 0.

Tuning and optimizing the RIPng network

Setting RIPng timers

About RIPng timers

You can adjust RIPng timers to optimize the performance of the RIPng network.

Restrictions and guidelines

When you adjust RIPng timers, consider the network performance, and perform unified configurations on routers running RIPng to avoid unnecessary network traffic or route oscillation.

Procedure

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*]
3. Set RIPng timers.
   timers { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* } *
   The default settings are as follows:
   - The update timer is 30 seconds.
   - The timeout timer is 180 seconds.

- The suppress timer is 120 seconds.
- The garbage-collect timer is 120 seconds.

Configuring split horizon and poison reverse

Restrictions and guidelines for split horizon and poison reverse

When you configure split horizon and poison reverse, following these restrictions and guidelines:

- If both split horizon and poison reverse are configured, only the poison reverse feature takes effect.
- Split horizon disables RIPng from sending routes through the interface where the routes were learned to prevent routing loops between neighbors. As a best practice, enable split horizon to prevent routing loops in normal cases.
- Poison reverse enables a route learned from an interface to be advertised through the interface. However, the metric of the route is set to 16, which means the route is unreachable.

Configuring split horizon

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable split horizon.
   `ripng split-horizon`
   By default, split horizon is enabled.

Configuring poison reverse

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable poison reverse.
   `ripng poison-reverse`
   By default, poison reverse is disabled.

Configuring the RIPng packet sending rate

About RIPng packet sending rate configuration

Perform this task to specify the interval for sending RIPng packets and the maximum number of RIPng packets that can be sent at each interval. This feature can avoid excessive RIPng packets from affecting system performance and consuming too much bandwidth.

Procedure

1. Enter system view.
   `system-view`
2. Enter RIPng view.
   `ripng` [*`process-id`*]
3. Configuring the RIPng packet sending rate.
   - Execute the following commands in sequence to configure the RIPng packet sending rate in RIPng view:

ripng [*process-id*]

output-delay *time* **count** *count*

By default, an interface that runs the RIPng process sends a maximum of three RIPng packets every 20 milliseconds.

- Execute the following commands in sequence to configure the RIPng packet sending rate in interface view:

  interface *interface-type interface-number*

  ripng output-delay *time* **count** *count*

  By default, an interface uses the RIPng packet sending rate of the RIPng process that it runs.

Setting the interval for sending triggered updates

About setting the interval for sending triggered updates

Perform this task to avoid network overhead and reduce system resource consumption caused by frequent RIPng triggered updates.

You can use the **timer triggered** command to set the maximum interval, minimum interval, and incremental interval for sending RIPng triggered updates.

For a stable network, the minimum interval is used. If network changes become frequent, the triggered update sending interval is incremented by the incremental interval × 2^{n-2} for each triggered update until the maximum interval is reached. The value *n* is the number of triggered update times.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*]

3. Set the interval for sending triggered updates.

   timer triggered *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   The default maximum interval is 5 seconds, the default minimum interval is 50 milliseconds, and the default incremental interval is 200 milliseconds.

Configuring RIPng GR

About RIPng GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must have GR capability.
- **GR helper**—A neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

After RIPng restarts on a router, the router must learn RIPng routes again and updates its FIB table, which causes network disconnections and route reconvergence.

With the GR feature, the restarting router (known as the GR restarter) can notify the event to its GR capable neighbors. GR capable neighbors (known as GR helpers) maintain their adjacencies with

the router within a configurable GR interval. During this process, the FIB table of the router does not change. After the restart, the router contacts its neighbors to retrieve its FIB.

By default, a RIPng-enabled device acts as the GR helper. Perform this task on the GR restarter.

Restrictions and guidelines

You cannot enable RIPng NSR on a device that acts as GR restarter.

Procedure

1. Enter system view.
   system-view
2. Enable RIPng and enter RIPng view.
   ripng [*process-id*]
3. Enable the GR capability for RIPng.
   graceful-restart
   By default, RIPng GR is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   The default GR interval is 60 seconds.

Configuring RIPng NSR

About RIPng NSR

Nonstop routing (NSR) backs up RIPng routing information from the active process to the standby process. After an active/standby switchover, NSR can complete route regeneration without tearing down adjacencies or impacting forwarding services.

NSR does not require the cooperation of neighboring devices to recover routing information, and it is typically used more often than GR.

Restrictions and guidelines

RIPng NSR enabled for a RIPng process takes effect only on that process. If multiple RIPng processes exist, enable RIPng NSR for each process as a best practice.

A device that has RIPng NSR enabled cannot act as GR restarter.

Procedure

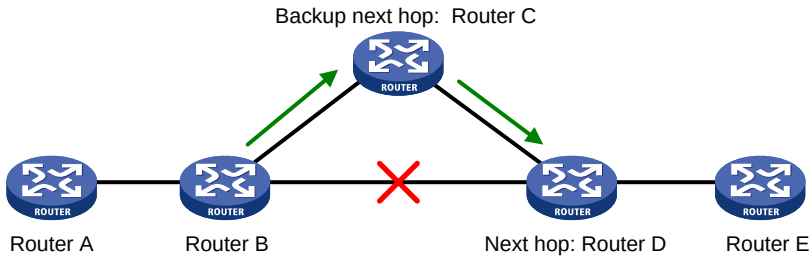
1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*]
3. Enable RIPng NSR.
   non-stop-routing
   By default, RIPng NSR is disabled.

Configuring RIPng FRR

About RIPng FRR

A link or router failure on a path can cause packet loss and even routing loop until RIPng completes routing convergence based on the new network topology. FRR enables fast rerouting to minimize the impact of link or node failures.

Figure 1 Network diagram for RIPng FRR



As shown in Figure 1, configure FRR on Router B by using a routing policy to specify a backup next hop. When the primary link fails, RIPng directs packets to the backup next hop. At the same time, RIPng calculates the shortest path based on the new network topology. Then, the device forwards packets over that path after network convergence.

Restrictions and guidelines for RIPng FRR

RIPng FRR is available only when the state of the primary link (with Layer 3 interfaces staying up) changes from bidirectional to unidirectional or down.

RIPng FRR is only effective for RIPng routes that are learned from directly connected neighbors.

Enabling RIPng FRR

1. Enter system view.
   `system-view`
2. Configure a routing policy.
   You must specify a next hop by using the **`apply ipv6 fast-reroute backup-interface`** command in a routing policy and specify the routing policy for FRR.
   For more information about routing policy configuration, see "Configuring routing policies."
3. Enter RIPng view.
   `ripng` [*`process-id`*]
4. Enable RIPng FRR.
   `fast-reroute route-policy` *`route-policy-name`*
   By default, RIPng FRR is disabled.

Enabling BFD for RIPng FRR

About BFD for RIPng FRR

By default, RIPng FRR does not use BFD to detect primary link failures. For quicker RIPng FRR, use BFD single-hop echo detection on the primary link of redundant links to detect link failure.

Procedure

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ipv6 *ipv6-address*
   By default, the source IP address of BFD echo packets is not configured.
   As a best practice, do not configure the source IP address on the same network segment as any local interfaces.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD single-hop echo detection for RIPng FRR.
   ripng primary-path-detect bfd echo
   By default, BFD single-hop echo detection is disabled for RIPng FRR.

Enhancing RIPng security

Configuring zero field check for RIPng packets

About zero field check for RIPng packets

Some fields in the RIPng packet header must be zero. These fields are called zero fields. You can enable zero field check for incoming RIPng packets. If a zero field of a packet contains a non-zero value, RIPng does not process the packets. If you are certain that all packets are trustworthy, disable the zero field check to save CPU resources.

Procedure

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*]
3. Enable the zero field check for incoming RIPng packets.
   checkzero
   By default, zero field check for incoming RIPng packets is enabled.

Applying an IPsec profile

About IPsec profiles

To protect routing information and prevent attacks, you can configure RIPng to authenticate protocol packets by using an IPsec profile.

An IPsec profile contains inbound and outbound security parameter indexes (SPIs). RIPng compares the inbound SPI defined in the IPsec profile with the outbound SPI in the received packets. Two RIPng devices accept the packets from each other and establish a neighbor relationship only if the SPIs are the same and the relevant IPsec profiles match.

For more information about IPsec profiles, see *Security Configuration Guide*.

Restrictions and guidelines

You can apply an IPsec profile to a RIPng process or to an interface. If an interface and its process each have an IPsec profile, the IPsec profile applied to the interface takes effect.

Applying an IPsec profile to a process

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*]
3. Apply an IPsec profile to the process.
   enable ipsec-profile *profile-name*
   By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an IPsec profile to the interface.
   ripng ipsec-profile *profile-name*
   By default, no IPsec profile is applied.

Display and maintenance commands for RIPng

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display configuration information for a RIPng process.	**display ripng** [*process-id*]
Display RIPng GR information.	**display ripng** [*process-id*] **graceful-restart**
Display RIPng NSR information.	**display ripng** [*process-id*] **non-stop-routing**
Display routes in the RIPng database.	**display ripng** *process-id* **database** [*ipv6-address prefix-length*]
Display interface information for a RIPng process.	**display ripng** *process-id* **interface** [*interface-type interface-number*]
Display neighbor information for a RIPng process.	**display ripng** *process-id* **neighbor** [*interface-type interface-number*]
Display the routing information for a RIPng process.	**display ripng** *process-id* **route** [*ipv6-address prefix-length* [**verbose**] | **peer** *ipv6-address* | **statistics**]
Restart a RIPng process.	**reset ripng** *process-id* **process**
Clear statistics for a RIPng process.	**reset ripng** *process-id* **statistics**

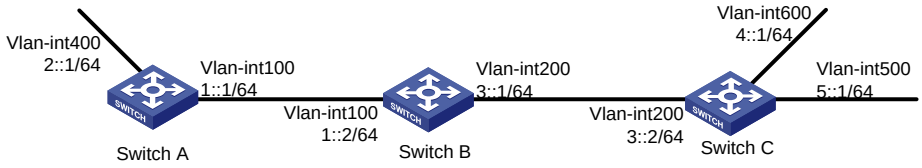
RIPng configuration examples

Example: Configuring basic RIPng

Network configuration

As shown in Figure 2, Switch A, Switch B, and Switch C run RIPng. Configure route filtering on Switch B to accept all received routes except the route 2::/64 and to advertise only the route 4::/64.

Figure 2 Network diagram



Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 1
[SwitchA-ripng-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 400
[SwitchA-Vlan-interface400] ripng 1 enable
[SwitchA-Vlan-interface400] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ripng 1
[SwitchB-ripng-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 400
[SwitchB-Vlan-interface400] ripng 1 enable
[SwitchB-Vlan-interface400] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 1
[SwitchC-ripng-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] ripng 1 enable
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 500
[SwitchC-Vlan-interface500] ripng 1 enable
```

```
[SwitchC-Vlan-interface500] quit
[SwitchC] interface vlan-interface 600
[SwitchC-Vlan-interface600] ripng 1 enable
[SwitchC-Vlan-interface600] quit
```

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------

 Peer FE80::20F:E2FF:FE23:82F5 on Vlan-interface100
 Destination 2::/64,
     via FE80::20F:E2FF:FE23:82F5, cost 1, tag 0, AOF, 6 secs
 Peer FE80::20F:E2FF:FE00:100  on Vlan-interface200
 Destination 4::/64,
     via FE80::20F:E2FF:FE00:100, cost 1, tag 0, AOF, 11 secs
 Destination 5::/64,
     via FE80::20F:E2FF:FE00:100, cost 1, tag 0, AOF, 11
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 3::/64,
     via ::, cost 0, tag 0, DOF
```

Display the RIPng routing table on Switch A.

```
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------

 Peer FE80::200:2FF:FE64:8904 on Vlan-interface100
 Destination 3::/64,
     via FE80::200:2FF:FE64:8904, cost 1, tag 0, AOF, 31 secs
 Destination 4::/64,
     via FE80::200:2FF:FE64:8904, cost 2, tag 0, AOF, 31 secs
 Destination 5::/64,
     via FE80::200:2FF:FE64:8904, cost 2, tag 0, AOF, 31 secs
 Local route
 Destination 2::/64,
     via ::, cost 0, tag 0, DOF
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
```

3. Configure route filtering:

Use IPv6 prefix lists on Switch B to filter received and redistributed routes.

```
[SwitchB] ipv6 prefix-list aaa permit 4:: 64
[SwitchB] ipv6 prefix-list bbb deny 2:: 64
[SwitchB] ipv6 prefix-list bbb permit :: 0 less-equal 128
[SwitchB] ripng 1
[SwitchB-ripng-1] filter-policy prefix-list aaa export
```

```
[SwitchB-ripng-1] filter-policy prefix-list bbb import
[SwitchB-ripng-1] quit
```

Display RIPng routing tables on Switch B and Switch A.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------

 Peer FE80::1:100 on Vlan-interface100

 Peer FE80::3:200 on Vlan-interface200
 Destination 4::/64,
     via FE80::2:200, cost 1, tag 0, AOF, 11 secs
 Destination 5::/64,
     via FE80::2:200, cost 1, tag 0, AOF, 11 secs
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 3::/64,
     via ::, cost 0, tag 0, DOF
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------

 Peer FE80::2:100 on Vlan-interface100
 Destination 4::/64,
     via FE80::1:100, cost 2, tag 0, AOF, 2 secs
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 2::/64,
     via ::, cost 0, tag 0, DOF
```

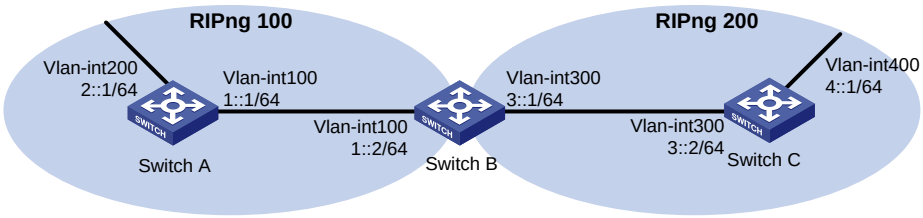
Example: Configuring RIPng route redistribution

Network configuration

As shown in Figure 3, Switch B communicates with Switch A through RIPng 100 and with Switch C through RIPng 200.

Configure route redistribution on Switch B, so the two RIPng processes can redistribute routes from each other.

Figure 3 Network diagram



Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Enable RIPng 100 on Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 100
[SwitchA-ripng-100] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 100 enable
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ripng 100 enable
[SwitchA-Vlan-interface200] quit
```

   # Enable RIPng 100 and RIPng 200 on Switch B.

```
<SwitchB> system-view
[SwitchB] ripng 100
[SwitchB-ripng-100] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 100 enable
[SwitchB-Vlan-interface100] quit
[SwitchB] ripng 200
[SwitchB-ripng-200] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ripng 200 enable
[SwitchB-Vlan-interface300] quit
```

   # Enable RIPng 200 on Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 200
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ripng 200 enable
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ripng 200 enable
[SwitchC-Vlan-interface400] quit
```

   # Display the routing table on Switch A.

```
[SwitchA] display ipv6 routing-table

Destinations : 7 Routes : 7
```

```
Destination: ::1/128                                    Protocol  : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost      : 0

Destination: 1::/64                                     Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : Vlan100                                    Cost      : 0

```

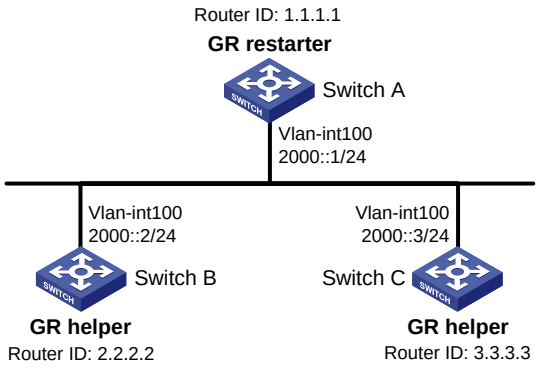
Example: Configuring RIPng GR

Network configuration

As shown in Figure 4, Switch A, Switch B, and Switch C learn IPv6 routing information through RIPng.

Configure Switch A as the GR restarter. Configure Switch B and Switch C as the GR helpers to synchronize their routing tables with Switch A by using GR.

Figure 4 Network diagram



Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure RIPng on the switches to ensure the following: (Details not shown.)
   - Switch A, Switch B, and Switch C can communicate with each other at Layer 3.

- Dynamic route update can be implemented among them with RIPng.

3. Enable RIPng GR on Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 1
[SwitchA-ripng-1] graceful-restart
```

Verifying the configuration

Restart RIPng or trigger an active/standby switchover, and then display GR status on Switch A.

```
<SwitchA> display ripng 1 graceful-restart
RIPng process: 1
 Graceful Restart capability     : Enabled
 Current GR state                : Normal
 Graceful Restart period         : 60  seconds
 Graceful Restart remaining time: 0   seconds
```

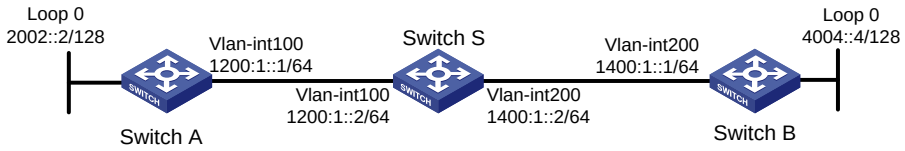
Example: Configuring RIPng NSR

Network configuration

As shown in Figure 5, Switch S, Switch A, and Switch B learn IPv6 routing information through RIPng.

Enable RIPng NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 5 Network diagram



Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure RIPng on the switches to ensure the following: (Details not shown.)
   - Switch S, Switch A, and Switch B can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPng.
3. Enable RIPng NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] ripng 1
[SwitchS-ripng-1] non-stop-routing
[SwitchS-ripng-1] quit
```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```

Continue? [y/n]:y
Re-optimization of the placement start. You will be notified on completion
Re-optimization of the placement complete. Use 'display placement' to view the new
placement
```

During the switchover period, display RIPng neighbors on Switch A to verify the neighbor relationship between Switch A and Switch S.

```
[SwitchA] display ripng 1 neighbor
 Neighbor Address: FE80::AE45:5CE7:422E:2867
     Interface  : Vlan-interface100
     Version    : RIPng version 1     Last update: 00h00m23s
     Bad packets: 0                   Bad routes : 0
```

Display RIPng routes on Switch A to verify if Switch A has a route to the loopback interface on Switch B.

```
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------
 Peer FE80::AE45:5CE7:422E:2867 on Vlan-interface100
 Destination 1400:1::/64,
     via FE80::AE45:5CE7:422E:2867, cost 1, tag 0, AOF, 1 secs
 Destination 4004::4/128,
     via FE80::AE45:5CE7:422E:2867, cost 2, tag 0, AOF, 1 secs
 Local route
 Destination 2002::2/128,
     via ::, cost 0, tag 0, DOF
 Destination 1200:1::/64,
     via ::, cost 0, tag 0, DOF
```

Display RIPng neighbors on Switch B to verify the neighbor relationship between Switch B and Switch S.

```
[SwitchB] display ripng 1 neighbor
 Neighbor Address: FE80::20C:29FF:FECE:6277
     Interface  : Vlan-interface200
     Version    : RIPng version 1     Last update: 00h00m18s
     Bad packets: 0                   Bad routes : 0
```

Display RIPng routes on Switch B to verify if Switch B has a route to the loopback interface on Switch A.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------
 Peer FE80::20C:29FF:FECE:6277 on Vlan-interface200
```

```
Destination 2002::2/128,
    via FE80::20C:29FF:FECE:6277, cost 2, tag 0, AOF, 24 secs
Destination 1200:1::/64,
    via FE80::20C:29FF:FECE:6277, cost 1, tag 0, AOF, 24 secs
Local route
Destination 4004::4/128,
    via ::, cost 0, tag 0, DOF
Destination 1400:1::/64,
    via ::, cost 0, tag 0, DOF
```

The output shows the following when an active/standby switchover occurs on Switch S:

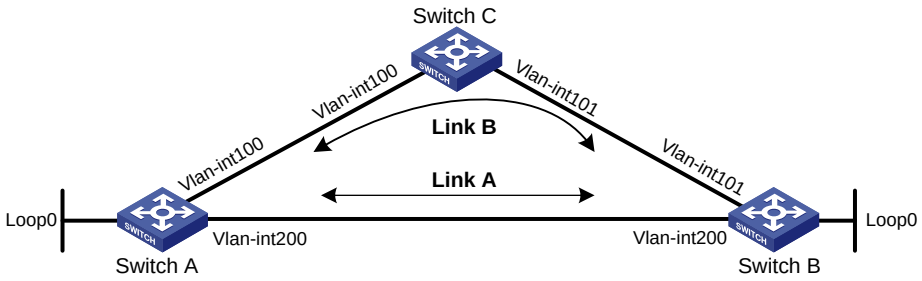
- The neighbor relationships and routing information on Switch A and Switch B have not changed.
- The traffic from Switch A to Switch B has not been impacted.

Example: Configuring RIPng FRR

Network configuration

As shown in Figure 6, Switch A, Switch B, and Switch C run RIPng. Configure RIPng FRR so that when Link A becomes unidirectional, traffic can be switched to Link B immediately.

Figure 6 Network diagram



Device	Interface	IP address
Switch A	VLAN-interface 100	1::1/64
Switch A	VLAN-interface 200	2::1/64
Switch A	Loopback 0	10::1/128
Switch B	VLAN-interface 101	3::1/64
Switch B	VLAN-interface 200	2::2/64
Switch B	Loopback 0	20::1/128
Switch C	VLAN-interface 100	1::2/64
Switch C	VLAN-interface 101	3::2/64

Procedure

1. Configure IPv6 addresses for the interfaces on the switches. (Details not shown.)
2. Configure RIPng on the switches to make sure Switch A, Switch B, and Switch C can communicate with each other at Layer 3. (Details not shown.)
3. Configure RIPng FRR:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ipv6 prefix-list abc index 10 permit 20::1 128
[SwitchA] route-policy frr permit node 10
[SwitchA-route-policy-frr-10] if-match ipv6 address prefix-list abc
[SwitchA-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 100 backup-nexthop 1::2
[SwitchA-route-policy-frr-10] quit
[SwitchA] ripng 1
[SwitchA-ripng-1] fast-reroute route-policy frr
[SwitchA-ripng-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ipv6 prefix-list abc index 10 permit 10::1 128
[SwitchB] route-policy frr permit node 10
[SwitchB-route-policy-frr-10] if-match ipv6 address prefix-list abc
[SwitchB-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 101 backup-nexthop 3::2
[SwitchB-route-policy-frr-10] quit
[SwitchB] ripng 1
[SwitchB-ripng-1] fast-reroute route-policy frr
[SwitchB-ripng-1] quit
```

Verifying the configuration

Display the route 20::1/128 on Switch A to view the backup next hop information.

```
[SwitchA] display ipv6 routing-table 20::1 128 verbose

Summary count : 1

```

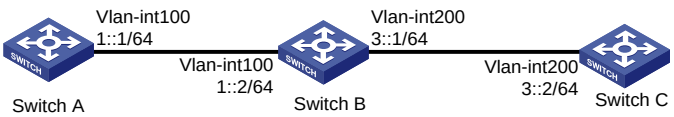
Example: Configuring RIPng IPsec profile

Network configuration

As shown in Figure 7, configure RIPng on the switches, and configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 7 Network diagram



Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ripng 1
   [SwitchA-ripng-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ripng 1 enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ripng 1
   [SwitchB-ripng-1] quit
   ```

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ripng 1 enable
[SwitchB-Vlan-interface200] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 1
[SwitchC-ripng-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] ripng 1 enable
[SwitchC-Vlan-interface200] quit
```

3. Configure RIPng IPsec profiles:

- On Switch A:

  # Create an IPsec transform set named **protrf1**.

  ```
  [SwitchA] ipsec transform-set protrf1
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchA-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
  [SwitchA-ipsec-transform-set-protrf1] esp authentication-algorithm md5
  ```

  # Specify transport mode for encapsulation.

  ```
  [SwitchA-ipsec-transform-set-protrf1] encapsulation-mode transport
  [SwitchA-ipsec-transform-set-protrf1] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchA] ipsec profile profile001 manual
  ```

  # Reference IPsec transform set **protrf1**.

  ```
  [SwitchA-ipsec-profile-profile001-manual] transform-set protrf1
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchA-ipsec-profile-profile001-manual] sa spi inbound esp 256
  [SwitchA-ipsec-profile-profile001-manual] sa spi outbound esp 256
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchA-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
  [SwitchA-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
  [SwitchA-ipsec-profile-profile001-manual] quit
  ```

- On Switch B:

  # Create an IPsec transform set named **protrf1**.

  ```
  [SwitchB] ipsec transform-set protrf1
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchB-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
  [SwitchB-ipsec-transform-set-protrf1] esp authentication-algorithm md5
  ```

  # Specify transport mode for encapsulation.

  ```
  [SwitchB-ipsec-transform-set-protrf1] encapsulation-mode transport
  [SwitchB-ipsec-transform-set-protrf1] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchB] ipsec profile profile001 manual
  ```

  # Reference IPsec transform set **protrf1**.

  ```
  [SwitchB-ipsec-profile-profile001-manual] transform-set protrf1
  ```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-profile001-manual] sa spi inbound esp 256
[SwitchB-ipsec-profile-profile001-manual] sa spi outbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
[SwitchB-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
[SwitchB-ipsec-profile-profile001-manual] quit
```

- On Switch C:

  # Create an IPsec transform set named **protrf1**.

  ```
  [SwitchC] ipsec transform-set protrf1
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchC-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
  [SwitchC-ipsec-transform-set-protrf1] esp authentication-algorithm md5
  ```

  # Specify transport mode for encapsulation.

  ```
  [SwitchC-ipsec-transform-set-protrf1] encapsulation-mode transport
  [SwitchC-ipsec-transform-set-protrf1] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchC] ipsec profile profile001 manual
  ```

  # Reference IPsec transform set **protrf1**.

  ```
  [SwitchC-ipsec-profile-profile001-manual] transform-set protrf1
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchC-ipsec-profile-profile001-manual] sa spi inbound esp 256
  [SwitchC-ipsec-profile-profile001-manual] sa spi outbound esp 256
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchC-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
  [SwitchC-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
  [SwitchC-ipsec-profile-profile001-manual] quit
  ```

4. Apply the IPsec profiles to the RIPng process on each device:
   - On Switch A:

     ```
     [SwitchA] ripng 1
     [SwitchA-ripng-1] enable ipsec-profile profile001
     [SwitchA-ripng-1] quit
     ```

   - On Switch B:

     ```
     [SwitchB] ripng 1
     [SwitchB-ripng-1] enable ipsec-profile profile001
     [SwitchB-ripng-1] quit
     ```

   - On Switch C:

     ```
     [SwitchC] ripng 1
     [SwitchC-ripng-1] enable ipsec-profile profile001
     [SwitchC-ripng-1] quit
     ```

Verifying the configuration

Verify that the RIPng packets between Switches A, B and C are protected by IPsec. (Details not shown.)

Contents

Configuring OSPFv3

About OSPFv3

This chapter describes how to configure RFC 2740-compliant Open Shortest Path First version 3 (OSPFv3) for an IPv6 network.

Comparison of OSPFv3 with OSPFv2

OSPFv3 and OSPFv2 have the following in common:

- 32-bit router ID and area ID.
- Hello, Database Description (DD), Link State Request (LSR), Link State Update (LSU), Link State Acknowledgment (LSAck).
- Mechanisms for finding neighbors and establishing adjacencies.
- Mechanisms for advertising and aging LSAs.

OSPFv3 and OSPFv2 have the following differences:

- OSPFv3 runs on a per-link basis. OSPFv2 runs on a per-IP-subnet basis.
- OSPFv3 supports running multiple processes on an interface, but OSPFv2 does not support.
- OSPFv3 identifies neighbors by router ID. OSPFv2 identifies neighbors by IP address.

For more information about OSPFv2, see "Configuring OSPF."

OSPFv3 packets

OSPFv3 uses the following packet types:

- **Hello**—Periodically sent to find and maintain neighbors, containing timer values, information about the DR, BDR, and known neighbors.
- **DD**—Describes the digest of each LSA in the LSDB, exchanged between two routers for data synchronization.
- **LSR**—Requests needed LSAs from the neighbor. After exchanging the DD packets, the two routers know which LSAs of the neighbor are missing from their LSDBs. They then send an LSR packet to each other, requesting the missing LSAs. The LSA packet contains the digest of the missing LSAs.
- **LSU**—Transmits the requested LSAs to the neighbor.
- **LSAck**—Acknowledges received LSU packets.

OSPFv3 LSA types

OSPFv3 sends routing information in LSAs. The following LSAs are commonly used:

- **Router LSA**—Type-1 LSA, originated by all routers. This LSA describes the collected states of the router's interfaces to an area, and is flooded throughout a single area only.
- **Network LSA**—Type-2 LSA, originated for broadcast and NBMA networks by the DR. This LSA contains the list of routers connected to the network, and is flooded throughout a single area only.
- **Inter-Area-Prefix LSA**—Type-3 LSA, originated by ABRs and flooded throughout the LSA's associated area. Each Inter-Area-Prefix LSA describes a route with IPv6 address prefix to a destination outside the area, yet still inside the AS.

- **Inter-Area-Router LSA**—Type-4 LSA, originated by ABRs and flooded throughout the LSA's associated area. Each Inter-Area-Router LSA describes a route to ASBR.
- **AS External LSA**—Type-5 LSA, originated by ASBRs, and flooded throughout the AS, except stub areas and Not-So-Stubby Areas (NSSAs). Each AS External LSA describes a route to another AS. A default route can be described by an AS External LSA.
- **NSSA LSA**—Type-7 LSA, originated by ASBRs in NSSAs and flooded throughout a single NSSA. NSSA LSAs describe routes to other ASs.
- **Link LSA**—Type-8 LSA. A router originates a separate Link LSA for each attached link. Link LSAs have link-local flooding scope. Each Link LSA describes the IPv6 address prefix of the link and Link-local address of the router.
- **Intra-Area-Prefix LSA**—Type-9 LSA. Each Intra-Area-Prefix LSA contains IPv6 prefix information on a router, stub area, or transit area information, and has area flooding scope. It was introduced because Router LSAs and Network LSAs contain no address information.
- **Grace LSA**—Type-11 LSA, generated by a GR restarter at reboot and transmitted on the local link. The GR restarter describes the cause and interval of the reboot in the Grace LSA to notify its neighbors that it performs a GR operation.

Protocols and standards

- RFC 2328, *OSPF Version 2*
- RFC 3101, *OSPF Not-So-Stubby Area (NSSA) Option*
- RFC 4552, *Authentication/Confidentiality for OSPFv3*
- RFC 5187, *OSPFv3 Graceful Restart*
- RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates*
- RFC 5329, *Traffic Engineering Extensions to OSPF Version 3*
- RFC 5340, *OSPF for IPv6*
- RFC 5643, *Management Information Base for OSPFv3*
- RFC 6506, *Supporting Authentication Trailer for OSPFv3*
- RFC 6969, *OSPFv3 Instance ID Registry Update*
- RFC 7166, *Supporting Authentication Trailer for OSPFv3*

Restrictions: Hardware compatibility with OSPFv3

The S5110V2-SI, S5000V3-EI, S5000V5-EI, S5000E-X, S5000X-EI, and WAS6000 switch series do not support OSPFv3.

OSPFv3 tasks at a glance

To configure OSPFv3, perform the following tasks:

1. Enabling OSPFv3
2. (Optional.) Configuring OSPFv3 area parameters
   - Configuring a stub area
   - Configuring an NSSA area
   - Configuring an OSPFv3 virtual link

     Perform this task on an ABR to create a virtual link when connectivity cannot be maintained between a non-backbone area and the backbone, or within the backbone.
3. (Optional.) Configuring OSPFv3 network types

- Setting the broadcast network type for an OSPFv3 interface
- Setting the NBMA network type for an OSPFv3 interface
- Setting the P2MP network type for an OSPFv3 interface
- Setting the P2P network type for an OSPFv3 interface

4. (Optional.) Configuring OSPFv3 route control
   - Configuring OSPFv3 inter-area route summarization
   - Configuring OSPFv3 received route filtering
   - Configuring Inter-Area-Prefix LSA filtering
   - Setting an OSPFv3 cost for an interface
   - Setting a preference for OSPFv3
   - Configuring OSPFv3 route redistribution
5. (Optional.) Setting OSPFv3 timers
   - Setting OSPFv3 packet timers
   - Setting LSA transmission delay
   - Setting SPF calculation interval
   - Setting the LSA generation interval
   - Setting the LSU transmit rate
6. (Optional.) Setting a DR priority for an interface
7. (Optional.) Configuring OSPFv3 packet parameters
   - Ignoring MTU check for DD packets
   - Disabling interfaces from receiving and sending OSPFv3 packets
8. (Optional.) Configuring prefix suppression
9. (Optional.) Configuring a stub router
10. (Optional.) Enhancing OSPFv3 availability
    - Configuring OSPFv3 GR
    - Configuring OSPFv3 NSR
    - Configuring BFD for OSPFv3
    - Configuring OSPFv3 FRR
11. (Optional.) Enhancing OSPFv3 security
    - Configuring OSPFv3 authentication
    - Applying an IPsec profile for authenticating OSPFv3 packets
12. (Optional.) Configuring OSPFv3 logging and SNMP notifications
    - Enabling logging for neighbor state changes
    - Setting the maximum number of OSPFv3 logs
    - Configuring OSPFv3 network management

Enabling OSPFv3

About enabling OSPFv3

To enable an OSPFv3 process on a router:

1. Enable the OSPFv3 process globally.
2. Assign the OSPFv3 process a router ID.
3. Enable the OSPFv3 process on related interfaces.

An OSPFv3 process ID has only local significance. Process 1 on a router can exchange packets with process 2 on another router.

OSPFv3 requires you to manually specify a router ID for each router in an AS. Make sure all assigned router IDs in the AS are unique.

Restrictions and guideline

If a router runs multiple OSPFv3 processes, you must specify a unique router ID for each process.

Procedure

1. Enter system view.
   system-view
2. Enable an OSPFv3 process and enter its view.
   ospfv3 [*process-id*]
   By default, no OSPFv3 processes are enabled.
3. Specify a router ID.
   router-id *router-id*
   By default, no router ID is configured.
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
   By default, no OSPFv3 processes are enabled on an interface.

Configuring OSPFv3 area parameters

About OSPFv3 areas

OSPFv3 has the same stub area, NSSA area, and virtual link features as OSPFv2.

After you split an OSPFv3 AS into multiple areas, the LSA number is reduced and OSPFv3 applications are extended. To further reduce the size of routing tables and the number of LSAs, configure the non-backbone areas at an AS edge as stub areas.

A stub area cannot import external routes, but an NSSA area can import external routes into the OSPFv3 routing domain while retaining other stub area characteristics.

Non-backbone areas exchange routing information through the backbone area, so the backbone and non-backbone areas (including the backbone itself) must be fully meshed. If no connectivity can be achieved, configure virtual links.

Configuring a stub area

Restrictions and guidelines

To configure a stub area, you must perform this task on all routers attached to the area.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]

3. Enter OSPFv3 area view.

   area *area-id*

4. Configure the area as a stub area.

   stub [**default-route-advertise-always** | **no-summary**] *

   By default, no area is configured as a stub area.

   The **no-summary** keyword is only available on the ABR of a stub area. If you specify the **no-summary** keyword, the ABR only advertises a default route in an Inter-Area-Prefix LSA into the stub area.

5. (Optional.) Set a cost for the default route advertised to the stub area.

   default-cost *cost-value*

   By default, the cost for the default route advertised to the stub area is 1.

Configuring an NSSA area

Restrictions and guidelines

To configure an NSSA area, you must perform this task on all routers attached to the area.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Enter OSPFv3 area view.

   area *area-id*

4. Configure the area as an NSSA area.

   nssa [**default-route-advertise** [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] * | **no-import-route** | **no-summary** | [**translate-always** | **translate-never**] | **suppress-fa** | **translator-stability-interval** *value*] *

   By default, no area is configured as an NSSA area.

   To configure a totally NSSA area, execute the **nssa no-summary** command on the ABR. The ABR of a totally NSSA area does not advertise inter-area routes into the area.

5. (Optional.) Set a cost for the default route advertised to the NSSA area.

   default-cost *cost-value*

   By default, the cost for the default route advertised to the NSSA area is 1.

   This command takes effect only on the ABR/ASBR of an NSSA or totally NSSA area.

Configuring an OSPFv3 virtual link

About OSPFv3 virtual links

You can configure a virtual link to maintain connectivity between a non-backbone area and the backbone, or in the backbone itself.

Restrictions and guidelines

Both ends of a virtual link are ABRs that must be configured with the **vlink-peer** command.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure a virtual link.
   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | **retransmit** *seconds* | **trans-delay** *seconds*] *

Configuring OSPFv3 network types

Restrictions and guidelines for OSPFv3 network type configuration

Based on the link layer protocol, OSPFv3 classifies networks into different types, including broadcast, NBMA, P2MP, and P2P.

- If any routers in a broadcast network do not support multicasting, you can change the network type to NBMA.
- If only two routers running OSPFv3 exist on a network segment, you can change the network type to P2P to save costs.

Setting the broadcast network type for an OSPFv3 interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to broadcast for the OSPFv3 interface.
   ospfv3 network-type broadcast [**instance** *instance-id*]
   By default, the network type of an interface is broadcast.

Setting the NBMA network type for an OSPFv3 interface

Restrictions and guidelines

For NBMA interfaces, you must specify the link-local IP addresses and DR priorities for their neighbors because these interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to NBMA for the OSPFv3 interface.

ospfv3 network-type nbma [**instance** *instance-id*]

By default, the network type of an interface is broadcast.

4. (Optional.) Set the router priority for the interface

   ospfv3 dr-priority *priority*

   By default, an interface has a router priority of 1.

   An interface's router priority determines its privilege in DR/BDR selection.

5. Specify an NBMA neighbor.

   ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]

   By default, no link-local address is specified for the neighbor interface.

Setting the P2MP network type for an OSPFv3 interface

Restrictions and guidelines

For P2MP interfaces (only when in unicast mode), you must specify the link-local IP addresses of their neighbors because these interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the network type to P2MP for the OSPFv3 interface.

   ospfv3 network-type p2mp [**unicast**] [**instance** *instance-id*]

   By default, the network type of an interface is broadcast.

4. Specify a P2MP unicast neighbor.

   ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]

   By default, no link-local address is specified for the neighbor interface.

Setting the P2P network type for an OSPFv3 interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the network type to P2P for the OSPFv3 interface.

   ospfv3 network-type p2p [**instance** *instance-id*]

   By default, the network type of an interface is broadcast.

Configuring OSPFv3 route control

Configuring OSPFv3 inter-area route summarization

About OSPFv3 inter-area route summarization

If contiguous network segments exist in an area, you can summarize them into one network segment on the ABR. The ABR will advertise only the summary route. Any LSA on the specified network segment will not be advertised, reducing the LSDB size in other areas.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure route summarization on the ABR.
   abr-summary *ipv6-address prefix-length* [**not-advertise**] [**cost** *cost-value*]
   By default, route summarization is not configured on an ABR.

Configuring redistributed route summarization

About redistributed route summarization

Perform this task to enable an ASBR to summarize external routes within the specified address range into a single route.

An ASBR can summarize routes in the following LSAs:

- Type-5 LSAs.
- Type-7 LSAs in an NSSA area.
- Type-5 LSAs translated from Type-7 LSAs in an NSSA area if the ASBR (also an ABR) is a translator. If the ASBR is not a translator, it cannot summarize routes in Type-5 LSAs translated from Type-7 LSAs.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Configure route summarization on an ASBR.
   asbr-summary *ipv6-address prefix-length* [**cost** *cost-value* | **not-advertise** | **nssa-only** | **tag** *tag*] *
   By default, route summarization is not configured on an ASBR.

Configuring OSPFv3 received route filtering

About OSPFv3 received route filtering

This task allows you to filter routes calculated by using received LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Configure OSPFv3 to filter routes calculated by using received LSAs.

   filter-policy { *ipv6-acl-number* [**gateway** *prefix-list-name*] | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **route-policy** *route-policy-name* } **import**

   By default, OSPFv3 accepts all routes calculated by using received LSAs.

   This command can only filter routes computed by OSPFv3. Only routes not filtered out can be added into the local routing table.

Configuring Inter-Area-Prefix LSA filtering

Restrictions and guidelines

The **filter** command takes effect only on ABRs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Enter OSPFv3 area view.

   area *area-id*

4. Configure OSPFv3 to filter Inter-Area-Prefix LSAs.

   filter { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }

   By default, OSPFv3 accepts all Inter-Area-Prefix LSAs.

Setting an OSPFv3 cost for an interface

About setting an OSPFv3 cost for an interface

You can set an OSPFv3 cost for an interface with one of the following methods:

- Set the cost value in interface view.
- Set a bandwidth reference value for the interface, and OSPFv3 computes the cost automatically based on the bandwidth reference value by using the following formula:

  Interface OSPFv3 cost = Bandwidth reference value (100 Mbps) / Interface bandwidth (Mbps)

  - If the calculated cost is greater than 65535, the value of 65535 is used.
  - If the calculated cost is smaller than 1, the value of 1 is used.
- If no cost is set for an interface, OSPFv3 automatically computes the cost for the interface.

Setting a cost in interface view

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set an OSPFv3 cost for the interface.
   ospfv3 cost *cost-value* [**instance** *instance-id*]
   By default, the OSPFv3 cost is 1 for a VLAN interface, is 0 for a loopback interface. The OSPFv3 cost is automatically computed according to the interface bandwidth for other interfaces.

Setting a bandwidth reference value

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Set a bandwidth reference value.
   bandwidth-reference *value*
   The default bandwidth reference value is 100 Mbps.

Setting a preference for OSPFv3

About routing protocol preference

A router can run multiple routing protocols. The system assigns a priority for each protocol. When these routing protocols find the same route, the route found by the protocol with the highest priority is selected.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Set a preference for OSPFv3.
   preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *
   By default, the preference of OSPFv3 internal routes is 10, and the preference of OSPFv3 external routes is 150.

Configuring OSPFv3 route redistribution

Restrictions and guidelines

Because OSPFv3 is a link state routing protocol, it cannot directly filter LSAs to be advertised. OSPFv3 filters only redistributed routes. Only routes that are not filtered out can be advertised in LSAs.

Procedure

1. Enter system view.
   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Configure OSPFv3 to redistribute routes from other routing protocols.

   import-route { **direct** | **static** } [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **ospfv3** | **ripng** } [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, route redistribution is disabled.

4. (Optional.) Configure OSPFv3 to filter redistributed routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [**direct** | { **ospfv3** | **ripng** } [*process-id*] | **static**]

   By default, OSPFv3 accepts all redistributed routes.

   This command filters only routes redistributed by the **import-route** command. If no routes are redistributed by the **import-route** command, this command does not take effect.

5. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Configuring default route redistribution

About default route redistribution

The **import-route** command cannot redistribute a default external route. To redistribute a default route, perform this task.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Redistribute a default route.

   default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no default route is redistributed.

4. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Setting OSPFv3 timers

Setting OSPFv3 packet timers

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the hello interval.

   ospfv3 timer hello *seconds* [**instance** *instance-id*]

   The default hello interval on P2P and broadcast interfaces is 10 seconds. The default hello interval on P2MP and NBMA interfaces is 30 seconds.

4. Set the dead interval.

   ospfv3 timer dead *seconds* [**instance** *instance-id*]

   The default dead interval on P2P and broadcast interfaces is 40 seconds. The default dead interval on P2MP and NBMA interfaces is 120 seconds.

   The dead interval set on neighboring interfaces cannot be too short. If the interval is too short, a neighbor is easily down.

5. Set the poll interval.

   ospfv3 timer poll *seconds* [**instance** *instance-id*]

   By default, the poll interval is 120 seconds.

6. Set the LSA retransmission interval.

   ospfv3 timer retransmit *interval* [**instance** *instance-id*]

   The default LSA retransmission interval is 5 seconds.

   The LSA retransmission interval cannot be too short. If the interval is too short, unnecessary retransmissions will occur.

Setting LSA transmission delay

About setting LSA transmission delay

Each LSA in the LSDB has an age that is incremented by 1 every second, but the age does not change during transmission. Therefore, it is necessary to add a transmission delay into the age time, especially for low-speed links.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the LSA transmission delay.

   ospfv3 trans-delay *seconds* [**instance** *instance-id*]

   By default, the LSA transmission delay is 1 second.

Setting SPF calculation interval

About setting SPF calculation interval

LSDB changes result in SPF calculations. When the topology changes frequently, a large amount of network and router resources are occupied by SPF calculation. You can adjust the SPF calculation interval to reduce the impact.

For a stable network, the minimum interval is used. If network changes become frequent, the SPF calculation interval is incremented by the incremental interval × 2^{n-2} for each calculation until the maximum interval is reached. The value *n* is the number of calculation times.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Set the SPF calculation interval.

   spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the LSA generation interval

About setting the LSA generation interval

You can adjust the LSA generation interval to protect network resources and routers from being over consumed by frequent network changes.

For a stable network, the minimum interval is used. If network changes become frequent, the LSA generation interval is incremented by the incremental interval × 2^{n-2} for each generation until the maximum interval is reached. The value *n* is the number of generation times.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Set the LSA generation interval.

   lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 0 milliseconds, and the incremental interval is 0 milliseconds.

Setting the LSU transmit rate

About setting the LSU transmit rate

Sending large numbers of LSU packets affects router performance and consumes a large amount of network bandwidth. You can configure the router to send LSU packets at an interval and to limit the maximum number of LSU packets sent out of an OSPFv3 interface at each interval.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Set the LSU transmit rate.

   transmit-pacing interval *interval* **count** *count*

   By default, an OSPFv3 interface sends a maximum of three LSU packets every 20 milliseconds.

Setting a DR priority for an interface

About DR priority

The router priority is used for DR election. Interfaces having the priority 0 cannot become a DR or BDR.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set a router priority.
   ospfv3 dr-priority *priority* [**instance** *instance-id*]
   The default router priority is 1.

Configuring OSPFv3 packet parameters

Ignoring MTU check for DD packets

About ignoring MTU check for DD packets

When LSAs are few in DD packets, it is unnecessary to check the MTU in DD packets to improve efficiency.

Restrictions and guidelines

A neighbor relationship can be established only if the interface's MTU is the same as that of the peer.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Ignore MTU check for DD packets.
   ospfv3 mtu-ignore [**instance** *instance-id*]
   By default, OSPFv3 does not ignore MTU check for DD packets.

Disabling interfaces from receiving and sending OSPFv3 packets

About disabling interfaces from receiving and sending OSPFv3 packets

After an OSPFv3 interface is set to **silent**, direct routes of the interface can still be advertised in Intra-Area-Prefix LSAs through other interfaces, but other OSPFv3 packets cannot be advertised. No neighboring relationship can be established on the interface. This feature can enhance the adaptability of OSPFv3 networking.

Procedure

1. Enter system view.
   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Disable interfaces from receiving and sending OSPFv3 packets.

   silent-interface { *interface-type interface-number* | **all** }

   By default, the interfaces can receive and send OSPFv3 packets.

   This command disables only the interfaces that run the current process. However, multiple OSPFv3 processes can disable the same interface from receiving and sending OSPFv3 packets.

Configuring prefix suppression

About prefix suppression

By default, an OSPFv3 interface advertises all of its prefixes in LSAs. To speed up OSPFv3 convergence, you can suppress interfaces from advertising all of their prefixes. This feature helps improve network security by preventing IP routing to the suppressed networks.

When prefix suppression is enabled:

- OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-8 LSAs.
- On broadcast and NBMA networks, the DR does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-2 LSAs.
- On P2P and P2MP networks, OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-1 LSAs.

Restrictions and guidelines for prefix suppression

As a best practice, configure prefix suppression on all OSPFv3 routers if you want to use prefix suppression.

Configuring prefix suppression for an OSPFv3 process

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Enable prefix suppression for the OSPFv3 process.

   prefix-suppression

   By default, prefix suppression is disabled for an OSPFv3 process.

   Enabling prefix suppression for an OSPFv3 process does not suppress the prefixes of loopback interfaces and passive interfaces.

Configuring prefix suppression for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable prefix suppression for the interface.

ospfv3 prefix-suppression [**disable**] [**instance** *instance-id*]

By default, prefix suppression is disabled for an interface.

Configuring a stub router

About stub routers

A stub router is used for traffic control. It reports its status as a stub router to neighboring OSPFv3 routers. The neighboring routers can have a route to the stub router, but they do not use the stub router to forward data.

Use either of the following methods to configure a router as a stub router:

- Clear the R-bit of the Option field in Type-1 LSAs. When the R-bit is clear, the OSPFv3 router can participate in OSPFv3 topology distribution without forwarding traffic.
- Use the OSPFv3 max-metric router LSA feature. This feature enables OSPFv3 to advertise its locally generated Type-1 LSAs with a maximum cost of 65535. Neighbors do not send packets to the stub router as long as they have a route with a smaller cost.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id*]
3. Configure the router as a stub router.
   - Configure the router as a stub router and clear the R-bit of the Option field in Type-1 LSAs.

     stub-router r-bit [**include-stub** | **on-startup** *seconds*] *
   - Configure the router as a stub router and advertise the locally generated Type-1 LSAs with the maximum cost of 65535.

     stub-router max-metric [**external-lsa** [*max-metric-value*] | **summary-lsa** [*max-metric-value*] | **include-stub** | **on-startup** *seconds*] *

   By default, the router is not configured as a stub router.

   A stub router is not related to a stub area.

Configuring OSPFv3 GR

About OSPFv3 GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must be Graceful Restart capable.
- **GR helper**—The neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

To prevent service interruption after a master/backup switchover, a GR restarter running OSPFv3 must perform the following tasks:

- Keep the GR restarter forwarding entries stable during reboot.
- Establish all adjacencies and obtain complete topology information after reboot.

After the active/standby switchover, the GR restarter sends a Grace LSA to tell its neighbors that it performs a GR. Upon receiving the Grace LSA, the neighbors with the GR helper capability enter the helper mode (and are called GR helpers). Then, the GR restarter retrieves its adjacencies and LSDB with the help of the GR helpers.

Restrictions and guidelines for OSPFv3 GR

You cannot enable OSPFv3 NSR on a device that acts as GR restarter.

Configuring GR restarter

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Enable the GR capability.
   graceful-restart enable [**global** | **planned-only**] *
   By default, OSPFv3 GR restarter capability is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring GR helper

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Enable the GR helper capability.
   graceful-restart helper enable [**planned-only**]
   By default, the GR helper capability is enabled.
4. Enable strict LSA checking.
   graceful-restart helper strict-lsa-checking
   By default, strict LSA checking is disabled.

Triggering OSPFv3 GR

About triggering OSPFv3 GR

OSPFv3 GR is triggered by an active/standby switchover or when this task is performed.

Procedure

To trigger OSPFv3 GR, execute the **reset ospfv3** [*process-id*] **process graceful-restart** command in user view.

Configuring OSPFv3 NSR

About OSPFv3 NSR

Nonstop routing (NSR) backs up OSPFv3 link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without tearing down adjacencies or impacting forwarding services.

NSR does not require the cooperation of neighboring devices to recover routing information, and it is typically used more often than GR.

Restrictions and guidelines

A device that has OSPFv3 NSR enabled cannot act as GR restarter.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Enable OSPFv3 NSR.
   non-stop-routing

   By default, OSPFv3 NSR is disabled.

   This command takes effect only for the current process. As a best practice, enable OSPFv3 NSR for each process if multiple OSPFv3 processes exist.

Configuring BFD for OSPFv3

About BFD for OSPFv3

Bidirectional forwarding detection (BFD) provides a mechanism to quickly detect the connectivity of links between OSPFv3 neighbors, improving the convergence speed of OSPFv3. For more information about BFD, see *High Availability Configuration Guide*.

After discovering neighbors by sending hello packets, OSPFv3 notifies BFD of the neighbor addresses, and BFD uses these addresses to establish sessions. Before a BFD session is established, it is in the down state. In this state, BFD control packets are sent at an interval of no less than 1 second to reduce BFD control packet traffic. After the BFD session is established, BFD control packets are sent at the negotiated interval, thereby implementing fast fault detection.

To configure BFD for OSPFv3, you need to configure OSPFv3 first.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Specify a router ID.
   router-id *router-id*
4. Quit the OSPFv3 view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*

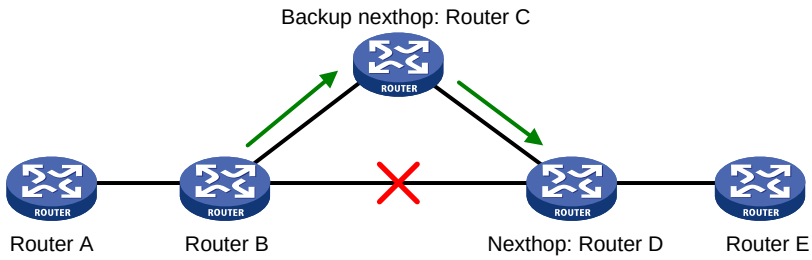
6. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
7. Enable BFD on the interface.
   ospfv3 bfd enable [**instance** *instance-id*]
   By default, BFD is disabled on the OSPFv3 interface.

Configuring OSPFv3 FRR

About OSPFv3 FRR

A primary link failure can cause packet loss and even a routing loop until OSPFv3 completes routing convergence based on the new network topology. OSPFv3 FRR enables fast rerouting to minimize the failover time.

Figure 1 Network diagram for OSPFv3 FRR



As shown in Figure 1, configure FRR on Router B. OSPFv3 FRR automatically calculates a backup next hop or specifies a backup next hop by using a routing policy. When the primary link fails, OSPFv3 directs packets to the backup next hop. At the same time, OSPFv3 calculates the shortest path based on the new network topology. It forwards packets over the path after network convergence.

You can configure OSPFv3 FRR to calculate a backup next hop by using the loop free alternate (LFA) algorithm, or specify a backup next hop by using a routing policy.

Configuring OSPFv3 FRR to use the LFA algorithm to calculate a backup next hop

Restrictions and guidelines

Do not use the **fast-reroute lfa** command together with the **vlink-peer** command.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA on an interface.
   ospfv3 fast-reroute lfa-backup exclude
   By default, the interface on which LFA is enabled can be selected as a backup interface.
4. Return to system view.
   quit

5. Enter OSPFv3 view.
   ospfv3 [*process-id*]
6. Enable OSPFv3 FRR to use the LFA algorithm to calculate a backup next hop.
   fast-reroute lfa [**abr-only**]
   By default, OSPFv3 FRR is disabled.
   If **abr-only** is specified, the route to the ABR is selected as the backup path.

Configuring OSPFv3 FRR to use a backup next hop in a routing policy

About configuring a backup next hop in a routing policy

Before you perform this task, use the **apply ipv6 fast-reroute backup-interface** command to specify a backup next hop in the routing policy to be used. For more information about the **apply ipv6 fast-reroute backup-interface** command and routing policy configuration, see "Configuring routing policies."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA on an interface.
   ospfv3 fast-reroute lfa-backup exclude
   By default, the interface is enabled with LFA and it can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPFv3 view.
   ospfv3 [*process-id*]
6. Configure OSPFv3 FRR to use a backup next hop in a routing policy.
   fast-reroute route-policy *route-policy-name*
   By default, OSPFv3 FRR is disabled.

Configuring BFD control packet mode for OSPFv3 FRR

About BFD control packet mode for OSPFv3 FRR

By default, OSPFv3 FRR does not use BFD to detect primary link failures. To speed up OSPFv3 convergence, enable BFD control packet mode for OSPFv3 FRR to detect primary link failures. This mode requires BFD configuration on both OSPFv3 routers on the link.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for OSPFv3 FRR.
   ospfv3 primary-path-detect bfd ctrl [**instance** *instance-id*]

By default, BFD control packet mode is disabled for OSPFv3 FRR.

Configuring BFD echo packet mode for OSPFv3 FRR

About BFD echo packet mode for OSPFv3 FRR

By default, OSPFv3 FRR does not use BFD to detect primary link failures. To speed up OSPFv3 convergence, enable BFD echo packet mode for OSPFv3 FRR to detect primary link failures. This mode requires BFD configuration on one OSPFv3 router on the link.

Procedure

1. Enter system view.
   system-view
2. Configure the source IPv6 address of BFD echo packets.
   bfd echo-source-ipv6 *ipv6-address*
   By default, the source IPv6 address of BFD echo packets is not configured.
   The source IPv6 address cannot be on the same network segment as any local interface's IP address.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD echo packet mode for OSPFv3 FRR.
   ospfv3 primary-path-detect bfd echo [**instance** *instance-id*]
   By default, BFD echo packet mode is disabled for OSPFv3 FRR.

Enhancing OSPFv3 security

Configuring OSPFv3 authentication

About OSPFv3 authentication

OSPFv3 uses keychain authentication to prevent routing information from being leaked and routers from being attacked.

OSPFv3 adds the Authentication Trailer option into outgoing packets, and uses the authentication information in the option to authenticate incoming packets. Only packets that pass the authentication can be received. If a packet fails the authentication, the OSPFv3 neighbor relationship cannot be established.

Restrictions and guidelines

The authentication mode specified for an OSPFv3 interface has a higher priority than the mode specified for an OSPFv3 area.

OSPFv3 supports only the HMAC-SHA-256 and HMAC-SM3 authentication algorithms.

The ID of keys used for authentication can only be in the range of 0 to 65535.

Configuring OSPFv3 area authentication

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]

3. Enter OSPFv3 area view.

   area *area-id*

4. Specify an authentication mode for the area.

   authentication-mode keychain *keychain-name*

   By default, no authentication is performed for the area.

   For more information about keychains, see *Security Configuration Guide*.

Configuring OSPFv3 interface authentication

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify an authentication mode for the interface.

   ospfv3 authentication-mode keychain *keychain-name* [**instance** *instance-id*]

   By default, no authentication is performed for the interface.

   For more information about keychains, see *Security Configuration Guide*.

Applying an IPsec profile for authenticating OSPFv3 packets

About IPsec profile for authenticating OSPFv3 packets

To protect routing information and prevent attacks, OSPFv3 can authenticate protocol packets by using an IPsec profile. For more information about IPsec profiles, see *Security Configuration Guide*.

Outbound OSPFv3 packets carry the Security Parameter Index (SPI) defined in the relevant IPsec profile. A device compares the SPI carried in a received packet with the configured IPsec profile. If they match, the device accepts the packet. Otherwise, the device discards the packet and will not establish a neighbor relationship with the sending device.

Restrictions and guidelines for applying an IPsec profile

You can configure an IPsec profile for an area, an interface, or a virtual link.

- To implement area-based IPsec protection, configure the same IPsec profile on the routers in the target area.
- To implement interface-based IPsec protection, configure the same IPsec profile on the interfaces between two neighboring routers.
- To implement virtual link-based IPsec protection, configure the same IPsec profile on the two routers connected over the virtual link.
- If an interface and its area each have an IPsec profile configured, the interface uses its own IPsec profile.
- If a virtual link and area 0 each have an IPsec profile configured, the virtual link uses its own IPsec profile.

Applying an IPsec profile to an area

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Enter OSPFv3 area view.

   area *area-id*

4. Apply an IPsec profile to the area.
   enable ipsec-profile *profile-name*
   By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an IPsec profile to the interface.
   ospfv3 ipsec-profile *profile-name* [**instance** *instance-id*]
   By default, no IPsec profile is applied.

Applying an IPsec profile to a virtual link

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Enter OSPFv3 area view.
   area *area-id*
4. Apply an IPsec profile to a virtual link.
   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | **retransmit** *seconds* | **trans-delay** *seconds*] *
   By default, no IPsec profile is applied.

Configuring OSPFv3 logging and SNMP notifications

Enabling logging for neighbor state changes

About neighbor state change logging

With this feature enabled, the router delivers logs about neighbor state changes to its information center. The information center processes logs according to user-defined output rules (whether to output logs and where to output). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id*]
3. Enable logging for neighbor state changes.
   log-peer-change
   By default, this feature is enabled.

Setting the maximum number of OSPFv3 logs

About OSPFv3 logs

OSPFv3 logs include route calculation logs, neighbor logs, and LSA aging logs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id*]

3. Set the maximum number of OSPFv3 logs.

   event-log { **lsa-flush** | **peer** | **spf** } **size** *count*

   By default, the maximum number of LSA aging logs, neighbor logs, or route calculation logs is 10.

Configuring OSPFv3 network management

About OSPFv3 network management

This task involves the following configurations:

- Bind an OSPFv3 process to MIB so that you can use network management software to manage the specified OSPFv3 process.
- Enable SNMP notifications for OSPFv3 to report important events.
- Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

To report critical OSPFv3 events to an NMS, enable SNMP notifications for OSPFv3. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

The standard OSPFv3 MIB provides only single-instance MIB objects. To identify multiple OSPFv3 processes in the standard OSPFv3 MIB, you must assign a unique context name to each OSPFv3 process.

Context is a method introduced to SNMPv3 for multiple-instance management. For SNMPv1/v2c, you must specify a community name as a context name for protocol identification.

Procedure

1. Enter system view.

   system-view

2. Bind MIB to an OSPFv3 process.

   ospfv3 mib-binding *process-id*

   By default, MIB is bound to the process with the smallest process ID.

3. Enable SNMP notifications for OSPFv3.

   snmp-agent trap enable ospfv3 [**grrestarter-status-change** | **grhelper-status-change** | **if-state-change** | **if-cfg-error** | **if-bad-pkt** | **neighbor-state-change** | **nssatranslator-status-change** | **virtif-bad-pkt** | **virtif-cfg-error** | **virtif-state-change** | **virtgrhelper-status-change** | **virtneighbor-state-change**]*

   By default, SNMP notifications for OSPFv3 are enabled.

4. Enter OSPFv3 view.

ospfv3 [*process-id*]

5. Configure an SNMP context for the OSPFv3 process.

   snmp context-name *context-name*

   By default, no SNMP context is configured for the OSPFv3 process.

6. (Optional.) Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

   snmp trap rate-limit interval *trap-interval* **count** *trap-number*

   By default, OSPFv3 outputs a maximum of seven SNMP notifications within 10 seconds.

Display and maintenance commands for OSPFv3

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display summary route information on the OSPFv3 ABR.	**display ospfv3** [*process-id*] [**area** *area-id*] **abr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 neighbor information.	**display ospfv3** [*process-id*] [**area** *area-id*] **peer** [[*interface-type interface-number*] [**verbose**] | *peer-router-id* | **statistics**]
Display OSPFv3 request list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPFv3 retransmission list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPFv3 topology information.	**display ospfv3** [*process-id*] [**area** *area-id*] **spf-tree** [**verbose**]
Display OSPFv3 process information.	**display ospfv3** [*process-id*] [**verbose**]
Display information about the routes to OSPFv3 ABR and ASBR.	**display ospfv3** [*process-id*] **abr-asbr**
Display summary route information on the OSPFv3 ASBR.	**display ospfv3** [*process-id*] **asbr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 log information.	**display ospfv3** [*process-id*] **event-log** { **lsa-flush** | **peer** | **spf** }
Display OSPFv3 GR information.	**display ospfv3** [*process-id*] **graceful-restart** [**verbose**]
Display OSPFv3 interface information.	**display ospfv3** [*process-id*] **interface** [*interface-type interface-number* | **verbose**]
Display OSPFv3 LSDB information.	**display ospfv3** [*process-id*] **lsdb** [{ **external** | **grace** | **inter-prefix** | **inter-router** | **intra-prefix** | **link** | **network** | **nssa** | **router** | **unknown** [*type*] } [*link-state-id*] [**originate-router** *router-id* | **self-originate**] | **statistics** | **total** | **verbose**]

Task	Command
Display OSPFv3 next hop information.	**display ospfv3** [*process-id*] **nexthop**
Display OSPFv3 NSR information.	**display ospfv3** [*process-id*] **non-stop-routing**
Display OSPFv3 routing information.	**display ospfv3** [*process-id*] **routing** [*ipv6-address prefix-length*]
Display OSPFv3 statistics.	**display ospfv3** [*process-id*] **statistics** [**error**]
Display OSPFv3 virtual link information.	**display ospfv3** [*process-id*] **vlink**
Clear OSPFv3 log information.	**reset ospfv3** [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]
Restart an OSPFv3 process.	**reset ospfv3** [*process-id*] **process** [**graceful-restart**]
Restart OSPFv3 route redistribution.	**reset ospfv3** [*process-id*] **redistribution**
Clear OSPFv3 statistics.	**reset ospfv3** [*process-id*] **statistics**

OSPFv3 configuration examples

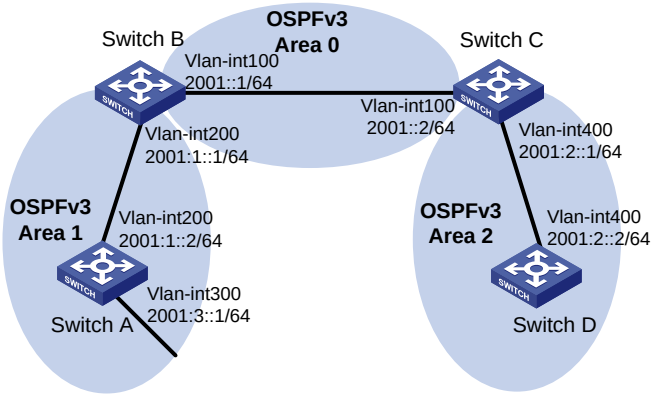
Example: Configuring OSPFv3 stub area

Network configuration

As shown in Figure 2:

- Enable OSPFv3 on all switches.
- Split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 2 as a stub area to reduce LSAs in the area without affecting route reachability.

Figure 2 Network diagram



Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)

2. Configure basic OSPFv3:

On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 300
[SwitchA-Vlan-interface300] ospfv3 1 area 1
[SwitchA-Vlan-interface300] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 1 area 2
[SwitchC-Vlan-interface400] quit
```

On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 400
[SwitchD-Vlan-interface400] ospfv3 1 area 2
[SwitchD-Vlan-interface400] quit
```

Display OSPFv3 neighbors on Switch B.

```
[SwitchB] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 2.2.2.2

 Area: 0.0.0.0
```

```
 Router ID       Pri State            Dead-Time InstID Interface
 3.3.3.3         1   Full/BDR         00:00:40  0      Vlan100

 Area: 0.0.0.1
 Router ID       Pri State            Dead-Time InstID Interface
 1.1.1.1         1   Full/DR          00:00:40  0      Vlan200
```

Display OSPFv3 neighbors on Switch C.

```
[SwitchC] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 3.3.3.3

 Area: 0.0.0.0
 Router ID       Pri State            Dead-Time InstID Interface
 2.2.2.2         1   Full/DR          00:00:40  0      Vlan100

 Area: 0.0.0.2
 Router ID       Pri State            Dead-Time InstID Interface
 4.4.4.4         1   Full/BDR         00:00:40  0      Vlan400
```

Display OSPFv3 routing table information on Switch D.

```
[SwitchD] display ospfv3 routing

              OSPFv3 Process 1 with Router ID 4.4.4.4
 I  - Intra area route,  E1 - Type 1 external route,  N1 - Type 1 NSSA route
 IA - Inter area route,  E2 - Type 2 external route,  N2 - Type 2 NSSA route
 *  - Selected route

*Destination: 2001::/64
  Type       : IA                       Area       : 0.0.0.2

 BkNexthop   : N/A

*Destination: 2001:2::/64
 Type        : I                         Area       : 0.0.0.2
 AdvRouter   : 4.4.4.4                   Preference : 10
 NibID       : 0x23000001                Cost       : 1
 Interface   : Vlan400                   BkInterface: N/A
 Nexthop     : ::
 BkNexthop   : N/A

Total: 2
Intra area: 1         Inter area: 1         ASE: 0         NSSA: 0
```

The output shows that route entries are reduced. All indirect routes are removed, except the default route.

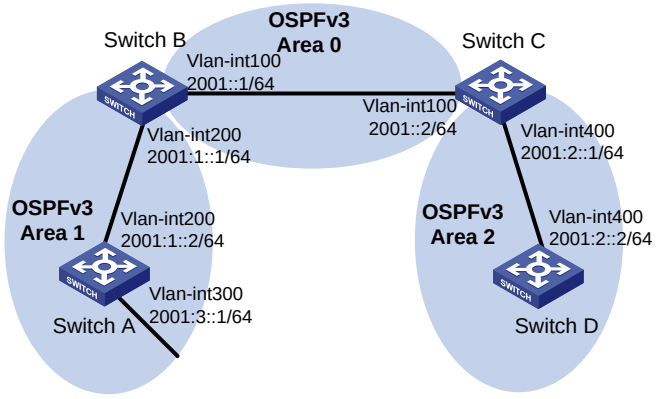
Example: Configuring OSPFv3 NSSA area

Network configuration

As shown in Figure 3:

- Configure OSPFv3 on all switches and split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 1 as an NSSA area and configure Switch A as an ASBR to redistribute static routes into the AS.

Figure 3 Network diagram



Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3 (see "Example: Configuring OSPFv3 stub area").
3. Configure Area 1 as an NSSA area:

   # Configure Switch A.

```
[SwitchA] ospfv3
[SwitchA-ospfv3-1] area 1
[SwitchA-ospfv3-1-area-0.0.0.1] nssa
[SwitchA-ospfv3-1-area-0.0.0.1] quit
```

```
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
[SwitchB] ospfv3
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] nssa
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

Display OSPFv3 routing information on Switch D.

```
[SwitchD] display ospfv3 1 routing

              OSPFv3 Process 1 with Router ID 4.4.4.4
------------------------------------------------------------------------

Total: 5
Intra area: 1         Inter area: 3         ASE: 1         NSSA: 0
```

The output shows an AS external route imported from the NSSA area exists on Switch D.

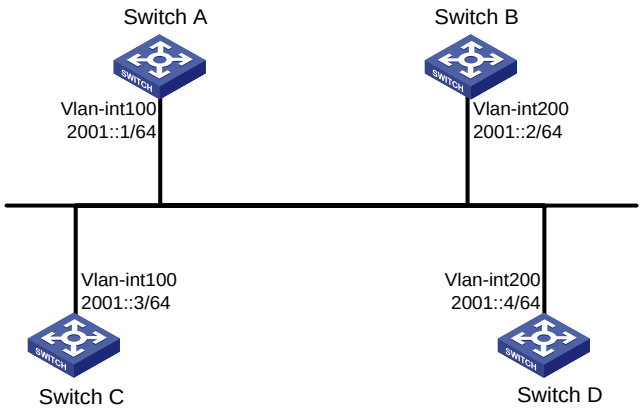
Example: Configuring OSPFv3 DR election

Network configuration

As shown in Figure 4:

- Configure router priority 100 for Switch A, the highest priority on the network, so it will become the DR.
- Configure router priority 2 for Switch C, the second highest priority on the network, so it will become the BDR.
- Configure router priority 0 for Switch B, so it cannot become a DR or BDR.
- Switch D uses the default router priority 1.

Figure 4 Network diagram



Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
```

```
[SwitchA-Vlan-interface100] ospfv3 1 area 0
[SwitchA-Vlan-interface100] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 0
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] ospfv3 1 area 0
[SwitchD-Vlan-interface200] quit
```

Display neighbor information on Switch A. The switches have the same default DR priority 1, so Switch D (the switch with the highest router ID) is elected as the DR, and Switch C is the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         1   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:35  0      Vlan100
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. The neighbor states are all full.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         1   Full/DROther      00:00:30  0      Vlan100
```

```
 2.2.2.2         1   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:31  0      Vlan100
```

3. Configure router priorities for interfaces:

Set the router priority of VLAN-interface 100 to 100 on Switch A.

```
[SwitchA] interface Vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 dr-priority 100
[SwitchA-Vlan-interface100] quit
```

Set the router priority of VLAN-interface 200 to 0 on Switch B.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 dr-priority 0
[SwitchB-Vlan-interface200] quit
```

Set the router priority of VLAN-interface 100 to 2 on Switch C.

```
[SwitchC] interface Vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 dr-priority 2
[SwitchC-Vlan-interface100] quit
```

Display neighbor information on Switch A. Router priorities have been updated, but the DR and BDR are not changed.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         0   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:35  0      Vlan200
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. Switch D is still the DR.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         100 Full/DROther      00:00:30  0      Vlan100
 2.2.2.2         0   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:31  0      Vlan100
```

4. Restart DR and BDR election:

Use the **shutdown** and **undo shutdown** commands on interfaces to restart DR and BDR election. (Details not shown.)

Display neighbor information on Switch A. The output shows that Switch C becomes the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
```

```
 Router ID       Pri State            Dead-Time InstID Interface

 3.3.3.3         2   Full/BDR         00:00:35  0      Vlan100
 4.4.4.4         1   Full/DROther     00:00:33  0      Vlan200
```

Display neighbor information on Switch D.

```
[SwitchD] display ospfv3 peer

             OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
----------------------------------------------------------------------------
 Router ID       Pri State            Dead-Time InstID Interface
 1.1.1.1         100 Full/DR          00:00:30  0      Vlan100
 2.2.2.2         0   2-Way/DROther    00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR         00:00:31  0      Vlan100
```

The output shows that Switch A becomes the DR.

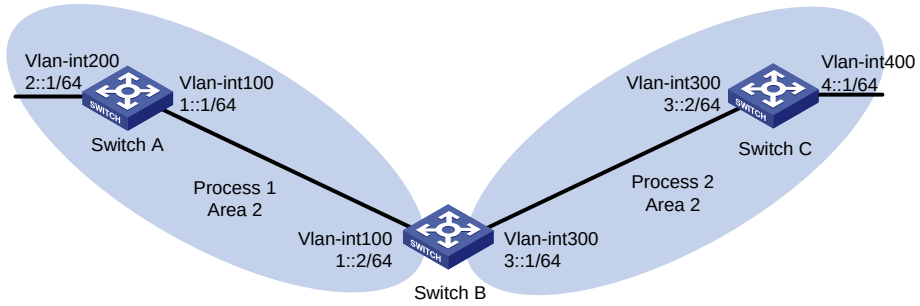
Example: Configuring OSPFv3 route redistribution

Network configuration

As shown in Figure 5:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2.
- Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B, and set the metric for redistributed routes to 3. Switch C can then learn the routes destined for 1::0/64 and 2::0/64, and Switch A cannot learn the routes destined for 3::0/64 or 4::0/64.

Figure 5 Network diagram



Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
```

```
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 7 Routes : 7

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0

Destination: 3::/64                                 Protocol  : Direct
NextHop    : ::                                     Preference: 0
Interface  : Vlan300                                Cost      : 0

Destination: 3::2/128                               Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0

Destination: 4::/64                                 Protocol  : Direct
```

```
NextHop    : ::                                    Preference: 0
Interface  : Vlan400                               Cost      : 0

Destination: 4::1/128                              Protocol  : Direct
NextHop    : ::1                                   Preference: 0
Interface  : InLoop0                               Cost      : 0

Destination: FE80::/10                             Protocol  : Direct
NextHop    : ::                                    Preference: 0
Interface  : NULL0                                 Cost      : 0

Destination: FF00::/8                              Protocol  : Direct
NextHop    : ::                                    Preference: 0
Interface  : NULL0                                 Cost      : 0
```

3. Configure OSPFv3 route redistribution:

Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B, and set the metric for redistributed routes to 3.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] import-route ospfv3 1 cost 3
[SwitchB-ospfv3-2] import-route direct cost 3
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 9 Routes : 9

Destination: ::1/128                               Protocol  : Direct
NextHop    : ::1                                   Preference: 0
Interface  : InLoop0                               Cost      : 0

Destination: 1::/64                                Protocol  : O_ASE2

NextHop    : ::                                     Preference: 0
Interface  : NULL0                                  Cost      : 0
```

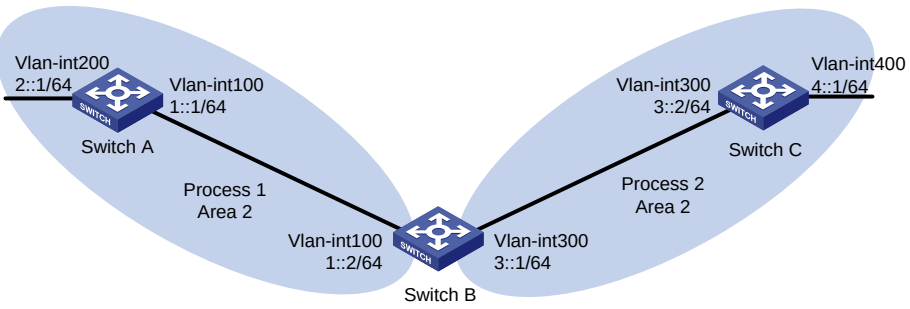
Example: Configuring OSPFv3 route summarization

Network configuration

As shown in Figure 6:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2, respectively.
- On Switch A, configure IPv6 addresses 2:1:1::1/64, 2:1:2::1/64, and 2:1:3::1/64 for VLAN-interface 200.
- On Switch B, configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1. Switch C can then learn the routes destined for 2::/64, 2:1:1::/64, 2:1:2::/64, and 2:1:3::/64.
- On Switch B, configure route summarization to advertise only summary route 2::/16 to Switch C.

Figure 6 Network diagram



Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
```

```
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 2:1:1::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:2::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:3::1 64
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

3. Configure OSPFv3 route redistribution:

Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] import-route ospfv3 1
[SwitchB-ospfv3-2] import-route direct
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 12 Routes : 12

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0
```

```
Destination: 1::/64                                   Protocol  : O_ASE2

Interface  : NULL0                                    Cost      : 0

Destination: FF00::/8                                 Protocol  : Direct
NextHop    : ::                                       Preference: 0
Interface  : NULL0                                    Cost      : 0
```

4. Configure ASBR route summarization:

On Switch B, configure OSPFv3 process 2 to advertise a single route 2::/16.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] asbr-summary 2:: 16
```

```
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 9 Routes : 9

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0

Example: Configuring OSPFv3 GR

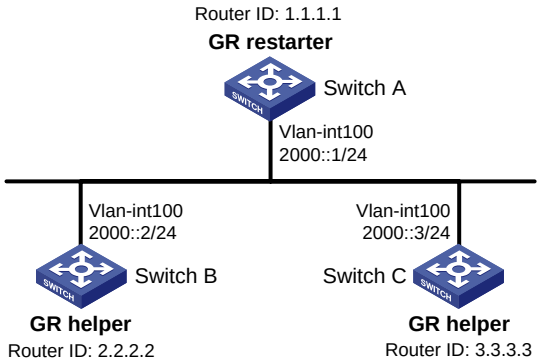
Network configuration

As shown in Figure 7:

- Switch A, Switch B, and Switch C that reside in the same AS and the same OSPFv3 routing domain are GR capable.

- Switch A acts as the GR restarter. Switch B and Switch C act as the GR helpers, and synchronize their LSDBs with Switch A through GR.

Figure 7 Network diagram



Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 process 1, enable GR, and set the router ID to 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3 1
   [SwitchA-ospfv3-1] router-id 1.1.1.1
   [SwitchA-ospfv3-1] graceful-restart enable
   [SwitchA-ospfv3-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ospfv3 1 area 1
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable OSPFv3 and set the router ID to 2.2.2.2. (By default, GR helper is enabled on Switch B.)

   ```
   <SwitchB> system-view
   [SwitchB] ospfv3 1
   [SwitchB-ospfv3-1] router-id 2.2.2.2
   [SwitchB-ospfv3-1] quit
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] ospfv3 1 area 1
   [SwitchB-Vlan-interface100] quit
   ```

   # On Switch C, enable OSPFv3 and set the router ID to 3.3.3.3. (By default, GR helper is enabled on Switch C.)

   ```
   <SwitchC> system-view
   [SwitchC] ospfv3 1
   [SwitchC-ospfv3-1] router-id 3.3.3.3
   [SwitchC-ospfv3-1] quit
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] ospfv3 1 area 1
   [SwitchC-Vlan-interface100] quit
   ```

Verifying the configuration

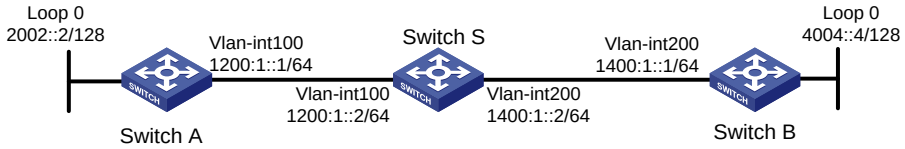
Perform a master/backup switchover on Switch A to trigger an OSPFv3 GR operation. (Details not shown.)

Example: Configuring OSPFv3 NSR

Network configuration

As shown in Figure 8, Switch S, Switch A, and Switch B belong to the same OSPFv3 routing domain. Enable OSPFv3 NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 8 Network diagram



Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch S, Switch A, and Switch B can communicate with each other at Layer 3. (Details not shown.)
3. Configure OSPFv3:

   # On Switch A, enable OSPFv3, and set the router ID to 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 1
[SwitchA-Vlan-interface100] quit
```

   # On Switch B, enable OSPFv3, and set the router ID to 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

   # On Switch S, enable OSPFv3, set the router ID to 3.3.3.3, and enable NSR.

```
<SwitchS> system-view
[SwitchS] ospfv3 1
[SwitchS-ospfv3-1] router-id 3.3.3.3
[SwitchS-ospfv3-1] non-stop-routing
[SwitchS-ospfv3-1] quit
[SwitchS] interface vlan-interface 100
[SwitchS-Vlan-interface100] ospfv3 1 area 1
[SwitchS-Vlan-interface100] quit
[SwitchS] interface vlan-interface 200
[SwitchS-Vlan-interface200] ospfv3 1 area 1
[SwitchS-Vlan-interface200] quit
```

Verifying the configuration

Verify the following:

- When an active/standby switchover occurs on Switch S, the neighbor relationships and routing information on Switch A and Switch B have not changed. (Details not shown.)
- The traffic from Switch A to Switch B has not been impacted. (Details not shown.)

Example: Configuring BFD for OSPFv3

Network configuration

As shown in Figure 9:

- Configure OSPFv3 on Switch A, Switch B and Switch C and configure BFD over the link Switch A<—>L2 Switch<—>Switch B.
- After the link Switch A<—>L2 Switch<—>Switch B fails, BFD can quickly detect the failure and notify OSPFv3 of the failure. Then Switch A and Switch B communicate through Switch C.

Figure 9 Network diagram

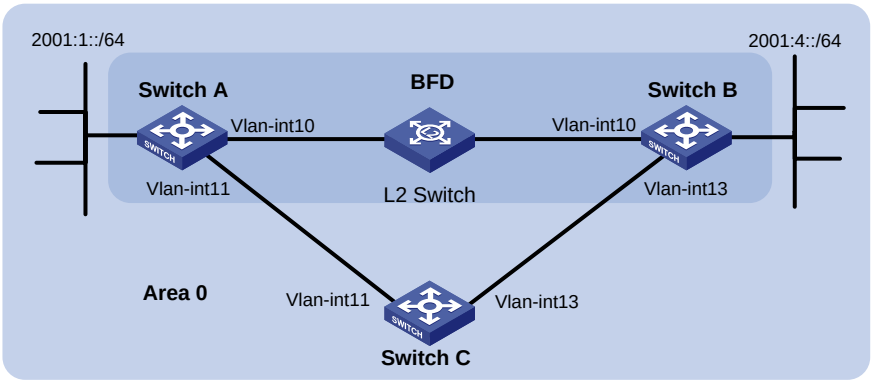


Table 1 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	2001::1/64
Switch A	Vlan-int11	2001:2::1/64
Switch B	Vlan-int10	2001::2/64
Switch B	Vlan-int13	2001:3::2/64
Switch C	Vlan-int11	2001:2::2/64
Switch C	Vlan-int13	2001:3::1/64

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 10
```

```
[SwitchA-Vlan-interface10] ospfv3 1 area 0
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] ospfv3 1 area 0
[SwitchA-Vlan-interface11] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 1 area 0
[SwitchB-Vlan-interface10] quit
[SwitchB] interface vlan-interface 13
[SwitchB-Vlan-interface13] ospfv3 1 area 0
[SwitchB-Vlan-interface13] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 11
[SwitchC-Vlan-interface11] ospfv3 1 area 0
[SwitchC-Vlan-interface11] quit
[SwitchC] interface vlan-interface 13
[SwitchC-Vlan-interface13] ospfv3 1 area 0
[SwitchC-Vlan-interface13] quit
```

3. Configure BFD:

Enable BFD and configure BFD parameters on Switch A.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospfv3 bfd enable
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] return
```

Enable BFD and configure BFD parameters on Switch B.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
```

Verifying the configuration

Display the BFD information on Switch A.

```
<SwitchA> display bfd session
```

```
 Total Session Num: 1           Init Mode: Active

 IPv6 session working in control packet mode:

     Local Discr: 1441               Remote Discr: 1450
       Source IP: FE80::20F:FF:FE00:1202 (link-local address of VLAN-interface 10 on
Switch A)
  Destination IP: FE80::20F:FF:FE00:1200 (link-local address of VLAN-interface 10 on
Switch B)
   Session State: Up                     Interface: Vlan10
       Hold Time: 2319ms
```

Display routes destined for 2001:4::0/64 on Switch A.

```
<SwitchA> display ipv6 routing-table 2001:4::0 64

Summary Count : 1

Destination: 2001:4::/64                              Protocol  : O_INTRA
NextHop    : FE80::20F:FF:FE00:1200                   Preference: 10
Interface  : Vlan10                                   Cost      : 1
```

The output information shows that Switch A communicates with Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display routes to 2001:4::0/64 on Switch A.

```
<SwitchA> display ipv6 routing-table 2001:4::0 64

Summary Count : 1

Destination: 2001:4::/64                              Protocol  : O_INTRA
NextHop    : FE80::BAAF:67FF:FE27:DCD0                Preference: 10
Interface  : Vlan11                                   Cost      : 2
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring OSPFv3 FRR

Network configuration

As shown in Figure 10, Switch A, Switch B, and Switch C reside in the same OSPFv3 domain. Configure OSPFv3 FRR so that when Link A fails, traffic is immediately switched to Link B.

Figure 10 Network diagram

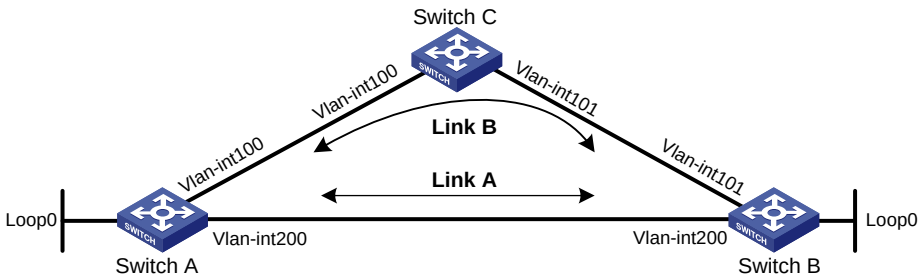

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	1::1/64	Switch B	Vlan-int101	3::1/64
	Vlan-int200	2::1/64		Vlan-int200	2::2/64
	Loop0	10::1/128		Loop0	20::1/128
Switch C	Vlan-int100	1::2/64			
	Vlan-int101	3::2/64			

Procedure

1. Configure IPv6 addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch A, Switch B, and Switch C can communicate with each other at the network layer. (Details not shown.)
3. Configure OSPFv3 FRR to automatically calculate the backup next hop:

   You can enable OSPFv3 FRR to either calculate a backup next hop by using the LFA algorithm, or specify a backup next hop by using a routing policy.

   - (Method 1.) Enable OSPFv3 FRR to calculate the backup next hop by using the LFA algorithm:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ospfv3 1
     [SwitchA-ospfv3-1] fast-reroute lfa
     [SwitchA-ospfv3-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ospfv3 1
     [SwitchB-ospfv3-1] fast-reroute lfa
     [SwitchB-ospfv3-1] quit
     ```

   - (Method 2.) Enable OSPFv3 FRR to designate a backup next hop by using a routing policy:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ipv6 prefix-list abc index 10 permit 20::1 128
     [SwitchA] route-policy frr permit node 10
     [SwitchA-route-policy-frr-10] if-match ipv6 address prefix-list abc
     [SwitchA-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
     vlan-interface 100 backup-nexthop 1::2
     [SwitchA-route-policy-frr-10] quit
     [SwitchA] ospfv3 1
     [SwitchA-ospfv3-1] fast-reroute route-policy frr
     [SwitchA-ospfv3-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ipv6 prefix-list abc index 10 permit 10::1 128
     [SwitchB] route-policy frr permit node 10
     [SwitchB-route-policy-frr-10] if-match ipv6 address prefix-list abc
     ```

```
[SwitchB-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 101 backup-nexthop 3::2
[SwitchB-route-policy-frr-10] quit
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] fast-reroute route-policy frr
[SwitchB-ospfv3-1] quit
```

Verifying the configuration

Display the route 20::1/128 on Switch A to view the backup next hop information.

```
[SwitchA] display ipv6 routing-table 20::1 128 verbose

Summary count : 1

Destination: 20::1/128
