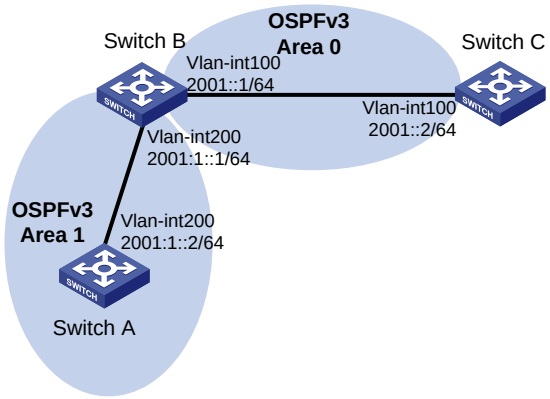
Example: Configuring OSPFv3 IPsec profile

Network configuration

As shown in Figure 11, all switches run OSPFv3, and the AS is divided into two areas.

Configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 11 Network diagram



Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3 basic features:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
```

```
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

3. Configure OSPFv3 IPsec profiles:

- On Switch A:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchA] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchA-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchA-ipsec-transform-set-trans] protocol esp
  [SwitchA-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchA-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchA-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchA] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchA-ipsec-profile-manual-profile001] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa spi outbound esp 123456
  [SwitchA-ipsec-profile-manual-profile001] sa spi inbound esp 123456
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa string-key outbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] sa string-key inbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] quit
  ```

- On Switch B:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchB] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchB-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchB-ipsec-transform-set-trans] protocol esp
  [SwitchB-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchB-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchB-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchB] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchB-ipsec-profile-manual-profile001] transform-set trans
  ```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-manual-profile001] sa spi outbound esp 123456
[SwitchB-ipsec-profile-manual-profile001] sa spi inbound esp 123456
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-manual-profile001] sa string-key outbound esp simple
abcdefg
[SwitchB-ipsec-profile-manual-profile001] sa string-key inbound esp simple
abcdefg
[SwitchB-ipsec-profile-manual-profile001] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchB] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchB-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchB-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchB-ipsec-profile-manual-profile001] sa string-key inbound esp simple byebye
[SwitchB-ipsec-profile-manual-profile001] quit
```

- On Switch C:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchC] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchC-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchC-ipsec-transform-set-trans] protocol esp
  [SwitchC-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchC-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchC-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile002**.

  ```
  [SwitchC] ipsec profile profile002 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchC-ipsec-profile-manual-profile002] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchC-ipsec-profile-manual-profile002] sa spi outbound esp 256
  [SwitchC-ipsec-profile-manual-profile002] sa spi inbound esp 256
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchC-ipsec-profile-manual-profile002] sa string-key outbound esp simple
  byebye
  [SwitchC-ipsec-profile-manual-profile001] sa string-key inbound esp simple byebye
  [SwitchC-ipsec-profile-manual-profile001] quit
  ```

4. Apply the IPsec profiles to areas:

Configure Switch A.

```
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] area 1
```

```
[SwitchA-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchA-ospfv3-1-area-0.0.0.1] quit
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] area 0
[SwitchB-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchB-ospfv3-1-area-0.0.0.0] quit
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

Configure Switch C.

```
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] area 0
[SwitchC-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchC-ospfv3-1-area-0.0.0.0] quit
[SwitchC-ospfv3-1] quit
```

Verifying the configuration

Verify that OSPFv3 packets between Switches A, B, and C are protected by IPsec. (Details not shown.)

Contents

Configuring IPv6 PBR

About IPv6 PBR

IPv6 policy-based routing (PBR) uses user-defined policies to route IPv6 packets. A policy can specify parameters for packets that match specific criteria such as ACLs. The parameters include the next hop.

IPv6 packet forwarding process

A device forwards received IPv6 packets using the following process:

1. The device uses PBR to forward matching packets.
2. If one of the following events occurs, the device searches for a route (except the default route) in the routing table to forward packets:
   - The packets do not match the PBR policy.
   - The PBR-based forwarding fails.
3. If the forwarding fails, the device uses the default route to forward packets.

IPv6 PBR types

IPv6 PBR includes the following types:

- **Local PBR**—Guides the forwarding of locally generated packets, such as the ICMP packets generated by using the **`ping`** command.
- **Interface PBR**—Guides the forwarding of packets received on an interface only.

Policy

An IPv6 policy includes match criteria and actions to be taken on the matching packets. A policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.
- A node has a match mode of **permit** or **deny**.

An IPv6 policy compares packets with nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup for the packet.

Relationship between if-match clauses

IPv6 PBR supports only the **`if-match acl`** clause to set an ACL match criterion. On a node, you can specify only one **`if-match`** clause.

Relationship between apply clauses

IPv6 PBR supports only the **`apply next-hop`** clause to set next hops.

Relationship between the match mode and clauses on the node

Does a packet match all the if-match clauses on the node?	Match mode	
	In permit mode	**In deny mode**
Yes	• If the node contains **apply** clauses, IPv6 PBR executes the **apply** clauses on the node. ○ If IPv6 PBR-based forwarding succeeds, IPv6 PBR does not compare the packet with the next node. • If the node does not contain **apply** clauses, the device performs a routing table lookup for the packet.	The device performs a routing table lookup for the packet.
No	IPv6 PBR compares the packet with the next node.	IPv6 PBR compares the packet with the next node.

NOTE:

A node that has no **if-match** clauses matches any packet.

IPv6 PBR and Track

IPv6 PBR can work with the Track feature to dynamically adapt the availability status of an **apply** clause to the link status of a tracked object. The tracked object can be a next hop.

- When the track entry associated with an object changes to **Negative**, the **apply** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **apply** clause is valid.

For more information about Track and IPv6 PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: IPv6 PBR configuration

If the device performs forwarding in software, IPv6 PBR does not process IP packets destined for the local device.

If the device performs forwarding in hardware and a packet destined for it matches an IPv6 PBR policy, IPv6 PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure an IPv6 PBR policy, be careful to avoid this situation.

IPv6 PBR tasks at a glance

To configure IPv6 PBR, perform the following tasks:

1. Configuring an IPv6 policy
   a. Creating an IPv6 node
   b. Setting match criteria for an IPv6 node

c. Configuring actions for an IPv6 node

2. Specifying a policy for IPv6 PBR

   Choose the following tasks as needed:

   - Specifying an IPv6 policy for IPv6 local PBR
   - Specifying an IPv6 policy for IPv6 interface PBR

Configuring an IPv6 policy

Creating an IPv6 node

1. Enter system view.

   system-view

2. Create an IPv6 policy or policy node and enter its view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. (Optional.) Configure a description for the IPv6 policy node.

   description *text*

   By default, no description is configured for an IPv6 policy node.

Setting match criteria for an IPv6 node

1. Enter system view.

   system-view

2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Set match criteria.

   - Set an ACL match criterion.

     if-match acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }

     By default, no ACL match criterion is set.

     The ACL match criterion cannot match Layer 2 information.

     When using the ACL to match packets, IPv6 PBR ignores the action (**permit** or **deny**) and time range settings in the ACL.

Configuring actions for an IPv6 node

About apply clauses

IPv6 PBR supports only the **apply next-hop** clause to set next hops for matching packets.

Restrictions and guidelines for action configuration

If you specify a next hop or default next hop, IPv6 PBR periodically performs a lookup in the FIB table to determine its availability. Temporary service interruption might occur if IPv6 PBR does not update the route immediately after its availability status changes.

Configuring actions for a node

1. Enter system view.

   system-view

2. Enter IPv6 policy node view.

ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Configure actions for a node.
   - Set next hops for permitted IPv6 packets.

     apply next-hop { *ipv6-address* [**direct**] [**track** *track-entry-number*] } &<1-2>

     By default, no next hops are specified.

     You can specify multiple next hops for backup in one command line or by executing this command multiple times. You can specify a maximum of two next hops for a node.

Specifying a policy for IPv6 PBR

Specifying an IPv6 policy for IPv6 local PBR

About IPv6 local PBR

Perform this task to specify an IPv6 policy for IPv6 local PBR to guide the forwarding of locally generated packets.

Restrictions and guidelines

You can specify only one policy for IPv6 local PBR and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy.

IPv6 local PBR might affect local services, such as ping and Telnet. When you use IPv6 local PBR, make sure you fully understand its impact on local services of the device.

Procedure

1. Enter system view.

   system-view

2. Specify an IPv6 policy for IPv6 local PBR.

   ipv6 local policy-based-route *policy-name*

   By default, IPv6 local PBR is not enabled.

Specifying an IPv6 policy for IPv6 interface PBR

About interface PBR

Perform this task to apply an IPv6 policy to an interface to guide the forwarding of packets received on the interface only.

Restrictions and guidelines

You can apply only one policy to an interface and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy from the interface.

You can apply a policy to multiple interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify an IPv6 policy for IPv6 interface PBR.

   ipv6 policy-based-route *policy-name*

By default, no IPv6 policy is applied to the interface.

Display and maintenance commands for IPv6 PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PBR policy information.	**display ipv6 policy-based-route** [**policy** *policy-name*]
Display IPv6 interface PBR configuration and statistics.	**display ipv6 policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display IPv6 local PBR configuration and statistics.	**display ipv6 policy-based-route local** [**slot** *slot-number*]
Display IPv6 PBR configuration.	**display ipv6 policy-based-route setup**
Clear IPv6 PBR statistics.	**reset ipv6 policy-based-route statistics** [**policy** *policy-name*]

IPv6 PBR configuration examples

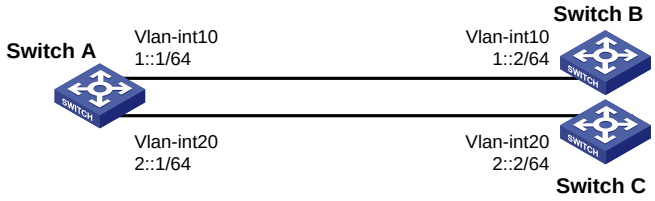
Example: Configuring packet type-based IPv6 local PBR

Network configuration

As shown in Figure 1, Switch B and Switch C are connected through Switch A. Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets to the next hop 1::2 (Switch B).

Figure 1 Network diagram



Procedure

1. Configure Switch A:

Create VLAN 10 and VLAN 20.

```
<SwitchA> system-view
[SwitchA] vlan 10
[SwitchA-vlan10] quit
[SwitchA] vlan 20
[SwitchA-vlan20] quit
```

Configure the IPv6 addresses of VLAN-interface 10 and VLAN-interface 20.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 1::1 64
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 2::1 64
[SwitchA-Vlan-interface20] quit
```

Configure ACL 3001 to match TCP packets.

```
[SwitchA] acl ipv6 advanced 3001
[SwitchA-acl-ipv6-adv-3001] rule permit tcp
[SwitchA-acl-ipv6-adv-3001] quit
```

Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

```
[SwitchA] ipv6 policy-based-route aaa permit node 5
[SwitchA-pbr6-aaa-5] if-match acl 3001
[SwitchA-pbr6-aaa-5] apply next-hop 1::2
[SwitchA-pbr6-aaa-5] quit
```

Configure IPv6 local PBR by applying policy **aaa** to Switch A.

```
[SwitchA] ipv6 local policy-based-route aaa
```

2. Configure Switch B:

Create VLAN 10.

```
<SwitchB> system-view
[SwitchB] vlan 10
[SwitchB-vlan10] quit
```

Configure the IPv6 address of VLAN-interface 10.

```
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ipv6 address 1::2 64
```

3. Configure Switch C:

Create VLAN 20.

```
<SwitchC> system-view
[SwitchC] vlan 20
[SwitchC-vlan20] quit
```

Configure the IPv6 address of VLAN-interface 20.

```
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ipv6 address 2::2 64
```

Verifying the configuration

1. Perform telnet operations to verify that IPv6 local PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Switch A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Switch A. (Details not shown.)
2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Switch A. (Details not shown.)

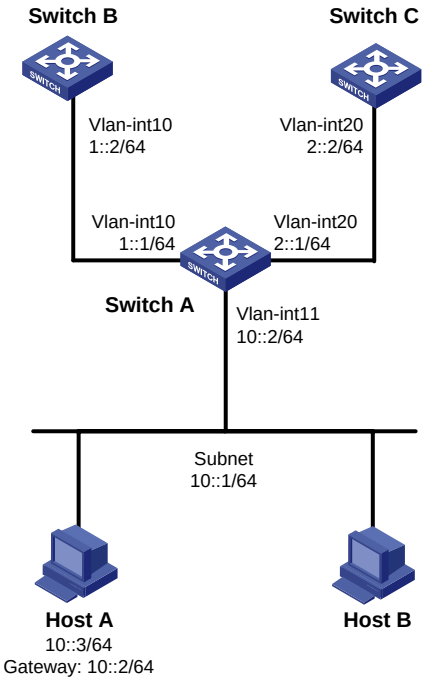
Example: Configuring packet type-based IPv6 interface PBR

Network configuration

As shown in Figure 2, Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets received on VLAN-interface 11 to the next hop 1::2 (Switch B).

Figure 2 Network diagram



Procedure

1. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   [SwitchA] vlan 20
   [SwitchA-vlan20] quit
   ```

   # Configure RIPng.

```
[SwitchA] ripng 1
[SwitchA-ripng-1] quit
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 1::1 64
[SwitchA-Vlan-interface10] ripng 1 enable
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 2::1 64
[SwitchA-Vlan-interface20] ripng 1 enable
[SwitchA-Vlan-interface20] quit
```

Configure ACL 3001 to match TCP packets.

```
[SwitchA] acl ipv6 advanced 3001
[SwitchA-acl-ipv6-adv-3001] rule permit tcp
[SwitchA-acl-ipv6-adv-3001] quit
```

Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

```
[SwitchA] ipv6 policy-based-route aaa permit node 5
[SwitchA-pbr6-aaa-5] if-match acl 3001
[SwitchA-pbr6-aaa-5] apply next-hop 1::2
[SwitchA-pbr6-aaa-5] quit
```

Configure IPv6 interface PBR by applying policy **aaa** to VLAN-interface 11.

```
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] ipv6 address 10::2 64
[SwitchA-Vlan-interface11] undo ipv6 nd ra halt
[SwitchA-Vlan-interface11] ripng 1 enable
[SwitchA-Vlan-interface11] ipv6 policy-based-route aaa
```

2. Configure Switch B:

Create VLAN 10.

```
<SwitchB> system-view
[SwitchB] vlan 10
[SwitchB-vlan10] quit
```

Configure RIPng.

```
[SwitchB] ripng 1
[SwitchB-ripng-1] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ipv6 address 1::2 64
[SwitchB-Vlan-interface10] ripng 1 enable
[SwitchB-Vlan-interface10] quit
```

3. Configure Switch C:

Create VLAN 20.

```
<SwitchC> system-view
[SwitchC] vlan 20
[SwitchC-vlan20] quit
```

Configure RIPng.

```
[SwitchC] ripng 1
[SwitchC-ripng-1] quit
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ipv6 address 2::2 64
```

```
[SwitchC-Vlan-interface20] ripng 1 enable
[SwitchC-Vlan-interface20] quit
```

Verifying the configuration

1. Enable IPv6 and configure the IPv6 address 10::3 for Host A.

```
C:\>ipv6 install
Installing...
Succeeded.
C:\>ipv6 adu 4/10::3
```

2. Perform telnet operations to verify that IPv6 interface PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Host A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Host A. (Details not shown.)

3. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Host A. (Details not shown.)

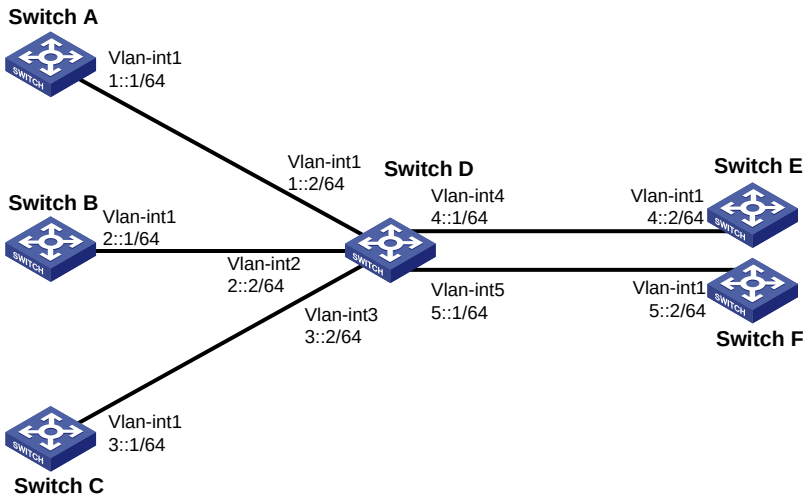
Example: Configuring packet type-based IPv6 global PBR

Network configuration

As shown in Figure 3, Switch E and Switch F do not have a route to reach each other.

Configure IPv6 global PBR on Switch D to forward TCP packets to the next hop 4::2 (Switch E).

Figure 3 Network diagram



Procedure

1. Configure IPv6 addresses for the interfaces. Make sure Switch A, B and C can communicate with Switch E and Switch F, respectively. (Details not shown.)
2. Configure Switch D:

   # Configure IPv6 ACL 3101 to match TCP packets sourced from networks 1::0/64, 2::0/64, and 3::0/64.

```
<SwitchD> system-view
[SwitchD] acl ipv6 advanced 3101
[SwitchD-acl-ipv6-adv-3101] rule permit tcp source 1::0 64
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 2::0 64
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 3::0 64
```

```
[SwitchD-acl-ipv4-adv-3101] quit
```

Configure node 5 in IPv6 PBR policy **aaa** to forward TCP packets that match ACL 3101 to next hop 4::2.

```
[SwitchD] ipv6 policy-based-route aaa permit node 5
[SwitchD-pbr6-aaa-5] if-match acl 3101
[SwitchD-pbr6-aaa-5] apply next-hop 4::2
[SwitchD-pbr6-aaa-5] quit
```

Specify IPv6 PBR policy **aaa** as the IPv6 global PBR policy.

```
[SwitchD] ipv6 global policy-based-route aaa
```

Verifying the configuration

1. Perform telnet operations to verify that IPv6 global PBR on Switch D operates as configured to forward the matching TCP packets to the next hop 4::2 (Switch E), as follows:

   # Verify that you can telnet to Switch E from Switch A, Switch B, and Switch C successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch F from Switch A, Switch B, or Switch C. (Details not shown.)

2. Verify that Switch D forwards packets other than TCP packets as long as a route is available. For example, verify that you can ping Switch F from Switch A, Switch B, and Switch C. (Details not shown.)

Contents

Configuring routing policies

About routing policies

Routing policies control routing paths by filtering and modifying routing information.

Routing policies can filter advertised, received, and redistributed routes, and modify attributes for specific routes.

Implementation of a routing policy

To configure a routing policy:

1. Configure filters based on route attributes.
2. Create a routing policy and apply filters to the routing policy.

Filters

Routing policies can use the following filters to match routes.

ACL

An ACL can match the destination or next hop of routes.

For more information about ACLs, see *ACL and QoS Configuration Guide*.

IP prefix list

An IP prefix list matches the destination address of routes.

An IP prefix list can contain multiple items that specify prefix ranges. Each destination IP address prefix of a route is compared with these items in ascending order of their index numbers. A prefix matches the IP prefix list if it matches one item in the list.

Routing policy

A routing policy can contain multiple nodes, which are in a logical OR relationship. A node with a smaller number is matched first. A route matches the routing policy if it matches one node (except the node configured with the **continue** clause) in the routing policy.

Each node has a match mode of **permit** or **deny**.

- **permit**—Specifies the **permit** match mode for a routing policy node. If a route meets all the **if-match** clauses of the node, it is handled by the **apply** clauses of the node. The route is not compared with the next node unless the **continue** clause is configured. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.
- **deny**—Specifies the **deny** match mode for a routing policy node. The **apply** and **continue** clauses of a deny node are never executed. If a route meets all the **if-match** clauses of the node, it is denied without being compared with the next node. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.

A node can contain a set of **if-match**, **apply**, and **continue** clauses.

- **if-match** clauses—Specify the match criteria that match the attributes of routes. The **if-match** clauses are in a logical AND relationship. A route must meet all the **if-match** clauses to match the node.
- **apply** clauses—Specify the actions to be taken on permitted routes, such as modifying a route attribute.

- **continue** clause—Specifies the next node. A route that matches the current node (permit node) must match the specified next node in the same routing policy. The **continue** clause combines the **if-match** and **apply** clauses of the two nodes to improve flexibility of the routing policy. After you configure a **continue** clause, a route can pass the routing policy even if it does not match the specified next node. To reject such a route, add a **deny** node without clauses.

Follow these guidelines when you configure **if-match**, **apply**, and **continue** clauses:

- If you only want to filter routes, do not configure **apply** clauses.
- If you do not configure any **if-match** clauses for a permit node, the node will permit all routes.
- Configure a permit node containing no **if-match** or **apply** clauses following multiple deny nodes to allow unmatched routes to pass.

Routing policy tasks at a glance

To configure a routing policy, perform the following tasks:

1. (Optional.) Configure filters:
   - Configuring an IPv4 prefix list
   - Configuring an IPv6 prefix list
2. Configuring a routing policy:
   a. Creating a routing policy
   b. Configuring if-match clauses
   c. Configuring apply clauses
   d. Configuring the continue clause

Configuring an IPv4 prefix list

Restrictions and guidelines

If all the items are set to **deny** mode, no routes can pass the IPv4 prefix list. To permit unmatched IPv4 routes, you must configure the **permit** 0.0.0.0 0 **less-equal** 32 item following multiple **deny** items.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv4 prefix list.

   ip prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

Configuring an IPv6 prefix list

Restrictions and guidelines

If all items are set to **deny** mode, no routes can pass the IPv6 prefix list. To permit unmatched IPv6 routes, you must configure the **permit** :: 0 **less-equal** 128 item following multiple **deny** items.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv6 prefix list.

   ipv6 prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ipv6-address* { **inverse** *inverse-prefix-length* | *prefix-length* [**greater-equal** *min-prefix-length*] [**less-equal** *max-prefix-length*] }

Configuring a routing policy

Creating a routing policy

About creating a routing policy

A routing policy must have a minimum of one permit node. If all the nodes are in **deny** mode, no routes can pass the routing policy.

Procedure

1. Enter system view.

   system-view

2. Create a routing policy and a node, and enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

Configuring if-match clauses

About if-match clause configuration

You can either specify no **if-match** clauses or multiple **if-match** clauses for a routing policy node. If no **if-match** clause is specified for a permit node, all routes can pass the node. If no **if-match** clause is specified for a deny node, no routes can pass the node.

Restrictions and guidelines

When you configure **if-match** clauses, follow these restrictions and guidelines:

- The **if-match** clauses of a routing policy node have a logical AND relationship. A route must meet all **if-match** clauses before it can be executed by the **apply** clauses of the node. If an **if-match** command exceeds the maximum length, multiple **if-match** clauses of the same type are generated. These clauses have a logical OR relationship. A route only needs to meet one of them.
- All IPv4 routes match a node if the **if-match** clauses of the node use only IPv6 ACLs. All IPv6 routes match a node if the **if-match** clauses of the node use only IPv4 ACLs.
- If the ACL used by an **if-match** clause does not exist, the clause is always matched. If no rules of the specified ACL are matched or the match rules are inactive, the clause is not matched.
- If the prefix list, community list, or extended community list used by an **if-match** clause does not exist, the clause is always matched. If no rules of the specified prefix list, community list, or extended community list are matched, the clause is not matched.

Procedure

1. Enter system view.

   system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Match routes whose destination, next hop, or source address matches an ACL or prefix list.

   IPv4:

if-match ip { **address** | **next-hop** | **route-source** } { **acl** *ipv4-acl-number* | **prefix-list** *prefix-list-name* }

IPv6:

if-match ipv6 { **address** | **next-hop** | **route-source** } { **acl** *ipv6-acl-number* | **prefix-list** *prefix-list-name* }

By default, no ACL or prefix list match criterion is configured.

4. Configure route match criteria.
   - Match routes having the specified cost.
     if-match cost *cost-value*
   - Match routes having the specified output interface.
     if-match interface { *interface-type interface-number* }&<1-16>
   - Match routes having the specified route type.
     if-match route-type { **external-type1** | **external-type1or2** | **external-type2** | **internal** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2** } *
   - Match IGP routes having the specified tag value.
     if-match tag *tag-value*

   By default, no route match criteria are configured.

Configuring apply clauses

1. Enter system view.
   system-view
2. Enter routing policy node view.
   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*
3. Configure the route cost and cost type.
   - Set a cost for routes.
     apply cost [**+** | **-**] *cost-value*
     By default, no cost is set for routes.
   - Set a cost type for routes.
     apply cost-type { **type-1** | **type-2** }
     By default, no cost type is set for routes.
4. Set the next hop for routes.
   IPv4:
   apply ip-address next-hop *ip-address* [**public**]
   IPv6:
   apply ipv6 next-hop *ipv6-address*
   By default, no next hop is set for routes.
   The configuration does not apply to redistributed routes.
5. Configure route priorities.
   - Set an IP precedence for matching routes.
     apply ip-precedence { *value* | **clear** }
     By default, no IP precedence is set.
   - Set a preference.
     apply preference *preference*

By default, no preference is set.

- Set a prefix priority.

  apply prefix-priority { **critical** | **high** | **medium** }

  By default, the prefix priority is low.

6. Set a tag value for IGP routes.

   apply tag *tag-value*

   By default, no tag value is set for IGP routes.

7. Set a backup link for fast reroute (FRR).

   IPv4:

   apply fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ip-address*] | **backup-nexthop** *ip-address* }

   IPv6:

   apply ipv6 fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ipv6-address*] | **backup-nexthop** *ipv6-address* }

   By default, no backup link is set for FRR.

Configuring the continue clause

Restrictions and guidelines

When you configure the **continue** clause to combine multiple nodes, follow these restrictions and guidelines:

- If you configure an **apply** clause that sets different attribute values on all the nodes, the **apply** clause of the node configured most recently takes effect.
- If you configure the following **apply** clauses on all the nodes, the **apply** clause of each node takes effect:
  - **apply as-path** without the **replace** keyword.
  - **apply cost** with the **+** or **–** keyword.
  - **apply community** with the **additive** keyword.
  - **apply extcommunity** with the **additive** keyword.
- The **apply comm-list delete** clause configured on the current node cannot delete the community attributes set by the **apply community** clauses of the preceding nodes.

Procedure

1. Enter system view.

   system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Specify the next node to be matched.

   continue [*node-number*]

   By default, no continue clause is configured.

   The specified next node must have a larger number than the current node.

Configuring the routing policy change delay timer

About the routing policy change delay timer

This feature makes a routing policy take effect after a delayed time interval, which prevents incomplete routing policy configuration from being issued to cause incorrect route advertisement. The system automatically starts the timer when a routing policy changes. The changes will not take effect on the policy until the change delay timer expires.

A routing policy changes when one of the following events occurs:

- A routing policy is created.
- A routing policy node, **if-match** clause, or **apply** clause is added, modified, or deleted for a routing policy.
- An IPv4 prefix list, IPv6 prefix list, AS path list, community list, extended community list, or MAC list is added, modified, or deleted.
- The ACL used by an **if-match** clause changes.

Procedure

1. Enter system view.

   system-view

2. Set the routing policy change delay timer.

   route-policy-change delay-time { *time-value* | **unlimited** }

   By default, routing policy changes immediately take effect, but the routing protocol waits five seconds before processing routes from the new routing policy.

   When the delay timer expires, the routing protocol waits five seconds before processing routes from the new routing policy.

Display and maintenance commands for routing policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv4 prefix list statistics.	**display ip prefix-list** [**name** *prefix-list-name*]
Display IPv6 prefix list statistics.	**display ipv6 prefix-list** [**name** *prefix-list-name*]
Display routing policy information.	**display route-policy** [**name** *route-policy-name*]
Clear IPv4 prefix list statistics.	**reset ip prefix-list** [*prefix-list-name*]
Clear IPv6 prefix list statistics.	**reset ipv6 prefix-list** [*prefix-list-name*]

Routing policy configuration examples

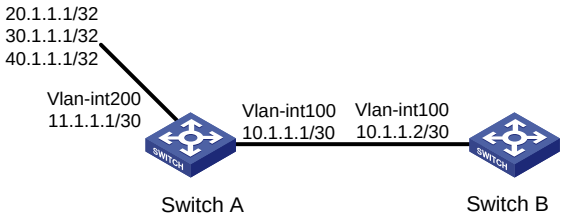
Example: Configuring a routing policy for redistributing static routes to RIP

Network configuration

As shown in Figure 1, Switch A exchanges routing information with Switch B by using RIP.

On Switch A, configure three static routes. Use a routing policy to configure Switch B to redistribute networks 20.1.1.1/32 and 40.1.1.1/32 and block network 30.1.1.1/32.

Figure 1 Network diagram



Procedure

1. Configure Switch A:

   # Configure IP addresses for interfaces VLAN-interface 100 and VLAN-interface 200.

   ```
   <SwitchA> system-view
   [SwitchA] interface vlan-interface 100
   [SwitchA-vlan-interface100] ip address 10.1.1.1 30
   [SwitchA-vlan-interface100] quit
   [SwitchA] interface vlan-interface 200
   [SwitchA-vlan-interface200] ip address 11.1.1.1 30
   [SwitchA-vlan-interface200] quit
   ```

   # Enable RIP on interface VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-vlan-interface100] rip 1 enable
   [SwitchA-vlan-interface100] quit
   ```

   # Configure three static routes and set the next hop of the three routes to 11.1.1.2.

   ```
   [SwitchA] ip route-static 20.1.1.1 32 11.1.1.2
   [SwitchA] ip route-static 30.1.1.1 32 11.1.1.2
   [SwitchA] ip route-static 40.1.1.1 32 11.1.1.2
   ```

   # Configure a routing policy.

   ```
   [SwitchA] ip prefix-list a index 10 permit 30.1.1.1 32
   [SwitchA] route-policy static2rip deny node 0
   [SwitchA-route-policy-static2rip-0] if-match ip address prefix-list a
   [SwitchA-route-policy-static2rip-0] quit
   [SwitchA] route-policy static2rip permit node 10
   [SwitchA-route-policy-static2rip-10] quit
   ```

   # Enable RIP and apply routing policy **static2rip** to filter redistributed static routes.

   ```
   [SwitchA] rip
   [SwitchA-rip-1] import-route static route-policy static2rip
   ```

2. Configure Switch B:

   # Configure an IP address for interface VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-vlan-interface100] ip address 10.1.1.2 30
```

   # Enable RIP.

```
[SwitchB] rip
[SwitchB-rip-1] quit
```

   # Enable RIP on the interface.

```
[SwitchB] interface vlan-interface 100
[SwitchB-vlan-interface100] rip 1 enable
[SwitchB-vlan-interface100] quit
```

Verifying the configuration

Display the routing table information on Switch B.

```
<SwitchB> display ip routing-table

Destinations : 14       Routes : 14

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.1.1.0/30        Direct  0   0           10.1.1.2        Vlan100

224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop
```

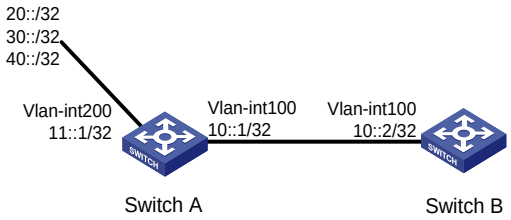
Example: Configuring a routing policy for IPv6 route redistribution

Network configuration

As shown in Figure 2:

- Run RIPng on Switch A and Switch B.
- Configure three static routes on Switch A.
- On Switch A, apply a routing policy to redistribute static routes 20::/32 and 40::/32 and deny route 30::/32.

Figure 2 Network diagram



Procedure

1. Configure Switch A:

Configure IPv6 addresses for VLAN-interface 100 and VLAN-interface 200.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 address 10::1 32
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 11::1 32
[SwitchA-Vlan-interface200] quit
```

Enable RIPng on VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
```

Configure three static routes with next hop 11::2, and make sure the static routes are active.

```
[SwitchA] ipv6 route-static 20:: 32 11::2
[SwitchA] ipv6 route-static 30:: 32 11::2
[SwitchA] ipv6 route-static 40:: 32 11::2
```

Configure a routing policy.

```
[SwitchA] ipv6 prefix-list a index 10 permit 30:: 32
[SwitchA] route-policy static2ripng deny node 0
[SwitchA-route-policy-static2ripng-0] if-match ipv6 address prefix-list a
[SwitchA-route-policy-static2ripng-0] quit
[SwitchA] route-policy static2ripng permit node 10
[SwitchA-route-policy-static2ripng-10] quit
```

Enable RIPng and apply the routing policy to static route redistribution.

```
[SwitchA] ripng
[SwitchA-ripng-1] import-route static route-policy static2ripng
```

2. Configure Switch B:

Configure the IPv6 address for VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ipv6 address 10::2 32
```

Enable RIPng.

```
[SwitchB] ripng
[SwitchB-ripng-1] quit
```

Enable RIPng on VLAN-interface 100.

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
```

```
    [SwitchB-Vlan-interface100] quit
```

Verifying the configuration

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect
 ----------------------------------------------------------------

 Peer FE80::7D58:0:CA03:1 on Vlan-interface 100
 Destination 20::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 8 secs
 Destination 40::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 3 secs
 Local route
 Destination 10::/32,
     via ::, cost 0, tag 0, DOF
```

IP Multicast Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

Preface

This configuration guide describes IP multicast fundamentals and configuration procedures. It covers the IPv4 multicast configuration and IPv6 multicast configuration. With multicast, you can implement efficient point-to-multipoint data transmission in your network.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** >

Convention	Description
	Folder.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
ⓘ **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Multicast overview

Introduction to multicast

As a technique that coexists with unicast and broadcast, the multicast technique effectively addresses the issue of point-to-multipoint data transmission. By enabling high-efficiency point-to-multipoint data transmission over a network, multicast greatly saves network bandwidth and reduces network load.

By using multicast technology, a network operator can easily provide bandwidth-critical and time-critical information services. These services include live webcasting, Web TV, distance learning, telemedicine, Web radio, and real-time video conferencing.

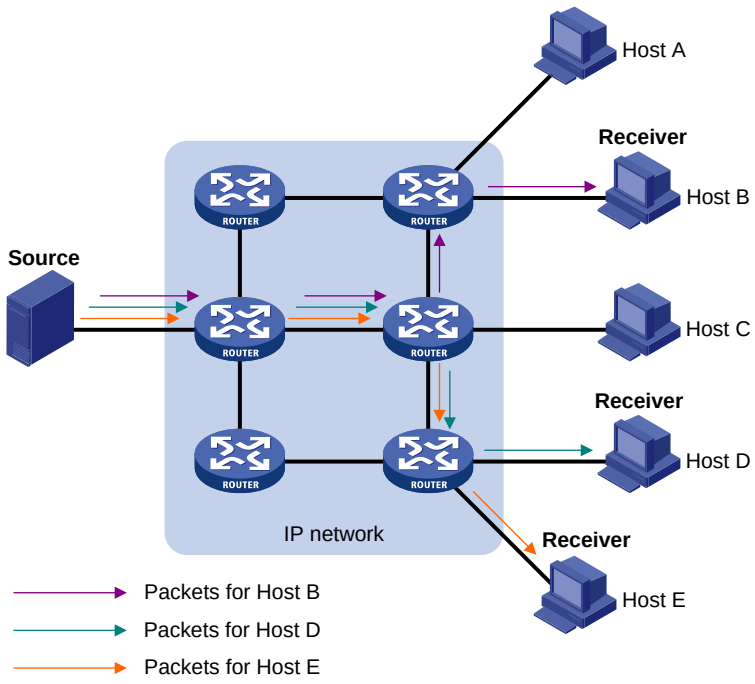
Information transmission techniques

The information transmission techniques include unicast, broadcast, and multicast.

Unicast

In unicast transmission, the information source must send a separate copy of information to each host that needs the information.

Figure 1 Unicast transmission



In Figure 1, Host B, Host D, and Host E need the information. A separate transmission channel must be established from the information source to each of these hosts.

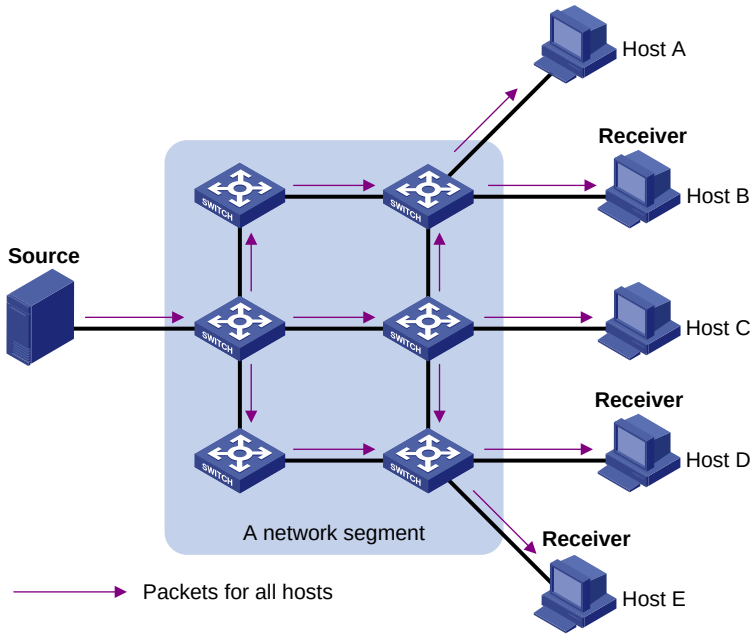
In unicast transmission, the traffic transmitted over the network is proportional to the number of hosts that need the information. If a large number of hosts need the information, the information source must send a separate copy of the same information to each of these hosts. Sending many copies can place a tremendous pressure on the information source and the network bandwidth.

Unicast is not suitable for batch transmission of information.

Broadcast

In broadcast transmission, the information source sends information to all hosts on the subnet, even if some hosts do not need the information.

Figure 2 Broadcast transmission



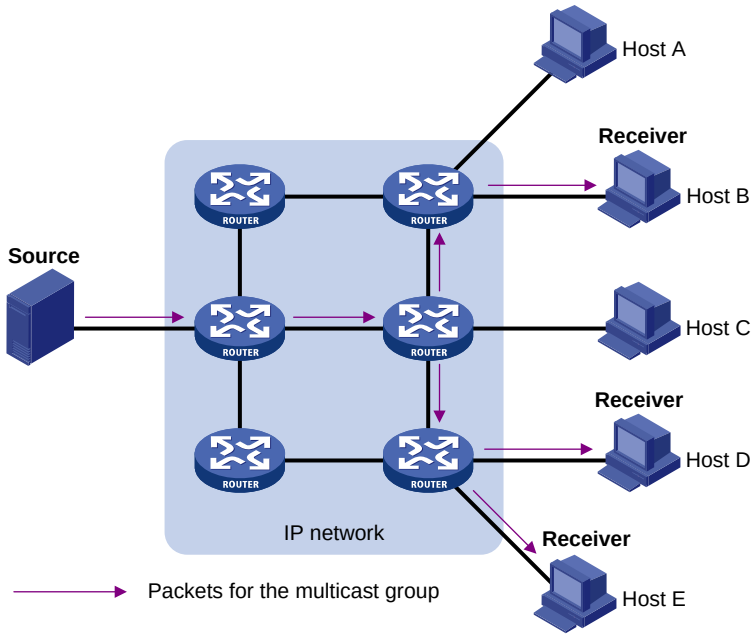
In Figure 2, only Host B, Host D, and Host E need the information. If the information is broadcast to the subnet, Host A and Host C also receive it. In addition to information security issues, broadcasting to hosts that do not need the information also causes traffic flooding on the same subnet.

Broadcast is disadvantageous in transmitting data to specific hosts. Moreover, broadcast transmission is a significant waste of network resources.

Multicast

Multicast provides point-to-multipoint data transmissions with the minimum network consumption. When some hosts on the network need multicast information, the information sender, or multicast source, sends only one copy of the information. Multicast distribution trees are built through multicast routing protocols, and the packets are replicated only on nodes where the trees branch.

Figure 3 Multicast transmission



In Figure 3, the multicast source sends only one copy of the information to a multicast group. Host B, Host D, and Host E, which are information receivers, must join the multicast group. The routers on the network duplicate and forward the information based on the distribution of the group members. Finally, the information is correctly delivered to Host B, Host D, and Host E.

To summarize, multicast has the following advantages:

- **Advantages over unicast**—Multicast data is replicated and distributed until it flows to the farthest-possible node from the source. The increase of receiver hosts will not remarkably increase the load of the source or the usage of network resources.
- **Advantages over broadcast**—Multicast data is sent only to the receivers that need it. This saves network bandwidth and enhances network security. In addition, multicast data is not confined to the same subnet.

Multicast features

- A multicast group is a multicast receiver set identified by an IP multicast address. Hosts must join a multicast group to become members of the multicast group before they receive the multicast data addressed to that multicast group. Typically, a multicast source does not need to join a multicast group.
- A multicast source is an information sender. It can send data to multiple multicast groups at the same time. Multiple multicast sources can send data to the same multicast group at the same time.
- The group memberships are dynamic. Hosts can join or leave multicast groups at any time. Multicast groups are not subject to geographic restrictions.
- Multicast routers or Layer 3 multicast devices are routers or Layer 3 switches that support Layer 3 multicast. They provide multicast routing and manage multicast group memberships on stub subnets with attached group members. A multicast router itself can be a multicast group member.

For a better understanding of the multicast concept, you can compare multicast transmission to the transmission of TV programs.

Table 1 Comparing TV program transmission and multicast transmission

TV program transmission	Multicast transmission
A TV station transmits a TV program through a channel.	A multicast source sends multicast data to a multicast group.
A user tunes the TV set to the channel.	A receiver joins the multicast group.
The user starts to watch the TV program transmitted by the TV station on the channel.	The receiver starts to receive the multicast data sent by the source to the multicast group.
The user turns off the TV set or tunes to another channel.	The receiver leaves the multicast group or joins another group.

Multicast benefits and applications

Multicast benefits

- **Enhanced efficiency**—Reduces the processor load of information source servers and network devices.
- **Optimal performance**—Reduces redundant traffic.
- **Distributed application**—Enables point-to-multipoint applications at the price of minimum network resources.

Multicast applications

- Multimedia and streaming applications, such as Web TV, Web radio, and real-time video/audio conferencing
- Communication for training and cooperative operations, such as distance learning and telemedicine
- Data warehouse and financial applications (stock quotes)
- Any other point-to-multipoint application for data distribution

Multicast models

Based on how the receivers treat the multicast sources, the multicast models include any-source multicast (ASM), source-filtered multicast (SFM), and source-specific multicast (SSM).

ASM model

In the ASM model, any multicast sources can send information to a multicast group. Receivers can join a multicast group and get multicast information addressed to that multicast group from any multicast sources. In this model, receivers do not know the positions of the multicast sources in advance.

SFM model

The SFM model is derived from the ASM model. To a multicast source, the two models appear to have the same multicast membership architecture.

The SFM model functionally extends the ASM model. The upper-layer software checks the source address of received multicast packets and permits or denies multicast traffic from specific sources.

The receivers obtain the multicast data from only part of the multicast sources. To a receiver, multicast sources are not all valid, but are filtered.

SSM model

The SSM model provides a transmission service that enables multicast receivers to specify the multicast sources in which they are interested.

In the SSM model, receivers have already determined the locations of the multicast sources. This is the main difference between the SSM model and the ASM model. In addition, the SSM model uses a different multicast address range than the ASM/SFM model. Dedicated multicast forwarding paths are established between receivers and the specified multicast sources.

Multicast addresses

IP multicast addresses

IPv4 multicast addresses

IANA assigned the Class D address block (224.0.0.0 to 239.255.255.255) to IPv4 multicast.

Table 2 Class D IP address blocks and description

Address block	Description
224.0.0.0 to 224.0.0.255	Reserved permanent group addresses. The IP address 224.0.0.0 is reserved. Other IP addresses can be used by routing protocols and for topology searching, protocol maintenance, and so on. Table 3 lists common permanent group addresses. A packet destined for an address in this block will not be forwarded beyond the local subnet regardless of the TTL value in the IP header.
224.0.1.0 to 238.255.255.255	Globally scoped group addresses. This block includes the following types of designated group addresses: • **232.0.0.0/8**—SSM group addresses. • **233.0.0.0/8**—Glop group addresses.
239.0.0.0 to 239.255.255.255	Administratively scoped multicast addresses. These addresses are considered locally unique rather than globally unique. You can reuse them in domains administered by different organizations without causing conflicts. For more information, see RFC 2365.

NOTE:

Glop is a mechanism for assigning multicast addresses between different ASs. By filling an AS number into the middle two bytes of 233.0.0.0, you get 255 multicast addresses for that AS. For more information, see RFC 2770.

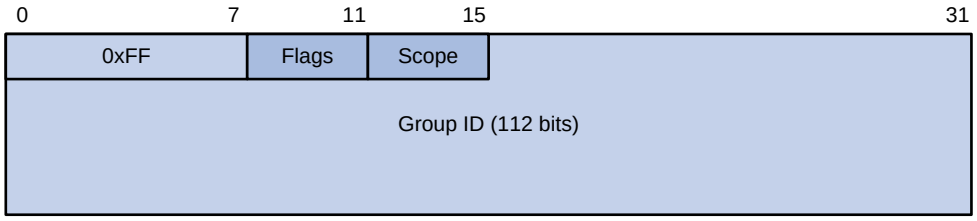
Table 3 Common permanent multicast group addresses

Address	Description
224.0.0.1	All systems on this subnet, including hosts and routers.
224.0.0.2	All multicast routers on this subnet.
224.0.0.3	Unassigned.
224.0.0.4	DVMRP routers.
224.0.0.5	OSPF routers.

Address	Description
224.0.0.6	OSPF designated routers and backup designated routers.
224.0.0.7	Shared Tree (ST) routers.
224.0.0.8	ST hosts.
224.0.0.9	RIPv2 routers.
224.0.0.11	Mobile agents.
224.0.0.12	DHCP server/relay agent.
224.0.0.13	All Protocol Independent Multicast (PIM) routers.
224.0.0.14	RSVP encapsulation.
224.0.0.15	All Core-Based Tree (CBT) routers.
224.0.0.16	Designated SBM.
224.0.0.17	All SBMs.
224.0.0.18	VRRP.

IPv6 multicast addresses

Figure 4 IPv6 multicast format



The following describes the fields of an IPv6 multicast address:

- **0xFF**—The most significant eight bits are 11111111.
- **Flags**—The Flags field contains four bits.

  Figure 5 Flags field format

  
  Table 4 Flags field description

Bit	Description
0	Reserved, set to 0.
R	• When set to 0, this address is an IPv6 multicast address without an embedded RP address. • When set to 1, this address is an IPv6 multicast address with an embedded RP address. (The P and T bits must also be set to 1.)
P	• When set to 0, this address is an IPv6 multicast address not based on a unicast prefix. • When set to 1, this address is an IPv6 multicast address based on a unicast prefix. (The T bit must also be set to 1.)

Bit	Description
T	• When set to 0, this address is an IPv6 multicast address permanently-assigned by IANA. • When set to 1, this address is a transient or dynamically assigned IPv6 multicast address.

- **Scope**—The Scope field contains four bits, which represent the scope of the IPv6 internetwork for which the multicast traffic is intended.

  Table 5 Values of the Scope field

Value	Meaning
0, F	Reserved.
1	Interface-local scope.
2	Link-local scope.
3	Subnet-local scope.
4	Admin-local scope.
5	Site-local scope.
6, 7, 9 through D	Unassigned.
8	Organization-local scope.
E	Global scope.

- **Group ID**—The Group ID field contains 112 bits. It uniquely identifies an IPv6 multicast group in the scope that the Scope field defines.

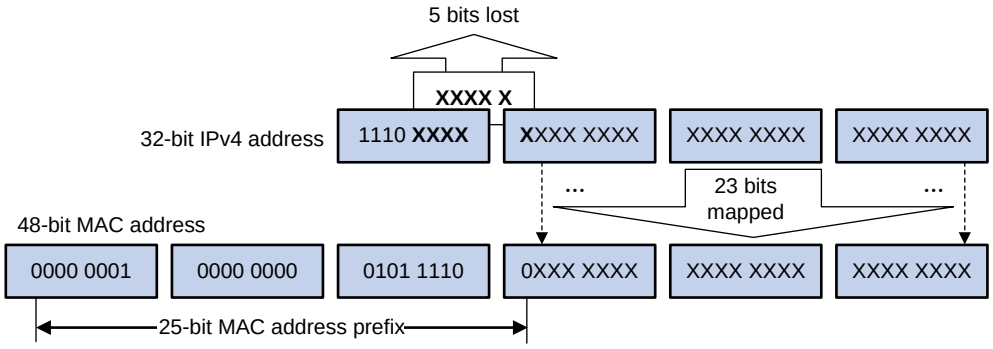
Ethernet multicast MAC addresses

An Ethernet multicast MAC address identifies receivers that belong to the same multicast group at the data link layer.

IPv4 multicast MAC addresses

As defined by IANA, the most significant 24 bits of an IPv4 multicast MAC address are 0x01005E. Bit 25 is 0, and the other 23 bits are the least significant 23 bits of an IPv4 multicast address.

Figure 6 IPv4-to-MAC address mapping

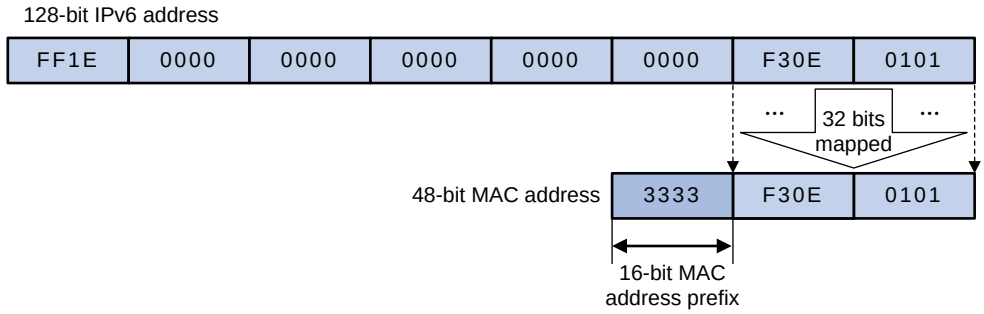


The most significant four bits of an IPv4 multicast address are fixed at 1110. In an IPv4-to-MAC address mapping, five bits of the IPv4 multicast address are lost. As a result, 32 IPv4 multicast addresses are mapped to the same IPv4 multicast MAC address. A device might receive unwanted multicast data at Layer 2 processing, which needs to be filtered by the upper layer.

IPv6 multicast MAC addresses

As defined by IANA, the most significant 16 bits of an IPv6 multicast MAC address are 0x3333. The least significant 32 bits are mapped from the least significant 32 bits of an IPv6 multicast address. Therefore, the problem of duplicate IPv6-to-MAC address mapping also arises like IPv4-to-MAC address mapping.

Figure 7 IPv6-to-MAC address mapping



Multicast protocols

Multicast protocols include the following categories:

- Layer 3 and Layer 2 multicast protocols:
  - Layer 3 multicast refers to IP multicast operating at the network layer.

    Layer 3 multicast protocols—IGMP, MLD, PIM, IPv6 PIM, MSDP, MBGP, and IPv6 MBGP.
  - Layer 2 multicast refers to IP multicast operating at the data link layer.

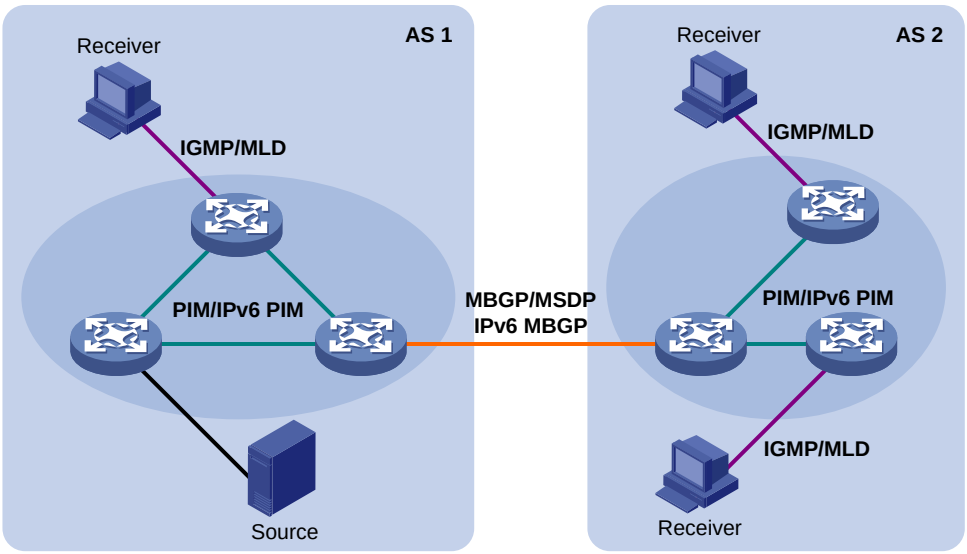
    Layer 2 multicast protocols—IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.
- IPv4 and IPv6 multicast protocols:
  - **For IPv4 networks**—IGMP snooping, PIM snooping, multicast VLAN, IGMP, PIM, MSDP, and MBGP.
  - **For IPv6 networks**—MLD snooping, IPv6 PIM snooping, IPv6 multicast VLAN, MLD, IPv6 PIM, and IPv6 MBGP.

This section provides only general descriptions about applications and functions of the Layer 2 and Layer 3 multicast protocols in a network. For more information about these protocols, see the related chapters.

Layer 3 multicast protocols

In Figure 8, Layer 3 multicast protocols include multicast group management protocols and multicast routing protocols.

Figure 8 Positions of Layer 3 multicast protocols



- Multicast group management protocols:

  Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) protocol are multicast group management protocols. Typically, they run between hosts and Layer 3 multicast devices that directly connect to the hosts to establish and maintain multicast group memberships.

- Multicast routing protocols:

  A multicast routing protocol runs on Layer 3 multicast devices to establish and maintain multicast routes and correctly and efficiently forward multicast packets. Multicast routes constitute loop-free data transmission paths (also known as multicast distribution trees) from a data source to multiple receivers.

  In the ASM model, multicast routes include intra-domain routes and inter-domain routes.

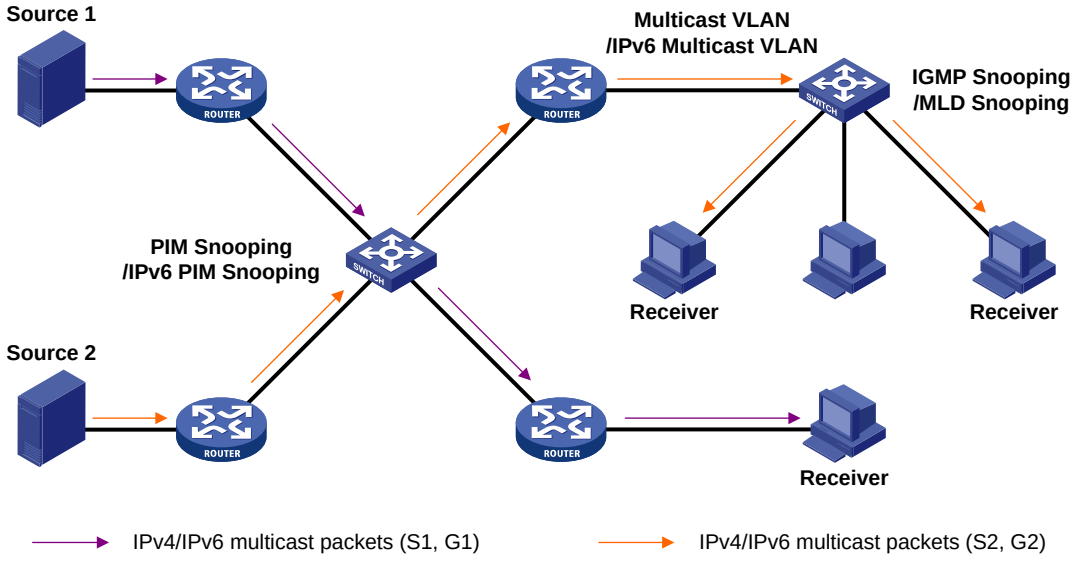
  - An intra-domain multicast routing protocol discovers multicast sources and builds multicast distribution trees within an AS to deliver multicast data to receivers. Among a variety of mature intra-domain multicast routing protocols, PIM is most widely used. Based on the forwarding mechanism, PIM has dense mode (often referred to as PIM-DM) and sparse mode (often referred to as PIM-SM).
  - An inter-domain multicast routing protocol is used for delivering multicast information between two ASs. So far, mature solutions include Multicast Source Discovery Protocol (MSDP) and MBGP. MSDP propagates multicast source information among different ASs. MBGP is an extension of the MP-BGP for exchanging multicast routing information among different ASs.

  For the SSM model, multicast routes are not divided into intra-domain routes and inter-domain routes. Because receivers know the positions of the multicast sources, channels established through PIM-SM are sufficient for the transport of multicast information.

Layer 2 multicast protocols

In Figure 9, Layer 2 multicast protocols include IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.

Figure 9 Positions of Layer 2 multicast protocols



- IGMP snooping and MLD snooping:

  IGMP snooping and MLD snooping are multicast constraining mechanisms that run on Layer 2 devices. They manage and control multicast groups by monitoring and analyzing IGMP or MLD messages exchanged between the hosts and Layer 3 multicast devices. This effectively controls the flooding of multicast data in Layer 2 networks.

- PIM snooping and IPv6 PIM snooping:

  PIM snooping and IPv6 PIM snooping run on Layer 2 devices. They work with IGMP snooping or MLD snooping to analyze received PIM messages. Then, they add the ports that are interested in specific multicast data to a PIM snooping routing entry or IPv6 PIM snooping routing entry. In this way, multicast data can be forwarded to only the ports that are interested in the data.

- Multicast VLAN and IPv6 multicast VLAN:

  Multicast VLAN or IPv6 multicast VLAN runs on a Layer 2 device in a multicast network where multicast receivers for the same group exist in different VLANs. With these protocols, the Layer 3 multicast device sends only one copy of multicast to the multicast VLAN or IPv6 multicast VLAN on the Layer 2 device. This method avoids waste of network bandwidth and extra burden on the Layer 3 device.

Multicast packet forwarding mechanism

In a multicast model, receiver hosts of a multicast group are usually located at different areas on the network. They are identified by the same multicast group address. To deliver multicast packets to these receivers, a multicast source encapsulates the multicast data in an IP packet with the multicast group address as the destination address. Multicast routers on the forwarding paths forward multicast packets that an incoming interface receives through multiple outgoing interfaces. Compared to a unicast model, a multicast model is more complex in the following aspects:

- To ensure multicast packet transmission on the network, different routing tables are used to guide multicast forwarding. These routing tables include unicast routing tables, routing tables for multicast (for example, the MBGP routing table), and static multicast routing tables.
- To process the same multicast information from different peers received on different interfaces, the multicast device performs an RPF check on each multicast packet. The RPF check result determines whether the packet will be forwarded or discarded. The RPF check mechanism is the basis for most multicast routing protocols to implement multicast forwarding.

For more information about the RPF mechanism, see "Configuring multicast routing and forwarding" and "Configuring IPv6 multicast routing and forwarding."

IP multicast architecture

IP multicast addresses the following issues:

- Where should the multicast source transmit information to? (Multicast addressing.)
- What receivers exist on the network? (Host registration.)
- Where is the multicast source that will provide data to the receivers? (Multicast source discovery.)
- How is the information transmitted to the receivers? (Multicast routing.)

IP multicast is an end-to-end service. The multicast architecture involves the following parts:

- **Addressing mechanism**—A multicast source sends information to a group of receivers through a multicast address.
- **Host registration**—Receiver hosts can join and leave multicast groups dynamically. This mechanism is the basis for management of group memberships.
- **Multicast routing**—A multicast distribution tree (a forwarding path tree for multicast data on the network) is constructed for delivering multicast data from a multicast source to receivers.
- **Multicast applications**—A software system that supports multicast applications, such as video conferencing, must be installed on multicast sources and receiver hosts. The TCP/IP stack must support reception and transmission of multicast data.

Common notations in multicast

The following notations are commonly used in multicast transmission:

- **(*, G)**—Rendezvous point tree (RPT), or a multicast packet that any multicast source sends to multicast group G. The asterisk (*) represents any multicast source, and "G" represents a specific multicast group.
- **(S, G)**—Shortest path tree (SPT), or a multicast packet that multicast source "S" sends to multicast group "G." "S" represents a specific multicast source, and "G" represents a specific multicast group.

Contents

Configuring IGMP snooping

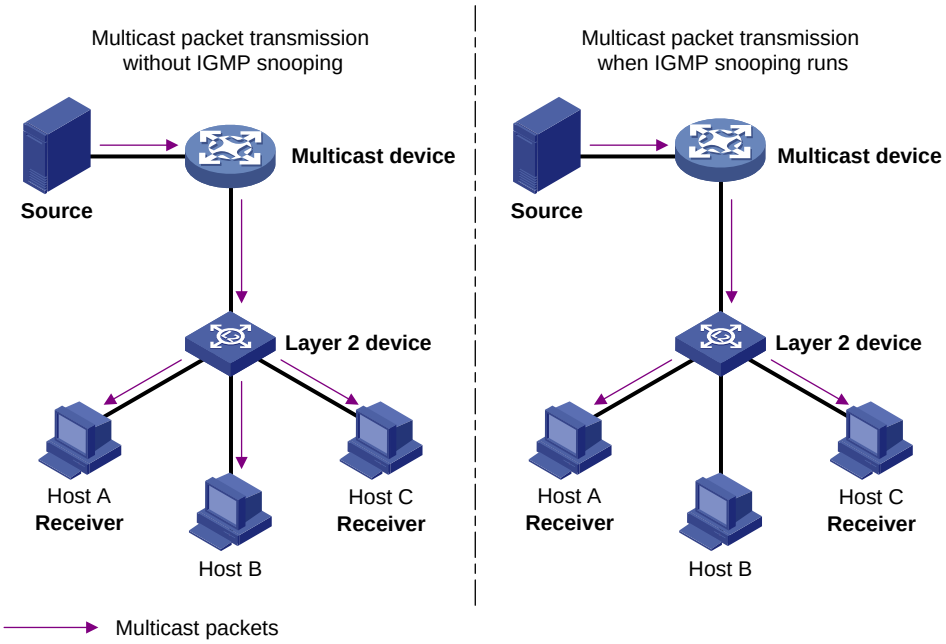
About IGMP snooping

IGMP snooping runs on a Layer 2 device as a multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from IGMP packets that are exchanged between the hosts and the Layer 3 device.

Fundamentals of IGMP snooping

As shown in Figure 1, when IGMP snooping is not enabled, the Layer 2 switch floods multicast packets to all hosts in a VLAN. When IGMP snooping is enabled, the Layer 2 switch forwards multicast packets of known multicast groups to only the receivers.

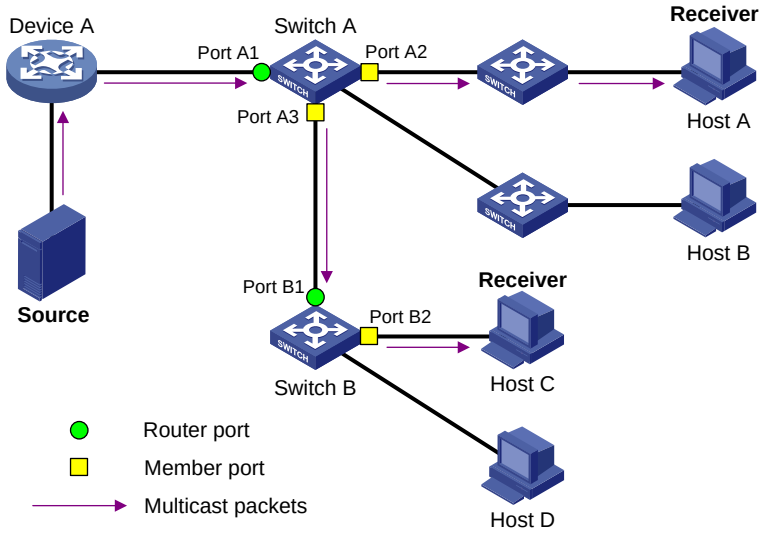
Figure 1 Multicast packet transmission without and with IGMP snooping



IGMP snooping ports

As shown in Figure 2, IGMP snooping runs on Switch A and Switch B, and Host A and Host C are receivers in a multicast group. IGMP snooping ports are divided into member ports and router ports.

Figure 2 IGMP snooping ports



Router ports

On an IGMP snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an IGMP general query whose source address is not 0.0.0.0 or receives a PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives either of the messages before the timer expires, the timer is reset. If the port does not receive either of the messages when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in IGMP snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in IGMP snooping is a Layer 2 interface.

Member ports

On an IGMP snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an IGMP report, it is added to the associated dynamic IGMP snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an IGMP report before the timer expires, the timer is reset. If the port does not receive an IGMP report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static IGMP snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How IGMP snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

IGMP messages types include general query, IGMP report, and leave message. An IGMP snooping-enabled Layer 2 device performs differently depending on the message types.

General query

The IGMP querier periodically sends IGMP general queries to all hosts and devices on the local subnet to check for the existence of multicast group members.

After receiving an IGMP general query, the Layer 2 device forwards the query to all ports in the VLAN except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

IGMP report

A host sends an IGMP report to the IGMP querier for the following purposes:

- Responds to queries if the host is a multicast group member.
- Applies for a multicast group membership.

After receiving an IGMP report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN. It also resolves the address of the reported multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an IGMP report through a non-router port because of the host IGMP report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their IGMP reports upon receiving IGMP reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port.

Leave message

An IGMPv1 receiver host does not send any leave messages when it leaves a multicast group. The Layer 2 device cannot immediately update the status of the port that connects to the receiver host. The Layer 2 device does not remove the port from the outgoing interface list in the associated forwarding entry until the aging time for the group expires.

An IGMPv2 or IGMPv3 host sends an IGMP leave message when it leaves a multicast group.

When the Layer 2 device receives an IGMP leave message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the group address in the message.

- If no match is found, the Layer 2 device discards the IGMP leave message.
- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the IGMP leave message.

- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Discards the IGMP leave message.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.
- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the IGMP leave message to all router ports in the VLAN.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.

After receiving the IGMP leave message on a port, the IGMP querier resolves the multicast group address in the message. Then, it sends an IGMP group-specific query to the multicast group through the receiving port.

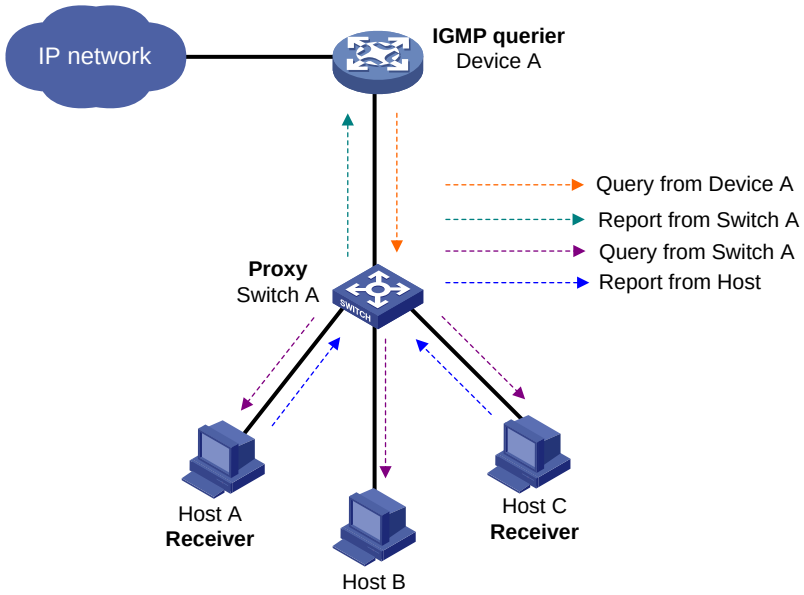
After receiving the IGMP group-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN. Then, it waits for the responding IGMP report from the directly connected hosts. For the dynamic member port that received the leave message, the Layer 2 device also performs one of the following actions:

- If the port receives an IGMP report before the aging timer expires, the Layer 2 device resets the aging timer.
- If the port does not receive an IGMP report when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the multicast group.

IGMP snooping proxying

As shown in Figure 3, to reduce the number of IGMP report and leave messages received by the upstream device, you can enable IGMP snooping proxying on the edge device. With IGMP snooping proxying enabled, the edge device acts as a host for the upstream IGMP snooping querier to send IGMP report and leave messages to Device A. The host IGMP report suppression mechanism on the edge device does not take effect.

Figure 3 IGMP snooping proxying



The IGMP snooping proxy device processes different IGMP messages as follows:

- General query.

  After receiving an IGMP general query, the device forwards the query to all ports in the VLAN except the receiving port. The device also generates an IGMP report based on the local membership information and sends the report to all router ports.

- Group-specific query or group-and-source-specific query.

  After receiving an IGMP group-specific query or group-and-source-specific query, the device forwards the query to all ports in the VLAN except the receiving port. If the forwarding entry has a member port, the device sends a report to all router ports in the VLAN.

- Report.

  After receiving an IGMP report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Leave message.

  After receiving the IGMP leave message on a port, the device sends an IGMP group-specific query through the receiving port. The device sends the IGMP leave message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: IGMP snooping configuration

For IGMP reports received from secondary VLANs, the associated IGMP snooping forwarding entries are maintained by the primary VLAN. Therefore, you need to enable IGMP snooping only for the primary VLAN. The IGMP snooping configuration made in secondary VLANs does not take effect. For more information about primary VLANs and secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

The IGMP snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in IGMP-snooping view. The configuration made in VLAN view and the configuration made in IGMP-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in IGMP-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in IGMP-snooping view. The interface-specific configuration takes priority over the configuration made in IGMP-snooping view.

VLAN-based IGMP snooping tasks at a glance

To configure IGMP snooping for VLANs, perform the following tasks:

1. Enabling the IGMP snooping feature
2. Enabling IGMP snooping

   Choose the following tasks as needed:
   - Enabling IGMP snooping globally
   - Enabling IGMP snooping for VLANs
3. (Optional.) Configuring basic IGMP snooping features
   - Specifying an IGMP snooping version
   - Setting the maximum number of IGMP snooping forwarding entries
   - Configuring static multicast MAC address entries
   - Setting the IGMP last member query interval
4. (Optional.) Configuring IGMP snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
5. (Optional.) Configuring the IGMP snooping querier
   - Enabling the IGMP snooping querier
   - Enabling IGMP snooping querier election
   - Configuring parameters for IGMP general queries and responses
6. (Optional.) Enabling IGMP snooping proxying
7. (Optional.) Configuring parameters for IGMP messages
   - Configuring source IP addresses for IGMP messages
   - Setting the 802.1p priority for IGMP messages
8. (Optional.) Configuring IGMP snooping policies
   - Configuring a multicast group policy
   - Enabling multicast source port filtering
   - Enabling dropping unknown multicast data
   - Enabling IGMP report suppression
   - Setting the maximum number of multicast groups on a port
   - Enabling multicast group replacement
   - Enabling host tracking
   - Configuring an IGMP snooping access control policy
9. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets

Enabling the IGMP snooping feature

About enabling the IGMP snooping feature

You must enable the IGMP snooping feature before you configure other IGMP snooping features.

Procedure

1. Enter system view.
   `system-view`
2. Enable the IGMP snooping feature and enter IGMP-snooping view.
   `igmp-snooping`
   By default, the IGMP snooping feature is disabled.

Enabling IGMP snooping

Enabling IGMP snooping globally

About enabling IGMP snooping globally

After you enable IGMP snooping globally, IGMP snooping is enabled for all VLANs. You can disable IGMP snooping for a VLAN when IGMP snooping is globally enabled.

Restrictions and guidelines

To configure other IGMP snooping features for VLANs, you must enable IGMP snooping for the specific VLANs even though IGMP snooping is enabled globally.

The VLAN-specific IGMP snooping configuration takes priority over the global IGMP snooping configuration. For example, if you enable IGMP snooping globally and then use the **`igmp-snooping disable`** command to disable IGMP snooping for a VLAN, IGMP snooping is disabled in the VLAN.

Procedure

1. Enter system view.
   `system-view`
2. Enter IGMP-snooping view.
   `igmp-snooping`
3. Enable IGMP snooping globally.
   `global-enable`
   By default, IGMP snooping is disabled globally.
4. (Optional.) Disable IGMP snooping for a VLAN.
   a. Return to system view.
      `quit`
   b. Enter VLAN view.
      `vlan` *`vlan-id`*
   c. Disable IGMP snooping for the VLAN.
      `igmp-snooping disable`
      By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for VLANs

Restrictions and guidelines

You can enable IGMP snooping for multiple VLANs by using the **enable vlan** command in IGMP-snooping view or for a VLAN by using the **igmp-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in IGMP-snooping view.

IGMP snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling IGMP snooping for multiple VLANs

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable IGMP snooping for the specified VLANs.
   enable vlan *vlan-list*
   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable IGMP snooping for the VLAN.
   igmp-snooping enable
   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Configuring basic IGMP snooping features

Specifying an IGMP snooping version

About IGMP snooping versions

Different IGMP snooping versions process different versions of IGMP messages.

- IGMPv2 snooping processes IGMPv1 messages, IGMPv2 messages, and IGMPv3 queries, but it floods IGMPv3 reports in the VLAN instead of processing them.
- IGMPv3 snooping processes IGMPv1, IGMPv2, and IGMPv3 messages.

Restrictions and guidelines

If you change the IGMP snooping version from 2 to 3, the device performs the following actions:

- Clears all IGMP snooping forwarding entries that are dynamically created.
- Keeps static IGMPv3 snooping forwarding entries (*, G).
- Clears static IGMPv3 snooping forwarding entries (S, G), which will be restored when the IGMP snooping version is switched back to 3.

For more information about static IGMP snooping forwarding entries, see "Configuring a static member port."

Specifying an IGMP snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Specify an IGMP snooping version for multiple VLANs.
   version *version-number* **vlan** *vlan-list*
   By default, the IGMP snooping version for a VLAN is 2.

Specifying an IGMP snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an IGMP snooping version for the VLAN.
   igmp-snooping version *version-number*
   By default, the IGMP snooping version for a VLAN is 2.

Setting the maximum number of IGMP snooping forwarding entries

About setting the maximum number of IGMP snooping forwarding entries

You can modify the maximum number of IGMP snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the maximum number of IGMP snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of IGMP snooping forwarding entries is 4294967295.

Configuring static multicast MAC address entries

About static multicast MAC address entries

In Layer 2 multicast, multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as IGMP snooping). You can also manually configure static multicast MAC address entries by binding multicast MAC addresses and ports to control the destination ports of the multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static multicast MAC address entry in system view

1. Enter system view.
   system-view
2. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static multicast MAC address entry in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the IGMP last member query interval

About the IGMP last member query interval

A receiver host starts a report delay timer for a multicast group when it receives an IGMP group-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the group.

The IGMP last member query interval defines the maximum response time advertised in IGMP group-specific queries. Set an appropriate value for the IGMP last member query interval to speed up hosts' responses to IGMP group-specific queries and avoid IGMP report traffic bursts.

Setting the IGMP last member query interval globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the IGMP last member query interval globally.
   last-member-query-interval *interval*

   By default, the global IGMP last member query interval is 1 second.

Setting the IGMP last member query interval for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*

3. Set the IGMP last member query interval for the VLAN.

   igmp-snooping last-member-query-interval *interval*

   By default, the IGMP last member query interval is 1 second for a VLAN.

Configuring IGMP snooping port features

Setting aging timers for dynamic ports

About aging timers for dynamic ports

A dynamic router port is removed from the dynamic router port list if it does not receive an IGMP general query or PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an IGMP report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports. For example, if the memberships of multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports. If the memberships of multicast groups rarely change, set a relatively large value.

If a dynamic router port receives a PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **router-aging-time** or **igmp-snooping router-aging-time** command does not take effect on the port.

IGMP group-specific queries originated by the Layer 2 device trigger the adjustment of aging timers for dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the IGMP last member query interval. For more information about setting the IGMP last member query interval on the Layer 2 device, see "Setting the IGMP last member query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Set the aging timer for dynamic router ports globally.

   router-aging-time *seconds*

   By default, the aging timer for dynamic router ports is 260 seconds.

4. Set the global aging timer for dynamic member ports globally.

   host-aging-time *seconds*

   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging timer for dynamic router ports in the VLAN.

   igmp-snooping router-aging-time *seconds*

   By default, the aging timer for dynamic router ports is 260 seconds.

4. Set the aging timer for dynamic member ports in the VLAN.

igmp-snooping host-aging-time *seconds*

By default, the aging timer for dynamic member ports is 260 seconds.

Configuring a static member port

About static member ports

You can configure a port as a static member port for a multicast group so that hosts attached to the port can always receive multicast for the group. The static member port does not respond to IGMP queries. When you complete or cancel this configuration on a port, the port does not send an unsolicited IGMP report or leave message.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure the port as a static member port.

   igmp-snooping static-group *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*

   By default, a port is not a static member port.

Configuring a static router port

About static router ports

You can configure a port as a static router port for a multicast group so that all multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure the port as a static router port.

   igmp-snooping static-router-port vlan *vlan-id*

   By default, a port is not a static router port.

Configuring a port as a simulated member host

About simulated member hosts

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited IGMP report when you complete the configuration.
- It responds to IGMP general queries with IGMP reports.
- It sends an IGMP leave message when you cancel the configuration.

The version of IGMP running on the simulated member host is the same as the version of IGMP snooping running on the port. The port ages out in the same way as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   igmp-snooping host-join *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*

   By default, the port is not a simulated member host.

Enabling fast-leave processing

About fast-leave processing

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for a multicast group when the port receives a leave massage. The Layer 2 device no longer sends or forwards IGMP group-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts in a VLAN. If you do so, the remaining receivers cannot receive multicast data for a group after a receiver leaves the group.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]

   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*

3. Enable fast-leave processing on the port.
   igmp-snooping fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About disabling a port from becoming a dynamic router port

A receiver host might send IGMP general queries or PIM hello messages for testing purposes. On the Layer 2 device, the port that receives either of the messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive multicast data that it does not want to receive.
- The port forwards the IGMP general queries or PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the IGMP querier or DR election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable a port from becoming a dynamic router port. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.
   igmp-snooping router-port-deny [**vlan** *vlan-list*]
   By default, a port is allowed to become a dynamic router port.

Configuring the IGMP snooping querier

Enabling the IGMP snooping querier

About the IGMP snooping querier

This feature enables the Layer 2 device to periodically send IGMP general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an IGMP snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the IGMP snooping querier on a multicast network that runs IGMP. An IGMP snooping querier does not take part in IGMP querier elections. However, it might affect IGMP querier elections if it sends IGMP general queries with a low source IP address.

Enabling the IGMP snooping querier for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the IGMP snooping querier for the VLAN.
   igmp-snooping querier
   By default, the IGMP snooping querier is disabled for a VLAN.

Enabling IGMP snooping querier election

About IGMP snooping querier election

To avoid traffic interruption caused by the failure of a single querier in a VLAN, configure multiple queriers in the VLAN and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for IGMP snooping querier election is the same as that for IGMP querier election.

Prerequisites for enabling IGMP snooping querier election

Before you enable IGMP snooping querier election, you must complete the following tasks:

- Enable the IGMP snooping querier for a VLAN. For more information about enabling the IGMP snooping querier, see "Enabling the IGMP snooping querier."
- Configure the source IP address for IGMP general queries as an IP address different from 0.0.0.0 and the local querier IP address. An IGMP snooping querier performs querier election only if the source IP address of a received IGMP general query is not 0.0.0.0 or its own IP address.
- Make sure the candidate IGMP snooping queriers run the same IGMP snooping version. To specify the IGMP snooping version, use the **igmp-snooping version** command.

Enabling IGMP snooping querier election for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable IGMP snooping querier election for the VLAN.
   igmp-snooping querier-election
   By default, IGMP snooping querier election is disabled for a VLAN.

Configuring parameters for IGMP general queries and responses

About parameters for IGMP general queries and responses

You can modify the IGMP general query interval based on the actual condition of the network.

A receiver host starts a report delay timer for each multicast group that it has joined when it receives an IGMP general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the corresponding multicast group.

Set an appropriate value for the maximum response time for IGMP general queries to speed up hosts' responses to IGMP general queries and avoid IGMP report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting multicast group members, make sure the IGMP general query interval is greater than the maximum response time for IGMP general queries.

Configuring parameters for IGMP general queries and responses globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the maximum response time for IGMP general queries.
   max-response-time *seconds*
   By default, the maximum response time for IGMP general queries is 10 seconds.

Configuring parameters for IGMP general queries and responses in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the IGMP general query interval in the VLAN.
   igmp-snooping query-interval *interval*
   By default, the IGMP general query interval is 125 seconds for a VLAN.
4. Set the maximum response time for IGMP general queries in the VLAN.
   igmp-snooping max-response-time *seconds*
   By default, the maximum response time for IGMP general queries is 10 seconds for a VLAN.

Enabling IGMP snooping proxying

About enabling IGMP snooping proxying

The device enabled with IGMP snooping proxying is called an IGMP snooping proxy. The IGMP snooping proxy acts as a host to the upstream device. Enabled with IGMP snooping querier, the IGMP snooping proxy acts as the router to downstream devices and receives report and leave messages on behalf of the upstream device. As a best practice, enable IGMP snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling IGMP snooping proxying

Before you enable IGMP snooping proxying for a VLAN, you must first enable IGMP snooping globally and enable IGMP snooping for the VLAN. IGMP snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with IGMP snooping querier. For more information about enabling IGMP snooping querier, see "Enabling the IGMP snooping querier."

Enabling IGMP snooping proxying for a VLAN

1. Enter system view.

system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable IGMP snooping proxying for the VLAN.

   igmp-snooping proxy enable

   By default, IGMP snooping proxying is disabled for a VLAN.

Configuring parameters for IGMP messages

Configuring source IP addresses for IGMP messages

About configuring source IP addresses for IGMP messages

The IGMP snooping querier might send IGMP general queries with the source IP address 0.0.0.0. The port that receives such queries will not be maintained as a dynamic router port. This might prevent the associated dynamic IGMP snooping forwarding entry from being correctly created at the data link layer and eventually cause multicast traffic forwarding failures. To avoid this problem, you can configure a non-all-zero IP address as the source IP address of the IGMP queries on the IGMP snooping querier. This configuration might affect the IGMP querier election within the subnet.

You can also change the source IP address of IGMP reports or leave messages sent by a simulated member host or an IGMP snooping proxy.

Configuring the source IP addresses for IGMP messages in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Configure the source IP address for IGMP general queries.

   igmp-snooping general-query source-ip *ip-address*

   By default, the source IP address of IGMP general queries is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

4. Configure the source IP address for IGMP group-specific queries.

   igmp-snooping special-query source-ip *ip-address*

   By default, the source IP address of IGMP group-specific queries is one of the following:

   - The source address of IGMP group-specific queries if the IGMP snooping querier of the VLAN has received IGMP general queries.
   - The IP address of the current VLAN interface if the IGMP snooping querier does not receive an IGMP general query.
   - 0.0.0.0 if the IGMP snooping querier does not receive an IGMP general query and the current VLAN interface does not have an IP address.

5. Configure the source IP address for IGMP reports.

   igmp-snooping report source-ip *ip-address*

   By default, the source IP address of IGMP reports is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

6. Configure the source IP address for IGMP leave messages.

   igmp-snooping leave source-ip *ip-address*

By default, the source IP address of IGMP leave messages is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

Setting the 802.1p priority for IGMP messages

About the 802.1p priority for IGMP messages

When congestion occurs on outgoing ports of the Layer 2 device, it forwards IGMP messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to IGMP messages that are created or forwarded by the device.

Setting the 802.1p priority for IGMP messages globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the 802.1p priority for IGMP messages.
   dot1p-priority *priority*
   By default, the global 802.1p priority is 6 for IGMP messages.

Setting the 802.1p priority for IGMP messages in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the 802.1p priority for IGMP messages in the VLAN.
   igmp-snooping dot1p-priority *priority*
   By default, the 802.1p priority is 6 for IGMP messages in a VLAN.

Configuring IGMP snooping policies

Configuring a multicast group policy

About multicast group policies

This feature enables the Layer 2 device to filter IGMP reports by using an ACL that specifies the multicast groups and the optional sources. It is used to control the multicast groups that hosts can join. This configuration takes effect only on the multicast groups that ports join dynamically.

In a multicast application, a host sends an unsolicited IGMP report when a user requests a multicast program. The Layer 2 device uses the multicast group policy to filter the IGMP report. The host can join the multicast group only if the IGMP report is permitted by the multicast group policy.

Configuring a multicast group policy globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Configure a multicast group policy globally.

group-policy *ipv4-acl-number* [**vlan** *vlan-list*]

By default, no multicast group policies are configured, and hosts can join any multicast groups.

Configuring a multicast group policy on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a multicast group policy on the port.
   igmp-snooping group-policy *ipv4-acl-number* [**vlan** *vlan-list*]

   By default, no multicast group policies are configured on a port, and hosts attached to the port can join any multicast groups.

Enabling multicast source port filtering

About multicast source port filtering

This feature enables the Layer 2 device to discard all multicast data packets and to accept multicast protocol packets. You can enable this feature on ports that connect only to multicast receivers.

Restrictions and guidelines

When multicast source port filtering is enabled, the system automatically enables multicast source port filtering.

The configuration made for multiple interfaces in IGMP-snooping view has the same priority as the interface-specific configuration, and the most recent configuration takes effect.

Enabling multicast source port filtering in IGMP-snooping view

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable multicast source port filtering.
   source-deny port *interface-list*

   By default, multicast source port filtering is disabled.

Enabling multicast source port filtering in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Enable multicast source port filtering.
   igmp-snooping source-deny

   By default, multicast source port filtering is disabled.

Enabling dropping unknown multicast data

About dropping unknown multicast data

Unknown multicast data refers to multicast data for which no forwarding entries exist in the IGMP snooping forwarding table. This feature enables the device to forward unknown multicast data only to the router port. If the device does not have a router port, unknown multicast data will be dropped.

If you do not enable this feature, the unknown multicast data is flooded in the VLAN to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv4 multicast data is enabled, the device also drops unknown IPv6 multicast data.

When this feature is enabled in a VLAN, the device still forwards unknown multicast data out of router ports except the receiving router port in this VLAN.

Enabling dropping unknown multicast data for a VLAN

1. Enter system view.

   system-view
2. Enter VLAN view.

   vlan *vlan-id*
3. Enable dropping unknown multicast data for the VLAN.

   igmp-snooping drop-unknown

   By default, dropping unknown multicast data is disabled for a VLAN. Unknown multicast data is flooded in the VLAN.

Enabling IGMP report suppression

About IGMP report suppression

This feature enables the Layer 2 device to forward only the first IGMP report for a multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce multicast traffic.

Procedure

1. Enter system view.

   system-view
2. Enter IGMP-snooping view.

   igmp-snooping
3. Enable IGMP report suppression.

   report-aggregation

   By default, IGMP report suppression is enabled.

Setting the maximum number of multicast groups on a port

About setting the maximum number of multicast groups on a port

You can set the maximum number of multicast groups on a port to regulate the port traffic. This feature takes effect only on the multicast groups that a port joins dynamically.

If the number of multicast groups on a port exceeds the limit, the system removes all the forwarding entries associated with the port. The receiver hosts attached to that port can join multicast groups

again before the number of multicast groups on the port reaches the limit. When the number of multicast groups on the port reaches the limit, the port automatically drops IGMP reports for new groups.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the maximum number of multicast groups on the port.
   igmp-snooping group-limit *limit* [**vlan** *vlan-list*]
   By default, no limit is placed on the maximum number of multicast groups on a port.

Enabling multicast group replacement

About multicast group replacement

When multicast group replacement is enabled, the port does not drop IGMP reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves the multicast group that has the lowest IP address and joins the new group contained in the IGMP report. The multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that a port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the IGMP snooping forwarding entries on the device reaches the upper limit.
- The multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling multicast group replacement globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]
   By default, multicast group replacement is disabled globally.

Enabling multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*

3. Enable multicast group replacement on the port.

   igmp-snooping overflow-replace [**vlan** *vlan-list*]

   By default, multicast group replacement is disabled on a port.

Enabling host tracking

About host tracking

This feature enables the Layer 2 device to record information about member hosts that are receiving multicast data. The information includes IP addresses of the hosts, length of time elapsed since the hosts joined multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Enabling host tracking globally

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Enable host tracking globally.

   host-tracking

   By default, host tracking is disabled globally.

Enabling host tracking for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable host tracking for the VLAN.

   igmp-snooping host-tracking

   By default, host tracking is disabled for a VLAN.

Configuring an IGMP snooping access control policy

About IGMP snooping access control policies

This feature enables the device to use ACLs to filter IGMP reports and leave messages from multicast users. Multicast users can join or leave only multicast groups permitted by the IGMP snooping access control policies.

Procedure

1. Enter system view.

   system-view

2. Enter user profile view.

   user-profile *profile-name*

   For more information about this command, see user profile commands in *Security Command Reference*.

3. Configure an IGMP snooping access control policy.

   igmp-snooping access-policy *ipv4-acl-number*

   By default, no IGMP snooping access control policies are configured. Multicast users can join or leave any multicast groups.

Setting the DSCP value for outgoing IGMP protocol packets

About the DSCP value for outgoing IGMP protocol packets

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP snooping view.
   igmp-snooping
3. Set the DSCP value for outgoing IGMP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Display and maintenance commands for IGMP snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IGMP snooping status.	**display igmp-snooping** [**global** | **vlan** *vlan-id*]

IGMP snooping configuration examples

Example: Configuring VLAN-based IGMP snooping group polices and simulated joining

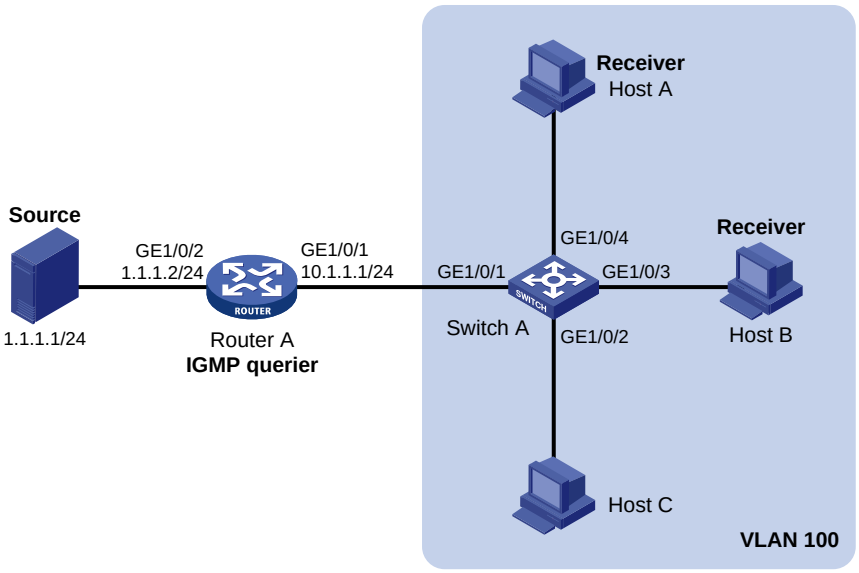
Network configuration

As shown in Figure 4, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping.

Configure a multicast group policy and simulated joining to meet the following requirements:

- Host A and Host B receive only the multicast data addressed to multicast group 224.1.1.1. Multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown multicast data instead of flooding it in VLAN 100.

Figure 4 Network diagram



Procedure

1. Assign an IP address and subnet mask to each interface, as shown in Figure 4. (Details not shown.)
2. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

3. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   [SwitchA-vlan100] igmp-snooping drop-unknown
   [SwitchA-vlan100] quit
   ```

Configure a multicast group policy so that hosts in VLAN 100 can join only multicast group 224.1.1.1.

```
[SwitchA] acl basic 2001
[SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
[SwitchA-acl-ipv4-basic-2001] quit
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] group-policy 2001 vlan 100
[SwitchA-igmp-snooping] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts of multicast group 224.1.1.1.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.2.2.2. (Details not shown.)

Display dynamic IGMP snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                          (00:03:23)
      GE1/0/4                          (00:04:10)
```

The output shows the following information:

- Host A and Host B have joined multicast group 224.1.1.1 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join multicast group 224.2.2.2.

Example: Configuring VLAN-based IGMP snooping static ports

Network configuration

As shown in Figure 5:

- Router A runs IGMPv2 and acts as the IGMP querier. Switch A, Switch B, and Switch C run IGMPv2 snooping.
- Host A and host C are permanent receivers of multicast group 224.1.1.1.

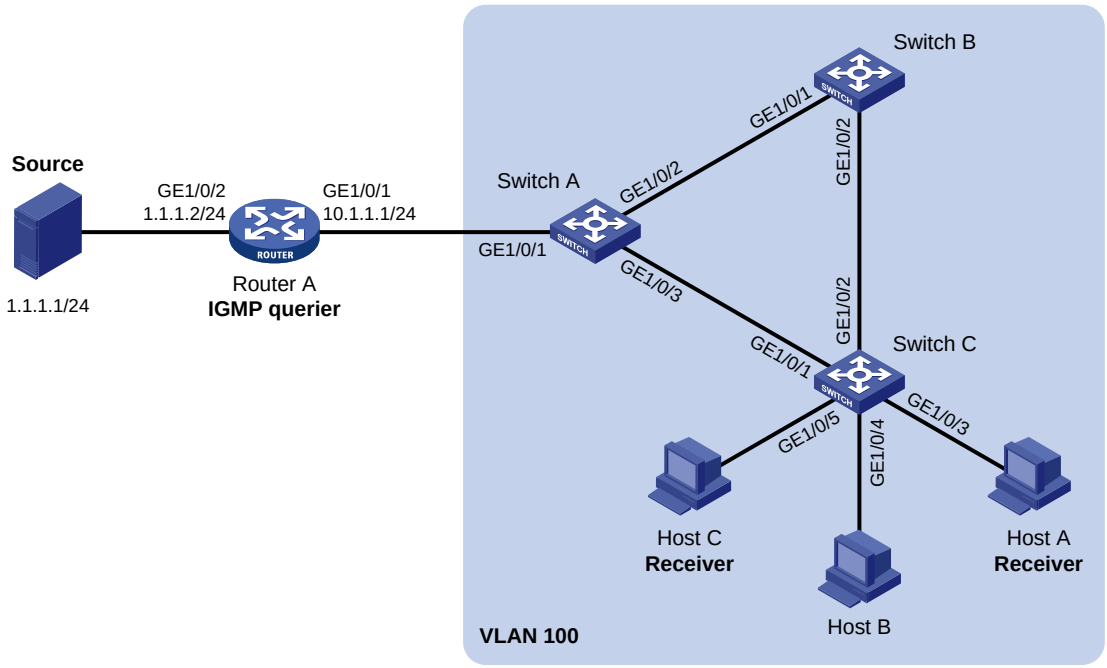
Configure static ports to meet the following requirements:

- To enhance the reliability of multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for multicast group 224.1.1.1.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. Multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one IGMP

query-response cycle must be completed before multicast data flows to the receivers along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, multicast data can flow to the receivers nearly uninterruptedly along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 5 Network diagram



Procedure

1. Assign an IP address and subnet mask to each interface, as shown in Figure 5. (Details not shown.)
2. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

3. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

4. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable IGMP snooping for VLAN 100.

```
[SwitchB-vlan100] igmp-snooping enable
[SwitchB-vlan100] quit
```

5. Configure Switch C:

Enable the IGMP snooping feature.

```
<SwitchC> system-view
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable IGMP snooping for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for multicast group 224.1.1.1.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
```

```
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

Display static IGMP snooping group entries for VLAN 100 on Switch C.

```
[SwitchC] display igmp-snooping static-group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of multicast group 224.1.1.1.

Example: Configuring the VLAN-based IGMP snooping querier

Network configuration

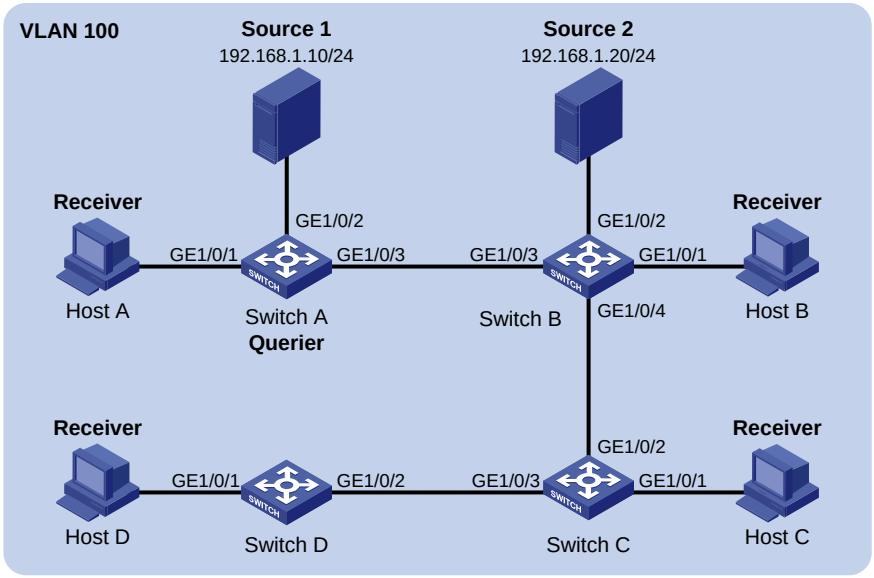
As shown in Figure 6:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Host A and Host C are receivers of multicast group 224.1.1.1, and Host B and Host D are receivers of multicast group 225.1.1.1.
- All host receivers run IGMPv2, and all switches run IGMPv2 snooping. Switch A (which is close to the multicast sources) acts as the IGMP snooping querier.

Configure the switches to meet the following requirements:

- To prevent the switches from flooding unknown data in the VLAN, enable all the switches to drop unknown multicast data.
- A switch does not mark a port that receives an IGMP query with source IP address 0.0.0.0 as a dynamic router port. This adversely affects the establishment of Layer 2 forwarding entries and multicast traffic forwarding. To avoid this, configure the source IP address of IGMP queries as a non-zero IP address.

Figure 6 Network diagram



Procedure

1. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   [SwitchA-vlan100] igmp-snooping drop-unknown
   ```

   # Configure Switch A as the IGMP snooping querier.

   ```
   [SwitchA-vlan100] igmp-snooping querier
   [SwitchA-vlan100] quit
   ```

   # In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP general queries.

   ```
   [SwitchA-vlan100] igmp-snooping general-query source-ip 192.168.1.1
   ```

   # In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP group-specific queries.

   ```
   [SwitchA-vlan100] igmp-snooping special-query source-ip 192.168.1.1
   [SwitchA-vlan100] quit
   ```

2. Configure Switch B:

   # Enable the IGMP snooping feature.

   ```
   <SwitchB> system-view
   [SwitchB] igmp-snooping
   [SwitchB-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchB] vlan 100
   ```

```
[SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchB-vlan100] igmp-snooping enable
[SwitchB-vlan100] igmp-snooping drop-unknown
[SwitchB-vlan100] quit
```

3. Configure Switch C:

Enable the IGMP snooping feature.

```
<SwitchC> system-view
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] igmp-snooping drop-unknown
[SwitchC-vlan100] quit
```

4. Configure Switch D:

Enable the IGMP snooping feature.

```
<SwitchD> system-view
[SwitchD] igmp-snooping
[SwitchD-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchD-vlan100] igmp-snooping enable
[SwitchD-vlan100] igmp-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping on Switch B.

```
[SwitchB] display igmp-snooping statistics
Received IGMP general queries:  3
Received IGMPv1 reports:  0
Received IGMPv2 reports:  12
Received IGMP leaves:  0
Received IGMPv2 specific queries:  0
Sent     IGMPv2 specific queries:  0
Received IGMPv3 reports:  0
Received IGMPv3 reports with right and wrong records:  0
Received IGMPv3 specific queries:  0
Received IGMPv3 specific sg queries:  0
Sent     IGMPv3 specific queries:  0
Sent     IGMPv3 specific sg queries:  0
Received PIMv2 hello:  0
```

```
Received error IGMP messages:  0
```

The output shows that all switches except Switch A can receive the IGMP general queries after Switch A acts as the IGMP snooping querier.

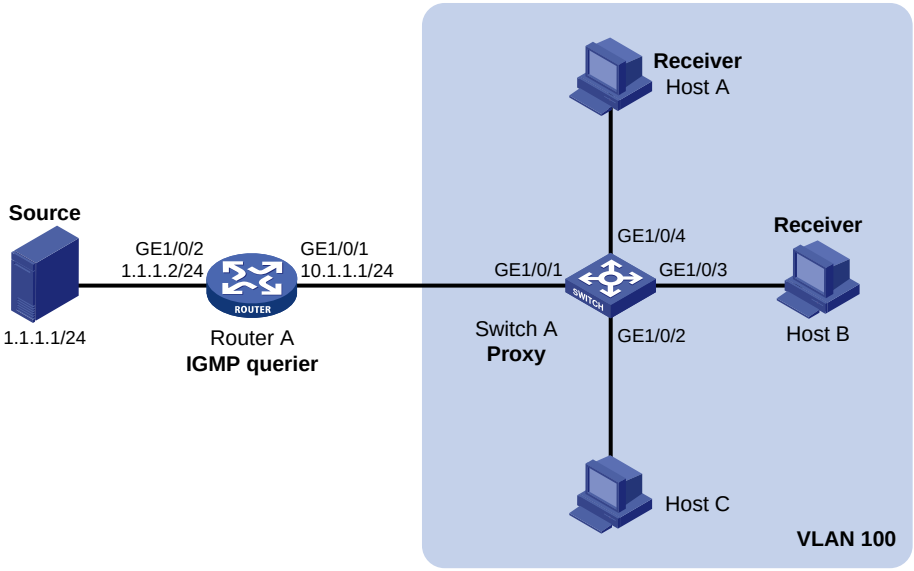
Example: Configuring VLAN-based IGMP snooping proxying

Network configuration

As shown in Figure 7, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping. Configure IGMP snooping proxying so that Switch A can perform the following actions:

- Forward IGMP report and leave messages to Router A.
- Respond to IGMP queries sent by Router A and forward the queries to downstream hosts.

Figure 7 Network diagram



Procedure

1. Assign an IP address and subnet mask to each interface, as shown in Figure 7. (Details not shown.)
2. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP and PIM-DM on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] pim dm
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```
3. Configure Switch A:

Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping and IGMP snooping proxying for the VLAN.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] igmp-snooping proxy enable
[SwitchA-vlan100] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
 Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                                  (00:04:00)
      GE1/0/4                                  (00:04:04)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of multicast group 224.1.1.1. Host A and Host B become receivers of the group.

Display IGMP group membership information on Router A.

```
[RouterA] display igmp group
IGMP groups in total: 1
 GigabitEthernet1/0/1(10.1.1.1):
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   224.1.1.1       0.0.0.0         00:00:31    00:02:03
```

Send an IGMP leave message from Host A to leave multicast group 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of multicast group 224.1.1.1. Only Host B remains as the receiver of the group.

Troubleshooting IGMP snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function on the Layer 2 device.

Solution

To resolve the problem:

1. Use the **display igmp-snooping** command to display IGMP snooping status.
2. If IGMP snooping is not enabled, use the **igmp-snooping** command in system view to enable the IGMP snooping feature. Then, use the **igmp-snooping enable** command in VLAN view to enable IGMP snooping for the VLAN.
3. If IGMP snooping is enabled globally but not enabled for the VLAN, use the **igmp-snooping enable** command in VLAN view to enable IGMP snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Multicast group policy does not work

Symptom

Hosts can receive multicast data for multicast groups that are not permitted by the multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl** command to verify that the configured ACL meets the multicast group policy requirements.
2. Use the **display this** command in IGMP-snooping view or in a corresponding interface view to verify that the correct multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **igmp-snooping group-policy** command to apply the correct multicast group policy.
3. Use the **display igmp-snooping** command to verify that dropping unknown multicast data is enabled. If it is not, use the **igmp-snooping drop-unknown** command to enable dropping unknown multicast data.
4. If the problem persists, contact H3C Support.

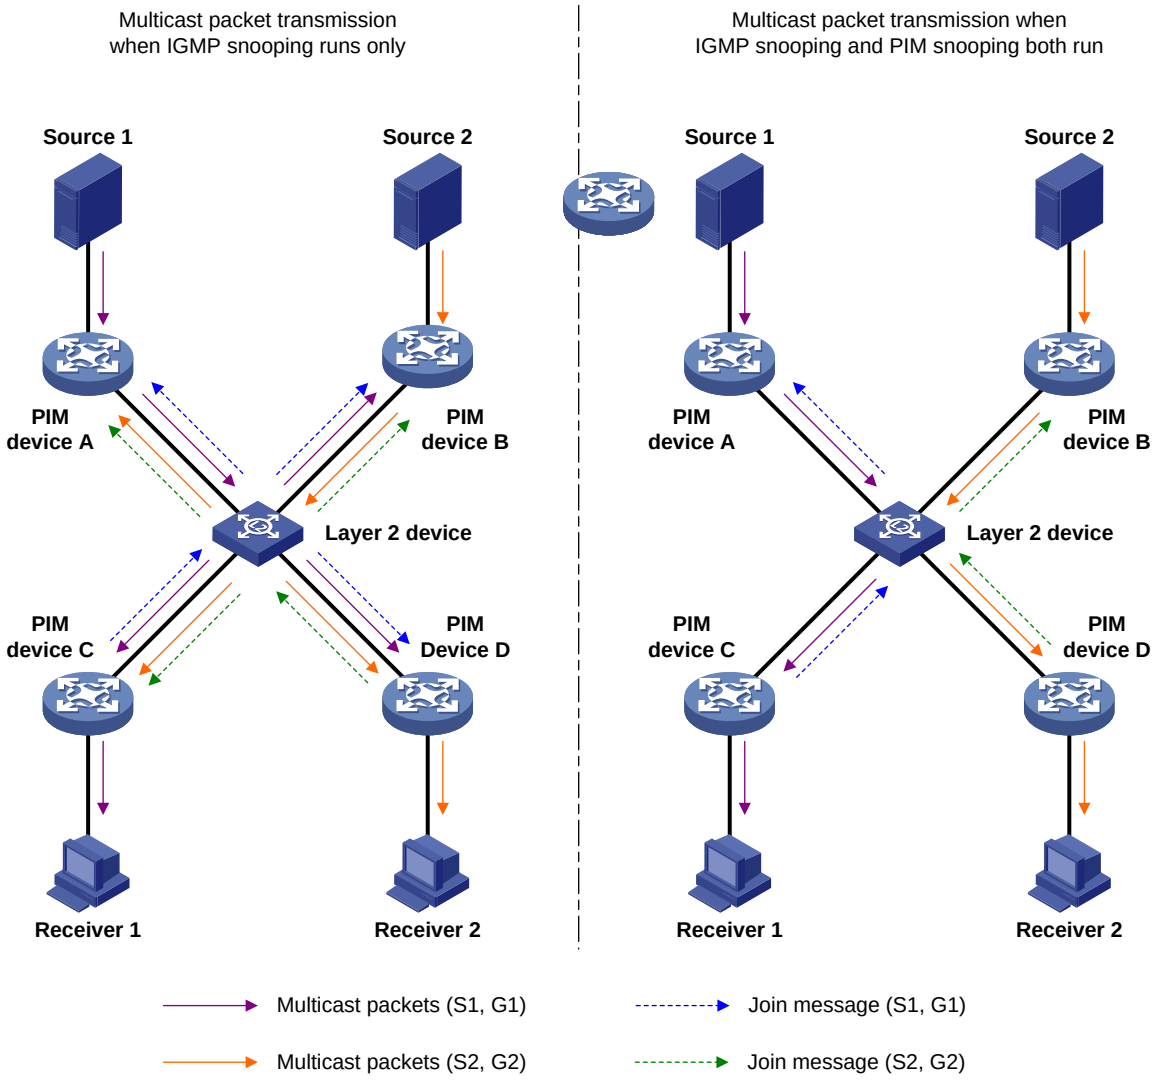
Configuring PIM snooping

About PIM snooping

PIM snooping runs on Layer 2 devices. It works with IGMP snooping to analyze received PIM messages, and adds the ports that are interested in specific multicast data to a PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with PIM snooping



As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the PIM routers are in the same VLAN.

- When the Layer 2 switch runs only IGMP snooping, it performs the following actions:
  - **a.** Maintains the router ports according to the received PIM hello messages that PIM routers send.
  - **b.** Floods all other types of received PIM messages except PIM hello messages in the VLAN.
  - **c.** Forwards all multicast data to all router ports in the VLAN.

Each PIM router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all PIM messages except PIM hello messages.

- When the Layer 2 switch runs both IGMP snooping and PIM snooping, it performs the following actions:
  a. Examines whether a PIM router is interested in the multicast data addressed to a multicast group according to the received PIM messages that the router sends.
  b. Adds only the ports that connect to the router and are interested in the data to a PIM snooping routing entry.
  c. Forwards PIM messages and multicast data to only the routers that are interested in the data, which saves network bandwidth.

For more information about IGMP snooping and the router port, see "Configuring IGMP snooping."

Restrictions and guidelines: PIM snooping configuration

PIM snooping does not take effect on secondary VLANs. As a best practice, do not configure PIM snooping for secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

After you configure PIM snooping for a VLAN, PIM snooping takes effect only on ports that belong to the VLAN.

PIM snooping tasks at a glance

To configure PIM snooping, perform the following tasks:

1. Enabling PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling PIM snooping

1. Enter system view.
   `system-view`
2. Enable the IGMP snooping feature and enter IGMP-snooping view.
   `igmp-snooping`
   By default, IGMP snooping is disabled.
   For more information about this command, see IGMP snooping commands in *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter VLAN view.
   `vlan` *`vlan-id`*
5. Enable IGMP snooping for the VLAN.
   `igmp-snooping enable`
   By default, IGMP snooping is disabled in a VLAN.

For more information about this command, see *IP Multicast Command Reference*.

6. Enable PIM snooping for the VLAN.

   pim-snooping enable

   By default, PIM snooping is disabled in a VLAN.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 multicast data interruption caused by the aging of PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives a PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives a PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global neighbor ports after a master/subordinate switchover.

   pim-snooping graceful-restart neighbor-aging-time *seconds*

   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.

   pim-snooping graceful-restart join-aging-time *seconds*

By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for PIM snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display PIM snooping neighbor information.	**display pim-snooping neighbor** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping router port information.	**display pim-snooping router-port** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping routing entries.	**display pim-snooping routing-table** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display statistics for the PIM messages learned through PIM snooping.	**display pim-snooping statistics**
Clear statistics for the PIM messages learned through PIM snooping.	**reset pim-snooping statistics**

PIM snooping configuration examples

Example: Configuring PIM snooping

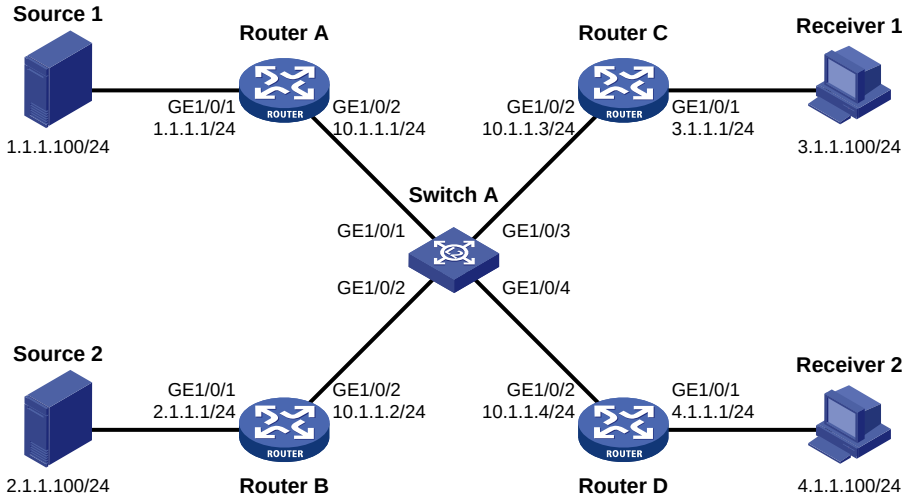
Network configuration

As shown in Figure 2:

- OSPF runs on the network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Receiver 1 and Receiver 2 belong to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Router C and Router D run IGMP on GigabitEthernet 1/0/1. Router A, Router B, Router C, and Router D run PIM-SM.
- GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure IGMP snooping and PIM snooping on Switch A. Then, Switch A forwards PIM protocol packets and multicast data packets only to the routers that are connected to receivers.

Figure 2 Network diagram



Procedure

1. Assign an IP address and subnet mask to each interface, as shown in Figure 2. (Details not shown.)
2. Configure OSPF on the routers. (Details not shown.)
3. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable PIM-SM on each interface.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] pim sm
   [RouterA-GigabitEthernet1/0/1] quit
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim sm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

   # Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

   ```
   [RouterA] pim
   [RouterA-pim] c-bsr 10.1.1.1
   [RouterA-pim] c-rp 10.1.1.1
   [RouterA-pim] quit
   ```

4. Configure Router B:

   # Enable IP multicast routing.

   ```
   <RouterB> system-view
   [RouterB] multicast routing
   [RouterB-mrib] quit
   ```

   # Enable PIM-SM on each interface.

   ```
   [RouterB] interface gigabitethernet 1/0/1
   [RouterB-GigabitEthernet1/0/1] pim sm
   [RouterB-GigabitEthernet1/0/1] quit
   [RouterB] interface gigabitethernet 1/0/2
   ```

```
[RouterB-GigabitEthernet1/0/2] pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

5. Configure Router C:

Enable IP multicast routing.

```
<RouterC> system-view
[RouterC] multicast routing
[RouterC-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] igmp enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

6. Configure Router D:

Enable IP multicast routing.

```
<RouterD> system-view
[RouterD] multicast routing
[RouterD-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] igmp enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

7. Configure Switch A:

Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping and PIM snooping for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display pim-snooping neighbor vlan 100
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
```

```
  10.1.1.1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  10.1.1.2
    Ports (1 in total):
      GE1/0/2                 (00:32:43)
  10.1.1.3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  10.1.1.4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are PIM snooping neighbors.

On Switch A, display PIM snooping routing entries for VLAN 100.

```
[SwitchA] display pim-snooping routing-table vlan 100
Total 2 entries.
FSM Flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 2 entries.
  (*, 224.1.1.1)
    Upstream neighbor: 10.1.1.1
      Upstream Ports (1 in total):
        GE1/0/1
      Downstream Ports (1 in total):
        GE1/0/3
          Expires: 00:03:01, FSM: J
  (*, 225.1.1.1)
    Upstream neighbor: 10.1.1.2
      Upstream Ports (1 in total):
        GE1/0/2
      Downstream Ports (1 in total):
        GE1/0/4
          Expires: 00:03:11, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for multicast group 224.1.1.1 only to Router C.
- Switch A will forward the multicast data intended for multicast group 225.1.1.1 only to Router D.

Troubleshooting PIM snooping

PIM snooping does not work on a Layer 2 device

Symptom

PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to display information about IGMP snooping and PIM snooping.
2. If IGMP snooping is not enabled, enable the IGMP snooping feature, and then enable IGMP snooping and PIM snooping for the VLAN.
3. If PIM snooping is not enabled, enable PIM snooping for the VLAN.
4. If the problem persists, contact H3C Support.

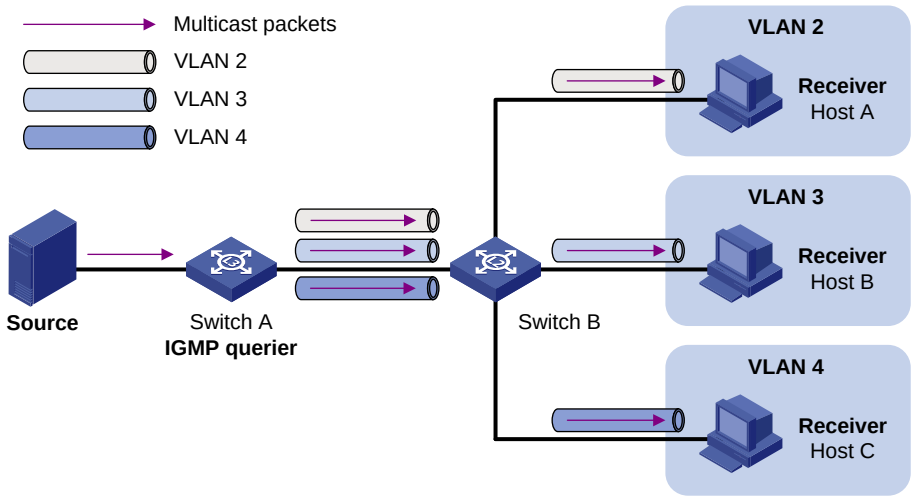
Contents

Configuring multicast VLANs

Multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in three different VLANs and the same multicast group. When Switch A (Layer 3 device) receives multicast data for that group, it sends three copies of the multicast data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the multicast VLAN feature



After a multicast VLAN is configured on Switch B, Switch A sends only one copy of the multicast data to the multicast VLAN on Switch B. This method saves network bandwidth and lessens the burden on the Layer 3 device.

Multicast VLAN implementations

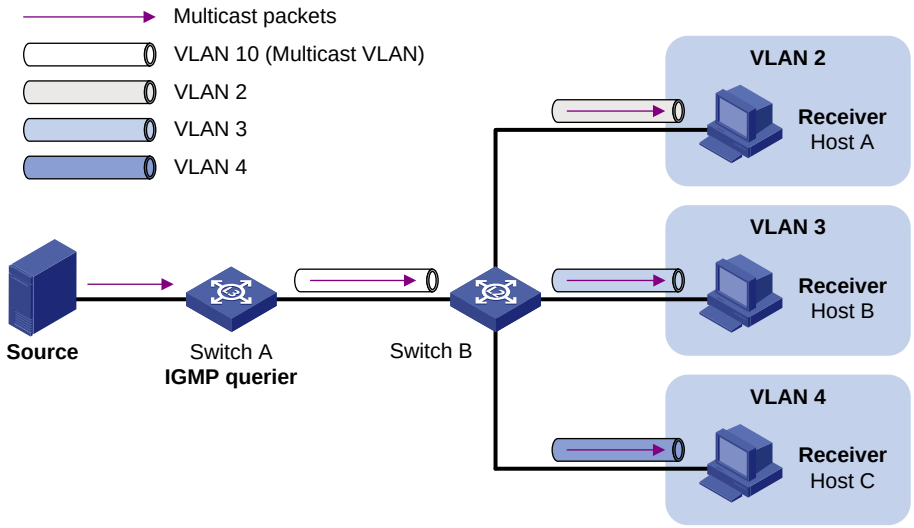
Multicast VLANs include sub-VLAN-based multicast VLANs and port-based multicast VLANs.

Sub-VLAN-based multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



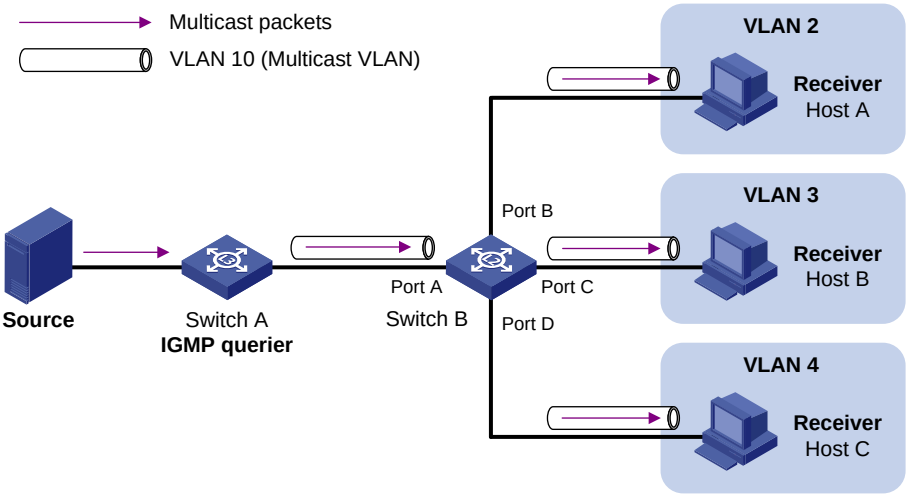
IGMP snooping manages router ports in the multicast VLAN and member ports in each sub-VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN in the multicast VLAN.

Port-based multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. All the user ports are hybrid ports and are assigned to VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and VLAN 2 through VLAN 4.

Figure 3 Port-based multicast VLAN



IGMP snooping manages the router ports and member ports in the multicast VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Switch B sends a separate copy to each user port in the multicast VLAN.

Restrictions and guidelines: Multicast VLAN configuration

The VLAN to be configured as a multicast VLAN must exist.

If you have configured both a sub-VLAN-based multicast VLAN and a port-based multicast VLAN on a device, the port-based multicast VLAN configuration takes effect.

The multicast VLAN feature does not take effect on secondary VLANs. As a best practice, do not configure the multicast VLAN feature for secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide.*

Configuring a sub-VLAN-based multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of a multicast VLAN must exist and cannot be multicast VLANs or sub-VLANs of any other multicast VLAN.

Prerequisites

Before you configure a sub-VLAN-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.

   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.

   multicast-vlan *vlan-id*

   By default, a VLAN is not a multicast VLAN.
3. Assign VLANs to the multicast VLAN as sub-VLANs.

   subvlan *vlan-list*

Configuring a port-based multicast VLAN

Restrictions and guidelines

You can assign user ports to a multicast VLAN in multicast VLAN view or assign a user port to a multicast VLAN in interface view. These configurations have the same priority.

A user port can belong to only one multicast VLAN.

Prerequisites

Before you configure a port-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN.
- Enable IGMP snooping for all the VLANs that contain multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the multicast VLAN and send the packets with the VLAN tag removed. For

more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to a multicast VLAN in multicast VLAN view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Assign ports to the multicast VLAN.
   port *interface-list*

Assigning user ports to a multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the multicast VLAN.
   port multicast-vlan *vlan-id*
   By default, a port does not belong to any multicast VLAN.

Setting the maximum number of multicast VLAN forwarding entries

About setting the maximum number of multicast VLAN forwarding entries

You can set the maximum number of multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of multicast VLAN forwarding entries.
   multicast-vlan entry-limit *limit*
   The default setting varies by device model. For more information, see the command reference.

Display and maintenance commands for multicast VLAN

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about multicast VLANs.	**display multicast-vlan** [*vlan-id*]
Display information about multicast VLAN forwarding entries.	**display multicast-vlan forwarding-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about multicast groups in multicast VLANs.	**display multicast-vlan group** [*source-address* | *group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear multicast groups in multicast VLANs.	**reset multicast-vlan group** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **vlan** *vlan-id*] *

Multicast VLAN configuration examples

Example: Configuring sub-VLAN-based multicast VLAN

Network configuration

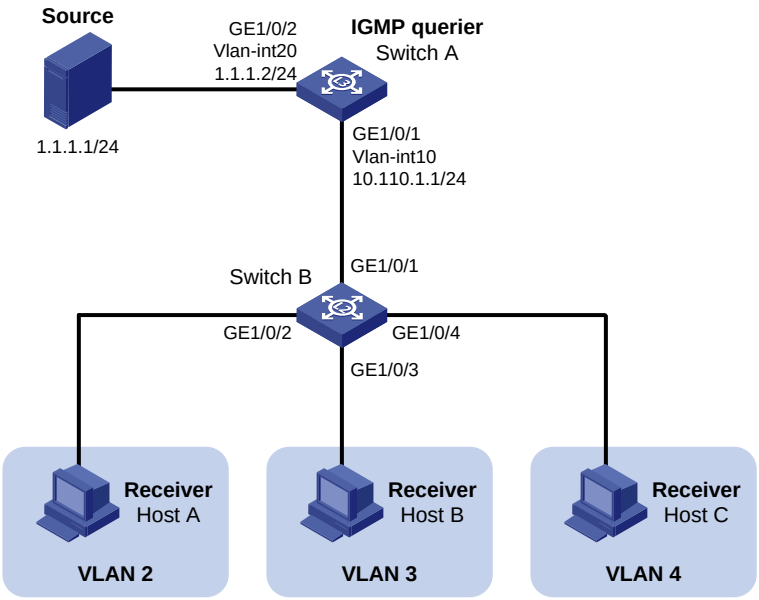
As shown in Figure 4:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 4 Network diagram



Procedure

1. Configure Switch A:

   # Enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   [SwitchA] vlan 20
   [SwitchA-vlan20] port gigabitethernet 1/0/2
   [SwitchA-vlan20] quit
   ```

   # Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ip address 1.1.1.2 24
   [SwitchA-Vlan-interface20] pim dm
   [SwitchA-Vlan-interface20] quit
   ```

   # Create VLAN 10.

   ```
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   ```

   # Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

   ```
   [SwitchA] interface gigabitethernet 1/0/1
   [SwitchA-GigabitEthernet1/0/1] port link-type hybrid
   [SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
   [SwitchA-GigabitEthernet1/0/1] quit
   ```

   # Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ip address 10.110.1.1 24
   [SwitchA-Vlan-interface10] igmp enable
   [SwitchA-Vlan-interface10] quit
   ```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as a multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] multicast-vlan 10
[SwitchB-mvlan-10] subvlan 2 to 4
[SwitchB-mvlan-10] quit
```

Verifying the configuration

Display information about all multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about multicast groups in multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan group
Total 1 entries.

Multicast VLAN 10: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that multicast group 224.1.1.1 belongs to multicast VLAN 10. Multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based multicast VLAN

Network configuration

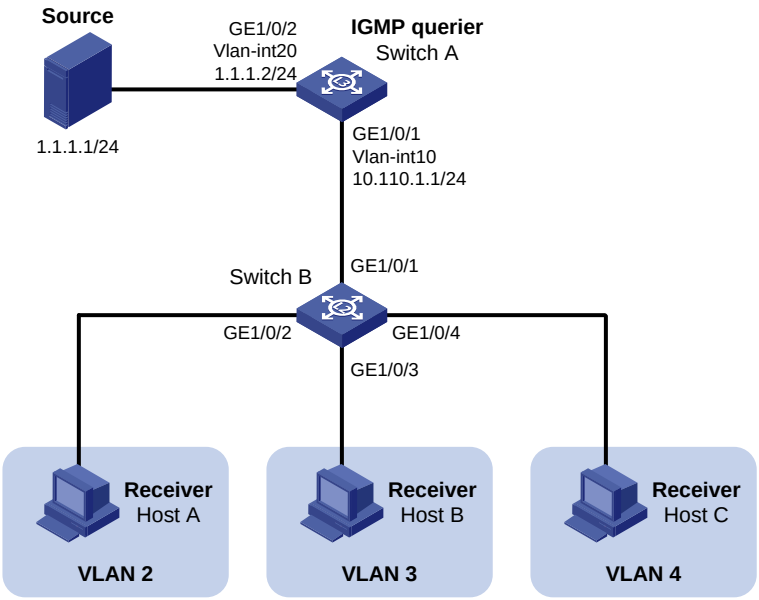
As shown in Figure 5:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 5 Network diagram



Procedure

1. Configure Switch A:

   # Enable IP multicast routing.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ip address 1.1.1.2 24
[SwitchA-Vlan-interface20] pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

```
[SwitchA] vlan 10
[SwitchA-vlan10] port gigabitethernet 1/0/1
[SwitchA-vlan10] quit
```

Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 10.110.1.1 24
[SwitchA-Vlan-interface10] igmp enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as a multicast VLAN.

```
[SwitchB] multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic IGMP snooping forwarding entries on Switch B.

```
[SwitchB] display igmp-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
```

```
(0.0.0.0, 224.1.1.1)
  Host slots (0 in total):
  Host ports (3 in total):
    GE1/0/2        (00:03:23)
    GE1/0/3        (00:04:07)
    GE1/0/4        (00:04:16)
```

The output shows that IGMP snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the multicast data of VLAN 10 through these user ports.

Contents

Configuring MLD snooping

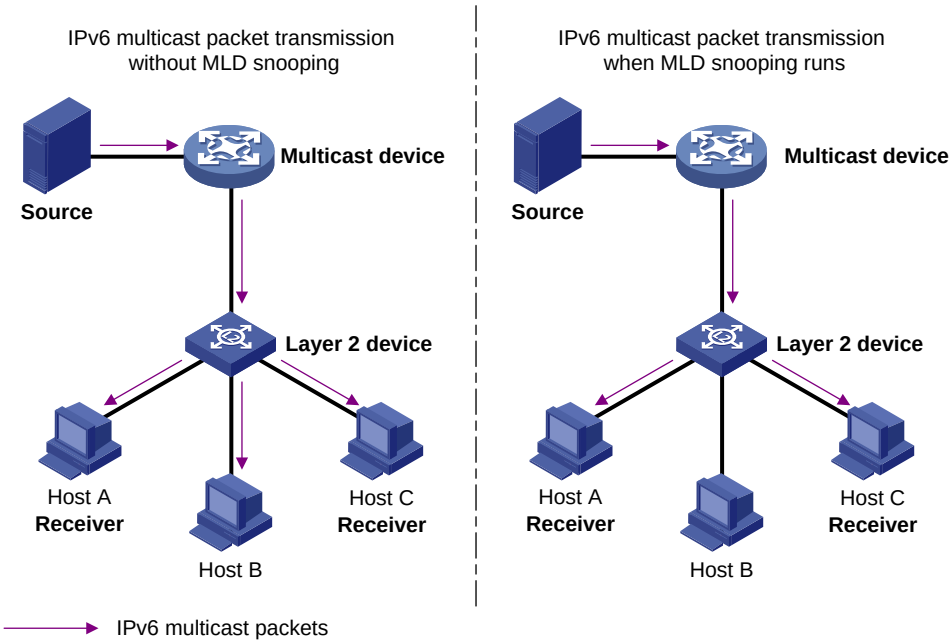
About MLD snooping

MLD snooping runs on a Layer 2 device as an IPv6 multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from MLD messages that are exchanged between the hosts and the Layer 3 device.

Fundamentals of MLD snooping

As shown in Figure 1, when MLD snooping is not enabled, the Layer 2 switch floods IPv6 multicast packets all hosts in a VLAN. When MLD snooping is enabled, the Layer 2 switch forwards multicast packets of known IPv6 multicast groups to only the receivers.

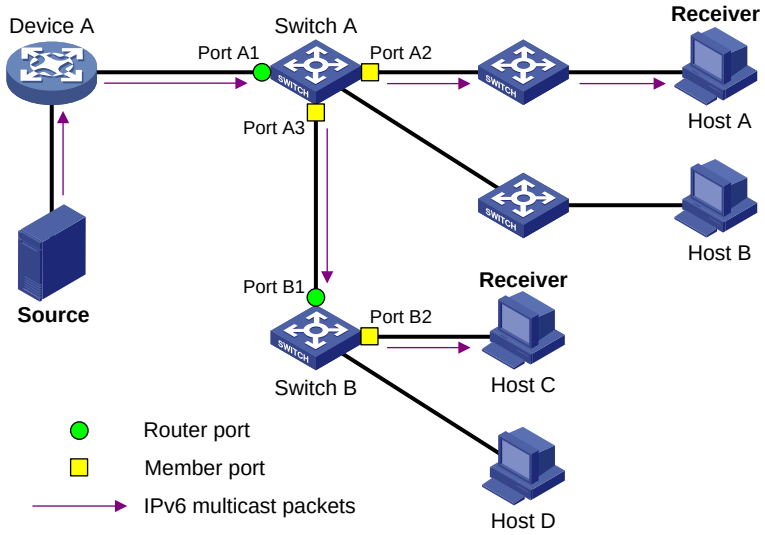
Figure 1 Multicast packet transmission processes without and with MLD snooping



MLD snooping ports

As shown in Figure 2, MLD snooping runs on Switch A and Switch B, and Host A and Host C are receiver hosts in an IPv6 multicast group. MLD snooping ports are divided into member ports and router ports.

Figure 2 MLD snooping ports



Router ports

On an MLD snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an MLD general query whose source address is not 0::0 or receives an IPv6 PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives either of the messages before the timer expires, the timer is reset. If the port does not receive either of the messages when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in MLD snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in MLD snooping is a Layer 2 interface.

Member ports

On an MLD snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an MLD report, it is added to the associated dynamic MLD snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an MLD report before the timer expires, the timer is reset. If the port does not receive an MLD report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static MLD snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How MLD snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

MLD messages include general query, MLD report, and done message. An MLD snooping-enabled Layer 2 device performs differently depending on the MLD message types.

General query

The MLD querier periodically sends MLD general queries to all hosts and devices on the local subnet to check for the existence of IPv6 multicast group members.

After receiving an MLD general query, the Layer 2 device forwards the query to all ports in the VLAN except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the router port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

MLD report

A host sends an MLD report to the MLD querier for the following purposes:

- Responds to queries if the host is an IPv6 multicast group member.
- Applies for an IPv6 multicast group membership.

After receiving an MLD report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN. It also resolves the IPv6 address of the reported IPv6 multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry for the group with the receiving port an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the port as a dynamic member port to the forwarding entry and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an MLD report through a non-router port because of the host MLD report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their MLD reports upon receiving MLD reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port.

Done message

When a host leaves an IPv6 multicast group, the host sends an MLD done message to the Layer 3 devices. When the Layer 2 device receives the MLD done message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the IPv6 multicast group address in the message.

- If no match is found, the Layer 2 device discards the MLD done message.
- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the MLD done message.
- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Discards the MLD done message.

- Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
- Sets the aging timer for the receiving port to twice the MLD last listener query interval.

- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the MLD done message to all router ports in the VLAN.
  - Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the MLD last listener query interval.

After receiving the MLD done message on a port, the MLD querier resolves the IPv6 multicast group address in the message. Then, it sends an MLD multicast-address-specific query to the IPv6 multicast group through the receiving port.

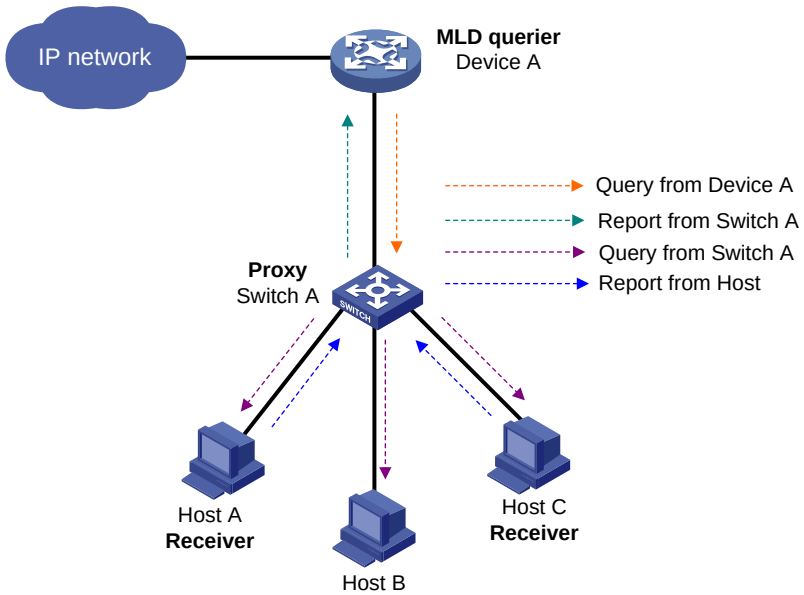
After receiving the MLD multicast-address-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN. Then, it waits for the responding MLD report from the directly connected hosts. For the dynamic member port that received the done message, the Layer 2 device also performs one of the following actions:

- If the port receives an MLD report before the aging timer expires, the Layer 2 device resets the aging timer for the port.
- If the port does not receive any MLD report messages when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the IPv6 multicast group.

MLD snooping proxying

As shown in Figure 3, to reduce the number of MLD report and done messages received by the upstream device, you can enable MLD snooping proxying on the edge device. With MLD snooping proxying enabled, the edge device acts as a host for the upstream MLD snooping querier to send MLD report and done messages to Device A. The host MLD report suppression mechanism on the edge device does not take effect.

Figure 3 MLD snooping proxying



The MLD snooping proxy device processes different MLD messages as follows:

- General query.

After receiving an MLD general query, the device forwards the query to all ports in the VLAN except the receiving port. The device also generates an MLD report based on the local membership information and sends the report to all router ports.

- Multicast-address-specific query or multicast-address-and-source-specific query.

  After receiving an MLD multicast-address-specific query or multicast-address-and-source-specific query, the device forwards the query to all ports in the VLAN except the receiving port. If the forwarding entry has a member port, the device sends a response to all router ports in the VLAN.

- Report.

  After receiving an MLD report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Done message.

  After receiving the MLD done message on a port, the device sends an MLD multicast-address-specific query through the receiving port. The device sends the MLD done message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: MLD snooping configuration

For MLD reports received from secondary VLANs, the relevant MLD snooping forwarding entries are maintained by the primary VLAN. Therefore, you need to enable MLD snooping only for the primary VLAN. The configuration made in secondary VLANs will not take effect. For more information about primary VLANs and secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

The MLD snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in MLD-snooping view. The VLAN-specific configuration and the configuration made in MLD-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in MLD-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in MLD-snooping view. The interface-specific configuration takes priority over the configuration made in MLD-snooping view.

VLAN-based MLD snooping tasks at a glance

To configure MLD snooping for VLANs, perform the following tasks:

1. Enabling the MLD snooping feature
2. Enabling MLD snooping

   Choose the following tasks as needed:

   - Enabling MLD snooping globally
   - Enabling MLD snooping for VLANs
3. (Optional.) Configuring basic MLD snooping features
   - Specifying an MLD snooping version
   - Setting the maximum number of MLD snooping forwarding entries
   - Configuring static IPv6 multicast MAC address entries
   - Setting the MLD last listener query interval
4. (Optional.) Configuring MLD snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
5. (Optional.) Configuring the MLD snooping querier
   - Enabling the MLD snooping querier
   - Enabling MLD snooping querier election
   - Configuring parameters for MLD general queries and responses
6. (Optional.) Enabling MLD snooping proxying
7. (Optional.) Configuring parameters for MLD messages
   - Configuring source IPv6 addresses for MLD messages
   - Setting the 802.1p priority for MLD messages
8. (Optional.) Configuring MLD snooping policies
   - Configuring an IPv6 multicast group policy
   - Enabling IPv6 multicast source port filtering
   - Enabling dropping unknown IPv6 multicast data
   - Enabling MLD report suppression
   - Setting the maximum number of IPv6 multicast groups on a port
   - Enabling IPv6 multicast group replacement
   - Enabling host tracking
9. (Optional.) Setting the DSCP value for outgoing MLD protocol packets

Enabling the MLD snooping feature

About enabling the MLD snooping feature

You must enable the MLD snooping feature before you configure other MLD snooping features.

Procedure

1. Enter system view.
   system-view
2. Enable the MLD snooping feature and enter MLD-snooping view.
   mld-snooping
   By default, the MLD snooping feature is disabled.

Enabling MLD snooping

Enabling MLD snooping globally

About enabling MLD snooping globally

After you enable MLD snooping globally, MLD snooping is enabled for all VLANs. You can disable MLD snooping for a VLAN when MLD snooping is globally enabled.

Restrictions and guidelines

To configure other MLD snooping features for VLANs, you must enable MLD snooping for the specific VLANs even though MLD snooping is enabled globally.

The VLAN-specific MLD snooping configuration takes priority over the global MLD snooping configuration. For example, if you enable MLD snooping globally and then use the **mld-snooping disable** command to disable MLD snooping for a VLAN, MLD snooping is disabled in the VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable MLD snooping globally.
   global-enable
   By default, MLD snooping is disabled globally.
4. (Optional.) Disable MLD snooping for a VLAN.
   a. Return to system view.
      quit
   b. Enter VLAN view.
      vlan *vlan-id*
   c. Disable MLD snooping for the VLAN.
      mld-snooping disable
      By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for VLANs

Restrictions and guidelines

You can enable MLD snooping for multiple VLANs by using the **enable vlan** command in MLD-snooping view or for a VLAN by using the **mld-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in MLD-snooping view.

MLD snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling MLD snooping for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable MLD snooping for multiple VLANs.
   enable vlan *vlan-list*

   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping for the VLAN.
   mld-snooping enable

   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Configuring basic MLD snooping features

Specifying an MLD snooping version

About MLD snooping versions

Different MLD snooping versions can process different versions of MLD messages:

- MLDv1 snooping can process MLDv1 messages and MLDv2 queries, but it floods MLDv2 reports in the VLAN instead of processing them.
- MLDv2 snooping can process MLDv1 and MLDv2 messages.

Restrictions and guidelines

If you change the version of MLD snooping from 2 to 1, the system performs the following actions:

- Clears all MLD snooping forwarding entries that are dynamically created.
- Keeps static MLDv2 snooping forwarding entries (*, G).
- Clears static MLDv2 snooping forwarding entries (S, G), which will be restored when MLD snooping is switched back to MLDv2 snooping.

For more information about static MLD snooping forwarding entries, see "Configuring a static member port."

Specifying an MLD snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Specify an MLD snooping version for multiple VLANs.

version *version-number* **vlan** *vlan-list*

By default, the MLD snooping version for a VLAN is 1.

Specifying an MLD snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an MLD snooping version for the VLAN.
   mld-snooping version *version-number*
   By default, the MLD snooping version for a VLAN is 1.

Setting the maximum number of MLD snooping forwarding entries

About setting the maximum number of MLD snooping forwarding entries

You can modify the maximum number of MLD snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the maximum number of MLD snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of MLD snooping forwarding entries is 4294967295.

Configuring static IPv6 multicast MAC address entries

About static IPv6 multicast MAC address entries

In Layer 2 IPv6 multicast, IPv6 multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as MLD snooping). You can also manually configure static IPv6 multicast MAC address entries by binding IPv6 multicast MAC addresses and ports to control the destination ports of the IPv6 multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static IPv6 multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static IPv6 multicast MAC address entry in system view

1. Enter system view.
   system-view
2. Configure a static IPv6 multicast MAC address entry.
   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static IPv6 multicast MAC address entry in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a static IPv6 multicast MAC address entry.
   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the MLD last listener query interval

About the MLD last listener query interval

A receiver host starts a report delay timer for an IPv6 multicast group when it receives an MLD multicast-address-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the group.

The MLD last listener query interval defines the maximum response time advertised in MLD multicast-address-specific queries. Set an appropriate value for the MLD last listener query interval to speed up hosts' responses to MLD multicast-address-specific queries and avoid MLD report traffic bursts.

Setting the MLD last listener query interval globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the MLD last listener query interval globally.
   last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second.

Setting the MLD last listener query interval for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the MLD last listener query interval for the VLAN
   mld-snooping last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second for a VLAN.

Configuring MLD snooping port features

Setting aging timers for dynamic ports

About aging timers for dynamic ports

A dynamic router port is removed from the dynamic router port list if it does not receive an MLD general query or IPv6 PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an MLD report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports based on the actual network requirement. For example, if the memberships of IPv6 multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports.

If a dynamic router port receives an IPv6 PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **mld-snooping router-aging-time** command does not take effect on the port.

MLD multicast-address-specific queries originated by the Layer 2 device trigger the adjustment of aging timers of dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the MLD last listener query interval. For more information about setting the MLD last listener query interval on the Layer 2 device, see "Setting the MLD last listener query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the aging timer for dynamic router ports globally.
   router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the aging timer for dynamic member ports globally.
   host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging timer for dynamic router ports in the VLAN.
   mld-snooping router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds for a VLAN.
4. Set the aging timer for dynamic member ports in the VLAN.
   mld-snooping host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds for a VLAN.

Configuring a static member port

About static member ports

You can configure a port as a static member port for an IPv6 multicast group so that all hosts attached to the port can always receive IPv6 multicast data for the group. The static member port does not respond to MLD queries. When you complete or cancel this configuration, the port does not send an unsolicited report or done message.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure the port as a static member port.

   mld-snooping static-group *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*

   By default, a port is not a static member port.

Configuring a static router port

About static router ports

You can configure a port as a static router port for an IPv6 multicast group so that all IPv6 multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure the port as a static router port.

   mld-snooping static-router-port vlan *vlan-id*

   By default, a port is not a static router port.

Configuring a port as a simulated member host

About simulated member hosts

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited MLD report when you complete the configuration.
- It responds to MLD general queries with MLD reports.

- It sends an MLD done message when you remove the configuration.

The version of MLD running on the simulated member host is the same as the version of MLD snooping running on the port. The port ages out in the same ways as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   mld-snooping host-join *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*

   By default, the port is not a simulated member host.

Enabling fast-leave processing

About fast-leave processing

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for an IPv6 multicast group when the port receives a done message. The device no longer sends or forwards MLD multicast-address-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts attached in a VLAN. If you do so, the remaining receivers cannot receive IPv6 multicast data for a group after a receiver leaves the group.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]

   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable fast-leave processing on the port.
   mld-snooping fast-leave [**vlan** *vlan-list*]

By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About disabling a port from becoming a dynamic router port

A receiver host might send MLD general queries or IPv6 PIM hello messages for testing purposes. On the Layer 2 device, the port that receives either of the messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All IPv6 multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive IPv6 multicast data that it does not expect.
- The port forwards the MLD general queries or IPv6 PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the MLD querier or DR election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable the port from becoming a dynamic router port when receiving either of the messages. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.
   mld-snooping router-port-deny [**vlan** *vlan-list*]
   By default, a port is allowed to become a dynamic router port.

Configuring the MLD snooping querier

Enabling the MLD snooping querier

About the MLD snooping querier

This feature enables the Layer 2 device to periodically send MLD general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an MLD snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the MLD snooping querier on an IPv6 multicast network that runs MLD. An MLD snooping querier does not participate in MLD querier elections. However, it might affect MLD querier elections if it sends MLD general queries with a low source IPv6 address.

Enabling the MLD snooping querier for a VLAN

1. Enter system view.

system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable the MLD snooping querier for the VLAN.

   mld-snooping querier

   By default, the MLD snooping querier is disabled for a VLAN.

Enabling MLD snooping querier election

About MLD snooping querier election

To avoid traffic interruption caused by the failure of a single querier in a VLAN, configure multiple queriers in the VLAN and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for MLD snooping querier election is the same as that for MLD querier election.

Prerequisites

Before you enable MLD snooping querier election, you must complete the following tasks:

- Enable the MLD snooping querier for a VLAN. For more information about enabling the MLD snooping querier, see "Enabling the MLD snooping querier."
- Configure the source IPv6 address for MLD general queries as an IPv6 address different from :: and the local querier IPv6 address. An MLD snooping querier performs querier election only if the source IPv6 address of a received MLD general query is not :: or its own IPv6 address.
- Make sure the candidate MLD snooping queriers run the same MLD snooping version. To specify the MLD snooping version, use the **mld-snooping version** command.

Enabling MLD snooping querier election for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable MLD snooping querier election for the VLAN.

   mld-snooping querier-election

   By default, MLD snooping querier election is disabled for a VLAN.

Configuring parameters for MLD general queries and responses

About parameters for MLD general queries and responses

You can modify the MLD general query interval based on the actual network conditions.

A receiver host starts a report delay timer for each IPv6 multicast group that it has joined when it receives an MLD general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the corresponding IPv6 multicast group.

Set an appropriate value for the maximum response time for MLD general queries to speed up hosts' responses to MLD general queries and avoid MLD report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting IPv6 multicast group members, make sure the MLD general query interval is greater than the maximum response time for MLD general queries.

Configuring parameters for MLD general queries and responses globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the maximum response time for MLD general queries.
   max-response-time *seconds*
   By default, the maximum response time for MLD general queries is 10 seconds.

Configuring parameters for MLD general queries and responses for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the MLD general query interval in the VLAN.
   mld-snooping query-interval *interval*
   By default, the MLD general query interval for a VLAN is 125 seconds.
4. Set the maximum response time for MLD general queries in the VLAN.
   mld-snooping max-response-time *seconds*
   By default, the maximum response time for MLD general queries for a VLAN is 10 seconds.

Enabling MLD snooping proxying

About MLD snooping proxying

The device enabled with MLD snooping proxying is called an MLD snooping proxy. The MLD snooping proxy acts as a host to the upstream device. Enabled with MLD snooping querier, the MLD snooping proxy acts as the router to downstream devices and receives report and done messages on behalf of the upstream device. As a best practice, enable MLD snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling MLD snooping proxying

Before you enable MLD snooping proxying for a VLAN, you must first enable MLD snooping globally and enable MLD snooping for the VLAN. MLD snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with MLD snooping querier. For more information about enabling MLD snooping querier, see "Enabling the MLD snooping querier."

Enabling MLD snooping proxying for a VLAN

1. Enter system view.

system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable MLD snooping proxying for the VLAN.

   mld-snooping proxy enable

   By default, MLD snooping proxying is disabled for a VLAN.

Configuring parameters for MLD messages

Configuring source IPv6 addresses for MLD messages

About configuring source IPv6 addresses for MLD messages

You can change the source IPv6 address of the MLD queries sent by an MLD snooping querier. This configuration might affect MLD querier election within the subnet.

You can also change the source IPv6 address of MLD reports or done messages sent by a simulated member host or an MLD snooping proxy.

Configuring the source IPv6 addresses for MLD messages for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Configure the source IPv6 address for MLD general queries.

   mld-snooping general-query source-ip *ipv6-address*

   By default, the source IPv6 address of MLD general queries is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

4. Configure the source IPv6 address for MLD multicast-address-specific queries.

   mld-snooping special-query source-ip *ipv6-address*

   By default, the source IPv6 address of MLD multicast-address-specific queries is one of the following:

   - The source address of MLD general queries if the MLD snooping querier of the VLAN has received MLD general queries.
   - The IPv6 link-local address of the current VLAN interface if the MLD snooping querier does not receive an MLD general query.
   - FE80::02FF:FFFF:FE00:0001 if the MLD snooping querier does not receive an MLD general query and the current VLAN interface does not have an IPv6 link-local address.

5. Configure the source IPv6 address for MLD reports.

   mld-snooping report source-ip *ipv6-address*

   By default, the source IPv6 address of MLD reports is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

6. Configure the source IPv6 address for MLD done messages.

   mld-snooping done source-ip *ipv6-address*

   By default, the source IPv6 address of MLD done messages is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

Setting the 802.1p priority for MLD messages

About the 802.1p priority for MLD messages

When congestion occurs on outgoing ports of the Layer 2 device, it forwards MLD messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to MLD messages that are created or forwarded by the device.

Setting the 802.1p priority for MLD messages globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the 802.1p priority for MLD messages globally.
   dot1p-priority *priority*
   By default, the global 802.1p priority is 6 for MLD messages.

Setting the 802.1p priority for MLD messages for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the 802.1p priority for MLD messages in the VLAN.
   mld-snooping dot1p-priority *priority*
   By default, the 802.1p priority is 6 for MLD messages in a VLAN.

Configuring MLD snooping policies

Configuring an IPv6 multicast group policy

About IPv6 multicast group policies

This feature enables the Layer 2 device to filter MLD reports by using an ACL that specifies the IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that receiver hosts can join. This configuration takes effect on the IPv6 multicast groups that ports join dynamically.

In an IPv6 multicast application, a host sends an unsolicited MLD report when a user requests an IPv6 multicast program. The Layer 2 device uses the IPv6 multicast group policy to filter the MLD report. The host can join the IPv6 multicast group only if the MLD report is permitted by the IPv6 multicast group policy.

Configuring an IPv6 multicast group policy globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Configure an IPv6 multicast group policy globally.
   group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist. Hosts can join any IPv6 multicast groups.

Configuring an IPv6 multicast group policy on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure an IPv6 multicast group policy on the port.
   mld-snooping group-policy *ipv6-acl-number* [**vlan** *vlan-list*]

   By default, no IPv6 multicast group policies exist on a port. Hosts attached to the port can join any IPv6 multicast groups.

Enabling IPv6 multicast source port filtering

About IPv6 multicast source port filtering

This feature enables the Layer 2 device to discard all IPv6 multicast data packets and to accept IPv6 multicast protocol packets. You can enable this feature on ports that connect to only IPv6 multicast receivers.

The configuration made in MLD-snooping view has the same priority over the interface-specific configuration.

Restrictions and guidelines

When IPv6 multicast source port filtering is enabled, the device automatically enables IPv4 multicast source port filtering.

The configuration made in MLD-snooping view has the same priority as the interface-specific configuration, and the most recent configuration takes effect.

Enabling IPv6 multicast source port filtering in MLD-snooping view

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable IPv6 multicast source port filtering globally.
   source-deny port *interface-list*

   By default, IPv6 multicast source port filtering is disabled globally.

Enabling IPv6 multicast source port filtering in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Enable IPv6 multicast source port filtering on the port.
   mld-snooping source-deny

   By default, IPv6 multicast source port filtering is disabled on a port.

Enabling dropping unknown IPv6 multicast data

About dropping unknown IPv6 multicast data

Unknown IPv6 multicast data refers to IPv6 multicast data for which no forwarding entries exist in the MLD snooping forwarding table. This feature enables the device to forward unknown IPv6 multicast data only to the router port. If the device does not have a router port, unknown IPv6 multicast data will be dropped.

If you do not enable this feature, the unknown IPv6 multicast data is flooded in the VLAN to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv6 multicast data is enabled, the device also drops unknown IPv4 multicast data.

When this feature is enabled for a VLAN, the device still forwards unknown IPv6 multicast data out of router ports (except the receiving router port) in this VLAN.

Enabling dropping unknown IPv6 multicast data for a VLAN

1. Enter system view.

   `system-view`
2. Enter VLAN view.

   `vlan` *`vlan-id`*
3. Enable dropping unknown IPv6 multicast data for the VLAN.

   `mld-snooping drop-unknown`

   By default, dropping unknown IPv6 multicast data is disabled. Unknown IPv6 multicast data is flooded.

Enabling MLD report suppression

About MLD report suppression

This feature enables the Layer 2 device to forward only the first MLD report for an IPv6 multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce the multicast traffic.

Procedure

1. Enter system view.

   `system-view`
2. Enter MLD-snooping view.

   `mld-snooping`
3. Enable MLD report suppression.

   `report-aggregation`

   By default, MLD report suppression is enabled.

Setting the maximum number of IPv6 multicast groups on a port

About setting the maximum number of IPv6 multicast groups on a port

You can set the maximum number of IPv6 multicast groups on a port to regulate the port traffic. This feature takes effect only on the IPv6 multicast groups that the port joins dynamically.

If the number of IPv6 multicast groups on a port exceeds the limit, the system removes all the forwarding entries related to that port. In this case, the receiver hosts attached to that port can join IPv6 multicast groups again before the number of IPv6 multicast groups on the port reaches the limit. When the number of IPv6 multicast groups on the port reaches the limit, the port automatically drops MLD reports for new IPv6 multicast groups.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the maximum number of IPv6 multicast groups on the port.
   mld-snooping group-limit *limit* [**vlan** *vlan-list*]
   By default, no limit is placed on the maximum number of IPv6 multicast groups on a port.

Enabling IPv6 multicast group replacement

About IPv6 multicast group replacement

When IPv6 multicast group replacement is enabled, the port does not drop MLD reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves an IPv6 multicast group that has the lowest IPv6 address and joins the new group contained in the MLD report. The IPv6 multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that the port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the MLD snooping forwarding entries on the device reaches the upper limit.
- The IPv6 multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling IPv6 multicast group replacement globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable IPv6 multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled globally.

Enabling IPv6 multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*

- Enter Layer 2 aggregate interface view.
  interface bridge-aggregation *interface-number*

3. Enable IPv6 multicast group replacement on the port.
   mld-snooping overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled on a port.

Enabling host tracking

About host tracking

This feature enables the Layer 2 device to record information about member hosts that are receiving IPv6 multicast data. The information includes IPv6 addresses of the hosts, length of time elapsed since the hosts joined IPv6 multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Enabling host tracking globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable host tracking globally.
   host-tracking
   By default, host tracking is disabled globally.

Enabling host tracking in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable host tracking for the VLAN.
   mld-snooping host-tracking
   By default, host tracking is disabled in a VLAN.

Setting the DSCP value for outgoing MLD protocol packets

About the DSCP value for outgoing MLD protocol packets

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Set the DSCP value for outgoing MLD protocol packets.
   dscp *dscp-value*

By default, the DSCP value is 48 for outgoing MLD protocol packets.

Display and maintenance commands for MLD snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display Layer 2 IPv6 multicast fast forwarding entries.	**display ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*ipv6-source-address* | *ipv6-group-address*] * [**slot** *slot-number*]
Display information about Layer 2 IPv6 multicast groups.	**display ipv6 l2-multicast ip** [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IPv6 multicast group entries.	**display ipv6 l2-multicast ip forwarding** [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display information about Layer 2 IPv6 MAC multicast groups.	**display ipv6 l2-multicast mac** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IPv6 MAC multicast group entries.	**display ipv6 l2-multicast mac forwarding** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display static IPv6 multicast MAC address entries.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]
Display MLD snooping status.	**display mld-snooping** [**global** | **vlan** *vlan-id*]
Display dynamic MLD snooping group entries.	**display mld-snooping group** [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id*] [**interface** *interface-type interface-number* | [**verbose**] [**slot** *slot-number*]]
Display host tracking information.	**display mld-snooping host-tracking vlan** *vlan-id* **group** *ipv6-group-address* [**source** *ipv6-source-address*] [**slot** *slot-number*]
Display dynamic router port information.	**display mld-snooping router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static MLD snooping group entries.	**display mld-snooping static-group** [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static router port information.	**display mld-snooping static-router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display statistics for the MLD messages and IPv6 PIM hello	**display mld-snooping statistics**

Task	Command
messages learned through MLD snooping.	
Clear Layer 2 IPv6 multicast fast forwarding entries.	**reset ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] { { *ipv6-source-address* | *ipv6-group-address* } * | **all** } [**slot** *slot-number*]
Clear dynamic MLD snooping group entries.	**reset mld-snooping group** { *ipv6-group-address* [*ipv6-source-address*] | **all** } [**vlan** *vlan-id*]
Clear dynamic router port information.	**reset mld-snooping router-port** { **all** | **vlan** *vlan-id* }
Clear statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping.	**reset mld-snooping statistics**

MLD snooping configuration examples

Example: Configuring VLAN-based IPv6 group policy and simulated joining

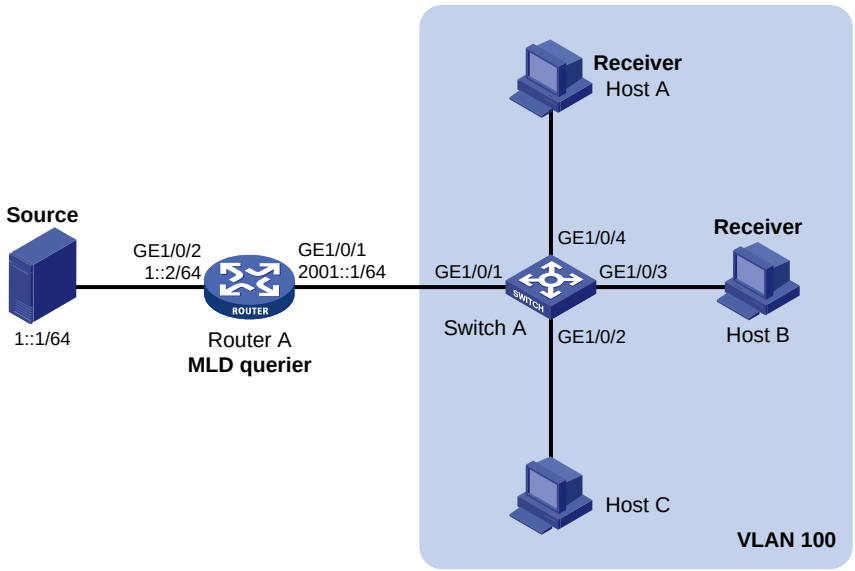
Network configuration

As shown in Figure 4, Router A runs MLDv1 and acts as the MLD querier, and Switch A runs MLDv1 snooping.

Configure the group policy and simulate joining to meet the following requirements:

- Host A and Host B receive only the IPv6 multicast data addressed to the IPv6 multicast group FF1E::101. IPv6 multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown IPv6 multicast data instead of flooding it in VLAN 100.

Figure 4 Network diagram



Procedure

1. Assign an IPv6 address and prefix length to each interface, as shown in Figure 4. (Details not shown.)
2. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```
3. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping, and enable dropping IPv6 unknown multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping drop-unknown
   [SwitchA-vlan100] quit
   ```

Configure an IPv6 multicast group policy so that hosts in VLAN 100 can join only IPv6 multicast group FF1E::101.

```
[SwitchA] acl ipv6 basic 2001
[SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
[SwitchA-acl-ipv6-basic-2001] quit
[SwitchA] mld-snooping
[SwitchA–mld-snooping] group-policy 2001 vlan 100
[SwitchA–mld-snooping] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts to join IPv6 multicast group FF1E::101.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping host-join ff1e::101 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] mld-snooping host-join ff1e::101 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast groups FF1E::101 and FF1E::202. (Details not shown.)

Display dynamic MLD snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                              (00:03:23)
      GE1/0/4                              (00:04:10)
```

The output shows the following information:

- Host A and Host B have joined IPv6 multicast group FF1E::101 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join the multicast group FF1E::202.

Example: Configuring VLAN-based static ports

Network configuration

As shown in Figure 5:

- Router A runs MLDv1 and acts as the MLD querier. Switch A, Switch B, and Switch C run MLDv1 snooping.
- Host A and Host C are permanent receivers of IPv6 multicast group FF1E::101.

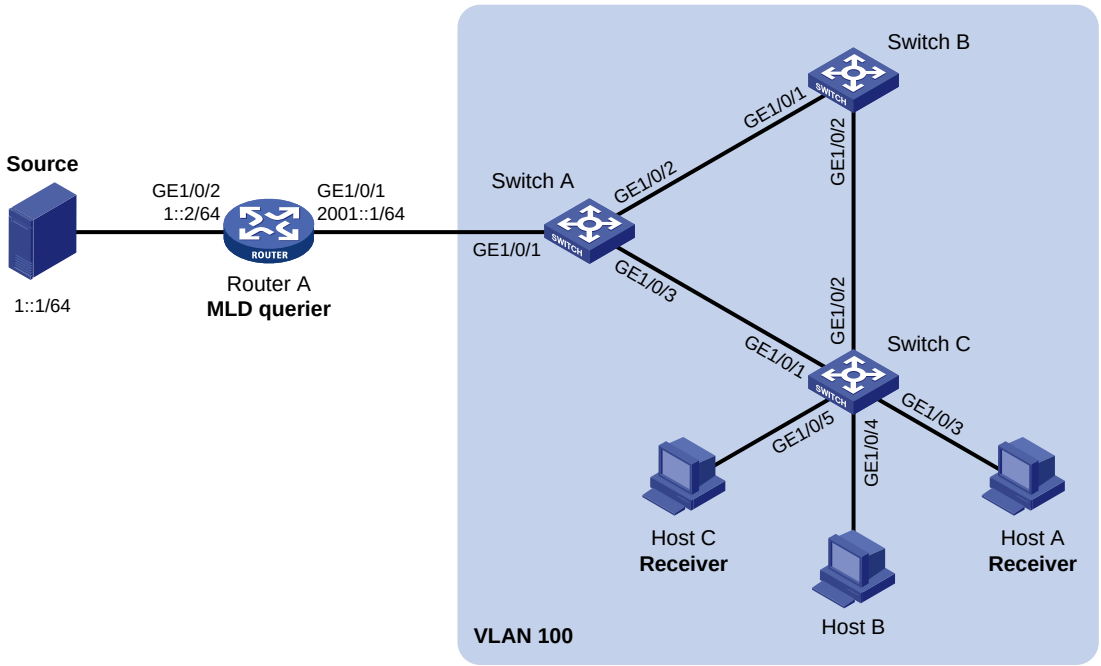
Configure static ports to meet the following requirements:

- To enhance the reliability of IPv6 multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for IPv6 multicast group FF1E::101.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. IPv6 multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one MLD query-response cycle must be completed before IPv6 multicast data flows to the receivers

along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, IPv6 multicast data can flow to the receivers nearly uninterrupted along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 5 Network diagram



Procedure

1. Assign an IPv6 address and prefix length to each interface, as shown in Figure 5. (Details not shown.)
2. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```
3. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable MLD snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

4. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable MLD snooping for VLAN 100.

```
[SwitchB-vlan100] mld-snooping enable
[SwitchB-vlan100] quit
```

5. Configure Switch C:

Enable the MLD snooping feature.

```
<SwitchC> system-view
[SwitchC] mld-snooping
[SwitchC-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable MLD snooping for VLAN 100.

```
[SwitchC-vlan100] mld-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for IPv6 multicast group FF1E::101.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
```

```
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

Display static MLD snooping group entries in VLAN 100 on Switch C.

```
[SwitchC] display mld-snooping static-group vlan 100
Total 1 entries).

VLAN 100: Total 1 entries).
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of IPv6 multicast group FF1E::101.

Example: Configuring the VLAN-based MLD snooping querier

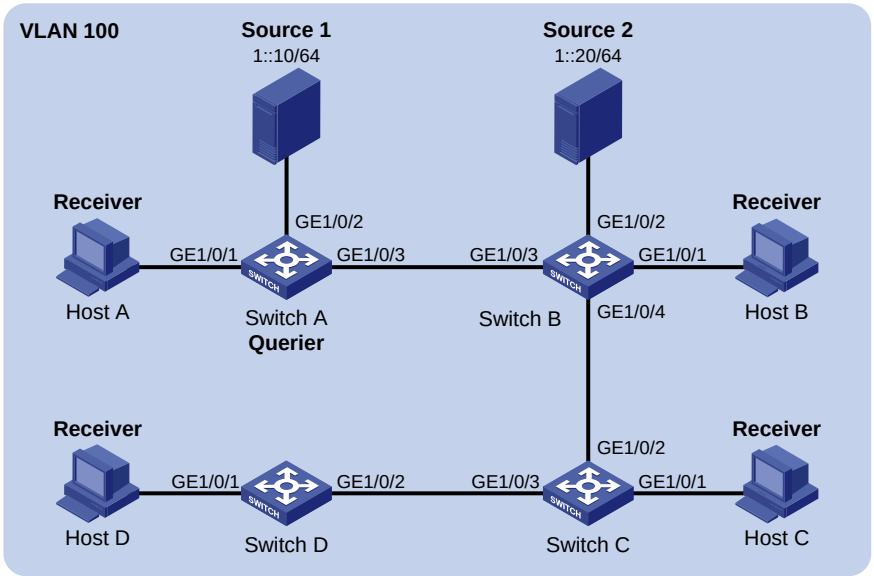
Network configuration

As shown in Figure 6:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to IPv6 multicast groups FF1E::101 and FF1E::102, respectively.
- Host A and Host C are receivers of IPv6 multicast group FF1E::101, and Host B and Host D are receivers of IPv6 multicast group FF1E::102.
- All host receivers run MLDv1 and all switches run MLDv1 snooping. Switch A (which is close to the multicast sources) acts as the MLD snooping querier.

To prevent the switches from flooding unknown IPv6 packets in the VLAN, enable all the switches to drop unknown IPv6 multicast packets.

Figure 6 Network diagram



Procedure

1. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping drop-unknown
   ```

   # Configure Switch A as the MLD snooping querier.

   ```
   [SwitchA-vlan100] MLD-snooping querier
   [SwitchA-vlan100] quit
   ```

2. Configure Switch B:

   # Enable the MLD snooping feature.

   ```
   <SwitchB> system-view
   [SwitchB] mld-snooping
   [SwitchB-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchB] vlan 100
   [SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

   ```
   [SwitchB-vlan100] mld-snooping enable
   [SwitchB-vlan100] mld-snooping drop-unknown
   [SwitchB-vlan100] quit
   ```

3. Configure Switch C:

   # Enable the MLD snooping feature.

   ```
   <SwitchC> system-view
   [SwitchC] mld-snooping
   [SwitchC-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchC] vlan 100
   [SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

   ```
   [SwitchC-vlan100] mld-snooping enable
   [SwitchC-vlan100] mld-snooping drop-unknown
   [SwitchC-vlan100] quit
   ```

4. Configure Switch D:

   # Enable the MLD snooping feature.

   ```
   <SwitchD> system-view
   [SwitchD] mld-snooping
   [SwitchD-mld-snooping] quit
   ```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchD-vlan100] mld-snooping enable
[SwitchD-vlan100] mld-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping on Switch B.

```
[SwitchB] display mld-snooping statistics
Received MLD general queries:  3
Received MLDv1 specific queries:  0
Received MLDv1 reports:  12
Received MLD dones:  0
Sent     MLDv1 specific queries:  0
Received MLDv2 reports:  0
Received MLDv2 reports with right and wrong records:  0
Received MLDv2 specific queries:  0
Received MLDv2 specific sg queries:  0
Sent     MLDv2 specific queries:  0
Sent     MLDv2 specific sg queries:  0
Received IPv6 PIM hello:  0
Received error MLD messages:  0
```

The output shows that all switches except Switch A can receive the MLD general queries after Switch A acts as the MLD snooping querier.

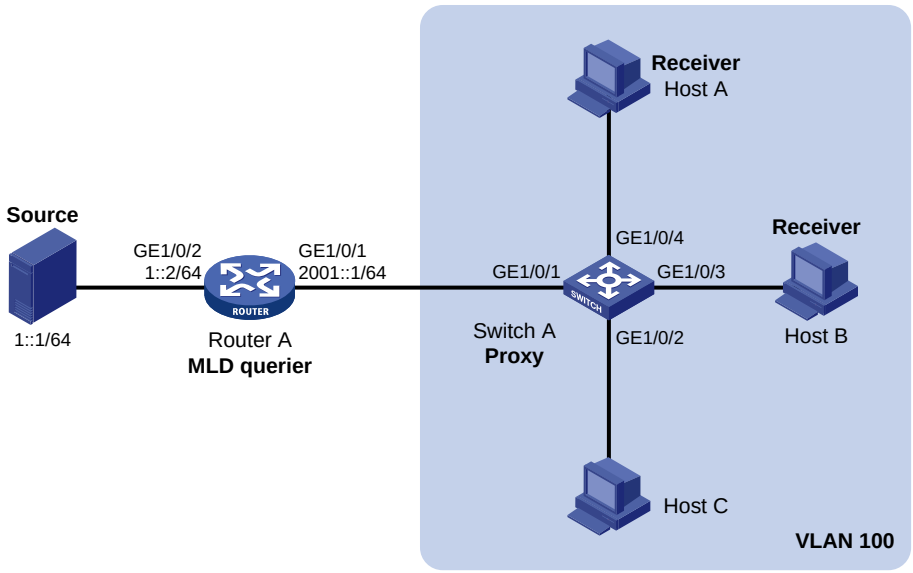
Example: Configuring VLAN-based MLD snooping proxying

Network configuration

As shown in Figure 7, Router A runs MLDv1 and acts as the MLD querier. Switch A runs MLDv1 snooping. Configure MLD snooping proxying so that Switch A can perform the following actions:

- Forward MLD report and done messages to Router A.
- Respond to MLD queries sent by Router A and forward the queries to downstream hosts.

Figure 7 Network diagram



Procedure

1. Assign an IPv6 address and subnet mask to each interface, as shown in Figure 7. (Details not shown.)
2. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD and IPv6 PIM-DM on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

3. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping and MLD snooping proxying for the VLAN.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping proxy enable
   [SwitchA-vlan100] quit
   ```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
 Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                                  (00:04:09)
      GE1/0/4                                  (00:03:06)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of IPv6 multicast group FF1E::101. Host A and Host B will receive IPv6 multicast data for the group.

Display MLD group membership information on Router A.

```
[RouterA] display mld group
MLD groups in total: 1
 GigabitEthernet1/0/1(2001::1):
  MLD groups reported in total: 1
   Group address: FF1E::101
    Last reporter: FE80::2FF:FFFF:FE00:1
    Uptime: 00:00:31
    Expires: 00:03:48
```

Send an MLD done message from Host A to leave IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of IPv6 multicast group FF1E::101. Only Host B will receive IPv6 multicast data for the group.

Troubleshooting MLD snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function through MLD snooping.

Solution

To resolve the problem:

1. Use the **display mld-snooping** command to display MLD snooping status.

2. If MLD snooping is not enabled, use the **mld-snooping** command in system view to enable the MLD snooping feature. Then, use the **mld-snooping enable** command in VLAN view to enable MLD snooping for the VLAN.
3. If MLD snooping is enabled globally but not enabled for the VLAN, use the **mld-snooping enable** command in VLAN view to enable MLD snooping for the VLAN.
4. If the problem persists, contact H3C Support.

IPv6 multicast group policy does not work

Symptom

Hosts can receive IPv6 multicast data for IPv6 multicast groups that are not permitted by the IPv6 multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl ipv6** command to verify that the configured IPv6 ACL meets the IPv6 multicast group policy requirements.
2. Use the **display this** command in MLD-snooping view or in interface view to verify that the correct IPv6 multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **mld-snooping group-policy** command to apply the correct IPv6 multicast group policy.
3. Use the **display mld-snooping** command to verify that dropping unknown IPv6 multicast data is enabled. If it is not, use the **mld-snooping drop-unknown** command to enable dropping unknown IPv6 multicast data.
4. If the problem persists, contact H3C Support.

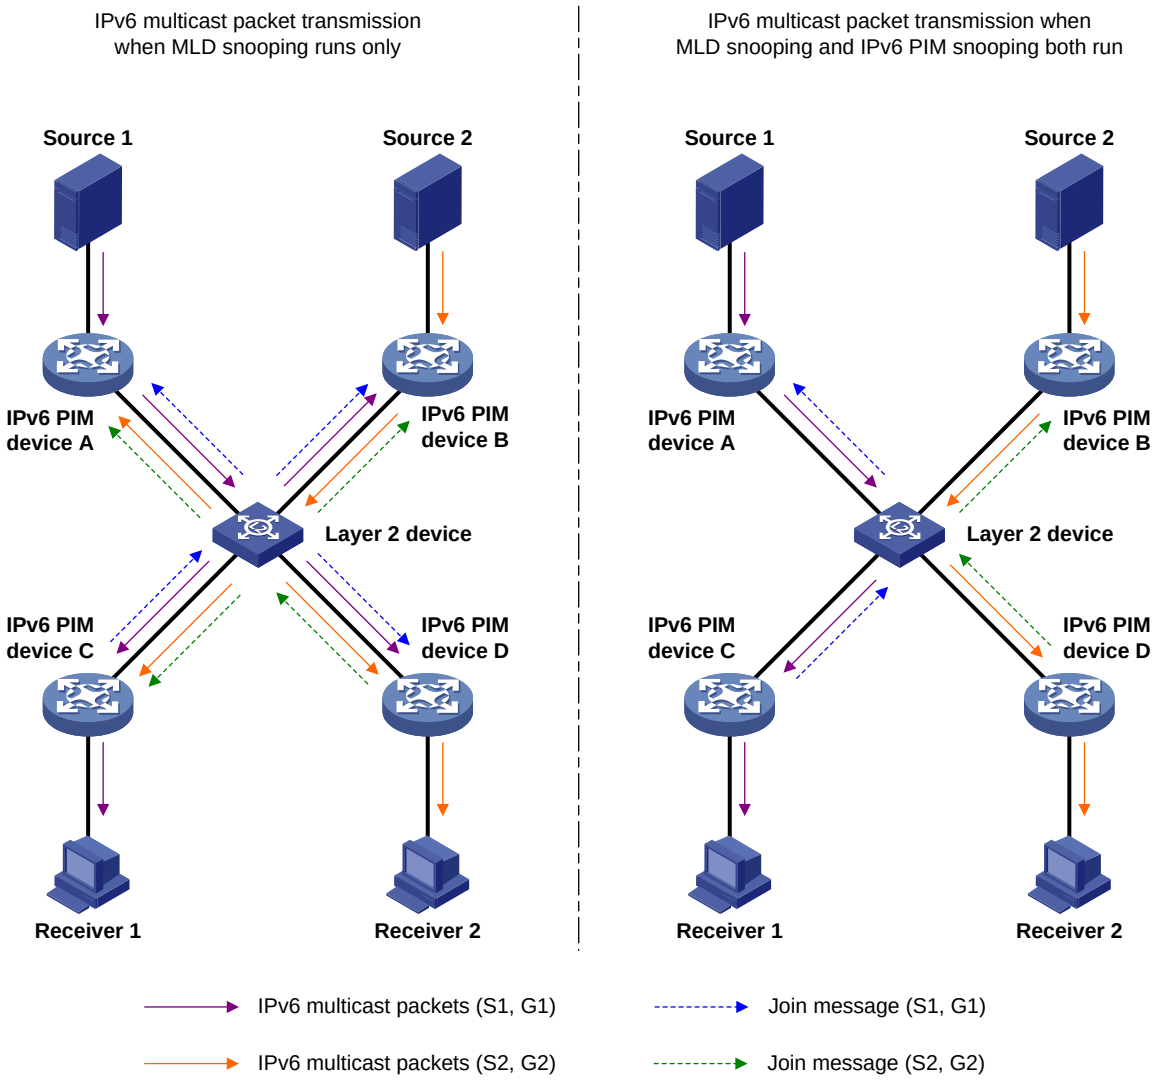
Configuring IPv6 PIM snooping

About IPv6 PIM snooping

IPv6 PIM snooping runs on Layer 2 devices. It works with MLD snooping to analyze received IPv6 PIM messages, and adds the ports that are interested in specific multicast data to an IPv6 PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with IPv6 PIM snooping



As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the IPv6 PIM-capable routers are in the same VLAN.

- When the Layer 2 switch only runs MLD snooping, it performs the following actions:
  a. Maintains the router ports according to the received IPv6 PIM hello messages that IPv6 PIM-capable routers send.

b. Floods all other types of received IPv6 PIM messages except PIM hello messages in the VLAN.

c. Forwards all multicast data to all router ports in the VLAN.

Each IPv6 PIM-capable router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all IPv6 PIM messages except IPv6 PIM hello messages.

- When the Layer 2 switch runs both MLD snooping and IPv6 PIM snooping, it performs the following actions:

  a. Examines whether an IPv6 PIM router is interested in the multicast data destined for a multicast group according to the received IPv6 PIM messages that the router sends.

  b. Adds only the ports that connect to the router and are interested in the data to an IPv6 PIM snooping routing entry.

  c. Forwards IPv6 PIM messages and the multicast data only to the router according to the multicast forwarding entry, which saves network bandwidth.

For more information about MLD snooping and the router port, see "Configuring MLD snooping."

Restrictions and guidelines: IPv6 PIM snooping configuration

As a best practice, do not configure IPv6 PIM snooping for secondary VLANs because IPv6 PIM snooping does not take effect on secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

After you enable IPv6 PIM snooping for a VLAN, IPv6 PIM snooping takes effect only on ports that belong to the VLAN.

IPv6 PIM snooping tasks at a glance

To configure IPv6 PIM snooping, perform the following tasks:

1. Enabling IPv6 PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling IPv6 PIM snooping

1. Enter system view.
   system-view
2. Enable the MLD snooping feature and enter MLD -snooping view.
   mld-snooping
   By default, MLD snooping is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter VLAN view.
   vlan *vlan-id*
5. Enable MLD snooping for the VLAN.

mld-snooping enable

By default, MLD snooping is disabled in a VLAN.

For more information about this command, see *IP Multicast Command Reference*.

6. Enable IPv6 PIM snooping for the VLAN.

   ipv6 pim-snooping enable

   By default, IPv6 PIM snooping is disabled in a VLAN.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 IPv6 multicast data interruption caused by the aging of IPv6 PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives an IPv6 PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives an IPv6 PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global neighbor ports after a master/subordinate switchover.

   pim-snooping graceful-restart neighbor-aging-time *seconds*

   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.

   pim-snooping graceful-restart join-aging-time *seconds*

   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for IPv6 PIM snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PIM snooping neighbor information.	**display ipv6 pim-snooping neighbor** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping router port information.	**display ipv6 pim-snooping router-port** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping routing entries.	**display ipv6 pim-snooping routing-table** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**display ipv6 pim-snooping statistics**
Clear statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**reset ipv6 pim-snooping statistics**

IPv6 PIM snooping configuration examples

Example: Configuring IPv6 PIM snooping

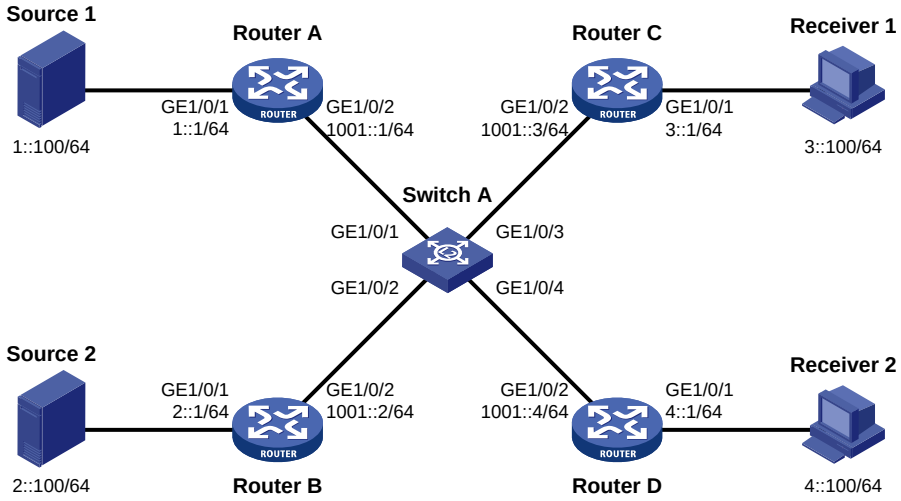
Network configuration

As shown in Figure 2:

- OSPFv3 runs on the network.
- Source 1 and Source 2 send IPv6 multicast data to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Receiver 1 and Receiver 2 belong to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Router C and Router D run MLD on GigabitEthernet 1/0/1.
- Router A, Router B, Router C, and Router D run IPv6 PIM-SM. GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure MLD snooping and IPv6 PIM snooping on Switch A. Then, Switch A forwards IPv6 PIM protocol packets and IPv6 multicast data packets only to routers that are connected to receivers.

Figure 2 Network diagram



Procedure

1. Assign an IPv6 address and prefix length to each interface, as shown in Figure 2. (Details not shown.)
2. Configure OSPFv3 on the routers. (Details not shown.)
3. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable IPv6 PIM-SM on each interface.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] ipv6 pim sm
   [RouterA-GigabitEthernet1/0/1] quit
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim sm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

   # Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

   ```
   [RouterA] ipv6 pim
   [RouterA-pim6] c-bsr 1001::1
   [RouterA-pim6] c-rp 1001::1
   [RouterA-pim6] quit
   ```

4. Configure Router B:

   # Enable IPv6 multicast routing.

   ```
   <RouterB> system-view
   [RouterB] ipv6 multicast routing
   [RouterB-mrib6] quit
   ```

   # Enable IPv6 PIM-SM on each interface.

   ```
   [RouterB] interface gigabitethernet 1/0/1
   [RouterB-GigabitEthernet1/0/1] ipv6 pim sm
   [RouterB-GigabitEthernet1/0/1] quit
   [RouterB] interface gigabitethernet 1/0/2
   ```

```
[RouterB-GigabitEthernet1/0/2] ipv6 pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

5. Configure Router C:

Enable IPv6 multicast routing.

```
<RouterC> system-view
[RouterC] ipv6 multicast routing
[RouterC-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] mld enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] ipv6 pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

6. Configure Router D:

Enable IPv6 multicast routing.

```
<RouterD> system-view
[RouterD] ipv6 multicast routing
[RouterD-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] mld enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] ipv6 pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

7. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping and IPv6 PIM snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] ipv6 pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display IPv6 PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping neighbor vlan 100
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
```

```
  FE80::1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  FE80::2
   Ports (1 in total):
      GE1/0/2                 (00:32:43)
  FE80::3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  FE80::4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are IPv6 PIM snooping neighbors.

On Switch A, display IPv6 PIM snooping routing entries for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping routing-table vlan 100
Total 2 entries.
FSM flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 2 entries.
  (*, FF1E::101)
    Upstream neighbor: FE80::1
      Upstream ports (1 in total):
        GE1/0/1
      Downstream ports (1 in total):
        GE1/0/3
          Expires: 00:03:01, FSM: J
  (*, FF2E::101)
    Upstream neighbor: FE80::2
      Upstream ports (1 in total):
        GE1/0/2
      Downstream ports (1 in total):
        GE1/0/4
          Expires: 00:03:01, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for IPv6 multicast group FF1E::101 to only Router C.
- Switch A will forward the multicast data intended for IPv6 multicast group FF2E::101 to only Router D.

Troubleshooting IPv6 PIM snooping

This section describes common IPv6 PIM snooping problems and how to troubleshoot them.

IPv6 PIM snooping does not work on a Layer 2 device

Symptom

IPv6 PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about MLD snooping and IPv6 PIM snooping.
2. If MLD snooping is not enabled, enable the MLD snooping feature, and then enable MLD snooping and IPv6 PIM snooping for the VLAN.
3. If IPv6 PIM snooping is not enabled, enable IPv6 PIM snooping for the VLAN.
4. If the problem persists, contact H3C Support.

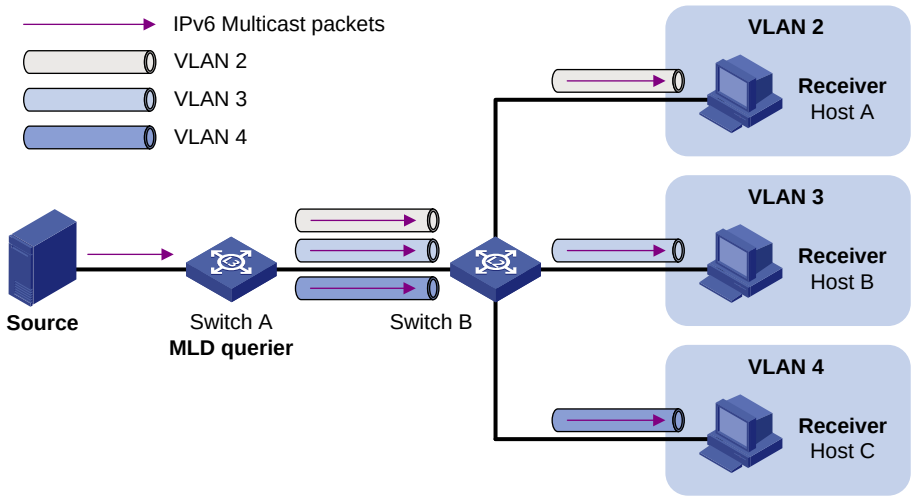
Contents

Configuring IPv6 multicast VLANs

IPv6 multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in different VLANs and the same IPv6 multicast group. When Switch A (Layer 3 device) receives IPv6 multicast data for that group, it forwards three copies of the data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the IPv6 multicast VLAN feature



After an IPv6 multicast VLAN is configured on Switch B, Switch A sends one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. This saves network bandwidth and lessens the burden on the Layer 3 device.

IPv6 multicast VLAN methods

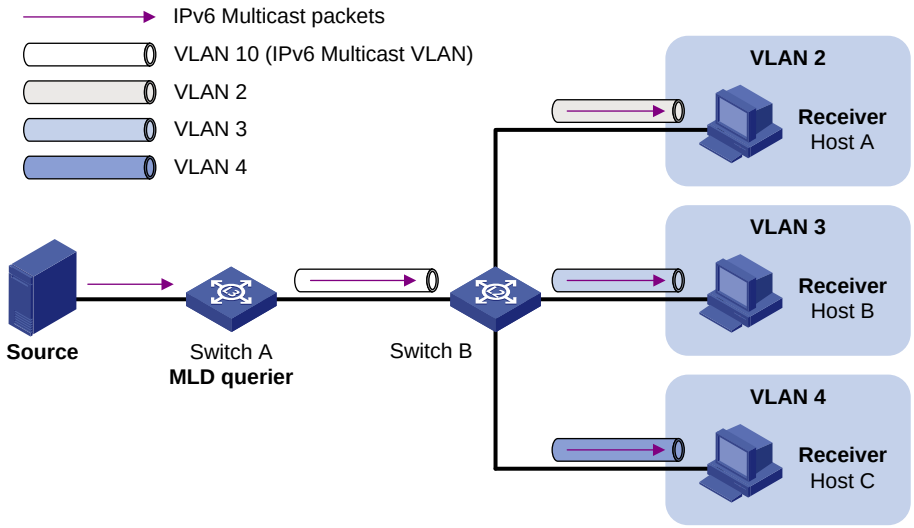
IPv6 multicast VLANs support sub-VLAN-based IPv6 multicast VLANs and port-based IPv6 multicast VLANs.

Sub-VLAN-based IPv6 multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- MLD snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



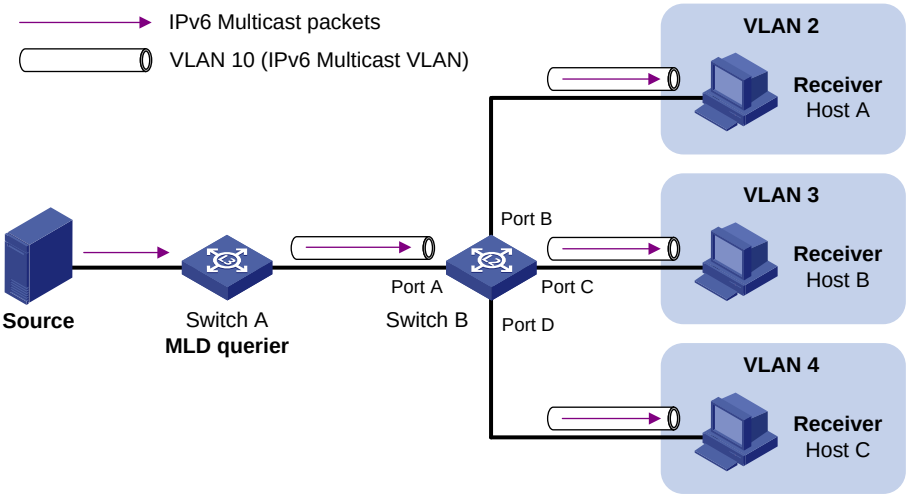
MLD snooping manages router ports in the IPv6 multicast VLAN and member ports in each sub-VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN of the IPv6 multicast VLAN.

Port-based IPv6 multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively. All the user ports (ports with attached hosts) on Switch B are hybrid ports.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. All the user ports are assigned to VLAN 10.
- MLD snooping is enabled for the IPv6 multicast VLAN and its sub-VLANs.

Figure 3 Port-based IPv6 multicast VLAN



MLD snooping manages the router ports and member ports in the IPv6 multicast VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each user port in the IPv6 multicast VLAN.

Restrictions and guidelines: IPv6 multicast VLAN configuration

The VLAN to be configured as an IPv6 multicast VLAN must exist.

If you have configured both a sub-VLAN-based IPv6 multicast VLAN and a port-based IPv6 multicast VLAN on a device, the port-based IPv6 multicast VLAN configuration takes effect.

The IPv6 multicast VLAN feature does not take effect on secondary VLANs. As a best practice, do not configure the IPv6 multicast VLAN feature for secondary VLANs. For more information about secondary VLAN, see *Layer 2—LAN Switching Configuration Guide.*

Configuring a sub-VLAN-based IPv6 multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of an IPv6 multicast VLAN must exist and cannot be IPv6 multicast VLANs or sub-VLANs of any other IPv6 multicast VLANs.

Prerequisites

Before you configure a sub-VLAN-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN, and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.

   system-view
2. Configure a VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.

   ipv6 multicast-vlan *vlan-id*

   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign VLANs to the IPv6 multicast VLAN as sub-VLANs.

   subvlan *vlan-list*

   By default, an IPv6 multicast VLAN does not have any sub-VLANs.

Configuring a port-based IPv6 multicast VLAN

Restrictions and guidelines

You can assign user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view or assign a user port to an IPv6 multicast VLAN in interface view.

A user port can belong to only one IPv6 multicast VLAN.

Prerequisites

Before you configure a port-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN.

- Enable MLD snooping for all the VLANs that contain the multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the IPv6 multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign ports to the IPv6 multicast VLAN as user ports.
   port *interface-list*

Assigning user ports to an IPv6 multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the IPv6 multicast VLAN as a user port.
   ipv6 port multicast-vlan *vlan-id*
   By default, a port does not belong to any IPv6 multicast VLAN.

Setting the maximum number of IPv6 multicast VLAN forwarding entries

About setting the maximum number of IPv6 multicast VLAN forwarding entries

You can set the maximum number of IPv6 multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create IPv6 multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of IPv6 multicast VLAN forwarding entries.
   ipv6 multicast-vlan entry-limit *limit*
   The default setting varies by device model. For more information, see the command reference.

Display and maintenance commands for IPv6 multicast VLANs

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IPv6 multicast VLANs.	**display ipv6 multicast-vlan** [*vlan-id*]
Display IPv6 multicast VLAN forwarding entries.	**display ipv6 multicast-vlan forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about information about IPv6 multicast group entries in IPv6 multicast VLANs.	**display ipv6 multicast-vlan group** [*ipv6-source-address* | *ipv6-group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear IPv6 multicast group entries in IPv6 multicast VLANs.	**reset ipv6 multicast-vlan group** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **vlan** *vlan-id*] *

IPv6 multicast VLAN configuration examples

Example: Configuring sub-VLAN-based IPv6 multicast VLAN

Network configuration

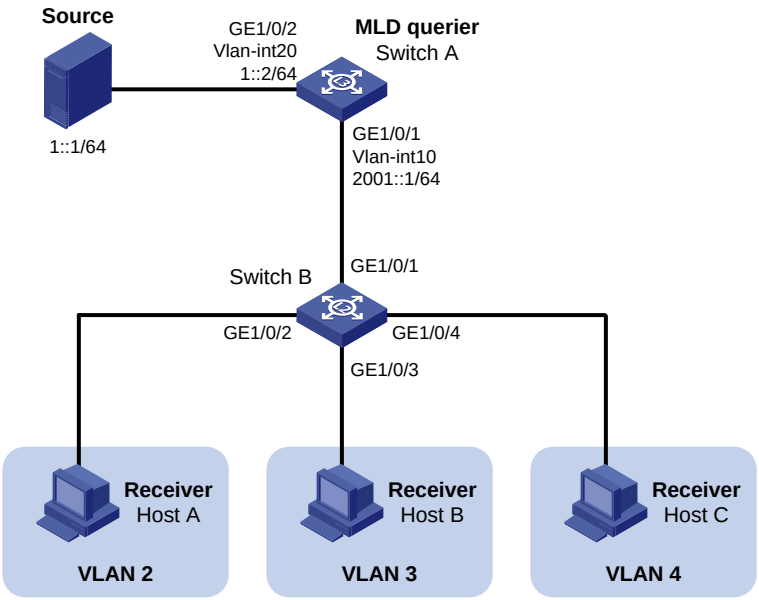
As shown in Figure 4:

- Layer 3 device Switch A runs MLD and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 4 Network diagram



Procedure

1. Configure Switch A:

Enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 1::2 64
[SwitchA-Vlan-interface20] ipv6 pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10.

```
[SwitchA] vlan 10
[SwitchA-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] port link-type hybrid
[SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchA-GigabitEthernet1/0/1] quit
```

Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] ipv6 multicast-vlan 10
[SwitchB-ipv6-mvlan-10] subvlan 2 to 4
[SwitchB-ipv6-mvlan-10] quit
```

Verifying the configuration

Display information about all IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about IPv6 multicast groups in IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan group
Total 1 entries.

IPv6 multicast VLAN 10: Total 1 entries.
  (::, FF1E::101)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that IPv6 multicast group FF1E::101 belongs to IPv6 multicast VLAN 10. IPv6 multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the IPv6 multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based IPv6 multicast VLAN

Network configuration

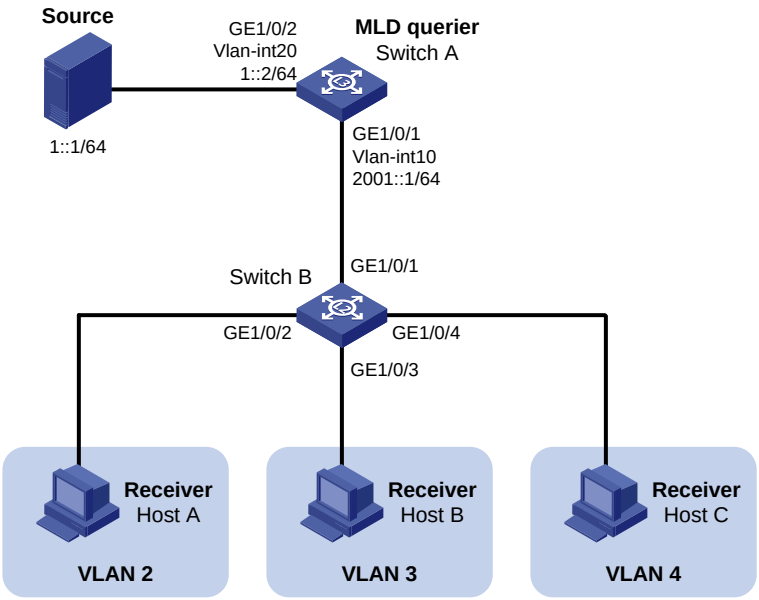
As shown in Figure 5:

- Layer 3 device Switch A runs MLDv1 and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 5 Network diagram



Procedure

1. Configure Switch A:

   # Enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 1::2 64
[SwitchA-Vlan-interface20] ipv6 pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

```
[SwitchA] vlan 10
[SwitchA-vlan10] port gigabitethernet 1/0/1
[SwitchA-vlan10] quit
```

Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN.

```
[SwitchB] ipv6 multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-ipv6-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-ipv6-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] ipv6 port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic MLD snooping forwarding entries on Switch B.

```
[SwitchB] display mld-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
```

```
(::, FF1E::101)
  Host slots (0 in total):
  Host ports (3 in total):
    GE1/0/2         (00:03:23)
    GE1/0/3         (00:04:07)
    GE1/0/4         (00:04:16)
```

The output shows that MLD snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the IPv6 multicast data of VLAN 10 through these user ports.

ACL and QoS Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

New H3C Technologies Co., Ltd.
http://www.h3c.com

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This configuration guide describes ACL and QoS fundamentals and configuration procedures, including ACL, QoS, data buffer, and time range.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring ACLs

About ACLs

An access control list (ACL) is a set of rules for identifying traffic based on criteria such as source IP address, destination IP address, and port number. The rules are also called permit or deny statements.

ACLs are primarily used for packet filtering. You can also use ACLs in QoS, security, routing, and other modules for identifying traffic. The packet drop or forwarding decisions depend on the modules that use ACLs.

Numbering and naming ACLs

When creating an ACL, you must assign it a number or name for identification. You can specify an existing ACL by its number or name. Each ACL type has a unique range of ACL numbers.

For basic or advanced ACLs with the same number, you must use the **`ipv6`** keyword to distinguish them. For ACLs with the same name, you must use the **`ipv6`** or **`mac`** keywords to distinguish them.

ACL types

Type	ACL number	IP version	Match criteria
Basic ACLs	2000 to 2999	IPv4	Source IPv4 address.
		IPv6	Source IPv6 address.
Advanced ACLs	3000 to 3999	IPv4	Source IPv4 address, destination IPv4 address, packet priority, protocol number, and other Layer 3 and Layer 4 header fields.
		IPv6	Source IPv6 address, destination IPv6 address, packet priority, protocol number, and other Layer 3 and Layer 4 header fields.
Layer 2 ACLs	4000 to 4999	IPv4 and IPv6	Layer 2 header fields, such as source and destination MAC addresses, 802.1p priority, and link layer protocol type.

Match order

The rules in an ACL are sorted in a specific order. When a packet matches a rule, the device stops the match process and performs the action defined in the rule. If an ACL contains overlapping or conflicting rules, the matching result and action to take depend on the rule order.

The following ACL match orders are available:

- **config**—Sorts ACL rules in ascending order of rule ID. A rule with a lower ID is matched before a rule with a higher ID. If you use this method, check the rules and their order carefully.
- **auto**—Sorts ACL rules in depth-first order. Depth-first ordering makes sure any subset of a rule is always matched before the rule. Table 1 lists the sequence of tie breakers that depth-first ordering uses to sort rules for each type of ACL.

Table 1 Sort ACL rules in depth-first order

ACL type	Sequence of tie breakers
IPv4 basic ACL	**1.** More 0s in the source IPv4 address wildcard (more 0s means a narrower IPv4 address range). **2.** Rule configured earlier.
IPv4 advanced ACL	**1.** Specific protocol number. **2.** More 0s in the source IPv4 address wildcard mask. **3.** More 0s in the destination IPv4 address wildcard. **4.** Narrower TCP/UDP service port number range. **5.** Rule configured earlier.
IPv6 basic ACL	**1.** Longer prefix for the source IPv6 address (a longer prefix means a narrower IPv6 address range). **2.** Rule configured earlier.
IPv6 advanced ACL	**1.** Specific protocol number. **2.** Longer prefix for the source IPv6 address. **3.** Longer prefix for the destination IPv6 address. **4.** Narrower TCP/UDP service port number range. **5.** Rule configured earlier.
Layer 2 ACL	**1.** More 1s in the source MAC address mask (more 1s means a smaller MAC address). **2.** More 1s in the destination MAC address mask. **3.** Rule configured earlier.

A wildcard mask, also called an inverse mask, is a 32-bit binary number represented in dotted decimal notation. In contrast to a network mask, the 0 bits in a wildcard mask represent "do care" bits, and the 1 bits represent "don't care" bits. If the "do care" bits in an IP address are identical to the "do care" bits in an IP address criterion, the IP address matches the criterion. All "don't care" bits are ignored. The 0s and 1s in a wildcard mask can be noncontiguous. For example, 0.255.0.255 is a valid wildcard mask.

Rule numbering

ACL rules can be manually numbered or automatically numbered. This section describes how automatic ACL rule numbering works.

Rule numbering step

If you do not assign an ID to the rule you are creating, the system automatically assigns it a rule ID. The rule numbering step sets the increment by which the system automatically numbers rules. For example, the default ACL rule numbering step is 5. If you do not assign IDs to rules you are creating, they are automatically numbered 0, 5, 10, 15, and so on. The wider the numbering step, the more rules you can insert between two rules.

By introducing a gap between rules rather than contiguously numbering rules, you have the flexibility of inserting rules in an ACL. This feature is important for a config-order ACL, where ACL rules are matched in ascending order of rule ID.

The rule numbering step sets the increment by which the system numbers rules automatically. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 12, the rule is numbered 15.

The wider the numbering step, the more rules you can insert between two rules. Whenever the step or start rule ID changes, the rules are renumbered, starting from the start rule ID. For example, if there are five rules numbered 0, 5, 9, 10, and 15, changing the step from 5 to 2 causes the rules to be renumbered 0, 2, 4, 6, and 8.

Automatic rule numbering and renumbering

The ID automatically assigned to an ACL rule takes the nearest higher multiple of the numbering step to the current highest rule ID, starting with 0.

For example, if the step is 5, and there are five rules numbered 0, 5, 9, 10, and 12, the newly defined rule is numbered 15. If the ACL does not contain a rule, the first rule is numbered 0.

Whenever the step changes, the rules are renumbered, starting from 0. For example, changing the step from 5 to 2 renumbers rules 5, 10, 13, and 15 as rules 0, 2, 4, and 6.

For an ACL of the match order **auto**, rules are sorted in depth-first order, and are renumbered based on the match order. For example, rules are in the match order of 0, 10, and 5. Changing the numbering step to 2 renumbers rules 0, 10, and 5 (not 0, 5, and 10) as rules 0, 2, 4.

Fragment filtering with ACLs

Traditional packet filtering matches only first fragments of packets, and allows all subsequent non-first fragments to pass through. Attackers can fabricate non-first fragments to attack networks.

To avoid risks, the ACL feature is designed as follows:

- Filters all fragments by default, including non-first fragments.
- Allows for matching criteria modification for efficiency. For example, you can configure the ACL to filter only non-first fragments.

Restrictions and guidelines: ACL configuration

- If you create a numbered ACL, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **number** *acl-number*.
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } *acl-number*.
- If you create a ACL by using the **acl** [**ipv6**] **number** *acl-number* **name** *acl-name* command, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **name** *acl-name* (for only basic ACLs and advanced ACLs).
  - **acl** [**ipv6**] **number** *acl-number* [**name** *acl-name*].
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac**] } **name** *acl-name*.
- If you create a named ACL by using the **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name* command, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **name** *acl-name* (for only basic ACLs and advanced ACLs).
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name*.
- Matching packets are forwarded through slow forwarding if an ACL rule contains match criteria or has functions enabled in addition to the following match criteria and functions:
  - Source and destination IP addresses.
  - Source and destination ports.
  - Transport layer protocol.
  - ICMP or ICMPv6 message type, message code, and message name.
  - Logging.
  - Time range.

  Slow forwarding requires packets to be sent to the control plane for forwarding entry calculation, which affects the device forwarding performance.

ACL tasks at a glance

To configure an ACL, perform the following tasks:

- Configure ACLs according to the characteristics of the packets to be matched
  - Configuring a basic ACL
  - Configuring an advanced ACL
  - Configuring a Layer 2 ACL
- (Optional.) Copying an ACL
- (Optional.) Configuring packet filtering with ACLs

Configuring a basic ACL

About basic ACLs

Basic ACLs match packets based only on source IP addresses.

Configuring an IPv4 basic ACL

1. Enter system view.

   system-view
2. Create an IPv4 basic ACL and enter its view. Choose one option as needed:
   - Create an IPv4 basic ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create an IPv4 basic ACL by specifying the **basic** keyword.

     acl basic { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]
3. (Optional.) Configure a description for the IPv4 basic ACL.

   description *text*

   By default, an IPv4 basic ACL does not have a description.
4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.
5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | **logging**| **source** { *source-address source-wildcard* | **any** } | **time-range** *time-range-name*] *

   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.
6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

Configuring an IPv6 basic ACL

Restrictions and guidelines

If an IPv6 basic ACL is used for QoS traffic classification or packet filtering:

- Do not specify the **fragment** keyword.
- Do not specify the **routing** keyword if the ACL is for outbound application.

Procedure

1. Enter system view.
   system-view
2. Create an IPv6 basic ACL view and enter its view. Choose one option as needed:
   - Create an IPv6 basic ACL by specifying an ACL number.
     acl ipv6 number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create an IPv6 basic ACL by specifying the **basic** keyword.
     acl ipv6 basic { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]
3. (Optional.) Configure a description for the IPv6 basic ACL.
   description *text*
   By default, an IPv6 basic ACL does not have a description.
4. (Optional.) Set the rule numbering step.
   step *step-value* [**start** *start-value*]
   By default, the rule numbering step is 5 and the start rule ID is 0.
5. Create or edit a rule.
   rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | **logging**| **routing** [**type** *routing-type*] | **source** { *source-address source-prefix* | *source-address*/*source-prefix* | **any** } | **time-range** *time-range-name*] *
   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.
6. (Optional.) Add or edit a rule comment.
   rule *rule-id* **comment** *text*
   By default, no rule comment is configured.

Configuring an advanced ACL

About advanced ACLs

Advanced ACLs match packets based on the following criteria:

- Source IP addresses.
- Destination IP addresses.
- Packet priorities.
- Protocol types.
- Other protocol header information, such as TCP/UDP source and destination port numbers, TCP flags, ICMP message types, and ICMP message codes.

Compared to basic ACLs, advanced ACLs allow more flexible and accurate filtering.

Configuring an IPv4 advanced ACL

1. Enter system view.

   system-view

2. Create an IPv4 advanced ACL and enter its view. Choose one option as needed:
   - Create a numbered IPv4 advanced ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create an IPv4 advanced ACL by specifying the **advanced** keyword.

     acl advanced { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv4 advanced ACL.

   description *text*

   By default, an IPv4 advanced ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port* | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port* | **time-range** *time-range-name*] *

   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

Configuring an IPv6 advanced ACL

Restrictions and guidelines

If an IPv6 advanced ACL is for QoS traffic classification or packet filtering:

- Do not specify the **fragment** keyword.
- Do not specify the **routing**, **hop-by-hop**, or **flow-label** keyword if the ACL is for outbound application.

Procedure

1. Enter system view.

   system-view

2. Create an IPv6 advanced ACL and enter its view. Choose one option as needed:
   - Create a numbered IPv6 advanced ACL by specifying an ACL number.

     acl ipv6 number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

- Create an IPv6 advanced ACL by specifying the **advanced** keyword.

  acl ipv6 advanced { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv6 advanced ACL.

   description *text*

   By default, an IPv6 advanced ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **destination-port** *operator port* | | **dscp** *dscp* | **flow-label** *flow-label-value* | **fragment** | **icmp6-type** { *icmp6-type icmp6-code* | *icmp6-message* } | **logging** | **routing** [**type** *routing-type*] | **hop-by-hop** [**type** *hop-type*] | **source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **source-port** *operator port* | **time-range** *time-range-name*] *

   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

Configuring a Layer 2 ACL

About Layer 2 ACLs

Layer 2 ACLs, also called Ethernet frame header ACLs, match packets based on Layer 2 Ethernet header fields, such as:

- Source MAC address.
- Destination MAC address.
- 802.1p priority (VLAN priority).
- Link layer protocol type.
- Encapsulation type.

Procedure

1. Enter system view.

   system-view

2. Create a Layer 2 ACL and enter its view. Choose one option as needed:

   - Create a Layer 2 ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

   - Create a Layer 2 ACL by specifying the **mac** keyword.

     acl mac { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the Layer 2 ACL.

   description *text*

By default, a Layer 2 ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**cos** *dot1p* | **counting** | **dest-mac** *dest-address dest-mask* | { **lsap** *lsap-type lsap-type-mask* | **type** *protocol-type protocol-type-mask* } | **source-mac** *source-address source-mask* | **time-range** *time-range-name*] *

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

Copying an ACL

About copying an ACL

You can create an ACL by copying an existing ACL (source ACL). The new ACL (destination ACL) has the same properties and content as the source ACL, but uses a different number or name than the source ACL.

Restrictions and guidelines

To successfully copy an ACL, make sure:

- The destination ACL is the same type as the source ACL.
- The source ACL already exists, but the destination ACL does not.

Procedure

1. Enter system view.

   system-view

2. Copy an existing ACL to create a new ACL.

   acl [**ipv6** | **mac**] **copy** { *source-acl-number* | **name** *source-acl-name* } **to** { *dest-acl-number* | **name** *dest-acl-name* }

Configuring packet filtering with ACLs

About packet filtering with ACLs

This section describes procedures for using an ACL to filtering packets. For example, you can apply an ACL to an interface to filter incoming or outgoing packets.

Applying an ACL to an interface for packet filtering

Restrictions and guidelines

To the same direction of an interface, you can apply a maximum of three ACLs: one IPv4 ACL, one IPv6 ACL, and one Layer 2 ACL.

The term "interface" in this section collectively refers to Layer 2 Ethernet interfaces and VLAN interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an ACL to the interface to filter packets.
   packet-filter [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } { **inbound** | **outbound** } [**hardware-count**]
   By default, an interface does not filter packets.

Configuring logging and SNMP notifications for packet filtering

About configuring logging and SNMP notifications for packet filtering

You can configure the ACL module to generate log entries or SNMP notifications for packet filtering and output them to the information center or SNMP module at the output interval. The log entry or notification records the number of matching packets and the matched ACL rules. When the first packet of a flow matches an ACL rule, the output interval starts, and the device immediately outputs a log entry or notification for this packet. When the output interval ends, the device outputs a log entry or notification for subsequent matching packets of the flow.

For more information about the information center and SNMP, see *Network Management and Monitoring Configuration Guide.*

Procedure

1. Enter system view.
   system-view
2. Set the interval for outputting packet filtering logs or notifications.
   acl { **logging** | **trap** } **interval** *interval*
   The default setting is 0 minutes. By default, the device does not generate log entries or SNMP notifications for packet filtering.

Setting the packet filtering default action

1. Enter system view.
   system-view
2. Set the packet filtering default action to deny.
   packet-filter default deny
   By default, the packet filter permits packets that do not match any ACL rule to pass.

Display and maintenance commands for ACL

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display ACL configuration and match statistics.	**display acl** [**ipv6** | **mac**] { *acl-number* | **all** | **name** *acl-name* }

Task	Command
Display ACL application information for packet filtering.	**display packet-filter interface** [*interface-type interface-number*] [**inbound** | **outbound**] [**slot** *slot-number*]
Display match statistics for packet filtering ACLs.	**display packet-filter statistics interface** *interface-type interface-number* { **inbound** | **outbound** } [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] [**brief**]
Display the accumulated statistics for packet filtering ACLs.	**display packet-filter statistics sum** { **inbound** | **outbound** } [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } [**brief**]
Display detailed ACL packet filtering information.	**display packet-filter verbose interface** *interface-type interface-number* { **inbound** | **outbound** } [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] [**slot** *slot-number*]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Clear match statistics for packet filtering ACLs.	**reset packet-filter statistics interface** [*interface-type interface-number*] { **inbound** | **outbound** } [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }]

ACL configuration examples

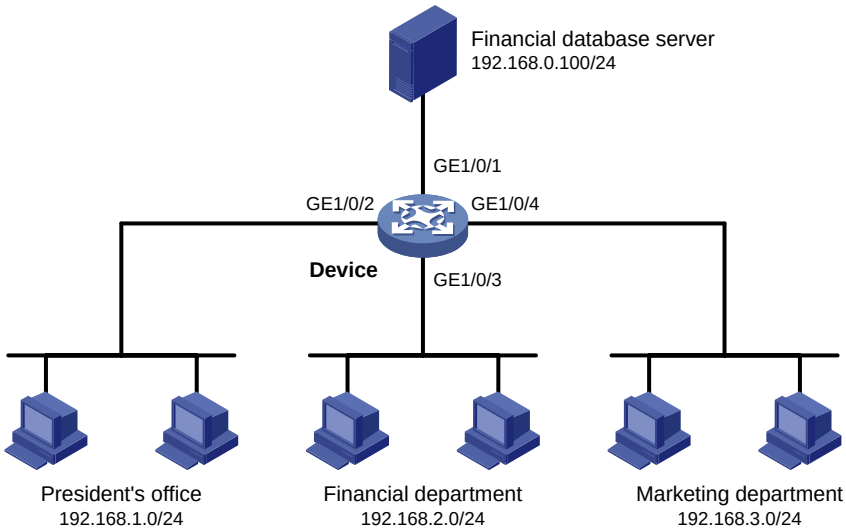
Example: Configuring interface-based packet filter

Network configuration

A company interconnects its departments through the device. Configure a packet filter to:

- Permit access from the President's office at any time to the financial database server.
- Permit access from the Finance department to the database server only during working hours (from 8:00 to 18:00) on working days.
- Deny access from any other department to the database server.

Figure 1 Network diagram



Procedure

Create a periodic time range from 8:00 to 18:00 on working days.

```
<Device> system-view
[Device] time-range work 08:0 to 18:00 working-day
```

Create an IPv4 advanced ACL numbered 3000.

```
[Device] acl advanced 3000
```

Configure a rule to permit access from the President's office to the financial database server.

```
[Device-acl-ipv4-adv-3000] rule permit ip source 192.168.1.0 0.0.0.255 destination
192.168.0.100 0
```

Configure a rule to permit access from the Finance department to the database server during working hours.

```
[Device-acl-ipv4-adv-3000] rule permit ip source 192.168.2.0 0.0.0.255 destination
192.168.0.100 0 time-range work
```

Configure a rule to deny access to the financial database server.

```
[Device-acl-ipv4-adv-3000] rule deny ip source any destination 192.168.0.100 0
[Device-acl-ipv4-adv-3000] quit
```

Apply IPv4 advanced ACL 3000 to filter outgoing packets on interface GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] packet-filter 3000 outbound
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify that a PC in the Finance department can ping the database server during working hours. (All PCs in this example use Windows XP).

```
C:\> ping 192.168.0.100

Pinging 192.168.0.100 with 32 bytes of data:

Reply from 192.168.0.100: bytes=32 time=1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255
```

```
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.0.100:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

Verify that a PC in the Marketing department cannot ping the database server during working hours.

```
C:\> ping 192.168.0.100

Pinging 192.168.0.100 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.0.100:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

Display configuration and match statistics for IPv4 advanced ACL 3000 on the device during working hours.

```
[Device] display acl 3000
Advanced IPv4 ACL 3000, 3 rules,
ACL's step is 5
 rule 0 permit ip source 192.168.1.0 0.0.0.255 destination 192.168.0.100 0
 rule 5 permit ip source 192.168.2.0 0.0.0.255 destination 192.168.0.100 0 time-range work (Active)
 rule 10 deny ip destination 192.168.0.100 0
```

The output shows that rule 5 is active. Rule 5 and rule 10 have been matched four times as the result of the ping operations.

Contents

QoS overview

In data communications, Quality of Service (QoS) provides differentiated service guarantees for diversified traffic in terms of bandwidth, delay, jitter, and drop rate, all of which can affect QoS.

QoS manages network resources and prioritizes traffic to balance system resources.

The following section describes typical QoS service models and widely used QoS techniques.

QoS service models

This section describes several typical QoS service models.

Best-effort service model

The best-effort model is a single-service model. The best-effort model is not as reliable as other models and does not guarantee delay-free delivery.

The best-effort service model is the default model for the Internet and applies to most network applications. It uses the First In First Out (FIFO) queuing mechanism.

IntServ model

The integrated service (IntServ) model is a multiple-service model that can accommodate diverse QoS requirements. This service model provides the most granularly differentiated QoS by identifying and guaranteeing definite QoS for each data flow.

In the IntServ model, an application must request service from the network before it sends data. IntServ signals the service request with the RSVP. All nodes receiving the request reserve resources as requested and maintain state information for the application flow.

The IntServ model demands high storage and processing capabilities because it requires all nodes along the transmission path to maintain resource state information for each flow. This model is suitable for small-sized or edge networks. However, it is not suitable for large-sized networks, for example, the core layer of the Internet, where billions of flows are present.

DiffServ model

The differentiated service (DiffServ) model is a multiple-service model that can meet diverse QoS requirements. It is easy to implement and extend. DiffServ does not signal the network to reserve resources before sending data, as IntServ does.

QoS techniques in a network

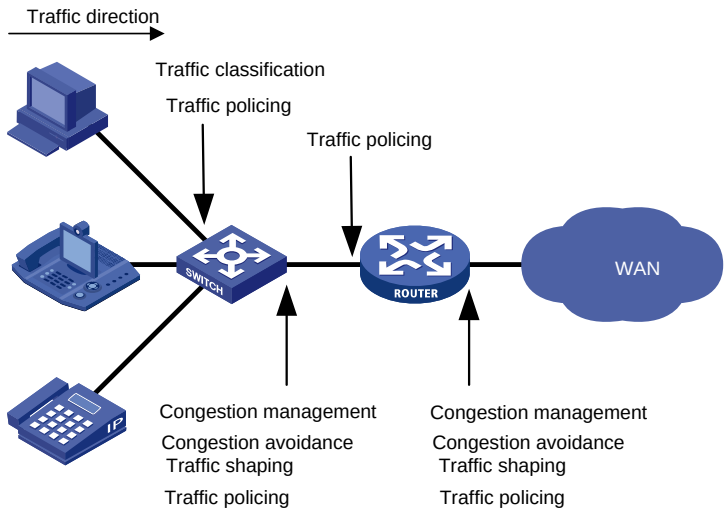
The QoS techniques include the following features:

- Traffic classification.
- Traffic policing.
- Traffic shaping.
- Rate limit.
- Congestion management.
- Congestion avoidance.

The following section briefly introduces these QoS techniques.

All QoS techniques in this document are based on the DiffServ model.

Figure 1 Position of the QoS techniques in a network



As shown in Figure 1, traffic classification, traffic shaping, traffic policing, congestion management, and congestion avoidance mainly implement the following functions:

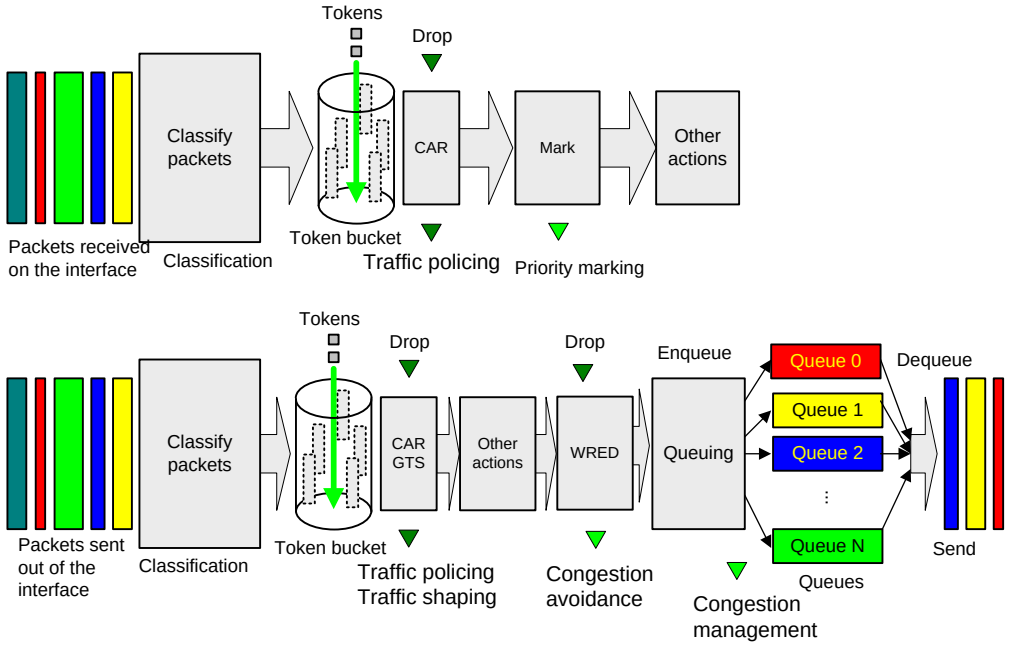
- **Traffic classification**—Uses match criteria to assign packets with the same characteristics to a traffic class. Based on traffic classes, you can provide differentiated services.
- **Traffic policing**—Polices flows and imposes penalties to prevent aggressive use of network resources. You can apply traffic policing to both incoming and outgoing traffic of a port.
- **Traffic shaping**—Adapts the output rate of traffic to the network resources available on the downstream device to eliminate packet drops. Traffic shaping usually applies to the outgoing traffic of a port.
- **Congestion management**—Provides a resource scheduling policy to determine the packet forwarding sequence when congestion occurs. Congestion management usually applies to the outgoing traffic of a port.
- **Congestion avoidance**—Monitors the network resource usage. It is usually applied to the outgoing traffic of a port. When congestion worsens, congestion avoidance reduces the queue length by dropping packets.

QoS processing flow in a device

Figure 2 briefly describes how the QoS module processes traffic.

1. Traffic classifier identifies and classifies traffic for subsequent QoS actions.
2. The QoS module takes various QoS actions on classified traffic as configured, depending on the traffic processing phase and network status. For example, you can configure the QoS module to perform the following operations:
   - Traffic policing for incoming traffic.
   - Traffic shaping for outgoing traffic.
   - Congestion avoidance before congestion occurs.
   - Congestion management when congestion occurs.

Figure 2 QoS processing flow



QoS configuration approaches

You can configure QoS by using the MQC approach or non-MQC approach.

In the modular QoS configuration (MQC) approach, you configure QoS service parameters by using QoS policies. A QoS policy defines QoS actions to take on different classes of traffic and can be applied to an object (such as an interface) to control traffic.

In the non-MQC approach, you configure QoS service parameters without using a QoS policy. For example, you can use the rate limit feature to set a rate limit on an interface without using a QoS policy.

Configuring a QoS policy

About QoS policies

A QoS policy has the following components:

- **Traffic class**—Defines criteria to match packets.
- **Traffic behavior**—Defines QoS actions to take on matching packets.

By associating a traffic class with a traffic behavior, a QoS policy can perform the QoS actions on matching packets.

A QoS policy can have multiple class-behavior associations.

QoS policy tasks at a glance

To configure a QoS policy, perform the following tasks:

1. Defining a traffic class
2. Defining a traffic behavior
3. Defining a QoS policy
4. Applying the QoS policy
   - Applying the QoS policy to an interface
   - Applying the QoS policy to VLANs
   - Applying the QoS policy globally
   - Applying the QoS policy to a user profile

Defining a traffic class

1. Enter system view.
   system-view
2. Create a traffic class and enter traffic class view.
   traffic classifier *classifier-name* [**operator** { **and** | **or** }]
3. (Optional.) Configure a description for the traffic class.
   description *text*

   By default, no description is configured for a traffic class.
4. Configure a match criterion.
   if-match *match-criteria*

   By default, no match criterion is configured.

   For more information, see the **if-match** command in *ACL and QoS Command Reference*.

Defining a traffic behavior

1. Enter system view.
   system-view
2. Create a traffic behavior and enter traffic behavior view.

traffic behavior *behavior-name*

3. Configure an action in the traffic behavior.

   By default, no action is configured for a traffic behavior.

   For more information about configuring an action, see the subsequent chapters for traffic policing, traffic filtering, priority marking, class-based accounting, and so on.

Defining a QoS policy

1. Enter system view.

   system-view

2. Create a QoS policy and enter QoS policy view.

   qos policy *policy-name*

3. Associate a traffic class with a traffic behavior to create a class-behavior association in the QoS policy.

   classifier *classifier-name* **behavior** *behavior-name* [**insert-before** *before-classifier-name*]

   By default, a traffic class is not associated with a traffic behavior.

   Repeat this step to create more class-behavior associations.

Applying the QoS policy

Application destinations

You can apply a QoS policy to the following destinations:

- **Interface**—The QoS policy takes effect on the traffic sent or received on the interface.
- **VLAN**—The QoS policy takes effect on the traffic sent or received on all ports in the VLAN.
- **Globally**—The QoS policy takes effect on the traffic sent or received on all ports.
- **User profile**—The QoS policy takes effect on the traffic sent or received by the online users of the user profile.

Restrictions and guidelines for applying a QoS policy

You can modify traffic classes, traffic behaviors, and class-behavior associations in a QoS policy even after it is applied (except that it is applied to a user profile). If a traffic class uses an ACL for traffic classification, you can delete or modify the ACL.

When a QoS policy containing a CAR action is applied on an IRF fabric, the traffic matching the QoS policy might enter the IRF fabric through interfaces on different IRF member devices. In this case, the actual rate limit that takes effect is the sum of the CIR and PIR in the CAR action multiplied by the number of involved port groups by default. Interfaces on different IRF member devices belong to different port groups. Interfaces on the same IRF member device can belong to the same or different port groups. To identify port group information, execute the **debug port mapping** command in probe view. Interfaces with the same **Unit** value belong to the same port group.

When a QoS policy containing a CAR action is applied on an IRF fabric, the traffic matching the QoS policy might leave the IRF fabric through interfaces on different IRF member devices. In this case, the actual rate limit that takes effect is the sum of the CIR and PIR in the CAR action multiplied by the number of IRF member devices that host the interfaces by default.

Applying the QoS policy to an interface

Restrictions and guidelines

A QoS policy can be applied to multiple interfaces. However, only one QoS policy can be applied to one direction (inbound or outbound) of an interface.

The QoS policy applied to the outgoing traffic on an interface does not regulate local packets. Local packets refer to critical protocol packets sent by the local system for operation maintenance. The most common local packets include link maintenance, RIP, LDP, and SSH packets.

The term "interface" in this section refers to Layer 2 Ethernet interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply the QoS policy to the interface.
   qos apply policy *policy-name* { **inbound** | **outbound**
   By default, no QoS policy is applied to an interface.

Applying the QoS policy to VLANs

About QoS policy application to VLANs

You can apply a QoS policy to VLANs to regulate the traffic on all ports of the VLANs.

Restrictions and guidelines

QoS policies cannot be applied to dynamic VLANs, including VLANs created by GVRP.

When you apply a QoS policy to VLANs, the QoS policy is applied to the specified VLANs on all IRF member devices. If the hardware resources of an IRF member device are insufficient, applying a QoS policy to VLANs might fail on the IRF member device. The system does not automatically roll back the QoS policy configuration already applied to other IRF member devices. To ensure consistency, use the **undo qos vlan-policy** command to manually remove the QoS policy configuration applied to them.

Procedure

1. Enter system view.
   system-view
2. Apply the QoS policy to VLANs.
   qos vlan-policy *policy-name* **vlan** *vlan-id-list* { **inbound** | **outbound** }
   By default, no QoS policy is applied to a VLAN.

Applying the QoS policy globally

About global QoS policy application

You can apply a QoS policy globally to the inbound or outbound direction of all ports.

Restrictions and guidelines

If the hardware resources of an IRF member device are insufficient, applying a QoS policy globally might fail on the IRF member device. The system does not automatically roll back the QoS policy configuration already applied to other IRF member devices. To ensure consistency, you must use

the **undo qos apply policy global** command to manually remove the QoS policy configuration applied to them.

Procedure

1. Enter system view.
   system-view
2. Apply the QoS policy globally.
   qos apply policy *policy-name* **global** { **inbound** | **outbound**
   By default, no QoS policy is applied globally.

Applying the QoS policy to a user profile

About QoS policy application to a user profile

When a user profile is configured, you can perform traffic policing based on users. After a user passes authentication, the authentication server sends the name of the user profile associated with the user to the device. The QoS policy configured in user profile view takes effect only when users come online.

Restrictions and guidelines

You can apply a QoS policy to multiple user profiles. In one direction of each user profile, only one policy can be applied. To modify a QoS policy already applied to a direction, first remove the applied QoS policy.

Procedure

1. Enter system view.
   system-view
2. Enter user profile view.
   user-profile *profile-name*
3. Apply the QoS policy to the user profile.
   qos apply policy *policy-name* { **inbound** | **outbound** }
   By default, no QoS policy is applied to a user profile.

Parameter	Description
inbound	Applies a QoS policy to the traffic received by the device from the user profile.
outbound	Applies a QoS policy to the traffic sent by the device to the user profile.

Display and maintenance commands for QoS policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display QoS policy configuration.	**display qos policy user-defined** [*policy-name* [**classifier** *classifier-name*]] [**slot** *slot-number*]

Task	Command
Display information about QoS policies applied globally.	**display qos policy global** [**slot** *slot-number*] [**inbound** | **outbound**]
Display information about QoS policies applied to interfaces.	**display qos policy interface** [*interface-type interface-number*] [**inbound** | **outbound**]
Display information about QoS policies applied to user profiles.	**display qos policy user-profile** [**name** *profile-name*] [**user-id** *user-id*] [**slot** *slot-number*] [**inbound** | **outbound**]
Display information about QoS policies applied to VLANs.	**display qos vlan-policy** { **name** *policy-name* | **vlan** [*vlan-id*] } [**slot** *slot-number*] [**inbound** | **outbound**]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Display traffic behavior configuration.	**display traffic behavior user-defined** [*behavior-name*] [**slot** *slot-number*]
Display traffic class configuration.	**display traffic classifier user-defined** [*classifier-name*] [**slot** *slot-number*]
Clear the statistics of the QoS policy applied in a certain direction of a VLAN.	**reset qos vlan-policy** [**vlan** *vlan-id*] [**inbound** | **outbound**]
Clear the statistics for a QoS policy applied globally.	**reset qos policy global** [**inbound** | **outbound**]
Clear the statistics for a QoS policy applied globally.	**reset qos policy global** [**inbound** | **outbound**]
Clear the statistics of the QoS policy applied in a certain direction of a VLAN.	**reset qos vlan-policy** [**vlan** *vlan-id*] [**inbound** | **outbound**]

Configuring priority mapping

About priority mapping

When a packet arrives, a device assigns a set of QoS priority parameters to the packet based on either of the following:

- A priority field carried in the packet.
- The port priority of the incoming port.

This process is called priority mapping. During this process, the device can modify the priority of the packet according to the priority mapping rules. The set of QoS priority parameters decides the scheduling priority and forwarding priority of the packet.

Priority mapping is implemented with priority maps and involves the following priorities:

- 802.1p priority.
- DSCP.
- EXP.
- IP precedence.
- Local precedence.
- Drop priority.

About priorities

Priorities include the following types: priorities carried in packets, and priorities locally assigned for scheduling only.

Packet-carried priorities include 802.1p priority, DSCP precedence, IP precedence, and EXP. These priorities have global significance and affect the forwarding priority of packets across the network. For more information about these priorities, see "Appendixes."

Locally assigned priorities only have local significance. They are assigned by the device only for scheduling. These priorities include the local precedence, drop priority, and user priority, as follows:

- **Local precedence**—Used for queuing. A local precedence value corresponds to an output queue. A packet with higher local precedence is assigned to a higher priority output queue to be preferentially scheduled.
- **Drop priority**—Used for making packet drop decisions. Packets with the highest drop priority are dropped preferentially.
- **User priority**—Precedence that the device automatically extracts from a priority field of the packet according to its forwarding path. It is a parameter for determining the scheduling priority and forwarding priority of the packet. The user priority represents the following items:
  - The 802.1p priority for Layer 2 packets.
  - The IP precedence for Layer 3 packets.
  - The EXP for MPLS packets.

The device supports only local precedence for scheduling.

Priority maps

The device provides various types of priority maps. By looking through a priority map, the device decides which priority value to assign to a packet for subsequent packet processing.

The default priority maps (as shown in Appendix B Default priority maps) are available for priority mapping. They are adequate in most cases. If a default priority map cannot meet your requirements, you can modify the priority map as required.

Priority mapping configuration methods

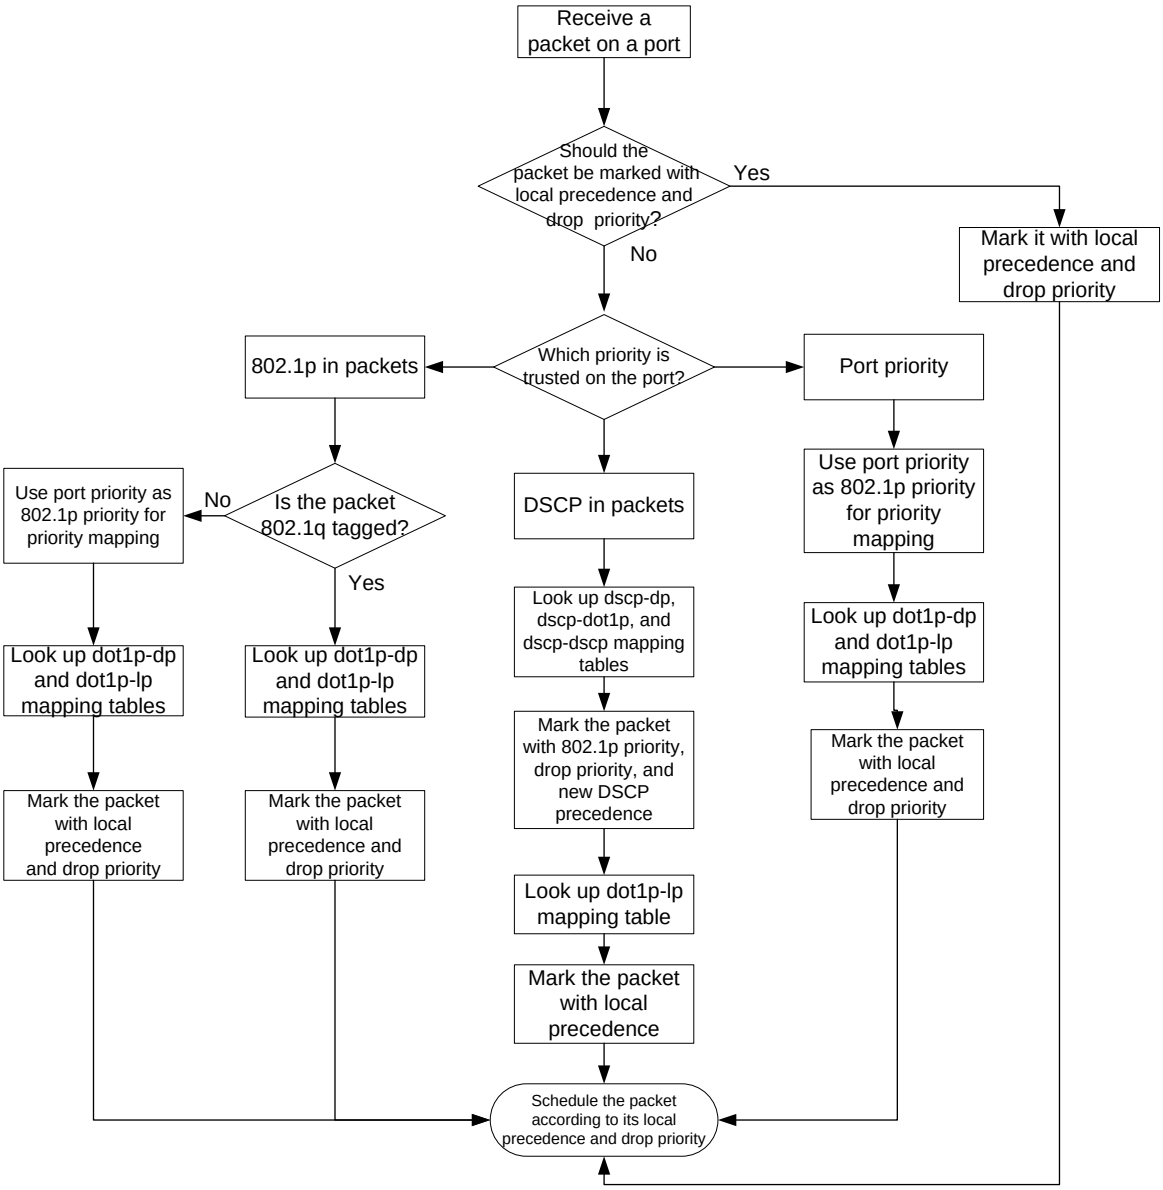
You can configure priority mapping by using any of the following methods:

- **Configuring priority trust mode**—In this method, you can configure a port to look up a trusted priority type (802.1p, for example) in incoming packets in the priority maps. Then, the system maps the trusted priority to the target priority types and values.
- **Changing port priority**—If no packet priority is trusted, the port priority of the incoming port is used. By changing the port priority of a port, you change the priority of the incoming packets on the port.

Priority mapping process

On receiving an Ethernet packet on a port, the switch marks the scheduling priorities (local precedence and drop precedence) for the Ethernet packet. This procedure is done according to the priority trust mode of the receiving port and the 802.1Q tagging status of the packet, as shown in Figure 3.

Figure 3 Priority mapping process for an Ethernet packet



For information about priority marking, see "Configuring priority marking."

Priority mapping tasks at a glance

To configure priority mapping, perform the following tasks:

1. (Optional.) Configuring a priority map
2. Configure a priority mapping method:
   - Configuring a port to trust packet priority for priority mapping
   - Changing the port priority of an interface

Configuring a priority map

1. Enter system view.

system-view

2. Enter priority map view.
   qos map-table{ **dot1p-lp** | **dscp-dot1p** | **dscp-dscp** }
3. Configure mappings for the priority map.
   import *import-value-list* **export** *export-value*

   By default, the default priority maps are used. For more information, see "Appendix B Default priority maps."

   If you execute this command multiple times, the most recent configuration takes effect.

Configuring a port to trust packet priority for priority mapping

About configuring a port to trust packet priority

You can configure the device to trust a particular priority field carried in packets for priority mapping on ports or globally. When you configure the trusted packet priority type on an interface, use the following available keywords:

- **dot1p**—Uses the 802.1p priority of received packets for mapping.
- **dscp**—Uses the DSCP precedence of received IP packets for mapping.

Restrictions and guidelines

The term "interface" in this section refers to Layer 2 Ethernet interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the trusted packet priority type.
   qos trust { **dot1p** | **dscp** }

   By default, an interface does not trust any packet priority and uses the port priority as the 802.1p priority for mapping.

Changing the port priority of an interface

About port priority

If an interface does not trust any packet priority, the device uses its port priority to look for priority parameters for the incoming packets. By changing port priority, you can prioritize traffic received on different interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the port priority of the interface.
   qos priority [**dscp**] *priority-value*

The default setting is 0.

Display and maintenance commands for priority mapping

Execute **display** commands in any view.

Task	Command
Display priority map configuration.	**display qos map-table** [**dot1p-lp** | **dscp-dot1p** | **dscp-dscp**]
Display the trusted packet priority type on a port.	**display qos trust interface** [*interface-type interface-number*]

Priority mapping configuration examples

Example: Configuring a priority trust mode

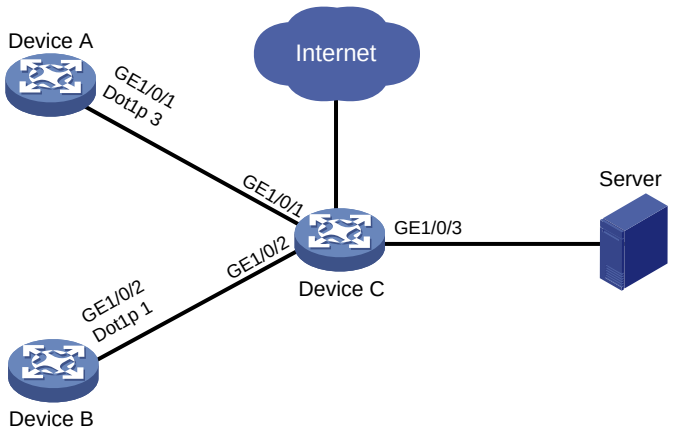
Network configuration

As shown in Figure 4:

- The 802.1p priority of traffic from Device A to Device C is 3.
- The 802.1p priority of traffic from Device B to Device C is 1.

Configure Device C to preferentially process packets from Device A to the server when GigabitEthernet 1/0/3 of Device C is congested.

Figure 4 Network diagram



Procedure

(Method 1) Configure Device C to trust packet priority

Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to trust the 802.1p priority for priority mapping.

```
<DeviceC> system-view
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] qos trust dot1p
```

```
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] qos trust dot1p
[DeviceC-GigabitEthernet1/0/2] quit
```

(Method 2) Configure Device C to trust port priority

Assign port priority to GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2. Make sure the following requirements are met:

- The priority of GigabitEthernet 1/0/1 is higher than that of GigabitEthernet 1/0/2.
- No trusted packet priority type is configured on GigabitEthernet 1/0/1 or GigabitEthernet 1/0/2.

```
<DeviceC> system-view
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] qos priority 3
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] qos priority 1
[DeviceC-GigabitEthernet1/0/2] quit
```

Example: Configuring priority mapping tables and priority marking

Network configuration

As shown in Figure 5:

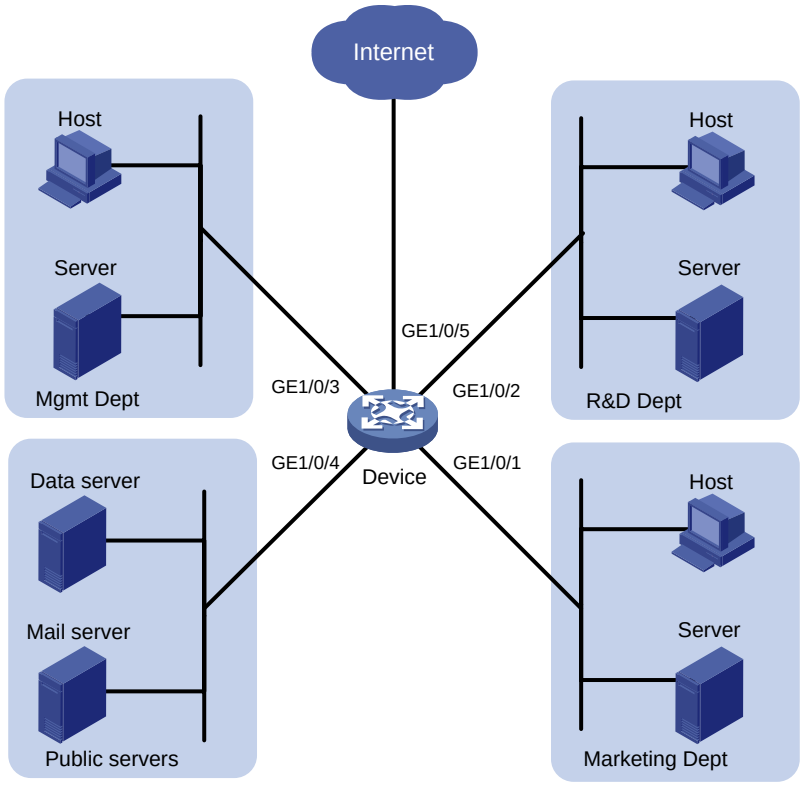
- The Marketing department connects to GigabitEthernet 1/0/1 of Device, which sets the 802.1p priority of traffic from the Marketing department to 3.
- The R&D department connects to GigabitEthernet 1/0/2 of Device, which sets the 802.1p priority of traffic from the R&D department to 4.
- The Management department connects to GigabitEthernet 1/0/3 of Device, which sets the 802.1p priority of traffic from the Management department to 5.

Configure port priority, 802.1p-to-local mapping table, and priority marking to implement the plan as described in Table 1.

Table 1 Configuration plan

Traffic destination	Traffic priority order	Queuing plan		
		Traffic source	Output queue	Queue priority
Public servers	R&D department > Management department > Marketing department	R&D department	6	High
		Management department	4	Medium
		Marketing department	2	Low
Internet	Management department > Marketing department > R&D department	R&D department	2	Low
		Management department	6	High
		Marketing department	4	Medium

Figure 5 Network diagram



Procedure

1. Configure trusting port priority:

   # Set the port priority of GigabitEthernet 1/0/1 to 3.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] qos priority 3
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Set the port priority of GigabitEthernet 1/0/2 to 4.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] qos priority 4
   [Device-GigabitEthernet1/0/2] quit
   ```

   # Set the port priority of GigabitEthernet 1/0/3 to 5.

   ```
   [Device] interface gigabitethernet 1/0/3
   [Device-GigabitEthernet1/0/3] qos priority 5
   [Device-GigabitEthernet1/0/3] quit
   ```

2. Configure the 802.1p-to-local mapping table to map 802.1p priority values 3, 4, and 5 to local precedence values 2, 6, and 4.

   This guarantees the R&D department, Management department, and Marketing department decreased priorities to access the public servers.

   ```
   [Device] qos map-table dot1p-lp
   [Device-maptbl-dot1p-lp] import 3 export 2
   [Device-maptbl-dot1p-lp] import 4 export 6
   [Device-maptbl-dot1p-lp] import 5 export 4
   [Device-maptbl-dot1p-lp] quit
   ```

3. Configure priority marking to mark the packets from Management department, Marketing department, and R&D department to the Internet with 802.1p priority values 4, 5, and 3.

This guarantees the Management department, Marketing department, and R&D department decreased priorities to access the Internet.

Create ACL 3000, and configure a rule to match HTTP packets.

```
[Device] acl advanced 3000
[Device-acl-adv-3000] rule permit tcp destination-port eq 80
[Device-acl-adv-3000] quit
```

Create a traffic class named **http**, and use ACL 3000 as a match criterion.

```
[Device] traffic classifier http
[Device-classifier-http] if-match acl 3000
[Device-classifier-http] quit
```

Create a traffic behavior named **admin**, and configure a marking action for the Management department.

```
[Device] traffic behavior admin
[Device-behavior-admin] remark dot1p 4
[Device-behavior-admin] quit
```

Create a QoS policy named **admin**, and associate traffic class **http** with traffic behavior **admin** in QoS policy **admin**.

```
[Device] qos policy admin
[Device-qospolicy-admin] classifier http behavior admin
[Device-qospolicy-admin] quit
```

Apply QoS policy **admin** to the inbound direction of GigabitEthernet 1/0/3.

```
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] qos apply policy admin inbound
```

Create a traffic behavior named **market**, and configure a marking action for the Marketing department.

```
[Device] traffic behavior market
[Device-behavior-market] remark dot1p 5
[Device-behavior-market] quit
```

Create a QoS policy named **market**, and associate traffic class **http** with traffic behavior **market** in QoS policy **market**.

```
[Device] qos policy market
[Device-qospolicy-market] classifier http behavior market
[Device-qospolicy-market] quit
```

Apply QoS policy **market** to the inbound direction of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy market inbound
```

Create a traffic behavior named **rd**, and configure a marking action for the R&D department.

```
[Device] traffic behavior rd
[Device-behavior-rd] remark dot1p 3
[Device-behavior-rd] quit
```

Create a QoS policy named **rd**, and associate traffic class **http** with traffic behavior **rd** in QoS policy **rd**.

```
[Device] qos policy rd
[Device-qospolicy-rd] classifier http behavior rd
[Device-qospolicy-rd] quit
```

Apply QoS policy **rd** to the inbound direction of GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] qos apply policy rd inbound
```

Configuring traffic policing, GTS, and rate limit

About traffic policing, GTS, and rate limit

Traffic limit helps assign network resources (including bandwidth) and increase network performance. For example, you can configure a flow to use only the resources committed to it in a certain time range. This avoids network congestion caused by burst traffic.

Traffic policing, Generic Traffic Shaping (GTS), and rate limit control the traffic rate and resource usage according to traffic specifications. You can use token buckets for evaluating traffic specifications.

Traffic evaluation and token buckets

Token bucket features

A token bucket is analogous to a container that holds a certain number of tokens. Each token represents a certain forwarding capacity. The system puts tokens into the bucket at a constant rate. When the token bucket is full, the extra tokens cause the token bucket to overflow.

Evaluating traffic with the token bucket

A token bucket mechanism evaluates traffic by looking at the number of tokens in the bucket. If the number of tokens in the bucket is enough for forwarding the packets:

- The traffic conforms to the specification (called conforming traffic).
- The corresponding tokens are taken away from the bucket.

Otherwise, the traffic does not conform to the specification (called excess traffic).

A token bucket has the following configurable parameters:

- Mean rate at which tokens are put into the bucket, which is the permitted average rate of traffic. It is usually set to the committed information rate (CIR).
- Burst size or the capacity of the token bucket. It is the maximum traffic size permitted in each burst. It is usually set to the committed burst size (CBS). The set burst size must be greater than the maximum packet size.

Each arriving packet is evaluated.

Complicated evaluation

You can set two token buckets, bucket C and bucket E, to evaluate traffic in a more complicated environment and achieve more policing flexibility. The following are main mechanisms used for complicated evaluation:

- **Single rate two color**—Uses one token bucket and the following parameters:
  - **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
  - **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.

  When a packet arrives, the following rules apply:
  - If bucket C has enough tokens to forward the packet, the packet is colored green.
  - Otherwise, the packet is colored red.
- **Single rate three color**—Uses two token buckets and the following parameters:

- **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
- **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.
- **EBS**—Size of bucket E minus size of bucket C, which specifies the transient burst of traffic that bucket E can forward. The EBS cannot be 0. The size of E bucket is the sum of the CBS and EBS.

When a packet arrives, the following rules apply:

- If bucket C has enough tokens, the packet is colored green.
- If bucket C does not have enough tokens but bucket E has enough tokens, the packet is colored yellow.
- If neither bucket C nor bucket E has sufficient tokens, the packet is colored red.

- **Two rate three color**—Uses two token buckets and the following parameters:
  - **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
  - **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.
  - **PIR**—Rate at which tokens are put into bucket E, which specifies the average packet transmission or forwarding rate allowed by bucket E.
  - **EBS**—Size of bucket E, which specifies the transient burst of traffic that bucket E can forward.

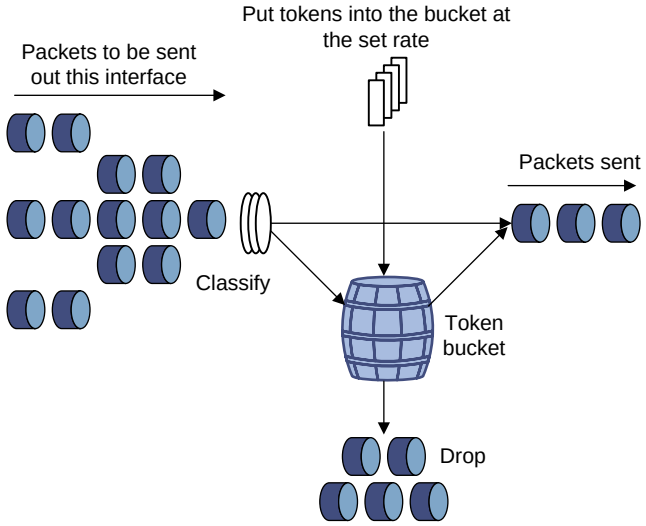
  When a packet arrives, the following rules apply:
  - If bucket C has enough tokens, the packet is colored green.
  - If bucket C does not have enough tokens but bucket E has enough tokens, the packet is colored yellow.
  - If neither bucket C nor bucket E has sufficient tokens, the packet is colored red.

Traffic policing

Traffic policing supports policing the inbound traffic and the outbound traffic.

A typical application of traffic policing is to supervise the specification of traffic entering a network and limit it within a reasonable range. Another application is to "discipline" the extra traffic to prevent aggressive use of network resources by an application. For example, you can limit bandwidth for HTTP packets to less than 50% of the total. If the traffic of a session exceeds the limit, traffic policing can drop the packets or reset the IP precedence of the packets. Figure 6 shows an example of policing outbound traffic on an interface.

Figure 6 Traffic policing



Traffic policing is widely used in policing traffic entering the ISP networks. It can classify the policed traffic and take predefined policing actions on each packet depending on the evaluation result:

- Forwarding the packet if the evaluation result is "conforming."
- Dropping the packet if the evaluation result is "excess."
- Forwarding the packet with its precedence re-marked if the evaluation result is "conforming."

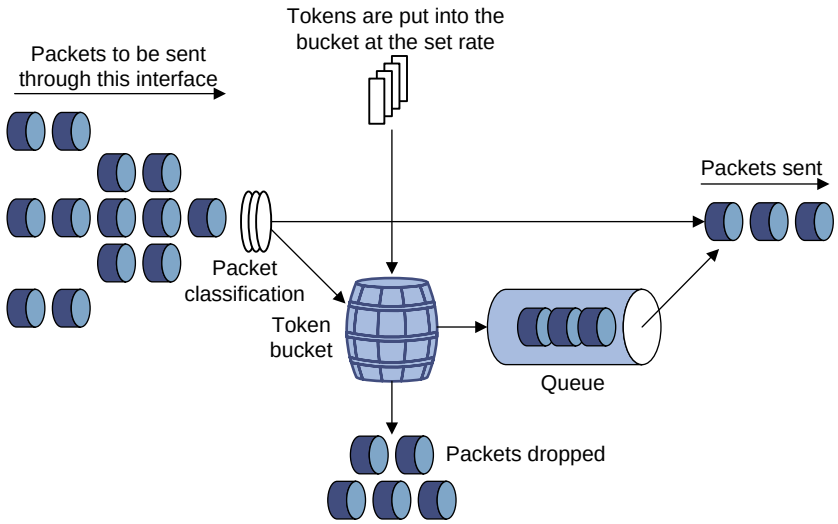
GTS

GTS supports shaping the outbound traffic. GTS limits the outbound traffic rate by buffering exceeding traffic. You can use GTS to adapt the traffic output rate on a device to the input traffic rate of its connected device to avoid packet loss.

The differences between traffic policing and GTS are as follows:

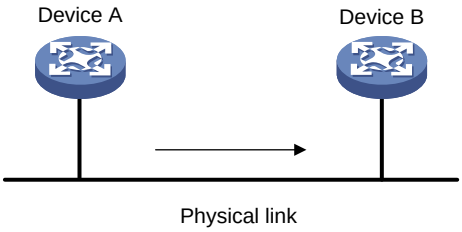
- Packets to be dropped with traffic policing are retained in a buffer or queue with GTS, as shown in Figure 7. When enough tokens are in the token bucket, the buffered packets are sent at an even rate.
- GTS can result in additional delay and traffic policing does not.

Figure 7 GTS



For example, in Figure 8, Device B performs traffic policing on packets from Device A and drops packets exceeding the limit. To avoid packet loss, you can perform GTS on the outgoing interface of Device A so that packets exceeding the limit are cached in Device A. Once resources are released, GTS takes out the cached packets and sends them out.

Figure 8 GTS application



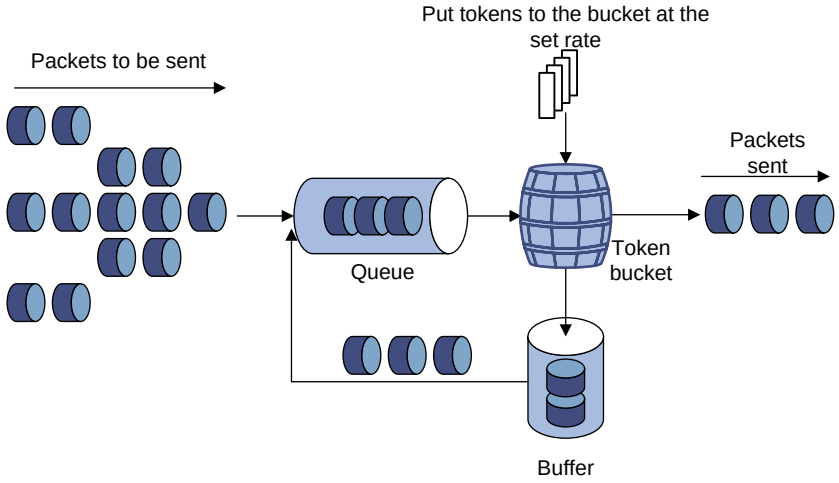
Rate limit

Rate limit controls the rate of inbound and outbound traffic. The outbound traffic is taken for example.

The rate limit of an interface specifies the maximum rate for forwarding packets (excluding critical packets).

Rate limit also uses token buckets for traffic control. When rate limit is configured on an interface, a token bucket handles all packets to be sent through the interface for rate limiting. If enough tokens are in the token bucket, packets can be forwarded. Otherwise, packets are put into QoS queues for congestion management. In this way, the traffic passing the interface is controlled.

Figure 9 Rate limit implementation



The token bucket mechanism limits traffic rate when accommodating bursts. It allows bursty traffic to be transmitted if enough tokens are available. If tokens are scarce, packets cannot be transmitted until efficient tokens are generated in the token bucket. It restricts the traffic rate to the rate for generating tokens.

Rate limit controls the total rate of all packets on an interface. It is easier to use than traffic policing in controlling the total traffic rate.

Restrictions and guidelines: Traffic policing, GTS, and rate limit configuration

The specified CIR does not take traffic transmitted in interframe gaps into account, and the actually allowed rate on an interface is greater than the specified CIR.

An interframe gap is a time interval for transmitting 12 bits between frames. This gap serves the following roles:

- Allows the device to differentiate one frame from another.
- Allows for time for the device to process the current frame and to prepare for receiving the next frame.

Configuring traffic policing

Restrictions and guidelines

The device supports the following application destinations for traffic policing:

- Interface.
- VLANs.
- Globally.
- User profile.

Procedure

1. Enter system view.
   `system-view`
2. Define a traffic class.

a. Create a traffic class and enter traffic class view.

traffic classifier *classifier-name* [**operator** { **and** | **or** }]

b. Configure a match criterion.

if-match *match-criteria*

By default, no match criterion is configured.

For more information about the **if-match** command, see *ACL and QoS Command Reference*.

c. Return to system view.

quit

3. Define a traffic behavior.

a. Create a traffic behavior and enter traffic behavior view.

traffic behavior *behavior-name*

b. Configure a traffic policing action.

car cir *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

car cir *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

By default, no traffic policing action is configured.

c. Return to system view.

quit

4. Define a QoS policy.

a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

Configuring GTS

Restrictions and guidelines

The term "interface" in this section refers to Layer 2 Ethernet interfaces.

Procedure

1. Enter system view.

system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Configure GTS for a queue.

qos gts queue *queue-id* **cir** *committed-information-rate* [**cbs** *committed-burst-size*]

undo qos gts queue *queue-id*

By default, GTS is not configured on an interface.

Configuring the rate limit

Restrictions and guidelines

The term "interface" in this section refers to Layer 2 Ethernet interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the rate limit for the interface.
   qos lr { **inbound** | **outbound** } **cir** *committed-information-rate* [**cbs** *committed-burst-size*]

   By default, no rate limit is configured on an interface.

Display and maintenance commands for traffic policing, GTS, and rate limit

Execute **display** commands in any view.

Task	Command
Display GTS configuration and statistics for interfaces.	**display qos gts interface** [*interface-type interface-number*]
Display rate limit configuration and statistics.	**display qos lr interface** [*interface-type interface-number*]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Display traffic behavior configuration.	**display traffic behavior user-defined** [*behavior-name*]

Traffic policing, GTS, and rate limit configuration examples

Example: Configuring traffic policing and GTS

Network requirements

As shown in Figure 10:

- The server, Host A, and Host B can access the Internet through Device A and Device B.

- The server, Host A, and GigabitEthernet 1/0/1 of Device A are in the same network segment.
- Host B and GigabitEthernet 1/0/2 of Device A are in the same network segment.

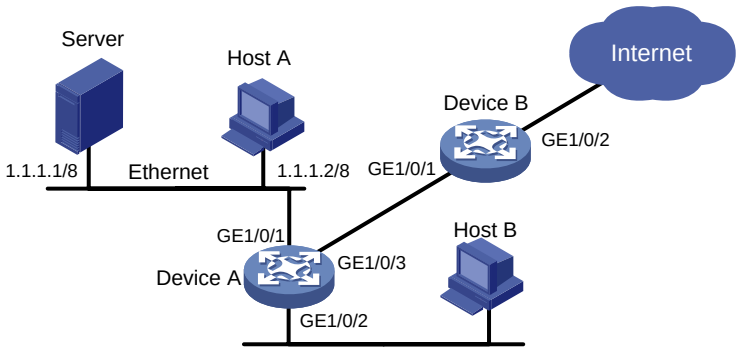
Perform traffic control for the packets that GigabitEthernet 1/0/1 of Device A receives from the server and Host A using the following guidelines:

- Limit the rate of packets from the server to 10240 kbps. When the traffic rate is below 10240 kbps, the traffic is forwarded. When the traffic rate exceeds 10240 kbps, the excess packets are marked with DSCP value 0 and then forwarded.
- Limit the rate of packets from Host A to 2560 kbps. When the traffic rate is below 2560 kbps, the traffic is forwarded. When the traffic rate exceeds 2560 kbps, the excess packets are dropped.

Perform traffic control on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 of Device B using the following guidelines:

- Limit the incoming traffic rate on GigabitEthernet 1/0/1 to 20480 kbps, and the excess packets are dropped.
- Limit the outgoing traffic rate on GigabitEthernet 1/0/2 to 10240 kbps, and the excess packets are dropped.

Figure 10 Network diagram



Configuration procedure

1. Configure Device A:

Configure ACL 2001 and ACL 2002 to permit the packets from the server and Host A, respectively.

```
[DeviceA] acl basic 2001
[DeviceA-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0
[DeviceA-acl-ipv4-basic-2001] quit
[DeviceA] acl basic 2002
[DeviceA-acl-ipv4-basic-2002] rule permit source 1.1.1.2 0
[DeviceA-acl-ipv4-basic-2002] quit
```

Create a traffic class named **server**, and use ACL 2001 as the match criterion.

```
[DeviceA] traffic classifier server
[DeviceA-classifier-server] if-match acl 2001
[DeviceA-classifier-server] quit
```

Create a traffic class named **host**, and use ACL 2002 as the match criterion.

```
[DeviceA] traffic classifier host
[DeviceA-classifier-host] if-match acl 2002
[DeviceA-classifier-host] quit
```

Create a traffic behavior named **server**, and configure a traffic policing action (CIR 10240 kbps).

```
[DeviceA] traffic behavior server
```

```
[DeviceA-behavior-server] car cir 10240 red remark-dscp-pass 0
[DeviceA-behavior-server] quit
```

Create a traffic behavior named **host**, and configure a traffic policing action (CIR 2560 kbps).

```
[DeviceA] traffic behavior host
[DeviceA-behavior-host] car cir 2560
[DeviceA-behavior-host] quit
```

Create a QoS policy named **car**, and associate traffic classes **server** and **host** with traffic behaviors **server** and **host** in QoS policy **car**, respectively.

```
[DeviceA] qos policy car
[DeviceA-qospolicy-car] classifier server behavior server
[DeviceA-qospolicy-car] classifier host behavior host
[DeviceA-qospolicy-car] quit
```

Apply QoS policy **car** to the inbound direction of GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] qos apply policy car inbound
```

2. Configure Device B:

Create ACL 3001, and configure a rule to match HTTP packets.

```
<DeviceB> system-view
[DeviceB] acl advanced 3001
[DeviceB-acl-adv-3001] rule permit tcp destination-port eq 80
[DeviceB-acl-adv-3001] quit
```

Create a traffic class named **http**, and use ACL 3001 as a match criterion.

```
[DeviceB] traffic classifier http
[DeviceB-classifier-http] if-match acl 3001
[DeviceB-classifier-http] quit
```

Create a traffic class named **class**, and configure the traffic class to match all packets.

```
[DeviceB] traffic classifier class
[DeviceB-classifier-class] if-match any
[DeviceB-classifier-class] quit
```

Create a traffic behavior named **car_inbound**, and configure a traffic policing action (CIR 20480 kbps).

```
[DeviceB] traffic behavior car_inbound
[DeviceB-behavior-car_inbound] car cir 20480
[DeviceB-behavior-car_inbound] quit
```

Create a traffic behavior named **car_outbound**, and configure a traffic policing action (CIR 10240 kbps).

```
[DeviceB] traffic behavior car_outbound
[DeviceB-behavior-car_outbound] car cir 10240
[DeviceB-behavior-car_outbound] quit
```

Create a QoS policy named **car_inbound**, and associate traffic class **class** with traffic behavior **car_inbound** in QoS policy **car_inbound**.

```
[DeviceB] qos policy car_inbound
[DeviceB-qospolicy-car_inbound] classifier class behavior car_inbound
[DeviceB-qospolicy-car_inbound] quit
```

Create a QoS policy named **car_outbound**, and associate traffic class **http** with traffic behavior **car_outbound** in QoS policy **car_outbound**.

```
[DeviceB] qos policy car_outbound
[DeviceB-qospolicy-car_outbound] classifier http behavior car_outbound
```

```
[DeviceB-qospolicy-car_outbound] quit
```

Apply QoS policy **car_inbound** to the inbound direction of GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] qos apply policy car_inbound inbound
```

Apply QoS policy **car_outbound** to the outbound direction of GigabitEthernet 1/0/2.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] qos apply policy car_outbound outbound
```

Configuring congestion management

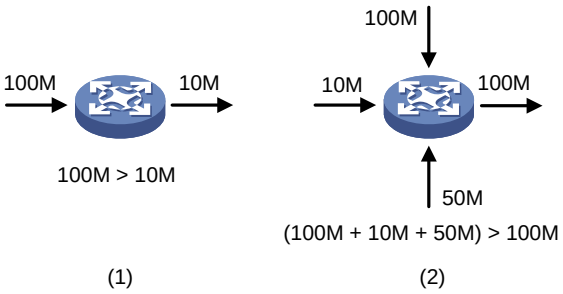
About congestion management

Cause, negative results, and countermeasure of congestion

Congestion occurs on a link or node when traffic size exceeds the processing capability of the link or node. It is typical of a statistical multiplexing network and can be caused by link failures, insufficient resources, and various other causes.

Figure 11 shows two typical congestion scenarios.

Figure 11 Traffic congestion scenarios



Congestion produces the following negative results:

- Increased delay and jitter during packet transmission.
- Decreased network throughput and resource use efficiency.
- Network resource (memory, in particular) exhaustion and even system breakdown.

Congestion is unavoidable in switched networks and multiuser application environments. To improve the service performance of your network, take measures to manage and control it.

The key to congestion management is defining a resource dispatching policy to prioritize packets for forwarding when congestion occurs.

Congestion management methods

Congestion management uses queuing and scheduling algorithms to classify and sort traffic leaving a port.

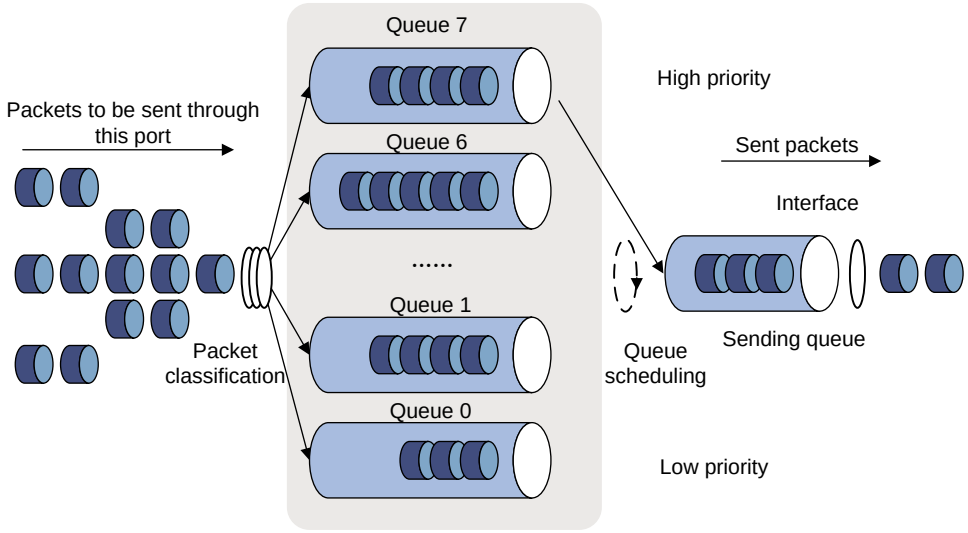
The device supports the following queuing mechanisms:

- SP.
- WRR.

SP queuing

SP queuing is designed for mission-critical applications that require preferential service to reduce the response delay when congestion occurs.

Figure 12 SP queuing



In Figure 12, SP queuing classifies eight queues on a port into eight classes, numbered 7 to 0 in descending priority order.

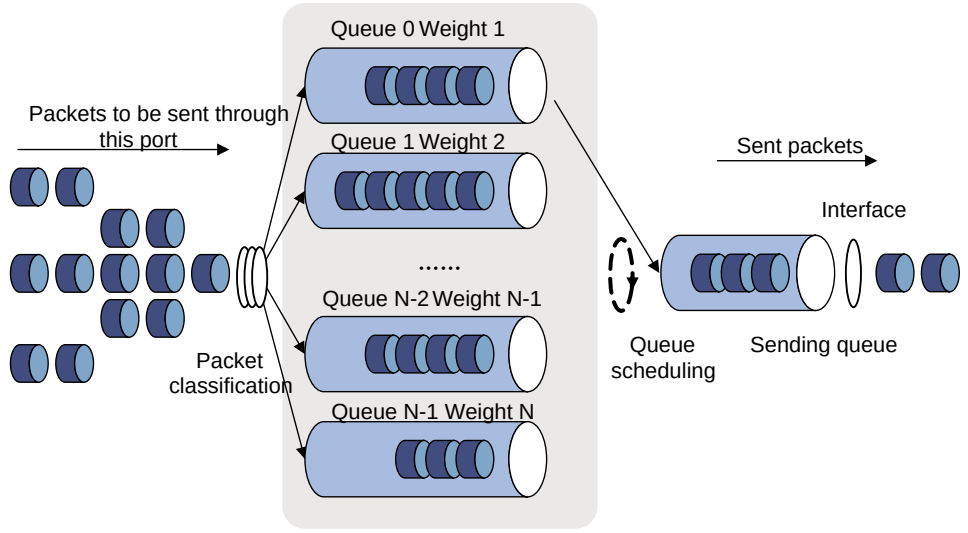
SP queuing schedules the eight queues in the descending order of priority. SP queuing sends packets in the queue with the highest priority first. When the queue with the highest priority is empty, it sends packets in the queue with the second highest priority, and so on. You can assign mission-critical packets to a high priority queue to make sure they are always served first. Common service packets can be assigned to low priority queues to be transmitted when high priority queues are empty.

The disadvantage of SP queuing is that packets in the lower priority queues cannot be transmitted if packets exist in the higher priority queues. In the worst case, lower priority traffic might never get serviced.

WRR queuing

WRR queuing schedules all the queues in turn to ensure that every queue is served for a certain time, as shown in Figure 13.

Figure 13 WRR queuing



Assume a port provides eight output queues. WRR assigns each queue a weight value (represented by w7, w6, w5, w4, w3, w2, w1, or w0). The weight value of a queue decides the proportion of resources assigned to the queue. On a 100 Mbps port, you can set the weight values to 50, 30, 10, 10, 50, 30, 10, and 10 for w7 through w0. In this way, the queue with the lowest priority can get a minimum of 5 Mbps of bandwidth. WRR solves the problem that SP queuing might fail to serve packets in low-priority queues for a long time.

Another advantage of WRR queuing is that when the queues are scheduled in turn, the service time for each queue is not fixed. If a queue is empty, the next queue will be scheduled immediately. This improves bandwidth resource use efficiency.

WRR queuing includes the following types:

- **Basic WRR queuing**—Contains multiple queues. You can set the weight for each queue, and WRR schedules these queues based on the user-defined parameters in a round robin manner.
- **Group-based WRR queuing**—All the queues are scheduled by WRR. You can divide output queues to WRR priority queue group 1 and WRR priority queue group 2. Round robin queue scheduling is performed for group 1 first. If group 1 is empty, round robin queue scheduling is performed for group 2. Only WRR priority queue group 1 is supported in the current software version.

On an interface enabled with group-based WRR queuing, you can assign queues to the SP group. Queues in the SP group are scheduled with SP. The SP group has higher scheduling priority than the WRR groups.

Congestion management tasks at a glance

To configure congestion management, perform the following tasks:

- Configuring queuing on an interface
  - Configuring SP queuing
  - Configuring WRR queuing
  - Configuring SP+WRR queuing
- Configuring a queue scheduling profile

Configuring queuing on an interface

Restrictions and guidelines for queuing configuration

The term "interface" in this section refers to Layer 2 Ethernet interfaces.

The queue ID, queue name, group, and weight in the **`display qos queue interface`** command output form a queue scheduling template. A queue scheduling template corresponds to a unique combination of queue parameter settings on an interface.

The device supports a maximum of eight queue scheduling templates, including the default queue scheduling template, the queue scheduling template for IRF physical interfaces, and predefined queue scheduling template for the CPU. If multiple interfaces use the same user-created queue scheduling template, make sure at least one other queue scheduling template has not been used on any interface.

If all queue scheduling templates are used, you can configure congestion management through a queue scheduling profile (see "Configuring a queue scheduling profile").

Configuring SP queuing

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Configure SP queuing.
   qos sp
   By default, an interface uses byte-count WRR queuing.

Configuring WRR queuing

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable WRR queuing.
   qos wrr weight
   By default, an interface uses packet-count WRR queuing.
4. Assign a queue to a WRR group, and configure scheduling parameters for the queue.
   qos wrr *queue-id* **group 1 weight** *schedule-value*
   By default, all queues on a WRR-enabled interface are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

Configuring SP+WRR queuing

Restrictions and guidelines

To configure the scheduling weight, you must specify the same scheduling unit as specified when enabling WRR queuing.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable byte-count or packet-count WRR queuing.
   qos wrr weight
   By default, an interface uses packet-count WRR queuing.
4. Assign a queue to the SP group.
   qos wrr *queue-id* **group sp**
   By default, all queues on a WRR-enabled interface are in WRR group 1.
5. Assign a queue to a WRR group, and configure a scheduling weight for the queue.
   qos wrr *queue-id* **group 1 weight** *schedule-value*
   By default, all queues on a WRR-enabled interface are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

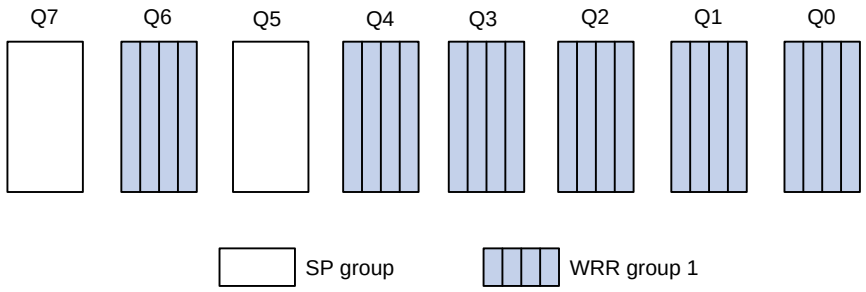
Configuring a queue scheduling profile

About queue scheduling profiles

In a queue scheduling profile, you can configure scheduling parameters for each queue. By applying the queue scheduling profile to an interface, you can implement congestion management on the interface.

Queue scheduling profiles support two queue scheduling algorithms: SP and WRR. In a queue scheduling profile, you can also configure SP+WRR. For information about each scheduling algorithm, see "About congestion management." When SP and WRR groups are configured in a queue scheduling profile, Figure 14 shows the scheduling order.

Figure 14 Queue scheduling profile configured with both SP and WRR



- Queue 7 has the highest priority in the SP group. Its packets are sent preferentially.
- Queue 5 has the second highest priority in the SP group. Packets in queue 5 are sent when queue 7 is empty.
- All queues in WRR group 1 are scheduled according to their weights. When queue 7 and queue 5 are empty, WRR group 1 is scheduled.

Restrictions and guidelines for queue scheduling profile configuration

When you configure a queue scheduling profile, follow these restrictions and guidelines:

- The term "interface" in this section refers to Layer 2 Ethernet interfaces.
- Only one queue scheduling profile can be applied to an interface.
- You can modify the scheduling parameters in a queue scheduling profile already applied to an interface.

Configuring a queue scheduling profile

1. Enter system view.
   `system-view`
2. Create a queue scheduling profile and enter queue scheduling profile view.
   `qos qmprofile` *`profile-name`*
3. (Optional.) Configure queue scheduling parameters.
   - Configure a queue to use SP.
     `queue` *`queue-id`* **`sp`**
   - Configure a queue to use WRR.

queue *queue-id* **wrr group** *group-id* { **weight** | **byte-count** } *schedule-value*

By default, all queues in a queue scheduling profile use SP queuing.

Applying a queue scheduling profile

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply the queue scheduling profile to the outbound direction of the interface.
   qos apply qmprofile *profile-name*
   By default, no queue scheduling profile is applied to an interface.

Example: Configuring a queue scheduling profile

Network configuration

Configure a queue scheduling profile to meet the following requirements on GigabitEthernet 1/0/1:

- Queue 7 has the highest priority, and its packets are sent preferentially.
- Queue 0 through queue 6 are in the WRR group and are scheduled according to their packet-count weights, which are 2, 1, 2, 4, 6, 8, and 10, respectively. When queue 7 is empty, the WRR group is scheduled.

Procedure

Enter system view.

```
<Sysname> system-view
```

Create a queue scheduling profile named **qm1**.

```
[Sysname] qos qmprofile qm1
[Sysname-qmprofile-qm1]
```

Configure queue 7 to use SP queuing.

```
[Sysname-qmprofile-qm1] queue 7 sp
```

Assign queue 0 through queue 6 to WRR group 1, with their packet-count weights as 2, 1, 2, 4, 6, 8, and 10, respectively.

```
[Sysname-qmprofile-qm1] queue 0 wrr group 1 weight 2
[Sysname-qmprofile-qm1] queue 1 wrr group 1 weight 1
[Sysname-qmprofile-qm1] queue 2 wrr group 1 weight 2
[Sysname-qmprofile-qm1] queue 3 wrr group 1 weight 4
[Sysname-qmprofile-qm1] queue 4 wrr group 1 weight 6
[Sysname-qmprofile-qm1] queue 5 wrr group 1 weight 8
[Sysname-qmprofile-qm1] queue 6 wrr group 1 weight 10
[Sysname-qmprofile-qm1] quit
```

Apply queue scheduling profile **qm1** to GigabitEthernet 1/0/1.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos apply qmprofile qm1
```

After the configuration is completed, GigabitEthernet 1/0/1 performs queue scheduling as specified in queue scheduling profile **qm1**.

Display and maintenance commands for congestion management

Execute **display** commands in any view.

Task	Command
Display the configuration of queue scheduling profiles.	**display qos qmprofile configuration** [*profile-name*] [**slot** *slot-number*]
Display the queue scheduling profiles applied to interfaces.	**display qos qmprofile interface** [*interface-type interface-number*]
Display outbound queue-based traffic statistics for interfaces.	**display qos queue-statistics interface outbound**
Display SP queuing configuration.	**display qos queue sp interface** [*interface-type interface-number*]
Display WRR queuing configuration.	**display qos queue wrr interface** [*interface-type interface-number*]

Configuring traffic filtering

About traffic filtering

You can filter in or filter out traffic of a class by associating the class with a traffic filtering action. For example, you can filter packets sourced from an IP address according to network status.

Restrictions and guidelines: Traffic filtering configuration

The device supports the following application destinations for traffic filtering:

- Interface.
- VLANs.
- Globally.
- User profile.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about configuring match criteria, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure the traffic filtering action.
      filter { **deny** | **permit** }
      By default, no traffic filtering action is configured.
      If a traffic behavior has the **filter deny** action, all other actions in the traffic behavior except class-based accounting do not take effect.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.
classifier *classifier-name* **behavior** *behavior-name*
By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.
quit

5. Apply the QoS policy.
For more information, see "Applying the QoS policy."
By default, no QoS policy is applied.

6. (Optional.) Display the traffic filtering configuration.
display traffic behavior user-defined [*behavior-name*]
This command is available in any view.

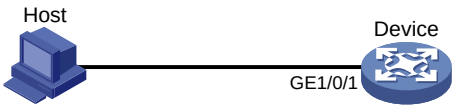
Traffic filtering configuration examples

Example: Configuring traffic filtering

Network configuration

As shown in Figure 15, configure traffic filtering on GigabitEthernet 1/0/1 to deny the incoming packets with a source port number other than 21.

Figure 15 Network diagram



Procedure

Create advanced ACL 3000, and configure a rule to match packets whose source port number is not 21.

```
<Device> system-view
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule 0 permit tcp source-port neq 21
[Device-acl-ipv4-adv-3000] quit
```

Create a traffic class named **classifier_1**, and use ACL 3000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 3000
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1**, and configure the traffic filtering action to drop packets.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] filter deny
[Device-behavior-behavior_1] quit
```

Create a QoS policy named **policy**, and associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[Device] qos policy policy
```

```
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy inbound
```

Configuring priority marking

About priority marking

Priority marking sets the priority fields or flag bits of packets to modify the priority of packets. For example, you can use priority marking to set IP precedence or DSCP for a class of IP packets to control the forwarding of these packets.

To configure priority marking to set the priority fields or flag bits for a class of packets, perform the following tasks:

1. Configure a traffic behavior with a priority marking action.
2. Associate the traffic class with the traffic behavior.

Priority marking can be used together with priority mapping. For more information, see "Configuring priority mapping."

Configuring priority marking

Restrictions and guidelines

The device supports applying a QoS policy containing a priority marking action only to the inbound direction.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a priority marking action.
      For configurable priority marking actions, see the **remark** commands in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.
classifier *classifier-name* **behavior** *behavior-name*
By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.
quit

5. Apply the QoS policy.
For more information, see "Applying the QoS policy."
By default, no QoS policy is applied.

6. (Optional.) Display the priority marking configuration.
display traffic behavior user-defined [*behavior-name*]
This command is available in any view.

Priority marking configuration examples

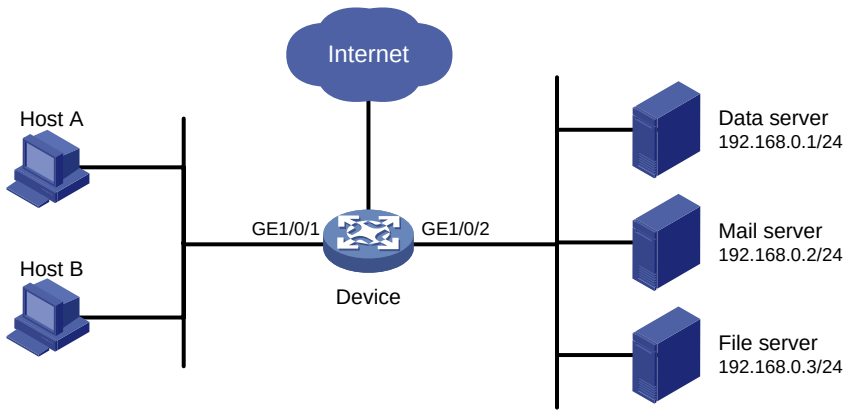
Example: Configuring priority marking

Network configuration

As shown in Figure 16, configure priority marking on the device to meet the following requirements:

Traffic source	Destination	Processing priority
Host A, B	Data server	High
Host A, B	Mail server	Medium
Host A, B	File server	Low

Figure 16 Network diagram



Procedure

Create advanced ACL 3000, and configure a rule to match packets with destination IP address 192.168.0.1.

```
<Device> system-view
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.1 0
[Device-acl-ipv4-adv-3000] quit
```

Create advanced ACL 3001, and configure a rule to match packets with destination IP address 192.168.0.2.

```
[Device] acl advanced 3001
[Device-acl-ipv4-adv-3001] rule permit ip destination 192.168.0.2 0
[Device-acl-ipv4-adv-3001] quit
```

Create advanced ACL 3002, and configure a rule to match packets with destination IP address 192.168.0.3.

```
[Device] acl advanced 3002
[Device-acl-ipv4-adv-3002] rule permit ip destination 192.168.0.3 0
[Device-acl-ipv4-adv-3002] quit
```

Create a traffic class named **classifier_dbserver**, and use ACL 3000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_dbserver
[Device-classifier-classifier_dbserver] if-match acl 3000
[Device-classifier-classifier_dbserver] quit
```

Create a traffic class named **classifier_mserver**, and use ACL 3001 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_mserver
[Device-classifier-classifier_mserver] if-match acl 3001
[Device-classifier-classifier_mserver] quit
```

Create a traffic class named **classifier_fserver**, and use ACL 3002 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_fserver
[Device-classifier-classifier_fserver] if-match acl 3002
[Device-classifier-classifier_fserver] quit
```

Create a traffic behavior named **behavior_dbserver**, and configure the action of setting the local precedence value to 4.

```
[Device] traffic behavior behavior_dbserver
[Device-behavior-behavior_dbserver] remark local-precedence 4
[Device-behavior-behavior_dbserver] quit
```

Create a traffic behavior named **behavior_mserver**, and configure the action of setting the local precedence value to 3.

```
[Device] traffic behavior behavior_mserver
[Device-behavior-behavior_mserver] remark local-precedence 3
[Device-behavior-behavior_mserver] quit
```

Create a traffic behavior named **behavior_fserver**, and configure the action of setting the local precedence value to 2.

```
[Device] traffic behavior behavior_fserver
[Device-behavior-behavior_fserver] remark local-precedence 2
[Device-behavior-behavior_fserver] quit
```

Create a QoS policy named **policy_server**, and associate traffic classes with traffic behaviors in the QoS policy.

```
[Device] qos policy policy_server
[Device-qospolicy-policy_server] classifier classifier_dbserver behavior
behavior_dbserver
[Device-qospolicy-policy_server] classifier classifier_mserver behavior
behavior_mserver
[Device-qospolicy-policy_server] classifier classifier_fserver behavior
behavior_fserver
```

```
[Device-qospolicy-policy_server] quit
```

Apply QoS policy **policy_server** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy_server inbound
[Device-GigabitEthernet1/0/1] quit
```

Configuring nesting

About nesting

Nesting adds a VLAN tag to the matching packets to allow the VLAN-tagged packets to pass through the corresponding VLAN. For example, you can add an outer VLAN tag to packets from a customer network to a service provider network. This allows the packets to pass through the service provider network by carrying a VLAN tag assigned by the service provider.

Restrictions and guidelines: Nesting configuration

The device supports applying a QoS policy containing a nesting action only to the inbound direction:

Do not enable QinQ and apply a QoS policy containing a nesting action on the same interface. Otherwise, QinQ or the QoS policy does not take effect.

To use the nesting action to add an outer VLAN tag to packets with the specified VLAN ID, you must use the **if-match customer-vlan-id** *vlan-id-list* command to match the single-tagged packets.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured for a traffic class.
      For more information about the match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure an outer VLAN tag adding action.
      nest top-most vlan *vlan-id*
      By default, no outer VLAN tag adding action is configured for a traffic behavior.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

6. (Optional.) Display the nesting configuration.

display traffic behavior user-defined [*behavior-name*]

This command is available in any view.

Nesting configuration examples

Example: Configuring nesting

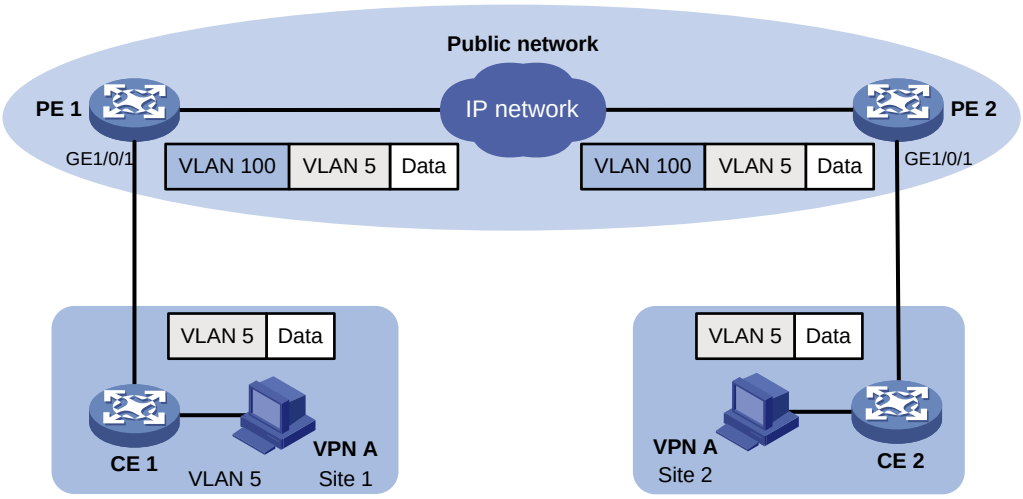
Network configuration

As shown in Figure 17:

- Site 1 and Site 2 in VPN A are two branches of a company. They use VLAN 5 to transmit traffic.
- Because Site 1 and Site 2 are located in different areas, the two sites use the VPN access service of a service provider. The service provider assigns VLAN 100 to the two sites.

Configure nesting, so that the two branches can communicate through the service provider network.

Figure 17 Network diagram



Procedure

1. Configuring PE 1:

Create a traffic class named **test** to match traffic with VLAN ID 5.

```
<PE1> system-view
[PE1] traffic classifier test
[PE1-classifier-test] if-match customer-vlan-id 5
[PE1-classifier-test] quit
```

Configure an action to add outer VLAN tag 100 in traffic behavior **test**.

```
[PE1] traffic behavior test
[PE1-behavior-test] nest top-most vlan 100
[PE1-behavior-test] quit
```

Create a QoS policy named **test**, and associate class **test** with behavior **test** in the QoS policy.

```
[PE1] qos policy test
[PE1-qospolicy-test] classifier test behavior test
[PE1-qospolicy-test] quit
```

Configure the downlink port (GigabitEthernet 1/0/1) as a hybrid port, and assign the port to VLAN 100 as an untagged member.

```
[PE1] interface gigabitethernet 1/0/1
[PE1-GigabitEthernet1/0/1] port link-type hybrid
[PE1-GigabitEthernet1/0/1] port hybrid vlan 100 untagged
```

Apply QoS policy **test** to the incoming traffic of GigabitEthernet 1/0/1.

```
[PE1-GigabitEthernet1/0/1] qos apply policy test inbound
[PE1-GigabitEthernet1/0/1] quit
```

Configure the uplink port (GigabitEthernet 1/0/2) as a trunk port, and assign it to VLAN 100.

```
[PE1] interface gigabitethernet 1/0/2
[PE1-GigabitEthernet1/0/2] port link-type trunk
[PE1-GigabitEthernet1/0/2] port trunk permit vlan 100
[PE1-GigabitEthernet1/0/2] quit
```

2. Configuring PE 2:

Configure PE 2 in the same way PE 1 is configured.

Configuring traffic redirecting

About traffic redirecting

Traffic redirecting redirects packets matching the specified match criteria to a location for processing.

You can redirect packets to the following destinations:

- CPU.
- Interface.

Restrictions and guidelines: Traffic redirecting configuration

- The device supports applying a QoS policy containing a traffic redirecting action only to the inbound direction of an interface.
- If you execute the **redirect** command multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured for a traffic class.
      For more information about the match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a traffic redirecting action.
      redirect { **cpu** | **interface** *interface-type interface-number* }
      By default, no traffic redirecting action is configured for a traffic behavior.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

6. (Optional.) Display traffic redirecting configuration.

display traffic behavior user-defined [*behavior-name*]

This command is available in any view.

Traffic redirecting configuration examples

Example: Configuring traffic redirecting

Network configuration

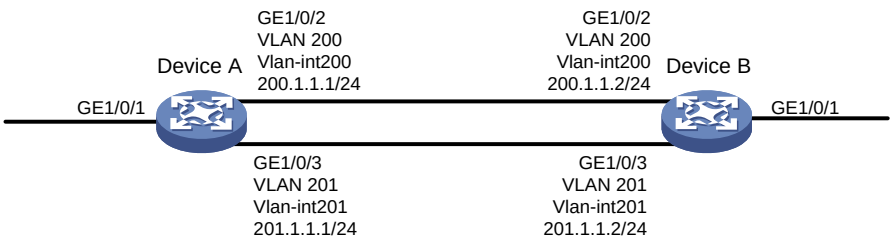
As shown in Figure 18:

- Device A is connected to Device B through two links. Device A and Device B are each connected to other devices.
- GigabitEthernet 1/0/1 of Device A is a trunk port and belongs to VLAN 200 and VLAN 201.
- GigabitEthernet 1/0/2 of Device A and GigabitEthernet 1/0/2 of Device B belong to VLAN 200.
- GigabitEthernet 1/0/3 of Device A and GigabitEthernet 1/0/3 of Device B belong to VLAN 201.
- On Device A, the IP address of VLAN-interface 200 is 200.1.1.1/24, and that of VLAN-interface 201 is 201.1.1.1/24.
- On Device B, the IP address of VLAN-interface 200 is 200.1.1.2/24, and that of VLAN-interface 201 is 201.1.1.2/24.

Configure the actions of redirecting traffic to an interface to meet the following requirements:

- Packets with source IP address 2.1.1.1 received on GigabitEthernet 1/0/1 of Device A are forwarded to GigabitEthernet 1/0/2.
- Packets with source IP address 2.1.1.2 received on GigabitEthernet 1/0/1 of Device A are forwarded to GigabitEthernet 1/0/3.
- Other packets received on GigabitEthernet 1/0/1 of Device A are forwarded according to the routing table.

Figure 18 Network diagram



Procedure

Create basic ACL 2000, and configure a rule to match packets with source IP address 2.1.1.1.

```
<DeviceA> system-view
[DeviceA] acl basic 2000
[DeviceA-acl-ipv4-basic-2000] rule permit source 2.1.1.1 0
[DeviceA-acl-ipv4-basic-2000] quit
```

Create basic ACL 2001, and configure a rule to match packets with source IP address 2.1.1.2.

```
[DeviceA] acl basic 2001
[DeviceA-acl-ipv4-basic-2001] rule permit source 2.1.1.2 0
[DeviceA-acl-ipv4-basic-2001] quit
```

Create a traffic class named **classifier_1**, and use ACL 2000 as the match criterion in the traffic class.

```
[DeviceA] traffic classifier classifier_1
[DeviceA-classifier-classifier_1] if-match acl 2000
[DeviceA-classifier-classifier_1] quit
```

Create a traffic class named **classifier_2**, and use ACL 2001 as the match criterion in the traffic class.

```
[DeviceA] traffic classifier classifier_2
[DeviceA-classifier-classifier_2] if-match acl 2001
[DeviceA-classifier-classifier_2] quit
```

Create a traffic behavior named **behavior_1**, and configure the action of redirecting traffic to GigabitEthernet 1/0/2.

```
[DeviceA] traffic behavior behavior_1
[DeviceA-behavior-behavior_1] redirect interface gigabitethernet 1/0/2
[DeviceA-behavior-behavior_1] quit
```

Create a traffic behavior named **behavior_2**, and configure the action of redirecting traffic to GigabitEthernet 1/0/3.

```
[DeviceA] traffic behavior behavior_2
[DeviceA-behavior-behavior_2] redirect interface gigabitethernet 1/0/3
[DeviceA-behavior-behavior_2] quit
```

Create a QoS policy named **policy**.

```
[DeviceA] qos policy policy
```

Associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[DeviceA-qospolicy-policy] classifier classifier_1 behavior behavior_1
```

Associate traffic class **classifier_2** with traffic behavior **behavior_2** in the QoS policy.

```
[DeviceA-qospolicy-policy] classifier classifier_2 behavior behavior_2
[DeviceA-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] qos apply policy policy inbound
```

Configuring global CAR

About global CAR

Global committed access rate (CAR) is an approach to policing traffic flows globally. It adds flexibility to common CAR where traffic policing is performed only on a per-traffic class or per-interface basis. In this approach, CAR actions are created in system view and each can be used to police multiple traffic flows as a whole.

Global CAR provides the following CAR actions: aggregate CAR and hierarchical CAR.

Aggregate CAR

An aggregate CAR action is created globally. It can be directly applied to interfaces or used in the traffic behaviors associated with different traffic classes to police multiple traffic flows as a whole. The total rate of the traffic flows must conform to the traffic policing specifications set in the aggregate CAR action.

Hierarchical CAR

A hierarchical CAR action is created globally. It must be used in conjunction with a common CAR or aggregate CAR action. With a hierarchical CAR action, you can limit the total traffic of multiple traffic classes.

A hierarchical CAR action can be used in the common or aggregate CAR action for a traffic class in either AND mode or OR mode.

- In AND mode, the rate of the traffic class is strictly limited under the common or aggregate CAR. This mode applies to flows that must be strictly rate limited.
- In OR mode, the traffic class can use idle bandwidth of other traffic classes associated with the hierarchical CAR. This mode applies to high priority, bursty traffic like video.

By using the two modes appropriately, you can improve bandwidth efficiency.

For example, suppose two flows exist: a low priority data flow and a high priority, bursty video flow. Their total traffic rate cannot exceed 4096 kbps and the video flow must be assured of at least 2048 kbps bandwidth. You can perform the following tasks:

- Configure common CAR actions to set the traffic rate to 2048 kbps for the two flows.
- Configure a hierarchical CAR action to limit their total traffic rate to 4096 kbps.
- Use the action in AND mode in the common CAR action for the data flow.
- Use the action in OR mode in the common CAR action for the video flow.

The video flow is assured of 2048 kbps bandwidth and can use idle bandwidth of the data flow.

In a bandwidth oversubscription scenario, the uplink port bandwidth is lower than the total downlink port traffic rate. You can use hierarchical CAR to meet the following requirements:

- Limit the total rate of downlink port traffic.
- Allow each downlink port to forward traffic at the maximum rate when the other ports are idle.

For example, you can perform the following tasks:

- Use common CAR actions to limit the rates of Internet access flow 1 and flow 2 to both 128 kbps.
- Use a hierarchical CAR action to limit their total traffic rate to 192 kbps.

- Use the hierarchical CAR action for both flow 1 and flow 2 in AND mode.

When flow 1 is not present, flow 2 is transmitted at the maximum rate, 128 kbps. When both flows are present, the total rate of the two flows cannot exceed 192 kbps. As a result, the traffic rate of flow 2 might drop below 128 kbps.

Restrictions and guidelines: Global CAR configuration

- Only aggregate CAR is supported in the current software version.
- The device supports applying a QoS policy containing an aggregate CAR action only to the inbound direction.
- When a QoS policy containing an aggregate CAR action is applied on an IRF fabric, the traffic matching the QoS policy might enter the IRF fabric through interfaces on different IRF member devices. In this case, the actual rate limit that takes effect is the sum of the CIR and PIR in the aggregate CAR action multiplied by the number of involved port groups. Interfaces on different IRF member devices belong to different port groups. Interfaces on the same IRF member device can belong to the same or different port groups. To identify port group information, execute the **debug port mapping** command in probe view. Interfaces with the same **Unit** value belong to the same port group.

Configuring aggregate CAR

1. Enter system view.

   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.

      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.

      if-match *match-criteria*

      By default, no match criterion is configured.

      For configurable match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.

      quit
3. Configure an aggregate CAR action.

   qos car *car-name* **aggregative cir** *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

   qos car *car-name* **aggregative cir** *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

   By default, no aggregate CAR action is configured.
4. Define a traffic behavior.
   a. Enter traffic behavior view.

      traffic behavior *behavior-name*
   b. Use the aggregate CAR in the traffic behavior.

car name *car-name*

By default, no aggregate CAR action is used in a traffic behavior.

5. Apply the QoS policy.

   For more information, see "Applying the QoS policy."

   By default, no QoS policy is applied.

Display and maintenance commands for global CAR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display statistics for global CAR actions.	**display qos car name** [*car-name*]
Clear statistics for global CAR actions.	**reset qos car name** [*car-name*]

Configuring class-based accounting

About class-based accounting

Class-based accounting collects statistics on a per-traffic class basis. For example, you can define the action to collect statistics for traffic sourced from a certain IP address. By analyzing the statistics, you can determine whether anomalies have occurred and what action to take.

Restrictions and guidelines: Class-based accounting configuration

The device supports the following application destinations for class-based accounting:

- Interface.
- VLANs.
- Globally.
- User profile.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure an accounting action.
      accounting { **byte** | **packet** }
      By default, no traffic accounting action is configured.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.
classifier *classifier-name* **behavior** *behavior-name*
By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.
quit

5. Apply the QoS policy.
For more information, see "Applying the QoS policy."
By default, no QoS policy is applied.

6. (Optional.) Display the class-based accounting configuration.
display traffic behavior user-defined [*behavior-name*]

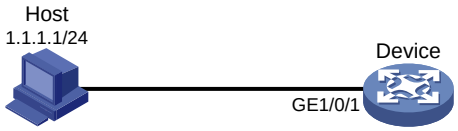
Class-based accounting configuration examples

Example: Configuring class-based accounting

Network configuration

As shown in Figure 19, configure class-based accounting on GigabitEthernet 1/0/1 to collect statistics for incoming traffic from 1.1.1.1/24.

Figure 19 Network diagram



Procedure

Create basic ACL 2000, and configure a rule to match packets with source IP address 1.1.1.1.

```
<Device> system-view
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 1.1.1.1 0
[Device-acl-ipv4-basic-2000] quit
```

Create a traffic class named **classifier_1**, and use ACL 2000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 2000
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1**, and configure the class-based accounting action.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] accounting packet
[Device-behavior-behavior_1] quit
```

Create a QoS policy named **policy**, and associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[Device] qos policy policy
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy inbound
[Device-GigabitEthernet1/0/1] quit
```

Display traffic statistics to verify the configuration.

```
[Device] display qos policy interface gigabitethernet 1/0/1
Interface: GigabitEthernet1/0/1
  Direction: Inbound
  Policy: policy
   Classifier: classifier_1
     Operator: AND
     Rule(s) :
      If-match acl 2000
     Behavior: behavior_1
      Accounting enable:
        28529 (Packets)
```

Appendixes

Appendix A Acronyms

Table 2 Appendix A Acronyms

Acronym	Full spelling
BE	Best Effort
CAR	Committed Access Rate
CBS	Committed Burst Size
CE	Congestion Experienced
CIR	Committed Information Rate
DiffServ	Differentiated Service
DSCP	Differentiated Services Code Point
EBS	Excess Burst Size
FIFO	First in First out
FQ	Fair Queuing
GTS	Generic Traffic Shaping
IntServ	Integrated Service
ISP	Internet Service Provider
MPLS	Multiprotocol Label Switching
PE	Provider Edge
PIR	Peak Information Rate
QoS	Quality of Service
RED	Random Early Detection
RSVP	Resource Reservation Protocol
RTP	Real-Time Transport Protocol
SP	Strict Priority
ToS	Type of Service
VoIP	Voice over IP
VPN	Virtual Private Network
WFQ	Weighted Fair Queuing
WRED	Weighted Random Early Detection
WRR	Weighted Round Robin

Appendix B Default priority maps

For the default **dscp-dscp** priority map, an input value yields a target value equal to it.

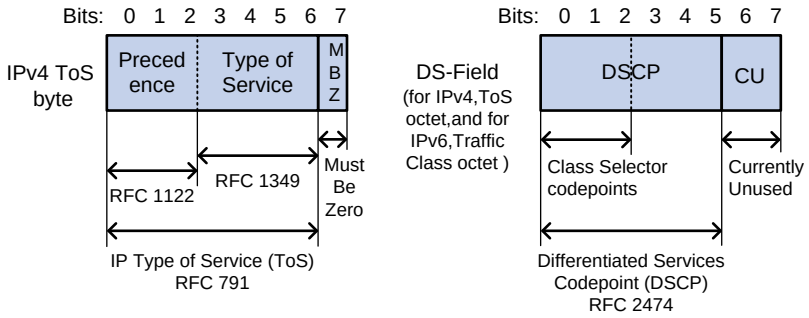
Appendix C Introduction to packet precedence

IP precedence and DSCP values

Figure 20 ToS and DS fields



As shown in Figure 20, the ToS field in the IP header contains 8 bits. The first 3 bits (0 to 2) represent IP precedence from 0 to 7. According to RFC 2474, the ToS field is redefined as the differentiated services (DS) field. A DSCP value is represented by the first 6 bits (0 to 5) of the DS field and is in the range 0 to 63. The remaining 2 bits (6 and 7) are reserved.

Table 6 IP precedence

IP precedence (decimal)	IP precedence (binary)	Description
0	000	Routine
1	001	priority
2	010	immediate

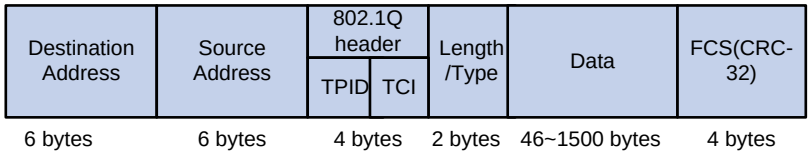
0	000000	be (default)

802.1p priority

802.1p priority lies in the Layer 2 header. It applies to occasions where Layer 3 header analysis is not needed and QoS must be assured at Layer 2.

Figure 21 An Ethernet frame with an 802.1Q tag header



As shown in Figure 21, the 4-byte 802.1Q tag header contains the 2-byte tag protocol identifier (TPID) and the 2-byte tag control information (TCI). The value of the TPID is 0x8100. Figure 22 shows the format of the 802.1Q tag header. The Priority field in the 802.1Q tag header is called 802.1p priority, because its use is defined in IEEE 802.1p. Table 8 shows the values for 802.1p priority.

Figure 22 802.1Q tag header

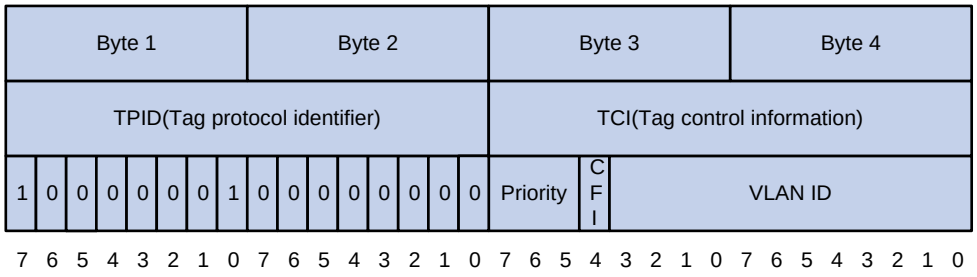


Table 8 Description on 802.1p priority

802.1p priority (decimal)	802.1p priority (binary)	Description
0	000	best-effort
1	001	background

Configuring data buffers

About data buffers

Data buffer types

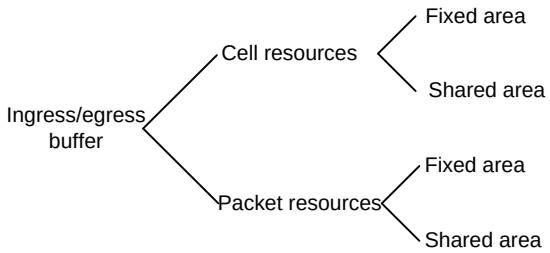
Data buffers temporarily store packets to avoid packet loss.

The following data buffers are available:

- **Ingress buffer**—Stores incoming packets when the CPU is busy.
- **Egress buffer**—Stores outgoing packets when network congestion occurs.

Figure 1 shows the structure of ingress and egress buffers.

Figure 1 Data buffer structure



Cell resources and packet resources

A buffer uses the following types of resources:

- **Cell resources**—Store packets. The buffer uses cell resources based on packet sizes. Suppose a cell resource provides 208 bytes. The buffer allocates one cell resource to a 128-byte packet and two cell resources to a 300-byte packet.
- **Packet resources**—Store packet pointers. A packet pointer indicates where the packet is located in cell resources. The buffer uses one packet resource for each incoming or outgoing packet.

Fixed area and shared area

Each type of resources has a fixed area and a shared area.

- **Fixed area**—Partitioned into queues, each of which is equally divided by all the interfaces on the switch, as shown in Figure 2. When congestion occurs or the CPU is busy, the following rules apply:

  a. An interface first uses the relevant queues of the fixed area to store packets.

  b. When a queue is full, the interface uses the corresponding queue of the shared area.

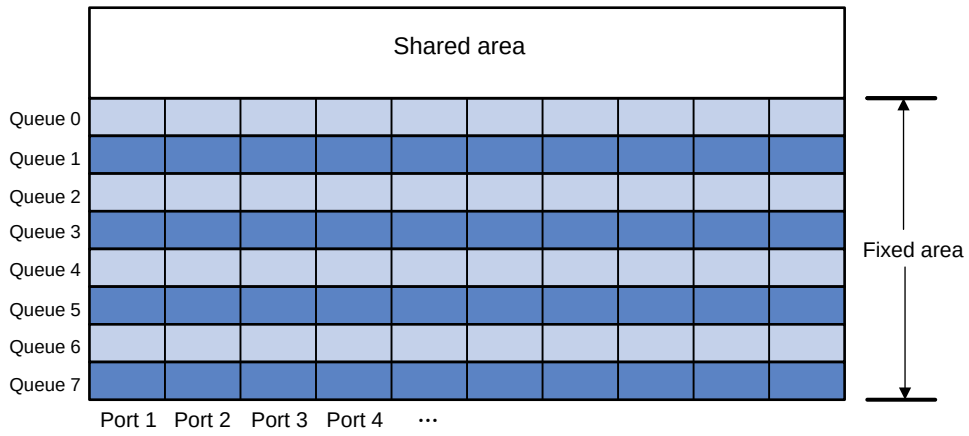
  c. When the queue in the shared area is also full, the interface discards subsequent packets.

  The system allocates the fixed area among queues as specified by the user. Even if a queue is not full, other queues cannot preempt its space. Similarly, the share of a queue for an interface cannot be preempted by other interfaces even if it is not full.
- **Shared area**—Partitioned into queues, each of which is not equally divided by the interfaces, as shown in Figure 2. The system determines the actual shared-area space for each queue

according to user configuration and the number of packets actually received and sent. If a queue is not full, other queues can preempt its space.

The system puts packets received or sent on all interfaces into a queue in the order they arrive. When the queue is full, subsequent packets are dropped.

Figure 2 Fixed area and shared area



Restrictions and guidelines: Data buffer configuration

You can configure data buffers either manually or automatically by enabling the Burst feature. If you have configured data buffers in one way, delete the configuration before using the other way. Otherwise, the new configuration does not take effect.

Inappropriate data buffer changes can cause system problems. Before manually changing data buffer settings, make sure you understand its impact on your device. As a best practice, use the **`burst-mode enable`** command if the system requires large buffer spaces.

Data buffer tasks at a glance

To configure the data buffer, perform the following tasks:

- Enabling the Burst feature
- Configuring data buffers manually

Enabling the Burst feature

About the Burst feature

The Burst feature enables the device to automatically allocate cell and packet resources. It is well suited to the following scenarios:

- Broadcast or multicast traffic is intensive, resulting in bursts of traffic.
- Traffic comes in and goes out in one of the following ways:
  - Enters a device from a high-speed interface and goes out of a low-speed interface.
  - Enters from multiple same-rate interfaces at the same time and goes out of an interface with the same rate.

The default data buffer settings are changed after the Burst feature is enabled. You can display the data buffer settings by using the **display buffer** command.

Procedure

1. Enter system view.

   system-view

2. Enable the Burst feature.

   burst-mode enable

   By default, the Burst feature is disabled.

Configuring data buffers manually

About manual data buffer configuration

Each type of resources of a buffer, packet or cell, has a fixed size. After you set the shared-area size for a type of resources, the rest is automatically assigned to the fixed area.

By default, all queues have an equal share of the shared area and the fixed area. You can change the maximum shared-area space and the fixed-area for a queue. The unconfigured queues use the default settings.

Restrictions and guidelines

In Release 6126P13 and later versions, you can set the following parameters to 100% in a multicast video scenario to relieve the problem of stuck pictures:

- The maximum shared-area ratio of cell resources for a queue.
- The total shared-area ratio of cell resources.
- The maximum shared-area ratio of packet resources for a queue.
- The total shared-area ratio of packet resources.

The preceding settings are mutually exclusive with the Burst function. Disable the Burst function before configuring these settings.

Procedure

1. Enter system view.

   system-view

2. Configure buffer assignment rules. Choose the options to configure as needed:
   - Set the total shared-area ratio.

     buffer egress [**slot** *slot-number*] { **cell** | **packet** } **total-shared ratio** *ratio*

     If this command is not configured, you can display the default value by using the **display buffer** command.
   - Set the maximum shared-area ratio for a queue.

     buffer egress [**slot** *slot-number*] { **cell** | **packet** } [**queue** *queue-id*] **shared ratio** *ratio*

     The default setting is 10% for both cell resources and packet resources.

     The actual maximum shared-area space for each queue is determined based on your configuration and the number of packets to be received and sent.
   - Set the fixed-area ratio for a queue.

     buffer egress [**slot** *slot-number*] { **cell** | **packet** } **queue** *queue-id* **guaranteed ratio** *ratio*

     The default setting is 12% for both cell resources and packet resources.

The sum of fixed-area ratios configured for all queues cannot exceed the total fixed-area ratio. Otherwise, the configuration fails.

3. Apply buffer assignment rules.

   buffer apply

   You cannot directly modify the applied configuration. To modify the configuration, you must cancel the application, reconfigure data buffers, and reapply the configuration.

Display and maintenance commands for data buffers

Execute **display** commands in any view.

Task	Command
Display buffer size settings.	**display buffer** [**slot** *slot-number*] [**queue** [*queue-id*]]
Display data buffer usage.	**display buffer usage** [**slot** *slot-number*]

Contents

Configuring time ranges

About time ranges

You can implement a service based on the time of the day by applying a time range to it. A time-based service takes effect only in time periods specified by the time range. For example, you can implement time-based ACL rules by applying a time range to them.

The following basic types of time ranges are available:

- **Periodic time range**—Recurs periodically on a day or days of the week.
- **Absolute time range**—Represents only a period of time and does not recur.

The active period of a time range is calculated as follows:

1. Combining all periodic statements.
2. Combining all absolute statements.
3. Taking the intersection of the two statement sets as the active period of the time range.

Restrictions and guidelines: Time range configuration

When you configure the ACL hardware mode, follow these restrictions and guidelines:

- If a time range does not exist, the service based on the time range does not take effect.
- You can create a maximum of 1024 time ranges, each with a maximum of 32 periodic statements and 12 absolute statements.

Procedure

1. Enter system view.

   system-view

2. Create or edit a time range.

   time-range *time-range-name* { *start-time* **to** *end-time days* [**from** *time1 date1*] [**to** *time2 date2*] | **from** *time1 date1* [**to** *time2 date2*] | **to** *time2 date2* }

   If an existing time range name is provided, this command adds a statement to the time range.

Display and maintenance commands for time ranges

Execute the **display** command in any view.

Task	Command
Display time range configuration and status.	**display time-range** { *time-range-name* | **all** }

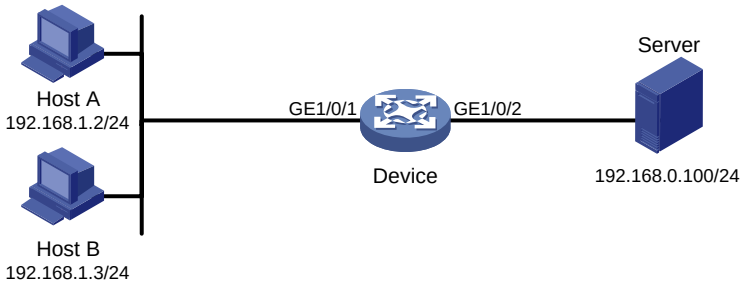
Time range configuration examples

Example: Configuring a time range

Network configuration

As shown in Figure 1, configure an ACL on the device to allow Host A to access the server only during 8:00 and 18:00 on working days from June 2015 to the end of the year.

Figure 1 Network diagram



Procedure

Create a periodic time range during 8:00 and 18:00 on working days from June 2015 to the end of the year.

```
<Device> system-view
[Device] time-range work 8:0 to 18:0 working-day from 0:0 6/1/2015 to 24:00 12/31/2015
```

Create an IPv4 basic ACL numbered 2001, and configure a rule in the ACL to permit packets only from 192.168.1.2/32 during the time range **work**.

```
[Device] acl basic 2001
[Device-acl-ipv4-basic-2001] rule permit source 192.168.1.2 0 time-range work
[Device-acl-ipv4-basic-2001] rule deny source any time-range work
[Device-acl-ipv4-basic-2001] quit
```

Apply IPv4 basic ACL 2001 to filter outgoing packets on GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] packet-filter 2001 outbound
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Verify that the time range **work** is active on the device.

```
[Device] display time-range all
Current time is 13:58:35 6/19/2015 Friday

Time-range : work (Active)
 08:00 to 18:00 working-day
 from 00:00 6/1/2015 to 00:00 1/1/2016
```

Security Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This configuration guide describes security fundamentals and configuration. It covers the following features:

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Contents

Configuring AAA

About AAA

AAA implementation

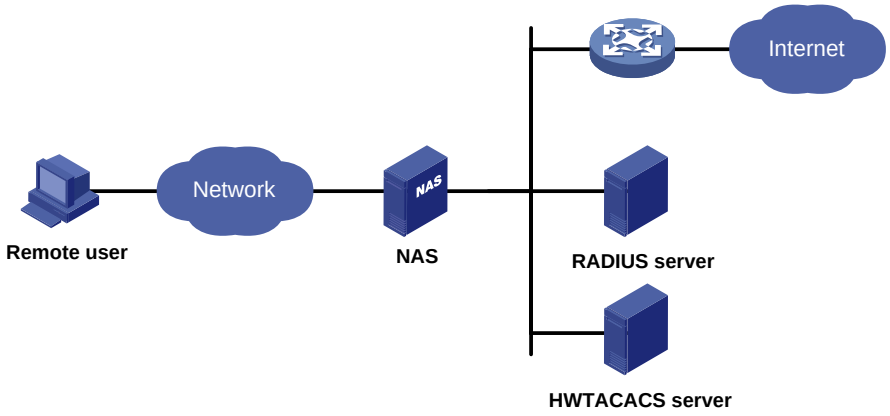
Authentication, Authorization, and Accounting (AAA) provides a uniform framework for implementing network access management. This feature specifies the following security functions:

- **Authentication**—Identifies users and verifies their validity.
- **Authorization**—Grants different users different rights, and controls the users' access to resources and services. For example, you can permit office users to read and print files and prevent guests from accessing files on the device.
- **Accounting**—Records network usage details of users, including the service type, start time, and traffic. This function enables time-based and traffic-based charging and user behavior auditing.

AAA network diagram

AAA uses a client/server model. The client runs on the access device, or the network access server (NAS), which authenticates user identities and controls user access. The server maintains user information centrally. See Figure 1.

Figure 1 AAA network diagram



To access networks or resources beyond the NAS, a user sends its identity information to the NAS. The NAS transparently passes the user information to AAA servers and waits for the authentication, authorization, and accounting result. Based on the result, the NAS determines whether to permit or deny the access request.

AAA has various implementations, including HWTACACS, LDAP, and RADIUS. RADIUS is most often used.

You can use different servers to implement different security functions. For example, you can use an HWTACACS server for authentication and authorization, and use a RADIUS server for accounting.

You can choose the security functions provided by AAA as needed. For example, if your company wants employees to be authenticated before they access specific resources, you would deploy an authentication server. If network usage information is needed, you would also configure an accounting server.

The device performs dynamic password authentication.

RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a distributed information interaction protocol that uses a client/server model. The protocol can protect networks against unauthorized access and is often used in network environments that require both high security and remote user access.

The RADIUS authorization process is combined with the RADIUS authentication process, and user authorization information is piggybacked in authentication responses. RADIUS uses UDP port 1812 for authentication and UDP port 1813 for accounting.

RADIUS was originally designed for dial-in user access, and has been extended to support additional access methods, such as Ethernet and ADSL.

Client/server model

The RADIUS client runs on the NASs located throughout the network. It passes user information to RADIUS servers and acts on the responses to, for example, reject or accept user access requests.

The RADIUS server runs on the computer or workstation at the network center and maintains information related to user authentication and network service access.

The RADIUS server operates using the following process:

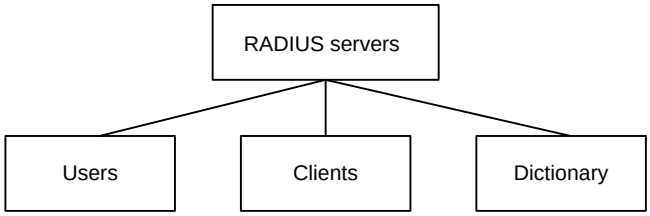
1. Receives authentication, authorization, and accounting requests from RADIUS clients.
2. Performs user authentication, authorization, or accounting.
3. Returns user access control information (for example, rejecting or accepting the user access request) to the clients.

The RADIUS server can also act as the client of another RADIUS server to provide authentication proxy services.

The RADIUS server maintains the following databases:

- **Users**—Stores user information, such as the usernames, passwords, applied protocols, and IP addresses.
- **Clients**—Stores information about RADIUS clients, such as shared keys and IP addresses.
- **Dictionary**—Stores RADIUS protocol attributes and their values.

Figure 2 RADIUS server databases



Information exchange security mechanism

The RADIUS client and server exchange information between them with the help of shared keys, which are preconfigured on the client and server. A RADIUS packet has a 16-byte field called Authenticator. This field includes a signature generated by using the MD5 algorithm, the shared key, and some other information. The receiver of the packet verifies the signature and accepts the packet only when the signature is correct. This mechanism ensures the security of information exchanged between the RADIUS client and server.

The shared keys are also used to encrypt user passwords that are included in RADIUS packets.

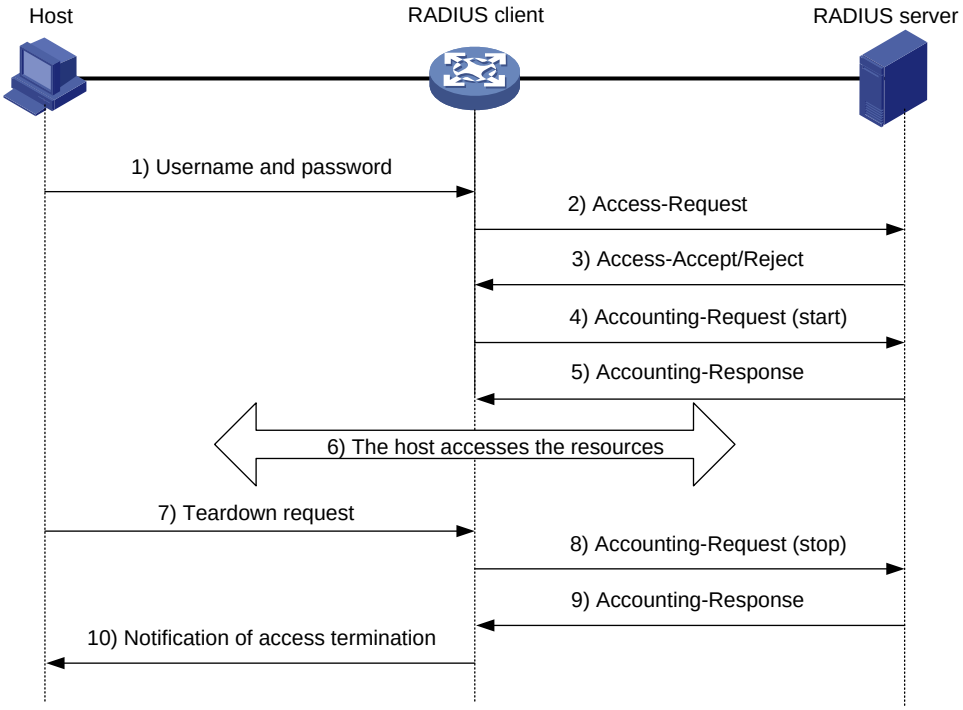
User authentication methods

The RADIUS server supports multiple user authentication methods, such as PAP, CHAP, and EAP.

Basic RADIUS packet exchange process

Figure 3 illustrates the interactions between a user host, the RADIUS client, and the RADIUS server.

Figure 3 Basic RADIUS packet exchange process



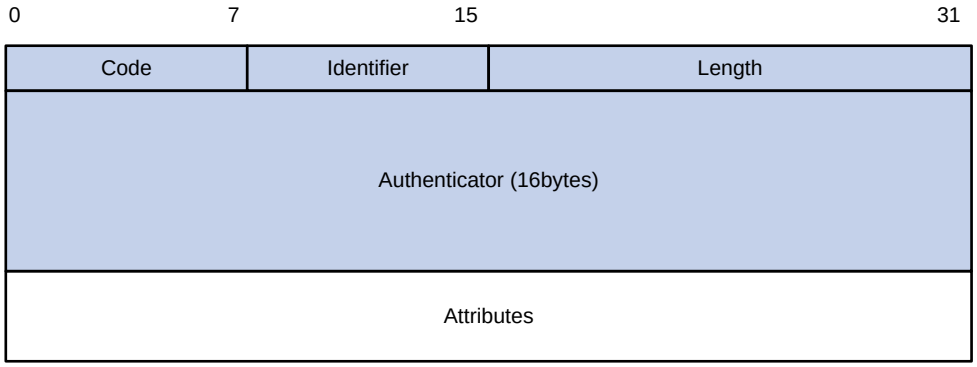
RADIUS uses in the following workflow:

1. The host sends a connection request that includes the user's username and password to the RADIUS client.
2. The RADIUS client sends an authentication request (Access-Request) to the RADIUS server. The request includes the user's password, which has been processed by the MD5 algorithm and shared key.
3. The RADIUS server authenticates the username and password. If the authentication succeeds, the server sends back an Access-Accept packet that contains the user's authorization information. If the authentication fails, the server returns an Access-Reject packet.
4. The RADIUS client permits or denies the user according to the authentication result. If the result permits the user, the RADIUS client sends a start-accounting request (Accounting-Request) packet to the RADIUS server.
5. The RADIUS server returns an acknowledgment (Accounting-Response) packet and starts accounting.
6. The user accesses the network resources.
7. The host requests the RADIUS client to tear down the connection.
8. The RADIUS client sends a stop-accounting request (Accounting-Request) packet to the RADIUS server.
9. The RADIUS server returns an acknowledgment (Accounting-Response) and stops accounting for the user.
10. The RADIUS client notifies the user of the termination.

RADIUS packet format

RADIUS uses UDP to transmit packets. The protocol also uses a series of mechanisms to ensure smooth packet exchange between the RADIUS server and the client. These mechanisms include the timer mechanism, the retransmission mechanism, and the backup server mechanism.

Figure 4 RADIUS packet format



Descriptions of the fields are as follows:

- The Code field (1 byte long) indicates the type of the RADIUS packet. Table 1 gives the main values and their meanings.

  Table 1 Main values of the Code field

Code	Packet type	Description
1	Access-Request	From the client to the server. A packet of this type includes user information for the server to authenticate the user. It must contain the User-Name attribute and can optionally contain the attributes of NAS-IP-Address, User-Password, and NAS-Port.
2	Access-Accept	From the server to the client. If all attribute values included in the Access-Request are acceptable, the authentication succeeds, and the server sends an Access-Accept response.
3	Access-Reject	From the server to the client. If any attribute value included in the Access-Request is unacceptable, the authentication fails, and the server sends an Access-Reject response.
4	Accounting-Request	From the client to the server. A packet of this type includes user information for the server to start or stop accounting for the user. The Acct-Status-Type attribute in the packet indicates whether to start or stop accounting.
5	Accounting-Response	From the server to the client. The server sends a packet of this type to notify the client that it has received the Accounting-Request and has successfully recorded the accounting information.

- The Identifier field (1 byte long) is used to match response packets with request packets and to detect duplicate request packets. The request and response packets of the same exchange process for the same purpose (such as authentication or accounting) have the same identifier.
- The Length field (2 bytes long) indicates the length of the entire packet (in bytes), including the Code, Identifier, Length, Authenticator, and Attributes fields. Bytes beyond this length are considered padding and are ignored by the receiver. If the length of a received packet is less than this length, the packet is dropped.
- The Authenticator field (16 bytes long) is used to authenticate responses from the RADIUS server and to encrypt user passwords. There are two types of authenticators: request authenticator and response authenticator.

- The Attributes field (variable in length) includes authentication, authorization, and accounting information. This field can contain multiple attributes, each with the following subfields:
  - **Type**—Type of the attribute.
  - **Length**—Length of the attribute in bytes, including the Type, Length, and Value subfields.
  - **Value**—Value of the attribute. Its format and content depend on the Type subfield.

Extended RADIUS attributes

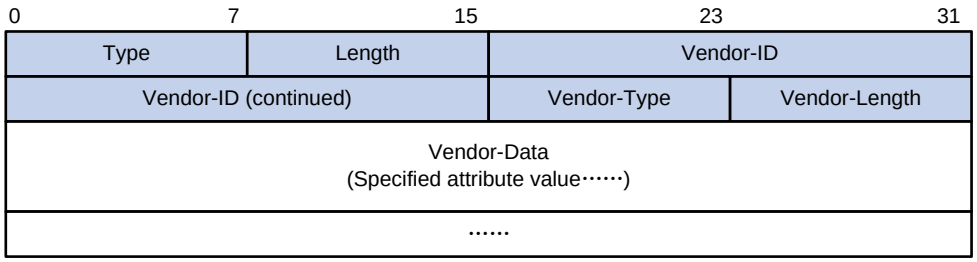
The RADIUS protocol features excellent extensibility. The Vendor-Specific attribute (attribute 26) allows a vendor to define extended attributes. The extended attributes can implement functions that the standard RADIUS protocol does not provide.

A vendor can encapsulate multiple subattributes in the TLV format in attribute 26 to provide extended functions. As shown in Figure 5, a subattribute encapsulated in attribute 26 consists of the following parts:

- **Vendor-ID**—ID of the vendor. The most significant byte is 0. The other three bytes contains a code compliant to RFC 1700.
- **Vendor-Type**—Type of the subattribute.
- **Vendor-Length**—Length of the subattribute.
- **Vendor-Data**—Contents of the subattribute.

The device supports RADIUS subattributes with a vendor ID of 25506. For more information, see "Appendix C RADIUS subattributes (vendor ID 25506)."

Figure 5 Format of attribute 26



HWTACACS

HW Terminal Access Controller Access Control System (HWTACACS) is an enhanced security protocol based on TACACS (RFC 1492). HWTACACS is similar to RADIUS, and uses a client/server model for information exchange between the NAS and the HWTACACS server.

HWTACACS typically provides AAA services for PPP, VPDN, and terminal users. In a typical HWTACACS scenario, terminal users need to log in to the NAS. Working as the HWTACACS client, the NAS sends users' usernames and passwords to the HWTACACS server for authentication. After passing authentication and obtaining authorized rights, a user logs in to the device and performs operations. The HWTACACS server records the operations that each user performs.

Differences between HWTACACS and RADIUS

HWTACACS and RADIUS have many features in common, such as using a client/server model, using shared keys for data encryption, and providing flexibility and scalability. Table 2 lists the primary differences between HWTACACS and RADIUS.

Table 2 Primary differences between HWTACACS and RADIUS

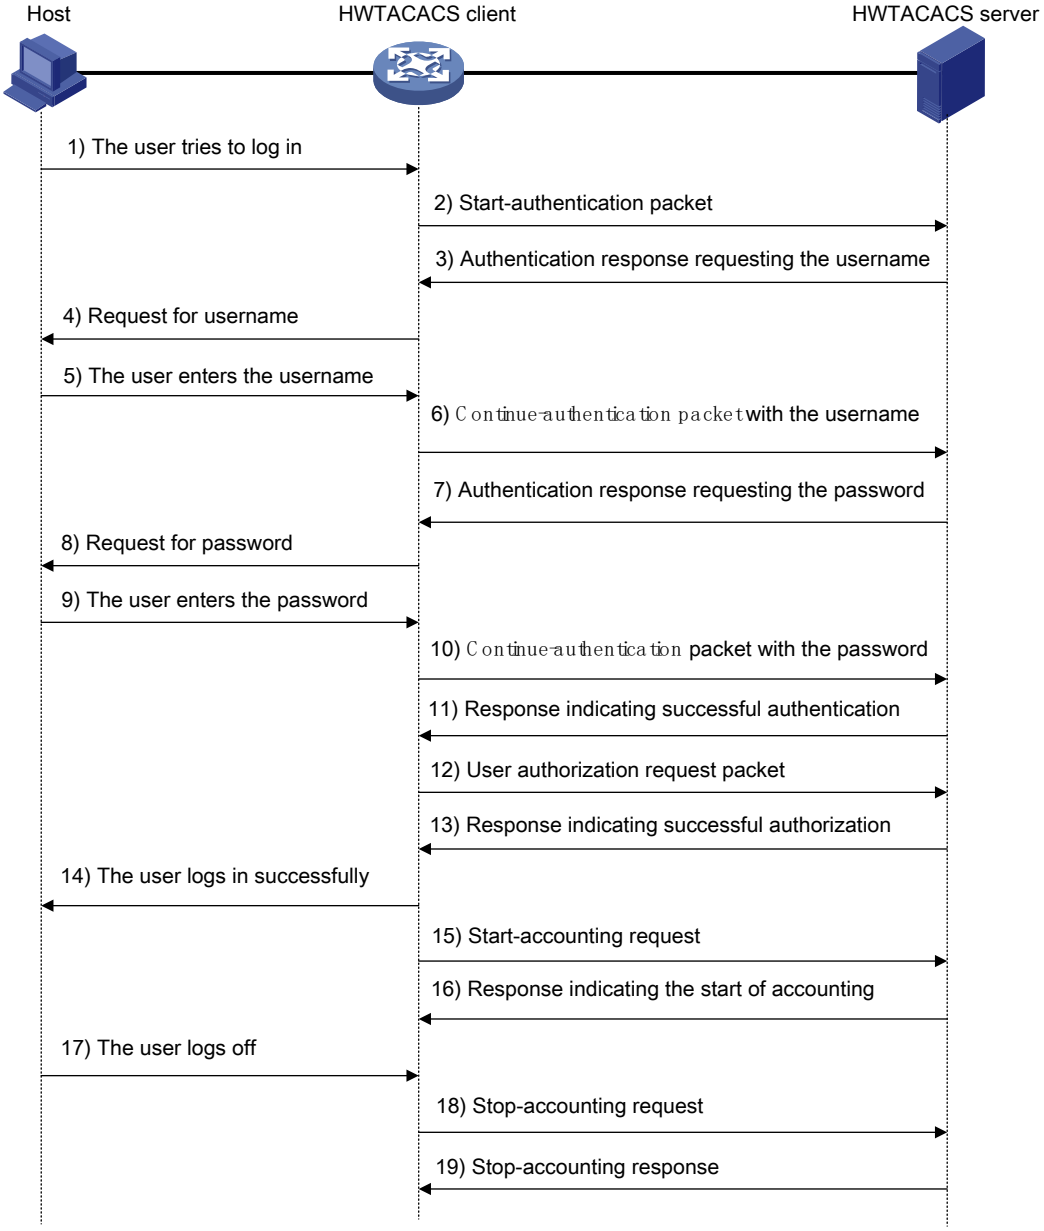
HWTACACS	RADIUS
Uses TCP, which provides reliable network	Uses UDP, which provides high transport efficiency.

HWTACACS	RADIUS
transmission.	
Encrypts the entire packet except for the HWTACACS header.	Encrypts only the user password field in an authentication packet.
Protocol packets are complicated and authorization is independent of authentication. Authentication and authorization can be deployed on different HWTACACS servers.	Protocol packets are simple and the authorization process is combined with the authentication process.
Supports authorization of configuration commands. Access to commands depends on both the user's roles and authorization. A user can use only commands that are permitted by the user roles and authorized by the HWTACACS server.	Does not support authorization of configuration commands. Access to commands solely depends on the user's roles. For more information about user roles, see *Fundamentals Configuration Guide*.

Basic HWTACACS packet exchange process

Figure 6 describes how HWTACACS performs user authentication, authorization, and accounting for a Telnet user.

Figure 6 Basic HWTACACS packet exchange process for a Telnet user



HWTACACS operates using in the following workflow:

1. A Telnet user sends an access request to the HWTACACS client.
2. The HWTACACS client sends a start-authentication packet to the HWTACACS server when it receives the request.
3. The HWTACACS server sends back an authentication response to request the username.
4. Upon receiving the response, the HWTACACS client asks the user for the username.
5. The user enters the username.
6. After receiving the username from the user, the HWTACACS client sends the server a continue-authentication packet that includes the username.
7. The HWTACACS server sends back an authentication response to request the login password.
8. Upon receipt of the response, the HWTACACS client prompts the user for the login password.
9. The user enters the password.

10. After receiving the login password, the HWTACACS client sends the HWTACACS server a continue-authentication packet that includes the login password.
11. If the authentication succeeds, the HWTACACS server sends back an authentication response to indicate that the user has passed authentication.
12. The HWTACACS client sends a user authorization request packet to the HWTACACS server.
13. If the authorization succeeds, the HWTACACS server sends back an authorization response, indicating that the user is now authorized.
14. Knowing that the user is now authorized, the HWTACACS client pushes its CLI to the user and permits the user to log in.
15. The HWTACACS client sends a start-accounting request to the HWTACACS server.
16. The HWTACACS server sends back an accounting response, indicating that it has received the start-accounting request.
17. The user logs off.
18. The HWTACACS client sends a stop-accounting request to the HWTACACS server.
19. The HWTACACS server sends back a stop-accounting response, indicating that the stop-accounting request has been received.

LDAP

The Lightweight Directory Access Protocol (LDAP) provides standard multiplatform directory service. LDAP was developed on the basis of the X.500 protocol. It improves the following functions of X.500:

- Read/write interactive access.
- Browse.
- Search.

LDAP is suitable for storing data that does not often change. The protocol is used to store user information. For example, LDAP server software Active Directory Server is used in Microsoft Windows operating systems. The software stores the user information and user group information for user login authentication and authorization.

LDAP directory service

LDAP uses directories to maintain the organization information, personnel information, and resource information. The directories are organized in a tree structure and include entries. An entry is a set of attributes with distinguished names (DNs). The attributes are used to store information such as usernames, passwords, emails, computer names, and phone numbers.

LDAP uses a client/server model, and all directory information is stored in the LDAP server. Commonly used LDAP server products include Microsoft Active Directory Server, IBM Tivoli Directory Server, and Sun ONE Directory Server.

LDAP authentication and authorization

AAA can use LDAP to provide authentication and authorization services for users. LDAP defines a set of operations to implement its functions. The main operations for authentication and authorization are the bind operation and search operation.

- The bind operation allows an LDAP client to perform the following operations:
  - Establish a connection with the LDAP server.
  - Obtain the access rights to the LDAP server.
  - Check the validity of user information.
- The search operation constructs search conditions and obtains the directory resource information of the LDAP server.

In LDAP authentication, the client completes the following tasks:

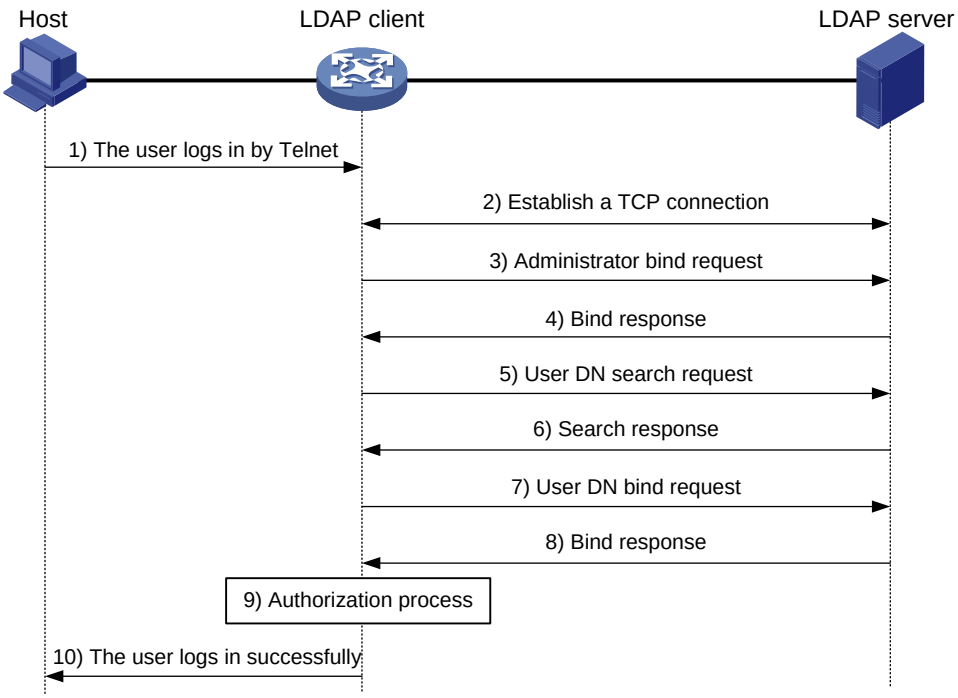
1. Uses the LDAP server administrator DN to bind with the LDAP server. After the binding is created, the client establishes a connection to the server and obtains the right to search.
2. Constructs search conditions by using the username in the authentication information of a user. The specified root directory of the server is searched and a user DN list is generated.
3. Binds with the LDAP server by using each user DN and password. If a binding is created, the user is considered legal.

In LDAP authorization, the client performs the same tasks as in LDAP authentication. When the client constructs search conditions, it obtains both authorization information and the user DN list.

Basic LDAP authentication process

The following example illustrates the basic LDAP authentication process for a Telnet user.

Figure 7 Basic LDAP authentication process for a Telnet user



The following shows the basic LDAP authentication process:

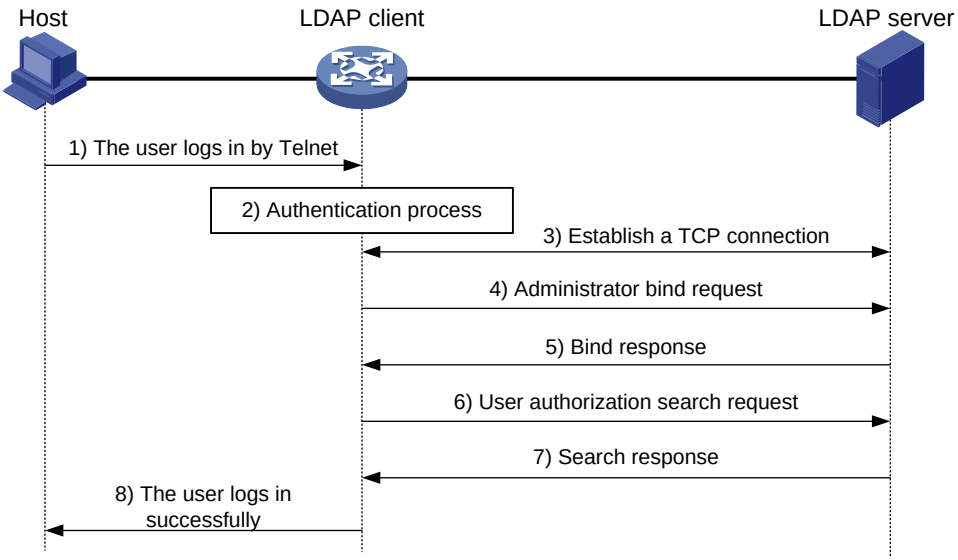
1. A Telnet user initiates a connection request and sends the username and password to the LDAP client.
2. After receiving the request, the LDAP client establishes a TCP connection with the LDAP server.
3. To obtain the right to search, the LDAP client uses the administrator DN and password to send an administrator bind request to the LDAP server.
4. The LDAP server processes the request. If the bind operation is successful, the LDAP server sends an acknowledgment to the LDAP client.
5. The LDAP client sends a user DN search request with the username of the Telnet user to the LDAP server.
6. After receiving the request, the LDAP server searches for the user DN by the base DN, search scope, and filtering conditions. If a match is found, the LDAP server sends a response to notify the LDAP client of the successful search. There might be one or more user DNs found.
7. The LDAP client uses the obtained user DN and the entered user password as parameters to send a user DN bind request to the LDAP server. The server will check whether the user password is correct.

8. The LDAP server processes the request, and sends a response to notify the LDAP client of the bind operation result. If the bind operation fails, the LDAP client uses another obtained user DN as the parameter to send a user DN bind request to the LDAP server. This process continues until a DN is bound successfully or all DNs fail to be bound. If all user DNs fail to be bound, the LDAP client notifies the user of the login failure and denies the user's access request.
9. The LDAP client saves the user DN that has been bound and exchanges authorization packets with the authorization server.
   - If LDAP authorization is used, see the authorization process shown in Figure 8.
   - If another method is expected for authorization, the authorization process of that method applies.
10. After successful authorization, the LDAP client notifies the user of the successful login.

Basic LDAP authorization process

The following example illustrates the basic LDAP authorization process for a Telnet user.

Figure 8 Basic LDAP authorization process for a Telnet user



The following shows the basic LDAP authorization process:

1. A Telnet user initiates a connection request and sends the username and password to the device. The device will act as the LDAP client during authorization.
2. After receiving the request, the device exchanges authentication packets with the authentication server for the user:
   - If LDAP authentication is used, see the authentication process shown in Figure 7.
     - If the device (the LDAP client) uses the same LDAP server for authentication and authorization, skip to step 6.
     - If the device (the LDAP client) uses different LDAP servers for authentication and authorization, skip to step 4.
   - If another authentication method is used, the authentication process of that method applies. The device acts as the LDAP client. Skip to step 3.
3. The LDAP client establishes a TCP connection with the LDAP authorization server.
4. To obtain the right to search, the LDAP client uses the administrator DN and password to send an administrator bind request to the LDAP server.
5. The LDAP server processes the request. If the bind operation is successful, the LDAP server sends an acknowledgment to the LDAP client.

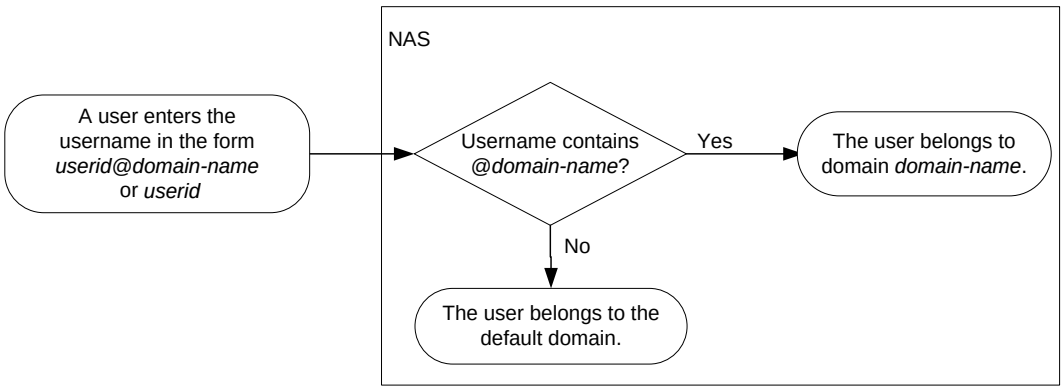
6. The LDAP client sends an authorization search request with the username of the Telnet user to the LDAP server. If the user uses the same LDAP server for authentication and authorization, the client sends the request with the saved user DN of the Telnet user to the LDAP server.
7. After receiving the request, the LDAP server searches for the user information by the base DN, search scope, filtering conditions, and LDAP attributes. If a match is found, the LDAP server sends a response to notify the LDAP client of the successful search.
8. After successful authorization, the LDAP client notifies the user of the successful login.

User management based on ISP domains and user access types

AAA manages users based on the users' ISP domains and access types.

On a NAS, each user belongs to one ISP domain. The NAS determines the ISP domain to which a user belongs based on the username entered by the user at login.

Figure 9 Determining the ISP domain for a user by username



AAA manages users in the same ISP domain based on the users' access types. The device supports the following user access types:

- **LAN**—LAN users must pass 802.1X or MAC authentication to come online.
- **Login**—Login users include SSH, Telnet, FTP, and terminal users that log in to the device. Terminal users can access through a console port.
- **Portal**—Portal users must pass portal authentication to access the network.
- **HTTP/HTTPS**—Users log in to the device through HTTP or HTTPS.

The device also provides authentication modules (such as 802.1X) for implementation of user authentication management policies. If you configure these authentication modules, the ISP domains for users of the access types depend on the configuration of the authentication modules.

Authentication, authorization, and accounting methods

AAA supports configuring different authentication, authorization, and accounting methods for different types of users in an ISP domain. The NAS determines the ISP domain and access type of a user. The NAS also uses the methods configured for the access type in the domain to control the user's access.

AAA also supports configuring a set of default methods for an ISP domain. These default methods are applied to users for whom no AAA methods are configured.

Authentication methods

The device supports the following authentication methods:

- **No authentication**—This method trusts all users and does not perform authentication. For security purposes, do not use this method.
- **Local authentication**—The NAS authenticates users by itself, based on the locally configured user information including the usernames, passwords, and attributes. Local authentication allows high speed and low cost, but the amount of information that can be stored is limited by the size of the storage space.
- **Remote authentication**—The NAS works with a remote server to authenticate users. The NAS communicates with the remote server through the RADIUS, LDAP, or HWTACACS protocol. The server manages user information in a centralized manner. Remote authentication provides high capacity, reliable, and centralized authentication services for multiple NASs. You can configure backup methods to be used when the remote server is not available.

Authorization methods

The device supports the following authorization methods:

- **No authorization**—The NAS performs no authorization exchange. The following default authorization information applies after users pass authentication:
  - Login users obtain the level-0 user role. For more information about the level-0 user role, see RBAC configuration in *Fundamentals Configuration Guide*.
  - The working directory for FTP, SFTP, and SCP login users is the root directory of the NAS. However, the users do not have permission to access the root directory.
  - Non-login users can access the network.
- **Local authorization**—The NAS performs authorization according to the user attributes locally configured for users.
- **Remote authorization**—The NAS works with a remote server to authorize users. RADIUS authorization is bound with RADIUS authentication. RADIUS authorization can work only after RADIUS authentication is successful, and the authorization information is included in the Access-Accept packet. HWTACACS or LDAP authorization is separate from authentication, and the authorization information is included in the authorization response after successful authentication. You can configure backup methods to be used when the remote server is not available.

Accounting methods

The device supports the following accounting methods:

- **No accounting**—The NAS does not perform accounting for the users.
- **Local accounting**—Local accounting is implemented on the NAS. It counts and controls the number of concurrent users that use the same local user account, but does not provide statistics for charging.
- **Remote accounting**—The NAS works with a RADIUS server or HWTACACS server for accounting. You can configure backup methods to be used when the remote server is not available.

AAA extended functions

The device provides the following login services to enhance device security:

- **Command authorization**—Enables the NAS to let the authorization server determine whether a command entered by a login user is permitted. Login users can execute only commands permitted by the authorization server. For more information about command authorization, see *Fundamentals Configuration Guide*.
- **Command accounting**—When command authorization is disabled, command accounting enables the accounting server to record all valid commands executed on the device. When command authorization is enabled, command accounting enables the accounting server to record all authorized commands. For more information about command accounting, see *Fundamentals Configuration Guide*.

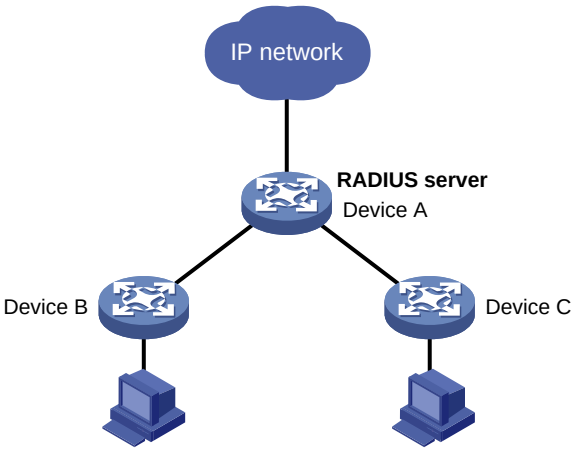
- **User role authentication**—Authenticates each user that wants to obtain another user role without logging out or getting disconnected. For more information about user role authentication, see *Fundamentals Configuration Guide*.

RADIUS server feature of the device

Enable the RADIUS server feature of the device to work with RADIUS clients for user authentication and authorization. The device can act as a dedicated RADIUS server or as both a RADIUS server and a RADIUS client at the same time.

The RADIUS server feature provides for flexible networks with less cost. As shown in Figure 10, Device A provides RADIUS server functions at the distribution layer; Device B and Device C are configured with RADIUS schemes to implement user authentication and authorization at the access layer.

Figure 10 Network diagram



The RADIUS server feature supports the following operations:

- Manages RADIUS user data, which is generated from local user information and includes user name, password, description, authorization ACL, authorization VLAN, and expiration time.
- Manages RADIUS clients. You can add, modify, and delete RADIUS clients. A RADIUS client is identified by the IP address, and it includes attribute information such as the shared key. The RADIUS server feature processes authentication requests only from the managed RADIUS clients and ignores requests from unknown clients.
- Authenticates and authorizes users of the network access type. The server does not provide accounting.

When the RADIUS server receives a RADIUS packet, it performs the following actions:

1. Verifies that the packet is sent from a managed RADIUS client.
2. Verifies the packet with the shared key.
3. Verifies that the user account exists, the password is correct, and other attributes meet the requirements (for example, the account is in the validity period).
4. Determines the authentication result and authorizes specific privileges to the authenticated user.

The RADIUS server feature of the device has the following restrictions:

- The authentication port is fixed at UDP 1812 and cannot be modified.
- The feature is supported on IPv4 networks, but not on IPv6 networks.
- The server provides only PAP and CHAP authentication methods.
- User names sent to the RADIUS server cannot include a domain name.

Protocols and standards

- RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*
- RFC 2866, *RADIUS Accounting*
- RFC 2867, *RADIUS Accounting Modifications for Tunnel Protocol Support*
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*
- RFC 2869, *RADIUS Extensions*
- RFC 3576, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*
- RFC 4818, *RADIUS Delegated-IPv6-Prefix Attribute*
- RFC 5176, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*
- RFC 1492, *An Access Control Protocol, Sometimes Called TACACS*
- RFC 1777, *Lightweight Directory Access Protocol*
- RFC 2251, *Lightweight Directory Access Protocol (v3)*

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

AAA tasks at a glance

To configure AAA, perform the following tasks:

1. Configuring AAA schemes

   If local authentication is used, configure local users and the related attributes. If remote authentication is used, configure the required RADIUS, LDAP, or HWTACACS schemes.

   - Configuring local users
   - Configuring RADIUS
   - Configuring HWTACACS
   - Configuring LDAP
2. Configuring an ISP domain
   a. Creating an ISP domain
   b. Configuring ISP domain attributes
3. Configuring AAA methods for an ISP domain

   Configure authentication, authorization, and accounting methods for an ISP domain as needed. These methods use existing AAA schemes.

   - Configuring authentication methods for an ISP domain
   - Configuring authorization methods for an ISP domain
   - Configuring accounting methods for an ISP domain
4. (Optional.) Configuring advanced AAA features
   - Setting the maximum number of concurrent login users
   - Configuring a NAS-ID
   - Configuring the device ID

Configuring local users

About local users

To implement local authentication, authorization, and accounting, create local users and configure user attributes on the device. The local users and attributes are stored in the local user database on the device. A local user is uniquely identified by the combination of a username and a user type.

Local users are classified into the following types:

- **Device management user**—User that logs in to the device for device management.
- **Network access user**—User that accesses network resources through the device.

The following shows the configurable local user attributes:

- **Description**—Descriptive information of the user.
- **Service type**—Services that the user can use. Local authentication checks the service types of a local user. If none of the service types is available, the user cannot pass authentication.
- **User state**—Whether or not a local user can request network services. There are two user states: active and blocked. A user in active state can request network services, but a user in blocked state cannot.
- **Upper limit of concurrent logins using the same user name**—Maximum number of users that can concurrently access the device by using the same user name. When the number reaches the upper limit, no more local users can access the device by using the user name.
- **User group**—Each local user belongs to a local user group and has all attributes of the group. The attributes include the password control attributes and authorization attributes. For more information about local user group, see "Configuring user group attributes."
- **Binding attributes**—Binding attributes control the scope of users, and are checked during local authentication of a user. If the attributes of a user do not match the binding attributes configured for the local user account, the user cannot pass authentication.
- **Authorization attributes**—Authorization attributes indicate the user's rights after it passes local authentication.

  Configure the authorization attributes based on the service type of local users.

  You can configure an authorization attribute in user group view or local user view. The setting of an authorization attribute in local user view takes precedence over the attribute setting in user group view.

  The attribute configured in user group view takes effect on all local users in the user group.

  The attribute configured in local user view takes effect only on the local user.
- **Password control attributes**—Password control attributes help control password security for local users. Password control attributes include password aging time, minimum password length, password composition checking, password complexity checking, and login attempt limit.

  You can configure a password control attribute in system view, user group view, or local user view. A password control attribute with a smaller effective range has a higher priority. For more information about password management and global password configuration, see "Configuring password control."
- **Validity period**—Time period in which a network access user is considered valid for authentication.

Local user configuration tasks at a glance

To configure local users, perform the following tasks:

1. Configuring local user attributes
   - Configuring attributes for device management users
   - Configuring attributes for network access users
2. (Optional.) Configuring user group attributes
3. (Optional.) Configuring the local user auto-delete feature

Restrictions and guidelines for local user configuration

As from release 6348P01, the factory defaults of the device provide a default local user named **clouduser** of the HTTP type. The user password is **admin** and the user role is **network-admin**. In versions earlier than 6348P01, no default local user is provided.

Configuring attributes for device management users

Restrictions and guidelines

When you configure the interface binding attribute for a device management user, follow these restrictions and guidelines to avoid authentication failure:

- Specify the actual access interface of the user as the binding interface for the user.
- Make sure the user's authentication packets include the user's access interface.

If password control is globally enabled for device management users by using the **password-control enable** command, the device neither displays local user passwords nor retains them in the running configuration. When you globally disable password control for device management users, local user passwords are automatically restored to the running configuration. To display the running configuration, use the **display current-configuration** command.

You can configure authorization attributes and password control attributes in local user view or user group view. The setting in local user view takes precedence over the setting in user group view.

Procedure

1. Enter system view.

   system-view

2. Add a device management user and enter device management user view.

   local-user *user-name* **class manage**

3. Configure a password for the device management user.

   In non-FIPS mode:

   password [{ **hash** | **simple** } *string*]

   A non-password-protected user passes authentication if the user provides the correct username and passes attribute checks. To enhance security, configure a password for each device management user.

   In FIPS mode:

   password

   Only password-protected users can pass authentication. You must set the password in interactive mode for a device management user.

4. Assign services to the device management user.

   In non-FIPS mode:

service-type { **ftp** | { **http** | **https** | **ssh** | **telnet** | **terminal** } * }

In FIPS mode:

service-type { **https** | **ssh** | **terminal** } *

By default, no services are authorized to a device management user.

5. (Optional.) Set the status of the device management user.

   state { **active** | **block** }

   By default, a device management user is in active state and can request network services.

6. (Optional.) Set the upper limit of concurrent logins using the device management username.

   access-limit *max-user-number*

   By default, the number of concurrent logins is not limited for a device management user.

   This command takes effect only when local accounting is configured for device management users. This command does not apply to FTP, SFTP, or SCP users that do not support accounting.

7. (Optional.) Configure the interface binding attribute for the device management user.

   bind-attribute location interface *interface-type interface-number*

   By default, no interface binding attribute is configured for a device management user.

8. (Optional.) Configure authorization attributes for the device management user.

   authorization-attribute { **idle-cut** *minutes* | **user-role** *role-name* | **work-directory** *directory-name* } *

   The following default settings apply:

   - The working directory for FTP, SFTP, and SCP users is the root directory of the NAS. However, the users do not have permission to access the root directory.
   - The network-operator user role is assigned to local users that are created by a network-admin or level-15 user.

9. (Optional.) Configure password control attributes for the device management user. Choose the following tasks as needed:

   - Set the password aging time.

     password-control aging *aging-time*

   - Set the minimum password length.

     password-control length *length*

   - Configure the password composition policy.

     password-control composition type-number *type-number* [**type-length** *type-length*]

   - Configure the password complexity checking policy.

     password-control complexity { **same-character** | **user-name** } **check**

   - Configure the maximum login attempts and the action to take if there is a login failure.

     password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

   By default, a device management user uses password control attributes of the user group to which the user belongs.

10. (Optional.) Assign the device management user to a user group.

    group *group-name*

    By default, a device management user belongs to user group **system**.

Configuring attributes for network access users

Restrictions and guidelines

If password control is globally enabled for network access users by using the **password-control enable network-class** command, the device neither displays local user passwords nor retains them in the running configuration. When you globally disable password control for network access users, local user passwords are automatically restored to the running configuration. To display the running configuration, use the **display current-configuration** command.

You can configure authorization attributes and password control attributes in local user view or user group view. The setting in local user view takes precedence over the setting in user group view.

Configure the **location** binding attribute based on the service types of users.

- For 802.1X users, specify the 802.1X-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For MAC authentication users, specify the MAC authentication-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For Web authentication users, specify the Web authentication-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For portal users, specify the portal-enabled interfaces through which the users access the device. Specify the Layer 2 Ethernet interfaces if portal is enabled on VLAN interfaces and the **portal roaming enable** command is not used.

Procedure

1. Enter system view.

   system-view
2. Add a network access user and enter network access user view.

   local-user *user-name* **class network**
3. (Optional.) Configure a password for the network access user.

   password { **cipher** | **simple** } *string*
4. (Optional.) Configure a description for the network access user.

   description *text*

   By default, no description is configured for a local user.
5. Assign services to the network access user.

   service-type { **lan-access** | **portal** }

   By default, no services are authorized to a network access user.
6. (Optional.) Set the status of the network access user.

   state { **active** | **block** }

   By default, a network access user is in active state and can request network services.
7. (Optional.) Set the upper limit of concurrent logins using the network access username.

   access-limit *max-user-number*

   By default, the number of concurrent logins is not limited for a network access user.
8. (Optional.) Configure binding attributes for the network access user.

   bind-attribute { **ip** *ip-address* | **location interface** *interface-type interface-number* | **mac** *mac-address* | **vlan** *vlan-id* } *

   By default, no binding attributes are configured for a network access user.
9. (Optional.) Configure authorization attributes for the network access user.

authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **session-timeout** *minutes* | **user-profile** *profile-name* | **vlan** *vlan-id* } *

By default, a network access user does not have authorization attributes.

10. (Optional.) Configure password control attributes for the network access user. Choose the following tasks as needed:
    - Set the minimum password length.

      password-control length *length*
    - Configure the password composition policy.

      password-control composition type-number *type-number* [**type-length** *type-length*]
    - Configure the password complexity checking policy.

      password-control complexity { **same-character** | **user-name** } **check**

    By default, a network access user uses password control attributes of the user group to which the user belongs.
11. (Optional.) Assign the network access user to a user group.

    group *group-name*

    By default, a network access user belongs to user group **system**.
12. (Optional.) specify the validity period for the local user.

    validity-datetime { **from** *start-date start-time* **to** *expiration-date expiration-time* | **from** *start-date start-time* | **to** *expiration-date expiration-time* }

    By default, the validity period for a network access user does not expire.

Configuring user group attributes

About user group attributes

User groups simplify local user configuration and management. A user group contains a group of local users and has a set of local user attributes. You can configure local user attributes for a user group to implement centralized user attributes management for the local users in the group. Local user attributes that are manageable include authorization attributes.

Procedure

1. Enter system view.

   system-view
2. Create a user group and enter user group view.

   user-group *group-name*

   By default, a system-defined user group exists. The group name is **system**.
3. Configure authorization attributes for the user group.

   authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **session-timeout** *minutes* | **user-profile** *profile-name* | **vlan** *vlan-id* | **work-directory** *directory-name* } *

   By default, no authorization attributes are configured for a user group.
4. (Optional.) Configure password control attributes for the user group. Choose the following tasks as needed:
   - Set the password aging time.

     password-control aging *aging-time*

- Set the minimum password length.
  password-control length *length*
- Configure the password composition policy.
  password-control composition type-number *type-number* [**type-length** *type-length*]
- Configure the password complexity checking policy.
  password-control complexity { **same-character** | **user-name** } **check**
- Configure the maximum login attempts and the action to take for login failures.
  password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

By default, a user group uses the global password control settings. For more information, see "Configuring password control."

Configuring the local user auto-delete feature

About the local user auto-delete feature

This feature enables the device to examine the validity of local users at fixed time periods of 10 minutes and automatically delete expired local users.

Procedure

1. Enter system view
   system-view
2. Enable the local user auto-delete feature.
   local-user auto-delete enable
   By default, the local user auto-delete feature is disabled.

Display and maintenance commands for local users and local user groups

Execute **display** commands in any view.

Task	Command
Display the local user configuration and online user statistics.	**display local-user** [**class** { **manage** | **network** } | **idle-cut** { **disable** | **enable** } | **service-type** { **ftp** | **http** | **https** | **lan-access** | **portal** | **ssh** | **telnet** | **terminal** } | **state** { **active** | **block** } | **user-name** *user-name* **class** { **manage** | **network** } | **vlan** *vlan-id*]
Display user group configuration.	**display user-group** { **all** | **name** *group-name* }

Configuring RADIUS

RADIUS tasks at a glance

To configure RADIUS, perform the following tasks:

1. Configuring an EAP profile

   To perform EAP-based RADIUS server status detection, you must configure an EAP profile and specify the EAP profile in a test profile.
2. Configuring a test profile for RADIUS server status detection

   To detect the status of a RADIUS server, you must configure a test profile and configure the RADIUS server to use the test profile in a RADIUS scheme.
3. Creating a RADIUS scheme
4. Specifying RADIUS authentication servers
5. Specifying the RADIUS accounting servers
6. Specifying the shared keys for secure RADIUS communication

   Perform this task if no shared keys are specified when configuring RADIUS authentication or accounting servers.
7. (Optional.) Setting the status of RADIUS servers
8. (Optional.) Setting RADIUS timers
9. (Optional.) Configuring parameters for RADIUS packets
   - Specifying the source IP address for outgoing RADIUS packets
   - Setting the username format and traffic statistics units
   - Setting the maximum number of RADIUS request transmission attempts
   - Setting the maximum number of real-time accounting attempts
   - Setting the DSCP priority for RADIUS packets
10. (Optional.) Configuring parameters for RADIUS attributes
    - Specifying the format of the NAS-Port attribute
    - Configuring the Login-Service attribute check method for SSH, FTP, and terminal users
    - Interpreting the RADIUS class attribute as CAR parameters
    - Configuring the MAC address format for RADIUS attribute 31
    - Specifying the format of the NAS-Port-ID attribute
    - Setting the data measurement unit for the Remanent_Volume attribute
    - Configuring the RADIUS attribute translation feature
11. (Optional.) Configuring extended RADIUS features
    - Configuring RADIUS stop-accounting packet buffering
    - Enabling forcibly sending stop-accounting packets
    - Enabling the RADIUS server load sharing feature
    - Configuring the RADIUS accounting-on feature
    - Configuring the RADIUS session-control feature
    - Configuring the RADIUS DAS feature
    - Enabling SNMP notifications for RADIUS
    - Disabling the RADIUS service

Restrictions and guidelines for RADIUS configuration

If the authentication server in a RADIUS scheme is provided by the RADIUS server feature on the device, you need to configure only the following items for the RADIUS scheme:

- RADIUS authentication server.
- Shared key for RADIUS communication.
- Username format for interaction with the RADIUS server.

Configuring an EAP profile

About EAP profiles

An EAP profile is a collection of EAP authentication settings, including the EAP authentication method and the CA certificate file to be used for some EAP authentication methods.

Restrictions and guidelines

You can specify an EAP profile in multiple test profiles.

You can configure a maximum of 16 EAP profiles.

Prerequisites

Before you specify a CA certificate file, use FTP or TFTP to transfer the CA certificate file to the root directory of the default storage medium on the device.

In an IRF fabric, make sure a CA certificate file already exists in the root directory of the default storage medium on the master device before you specify the file.

Procedure

1. Enter system view.

   system-view

2. Create an EAP profile and enter EAP profile view.

   eap-profile *eap-profile-name*

3. Specify the EAP authentication method.

   method { **md5** | **peap-gtc** | **peap-mschapv2** | **ttls-gtc** | **ttls-mschapv2** }

   By default, the EAP authentication method is MD5-challenge.

4. Specify a CA certificate file for EAP authentication.

   ca-file *file-name*

   By default, no CA certificate file is specified for EAP authentication.

   You must specify a CA certificate file to verify the RADIUS server certificate if the EAP authentication method is PEAP-GTC, PEAP-MSCHAPv2, TTLS-GTC, or TTLS-MSCHAPv2.

Configuring a test profile for RADIUS server status detection

About test profiles for RADIUS server status detection

To detect the reachability or availability of a RADIUS authentication server, specify a test profile for the RADIUS server when you specify the server in a RADIUS scheme. With the test profile, the device refreshes the RADIUS server status at each detection interval according to the detection result. If the server is unreachable or unavailable, the device sets the status of the server to blocked. If the server is reachable or available, the device sets the status of the server to active.

The device supports the following RADIUS server status detection methods:

- **Simple detection**—For a RADIUS server, the device simulates an authentication request with the username and password specified in the test profile used by the server. The authentication request is sent to the RADIUS server within each detection interval. The device determines that the RADIUS server is reachable if the device receives a response from the server within the interval.
- **EAP-based detection**—For a RADIUS server, the device simulates an EAP authentication with the username and password specified in the test profile used by the server. The simulated EAP authentication starts at the beginning of each detection interval. If the EAP authentication completes within a detection interval, the device determines that the RADIUS server is available.

Simulating a complete EAP authentication process, EAP-based detection provides more reliable detection results than simple detection. As a best practice, configure EAP-based detection on a network environment where EAP authentication is configured.

Restrictions and guidelines

You can configure multiple test profiles in the system.

The device starts detecting the status of a RADIUS authentication server only if an existing test profile is specified for the server.

If you specify a nonexistent EAP profile in a test profile, the device performs simple detection for the RADIUS servers that use the test profile. After the EAP profile is configured, the device will start EAP-based detection at the next detection interval.

The device stops detecting the status of a RADIUS server when one of the following operations is performed:

- The RADIUS server is removed from the RADIUS scheme.
- The test profile configuration for the RADIUS server is removed in RADIUS scheme view.
- The test profile specified for the RADIUS server is deleted.
- The RADIUS server is manually set to the blocked state.
- The RADIUS scheme that contains the RADIUS server is deleted.

Procedure

1. Enter system view.

   system-view

2. Configure a test profile for detecting the status of RADIUS authentication servers.

   radius-server test-profile *profile-name* **username** *name* [**password** { **cipher** | **simple** } *string*] [**interval** *interval*] [**eap-profile** *eap-profile-name*]

Creating a RADIUS scheme

Restrictions and guidelines

You can configure a maximum of 16 RADIUS schemes. A RADIUS scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.

   system-view

2. Create a RADIUS scheme and enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

Specifying RADIUS authentication servers

About RADIUS authentication servers

A RADIUS authentication server completes authentication and authorization together, because authorization information is piggybacked in authentication responses sent to RADIUS clients.

You can specify one primary authentication server and a maximum of 16 secondary authentication servers for a RADIUS scheme. Secondary servers provide AAA services when the primary server becomes unreachable. The device searches for an active server in the order the secondary servers are configured.

When RADIUS server load sharing is enabled, the device distributes the workload over all servers without considering the primary and secondary server roles. The device checks the weight value and number of currently served users for each active server, and then determines the most appropriate server in performance to receive an authentication request.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

A RADIUS authentication server can function as the primary authentication server for one scheme and a secondary authentication server for another scheme at the same time.

Two authentication servers in a scheme, primary or secondary, cannot have the same combination of host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify the primary RADIUS authentication server.

   primary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **test-profile** *profile-name* | **weight** *weight-value*] *

   By default, no primary RADIUS authentication server is specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

4. (Optional.) Specify a secondary RADIUS authentication server.

   secondary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **test-profile** *profile-name* | **weight** *weight-value*] *

   By default, no secondary RADIUS authentication servers are specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

Specifying the RADIUS accounting servers

About RADIUS accounting servers

You can specify one primary accounting server and a maximum of 16 secondary accounting servers for a RADIUS scheme. Secondary servers provide AAA services when the primary server becomes unavailable. The device searches for an active server in the order the secondary servers are configured.

When RADIUS server load sharing is enabled, the device distributes the workload over all servers without considering the primary and secondary server roles. The device checks the weight value and number of currently served users for each active server, and then determines the most appropriate server in performance to receive an accounting request.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

A RADIUS accounting server can function as the primary accounting server for one scheme and a secondary accounting server for another scheme at the same time.

Two accounting servers in a scheme, primary or secondary, cannot have the same combination of host name, IP address, and port number.

RADIUS does not support accounting for FTP, SFTP, and SCP users.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Specify the primary RADIUS accounting server.
   primary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **weight** *weight-value*] *
   By default, no primary RADIUS accounting server is specified.
   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.
4. (Optional.) Specify a secondary RADIUS accounting server.
   secondary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **weight** *weight-value*] *
   By default, no secondary RADIUS accounting servers are specified.
   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

Specifying the shared keys for secure RADIUS communication

About the shared keys for secure RADIUS communication

The RADIUS client and server use the MD5 algorithm and shared keys to generate the Authenticator value for packet authentication and user password encryption. The client and server must use the same key for each type of communication.

A key configured in this task is for all servers of the same type (accounting or authentication) in the scheme. The key has a lower priority than a key configured individually for a RADIUS server.

Restrictions and guidelines

The shared key configured on the device must be the same as the shared key configured on the RADIUS server.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Specify a shared key for secure RADIUS communication.
   key { **accounting** | **authentication** } { **cipher** | **simple** } *string*
   By default, no shared key is specified for secure RADIUS communication.

Setting the status of RADIUS servers

About RADIUS server status

To control the RADIUS servers with which the device communicates when the current servers are no longer available, set the status of RADIUS servers to blocked or active. You can specify one primary

RADIUS server and multiple secondary RADIUS servers. The secondary servers function as the backup of the primary server. When the RADIUS server load sharing feature is disabled, the device chooses servers based on the following rules:

- When the primary server is in active state, the device first tries to communicate with the primary server. If the primary server is unreachable, the device searches for an active secondary server in the order the servers are configured.
- When one or more servers are in active state, the device tries to communicate with these active servers only, even if the servers are unavailable.
- When all servers are in blocked state, the device only tries to communicate with the primary server.
- If a server is unreachable, the device performs the following operations:
  - Changes the server status to blocked.
  - Starts a quiet timer for the server.
  - Tries to communicate with the next secondary server in active state that has the highest priority.
- When the quiet timer of a server expires or you manually set the server to the active state, the status of the server changes back to active. The device does not check the server again during the authentication or accounting process.
- The search process continues until the device finds an available secondary server or has checked all secondary servers in active state. If no server is reachable, the device considers the authentication or accounting attempt a failure.
- When you remove a server in use, communication with the server times out. The device looks for a server in active state by first checking the primary server, and then checking secondary servers in the order they are configured.
- When a RADIUS server's status changes automatically, the device changes this server's status accordingly in all RADIUS schemes in which this server is specified.
- When a RADIUS server is manually set to blocked, server detection is disabled for the server, regardless of whether a test profile has been specified for the server. When the RADIUS server is set to active state, server detection is enabled for the server on which an existing test profile is specified.

By default, the device sets the status of all RADIUS servers to active. However, in some situations, you must change the status of a server. For example, if a server fails, you can change the status of the server to blocked to avoid communication attempts to the server.

Restrictions and guidelines

The configured server status cannot be saved to any configuration file, and can only be viewed by using the **display radius scheme** command.

After the device restarts, all servers are restored to the active state.

The device selects a reachable server for the authentication or accounting of a new user according to the server selection rules in this section if the RADIUS server load sharing feature is disabled. However, these rules are inapplicable to the reauthentication of online users if the RADIUS server selection mode for reauthentication is set to inherit by using the **reauthentication server-select inherit** command.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set the RADIUS server status. Choose the following tasks as needed:

- Set the status of the primary RADIUS authentication server.

  state primary authentication { **active** | **block** }
- Set the status of the primary RADIUS accounting server.

  state primary accounting { **active** | **block** }
- Set the status of a secondary RADIUS authentication server.

  state secondary authentication [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number*]] { **active** | **block** }
- Set the status of a secondary RADIUS accounting server.

  state secondary accounting [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number*]] { **active** | **block** }

By default, a RADIUS server is in active state.

Setting RADIUS timers

About RADIUS timers

The device uses the following types of timers to control communication with a RADIUS server:

- **Server response timeout timer** (**response-timeout**)—Defines the RADIUS request retransmission interval. The timer starts immediately after a RADIUS request is sent. If the device does not receive a response from the RADIUS server before the timer expires, it resends the request.
- **Server quiet timer** (**quiet**)—Defines the duration to keep an unreachable server in blocked state. If one server is not reachable, the device changes the server status to blocked, starts this timer for the server, and tries to communicate with another server in active state. After the server quiet timer expires, the device changes the status of the server back to active.
- **Real-time accounting timer** (**realtime-accounting**)—Defines the interval at which the device sends real-time accounting packets to the RADIUS accounting server for online users.

Restrictions and guidelines

Consider the number of secondary servers when you configure the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer. If the RADIUS scheme includes many secondary servers, the retransmission process might be too long and the client connection in the access module, such as Telnet, can time out.

When the client connections have a short timeout period, a large number of secondary servers can cause the initial authentication or accounting attempt to fail. In this case, reconnect the client rather than adjusting the RADIUS packet transmission attempts and server response timeout timer. Typically, the next attempt will succeed, because the device has blocked the unreachable servers to shorten the time to find a reachable server.

Make sure the server quiet timer is set correctly. A timer that is too short might result in frequent authentication or accounting failures. This is because the device will continue to attempt to communicate with an unreachable server that is in active state. A timer that is too long might temporarily block a reachable server that has recovered from a failure. This is because the server will remain in blocked state until the timer expires.

A short real-time accounting interval helps improve accounting precision but requires many system resources. When there are 1000 or more users, set the interval to 15 minutes or longer.

Procedure

1. Enter system view.

   system-view
2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Set RADIUS timers. Choose the following tasks as needed:
   - Set the RADIUS server response timeout timer.
     timer response-timeout *seconds*
     The default setting is 3 seconds.
   - Set the quiet timer for the servers.
     timer quiet *minutes*
     The default setting is 5 minutes.
   - Set the real-time accounting timer.
     timer realtime-accounting *interval* [**second**]
     The default setting is 12 minutes.

Specifying the source IP address for outgoing RADIUS packets

About the source IP address for outgoing RADIUS packets

The source IP address of RADIUS packets that a NAS sends must match the IP address of the NAS configured on the RADIUS server. A RADIUS server identifies a NAS by its IP address. Upon receiving a RADIUS packet, the RADIUS server checks the source IP address of the packet.

- If it is the IP address of a managed NAS, the server processes the packet.
- If it is not the IP address of a managed NAS, the server drops the packet.

Before sending a RADIUS packet, the NAS selects a source IP address in the following order:

1. The source IP address specified for the RADIUS scheme.
2. The source IP address specified in system view.
3. The IP address of the outbound interface specified by the route.

Restrictions and guidelines for source IP address configuration

You can specify a source IP address for outgoing RADIUS packets in RADIUS scheme view or in system view.

- The IP address specified in RADIUS scheme view applies only to one RADIUS scheme.
- The IP address specified in system view applies to all RADIUS schemes.

The source IP address of RADIUS packets that a NAS sends must match the IP address of the NAS that is configured on the RADIUS server.

As a best practice, specify a loopback interface address as the source IP address for outgoing RADIUS packets to avoid RADIUS packet loss caused by physical port errors.

The source address of outgoing RADIUS packets is typically the IP address of an egress interface on the NAS to communicate with the RADIUS server. However, in some situations, you must change the source IP address. For example, when VRRP is configured for stateful failover, configure the virtual IP of the uplink VRRP group as the source address.

You can directly specify a source IP address for outgoing RADIUS packets or specify a source interface to provide the source IP address for outgoing RADIUS packets. The source interface configuration and the source IP address configuration overwrite each other.

Specifying a source interface or source IP address for all RADIUS schemes

1. Enter system view.
   system-view
2. Specify a source interface or source IP address for outgoing RADIUS packets.

radius nas-ip { **interface** *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } }

By default, the source IP address of an outgoing RADIUS packet is the primary IPv4 address or the IPv6 address of the outbound interface.

Specifying a source interface or source IP address for a RADIUS scheme

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify a source interface or source IP address for outgoing RADIUS packets.

   nas-ip { *ipv4-address* | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

   By default, the source IP address of an outgoing RADIUS packet is that specified by using the **radius nas-ip** command in system view. If the **radius nas-ip** command is not used, the source IP address is the primary IP address of the outbound interface.

Setting the username format and traffic statistics units

About the username format and traffic statistics units

A username is in the *userid@isp-name* format, where the *isp-name* part represents the user's ISP domain name. By default, the ISP domain name is included in a username. However, older RADIUS servers might not recognize usernames that contain the ISP domain names. In this case, you can configure the device to remove the domain name of each username to be sent.

The device reports online user traffic statistics in accounting packets. The traffic measurement units are configurable.

Restrictions and guidelines

If two or more ISP domains use the same RADIUS scheme, configure the RADIUS scheme to keep the ISP domain name in usernames for domain identification.

For accounting accuracy, make sure the traffic statistics units configured on the device and on the RADIUS accounting servers are the same.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Set the format for usernames sent to the RADIUS servers.

   user-name-format { **keep-original** | **with-domain** | **without-domain** }

   By default, the ISP domain name is included in a username.

   If the device is specified as the RADIUS server in the scheme, the username format must be set to **without-domain**.

4. Set the data flow and packet measurement units for traffic statistics.

   data-flow-format { **data** { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** } | **packet** { **giga-packet** | **kilo-packet** | **mega-packet** | **one-packet** } }*

   By default, traffic is counted in bytes and packets.

Setting the maximum number of RADIUS request transmission attempts

About setting the maximum number of RADIUS request transmission attempts

RADIUS uses UDP packets to transfer data. Because UDP communication is not reliable, RADIUS uses a retransmission mechanism to improve reliability. A RADIUS request is retransmitted if the NAS does not receive a server response for the request within the response timeout timer. For more information about the RADIUS server response timeout timer, see "Setting the status of RADIUS servers."

You can set the maximum number for the NAS to retransmit a RADIUS request to the same server. When the maximum number is reached, the NAS tries to communicate with other RADIUS servers in active state. If no other servers are in active state at the time, the NAS considers the authentication or accounting attempt a failure.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set the maximum number of RADIUS request transmission attempts.
   retry *retries*
   By default, the maximum number is 3 for RADIUS request transmission attempts.

Setting the maximum number of real-time accounting attempts

About setting the maximum number of real-time accounting attempts

If you set the maximum number of real-time accounting attempts, the device will disconnect users from whom no accounting responses are received within the permitted attempts.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set the maximum number of real-time accounting attempts.
   retry realtime-accounting *retries*
   By default, the maximum number is 5 for real-time accounting attempts.

Setting the DSCP priority for RADIUS packets

About the DSCP priority for RADIUS packets

The DSCP priority in the ToS field determines the transmission priority of RADIUS packets. A larger value represents a higher priority.

Procedure

1. Enter system view.

system-view

2. Set the DSCP priority for RADIUS packets.
   radius [**ipv6**] **dscp** *dscp-value*
   By default, the DSCP priority is 0 for RADIUS packets.

Specifying the format of the NAS-Port attribute

About this task

Perform this task to specify the format of the NAS-Port attribute (attribute 5) sent by the device to the RADIUS server. The following formats are available:

- **Default format**—Contains the following portions:
  - 8-bit IRF member ID.
  - 4-bit slot number.
  - 8-bit port index.
  - 12-bit VLAN ID.
- **Port format**—Contains the value in the last segment of the user access interface. For example, if a user comes online from GigabitEthernet 1/0/2, the value for the NAS-Port attribute is 2.

Software version and feature compatibility

This feature is supported only in Release 6342 and later.

Restrictions and guidelines

To exchange RADIUS packets correctly with a RADIUS server, configure the device with the same NAS-Port attribute format as the RADIUS server.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set the NAS-Port attribute format to the port format.
   attribute 5 format port
   By default, the NAS-Port attribute uses the default format.

Configuring the Login-Service attribute check method for SSH, FTP, and terminal users

About Login-Service attribute check methods

The device supports the following check methods for the Login-Service attribute (RADIUS attribute 15) of SSH, FTP, and terminal users:

- **Strict**—Matches Login-Service attribute values 50, 51, and 52 for SSH, FTP, and terminal services, respectively.
- **Loose**—Matches the standard Login-Service attribute value 0 for SSH, FTP, and terminal services.

An Access-Accept packet received for a user must contain the matching attribute value. Otherwise, the user cannot log in to the device.

Restrictions and guidelines

Use the loose check method only when the server does not issue Login-Service attribute values 50, 51, and 52 for SSH, FTP, and terminal users.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Configure the Login-Service attribute check method for SSH, FTP, and terminal users.

   attribute 15 check-mode { **loose** | **strict** }

   The default check method is strict.

Interpreting the RADIUS class attribute as CAR parameters

About interpreting the RADIUS class attribute as CAR parameters

A RADIUS server may deliver CAR parameters for user-based traffic monitoring and control by using the RADIUS class attribute (attribute 25) in RADIUS packets. You can configure the device to interpret the class attribute to CAR parameters.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Interpret the RADIUS class attribute as CAR parameters.

   attribute 25 car

   By default, the RADIUS class attribute is not interpreted as CAR parameters.

Configuring the MAC address format for RADIUS attribute 31

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the MAC address format in RADIUS attribute 31. Configure the MAC address format for RADIUS attribute 31 to meet the requirements of the RADIUS servers.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Configure the MAC address format for RADIUS attribute 31.

   attribute 31 mac-format section { **one** |{ **six** | **three** } **separator** *separator-character* } { **lowercase** | **uppercase** }

   By default, a MAC address is in the format of HH-HH-HH-HH-HH-HH. The MAC address is separated by hyphen (-) into six sections with letters in upper case.

   The **one** keyword is available only in Release 6312 and later.

Specifying the format of the NAS-Port-ID attribute

About this task

Perform this task to specify the format of the NAS-Port-ID attribute (attribute 87) sent by the device to the RADIUS server. The following formats are available:

- **Default format**—The default format varies by user access type.
  - For portal users, the NAS-Port-Id attribute is in the *SlotID***00***IfNOVlanID* format:
    - *SlotID*—Represents a 2-byte IRF member ID.
    - **00**—Represents a 2-byte string of 0s.
    - *IfNO*—Represents a 3-byte port index.
    - *VLANID*—Represents a 9-byte VLAN ID.
  - For 802.1X and MAC authentication users, the NAS-Port-Id attribute is in the **slot=***xx***;subslot=***xx***;port=***xx***;vlanid=***xx* format.
    - **slot**—IRF member ID.
    - **subslot**—Slot number.
    - **port**—Port index.
    - **vlanid**—VLAN ID
  - For login users, the device does not include the NAS-Port-Id attribute in RADIUS packets.
- **Interface-name format**—Contains the name of the user access interface. For example, if a user accesses the network from GigabitEthernet 1/0/1, the NAS-Port-ID attribute is set to **GigabitEthernet1/0/1**.

Software version and feature compatibility

This feature is supported only in Release 6342 and later.

Restrictions and guidelines

To exchange RADIUS packets correctly with a RADIUS server, configure the device with the same NAS-Port-ID attribute format as the RADIUS server.

Procedure

1. Enter system view.

   `system-view`
2. Enter RADIUS scheme view.

   `radius scheme` *`radius-scheme-name`*
3. Set the NAS-Port-ID attribute format to the interface name format.

   `attribute 87 format interface-name`

   By default, the NAS-Port attribute uses the default format.

Setting the data measurement unit for the Remanent_Volume attribute

About the data measurement unit for the Remanent_Volume attribute

The RADIUS server uses the Remanent_Volume attribute in authentication or real-time accounting responses to notify the device of the current amount of data available for online users.

Restrictions and guidelines

Make sure the configured measurement unit is the same as the user data measurement unit on the RADIUS server.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set the data measurement unit for the Remanent_Volume attribute.
   attribute remanent-volume unit { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** }
   By default, the data measurement unit is kilobyte.

Configuring the RADIUS attribute translation feature

About RADIUS attribute translation

The RADIUS attribute translation feature enables the device to work correctly with the RADIUS servers of different vendors that support RADIUS attributes incompatible with the device.

RADIUS attribute translation has the following implementations:

- **Attribute conversion**—Converts source RADIUS attributes into destination RADIUS attributes based on RADIUS attribute conversion rules.
- **Attribute rejection**—Rejects RADIUS attributes based on RADIUS attribute rejection rules.

When the RADIUS attribute translation feature is enabled, the device processes RADIUS packets as follows:

- For the sent RADIUS packets:
  - Deletes the rejected attributes from the packets.
  - Uses the destination RADIUS attributes to replace the attributes that match RADIUS attribute conversion rules in the packets.
- For the received RADIUS packets:
  - Ignores the rejected attributes in the packets.
  - Interprets the attributes that match RADIUS attribute conversion rules as the destination RADIUS attributes.

To identify proprietary RADIUS attributes, you can define the attributes as extended RADIUS attributes, and then convert the extended RADIUS attributes to device-supported attributes.

Restrictions and guidelines for RADIUS attribute translation configuration

Configure either conversion rules or rejection rules for a RADIUS attribute.

Configure either direction-based rules or packet type-based rules for a RADIUS attribute.

For direction-based translation of a RADIUS attribute, you can configure a rule for each direction (inbound or outbound). For packet type-based translation of a RADIUS attribute, you can configure a rule for each RADIUS packet type (RADIUS Access-Accept, RADIUS Access-Request, or RADIUS accounting).

Configuring the RADIUS attribute translation feature for a RADIUS scheme

1. Enter system view.
   system-view
2. (Optional.) Define an extended RADIUS attribute.

radius attribute extended *attribute-name* [**vendor** *vendor-id*] **code** *attribute-code* **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** }

3. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

4. Enable the RADIUS attribute translation feature.

   attribute translate

   By default, this feature is disabled.

5. Configure a RADIUS attribute conversion rule or a RADIUS attribute reject rule. Choose the following tasks as needed:

   - Configure a RADIUS attribute conversion rule.

     attribute convert *src-attr-name* **to** *dest-attr-name* { { **access-accept** | **access-request** | **accounting** } * | { **received** | **sent** } * }

     By default, no RADIUS attribute conversion rules are configured.

   - Configure a RADIUS attribute rejection rule.

     attribute reject *attr-name* { { **access-accept** | **access-request** | **accounting** } * | { **received** | **sent** } * }

     By default, no RADIUS attribute rejection rules are configured.

Configuring the RADIUS attribute translation feature for a RADIUS DAS

1. Enter system view.

   system-view

2. (Optional.) Define an extended RADIUS attribute.

   radius attribute extended *attribute-name* [**vendor** *vendor-id*] **code** *attribute-code* **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** }

3. Enter RADIUS DAS view.

   radius dynamic-author server

4. Enable the RADIUS attribute translation feature.

   attribute translate

   By default, this feature is disabled.

5. Configure a RADIUS attribute conversion rule or a RADIUS attribute rejection rule. Choose the following tasks as needed:

   - Configure a RADIUS attribute conversion rule.

     attribute convert *src-attr-name* **to** *dest-attr-name* { { **coa-ack** | **coa-request** } * | { **received** | **sent** } * }

     By default, no RADIUS attribute conversion rules are configured.

   - Configure a RADIUS attribute rejection rule.

     attribute reject *attr-name* { { **coa-ack** | **coa-request** } * | { **received** | **sent** } * }

     By default, no RADIUS attribute rejection rules are configured.

Configuring RADIUS stop-accounting packet buffering

About RADIUS stop-accounting packet buffering

The device sends RADIUS stop-accounting requests when it receives connection teardown requests from hosts or connection teardown commands from an administrator. However, the device might fail

to receive a response for a stop-accounting request in a single transmission. Enable the device to buffer RADIUS stop-accounting requests that have not received responses from the accounting server. The device will resend the requests until responses are received.

To limit the transmission times, set a maximum number of transmission attempts that can be made for individual RADIUS stop-accounting requests. When the maximum attempts are made for a request, the device discards the buffered request.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Enable buffering of RADIUS stop-accounting requests to which no responses have been received.

   stop-accounting-buffer enable

   By default, the buffering feature is enabled.

4. (Optional.) Set the maximum number of transmission attempts for individual RADIUS stop-accounting requests.

   retry stop-accounting *retries*

   The default setting is 500.

Enabling forcibly sending stop-accounting packets

About forcibly sending stop-accounting packets

Typically, if the device does not send a start-accounting packet to the RADIUS server for an authenticated user, it does not send a stop-accounting packet when the user goes offline. If the server has generated a user entry for the user without start-accounting packets, it does not release the user entry when the user goes offline. This feature forces the device to send stop-accounting packets to the RADIUS server when the user goes offline for timely releasing the user entry on the server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Enable the device to send stop-accounting packets when users for which no start-accounting packets are sent go offline.

   stop-accounting-packet send-force

   By default, forcibly sending stop-accounting packets is disabled. The device does not send stop-accounting packets when users for which no start-accounting packets are sent go offline.

Enabling the RADIUS server load sharing feature

About RADIUS server load sharing

By default, the device communicates with RADIUS servers based on the server roles. It first attempts to communicate with the primary server, and, if the primary server is unreachable, it then searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication. In this process, the workload is always placed on the active server.

Use the RADIUS server load sharing feature to dynamically distribute the workload over multiple servers regardless of their server roles. The device forwards an AAA request to the most appropriate server of all active servers in the scheme after it compares the weight values and numbers of currently served users. Specify a weight value for each RADIUS server based on the AAA capacity of the server. A larger weight value indicates a higher AAA capacity.

In RADIUS server load sharing, once the device sends a start-accounting request to a server for a user, it forwards all subsequent accounting requests of the user to the same server. If the accounting server is unreachable, the device returns an accounting failure message rather than searching for another active accounting server.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Enable the RADIUS server load sharing feature.
   server-load-sharing enable
   By default, this feature is disabled.

Configuring the RADIUS accounting-on feature

About RADIUS accounting-on

When the accounting-on feature is enabled, the device automatically sends an accounting-on packet to the RADIUS server after the entire device reboots. Upon receiving the accounting-on packet, the RADIUS server logs out all online users so they can log in again through the device. Without this feature, users cannot log in again after the reboot, because the RADIUS server considers them to come online.

You can configure the interval for which the device waits to resend the accounting-on packet and the maximum number of retries.

The extended accounting-on feature enhances the accounting-on feature in a distributed architecture.

The extended accounting-on feature is applicable to LAN users. The user data is saved to the IRF member devices through which the users access the system. When the extended accounting-on feature is enabled, the system automatically sends an accounting-on packet to the RADIUS server after a member device reboots. The packet contains the member device identifier. Upon receiving the accounting-on packet, the RADIUS server logs out all online users that access the system through the member device. If no users have come online through the member device, the IRF fabric does not send an accounting-on packet after the member device reboots.

Restrictions and guidelines

For the extended accounting-on feature to take effect, the RADIUS server must run on IMC and the accounting-on feature must be enabled.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Enable accounting-on.
   accounting-on enable [**interval** *interval* | **send** *send-times*] *
   By default, the accounting-on feature is disabled.

4. (Optional.) Enable extended accounting-on.

   accounting-on extended

   By default, extended accounting-on is disabled.

Configuring the RADIUS session-control feature

About RADIUS session-control

Enable this feature for the RADIUS server to dynamically change the user authorization information (such as the authorization ACL, VLAN, and user group) or forcibly disconnect users by using session-control packets. This task enables the device to receive RADIUS session-control packets on UDP port 1812.

To verify the session-control packets sent from a RADIUS server, specify the RADIUS server as a session-control client to the device.

Restrictions and guidelines

The RADIUS session-control feature can only work with RADIUS servers running on IMC. The session-control client configuration takes effect only when the session-control feature is enabled.

If the device acts as the NAS and the IMC server deployed with EAD assigns authorization ACLs to the device, you must enable the session-control feature on the device. This ensures that the authorization ACLs can take effect.

Procedure

1. Enter system view.

   system-view

2. Enable the session-control feature.

   radius session-control enable

   By default, the session-control feature is disabled.

3. Specify a session-control client.

   radius session-control client { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**key** { **cipher** | **simple** } *string*]

   By default, no session-control clients are specified.

Configuring the RADIUS DAS feature

About the RADIUS DAS feature

Dynamic Authorization Extensions (DAE) to RADIUS, defined in RFC 5176, can log off online users and change online user authorization information.

In a RADIUS network, the RADIUS server typically acts as the DAE client (DAC) and the NAS acts as the DAE server (DAS).

When the RADIUS DAS feature is enabled, the NAS performs the following operations:

1. Listens to the default or specified UDP port to receive DAE requests.
2. Logs off online users that match the criteria in the requests, changes their authorization information, shuts down or reboots their access ports, or reauthenticates the users.
3. Sends DAE responses to the DAC.

DAE defines the following types of packets:

- **Disconnect Messages (DMs)**—The DAC sends DM requests to the DAS to log off specific online users.

- **Change of Authorization Messages (CoA Messages)**—The DAC sends CoA requests to the DAS to change the authorization information of specific online users.

Procedure

1. Enter system view.

   system-view

2. Enable the RADIUS DAS feature and enter RADIUS DAS view.

   radius dynamic-author server

   By default, the RADIUS DAS feature is disabled.

3. Specify a RADIUS DAC.

   client { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**key** { **cipher** | **simple** } *string*]

   By default, no RADIUS DACs are specified.

4. (Optional.) Specify the RADIUS DAS port.

   port *port-number*

   By default, the RADIUS DAS port is 3799.

Enabling SNMP notifications for RADIUS

About SNMP notifications for RADIUS

When SNMP notifications are enabled for RADIUS, the SNMP agent supports the following notifications generated by RADIUS:

- **RADIUS server unreachable notification**—The RADIUS server cannot be reached. RADIUS generates this notification if it does not receive a response to an accounting or authentication request within the specified number of RADIUS request transmission attempts.
- **RADIUS server reachable notification**—The RADIUS server can be reached. RADIUS generates this notification for a previously blocked RADIUS server after the quiet timer expires.
- **Excessive authentication failures notification**—The number of authentication failures compared to the total number of authentication attempts exceeds the specified threshold.

For RADIUS SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for RADIUS.

   snmp-agent trap enable radius [**accounting-server-down** | **accounting-server-up** | **authentication-error-threshold** | **authentication-server-down** | **authentication-server-up**] *

   By default, all SNMP notifications are disabled for RADIUS.

Disabling the RADIUS service

About disabling the RADIUS service

By default, the RADIUS service is enabled. The device can send and receive RADIUS packets. Attackers might use RADIUS session-control and DAE ports to attack the device. To protect the device when such an attack occurs, disable the RADIUS service temporarily on the device. After the network is secure, re-enable the RADIUS service.

If settings on the RADIUS servers require modification or the RADIUS servers cannot provide services temporarily, you can temporarily disable the RADIUS service on the device.

When the RADIUS service is disabled, the device stops sending and receiving RADIUS packets. If a new user comes online, the device uses the backup authentication, authorization, or accounting method to process that user. If the device has not finished requesting authentication or accounting for a user before the RADIUS service is disabled, it uses the following rules to process that user:

- If the device has sent RADIUS authentication requests for that user to a RADIUS server, the device processes that user depending on whether it receives a response from the RADIUS server.
  - If the device receives a response from the RADIUS server, it uses the response to determine whether that user has passed authentication. If that user has passed authentication, the device assigns authorization information to that user according to the response.
  - If the device does not receive any response from the RADIUS server, it attempts to use the backup authentication method to authenticate that user.
- If the device has sent RADIUS start-accounting requests for that user to a RADIUS server, the device processes that user depending on whether it receives a response from the RADIUS server.
  - If the device receives a response from the RADIUS server, it allows that user to come online. However, the device cannot send out accounting-update or stop-accounting requests to the RADIUS server. It cannot buffer the accounting requests, either. When that user goes offline, the RADIUS server cannot log off that user in time. The accounting result might be inaccurate.
  - If the device does not receive any response from the RADIUS server, it attempts to use the backup accounting method.

Restrictions and guidelines

Disabling the RADIUS service does not affect the RADIUS server feature of the device.

The authentication, authorization, and accounting processes undertaken by other methods are not switched to RADIUS when you re-enable the RADIUS service.

Procedure

1. Enter system view.

   `system-view`
2. Disable the RADIUS service.

   `undo radius enable`

   By default, the RADIUS service is enabled.

   To re-enable the RADIUS service, use the **`radius enable`** command.

Display and maintenance commands for RADIUS

Execute **`display`** commands in any view and **`reset`** commands in user view.

Task	Command
Display the RADIUS scheme configuration.	**`display radius scheme`** [*`radius-scheme-name`*]
Display authentication and accounting load statistics for all RADIUS servers.	**`display radius server-load statistics`**
Display RADIUS packet statistics.	**`display radius statistics`**
Display information about buffered	**`display stop-accounting-buffer`**

Task	Command
RADIUS stop-accounting requests to which no responses have been received.	{ **radius-scheme** *radius-scheme-name* | **session-id** *session-id* | **time-range** *start-time end-time* | **user-name** *user-name* }
Clear history authentication and accounting load statistics for all RADIUS servers.	**reset radius server-load statistics**
Clear RADIUS statistics.	**reset radius statistics**
Clear the buffered RADIUS stop-accounting requests to which no responses have been received.	**reset stop-accounting-buffer** { **radius-scheme** *radius-scheme-name* | **session-id** *session-id* | **time-range** *start-time end-time* | **user-name** *user-name* }

Configuring HWTACACS

HWTACACS tasks at a glance

To configure HWTACACS, perform the following tasks:

1. Creating an HWTACACS scheme
2. Specifying the HWTACACS authentication servers
3. Specifying the HWTACACS authorization servers
4. Specifying the HWTACACS accounting servers
5. Specifying the shared keys for secure HWTACACS communication

   Perform this task if no shared keys are specified when configuring HWTACACS servers.
6. (Optional.) Setting HWTACACS timers
7. (Optional.) Configuring parameters for HWTACACS packets

Specifying the source IP address for outgoing HWTACACS packets

Setting the username format and traffic statistics units

8. (Optional.) Configuring HWTACACS stop-accounting packet buffering

Creating an HWTACACS scheme

Restrictions and guidelines

You can configure a maximum of 16 HWTACACS schemes. An HWTACACS scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.

   system-view
2. Create an HWTACACS scheme and enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

Specifying the HWTACACS authentication servers

About HWTACACS authentication servers

You can specify one primary authentication server and a maximum of 16 secondary authentication servers for an HWTACACS scheme. When the primary server is unreachable, the device searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary authentication server in one scheme and as the secondary authentication server in another scheme at the same time.

Two HWTACACS authentication servers in a scheme, primary or secondary, cannot have the same combination of host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify the primary HWTACACS authentication server.

   primary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection**] *

   By default, no primary HWTACACS authentication server is specified.

4. (Optional.) Specify a secondary HWTACACS authentication server.

   secondary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection**] *

   By default, no secondary HWTACACS authentication servers are specified.

Specifying the HWTACACS authorization servers

About HWTACACS authorization servers

You can specify one primary authorization server and a maximum of 16 secondary authorization servers for an HWTACACS scheme. When the primary server is not available, the device searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary authorization server of one scheme and as the secondary authorization server of another scheme at the same time.

Two HWTACACS authorization servers in a scheme, primary or secondary, cannot have the same combination of host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

hwtacacs scheme *hwtacacs-scheme-name*

3. Specify the primary HWTACACS authorization server.

   primary authorization { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection**] *

   By default, no primary HWTACACS authorization server is specified.

4. (Optional.) Specify a secondary HWTACACS authorization server.

   secondary authorization { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection**] *

   By default, no secondary HWTACACS authorization servers are specified.

Specifying the HWTACACS accounting servers

About HWTACACS accounting servers

You can specify one primary accounting server and a maximum of 16 secondary accounting servers for an HWTACACS scheme. When the primary server is not available, the device searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary accounting server of one scheme and as the secondary accounting server of another scheme at the same time.

Two HWTACACS accounting servers in a scheme, primary or secondary, cannot have the same combination of host name, IP address, and port number.

HWTACACS does not support accounting for FTP, SFTP, and SCP users.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify the primary HWTACACS accounting server.

   primary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection**] *

   By default, no primary HWTACACS accounting server is specified.

4. (Optional.) Specify a secondary HWTACACS accounting server.

   secondary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection**] *

   By default, no secondary HWTACACS accounting servers are specified.

Specifying the shared keys for secure HWTACACS communication

About shared keys for secure HWTACACS communication

The HWTACACS client and server use the MD5 algorithm and shared keys to generate the Authenticator value for packet authentication and user password encryption. The client and server must use the same key for each type of communication.

Perform this task to configure shared keys for servers in an HWTACACS scheme. The keys take effect on all servers for which a shared key is not individually configured.

Restrictions and guidelines

Make sure the shared key configured on the device is the same as the shared key configured on the HWTACACS server.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify a shared key for secure HWTACACS authentication, authorization, or accounting communication.

   key { **accounting** | **authentication** | **authorization** } { **cipher** | **simple** } *string*

   By default, no shared key is specified for secure HWTACACS communication.

Setting HWTACACS timers

About HWTACACS timers and server status

The device uses the following timers to control communication with an HWTACACS server:

- **Server response timeout timer (response-timeout)**—Defines the HWTACACS server response timeout timer. The device starts this timer immediately after an HWTACACS authentication, authorization, or accounting request is sent. If the device does not receive a response from the server within the timer, it sets the server to blocked. Then, the device sends the request to another HWTACACS server.
- **Real-time accounting timer (realtime-accounting)**—Defines the interval at which the device sends real-time accounting packets to the HWTACACS accounting server for online users.
- **Server quiet timer (quiet)**—Defines the duration to keep an unreachable server in blocked state. If a server is not reachable, the device changes the server status to blocked, starts this timer for the server, and tries to communicate with another server in active state. After the server quiet timer expires, the device changes the status of the server back to active.

The server quiet timer setting affects the status of HWTACACS servers. If the scheme includes one primary HWTACACS server and multiple secondary HWTACACS servers, the device communicates with the HWTACACS servers based on the following rules:

- When the primary server is in active state, the device communicates with the primary server. When the primary server is unreachable, the device researches a secondary server in active status in the order they are configured.
- When one or more servers are in active state, the device tries to communicate with these servers only, even if they are unreachable.
- When all servers are in blocked state, the device only tries to communicate with the primary server.
- If the primary server is unreachable, the device changes the server status to blocked and starts a quiet timer for the server. When the quiet timer of the server expires, the status of the server changes back to active. The device does not check the server again during the authentication, authorization, or accounting process.
- The search process continues until the device finds an available secondary server or has checked all secondary servers in active state. If no server is available, the device considers the authentication, authorization, or accounting attempt a failure.

- When you remove a server in use, communication with the server times out. The device looks for a server in active state by first checking the primary server, and then checking secondary servers in the order they are configured.
- When an HWTACACS server's status changes automatically, the device changes this server's status accordingly in all HWTACACS schemes in which this server is specified.

Restrictions and guidelines

A short real-time accounting interval helps improve accounting precision but requires many system resources. When there are 1000 or more users, set a real-time accounting interval longer than 15 minutes.

Procedure

1. Enter system view.
   system-view
2. Enter HWTACACS scheme view.
   hwtacacs scheme *hwtacacs-scheme-name*
3. Set the HWTACACS timers. Choose the following tasks as needed:
   - Set the HWTACACS server response timeout timer.
     timer response-timeout *seconds*
     By default, the HWTACACS server response timeout timer is 5 seconds.
   - Set the real-time accounting interval.
     timer realtime-accounting *minutes*
     By default, the real-time accounting interval is 12 minutes.
   - Set the server quiet timer.
     timer quiet *minutes*
     By default, the server quiet timer is 5 minutes.

Specifying the source IP address for outgoing HWTACACS packets

About the source IP address for outgoing HWTACACS packets

The source IP address of HWTACACS packets that a NAS sends must match the IP address of the NAS configured on the HWTACACS server. An HWTACACS server identifies a NAS by IP address. When the HWTACACS server receives a packet, it checks the source IP address of the packet.

- If it is the IP address of a managed NAS, the server processes the packet.
- If it is not the IP address of a managed NAS, the server drops the packet.

Before sending an HWTACACS packet, the NAS selects a source IP address in the following order:

1. The source IP address specified for the HWTACACS scheme.
2. The source IP address specified in system view.
3. The IP address of the outbound interface specified by the route.

Restrictions and guidelines for source IP address configuration

You can specify the source IP address for outgoing HWTACACS packets in HWTACACS scheme view or in system view.

- The IP address specified in HWTACACS scheme view applies to one HWTACACS scheme.
- The IP address specified in system view applies to all HWTACACS schemes.

The source IP address of HWTACACS packets that a NAS sends must match the IP address of the NAS that is configured on the HWTACACS server.

As a best practice, specify a loopback interface address as the source IP address for outgoing HWTACACS packets to avoid HWTACACS packet loss caused by physical port errors.

To communicate with the HWTACACS server, the source address of outgoing HWTACACS packets is typically the IP address of an egress interface on the NAS. However, in some situations, you must change the source IP address. For example, when VRRP is configured for stateful failover, configure the virtual IP of the uplink VRRP group as the source address.

You can directly specify a source IP address for outgoing HWTACACS packets or specify a source interface to provide the source IP address for outgoing HWTACACS packets. The source interface configuration and the source IP address configuration overwrite each other.

Specifying a source interface or source IP address for all HWTACACS schemes

1. Enter system view.

   system-view

2. Specify a source interface or source IP address for outgoing HWTACACS packets.

   hwtacacs nas-ip { **interface** *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } }

   By default, the source IP address of an HWTACACS packet sent to the server is the primary IPv4 address or the IPv6 address of the outbound interface.

Specifying a source interface or source IP address for an HWTACACS scheme

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify a source interface or source IP address for outgoing HWTACACS packets.

   nas-ip { *ipv4-address* | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

   By default, the source IP address of an outgoing HWTACACS packet is that configured by using the **hwtacacs nas-ip** command in system view. If the **hwtacacs nas-ip** command is not used, the source IP address is the primary IP address of the outbound interface.

Setting the username format and traffic statistics units

About the username format and traffic statistics units

A username is typically in the *userid@isp-name* format, where the *isp-name* part represents the user's ISP domain name. By default, the ISP domain name is included in a username. If HWTACACS servers do not recognize usernames that contain ISP domain names, you can configure the device to send usernames without domain names to the servers.

The device reports online user traffic statistics in accounting packets.

Restrictions and guidelines

If two or more ISP domains use the same HWTACACS scheme, configure the HWTACACS scheme to keep the ISP domain name in usernames for domain identification.

For accounting accuracy, make sure the traffic measurement units configured on the device are the same as the traffic measurement units configured on the HWTACACS accounting servers.

Procedure

1. Enter system view.

system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Set the format of usernames sent to the HWTACACS servers.

   user-name-format { **keep-original** | **with-domain** | **without-domain** }

   By default, the ISP domain name is included in a username.

4. Set the data flow and packet measurement units for traffic statistics.

   data-flow-format { **data** { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** } | **packet** { **giga-packet** | **kilo-packet** | **mega-packet** | **one-packet** } }*

   By default, traffic is counted in bytes and packets.

Configuring HWTACACS stop-accounting packet buffering

About HWTACACS stop-accounting packet buffering

The device sends HWTACACS stop-accounting requests when it receives connection teardown requests from hosts or connection teardown commands from an administrator. However, the device might fail to receive a response for a stop-accounting request in a single transmission. Enable the device to buffer HWTACACS stop-accounting requests that have not received responses from the accounting server. The device will resend the requests until responses are received.

To limit the transmission times, set a maximum number of attempts that can be made for transmitting individual HWTACACS stop-accounting requests. When the maximum attempts are made for a request, the device discards the buffered request.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Enable buffering of HWTACACS stop-accounting requests to which no responses have been received.

   stop-accounting-buffer enable

   By default, the buffering feature is enabled.

4. (Optional.) Set the maximum number of transmission attempts for individual HWTACACS stop-accounting requests.

   retry stop-accounting *retries*

   The default setting is 100.

Display and maintenance commands for HWTACACS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the configuration or server statistics of HWTACACS schemes.	**display hwtacacs scheme** [*hwtacacs-scheme-name* [**statistics**]]
Display information about buffered HWTACACS stop-accounting requests to which no responses have been received.	**display stop-accounting-buffer hwtacacs-scheme** *hwtacacs-scheme-name*

Task	Command
Clear HWTACACS statistics.	**reset hwtacacs statistics** { **accounting** | **all** | **authentication** | **authorization** }
Clear the buffered HWTACACS stop-accounting requests to which no responses have been received.	**reset stop-accounting-buffer hwtacacs-scheme** *hwtacacs-scheme-name*

Configuring LDAP

LDAP tasks at a glance

To configure LDAP, perform the following tasks:

1. Configuring an LDAP server
   a. Creating an LDAP server
   b. Configuring the IP address of the LDAP server
   c. (Optional.) Specifying the LDAP version
   d. (Optional.) Setting the LDAP server timeout period
   e. Configuring administrator attributes
   f. Configuring LDAP user attributes
2. (Optional.) Configuring an LDAP attribute map
3. Creating an LDAP scheme
4. Specifying the LDAP authentication server
5. (Optional.) Specifying the LDAP authorization server
6. (Optional.) Specifying an LDAP attribute map for LDAP authorization

Creating an LDAP server

1. Enter system view.
   system-view
2. Create an LDAP server and enter LDAP server view.
   ldap server *server-name*

Configuring the IP address of the LDAP server

Restrictions and guidelines

You can configure either an IPv4 address or an IPv6 address for an LDAP server. If you configure the IP address for an LDAP server multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Configure the IP address of the LDAP server.

{ ip *ipv4-address* | **ipv6** *ipv6-address* **}** [**port** *port-number*]

By default, an LDAP server does not have an IP address.

Specifying the LDAP version

Restrictions and guidelines

The device supports LDAPv2 and LDAPv3.

A Microsoft LDAP server supports only LDAPv3.

The LDAP version specified on the device must be consistent with the version specified on the LDAP server.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the LDAP version.
   protocol-version { **v2** | **v3** }
   By default, LDAPv3 is used.

Setting the LDAP server timeout period

About the LDAP server timeout period

If the device sends a bind or search request to an LDAP server without receiving the server's response within the server timeout period, the authentication or authorization request times out. Then, the device tries the backup authentication or authorization method. If no backup method is configured in the ISP domain, the device considers the authentication or authorization attempt a failure.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Set the LDAP server timeout period.
   server-timeout *time-interval*
   By default, the LDAP server timeout period is 10 seconds.

Configuring administrator attributes

About administrator attributes

To configure the administrator DN and password for binding with the LDAP server during LDAP authentication:

Procedure

1. Enter system view.
   system-view

2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the administrator DN.
   login-dn *dn-string*
   By default, no administrator DN is specified.
   The administrator DN specified on the device must be the same as the administrator DN configured on the LDAP server.
4. Configure the administrator password.
   login-password { **cipher** | **simple** } *string*
   By default, no administrator password is specified.

Configuring LDAP user attributes

About LDAP user attributes

To authenticate a user, an LDAP client must complete the following operations:

1. Establish a connection to the LDAP server.
2. Obtain the user DN from the LDAP server.
3. Use the user DN and the user's password to bind with the LDAP server.

LDAP provides a DN search mechanism for obtaining the user DN. According to the mechanism, an LDAP client sends search requests to the server based on the search policy determined by the LDAP user attributes of the LDAP client.

The LDAP user attributes include:

- Search base DN.
- Search scope.
- Username attribute.
- Username format.
- User object class.

Restrictions and guidelines

If the LDAP server contains many directory levels, a user DN search starting from the root directory can take a long time. To improve efficiency, you can change the start point by specifying the search base DN.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the user search base DN.
   search-base-dn *base-dn*
   By default, no user search base DN is specified.
4. (Optional.) Specify the user search scope.
   search-scope { **all-level** | **single-level** }
   By default, the user search scope is **all-level**.
5. (Optional.) Specify the username attribute.
   user-parameters user-name-attribute { *name-attribute* | **cn** | **uid** }

By default, the username attribute is **cn**.

6. (Optional.) Specify the username format.

   user-parameters user-name-format { **with-domain** | **without-domain** }

   By default, the username format is **without-domain**.

7. (Optional.) Specify the user object class.

   user-parameters user-object-class *object-class-name*

   By default, no user object class is specified, and the default user object class on the LDAP server is used. The default user object class for this command varies by server model.

Configuring an LDAP attribute map

About LDAP attribute maps

Configure an LDAP attribute map to define a list of LDAP-AAA attribute mapping entries. To apply the LDAP attribute map, specify the name of the LDAP attribute map in the LDAP scheme used for authorization.

The LDAP attribute map feature enables the device to convert LDAP attributes obtained from an LDAP authorization server to device-recognizable AAA attributes based on the mapping entries. Because the device ignores unrecognized LDAP attributes, configure the mapping entries to include important LDAP attributes that should not be ignored.

An LDAP attribute can be mapped only to one AAA attribute. Different LDAP attributes can be mapped to the same AAA attribute.

Procedure

1. Enter system view.

   system-view

2. Create an LDAP attribute map and enter LDAP attribute map view.

   ldap attribute-map *map-name*

3. Configure a mapping entry.

   map ldap-attribute *ldap-attribute-name* [**prefix** *prefix-value* **delimiter** *delimiter-value*] **aaa-attribute** { **user-group** | **user-profile** }

Creating an LDAP scheme

Restrictions and guidelines

You can configure a maximum of 16 LDAP schemes. An LDAP scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.

   system-view

2. Create an LDAP scheme and enter LDAP scheme view.

   ldap scheme *ldap-scheme-name*

Specifying the LDAP authentication server

1. Enter system view.

   system-view

2. Enter LDAP scheme view.

ldap scheme *ldap-scheme-name*

3. Specify the LDAP authentication server.
   authentication-server *server-name*
   By default, no LDAP authentication server is specified.

Specifying the LDAP authorization server

1. Enter system view.
   system-view
2. Enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*
3. Specify the LDAP authorization server.
   authorization-server *server-name*
   By default, no LDAP authorization server is specified.

Specifying an LDAP attribute map for LDAP authorization

About the LDAP attribute map for LDAP authorization

Specify an LDAP attribute map for LDAP authorization to convert LDAP attributes obtained from the LDAP authorization server to device-recognizable AAA attributes.

Restrictions and guidelines

You can specify only one LDAP attribute map in an LDAP scheme.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*
3. Specify an LDAP attribute map.
   attribute-map *map-name*
   By default, no LDAP attribute map is specified.

Display and maintenance commands for LDAP

Execute **display** commands in any view.

Task	Command
Display the configuration of LDAP schemes.	**display ldap scheme** [*ldap-scheme-name*]

Creating an ISP domain

About ISP domains

In a networking scenario with multiple ISPs, the device can connect to users of different ISPs. These users can have different user attributes, such as different username and password structures, different service types, and different rights. To manage users of different ISPs, configure authentication, authorization, and accounting methods and domain attributes for each ISP domain as needed.

The device supports a maximum of 16 ISP domains, including the system-defined ISP domain **system**. You can specify one of the ISP domains as the default domain.

On the device, each user belongs to an ISP domain. If a user does not provide an ISP domain name at login, the device considers the user belongs to the default ISP domain.

Each ISP domain has a set of system-defined AAA methods, which are local authentication, local authorization, and local accounting. If you do not configure any AAA methods for an ISP domain, the device uses the system-defined AAA methods for users in the domain.

The device chooses an authentication domain for each user in the following order:

1. The authentication domain specified for the access module.
2. The ISP domain in the username.
3. The default ISP domain of the device.

If the chosen domain does not exist on the device, the device searches for the ISP domain that accommodates users assigned to nonexistent domains. (Support for the authentication domain configuration depends on the access module.) If no such ISP domain is configured, user authentication fails.

Restrictions and guidelines for ISP domain configuration

An ISP domain cannot be deleted when it is the default ISP domain. Before you use the **undo domain** command, change the domain to a non-default ISP domain by using the **undo domain default enable** command.

You can modify the settings of the system-defined ISP domain **system**, but you cannot delete the domain.

To avoid RADIUS authentication, authorization, or accounting failures, use short domain names to ensure that usernames containing a domain name do not exceed 253 characters.

Creating an ISP domain

1. Enter system view.
   system-view
2. Create an ISP domain and enter ISP domain view.
   domain *isp-name*
   By default, a system-defined ISP domain exists. The domain name is **system**.

Specifying the default ISP domain

1. Enter system view.
   system-view

2. Specify the default ISP domain.

   domain default enable *isp-name*

   By default, the default ISP domain is the system-defined ISP domain **system**.

Specifying an ISP domain for users that are assigned to nonexistent domains

1. Enter system view.

   system-view

2. Specify the ISP domain to accommodate users that are assigned to nonexistent domains.

   domain if-unknown *isp-name*

   By default, no ISP domain is specified to accommodate users that are assigned to nonexistent domains.

Configuring ISP domain attributes

Setting ISP domain status

About the ISP domain status

By placing the ISP domain in active or blocked state, you allow or deny network service requests from users in the domain.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. Set the status of the ISP domain.

   state { **active** | **block** }

   By default, an ISP domain is in active state, and users in the domain can request network services.

Configuring authorization attributes for an ISP domain

About authorization attributes

The device supports the following authorization attributes:

- **ACL**—The device restricts authenticated users to access only the network resources permitted by the ACL.
- **CAR action**—The attribute controls the traffic flow of authenticated users.
- **Maximum number of multicast groups**—The attribute restricts the maximum number of multicast groups that an authenticated user can join concurrently.
- **IPv4 address pool**—The device assigns IPv4 addresses from the pool to authenticated users in the domain.
- **IPv6 address pool**—The device assigns IPv6 addresses from the pool to authenticated users in the domain.

- **Redirect URL**—The device redirects users in the domain to the URL after they pass authentication.
- **User group**—Authenticated users in the domain obtain all attributes of the user group.
- **User profile**—The device restricts the user's behavior based on the user profile.

The device assigns the authorization attributes in the ISP domain to the authenticated users that do not receive these attributes from the server.

Procedure

1. Enter system view.

   system-view
2. Enter ISP domain view.

   domain *isp-name*
3. Configure authorization attributes for authenticated users in the ISP domain.

   authorization-attribute { **acl** *acl-number* | **car inbound cir** *committed-information-rate* [**pir** *peak-information-rate*] **outbound cir** *committed-information-rate* [**pir** *peak-information-rate*] | **igmp max-access-number** *max-access-number* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **mld max-access-number** *max-access-number* | **url** *url-string* | **user-group** *user-group-name* | **user-profile** *profile-name* }

   The default settings are as follows:
   - An IPv4 user can concurrently join a maximum of four IGMP multicast groups.
   - An IPv6 user can concurrently join a maximum of four MLD multicast groups.
   - No other authorization attributes exist.

Including the idle timeout period in the user online duration to be sent to the server

About including the idle timeout period in the user online duration to be sent to the server

If a user goes offline due to connection failure or malfunction, the user's online duration sent to the server includes the idle timeout period assigned by the authorization server. The online duration generated on the server is longer than the actual online duration of the user.

For portal users, the device includes the idle timeout period set for the online portal user detection feature in the user online duration. For more information about online detection for portal users, see "Configuring portal authentication."

Procedure

1. Enter system view.

   system-view
2. Enter ISP domain view.

   domain *isp-name*
3. Configure the device to include the idle timeout period in the user online duration to be sent to the server.

   session-time include-idle-time

   By default, the user online duration sent to the server does not include the idle timeout period.

Configuring AAA methods for an ISP domain

Configuring authentication methods for an ISP domain

Restrictions and guidelines

When you configure remote authentication, follow these restrictions and guidelines:

- If the authentication method uses a RADIUS scheme and the authorization method does not use a RADIUS scheme, AAA accepts only the authentication result from the RADIUS server. The Access-Accept message from the RADIUS server also includes the authorization information, but the device ignores the information.
- If an HWTACACS scheme is specified, the device uses the entered username for role authentication. If a RADIUS scheme is specified, the device uses username **$enab***n***$** on the RADIUS server for role authentication. The variable *n* represents a user role level. For more information about user role authentication, see *Fundamentals Configuration Guide*.

The **none** keyword is not supported in FIPS mode.

Prerequisites

Before configuring authentication methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an authentication method for each access type and service type.
2. Determine whether to configure the default authentication method for all access types or service types. The default authentication method applies to all access users. However, the method has a lower priority than the authentication method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. (Optional.) Specify default authentication methods for all types of users.

   authentication default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

   By default, the default authentication method is **local**.

4. Specify authentication methods for a user type or a service.
   - Specify authentication methods for LAN users.

     authentication lan-access { **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authentication methods are used for LAN users.
   - Specify authentication methods for login users.

     authentication login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

By default, the default authentication methods are used for login users.

- Specify authentication methods for portal users.

  authentication portal { **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

  By default, the default authentication methods are used for portal users.

- Specify authentication methods for obtaining a temporary user role.

  authentication super { **hwtacacs-scheme** *hwtacacs-scheme-name* | **radius-scheme** *radius-scheme-name* } *

  By default, the default authentication methods are used for obtaining a temporary user role.

Configuring authorization methods for an ISP domain

Restrictions and guidelines

The device does not support LDAP authorization in the current software version.

To use a RADIUS scheme as the authorization method, specify the name of the RADIUS scheme that is configured as the authentication method for the ISP domain. If an invalid RADIUS scheme is specified as the authorization method, RADIUS authentication and authorization fail.

The **none** keyword is not supported in FIPS mode.

Prerequisites

Before configuring authorization methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an authorization scheme for each access type and service type.
2. Determine whether to configure the default authorization method for all access types or service types. The default authorization method applies to all access users. However, the method has a lower priority than the authorization method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. (Optional.) Specify default authorization methods for all types of users.

   authorization default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

   By default, the authorization method is **local**.

4. Specify authorization methods for a user type or a service.

   - Specify command authorization methods.

     authorization command { **hwtacacs-scheme** *hwtacacs-scheme-name* [**local**] [**none**] | **local** [**none**] | **none** }

     By default, the default authorization methods are used for command authorization.

   - Specify authorization methods for LAN users.

     authorization lan-access { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authorization methods are used for LAN users.

- Specify authorization methods for login users.

  authorization login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

  By default, the default authorization methods are used for login users.
- Specify authorization methods for portal users.

  authorization portal { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

  By default, the default authorization methods are used for portal users.

Configuring accounting methods for an ISP domain

Restrictions and guidelines

FTP, SFTP, and SCP users do not support accounting.

Local accounting does not provide statistics for charging. It only counts and controls the number of concurrent users that use the same local user account. The threshold is configured by using the **access-limit** command.

The **none** keyword is not supported in FIPS mode.

Prerequisites

Before configuring accounting methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an accounting method for each access type and service type.
2. Determine whether to configure the default accounting method for all access types or service types. The default accounting method applies to all access users. However, the method has a lower priority than the accounting method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view
2. Enter ISP domain view.

   domain *isp-name*
3. (Optional.) Specify default accounting methods for all types of users.

   accounting default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

   By default, the accounting method is **local**.
4. Specify accounting methods for a user type.
   - Specify the command accounting method.

     accounting command hwtacacs-scheme *hwtacacs-scheme-name*

     By default, the default accounting methods are used for command accounting.
   - Specify accounting methods for LAN users.

     accounting lan-access { **broadcast radius-scheme** *radius-scheme-name1* **radius-scheme** *radius-scheme-name2* [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

By default, the default accounting methods are used for LAN users.

- Specify accounting methods for login users.

  accounting login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

  By default, the default accounting methods are used for login users.

- Specify accounting methods for portal users.

  accounting portal { **broadcast radius-scheme** *radius-scheme-name1* **radius-scheme** *radius-scheme-name2* [**local**] [**none**] | **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

  By default, the default accounting methods are used for portal users.

5. (Optional.) Configure extended accounting policies.
   - Configure access control for users that encounter accounting-start failures.

     accounting start-fail { **offline** | **online** }

     By default, the device allows users that encounter accounting-start failures to stay online.
   - Configure access control for users that have failed all their accounting-update attempts.

     accounting update-fail { [**max-times** *max-times*] **offline** | **online** }

     By default, the device allows users that have failed all their accounting-update attempts to stay online.
   - Configure access control for users that have used up their data or time accounting quotas.

     accounting quota-out { **offline** | **online** }

     By default, the device logs off users that have used up their accounting quotas.

Display and maintenance commands for ISP domains

Execute **display** commands in any view.

Task	Command
Display configuration information about an ISP domain or all ISP domains.	**display domain** [*isp-name*]

Setting the maximum number of concurrent login users

About setting the maximum number of concurrent login users

Perform this task to set the maximum number of concurrent users that can log on to the device through a specific protocol, regardless of their authentication methods. The authentication methods include no authentication, local authentication, and remote authentication.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of concurrent login users.

   In non-FIPS mode:

aaa session-limit { **ftp** | **http** | **https** | **ssh** | **telnet** } *max-sessions*

In FIPS mode:

aaa session-limit { **https** | **ssh** } *max-sessions*

By default, the maximum number of concurrent login users is 32 for each user type.

Configuring a NAS-ID

About NAS-IDs

During RADIUS authentication, the device uses a NAS-ID to set the NAS-Identifier attribute of RADIUS packets so that the RADIUS server can identify the access location of users.

Configure a NAS-ID profile to maintain NAS-ID and VLAN bindings on the device so that the device can send different NAS-Identifier attribute strings in RADIUS requests from different VLANs.

Restrictions and guidelines

You can apply a NAS-ID profile to portal- or port security-enabled interfaces. For more information, see "Configuring portal authentication" and "Configuring port security."

You can configure multiple NAS-ID and VLAN bindings in a NAS-ID profile.

A NAS-ID can be bound with more than one VLAN, but a VLAN can be bound with only one NAS-ID. If you configure multiple bindings for the same VLAN, the most recent configuration takes effect.

Procedure

1. Enter system view.

   system-view
2. Create a NAS-ID profile and enter NAS-ID profile view.

   aaa nas-id profile *profile-name*
3. Configure a NAS-ID and VLAN binding in the profile.

   nas-id *nas-identifier* **bind vlan** *vlan-id*

Configuring the device ID

About the device ID

RADIUS uses the value of the Acct-Session-ID attribute as the accounting ID for a user. The device generates an Acct-Session-ID value for each online user based on the system time, random digits, and device ID.

Procedure

1. Enter system view.

   system-view
2. Configure the device ID.

   aaa device-id *device-id*

   By default, the device ID is 0.

Enabling password change prompt logging

About this task

Use this feature to enhance the protection of passwords for Telnet, SSH, HTTP, HTTPS, NETCONF over SSH, and NETCONF over SOAP users and improve the system security.

This feature enables the device to generate logs to prompt users to change their weak passwords at an interval of 24 hours and at the users' login.

A password is a weak password if it does not meet the following requirements:

- Password composition restriction configured by using the **password-control composition** command.
- Minimum password length restriction set by using the **password-control length** command.
- It cannot contain the username or the reverse letters of the username.

For a NETCONF over SSH or NETCONF over SOAP user, the device also generates a password change prompt log if any of the following conditions exists:

- The current password of the user is the default password or has expired.
- The user logs in to the device for the first time or uses a new password to log in after global password control is enabled.

The device will no longer generate password change prompt logs for a user when one of the following conditions exists:

- The password change prompt logging feature is disabled.
- The user has changed the password and the new password meets the password control requirements.
- The enabling status of a related password control feature has changed so the current password of the user meets the password control requirements.
- The password composition policy or the minimum password length has changed.

Software version and feature compatibility

This feature is supported only in Release 6318P01 and later.

Restrictions and guidelines

You can use the **display password-control** command to display password control configuration. For more information about password control commands, see password control commands in *Security Command Reference*.

Procedure

1. Enter system view.

   system-view
2. Enable password change prompt logging.

   local-server log change-password-prompt

   By default, password change prompt logging is enabled.

Configuring the RADIUS server feature

RADIUS server feature tasks at a glance

To configure the RADIUS server feature, perform the following tasks:

1. Configuring RADIUS users
2. Specifying RADIUS clients
3. Activating the RADIUS server configuration

Restrictions and guidelines for the RADIUS server feature

To use this feature, install the FreeRadius feature package compatible with the device software version. For more information about installing a feature package, see upgrading software in *Fundamentals Configuration Guide*.

To ensure correct operation of the RADIUS server feature, disable RADIUS session-control on the device.

Configuring RADIUS users

To configure RADIUS users, you must configure network access users, which are the basis of RADIUS user data.

A RADIUS user has the following attributes: user name, password, description, authorization ACL, authorization VLAN, and expiration time. For more information, see "Configuring attributes for network access users."

Specifying RADIUS clients

About specifying RADIUS clients

Perform this task to specify RADIUS clients and shared keys for centralized management. The RADIUS server feature does not accept requests from RADIUS clients that are not managed by the system.

Restrictions and guidelines

The IP address of a RADIUS client must be the same as the source IP address for outgoing RADIUS packets specified on the RADIUS client.

The shared key of a RADIUS client specified on the RADIUS server must be the same as the setting on the RADIUS client.

Procedure

1. Enter system view.

   `system-view`

2. Specify a RADIUS client.

   `radius-server client ip` *`ipv4-address`* **`key`** { **`cipher`** | **`simple`** } *`string`*

Activating the RADIUS server configuration

About activating the RADIUS server configuration

At the device startup, the RADIUS server configuration is automatically activated, including RADIUS users and RADIUS clients. You can immediately activate the most recent RADIUS server configuration if you have added, modified, or deleted RADIUS clients and network access users from which RADIUS user data is generated.

Procedure

1. Enter system view.

   `system-view`

2. Activate the RADIUS server configuration.

   `radius-server activate`

   Executing this command restarts the RADIUS server process and an authentication service interruption will occur during the restart.

Display and maintenance commands for RADIUS users and clients

Execute **display** commands in any view.

Task	Command
Display information about activated RADIUS users.	**display radius-server active-user** [*user-name*]
Display information about activated RADIUS clients.	**display radius-server active-client**

Configuring the connection recording policy

About the connection recording policy

Use this feature on scenarios where the device acts as an FTP, SSH, SFTP, or Telnet login client to establish a connection with a login server. This feature enables the device to provide an accounting server with the connection start and termination information. When the login client establishes a connection with the login server, the system sends a start-accounting request to the accounting server. When the connection is terminated, the system sends a stop-accounting request to the accounting server.

Restrictions and guidelines

The device includes the username entered by a user in the accounting packets to be sent to the AAA server for connection recording. The username format configured by using the **user-name-format** command in the accounting scheme does not take effect.

Procedure

1. Enter system view.
   system-view
2. Create a connection recording policy and enter its view.
   aaa connection-recording policy
3. Specify the accounting method for the connection recording policy.
   accounting hwtacacs-scheme *hwtacacs-scheme-name*

Display and maintenance commands for the connection recording policy

Execute **display** commands in any view.

Task	Command
Display the connection recording policy configuration.	**display aaa connection-recording policy**

Configuring the AAA test feature

About the AAA test feature

This feature enables the device to send authentication or accounting requests to the specified AAA servers to simulate an authentication or accounting process of a user. Use this feature to identify the reasons for the failure of the interaction between the device and the AAA servers. This feature is applicable only to RADIUS.

When performing an AAA test, the device ignores the status of the specified AAA servers and the RADIUS server load sharing feature. The process of an AAA test is as follows:

1. The device sends authentication requests that carry the specified username and password to the specified authentication server or to the authentication servers in the specified RADIUS scheme. The device tries to communicate with the authentication servers in the specified scheme in sequence.

   The process goes to the next step in the following situations:

   - The device receives an authentication response (no matter the authentication succeeds or fails).
   - The device does not receive any authentication response after making all authentication request attempts.

   This step is skipped if no correct authentication server is specified for the AAA test or no authentication servers are configured in the specified RADIUS scheme.
2. The device sends start-accounting requests to the specified accounting server or to the accounting servers in the specified RADIUS scheme. The device tries to communicate with the accounting servers in the specified scheme in sequence.

   The process goes to the next step in the following situations:

   - The device receives a start-accounting response (no matter the accounting succeeds or fails).
   - The device does not receive any start-accounting response after making all start-accounting request attempts.

   This step and the next step are skipped if no correct accounting server is specified for the AAA test or no accounting servers are configured in the specified RADIUS scheme.
3. The device sends stop-accounting requests to the accounting servers to which it has sent a start-accounting request.

   The process finishes in the following situations:

   - The device receives a stop-accounting response.
   - The device does not receive any stop-accounting response after making all stop-accounting request attempts.

To identify attributes that cause authentication or accounting failures, you can configure the device to carry specific attributes in RADIUS requests or define values for specific attributes in the requests. Table 3 shows the attributes that RADIUS requests carry by default.

Table 3 Attributes that RADIUS requests carry by default

Packet type	Attributes that the type of packets carry by default
RADIUS authentication request	User-Name CHAP-Password (or User-Password) CHAP-Challenge NAS-IP-Address (or NAS-IPv6-Address) Service-Type Framed-Protocol

Packet type	Attributes that the type of packets carry by default
	NAS-Identifier NAS-Port-Type Acct-Session-Id
RADIUS accounting request	User-Name Acct-Status-Type NAS-IP-Address (or NAS-IPv6-Address) NAS-Identifier Acct-Session-Id Acct-Delay-Time Acct-Terminate-Cause

Restrictions and guidelines

When you perform an AAA test, follow these restrictions and guidelines:

- The device might communicate with the AAA servers incorrectly during an AAA test. Make sure no users come online or go offline during an AAA text.
- If the configuration of the specified RADIUS scheme changes, the new configuration does not affect the current AAA test. The modification will take effect in the next test.
- The system can have only one AAA test at a time. Another AAA test can be performed only after the current test finishes.

When you configure attributes to be included in or excluded from RADIUS requests, follow these restrictions and guidelines:

- Before you include an attribute that is already configured to be excluded from RADIUS requests, you must cancel the exclusion configuration by using the **undo exclude** command.
- Before you exclude an attribute that is already configured to be included in RADIUS requests, you must cancel the inclusion configuration by using the **undo include** command.

Prerequisites

Before you perform an AAA test, you must configure a RADIUS scheme that contains the RADIUS servers to be tested.

Plan the RADIUS attributes to be included in RADIUS requests. Besides the attributes carried by default, the device adds the specified attributes to RADIUS packets in the order that they are specified by using the **include** command. Additional attributes cannot be added to a RADIUS request if the length of the RADIUS request reaches 4096 bytes.

Procedure

1. (Optional.) Configure a RADIUS attribute test group:
   a. Enter system view.
      system-view
   b. Create a RADIUS attribute test group and enter its view.
      radius attribute-test-group *attr-test-group-name*
      You can create multiple RADIUS attribute test groups.
   c. Include an attribute in RADIUS requests.
      include { **accounting** | **authentication** } { **name** *attribute-name* | [**vendor** *vendor-id*] **code** *attribute-code* } **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** } value *attribute-value*

Use this command to add attributes that RADIUS requests do not carry by default to the RADIUS requests.

For an attribute that RADIUS requests carry by default, you can use this command to change its attribute value.

d. Exclude an attribute from RADIUS requests.

exclude { **accounting** | **authentication** } **name** *attribute-name*

Use this command to exclude an attribute that RADIUS requests carry by default from the RADIUS requests sent during an AAA test to help troubleshoot authentication or accounting failures.

e. Return to system view.

quit

f. Return to user view.

quit

2. Perform an AAA test in user view.

test-aaa user *user-name* **password** *password* **radius-scheme** *radius-scheme-name* [**radius-server** { *ipv4-address* | **ipv6** *ipv6-address* } *port-number*] [**chap** | **pap**] [**attribute-test-group** attr-*test-group-name*] [**trace**]

AAA configuration examples

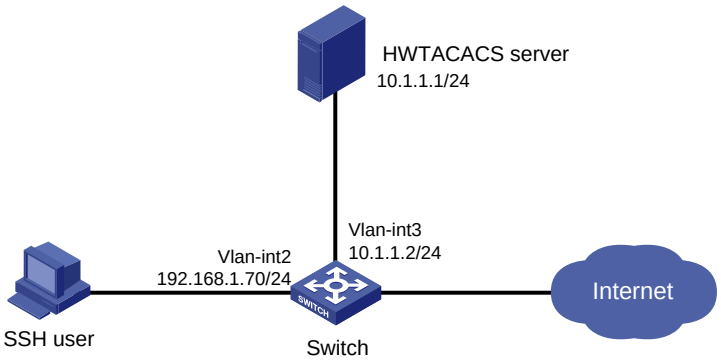
Example: Configuring AAA for SSH users by an HWTACACS server

Network configuration

As shown in Figure 11, configure the switch to meet the following requirements:

- Use the HWTACACS server for SSH user authentication, authorization, and accounting.
- Assign the default user role **network-operator** to SSH users after they pass authentication.
- Exclude domain names from the usernames sent to the HWTACACS server.
- Use **expert** as the shared keys for secure HWTACACS communication.

Figure 11 Network diagram



Configuring the HWTACACS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the switch

Configure IP addresses for the interfaces. (Details not shown.)

Create an HWTACACS scheme.

```
<Switch> system-view
[Switch] hwtacacs scheme hwtac
```

Specify the primary authentication server.

```
[Switch-hwtacacs-hwtac] primary authentication 10.1.1.1 49
```

Specify the primary authorization server.

```
[Switch-hwtacacs-hwtac] primary authorization 10.1.1.1 49
```

Specify the primary accounting server.

```
[Switch-hwtacacs-hwtac] primary accounting 10.1.1.1 49
```

Set the shared keys to **expert** in plaintext form for secure HWTACACS communication.

```
[Switch-hwtacacs-hwtac] key authentication simple expert
[Switch-hwtacacs-hwtac] key authorization simple expert
[Switch-hwtacacs-hwtac] key accounting simple expert
```

Exclude domain names from the usernames sent to the HWTACACS server.

```
[Switch-hwtacacs-hwtac] user-name-format without-domain
[Switch-hwtacacs-hwtac] quit
```

Create an ISP domain named **bbb** and configure the domain to use the HWTACACS scheme for authentication, authorization, and accounting of login users.

```
[Switch-isp-bbb] authentication login hwtacacs-scheme hwtac
[Switch-isp-bbb] authorization login hwtacacs-scheme hwtac
[Switch-isp-bbb] accounting login hwtacacs-scheme hwtac
[Switch-isp-bbb] quit
```

Create local RSA and DSA key pairs.

```
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Enable the default user role feature to assign authenticated SSH users the default user role **network-operator**.

```
[Switch] role default-role enable
```

Verifying the configuration

Initiate an SSH connection to the switch, and enter the correct username and password. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the network-operator user role. (Details not shown.)

Example: Configuring local authentication, HWTACACS authorization, and RADIUS accounting for SSH users

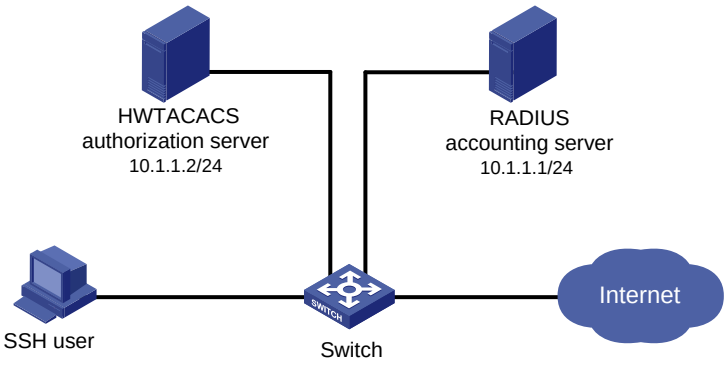
Network configuration

As shown in Figure 12, configure the switch to meet the following requirements:

- Perform local authentication for SSH users.
- Use the HWTACACS server and RADIUS server for SSH user authorization and accounting, respectively.
- Exclude domain names from the usernames sent to the servers.
- Assign the default user role **network-operator** to SSH users after they pass authentication.

Configure an account named **hello** for the SSH user. Configure the shared keys to **expert** for secure communication with the HWTACACS server and RADIUS server.

Figure 12 Network diagram



Configuring the HWTACACS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the RADIUS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Configure an HWTACACS scheme.

```
[Switch] hwtacacs scheme hwtac
```

```
[Switch-hwtacacs-hwtac] primary authorization 10.1.1.2 49
[Switch-hwtacacs-hwtac] key authorization simple expert
[Switch-hwtacacs-hwtac] user-name-format without-domain
[Switch-hwtacacs-hwtac] quit
```

Configure a RADIUS scheme.

```
[Switch] radius scheme rd
[Switch-radius-rd] primary accounting 10.1.1.1 1813
[Switch-radius-rd] key accounting simple expert
[Switch-radius-rd] user-name-format without-domain
[Switch-radius-rd] quit
```

Create a device management user.

```
[Switch] local-user hello class manage
```

Assign the SSH service to the local user.

```
[Switch-luser-manage-hello] service-type ssh
```

Set the password to **123456TESTplat&!** in plaintext form for the local user. In FIPS mode, you must set the password in interactive mode.

```
[Switch-luser-manage-hello] password simple 123456TESTplat&!
[Switch-luser-manage-hello] quit
```

Create an ISP domain named **bbb** and configure the login users to use local authentication, HWTACACS authorization, and RADIUS accounting.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login local
[Switch-isp-bbb] authorization login hwtacacs-scheme hwtac
[Switch-isp-bbb] accounting login radius-scheme rd
[Switch-isp-bbb] quit
```

Enable the default user role feature to assign authenticated SSH users the default user role **network-operator**.

```
[Switch] role default-role enable
```

Verifying the configuration

Initiate an SSH connection to the switch, and enter username **hello@bbb** and the correct password. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the network-operator user role. (Details not shown.)

Example: Configuring authentication and authorization for SSH users by a RADIUS server

Network configuration

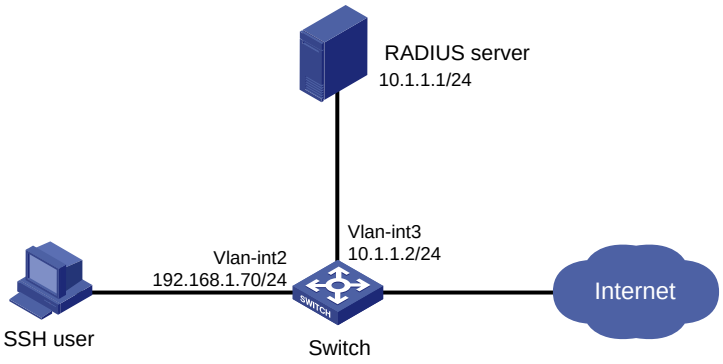
As shown in Figure 13, configure the switch to meet the following requirements:

- Use the RADIUS server for SSH user authentication and authorization.
- Include domain names in the usernames sent to the RADIUS server.
- Assign the default user role **network-operator** to SSH users after they pass authentication.

The RADIUS server runs on IMC PLAT 5.0 (E0101) and IMC UAM 5.0 (E0101). Add an account with username **hello@bbb** on the RADIUS server.

The RADIUS server and the switch use **expert** as the shared key for secure RADIUS communication. The ports for authentication and accounting are **1812** and **1813**, respectively.

Figure 13 Network diagram



Configuring the RADIUS server

1. Add the switch to the IMC Platform as an access device:

   Log in to IMC, click the **Service** tab, and select **User Access Manager** > **Access Device Management** > **Access Device** from the navigation tree. Then, click **Add** to configure an access device as follows:

   a. Set the shared key to **expert** for secure RADIUS communication.

   b. Set the ports for authentication and accounting to 1812 and 1813, respectively.

   c. Select **Device Management Service** from the **Service Type** list.

   d. Select **H3C** from the **Access Device Type** list.

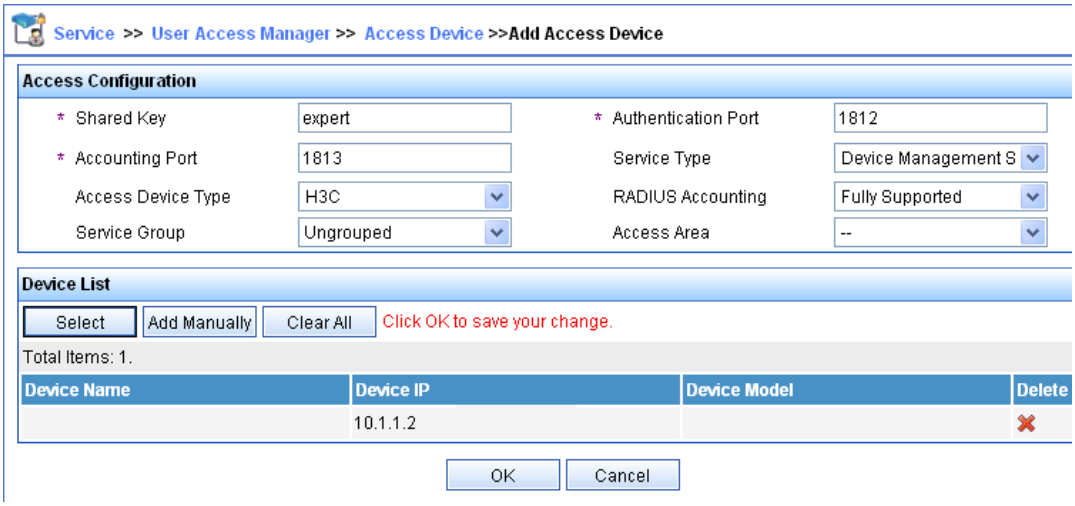
   e. Select an access device from the device list or manually add an access device. In this example, the device IP address is 10.1.1.2.

   f. Use the default values for other parameters and click **OK**.

   The IP address of the access device specified here must be the same as the source IP address of the RADIUS packets sent from the switch. The source IP address is chosen in the following order on the switch:

   - IP address specified by using the **`nas-ip`** command.
   - IP address specified by using the **`radius nas-ip`** command.
   - IP address of the outbound interface (the default).

   Figure 14 Adding the switch as an access device



2. Add an account for device management:

Click the **User** tab, and select **Access User View** > **Device Mgmt User** from the navigation tree. Then, click **Add** to configure a device management account as follows:

a. Enter account name **hello@bbb** and specify the password.

b. Select **SSH** from the **Service Type** list.

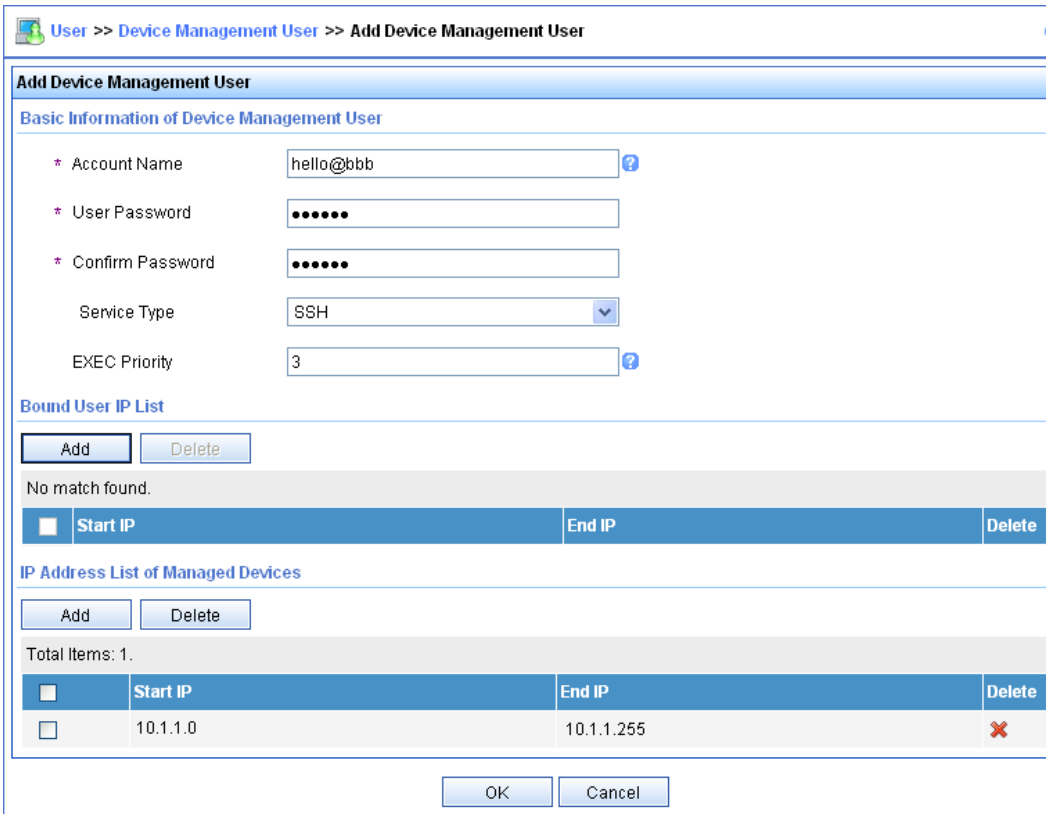
c. Specify 10.1.1.0 to 10.1.1.255 as the IP address range of the hosts to be managed.

d. Click **OK**.

NOTE:

The IP address range must contain the IP address of the switch.

Figure 15 Adding an account for device management



Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Enable the default user role feature to assign authenticated SSH users the default user role **network-operator**.

```
[Switch] role default-role enable
```

Create a RADIUS scheme.

```
[Switch] radius scheme rad
```

Specify the primary authentication server.

```
[Switch-radius-rad] primary authentication 10.1.1.1 1812
```

Set the shared key to **expert** in plaintext form for secure communication with the server.

```
[Switch-radius-rad] key authentication simple expert
```

Include domain names in the usernames sent to the RADIUS server.

```
[Switch-radius-rad] user-name-format with-domain
[Switch-radius-rad] quit
```

Create an ISP domain named **bbb** and configure authentication, authorization, and accounting methods for login users.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login radius-scheme rad
[Switch-isp-bbb] authorization login radius-scheme rad
[Switch-isp-bbb] accounting login none
[Switch-isp-bbb] quit
```

Verifying the configuration

Initiate an SSH connection to the switch, and enter username **hello@bbb** and the correct password. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the network-operator user role. (Details not shown.)

Example: Configuring authentication for SSH users by an LDAP server

Network configuration

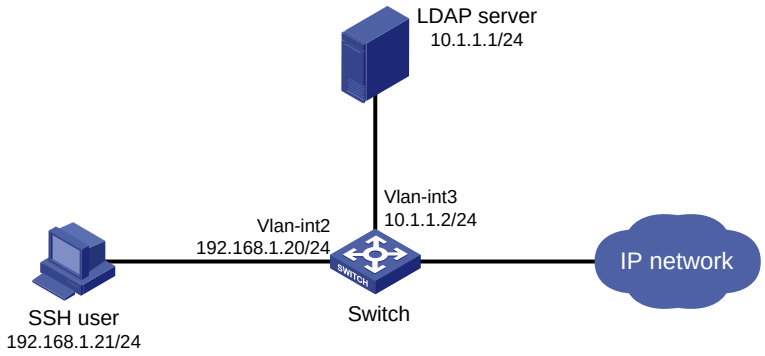
As shown in Figure 16, the LDAP server uses domain **ldap.com** and runs Microsoft Windows 2003 Server Active Directory.

Configure the switch to meet the following requirements:

- Use the LDAP server to authenticate SSH users.
- Assign the level-0 user role to SSH users after they pass authentication.

On the LDAP server, set the administrator password to **admin!123456**, add a user named **aaa**, and set the user's password to **ldap!123456**.

Figure 16 Network diagram



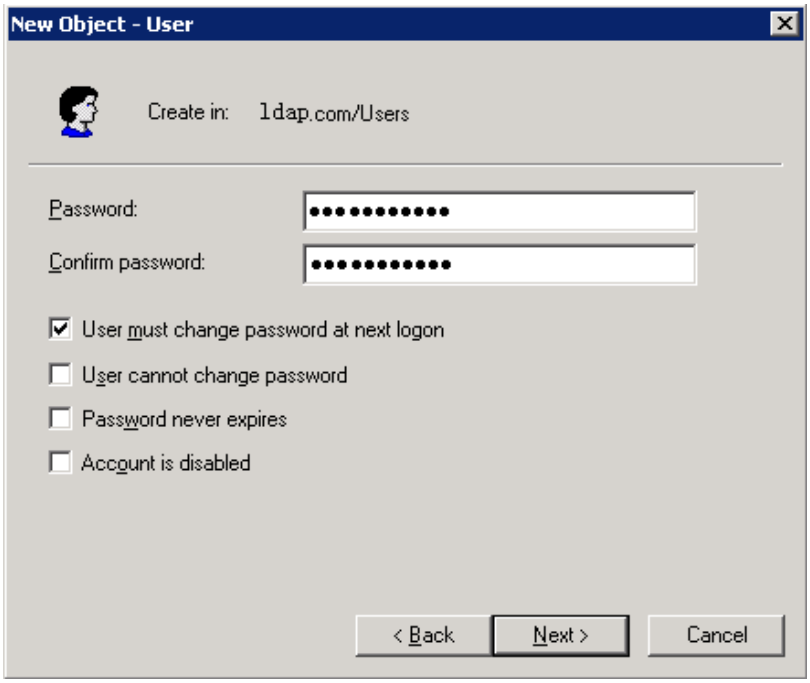
Configuring the LDAP server

1. Add a user named **aaa** and set the password to **ldap!123456**:
   a. On the LDAP server, select **Start** > **Control Panel** > **Administrative Tools**.
   b. Double-click **Active Directory Users and Computers**.
      The **Active Directory Users and Computers** window is displayed.
   c. From the navigation tree, click **Users** under the **ldap.com** node.
   d. Select **Action** > **New** > **User** from the menu to display the dialog box for adding a user.
   e. Enter logon name **aaa** and click **Next**.

      Figure 17 Adding user aaa

   f. In the dialog box, enter password **ldap!123456**, select options as needed, and click **Next**.

Figure 18 Setting the user's password



g. Click **OK**.

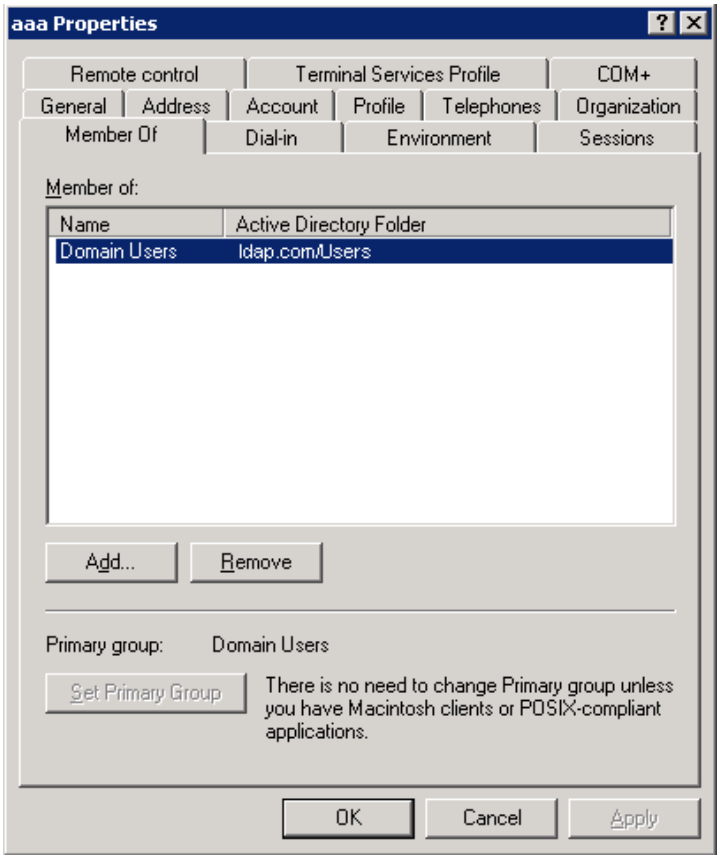
2. Add user **aaa** to group **Users**:

a. From the navigation tree, click **Users** under the **ldap.com** node.

b. In the right pane, right-click user **aaa** and select **Properties**.

c. In the dialog box, click the **Member Of** tab and click **Add**.

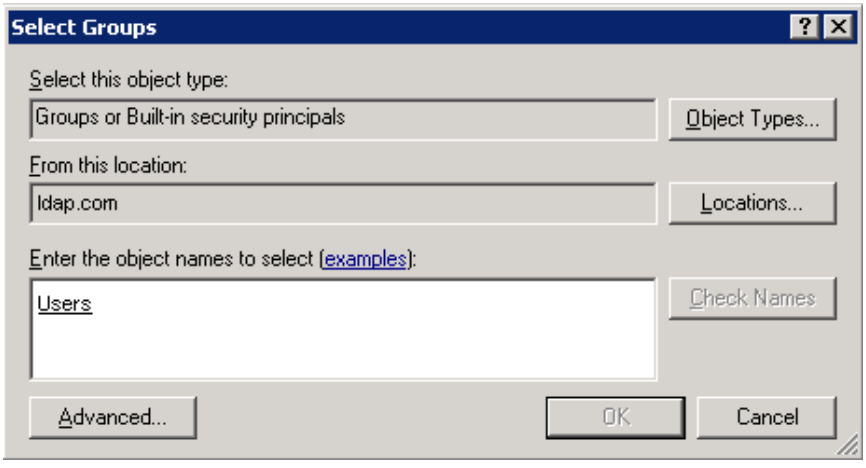
Figure 19 Modifying user properties



d. In the **Select Groups** dialog box, enter **Users** in the **Enter the object names to select** field, and click **OK**.

User **aaa** is added to group **Users**.

Figure 20 Adding user aaa to group Users



3. Set the administrator password to **admin!123456**:

a. In the right pane, right-click user **Administrator** and select **Set Password**.

b. In the dialog box, enter the administrator password. (Details not shown.)

Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Configure an LDAP server.

```
[Switch] ldap server ldap1
```

Specify the IP address of the LDAP authentication server.

```
[Switch-ldap-server-ldap1] ip 10.1.1.1
```

Specify the administrator DN.

```
[Switch-ldap-server-ldap1] login-dn cn=administrator,cn=users,dc=ldap,dc=com
```

Specify the administrator password.

```
[Switch-ldap-server-ldap1] login-password simple admin!123456
```

Configure the base DN for user search.

```
[Switch-ldap-server-ldap1] search-base-dn dc=ldap,dc=com
[Switch-ldap-server-ldap1] quit
```

Create an LDAP scheme.

```
[Switch] ldap scheme ldap-shm1
```

Specify the LDAP authentication server.

```
[Switch-ldap-ldap-shm1] authentication-server ldap1
[Switch-ldap-ldap-shm1] quit
```

Create an ISP domain named **bbb** and configure authentication, authorization, and accounting methods for login users.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login ldap-scheme ldap-shm1
[Switch-isp-bbb] authorization login none
[Switch-isp-bbb] accounting login none
[Switch-isp-bbb] quit
```

Verifying the configuration

Initiate an SSH connection to the switch, and enter username **aaa@bbb** and password **ldap!123456**. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the level-0 user role. (Details not shown.)

Example: Configuring AAA for 802.1X users by a RADIUS server

Network configuration

As shown in Figure 21, configure the switch to meet the following requirements:

- Use the RADIUS server for authentication, authorization, and accounting of 802.1X users.

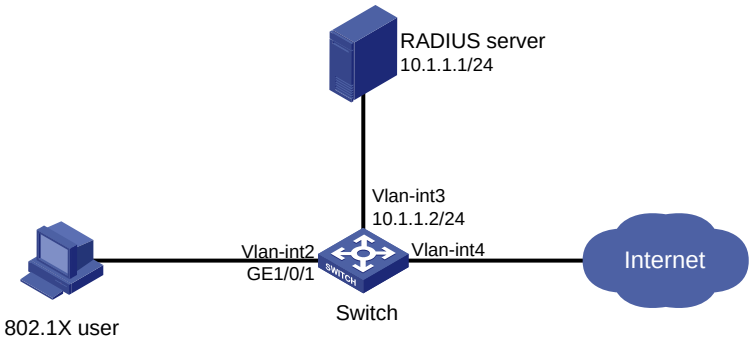
- Use MAC-based access control on GigabitEthernet 1/0/1 to authenticate all 802.1X users on the port separately.
- Include domain names in the usernames sent to the RADIUS server.

In this example, the RADIUS server runs on IMC PLAT 5.0 (E0101) and IMC UAM 5.0 (E0101). On the RADIUS server, perform the following tasks:

- Add a service that charges 120 dollars for up to 120 hours per month and assigns authenticated users to VLAN 4.
- Configure a user with name **dot1x@bbb** and assign the service to the user.

Set the shared keys to **expert** for secure RADIUS communication. Set the ports for authentication and accounting to 1812 and 1813, respectively.

Figure 21 Network diagram



Configuring the RADIUS server

1. Add the switch to the IMC Platform as an access device:

   Log in to IMC, click the **Service** tab, and select **User Access Manager** > **Access Device Management** > **Access Device** from the navigation tree. Then, click **Add** to configure an access device as follows:

   a. Set the shared key to **expert** for secure authentication and accounting communication.

   b. Set the ports for authentication and accounting to 1812 and 1813, respectively.

   c. Select **LAN Access Service** from the **Service Type** list.

   d. Select **H3C(General)** from the **Access Device Type** list.

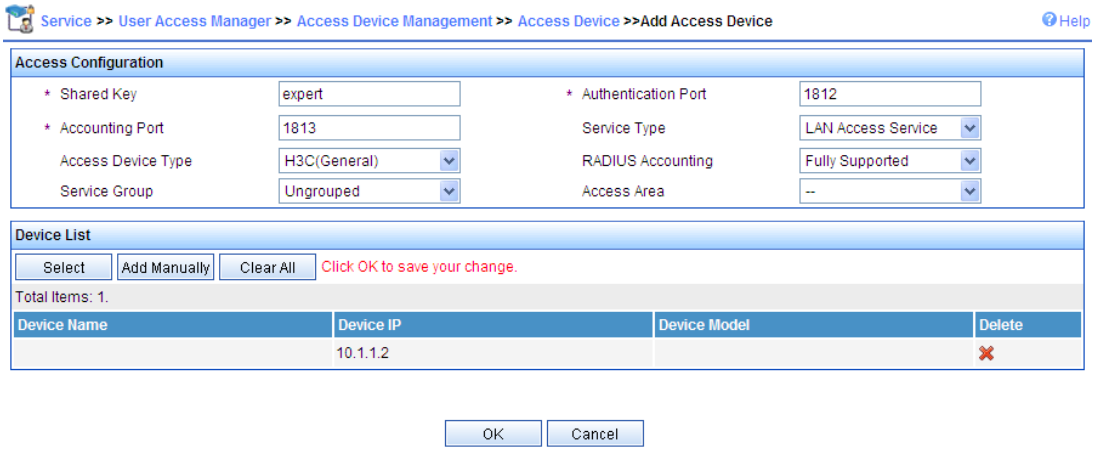
   e. Select an access device from the device list or manually add an access device. In this example, the device IP address is 10.1.1.2.

   f. Use the default values for other parameters and click **OK**.

   The IP address of the access device specified here must be the same as the source IP address of the RADIUS packets sent from the switch. The source IP address is chosen in the following order on the switch:

   - IP address specified by using the **`nas-ip`** command.
   - IP address specified by using the **`radius nas-ip`** command.
   - IP address of the outbound interface (the default).

Figure 22 Adding the switch as an access device



2. Add a charging plan:

   Click the **Service** tab, and select **Accounting Manager** > **Charging Plans** from the navigation tree to enter the charging plan configuration page. Then, click **Add** to configure a charging plan as follows:

   a. Add a plan named **UserAcct**.

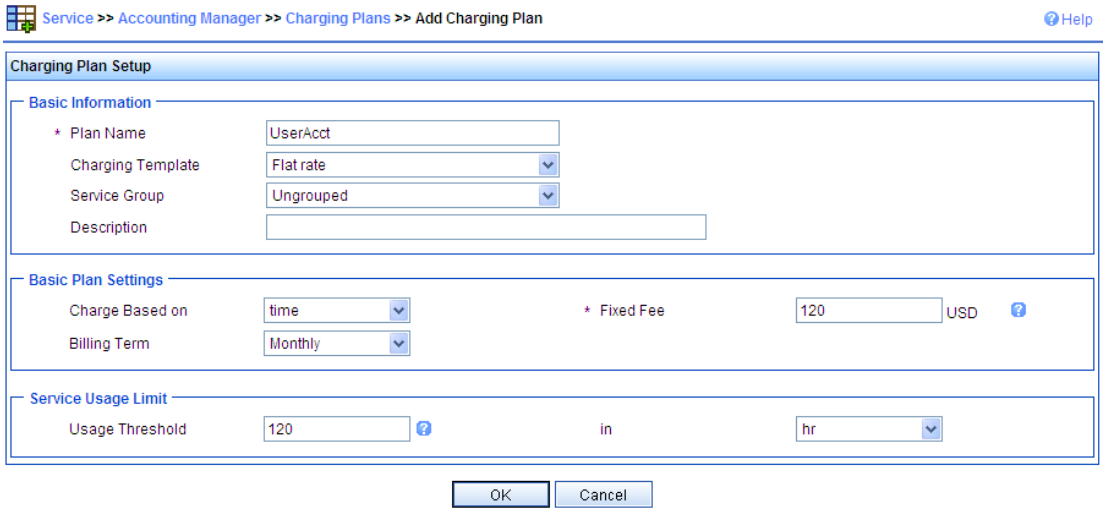
   b. Select **Flat rate** from the **Charging Template** list.

   c. Select **time** for **Charge Based on**, select **Monthly** for **Billing Term**, and enter **120** in the **Fixed Fee** field.

   d. Enter **120** in the **Usage Threshold** field and select **hr** (hours) for the **in** field. The configuration allows the user to access the Internet for up to 120 hours per month.

   e. Use the default values for other parameters and click **OK**.

Figure 23 Adding a charging plan



3. Add a service:

   Click the **Service** tab, and select **User Access Manager** > **Service Configuration** from the navigation tree. Then, click **Add** to configure a service as follows:

   a. Add a service named **Dot1x auth,** and set the service suffix to **bbb**, the authentication domain for the 802.1X user. With the service suffix configured, you must configure the access device to send usernames that include domain names to the RADIUS server.

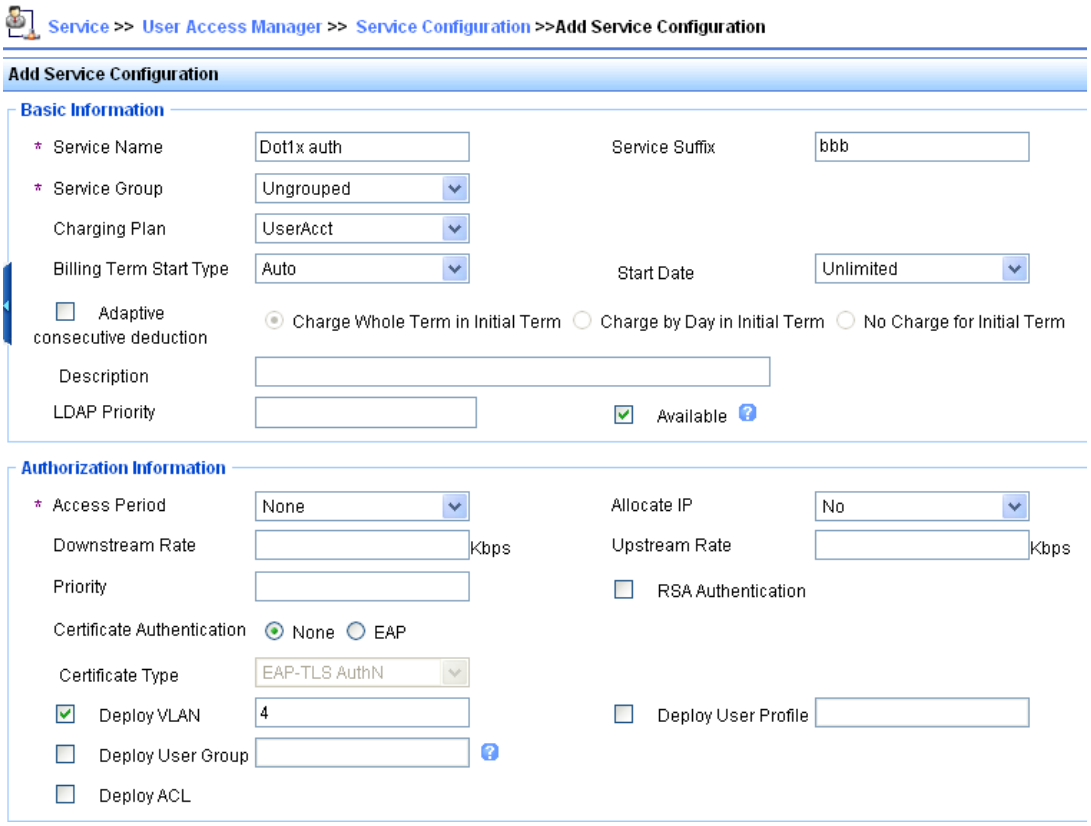
   b. Select **UserAcct** from the **Charging Plan** list.

c. Select **Deploy VLAN** and set the ID of the VLAN to be assigned to **4**.

d. Configure other parameters as needed.

e. Click **OK**.

Figure 24 Adding a service



4. Add a user:

Click the **User** tab, and select **Access User View** > **All Access Users** from the navigation tree to enter the **All Access Users** page. Then, click **Add** to configure a user as follows:

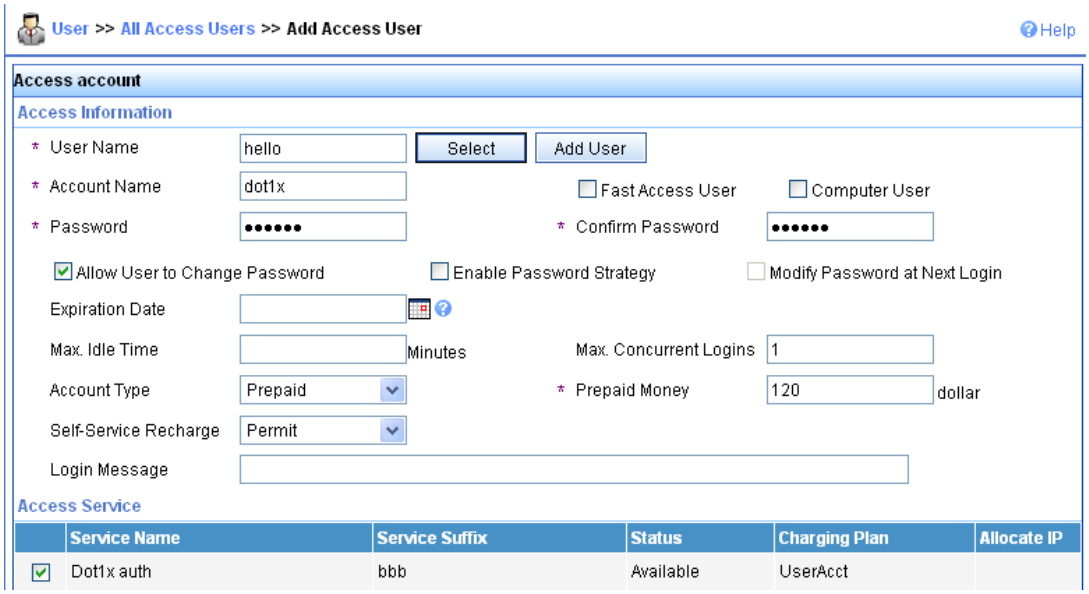
a. Select the user or add a user named **hello**.

b. Specify the account name as **dot1x** and configure the password.

c. Select **Dot1x auth** in the **Access Service** area.

d. Configure other parameters as needed and click **OK**.

Figure 25 Adding an access user account



Configuring the switch

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rad** and enter RADIUS scheme view.

   ```
   <Switch> system-view
   [Switch] radius scheme rad
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rad] primary authentication 10.1.1.1
   [Switch-radius-rad] primary accounting 10.1.1.1
   [Switch-radius-rad] key authentication simple expert
   [Switch-radius-rad] key accounting simple expert
   ```

   # Include domain names in the usernames sent to the RADIUS server.

   ```
   [Switch-radius-rad] user-name-format with-domain
   [Switch-radius-rad] quit
   ```

2. Configure an ISP domain:

   # Create an ISP domain named **bbb** and enter ISP domain view.

   ```
   [Switch] domain bbb
   ```

   # Configure the ISP domain to use RADIUS scheme **rad** for authentication, authorization, and accounting of LAN users.

   ```
   [Switch-isp-bbb] authentication lan-access radius-scheme rad
   [Switch-isp-bbb] authorization lan-access radius-scheme rad
   [Switch-isp-bbb] accounting lan-access radius-scheme rad
   [Switch-isp-bbb] quit
   ```

3. Configure 802.1X authentication:

   # Enable 802.1X globally.

   ```
   [Switch] dot1x
   ```

   # Enable 802.1X for GigabitEthernet 1/0/1.

   ```
   [Switch] interface gigabitethernet 1/0/1
   [Switch-GigabitEthernet1/0/1] dot1x
   ```

Configure the access control method. By default, an 802.1X-enabled port uses the MAC-based access control.

```
[Switch-GigabitEthernet1/0/1] dot1x port-method macbased
```

Verifying the configuration

1. On the host, use account **dot1x@bbb** to pass 802.1X authentication:

   # If the host runs the Windows XP 802.1X client, configure the network connection properties as follows:

   a. Click the **Authentication** tab of the properties window.

   b. Select the **Enable IEEE 802.1X authentication for this network** option.

   c. Select MD5 challenge as the EAP type.

   d. Click **OK**.

   The user passes authentication after entering the correct username and password on the authentication page.

   # If the host runs the iNode client, no advanced authentication options are required. The user can pass authentication after entering username **dot1x@bbb** and the correct password on the client property page.

   IMPORTANT:

   Make sure the client can update its IP address to access the resources in the authorized VLAN after passing authentication.

2. On the switch, verify that the server assigns the port connecting the client to VLAN 4 after the user passes authentication. (Details not shown.)
3. Display 802.1X connection information on the switch.

   ```
   [Switch] display dot1x connection
   ```

Example: Configuring authentication and authorization for 802.1X users by the device as a RADIUS server

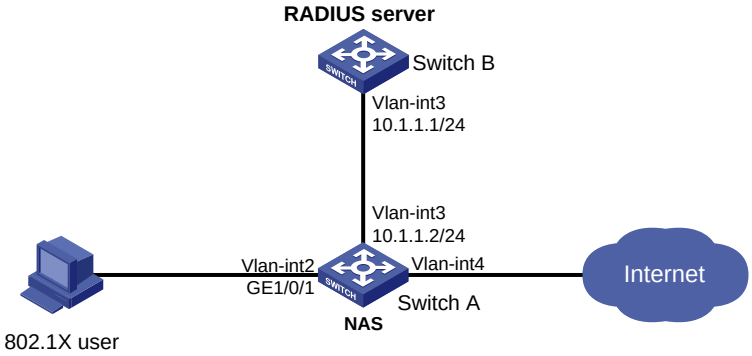
Network configuration

As shown in Figure 26, Switch B acts as the RADIUS server for authentication and authorization of 802.1X users connected to the NAS (Switch A).

Configure the switches to meet the following requirements:

- Perform 802.1X user authentication on GigabitEthernet 1/0/1 of the NAS.
- The shared key is **expert** and the authentication port is 1812.
- Exclude domain names from the usernames sent to the RADIUS server.
- The user name for 802.1X authentication is **dot1x**.
- After the user passes authentication, the RADIUS server authorizes VLAN 4 to the NAS port that the user is connecting to.

Figure 26 Network diagram



Procedure

1. Configure the NAS:
   a. Configure a RADIUS scheme:

      # Configure a RADIUS scheme named **rad** and enter RADIUS scheme view.

      ```
      <SwitchA> system-view
      [SwitchA] radius scheme rad
      ```

      # Specify the primary authentication server with IP address 10.1.1.1 and set the shared key to **expert** in plaintext form.

      ```
      [SwitchA-radius-rad] primary authentication 10.1.1.1 key simple expert
      ```

      # Exclude domain names from the usernames sent to the RADIUS server.

      ```
      [SwitchA-radius-rad] user-name-format without-domain
      [SwitchA-radius-rad] quit
      ```

   b. Configure an ISP domain:

      # Create an ISP domain named **bbb** and enter ISP domain view.

      ```
      [SwitchA] domain bbb
      ```

      # Configure the ISP domain to use RADIUS scheme **rad** for authentication and authorization of LAN users and not to perform accounting for LAN users.

      ```
      [SwitchA-isp-bbb] authentication lan-access radius-scheme rad
      [SwitchA-isp-bbb] authorization lan-access radius-scheme rad
      [SwitchA-isp-bbb] accounting lan-access none
      [SwitchA-isp-bbb] quit
      ```

   c. Configure 802.1X authentication:

      # Enable 802.1X for GigabitEthernet 1/0/1.

      ```
      [SwitchA] interface gigabitethernet 1/0/1
      [SwitchA-GigabitEthernet1/0/1] dot1x
      ```

      # Specify **bbb** as the mandatory authentication domain for 802.1X users on the interface.

      ```
      [SwitchA-GigabitEthernet1/0/1] dot1x mandatory-domain bbb
      [SwitchA-GigabitEthernet1/0/1] quit
      ```

      # Enable 802.1X globally.

      ```
      [SwitchA] dot1x
      ```

2. Configure the RADIUS server:

   # Create a network access user named **dot1x**.

   ```
   <SwitchB> system-view
   [SwitchB] local-user dot1x class network
   ```

   # Configure the password as **123456** in plaintext form.

```
[SwitchB-luser-network-dot1x] password simple 123456
```

Configure VLAN 4 as the authorization VLAN.

```
[SwitchB-luser-network-dot1x] authorization-attribute vlan 4
[SwitchB-luser-network-dot1x] quit
```

Configure the IP address of the RADIUS client as 10.1.1.2 and the shared key as **expert** in plaintext form.

```
[SwitchB] radius-server client ip 10.1.1.2 key simple expert
```

Activate the RADIUS server configuration.

```
[SwitchB] radius-server activate
```

Verifying the configuration

1. On the RADIUS server, display the activated RADIUS clients and users.

```
[SwitchB] display radius-server active-client
Total 1 RADIUS clients.
Client IP: 10.1.1.2
[SwitchB] display radius-server active-user dot1x
Total 1 RADIUS users matched.
Username: dot1x
  Description: Not configured
  Authorization attributes:
    VLAN ID: 4
    ACL number: Not configured
  Validity period:
    Expiration time: Not configured
```

2. On the host, use account **dot1x** for 802.1X authentication.

   If the host runs the Windows built-in 802.1X client, configure the network connection properties as follows:

   a. Click the **Authentication** tab of the properties window.
   b. Select the **Enable IEEE 802.1X authentication for this network** option.
   c. Select MD5 challenge as the EAP type.
   d. Click **OK**.

   If the host runs the iNode client, no advanced authentication options are required. The user passes authentication after entering the correct user name and password on the authentication page or the iNode client.

IMPORTANT:

Make sure the client can update its IP address to access the resources in the authorized VLAN after passing authentication.

3. On the NAS, verify that the RADIUS server assigns the port to VLAN 4 after the user passes authentication. (Details not shown.)
4. On the NAS, display online 802.1X user information.

```
[SwitchA] display dot1x connection
```

Troubleshooting AAA

RADIUS authentication failure

Symptom

User authentication always fails.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the RADIUS server.
- The username is not in the *userid@isp-name* format, or the ISP domain is not correctly configured on the NAS.
- The user is not configured on the RADIUS server.
- The password entered by the user is incorrect.
- The RADIUS server and the NAS are configured with different shared keys.

Solution

To resolve the problem:

1. Verify the following items:
   - The NAS and the RADIUS server can ping each other.
   - The username is in the *userid@isp-name* format and the ISP domain is correctly configured on the NAS.
   - The user is configured on the RADIUS server.
   - The correct password is entered.
   - The same shared key is configured on both the RADIUS server and the NAS.
2. If the problem persists, contact H3C Support.

RADIUS packet delivery failure

Symptom

RADIUS packets cannot reach the RADIUS server.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the RADIUS server.
- The NAS is not configured with the IP address of the RADIUS server.
- The authentication and accounting UDP ports configured on the NAS are incorrect.
- The RADIUS server's authentication and accounting port numbers are being used by other applications.

Solution

To resolve the problem:

1. Verify the following items:
   - The link between the NAS and the RADIUS server works well at both the physical and data link layers.
   - The IP address of the RADIUS server is correctly configured on the NAS.

    - The authentication and accounting UDP port numbers configured on the NAS are the same as those of the RADIUS server.
    - The RADIUS server's authentication and accounting port numbers are available.
2. If the problem persists, contact H3C Support.

RADIUS accounting error

Symptom

A user is authenticated and authorized, but accounting for the user is not normal.

Analysis

The accounting server configuration on the NAS is not correct. Possible reasons include:

- The accounting port number configured on the NAS is incorrect.
- The accounting server IP address configured on the NAS is incorrect. For example, the NAS is configured to use a single server to provide authentication, authorization, and accounting services, but in fact the services are provided by different servers.

Solution

To resolve the problem:

1. Verify the following items:
    - The accounting port number is correctly configured.
    - The accounting server IP address is correctly configured on the NAS.
2. If the problem persists, contact H3C Support.

Troubleshooting HWTACACS

Similar to RADIUS troubleshooting. See "RADIUS authentication failure," "RADIUS packet delivery failure," and "RADIUS accounting error."

LDAP authentication failure

Symptom

User authentication fails.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the LDAP server.
- The LDAP server IP address or port number configured on the NAS is not correct.
- The username is not in the *userid@isp-name* format, or the ISP domain is not correctly configured on the NAS.
- The user is not configured on the LDAP server.
- The password entered by the user is incorrect.
- The administrator DN or password is not configured.
- Some user attributes (for example, the username attribute) configured on the NAS are not consistent with those configured on the server.
- No user search base DN is specified for the LDAP scheme.

Solution

To resolve the problem:

1. Verify the following items:
   - The NAS and the LDAP server can ping each other.
   - The IP address and port number of the LDAP server configured on the NAS match those of the server.
   - The username is in the correct format and the ISP domain for the user authentication is correctly configured on the NAS.
   - The user is configured on the LDAP server.
   - The correct password is entered.
   - The administrator DN and the administrator password are correctly configured.
   - The user attributes (for example, the username attribute) configured on the NAS are consistent with those configured on the LDAP server.
   - The user search base DN for authentication is specified.
2. If the problem persists, contact H3C Support.

Appendixes

Appendix A Commonly used RADIUS attributes

Commonly used RADIUS attributes are defined in RFC 2865, RFC 2866, RFC 2867, and RFC 2868.

Table 4 Commonly used RADIUS attributes

No.	Attribute	No.	Attribute
1	User-Name	45	Acct-Authentic
2	User-Password	46	Acct-Session-Time
3	CHAP-Password	47	Acct-Input-Packets
4	NAS-IP-Address	48	Acct-Output-Packets
5	NAS-Port	49	Acct-Terminate-Cause
6	Service-Type	50	Acct-Multi-Session-Id
7	Framed-Protocol	51	Acct-Link-Count
8	Framed-IP-Address	52	Acct-Input-Gigawords
9	Framed-IP-Netmask	53	Acct-Output-Gigawords
10	Framed-Routing	54	(unassigned)
11	Filter-ID	55	Event-Timestamp
12	Framed-MTU	56-59	(unassigned)
13	Framed-Compression	60	CHAP-Challenge
14	Login-IP-Host	61	NAS-Port-Type
15	Login-Service	62	Port-Limit
16	Login-TCP-Port	63	Login-LAT-Port
17	(unassigned)	64	Tunnel-Type
18	Reply-Message	65	Tunnel-Medium-Type

No.	Attribute	No.	Attribute
19	Callback-Number	66	Tunnel-Client-Endpoint
20	Callback-ID	67	Tunnel-Server-Endpoint
21	(unassigned)	68	Acct-Tunnel-Connection
22	Framed-Route	69	Tunnel-Password
23	Framed-IPX-Network	70	ARAP-Password
24	State	71	ARAP-Features

35	Login-LAT-Node	82	Tunnel-Assignment-id
36	Login-LAT-Group	83	Tunnel-Preference
37	Framed-AppleTalk-Link	84	ARAP-Challenge-Response
38	Framed-AppleTalk-Network	85	Acct-Interim-Interval
39	Framed-AppleTalk-Zone	86	Acct-Tunnel-Packets-Lost
40	Acct-Status-Type	87	NAS-Port-Id
41	Acct-Delay-Time	88	Framed-Pool
42	Acct-Input-Octets	89	(unassigned)
43	Acct-Output-Octets	90	Tunnel-Client-Auth-id
44	Acct-Session-Id	91	Tunnel-Server-Auth-id

Appendix B Descriptions for commonly used standard RADIUS attributes

No.	Attribute	Description
1	User-Name	Name of the user to be authenticated.
2	User-Password	User password for PAP authentication, only present in Access-Request packets when PAP authentication is used.
3	CHAP-Password	Digest of the user password for CHAP authentication, only present in Access-Request packets when CHAP authentication is used.
4	NAS-IP-Address	IP address for the server to use to identify the client. Typically, a client

No.	Attribute	Description
		is identified by the IP address of its access interface. This attribute is only present in Access-Request packets.
5	NAS-Port	Physical port of the NAS that the user accesses.
6	Service-Type	Type of service that the user has requested or type of service to be provided.
7	Framed-Protocol	Encapsulation protocol for framed access.
8	Framed-IP-Address	IP address assigned to the user.
11	Filter-ID	Name of the filter list. This attribute is parsed as follows: • If the name starts with a digit, it indicates an ACL number. • If the name does not start with a digit, it indicates a user profile name.
12	Framed-MTU	MTU for the data link between the user and NAS. For example, this attribute can be used to define the maximum size of EAP packets allowed to be processed in 802.1X EAP authentication.
14	Login-IP-Host	IP address of the NAS interface that the user accesses.
15	Login-Service	Type of service that the user uses for login.
18	Reply-Message	Text to be displayed to the user, which can be used by the server to communicate information, for example, the cause of the authentication failure.
26	Vendor-Specific	Vendor-specific proprietary attribute. A packet can contain one or more proprietary attributes, each of which can contain one or more subattributes.
27	Session-Timeout	Maximum service duration for the user before termination of the session.
28	Idle-Timeout	Maximum idle time permitted for the user before termination of the session.
31	Calling-Station-Id	User identification that the NAS sends to the server. For the LAN access service provided by an H3C device, this attribute includes the MAC address of the user.
32	NAS-Identifier	Identification that the NAS uses to identify itself to the RADIUS server.
40	Acct-Status-Type	Type of the Accounting-Request packet. Possible values include: • **1**—Start. • **2**—Stop. • **3**—Interim-Update. • **4**—Reset-Charge. • **7**—Accounting-On. (Defined in the 3rd Generation Partnership Project.) • **8**—Accounting-Off. (Defined in the 3rd Generation Partnership Project.) • **9 to 14**—Reserved for tunnel accounting. • **15**—Reserved for failed.
45	Acct-Authentic	Authentication method used by the user. Possible values include: • **1**—RADIUS. • **2**—Local. • **3**—Remote.
60	CHAP-Challenge	CHAP challenge generated by the NAS for MD5 calculation during CHAP authentication.

No.	Attribute	Description
61	NAS-Port-Type	Type of the physical port of the NAS that is authenticating the user. Possible values include: • **15**—Ethernet. • **16**—Any type of ADSL. • **17**—Cable. (With cable for cable TV.) • **19**—WLAN-IEEE 802.11. • **201**—VLAN. • **202**—ATM. If the port is an ATM or Ethernet one and VLANs are implemented on it, the value of this attribute is 201.
64	Tunnel-Type	Tunneling protocols used. The value **13** represents VLAN. If the value is 13, the device interprets the Tunnel-Type, Tunnel-Medium-Type, and Tunnel-Private-Group-ID attributes as attributes to assign VLANs.
65	Tunnel-Medium-Type	Transport medium type to use for creating a tunnel. For VLAN assignment, the value must be **6** to indicate the 802 media plus Ethernet.
79	EAP-Message	Used to encapsulate EAP packets to allow RADIUS to support EAP authentication.
80	Message-Authenticator	Used for authentication and verification of authentication packets to prevent spoofing Access-Requests. This attribute is present when EAP authentication is used.
81	Tunnel-Private-Group-ID	Group ID for a tunnel session. To assign VLANs, the NAS conveys VLAN IDs by using this attribute.
87	NAS-Port-Id	String for describing the port of the NAS that is authenticating the user.
168	Framed-IPv6-Address	Server-assigned IPv6 address for the NAS to assign to the host. The address must be unique.

Appendix C RADIUS subattributes (vendor ID 25506)

Table 5 lists all RADIUS subattributes with a vendor ID of 25506. Support for these subattributes depends on the device model.

Table 5 RADIUS subattributes (vendor ID 25506)

No.	Subattribute	Description
1	Input-Peak-Rate	Peak rate in the direction from the user to the NAS, in bps.
2	Input-Average-Rate	Average rate in the direction from the user to the NAS, in bps.
3	Input-Basic-Rate	Basic rate in the direction from the user to the NAS, in bps.
4	Output-Peak-Rate	Peak rate in the direction from the NAS to the user, in bps.
5	Output-Average-Rate	Average rate in the direction from the NAS to the user, in bps.
6	Output-Basic-Rate	Basic rate in the direction from the NAS to the user, in bps.
15	Remanent_Volume	Total amount of data available for the connection, in different units for different server types.
17	ISP-ID	ISP domain where the user obtains authorization information.
20	Command	Operation for the session, used for session control. Possible

No.	Subattribute	Description
		values include: • **1**—Trigger-Request. • **2**—Terminate-Request. • **3**—SetPolicy. • **4**—Result. • **5**—PortalClear.
25	Result_Code	Result of the Trigger-Request or SetPolicy operation, zero for success and any other value for failure.
26	Connect_ID	Index of the user connection.
27	PortalURL	PADM redirect URL assigned to PPPoE users.
28	Ftp_Directory	FTP, SFTP, or SCP user working directory. When the RADIUS client acts as the FTP, SFTP, or SCP server, this attribute is used to set the working directory for an FTP, SFTP, or SCP user on the RADIUS client.
29	Exec_Privilege	EXEC user priority.
32	NAT-IP-Address	Public IP address assigned to the user when the source IP address and port are translated.
33	NAT-Start-Port	Start port number of the port range assigned to the user when the source IP address and port are translated.
34	NAT-End-Port	End port number of the port range assigned to the user when the source IP address and port are translated.
59	NAS_Startup_Timestamp	Startup time of the NAS in seconds, which is represented by the time elapsed after 00:00:00 on Jan. 1, 1970 (UTC).
60	Ip_Host_Addr	User IP address and MAC address included in authentication and accounting requests, in the format A.B.C.D hh:hh:hh:hh:hh:hh. A space is required between the IP address and the MAC address.
61	User_Notify	Information that must be sent from the server to the client transparently.
62	User_HeartBeat	Hash value assigned after an 802.1X user passes authentication, which is a 32-byte string. This attribute is stored in the user list on the NAS and verifies the handshake packets from the 802.1X user. This attribute only exists in Access-Accept and Accounting-Request packets.
98	Multicast_Receive_Group	IP address of the multicast group that the user's host joins as a receiver. This subattribute can appear multiple times in a multicast packet to indicate that the user belongs to multiple multicast groups.
100	IP6_Multicast_Receive_Group	IPv6 address of the multicast group that the user's host joins as a receiver. This subattribute can appear multiple times in a multicast packet to indicate that the user belongs to multiple multicast groups.
101	MLD-Access-Limit	Maximum number of MLD multicast groups that the user can join concurrently.
102	local-name	L2TP local tunnel name.
103	IGMP-Access-Limit	Maximum number of IGMP multicast groups that the user can join concurrently.
104	VPN-Instance	MPLS L3VPN instance to which a user belongs.

No.	Subattribute	Description
105	ANCP-Profile	ANCP profile name.
135	Client-Primary-DNS	IP address of the primary DNS server.
136	Client-Secondary-DNS	IP address of the secondary DNS server.
140	User_Group	User groups assigned after the user passes authentication. Typically, a user can belong to only one user group.
144	Acct_IPv6_Input_Octets	Bytes of IPv6 packets in the inbound direction. The measurement unit depends on the configuration on the device.
145	Acct_IPv6_Output_Octets	Bytes of IPv6 packets in the outbound direction. The measurement unit depends on the configuration on the device.
146	Acct_IPv6_Input_Packets	Number of IPv6 packets in the inbound direction. The measurement unit depends on the configuration on the device.
147	Acct_IPv6_Output_Packets	Number of IPv6 packets in the outbound direction. The measurement unit depends on the configuration on the device.
148	Acct_IPv6_Input_Gigawords	Bytes of IPv6 packets in the inbound direction. The measurement unit is 4G bytes.
149	Acct_IPv6_Output_Gigawords	Bytes of IPv6 packets in the outbound direction. The measurement unit is 4G bytes.
155	User-Roles	List of space-separated user roles.

210	Av-Pair	User-defined attribute pair. Available attribute pairs include:
		• Server-assigned voice VLAN in the format of device-traffic-class=voice.
		• Server-assigned user role in the format of shell:role=xxx.
		• Server-assigned ACL in the format of url-redirect-acl=xxx.
		• Server-assigned Web redirect URL in the format of url-redirect=xxx.
		• Server-deployed command to reboot a port, in the format of subscriber:command=bounce-host-port.
		• Server-assigned port shutdown duration in the format of bounce:seconds=xxx.
		• Server-deployed command to shut down a port, in the format of subscriber:command=disable-host-port.
		• Server-assigned MAC authentication offline detect timer (in seconds) in the format of mac-authentication: offline-detect-time=xxx. Value 0 of xxx indicates that MAC authentication offline detection is disabled.
		• Server-assigned MAC authentication offline detection flag in the format of mac-authentication: offline-detect-check=x. x has the following values:
		  ○ **0**—The device does not search for the ARP snooping entry or ND snooping entry of the MAC address.
		  ○ **1**—The device searches for the ARP snooping entry or ND snooping entry of the MAC address.
		• (Supported only in Release 6309P01 and later.) Server-assigned dynamic ACL. For more information about the format of this attribute, see "Appendix D Format of dynamic authorization ACLs." Support for this attribute in 802.1X authentication and MAC authentication depends on the device model. If the server assigns a user both this attribute and the Filter-ID attribute, the device will ignore this attribute. The device does not support using CoA messages to change the content assigned by this attribute or assign

No.	Subattribute	Description
		another ACL to the user.
230	NAS-Port-Name	Interface through which the user is connected to the NAS.
246	Auth_Detail_Result	Accounting details. The server sends Access-Accept packets with subattributes 246 and 250 in the following situations: • **1**—The subscriber charge is overdue. The subscriber is allowed to access network resources in the whitelist. If the subscriber accesses other network resources, the device redirects it to the URL specified by subattribute 250. • **2**—The broadband lease of the subscriber expires. The device redirects the subscriber to the URL specified by subattribute 250 when the subscriber requests to access webpages for the first time.
247	Input-Committed-Burst-Size	Committed burst size from the user to the NAS, in bits. The total length cannot exceed 4 bytes for this field. This subattribute must be assigned together with the Input-Average-Rate attribute.
248	Output-Committed-Burst-Size	Committed burst size from the NAS to the user, in bits. The total length cannot exceed 4 bytes for this field. This subattribute must be assigned together with the Output-Average-Rate attribute.
249	authentication-type	Authentication type. The value can be: • **1**—Intranet access authentication. • **2**—Internet access authentication. If the packet does not contain this subattribute, common authentication applies.
250	WEB-URL	Redirect URL for users.
251	Subscriber-ID	Family plan ID.
252	Subscriber-Profile	QoS policy name for the family plan of the subscriber.
255	Product_ID	Product name.

Appendix D Format of dynamic authorization ACLs

The server might assign a dynamic authorization ACL that contains multiple rules to a user in different ways:

- Assign only one Av-Pair subattribute to the user. In this subattribute, the dynamic ACL contains multiple rules separated by question marks (?).
- Assign multiple Av-Pair subattributes to the user. All the subattributes contain the same dynamic ACL and a different rule. Support for this method depends on the server model.

The format of a dynamic ACL rule is as follows:

aclrule?same?*acl-name*?*acl-type*?*ver-type*?*rule-id*?protocol=*protocol-type*?counting?dst-ip=*ip-addr*?src-ip=*ip-addr*?dst-port=*port-value*?src-port=*port-value*?action=*action-type*

The fields in the rule are described in Table 6. The following is an example of a dynamic ACL rule:

aclrule?same?test?1?1?1?protocol=3?counting?dst-ip=1.1.1.1/1.1.1.1?src-ip=1.1.1.1/0?dst-port=1.2000?src-port=5.2000-3000?action=1

Table 6 Fields in a dynamic ACL rule

Field	Description	Remarks
aclrule	Indicates that the following part is information about a dynamic ACL rule.	Required.
same	Indicates that the current user will inherit the dynamic ACL rules that have been successfully assigned to another authenticated user. If the server assigns one user the same dynamic ACL as another user but the rules are different for the two users, the device applies the dynamic ACL rules of the user that comes online first to the other user.	Required.
acl-name	ACL name, a case-insensitive string of 1 to 63 characters. The ACL name must begin with a letter and it cannot be **all** or the same as an existing static ACL on the device.	Required.
acl-type	ACL type. **1** indicates an advanced ACL. In the current software version, only advanced ACLs are supported.	Required.
ver-type	IP protocol type: • **1**—IPv4. • **2**—IPv6.	Required.
rule-id	ACL rule number, in the range of 0 to 65534.	Required.
protocol-type	Protocol type: • **1**—IP. • **2**—ICMP. • **3**—TCP. • **4**—UDP. • **5**—ICMPv6. • **6**—IPv6.	Optional.
counting	Indicates that rule match statistics is enabled. If a rule does not include this field, rule match statistics is disabled for the rule.	Optional.
ip-addr	IP address information. For example, 1.1.1.1/1.1.1.1, 1.1.1.1/0, or 3::3/128. If the value is **any**, the rule matches any IP address.	Optional.

port-value	TCP or UDP port information, in the *X*.*YYY* format.
	• ***X***—Operator.
	  ○ **1**—Equal to.
	  ○ **2**—Greater than.
	  ○ **3**—Smaller than.
	  ○ **4**—Not equal to.
	  ○ **5**—In the range of.
	• ***YYY***—Port number information.
	For example, 1.3000 and 5.2000-3000.
		Optional.

action-type	Action type: • **1**—Deny. • **2**—Permit.	Optional.

The following restrictions apply to dynamic authorization ACLs:

- For the former six fields (aclrule?same?*acl-name*?*acl-type*?*ver-type*?*rule-id*) of a dynamic ACL rule, their positions are fixed. The device cannot interpret a dynamic ACL rule if the positions of the six fields are changed. For the other fields, position changes are allowed.

- The settings for all the fields in the rules must meet the configuration logic of ACL rules on the device so the device can correctly interpret the rules.
- All dynamic ACL rules in one authorization must belong to the same ACL name.
- A dynamic ACL must have rules and the format of the rules must be valid.

Contents

802.1X overview

About the 802.1X protocol

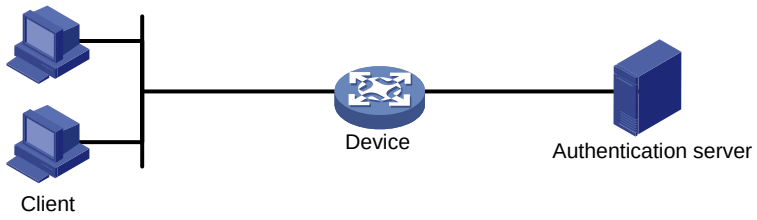
802.1X is a port-based network access control protocol widely used on Ethernet networks. The protocol controls network access by authenticating the devices connected to 802.1X-enabled LAN ports.

802.1X architecture

802.1X operates in the client/server model. As shown in Figure 1, 802.1X authentication includes the following entities:

- **Client (supplicant)**—A user terminal seeking access to the LAN. The terminal must have 802.1X software to authenticate to the access device.
- **Access device (authenticator)**—Authenticates the client to control access to the LAN. In a typical 802.1X environment, the access device uses an authentication server to perform authentication.
- **Authentication server**—Provides authentication services for the access device. The authentication server first authenticates 802.1X clients by using the data sent from the access device. Then, the server returns the authentication results to the access device to make access decisions. The authentication server is typically a RADIUS server. In a small LAN, you can use the access device as the authentication server.

Figure 1 802.1X architecture

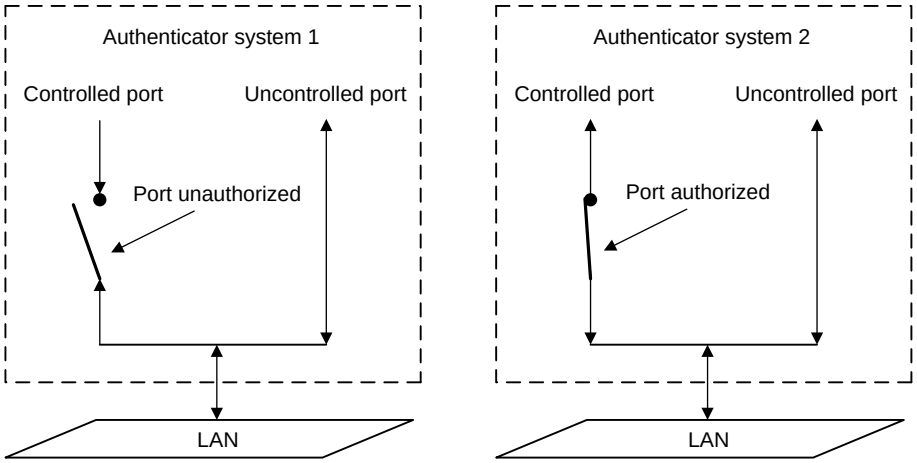


Controlled/uncontrolled port and port authorization status

802.1X defines two logical ports for the network access port: controlled port and uncontrolled port. Any packet arriving at the network access port is visible to both logical ports.

- **Uncontrolled port**—Is always open to receive and transmit authentication packets.
- **Controlled port**—Filters packets depending on the port state.
  - **Authorized state**—The controlled port is in authorized state when the client has passed authentication. The port allows traffic to pass through.
  - **Unauthorized state**—The port is in unauthorized state when the client has failed authentication. The port controls traffic by using one of the following methods:
    - Performs bidirectional traffic control to deny traffic to and from the client.
    - Performs unidirectional traffic control to deny traffic from the client. The device supports only unidirectional traffic control.

Figure 2 Authorization state of a controlled port



Packet exchange methods

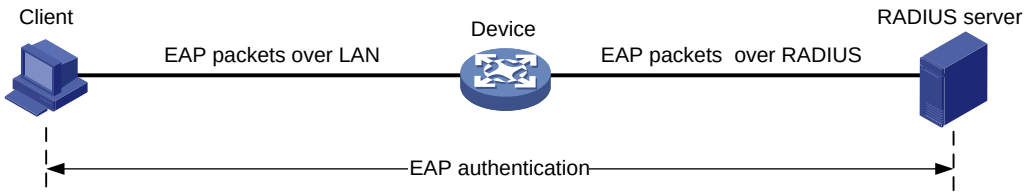
802.1X uses the Extensible Authentication Protocol (EAP) to transport authentication information for the client, the access device, and the authentication server. EAP is an authentication framework that uses the client/server model. The framework supports a variety of authentication methods, including MD5-Challenge, EAP-Transport Layer Security (EAP-TLS), and Protected EAP (PEAP).

802.1X defines EAP over LAN (EAPOL) for passing EAP packets between the client and the access device over a wired or wireless LAN. Between the access device and the authentication server, 802.1X delivers authentication information by either EAP relay or EAP termination.

EAP relay

EAP relay is defined in IEEE 802.1X. In this mode, the network device uses EAP over RADIUS (EAPOR) packets to send authentication information to the RADIUS server, as shown in Figure 3.

Figure 3 EAP relay



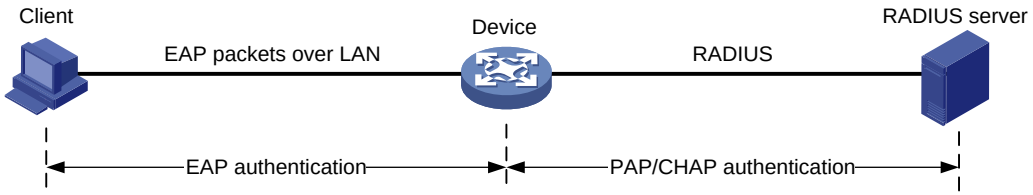
In EAP relay mode, the client must use the same authentication method as the RADIUS server. On the access device, you only need to use the **dot1x authentication-method eap** command to enable EAP relay.

EAP termination

As shown in Figure 4, the access device performs the following operations in EAP termination mode:

1. Terminates the EAP packets received from the client.
2. Encapsulates the client authentication information in standard RADIUS packets.
3. Uses PAP or CHAP to authenticate to the RADIUS server.

Figure 4 EAP termination



Comparing EAP relay and EAP termination

Packet exchange method	Benefits	Limitations
EAP relay	• Supports various EAP authentication methods. • The configuration and processing are simple on the access device.	The RADIUS server must support the EAP-Message and Message-Authenticator attributes, and the EAP authentication method used by the client.

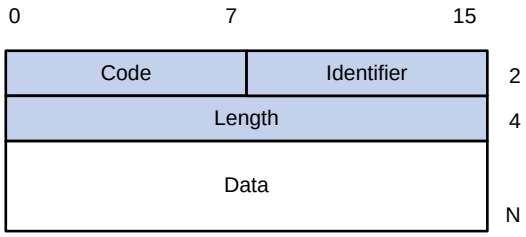
EAP termination	Works with any RADIUS server that supports PAP or CHAP authentication.	• Supports only the following EAP authentication methods:
		  ○ MD5-Challenge EAP authentication.
		  ○ The username and password EAP authentication initiated by an iNode 802.1X client.
		• The processing is complex on the access device.

Packet formats

EAP packet format

Figure 5 shows the EAP packet format.

Figure 5 EAP packet format

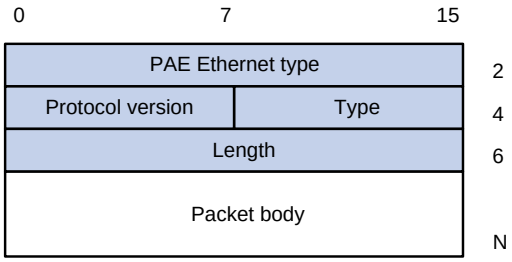


- **Code**—Type of the EAP packet. Options include Request (1), Response (2), Success (3), or Failure (4).
- **Identifier**—Used for matching Responses with Requests.
- **Length**—Length (in bytes) of the EAP packet. The EAP packet length is the sum of the Code, Identifier, Length, and Data fields.
- **Data**—Content of the EAP packet. This field appears only in a Request or Response EAP packet. The **Data** field contains the request type (or the response type) and the type data. Type 1 (Identity) and type 4 (MD5-Challenge) are two examples for the type field.

EAPOL packet format

Figure 6 shows the EAPOL packet format.

Figure 6 EAPOL packet format



- **PAE Ethernet type**—Protocol type. It takes the value 0x888E for EAPOL.
- **Protocol version**—The EAPOL protocol version used by the EAPOL packet sender.
- **Type**—Type of the EAPOL packet. Table 1 lists the types of EAPOL packets supported by the 802.1X implementation of the device.

  Table 1 Types of EAPOL packets

Value	Type	Description
0x00	EAP-Packet	The client and the access device uses EAP-Packets to transport authentication information.
0x01	EAPOL-Start	The client sends an EAPOL-Start message to initiate 802.1X authentication to the access device.
0x02	EAPOL-Logoff	The client sends an EAPOL-Logoff message to tell the access device that the client is logging off.

- **Length**—Data length in bytes, or length of the Packet body. If packet type is EAPOL-Start or EAPOL-Logoff, this field is set to 0, and no Packet body field follows.
- **Packet body**—Content of the packet. When the EAPOL packet type is EAP-Packet, the Packet body field contains an EAP packet.

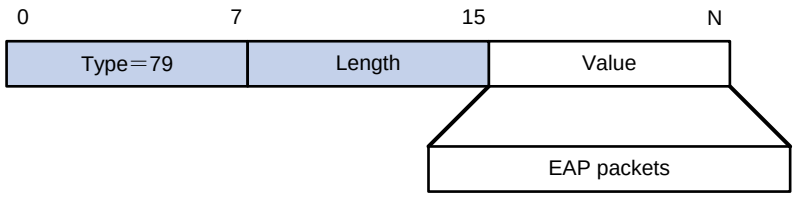
EAP over RADIUS

RADIUS adds two attributes, EAP-Message and Message-Authenticator, for supporting EAP authentication. For the RADIUS packet format, see "Configuring AAA."

- EAP-Message.

  RADIUS encapsulates EAP packets in the EAP-Message attribute, as shown in Figure 7. The Type field takes 79, and the Value field can be up to 253 bytes. If an EAP packet is longer than 253 bytes, RADIUS encapsulates it in multiple EAP-Message attributes.

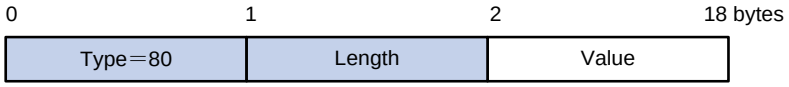
  Figure 7 EAP-Message attribute format



- Message-Authenticator.

  As shown in Figure 8, RADIUS includes the Message-Authenticator attribute in all packets that have an EAP-Message attribute to check their integrity. The packet receiver drops the packet if the calculated packet integrity checksum is different from the Message-Authenticator attribute value. The Message-Authenticator prevents EAP authentication packets from being tampered with during EAP authentication.

Figure 8 Message-Authenticator attribute format



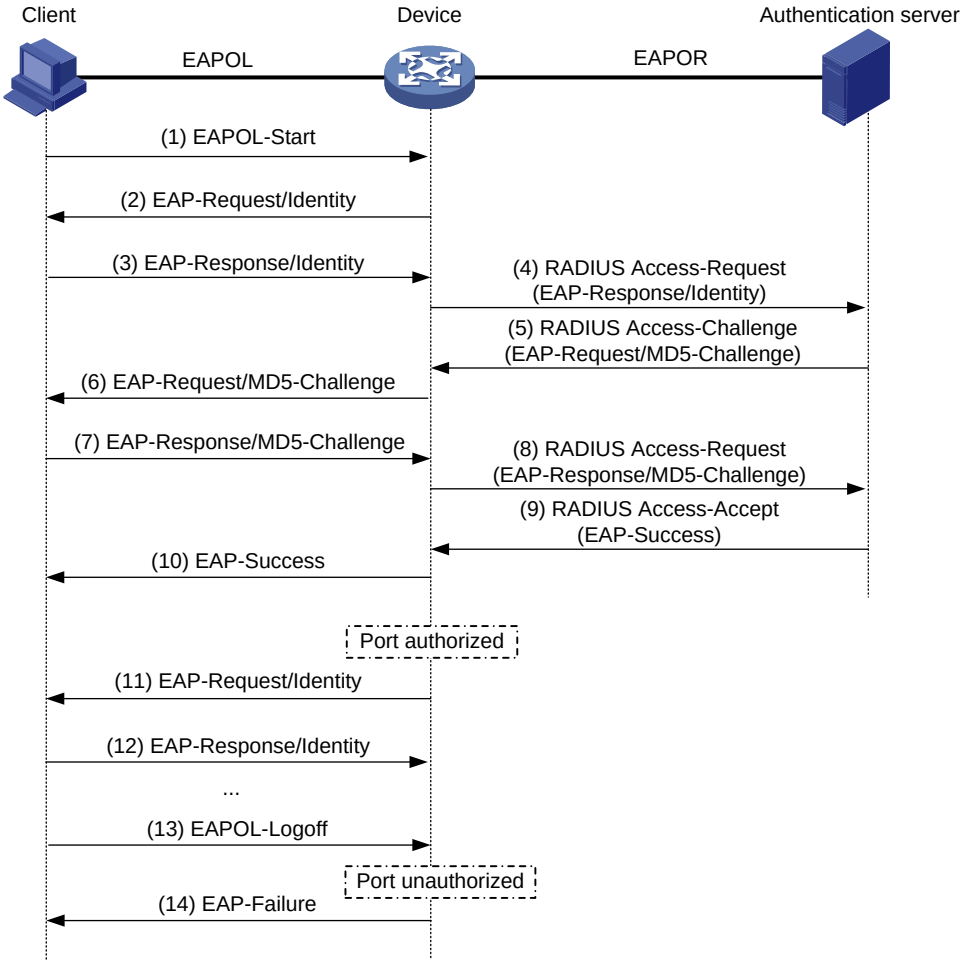
802.1X authentication procedures

802.1X authentication has two methods: EAP relay and EAP termination. You choose either mode depending on support of the RADIUS server for EAP packets and EAP authentication methods.

EAP relay

Figure 9 shows the basic 802.1X authentication procedure in EAP relay mode, assuming that MD5-Challenge EAP authentication is used.

Figure 9 802.1X authentication procedure in EAP relay mode



The following steps describe the 802.1X authentication procedure:

1. When a user launches the 802.1X client and enters a registered username and password, the 802.1X client sends an EAPOL-Start packet to the access device.
2. The access device responds with an EAP-Request/Identity packet to ask for the client username.
3. In response to the EAP-Request/Identity packet, the client sends the username in an EAP-Response/Identity packet to the access device.

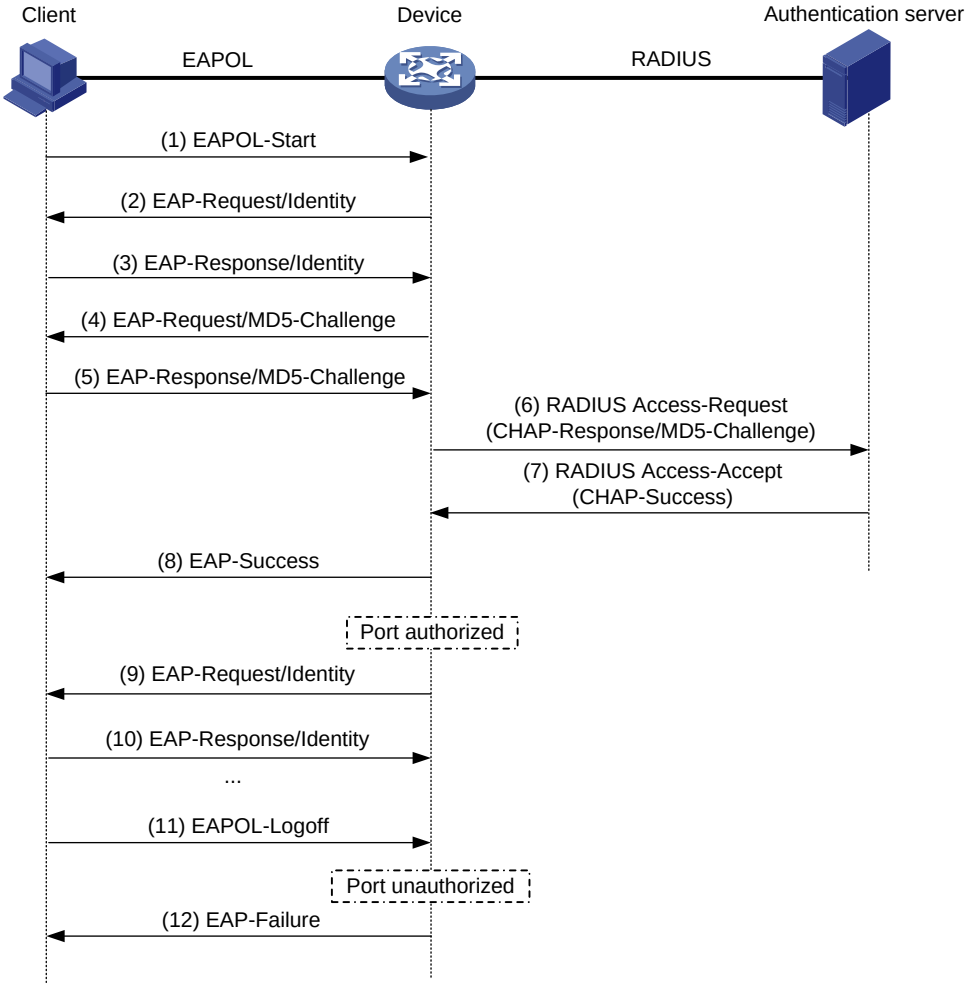
4. The access device relays the EAP-Response/Identity packet in a RADIUS Access-Request packet to the authentication server.
5. The authentication server uses the identity information in the RADIUS Access-Request to search its user database. If a matching entry is found, the server uses a randomly generated challenge (EAP-Request/MD5-Challenge) to encrypt the password in the entry. Then, the server sends the challenge in a RADIUS Access-Challenge packet to the access device.
6. The access device transmits the EAP-Request/MD5-Challenge packet to the client.
7. The client uses the received challenge to encrypt the password, and sends the encrypted password in an EAP-Response/MD5-Challenge packet to the access device.
8. The access device relays the EAP-Response/MD5-Challenge packet in a RADIUS Access-Request packet to the authentication server.
9. The authentication server compares the received encrypted password with the encrypted password it generated at step 5. If the two passwords are identical, the server considers the client valid and sends a RADIUS Access-Accept packet to the access device.
10. Upon receiving the RADIUS Access-Accept packet, the access device performs the following operations:
    a. Sends an EAP-Success packet to the client.
    b. Sets the controlled port in authorized state.

    The client can access the network.
11. After the client comes online, the access device periodically sends handshake requests to check whether the client is still online. By default, if two consecutive handshake attempts fail, the device logs off the client.
12. Upon receiving a handshake request, the client returns a response. If the client fails to return a response after a number of consecutive handshake attempts (two by default), the access device logs off the client. This handshake mechanism enables timely release of the network resources used by 802.1X users that have abnormally gone offline.
13. The client can also send an EAPOL-Logoff packet to ask the access device for a logoff.
14. In response to the EAPOL-Logoff packet, the access device changes the status of the controlled port from authorized to unauthorized. Then, the access device sends an EAP-Failure packet to the client.

EAP termination

Figure 10 shows the basic 802.1X authentication procedure in EAP termination mode, assuming that CHAP authentication is used.

Figure 10 802.1X authentication procedure in EAP termination mode



In EAP termination mode, the access device rather than the authentication server generates an MD5 challenge for password encryption. The access device then sends the MD5 challenge together with the username and encrypted password in a standard RADIUS packet to the RADIUS server.

802.1X authentication initiation

Both the 802.1X client and the access device can initiate 802.1X authentication.

802.1X client as the initiator

The client sends an EAPOL-Start packet to the access device to initiate 802.1X authentication. The destination MAC address of the packet is the IEEE 802.1X specified multicast address 01-80-C2-00-00-03 or the broadcast MAC address. If any intermediate device between the client and the authentication server does not support the multicast address, you must use an 802.1X client that can send broadcast EAPOL-Start packets. For example, you can use the iNode 802.1X client.

Access device as the initiator

If the client cannot send EAPOL-Start packets, configure the access device to initiate authentication. One example is the 802.1X client available with Windows XP.

The access device supports the following modes:

- **Multicast trigger mode**—The access device multicasts EAP-Request/Identity packets to initiate 802.1X authentication at the identity request interval.

- **Unicast trigger mode**—Upon receiving a frame from an unknown MAC address, the access device sends an EAP-Request/Identity packet out of the receiving port to the MAC address. The device retransmits the packet if no response has been received within the identity request timeout interval. This process continues until the maximum number of request attempts set by using the **`dot1x retry`** command is reached.

The username request timeout timer sets both the identity request interval for the multicast trigger and the identity request timeout interval for the unicast trigger.

Access control methods

H3C implements port-based access control as defined in the 802.1X protocol, and extends the protocol to support MAC-based access control.

- **Port-based access control**—Once an 802.1X user passes authentication on a port, any subsequent user can access the network through the port without authentication. When the authenticated user logs off, all other users are logged off.
- **MAC-based access control**—Each user is separately authenticated on a port. When a user logs off, no other online users are affected.

802.1X VLAN manipulation

Authorization VLAN

The authorization VLAN controls the access of an 802.1X user to authorized network resources. The device supports authorization VLANs assigned locally or by a remote server.

IMPORTANT:

Only remote servers can assign tagged authorization VLANs.

Remote VLAN authorization

In remote VLAN authorization, you must configure an authorization VLAN for a user on the remote server. After the user authenticates to the server, the server assigns authorization VLAN information to the device. Then, the device assigns the user access port to the authorization VLAN as a tagged or untagged member.

The device supports assignment of the following authorization VLAN information by the remote server:

- VLAN ID.
- VLAN name, which must be the same as the VLAN description on the access device.
- A string of VLAN IDs and VLAN names.

  In the string, some VLANs are represented by their IDs, and some VLANs are represented by their names.
- VLAN group name.

  For more information about VLAN groups, see *Layer 2—LAN Switching Configuration Guide*.
- VLAN ID with a suffix of **t** or **u**.

  The **t** and **u** suffixes require the device to assign the access port to the VLAN as a tagged or untagged member, respectively. For example, **2u** indicates assigning the port to VLAN 2 as an untagged member.

If a VLAN name or VLAN group name is assigned, the device converts the information into a VLAN ID before VLAN assignment.

IMPORTANT:

For a VLAN represented by its VLAN name to be assigned successfully, you must make sure the VLAN has been created on the device.

To assign VLAN IDs with suffixes, make sure the user access port is a hybrid or trunk port that performs port-based access control.

To ensure a successful assignment, the authorization VLANs assigned by the remote server cannot be any of the following types:

- Dynamically learned VLANs.
- Reserved VLANs.
- Private VLANs.

If the server assigns a group of VLANs, the access device selects a VLAN as described in Table 2.

Table 2 Authorization VLAN selection from a group of VLANs

VLAN information	Authorization VLAN selection

VLAN IDs
VLAN names
VLAN group name
VLAN IDs and VLAN names
	If the 802.1X-enabled port performs MAC-based access control, the device selects an authorization VLAN from the VLAN group for a user according to the following rules:
	• On a hybrid port with MAC-based VLAN enabled:
	  ○ If the port does not have online users, the device selects the VLAN with the lowest ID.
	  ○ If the port has online users, the device selects the VLAN that has the fewest online users. If two VLANs have the same number of online 802.1X users, the device selects the VLAN with the lower ID.
	• On an access, trunk, or MAC-based VLAN disabled hybrid port:
	  ○ If the port does not have online users, the device selects the VLAN with the lowest ID.
	  ○ If the port has online users, the device examines the VLAN group for the VLAN of the online users. If the VLAN is found, the VLAN is assigned to the user as the authorization VLAN. If the VLAN is not found, VLAN authorization fails.
	If the 802.1X-enabled port performs port-based access control, the device selects the VLAN with the lowest ID from the VLAN group. All subsequent 802.1X users are assigned to that VLAN.

VLAN IDs with suffixes	**1.** The device selects the leftmost VLAN ID without a suffix, or the leftmost VLAN ID suffixed by **u** as an untagged VLAN, whichever is more leftmost. **2.** The device assigns the untagged VLAN to the port as the PVID, and it assigns the remaining as tagged VLANs. If no untagged VLAN is assigned, the PVID of the port does not change. The port permits traffic from these tagged and untagged VLANs to pass through. For example, the authentication server sends the string **1u 2t 3** to the access device for a user. The device assigns VLAN 1 as an untagged VLAN and all remaining VLANs (including VLAN 3) as tagged VLANs. VLAN 1 becomes the PVID.

In Release 6318P01 and later, the device includes the User-VLAN-ID attribute in RADIUS accounting requests to inform the RADIUS server of the authorization VLAN assigned to 802.1X users. The RADIUS server can then include user authorization VLAN information in its logs about 802.1X users.

- If the RADIUS server assigns a VLAN ID or VLAN name as the authorization VLAN to a user, the device includes the server-assigned authorization VLAN in the User-VLAN-ID attribute.

- If the RADIUS server assigns a group of VLANs in the authorization VLAN information to a user, the device includes a VLAN in the User-VLAN-ID attribute as described in Table 3.

Table 3 Including a VLAN in the User-VLAN-ID attribute of RADIUS accounting packets

VLAN information	VLAN in the User-VLAN-ID attribute
VLAN IDs VLAN names VLAN group name VLAN IDs and VLAN names	• If the device has selected an authorization VLAN when it starts accounting for the user, it includes the selected VLAN in the User-VLAN-ID attribute. The VLAN will be included in start-accounting, real-time accounting, and stop-accounting request packets. • If the device has not selected an authorization VLAN when it starts accounting for the user, it includes the user's initial VLAN in the User-VLAN-ID attribute in start-accounting request packets. When sending real-time accounting or stop-accounting request packets, the device includes the assigned authorization VLAN in the User-VLAN-ID attribute.
VLAN IDs with suffixes	The device includes the untagged authorization VLAN in the User-VLAN-ID attribute in RADIUS accounting request packets. If no untagged authorization VLAN is available, the device includes the user's initial VLAN in the User-VLAN-ID attribute in RADIUS accounting request packets.

Local VLAN authorization

To perform local VLAN authorization for a user, specify the VLAN ID in the authorization attribute list of the local user account for that user. For each local user, you can specify only one authorization VLAN ID. The user access port is assigned to the VLAN as an untagged member.

IMPORTANT:

Local VLAN authorization does not support assignment of tagged VLANs.

For more information about local user configuration, see "Configuring AAA."

Authorization VLAN manipulation on an 802.1X-enabled port

Table 4 describes how the access device handles VLANs (except for the VLANs specified with suffixes) on an 802.1X-enabled port.

Table 4 VLAN manipulation

Port access control method	VLAN manipulation
Port-based	The device assigns the port to the first authenticated user's authorization VLAN. All subsequent 802.1X users can access the VLAN without authentication. If the authorization VLAN has the untagged attribute, the device assigns the port to the authorization VLAN as an untagged member and sets the VLAN as the PVID. If the authorization VLAN has the tagged attribute, the device assigns the port to the VLAN as a tagged member without changing the PVID. **NOTE:** The tagged attribute is supported only on trunk and hybrid ports.
MAC-based	On a hybrid port with MAC-based VLAN enabled, the device maps the MAC address of each user to its own authorization VLAN. The PVID of the port does not change. On an access, trunk, or MAC-based VLAN disabled hybrid port: • The device assigns the port to the first authenticated user's

Port access control method	VLAN manipulation
	authorization VLAN and sets the VLAN as the PVID if that authorization VLAN has the untagged attribute. • If the authorization VLAN has the tagged attribute, the device assigns the port to the authorization VLAN without changing its PVID.

IMPORTANT:

- If the users are attached to a port whose link type is access, make sure the authorization VLAN assigned by the server has the untagged attribute. VLAN assignment will fail if the server issues a VLAN that has the tagged attribute.
- When you assign VLANs to users attached to a trunk port or a MAC-based VLAN disabled hybrid port, make sure there is only one untagged VLAN. If a different untagged VLAN is assigned to a subsequent user, the user cannot pass authentication.
- As a best practice to enhance network security, do not use the **`port hybrid vlan`** command to assign a hybrid port to an authorization VLAN as a tagged member.

The VLAN assigned by the server to a user as an authorization VLAN might have been configured on the user access port but with a different tagging mode. For example, the server assigns an authorization VLAN with the tagged attribute, but the same VLAN configured on the port has the untagged attribute. In this situation, the VLAN settings that take effect on the user depend on the link type of the port.

- If the link type of the port is access or trunk, the authorization VLAN settings assigned by the server always take effect on the user as long as the user is online. After the user goes offline, the VLAN settings on the port take effect.
- If the link type of the port is hybrid, the VLAN settings configured on the port take effect. For example, the server assigns VLAN 30 with the untagged attribute to a user on the hybrid port. However, VLAN 30 has been configured on the port with the tagged attribute by using the **`port hybrid vlan tagged`** command. Finally, the VLAN has the tagged attribute on the port.

For an 802.1X authenticated user to access the network on a hybrid port when no authorization VLAN is configured for the user, perform one of the following tasks:

- If the port receives tagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as a tagged member in the VLAN.
- If the port receives untagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as an untagged member in the VLAN.

On a port with periodic online user reauthentication enabled, the MAC-based VLAN feature does not take effect on a user that has been online since before this feature was enabled. The access device creates a MAC-to-VLAN mapping for the user when the following requirements are met:

- The user passes reauthentication.
- The authorization VLAN for the user is changed.

For more information about VLAN configuration and MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Guest VLAN

The 802.1X guest VLAN on a port accommodates users that have not performed 802.1X authentication. Users in the guest VLAN can access a limited set of network resources, such as a software server, to download antivirus software and system patches. Once a user in the guest VLAN passes 802.1X authentication, it is removed from the guest VLAN and can access authorized network resources.

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the 802.1X-enabled port when the port is in auto state.	The device assigns the port to the 802.1X guest VLAN. All 802.1X users on this port can access only resources in the guest VLAN. The guest VLAN assignment varies by port link mode. For more information, see Table 4 in "Authorization VLAN."
A user in the 802.1X guest VLAN fails 802.1X authentication.	If an 802.1X Auth-Fail VLAN is available, the device assigns the port to the Auth-Fail VLAN. All users on this port can access only resources in the Auth-Fail VLAN. If no Auth-Fail VLAN is configured, the port is still in the 802.1X guest VLAN. All users on the port are in the guest VLAN. For information about the 802.1X Auth-Fail VLAN, see "Auth-Fail VLAN."
A user in the 802.1X guest VLAN passes 802.1X authentication.	The device removes the port from the 802.1X guest VLAN and assigns the port to the authorization VLAN of the user. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to the initial port VLAN. After the user logs off, the port is assigned to the guest VLAN again. **NOTE:** The initial PVID of an 802.1X-enabled port refers to the PVID used by the port before the port is assigned to any 802.1X VLANs.

IMPORTANT:

When the port receives a packet with a VLAN tag, the packet will be forwarded within the tagged VLAN if the VLAN is not the guest VLAN.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the 802.1X-enabled port and has not performed 802.1X authentication.	The device creates a mapping between the MAC address of the user and the 802.1X guest VLAN. The user can access only resources in the guest VLAN.
A user in the 802.1X guest VLAN fails 802.1X authentication.	If an 802.1X Auth-Fail VLAN is available, the device remaps the MAC address of the user to the Auth-Fail VLAN. The user can access only resources in the Auth-Fail VLAN. If no 802.1X Auth-Fail VLAN is configured, the user is removed from the guest VLAN and added to the initial PVID.
A user in the 802.1X guest VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN, the device remaps the MAC address of the user to the initial PVID on the port.

Auth-Fail VLAN

The 802.1X Auth-Fail VLAN on a port accommodates users that have failed 802.1X authentication because of the failure to comply with the organization security strategy. For example, the VLAN accommodates users that have entered a wrong password. Users in the Auth-Fail VLAN can access a limited set of network resources, such as a software server, to download antivirus software and system patches.

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication.	The device assigns the port to the Auth-Fail VLAN. All 802.1X users on this port can access only resources in the Auth-Fail VLAN. The Auth-Fail VLAN assignment varies by port link mode. For more information, see Table 4 in "Authorization VLAN."
A user in the 802.1X Auth-Fail VLAN fails 802.1X authentication.	The port is still in the Auth-Fail VLAN, and all 802.1X users on this port are in this VLAN.
A user in the 802.1X Auth-Fail VLAN passes 802.1X authentication.	The device assigns the port to the authorization VLAN of the user, and it removes the port from the Auth-Fail VLAN. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to the initial PVID. After the user logs off, the port is assigned to the guest VLAN. If no guest VLAN is configured, the port is assigned to the initial PVID of the port.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication.	The device maps the MAC address of the user to the 802.1X Auth-Fail VLAN. The user can access only resources in the Auth-Fail VLAN.
A user in the 802.1X Auth-Fail VLAN fails 802.1X authentication.	The user is still in the Auth-Fail VLAN.
A user in the 802.1X Auth-Fail VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN, the device remaps the MAC address of the user to the initial PVID on the port.

Critical VLAN

The 802.1X critical VLAN on a port accommodates 802.1X users that have failed authentication because none of the RADIUS servers in their ISP domain are reachable. Users in the critical VLAN can access a limited set of network resources depending on the configuration.

The critical VLAN feature takes effect when 802.1X authentication is performed only through RADIUS servers. If an 802.1X user fails local authentication after RADIUS authentication, the user is not assigned to the critical VLAN. For more information about the authentication methods, see "Configuring AAA."

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication because all the RADIUS servers are unreachable.	The device assigns the port to the critical VLAN. The 802.1X user and all subsequent 802.1X users on this port can access only resources in the 802.1X critical VLAN. The critical VLAN assignment varies by port link mode. For more information, see Table 4 in "Authorization VLAN."
A user in the 802.1X critical VLAN fails authentication because all the RADIUS servers are unreachable.	The port is still in the critical VLAN.
A user in the 802.1X critical VLAN fails authentication for any reason other than unreachable servers.	If an 802.1X Auth-Fail VLAN has been configured, the port is assigned to the Auth-Fail VLAN. If no 802.1X Auth-Fail VLAN is configured, the port is assigned to the initial PVID of the port.
A user in the 802.1X critical VLAN passes 802.1X authentication.	The device assigns the port to the authorization VLAN of the user, and it removes the port from the 802.1X critical VLAN. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to this port VLAN. After the user logs off, the port is assigned to the guest VLAN. If no 802.1X guest VLAN is configured, the initial PVID of the port is restored.
A user in the 802.1X guest VLAN fails authentication because all the RADIUS servers are unreachable.	The device assigns the port to the 802.1X critical VLAN, and all 802.1X users on this port are in this VLAN.
A user in the 802.1X Auth-Fail VLAN fails authentication because all the RADIUS servers are unreachable.	The port is still in the 802.1X Auth-Fail VLAN. All 802.1X users on this port can access only resources in the 802.1X Auth-Fail VLAN.
A user that has passed authentication fails reauthentication because all the RADIUS servers are unreachable, and the user is logged out of the device.	The device assigns the port to the 802.1X critical VLAN.

If the port is added to the critical VLAN because no RADIUS servers are reachable, the device performs the following operations after it detects a reachable RADIUS server:

1. Removes the port from the critical VLAN.
2. Sends a multicast EAP-Request/Identity message out of the port to trigger authentication.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication because all the RADIUS servers are unreachable.	The device maps the MAC address of the user to the 802.1X critical VLAN. The user can access only resources in the 802.1X critical VLAN.
A user in the 802.1X critical VLAN fails authentication because all the RADIUS servers are unreachable.	The user is still in the critical VLAN.
A user in the 802.1X critical VLAN fails 802.1X authentication for any reason other than unreachable servers.	If an 802.1X Auth-Fail VLAN has been configured, the device remaps the MAC address of the user to the Auth-Fail VLAN ID. If no 802.1X Auth-Fail VLAN has been configured, the device remaps the MAC address of the user to the initial PVID.
A user in the 802.1X critical VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN to the user, the device remaps the MAC address of the user to the initial PVID on the port.
A user in the 802.1X guest VLAN fails authentication because all the RADIUS servers are unreachable.	The device remaps the MAC address of the user to the 802.1X critical VLAN. The user can access only resources in the 802.1X critical VLAN.
A user in the 802.1X Auth-Fail VLAN fails authentication because all the RADIUS servers are unreachable.	The user remains in the 802.1X Auth-Fail VLAN.

If a user is added to the critical VLAN because no RADIUS servers are reachable, the device performs the following operations after it detects a reachable RADIUS server:

1. Removes the user from the critical VLAN.
2. Sends a unicast EAP-Request/Identity message out of the port to the user for reauthentication.

Critical voice VLAN

The 802.1X critical voice VLAN on a port accommodates 802.1X voice users that have failed authentication because none of the RADIUS servers in their ISP domain are reachable.

The critical voice VLAN feature takes effect when 802.1X authentication is performed only through RADIUS servers. If an 802.1X voice user fails local authentication after RADIUS authentication, the voice user is not assigned to the critical voice VLAN. For more information about the authentication methods, see "Configuring AAA."

When a reachable RADIUS server is detected, the device performs operations on a port based on its 802.1X access control method.

Port-based access control

When a reachable RADIUS server is detected, the device removes the port from the critical voice VLAN. The port sends a multicast EAP-Request/Identity packet to all 802.1X voice users on the port to trigger authentication.

MAC-based access control

When a reachable RADIUS server is detected, the device removes 802.1X voice users from the critical voice VLAN. The port sends a unicast EAP-Request/Identity packet to each 802.1X voice user that was assigned to the critical voice VLAN to trigger authentication.

ACL assignment

You can specify an ACL for an 802.1X user on the authentication server to control the user's access to network resources. After the user passes 802.1X authentication, the authentication server assigns the ACL to the user access port. Then, the port permits or drops the matching traffic for the user depending on the rules configured in the ACL. This ACL is called an authorization ACL.

The device supports assignment of static and dynamic ACLs as authorization ACLs.

- **Static ACLs**—Static ACLs can be assigned by a RADIUS server or the access device. When the server or access device assigns a static ACL to a user, it assigns only the ACL number. You must manually create the ACL and configure its rules on the access device.

  To change the access permissions of a user, you can use one of the following methods:

  - Modify ACL rules in the authorization ACL on the access device.
  - Assign another ACL to the user from the RADIUS server or the access device.

  Static ACLs and their rules can be manually deleted from the access device.
- **Dynamic ACLs**—Dynamic ACLs and their rules are automatically deployed by a RADIUS server, which are not configurable on the access device. Dynamic ACLs can only be named ACLs. After the device receives a server-deployed dynamic ACL and its rules, it automatically creates the ACL and configures its rules.

  If the dynamic ACL assigned by the server to a user has the same name as a static ACL, the dynamic ACL cannot be issued and the user cannot come online.

  A dynamic ACL and its rules are automatically deleted from the access device after all its users go offline.

  Dynamic ACLs and their rules cannot be manually modified or deleted on the access device. To display information about dynamic ACLs and their rules, use the **`display dot1x connection`** or **`display acl`** command.

IMPORTANT:

Assignment of dynamic ACLs is supported only in Release 6309P01 or later.

The supported authorization ACLs include the following types:

- Basic ACLs, which are numbered in the range of 2000 to 2999.
- Advanced ACLs, which are numbered in the range of 3000 to 3999.
- Layer 2 ACLs, which are numbered in the range of 4000 to 4999.

IMPORTANT:

For an authorization ACL to take effect, make sure the ACL exists with rules and none of the rules contains the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, or **`logging`** keyword.

For more information about ACLs, see *ACL and QoS Configuration Guide*.

User profile assignment

You can specify a user profile for an 802.1X user on the authentication server to control the user's access to network resources. After the user passes 802.1X authentication, the authentication server assigns the user profile to the user for filtering traffic.

The authentication server can be the local access device or a RADIUS server. In either case, the server only specifies the user profile name. You must configure the user profile on the access device.

To change the user's access permissions, you can use one of the following methods:

- Modify the user profile configuration on the access device.
- Specify another user profile for the user on the authentication server.

For more information about user profiles, see "Configuring user profiles."

Redirect URL assignment

The device supports the URL attribute assigned by a RADIUS server when the 802.1X-enabled port performs MAC-based access control and the port authorization state is **auto**. During authentication, the HTTP or HTTPS requests of an 802.1X user are redirected to the Web interface specified by the server-assigned URL attribute. After the user passes the Web authentication, the RADIUS server records the MAC address of the user and uses a DM (Disconnect Message) to log off the user. When the user initiates 802.1X authentication again, it will pass the authentication and come online successfully.

This feature is mutually exclusive with the EAD assistant feature.

By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

Periodic 802.1X reauthentication

Periodic 802.1X reauthentication tracks the connection status of online users and updates the authorization attributes (such as ACL and VLAN) assigned by the server.

The device reauthenticates online 802.1X users at the periodic reauthentication interval when the periodic online user reauthentication feature is enabled. The interval is controlled by a timer and the timer is user configurable. A change to the periodic reauthentication timer applies to online users only after the old timer expires and the users pass authentication.

The server-assigned session timeout timer (Session-Timeout attribute) and termination action (Termination-Action attribute) together can affect the periodic online user reauthentication feature. To display the server-assigned Session-Timeout and Termination-Action attributes, use the **`display dot1x connection`** command (see *Security Command Reference*).

- If the termination action is **Default** (logoff), periodic online user reauthentication on the device takes effect only when the periodic reauthentication timer is shorter than the session timeout timer.
- If the termination action is **Radius-request**, the periodic online user reauthentication settings on the device do not take effect. The device reauthenticates the online 802.1X users after the session timeout timer expires.

If no session timeout timer is assigned by the server, whether the device performs periodic 802.1X reauthentication depends on the periodic reauthentication configuration on the device. Support for the assignment of Session-Timeout and Termination-Action attributes depends on the server model.

With the RADIUS DAS feature enabled, the device immediately reauthenticates a user upon receiving a CoA message that carries the reauthentication attribute from a RADIUS authentication server. In this case, reauthentication will be performed regardless of whether 802.1X periodic reauthentication is enabled on the device. For more information about RADIUS DAS configuration, see "Configuring AAA."

By default, the device logs off online 802.1X users if no server is reachable for 802.1X reauthentication. The keep-online feature keeps authenticated 802.1X users online when no server is reachable for 802.1X reauthentication.

The VLANs assigned to an online user before and after reauthentication can be the same or different.

EAD assistant

Endpoint Admission Defense (EAD) is an H3C integrated endpoint access control solution to improve the threat defensive capability of a network. The solution enables the security client, security policy server, access device, and third-party server to operate together. If a terminal device seeks to access an EAD network, it must have an EAD client, which performs 802.1X authentication.

The EAD assistant feature enables the access device to redirect the HTTP or HTTPS requests of a user to a redirect URL for downloading and installing an EAD client. This feature eliminates the administrative task to deploy EAD clients.

EAD assistant is implemented by the following functionality:

- Free IP.

  A free IP is a freely accessible network segment, which has a limited set of network resources such as software and DHCP servers. To ensure security strategy compliance, an unauthenticated user can access only this segment to perform operations. For example, the user can download EAD client from a software server or obtain a dynamic IP address from a DHCP server.

- Redirect URL.

  If an unauthenticated 802.1X user is using a Web browser to access the network, EAD assistant redirects the network access requests of the user to a specific URL. For example, you can use this feature to redirect the user to the EAD client software download page.

The EAD assistant feature creates an ACL-based EAD rule automatically to open access to the redirect URL for each redirected user.

EAD rules are implemented by using ACL resources. When the EAD rule timer expires or the user passes authentication, the rule is removed. If users fail to download EAD client or fail to pass authentication before the timer expires, they must reconnect to the network to access the free IP.

Configuring 802.1X

Restrictions and guidelines: 802.1X configuration

You can configure the port security feature to perform 802.1X. Port security combines and extends 802.1X and MAC authentication. It applies to a network (a WLAN, for example) that requires different authentication methods for different users on a port. For more information about the port security feature, see "Configuring port security."

When you configure 802.1X settings on an interface, follow these restrictions and guidelines:

- 802.1X is supported only on Layer 2 Ethernet interfaces that do not belong to an aggregation group.
- Do not change the link type of a port when the 802.1X guest VLAN, Auth-Fail VLAN, or critical VLAN on the port has users.
- If multiple authentication methods are configured for the authentication domain and RADIUS remote authentication is the primary method, the device will not add users to the critical VLAN when the RADIUS is unreachable. Instead, it uses a backup authentication method to authentication users. The device adds a user to the critical VLAN only when RADIUS remote authentication is the final authentication method used for the user and the RADIUS server is unreachable.

  To configure multiple authentication methods for an authentication domain, use the **`authentication default`** command.

To ensure a successful HTTPS redirect for users in either of the following situations, make sure VLAN interfaces exist for the VLANs that transport their packets:

- The users are assigned a redirect URL.
- EAD assistant is enabled.

802.1X tasks at a glance

To configure 802.1X authentication, perform the following tasks:

1. Enabling 802.1X
2. Configuring basic 802.1X features
   - Enabling EAP relay or EAP termination
   - Setting the port authorization state
   - Specifying an access control method
   - (Optional.) Specifying a mandatory authentication domain on a port
   - (Optional.) Setting the 802.1X authentication timeout timers
   - (Optional.) Configuring 802.1X reauthentication
   - (Optional.) Setting the quiet timer
3. (Optional.) Configuring 802.1X VLAN assignment
   - Configuring an 802.1X guest VLAN
   - Enabling 802.1X guest VLAN assignment delay
   - Configuring an 802.1X Auth-Fail VLAN
   - Configuring an 802.1X critical VLAN
   - Enabling the 802.1X critical voice VLAN feature
4. (Optional.) Setting the upper limit for 802.1X parameters

- Setting the maximum number of concurrent 802.1X users on a port
- Setting the maximum number of authentication request attempts
- Setting the maximum number of 802.1X authentication attempts for MAC authenticated users

5. (Optional.) Configuring other 802.1X features
   - Configuring 802.1X unauthenticated user aging
   - Sending EAP-Success packets on assignment of users to the 802.1X critical VLAN
   - Enabling 802.1X online user synchronization
   - Configuring the authentication trigger feature

     Perform this task when 802.1X clients cannot initiate authentication.
   - Discarding duplicate 802.1X EAPOL-Start requests
   - Configuring online user handshake
   - Configuring packet detection for 802.1X authentication
   - Specifying supported domain name delimiters
   - Removing the VLAN tags of 802.1X protocol packets sent out of a port
   - Enabling 802.1X user IP freezing
   - Enabling generation of dynamic IPSG binding entries for 802.1X authenticated users
   - Configuring 802.1X MAC address binding
   - Configuring the EAD assistant feature
   - Setting the maximum size of EAP-TLS fragments sent to the server

     Use this feature to reduce the size of authentication packets sent to the server when the device uses EAP-TLS authentication method in EAP relay mode.
   - Logging off 802.1X users
   - Enabling 802.1X user logging

Prerequisites for 802.1X

Before you configure 802.1X, complete the following tasks:

- Configure an ISP domain and AAA scheme (local or RADIUS authentication) for 802.1X users.
- If RADIUS authentication is used, create user accounts on the RADIUS server.
- If local authentication is used, create local user accounts on the access device and set the service type to **lan-access**.

Enabling 802.1X

Restrictions and guidelines

For 802.1X to take effect on a port, you must enable it both globally and on the port.

If the PVID is a voice VLAN, the 802.1X feature cannot take effect on the port. For more information about voice VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`
2. Enable 802.1X globally.

   `dot1x`

By default, 802.1X is disabled globally.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable 802.1X on a port.

   dot1x

   By default, 802.1X is disabled on a port.

Enabling EAP relay or EAP termination

About EAP mode selection

Consider the following factors to select a proper EAP mode:

- Support of the RADIUS server for EAP packets.
- Authentication methods supported by the 802.1X client and the RADIUS server.

Restrictions and guidelines

- If EAP relay mode is used, the **user-name-format** command configured in RADIUS scheme view does not take effect. The access device sends the authentication data from the client to the server without any modification. For more information about the **user-name-format** command, see *Security Command Reference*.
- You can use both EAP termination and EAP relay in any of the following situations:
  - The client is using only MD5-Challenge EAP authentication. If EAP termination is used, you must enable CHAP authentication on the access device.
  - The client is an iNode 802.1X client and initiates only the username and password EAP authentication. If EAP termination is used, you can enable either PAP or CHAP authentication on the access device. However, for the purpose of security, you must use CHAP authentication on the access device.
- To use EAP-TLS, PEAP, or any other EAP authentication methods, you must use EAP relay. When you make your decision, see "Comparing EAP relay and EAP termination" for help.

Procedure

1. Enter system view.

   system-view

2. Configure EAP relay or EAP termination.

   dot1x authentication-method { **chap** | **eap** | **pap** }

   By default, the access device performs EAP termination and uses CHAP to communicate with the RADIUS server.

Setting the port authorization state

About port authorization states

The port authorization state determines whether the client is granted access to the network. You can control the following authorization states of a port:

- **Authorized**—Places the port in the authorized state, enabling users on the port to access the network without authentication.
- **Unauthorized**—Places the port in the unauthorized state, denying any access requests from users on the port.

- **Auto**—Places the port initially in unauthorized state to allow only EAPOL packets to pass. After a user passes authentication, sets the port in the authorized state to allow access to the network. You can use this option in most scenarios.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the port authorization state.
   dot1x port-control { **authorized-force** | **auto** | **unauthorized-force** }
   By default, the **auto** state applies.

Specifying an access control method

About access control methods

The device supports port-based and MAC-based access control methods.

Restrictions and guidelines

If online 802.1X users are present on a port, changing its access control method will cause the online users to go offline.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an access control method.
   dot1x port-method { **macbased** | **portbased** }
   By default, MAC-based access control applies.

Specifying a mandatory authentication domain on a port

About the mandatory authentication domain

You can place all 802.1X users in a mandatory authentication domain for authentication, authorization, and accounting on a port. No user can use an account in any other domain to access the network through the port. The implementation of a mandatory authentication domain enhances the flexibility of 802.1X access control deployment.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify a mandatory 802.1X authentication domain on the port.
   dot1x mandatory-domain *domain-name*

By default, no mandatory 802.1X authentication domain is specified.

Setting the 802.1X authentication timeout timers

About 802.1X authentication timeout timers

The network device uses the following 802.1X authentication timeout timers:

- **Client timeout timer**—Starts when the access device sends an EAP-Request/MD5-Challenge packet to a client. If no response is received when this timer expires, the access device retransmits the request to the client.
- **Server timeout timer**—Starts when the access device sends a RADIUS Access-Request packet to the authentication server. If no response is received when this timer expires, the 802.1X authentication fails.

Restrictions and guidelines

In most cases, the default settings are sufficient. You can edit the timers, depending on the network conditions.

- In a low-speed network, increase the client timeout timer.
- In a network with authentication servers of different performance, adjust the server timeout timer.

To avoid forced logoff before the server timeout timer expires, set the server timeout timer to a value that is lower than or equal to the product of the following values:

- The maximum number of RADIUS packet transmission attempts set by using the **retry** command in RADIUS scheme view.
- The RADIUS server response timeout timer set by using the **timer response-timeout** command in RADIUS scheme view.

For information about setting the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Set the client timeout timer.
   dot1x timer supp-timeout *supp-timeout-value*
   The default is 30 seconds.
3. Set the server timeout timer.
   dot1x timer server-timeout *server-timeout-value*
   The default is 100 seconds.

Configuring 802.1X reauthentication

Restrictions and guidelines

The device selects a periodic reauthentication timer for 802.1X reauthentication in the following order:

1. Server-assigned reauthentication timer.
2. Port-specific reauthentication timer.
3. Global reauthentication timer.
4. Default reauthentication timer.

After you perform a manual reauthentication, the device reauthenticates all online 802.1X users on a port regardless of the server-assigned reauthentication attribute and the periodic reauthentication feature on the port.

Modification to the mandatory authentication domain or EAP message handling method setting does not affect the reauthentication of online 802.1X users. The modified setting takes effect only on 802.1X users that come online after the modification.

If periodic reauthentication is triggered for a user while that user is waiting for online synchronization, the system performs online synchronization and does not perform reauthentication for the user.

Procedure

1. Enter system view.

   system-view
2. Set the periodic reauthentication timer.
   - Set a global periodic reauthentication timer.

     dot1x timer reauth-period *reauth-period-value*

     The default setting is 3600 seconds.
   - Execute the following commands in sequence to set a port-specific periodic reauthentication timer:

     interface *interface-type interface-number*

     dot1x timer reauth-period *reauth-period-value*

     quit

     By default, no periodic reauthentication timer is set on a port. The port uses the global 802.1X periodic reauthentication timer.
3. Enter interface view.

   interface *interface-type interface-number*
4. Enable periodic online user reauthentication.

   dot1x re-authenticate

   By default, the feature is disabled.
5. (Optional.) Manually reauthenticate all online 802.1X users on the port.

   dot1x re-authenticate manual
6. (Optional.) Enable the keep-online feature for 802.1X users.

   dot1x re-authenticate server-unreachable keep-online

   By default, this feature is disabled. The device logs off online 802.1X users if no authentication server is reachable for 802.1X reauthentication.

   Use the keep-online feature according to the actual network condition. In a fast-recovery network, you can use the keep-online feature to prevent 802.1X users from coming online and going offline frequently.

Setting the quiet timer

About the quiet timer

The quiet timer enables the access device to wait a period of time before it can process any authentication request from a client that has failed an 802.1X authentication.

Restrictions and guidelines

You can edit the quiet timer, depending on the network conditions.

- In a vulnerable network, set the quiet timer to a high value.

- In a high-performance network with quick authentication response, set the quiet timer to a low value.

Procedure

1. Enter system view.

   system-view
2. Enable the quiet timer.

   dot1x quiet-period

   By default, the timer is disabled.
3. Set the quiet timer.

   dot1x timer quiet-period *quiet-period-value*

   The default is 60 seconds.

Configuring an 802.1X guest VLAN

Restrictions and guidelines

- You can configure only one 802.1X guest VLAN on a port. The 802.1X guest VLANs on different ports can be different.
- Assign different IDs to the port VLAN, the voice VLAN, and the 802.1X guest VLAN on a port. The assignment makes sure the port can correctly process incoming VLAN-tagged traffic.
- For the 802.1X guest VLAN feature to work correctly, do not configure this feature together with EAD assistant.
- On a hybrid port, the guest VLAN can only be an untagged VLAN.
- If a voice VLAN and an 802.1X guest VLAN are both configured on a hybrid port, the voice VLAN has higher priority than the 802.1X guest VLAN. A packet is forwarded out of the voice VLAN if it matches the voice VLAN settings. If it does not match the voice VLAN settings, its source MAC address might be added to the 802.1X guest VLAN.
- When you configure multiple security features on a port, follow the guidelines in Table 5.

  Table 5 Relationships of the 802.1X guest VLAN and other security features

Feature	Relationship description	Reference
802.1X Auth-Fail VLAN on a port that performs MAC-based access control	The 802.1X Auth-Fail VLAN has a higher priority than the 802.1X guest VLAN.	See "802.1X VLAN manipulation."
Port intrusion protection actions on a port that performs MAC-based access control	The 802.1X guest VLAN feature has higher priority than the block MAC action. The 802.1X guest VLAN feature has lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure an 802.1X guest VLAN, complete the following tasks:

- Create the VLAN to be specified as the 802.1X guest VLAN.
- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.

    - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the guest VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the 802.1X guest VLAN on the port.
   dot1x guest-vlan *guest-vlan-id*
   By default, no 802.1X guest VLAN exists on a port.

Enabling 802.1X guest VLAN assignment delay

About 802.1X guest VLAN assignment delay

This feature delays assigning an 802.1X-enabled port to the 802.1X guest VLAN when 802.1X authentication is triggered on the port.

This feature applies only to situations where 802.1X authentication is triggered by EAPOL-Start packets from 802.1X clients or packets from unknown MAC addresses.

To use this feature, the 802.1X-enabled port must perform MAC-based access control. To use the new MAC-triggered 802.1X guest VLAN assignment delay, you must also configure 802.1X unicast trigger on the port.

When 802.1X authentication is triggered on a port, the device performs the following operations:

1. Sends a unicast EAP-Request/Identity packet to the MAC address that triggers the authentication.
2. Retransmits the packet if no response is received within the username request timeout interval set by using the **dot1x timer tx-period** command.
3. Assigns the port to the 802.1X guest VLAN after the maximum number of request attempts set by using the **dot1x retry** command is reached.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable 802.1X guest VLAN assignment delay on the port.
   dot1x guest-vlan-delay { **eapol** | **new-mac** }
   By default, 802.1X guest VLAN assignment delay is disabled on a port.

Configuring an 802.1X Auth-Fail VLAN

Restrictions and guidelines

- Assign different IDs to the port VLAN, the voice VLAN, and the 802.1X Auth-Fail VLAN on a port. The assignment makes sure the port can correctly process VLAN-tagged incoming traffic.

- You can configure only one 802.1X Auth-Fail VLAN on a port. The 802.1X Auth-Fail VLANs on different ports can be different.
- On a hybrid port, the Auth-Fail VLAN can only be an untagged VLAN.
- When you configure multiple security features on a port, follow the guidelines in Table 6.

Table 6 Relationships of the 802.1X Auth-Fail VLAN with other features

Feature	Relationship description	Reference
MAC authentication guest VLAN on a port that performs MAC-based access control	The 802.1X Auth-Fail VLAN has a high priority.	See "Configuring MAC authentication."
Port intrusion protection actions on a port that performs MAC-based access control	The 802.1X Auth-Fail VLAN feature has higher priority than the block MAC action. The 802.1X Auth-Fail VLAN feature has lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure an 802.1X Auth-Fail VLAN, complete the following tasks:

- Create the VLAN to be specified as the 802.1X Auth-Fail VLAN.
- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.
  - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the Auth-Fail VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Configure the 802.1X Auth-Fail VLAN on the port.
   `dot1x auth-fail vlan` *`authfail-vlan-id`*
   By default, no 802.1X Auth-Fail VLAN exists on a port.

Configuring an 802.1X critical VLAN

Restrictions and guidelines for 802.1X critical VLAN configuration

- Assign different IDs to the PVID, the voice VLAN, and the 802.1X critical VLAN on a port. The assignment makes sure the port can correctly process VLAN-tagged incoming traffic.
- You can configure only one 802.1X critical VLAN on a port. The 802.1X critical VLANs on different ports can be different.
- On a hybrid port, the critical VLAN can only be an untagged VLAN.

Prerequisites

Before you configure an 802.1X critical VLAN, complete the following tasks:

- Create the VLAN to be specified as a critical VLAN.
- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.
  - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the critical VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the 802.1X critical VLAN on the port.

   dot1x critical vlan *critical-vlan-id*

   By default, no 802.1X critical VLAN exists on a port.

Enabling the 802.1X critical voice VLAN feature

Hardware and feature compatibility

This feature is not supported on the following switch series:

- S5000E-X.
- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000X-EI.
- WAS6000.

Restrictions and guidelines

The feature does not take effect if the voice user has been in the 802.1X Auth-Fail VLAN.

Prerequisites

Before you enable the 802.1X critical voice VLAN feature on a port, complete the following tasks:

- Enable LLDP both globally and on the port.

  The device uses LLDP to identify voice users. For information about LLDP, see *Layer 2—LAN Switching Configuration Guide*.
- Enable voice VLAN on the port.

  For information about voice VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- Specify an 802.1X critical VLAN on the port. This setting ensures that a voice user is assigned to the critical VLAN if it has failed authentication for unreachability of RADIUS servers before the device recognizes it as a voice user. If an 802.1X critical VLAN is not available, the voice user might be logged off instead.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the 802.1X critical voice VLAN feature on a port.
   dot1x critical-voice-vlan
   By default, the 802.1X critical voice VLAN feature is disabled on a port.

Configuring 802.1X unauthenticated user aging

About 802.1X unauthenticated user aging

802.1X unauthenticated user aging applies to users added to an 802.1X guest, critical, or Auth-Fail VLAN because they have not been authenticated or have failed authentication.

When a user in one of those VLANs ages out, the device removes the user from the VLAN and deletes the MAC address entry for the user from the access port.

For users in one of those VLANs on one port to be authenticated successfully and come online on another port, enable this feature. In any other scenarios, disable this feature as a best practice.

The 802.1X user aging mechanism on a port depends on its access control mode.

- If the port uses port-based access control, a user aging timer starts when the port is assigned to the critical or Auth-Fail VLAN. When the aging timer expires, the port is removed from the VLAN and all MAC address entries for users in the VLAN are also removed.
- If the port uses MAC-based access control, a user aging timer starts for each 802.1X user when they are assigned to the Auth-Fail, critical, or guest VLAN. When the aging timer for a user expires, the device removes that user from the VLAN.

The removed users will be unable to access any network resources until after another authentication is triggered.

Restrictions and guidelines

As a best practice, use this feature on a port only if you want to have its unauthenticated users to be authenticated and come online on a different port.

Procedure

1. Enter system view.
   system-view
2. Set the user aging timer for a type of 802.1X VLAN.
   dot1x timer user-aging { **auth-fail-vlan** | **critical-vlan** | **guest-vlan** } *aging-time-value*
   By default, the user aging timers for all applicable types of 802.1X VLANs are 1000 seconds.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable 802.1X unauthenticated user aging.
   dot1x unauthenticated-user aging enable
   By default, 802.1X unauthenticated user aging is enabled.

Sending EAP-Success packets on assignment of users to the 802.1X critical VLAN

About this task

By default, the device sends EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X critical VLAN. Some 802.1X clients, such as Windows built-in 802.1X clients, cannot respond to the EAP-Request/Identity packet from the device for reauthentication if they have received an EAP-Failure packet. As a result, reauthentication for these clients will fail after the authentication server becomes reachable.

To avoid this situation, enable the device to send EAP-Success packets instead of EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X critical VLAN.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the device to send an EAP-Success packet to an 802.1X client when its client user is assigned to the critical VLAN on the port.

   dot1x critical eapol

   By default, the device sends an EAP-Failure packet to an 802.1X client when its client user is assigned to the critical VLAN.

Enabling 802.1X online user synchronization

About 802.1X online user synchronization

IMPORTANT:

This feature takes effect only when the device uses an IMC RADIUS server to authenticate 802.1X users.

To ensure that the RADIUS server maintains the same online 802.1X user information as the device after the server state changes from unreachable to reachable, use this feature.

This feature synchronizes online 802.1X user information between the device and the RADIUS server when the RADIUS server state is detected having changed from unreachable to reachable.

When synchronizing online 802.1X user information on a port with the RADIUS server, the device initiates 802.1X authentication in turn for each authenticated online 802.1X user to the RADIUS server.

If synchronization fails for an online user, the device logs off that user unless the failure occurs because the server has become unreachable again.

Restrictions and guidelines

The amount of time required to complete online user synchronization increases as the number of online users grows. This might result in an increased delay for new 802.1X users and users in the critical VLAN to authenticate or reauthenticate to the RADIUS server and come online.

To have this feature take effect, you must use it in conjunction with the RADIUS server status detection feature, which is configurable with the **radius-server test-profile** command. When you configure this feature, make sure the detection interval is shorter than the RADIUS server quiet timer configured by using the **timer quiet** command in RADIUS scheme view. The server

state changes to active on expiration of the quiet timer regardless of its actual reachability. Setting a shorter detection interval than the quiet timer prevents the RADIUS server status detection feature from falsely reporting the server reachability.

For more information about the RADIUS server status detection feature, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable 802.1X online user synchronization.
   dot1x server-recovery online-user-sync
   By default, 802.1X online user synchronization is disabled.

Configuring the authentication trigger feature

About authentication triggers

The authentication trigger feature enables the access device to initiate 802.1X authentication when 802.1X clients cannot initiate authentication.

This feature provides the multicast trigger and unicast trigger (see 802.1X authentication initiation in "802.1X overview").

Restrictions and guidelines

- Enable the multicast trigger on a port when the clients attached to the port cannot send EAPOL-Start packets to initiate 802.1X authentication.
- Enable the unicast trigger on a port if only a few 802.1X clients are attached to the port and these clients cannot initiate authentication.
- To avoid duplicate authentication packets, do not enable both triggers on a port.
- As a best practice, do not use the unicast trigger on a port that performs port-based access control. If you do so, users on the port might fail to come online correctly.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Set the username request timeout timer.
   dot1x timer tx-period *tx-period-value*
   The default is 30 seconds.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable an authentication trigger.
   dot1x { **multicast-trigger** | **unicast-trigger** }
   By default, the multicast trigger is enabled, and the unicast trigger is disabled.

Discarding duplicate 802.1X EAPOL-Start requests

About this task

During 802.1X authentication, the device might receive duplicate EAPOL-Start requests from an 802.1X user. By default, the device delivers the duplicate EAPOL-Start requests to the authentication server as long as they are legal. However, this mechanism might result in authentication failure if the authentication server cannot respond to duplicate EAPOL-Start requests. To resolve this issue, perform this task on the user access interface to discard duplicate EAPOL-Start requests.

Restrictions and guidelines

This feature is supported only in Release 6309P01 or later.

As a best practice, perform this task only if the server cannot respond to duplicate EAPOL-Start requests. Do not perform this task in other situations.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 Ethernet interface view.

   interface *interface-type interface-number*
3. Discard duplicate EAPOL-Start requests on the interface.

   dot1x duplicate-eapol-start discard

   By default, the device does not discard duplicate EAPOL-Start requests on an interface if the requests are legal.

Setting the maximum number of concurrent 802.1X users on a port

About setting the maximum number of concurrent 802.1X users on a port

Perform this task to prevent the system resources from being overused.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the maximum number of concurrent 802.1X users on a port.

   dot1x max-user *max-number*

   The default is 4294967295.

Setting the maximum number of authentication request attempts

About authentication request retransmission

The access device retransmits an authentication request if it does not receive any responses to the request from the client within a period of time. To set the time, use the **dot1x timer tx-period** *tx-period-value* command or the **dot1x timer supp-timeout** *supp-timeout-value* command. The access device stops retransmitting the request if it has made the maximum number of request transmission attempts but still receives no response.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of attempts for sending an authentication request.

   dot1x retry *retries*

   The default setting is 2.

Configuring online user handshake

About online user handshake

The online user handshake feature checks the connectivity status of online 802.1X users. The access device sends handshake requests (EAP-Request/Identity) to online users at the interval specified by the **dot1x timer handshake-period** command. If the device does not receive any EAP-Response/Identity packets from an online user after it has made the maximum handshake attempts, the device sets the user to offline state. To set the maximum handshake attempts, use the **dot1x retry** command.

Typically, the device does not reply to 802.1X clients' EAP-Response/Identity packets with EAP-Success packets. Some 802.1X clients will go offline if they do not receive the EAP-Success packets for handshake. To avoid this issue, enable the online user handshake reply feature.

If iNode clients are deployed, you can also enable the online user handshake security feature to check authentication information in the handshake packets from clients. This feature can prevent 802.1X users that use illegal client software from bypassing iNode security check, such as dual network interface cards (NICs) detection. If a user fails the handshake security checking, the device sets the user to the offline state.

Restrictions and guidelines

- If the network has 802.1X clients that cannot exchange handshake packets with the access device, disable the online user handshake feature. This operation prevents the 802.1X connections from being incorrectly torn down.
- To use the online user handshake security feature, make sure the online user handshake feature is enabled.
- The online user handshake security feature takes effect only on the network where the iNode client and IMC server are used.
- Enable the online user handshake reply feature only if 802.1X clients will go offline without receiving EAP-Success packets from the device.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Set the handshake timer.

   dot1x timer handshake-period *handshake-period-value*

   The default is 15 seconds.
3. Enter interface view.

   interface *interface-type interface-number*
4. Enable the online user handshake feature.

   dot1x handshake

   By default, the feature is enabled.
5. (Optional.) Enable the online user handshake security feature.

   dot1x handshake secure

   By default, the feature is disabled.
6. (Optional.) Enable the 802.1X online user handshake reply feature.

   dot1x handshake reply enable

   By default, the device does not reply to 802.1X clients' EAP-Response/Identity packets during the online handshake process.

Configuring packet detection for 802.1X authentication

About this task

When packet detection for 802.1X authentication is enabled on a port, the device sends detection packets to 802.1X users connected to that port at offline detection intervals set by using the offline detection timer. If the device does not receive a response from a user after it has made the maximum packet transmission attempts within an offline detection interval, it logs off that user and requests the RADIUS server to stop accounting for the user.

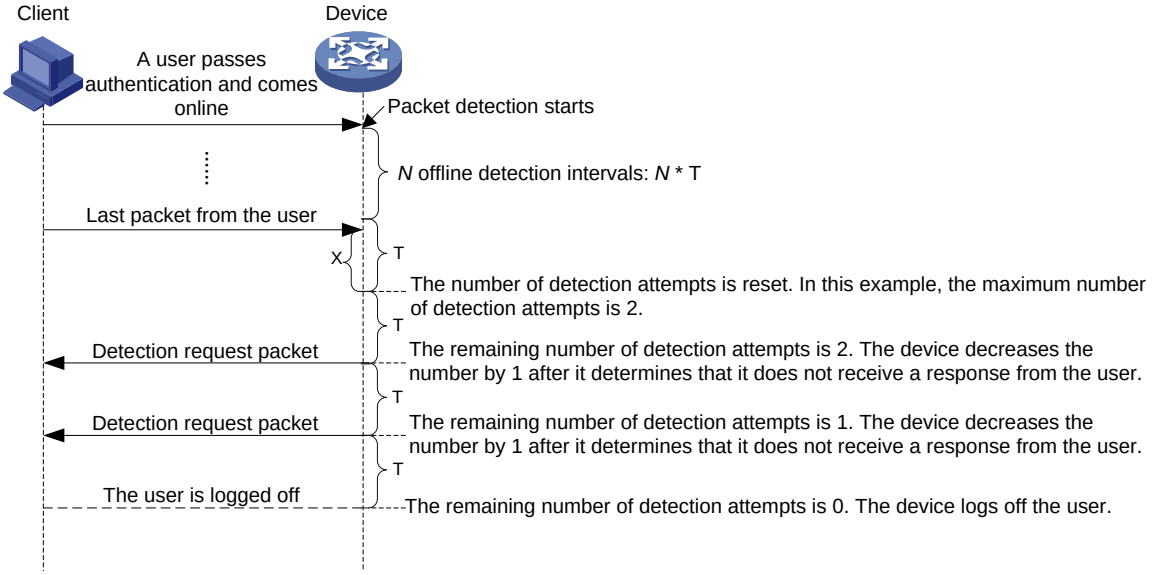
When packet detection for 802.1X authentication and 802.1X offline detection are both enabled, the device processes an 802.1X user as follows:

- If 802.1X offline detection determines that a user is online, the device does not send detection packets to that user.
- If 802.1X offline detection determines that a user is offline, the device does not immediately logs off that user. Instead, the device sends a detection packet to that user. It will log off that user if it does not receive a response from that user after it has made the maximum packet transmission attempts within an offline detection interval.

802.1X uses ARP request packets to detect the online status of IPv4 users and uses NS packets to detect the online status of IPv6 users.

Packet detection adopts the principle of counting prior to judging. The device decreases the detection attempts (packet transmission attempts) by 1 only after it determines that it does not receive a response from a user. The device stops the detection process when the number of detection attempts becomes 0. The duration from the time when the user sends the last packet to the time when the user is logged off is calculated by using the following formula: duration = (*retries* + 1) * T + X. Figure 11 shows the packet detection process. In this example, the device sends a detection packet to an 802.1X user for a maximum of two times.

Figure 11 Network diagram for packet detection process



The duration from the time when the user sends the last packet to the time when the user is logged off equals to 3 * T + X.

Feature and software version compatibility

This feature is supported only in Release 6348P01 and later.

Restrictions and guidelines

To ensure that the device is aware of user IP address changes, enable ARP snooping and ND snooping in conjunction with packet detection for 802.1X authentication. If you do not enable ARP snooping or ND snooping, the device is unaware of user IP address changes. As a result, the device still sends detection packets to the users' original IP addresses and falsely log off these users.

Procedure

1. Enter system view.
   `system-view`
2. Set the offline detection timer.
   `dot1x timer offline-detect` *`offline-detect-value`*
   By default, the offline detection timer expires in 300 seconds.
3. Enter interface view.
   `interface` *`interface-type interface-number`*
4. Enable packet detection for 802.1X authentication.
   `dot1x packet-detect enable`
   By default, packet detection for 802.1X authentication is disabled.
5. Set the maximum number of attempts for sending a detection packet to an 802.1X user.
   `dot1x packet-detect retry` *`retries`*
   By default, the device sends a detection packet to an 802.1X user for a maximum of two times.

Specifying supported domain name delimiters

About supported domain name delimiters

By default, the access device supports the at sign (@) as the delimiter. You can also configure the access device to accommodate 802.1X users that use other domain name delimiters. The

configurable delimiters include the at sign (@), backslash (\), dot (.), and forward slash (/). Usernames that include domain names can use the format of *username@domain-name*, *domain-name******username*, *username***.***domain-name*, or *username***/***domain-name*.

If an 802.1X username string contains multiple configured delimiters, the rightmost delimiter is the domain name delimiter. For example, if you configure the backslash (\), dot (.), and forward slash (/) as delimiters, the domain name delimiter for the username string 121.123/22\@abc is the backslash (\). The username is @**abc** and the domain name is **121.123/22**.

Restrictions and guidelines

If a username string contains none of the delimiters, the access device authenticates the user in the mandatory or default ISP domain.

If you configure the access device to send usernames with domain names to the RADIUS server, make sure the domain delimiter can be recognized by the RADIUS server. For username format configuration, see the **user-name-format** command in *Security Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Specify a set of domain name delimiters for 802.1X users.

   dot1x domain-delimiter *string*

   By default, only the at sign (@) delimiter is supported.

Removing the VLAN tags of 802.1X protocol packets sent out of a port

About removing the VLAN tags of 802.1X protocol packets sent out of a port

This feature operates on a hybrid port to have it send 802.1X protocol packets with their VLAN tags removed, regardless of whether the port is a tagged or untagged member of a VLAN.

Use this feature if the 802.1X-enabled hybrid port is a tagged member of its PVID and the attached 802.1X clients cannot recognize VLAN-tagged 802.1X protocol packets.

Restrictions and guidelines

This feature removes the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients. Do not use this feature if VLAN-aware 802.1X clients are attached to the port. As a best practice, perform this task only in the described applicable scenario.

Prerequisites

Set the link type of the 802.1X-enabled port to hybrid. For more information, see VLAN configuration in *Layer 2 LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Remove the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients.

   dot1x eapol untag

   By default, whether the device removes the VLAN tags of all 802.1X protocol packets sent out of a port to 802.1X clients depends on the configuration in the VLAN module.

CAUTION:

This command removes the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients. Do not use this command if VLAN-aware 802.1X clients are attached to the port. As a best practice, use this command only in the described applicable scenario.

Setting the maximum number of 802.1X authentication attempts for MAC authenticated users

About authentication attempts for MAC authenticated users

When a port uses both 802.1X authentication and MAC authentication, the device accepts 802.1X authentication requests from MAC authenticated users. If a MAC authenticated user passes 802.1X authentication, the user will come online as an 802.1X user. If the user fails 802.1X authentication, the user continues to make 802.1X authentication attempts depending on client configuration.

Perform this task to limit the number of 802.1X authentication attempts made by a MAC authenticated user.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the maximum number of 802.1X authentication attempts for MAC authenticated users on the port.

   dot1x after-mac-auth max-attempt *max-attempts*

   By default, the number of 802.1X authentication attempts for MAC authenticated users is not limited on a port.

Enabling 802.1X user IP freezing

About 802.1X user IP freezing

This feature works with the IP source guard feature. 802.1X-based IP source guard requires that 802.1X clients support sending user IP addresses to the access device. The device uses information such as user MAC addresses and IP addresses obtained through 802.1X to generate IPSG bindings to filter out IPv4 packets from unauthenticated 802.1X users. For information about IP source guard, see "Configuring IP source guard."

This feature prevents any authenticated 802.1X users on a port from changing their IP addresses. After you enable this feature, the port does not update the IP addresses in dynamic IPSG bindings for 802.1X users. If an 802.1X user uses an IP address different from the IP address in its IPSG binding entry, the port denies the user access.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable 802.1X user IP freezing.

   dot1x user-ip freeze

   By default, 802.1X user IP freezing is disabled.

Enabling generation of dynamic IPSG binding entries for 802.1X authenticated users

About this task

IMPORTANT:

This feature must operate in conjunction with the IP source guard (IPSG) feature.

By default, the device generates a dynamic IPv4SG or IPv6SG binding entry for an 802.1X authenticated user after the user obtains a static or DHCP assigned IP address.

To improve security by allowing only 802.1X users with DHCP assigned IP addresses to access the network, perform the following operations:

- Enable IPSG.
- Disable generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users.
- Enable DHCP snooping. The device will generate IPv4SG or IPv6SG binding entries for the users based on DHCP snooping.

For more information about IPSG, see IP source guard in *Security Configuration Guide*.

Software version and feature compatibility

This feature is supported only in Release 6340 and later.

Restrictions and guidelines

This feature takes effect only on 802.1X users that come online after the feature is enabled. If the IP address of an online 802.1X user changes, the device updates the dynamic IPv4SG or IPv6SG binding entry for that user.

Disabling this feature does not delete the existing dynamic IPv4SG or IPv6SG binding entries for online 802.1X users. If the IP address of an online 802.1X user changes after the feature is disabled, the device deletes the dynamic IPv4SG or IPv6SG binding entry for that user.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users.

   dot1x { **ip-verify-source** | **ipv6-verify-source** } **enable**

   By default, generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users is enabled.

Configuring 802.1X MAC address binding

About 802.1X MAC address binding

This feature can automatically bind MAC addresses of authenticated 802.1X users to the users' access port and generate 802.1X MAC address binding entries. You can also use the **dot1x mac-binding** *mac-address* command to manually add 802.1X MAC address binding entries.

802.1X MAC address binding entries never age out. They can survive a user logoff or a device reboot. If users in the 802.1X MAC address binding entries perform 802.1X authentication on another port, they cannot pass authentication.

Restrictions and guidelines

The 802.1X MAC address binding feature takes effect only when the port performs MAC-based access control.

To delete an 802.1X MAC address binding entry, use the **undo dot1x mac-binding** *mac-address* command. An 802.1X MAC address binding entry cannot be deleted when the user in the entry is online.

After the number of 802.1X MAC address binding entries reaches the upper limit of concurrent 802.1X users (set by using the **dot1x max-user** command), the following restrictions exist:

- Users not in the binding entries will fail authentication even after users in the binding entries go offline.
- New 802.1X MAC address binding entries are not allowed.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the 802.1X MAC address binding feature.
   dot1x mac-binding enable
   By default, the feature is disabled.
4. (Optional.) Manually add an 802.1X MAC address binding entry.
   dot1x mac-binding *mac-address*
   By default, no 802.1X MAC address binding entries exist on a port.

Configuring the EAD assistant feature

Hardware and feature compatibility

This feature is not supported on the following switch series:

- S5000E-X.
- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000X-EI.
- WAS6000.

Restrictions and guidelines

When you configure EAD assistant, follow these restrictions and guidelines:

- You must disable MAC authentication and port security globally before you enable the EAD assistant feature.
- To make the EAD assistant feature take effect on an 802.1X-enabled port, you must set the port authorization mode to **auto**.
- When global MAC authentication or port security is enabled, the free IP does not take effect.
- For the 802.1X guest VLAN feature to work correctly, do not enable EAD assistant together with the 802.1X guest VLAN feature.
- As from Release 6331, the **dot1x ead-assistant permit authentication-escape** command is added to remove the 802.1X Auth-Fail VLAN and critical VLAN malfunction issue when EAD assistant is enabled. This command enables the device to remove the EAD entries of users before it assigns the users to 802.1X Auth-Fail and critical VLANs.
- If you use free IP and Auth-Fail VLAN features together, make sure the resources in the Auth-Fail VLAN are on the free IP segments.
- The server that provides the redirect URL must be on the free IP accessible to unauthenticated users.

As from Release 6328, you can use EAD assistant in conjunction with MAC authentication. When you use both EAD assistant and MAC authentication on the device, follow these restrictions and guidelines:

- If both EAD assistant and MAC authentication are configured, the device does not mark the MAC address of a user that has failed MAC authentication as a silent MAC address. If the user has never passed MAC authentication, packets from the user can trigger MAC authentication again only after the user's EAD entry ages out.
- As a best practice, do not configure MAC authentication guest VLANs or critical VLANs. The VLANs might fail to work correctly when both EAD assistant and MAC authentication are configured on the device.
- As a best practice, do not configure the Web authentication or IP source guard feature. These features might fail to work correctly when both EAD assistant and MAC authentication are configured on the device.
- If the MAC address of a user has been marked as a silent MAC address before you enable EAD assistant, packets from the user can trigger 802.1X or MAC authentication only after the quiet timer expires.
- As from Release 6331, the **dot1x ead-assistant permit authentication-escape** command is added to remove the MAC authentication critical VLAN malfunction issue when EAD assistant is enabled. This command enables the device to remove the EAD entries of users before it assigns the users to MAC authentication critical VLANs.

Procedure

1. Enter system view.

   system-view

2. Enable the EAD assistant feature.

   dot1x ead-assistant enable

   By default, this feature is disabled.

3. Configure a free IP.

   dot1x ead-assistant free-ip *ip-address* { *mask-length* | *mask-address* }

   Repeat this command to configure multiple free IPs.

4. (Optional.) Configure the redirect URL if users will use Web browsers to access the network.

   dot1x ead-assistant url *url-string*

By default, no redirect URL exists.

By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

5. (Optional.) Set the EAD rule timer.

   dot1x timer ead-timeout *ead-timeout-value*

   The default setting is 30 minutes.

   To avoid using up ACL resources when a large number of EAD users exist, you can shorten the EAD rule timer.

6. (Optional.) Enable support for 802.1X Auth-Fail and critical VLANs and MAC authentication critical VLANs when 802.1X EAD assistant is enabled.

   dot1x ead-assistant permit authentication-escape

   By default, 802.1X Auth-Fail and critical VLANs and MAC authentication critical VLANs cannot take effect when 802.1X EAD assistant is enabled.

   This command is supported only in Release 6331 and later.

Setting the maximum size of EAP-TLS fragments sent to the server

About 802.1X EAP-TLS fragmentation

When the device uses EAP-TLS authentication method in EAP relay mode, the RADIUS packets might exceed the maximum packet size supported by the RADIUS server. This situation typically occurs because long EAP-TLS messages are encapsulated in the EAP-Message attribute of the RADIUS packet sent to the RADIUS server.

To avoid authentication failures caused by oversized packets, fragment the EAP-TLS messages depending on the maximum RADIUS packet size supported by the remote RADIUS server.

For example, the maximum packet length allowed by the server is 1200 bytes and the length of a RADIUS packet (excluding the EAP-Message attribute) is 800 bytes. To make sure the maximum length of a RADIUS packet does not exceed 1200 bytes, you must set the maximum length of an EAP-TLS fragment to a value less than 400 bytes.

Restrictions and guidelines

802.1X EAP-TLS fragmentation takes effect only when EAP relay mode is used. For more information about enabling EAP relay, see "Enabling EAP relay or EAP termination."

Procedure

1. Enter system view.

   system-view

2. Enable 802.1X EAP-TLS fragmentation and set the maximum EAP-TLS fragment size.

   dot1x eap-tls-fragment to-server *eap-tls-max-length*

   By default, EAP-TLS messages are not fragmented.

Logging off 802.1X users

About this task

Perform this task to log off the specified 802.1X users and clear information about these users from the device. These users must perform 802.1X authentication to come online again.

Software version and feature compatibility

This feature is supported only in Release 6318P01 and later.

Procedure

To log off 802.1X users, execute the following command in user view:

reset dot1x access-user [**interface** *interface-type interface-number* | **mac** *mac-address* | **username** *username* | **vlan** *vlan-id*]

Enabling 802.1X user logging

About 802.1X user logging

This feature enables the device to generate logs about 802.1X users and send the logs to the information center. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

To prevent excessive 802.1X user log entries, use this feature only if you need to analyze abnormal 802.1X user logins or logouts.

Procedure

1. Enter system view.

   system-view

2. Enable 802.1X user logging.

   dot1x access-user log enable [**abnormal-logoff** | **failed-login** | **normal-logoff** | **successful-login**] *

   By default, 802.1X user logging is disabled.

   If you do not specify any parameters, this command enables all types of 802.1X user logs.

Display and maintenance commands for 802.1X

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display 802.1X session information, statistics, or configuration information of specified or all ports.	**display dot1x** [**sessions** | **statistics**] [**interface** *interface-type interface-number*]
Display online 802.1X user information.	**display dot1x connection** [**open**] [**interface** *interface-type interface-number* | **slot** *slot-number* | **user-mac** *mac-address* | **user-name** *name-string*]
Display MAC address information of 802.1X users in 802.1X VLANs of a specific type.	**display dot1x mac-address** { **auth-fail-vlan** | **critical-vlan** | **guest-vlan** } [**interface** *interface-type interface-number*]
Remove users from the 802.1X guest VLAN on a port.	**reset dot1x guest-vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]
Clear 802.1X statistics.	**reset dot1x statistics** [**interface**

Task	Command
	interface-type interface-number]

802.1X authentication configuration examples

Example: Configuring basic 802.1X authentication

Network configuration

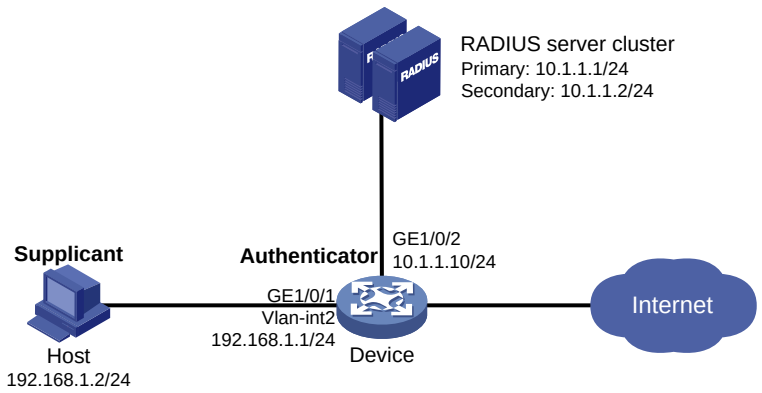
As shown in Figure 12, the access device performs 802.1X authentication for users that connect to GigabitEthernet 1/0/1. Implement MAC-based access control on the port, so the logoff of one user does not affect other online 802.1X users.

Use RADIUS servers to perform authentication, authorization, and accounting for the 802.1X users. If RADIUS authentication fails, perform local authentication on the access device.

Configure the RADIUS server at 10.1.1.1/24 as the primary authentication and accounting server, and the RADIUS server at 10.1.1.2/24 as the secondary authentication and accounting server. Assign all users to ISP domain **bbb**.

Set the shared key to **name** for packets between the access device and the authentication server. Set the shared key to **money** for packets between the access device and the accounting server.

Figure 12 Network diagram



Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS servers and add user accounts for the 802.1X users. Make sure the RADIUS servers can provide authentication, authorization, and accounting services. (Details not shown.)
2. Assign an IP address to each interface. (Details not shown.)
3. Configure user accounts for the 802.1X users on the access device:

   # Add a local network access user with username **localuser** and password **localpass** in plaintext. (Make sure the username and password are the same as those configured on the RADIUS servers.)

   ```
   <Device> system-view
   [Device] local-user localuser class network
   [Device-luser-network-localuser] password simple localpass
   ```

   # Set the service type to **lan-access**.

```
[Device-luser-network-localuser] service-type lan-access
[Device-luser-network-localuser] quit
```

4. Configure a RADIUS scheme on the access device:

   # Create a RADIUS scheme named **radius1** and enter RADIUS scheme view.

   ```
   [Device] radius scheme radius1
   ```

   # Specify the IP addresses of the primary authentication and accounting RADIUS servers.

   ```
   [Device-radius-radius1] primary authentication 10.1.1.1
   [Device-radius-radius1] primary accounting 10.1.1.1
   ```

   # Configure the IP addresses of the secondary authentication and accounting RADIUS servers.

   ```
   [Device-radius-radius1] secondary authentication 10.1.1.2
   [Device-radius-radius1] secondary accounting 10.1.1.2
   ```

   # Specify the shared key between the access device and the authentication server.

   ```
   [Device-radius-radius1] key authentication simple name
   ```

   # Specify the shared key between the access device and the accounting server.

   ```
   [Device-radius-radius1] key accounting simple money
   ```

   # Exclude the ISP domain names from the usernames sent to the RADIUS servers.

   ```
   [Device-radius-radius1] user-name-format without-domain
   [Device-radius-radius1] quit
   ```

   NOTE:

   The access device must use the same username format as the RADIUS server. If the RADIUS server includes the ISP domain name in the username, so must the access device.

5. Configure an ISP domain on the access device:

   # Create an ISP domain named **bbb** and enter ISP domain view.

   ```
   [Device] domain bbb
   ```

   # Apply RADIUS scheme **radius1** to the ISP domain, and specify local authentication as the secondary authentication method.

   ```
   [Device-isp-bbb] authentication lan-access radius-scheme radius1 local
   [Device-isp-bbb] authorization lan-access radius-scheme radius1 local
   [Device-isp-bbb] accounting lan-access radius-scheme radius1 local
   [Device-isp-bbb] quit
   ```

6. Configure 802.1X on the access device:

   # Enable 802.1X on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] dot1x
   ```

   # Enable MAC-based access control on the port. By default, the port uses MAC-based access control.

   ```
   [Device-GigabitEthernet1/0/1] dot1x port-method macbased
   ```

   # Specify ISP domain **bbb** as the mandatory domain.

   ```
   [Device-GigabitEthernet1/0/1] dot1x mandatory-domain bbb
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Enable 802.1X globally.

   ```
   [Device] dot1x
   ```

7. Configure the 802.1X client. If an iNode client is used, do not select the **Carry version info** option in the client configuration. (Details not shown.)

Verifying the configuration

Verify the 802.1X configuration on GigabitEthernet 1/0/1.

```
[Device] display dot1x interface gigabitethernet 1/0/1
```

Display the user connection information after an 802.1X user passes authentication.

```
[Device] display dot1x connection
```

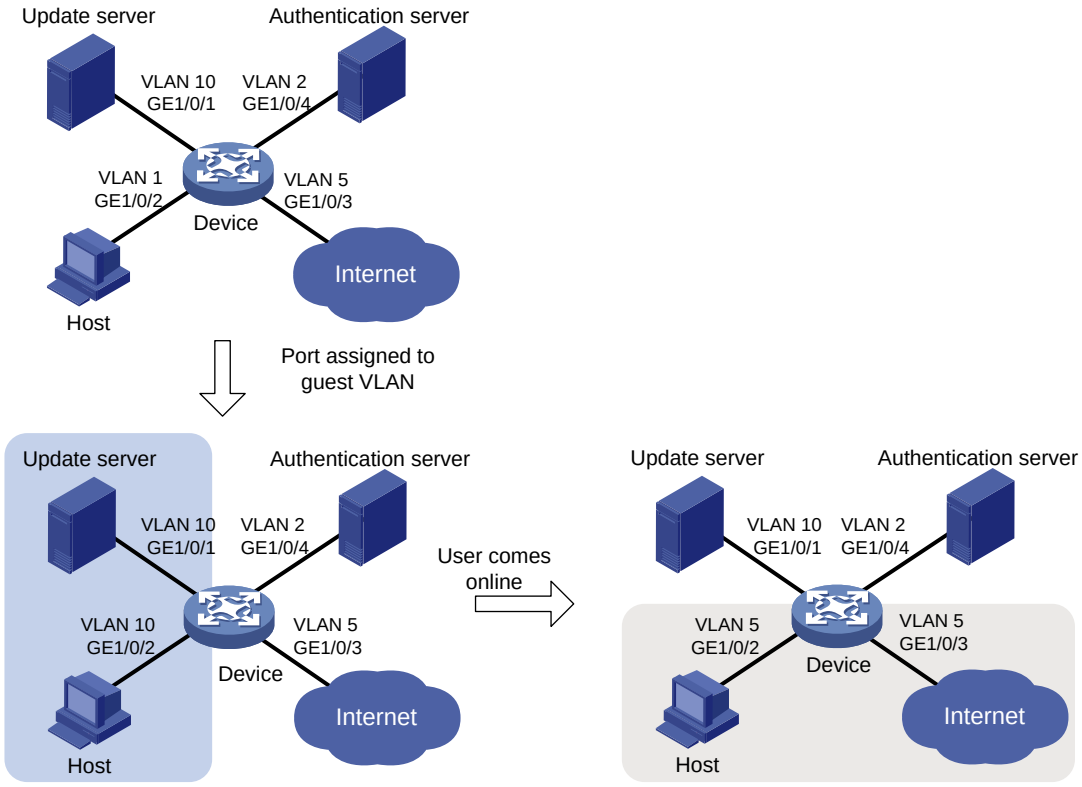
Example: Configuring 802.1X guest VLAN and authorization VLAN

Network configuration

As shown in Figure 13:

- Use RADIUS servers to perform authentication, authorization, and accounting for 802.1X users that connect to GigabitEthernet 1/0/2. Implement port-based access control on the port.
- Configure VLAN 10 as the 802.1X guest VLAN on GigabitEthernet 1/0/2. The host and the update server are both in VLAN 10, and the host can access the update server and download the 802.1X client software.
- Configure a QoS policy to deny packets destined for the Internet (5.1.1.1) and apply the QoS policy to the outbound direction of VLAN 10. The configuration prevents users in the 802.1X guest VLAN from accessing the Internet before they pass 802.1X authentication.
- After the host passes 802.1X authentication, the access device assigns the host to VLAN 5 where GigabitEthernet 1/0/3 is. The host can access the Internet.

Figure 13 Network diagram



Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS server to provide authentication, authorization, and accounting services. Configure user accounts and authorization VLAN (VLAN 5 in this example) for the users. (Details not shown.)
2. Create VLANs, and assign ports to the VLANs on the access device.

   NOTE:

   By default, VLAN 1 exists and all ports belong to the VLAN. You do not need to create the VLAN or assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   <Device> system-view
   [Device] vlan 10
   [Device-vlan10] port gigabitethernet 1/0/1
   [Device-vlan10] quit
   [Device] vlan 2
   [Device-vlan2] port gigabitethernet 1/0/4
   [Device-vlan2] quit
   [Device] vlan 5
   [Device-vlan5] port gigabitethernet 1/0/3
   [Device-vlan5] quit
   ```

3. Configure a QoS policy:

   # Configure advanced ACL 3000 to match packets destined for 5.1.1.1.

   ```
   [Device] acl advanced 3000
   [Device-acl-ipv4-adv-3000] rule permit ip destination 5.1.1.1 0.0.0.255
   [Device-acl-ipv4-adv-3000] quit
   ```

   # Specify advanced ACL 3000 in traffic class **classifier_1** to match traffic.

   ```
   [Device] traffic classifier classifier_1
   [Device-classifier-classifier_1] if-match acl 3000
   [Device-classifier-classifier_1] quit
   ```

   # Configure traffic behavior **behavior_1** to deny matching packets.

   ```
   [Device] traffic behavior behavior_1
   [Device-behavior-behavior_1] filter deny
   [Device-behavior-behavior_1] quit
   ```

   # Configure QoS policy **policy_1** to associate traffic class **classifier_1** with traffic behavior **behavior_1**.

   ```
   [Device] qos policy policy_1
   [Device-qospolicy-policy_1] classifier classifier_1 behavior behavior_1
   [Device-qospolicy-policy_1] quit
   ```

   # Apply QoS policy **policy_1** to the outbound direction of VLAN 10.

   ```
   [Device] qos vlan-policy policy_1 vlan 10 outbound
   ```

4. Configure a RADIUS scheme on the access device:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.11.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.11.1.1 1812
   ```

Specify the server at 10.11.1.1 as the primary accounting server, and set the accounting port to 1813.

```
[Device-radius-2000] primary accounting 10.11.1.1 1813
```

Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

```
[Device-radius-2000] key authentication simple abc
```

Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

```
[Device-radius-2000] key accounting simple abc
```

Exclude the ISP domain names from the usernames sent to the RADIUS server.

```
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

5. Configure an ISP domain on the access device:

Create ISP domain **bbb** and enter ISP domain view.

```
[Device] domain bbb
```

Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

```
[Device-isp-bbb] authentication lan-access radius-scheme 2000
[Device-isp-bbb] authorization lan-access radius-scheme 2000
[Device-isp-bbb] accounting lan-access radius-scheme 2000
[Device-isp-bbb] quit
```

6. Configure 802.1X on the access device:

Enable 802.1X on GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] dot1x
```

Implement port-based access control on the port.

```
[Device-GigabitEthernet1/0/2] dot1x port-method portbased
```

Set the port authorization mode to **auto**. By default, the port uses the auto mode.

```
[Device-GigabitEthernet1/0/2] dot1x port-control auto
```

Specify VLAN 10 as the 802.1X guest VLAN on GigabitEthernet 1/0/2.

```
[Device-GigabitEthernet1/0/2] dot1x guest-vlan 10
[Device-GigabitEthernet1/0/2] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

7. Configure the 802.1X client. Make sure the 802.1X client can update its IP address after the access port is assigned to the guest VLAN or an authorization VLAN. (Details not shown.)

Verifying the configuration

Verify the 802.1X guest VLAN configuration on GigabitEthernet 1/0/2.

```
[Device] display dot1x interface gigabitethernet 1/0/2
```

Verify that GigabitEthernet 1/0/2 is assigned to VLAN 10 before any user passes authentication on the port.

```
[Device] display vlan 10
```

After a user passes authentication, display information on GigabitEthernet 1/0/2. Verify that GigabitEthernet 1/0/2 is assigned to VLAN 5.

```
[Device] display interface gigabitethernet 1/0/2
```

Example: Configuring 802.1X with ACL assignment

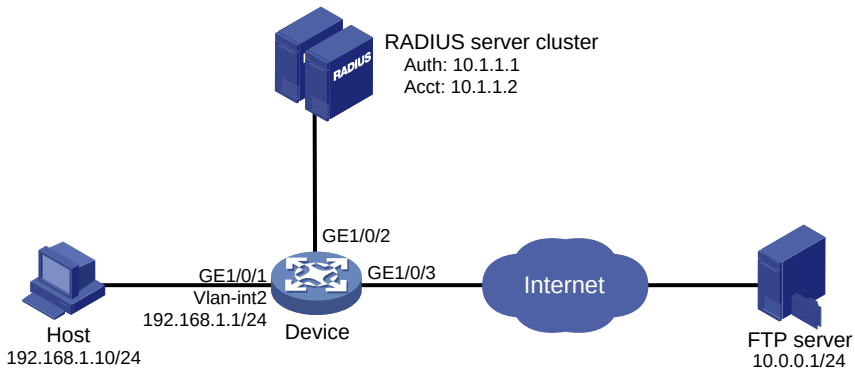
Network configuration

As shown in Figure 14, the host that connects to GigabitEthernet 1/0/1 must pass 802.1X authentication to access the Internet.

Perform 802.1X authentication on GigabitEthernet 1/0/1. Use the RADIUS server at 10.1.1.1 as the authentication and authorization server, and the RADIUS server at 10.1.1.2 as the accounting server.

Configure ACL assignment on GigabitEthernet 1/0/1 to deny access of 802.1X users to the FTP server from 8:00 to 18:00 on weekdays.

Figure 14 Network diagram



Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS servers to provide authentication, authorization, and accounting services. Add user accounts and specify the ACL (ACL 3000 in this example) for the users. (Details not shown.)
2. Assign an IP address to each interface, as shown in Figure 14. (Details not shown.)
3. Configure a RADIUS scheme on the access device:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   <Device> system-view
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   ```

   # Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

   ```
   [Device-radius-2000] primary accounting 10.1.1.2 1813
   ```

   # Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

   ```
   [Device-radius-2000] key authentication simple abc
   ```

   # Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

   ```
   [Device-radius-2000] key accounting simple abc
   ```

   # Exclude the ISP domain names from the usernames sent to the RADIUS server.

   ```
   [Device-radius-2000] user-name-format without-domain
   ```

```
[Device-radius-2000] quit
```

4. Configure an ISP domain on the access device:

   # Create ISP domain **bbb** and enter ISP domain view.

   ```
   [Device] domain bbb
   ```

   # Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

   ```
   [Device-isp-bbb] authentication lan-access radius-scheme 2000
   [Device-isp-bbb] authorization lan-access radius-scheme 2000
   [Device-isp-bbb] accounting lan-access radius-scheme 2000
   [Device-isp-bbb] quit
   ```

5. Configure a time range named **ftp** from 8:00 to 18:00 on weekdays on the access device.

   ```
   [Device] time-range ftp 8:00 to 18:00 working-day
   ```

6. Configure ACL 3000 to deny packets destined for the FTP server at 10.0.0.1 during the specified time range on the access device.

   ```
   [Device] acl advanced 3000
   [Device-acl-ipv4-adv-3000] rule 0 deny ip destination 10.0.0.1 0 time-range ftp
   [Device-acl-ipv4-adv-3000] quit
   ```

7. Configure 802.1X on the access device:

   # Enable 802.1X on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] dot1x
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Enable 802.1X globally.

   ```
   [Device] dot1x
   ```

8. Configure the 802.1X client. Make sure the client is able to update its IP address after the access port is assigned to the 802.1X guest VLAN or an authorization VLAN. (Details not shown.)

Verifying the configuration

Use the user account to pass authentication. (Details not shown.)

Verify that the user cannot ping the FTP server at any time from 8:00 to 18:00 on any weekday.

```
C:\>ping 10.0.0.1

Pinging 10.0.0.1 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 10.0.0.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

The output shows that ACL 3000 is active on the user, and the user cannot access the FTP server.

Example: Configuring 802.1X with EAD assistant (with DHCP relay agent)

Network configuration

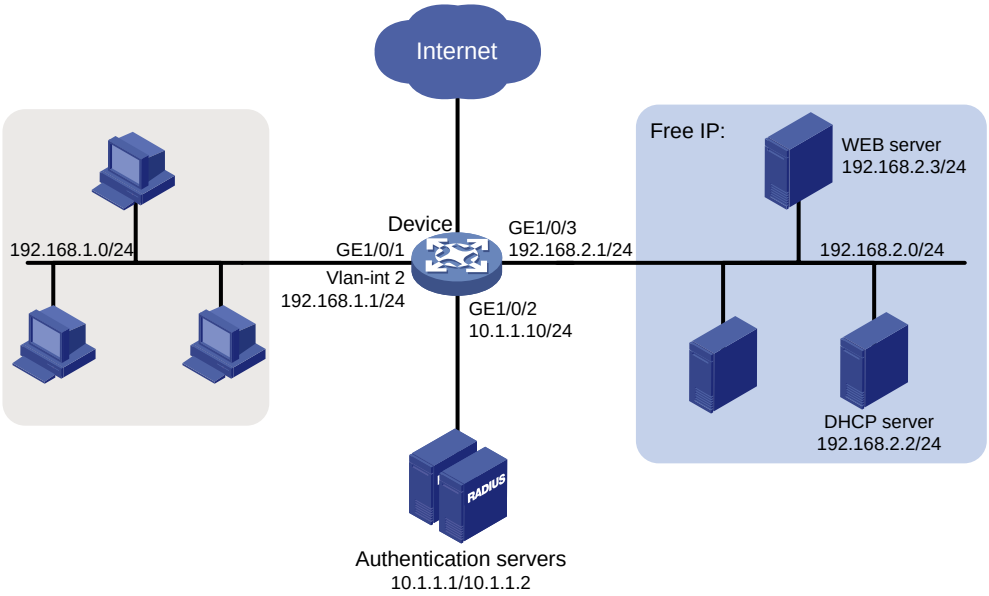
As shown in Figure 15:

- The intranet 192.168.1.0/24 is attached to GigabitEthernet 1/0/1 of the access device.
- The hosts use DHCP to obtain IP addresses.
- A DHCP server and a Web server are deployed on the 192.168.2.0/24 subnet for users to obtain IP addresses and download client software.

Deploy an EAD solution for the intranet to meet the following requirements:

- Allow unauthenticated users and users that have failed 802.1X authentication to access 192.168.2.0/24. The users can obtain IP addresses and download software.
- If these users use a Web browser to access a network other than 192.168.2.0/24, redirect them to the Web server for 802.1X client downloading.
- Allow authenticated 802.1X users to access the network.

Figure 15 Network diagram



Procedure

1. Make sure the DHCP server, the Web server, and the authentication servers have been configured correctly. (Details not shown.)
2. Configure an IP address for each interface. (Details not shown.)
3. Configure DHCP relay:

   # Enable DHCP.

   ```
   <Device> system-view
   [Device] dhcp enable
   ```

   # Enable the DHCP relay agent on VLAN-interface 2.

   ```
   [Device] interface vlan-interface 2
   [Device-Vlan-interface2] dhcp select relay
   ```

   # Specify the DHCP server 192.168.2.2 on the relay agent interface VLAN-interface 2.

```
[Device-Vlan-interface2] dhcp relay server-address 192.168.2.2
[Device-Vlan-interface2] quit
```

4. Configure a RADIUS scheme:

Create RADIUS scheme **2000** and enter RADIUS scheme view.

```
[Device] radius scheme 2000
```

Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

```
[Device-radius-2000] primary authentication 10.1.1.1 1812
```

Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

```
[Device-radius-2000] primary accounting 10.1.1.2 1813
```

Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

```
[Device-radius-2000] key authentication simple abc
```

Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

```
[Device-radius-2000] key accounting simple abc
```

Exclude the ISP domain names from the usernames sent to the RADIUS server.

```
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

5. Configure an ISP domain:

Create ISP domain **bbb** and enter ISP domain view.

```
[Device] domain bbb
```

Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

```
[Device-isp-bbb] authentication lan-access radius-scheme 2000
[Device-isp-bbb] authorization lan-access radius-scheme 2000
[Device-isp-bbb] accounting lan-access radius-scheme 2000
[Device-isp-bbb] quit
```

6. Configure 802.1X:

Configure the free IP.

```
[Device] dot1x ead-assistant free-ip 192.168.2.0 24
```

Configure the redirect URL for client software download.

```
[Device] dot1x ead-assistant url http://192.168.2.3
```

Enable the EAD assistant feature.

```
[Device] dot1x ead-assistant enable
```

Enable 802.1X on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] dot1x
[Device-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

Verifying the configuration

Verify the 802.1X configuration.

```
[Device] display dot1x
```

Verify that you can ping an IP address on the free IP subnet from a host.

```
C:\>ping 192.168.2.3
```

```
Pinging 192.168.2.3 with 32 bytes of data:

Reply from 192.168.2.3: bytes=32 time<1ms TTL=128
Reply from 192.168.2.3: bytes=32 time<1ms TTL=128
Reply from 192.168.2.3: bytes=32 time<1ms TTL=128
Reply from 192.168.2.3: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.2.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

The output shows that you can access the free IP subnet before passing 802.1X authentication.

Verify that you are redirected to the Web server when you enter in your Web browser an IP address not on the free IP. (Details not shown.)

Example: Configuring 802.1X with EAD assistant (with DHCP server)

Network configuration

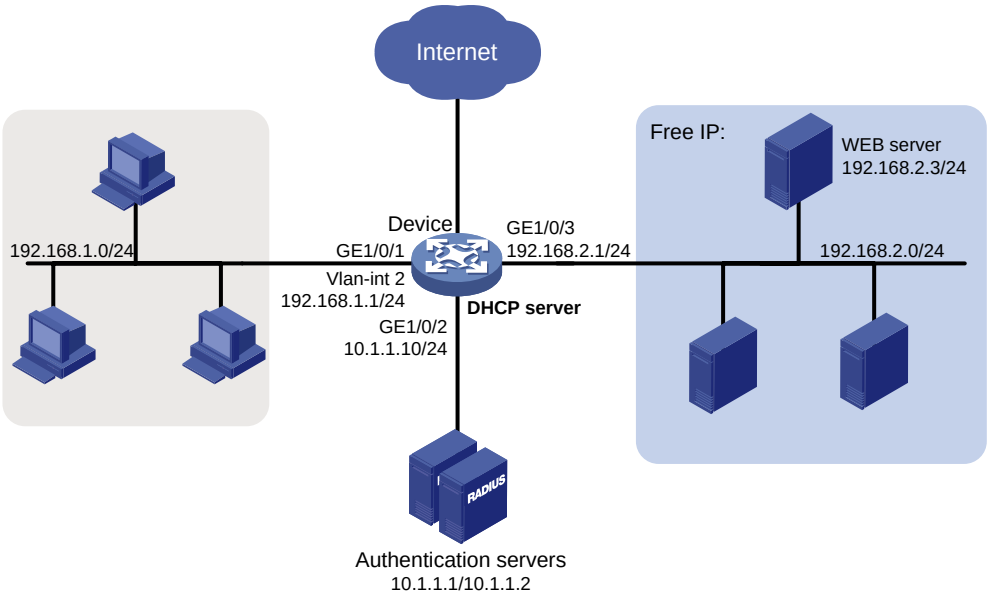
As shown in Figure 16:

- The intranet 192.168.1.0/24 is attached to GigabitEthernet 1/0/1 of the access device.
- The hosts use DHCP to obtain IP addresses.
- A Web server is deployed on the 192.168.2.0/24 subnet for users to download client software.

Deploy an EAD solution for the intranet to meet the following requirements:

- Allow unauthenticated users and users that have failed 802.1X authentication to access 192.168.2.0/24. The users can download software.
- If these users use a Web browser to access a network other than 192.168.2.0/24, redirect them to the Web server for 802.1X client downloading.
- Allow authenticated 802.1X users to access the network.

Figure 16 Network diagram



Procedure

1. Make sure the Web server and the authentication servers have been configured correctly. (Details not shown.)
2. Configure an IP address for each interface. (Details not shown.)
3. Configure the DHCP server:

   # Enable DHCP.

   ```
   <Device> system-view
   [Device] dhcp enable
   ```

   # Enable the DHCP server on VLAN-interface 2.

   ```
   [Device] interface vlan-interface 2
   [Device-Vlan-interface2] dhcp select server
   [Device-Vlan-interface2] quit
   ```

   # Create DHCP address pool **0**.

   ```
   [Device] dhcp server ip-pool 0
   ```

   # Specify subnet 192.168.1.0/24 in DHCP address pool 0.

   ```
   [Device-dhcp-pool-0] network 192.168.1.0 mask 255.255.255.0
   ```

   # Specify the gateway address 192.168.1.1 in DHCP address pool 0.

   ```
   [Device-dhcp-pool-0] gateway-list 192.168.1.1
   [Device-dhcp-pool-0] quit
   ```

4. Configure a RADIUS scheme:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   ```

   # Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

   ```
   [Device-radius-2000] primary accounting 10.1.1.2 1813
   ```

Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

```
[Device-radius-2000] key authentication simple abc
```

Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

```
[Device-radius-2000] key accounting simple abc
```

Exclude the ISP domain names from the usernames sent to the RADIUS server.

```
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

5. Configure an ISP domain:

Create ISP domain **bbb** and enter ISP domain view.

```
[Device] domain bbb
```

Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

```
[Device-isp-bbb] authentication lan-access radius-scheme 2000
[Device-isp-bbb] authorization lan-access radius-scheme 2000
[Device-isp-bbb] accounting lan-access radius-scheme 2000
[Device-isp-bbb] quit
```

6. Configure 802.1X:

Configure the free IP.

```
[Device] dot1x ead-assistant free-ip 192.168.2.0 24
```

Configure the redirect URL for client software download.

```
[Device] dot1x ead-assistant url http://192.168.2.3
```

Enable the EAD assistant feature.

```
[Device] dot1x ead-assistant enable
```

Enable 802.1X on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] dot1x
[Device-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

Verifying the configuration

Verify the 802.1X configuration.

```
[Device] display dot1x
```

Verify that you can ping an IP address on the free IP subnet from a host.

```
C:\>ping 192.168.2.3

Pinging 192.168.2.3 with 32 bytes of data:

Reply from 192.168.2.3: bytes=32 time<1ms TTL=128
Reply from 192.168.2.3: bytes=32 time<1ms TTL=128
Reply from 192.168.2.3: bytes=32 time<1ms TTL=128
Reply from 192.168.2.3: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.2.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
```

```
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

The output shows that you can access the free IP subnet before passing 802.1X authentication.

Verify that you are redirected to the Web server when you enter in your Web browser an IP address not on the free IP. (Details not shown.)

Troubleshooting 802.1X

EAD assistant URL redirection failure

Symptom

Unauthenticated users are not redirected to the specified redirect URL after they enter external website addresses in their Web browsers.

Analysis

Redirection will not happen for one of the following reasons:

- The address is in the string format. The operating system of the host regards the string as a website name and tries to resolve the string. If the resolution fails, the operating system sends an ARP request, but the target address is not in the dotted decimal notation. The redirection feature does redirect this kind of ARP request.
- The address is within a free IP segment. No redirection will take place, even if no host is present with the address.
- The redirect URL is not in a free IP segment.
- No server is using the redirect URL, or the server with the URL does not provide Web services.

Solution

To resolve the issue:

1. Enter a dotted decimal IP address that is not in any free IP segments.
2. Verify that the access device and the server are configured correctly.
3. If the issue persists, contact H3C Support.

Contents

Configuring MAC authentication

About MAC authentication

MAC authentication controls network access by authenticating source MAC addresses on a port. The feature does not require client software, and users do not have to enter a username and password for network access. The device initiates a MAC authentication process when it detects an unknown source MAC address on a MAC authentication-enabled port. If the MAC address passes authentication, the user can access authorized network resources. If the authentication fails, the device marks the MAC address as a silent MAC address, drops the packet, and starts a quiet timer. The device drops all subsequent packets from the MAC address within the quiet time. The quiet mechanism avoids repeated authentication during a short time.

User account policies

MAC authentication supports the following user account policies:

- **Global user account policy**—It can be either of the following options:
  - **MAC-based user account policy**—One MAC-based user account for each user. As shown in Figure 1, the access device uses the source MAC addresses in packets as the usernames and passwords of users for MAC authentication. This policy is suitable for an insecure environment.

    NOTE:

    MAC-based user account policy also supports configuring a password shared by all MAC-based user accounts.

  - **Shared user account policy**—One shared user account for all users. You specify one username and password, which are not necessarily a MAC address, for all MAC authentication users on the access device, as shown in Figure 2. This policy is suitable for a secure environment.
- **MAC range-specific user account policy**—One shared user account for users in a specific MAC address range. You specify one username and password (which are not necessarily a MAC address) for users in a specific MAC address range on the access device, as shown in Figure 3. For example, you can specify a username and password for users with a specific OUI for MAC authentication.

IMPORTANT:

- You can use global and MAC range-specific user account policies together. For users in a MAC address range, the MAC range-specific user account settings have higher priority than the global user account settings.
- If a RADIUS server is used for MAC authentication, you must create the user accounts on the RADIUS server based on the user account policy on the access device.

Figure 1 MAC-based user account policy

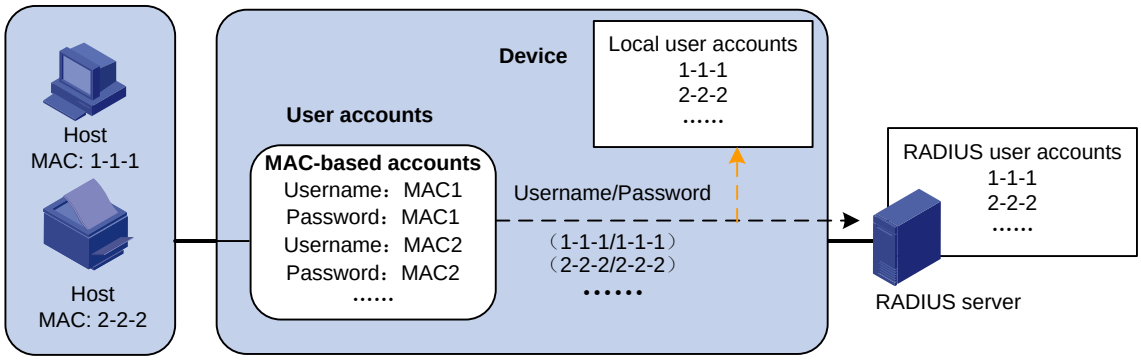

Figure 2 Shared user account policy (global)

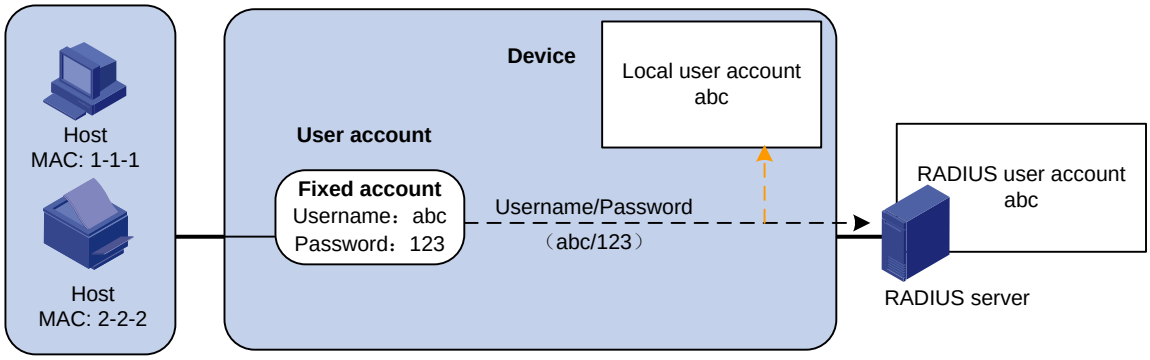

Figure 3 Shared user account policy (specific to MAC address ranges)

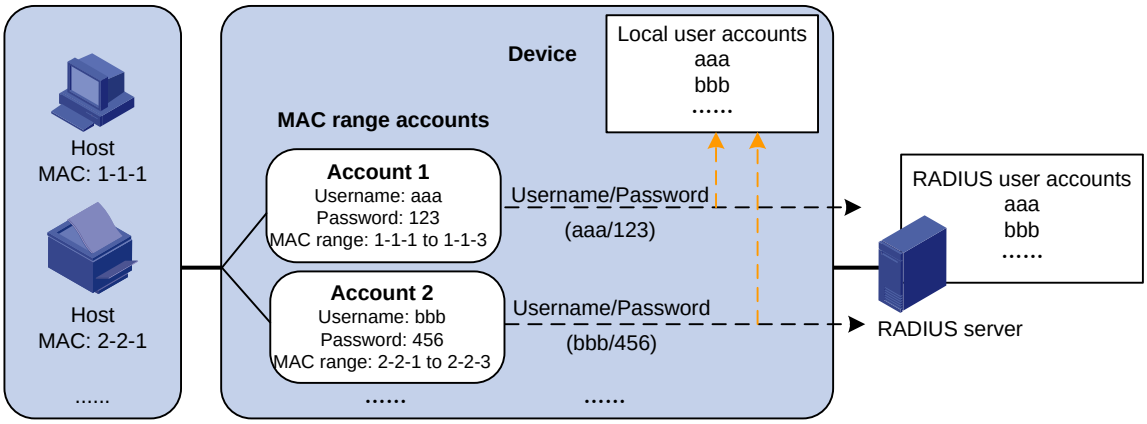


Authentication methods

You can perform MAC authentication on the access device (local authentication) or through a RADIUS server.

For more information about configuring local authentication and RADIUS authentication, see "Configuring AAA."

RADIUS authentication

If MAC-based accounts are used, the access device by default sends the source MAC address of a packet as the username and password to the RADIUS server for authentication. If a password is

configured for MAC-based accounts, the access device sends the configured password as the password to the RADIUS server.

If a shared account is used, the access device sends the shared account username and password to the RADIUS server for authentication.

The access device and the RADIUS server use Password Authentication Protocol (PAP) or Challenge Handshake Authentication Protocol (CHAP) for communication.

Local authentication

If MAC-based accounts are used, the access device by default uses the source MAC address of a packet as the username and password to search the local account database for a match. If a password is configured for MAC-based accounts, the device uses the configured password to search the local account database for a match.

If a shared account is used, the access device uses the shared account username and password to search the local account database for a match.

VLAN assignment

Authorization VLAN

The authorization VLAN controls the access of a MAC authentication user to authorized network resources. The device supports authorization VLANs assigned locally or by a remote server.

IMPORTANT:

Only remote servers can assign tagged authorization VLANs.

Remote VLAN authorization

In remote VLAN authorization, you must configure an authorization VLAN for a user on the remote server. After the user authenticates to the server, the server assigns authorization VLAN information to the device. Then, the device assigns the user access port to the authorization VLAN as a tagged or untagged member.

The device supports assignment of the following authorization VLAN information by the remote server:

- VLAN ID.
- VLAN name, which must be the same as the VLAN description on the access device.
- A string of VLAN IDs and VLAN names.

  In the string, some VLANs are represented by their IDs, and some VLANs are represented by their names.
- VLAN group name.

  For more information about VLAN groups, see *Layer 2—LAN Switching Configuration Guide*.
- VLAN ID with a suffix of **t** or **u**.

  The **t** and **u** suffixes require the device to assign the access port to the VLAN as a tagged or untagged member, respectively. For example, **2u** indicates assigning the port to VLAN 2 as an untagged member.

If a VLAN name or VLAN group name is assigned, the device converts the information into a VLAN ID before VLAN assignment.

IMPORTANT:

For a VLAN represented by its VLAN name to be assigned successfully, you must make sure the VLAN has been created on the device.

To assign VLAN IDs with suffixes, make sure the user access port is a hybrid or trunk port.

IMPORTANT:

To ensure a successful assignment, the authorization VLANs assigned by the remote server cannot be any of the following types:

- Dynamically learned VLANs.
- Reserved VLANs.
- Private VLANs.

If the server assigns a group of VLANs, the access device selects a VLAN as described in Table 1.

Table 1 Authorization VLAN selection from a group of VLANs

VLAN information	Authorization VLAN selection

VLAN IDs
VLAN names
VLAN group name
VLAN IDs and VLAN names
	The device selects an authorization VLAN from the VLAN group for a user according to the following rules:
	• On a hybrid port with MAC-based VLAN enabled:
	  ○ If the port does not have online users, the device selects the VLAN with the lowest ID.
	  ○ If the port has online users, the device selects the VLAN that has the fewest online users. If two VLANs have the same number of online 802.1X users, the device selects the VLAN with the lower ID.
	• On an access, trunk, or MAC-based VLAN disabled hybrid port:
	  ○ If the port does not have online users, the device selects the VLAN with the lowest ID.
	  ○ If the port has online users, the device examines the VLAN group for the VLAN of the online users. If the VLAN is found, the VLAN is assigned to the user as the authorization VLAN. If the VLAN is not found, VLAN authorization fails.

VLAN IDs with suffixes	**1.** The device selects the leftmost VLAN ID without a suffix, or the leftmost VLAN ID suffixed by **u** as an untagged VLAN, whichever is more leftmost. **2.** The device assigns the untagged VLAN to the port as the PVID, and it assigns the remaining as tagged VLANs. If no untagged VLAN is assigned, the PVID of the port does not change. The port permits traffic from these tagged and untagged VLANs to pass through. For example, the authentication server sends the string **1u 2t 3** to the access device for a user. The device assigns VLAN 1 as an untagged VLAN and all remaining VLANs (including VLAN 3) as tagged VLANs. VLAN 1 becomes the PVID.

In Release 6318P01 and later, the device includes the User-VLAN-ID attribute in RADIUS accounting requests to inform the RADIUS server of the authorization VLAN assigned to MAC authentication users. The RADIUS server can then include user authorization VLAN information in its logs about MAC authentication users.

- If the RADIUS server assigns a VLAN ID or VLAN name as the authorization VLAN to a user, the device includes the server-assigned authorization VLAN in the User-VLAN-ID attribute.
- If the RADIUS server assigns a group of VLANs in the authorization VLAN information to a user, the device includes a VLAN in the User-VLAN-ID attribute as described in Table 2.

Table 2 Including a VLAN in the User-VLAN-ID attribute of RADIUS accounting packets

VLAN information	VLAN in the User-VLAN-ID attribute
VLAN IDs VLAN names VLAN group name	• If the device has selected an authorization VLAN when it starts accounting for the user, it includes the selected VLAN in the User-VLAN-ID attribute. The VLAN will be included in start-accounting, real-time accounting, and stop-accounting

VLAN information	VLAN in the User-VLAN-ID attribute
VLAN IDs and VLAN names	request packets. • If the device has not selected an authorization VLAN when it starts accounting for the user, it includes the user's initial VLAN in the User-VLAN-ID attribute in start-accounting request packets. When sending real-time accounting or stop-accounting request packets, the device includes the assigned authorization VLAN in the User-VLAN-ID attribute.
VLAN IDs with suffixes	The device includes the untagged authorization VLAN in the User-VLAN-ID attribute in RADIUS accounting request packets. If no untagged authorization VLAN is available, the device includes the user's initial VLAN in the User-VLAN-ID attribute in RADIUS accounting request packets.

Local VLAN authorization

To perform local VLAN authorization for a user, specify the VLAN ID in the authorization attribute list of the local user account for that user. For each local user, you can specify only one authorization VLAN ID. The user access port is assigned to the VLAN as an untagged member.

IMPORTANT:

Local VLAN authorization does not support assignment of tagged VLANs.

For more information about local user configuration, see "Configuring AAA."

Authorization VLAN manipulation on a MAC authentication-enabled port

Table 3 describes the way the network access device handles authorization VLANs (except for the VLANs specified with suffixes) for MAC authenticated users on a port.

Table 3 VLAN manipulation

Port type	VLAN manipulation
• Access port • Trunk port • Hybrid port with MAC-based VLAN disabled	• The device assigns the port to the first authenticated user's authorization VLAN and sets the VLAN as the PVID if that authorization VLAN has the untagged attribute. • If the authorization VLAN has the tagged attribute, the device assigns the port to the authorization VLAN without changing its PVID. **NOTE:** The tagged attribute is supported only on trunk and hybrid ports.
Hybrid port with MAC-based VLAN enabled	The device maps the MAC address of each user to its own authorization VLAN regardless of whether the port is a tagged member. The PVID of the port does not change.

IMPORTANT:

- If the users are attached to a port whose link type is access, make sure the authorization VLAN assigned by the server has the untagged attribute. VLAN assignment will fail if the server issues a VLAN that has the tagged attribute.
- When you assign VLANs to users attached to a trunk port or a MAC-based VLAN disabled hybrid port, make sure there is only one untagged VLAN. If a different untagged VLAN is assigned to a subsequent user, the user cannot pass authentication.
- As a best practice to enhance network security, do not use the **`port hybrid vlan`** command to assign a hybrid port to an authorization VLAN as a tagged member.

The VLAN assigned by the server to a user as an authorization VLAN might have been configured on the user access port but with a different tagging mode. For example, the server assigns an authorization VLAN with the tagged attribute, but the same VLAN configured on the port has the untagged attribute. In this situation, the VLAN settings that take effect on the user depend on the link type of the port.

- If the link type of the port is access or trunk, the authorization VLAN settings assigned by the server always take effect on the user as long as the user is online. After the user goes offline, the VLAN settings on the port take effect.
- If the link type of the port is hybrid, the VLAN settings configured on the port take effect. For example, the server assigns VLAN 30 with the untagged attribute to a user on the hybrid port. However, VLAN 30 has been configured on the port with the tagged attribute by using the **`port hybrid vlan tagged`** command. Finally, the VLAN has the tagged attribute on the port.

For a MAC authenticated user to access the network on a hybrid port when no authorization VLAN is configured for the user, perform one of the following tasks:

- If the port receives tagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as a tagged member in the VLAN.
- If the port receives untagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as an untagged member in the VLAN.

Guest VLAN

The MAC authentication guest VLAN on a port accommodates users that have failed MAC authentication for any reason other than server unreachable. For example, the VLAN accommodates users with invalid passwords entered.

You can deploy a limited set of network resources in the MAC authentication guest VLAN. For example, a software server for downloading software and system patches.

A hybrid port is always assigned to a MAC authentication guest VLAN as an untagged member. After the assignment, do not reconfigure the port as a tagged member in the VLAN.

The device reauthenticates users in the MAC authentication guest VLAN at a specific interval. Table 4 shows the way that the network access device handles guest VLANs for MAC authentication users.

Table 4 VLAN manipulation

Authentication status	VLAN manipulation
A user in the MAC authentication guest VLAN fails MAC authentication.	The user is still in the MAC authentication guest VLAN.
A user in the MAC authentication guest VLAN passes MAC authentication.	The device remaps the MAC address of the user to the authorization VLAN assigned by the authentication server. If no authorization VLAN is configured for the user on the authentication server, the device remaps the MAC address of the user to the PVID of the port.

Critical VLAN

The MAC authentication critical VLAN on a port accommodates users that have failed MAC authentication because no RADIUS authentication servers are reachable. Users in a MAC authentication critical VLAN can access only network resources in the critical VLAN.

The critical VLAN feature takes effect when MAC authentication is performed only through RADIUS servers. If a MAC authentication user fails local authentication after RADIUS authentication, the user is not assigned to the critical VLAN. For more information about the authentication methods, see "Configuring AAA."

Table 5 shows the way that the network access device handles critical VLANs for MAC authentication users.

Table 5 VLAN manipulation

Authentication status	VLAN manipulation
A user fails MAC authentication because all the RADIUS servers are unreachable.	The device maps the MAC address of the user to the MAC authentication critical VLAN. The user is still in the MAC authentication critical VLAN if the user fails MAC reauthentication because all the RADIUS servers are unreachable. If no MAC authentication critical VLAN is configured, the device maps the MAC address of the user to the PVID of the port.
A user in the MAC authentication guest VLAN fails authentication because all the RADIUS servers are unreachable.	The user remains in the MAC authentication guest VLAN.
A user in the MAC authentication critical VLAN fails MAC authentication for any reason other than server unreachable.	If a guest VLAN has been configured, the device maps the MAC address of the user to the guest VLAN. If no guest VLAN is configured, the device maps the MAC address of the user to the PVID of the port.
A user in the MAC authentication critical VLAN passes MAC authentication.	The device remaps the MAC address of the user to the authorization VLAN assigned by the authentication server. If no authorization VLAN is configured for the user on the authentication server, the device remaps the MAC address of the user to the PVID of the access port.

Critical voice VLAN

The MAC authentication critical voice VLAN on a port accommodates MAC authentication voice users that have failed authentication because none of the RADIUS servers in their ISP domain are reachable.

The critical voice VLAN feature takes effect when MAC authentication is performed only through RADIUS servers. If a MAC authentication voice user fails local authentication after RADIUS authentication, the user is not assigned to the critical voice VLAN. For more information about the authentication methods, see "Configuring AAA."

Table 6 shows the way that the network access device handles critical voice VLANs for MAC authentication voice users.

Table 6 VLAN manipulation

Authentication status	VLAN manipulation
A voice user fails MAC authentication because all the RADIUS servers are unreachable.	The device maps the MAC address of the voice user to the MAC authentication critical voice VLAN. The voice user is still in the MAC authentication critical voice VLAN if the voice user fails MAC reauthentication because all the RADIUS servers are unreachable. If no MAC authentication critical voice VLAN is configured, the device maps the MAC address of the voice user to the PVID of the port.
A voice user in the MAC authentication critical voice VLAN fails MAC authentication for any reason other than server unreachable.	If a guest VLAN has been configured, the device maps the MAC address of the voice user to the guest VLAN. If no guest VLAN is configured, the device maps the MAC address of the voice user to the PVID of the port.

Authentication status	VLAN manipulation
A voice user in the MAC authentication critical voice VLAN passes MAC authentication.	The device remaps the MAC address of the voice user to the authorization VLAN assigned by the authentication server. If no authorization VLAN is configured for the voice user on the authentication server, the device remaps the MAC address of the voice user to the PVID of the access port.

ACL assignment

You can specify an authorization ACL in the user account for a MAC authentication user on the authentication server to control the user's access to network resources. After the user passes MAC authentication, the authentication server assigns the authorization ACL to the user access port. Then, the port permits or drops the matching traffic for the user depending on the rules configured in the ACL. This ACL is called an authorization ACL.

The device supports assignment of static and dynamic ACLs as authorization ACLs.

- **Static ACLs**—Static ACLs can be assigned by a RADIUS server or the access device. When the server or access device assigns a static ACL to a user, it assigns only the ACL number. You must manually create the ACL and configure its rules on the access device.

  To change the access permissions of a user, you can use one of the following methods:

  - Modify ACL rules in the authorization ACL on the access device.
  - Assign another ACL to the user from the RADIUS server or the access device.

  Static ACLs and their rules can be manually deleted from the access device.
- **Dynamic ACLs**—Dynamic ACLs and their rules are automatically deployed by a RADIUS server, which are not configurable on the access device. Dynamic ACLs can only be named ACLs. After the device receives a server-deployed dynamic ACL and its rules, it automatically creates the ACL and configures its rules.

  If the dynamic ACL assigned by the server to a user has the same name as a static ACL, the dynamic ACL cannot be issued and the user cannot come online.

  A dynamic ACL and its rules are automatically deleted from the access device after all its users go offline.

  Dynamic ACLs and their rules cannot be manually modified or deleted on the access device. To display information about dynamic ACLs and their rules, use the **`display mac-authentication connection`** or **`display acl`** command.

IMPORTANT:

Assignment of dynamic ACLs is supported only in Release 6309P01 or later.

The supported authorization ACLs include the following types:

- Basic ACLs, which are numbered in the range of 2000 to 2999.
- Advanced ACLs, which are numbered in the range of 3000 to 3999.
- Layer 2 ACLs, which are numbered in the range of 4000 to 4999.

IMPORTANT:

For an authorization ACL to take effect, make sure the ACL exists with rules and none of the rules contains the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, **`cos`**, **`dest-mac`**, **`lsap`**, **`vxlan`**, or **`logging`** keyword.

For more information about ACLs, see *ACL and QoS Configuration Guide*.

User profile assignment

You can specify a user profile in the user account for a MAC authentication user on the authentication server to control the user's access to network resources. After the user passes MAC authentication, the authentication server assigns the user profile to the user to filter traffic for this user.

The authentication server can be the local access device or a RADIUS server. In either case, the server only specifies the user profile name. You must configure the user profile on the access device.

To change the user's access permissions, you can use one of the following methods:

- Modify the user profile configuration on the access device.
- Specify another user profile for the user on the authentication server.

For more information about user profiles, see "Configuring user profiles."

Redirect URL assignment

The device supports the URL attribute assigned by a RADIUS server. During MAC authentication, the HTTP or HTTPS requests of a user are redirected to the Web interface specified by the server-assigned URL attribute. After the user passes the Web authentication, the RADIUS server records the MAC address of the user and uses a DM (Disconnect Message) to log off the user. When the user initiates MAC authentication again, it will pass the authentication and come online successfully.

By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

Periodic MAC reauthentication

Periodic MAC reauthentication tracks the connection status of online users, and updates the authorization attributes assigned by the RADIUS server. The attributes include the ACL and VLAN.

The device reauthenticates online MAC authentication users at the periodic reauthentication interval when the periodic MAC reauthentication feature is enabled. The interval is controlled by a timer and the timer is user configurable. A change to the periodic reauthentication timer applies to online MAC authentication users only after the old timer expires and the MAC authentication users pass authentication.

The server-assigned RADIUS Session-Timeout (attribute 27) and Termination-Action (attribute 29) attributes together can affect the periodic MAC reauthentication feature. To display the server-assigned Session-Timeout and Termination-Action attributes, use the **display mac-authentication connection** command.

- If the termination action is to log off users, periodic MAC reauthentication takes effect only when the periodic reauthentication timer is shorter than the session timeout timer. If the session timeout timer is shorter, the device logs off online authenticated users when the session timeout timer expires.
- If the termination action is to reauthenticate users, the periodic MAC reauthentication configuration on the device cannot take effect. The device reauthenticates online MAC authentication users after the server-assigned session timeout timer expires.

If no session timeout timer is assigned by the server, whether the device performs periodic MAC reauthentication depends on the periodic MAC reauthentication configuration on the device. Support for the assignment of Session-Timeout and Termination-Action attributes depends on the server model.

With the RADIUS DAS feature enabled, the device immediately reauthenticates a user upon receiving a CoA message that carries the reauthentication attribute from a RADIUS authentication server. In this case, reauthentication will be performed regardless of whether periodic MAC reauthentication is enabled on the device. For more information about RADIUS DAS configuration, see "Configuring AAA."

By default, the device logs off online MAC authentication users if no server is reachable for MAC reauthentication. The keep-online feature keeps authenticated MAC authentication users online when no server is reachable for MAC reauthentication.

The VLANs assigned to an online user before and after reauthentication can be the same or different.

Restrictions and guidelines: MAC authentication configuration

When you configure MAC authentication on an interface, follow these restrictions and guidelines:

- MAC authentication is supported only on Layer 2 Ethernet interfaces that do not belong to an aggregation group.
- Do not change the link type of a port when the MAC authentication guest VLAN or critical VLAN on the port has users.

If the MAC address that has failed authentication is a static MAC address or a MAC address that has passed any security authentication, the device does not mark the MAC address as a silent address.

To ensure a successful HTTPS redirect for users who are assigned a redirect URL, make sure VLAN interfaces exist for the VLANs that transport their packets.

MAC authentication tasks at a glance

To configure MAC authentication, perform the following tasks:

1. Enabling MAC authentication
2. Configure basic MAC authentication features
   - Specifying a MAC authentication method
   - Specifying a MAC authentication domain
   - Configuring user account policy
   - (Optional.) Configuring MAC authentication timers
   - (Optional.) Configuring periodic MAC reauthentication
3. (Optional.) Configuring MAC authentication VLAN assignment
   - Configuring a MAC authentication guest VLAN
   - Configuring a MAC authentication critical VLAN
   - Enabling the MAC authentication critical voice VLAN feature
4. (Optional.) Configuring other MAC authentication features
   - Configuring unauthenticated MAC authentication user aging
   - Configuring MAC authentication offline detection
   - Configuring packet detection for MAC authentication
   - Enabling online user synchronization for MAC authentication
   - Setting the maximum number of concurrent MAC authentication users on a port
   - Enabling MAC authentication multi-VLAN mode on a port

     Perform this task to not reauthenticate online users when VLAN changes occur on a port.

Prerequisites for MAC authentication

Before you configure MAC authentication, complete the following tasks:

1. Make sure the port security feature is disabled. For more information about port security, see "Configuring port security."
2. Configure an ISP domain and specify an AAA method. For more information, see "Configuring AAA."
   - For local authentication, you must also create local user accounts (including usernames and passwords) and specify the **lan-access** service for local users.
   - For RADIUS authentication, make sure the device and the RADIUS server can reach each other and create user accounts on the RADIUS server. If you are using MAC-based accounts, make sure the username and password for each account are the same as the MAC address of each MAC authentication user.

Enabling MAC authentication

Restrictions and guidelines

For MAC authentication to take effect on a port, you must enable this feature globally and on the port.

MAC authentication cannnot take effect on a port if the device has run out of ACL resources when you perform either of the following operations:

- Enable MAC authentication on the port while MAC authentication has been enabled globally.
- Enable MAC authentication globally in system while MAC authentication has been enabled on the port.

Procedure

1. Enter system view.
   `system-view`
2. Enable MAC authentication globally.
   `mac-authentication`
   By default, MAC authentication is disabled globally.
3. Enter interface view.
   `interface` *`interface-type interface-number`*
4. Enable MAC authentication on the port.
   `mac-authentication`
   By default, MAC authentication is disabled on a port.

Specifying a MAC authentication method

About MAC authentication methods

RADIUS-based MAC authentication supports the following authentication methods:

- **PAP**—Transports usernames and passwords in plain text. The authentication method applies to scenarios that do not require high security.
- **CHAP**—Transports usernames in plain text and passwords in encrypted form over the network. CHAP is more secure than PAP.

Restrictions and guidelines

The device must use the same authentication method as the RADIUS server.

Procedure

1. Enter system view.
   system-view
2. Specify an authentication method for MAC authentication.
   mac-authentication authentication-method { **chap** | **pap** }
   By default, the device uses PAP for MAC authentication.

Specifying a MAC authentication domain

About authentication domains for MAC authentication

By default, MAC authentication users are in the system default authentication domain. To implement different access policies for users, you can use one of the following methods to specify authentication domains for MAC authentication users:

- Specify a global authentication domain in system view. This domain setting applies to all ports enabled with MAC authentication.
- Specify an authentication domain for an individual port in interface view.

MAC authentication chooses an authentication domain for users on a port in this order: the port-specific domain, the global domain, and the default domain. For more information about authentication domains, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Specify an authentication domain for MAC authentication users.
   - In system view:
     mac-authentication domain *domain-name*
   - In interface view:
     interface *interface-type interface-number*
     mac-authentication domain *domain-name*

   By default, the system default authentication domain is used for MAC authentication users.

Configuring user account policy

Restrictions and guidelines

IMPORTANT:
MAC range-specific user accounts are supported only in Release 6310 or later.

For users in a MAC address range, the MAC address range-specific user account has higher priority than the global user account settings.

You can configure a maximum of 16 MAC address ranges and must make sure the MAC address ranges do not overlap.

If you configure user account settings multiple times for the same MAC address range, the most recent configuration overwrites the previous configuration.

The MAC range-specific accounts apply only to unicast MAC addresses.

- If you specify a MAC address range that contains only multicast MAC addresses, execution of this command will fail.
- If you specify a MAC address range that contains both unicast and multicast MAC addresses, the command takes effect only on unicast MAC addresses.

The all-zero MAC address is invalid for MAC authentication. Users with the all-zero MAC address cannot pass MAC authentication.

Procedure

1. Enter system view.

   system-view

2. Configure the global MAC authentication user account policy.
   - Use one MAC-based user account for each user.

     mac-authentication user-name-format mac-address [{ **with-hyphen** [**separator colon**] | **without-hyphen** } [**lowercase** | **uppercase**]] [**password** { **cipher** | **simple** } *string*]

     The **separator colon** keywords are available only in Release 6340 and later.
   - Use one shared user account for all users.

     mac-authentication user-name-format fixed [**account** *name*] [**password** { **cipher** | **simple** } *string*]

   By default, the device uses the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation without hyphens, and letters are in lower case.
3. Specify one shared user account specific to a MAC address range.

   mac-authentication mac-range-account mac-address *mac-address* **mask** { *mask* | *mask-length* } **account** *name* **password** { **cipher** | **simple** } *string*

   By default, no username or password is configured specific to a MAC address range. The global user account policy applies to the users.

Configuring MAC authentication timers

About MAC authentication timers

MAC authentication uses the following timers:

- **Offline detection timer**—Sets the interval that the device must wait for traffic from a user before the device determines that the user is idle. If the device has not received traffic from a user before the timer expires, the device logs off that user and requests the accounting server to stop accounting for the user. This timer takes effect only when the MAC authentication offline detection feature is enabled.

  As a best practice, set the MAC address aging timer to the same value as the offline detection timer. This operation prevents a MAC authenticated user from being logged off within the offline detect interval because of MAC address entry expiration.
- **Quiet timer**—Sets the interval that the device must wait before the device can perform MAC authentication for a user that has failed MAC authentication. All packets from the MAC address are dropped during the quiet time. This quiet mechanism prevents repeated authentication from affecting system performance.

- **Server timeout timer**—Sets the interval that the device waits for a response from a RADIUS server before the device determines that the RADIUS server is unavailable. If the timer expires during MAC authentication, the user fails MAC authentication.

Restrictions and guidelines

To avoid forced logoff before the server timeout timer expires, set the server timeout timer to a value that is lower than or equal to the product of the following values:

- The maximum number of RADIUS packet transmission attempts set by using the **retry** command in RADIUS scheme view.
- The RADIUS server response timeout timer set by using the **timer response-timeout** command in RADIUS scheme view.

For information about setting the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer, see "Configuring AAA."

Procedure

1. Enter system view.

   system-view
2. Configure MAC authentication timers.

   mac-authentication timer { **offline-detect** *offline-detect-value* | **quiet** *quiet-value* | **server-timeout** *server-timeout-value* }

   By default, the offline detection timer is 300 seconds, the quiet timer is 60 seconds, and the server timeout timer is 100 seconds.

Configuring periodic MAC reauthentication

Restrictions and guidelines

The device selects a periodic reauthentication timer for MAC reauthentication in the following order:

1. Server-assigned reauthentication timer.
2. Port-specific reauthentication timer.
3. Global reauthentication timer.
4. Default reauthentication timer.

Modification to the MAC authentication domain, MAC authentication method, or user account format setting does not affect the reauthentication of online MAC authentication users. The modified setting takes effect only on MAC authentication users that come online after the modification.

If periodic reauthentication is triggered for a user while that user is waiting for online synchronization, the system performs online synchronization and does not perform reauthentication for the user.

Procedure

1. Enter system view.

   system-view
2. Set the periodic MAC reauthentication timer.
   - Set a global periodic reauthentication timer.

     mac-authentication timer reauth-period *reauth-period-value*

     The default setting is 3600 seconds.
   - Execute the following commands in sequence to set a port-specific periodic reauthentication timer:

     interface *interface-type interface-number*

     mac-authentication timer reauth-period *reauth-period-value*

quit

By default, no periodic MAC reauthentication timer is set on a port. The port uses the global periodic MAC reauthentication timer.

3. Enter interface view.
   interface *interface-type interface-number*
4. Enable periodic MAC reauthentication.
   mac-authentication re-authenticate

   By default, periodic MAC reauthentication is disabled on a port.
5. (Optional.) Enable the keep-online feature for MAC authenticated users on the port.
   mac-authentication re-authenticate server-unreachable keep-online

   By default, the keep-online feature is disabled. The device logs off online MAC authentication users if no server is reachable for MAC reauthentication.

   In a fast-recovery network, you can use the keep-online feature to prevent MAC authentication users from coming online and going offline frequently.

Configuring a MAC authentication guest VLAN

Restrictions and guidelines

When you configure the MAC authentication guest VLAN on a port, follow the guidelines in Table 7.

Table 7 Relationships of the MAC authentication guest VLAN with other security features

Feature	Relationship description	Reference
Quiet feature of MAC authentication	The MAC authentication guest VLAN feature has higher priority. When a user fails MAC authentication, the user can access the resources in the guest VLAN. The user's MAC address is not marked as a silent MAC address.	See "Configuring MAC authentication timers."
Port intrusion protection	The guest VLAN feature has higher priority than the block MAC action but lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure the MAC authentication guest VLAN on a port, complete the following tasks:

- Create the VLAN to be specified as the MAC authentication guest VLAN.
- Configure the port as a hybrid port, and configure the VLAN as an untagged member on the port.
- Enable MAC-based VLAN on the port.

For information about VLAN configuration, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify the MAC authentication guest VLAN on the port.
   mac-authentication guest-vlan *guest-vlan-id*

By default, no MAC authentication guest VLAN is specified on a port.

You can configure only one MAC authentication guest VLAN on a port. The MAC authentication guest VLANs on different ports can be different.

4. Set the authentication interval for users in the MAC authentication guest VLAN.

   mac-authentication guest-vlan auth-period *period-value*

   The default setting is 30 seconds.

Configuring a MAC authentication critical VLAN

Restrictions and guidelines

When you configure the MAC authentication critical VLAN on a port, follow the guidelines in Table 8.

Table 8 Relationships of the MAC authentication critical VLAN with other security features

Feature	Relationship description	Reference
Quiet feature of MAC authentication	The MAC authentication critical VLAN feature has higher priority. When a user fails MAC authentication because no RADIUS authentication server is reachable, the user can access the resources in the critical VLAN. The user's MAC address is not marked as a silent MAC address.	See "Configuring MAC authentication timers."
Port intrusion protection	The critical VLAN feature has higher priority than the block MAC action but lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure the MAC authentication critical VLAN on a port, complete the following tasks:

- Create the VLAN to be specified as the MAC authentication critical VLAN.
- Configure the port as a hybrid port, and configure the VLAN as an untagged member on the port.
- Enable MAC-based VLAN on the port.

For information about VLAN configuration, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify the MAC authentication critical VLAN on the port.

   mac-authentication critical vlan *critical-vlan-id*

   By default, no MAC authentication critical VLAN is specified on a port.

   You can configure only one MAC authentication critical VLAN on a port. The MAC authentication critical VLANs on different ports can be different.

Enabling the MAC authentication critical voice VLAN feature

Hardware and feature compatibility

This feature is not supported on the following switch series:

- S5000E-X.
- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000X-EI.
- WAS6000.

Prerequisites

Before you enable the MAC authentication critical voice VLAN feature on a port, complete the following tasks:

- Enable LLDP both globally and on the port.

  The device uses LLDP to identify voice users. For information about LLDP, see *Layer 2—LAN Switching Configuration Guide*.
- Enable voice VLAN on the port.

  For information about voice VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- Specify a MAC authentication critical VLAN on the port. This setting ensures that a voice user is assigned to the critical VLAN if it has failed authentication for unreachability of RADIUS servers before the device recognizes it as a voice user. If a MAC authentication critical VLAN is not available, the voice user might be logged off instead.

Procedure

1. Enter system view.

   `system-view`
2. Enter interface view.

   `interface` *`interface-type interface-number`*
3. Enable the MAC authentication critical voice VLAN feature on a port.

   `mac-authentication critical-voice-vlan`

   By default, the MAC authentication critical voice VLAN feature is disabled on a port.

Configuring unauthenticated MAC authentication user aging

About unauthenticated MAC authentication user aging

Unauthenticated MAC authentication user aging applies to users added to a MAC authentication guest or critical VLAN because they have not been authenticated or have failed authentication.

When a user in one of those VLANs ages out, the device removes the user from the VLAN and deletes the MAC address entry for the user from the access port.

For users in one of those VLANs on one port to be authenticated successfully and come online on another port, enable this feature. In any other scenarios, disable this feature as a best practice.

Restrictions and guidelines

As a best practice, use this feature on a port only if you want to have its unauthenticated users to be authenticated and come online on a different port.

Procedure

1. Enter system view.

   system-view

2. Set the user aging timer for a type of MAC authentication VLAN.

   mac-authentication timer user-aging { **critical-vlan** | **guest-vlan** } *aging-time-value*

   By default, the user aging timer is 1000 seconds for all applicable types of MAC authentication VLANs.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable unauthenticated MAC authentication user aging.

   mac-authentication unauthenticated-user aging enable

   By default, unauthenticated MAC authentication user aging is enabled.

Configuring MAC authentication offline detection

About MAC authentication offline detection

Enable MAC authentication offline detection to detect idle users on a port. If the port has not received traffic from a user when the offline detection timer expires, the device logs off that user and requests the accounting server to stop accounting for the users. For information about setting the offline detection timer in system view, see "Configuring MAC authentication timers."

Disabling this feature disables the device from inspecting the online user status.

In addition to port-based MAC authentication offline detection, you can configure offline detection parameters on a per-user basis, as follows:

- Set an offline detection timer specific to a user and control whether to use the ARP snooping or ND snooping table to determine the offline state of the user.
  - If the ARP snooping or ND snooping table is used, the device searches the ARP snooping or ND snooping table before it checks for traffic from the user within the detection interval. If a matching ARP snooping or ND snooping entry is found, the device resets the offline detection timer and the user stays online. If the offline detection timer expires because the device has not found a matching snooping entry for the user or received traffic from the user, the device disconnects the user.
  - If the ARP or ND snooping table is not used, the device disconnects the user if it has not received traffic from that user before the offline detection timer expires.

  When disconnecting the user, the device also notifies the RADIUS server (if any) to stop user accounting.
- Skip offline detection for the user. You can choose this option if the user is a dumb terminal. A dumb terminal might fail to come online again after it is logged off by the offline detection feature.

The device uses the offline detection settings for a user in the following sequence:

1. User-specific offline detection settings.
2. Offline detection settings assigned to the user by the RADIUS server. The settings include the offline detection timer, use of the ARP or ND snooping table in offline detection, and whether to ignore offline detection.

3. Port-based offline detection settings.

Restrictions and guidelines

When MAC authentication offline detection is used, make sure the aging timer value for dynamic MAC address entries is less than or equal to the default offline detection timer value (300 seconds) for MAC authentication users. The aging timer for dynamic MAC address entries is configurable with the **mac-address timer aging** *seconds* command.

For the user-specific offline detection feature to take effect on a user, make sure the MAC authentication offline detection feature is enabled on the user's access port.

The user-specific offline detection settings take effect on the online users immediately after they are configured.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Configure MAC authentication offline detection for a user.

   mac-authentication offline-detect mac-address *mac-address* { **ignore** | **timer** *offline-detect-value* [**check-arp-or-nd-snooping**] }

   By default, offline detection settings configured on access ports take effect and the offline detection timer set in system view is used.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable MAC authentication offline detection.

   mac-authentication offline-detect enable

   By default, MAC authentication offline detection is enabled on a port.

Configuring packet detection for MAC authentication

About this task

When packet detection for MAC authentication is enabled on a port, the device sends detection packets to MAC authentication users connected to that port at offline detection intervals set by using the offline detection timer. If the device does not receive a response from a user after it has made the maximum packet transmission attempts within an offline detection interval, it logs off that user and requests the RADIUS server to stop accounting for the user.

When packet detection for MAC authentication and MAC authentication offline detection are both enabled, the device processes a MAC authentication user as follows:

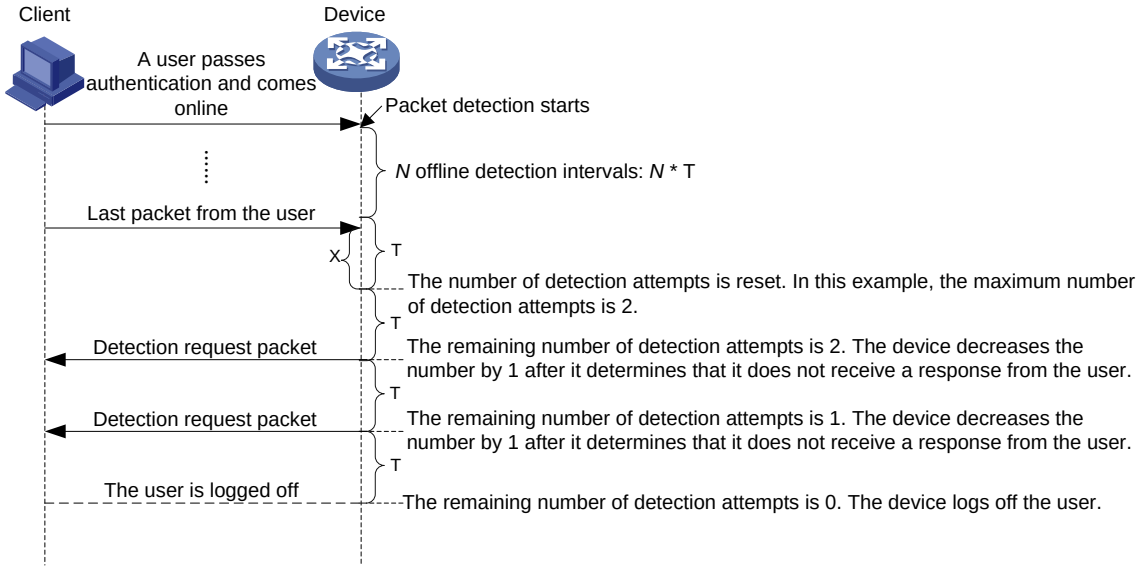
- If MAC authentication offline detection determines that a user is online, the device does not send detection packets to that user.
- If MAC authentication offline detection determines that a user is offline, the device does not immediately logs off that user. Instead, the device sends a detection packet to that user. It will log off that user if it does not receive a response from that user after it has made the maximum packet transmission attempts within an offline detection interval.

MAC authentication uses ARP request packets to detect the online status of IPv4 users and uses NS packets to detect the online status of IPv6 users.

Packet detection adopts the principle of counting prior to judging. The device decreases the detection attempts (packet transmission attempts) by 1 only after it determines that it does not receive a response from a user. The device stops the detection process when the number of detection attempts becomes 0. The duration from the time when the user sends the last packet to the

time when the user is logged off is calculated by using the following formula: duration = (*retries* + 1) * T + X. Figure 4 shows the packet detection process. In this example, the device sends a detection packet to a MAC authentication user for a maximum of two times.

Figure 4 Network diagram for packet detection process



The duration from the time when the user sends the last packet to the time when the user is logged off equals to 3 * T + X.

Feature and software version comaptibiltiy

This feature is supported only in Release 6348P01 and later.

Restrictions and guidelines

To ensure that the device is aware of user IP address changes, enable ARP snooping and ND snooping in conjunction with packet detection for MAC authentication. If you do not enable ARP snooping or ND snooping, the device is unaware of user IP address changes. As a result, the device still sends detection packets to the users' original IP addresses and falsely log off these users.

Procedure

1. Enter system view.

   system-view

2. Set the offline detection timer.

   mac-authentication timer offline-detect *offline-detect-value*

   By default, the offline detection timer expires in 300 seconds.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable packet detection for MAC authentication.

   mac-authentication packet-detect enable

   By default, packet detection for MAC authentication is disabled.

5. Set the maximum number of attempts for sending a detection packet to a MAC authentication user.

   mac-authentication packet-detect retry *retries*

   By default, the device sends a detection packet to a MAC authentication user for a maximum of two times.

Enabling online user synchronization for MAC authentication

About online user synchronization for MAC authentication

IMPORTANT:

This feature takes effect only when the device uses an IMC RADIUS server to authenticate MAC authentication users.

To ensure that the RADIUS server maintains the same online MAC authentication user information as the device after the server state changes from unreachable to reachable, use this feature.

This feature synchronizes online MAC authentication user information between the device and the RADIUS server when the RADIUS server state is detected having changed from unreachable to reachable.

When synchronizing online MAC authentication user information on a port with the RADIUS server, the device initiates MAC authentication in turn for each authenticated online MAC authentication user to the RADIUS server.

If synchronization fails for an online user, the device logs off that user unless the failure occurs because the server has become unreachable again.

Restrictions and guidelines

The amount of time required to complete online user synchronization increases as the number of online users grows. This might result in an increased delay for new MAC authentication users and users in the critical VLAN to authenticate or reauthenticate to the RADIUS server and come online.

To have this feature take effect, you must use it in conjunction with the RADIUS server status detection feature, which is configurable with the **`radius-server test-profile`** command. For more information about the RADIUS server status detection feature, see "Configuring AAA."

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable online user synchronization for MAC authentication.
   `mac-authentication server-recovery online-user-sync`
   By default, online user synchronization for MAC authentication is disabled.

Setting the maximum number of concurrent MAC authentication users on a port

About limiting the number of concurrent MAC authentication users on a port

Perform this task to prevent the system resources from being overused.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.

interface *interface-type interface-number*

3. Set the maximum number of concurrent MAC authentication users on the port.

   mac-authentication max-user *max-number*

   The default setting is 4294967295.

Enabling MAC authentication multi-VLAN mode on a port

About VLAN modes of MAC authentication

By default, MAC authentication single-VLAN mode applies on a port. In this mode, traffic from an online user cannot be sent in different VLANs on a port without service interruption. To accommodate applications that are sensitive to delay or service interruption in a multi-VLAN environment, for example, IP phones, enable MAC authentication multi-VLAN mode.

In multi-VLAN mode, the port forwards traffic from a user in different VLANs without reauthentication if the user has been authenticated and come online in any VLAN on the port. Free of reauthentication, traffic from an online user can be sent in different VLANs without delay or service interruption.

In single-VLAN mode, the port reauthenticates an online user when traffic received from that user contains a VLAN tag different from the VLAN in which the user was authenticated. The authentication process differs depending on the MAC move setting in port security and the authorization VLAN assignment status, as follows:

- If no authorization VLAN has been assigned to the online user, the device first logs off the user and then reauthenticates the user in the new VLAN.
- If the online user has been assigned an authorization VLAN, the device handles the user depending on the MAC move setting in port security.
  - If MAC move is disabled in port security, the user cannot pass authentication and come online from the new VLAN until after it goes offline from the port.
  - If MAC move is enabled in port security, the user can pass authentication on the new VLAN and come online without having to first go offline from the port. After the user passes authentication on the new VLAN, the original authentication session of the user is deleted from the port.

To enable the port security MAC move feature, use the **port-security mac-move permit** command.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable MAC authentication multi-VLAN mode.

   mac-authentication host-mode multi-vlan

   By default, MAC authentication operates in single-VLAN mode on a port.

Configuring MAC authentication delay

About MAC authentication delay

When both 802.1X authentication and MAC authentication are enabled on a port, you can delay MAC authentication so that 802.1X authentication is preferentially triggered.

If no 802.1X authentication is triggered or 802.1X authentication fails within the delay period, the port continues to process MAC authentication.

Restrictions and guidelines

Do not set the port security mode to **mac-else-userlogin-secure** or **mac-else-userlogin-secure-ext** when you use MAC authentication delay. The delay does not take effect on a port in either of the two modes. For more information about port security modes, see "Configuring port security."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable MAC authentication delay and set the delay timer.
   mac-authentication timer auth-delay *time*
   By default, MAC authentication delay is disabled.

Including user IP addresses in MAC authentication requests

About the feature of including user IP addresses in MAC authentication requests

IMPORTANT:
This feature can only operate in conjunction with an IMC server.

To avoid IP conflicts that result from changes to static IP addresses, use this feature on a port that has MAC authentication users with static IP addresses.

This feature adds user IP addresses to the MAC authentication requests sent to the authentication server. When MAC authentication is triggered for a user, the device checks the user's IP address for invalidity.

- If the IP address is valid, the device sends a MAC authentication request with the IP address included.
- If the IP address is not a valid host IP address or the triggering packet does not contain an IP address, the device does not initiate MAC authentication.
- If the packet is a DHCP packet with a source IP address of 0.0.0.0, the device sends a MAC authentication request without including the IP address. In this case, the IMC server does not examine the user IP address when it performs authentication.

Upon receipt of the authentication request that includes a user's IP address, the IMC server compares the user's IP and MAC addresses with its local IP-MAC mappings.

- If an exact match is found or if no match is found, the user passes MAC authentication. In the latter case, the server creates an IP-MAC mapping for the user.
- If a mapping is found for the MAC address but the IP addresses do not match, the user fails the MAC authentication.

Restrictions and guidelines

Do not use this feature in conjunction with the MAC authentication guest VLAN on a port. If both features are used, the device cannot perform MAC authentication for a user once that user is added to the MAC authentication guest VLAN.

You can specify an ACL to identify source IP addresses that can or cannot trigger MAC authentication. When you configure the ACL, follow these guidelines:

- The specified ACL number represents an IPv4 ACL and an IPv6 ACL with the same number. For example, if the ACL number is 2000, you specify both IPv4 ACL 2000 and IPv6 ACL 2000. The IPv4 ACL and the IPv6 ACL will be used to process IPv4 packets and IPv6 packets, respectively.
- Use permit rules to identify source IP addresses that are valid for MAC authentication. Use deny rules to identify source IP addresses that cannot trigger MAC authentication.
- In the rules, only the action keyword (permit or deny) and the source IP match criterion can take effect.
- As a best practice, configure a deny rule to exclude the IPv6 IP addresses that start with fe80 from triggering MAC authentication.
- If you configure permit rules, add a **`deny all`** rule at the bottom of the ACL.

IMPORTANT:

If the user host is configured with IPv6, the device might receive packets that contain an IPv6 link-local address, which starts with fe80. MAC authentication failure or incorrect MAC-IP binding will occur if this address is used in MAC authentication. To avoid these issues, configure a basic ACL to exclude the IPv6 IP addresses that start with fe80.

Procedure

1. Enter system view.

   `system-view`
2. Enter interface view.

   `interface` *`interface-type interface-number`*
3. Include user IP addresses in MAC authentication requests.

   `mac-authentication carry user-ip` [**`exclude-ip acl`** *`acl-number`*]

   By default, a MAC authentication request does not include the user IP address.

Enabling parallel processing of MAC authentication and 802.1X authentication

About parallel processing of MAC authentication and 802.1X authentication

This feature enables a port that processes MAC authentication after 802.1X authentication is finished to process MAC authentication in parallel with 802.1X authentication.

Make sure the port meets the following requirements:

- The port is configured with both 802.1X authentication and MAC authentication and performs MAC-based access control for 802.1X authentication.
- The port is enabled with the 802.1X unicast trigger.

When the port receives a packet from an unknown MAC address, it sends a unicast EAP-Request/Identity packet to the MAC address. After that, the port immediately processes MAC authentication without waiting for the 802.1X authentication result.

After MAC authentication succeeds, the port is assigned to the MAC authentication authorization VLAN.

- If 802.1X authentication fails, the MAC authentication result takes effect.
- If 802.1X authentication succeeds, the device handles the port and the MAC address based on the 802.1X authentication result.

The process sequence of 802.1X authentication and MAC authentication is configurable in other ways. For the port to perform MAC authentication before it is assigned to the 802.1X guest VLAN, enable new MAC-triggered 802.1X guest VLAN assignment delay. For information about new MAC-triggered 802.1X guest VLAN assignment delay, see "Configuring 802.1X."

Restrictions and guidelines

To configure both 802.1X authentication and MAC authentication on the port, use one of the following methods:

- Enable the 802.1X and MAC authentication features separately on the port.
- Enable port security on the port. The port security mode must be **userlogin-secure-or-mac** or **userlogin-secure-or-mac-ext**.

  For information about port security mode configuration, see "Configuring port security."

For the parallel processing feature to work correctly, do not enable MAC authentication delay on the port. This operation will delay MAC authentication after 802.1X authentication is triggered.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable parallel processing of MAC authentication and 802.1X authentication on the port.

   mac-authentication parallel-with-dot1x

   By default, this feature is disabled.

Logging off MAC authentication users

About this task

Perform this task to log off the specified MAC authentication users and clear information about these users from the device. These users must perform MAC authentication to come online again.

Software version and feature compatibility

This feature is supported only in Release 6318P01 and later.

Procedure

To log off MAC authentication users, execute the following command in user view:

reset mac-authentication access-user [**interface** *interface-type interface-number* | **mac** *mac-address* | **username** *username* | **vlan** *vlan-id*]

Enabling MAC authentication user logging

About MAC authentication user logging

This feature enables the device to generate logs about MAC authentication users and send the logs to the information center. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

To prevent excessive MAC authentication user log entries, use this feature only if you need to analyze abnormal MAC authentication user logins or logouts.

Procedure

1. Enter system view.

   system-view

2. Enable MAC authentication user logging.

   mac-authentication access-user log enable [**failed-login** | **logoff** | **successful-login**] *

   By default, MAC authentication user logging is disabled.

   If you do not specify any parameters, this command enables all types of MAC authentication user logs.

Display and maintenance commands for MAC authentication

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display MAC authentication information.	**display mac-authentication** [**interface** *interface-type interface-number*]
Display MAC authentication connections.	**display mac-authentication connection** [**open**] [**interface** *interface-type interface-number* | **slot** *slot-number* | **user-mac** *mac-address* | **user-name** *user-name*]
Display the MAC addresses of MAC authentication users in a type of MAC authentication VLAN.	**display mac-authentication mac-address** { **critical-vlan** | **guest-vlan** } [**interface** *interface-type interface-number*]
Clear MAC authentication statistics.	**reset mac-authentication statistics** [**interface** *interface-type interface-number*]
Remove users from the MAC authentication critical VLAN on a port.	**reset mac-authentication critical vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]
Remove users from the MAC authentication critical voice VLAN on a port.	**reset mac-authentication critical-voice-vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]
Remove users from the MAC authentication guest VLAN on a port.	**reset mac-authentication guest-vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]

MAC authentication configuration examples

Example: Configuring local MAC authentication

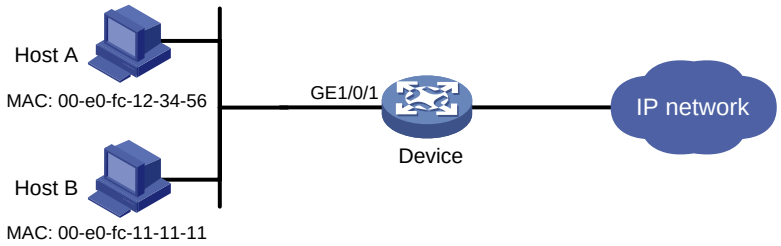
Network configuration

As shown in Figure 5, the device performs local MAC authentication on GigabitEthernet 1/0/1 to control Internet access of users.

Configure the device to meet the following requirements:

- Detect whether a user has gone offline every 180 seconds.
- Deny a user for 180 seconds if the user fails MAC authentication.
- Authenticate all users in ISP domain **bbb**.
- Use the MAC address of each user as both the username and password for authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

Figure 5 Network diagram



Procedure

Add a network access local user. In this example, configure both the username and password as Host A's MAC address 00-e0-fc-12-34-56.

```
<Device> system-view
[Device] local-user 00-e0-fc-12-34-56 class network
[Device-luser-network-00-e0-fc-12-34-56] password simple 00-e0-fc-12-34-56
```

Specify the LAN access service for the user.

```
[Device-luser-network-00-e0-fc-12-34-56] service-type lan-access
[Device-luser-network-00-e0-fc-12-34-56] quit
```

Configure ISP domain **bbb** to perform local authentication for LAN users.

```
[Device] domain bbb
[Device-isp-bbb] authentication lan-access local
[Device-isp-bbb] quit
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] mac-authentication
[Device-GigabitEthernet1/0/1] quit
```

Specify ISP domain **bbb** as the MAC authentication domain.

```
[Device] mac-authentication domain bbb
```

Configure MAC authentication timers.

```
[Device] mac-authentication timer offline-detect 180
[Device] mac-authentication timer quiet 180
```

Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

```
[Device] mac-authentication user-name-format mac-address with-hyphen lowercase
```

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Verifying the configuration

Display MAC authentication settings and statistics to verify your configuration.

```
[Device] display mac-authentication
 Global MAC authentication parameters:
   MAC authentication                  : Enabled
   Authentication method               : PAP
   User name format                    : MAC address in lowercase(xx-xx-xx-xx-xx-xx)
           Username                    : mac
           Password                    : Not configured
   Offline detect period               : 180 s
   Quiet period                        : 180 s
   Server timeout                      : 100 s
   Reauth period                       : 3600 s
   User aging period for critical VLAN : 1000 s
   User aging period for guest VLAN    : 1000 s
   Authentication domain               : bbb
 Online MAC-auth wired users           : 1

 Silent MAC users:
          MAC address       VLAN ID  From port               Port index
          00e0-fc11-1111    8        GE1/0/1                 1

 GigabitEthernet1/0/1 is link-up
   MAC authentication               : Enabled
   Carry User-IP                    : Disabled
   Authentication domain            : Not configured
   Auth-delay timer                 : Disabled
   Periodic reauth                  : Disabled
   Re-auth server-unreachable       : Logoff
   Guest VLAN                       : Not configured
   Guest VLAN reauthentication      : Enabled
     Guest VLAN auth-period         : 30 s
   Critical VLAN                    : Not configured
   Critical voice VLAN              : Disabled
   Host mode                        : Single VLAN
   Offline detection                : Enabled
   Authentication order             : Default
   User aging                       : Enabled
   Server-recovery online-user-sync : Enabled

   Auto-tag feature                 : Disabled
   VLAN tag configuration ignoring  : Disabled
   Max online users                 : 4294967295
```

```
Authentication attempts          : successful 1, failed 0
Current online users             : 1
       MAC address       Auth state
       00e0-fc12-3456    Authenticated
```

The output shows that Host A has passed MAC authentication and has come online. Host B failed MAC authentication and its MAC address is marked as a silent MAC address.

Example: Configuring RADIUS-based MAC authentication

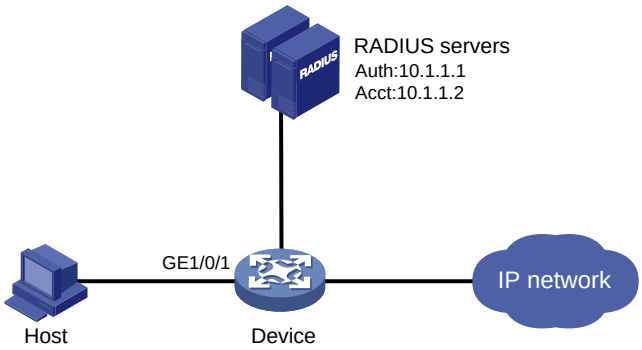
Network configuration

As shown in Figure 6, the device uses RADIUS servers to perform authentication, authorization, and accounting for users. The RADIUS servers use the CHAP authentication method.

To control user access to the Internet by MAC authentication, perform the following tasks:

- Enable MAC authentication globally and on GigabitEthernet 1/0/1.
- Configure the device to use CHAP for MAC authentication.
- Configure the device to detect whether a user has gone offline every 180 seconds.
- Configure the device to deny a user for 180 seconds if the user fails MAC authentication.
- Configure all users to belong to ISP domain **bbb**.
- Use a shared user account for all users, with username **aaa** and password **123456**.

Figure 6 Network diagram



Procedure

Make sure the RADIUS servers and the access device can reach each other.

1. Configure the RADIUS servers to provide authentication, authorization, and accounting services. Create a shared account with username **aaa** and password **123456** for MAC authentication users. (Details not shown.)
2. Configure RADIUS-based MAC authentication on the device:

   # Configure a RADIUS scheme.

```
<Device> system-view
[Device] radius scheme 2000
[Device-radius-2000] primary authentication 10.1.1.1 1812
[Device-radius-2000] primary accounting 10.1.1.2 1813
[Device-radius-2000] key authentication simple abc
[Device-radius-2000] key accounting simple abc
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

Specify CHAP as the authentication method for MAC authentication.

```
[Device] mac-authentication authentication-method chap
```

Apply the RADIUS scheme to ISP domain **bbb** for authentication, authorization, and accounting.

```
[Device] domain bbb
[Device-isp-bbb] authentication default radius-scheme 2000
[Device-isp-bbb] authorization default radius-scheme 2000
[Device-isp-bbb] accounting default radius-scheme 2000
[Device-isp-bbb] quit
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] mac-authentication
[Device-GigabitEthernet1/0/1] quit
```

Specify the MAC authentication domain as ISP domain **bbb**.

```
[Device] mac-authentication domain bbb
```

Set MAC authentication timers.

```
[Device] mac-authentication timer offline-detect 180
[Device] mac-authentication timer quiet 180
```

Specify username **aaa** and password **123456** in plain text for the account shared by MAC authentication users.

```
[Device] mac-authentication user-name-format fixed account aaa password simple 123456
```

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Verifying the configuration

Verify the MAC authentication configuration.

```
[Device] display mac-authentication
 Global MAC authentication parameters:
   MAC authentication                  : Enabled
   Authentication method               : CHAP
   Username format                     : Fixed account
           Username                    : aaa
           Password                    : ******
   Offline detect period               : 180 s
   Quiet period                        : 180 s
   Server timeout                      : 100 s
   Reauth period                       : 3600 s
   User aging period for critical VLAN : 1000 s
   User aging period for guest VLAN    : 1000 s

Host mode                        : Single VLAN
Offline detection                : Enabled
Authentication order             : Default
User aging                       : Enabled
Server-recovery online-user-sync : Enabled

Auto-tag feature                 : Disabled
VLAN tag configuration ignoring  : Disabled
Max online users                 : 4294967295
Authentication attempts          : successful 1, failed 0
Current online users             : 1
       MAC address       Auth state
       00e0-fc12-3456    Authenticated
```

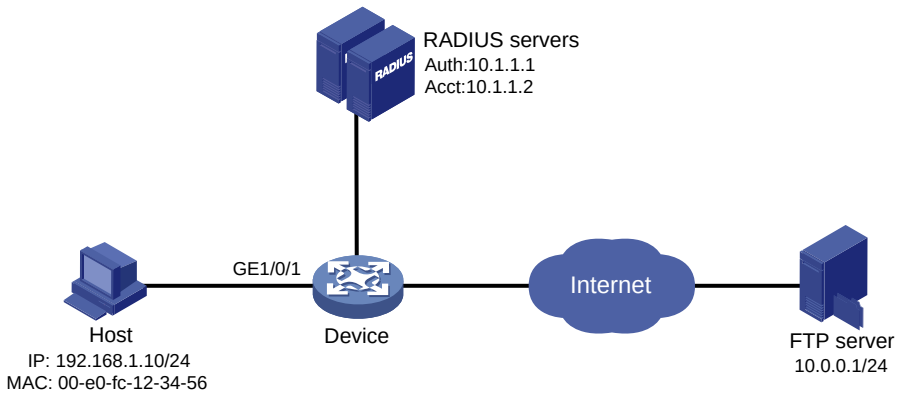
Example: Configuring ACL assignment for MAC authentication

Network configuration

As shown in Figure 7, configure the device to meet the following requirements:

- Use RADIUS servers to perform authentication, authorization, and accounting for users.
- Perform MAC authentication on GigabitEthernet 1/0/1 to control Internet access.
- Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.
- Use an ACL to deny authenticated users to access the FTP server at 10.0.0.1.

Figure 7 Network diagram



Procedure

Make sure the RADIUS servers and the access device can reach each other.

1. Configure the RADIUS servers:

Configure the RADIUS servers to provide authentication, authorization, and accounting services. (Details not shown.)

Add a user account with **00-e0-fc-12-34-56** as both the username and password on each RADIUS server. (Details not shown.)

Specify ACL 3000 as the authorization ACL for the user account. (Details not shown.)

2. Configure ACL 3000 to deny packets destined for 10.0.0.1 on the device.

```
<Device> system-view
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule 0 deny ip destination 10.0.0.1 0
[Device-acl-ipv4-adv-3000] quit
```

3. Configure RADIUS-based MAC authentication on the device:

Configure a RADIUS scheme.

```
[Device] radius scheme 2000
[Device-radius-2000] primary authentication 10.1.1.1 1812
[Device-radius-2000] primary accounting 10.1.1.2 1813
[Device-radius-2000] key authentication simple abc
[Device-radius-2000] key accounting simple abc
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

Apply the RADIUS scheme to an ISP domain for authentication, authorization, and accounting.

```
[Device] domain bbb
[Device-isp-bbb] authentication default radius-scheme 2000
[Device-isp-bbb] authorization default radius-scheme 2000
[Device-isp-bbb] accounting default radius-scheme 2000
[Device-isp-bbb] quit
```

Specify the ISP domain for MAC authentication.

```
[Device] mac-authentication domain bbb
```

Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

```
[Device] mac-authentication user-name-format mac-address with-hyphen lowercase
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] mac-authentication
[Device-GigabitEthernet1/0/1] quit
```

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Verifying the configuration

Verify the MAC authentication configuration.

```
[Device] display mac-authentication
 Global MAC authentication parameters:
   MAC authentication                 : Enable
   Authentication method              : PAP
```

```
  Username format                    : MAC address in lowercase(xx-xx-xx-xx-xx-xx)
          Username                   : mac
          Password                   : Not configured
  Offline detect period              : 300 s
  Quiet period                       : 60 s
  Server timeout                     : 100 s
  Reauth period                      : 3600 s
  User aging period for critical VLAN : 1000 s
  User aging period for guest VLAN    : 1000 s
  Authentication domain              : bbb
Online MAC-auth wired users          : 1

Silent MAC users:
         MAC address       VLAN ID  From port               Port index

GigabitEthernet1/0/1  is link-up
  MAC authentication               : Enabled
  Carry User-IP                    : Disabled
  Authentication domain            : Not configured
  Auth-delay timer                 : Disabled
  Periodic reauth                  : Disabled
  Re-auth server-unreachable       : Logoff
  Guest VLAN                       : Not configured
  Guest VLAN reauthentication      : Enabled
    Guest VLAN auth-period         : 30 s
  Critical VLAN                    : Not configured
  Critical voice VLAN              : Disabled
  Host mode                        : Single VLAN
  Offline detection                : Enabled
  Authentication order             : Default
  User aging                       : Enabled
  Server-recovery online-user-sync : Enabled

  Auto-tag feature                 : Disabled
  VLAN tag configuration ignoring  : Disabled
  Max online users                 : 4294967295
  Authentication attempts          : successful 1, failed 0
  Current online users             : 1
         MAC address       Auth state
         00e0-fc12-3456    Authenticated
```

Verify that you cannot ping the FTP server from the host.

```
C:\>ping 10.0.0.1

Pinging 10.0.0.1 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
```

```
Request timed out.

Ping statistics for 10.0.0.1:
   Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

The output shows that ACL 3000 has been assigned to GigabitEthernet 1/0/1 to deny access to the FTP server.

Contents

Configuring portal authentication

About portal authentication

Portal authentication controls user access to networks. Portal authenticates a user by the username and password the user enters on a portal authentication page. Typically, portal authentication is deployed on the access layer and vital data entries.

In a portal-enabled network, users can actively initiate portal authentication by visiting the authentication website provided by the portal Web server. Or, they are redirected to the portal authentication page for authentication when they visit other websites.

The device supports Portal 1.0, Portal 2.0, and Portal 3.0.

Advantages of portal authentication

Portal authentication has the following advantages:

- Allows users to perform authentication through a Web browser without installing client software.
- Provides ISPs with diversified management choices and extended functions. For example, the ISPs can place advertisements, provide community services, and publish information on the authentication page.
- Supports multiple authentication modes. For example, re-DHCP authentication implements a flexible address assignment scheme and saves public IP addresses. Cross-subnet authentication can authenticate users who reside in a different subnet than the access device.

Extended portal functions

By forcing patching and anti-virus policies, extended portal functions help hosts to defend against viruses. Portal supports the following extended functions:

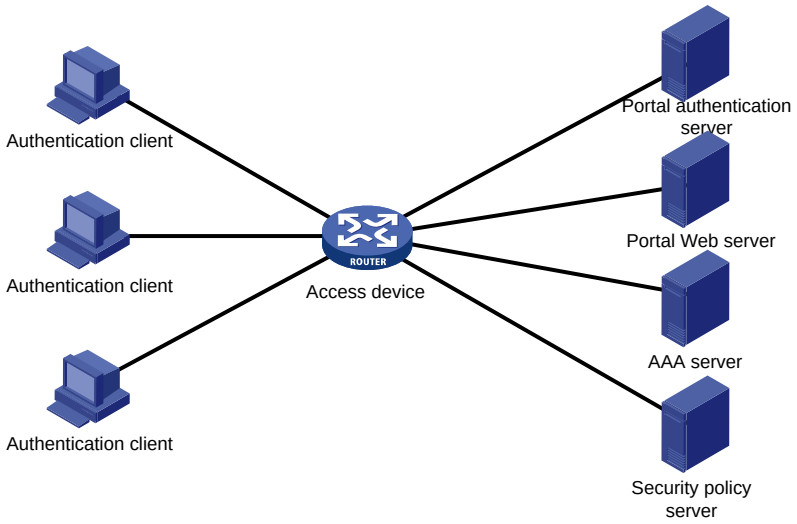
- **Security check**—Detects after authentication whether or not a user host installs anti-virus software, virus definition file, unauthorized software, and operating system patches.
- **Resource access restriction**—Allows an authenticated user to access certain network resources such as the virus server and the patch server. Users can access more network resources after passing security check.

Security check must cooperate with the H3C IMC security policy server and the iNode client.

Portal system

A typical portal system consists of these basic components: authentication client, access device, portal authentication server, portal Web server, AAA server, and security policy server.

Figure 1 Portal system



Authentication client

An authentication client is a Web browser that runs HTTP/HTTPS or a user host that runs a portal client. Security check for the user host is implemented through the interaction between the portal client and the security policy server. Only the H3C iNode client is supported.

Access device

An access device provides access services. It has the following functions:

- Redirects all HTTP or HTTPS requests of unauthenticated users to the portal Web server.
- Interacts with the portal authentication server and the AAA server to complete authentication, authorization, and accounting.
- Allows users that pass portal authentication to access authorized network resources.

Portal server

A portal server collectively refers to a portal authentication server and portal Web server.

The portal Web server pushes the Web authentication page to authentication clients and forwards user authentication information (username and password) to the portal authentication server. The portal authentication server receives authentication requests from authentication clients and interacts with the access device to authenticate users. The portal Web server is typically integrated with the portal authentication server and it can also be an independent server.

AAA server

The AAA server interacts with the access device to implement authentication, authorization, accounting for portal users. In a portal system, a RADIUS server can perform authentication, authorization, accounting for portal users, and an LDAP server can perform authentication for portal users.

Security policy server

The security policy server interacts with the portal client and the access device for security check and authorization for users. Only hosts that run portal clients can interact with the security policy server.

Portal authentication using a remote portal server

The components of a portal system interact as follows:

1. An unauthenticated user initiates authentication by accessing an Internet website through a Web browser. When receiving the HTTP or HTTPS request, the access device redirects it to the

Web authentication page provided by the portal Web server. The user can also visit the authentication website to log in. The user must log in through the H3C iNode client for extended portal functions.

2. The user enters the authentication information on the authentication page/dialog box and submits the information. The portal Web server forwards the information to the portal authentication server. The portal authentication server processes the information and forwards it to the access device.
3. The access device interacts with the AAA server to implement authentication, authorization, accounting for the user.
4. If security policies are not imposed on the user, the access device allows the authenticated user to access networks.

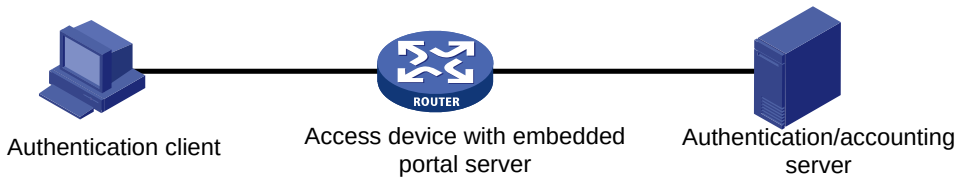
   If security policies are imposed on the user, the portal client, the access device, and the security policy server interact to check the user host. If the user passes the security check, the security policy server authorizes the user to access resources based on the check result.

Local portal service

System components

As shown in Figure 2, a local portal system consists of an authentication client, access device, and AAA server. The access device acts as both the portal Web server and the portal authentication server to provide the local portal Web service for the authentication client. The authentication client can only be a Web browser, and it cannot be a user host that runs a portal client. Therefore, extended portal functions are not supported and no security policy server is required.

Figure 2 System components



Portal page customization

To provide the local portal web service, you must customize a set of authentication pages that the device will push to users. You can customize multiple sets of authentication pages, compress each set of the pages to a .zip file, and upload the compressed files to the storage medium of the device. On the device, you must specify one of the files as the default authentication page file by using the **default-logon-page** command.

For more information about authentication page customization, see "Customizing authentication pages."

Portal authentication modes

Portal authentication has three modes: direct authentication, re-DHCP authentication, and cross-subnet authentication. In direct authentication and re-DHCP authentication, no Layer 3 forwarding devices exist between the authentication client and the access device. In cross-subnet authentication, Layer 3 forwarding devices can exist between the authentication client and the access device.

Direct authentication

A user manually configures a public IP address or obtains a public IP address through DHCP. Before authentication, the user can access only the portal Web server and predefined authentication-free

websites. After passing authentication, the user can access other network resources. The process of direct authentication is simpler than that of re-DHCP authentication.

Re-DHCP authentication

Before a user passes authentication, DHCP allocates an IP address (a private IP address) to the user. The user can access only the portal Web server and predefined authentication-free websites. After the user passes authentication, DHCP reallocates an IP address (a public IP address) to the user. The user then can access other network resources. No public IP address is allocated to users who fail authentication. Re-DHCP authentication saves public IP addresses. For example, an ISP can allocate public IP addresses to broadband users only when they access networks beyond the residential community network.

Only the H3C iNode client supports re-DHCP authentication. IPv6 portal authentication does not support the re-DHCP authentication mode.

Cross-subnet authentication

Cross-subnet authentication is similar to direct authentication, except it allows Layer 3 forwarding devices to exist between the authentication client and the access device.

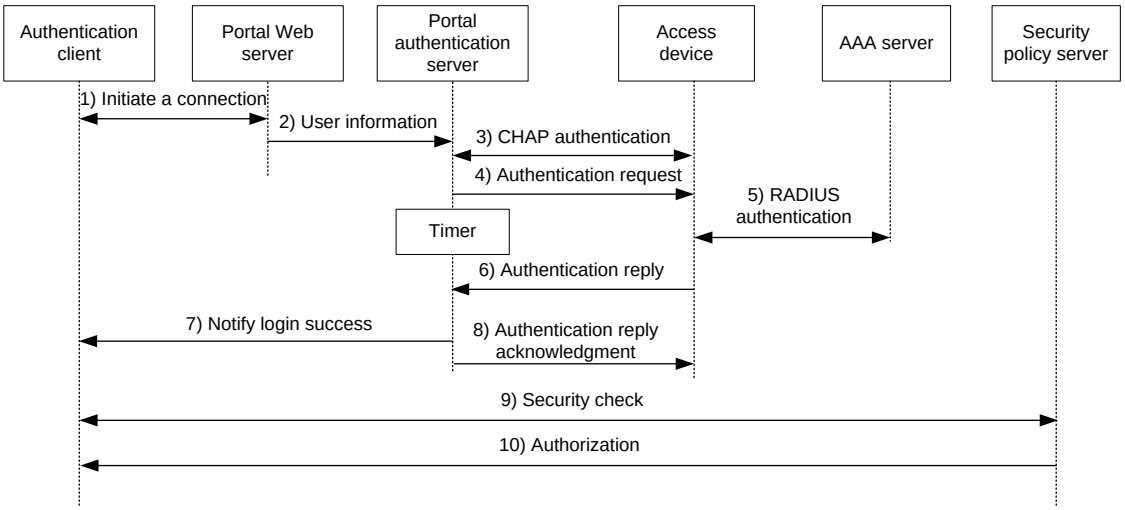
In direct authentication, re-DHCP authentication, and cross-subnet authentication, a user's IP address uniquely identifies the user. After a user passes authentication, the access device generates an ACL for the user based on the user's IP address to control forwarding of the packets from the user. Because no Layer 3 forwarding device exists between authentication clients and the access device in direct authentication and re-DHCP authentication, the access device can learn the user MAC addresses. The access device can enhance its capability of controlling packet forwarding by using the learned MAC addresses.

Portal authentication process

Direct authentication and cross-subnet authentication share the same authentication process. Re-DHCP authentication has a different process as it has two address allocation procedures.

Direct authentication/cross-subnet authentication process (with CHAP/PAP authentication)

Figure 3 Direct authentication/cross-subnet authentication process



The direct/cross-subnet authentication process is as follows:

1. A portal user access the Internet through HTTP or HTTPS, and the HTTP or HTTPS packet arrives at the access device.
   - If the packet matches a portal free rule, the access device allows the packet to pass.

- If the packet does not match any portal-free rule, the access device redirects the packet to the portal Web server. The portal Web server pushes the Web authentication page to the user for him to enter his username and password.

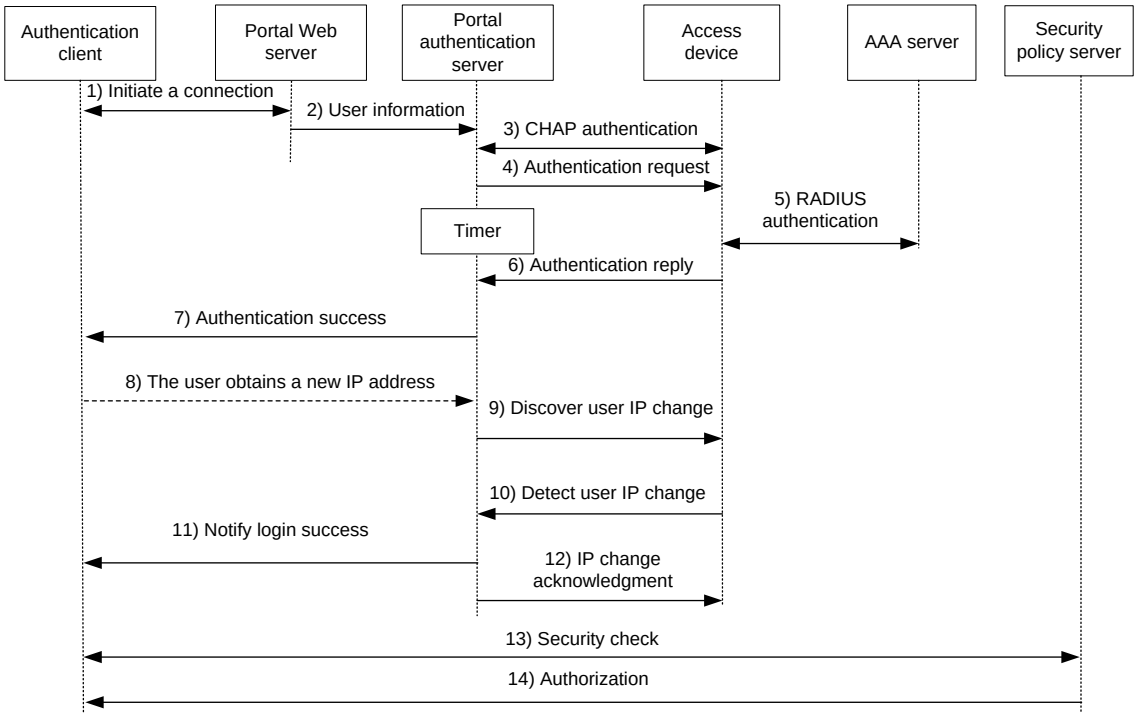
2. The portal Web server submits the user authentication information to the portal authentication server.
3. The portal authentication server and the access device exchange CHAP messages. This step is skipped for PAP authentication. The portal authentication server decides the method (CHAP or PAP) to use.
4. The portal authentication server adds the username and password into an authentication request packet and sends it to the access device. Meanwhile, the portal authentication server starts a timer to wait for an authentication reply packet.
5. The access device and the RADIUS server exchange RADIUS packets.
6. The access device sends an authentication reply packet to the portal authentication server to notify authentication success or failure.
7. The portal authentication server sends an authentication success or failure packet to the client.
8. If the authentication is successful, the portal authentication server sends an authentication reply acknowledgment packet to the access device.

If the client is an iNode client, the authentication process includes step 9 and step 10 for extended portal functions. Otherwise the authentication process is complete.

9. The client and the security policy server exchange security check information. The security policy server detects whether or not the user host installs anti-virus software, virus definition files, unauthorized software, and operating system patches.
10. The security policy server authorizes the user to access certain network resources based on the check result. The access device saves the authorization information and uses it to control access of the user.

Re-DHCP authentication process (with CHAP/PAP authentication)

Figure 4 Re-DHCP authentication process



The re-DHCP authentication process is as follows:

Step 1 through step 7 are the same as those in the direct authentication/cross-subnet authentication process.

8. After receiving the authentication success packet, the client obtains a public IP address through DHCP. The client then notifies the portal authentication server that it has a public IP address.
9. The portal authentication server notifies the access device that the client has obtained a public IP address.
10. The access device detects the IP change of the client through DHCP and then notifies the portal authentication server that it has detected an IP change of the client IP.
11. After receiving the IP change notification packets sent by the client and the access device, the portal authentication server notifies the client of login success.
12. The portal authentication server sends an IP change acknowledgment packet to the access device.

Step 13 and step 14 are for extended portal functions.

13. The client and the security policy server exchanges security check information. The security policy server detects whether or not the user host installs anti-virus software, virus definition files, unauthorized software, and operating system patches.
14. The security policy server authorizes the user to access certain network resources based on the check result. The access device saves the authorization information and uses it to control access of the user.

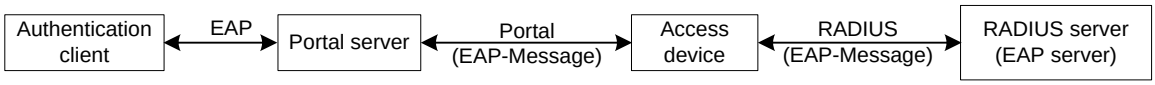
Portal support for EAP

To use portal authentication that supports EAP, the portal authentication server and client must be the H3C IMC portal server and the H3C iNode portal client. Local portal authentication does not support EAP authentication.

Compared with username and password based authentication, digital certificate-based authentication ensures higher security.

The Extensible Authentication Protocol (EAP) supports several digital certificate-based authentication methods, for example, EAP-TLS. Working together with EAP, portal authentication can implement digital certificate-based user authentication.

Figure 5 Portal support for EAP working flow diagram



As shown in Figure 5, the authentication client and the portal authentication server exchange EAP authentication packets. The portal authentication server and the access device exchange portal authentication packets that carry the EAP-Message attributes. The access device and the RADIUS server exchange RADIUS packets that carry the EAP-Message attributes. The RADIUS server that supports the EAP server function processes the EAP packets encapsulated in the EAP-Message attributes, and provides the EAP authentication result.

The access device does not process but only transports EAP-Message attributes between the portal authentication server and the RADIUS server. Therefore, the access device requires no additional configuration to support EAP authentication.

Portal filtering rules

The access device uses portal filtering rules to control user traffic forwarding.

Based on the configuration and authentication status of portal users, the device generates the following categories of portal filtering rules:

- **Category 1**—The rule permits user packets that are destined for the portal Web server and packets that match the portal-free rules to pass through.
- **Category 2**—For an authenticated user with no ACL authorized, the rule allows the user to access any destination network resources. For an authenticated user with an ACL authorized, the rule allows users to access resources permitted by the ACL. The device adds the rule when a user comes online and deletes the rule when the user goes offline.

  The device supports the following types of authorization ACLs:

  - Basic ACLs (ACL 2000 to ACL 2999).
  - Advanced ACLs (ACL 3000 to ACL 3999).
  - Layer 2 ACLs (ACL 4000 to ACL 4999).

  For an authorization ACL to take effect, make sure the ACL exists and has ACL rules excluding rules configured with the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, or **`logging`** keyword. For more information about ACL rules, see ACL commands in *ACL and QoS Command Reference*.
- **Category 3**—The rule redirects all HTTP or HTTPS requests from unauthenticated users to the portal Web server.
- **Category 4**—For direct authentication and cross-subnet authentication, the rule forbids any user packets to pass through. For re-DHCP authentication, the device forbids user packets with private source addresses to pass.

After receiving a user packet, the device compares the packet against the filtering rules from category 1 to category 4. Once the packet matches a rule, the matching process completes.

Restrictions and guidelines: Portal configuration

Portal authentication through Web does not support security check for users. To implement security check, the client must be the H3C iNode client.

Portal authentication supports NAT traversal whether it is initiated by a Web client or an H3C iNode client. NAT traversal must be configured when the portal client is on a private network and the portal server is on a public network.

Portal authentication tasks at a glance

To configure portal authentication, perform the following tasks:

1. Configuring a remote portal service

   Perform this task if a remote portal server is used.

   - Configuring a remote portal authentication server
   - Configuring a portal Web server
2. Configuring a local portal service

   Perform this task if the access device acts as a portal authentication server and portal Web server.

   - Configuring local portal service features
   - Configuring a portal Web server
3. Enabling portal authentication and specifying a portal Web server
   - Enabling portal authentication on an interface
   - Specifying a portal Web server on an interface
4. (Optional.) Specifying a preauthentication IP address pool
5. (Optional.) Specifying a portal authentication domain

6. (Optional.) Controlling portal user access
   - Configuring a portal-free rule
   - Configuring an authentication source subnet
   - Configuring an authentication destination subnet
   - Configuring support of Web proxy for portal authentication
   - Checking the issuing of category-2 portal filtering rules
   - Setting the maximum number of portal users
   - Enabling strict-checking on portal authorization information
   - Allowing only users with DHCP-assigned IP addresses to pass portal authentication
   - Enabling portal roaming
   - Configuring the portal fail-permit feature
7. (Optional.) Configuring portal detection features
   - Configuring online detection of portal users
   - Configuring portal authentication server detection
   - Configuring portal Web server detection
   - Configuring portal user synchronization
8. (Optional.) Configuring attributes for portal packets and RADIUS packets
   - Configuring portal packet attributes

     You can configure the BAS-IP or BAS-IPv6 attribute for portal packets and specify the device ID.
   - Configuring attributes for RADIUS packets

     You can configure the NAS-Port-Id and NAS-Port-Type attributes and apply a NAS-ID profile to an interface.
9. (Optional.) Configuring online and offline related features for portal users
   - Logging out online portal users
   - Enabling portal user login/logout logging
10. (Optional.) Configuring extended portal authentication features
    - Disabling the Rule ARP or ND entry feature for portal clients
    - Configuring Web redirect

Prerequisites for portal authentication

The portal feature provides a solution for user identity authentication and security check. To complete user identity authentication, portal must cooperate with RADIUS.

Before you configure portal, you must complete the following tasks:

- The portal authentication server, portal Web server, and RADIUS server have been installed and configured correctly.
- To use the re-DHCP portal authentication mode, make sure the DHCP relay agent is enabled on the access device, and the DHCP server is installed and configured correctly.
- The portal client, access device, and servers can reach each other.
- To use the remote RADIUS server, configure usernames and passwords on the RADIUS server, and configure the RADIUS client on the access device. For information about RADIUS client configuration, see "Configuring AAA."
- To implement extended portal functions, install and configure CAMS EAD or IMC EAD. Make sure the ACLs configured on the access device correspond to the isolation ACL and the security ACL on the security policy server. For installation and configuration about the security

policy server, see *CAMS EAD Security Policy Component User Manual* or *IMC EAD Security Policy Help*.

Configuring a remote portal authentication server

About configuring the remote portal authentication server

With portal authentication enabled, the device searches for a portal authentication server for a received portal request packet according to the source IP address of the packet.

- If a matching portal authentication server is found, the device regards the packet valid and sends an authentication response packet to the portal authentication server. After a user logs in to the device, the user interacts with the portal authentication server as needed.
- If no matching portal authentication server is found, the device drops the packet.

Restrictions and guidelines

Do not delete a portal authentication server in use. Otherwise, users authenticated by that server cannot log out correctly.

Procedure

1. Enter system view.

   system-view

2. Create a portal authentication server and enter its view.

   portal server *server-name*

   You can create multiple portal authentication servers.

3. Specify the IP address of the portal authentication server.

   IPv4:

   ip *ipv4-address* [**key** { **cipher** | **simple** } *string*]

   IPv6:

   ipv6 *ipv6-address* [**key** { **cipher** | **simple** } *string*]

4. (Optional.) Set the destination UDP port number used by the device to send unsolicited portal packets to the portal authentication server.

   port *port-number*

   By default, the UDP port number is 50100.

   This port number must be the same as the listening port number specified on the portal authentication server.

5. (Optional.) Specify the portal authentication server type.

   server-type { **cmcc** | **imc** }

   By default, the portal authentication server type is IMC.

   The specified server type must be the same as the type of the portal authentication server actually used.

6. (Optional.) Configure the device to periodically register with the portal authentication server.

   server-register [**interval** *interval-value*]

   By default, the device does not register with a portal authentication server.

Configuring a portal Web server

Portal Web server tasks at a glance

To configure a portal Web server, perform the following tasks:

1. Configure basic parameters for a portal Web server
2. (Optional.) Enabling the captive-bypass feature
3. (Optional.) Configuring a match rule for URL redirection

Configure basic parameters for a portal Web server

1. Enter system view.
   system-view
2. Create a portal Web server and enter its view.
   portal web-server *server-name*
   You can create multiple portal Web servers.
3. Specify the URL of the portal Web server.
   url *url-string*
   By default, no URL is specified for a portal Web server.
4. Configure the parameters to be carried in the URL when the device redirects it to users.
   url-parameter *param-name* { **original-url** | **source-address** | **source-mac** [**encryption** { **aes** | **des** } **key** { **cipher** | **simple** } *string*] | **value** *expression* }
   By default, no redirection URL parameters are configured.
5. (Optional.) Specify the portal Web server type.
   server-type { **cmcc** | **imc** }
   By default, the portal Web server type is IMC.
   This configuration is applicable to only to the remote portal service.
   The specified server type must be the same as the type of the portal Web server actually used.

Enabling the captive-bypass feature

About the captive-bypass feature

By default, the device automatically pushes the portal authentication page to iOS devices and some Android devices when they are connected to the network. The captive-bypass feature enables the device to push the portal authentication page to iOS devices and some Android devices only when they access the Internet by using browsers.

Procedure

1. Enter system view.
   system-view
2. Enter portal Web server view.
   portal web-server *server-name*
3. Enable the captive-pass feature.
   captive-bypass enable
   By default, the captive-bypass feature is disabled.

Configuring a match rule for URL redirection

About match rules for URL redirection

A URL redirection match rule matches HTTP or HTTPS requests by user-requested URL or User-Agent information, and redirects the matching requests to the specified redirection URL. Therefore, URL redirection match rules allow for more flexible URL redirection than the **url** command. The **url** command is only used to redirect HTTP or HTTPS requests from unauthenticated users to the portal Web server for authentication.

Restrictions and guidelines

For a user to successfully access a redirection URL, configure a portal-free rule to allow HTTP or HTTPS requests destined for the redirection URL to pass. For information about configuring portal-free rules, see the **portal free-rule** command.

If both the **url** and **if-match** commands are executed, the **if-match** command takes priority to perform URL redirection.

Procedure

1. Enter system view.

   system-view
2. Enter portal Web server view.

   portal web-server *server-name*
3. Configure a match rule for URL redirection.

   if-match { **original-url** *url-string* **redirect-url** *url-string* [**url-param-encryption** { **aes** | **des** } **key** { **cipher** | **simple** } *string*] | **user-agent** *string* **redirect-url** *url-string* }

Configuring local portal service features

About the local portal service

After a local portal service is configured, the device acts as the portal Web server and portal authentication server to perform portal authentication on users. The portal authentication page file is saved in the root directory of the device.

Restrictions and guidelines for configuring local portal service features

For an interface to use the local portal service, the URL of the portal Web server specified for the interface must meet the following requirements:

- The IP address in the URL must be the IP address of a Layer 3 interface (except 127.0.0.1) on the device, and the IP address must be reachable to portal clients.
- The URL must be ended with **/portal/**. For example: **http://1.1.1.1/portal/**.

As a best practice for the correct operation of the local portal Web service, use the default authentication page file in the root directory of the device storage medium. To use custom authentication pages, you must strictly follow the related restrictions and guidelines when customizing your own authentication pages. For more information about the restrictions and guidelines, see "Customizing authentication pages."

Customizing authentication pages

About customizing authentication pages

Authentication pages are HTML files. Local portal authentication requires the following authentication pages:

- Logon page
- Logon success page
- Logon failure page
- Online page
- System busy page
- Logoff success page

You must customize the authentication pages, including the page elements that the authentication pages will use, for example, **back.jpg** for authentication page **Logon.htm**.

Follow the authentication page customization rules when you edit the authentication page files.

File name rules

The names of the main authentication page files are fixed (see Table 1). You can define the names of the files other than the main authentication page files. File names and directory names are case insensitive.

Table 1 Main authentication page file names

Main authentication page	File name
Logon page	logon.htm
Logon success page	logonSuccess.htm
Logon failure page	logonFail.htm
Online page Pushed after the user gets online for online notification	online.htm
System busy page Pushed when the system is busy or the user is in the logon process	busy.htm
Logoff success page	logoffSuccess.htm

Page request rules

The local portal Web server supports only Get and Post requests.

- **Get requests**—Used to get the static files in the authentication pages and allow no recursion. For example, if file **Logon.htm** includes contents that perform Get action on file **ca.htm**, file **ca.htm** cannot include any reference to file **Logon.htm**.
- **Post requests**—Used when users submit username and password pairs, log in, and log out.

Post request attribute rules

1. Observe the following requirements when editing a form of an authentication page:
   - An authentication page can have multiple forms, but there must be one and only one form whose action is **logon.cgi**. Otherwise, user information cannot be sent to the access device.
   - The username attribute is fixed as **PtUser**. The password attribute is fixed as **PtPwd**.
   - The value of the **PtButton** attribute is either **Logon** or **Logoff**, which indicates the action that the user requests.

- A logon Post request must contain **PtUser**, **PtPwd**, and **PtButton** attributes.
- A logoff Post request must contain the **PtButton** attribute.

2. Authentication pages **logon.htm** and **logonFail.htm** must contain the logon Post request.

   The following example shows part of the script in page **logon.htm**.

```
<form action=logon.cgi method = post >
<p>User name:<input type="text" name = "PtUser" style="width:160px;height:22px"
maxlength=64>
<p>Password :<input type="password" name = "PtPwd" style="width:160px;height:22px"
maxlength=32>
<p><input type=SUBMIT value="Logon" name = "PtButton" style="width:60px;"
onclick="form.action=form.action+location.search;">
</form>
```

3. Authentication pages **logonSuccess.htm** and **online.htm** must contain the logoff Post request.

   The following example shows part of the script in page **online.htm**.

```
<form action=logon.cgi method = post >
<p><input type=SUBMIT value="Logoff" name="PtButton" style="width:60px;">
</form>
```

Page file compression and saving rules

You must compress the authentication pages and their page elements into a standard zip file.

- The name of a zip file can contain only letters, numbers, and underscores.
- The authentication pages must be placed in the root directory of the zip file.
- Zip files can be transferred to the device through FTP or TFTP and must be saved in the root directory of the device.

  Examples of zip files on the device:

```
<Sysname> dir
Directory of flash:
   1     -rw-      1405  Feb 28 2008 15:53:20   ssid1.zip
   0     -rw-      1405  Feb 28 2008 15:53:31   ssid2.zip
   2     -rw-      1405  Feb 28 2008 15:53:39   ssid3.zip
   3     -rw-      1405  Feb 28 2008 15:53:44   ssid4.zip
2540 KB total (1319 KB free)
```

Redirecting authenticated users to a specific webpage

To make the device automatically redirect authenticated users to a specific webpage, do the following in logon.htm and logonSuccess.htm:

1. In logon.htm, set the target attribute of Form to _**blank**.

   See the contents in gray:

```
<form method=post action=logon.cgi target="_blank">
```

2. Add the function for page loading pt_init() to LogonSuccess.htm.

   See the contents in gray:

```
<html>
<head>
<title>LogonSuccess</title>
<script type="text/javascript" language="javascript"
src="pt_private.js"></script>
</head>
<body onload="pt_init();" onbeforeunload="return pt_unload();">
```

```
    ... ...
    </body>
</html>
```

Configuring a local portal Web service

Prerequisites

Before you configure an HTTPS-based local portal Web service, you must complete the following tasks:

- Configure a PKI policy, obtain the CA certificate, and request a local certificate. For more information, see "Configuring PKI."
- Configure an SSL server policy, and specify the PKI domain configured in the PKI policy.

  During SSL connection establishment, the user browser might display a message that it cannot verify server identity by certificate. For users to perform portal authentication without checking such a message, configure an SSL server policy to request a client-trusted certificate on the device. The name of the policy must be **https_redirect**. For more information about SSL server policy configuration, see "Configuring SSL."

Procedure

1. Enter system view.

   system-view
2. Enable HTTP- or HTTPS-based local portal Web service and enter its view.

   portal local-web-server { **http** | **https ssl-server-policy** *policy-name* [**tcp-port** *port-number*] }
3. Specify the default authentication page file for the local portal Web service.

   default-logon-page *filename*

   By default, the default authentication page file for a local portal Web service is file **defaultfile.zip**.
4. (Optional.) Configure the HTTP or HTTPS listening TCP port for the local portal Web service.

   tcp-port *port-number*

   By default, the HTTP service listening port number is 80 and the HTTPS service listening port number is the TCP port number set by the **portal local-web-server** command.

Enabling portal authentication on an interface

Restrictions and guidelines

When you enable portal authentication on an interface, follow these restrictions and guidelines:

- Cross-subnet authentication mode (**layer3**) does not require Layer 3 forwarding devices between the access device and the portal authentication clients. However, if a Layer 3 forwarding device exists between the authentication client and the access device, you must use the cross-subnet portal authentication mode.
- You can enable both IPv4 portal authentication and IPv6 portal authentication on an interface.

When you configure re-DHCP portal authentication on an interface, follow these restrictions and guidelines:

- Make sure the interface has a valid IP address before you enable re-DHCP portal authentication on the interface.
- With re-DHCP portal authentication, configure authorized ARP on the interface as a best practice to make sure only valid users can access the network. With authorized ARP configured

on the interface, the interface learns ARP entries only from the users who have obtained a public address from DHCP.

- For successful re-DHCP portal authentication, make sure the BAS-IP or BAS-IPv6 attribute value is the same as the device IP address specified on the portal authentication server. To configure the attribute, use the **portal** { **bas-ip** | **bas-ipv6** } command.
- An IPv6 portal server does not support re-DHCP portal authentication.

Portal authentication supports HTTP and HTTPS redirect. To redirect portal users' HTTPS packets, make sure the specified HTTPS redirect listening port number (the default is 6654) is available. For more information about how to change the HTTPS redirect listening port number, see HTTPS redirect configuration in *Layer 3—IP Services Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Enable portal authentication.

   IPv4:

   portal enable method { **direct** | **layer3** | **redhcp** }

   IPv6:

   portal ipv6 enable method { **direct** | **layer3** }

   By default, portal authentication is disabled.

Specifying a portal Web server on an interface

About specifying a portal Web server on an interface

With a portal Web server specified on an interface, the device redirects the HTTP requests of portal users on the interface to the portal Web server.

You can specify both an IPv4 portal Web server and an IPv6 portal Web server on an interface.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Specify a portal Web server on the interface.

   portal [**ipv6**] **apply web-server** *server-name* [**fail-permit** | **secondary**]

   By default, no portal Web servers are specified on an interface.

   The **secondary** keyword is supported only in Release 6348P01 and later.

Specifying a preauthentication IP address pool

About preauthentication IP address pools

You must specify a preauthentication IP address pool on a portal-enabled interface in the following situation:

- Portal users access the network through a subinterface of the portal-enabled interface.

- The subinterface does not have an IP address.
- Portal users need to obtain IP addresses through DHCP.

After a user connects to a portal-enabled interface, the user uses an IP address for portal authentication according to the following rules:

- If the interface is configured with a preauthentication IP address pool, the user uses the following IP address:
  - If the client is configured to obtain an IP address automatically through DHCP, the user obtains an address from the specified IP address pool.
  - If the client is configured with a static IP address, the user uses the static IP address.
- If the interface has an IP address but no preauthentication IP pool specified, the user uses the static IP address or the IP address obtained from a DHCP server.
- If the interface has no IP address or preauthentication IP pool specified, the user cannot perform portal authentication.

After the user passes portal authentication, the AAA server authorizes an IP address pool for re-assigning an IP address to the user. If no authorized IP address pool is deployed, the user continues using the previous IP address.

Restrictions and guidelines

This configuration takes effect only when the direct IPv4 portal authentication is enabled on the interface.

Make sure the specified IP address pool exists and is complete. Otherwise, the user cannot obtain the IP address and cannot perform portal authentication.

If the portal user does not perform authentication or fails to pass authentication, the assigned IP address is still retained.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Specify a preauthentication IP address pool on the interface.
   portal [**ipv6**] **pre-auth ip-pool** *pool-name*
   By default, no preauthentication IP address pool is specified on an interface.

Specifying a portal authentication domain

About portal authentication domains

An authentication domain defines a set of authentication, authorization, and accounting policies. Each portal user belongs to an authentication domain and is authenticated, authorized, and accounted in the domain.

With an authentication domain specified on an interface, the device uses the authentication domain for AAA of portal users. This allows for flexible portal access control.

Restrictions and guidelines for specifying a portal authentication domain

The device selects the authentication domain for a portal user in this order:

1. ISP domain specified for the interface.
2. ISP domain carried in the username.
3. System default ISP domain.

If the chosen domain does not exist on the device, the device searches for the ISP domain configured to accommodate users assigned to nonexistent domains. If no such ISP domain is configured, user authentication fails. For information about ISP domains, see "Configuring AAA."

For the authorization ACL in the authentication domain, the following rules apply:

- If the user traffic matches a rule in the ACL, the device processes the traffic based on the permit or deny statement of the rule.
- If the user traffic does not match any rule in the ACL, the device permits the traffic. To deny such traffic, configure the last rule in the ACL to deny all packets by using the **rule deny ip** command.
- If the ACL contains rules that specify a source address, users might not be able to get online. Do not specify a source IPv4, IPv6, or MAC address when you configure a rule in the ACL.

Specifying a portal authentication domain on an interface

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Specify an portal authentication domain on the interface.

   portal [**ipv6**] **domain** *domain-name*

   By default, no portal authentication domain is specified on an interface.

   You can specify both an IPv4 portal authentication domain and an IPv6 portal authentication domain on an interface.

Controlling portal user access

Configuring a portal-free rule

About portal-free rules

A portal-free rule allows specified users to access specified external websites without portal authentication.

The matching items for a portal-free rule include the host name, source/destination IP address, TCP/UDP port number, source MAC address, access interface, and VLAN. Packets matching a portal-free rule will not trigger portal authentication, so users sending the packets can directly access the specified external websites.

Restrictions and guidelines for configuring a portal-free rule

If you specify both a VLAN and an interface, the interface must belong to the VLAN. If the interface does not belong to the VLAN, the portal-free rule does not take effect.

You cannot configure two or more portal-free rules with the same filtering criteria. Otherwise, the system prompts that the rule already exists.

Regardless of whether portal authentication is enabled or not, you can only add or remove a portal-free rule. You cannot modify it.

Configuring an IP-based portal-free rule

1. Enter system view.

   system-view

2. Configure an IP-based portal-free rule.

   IPv4:

   portal free-rule *rule-number* { **destination ip** { *ipv4-address* { *mask-length* | *mask* } | **any** } [**tcp** *tcp-port-numbe*r | **udp** *udp-port-number*] | **source ip** { *ipv4-address* { *mask-length* | *mask* } | **any** } [**tcp** *tcp-port-number* | **udp** *udp-port-number*] } * [**interface** *interface-type interface-number*]

   IPv6:

   portal free-rule *rule-number* { **destination ipv6** { *ipv6-address prefix-length* | **any** } [**tcp** *tcp-port-numbe*r | **udp** *udp-port-number*] | **source ipv6** { *ipv6-address prefix-length* | **any** } [**tcp** *tcp-port-number* | **udp** *udp-port-number*] } * [**interface** *interface-type interface-number*]

Configuring a source-based portal-free rule

1. Enter system view.

   system-view

2. Configure a source-based portal-free rule.

   portal free-rule *rule-number* **source** { **interface** *interface-type interface-number* | **mac** *mac-address* | **vlan** *vlan-id* } *

   The **vlan** *vlan-id* option takes effect only on portal users that access the network through VLAN interfaces.

Configuring a destination-based portal-free rule

1. Enter system view.

   system-view

2. Configure a destination-based portal-free rule.

   portal free-rule *rule-number* **destination** *host-name*

   Before you configure destination-based portal-free rules, make sure a DNS server is deployed on the network.

Configuring an authentication source subnet

About authentication source subnets

By configuring authentication source subnets, you specify that only HTTP or HTTPS packets from users on the authentication source subnets can trigger portal authentication. If an unauthenticated user is not on any authentication source subnet, the access device discards all the user's HTTP or HTTPS packets that do not match any portal-free rule.

Restrictions and guidelines

Authentication source subnets apply only to cross-subnet portal authentication.

In direct or re-DHCP portal authentication mode, a portal user and its access interface (portal-enabled) are on the same subnet. It is not necessary to specify the subnet as the authentication source subnet.

- In direct mode, the access device regards the authentication source subnet as any source IP address.

- In re-DHCP mode, the access device regards the authentication source subnet on an interface as the subnet to which the private IP address of the interface belongs.

If both authentication source subnets and destination subnets are configured on an interface, only the authentication destination subnets take effect.

You can configure multiple authentication source subnets. If the source subnets overlap, the subnet with the largest address scope (with the smallest mask or prefix) takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Configure a portal authentication source subnet.
   IPv4:
   portal layer3 source *ipv4-network-address* { *mask-length* | *mask* }
   By default, users from any subnets must pass portal authentication.
   IPv6:
   portal ipv6 layer3 source *ipv6-network-address prefix-length*
   By default, users from any subnets must pass portal authentication.

Configuring an authentication destination subnet

About authentication destination subnets

By configuring authentication destination subnets, you specify that users trigger portal authentication only when they accessing the specified subnets (excluding the destination IP addresses and subnets specified in portal-free rules). Users can access other subnets without portal authentication.

Restrictions and guidelines

If both authentication source subnets and destination subnets are configured on an interface, only the authentication destination subnets take effect.

You can configure multiple authentication destination subnets. If the destination subnets overlap, the subnet with the largest address scope (with the smallest mask or prefix) takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Configure a portal authentication destination subnet.
   IPv4:
   portal free-all except destination *ipv4-network-address* { *mask-length* | *mask* }
   IPv6:
   portal ipv6 free-all except destination *ipv6-network-address prefix-length*
   By default, users accessing any subnets must pass portal authentication.

Configuring support of Web proxy for portal authentication

About the support of Web proxy for portal authentication

To allow HTTP requests proxied by a Web proxy server to trigger portal authentication, specify the port number of the Web proxy server on the device. If a Web proxy server port is not specified on the device, HTTP requests proxied by the Web proxy server are dropped, and portal authentication cannot be triggered.

Restrictions and guidelines

If a user's browser uses the Web Proxy Auto-Discovery (WPAD) protocol to discover Web proxy servers, you must perform the following tasks on the device:

- Specify port numbers of the Web proxy servers.
- Configure portal-free rules to allow user packets destined for the WPAD server to pass without authentication.

If portal users enable Web proxy in their browsers, the users must add the IP address of the portal authentication server as a proxy exception in their browsers. Thus, HTTP packets that the users send to the portal authentication server will not be sent to Web proxy servers.

You cannot specify Web proxy server port 443 on the device.

You can execute this command multiple times to specify multiple port numbers of Web proxy servers.

Procedure

1. Enter system view.

   system-view

2. Specify the port number of a Web proxy server.

   portal web-proxy port *port-number*

   By default, no port numbers of Web proxy servers are specified. Proxied HTTP requests are dropped.

Checking the issuing of category-2 portal filtering rules

About checking the issuing of category-2 portal filtering rules

Category-2 portal filtering rules permit authenticated users to access authorized network resources. By default, the device allows an authenticated user to come online as long as a member device has issued a category-2 portal filtering rule for the user. Users coming online from global interfaces might fail to access network resources because some member ports might not have category-2 rules for the users. To resolve this issue, enable the device to check the issuing of category-2 portal filtering rules. Then, the device allows users to come online only when all member devices have issued category-2 portal filtering rules for the users.

As a best practice, perform this task when portal authentication is enabled on a global interface.

Procedure

1. Enter system view.

   system-view

2. Enable the device to check the issuing of category-2 portal filtering rules.

   portal user-rule assign-check enable

   By default, the device does not check the issuing of category-2 portal filtering rules.

Setting the maximum number of portal users

About setting the maximum number of portal users

Perform this task to control the total number of portal users in the system, and the maximum number of IPv4 or IPv6 portal users on an interface.

Restrictions and guidelines for setting the maximum number of portal users

Make sure the maximum combined number of IPv4 and IPv6 portal users specified on all interfaces does not exceed the system-allowed maximum number. Otherwise, the exceeding number of portal users will not be able to log in to the device.

Setting the global maximum number of portal users

1. Enter system view.

   system-view

2. Set the global maximum number of portal users.

   portal max-user *max-number*

   By default, no limit is set on the global number of portal users.

   If you set the global maximum number smaller than the number of current online portal users on the device, this configuration still takes effect. The online users are not affected but the system forbids new portal users to log in.

Setting the maximum number of portal users on an interface

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Set the maximum number of portal users.

   portal { **ipv4-max-user** | **ipv6-max-user** } *max-number*

   By default, no limit is set on the number of portal users on an interface.

   If you set the maximum number smaller than the current number of portal users on an interface, this configuration still takes effect. The online users are not affected but the system forbids new portal users to log in from the interface.

Enabling strict-checking on portal authorization information

About strict-checking on portal authorization information

The strict checking feature allows a portal user to stay online only when the authorization information for the user is successfully deployed.

Enabling strict checking on portal authentication information on an interface

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Enable strict checking on portal authorization information.

   portal authorization { **acl** | **user-profile** } **strict-checking**

CAUTION:

- The strict checking fails if the authorized ACL or user profile does not exist on the device or the device fails to deploy the user profile.
- You can enable strict checking on the authorized ACL, authorized user profile, or both. If you enable both ACL checking and user profile checking, the user will be logged out if either checking fails.

By default, strict checking on portal authorization information is disabled on an interface. Portal users stay online even when the authorized ACL or user profile does not exist or the device fails to deploy the user profile.

Allowing only users with DHCP-assigned IP addresses to pass portal authentication

About allowing only users with DHCP-assigned IP addresses to pass portal authentication

This feature allows only users with DHCP-assigned IP addresses to pass portal authentication. Use this feature to ensure that only users with valid IP addresses can access the network.

Restrictions and guidelines

This feature takes effect only when the device acts as both the access device and the DHCP server.

Configuration of this feature does not affect the online portal users.

Allowing only users with DHCP-assigned IP addresses to pass portal authentication on an interface

1. Enter system view.
   `system-view`
2. Enter Layer 3 interface view.
   `interface` *`interface-type interface-number`*
3. Allow only users with DHCP-assigned IP addresses to pass portal authentication.
   `portal` [**`ipv6`**] **`user-dhcp-only`**

CAUTION:

- After this feature is configured, users with static IP addresses cannot pass portal authentication to come online.
- When this feature is configured in an IPv6 network, disable the temporary IPv6 address feature. Otherwise, IPv6 users will use temporary IPv6 addresses to access the IPv6 network and will fail portal authentication.

By default, both users with IP addresses obtained through DHCP and users with static IP addresses can pass authentication to come online.

Enabling portal roaming

About portal roaming

If portal roaming is enabled on a VLAN interface, an online portal user can access resources from any Layer 2 port in the VLAN without re-authentication.

If portal roaming is disabled, to access external network resources from a Layer 2 port different from the current access port in the VLAN, the user must do the following:

1. Logs out from the current port.
2. Re-authenticates on the new Layer 2 port.

Restrictions and guidelines

Portal roaming takes effect only on portal users logging in from VLAN interfaces. It does not take effect on portal users logging in from common Layer 3 interface.

You cannot enable portal roaming when online portal users exist on the device.

For portal roaming to take effect, you must disable the Rule ARP or ND entry feature by using the **undo portal refresh** { **arp** | **nd** } **enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable portal roaming.
   portal roaming enable
   By default, portal roaming is disabled.

Configuring the portal fail-permit feature

About the portal fail-permit feature

Perform this task to configure the portal fail-permit feature on an interface. When the access device detects that the portal authentication server or portal Web server is unreachable, it allows users on the interface to have network access without portal authentication.

If you enable fail-permit for both a portal authentication server and a portal Web server on an interface, the interface does the following:

- Disables portal authentication when either server is unreachable.
- Resumes portal authentication when both servers are reachable.

After portal authentication resumes, unauthenticated users must pass portal authentication to access the network. Users who have passed portal authentication before the fail-permit event can continue accessing the network.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Enable portal fail-permit for a portal authentication server.
   portal [**ipv6**] **fail-permit server** *server-name*
   By default, portal fail-permit is disabled for a portal authentication server.
4. Enable portal fail-permit for a portal Web server.
   portal [**ipv6**] **fail-permit web-server**
   By default, portal fail-permit is disabled for a portal Web server.
   This feature is is supported only in Release 6348P01 and later.

Configuring portal detection features

Configuring online detection of portal users

About online detection for portal users

Use the online detection feature to quickly detect abnormal logouts of portal users. Configure ARP or ICMP detection for IPv4 portal users. Configure ND or ICMPv6 detection for IPv6 portal users.

If the device receives no packets from a portal user within the idle time, the device detects the user's online status as follows:

- **ICMP or ICMPv6 detection**—Sends ICMP or ICMPv6 requests to the user at configurable intervals to detect the user status.
  - If the device receives a reply within the maximum number of detection attempts, it considers that the user is online and stops sending detection packets. Then the device resets the idle timer and repeats the detection process when the timer expires.
  - If the device receives no reply after the maximum number of detection attempts, the device logs out the user.
- **ARP or ND detection**—Sends ARP or ND requests to the user and detects the ARP or ND entry status of the user at configurable intervals.
  - If the ARP or ND entry of the user is refreshed within the maximum number of detection attempts, the device considers that the user is online and stops detection. Then the device resets the idle timer and repeats the detection process when the timer expires.
  - If the ARP or ND entry of the user is not refreshed after the maximum number of detection attempts, the device logs out the user.

Restrictions and guidelines

ARP detection and ND detection apply only to direct and re-DHCP portal authentication. ICMP detection applies to all portal authentication modes.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Configure online detection of portal users.

   IPv4:

   portal user-detect type { **arp** | **icmp** } [**retry** *retries*] [**interval** *interval*] [**idle** *time*]

   IPv6:

   portal ipv6 user-detect type { **icmpv6** | **nd** } [**retry** *retries*] [**interval** *interval*] [**idle** *time*]

   By default, online detection is disabled for portal users on an interface.

Configuring portal authentication server detection

About portal authentication server detection

During portal authentication, if the communication between the access device and portal authentication server is broken, new portal users are not able to log in. Online portal users are not able to log out normally.

To address this problem, the access device needs to be able to detect the reachability changes of the portal server quickly and take corresponding actions to deal with the changes.

The portal authentication server detection feature enables the device to periodically detect portal packets sent by a portal authentication server to determine the reachability of the server. If the device receives a portal packet within a detection timeout (**timeout** *timeout*) and the portal packet is valid, the device considers the portal authentication server to be reachable. Otherwise, the device considers the portal authentication server to be unreachable.

Portal packets include user login packets, user logout packets, and heartbeat packets. Heartbeat packets are periodically sent by a server. By detecting heartbeat packets, the device can detect the server's actual status more quickly than by detecting other portal packets.

Restrictions and guidelines

The portal authentication server detection feature takes effect only when the device has a portal-enabled interface.

Only the IMC portal authentication server supports sending heartbeat packets. To test server reachability by detecting heartbeat packets, you must enable the server heartbeat feature on the IMC portal authentication server.

You can configure the device to take one or more of the following actions when the server reachability status changes:

- Sending a log message, which contains the name, the current state, and the original state of the portal authentication server.
- Enabling portal fail-permit. When the portal authentication server is unreachable, the portal fail-permit feature on an interface allows users on the interface to have network access. When the server recovers, it resumes portal authentication on the interface. For more information, see "Configuring the portal fail-permit feature."
- Make sure the detection timeout configured on the device is greater than the server heartbeat interval configured on the portal authentication server.

Procedure

1. Enter system view.

   system-view
2. Enter portal authentication server view.

   portal server *server-name*
3. Configure portal authentication server detection.

   server-detect [**timeout** *timeout*] **log**

   By default, portal authentication server detection is disabled.

Configuring portal Web server detection

About portal Web server detection

A portal authentication process cannot complete if the communication between the access device and the portal Web server is broken. To address this problem, you can enable portal Web server detection on the access device.

With the portal Web server detection feature, the access device simulates a Web access process to initiate a TCP connection to the portal Web server. If the TCP connection can be established successfully, the access device considers the detection successful, and the portal Web server is reachable. Otherwise, it considers the detection to have failed. Portal authentication status on interfaces of the access device does not affect the portal Web server detection feature.

You can configure the following detection parameters:

- **Detection interval**—Interval at which the device detects the server reachability.

- **Maximum number of consecutive failures**—If the number of consecutive detection failures reaches this value, the access device considers that the portal Web server is unreachable.

You can configure the device to take one or more of the following actions when the server reachability status changes:

- Sending a log message, which contains the name, the current state, and the original state of the portal Web server.
- Enabling portal fail-permit. When the portal Web server is unreachable, the portal fail-permit feature on an interface allows users on the interface to have network access. When the server recovers, it resumes portal authentication on the interface. For more information, see "Configuring the portal fail-permit feature."

Restrictions and guidelines

The portal Web server detection feature takes effect only when the URL of the portal Web server is specified and the device has a portal-enabled interface.

Procedure

1. Enter system view.

   system-view

2. Enter portal Web server view.

   portal web-server *server-name*

3. Configure portal Web server detection.

   server-detect [**interval** *interval*] [**retry** *retries*] **log**

   By default, portal Web server detection is disabled.

Configuring portal user synchronization

About portal user synchronization

Once the access device loses communication with a portal authentication server, the portal user information on the access device and that on the portal authentication server might be inconsistent after the communication resumes. To address this problem, the device provides the portal user synchronization feature. This feature is implemented by sending and detecting portal synchronization packets, as follows:

1. The portal authentication server sends the online user information to the access device in a synchronization packet at the user heartbeat interval.

   The user heartbeat interval is set on the portal authentication server.

2. Upon receiving the synchronization packet, the access device compares the users carried in the packet with its own user list and performs the following operations:
   - If a user contained in the packet does not exist on the access device, the access device informs the portal authentication server to delete the user. The access device starts the synchronization detection timer (**timeout** *timeout*) immediately when a user logs in.
   - If the user does not appear in any synchronization packet within a synchronization detection interval, the access device considers the user does not exist on the portal authentication server and logs the user out.

Restrictions and guidelines

Portal user synchronization requires a portal authentication server to support the portal user heartbeat function. Only the IMC portal authentication server supports the portal user heartbeat function. To implement the portal user synchronization feature, you also need to configure the user heartbeat function on the portal authentication server. Make sure the user heartbeat interval configured on the portal authentication server is not greater than the synchronization detection timeout configured on the access device.

Deleting a portal authentication server on the access device also deletes the user synchronization configuration for the portal authentication server.

Procedure

1. Enter system view.
   system-view
2. Enter portal authentication server view.
   portal server *server-name*
3. Configure portal user synchronization.
   user-sync timeout *timeout*
   By default, portal user synchronization is disabled.

Configuring portal packet attributes

Configuring the BAS-IP or BAS-IPv6 attribute

About this task

If the device runs Portal 2.0, the unsolicited packets sent to the portal authentication server must carry the BAS-IP attribute. If the device runs Portal 3.0, the unsolicited packets sent to the portal authentication server must carry the BAS-IP or BAS-IPv6 attribute.

After this attribute is configured, the source IP address for unsolicited notification portal packets the device sends to the portal authentication server is the configured BAS-IP or BAS-IPv6 address. If the attribute is not configured, the source IP address of the portal packets is the IP address of the packet output interface.

Restrictions and guidelines

During a re-DHCP portal authentication or mandatory user logout process, the device sends portal notification packets to the portal authentication server. For the authentication or logout process to complete, make sure the BAS-IP/BAS-IPv6 attribute is the same as the device IP address specified on the portal authentication server.

You must configure the BAS-IP or BAS-IPv6 attribute on a portal authentication-enabled interface if the following conditions are met:

- The portal authentication server is an H3C IMC server.
- The portal device IP address specified on the portal authentication server is not the IP address of the portal packet output interface.

Configuring the BAS-IP or BAS-IPv6 attribute on an interface

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Configure the BAS-IP or BAS-IPv6 attribute.
   IPv4:
   portal bas-ip *ipv4-address*
   By default, the BAS-IP attribute of an IPv4 portal reply packet is the source IPv4 address of the packet. The BAS-IP attribute of an IPv4 portal notification packet is the IPv4 address of the packet's output interface.
   IPv6:

portal bas-ipv6 *ipv6-address*

By default, the BAS-IPv6 attribute of an IPv6 portal reply packet is the source IPv6 address of the packet. The BAS-IPv6 attribute of an IPv6 portal notification packet is the IPv6 address of the packet's output interface.

Specifying the device ID

About specifying the device ID

The portal authentication server uses device IDs to identify the devices that send protocol packets to the portal server.

Restrictions and guidelines

Make sure the configured device ID is different than any other access devices communicating with the same portal authentication server.

Procedure

1. Enter system view.
   system-view
2. Specify the device ID.
   portal device-id *device-id*
   By default, a device is not configured with a device ID.

Configuring attributes for RADIUS packets

Specifying a format for the NAS-Port-Id attribute

About specifying a format for the NAS-Port-Id attribute

RADIUS servers from different vendors might require different formats of the NAS-Port-Id attribute in the RADIUS packets. You can specify the NAS-Port-Id attribute format as required.

The device supports predefined formats (format 1, 2, 3, and 4). For more information about the formats, see portal commands in *Security Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Specify the format for the NAS-Port-Id attribute.
   portal nas-port-id format { **1** | **2** | **3** | **4** }
   By default, the format for the NAS-Port-Id attribute is format 2.

Configuring the NAS-Port-Type attribute

About the NAS-Port-Type attribute

The NAS-Port-Type attribute in a RADIUS request represents the type of a user's access interface.

The access device might not be able to correctly obtain the type of users' access interfaces when multiple network devices exist between the access device and the portal client. For the access device to send the correct access interface type to the RADIUS server, perform this task to configure the NAS-Port-Type attribute.

Restrictions and guidelines

This configuration takes effect only on portal users that newly come online.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the NAS-Port-Type attribute carried in outgoing RADIUS requests on the interface.

   portal nas-port-type { **802.11** | **adsl-cap** | **adsl-dmt** | **async** | **cable** | **ethernet** | **g.3-fax** | **hdlc** | **idsl** | **isdn-async-v110** | **isdn-async-v120** | **isdn-sync** | **piafs** | **sdsl** | **sync** | **virtual** | **wireless-other** | **x.25** | **x.75** | **xdsl** }

   By default, the NAS-Port-Type carried in outgoing RADIUS requests is Ethernet (attribute value 15).

Applying a NAS-ID profile to an interface

About applying a NAS-ID profile to an interface

By default, the device sends its device name in the NAS-Identifier attribute of all RADIUS requests.

A NAS-ID profile enables you to send different NAS-Identifier attribute strings in RADIUS requests from different VLANs. The strings can be organization names, service names, or any user categorization criteria, depending on the administrative requirements.

For example, map the NAS-ID **companyA** to all VLANs of company A. The device will send **companyA** in the NAS-Identifier attribute for the RADIUS server to identify requests from any Company A users.

Restrictions and guidelines

You can apply a NAS-ID profile to a portal-enabled interface. If no NAS-ID profile is specified on the interface or no matching NAS-ID is found in the specified profile, the device uses the device name as the interface NAS-ID.

Procedure

1. Enter system view.

   system-view

2. Create a NAS-ID profile and enter NAS-ID profile view.

   aaa nas-id profile *profile-name*

   For more information about this command, see *Security Command Reference*.

3. Configure a NAS ID and VLAN binding in the profile.

   nas-id *nas-identifier* **bind vlan** *vlan-id*

   For more information about this command, see AAA commands in *Security Command Reference*. Portal access matches only the inner VLAN ID of QinQ packets. For more information about QinQ, see *Layer 2—LAN Switching Configuration Guide*.

4. Execute the following commands in sequence to specify the NAS-ID profile on the interface.

   a. Return to system view.

      quit

   b. Enter Layer 3 interface view.

      interface *interface-type interface-number*

c. Specify the NAS-ID profile on the interface.
portal nas-id-profile *profile-name*

Logging out online portal users

About logging out online portal users

This feature deletes users that have passed portal authentication and terminates ongoing portal authentications.

Restrictions and guidelines

When the number of online users exceeds 2000, executing the **portal delete-user** command takes a few minutes.

To ensure successful logout of online users, do not disable portal authentication or perform master/subordinate device switchover on the portal-enabled interface during the command execution.

Procedure

1. Enter system view.
   system-view
2. Log out online portal users.
   portal delete-user { *ipv4-address* | **all** | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

Enabling portal user login/logout logging

About enabling portal user login/logout logging

This feature logs information about user login and logout events. The information includes the username, user IP address and MAC address, user access interface, VLAN, and login result. The logs are sent to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable portal user login/logout logging.
   portal log enable
   By default, portal user login/logout logging is disabled.

Disabling the Rule ARP or ND entry feature for portal clients

About this task

When the Rule ARP or ND entry feature is enabled for portal clients, ARP or ND entries for portal clients are Rule entries after the clients come online. The Rule entries will not age out and will be deleted immediately after the portal clients go offline. If a portal client goes offline and then tries to get online before the ARP or ND entry is relearned for the client, the client will fail the authentication.

To avoid such authentication failure, disable this feature. Then, ARP or ND entries for portal clients are dynamic entries after the clients come online and are deleted only when they age out.

Restrictions and guidelines

Enabling or disabling of this feature does not affect existing Rule/dynamic ARP or ND entries.

Procedure

1. Enter system view.
   system-view
2. Disable the Rule ARP or ND entry feature for portal clients.
   undo portal refresh { **arp** | **nd** } **enable**
   By default, the Rule ARP or ND entry feature is enabled for portal clients.

Configuring Web redirect

About Web redirect

Web redirect is a simplified portal feature. With Web redirect, a user does not perform portal authentication but is directly redirected to the specified URL on the first Web access attempt in a browser. After the specified redirect interval, the user is redirected from the visiting website to the specified URL again.

Web redirect can provide ISPs with extended services. For example, the ISPs can place advertisements and publish information on the redirected webpage.

Restrictions and guidelines

The Web redirect feature takes effect only on HTTP packets that use the default port number 80.

Web redirect does not work when both Web redirect and portal authentication are enabled.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Configure Web redirect.
   web-redirect [**ipv6**] **url** *url-string* [**interval** *interval*]
   By default, Web redirect is disabled.

Display and maintenance commands for portal

Execute **display** commands in any view and the **reset** command in user view.

Task	Command
Display portal configuration and portal running state.	**display portal interface** *interface-type interface-number*
Display packet statistics for portal authentication servers.	**display portal packet statistics** [**server** *server-name*]
Display portal rules.	**display portal rule** { **all** | **dynamic** | **static** } **interface** *interface-type interface-number* [**slot** *slot-number*]

Task	Command
Display portal authentication server information.	**display portal server** [*server-name*]
Display portal user information.	**display portal user** { **all** | **interface** *interface-type interface-number* | **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**verbose**]
Display portal Web server information.	**display portal web-server** [*server-name*]
Display Web redirect rule information.	**display web-redirect rule interface** *interface-type interface-number* [**slot** *slot-number*]
Clear packet statistics for portal authentication servers.	**reset portal packet statistics** [**server** *server-name*]

Portal configuration examples

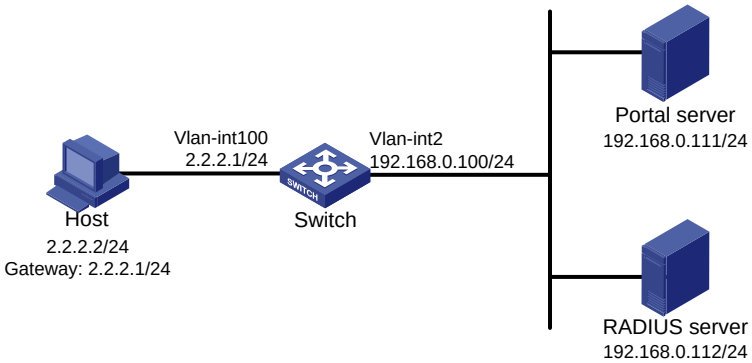
Example: Configuring direct portal authentication

Network configuration

As shown in Figure 6, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication/accounting server.

Configure direct portal authentication, so the host can access only the portal server before passing the authentication and access other network resources after passing the authentication.

Figure 6 Network diagram



Prerequisites

- Configure IP addresses for the host, switch, and servers as shown in Figure 6 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Configuring the portal authentication server on IMC PLAT 5.0

In this example, the portal server runs on IMC PLAT 5.0(E0101) and IMC UAM 5.0(E0101).

1. Configure the portal authentication server:

a. Log in to IMC and click the **Service** tab.

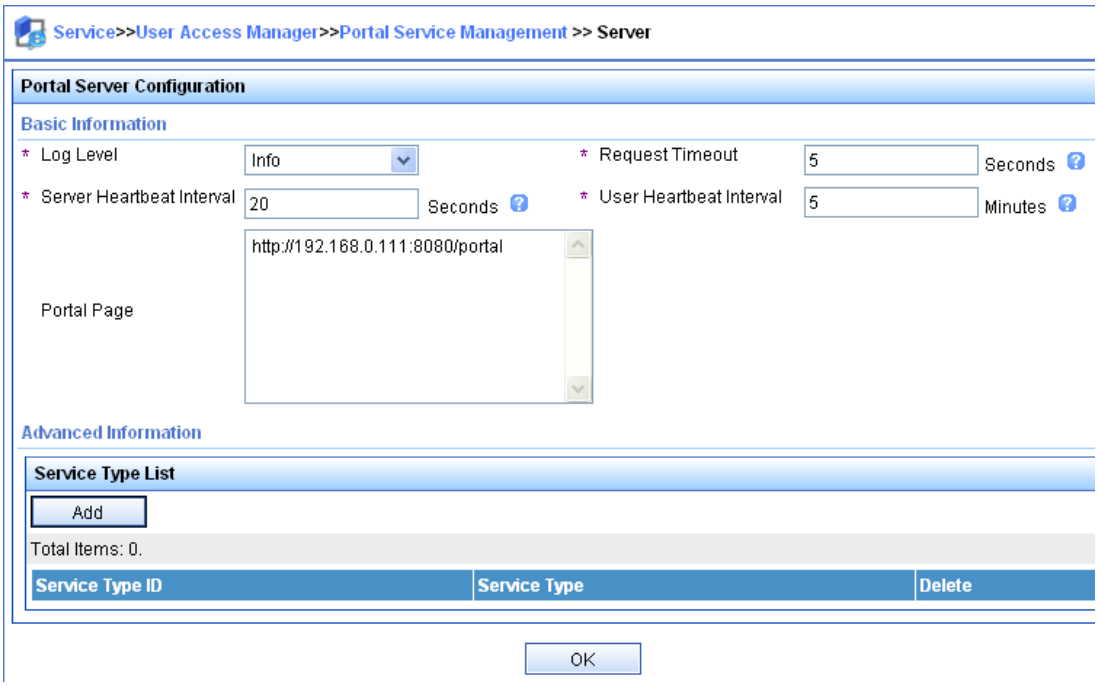
b. Select **User Access Manager** > **Portal Service Management** > **Server** from the navigation tree to open the portal server configuration page, as shown in Figure 7.

c. Configure the portal server parameters as needed.

   This example uses the default settings.

d. Click **OK**.

Figure 7 Portal server configuration



2. Configure the IP address group:

   a. Select **User Access Manager** > **Portal Service Management** > **IP Group** from the navigation tree to open the portal IP address group configuration page.

   b. Click **Add** to open the page as shown in Figure 8.

   c. Enter the IP group name.

   d. Enter the start IP address and end IP address of the IP group.

      Make sure the host IP address is in the IP group.

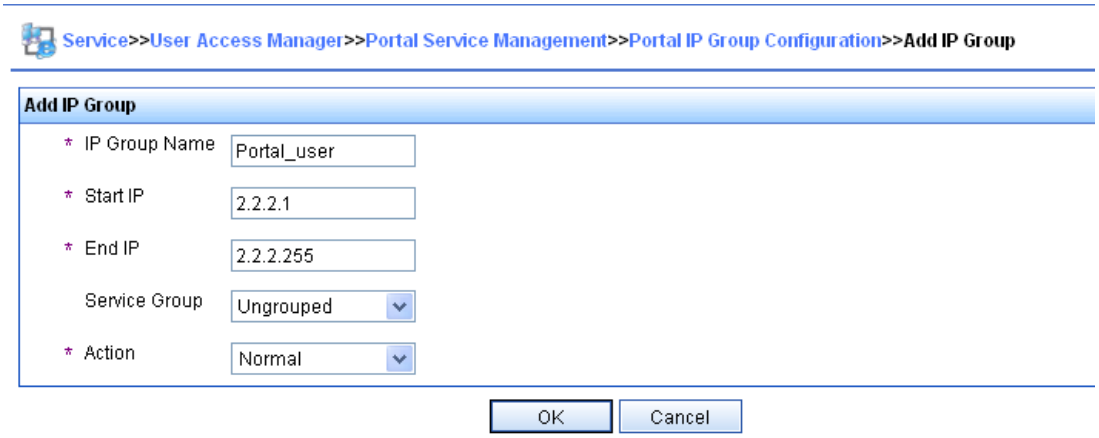
   e. Select a service group.

      This example uses the default group **Ungrouped**.

   f. Select the action **Normal**.

   g. Click **OK**.

Figure 8 Adding an IP address group

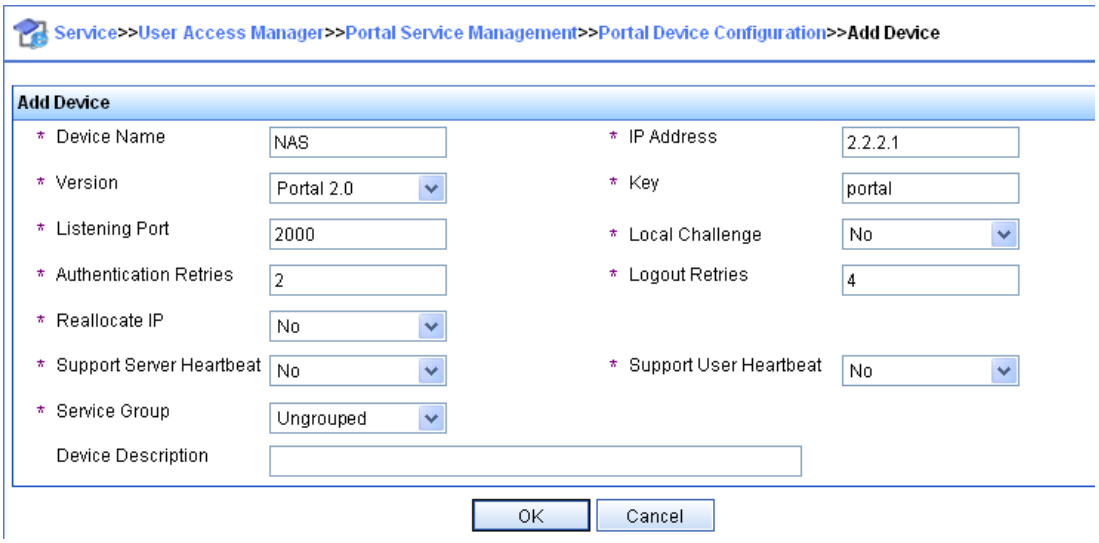


3. Add a portal device:
   a. Select **User Access Manager** > **Portal Service Management** > **Device** from the navigation tree to open the portal device configuration page.
   b. Click **Add** to open the page as shown in Figure 9.
   c. Enter the device name **NAS**.
   d. Enter the IP address of the switch's interface connected to the host.
   e. Enter the key, which must be the same as that configured on the switch.
   f. Set whether to enable IP address reallocation.

      This example uses direct portal authentication, and therefore select **No** from the **Reallocate IP** list.
   g. Select whether to support server heartbeat and user heartbeat functions.

      In this example, select **No** for both **Support Server Heartbeat** and **Support User Heartbeat**.
   h. Click **OK**.

Figure 9 Adding a portal device



4. Associate the portal device with the IP address group:
   a. As shown in Figure 10, click the icon in the **Port Group Information Management** column of device **NAS** to open the port group configuration page.

b. Click **Add** to open the page as shown in Figure 11.

c. Enter the port group name.

d. Select the configured IP address group.

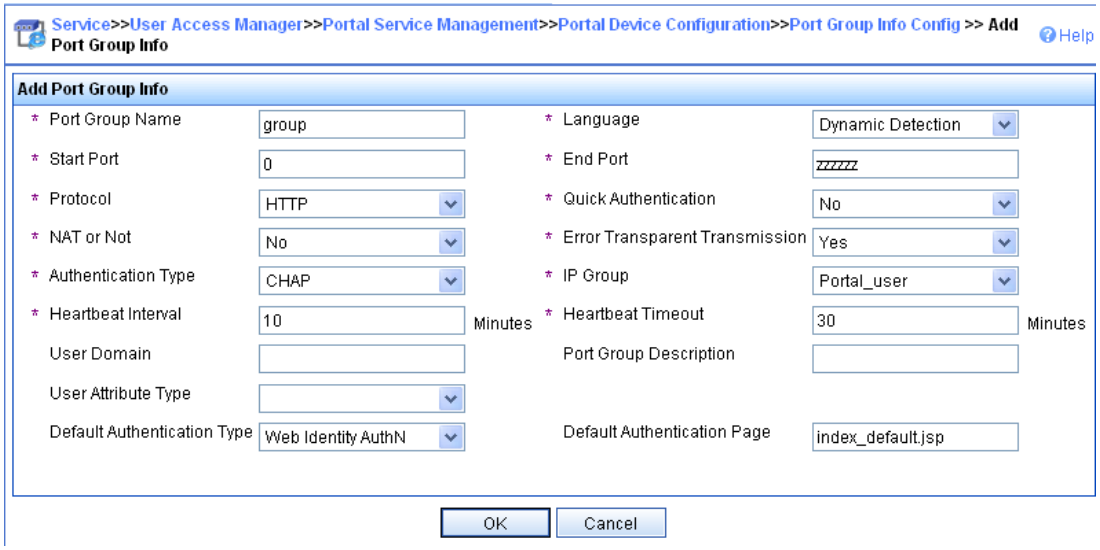
The IP address used by the user to access the network must be within this IP address group.

e. Use the default settings for other parameters.

f. Click **OK**.

Figure 10 Device list

Figure 11 Adding a port group



5. Select **User Access Manager** > **Service Parameters** > **Validate System Configuration** from the navigation tree to make the configurations take effect.

Configuring the switch

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<Switch> system-view
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.112
[Switch-radius-rs1] primary accounting 192.168.0.112
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-rs1] user-name-format without-domain
[Switch-radius-rs1] quit
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
 IPv4:
     Portal status: Enabled
     Portal authentication method: Direct
     Portal web server: newpt
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
```

```
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max Portal users: Not configured
     Bas-ip: 2.2.2.1
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                         Action
         --             --                                  --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max Portal users: Not configured
     Bas-ipv6: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                         Action
         --             --                                  --
     Layer3 source network:
         IP address                                         Prefix length

     Destination authenticate subnet:
         IP address                                         Prefix length
```

A user can perform portal authentication by using the H3C iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
 Total portal users: 1
  Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    2.2.2.2           100    Vlan-interface100
  Authorization information:
```

```
DHCP IP pool: N/A
User profile: N/A
Session group profile: N/A
ACL number: N/A
Inbound CAR: N/A
Outbound CAR: N/A
```

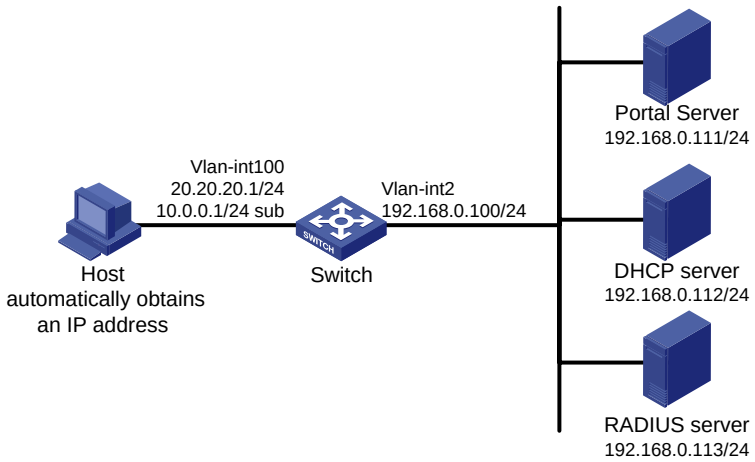
Example: Configuring re-DHCP portal authentication

Network configuration

As shown in Figure 12, the host is directly connected to the switch (the access device). The host obtains an IP address through the DHCP server. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication/accounting server.

Configure re-DHCP portal authentication. Before passing the authentication, the host is assigned a private IP address. After passing the authentication, the host gets a public IP address and can access network resources.

Figure 12 Network diagram



Restrictions and guidelines

- For re-DHCP portal authentication, configure a public address pool (20.20.20.0/24) and a private address pool (10.0.0.0/24) on the DHCP server. (Details not shown.)
- For re-DHCP portal authentication:
  - The switch must be configured as a DHCP relay agent.
  - The portal-enabled interface must be configured with a primary IP address (a public IP address) and a secondary IP address (a private IP address).

  For information about DHCP relay agent configuration, see *Layer 3—IP Services Configuration Guide*.
- Make sure the IP address of the portal device added on the portal server is the public IP address (20.20.20.1) of the switch's interface connecting the host. The private IP address range for the IP address group associated with the portal device is the private subnet 10.0.0.0/24 where the host resides. The public IP address range for the IP address group is the public subnet 20.20.20.0/24.

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 12 and make sure the host, switch, and servers can reach each other.

- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<Switch> system-view
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.113
[Switch-radius-rs1] primary accounting 192.168.0.113
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-rs1] user-name-format without-domain
[Switch-radius-rs1] quit
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure DHCP relay and authorized ARP:

Configure DHCP relay.

```
[Switch] dhcp enable
[Switch] dhcp relay client-information record
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] ip address 20.20.20.1 255.255.255.0
[Switch–Vlan-interface100] ip address 10.0.0.1 255.255.255.0 sub
[Switch-Vlan-interface100] dhcp select relay
[Switch-Vlan-interface100] dhcp relay server-address 192.168.0.112
```

Enable authorized ARP.

```
[Switch-Vlan-interface100] arp authorized enable
[Switch-Vlan-interface100] quit
```

4. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable re-DHCP portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method redhcp
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 20.20.20.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
 IPv4:
     Portal status: Enabled
     Portal authentication method: Redhcp
     Portal web server: newpt
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max Portal users: Not configured
     Bas-ip: 20.20.20.1
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                        Action
         --             --                                 --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
```

```
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max Portal users: Not configured
    Bas-ipv6: Not configured
    User detection: Not configured
    Action for server detection:
        Server type    Server name                     Action
        --             --                              --
    Layer3 source network:
        IP address                                     Prefix length

    Destination authenticate subnet:
        IP address                                     Prefix length
```

Before passing the authentication, a user that uses the H3C iNode client can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    20.20.20.2        100    Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
```

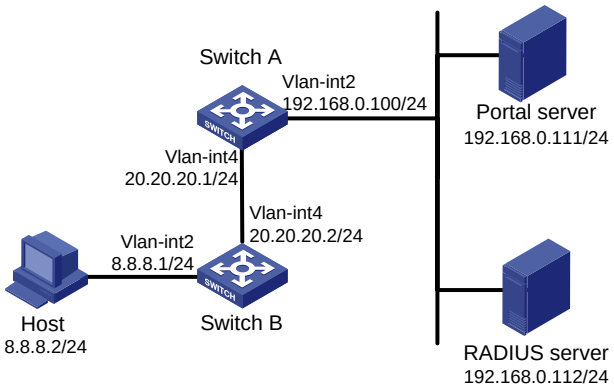
Example: Configuring cross-subnet portal authentication

Network configuration

As shown in Figure 13, Switch A supports portal authentication. The host accesses Switch A through Switch B. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication/accounting server.

Configure Switch A for cross-subnet portal authentication. Before passing the authentication, the host can access only the portal Web server. After passing the authentication, the user can access other network resources.

Figure 13 Network diagram



Restrictions and guidelines

Make sure the IP address of the portal device added on the portal authentication server is the IP address (20.20.20.1) of the switch's interface connecting the host. The IP address group associated with the portal device is the subnet of the host (8.8.8.0/24).

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 13 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <SwitchA> system-view
   [SwitchA] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [SwitchA-radius-rs1] primary authentication 192.168.0.112
   [SwitchA-radius-rs1] primary accounting 192.168.0.112
   [SwitchA-radius-rs1] key authentication simple radius
   [SwitchA-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [SwitchA-radius-rs1] user-name-format without-domain
   [SwitchA-radius-rs1] quit
   ```

   # Enable RADIUS session control.

   ```
   [SwitchA] radius session-control enable
   ```

2. Configure an authentication domain:

   # Create an ISP domain named **dm1** and enter its view.

   ```
   [SwitchA] domain dm1
   ```

   # Configure AAA methods for the ISP domain.

   ```
   [SwitchA-isp-dm1] authentication portal radius-scheme rs1
   [SwitchA-isp-dm1] authorization portal radius-scheme rs1
   [SwitchA-isp-dm1] accounting portal radius-scheme rs1
   [SwitchA-isp-dm1] quit
   ```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[SwitchA] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[SwitchA] portal server newpt
[SwitchA-portal-server-newpt] ip 192.168.0.111 key simple portal
[SwitchA-portal-server-newpt] port 50100
[SwitchA-portal-server-newpt] quit
```

Configure a portal Web server.

```
[SwitchA] portal web-server newpt
[SwitchA-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[SwitchA-portal-websvr-newpt] quit
```

Enable cross-subnet portal authentication on VLAN-interface 4.

```
[SwitchA] interface vlan-interface 4
[SwitchA–Vlan-interface4] portal enable method layer3
```

Specify portal Web server **newpt** on VLAN-interface 4.

```
[SwitchA–Vlan-interface4] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 4 to the portal authentication server.

```
[SwitchA–Vlan-interface4] portal bas-ip 20.20.20.1
[SwitchA–Vlan-interface4] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[SwitchA] display portal interface vlan-interface 4
 Portal information of Vlan-interface4
     NAS-ID profile: Not configured
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled

     Portal status: Enabled
     Portal authentication method: Layer3
     Portal web server: newpt
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max Portal users: Not configured
     Bas-ip: 20.20.20.1
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                       Action
         --             --                                --
     Layer3 source network:
         IP address              Mask
```

```
     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max Portal users: Not configured
     Bas-ipv6: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                     Action
         --             --                              --
     Layer3 source network:
         IP address                                     Prefix length

     Destination authenticate subnet:
         IP address                                     Prefix length
```

A user can perform portal authentication by using the H3C iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[SwitchA] display portal user interface vlan-interface 4
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0000-0000-0000    8.8.8.2           4      Vlan-interface4
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
```

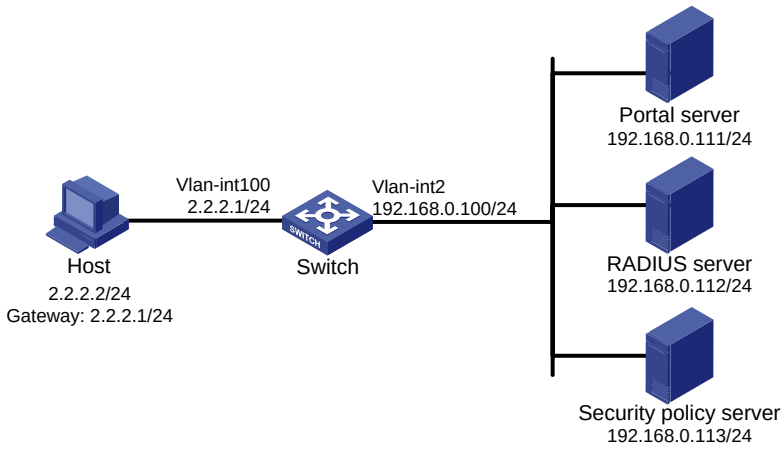
Example: Configuring extended direct portal authentication

Network configuration

As shown in Figure 14, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication/accounting server.

Configure extended direct portal authentication. If the host fails security check after passing identity authentication, it can access only subnet 192.168.0.0/24. After passing security check, the host can access other network resources.

Figure 14 Network diagram



Prerequisites

- Configure IP addresses for the host, switch, and servers as shown in Figure 14 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.112
   [Switch-radius-rs1] primary accounting 192.168.0.112
   [Switch-radius-rs1] key accounting simple radius
   [Switch-radius-rs1] key authentication simple radius
   [Switch-radius-rs1] user-name-format without-domain
   ```

   # Enable RADIUS session control.

   ```
   [Switch] radius session-control enable
   ```

   # Specify a session-control client with IP address 192.168.0.112 and shared key 12345 in plaintext form.

   ```
   [Switch] radius session-control client ip 192.168.0.112 key simple 12345
   ```

2. Configure an authentication domain:

Create an ISP domain named dm1 and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain dm1 as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[Switch-acl-ipv4-adv-3000] rule deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] acl advanced 3001
[Switch-acl-ipv4-adv-3001] rule permit ip
[Switch-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
```

```
    Authorization : Strict checking
    ACL           : Disabled
    User profile  : Disabled
 IPv4:
    Portal status: Enabled
    Portal authentication method: Direct
    Portal web server: newpt
    Secondary portal Web server: Not configured
    Portal mac-trigger-server: Not configured
    Authentication domain: Not configured
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max Portal users: Not configured
    Bas-ip: 2.2.2.1
    User detection:  Not configured
    Action for server detection:
        Server type    Server name                     Action
        --             --                              --
    Layer3 source network:
        IP address              Mask

    Destination authenticate subnet:
        IP address              Mask
IPv6:
    Portal status: Disabled
    Portal authentication method: Disabled
    Portal web server: Not configured
    Secondary portal Web server: Not configured
    Portal mac-trigger-server: Not configured
    Authentication domain: Not configured

    Action for server detection:
        Server type    Server name                     Action
        --             --                              --
    Layer3 source network:
        IP address                                     Prefix length

    Destination authenticate subnet:
        IP address                                     Prefix length
```

Before passing portal authentication, a user that uses the H3C iNode client can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.

- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC                IP                VLAN   Interface
  0015-e9a6-7cfe     2.2.2.2           100    Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: 3001 (active)
    Inbound CAR: N/A
    Outbound CAR: N/A
```

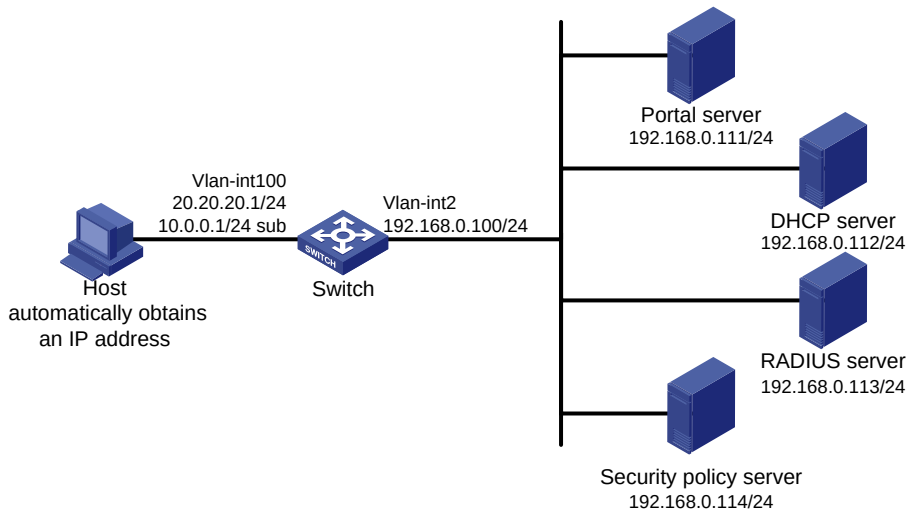
Example: Configuring extended re-DHCP portal authentication

Network configuration

As shown in Figure 15, the host is directly connected to the switch (the access device). The host obtains an IP address through the DHCP server. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication/accounting server.

Configure extended re-DHCP portal authentication. Before passing portal authentication, the host is assigned a private IP address. After passing portal identity authentication, the host obtains a public IP address and accepts security check. If the host fails the security check, it can access only subnet 192.168.0.0/24. After passing the security check, the host can access other network resources.

Figure 15 Network diagram



Restrictions and guidelines

- For re-DHCP portal authentication, configure a public address pool (20.20.20.0/24) and a private address pool (10.0.0.0/24) on the DHCP server. (Details not shown.)
- For re-DHCP portal authentication:
  - The switch must be configured as a DHCP relay agent.
  - The portal-enabled interface must be configured with a primary IP address (a public IP address) and a secondary IP address (a private IP address).

  For information about DHCP relay agent configuration, see *Layer 3—IP Services Configuration Guide*.
- Make sure the IP address of the portal device added on the portal server is the public IP address (20.20.20.1) of the switch's interface connecting the host. The private IP address range for the IP address group associated with the portal device is the private subnet 10.0.0.0/24 where the host resides. The public IP address range for the IP address group is the public subnet 20.20.20.0/24.

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 15 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<Switch> system-view
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.113
[Switch-radius-rs1] primary accounting 192.168.0.113
[Switch-radius-rs1] key accounting simple radius
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] user-name-format without-domain
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

Specify a session-control client with IP address 192.168.0.113 and shared key 12345 in plaintext form.

```
[Switch] radius session-control client ip 192.168.0.113 key simple 12345
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[Switch-acl-ipv4-adv-3000] rule deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] acl advanced 3001
[Switch-acl-ipv4-adv-3001] rule permit ip
[Switch-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure DHCP relay and authorized ARP:

Configure DHCP relay.

```
[Switch] dhcp enable
[Switch] dhcp relay client-information record
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] ip address 20.20.20.1 255.255.255.0
[Switch–Vlan-interface100] ip address 10.0.0.1 255.255.255.0 sub
[Switch-Vlan-interface100] dhcp select relay
[Switch-Vlan-interface100] dhcp relay server-address 192.168.0.112
```

Enable authorized ARP.

```
[Switch-Vlan-interface100] arp authorized enable
[Switch-Vlan-interface100] quit
```

5. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable re-DHCP portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method redhcp
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 20.20.20.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
```

```
    NAS-ID profile: Not configured
    Authorization : Strict checking
    ACL           : Disabled
    User profile  : Disabled

        --             --                               --
    Layer3 source network:
        IP address              Mask

    Destination authenticate subnet:
        IP address              Mask
IPv6:
    Portal status: Disabled
    Portal authentication method: Disabled
    Portal web server: Not configured
    Secondary portal Web server: Not configured
    Portal mac-trigger-server: Not configured
    Authentication domain: Not configured
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max Portal users: Not configured
    Bas-ipv6: Not configured
    User detection: Not configured
    Action for server detection:
        Server type    Server name                      Action
        --             --                               --
    Layer3 source network:
        IP address                                      Prefix length

    Destination authenticate subnet:
        IP address                                      Prefix length
```

Before passing portal authentication, a user that uses the H3C iNode client can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.

- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC                IP                 VLAN   Interface
  0015-e9a6-7cfe     20.20.20.2         100    Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: 3001 (active)
    Inbound CAR: N/A
    Outbound CAR: N/A
```

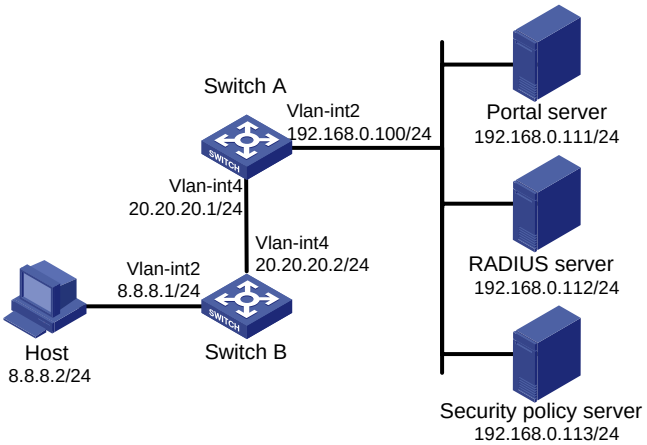
Example: Configuring extended cross-subnet portal authentication

Network configuration

As shown in Figure 16, Switch A supports portal authentication. The host accesses Switch A through Switch B. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication/accounting server.

Configure Switch A for extended cross-subnet portal authentication. Before passing portal authentication, the host can access only the portal server. After passing portal identity authentication, the host accepts security check. If the host fails the security check it can access only the subnet 192.168.0.0/24. After passing the security check, the host can access other network resources.

Figure 16 Network diagram



Restrictions and guidelines

Make sure the IP address of the portal device added on the portal server is the IP address (20.20.20.1) of the switch's interface connecting the host. The IP address group associated with the portal device is the subnet of the host (8.8.8.0/24).

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 16 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<SwitchA> system-view
[SwitchA] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[SwitchA-radius-rs1] primary authentication 192.168.0.112
[SwitchA-radius-rs1] primary accounting 192.168.0.112
[SwitchA-radius-rs1] key accounting simple radius
[SwitchA-radius-rs1] key authentication simple radius
[SwitchA-radius-rs1] user-name-format without-domain
```

Enable RADIUS session control.

```
[SwitchA] radius session-control enable
```

Specify a session-control client with IP address 192.168.0.112 and shared key 12345 in plaintext form.

```
[SwitchA] radius session-control client ip 192.168.0.112 key simple 12345
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[SwitchA] domain dm1
```

Configure AAA methods for the ISP domain.

```
[SwitchA-isp-dm1] authentication portal radius-scheme rs1
[SwitchA-isp-dm1] authorization portal radius-scheme rs1
[SwitchA-isp-dm1] accounting portal radius-scheme rs1
[SwitchA-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[SwitchA] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[SwitchA] acl advanced 3000
[SwitchA-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[SwitchA-acl-ipv4-adv-3000] rule deny ip
[SwitchA-acl-ipv4-adv-3000] quit
[SwitchA] acl advanced 3001
[SwitchA-acl-ipv4-adv-3001] rule permit ip
[SwitchA-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure portal authentication:

Configure a portal authentication server.

```
[SwitchA] portal server newpt
[SwitchA-portal-server-newpt] ip 192.168.0.111 key simple portal
[SwitchA-portal-server-newpt] port 50100
[SwitchA-portal-server-newpt] quit
```

Configure a portal Web server.

```
[SwitchA] portal web-server newpt
[SwitchA-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[SwitchA-portal-websvr-newpt] quit
```

Enable cross-subnet portal authentication on VLAN-interface 4.

```
[SwitchA] interface vlan-interface 4
[SwitchA–Vlan-interface4] portal enable method layer3
```

Specify portal Web server **newpt** on VLAN-interface 4.

```
[SwitchA–Vlan-interface4] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 4 to the portal authentication server.

```
[SwitchA–Vlan-interface4] portal bas-ip 20.20.20.1
[SwitchA–Vlan-interface4] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[SwitchA] display portal interface vlan-interface 4
 Portal information of Vlan-interface4
     NAS-ID profile: Not configured
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled

     Portal status: Enabled
     Portal authentication method: Layer3
     Portal web server: newpt
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max Portal users: Not configured
     Bas-ip: 20.20.20.1
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                       Action
         --             --                                --
     Layer3 source network:
         IP address              Mask
```

```
     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max Portal users: Not configured
     Bas-ip: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                        Action
         --             --                                 --
     Layer3 source network:
         IP address                                        Prefix length

     Destination authenticate subnet:
         IP address                                        Prefix length
```

Before passing portal authentication, a user that uses the H3C iNode client can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.
- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[SwitchA] display portal user interface vlan-interface 4
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    8.8.8.2           4    Vlan-interface4
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: 3001 (active)
    Inbound CAR: N/A
    Outbound CAR: N/A
```

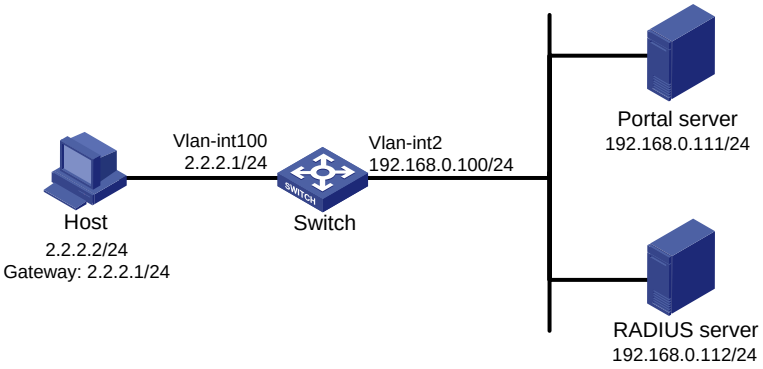
Example: Configuring portal server detection and portal user synchronization

Network configuration

As shown in Figure 17, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication/accounting server.

- Configure direct portal authentication on the switch, so the host can access only the portal server before passing the authentication and access other network resources after passing the authentication.
- Configure the switch to detect the reachability state of the portal authentication server, send log messages upon state changes, and disable portal authentication when the authentication server is unreachable.
- Configure the switch to synchronize portal user information with the portal server periodically.

Figure 17 Network diagram



Prerequisites

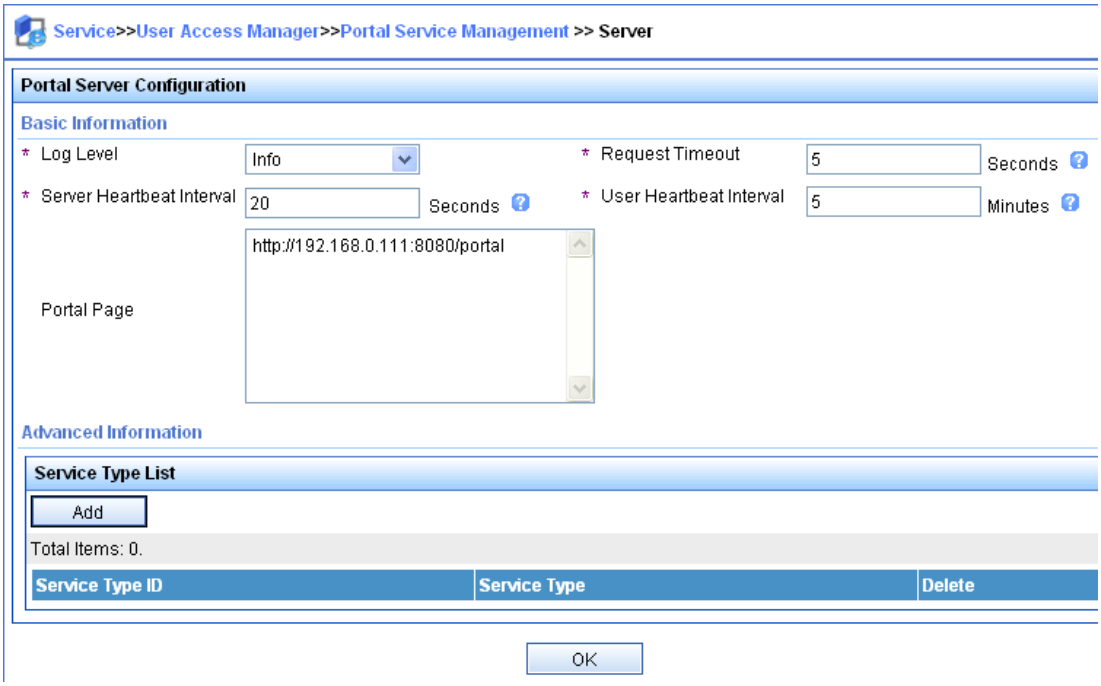
- Configure IP addresses for the switch and servers as shown in Figure 17 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Configuring the portal authentication server on IMC PLAT 5.0

In this example, the portal server runs on IMC PLAT 5.0(E0101) and IMC UAM 5.0(E0101).

1. Configure the portal authentication server:
   a. Log in to IMC and click the **Service** tab.
   b. Select **User Access Manager** > **Portal Service Management** > **Server** from the navigation tree to open the portal server configuration page, as shown in Figure 18.
   c. Configure the portal server heartbeat interval and user heartbeat interval.
   d. Use the default settings for other parameters.
   e. Click **OK**.

Figure 18 Portal authentication server configuration

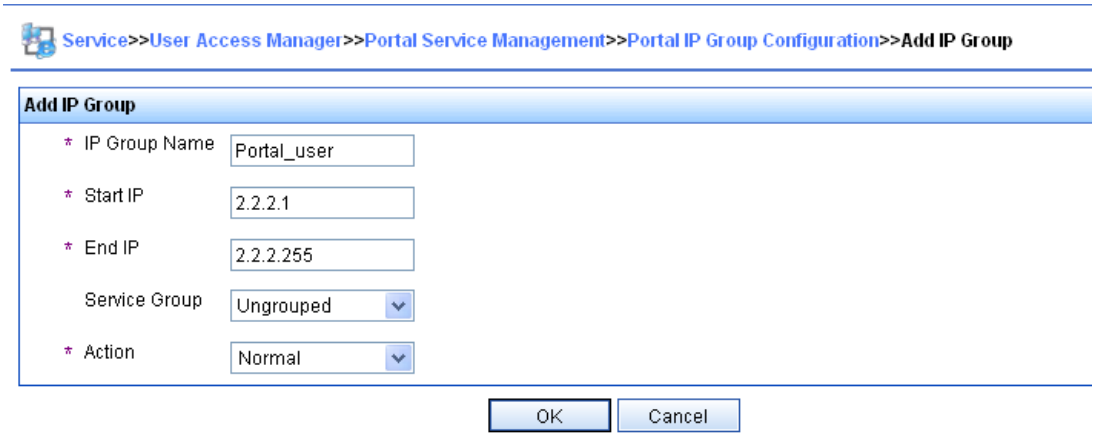


2. Configure the IP address group:
   a. Select **User Access Manager** > **Portal Service Management** > **IP Group** from the navigation tree to open the portal IP address group configuration page.
   b. Click **Add** to open the page as shown in Figure 19.
   c. Enter the IP group name.
   d. Enter the start IP address and end IP address of the IP group.

      Make sure the host IP address is in the IP group.
   e. Select a service group.

      This example uses the default group **Ungrouped**.
   f. Select the action **Normal**.
   g. Click **OK**.

Figure 19 Adding an IP address group



3. Add a portal device:

a. Select **User Access Manager** > **Portal Service Management** > **Device** from the navigation tree to open the portal device configuration page.

b. Click **Add** to open the page as shown in Figure 20.

c. Enter the device name **NAS**.

d. Enter the IP address of the switch's interface connected to the host.

e. Enter the key, which must be the same as that configured on the switch.

f. Set whether to enable IP address reallocation.

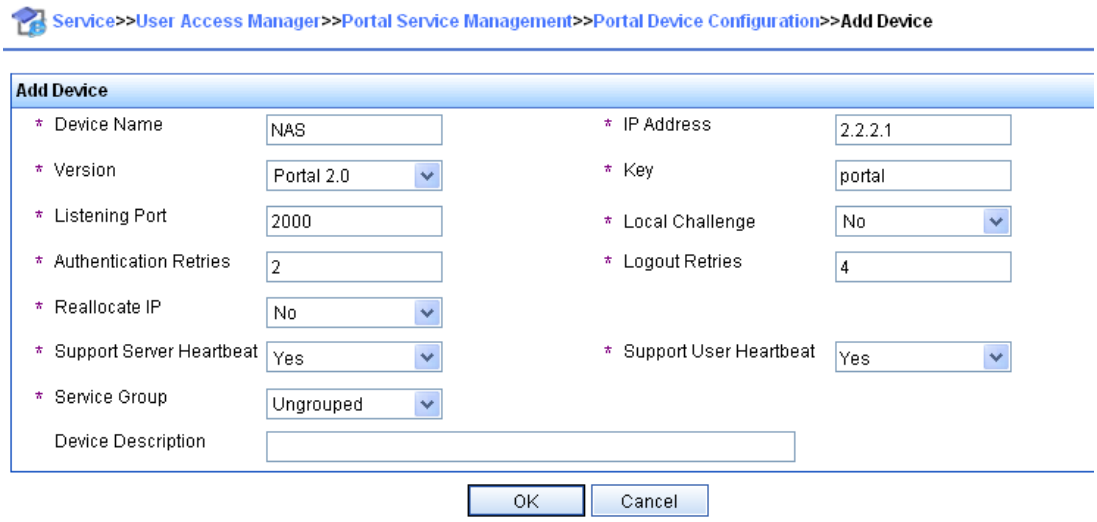
This example uses direct portal authentication, and therefore select **No** from the **Reallocate IP** list.

g. Select whether to support server heartbeat and user heartbeat functions.

In this example, select **Yes** for both **Support Server Heartbeat** and **Support User Heartbeat**.

h. Click **OK**.

Figure 20 Adding a portal device



4. Associate the portal device with the IP address group:

a. As shown in Figure 21, click the icon in the **Port Group Information Management** column of device **NAS** to open the port group configuration page.

b. Click **Add** to open the page as shown in Figure 22.

c. Enter the port group name.

d. Select the configured IP address group.

The IP address used by the user to access the network must be within this IP address group.

e. Use the default settings for other parameters.

f. Click **OK**.

Figure 21 Device list

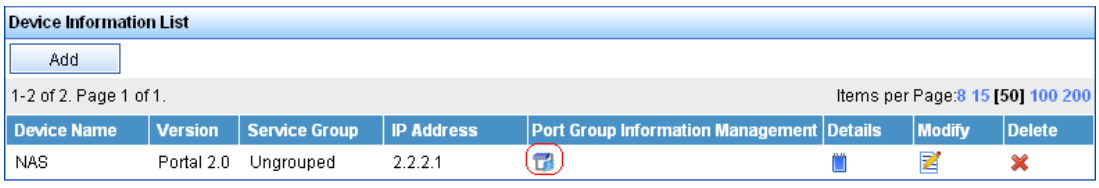


Figure 22 Adding a port group

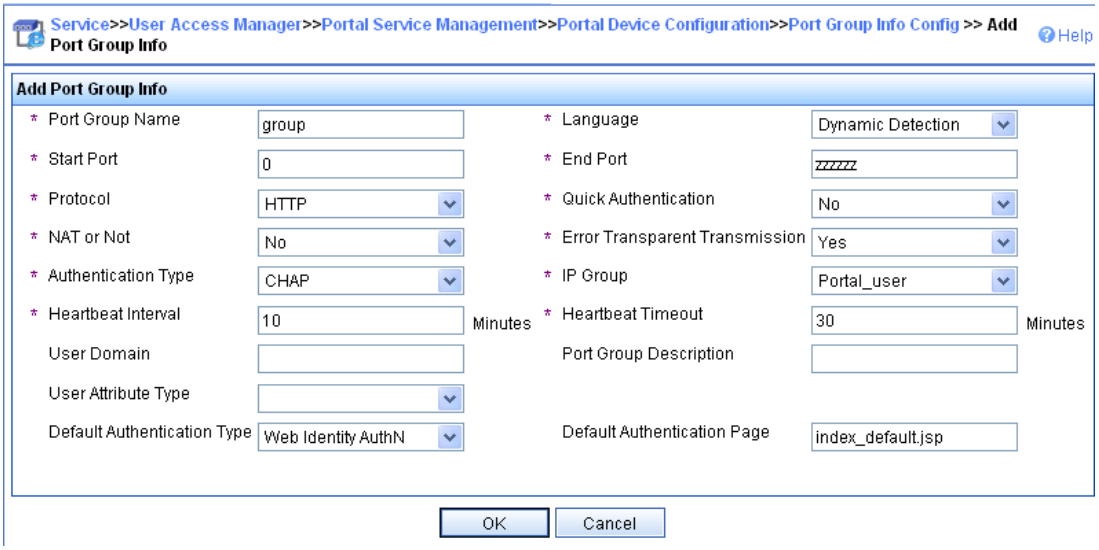


5. Select **User Access Manager** > **Service Parameters** > **Validate System Configuration** from the navigation tree to make the configurations take effect.

Configuring the switch

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.112
   [Switch-radius-rs1] primary accounting 192.168.0.112
   [Switch-radius-rs1] key authentication simple radius
   [Switch-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [Switch-radius-rs1] user-name-format without-domain
   [Switch-radius-rs1] quit
   ```

   # Enable RADIUS session control.

   ```
   [Switch] radius session-control enable
   ```

2. Configure an authentication domain:

   # Create an ISP domain named **dm1** and enter its view.

   ```
   [Switch] domain dm1
   ```

   # Configure AAA methods for the ISP domain.

   ```
   [Switch-isp-dm1] authentication portal radius-scheme rs1
   [Switch-isp-dm1] authorization portal radius-scheme rs1
   [Switch-isp-dm1] accounting portal radius-scheme rs1
   [Switch-isp-dm1] quit
   ```

   # Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

   ```
   [Switch] domain default enable dm1
   ```

3. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
```

Configure reachability detection of the portal authentication server: set the server detection interval to 40 seconds, and send log messages upon reachability status changes.

```
[Switch-portal-server-newpt] server-detect timeout 40 log
```

NOTE:

The value of **timeout** must be greater than or equal to the portal server heartbeat interval.

Configure portal user synchronization with the portal authentication server, and set the synchronization detection interval to 600 seconds.

```
[Switch-portal-server-newpt] user-sync timeout 600
[Switch-portal-server-newpt] quit
```

NOTE:

The value of **timeout** must be greater than or equal to the portal user heartbeat interval.

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Enable portal fail-permit for the portal authentication server **newpt**.

```
[Switch–Vlan-interface100] portal fail-permit server newpt
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Use the following command to display information about the portal authentication server.

```
[Switch] display portal server newpt
Portal server: newpt
  Type                 : IMC
  IP                   : 192.168.0.111
  VPN instance         : Not configured
  Port                 : 50100
  Server Detection     : Timeout 40s  Action: log
  User synchronization : Timeout 600s
  Status               : Up
```

The **Up** status of the portal authentication server indicates that the portal authentication server is reachable. If the access device detects that the portal authentication server is unreachable, the **Status** field in the command output displays **Down**. The access device generates a server

unreachable log "Portal server newpt turns down from up." and disables portal authentication on the access interface, so the host can access the external network without authentication.

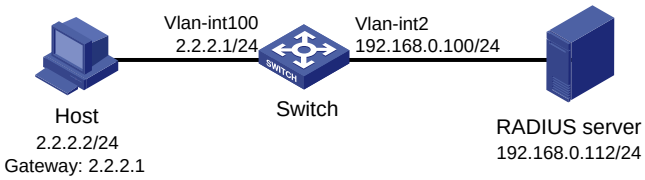
Example: Configuring direct portal authentication using a local portal Web service

Network configuration

As shown in Figure 23, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. The switch acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication/accounting server.

Configure direct portal authentication on the switch. Before a user passes portal authentication, the user can access only the portal Web server. After passing portal authentication, the user can access other network resources.

Figure 23 Network diagram



Prerequisites

- Configure IP addresses for the host, switch, and server as shown in Figure 23 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.112
   [Switch-radius-rs1] primary accounting 192.168.0.112
   [Switch-radius-rs1] key authentication simple radius
   [Switch-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [Switch-radius-rs1] user-name-format without-domain
   [Switch-radius-rs1] quit
   ```

   # Enable RADIUS session control.

   ```
   [Switch] radius session-control enable
   ```

2. Configure an authentication domain:

   # Create an ISP domain named **dm1** and enter its view.

   ```
   [Switch] domain dm1
   ```

   # Configure AAA methods for the ISP domain.

   ```
   [Switch-isp-dm1] authentication portal radius-scheme rs1
   ```

```
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal Web server named **newpt** and specify **http://2.2.2.1:2331/portal** as the URL of the portal Web server. The IP address in the URL must be the IP address of a Layer 3 interface reachable to portal clients or a loopback interface (except 127.0.0.1) on the device.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://2.2.2.1:2331/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
[Switch–Vlan-interface100] quit
```

Create an HTTP-based local portal Web service and enter its view.

```
[Switch] portal local-web-server http
```

Specify file **defaultfile.zip** as the default authentication page file for the local portal Web service. (Make sure the file exist under the root directory of the switch.)

```
[Switch–portal-local-websvr-http] default-logon-page defaultfile.zip
```

Set the HTTP listening port number to 2331 for the local portal Web service.

```
[Switch–portal-local-webserver-http] tcp-port 2331
[Switch–portal-local-websvr-http] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface 100
     Authorization                   Strict checking
     ACL                             Disabled
     User profile                    Disabled
 IPv4:
     Portal status: Enabled
     Portal authentication method: Direct
     Portal web server: newpt
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max Portal users: Not configured
     Bas-ip: Not configured
     User detection:  Not configured
     Action for server detection:
```

```
        Server type    Server name                          Action
        --             --                                   --
    Layer3 source network:
        IP address              Mask

    Destination authenticate subnet:
        IP address              Mask
IPv6:
    Portal status: Disabled
    Portal authentication method: Disabled
    Portal web server: Not configured
    Secondary portal Web server: Not configured
    Portal mac-trigger-server: Not configured
    Authentication domain: Not configured
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max Portal users: Not configured
    Bas-ipv6: Not configured
    User detection: Not configured
    Action for server detection:
        Server type    Server name                          Action
        --             --                                   --
    Layer3 source network:
        IP address                                          Prefix length

    Destination authenticate subnet:
        IP address                                          Prefix length
```

A user can perform portal authentication through a Web page. Before passing the authentication, the user can access only the authentication page **http://2.2.2.1:2331/portal** and all Web requests will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    2.2.2.2           100     Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
```

Troubleshooting portal

No portal authentication page is pushed for users

Symptom

When a user is redirected to the IMC portal authentication server, no portal authentication page or error message is prompted for the user. The login page is blank.

Analysis

The key configured on the portal access device and that configured on the portal authentication server are inconsistent. As a result, packet verification fails, and the portal authentication server refuses to push the authentication page.

Solution

Use the **display this** command in portal authentication server view on the access device to check whether a key is configured for the portal authentication server.

- If no key is configured, configure the right key.
- If a key is configured, use the **ip** or **ipv6** command in the portal authentication server view to correct the key, or correct the key configured for the access device on the portal authentication server.

Cannot log out portal users on the access device

Symptom

You cannot use the **portal delete-user** command on the access device to log out a portal user, but the portal user can log out by clicking the **Disconnect** button on the portal authentication client.

Analysis

When you execute the **portal delete-user** command on the access device to log out a user, the access device sends an unsolicited logout notification message to the portal authentication server. The destination port number in the logout notification is the listening port number of the portal authentication server configured on the access device. If this listening port number is not the actual listening port number configured on the server, the server cannot receive the notification. As a result, the server does not log out the user.

When a user uses the **Disconnect** button on the authentication client to log out, the portal authentication server sends an unsolicited logout request message to the access device. The access device uses the source port in the logout request as the destination port in the logout ACK message. As a result, the portal authentication server can definitely receive the logout ACK message and log out the user.

Solution

1. Use the **display portal server** command to display the listening port of the portal authentication server configured on the access device.
2. Use the **portal server** command in system view to change the listening port number to the actual listening port of the portal authentication server.

Cannot log out portal users on the RADIUS server

Symptom

The access device uses the H3C IMC server as the RADIUS server to perform identity authentication for portal users. You cannot log out the portal users on the RADIUS server.

Analysis

The H3C IMC server uses session control packets to send disconnection requests to the access device. On the access device, the listening UDP port for session control packets is disabled by default. Therefore, the access device cannot receive the portal user logout requests from the RADIUS server.

Solution

On the access device, execute the **`radius session-control enable`** command in system view to enable the RADIUS session control function.

Users logged out by the access device still exist on the portal authentication server

Symptom

After you log out a portal user on the access device, the user still exists on the portal authentication server.

Analysis

When you execute the **`portal delete-user`** command on the access device to log out a user, the access device sends an unsolicited logout notification to the portal authentication server. If the BAS-IP or BAS-IPv6 address carried in the logout notification is different from the portal device IP address specified on the portal authentication server, the portal authentication server discards the logout notification. When sending of the logout notifications times out, the access device logs out the user. However, the portal authentication server does not receive the logout notification successfully, and therefore it regards the user is still online.

Solution

Configure the BAS-IP or BAS-IPv6 attribute on the interface enabled with portal authentication. Make sure the attribute value is the same as the portal device IP address specified on the portal authentication server.

Re-DHCP portal authenticated users cannot log in successfully

Symptom

The device performs re-DHCP portal authentication for users. A user enters the correct username and password, and the client successfully obtains the private and public IP addresses. However, the authentication result for the user is failure.

Analysis

When the access device detects that the client IP address is changed, it sends an unsolicited portal packet to notify of the IP change to the portal authentication server. The portal authentication server notifies of the authentication success only after it receives the IP change notification from both the access device and the client.

If the BAS-IP or BAS-IPv6 address carried in the portal notification packet is different from the portal device IP address specified on the portal authentication server, the portal authentication server discards the portal notification packet. As a result, the portal authentication server considers that the user has failed the authentication.

Solution

Configure the BAS-IP or BAS-IPv6 attribute on the interface enabled with portal authentication. Make sure the attribute value is the same as the portal device IP address specified on the portal authentication server.

Contents

Configuring Web authentication

About Web authentication

Web authentication is deployed on Layer 2 Ethernet interfaces of the access device to control user access to networks. The access device redirects unauthenticated users to the specified website. The users can access the resources on the website without authentication. If the users want to access other network resources, they must pass authentication.

Advantages of Web authentication

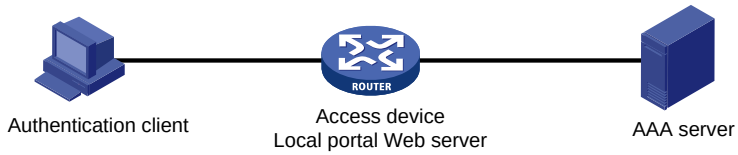
Web authentication has the following advantages:

- Allows users to perform authentication through webpages without installing client software.
- Provides ISPs with diversified management choices and extended functions. For example, the ISPs can place advertisements, provide community services, and publish information on the authentication page.

Web authentication system

A typical Web authentication system consists of four basic components: authentication client, access device, local portal Web server, and AAA server.

Figure 1 Web authentication system using the local portal server



Authentication client

An authentication client is a Web browser that runs HTTP or HTTPS.

Access device

An access device has the following functions:

- Redirects all user HTTP or HTTPS requests that do not match authentication-free rules to the Web authentication page before authentication.
- Interacts with the AAA server to complete authentication, authorization, and accounting. For more information about AAA, see "Configuring AAA."
- Allows users that pass authentication to access authorized network resources.

Local portal Web server

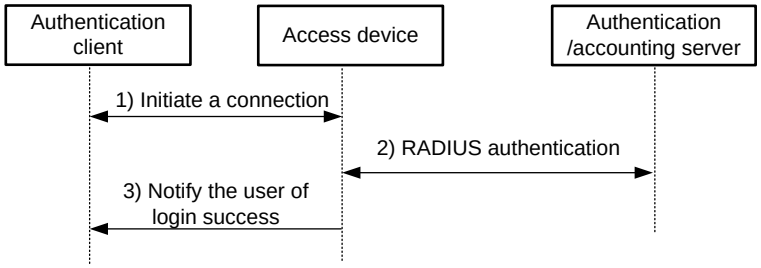
The access device acts as the local portal Web server. The local portal Web server pushes the Web authentication page to authentication clients and obtains user authentication information (username and password).

AAA server

An AAA server interacts with the access device to implement user authentication, authorization, and accounting. A RADIUS server can perform authentication, authorization, and accounting for Web authentication users. An LDAP server can perform authentication for Web authentication users.

Web authentication process

Figure 2 Web authentication process



The Web authentication process is as follows:

1. An unauthenticated user sends an HTTP or HTTPS request. When the access device receives the HTTP or HTTPS request on a Layer 2 Ethernet interface enabled with Web authentication, it redirects the request to the Web authentication page. The user enters the username and password on the Web authentication page.

   If the user requests the Web authentication page or free Web resources, the access device permits the request. No Web authentication is performed.
2. The access device and the AAA server exchange RADIUS packets to authenticate the user.
3. If the user passes RADIUS authentication, the local portal Web server pushes a login success page to the authentication client.

   If the user fails RADIUS authentication, the local portal Web server pushes a login failure page to the authentication client.

Web authentication support for VLAN assignment

Authorization VLAN

Web authentication uses VLANs authorized by the AAA server or the access device to control network resource access of authenticated users.

After a user passes Web authentication, the AAA server or the access device authorizes the user to access a VLAN. If the authorization VLAN does not exist, the access device first creates the VLAN and then assigns the user access interface as an untagged member to the VLAN. If the authorization VLAN already exists, the access device directly assigns the user access interface as an untagged member to the VLAN. Then, the user can access resources in the authorization VLAN.

Table 1 describes the way the access device handles authorization VLANs for Web authenticated users.

Table 1 VLAN manipulation

Port type	VLAN manipulation
• Access port • Trunk port • Hybrid port with MAC-based-VLAN disabled	The device assigns the port to the first authenticated user's authorization VLAN. The authorization VLAN becomes the PVID. All Web authentication users on the port must be assigned the same authorization VLAN. If a different authorization VLAN is assigned to a subsequent user, the user cannot pass Web authentication.
Hybrid port with MAC-based VLAN enabled	The device maps the MAC address of each user to its own authorization VLAN regardless of whether the port is a tagged member. The PVID of the port does not change.

Auth-Fail VLAN

An Auth-Fail VLAN is a VLAN assigned to users who fail authentication. The Auth-Fail VLAN provides network resources such as the patch server, virus definitions server, client software server, and anti-virus software server to the users. The users can use these resources to upgrade their client software or other programs.

Web authentication supports Auth-Fail VLAN on an interface that performs MAC-based access control. If a user on the interface fails authentication, the access devices creates a MAC VLAN entry based on the MAC address of the user and adds the user to the Auth-Fail VLAN. Then, the user can access the portal-free IP resources in the Auth-Fail VLAN. All HTTP or HTTPS requests to non-portal-free IP resources will be redirected to the authentication page. If the user still fails authentication, the interface remains in the Auth-Fail VLAN. If the user passes authentication, the access device removes the interface from the Auth-Fail VLAN and assigns the interface to a VLAN as follows:

- If the authentication server assigns an authorization VLAN to the user, the access device assigns the interface to the authorization VLAN.
- If the authentication server does not assign an authorization VLAN to the user, the access device assigns the interface to the default VLAN.

Web authentication support for authorization ACLs

Web authentication uses ACLs authorized by the AAA server or the access device to control user access to network resources and limit user access rights. When a user passes authentication, the AAA server and the access device assigns an authorization ACL to the access interface of the user. The access device filters traffic from the user on the access interface according to the authorized ACL.

You must configure the authorization ACLs on the access device if you specify authorization ACLs on the authentication server.

To change the access control criteria for the user, you can specify a different authorization ACL on the authentication server or change rules in the authorization ACL on the access device.

The device supports the following types of authorization ACLs:

- Basic ACLs (ACL 2000 to ACL 2999).
- Advanced ACLs (ACL 3000 to ACL 3999).
- Layer 2 ACLs (ACL 4000 to ACL 4999).

For an authorization ACL to take effect, make sure the ACL exists and has ACL rules excluding rules configured with the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, or **`logging`** keyword. For more information about ACL rules, see ACL commands in *ACL and QoS Command Reference*.

Restrictions and guidelines: Web authentication configuration

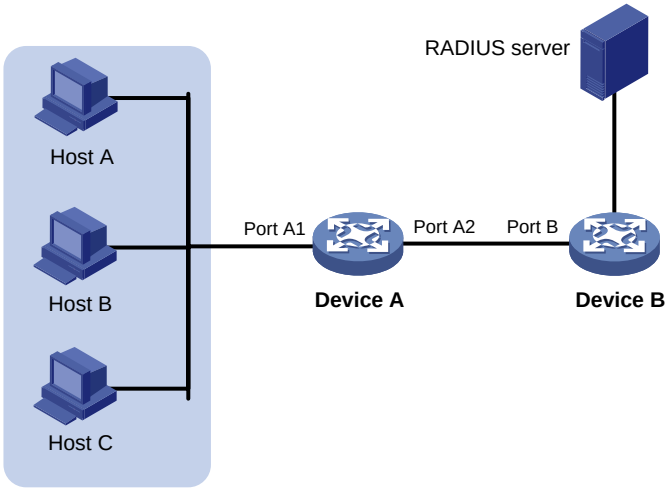
To redirect HTTPS requests for unauthenticated users correctly, make sure the packet incoming VLANs have Layer 3 interfaces (VLAN interfaces) configured.

To access the resources in the authorization or Auth-Fail VLAN, a user must update the IP address of the client after being assigned to the authorization or Auth-Fail VLAN.

As a best practice, perform Web authentication on users directly connected to the device. As shown in Figure 3, if you enable Web authentication on Port B to authenticate non-directly connected users (the hosts), you must follow these restrictions and guidelines:

- If the RADIUS server assigns an authorization VLAN to the users, make sure the following conditions are met:
  - The link between Device A and Device B is a trunk link.
  - The PVIDs of Port A1 and Port B are the same as the authorization VLAN ID.
- If the RADIUS server does not assign an authorization VLAN to the users, make sure the PVIDs of Port A1 and Port B are the same.

Figure 3 Web authentication for non-directly connected users



Web authentication tasks at a glance

To configure Web authentication, perform the following tasks:

1. Configuring a Web authentication server
2. Configuring a local portal service
3. Enabling Web authentication
4. (Optional.) Specifying a Web authentication domain
5. (Optional.) Setting the redirection wait time
6. (Optional.) Configuring the aging timer for temporary MAC address entries for Web authentication
7. (Optional.) Configuring a Web authentication-free subnet
8. (Optional.) Setting the maximum number of Web authentication users
9. (Optional.) Configuring online Web authentication user detection
10. (Optional.) Configuring an Auth-Fail VLAN
11. (Optional.) Configuring Web authentication to support Web proxy

Prerequisites for Web authentication

The device supports two methods for Web authentication, which are local authentication and RADIUS authentication.

To use the RADIUS authentication method, you must complete the following tasks:

- Install a RADIUS server and configure the RADIUS server properly.
- Make sure the authentication client, the access device, and the RADIUS server can reach each other.

- Configure user accounts on the RADIUS server and configure the RADIUS client information on the access device.

To use the local authentication method, you must configure local users on the access device.

For more information about RADIUS clients and local users, see "Configuring AAA."

Configuring a Web authentication server

Restrictions and guidelines

Specify the IP address of a Layer 3 interface on the device that is routable to the Web client as the listening IP address of the Web authentication server. As a best practice, use the IP address of a loopback interface rather than that of a Layer 3 interface. A loopback interface has the following advantages:

- The status of a loopback interface is stable. There will be no authentication page access failures caused by interface failures.
- A loopback interface does not forward received packets to any networks, avoiding impact on system performances when there are many network access requests.

Procedure

1. Enter system view.

   system-view
2. Create a Web authentication server and enter its view.

   web-auth server *server-name*
3. Specify the IP address and port number of the Web authentication server.

   ip *ipv4-address* **port** *port-number*

   The port number of the Web authentication server must be the same as the listening port of the local portal Web service.
4. Specify the redirection URL for the Web authentication server.

   url *url-string*

   The IP address and port number in the specified redirection URL must be the same as those of the Web authentication server.
5. (Optional.) Add parameters to the redirection URL of the Web authentication server.

   url-parameter *parameter-name* { **original-url** | **source-address** | **source-mac** | **value** *expression* }

   By default, no parameters are added to the redirection URL of a Web authentication server.

Configuring a local portal service

For information about the local portal service configuration, see "Configuring portal authentication."

Enabling Web authentication

Restrictions and guidelines

For Web authentication to operate correctly, do not enable port security or configure the port security mode on the Layer 2 Ethernet interface enabled with Web authentication. For more information about port security, see "Configuring port security."

To redirect Web authentication users' HTTPS packets, make sure the specified HTTPS redirect listening port number (the default is 6654) is available. For more information about how to change

the HTTPS redirect listening port number, see HTTPS redirect configuration in *Layer 3—IP Services Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable Web authentication and specify the Web authentication server.
   web-auth enable apply server *server-name*
   By default, Web authentication is disabled.

Specifying a Web authentication domain

About the Web authentication domain

You can specify different authentication domains for Web authentication users on different interfaces. After you specify a Web authentication domain on an interface, the device uses the authentication domain for AAA of all Web authentication users on the interface, ignoring the domain names carried in the usernames.

The device selects the authentication domain for a Web authentication user on an interface in this order:

1. The authentication domain specified for the interface.
2. The authentication domain carried in the username.
3. The system default authentication domain.
4. The ISP domain configured to accommodate users assigned to nonexistent domains.

If the selected domain does not exist on the device, user authentication fails. For information about ISP domains, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an authentication domain for Web authentication users on the interface.
   web-auth domain *domain-name*
   By default, no authentication domain is specified for Web authentication users.

Setting the redirection wait time

About the redirection wait time

The redirection wait time determines the length of time that the device waits to redirect a user to the specified webpage after the user passes Web authentication.

You need to change the redirection wait time in some scenarios, for example, when a user needs to update the client IP address after passing Web authentication. To ensure that the specified webpage can be successfully opened, set the redirection wait time to be greater than the time that the user takes to update the IP address of the client.

Procedure

1. Enter system view.
   system-view
2. Enter Web authentication server view.
   web-auth server *server-name*
3. Set the redirection wait time.
   redirect-wait-time *period*
   By default, the redirection wait time for authenticated users is 5 seconds.

Configuring the aging timer for temporary MAC address entries for Web authentication

About the aging timer

If Web authentication is enabled, the device generates a temporary MAC address entry when it detects traffic from a user for the first time. The entry records the MAC address, access interface, and VLAN ID of the user, as well as the aging time of the entry.

The aging timer works as follows:

- If the user does not initiate authentication when the aging timer expires, the device deletes the temporary entry.
- If the user passes authentication before the aging timer expires, the device deletes the aging timer and records online information for the Web authentication user.
- If the user fails authentication before the aging timer expires and an Auth-Fail VLAN is specified for Web authentication, the device binds the MAC address of the user to the Auth-Fail VLAN and reset the aging timer. If the user still fails authentication when the aging timer expires, the device deletes the temporary entry for the user.

Feature and software version comaptibiltiy

This feature is supported only in Release 6343P08 and later.

Restrictions and guidelines

As a best practice, change the aging timer to a bigger value in the following cases:

- Web authentication users without access rights frequently send traffic in a short time. As a result, the access device continuously initiates the web authentication process, increasing the load on the device.
- When a user fails authentication, the user does not have enough time to obtain resources from the Auth-Fail VLAN, for example, it failed to download the virus patches.

Procedure

1. Enter system view.
   system-view
2. Configure the aging timer for temporary MAC address entries.
   web-auth timer temp-entry-aging *aging-time-value*
   By default, the aging timer for temporary MAC address entries is 60 seconds.

Configuring a Web authentication-free subnet

About Web authentication-free subnets

You can configure a Web authentication-free subnet so that users can freely access the network resources in the subnet without being authenticated.

Restrictions and guidelines

As a best practice, do not configure the same address value for a Web authentication-free subnet and a 802.1X free IP. Otherwise, when you cancel one of the configuration, the other configuration does not take effect, either.

Procedure

1. Enter system view.
   system-view
2. Configure a Web authentication-free subnet.
   web-auth free-ip *ip-address* { *mask-length* | *mask* }

Setting the maximum number of Web authentication users

Restrictions and guidelines

If the maximum number of online Web authentication users you set is less than that of the current online Web authentication users, the limit can be set successfully and does not impact the online Web authentication users. However, the system does not allow new Web authentication users to log in until the number drops down below the limit.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the maximum number of Web authentication users on the interface.
   web-auth max-user *max-number*

   By default, the maximum number of Web authentication users is 1024.

Configuring online Web authentication user detection

About online Web authentication user detection

This feature enables the device to detect packets of an online user at the specified detection interval. If no packet from the user is received within the interval, the device logs out the user and notifies the RADIUS server to stop accounting for the user.

Restrictions and guidelines

To prevent the device from mistakenly logging out users, set the detection interval to be the same as the aging time of MAC address entries.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable online Web authentication user detection.
   web-auth offline-detect interval *interval*
   By default, online Web authentication user detection is disabled.

Configuring an Auth-Fail VLAN

Restrictions and guidelines

To make the Auth-Fail VLAN take effect, you must also enable MAC-based VLAN on the interface, and set the subnet of the Auth-Fail VLAN as the Web authentication-free subnet.

Because MAC-based VLAN takes effect only on Hybrid ports, Auth-Fail VLAN also takes effect only on Hybrid ports.

Do not delete the VLAN that has been configured as an Auth-Fail VLAN. To delete this VLAN, first cancel the Auth-Fail VLAN configuration by using **undo web-auth auth-fail vlan** command.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure an Auth-Fail VLAN.
   web-auth auth-fail vlan *authfail-vlan-id*
   By default, no Auth-Fail VLAN is configured on an interface.

Configuring Web authentication to support Web proxy

About support of Web proxy for Web authentication

By default, proxied HTTP requests cannot trigger Web authentication but are silently dropped. To allow such HTTP requests to trigger Web authentication, specify the port numbers of the Web proxy servers on the device.

Restrictions and guidelines

If a user's browser uses the Web Proxy Auto-Discovery (WPAD) protocol to discover Web proxy servers, you must perform the following tasks:

- Add the port numbers of the Web proxy servers on the device.
- Configure authentication-free rules to allow user packets destined for the IP address of the WPAD server to pass without authentication.

For Web authentication to support Web proxy:

- You must add the port numbers of the Web proxy servers on the device.

- Users must make sure their browsers that use a Web proxy server do not use the proxy server for the listening IP address of the local portal Web server. Thus, HTTP packets that the Web authentication user sends to the local portal Web server are not sent to the Web proxy server.

Procedure

1. Enter system view.

   system-view

2. Add a Web proxy server port number.

   web-auth proxy port *port-number*

   You can execute this command multiple times to specify multiple port numbers of Web proxy servers.

Display and maintenance commands for Web authentication

Execute **display** commands in any view.

Task	Command
Display Web authentication configuration information on interfaces.	**display web-auth** [**interface** *interface-type interface-number*]
Display Web authentication-free subnets.	**display web-auth free-ip**
Display Web authentication server information.	**display web-auth server** [*server-name*]
Display Web authentication user information.	**display web-auth user** [**interface** *interface-type interface-number* | **slot** *slot-number*]

Web authentication configuration examples

Example: Configuring Web authentication by using the local authentication method

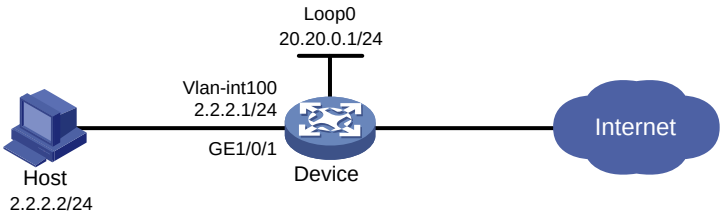
Network configuration

As shown in Figure 4, the host is directly connected to the device through GigabitEthernet 1/0/1.

Configure Web authentication on GigabitEthernet 1/0/1, and use local authentication and authorization for the users.

Configure the device to push customized Web authentication pages to users and use HTTP to transfer the authentication data.

Figure 4 Network diagram



Procedure

1. Customize the authentication pages, compress them to a file, and upload the file to the root directory of the storage medium of the device. In this example, the file is **abc.zip**. (Details not shown.)
2. Assign IP addresses to the host and the device as shown in Figure 4, and make sure the host and the device can reach each other.
3. Configure a local user:

   # Create a local network access user named **localuser**.

   ```
   <Device>system-view
   [Device] local-user localuser class network
   ```

   # Set the password to **localpass** in plaintext form for user **localuser.**

   ```
   [Device-luser-network-localuser] password simple localpass
   ```

   # Authorize the user to use LAN access services.

   ```
   [Device-luser-network-localuser] service-type lan-access
   [Device-luser-network-localuser] quit
   ```

4. Configure an ISP domain:

   # Create an ISP domain named **local**.

   ```
   [Device] domain local
   ```

   # Configure the ISP domain to perform local authentication, authorization, and accounting for LAN access users.

   ```
   [Device-isp-local] authentication lan-access local
   [Device-isp-local] authorization lan-access local
   [Device-isp-local] accounting lan-access local
   [Device-isp-local] quit
   ```

5. Configure a local portal Web service:

   # Create an HTTP-based local portal Web service and enter its view.

   ```
   [Device] portal local-web-server http
   ```

   # Specify file **abc.zip** as the default authentication page file for the local portal Web service. (This file must exist in the root directory of the device.)

   ```
   [Device-portal-local-websvr-http] default-logon-page abc.zip
   ```

   # Specify the HTTP listening port number as 80 for the portal Web service.

   ```
   [Device–portal-local-websvr-http] tcp-port 80
   [Device-portal-local-websvr-http] quit
   ```

6. Configure Web authentication:

   # Create a Web authentication server named **user**.

   ```
   [Device] web-auth server user
   ```

   # Configure the redirection URL for the Web authentication server as **http://20.20.0.1/portal/**.

   ```
   [Device-web-auth-server-user] url http://20.20.0.1/portal/
   ```

Specify 20.20.0.1 as the IP address and 80 as the port number for the Web authentication server.

```
[Device-web-auth-server-user] ip 20.20.0.1 port 80
[Device-web-auth-server-user] quit
```

Specify ISP domain **local** as the Web authentication domain.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] web-auth domain local
```

Enable Web authentication by using Web authentication server **user**.

```
[Device-GigabitEthernet1/0/1] web-auth enable apply server user
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Display online Web authentication user information after user **localuser** passes Web authentication.

```
<Device> display web-auth user
  Total online web-auth users: 1

User Name: localuser
  MAC address: acf1-df6c-f9ad
  Access interface: GigabitEthernet1/0/1
  Initial VLAN: 100
  Authorization VLAN: N/A
  Authorization ACL ID: N/A
  Authorization user profile: N/A
```

Example: Configuring Web authentication by using the RADIUS authentication method

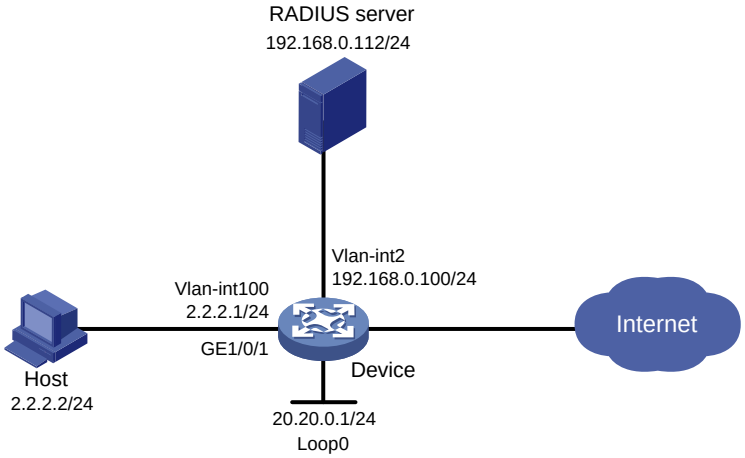
Network configuration

As shown in Figure 5, the host is directly connected to the device through GigabitEthernet 1/0/1.

Configure Web authentication on GigabitEthernet 1/0/1, and use a RADIUS server to perform authentication and authorization for the users.

Configure the device to push customized Web authentication pages to users and use HTTP to transfer the authentication data.

Figure 5 Network diagram



Procedure

1. Configure the RADIUS server properly to provide authentication and accounting functions for users. In this example, the username is configured as **user1** on the RADIUS server. (Details not shown.)
2. Customize the authentication pages, compress them to a file, and upload the file to the root directory of the storage medium of the switch. In this example, the file is **abc.zip**.
3. Create VLANs, assign IP addresses to the VLAN interfaces, and assign interfaces to the VLANs. Make sure the host, the RADIUS server, and the device can reach each other. (Details not shown.)
4. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1**.

   ```
   <Device> system-view
   [Device] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Device-radius-rs1] primary authentication 192.168.0.112
   [Device-radius-rs1] primary accounting 192.168.0.112
   [Device-radius-rs1] key authentication simple radius
   [Device-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [Device-radius-rs1] user-name-format without-domain
   [Device-radius-rs1] quit
   ```
5. Configure an authentication domain:

   # Create an ISP domain named **dm1**.

   ```
   [Device] domain dm1
   ```

   # Configure AAA methods for the ISP domain

   ```
   [Device-isp-dm1] authentication lan-access radius-scheme rs1
   [Device-isp-dm1] authorization lan-access radius-scheme rs1
   [Device-isp-dm1] accounting lan-access radius-scheme rs1
   [Device-isp-dm1] quit
   ```
6. Configure a local portal Web service:

   # Create an HTTP-based local portal Web service.

   ```
   [Device] portal local-web-server http
   ```

Specify the file **abc.zip** as the default authentication page file for the local portal Web service. (This file must exist in the directly root directory of the storage medium.)

```
[Device-portal-local-websvr-http] default-logon-page abc.zip
```

Specify 80 as the port number listened by the local portal Web service.

```
[Device–portal-local-websvr-http] tcp-port 80
[Device-portal-local-websvr-http] quit
```

7. Configure Web authentication:

Create Web authentication server named **user**.

```
[Device] web-auth server user
```

Specify **http://20.20.0.1/portal/** as the redirection URL for the Web authentication server.

```
[Device-web-auth-server-user] url http://20.20.0.1/portal/
```

Specify the IP address of the Web authentication server as 20.20.0.1 (the IP address of Loopback 0) and the port number as 80.

```
[Device-web-auth-server-user] ip 20.20.0.1 port 80
[Device-web-auth-server-user] quit
```

Specify domain **dml** as the Web authentication domain.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] web-auth domain dm1
```

Enable Web authentication by using Web authentication server **user**.

```
[Device-GigabitEthernet1/0/1] web-auth enable apply server user
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Display Web authentication user information after user **user1** passes Web authentication.

```
<Device> display web-auth user
  Total online web-auth users: 1

User Name: user1
  MAC address: acf1-df6c-f9ad
  Access interface: GigabitEthernet1/0/1
  Initial VLAN: 100
  Authorization VLAN: N/A
  Authorization ACL ID: N/A
  Authorization user profile: N/A
```

Troubleshooting Web authentication

Failure to come online (local authentication interface using the default ISP domain

Symptom

No authentication domain is specified for the local authentication interface. A user fails to pass Web authentication to come online.

Analysis

If no Web authentication domain is specified, the system default ISP domain (domain **system**) is used for Web authentication. The system default domain uses the local authentication method by

default. Using these default domain settings, the local authentication should have operated correctly.

The local authentication fails might because that the authentication method of the system default domain is changed or the system default domain is changed.

Solution

To resolve the problem, perform the following tasks:

1. Use the **`display domain`** command to identify whether the AAA methods for Web users in the system default domain are local.
2. If the AAA methods for Web users in the system default domain are not local, reconfigure the AAA methods as local.

Contents

Configuring triple authentication

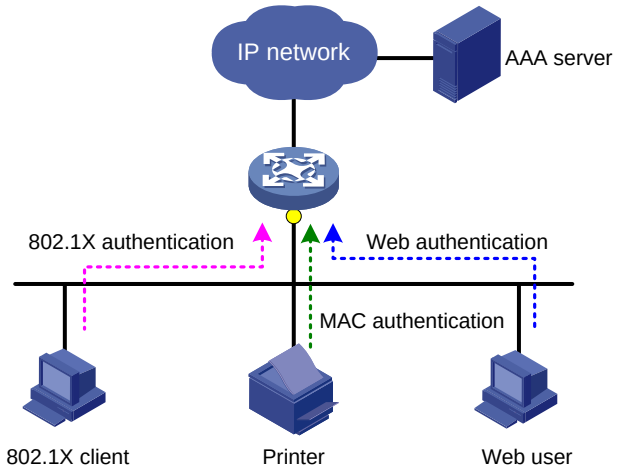
About triple authentication

Triple authentication enables an access port to perform Web, MAC, and 802.1X authentication. A terminal can access the network if it passes one type of authentication. For more information about 802.1X authentication, MAC authentication, and Web authentication, see "Configuring 802.1X authentication", "Configuring MAC authentication", and "Configuring Web authentication."

Typical network of triple authentication

Triple authentication is suitable for a LAN that comprises terminals that require different authentication services, as shown in Figure 1. The triple authentication-enabled access port can perform MAC authentication for the printer, 802.1X authentication for the PC installed with the 802.1X client, and Web authentication for the Web user.

Figure 1 Triple authentication network diagram



Triple authentication mechanism

The three types of authentication are triggered by different packets:

- The access port performs MAC authentication for a terminal when it receives an ARP or DHCP broadcast packet from the terminal for the first time. If the terminal passes MAC authentication, the terminal can access the network. If the MAC authentication fails, the access port performs 802.1X or Web authentication.
- The access port performs 802.1X authentication when it receives an EAP packet from an 802.1X client or a third-party client. If the unicast trigger feature of 802.1X is enabled on the access port, any packet from the client can trigger an 802.1X authentication.
- The access port performs Web authentication when it receives an HTTP packet from a terminal.

If a terminal triggers different types of authentication, the authentications are processed at the same time. The failure of one type of authentication does not affect the others. When a terminal passes one type of authentication, the other types of authentication are processed as follows:

- If the terminal first passes MAC authentication, Web authentication is terminated immediately, but 802.1X authentication will proceed. If the terminal also passes 802.1X authentication, the 802.1X authentication information will overwrite the MAC authentication information for the

terminal. If the terminal fails 802.1X authentication, the user stays online as a MAC authentication user, and only 802.1X authentication can be triggered again.

- If the terminal first passes 802.1X or Web authentication, the other types of authentication are terminated immediately and cannot be triggered again.

Triple authentication support for VLAN assignment

Authorization VLAN

After a user passes authentication, the authentication server assigns an authorization VLAN to the access port for the user. The user can then access the network resources in the authorized VLAN.

Authentication failure VLAN

The access port adds a user to an authentication failure VLAN configured on the port after the user fails authentication.

- For an 802.1X authentication user—Adds the user to the Auth-Fail VLAN configured for 802.1X authentication.
- For a Web authentication user—Adds the user to the Auth-Fail VLAN configured for Web authentication.
- For a MAC authentication user—Adds the user to the guest VLAN configured for MAC authentication.

The access port supports configuring all types of authentication failure VLANs at the same time. If a user fails more than one type of authentication, the authentication failure VLAN of the user changes as follows:

- If a user in the Web Auth-Fail VLAN fails MAC authentication, the user is moved to the MAC authentication guest VLAN.
- If a user in the Web Auth-Fail VLAN or MAC authentication guest VLAN fails 802.1X authentication, the user is moved to the 802.1X Auth-Fail VLAN.
- If a user in the 802.1X Auth-Fail VLAN fails MAC authentication or Web authentication, the user is still in the 802.1X Auth-Fail VLAN.

Server-unreachable VLAN

If a user fails authentication due to the unreachable server, the access port adds the user to an server-unreachable VLAN.

- For an 802.1X authentication user—Adds the user to the critical VLAN configured for 802.1X authentication.
- For a Web authentication user—Adds the user to the Auth-Fail VLAN configured for Web authentication.
- For a MAC authentication user—Adds the user to the critical VLAN configured for MAC authentication.

The access port supports configuring all types of server-unreachable VLANs at the same time. A user is added to the server-unreachable VLAN as follows:

- If the user does not undergo 802.1X authentication, the user is added to the server-unreachable VLAN configured for the last authentication.
- If the user in the Web Auth-Fail VLAN or the MAC authentication critical VLAN also fails 802.1X authentication, the user is added to the 802.1X authentication critical VLAN.

Triple authentication support for ACL authorization

After a user passes authentication, the authentication server assigns an authorization ACL to the access port for the user. The access port uses the ACL to filter traffic for the user.

To use ACL authorization, you must specify authorization ACLs on the authentication server and configure the ACLs on the access device. You can change the user's access authorization by changing the authorization ACL on the authentication server or changing rules of the authorization ACL on the access device.

Triple authentication support for online user detection

You can configure the following features to detect the online status of users:

- Enable online user detection for Web authentication users.
- Enable the online user handshake or periodic online user reauthentication feature for 802.1X users.
- Enable offline detection for MAC authentication users.

Restrictions and guidelines: Triple authentication

In triple authentication, 802.1X authentication must use the MAC-based access control method.

If Web authentication is enabled on a port, configure the subnets of the authentication failure VLANs and server-unreachable VLANs of the port as Web authentication-free subnets. This ensures that an authentication-failed user can access the authentication failure VLAN or server-unreachable VLAN.

Do not configure both Web authentication-free IPs and 802.1X free IPs. If you do so, only 802.1X free IPs take effect.

Triple authentication tasks at a glance

Choose the following tasks as needed:

- Configure 802.1X authentication

  For more information, see "Configuring 802.1X."
- Configure MAC authentication

  For more information, see "Configuring MAC authentication."
- Configure Web authentication

  For more information, see "Configuring Web authentication."

Triple authentication configuration examples

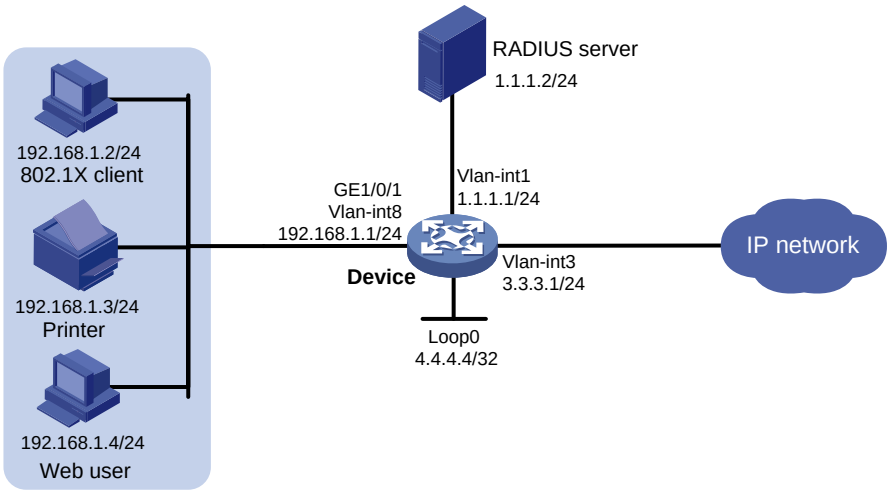
Example: Configuring basic triple authentication

Network configuration

As shown in Figure 2, the terminals are connected to the device to access the IP network. Configure triple authentication on the device's Layer 2 interface that connects to the terminals. A terminal passing one of the three authentication methods, 802.1X authentication, Web authentication, and MAC authentication, can access the IP network.

- Assign IP addresses on subnet 192.168.1.0/24 to the terminals.
- Use the remote RADIUS server to perform authentication, authorization, and accounting. Configure the device to send usernames carrying no ISP domain names to the RADIUS server.
- Configure the local Web authentication server on the device to use listening IP address 4.4.4.4. Configure the device to send a default authentication page to the Web user and forward authentication data by using HTTP.

Figure 2 Network diagram



Procedure

1. Make sure that the terminals, the server, and the device can reach each other. (Details not shown.)
2. Configure the RADIUS server to provide normal authentication, authorization, and accounting for users. In this example, configure the following on the RADIUS server:
   - An 802.1X user with username **userdot**.
   - A Web authentication user with username **userpt**.
   - A MAC authentication user with a username and password both being the MAC address of the printer **f07d6870725f**.
3. Configure Web authentication:

   # Configure VLANs and IP addresses for the VLAN interfaces, and add ports to specific VLANs. (Details not shown.)

   # Edit authentication pages, compress the pages to a .zip file named **abc**, and upload the .zip file to the device by FTP. (Details not shown.)

   # Create an HTTP-based local portal Web service, and specify file **abc.zip** as the default authentication page file of the local portal Web service.

   ```
   <Device> system-view
   [Device] portal local-web-server http
   [Device-portal-local-websvr-http] default-logon-page abc.zip
   [Device-portal-local-websvr-http] quit
   ```

   # Assign IP address 4.4.4.4 to Loopback 0.

   ```
   [Device] interface loopback 0
   [Device-LoopBack0] ip address 4.4.4.4 32
   [Device-LoopBack0] quit
   ```

   # Create a Web authentication server named **webserver** and enter its view.

   ```
   [Device] web-auth server webserver
   ```

   # Configure the redirection URL for the Web authentication server as **http://4.4.4.4/portal/**.

   ```
   [Device-web-auth-server-webserver] url http://4.4.4.4/portal/
   ```

   # Specify 4.4.4.4 as the IP address and 80 as the port number of the Web authentication server.

   ```
   [Device-web-auth-server-webserver] ip 4.4.4.4 port 80
   [Device-web-auth-server-webserver] quit
   ```

Enable Web authentication on GigabitEthernet 1/0/1 and specify Web authentication server **webserver** on the interface.

```
[Device] interface gigabitethernet 1/0/1
[Device–GigabitEthernet1/0/1] web-auth enable apply server webserver
[Device–GigabitEthernet1/0/1] quit
```

4. Configure 802.1X authentication:

Enable 802.1X authentication globally.

```
[Device] dot1x
```

Enable 802.1X authentication (MAC-based access control required) on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device–GigabitEthernet1/0/1] dot1x port-method macbased
[Device–GigabitEthernet1/0/1] dot1x
[Device–GigabitEthernet1/0/1] quit
```

5. Configure MAC authentication:

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device–GigabitEthernet1/0/1] mac-authentication
[Device–GigabitEthernet1/0/1] quit
```

6. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1**.

```
[Device] radius scheme rs1
```

Specify the primary authentication and accounting servers and keys.

```
[Device-radius-rs1] primary authentication 1.1.1.2
[Device-radius-rs1] primary accounting 1.1.1.2
[Device-radius-rs1] key authentication simple radius
[Device-radius-rs1] key accounting simple radius
```

Specify usernames sent to the RADIUS server to carry no domain names.

```
[Device-radius-rs1] user-name-format without-domain
[Device-radius-rs1] quit
```

7. Configure an ISP domain:

Create an ISP domain named **triple**.

```
[Device] domain triple
```

Configure the domain to use RADIUS scheme **rs1** for authentication, authorization and accounting of LAN access users.

```
[Device-isp-triple] authentication lan-access radius-scheme rs1
[Device-isp-triple] authorization lan-access radius-scheme rs1
[Device-isp-triple] accounting lan-access radius-scheme rs1
[Device-isp-triple] quit
```

Configure domain **triple** as the default domain. If a username entered by a user includes no ISP domain name, the AAA method of the default domain is used.

```
[Device] domain default enable triple
```

Verifying the configuration

1. Verify that the Web user can pass Web authentication.

On the Web user terminal, use a Web browser to access an external network and then enter the correct username and password on the authentication page **http://4.4.4.4/portal/logon.html**. (Details not shown.)

Display information about online Web authentication users.

```
[Device] display web-auth user
  Total online web-auth users: 1
User Name: localuser
  MAC address: acf1-df6c-f9ad
  Access interface: GigabitEthernet1/0/1
  Initial VLAN: 8
  Authorization VLAN: N/A
  Authorization ACL ID: N/A
  Authorization user profile: N/A
```

2. Verify that the printer can pass MAC authentication.

Connect the printer to the network. (Details not shown.)

Display information about online MAC authentication users.

```
[Device] display mac-authentication connection
Total connections: 1
Slot ID: 1
User MAC address: f07d-6870-725f
Access interface: GigabitEthernet1/0/1
Username: f07d6870725f
User access state: Successful
Authentication domain: triple
Initial VLAN: 8
Authorization untagged VLAN: N/A
Authorization tagged VLAN: N/A
Authorization VSI: N/A
Authorization ACL ID: N/A
Authorization user profile: N/A
Authorization CAR: N/A
Authorization URL: N/A
Termination action: Default
Session timeout period: N/A
Online from: 2015/01/04 18:01:43
Online duration: 0h 0m 2s
```

3. Verify that the 802.1X client can pass 802.1X authentication.

On the 802.1X client, initiate 802.1X authentication and then enter the correct username and password. (Details not shown.)

Display information about online 802.1X users.

```
[Device] display dot1x connection
Total connections: 1
Slot ID: 1
User MAC address: 7446-a091-84fe
Access interface: GigabitEthernet1/0/1
Username: userdot
User access state: Successful
Authentication domain: triple
```

```
IPv4 address: 192.168.1.2
Authentication method: CHAP
Initial VLAN: 8
Authorization untagged VLAN: N/A
Authorization tagged VLAN list: N/A
Authorization VSI: N/A
Authorization ACL ID: N/A
Authorization user profile: N/A
Authorization CAR: N/A
Authorization URL: N/A
Termination action: Default
Session timeout period: N/A
Online from: 2015/01/04 18:13:01
Online duration: 0h 0m 14s
```

Example: Configuring triple authentication to support authorization VLAN and authentication failure VLAN

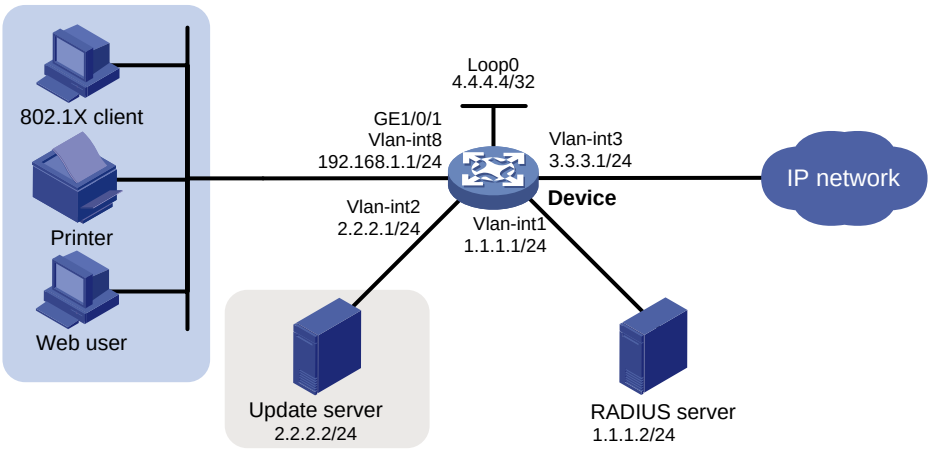
Network configuration

As shown in Figure 3, the terminals are connected to the device to access the IP network. Configure triple authentication on the device's Layer 2 interface connected to the terminals. A terminal passing one of the three authentication methods, 802.1X authentication, Web authentication, and MAC authentication, can access the IP network.

- The Web authentication terminal uses DHCP to get an IP address in 192.168.1.0/24 before authentication and in 3.3.3.0/24 after passing authentication. If the terminal fails authentication, it requests IP addresses in 2.2.2.0/24 through DHCP.

  You can use the access device or an attached device as the DHCP server. In this example, the access device (the device) provides the DHCP service.
- The 802.1X terminal uses DHCP to get an IP address in 192.168.1.0/24 before authentication and in 3.3.3.0/24 after passing authentication. If the terminal fails authentication, it requests IP addresses in 2.2.2.0/24 through DHCP.
- After passing authentication, the printer obtains IP address 3.3.3.111/24 that is bound with its MAC address through DHCP.
- Use the remote RADIUS server to perform authentication, authorization, and accounting. Configure the device to remove the ISP domain names from usernames sent to the RADIUS server.
- Configure the local Web authentication server on the device to use listening IP address 4.4.4.4. Configure the device to send a default authentication page to the Web user and forward authentication data by using HTTP.
- Configure VLAN 3 as the authorization VLAN. Users passing authentication are added to this VLAN.
- Configure VLAN 2 as the authentication failure VLAN. Users failing authentication are added to this VLAN.

Figure 3 Network diagram



Procedure

1. Make sure the terminals, the servers, and the device can reach each other. (Details not shown.)
2. Configure the RADIUS server to provide normal authentication, authorization, and accounting for users. In this example, configure the following on the RADIUS server:
   - An 802.1X user with username **userdot**.
   - A Web authentication user with username **userpt**.
   - A MAC authentication user with a username and password both being the MAC address of the printer **f07d6870725f**.
   - An authorization VLAN (VLAN 3).
3. Configure the IP address of the update server as an authentication-free IP address.

   ```
   <Device> system-view
   [Device] web-auth free-ip 2.2.2.2 24
   ```
4. Edit authentication pages, compress the pages to a .zip file named **defaultfile** and upload the .zip file to the device by FTP. (Details not shown.)
5. Configure DHCP:

   # Configure VLANs and IP addresses for the VLAN interfaces, and add ports to specific VLANs. (Details not shown.)

   # Enable DHCP.

   ```
   [Device] dhcp enable
   ```

   # Exclude the IP address of the update server from dynamic address assignment.

   ```
   [Device] dhcp server forbidden-ip 2.2.2.2
   ```

   # Configure DHCP address pool 1 to assign IP addresses and other configuration parameters to clients on subnet 192.168.1.0.

   ```
   [Device] dhcp server ip-pool 1
   [Device-dhcp-pool-1] network 192.168.1.0 mask 255.255.255.0
   [Device-dhcp-pool-1] expired day 0 hour 0 minute 1
   [Device-dhcp-pool-1] gateway-list 192.168.1.1
   [Device-dhcp-pool-1] quit
   ```

   # Configure DHCP address pool 2 to assign IP address and other configuration parameters to clients on subnet 2.2.2.0.

   ```
   [Device] dhcp server ip-pool 2
   [Device-dhcp-pool-2] network 2.2.2.0 mask 255.255.255.0
   [Device-dhcp-pool-2] expired day 0 hour 0 minute 1
   ```

```
[Device-dhcp-pool-2] gateway-list 2.2.2.1
[Device-dhcp-pool-2] quit
```

Configure DHCP address pool 3 to assign IP address and other configuration parameters to clients on subnet 3.3.3.0.

```
[Device] dhcp server ip-pool 3
[Device-dhcp-pool-3] network 3.3.3.0 mask 255.255.255.0
[Device-dhcp-pool-3] expired day 0 hour 0 minute 1
[Device-dhcp-pool-3] gateway-list 3.3.3.1
[Device-dhcp-pool-3] quit
```

Configure DHCP address pool 4, and bind the printer's MAC address f07d-6870-725f to IP address 3.3.3.111/24 in this address pool.

```
[Device] dhcp server ip-pool 4
[Device-dhcp-pool-4] static-bind ip-address 3.3.3.111 mask 255.255.255.0
client-identifier f07d-6870-725f
[Device-dhcp-pool-4] quit
```

6. Configure Web authentication:

Create an HTTP-based local portal Web service, and specify file **defaultfile.zip** as the default authentication page file of the local portal Web service.

```
[Device] portal local-web-server http
[Device-portal-local-websvr-http] default-logon-page defaultfile.zip
[Device-portal-local-websvr-http] quit
```

Assign IP address 4.4.4.4 to Loopback 0.

```
[Device] interface loopback 0
[Device-LoopBack0] ip address 4.4.4.4 32
[Device-LoopBack0] quit
```

Create a Web authentication server named **webserver**.

```
[Device] web-auth server webserver
```

Configure the redirection URL of the Web authentication server as **http://4.4.4.4/portal/**.

```
[Device-web-auth-server-webserver] url http://4.4.4.4/portal/
```

Specify 4.4.4.4 as the IP address and 80 as the port number of the Web authentication server.

```
[Device-web-auth-server-webserver] ip 4.4.4.4 port 80
[Device-web-auth-server-webserver] quit
```

Configure the IP address of the update server as an authentication-free IP address.

```
[Device] web-auth free-ip 2.2.2.2 24
```

Enable Web authentication on GigabitEthernet 1/0/1 and specify VLAN 2 as the Auth-Fail VLAN.

```
[Device] interface gigabitethernet 1/0/1
[Device–GigabitEthernet1/0/1] port link-type hybrid
[Device–GigabitEthernet1/0/1] mac-vlan enable
[Device–GigabitEthernet1/0/1] web-auth enable apply server webserver
[Device–GigabitEthernet1/0/1] web-auth auth-fail vlan 2
[Device–GigabitEthernet1/0/1] quit
```

7. Configure 802.1X authentication:

Enable 802.1X authentication globally.

```
[Device] dot1x
```

Enable 802.1X authentication (MAC-based access control required) on GigabitEthernet 1/0/1, and specify VLAN 2 as the Auth-Fail VLAN.

```
[Device] interface gigabitethernet 1/0/1
```

```
[Device–GigabitEthernet1/0/1] dot1x port-method macbased
[Device–GigabitEthernet1/0/1] dot1x
[Device–GigabitEthernet1/0/1] dot1x auth-fail vlan 2
[Device–GigabitEthernet1/0/1] quit
```

8. Configure MAC authentication:

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Enable MAC authentication on GigabitEthernet 1/0/1, and specify VLAN 2 as the guest VLAN.

```
[Device] interface gigabitethernet 1/0/1
[Device–GigabitEthernet1/0/1] mac-authentication
[Device–GigabitEthernet1/0/1] mac-authentication guest-vlan 2
[Device–GigabitEthernet1/0/1] quit
```

9. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1**.

```
[Device] radius scheme rs1
```

Specify the primary authentication and accounting servers and keys.

```
[Device-radius-rs1] primary authentication 1.1.1.2
[Device-radius-rs1] primary accounting 1.1.1.2
[Device-radius-rs1] key authentication simple radius
[Device-radius-rs1] key accounting simple radius
```

Specify usernames sent to the RADIUS server to carry no domain names.

```
[Device-radius-rs1] user-name-format without-domain
[Device-radius-rs1] quit
```

10. Configure an ISP domain:

Create an ISP domain named **triple**.

```
[Device] domain triple
```

Configure the domain to use RADIUS scheme **rs1** for authentication, authorization and accounting of LAN access users.

```
[Device-isp-triple] authentication lan-access radius-scheme rs1
[Device-isp-triple] authorization lan-access radius-scheme rs1
[Device-isp-triple] accounting lan-access radius-scheme rs1
[Device-isp-triple] quit
```

Configure domain **triple** as the default domain. If a username entered by a user includes no ISP domain name, the AAA methods of the default domain is used.

```
[Device] domain default enable triple
```

Verifying the configuration

1. Verify that the Web user can pass Web authentication.

On the Web user terminal, use a Web browser to access an external network and then enter the correct username and password on the authentication page **http://4.4.4.4/portal/logon.html**. (Details not shown.)

Use the **`display web-auth user`** command to display information about online users.

```
[Device] display web-auth user
  Total online web-auth users: 1

User Name: userpt
  MAC address: 6805-ca17-4a0b
  Access interface: GigabitEthernet1/0/1
```

```
  Initial VLAN: 8
  Authorization VLAN: 3
  Authorization ACL ID: N/A
  Authorization user profile: N/A
```

2. Verify that the printer can pass MAC authentication.

Connect the printer to the network. (Details not shown.)

Display information about online MAC authentication users.

```
[Device] display mac-authentication connection
Total connections: 1
Slot ID: 1
User MAC address: f07d-6870-725f
Access interface: GigabitEthernet1/0/1
Username: f07d6870725f
User access state: Successful
Authentication domain: triple
Initial VLAN: 8
Authorization untagged VLAN: 3
Authorization tagged VLAN: N/A
Authorization VSI: N/A
Authorization ACL ID: N/A
Authorization user profile: N/A
Authorization CAR: N/A
Authorization URL: N/A
Termination action: Default
Session timeout period: N/A
Online from: 2015/01/04 18:01:43
Online duration: 0h 0m 2s
```

3. Verify that the 802.1X user can pass 802.1X authentication.

On the 802.1X client, initiate 802.1X authentication and enter the correct username and password. (Details not shown.)

Display information about online 802.1X users.

```
[Device] display dot1x connection
Total connections: 1
Slot ID: 1
User MAC address: 7446-a091-84fe
Access interface: GigabitEthernet1/0/1
Username: userdot
User access state: Successful
Authentication domain: triple
IPv4 address: 3.3.3.3
Authentication method: CHAP
Initial VLAN: 8
Authorization untagged VLAN: 3
Authorization tagged VLAN list: N/A
Authorization VSI: N/A
Authorization ACL ID: N/A
Authorization user profile: N/A
Authorization CAR: N/A
```

```
Authorization URL: N/A
Termination action: Default
Session timeout period: N/A
Online from: 2015/01/04 18:13:01
Online duration: 0h 0m 14s
```

4. Verify that users that pass authentication have been assigned authorization VLANs.

Display MAC-VLAN entries of online users.

```
[Device] display mac-vlan all
  The following MAC VLAN addresses exist:
  S:Static  D:Dynamic
  MAC ADDR         MASK             VLAN ID   PRIO   STATE
  ------------------------------------------------------
  6805-ca17-4a0b   ffff-ffff-ffff   3         0      D
  f07d-6870-725f   ffff-ffff-ffff   3         0      D
  7446-a091-84fe   ffff-ffff-ffff   3         0      D
  Total MAC VLAN address count:3
```

5. Verify that online users have been assigned IP addresses.

```
[Device] display dhcp server ip-in-use
IP address       Client-identifier/    Lease expiration          Type
                  Hardware address
 3.3.3.111        01f0-7d68-7072-5f     Jan  4 18:14:17 2015      Auto:(C)
 3.3.3.2          0168-05ca-174a-0b     Jan  4 18:15:01 2015      Auto:(C)
 3.3.3.3          0174-46a0-9184-fe     Jan  4 18:15:03 2015      Auto:(C)
```

6. When a terminal fails authentication, it is added to VLAN 2. You can use the previous display commands to display the MAC-VLAN entry and IP address of the terminal. (Details not shown.)

Contents

Configuring port security

About port security

Port security combines and extends 802.1X and MAC authentication to provide MAC-based network access control. The feature applies to ports that use different authentication methods for users.

Major functions

Port security provides the following functions:

- Prevents unauthorized access to a network by checking the source MAC address of inbound traffic.
- Prevents access to unauthorized devices or hosts by checking the destination MAC address of outbound traffic.
- Controls MAC address learning and authentication on a port to make sure the port learns only source trusted MAC addresses.

Port security features

NTK

The need to know (NTK) feature prevents traffic interception by checking the destination MAC address in the outbound frames. The feature ensures that frames are sent only to the following hosts:

- Hosts that have passed authentication.
- Hosts whose MAC addresses have been learned or configured on the access device.

Intrusion protection

The intrusion protection feature checks the source MAC address in inbound frames for illegal frames, and takes a predefined action on each detected illegal frame. The action can be disabling the port temporarily, disabling the port permanently, or blocking frames from the illegal MAC address for 3 minutes (not user configurable).

A frame is illegal if its source MAC address cannot be learned in a port security mode or it is from a client that has failed 802.1X or MAC authentication.

Port security modes

Port security supports the following categories of security modes:

- **MAC learning control**—Includes two modes: autoLearn and secure. MAC address learning is permitted on a port in autoLearn mode and disabled in secure mode.
- **Authentication**—Security modes in this category implement MAC authentication, 802.1X authentication, or a combination of these two authentication methods.

Upon receiving a frame, the port in a security mode searches the MAC address table for the source MAC address. If a match is found, the port forwards the frame. If no match is found, the port learns the MAC address or performs authentication, depending on the security mode. If the frame is illegal, the port takes the predefined NTK or intrusion protection action, or sends SNMP notifications. Outgoing frames are not restricted by port security's NTK action unless they trigger the NTK feature.

Table 1 describes the port security modes and the security features.

Table 1 Port security modes

Purpose	Security mode		Features that can be triggered
Turning off the port security feature	noRestrictions (the default mode) In this mode, port security is disabled on the port and access to the port is not restricted.		N/A
Controlling MAC address learning	autoLearn		NTK/intrusion protection
	secure		
Performing 802.1X authentication	userLogin		N/A
	userLoginSecure		NTK/intrusion protection
	userLoginSecureExt		
	userLoginWithOUI		
Performing MAC authentication	macAddressWithRadius		NTK/intrusion protection
Performing a combination of MAC authentication and 802.1X authentication	Or	macAddressOrUserLoginSecure	NTK/intrusion protection
		macAddressOrUserLoginSecureExt	
	Else	macAddressElseUserLoginSecure	
		macAddressElseUserLoginSecureExt	

The mode names are illustrated as follows:

- **userLogin** specifies 802.1X authentication and port-based access control. **userLogin** with **Secure** specifies 802.1X authentication and MAC-based access control. **Ext** indicates allowing multiple 802.1X users to be authenticated and serviced at the same time. A security mode without **Ext** allows only one user to pass 802.1X authentication.
- **macAddress** specifies MAC authentication.
- **Else** specifies that the authentication method before **Else** is applied first. If the authentication fails, whether to turn to the authentication method following **Else** depends on the protocol type of the authentication request.
- **Or** specifies that the authentication method following **Or** is applied first. If the authentication fails, the authentication method before **Or** is applied.

Controlling MAC address learning

- autoLearn.

  A port in this mode can learn MAC addresses. The automatically learned MAC addresses are not added to the MAC address table as dynamic MAC address. Instead, these MAC addresses are added to the secure MAC address table as secure MAC addresses. You can also configure secure MAC addresses by using the **`port-security mac-address security`** command.

  A port in autoLearn mode allows frames sourced from the following MAC addresses to pass:

  - Secure MAC addresses.
  - MAC addresses configured by using the **`mac-address dynamic`** and **`mac-address static`** commands.

  When the number of secure MAC addresses reaches the upper limit, the port transitions to secure mode.

- secure.

MAC address learning is disabled on a port in secure mode. You configure MAC addresses by using the **mac-address static** and **mac-address dynamic** commands. For more information about configuring MAC address table entries, see *Layer 2—LAN Switching Configuration Guide*.

A port in secure mode allows only frames sourced from the following MAC addresses to pass:

- Secure MAC addresses.
- MAC addresses configured by using the **mac-address dynamic** and **mac-address static** commands.

Performing 802.1X authentication

- userLogin.

  A port in this mode performs 802.1X authentication and implements port-based access control. The port can service multiple 802.1X users. Once an 802.1X user passes authentication on the port, any subsequent 802.1X users can access the network through the port without authentication.

- userLoginSecure.

  A port in this mode performs 802.1X authentication and implements MAC-based access control. The port services only one user passing 802.1X authentication.

- userLoginSecureExt.

  This mode is similar to the userLoginSecure mode except that this mode supports multiple online 802.1X users.

- userLoginWithOUI.

  This mode is similar to the userLoginSecure mode. The difference is that a port in this mode also permits frames from one user whose MAC address contains a specific OUI.

  In this mode, the port performs OUI check at first. If the OUI check fails, the port performs 802.1X authentication. The port permits frames that pass OUI check or 802.1X authentication.

NOTE:

An OUI is a 24-bit number that uniquely identifies a vendor, manufacturer, or organization. In MAC addresses, the first three octets are the OUI.

Performing MAC authentication

macAddressWithRadius: A port in this mode performs MAC authentication, and services multiple users.

Performing a combination of MAC authentication and 802.1X authentication

- macAddressOrUserLoginSecure.

  This mode is the combination of the macAddressWithRadius and userLoginSecure modes. The mode allows one 802.1X authentication user and multiple MAC authentication users to log in.

  In this mode, the port performs 802.1X authentication first. By default, if 802.1X authentication fails, MAC authentication is performed.

  However, the port in this mode processes authentication differently when the following conditions exist:

  - The port is enabled with parallel processing of MAC authentication and 802.1X authentication.
  - The port is enabled with the 802.1X unicast trigger.
  - The port receives a packet from an unknown MAC address.

  Under such conditions, the port sends a unicast EAP-Request/Identity packet to the MAC address to initiate 802.1X authentication. After that, the port immediately processes MAC authentication without waiting for the 802.1X authentication result.

- macAddressOrUserLoginSecureExt.

  This mode is similar to the macAddressOrUserLoginSecure mode, except that this mode supports multiple 802.1X and MAC authentication users.
- macAddressElseUserLoginSecure.

  This mode is the combination of the macAddressWithRadius and userLoginSecure modes, with MAC authentication having a higher priority as the **Else** keyword implies. The mode allows one 802.1X authentication user and multiple MAC authentication users to log in.

  In this mode, the port performs MAC authentication upon receiving non-802.1X frames. Upon receiving 802.1X frames, the port performs MAC authentication and then, if the authentication fails, 802.1X authentication.
- macAddressElseUserLoginSecureExt.

  This mode is similar to the macAddressElseUserLoginSecure mode except that this mode supports multiple 802.1X and MAC authentication users as the **Ext** keyword implies.

Restrictions and guidelines: Port security configuration

This feature applies to networks, such as a WLAN, that require different authentication methods for different users on a port.

As a best practice, use the 802.1X authentication or MAC authentication feature rather than port security for scenarios that require only 802.1X authentication or MAC authentication. For more information about 802.1X and MAC authentication, see "Configuring 802.1X" and "Configuring MAC authentication."

Port security settings are supported only on Layer 2 Ethernet interfaces that do not belong to a Layer 2 aggregation group.

To ensure a successful HTTPS redirect for users who are assigned a redirect URL, make sure VLAN interfaces exist for the VLANs that transport their packets.

Port security tasks at a glance

To configure port security, perform the following tasks:

1. Configuring basic features of port security
   - Enabling port security
   - Setting the port security mode
   - Setting port security's limit on the number of secure MAC addresses on a port
   - Configuring secure MAC addresses
   - (Optional.) Configuring NTK
   - (Optional.) Configuring intrusion protection
2. (Optional.) Configuring extended features of port security
   - Ignoring authorization information from the server
   - Configuring MAC move
   - Enabling the authorization-fail-offline feature
   - Setting port security's limit on the number of MAC addresses for specific VLANs on a port
   - Enabling open authentication mode
   - Configuring free VLANs for port security
   - Applying a NAS-ID profile to port security

- Enabling traffic statistics for MAC authentication and 802.1X users
- Specifying an IP address and mask for calculating the source IP of ARP detection packets

The extended port security features can also take effect when port security is disabled but 802.1X or MAC authentication is enabled.

3. (Optional.) Enabling SNMP notifications for port security
4. (Optional.) Enabling port security user logging

Enabling port security

Restrictions and guidelines

When you configure port security, follow these restrictions and guidelines:

- When port security is enabled, you cannot enable 802.1X or MAC authentication, or change the access control mode or port authorization state. Port security automatically modifies these settings in different security modes.
- You can use the **undo port-security enable** command to disable port security. Because the command logs off online users, make sure no online users are present.
- Enabling or disabling port security resets the following security settings to the default:
  - 802.1X access control mode, which is MAC-based.
  - Port authorization state, which is **auto**.

For more information about 802.1X authentication and MAC authentication configuration, see "Configuring 802.1X" and "Configuring MAC authentication."

Prerequisites

Before you enable port security, disable 802.1X and MAC authentication globally.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enable port security.
   ```
   port-security enable
   ```
   By default, port security is disabled.

Setting the port security mode

Restrictions and guidelines

You can specify a port security mode when port security is disabled, but your configuration cannot take effect.

Changing the port security mode of a port logs off the online users of the port.

Do not enable 802.1X authentication or MAC authentication on a port where port security is enabled.

After enabling port security, you can change the port security mode of a port only when the port is operating in noRestrictions (the default) mode. To change the port security mode for a port in any other mode, first use the **undo port-security port-mode** command to restore the default port security mode.

The device supports the URL attribute assigned by a RADIUS server in the following port security modes:

- mac-authentication.

- mac-else-userlogin-secure.
- mac-else-userlogin-secure-ext.
- userlogin-secure.
- userlogin-secure-ext.
- userlogin-secure-or-mac.
- userlogin-secure-or-mac-ext.
- userlogin-withoui.

During authentication, the HTTP or HTTPS requests of a user are redirected to the Web interface specified by the server-assigned URL attribute. After the user passes the Web authentication, the RADIUS server records the MAC address of the user and uses a DM (Disconnect Message) to log off the user. When the user initiates 802.1X or MAC authentication again, it will pass the authentication and come online successfully.

To redirect the HTTPS requests of port security users, specify the HTTPS redirect listening port on the device. For more information, see HTTP redirect in *Layer 3—IP Services Configuration Guide*.

Prerequisites

Before you set a port security mode for a port, complete the following tasks:

- Disable 802.1X and MAC authentication.
- If you are configuring the autoLearn mode, set port security's limit on the number of secure MAC addresses. You cannot change the setting when the port is operating in autoLearn mode.

Procedure

1. Enter system view.

   system-view
2. Set an OUI value for user authentication.

   port-security oui index *index-value* **mac-address** *oui-value*

   By default, no OUI values are configured for user authentication.

   This command is required only for the **userlogin-withoui** mode.

   You can set multiple OUIs, but when the port security mode is **userlogin-withoui**, the port allows one 802.1X user and only one user that matches one of the specified OUIs.
3. Enter interface view.

   interface *interface-type interface-number*
4. Set the port security mode.

   port-security port-mode { **autolearn** | **mac-authentication** | **mac-else-userlogin-secure** | **mac-else-userlogin-secure-ext** | **secure** | **userlogin** | **userlogin-secure** | **userlogin-secure-ext** | **userlogin-secure-or-mac** | **userlogin-secure-or-mac-ext** | **userlogin-withoui** }

   By default, a port operates in noRestrictions mode.

Setting port security's limit on the number of secure MAC addresses on a port

About port security's limit on the number of secure MAC addresses on a port

You can set the maximum number of secure MAC addresses that port security allows on a port for the following purposes:

- Controlling the number of concurrent users on the port.

For a port operating in a security mode (except for autoLearn and secure), the upper limit equals the smaller of the following values:

- The limit of the secure MAC addresses that port security allows.
- The limit of concurrent users allowed by the authentication mode in use.

- Controlling the number of secure MAC addresses on the port in autoLearn mode.

  You can also set the maximum number of secure MAC addresses that port security allows for specific VLANs or each VLAN on a port.

Port security's limit on the number of secure MAC addresses on a port is independent of the MAC learning limit described in MAC address table configuration. For more information about MAC address table configuration, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the maximum number of secure MAC addresses allowed on a port.

   port-security max-mac-count *max-count*[**vlan** [*vlan-id-list*]]

   By default, port security does not limit the number of secure MAC addresses on a port.

Configuring secure MAC addresses

About secure MAC addresses

Secure MAC addresses are configured or learned in autoLearn mode. If the secure MAC addresses are saved, they can survive a device reboot. You can bind a secure MAC address only to one port in a VLAN.

Secure MAC addresses include static, sticky, and dynamic secure MAC addresses.

Table 2 Comparison of static, sticky, and dynamic secure MAC addresses

Type	Address sources	Aging mechanism	Can be saved and survive a device reboot?
Static	Manually added (by using the **port-security mac-address security** command without the **sticky** keyword).	Not available. The static secure MAC addresses never age out unless you perform any of the following tasks: • Manually remove these MAC addresses. • Change the port security mode. • Disable the port security feature.	Yes.
Sticky	• Manually added (by using the **port-security mac-address security** command with the **sticky** keyword). • Converted from dynamic secure MAC	By default, sticky MAC addresses do not age out. However, you can configure an aging timer or use the aging timer together with the inactivity aging feature to remove old sticky MAC addresses. • If only the aging timer is configured, the aging timer counts up regardless of whether traffic data has been sent from the sticky	Yes. The secure MAC aging timer restarts at a reboot.

Type	Address sources	Aging mechanism	Can be saved and survive a device reboot?
	addresses. • Automatically learned when the dynamic secure MAC feature is disabled.	MAC addresses. • If both the aging timer and the inactivity aging feature are configured, the aging timer restarts once traffic data is detected from the sticky MAC addresses.	
Dynamic	• Converted from sticky MAC addresses. • Automatically learned after the dynamic secure MAC feature is enabled.	Same as sticky MAC addresses.	No. All dynamic secure MAC addresses are lost at reboot.

When the maximum number of secure MAC address entries is reached, the port changes to secure mode. In secure mode, the port cannot add or learn any more secure MAC addresses. The port allows only frames sourced from secure MAC addresses or MAC addresses configured by using the **mac-address dynamic** or **mac-address static** command to pass through.

Prerequisites

Before you configure secure MAC addresses, complete the following tasks:

- Set port security's limit on the number of MAC addresses on the port. Perform this task before you enable autoLearn mode.
- Set the port security mode to autoLearn.
- Configure the port to permit packets of the specified VLAN to pass or add the port to the VLAN. Make sure the VLAN already exists.

Adding secure MAC addresses

1. Enter system view.

   system-view
2. Set the secure MAC aging timer.

   port-security timer autolearn aging [**second**] *time-value*

   By default, secure MAC addresses do not age out.
3. Configure a secure MAC address.
   - Configure a secure MAC address in system view.

     port-security mac-address security [**sticky**] *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*
   - Execute the following commands in sequence to configure a secure MAC address in interface view:

     interface *interface-type interface-number*

     port-security mac-address security [**sticky**] *mac-address* **vlan** *vlan-id*

   By default, no manually configured secure MAC addresses exist.

   In a VLAN, a MAC address cannot be specified as both a static secure MAC address and a sticky MAC address.

Enabling inactivity aging for secure MAC addresses

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable inactivity aging for secure MAC addresses.
   port-security mac-address aging-type inactivity
   By default, the inactivity aging feature is disabled for secure MAC addresses.

Enabling the dynamic secure MAC feature

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the dynamic secure MAC feature.
   port-security mac-address dynamic
   By default, the dynamic secure MAC feature is disabled. Sticky MAC addresses can be saved to the configuration file. Once saved, they can survive a device reboot.

Configuring NTK

About the NTK feature

The NTK feature checks the destination MAC address in outbound frames to make sure frames are forwarded only to trustworthy devices.

The NTK feature supports the following modes:

- **ntkonly**—Forwards only unicast frames with an authenticated destination MAC address.
- **ntk-withbroadcasts**—Forwards only broadcast and unicast frames with an authenticated destination MAC address.
- **ntk-withmulticasts**—Forwards only broadcast, multicast, and unicast frames with an authenticated destination MAC address.
- **ntkauto**—Forwards only broadcast, multicast, and unicast frames with an authenticated destination MAC address, and only when the port has online users.

Restrictions and guidelines

The NTK feature drops any unicast frame with an unknown destination MAC address.

Not all port security modes support triggering the NTK feature. For more information, see Table 1.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the NTK feature.

port-security ntk-mode { **ntk-withbroadcasts** | **ntk-withmulticasts** | **ntkauto** | **ntkonly** }

By default, NTK is disabled on a port and all frames are allowed to be sent.

Configuring intrusion protection

About intrusion protection

Intrusion protection takes one of the following actions on a port in response to illegal frames:

- **blockmac**—Adds the source MAC addresses of illegal frames to the blocked MAC address list and discards the frames. A blocked MAC address will be unblocked in 3 minutes. This interval is not user configurable.
- **disableport**—Disables the port until you bring it up manually.
- **disableport-temporarily**—Disables the port for a period of time. The period can be configured with the **port-security timer disableport** command.

Restrictions and guidelines

On a port operating in either macAddressElseUserLoginSecure mode or macAddressElseUserLoginSecureExt mode, intrusion protection is triggered only after both MAC authentication and 802.1X authentication fail for the same frame.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the intrusion protection feature.

   port-security intrusion-mode { **blockmac** | **disableport** | **disableport-temporarily** }

   By default, intrusion protection is disabled.
4. (Optional.) Set the silence timeout period during which a port remains disabled.

   a. **quit**

   b. **port-security timer disableport** *time-value*

   By default, the port silence timeout period is 20 seconds.

Ignoring authorization information from the server

About ignoring authorization information from the server

You can configure a port to ignore the authorization information received from the server (local or remote) after an 802.1X or MAC authentication user passes authentication.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Ignore the authorization information received from the authentication server.

   port-security authorization ignore

By default, a port uses the authorization information received from the authentication server.

Configuring MAC move

About MAC move

Port security MAC move takes effect in the following scenarios:

- **Inter-port move on a device**—An online user authenticated through 802.1X or MAC authentication moves between ports on the device. The user VLAN or authentication method might change or stay unchanged after the move.
- **Inter-VLAN move on a port**—An online user authenticated through 802.1X or MAC authentication moves between VLANs on a trunk or hybrid port. In addition, the packets that trigger authentication have VLAN tags.

Port security MAC move allows an online user authenticated through 802.1X or MAC authentication on one port or VLAN to be reauthenticated and come online on another port or VLAN without going offline first. After the user passes authentication on the new port or VLAN, the system removes the authentication session of the user on the original port or VLAN.

NOTE:

For MAC authentication, the MAC move feature applies only when MAC authentication single-VLAN mode is used. The MAC move feature does not apply to MAC authentication users that move between VLANs on a port with MAC authentication multi-VLAN mode enabled.

If this feature is disabled, 802.1X or MAC authenticated users must go offline first before they can be reauthenticated successfully on a new port or VLAN to come online.

For a user moving between ports, the port from which the user moves is called the source port and the port to which the user moves is called the destination port.

On the destination port, an 802.1X or MAC authentication user will reauthenticate in the VLAN authorized on the source port if the source port is enabled with MAC-based VLAN. If that VLAN is not permitted to pass through on the destination port, reauthentication will fail. To avoid this situation, enable VLAN check bypass on the destination port. This feature skips checking VLAN information in the packets that trigger 802.1X authentication or MAC authentication for users moving to the port.

Restrictions and guidelines

As a best practice to minimize security risks, enable MAC move only if user roaming between ports is required.

802.1X or MAC authenticated users cannot move between ports on a device or between VLANs on a port if the maximum number of online users on the authentication server has been reached.

MAC authentication multi-VLAN mode has higher priority than MAC move for users moving between VLANs on a port. If MAC authentication multi-VLAN mode is enabled, these users can come online in the new VLAN without being reauthenticated. To enable MAC authentication multi-VLAN mode, use the **`mac-authentication host-mode multi-vlan`** command. For more information about MAC authentication multi-VLAN mode, see "Configuring MAC authentication."

When you configure VLAN check bypass for users moving between ports, follow these guidelines:

- To ensure a successful reauthentication, enable VLAN check bypass on a destination port if the source port is enabled with MAC-based VLAN.
- If the destination port is an 802.1X-enabled trunk port, you must configure it to send 802.1X protocol packets without VLAN tags. For more information, see "Configuring 802.1X."

Procedure

1. Enter system view.

   `system-view`

2. Enable MAC move.

   port-security mac-move permit

   By default, MAC move is disabled.
3. (Optional.) Enable VLAN check bypass on the port for users moving to it.
   a. Enter interface view.

      interface *interface-type interface-number*
   b. Enable VLAN check bypass.

      port-security mac-move bypass-vlan-check

      By default, the VLAN check bypass feature is disabled.

      This command is supported only in Release 6318P01 and later.

Enabling the authorization-fail-offline feature

About the authorization-fail-offline feature

IMPORTANT:

The authorization-fail-offline feature takes effect only on port security users that have failed ACL or user profile authorization.

The authorization-fail-offline feature logs off port security users that have failed authorization.

A user fails authorization in the following situations:

- The device or server fails to assign the specified authorization attribute to the user.
- The device or server assigns authorization information that does not exist on the device to the user.

This feature does not apply to users that have failed VLAN authorization. The device logs off these users directly.

You can also enable the quiet timer feature for 802.1X or MAC authentication users that are logged off by the authorization-fail-offline feature. The device adds these users to the 802.1X or MAC authentication quiet queue. Within the quiet timer, the device does not process packets from these users or authenticate them. If you do not enable the quiet timer feature, the device immediately authenticates these users upon receiving packets from them.

Prerequisites

For the quiet timer feature to take effect, complete the following tasks:

- For 802.1X users, use the **dot1x quiet-period** command to enable the quiet timer and use the **dot1x timer quiet-period** command to set the timer.
- For MAC authentication users, use the **mac-authentication timer quiet** command to set the quiet timer for MAC authentication.

Procedure

1. Enter system view.

   system-view
2. Enable the authorization-fail-offline feature.

   port-security authorization-fail offline [**quiet-period**]

   By default, this feature is disabled, and the device does not log off users that have failed authorization.

Setting port security's limit on the number of MAC addresses for specific VLANs on a port

About port security's limit on the number of MAC addresses for specific VLANs on a port

Typically, port security allows the access of the following types of MAC addresses on a port:

- MAC addresses that pass 802.1X or MAC authentication.
- MAC addresses in the MAC authentication guest VLAN or MAC authentication critical VLAN.
- MAC addresses in the 802.1X guest VLAN, 802.1X Auth-Fail VLAN, or 802.1X critical VLAN.

This feature limits the number of MAC addresses that port security allows to access a port through specific VLANs. Use this feature to prevent resource contentions among MAC addresses and ensure reliable performance for each access user on the port. When the number of MAC addresses in a VLAN on the port reaches the upper limit, the device denies any subsequent MAC addresses in the VLAN on the port.

Restrictions and guidelines

On a port, the maximum number of MAC addresses in a VLAN cannot be smaller than the number of existing MAC addresses in the VLAN. If the specified maximum number is smaller, the setting does not take effect.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Set port security's limit on the number of MAC addresses for specific VLANs on the port.
   `port-security mac-limit` *`max-number`* **`per-vlan`** *`vlan-id-list`*
   The default setting is 2147483647.

Enabling open authentication mode

About open authentication mode

This feature enables access users (802.1X or MAC authentication users) of a port to come online and access the network even if they use nonexistent usernames or incorrect passwords.

Access users that come online in open authentication mode are called open users. Authorization and accounting are not available for open users. To display open user information, use the following commands:

- **`display dot1x connection open`**.
- **`display mac-authentication connection open`**.

This feature does not affect the access of users that use correct user information.

Restrictions and guidelines

When you configure open authentication mode, follow these restrictions and guidelines:

- If global open authentication mode is enabled, all ports are enabled with open authentication mode regardless of the port-specific open authentication mode setting. If global open authentication mode is disabled, whether a port is enabled with open authentication mode depends on the port-specific open authentication mode setting.

- The open authentication mode setting has lower priority than the 802.1X Auth-Fail VLAN and the MAC authentication guest VLAN. Open authentication mode does not take effect on a port if the port is also configured with the 802.1X Auth-Fail VLAN or the MAC authentication guest VLAN. For information about 802.1X authentication and MAC authentication, see "802.1X overview," "Configuring 802.1X," and "Configuring MAC authentication."

Procedure

1. Enter system view.
   system-view
2. Enable global open authentication mode.
   port-security authentication open global
   By default, global open authentication mode is disabled.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable open authentication mode on the port.
   port-security authentication open
   By default, open authentication mode is disabled on a port.

Configuring free VLANs for port security

About this task

This feature allows packets from the specified VLANs to not trigger 802.1X or MAC authentication on a port configured with any of the following features:

- 802.1X authentication.
- MAC authentication.
- One of the following port security modes:
  - userLogin.
  - userLoginSecure.
  - userLoginWithOUI.
  - userLoginSecureExt.
  - macAddressWithRadius.
  - macAddressOrUserLoginSecure.
  - macAddressElseUserLoginSecure.
  - macAddressOrUserLoginSecureExt.
  - macAddressElseUserLoginSecureExt.

Software and feature compatibility

This feature is supported only in Release 6328 and later.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure free VLANs for port security.
   port-security free-vlan *vlan-id-list*
   By default, no free VLANs for port security exist on a port.

Applying a NAS-ID profile to port security

About NAS-ID profiles

By default, the device sends its device name in the NAS-Identifier attribute of all RADIUS requests.

A NAS-ID profile enables you to send different NAS-Identifier attribute strings in RADIUS requests from different VLANs. The strings can be organization names, service names, or any user categorization criteria, depending on the administrative requirements.

For example, map the NAS-ID **companyA** to all VLANs of company A. The device will send **companyA** in the NAS-Identifier attribute for the RADIUS server to identify requests from any Company A users.

Restrictions and guidelines

You can apply a NAS-ID profile to port security globally or on a port. On a port, the device selects a NAS-ID profile in the following order:

1. The port-specific NAS-ID profile.
2. The NAS-ID profile applied globally.

If no NAS-ID profile is applied or no matching binding is found in the selected profile, the device uses the device name as the NAS-ID.

For more information about the NAS-ID profile configuration, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Apply a NAS-ID profile.
   - Apply a NAS-ID profile globally.
     port-security nas-id-profile *profile-name*
   - Execute the following commands in sequence to apply a NAS-ID profile to an interface:
     interface *interface-type interface-number*
     port-security nas-id-profile *profile-name*

   By default, no NAS-ID profile is applied in system view or in interface view.

Enabling traffic statistics for MAC authentication and 802.1X users

About this task

By default, 802.1X and MAC authentication user statistics collected and sent to the accounting server only include the online duration of the users. To collect and send their traffic statistics to the accounting server in addition to their online duration, perform this task.

This feature takes effect on 802.1X and MAC authentication users when port security is enabled, or when 802.1X and MAC authentication are separately enabled on the device.

If a port performs MAC authentication or 802.1X authentication in MAC-based access control mode, this feature collects user traffic statistics on a per-MAC basis on the port.

If a port performs 802.1X authentication in port-based access control mode, this feature collects user traffic statistics on a per-port basis on the port.

With this feature enabled, the device requires more ACL resources for new 802.1X or MAC authentication users. If the device has run out of ACL resources, the authentication will fail for new 802.1X or MAC authentication users.

Restrictions and guidelines

This feature is available in Release 6312 and later.

This feature takes effect only on users that come online after the feature is enabled.

Enable this feature only if traffic accounting is required and only if there are sufficient ACL resources. If the network has a large number of online 802.1X and MAC authentication users when this feature is enabled, ACL resources might become insufficient. This issue causes authentication failure of new 802.1X and MAC authentication users. For more information about 802.1X and MAC authentication, see "Configuring 802.1X" and "Configuring MAC authentication."

Procedure

1. Enter system view.

   `system-view`

2. Enable traffic statistics for 802.1X and MAC authentication users.

   `port-security traffic-statistics enable`

   By default, the device does not collect traffic statistics for 802.1X and MAC authentication users.

Specifying an IP address and mask for calculating the source IP of ARP detection packets

About this task

By default, the device uses 0.0.0.0 as the source IP address of ARP detection packets. The network might have users that cannot respond to ARP detection packets with source IP address 0.0.0.0. As a result, the device inadequately determines that these users have gone offline. To resolve the issue, use this feature to specify an IP address and mask for calculating the source IP of ARP detection packets sent to a user in conjunction with the user's IP address.

The device uses the following formula to calculate the source IP address of ARP detection packets: source IP = (user IP & specified mask) | (specified IP & ~specified mask). The ~mask parameter represents the reverse of a mask. For example, the reverse mask of 255.255.255.0 is 0.0.0.255. If the IP address of a user is 192.168.8.1/24 and the IP address and mask specified by using this feature is 1.1.1.11/255.255.255.0, the source IP address of ARP detection packets is 192.168.8.11/24.

Feature and software version compatibility

This feature is supported only in Release 6348P01 and later.

Restrictions and guidelines

This feature takes effect only on users that come online after this feature is configured.

Procedure

1. Enter system view.

   `system-view`

2. Specify an IP address and mask for calculating the source IP of ARP detection packets.

   `port-security packet-detect arp-source-ip factor` *`ip-address`* { *`mask`* | *`mask-length`* }

   By default, no IP address or mask is specified for calculating the source IP of ARP detection packets. The source IP of ARP detection packets is 0.0.0.0.

Enabling SNMP notifications for port security

About SNMP notifications for port security

Use this feature to report critical port security events to an NMS. For port security event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for port security.

   snmp-agent trap enable port-security [**address-learned** | **dot1x-failure** | **dot1x-logoff** | **dot1x-logon** | **intrusion** | **mac-auth-failure** | **mac-auth-logoff** | **mac-auth-logon**] *

   By default, SNMP notifications are disabled for port security.

Enabling port security user logging

About port security user logging

This feature enables the device to generate logs about port security users and send the logs to the information center. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

To prevent excessive port security user log entries, use this feature only if you need to analyze abnormal port security user events.

Procedure

1. Enter system view.

   system-view

2. Enable port security user logging.

   port-security access-user log enable [**failed-authorization** | **mac-learning** | **violation** | **vlan-mac-limit**] *

   By default, port security user logging is disabled.

   If you do not specify any parameters, this command enables all types of port security user logs.

Display and maintenance commands for port security

Execute **display** commands in any view:

Task	Command
Display the port security configuration, operation information, and statistics.	**display port-security** [**interface** *interface-type interface-number*]
Display information about blocked MAC addresses.	**display port-security mac-address block** [**interface** *interface-type*

Task	Command
	interface-number] [**vlan** *vlan-id*] [**count**]
Display information about secure MAC addresses.	**display port-security mac-address security** [**interface** *interface-type interface-number*] [**vlan** *vlan-id*] [**count**]

Port security configuration examples

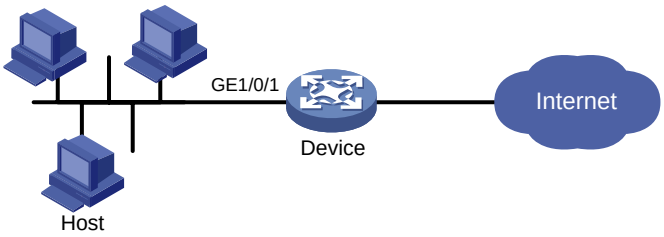
Example: Configuring port security in autoLearn mode

Network configuration

As shown in Figure 1, configure GigabitEthernet 1/0/1 on the device to meet the following requirements:

- Accept up to 64 users without authentication.
- Be permitted to learn and add MAC addresses as sticky MAC addresses, and set the secure MAC aging timer to 30 minutes.
- Stop learning MAC addresses after the number of secure MAC addresses reaches 64. If any frame with an unknown MAC address arrives, intrusion protection starts, and the port shuts down and stays silent for 30 seconds.

Figure 1 Network diagram



Procedure

Enable port security.

```
<Device> system-view
[Device] port-security enable
```

Set the secure MAC aging timer to 30 minutes.

```
[Device] port-security timer autolearn aging 30
```

Set port security's limit on the number of secure MAC addresses to 64 on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] port-security max-mac-count 64
```

Set the port security mode to autoLearn.

```
[Device-GigabitEthernet1/0/1] port-security port-mode autolearn
```

Configure the port to be silent for 30 seconds after the intrusion protection feature is triggered.

```
[Device-GigabitEthernet1/0/1] port-security intrusion-mode disableport-temporarily
[Device-GigabitEthernet1/0/1] quit
[Device] port-security timer disableport 30
```

Verifying the configuration

Verify the port security configuration.

```
[Device] display port-security interface gigabitethernet 1/0/1
Global port security parameters:
   Port security          : Enabled
   AutoLearn aging time   : 30 min
   Disableport timeout    : 30 s
   Blockmac timeout       : 180 s
   MAC move               : Denied
   Authorization fail     : Online
   NAS-ID profile         : Not configured
   Dot1x-failure trap     : Disabled
   Dot1x-logon trap       : Disabled
   Dot1x-logoff trap      : Disabled
   Intrusion trap         : Disabled
   Address-learned trap   : Disabled
   Mac-auth-failure trap  : Disabled
   Mac-auth-logon trap    : Disabled
   Mac-auth-logoff trap   : Disabled
   Open authentication    : Disabled
   OUI value list         :
    Index :  1           Value : 123401

 GigabitEthernet1/0/1 is link-up
   Port mode                       : autoLearn
   NeedToKnow mode                 : Disabled
   Intrusion protection mode       : DisablePortTemporarily
   Security MAC address attribute
       Learning mode               : Sticky
       Aging type                  : Periodical
   Max secure MAC addresses        : 64
   Current secure MAC addresses    : 0
   Authorization                   : Permitted
   NAS-ID profile                  : Not configured
   Free VLANs                      : Not configured
   Open authentication             : Disabled
   MAC-move VLAN check bypass      : Disabled
```

The port allows for MAC address learning, and you can view the number of learned MAC addresses in the **Current secure MAC addresses** field.

Display additional information about the learned MAC addresses.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port-security max-mac-count 64
 port-security port-mode autolearn
 port-security mac-address security sticky 0002-0000-0015 vlan 1
 port-security mac-address security sticky 0002-0000-0014 vlan 1
```

```
 port-security mac-address security sticky 0002-0000-0013 vlan 1
 port-security mac-address security sticky 0002-0000-0012 vlan 1
 port-security mac-address security sticky 0002-0000-0011 vlan 1
#
[Device-GigabitEthernet1/0/1] quit
```

Verify that the port security mode changes to **secure** after the number of MAC addresses learned by the port reaches 64.

```
[Device] display port-security interface gigabitethernet 1/0/1
```

Verify that the port will be disabled for 30 seconds after it receives a frame with an unknown MAC address. (Details not shown.)

After the port is re-enabled, delete several secure MAC addresses.

```
[Device] undo port-security mac-address security sticky 0002-0000-0015 vlan 1
[Device] undo port-security mac-address security sticky 0002-0000-0014 vlan 1
...
```

Verify that the port security mode of the port changes to **autoLearn**, and the port can learn MAC addresses again. (Details not shown.)

Example: Configuring port security in userLoginWithOUI mode

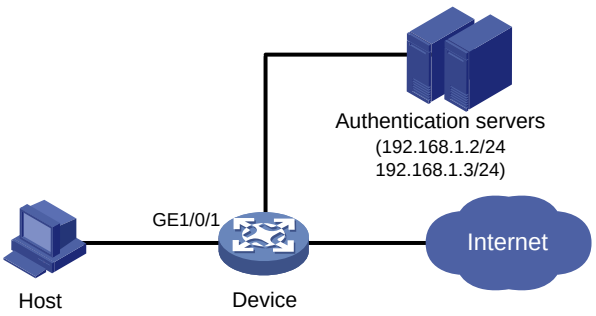
Network configuration

As shown in Figure 2, a client is connected to the device through GigabitEthernet 1/0/1. The device authenticates the client with a RADIUS server in ISP domain **sun**. If the authentication succeeds, the client is authorized to access the Internet.

- The RADIUS server at 192.168.1.2 acts as the primary authentication server and the secondary accounting server. The RADIUS server at 192.168.1.3 acts as the secondary authentication server and the primary accounting server. The shared key for authentication is **name**, and the shared key for accounting is **money**.
- All users use the authentication, authorization, and accounting methods of ISP domain **sun**.
- The RADIUS server response timeout time is 5 seconds. The maximum number of RADIUS packet retransmission attempts is 5. The device sends real-time accounting packets to the RADIUS server at 15-minute intervals, and sends usernames without domain names to the RADIUS server.

Configure GigabitEthernet 1/0/1 to allow only one 802.1X user and a user that uses one of the specified OUI values to be authenticated.

Figure 2 Network diagram



Procedure

The following configuration steps cover some AAA/RADIUS configuration commands. For more information about the commands, see *Security Command Reference*.

Make sure the host and the RADIUS server can reach each other.

1. Configure AAA:

Configure a RADIUS scheme named **radsun**.

```
<Device> system-view
[Device] radius scheme radsun
[Device-radius-radsun] primary authentication 192.168.1.2
[Device-radius-radsun] primary accounting 192.168.1.3
[Device-radius-radsun] secondary authentication 192.168.1.3
[Device-radius-radsun] secondary accounting 192.168.1.2
[Device-radius-radsun] key authentication simple name
[Device-radius-radsun] key accounting simple money
[Device-radius-radsun] timer response-timeout 5
[Device-radius-radsun] retry 5
[Device-radius-radsun] timer realtime-accounting 15
[Device-radius-radsun] user-name-format without-domain
[Device-radius-radsun] quit
```

Configure ISP domain **sun**.

```
[Device] domain sun
[Device-isp-sun] authentication lan-access radius-scheme radsun
[Device-isp-sun] authorization lan-access radius-scheme radsun
[Device-isp-sun] accounting lan-access radius-scheme radsun
[Device-isp-sun] quit
```

2. Configure 802.1X:

Set the 802.1X authentication method to CHAP. By default, the authentication method for 802.1X is CHAP.

```
[Device] dot1x authentication-method chap
```

Specify ISP domain **sun** as the mandatory authentication domain for 802.1X users on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] dot1x mandatory-domain sun
[Device-GigabitEthernet1/0/1] quit
```

3. Configure port security:

Enable port security.

```
[Device] port-security enable
```

Add five OUI values. (You can add up to 16 OUI values. The port permits only one user matching one of the OUIs to pass authentication.)

```
[Device] port-security oui index 1 mac-address 1234-0100-1111
[Device] port-security oui index 2 mac-address 1234-0200-1111
[Device] port-security oui index 3 mac-address 1234-0300-1111
[Device] port-security oui index 4 mac-address 1234-0400-1111
[Device] port-security oui index 5 mac-address 1234-0500-1111
```

Set the port security mode to userLoginWithOUI.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] port-security port-mode userlogin-withoui
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify that GigabitEthernet 1/0/1 allows only one 802.1X user to be authenticated.

```
[Device] display port-security interface gigabitethernet 1/0/1
Global port security parameters:
   Port security          : Enabled
   AutoLearn aging time   : 30 min
   Disableport timeout    : 30 s
   Blockmac timeout       : 180 s

```

Example: Configuring port security in macAddressElseUserLoginSecure mode

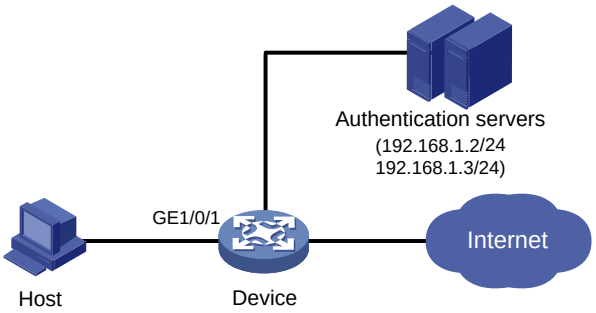
Network configuration

As shown in Figure 3, a client is connected to the device through GigabitEthernet 1/0/1. The device authenticates the client by a RADIUS server in ISP domain **sun**. If the authentication succeeds, the client is authorized to access the Internet.

Configure GigabitEthernet 1/0/1 of the device to meet the following requirements:

- Allow more than one MAC authenticated user to log on.
- For 802.1X users, perform MAC authentication first and then, if MAC authentication fails, 802.1X authentication. Allow only one 802.1X user to log on.
- Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in upper case.
- Set the total number of MAC authenticated users and 802.1X authenticated users to 64.
- Enable NTK (**ntkonly** mode) to prevent frames from being sent to unknown MAC addresses.

Figure 3 Network diagram



Procedure

Make sure the host and the RADIUS server can reach each other.

1. Configure RADIUS authentication/accounting and ISP domain settings. (See "Example: Configuring port security in userLoginWithOUI mode.")
2. Configure port security:

   # Enable port security.

   ```
   <Device> system-view
   [Device] port-security enable
   ```

   # Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in upper case.

   ```
   [Device] mac-authentication user-name-format mac-address with-hyphen uppercase
   ```

   # Specify the MAC authentication domain.

   ```
   [Device] mac-authentication domain sun
   ```

   # Set the 802.1X authentication method to CHAP. By default, the authentication method for 802.1X is CHAP.

   ```
   [Device] dot1x authentication-method chap
   ```

   # Set port security's limit on the number of MAC addresses to 64 on the port.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] port-security max-mac-count 64
   ```

Set the port security mode to macAddressElseUserLoginSecure.

```
[Device-GigabitEthernet1/0/1] port-security port-mode mac-else-userlogin-secure
```

Specify ISP domain **sun** as the mandatory authentication domain for 802.1X users.

```
[Device-GigabitEthernet1/0/1] dot1x mandatory-domain sun
```

Set the NTK mode of the port to ntkonly.

```
[Device-GigabitEthernet1/0/1] port-security ntk-mode ntkonly
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify the port security configuration.

```
[Device] display port-security interface gigabitethernet 1/0/1
Global port security parameters:
   Port security          : Enabled
   AutoLearn aging time   : 30 min
   Disableport timeout    : 30 s
   Blockmac timeout       : 180 s

```

Verify that frames with an unknown destination MAC address, multicast address, or broadcast address are discarded. (Details not shown.)

Troubleshooting port security

Cannot set the port security mode

Symptom

Cannot set the port security mode for a port.

Analysis

For a port operating in a port security mode other than noRestrictions, you cannot change the port security mode by using the **`port-security port-mode`** command.

Solution

To resolve the issue:

1. Set the port security mode to noRestrictions.
   ```
   [Device-GigabitEthernet1/0/1] undo port-security port-mode
   ```
2. Set a new port security mode for the port, for example, autoLearn.
   ```
   [Device-GigabitEthernet1/0/1] port-security port-mode autolearn
   ```
3. If the issue persists, contact H3C Support.

Cannot configure secure MAC addresses

Symptom

Cannot configure secure MAC addresses.

Analysis

No secure MAC address can be configured on a port operating in a port security mode other than autoLearn.

Solution

To resolve the issue:

1. Set the port security mode to autoLearn.
   ```
   [Device-GigabitEthernet1/0/1] undo port-security port-mode
   [Device-GigabitEthernet1/0/1] port-security max-mac-count 64
   [Device-GigabitEthernet1/0/1] port-security port-mode autolearn
   [Device-GigabitEthernet1/0/1] port-security mac-address security 1-1-2 vlan 1
   ```
2. If the issue persists, contact H3C Support.

Configuring user profiles

About user profiles

A user profile defines a set of parameters, such as a QoS policy, for a user or a class of users. A user profile can be reused when a user connected to the network on a different interface.

The user profile application allows flexible traffic policing on a per-user basis. Each time a user passes authentication, the server sends the device the name of the user profile specified for the user. The device applies the parameters in the user profile to the user.

User profiles are typically used for resource allocation per user. For example, the interface-based traffic policing limits the total amount of bandwidth available to a group of users. However, user-profile-based traffic policing can limit the amount of bandwidth available to a single user.

Prerequisites for user profile

A user profile works with authentication methods. You must configure authentication for a user profile. For information about supported authentication methods, see the configuration guides for the related authentication modules.

Configuring a user profile

1. Enter system view.
   system-view
2. Create a user profile and enter user profile view.
   user-profile *profile-name*
3. Apply an existing QoS policy to the user profile.
   qos apply policy *policy-name* { **inbound** | **outbound** }
   By default, no QoS policy is applied to a user profile.
   For information about QoS policies, see *ACL and QoS Configuration Guide*.

Display and maintenance commands for user profiles

Execute **display** commands in any view.

Task	Command
Display configuration and online user information for the specified user profile or all user profiles.	**display user-profile** [**name** *profile-name*] [**slot** *slot-number*]

User profile configuration examples

Example: Configuring user profiles and QoS policies

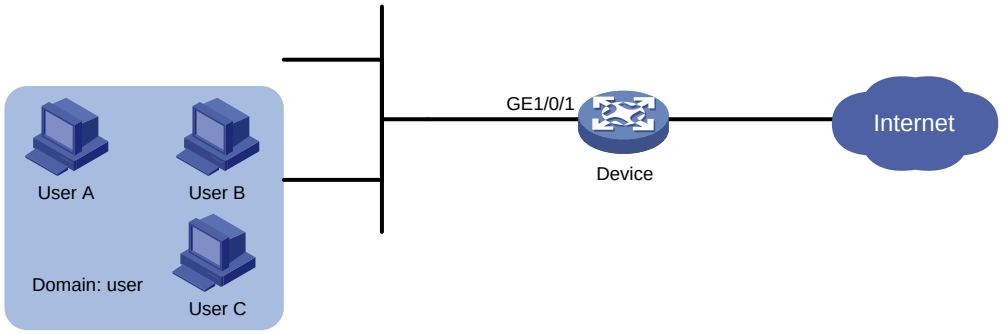
Network requirements

As shown in Figure 1, the device performs local 802.1X authentication on the users in domain **user** for authentication and authorization efficiency.

Configure user profiles and QoS policies on the device to meet the following requirements:

- User A cannot access the Internet during 8: 30 and 12:00 every day even if User A passes 802.1X authentication.
- User B has an upload speed of 2 Mbps after passing 802.1X authentication.
- User C has a download speed of 4 Mbps after passing 802.1X authentication.

Figure 1 Network diagram



Configuration procedure

1. Configure a QoS policy for User A:

   # Create a periodic time range from 8:30 to 12:00 every day.

   ```
   <Device> system-view
   [Device] time-range for_usera 8:30 to 12:00 daily
   ```

   # Create IPv4 basic ACL 2000, and configure a rule to match all packets during the time range **for_usera**.

   ```
   [Device] acl basic 2000
   [Device-acl-basic-2000] rule permit time-range for_usera
   [Device-acl-basic-2000] quit
   ```

   # Create a traffic class named **for_usera**, and use ACL 2000 as the match criterion.

   ```
   [Device] traffic classifier for_usera
   [Device-classifier-for_usera] if-match acl 2000
   [Device-classifier-for_usera] quit
   ```

   # Create a traffic behavior named **for_usera**, and configure the deny action.

   ```
   [Device] traffic behavior for_usera
   [Device-behavior-for_usera] filter deny
   [Device-behavior-for_usera] quit
   ```

   # Create a QoS policy named **for_usera**, and associate traffic class **for_usera** and traffic behavior **for_usera** in the QoS policy.

   ```
   [Device] qos policy for_usera
   [Device-qospolicy-for_usera] classifier for_usera behavior for_usera
   [Device-qospolicy-for_usera] quit
   ```

2. Create a user profile for User A and apply the QoS policy to the user profile:

   # Create a user profile named **usera**.

   ```
   [Device] user-profile usera
   ```

   # Apply QoS policy **for_usera** to the inbound direction of user profile **usera**.

   ```
   [[Device-user-profile-usera] qos apply policy for_usera inbound
   [Device-user-profile-usera] quit
   ```

3. Configure a QoS policy for limiting the traffic rate for User B:

   # Create a traffic class named **class** to match all packets.

   ```
   [Device] traffic classifier class
   [Device-classifier-class] if-match any
   [Device-classifier-class] quit
   ```

   # Create a traffic behavior named **for_userb**, and configure a traffic policing action (CIR 2000 kbps).

   ```
   [Device] traffic behavior for_userb
   [Device-behavior-for_userb] car cir 2000
   [Device-behavior-for_userb] quit
   ```

   # Create a QoS policy named **for_userb**, and associate traffic class **class** and traffic behavior **for_userb** in the QoS policy.

   ```
   [Device] qos policy for_userb
   [Device-qospolicy-for_userb] classifier class behavior for_userb
   [Device-qospolicy-for_userb] quit
   ```

4. Create a user profile for User B and apply the QoS policy to the user profile:

   # Create a user profile named **userb**.

   ```
   [Device] user-profile userb
   ```

   # Apply QoS policy **for_userb** to the inbound direction of user profile **userb**.

   ```
   [Device-user-profile-userb] qos apply policy for_userb inbound
   [Device-user-profile-userb] quit
   ```

5. Configure a QoS policy for limiting the traffic rate for User C:

   # Create a traffic behavior named **for_userc**, and configure a traffic policing action (CIR 4000 kbps).

   ```
   [Device] traffic behavior for_userc
   [Device-behavior-for_userc] car cir 4000
   [Device-behavior-for_userc] quit
   ```

   # Create a QoS policy named **for_userc**, and associate traffic class **class** and traffic behavior **for_userc** in the QoS policy.

   ```
   [Device] qos policy for_userc
   [Device-qospolicy-for_userc] classifier class behavior for_userc
   [Device-qospolicy-for_userc] quit
   ```

6. Create a user profile for User C and apply the QoS policy to the user profile:

   # Create a user profile named **userc**.

   ```
   [Device] user-profile userc
   ```

   # Apply QoS policy **for_userc** to the outbound direction of user profile **userc**.

   ```
   [Device-user-profile-userc] qos apply policy for_userc outbound
   [Device-user-profile-userc] quit
   ```

7. Configure local users:

   # Create a local user named **usera**.

   ```
   [Device] local-user usera class network
   ```

```
New local user added.
```

Set the password to **a12345** for user **usera**.

```
[Device-luser-network-usera] password simple a12345
```

Authorize user **usera** to use the LAN access service.

```
[Device-luser-network-usera] service-type lan-access
```

Specify user profile **usera** as the authorization user profile for user **usera**.

```
[Device-luser-network-usera] authorization-attribute user-profile usera
[Device-luser-network-usera] quit
```

Create a local user named **userb**.

```
[Device] local-user userb class network
New local user added.
```

Set the password to **b12345** for user **userb**.

```
[Device-luser-network-userb] password simple b12345
```

Authorize user **userb** to use the LAN access service.

```
[Device-luser-network-userb] service-type lan-access
```

Specify user profile **userb** as the authorization user profile for user **userb**.

```
[Device-luser-network-userb] authorization-attribute user-profile userb
[Device-luser-network-userb] quit
```

Create a local user named **userc**.

```
[Device] local-user userc class network
New local user added.
```

Set the password to **c12345** for user **userc**.

```
[Device-luser-network-userc] password simple c12345
```

Authorize user **userc** to use the LAN access service.

```
[Device-luser-network-userc] service-type lan-access
```

Specify user profile **userc** as the authorization user profile for user **userc**.

```
[Device-luser-network-userc] authorization-attribute user-profile userc
[Device-luser-network-userc] quit
```

8. Configure the authentication, authorization, and accounting methods for local users:

```
[Device] domain user
[Device-isp-user] authentication lan-access local
[Device-isp-user] authorization lan-access local
[Device-isp-user] accounting login none
[Device-isp-user] quit
```

9. Configure 802.1X:

Enable 802.1X on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] dot1x
```

Enable MAC-based access control on the port. By default, a port uses MAC-based access control.

```
[Device-GigabitEthernet1/0/1] dot1x port-method macbased
[Device-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

Verifying the configuration

Verify that the three users can pass 802.1X authentication and that QoS policies take effect on these users. (Details not shown.)

Display user profile information.

```
<Device> display user-profile
  User-Profile: usera
    Inbound:
      Policy: for_usera

    slot 1:
      User -:

Contents

Configuring password control

About password control

Password control allows you to implement the following features:

- Manage login and super password setup, expirations, and updates for local users.
- Control user login status based on predefined policies.

For more information about local users, see "Configuring AAA." For information about super passwords, see RBAC in *Fundamentals Configuration Guide*.

Password setting

Minimum password length

You can define the minimum length of user passwords. The system rejects the setting of a password that is shorter than the configured minimum length.

Password composition policy

A password can be a combination of characters from the following types:

- Uppercase letters A to Z.
- Lowercase letters a to z.
- Digits 0 to 9.
- Special characters in Table 1. For more information about special characters, see CLI in *Fundamentals Configuration Guide*.

Table 1 Special Characters

Character name	Symbol	Character name	Symbol
Ampersand sign	&	Apostrophe	'
Asterisk	*	At sign	@
Back quote	`	Back slash	\
Blank space	N/A	Caret	^
Colon	:	Comma	,
Dollar sign	$	Dot	.
Equal sign	=	Exclamation point	!
Left angle bracket	<	Left brace	{
Left bracket	[	Left parenthesis	(
Minus sign	-	Percent sign	%
Plus sign	+	Pound sign	#
Quotation marks	"	Right angle bracket	>
Right brace	}	Right bracket	]
Right parenthesis	)	Semi-colon	;

Character name	Symbol	Character name	Symbol
Slash	/	Tilde	~
Underscore	_	Vertical bar	|

Depending on the system's security requirements, you can set the minimum number of character types a password must contain and the minimum number of characters for each type, as shown in Table 2.

Table 2 Password composition policy

Password combination level	Minimum number of character types	Minimum number of characters for each type
Level 1	One	One
Level 2	Two	One
Level 3	Three	One
Level 4	Four	One

When a user sets or changes a password, the system checks if the password meets the combination requirement. If it does not, the operation fails.

Password complexity checking policy

A less complicated password is more likely to be cracked, such as a password containing the username or repeated characters. For higher security, you can configure a password complexity checking policy to ensure that all user passwords are relatively complicated. When a user configures a password, the system checks the complexity of the password. If the password is complexity-incompliant, the configuration will fail.

You can apply the following password complexity requirements:

- A password cannot contain the username or the reverse of the username. For example, if the username is **abc**, a password such as **abc982** or **2cba** is not complex enough.
- A minimum of three identical consecutive characters is not allowed. For example, password **a111** is not complex enough.

Password updating and expiration

Password updating

This feature allows you to set the minimum interval at which users can change their passwords. A user can only change the password once within the specified interval.

The minimum interval does not apply to the following situations:

- A user is prompted to change the password at first login.
- The password aging time expires.

Password expiration

Password expiration imposes a lifecycle on a user password. After the password expires, the user needs to change the password.

The system displays an error message for a login attempt with an expired password. The user is asked to provide a new password. The new password must be valid, and the user must enter exactly the same password when confirming it.

Web users, Telnet users, SSH users, and console users can change their own passwords. FTP users must have their passwords changed by the administrator.

Early notice on pending password expiration

When a user logs in, the system checks whether the password will expire in a time equal to or less than the specified notification period. If so, the system notifies the user when the password will expire and provides a choice for the user to change the password.

- If the user sets a new valid password, the system records the new password and the setup time.
- If the user does not or fails to change the password, the system allows the user to log in by using the current password until the password expires.

Web users, Telnet users, SSH users, and console users can change their own passwords. FTP users must have their passwords changed by the administrator.

Login with an expired password

You can allow a user to log in a certain number of times within a period of time after the password expires. For example, if you set the maximum number of logins with an expired password to 3 and the time period to 15 days, a user can log in three times within 15 days after the password expires.

Password history

This feature allows the system to store passwords that a user has used.

When a network access user changes the password, the system compares the new password with the current password and those stored in the password history records. The new password must be different from the current one and those stored in the history records by a minimum of four different characters. Otherwise, the system will display an error message, and the new password is not successfully set.

The local passwords and super passwords for device management users are stored in hash form and cannot be converted to plain texts. When a device management user changes a local password or super password, follow these rules:

- If the new password is set by using the hash method, the system will not compare the new password with the current one and those stored in the history password records.
- If the new password in set in plain text, the system compares the new password with the current password and those stored in the password history records. A new password must be different from those stored in the history password records. If the current password is required, the new password must also be different from the current one by a minimum of four different characters. Otherwise, the system will display an error message, and the new password is not successfully set.

You can set the maximum number of history password records for the system to maintain for each user. When the number of history password records exceeds the setting, the most recent record overwrites the earliest one.

Current login passwords are not stored in the password history for device management users. Device management users have their passwords saved in cipher text, which cannot be recovered to plaintext passwords.

User login control

First login

By default, if the global password control feature is enabled, users must change the password at first login before they can access the system. In this situation, password changes are not subject to the minimum password update interval. If it is not necessary for users to change the password at first login, disable the password change at first login feature.

Login attempt limit

Limiting the number of consecutive login failures can effectively prevent password guessing.

Login attempt limit takes effect on FTP, Web, and VTY users. It does not take effect on the following types of users:

- Nonexistent users (users not configured on the device).
- Users logging in to the device through console ports.

If a user fails to log in, the system adds the user account and the user's IP address to the password control blacklist. When the user fails to log in after making the maximum number of consecutive attempts, login attempt limit limits the user and user account in any of the following ways:

- Disables the user account until the account is manually removed from the password control blacklist.
- Allows the user to continue using the user account. The user's IP address and user account are removed from the password control blacklist when the user uses this account to successfully log in to the device.
- Disables the user account for a period of time.

  The user can use the account to log in when either of the following conditions exists:
  - The locking timer expires.
  - The account is manually removed from the password control blacklist before the locking timer expires.

NOTE:

This account is locked only for this user. Other users can still use this account, and the blacklisted user can use other user accounts.

Maximum account idle time

You can set the maximum account idle time for user accounts. When an account is idle for this period of time since the last successful login, the account becomes invalid.

Login control with a weak password

This feature is available only in Release 6318P01 and later.

The system checks for weak passwords for Telnet, SSH, HTTP, or HTTPS device management users. A password is weak if it does not meet the following requirements:

- Password composition restriction.
- Minimum password length restriction.
- Password complexity checking policy.

By default, the system displays a message about a weak password but does not force the user to change it. To improve the device security, you can enable the mandatory weak password change feature, which forces the users to change the identified weak passwords. The users can log in to the device only after their passwords meet the password requirements.

Password not displayed in any form

For security purposes, nothing is displayed when a user enters a password.

Logging

The system generates a log each time a user changes its password successfully or is added to the password control blacklist because of login failures.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

Restrictions and guidelines: Password control configuration

IMPORTANT:

To successfully enable the global password control feature and allow device management users to log in to the device, make sure the device have sufficient storage space.

The password control features can be configured in several different views, and different views support different features. The settings configured in different views or for different objects have the following application ranges:

- Settings for super passwords apply only to super passwords.
- Settings in local user view apply only to the password of the local user.
- Settings in user group view apply to the passwords of the local users in the user group if you do not configure password policies for these users in local user view.
- Global settings in system view apply to the passwords of the local users in all user groups if you do not configure password policies for these users in both local user view and user group view.

For local user passwords, the settings with a smaller application scope have higher priority.

Password control tasks at a glance

To configure password control, perform the following tasks:

1. Enabling password control
2. (Optional.) Setting global password control parameters
3. (Optional.) Setting user group password control parameters
4. (Optional.) Setting local user password control parameters
5. (Optional.) Setting super password control parameters

Enabling password control

About password control

In versions earlier than Release 6318P01:

Enable global password control to make all password control configurations take effect. For a specific password control feature to take effect, enable its own password control feature.

In Release 6318P01 and later versions:

The password expiration feature and the password history management feature take effect only after the global password control feature is also enabled.

Restrictions and guidelines

After global password control is enabled, follow these restrictions and guidelines:

- You cannot display the password and super password configurations for device management users by using the corresponding **display** commands.
- You cannot display the password configuration for network access users by using the corresponding **display** command.
- The passwords configured for local users must contain a minimum of four different characters.
- In FIPS mode, the global password control feature is enabled for device management users and cannot be disabled for them.
- To ensure correct function of password control, configure the device to use NTP to obtain the UTC time. After global password control is enabled, password control will record the UTC time when the password is set. The recorded UTC time might not be consistent with the actual UTC time due to power failure or device reboot. The inconsistency will cause the password expiration feature to malfunction. For information about NTP, see *Network Management and Monitoring Configuration Guide*.
- The device automatically generates a .dat file and saves the file to the storage media. The file is used to record authentication and login information of the local users. Do not manually delete or modify the file.
- The global password control feature enables the system to record history passwords. When the number of history password records of a user reaches the maximum number, the newest history record overwrites the earliest one. To delete the existing history password records, use one of the following methods:
  - Use the **undo password-control enable** command to disable the password control feature globally.
  - Use the **reset password-control history-record** command to clear the passwords manually.

Procedure

1. Enter system view.

   system-view
2. Enable the global password control feature.

   In non-FIPS mode:

   password-control enable [**network-class**]

   By default, the global password control feature is disabled for device management and network access users.

   In FIPS mode:

   password-control enable [**network-class**]

   By default, the global password control feature is enabled for device management users and cannot be disabled. The global password control feature is disabled for network access users.
3. (Optional.) Enable a specific password control feature.

   password-control { **aging** | **composition** | **history** | **length** } **enable**

   By default, all four password control features are enabled.

Setting global password control parameters

Restrictions and guidelines

The global password control parameters in system view apply to all device management and network access local users.

You can configure all password control features for device management users. The password aging time, minimum password length, password complexity policy, password composition policy, and user login attempt limit can be configured in system view, user group view, and local user view.

You can configure only the following password control features for network access users:

- Minimum password length.
- Password complexity policy.
- Password composition policy.
- Minimum password update interval.
- Maximum number of history password records for each user.

Where, the minimum password length, password complexity policy, and password composition policy can be configured in system view, user group view, and local user view.

The password settings with a smaller application scope have higher priority. For local users, password settings configured in local user view have the highest priority, and global settings in system view have the lowest priority.

The **password-control login-attempt** command takes effect immediately and can affect the users already in the password control blacklist. Other password control configurations do not take effect on users that have been logged in or passwords that have been configured.

Procedure

1. Enter system view.

   system-view

2. Configure password settings.
   - Set the minimum password length.

     In non-FIPS mode:

     password-control length *length*

     The default setting is 10 characters.

     In FIPS mode:

     password-control length *length*

     The default length is 15 characters.
   - Configure the password composition policy.

     In non-FIPS mode:

     password-control composition type-number *type-number* [**type-length** *type-length*]

     By default:

     – In versions earlier than Release 6318P01, a password must contain a minimum of one character type and a minimum of one character for each type.

     – In Release 6318P01 and later, a password must contain a minimum of two character types and a minimum of one character for each type.

     In FIPS mode:

     password-control composition type-number *type-number* [**type-length** *type-length*]

     By default, a password must contain a minimum of four character types and a minimum of one character for each type.
   - Configure the password complexity checking policy.

     password-control complexity { **same-character** | **user-name** } **check**

     In versions earlier than Release 6318P01, the system does not perform password complexity checking by default.

     In Release 6318P01 and later, the default settings are as follows:

     – In non-FIPS mode, username checking is enabled and repeated character checking is disabled.

- In FIPS mode, the system does not perform password complexity checking.

- Set the maximum number of history password records for each user.

  password-control history *max-record-number*

  The default setting is 4.

3. Configure password updating and expiration.

- Set the minimum password update interval.

  password-control update interval *interval*

  The default setting is 24 hours.

- Set the password aging time.

  password-control aging *aging-time*

  The default setting is 90 days.

- Set the number of days during which a user is notified of the pending password expiration.

  password-control alert-before-expire *alert-time*

  The default setting is 7 days.

- Set the maximum number of days and maximum number of times that a user can log in after the password expires.

  password-control expired-user-login delay *delay* **times** *times*

  By default, a user can log in three times within 30 days after the password expires.

4. Configure user login control.

- Configure the login attempt limit.

  password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

  By default, the maximum number of login attempts is 3 and a user failing to log in after the specified number of attempts must wait for 1 minute before trying again.

- Set the maximum account idle time.

  password-control login idle-time *idle-time*

  The default setting is 90 days.

  If a user account is idle for this period of time, the account becomes invalid and can no longer be used to log in to the device. To disable the account idle time restriction, set the idle time value to 0.

- Set the user authentication timeout time.

  password-control authentication-timeout *timeout*

  The default setting is 600 seconds.

  This command takes effect only on Telnet and terminal users.

- Disable password change at first login.

  undo password-control change-password first-login enable

  By default, the password change at first login feature is enabled.

  In FIPS mode, the password change at first login feature cannot be disabled.

- Enable mandatory weak password change.

  password-control change-password weak-password enable

  By default, the mandatory weak password change feature is disabled.

  This feature is available only in Release 6318P01 and later.

Setting user group password control parameters

1. Enter system view.

   system-view

2. Create a user group and enter its view.

   user-group *group-name*

   For information about how to configure a user group, see "Configuring AAA."

3. Configure the password aging time for the user group.

   password-control aging *aging-time*

   By default, the password aging time of the user group equals the global password aging time.

4. Configure the minimum password length for the user group.

   password-control length *length*

   By default, the minimum password length of the user group equals the global minimum password length.

5. Configure the password composition policy for the user group.

   password-control composition type-number *type-number* [**type-length** *type-length*]

   By default, the password composition policy of the user group equals the global password composition policy.

6. Configure the password complexity checking policy for the user group.

   password-control complexity { **same-character** | **user-name** } **check**

   By default, the password complexity checking policy of the user group equals the global password complexity checking policy.

7. Configure the login attempt limit.

   password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

   By default, the login-attempt policy of the user group equals the global login-attempt policy.

Setting local user password control parameters

1. Enter system view.

   system-view

2. Create a device management or network access user and enter its view.

   - Create a device management user and enter its view.

     local-user *user-name* **class manage**

   - Create a network access user and enter its view.

     local-user *user-name* **class network**

   For information about local user configuration, see "Configuring AAA."

3. Configure the password aging time for the local user.

   password-control aging *aging-time*

   By default, the setting equals that for the user group to which the local user belongs. If no aging time is configured for the user group, the global setting applies to the local user.

   This command is available only for device management users.

4. Configure the minimum password length for the local user.

   password-control length *length*

By default, the setting equals that for the user group to which the local user belongs. If no minimum password length is configured for the user group, the global setting applies to the local user.

5. Configure the password composition policy for the local user.

   password-control composition type-number *type-number* [**type-length** *type-length*]

   By default, the settings equal those for the user group to which the local user belongs. If no password composition policy is configured for the user group, the global settings apply to the local user.

6. Configure the password complexity checking policy for the local user.

   password-control complexity { **same-character** | **user-name** } **check**

   By default, the settings equal those for the user group to which the local user belongs. If no password complexity checking policy is configured for the user group, the global settings apply to the local user.

7. Configure the login attempt limit.

   password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

   By default, the settings equal those for the user group to which the local user belongs. If no login-attempt policy is configured for the user group, the global settings apply to the local user.

   This command is available only for device management users.

Setting super password control parameters

1. Enter system view.

   system-view

2. Set the password aging time for super passwords.

   password-control super aging *aging-time*

   The default setting is 90 days.

3. Configure the minimum length for super passwords.

   In non-FIPS mode:

   password-control super length *length*

   The default setting is 10 characters.

   In FIPS mode:

   password-control super length *length*

   The default setting is 15 characters.

4. Configure the password composition policy for super passwords.

   In non-FIPS mode:

   password-control super composition type-number *type-number* [**type-length** *type-length*]

   By default:

   - In versions earlier than Release 6318P01, a super password must contain a minimum of one character type and a minimum of one character for each type.
   - In Release 6318P01 and later, a super password must contain a minimum of two character types and a minimum of one character for each type.

   In FIPS mode:

   password-control super composition type-number *type-number* [**type-length** *type-length*]

By default, a super password must contain a minimum of four character types and a minimum of one character for each type.

Display and maintenance commands for password control

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display password control configuration.	**display password-control** [**super**]
Display information about users in the password control blacklist.	**display password-control blacklist** [**user-name** *user-name* | **ip** *ipv4-address* | **ipv6** *ipv6-address*]
Delete users from the password control blacklist.	**reset password-control blacklist** [**user-name** *user-name*]
Clear history password records.	**reset password-control history-record** [**user-name** *user-name* | **super** [**role** *role-name*] | **network-class** [**user-name** *user-name*]]

NOTE:

The **reset password-control history-record** command can delete the history password records of one or all users even when the password history management feature is disabled.

Password control configuration examples

Example: Configuring password control

Network configuration

Configure a global password control policy to meet the following requirements:

- A password must contain a minimum of 16 characters.
- A password must contain a minimum of four character types and a minimum of four characters for each type.
- An FTP or VTY user failing to provide the correct password in two successive login attempts is permanently prohibited from logging in.
- A user can log in five times within 60 days after the password expires.
- A password expires after 30 days.
- The minimum password update interval is 36 hours.
- The maximum account idle time is 30 days.
- A password cannot contain the username or the reverse of the username.
- A minimum of three identical consecutive characters is not allowed in a password.

Configure a super password control policy for user role **network-operator** to meet the following requirements:

- A super password must contain a minimum of 24 characters.

- A super password must contain a minimum of four character types and a minimum of five characters for each type.

Configure a password control policy for local Telnet user **test** to meet the following requirements:

- The password must contain a minimum of 24 characters.
- The password must contain a minimum of four character types and a minimum of five characters for each type.
- The password for the local user expires after 20 days.

Procedure

Enable the password control feature globally.

```
<Sysname> system-view
[Sysname] password-control enable
```

Disable a user account permanently if a user fails two consecutive login attempts on the user account.

```
[Sysname] password-control login-attempt 2 exceed lock
```

Set all passwords to expire after 30 days.

```
[Sysname] password-control aging 30
```

Globally set the minimum password length to 16 characters.

```
[Sysname] password-control length 16
```

Set the minimum password update interval to 36 hours.

```
[Sysname] password-control update-interval 36
```

Specify that a user can log in five times within 60 days after the password expires.

```
[Sysname] password-control expired-user-login delay 60 times 5
```

Set the maximum account idle time to 30 days.

```
[Sysname] password-control login idle-time 30
```

Refuse any password that contains the username or the reverse of the username.

```
[Sysname] password-control complexity user-name check
```

Refuse a password that contains a minimum of three identical consecutive characters.

```
[Sysname] password-control complexity same-character check
```

Globally specify that all passwords must each contain a minimum of four character types and a minimum of four characters for each type.

```
[Sysname] password-control composition type-number 4 type-length 4
```

Set the minimum super password length to 24 characters.

```
[Sysname] password-control super length 24
```

Specify that a super password must contain a minimum of four character types and a minimum of five characters for each type.

```
[Sysname] password-control super composition type-number 4 type-length 5
```

Configure a super password used for switching to user role **network-operator** as **123456789ABGFTweuix@#$%!** in plain text.

```
[Sysname] super password role network-operator simple 123456789ABGFTweuix@#$%!
```

Create a device management user named **test**.

```
[Sysname] local-user test class manage
```

Set the service type of the user to **Telnet**.

```
[Sysname-luser-manage-test] service-type telnet
```

Set the minimum password length to 24 for the local user.

```
[Sysname-luser-manage-test] password-control length 24
```

Specify that the password of the local user must contain a minimum of four character types and a minimum of five characters for each type.

```
[Sysname-luser-manage-test] password-control composition type-number 4 type-length 5
```

Set the password for the local user to expire after 20 days.

```
[Sysname-luser-manage-test] password-control aging 20
```

Configure the password of the local user in interactive mode.

```
[Sysname-luser-manage-test] password
Password:
Confirm :
Updating user information. Please wait ... ...
[Sysname-luser-manage-test] quit
```

Verifying the configuration

Display the global password control configuration.

```
<Sysname> display password-control
 Global password control configurations:
 Password control:                    Enabled(device management users)
                                      Disabled (network access users)
 Password aging:                      Enabled (30 days)
 Password length:                     Enabled (16 characters)
 Password composition:                Enabled (4 types, 4 characters per type)
 Password history:                    Enabled (max history record:4)
 Early notice on password expiration:  7 days
 Maximum login attempts:              2
 User authentication timeout:         600 seconds
 Action for exceeding login attempts:  Lock
 Minimum interval between two updates: 36 hours
 User account idle time:              30 days
 Logins with aged password:           5 times in 60 days
 Password complexity:                 Enabled (username checking)
                                      Enabled (repeated characters checking)
 Password change:                     Enabled (first login)
                                      Disabled (mandatory weak password change)
```

Display the password control configuration for super passwords.

```
<Sysname> display password-control super
 Super password control configurations:
 Password aging:                      Enabled (90 days)
 Password length:                     Enabled (24 characters)
 Password composition:                Enabled (4 types, 5 characters per type)
```

Display the password control configuration for local user **test**.

```
<Sysname> display local-user user-name test class manage
Total 1 local users matched.

Device management user test:
  State:                    Active
  Service type:             Telnet
```

```
User group:                system
Bind attributes:
Authorization attributes:
  Work directory:          flash:
  User role list:          network-operator
Password control configurations:
  Password aging:          20 days
  Password length:         24 characters
  Password composition:    4 types, 5 characters per type

Managing public keys

About public key management

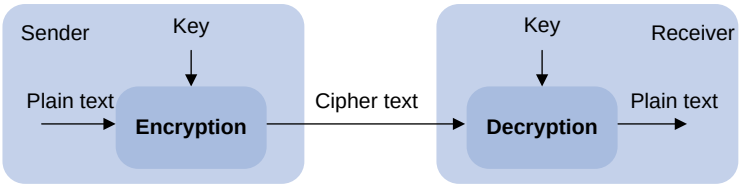
This chapter describes public key management for the following asymmetric key algorithms:

- Revest-Shamir-Adleman Algorithm (RSA).
- Digital Signature Algorithm (DSA).
- Elliptic Curve Digital Signature Algorithm (ECDSA).

Asymmetric key algorithm overview

Asymmetric key algorithms are used by security applications to secure communications between two parties, as shown in Figure 1. Asymmetric key algorithms use two separate keys (one public and one private) for encryption and decryption. Symmetric key algorithms use only one key.

Figure 1 Encryption and decryption



A key owner can distribute the public key in plain text on the network but must keep the private key in privacy. It is mathematically infeasible to calculate the private key even if an attacker knows the algorithm and the public key.

Usage of asymmetric key algorithms

Security applications (such as SSH, SSL, and PKI) use the asymmetric key algorithms for the following purposes:

- **Encryption and decryption**—Any public key receiver can use the public key to encrypt information, but only the private key owner can decrypt the information.
- **Digital signature**—The key owner uses the private key to digitally sign information to be sent. The receiver decrypts the information with the sender's public key to verify information authenticity.

RSA, DSA, and ECDSA can all perform digital signature, but only RSA can perform encryption and decryption.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

Public key management tasks at a glance

To manage public keys, perform the following tasks:

1. Creating a local key pair
2. Distributing a local host public key

   Choose one of the following tasks:

   - Exporting a host public key
   - Displaying a host public key

   To enable the peer device to authenticate the local device, you must distribute the local device's public key to the peer device.
3. Configuring a peer host public key

   Choose one of the following tasks:

   - Importing a peer host public key from a public key file
   - Entering a peer host public key

   To encrypt information sent to a peer device or authenticate the digital signature of the peer device, you must configure the peer device's public key on the local device.
4. (Optional.) Destroying a local key pair

Creating a local key pair

Restrictions and guidelines

When you create a local key pair, follow these guidelines:

- The key algorithm must be the same as required by the security application.
- When you create an RSA or DSA key pair, enter an appropriate key modulus length at the prompt. The longer the key modulus length, the higher the security, and the longer the key generation time.

  When you create an ECDSA key pair, choose the appropriate elliptic curve. The elliptic curve determines the ECDSA key length. The longer the key length, the higher the security, and the longer the key generation time.

  See Table 1 for more information about key modulus lengths and key lengths.
- If you do not assign the key pair a name, the system assigns the default name to the key pair and marks the key pair as **default**. You can also assign the default name to another key pair, but the system does not mark the key pair as **default**. The key pair name must be unique among all manually named key pairs that use the same key algorithm. If a name conflict occurs, the system asks whether you want to overwrite the existing key pair.
- The key pairs are automatically saved and can survive system reboots.

Table 1 A comparison of different types of asymmetric key algorithms

Type	Generated key pairs	Modulus/key length

RSA	• In non-FIPS mode:
	  ◦ One host key pair, if you specify a key pair name.
	  ◦ One server key pair and one host key pair, if you do not specify a key pair name.
	  Both key pairs use their default names.
	• In FIPS mode: One host key pair.
	NOTE:
	Only SSH 1.5 uses the RSA server key pair.
		RSA key modulus length:
		• In non-FIPS mode: 512 to 4096 bits, 1024 bits by default.
		To ensure security, use a minimum of 768 bits.
		• In FIPS mode: A multiple of 256 bits in the range of 2048 to 4096 bits, 2048 bits by default.

Type	Generated key pairs	Modulus/key length
DSA	One host key pair.	DSA key modulus length: • In non-FIPS mode: 512 to 2048 bits, 1024 bits by default. To ensure security, use a minimum of 768 bits. • In FIPS mode: 2048 bits.
ECDSA	One host key pair.	ECDSA key length: • In non-FIPS mode: 192, 256, 384, or 521 bits. • In FIPS mode: 256, 384, or 521 bits.

Procedure

1. Enter system view.

   system-view
2. Create a local key pair.

   In non-FIPS mode:

   public-key local create { **dsa** | **ecdsa** [**secp192r1** | **secp256r1** | **secp384r1** | **secp521r1**] | **rsa** } [**name** *key-name*]

   In FIPS mode:

   public-key local create { **dsa** | **ecdsa** [**secp256r1** | **secp384r1** | **secp521r1**] | **rsa** } [**name** *key-name*]

Distributing a local host public key

About distribution of local host public keys

You must distribute a local host public key to a peer device so the peer device can perform the following operations:

- Use the public key to encrypt information sent to the local device.
- Authenticate the digital signature signed by the local device.

To distribute a local host public key, you must first export or display the key.

- Export a host public key:
  - Export a host public key to a file.
  - Export a host public key to the monitor screen, and then save it to a file.

  After the key is exported to a file, transfer the file to the peer device. On the peer device, import the key from the file.
- Display a host public key.

  After the key is displayed, record the key, for example, copy it to an unformatted file. On the peer device, you must literally enter the key.

Exporting a host public key

Restrictions and guidelines

When you export a host public key, follow these restrictions and guidelines:

- If you specify a file name in the command, the command exports the key to the specified file.

- If you do not specify a file name, the command exports the key to the monitor screen. You must manually save the exported key to a file.

Procedure

1. Enter system view.

   system-view

2. Export a local host public key.
   - Export an RSA host public key:

     In non-FIPS mode:

     public-key local export rsa [**name** *key-name*] { **openssh** | **ssh1** | **ssh2** } [*filename*]

     In FIPS mode:

     public-key local export rsa [**name** *key-name*] { **openssh** | **ssh2** } [*filename*]
   - Export an ECDSA host public key.

     public-key local export ecdsa [**name** *key-name*] { **openssh** | **ssh2** } [*filename*]
   - Export a DSA host public key.

     public-key local export dsa [**name** *key-name*] { **openssh** | **ssh2** } [*filename*]

Displaying a host public key

Perform the following tasks in any view:

- Display local RSA public keys.

  display public-key local rsa public [**name** *key-name*]

  Do not distribute the RSA server public key **serverkey (default)** to a peer device.
- Display local ECDSA public keys.

  display public-key local ecdsa public [**name** *key-name*]
- Display local DSA public keys.

  display public-key local dsa public [**name** *key-name*]

Configuring a peer host public key

About peer host public key configuration

To encrypt information sent to a peer device or authenticate the digital signature of the peer device, you must configure the peer device's public key on the local device.

You can configure the peer host public key by using the following methods:

- Import the peer host public key from a public key file (recommended).
- Manually enter (type or copy) the peer host public key.

For information about how to obtain the host public key of a device, see "Distributing a local host public key."

Restrictions and guidelines for peer host public key configuration

When you configure a peer host public key, follow these restrictions and guidelines:

- When you manually enter the peer host public key, make sure the entered key is in the correct format. To obtain the peer host public key in the correct format, use the **display public-key local public** command to display the public key on the peer device and record the key. The format of the public key displayed in any other way might be incorrect. If the key is not in the correct format, the system discards the key and displays an error message.
- Always import rather than enter the peer host public key if you are not sure whether the device supports the format of the recorded peer host public key.

Importing a peer host public key from a public key file

About importing a peer host public key

Before you perform this task, make sure you have exported the host public key to a file on the peer device and obtained the file from the peer device. For information about exporting a host public key, see "Exporting a host public key."

After you import the key, the system automatically converts the imported public key to a string in the Public Key Cryptography Standards (PKCS) format.

Procedure

1. Enter system view.

   system-view
2. Import a peer host public key from a public key file.

   public-key peer *keyname* **import sshkey** *filename*

   By default, no peer host public keys exist.

Entering a peer host public key

About entering a peer host public key

Before you perform this task, make sure you have displayed the key on the peer device and recorded the key. For information about displaying a host public key, see "Displaying a host public key."

Procedure

1. Enter system view.

   system-view
2. Specify a name for the peer host public key and enter public key view.

   public-key peer *keyname*
3. Type or copy the key.

   You can use spaces and carriage returns, but the system does not save them.
4. Exit public key view.

   peer-public-key end

   When you exit public key view, the system automatically saves the peer host public key.

Destroying a local key pair

About destroying a local key pair

To ensure security, destroy the local key pair and generate a new key pair in any of the following situations:

- The local key has leaked. An intrusion event might occur.
- The storage media of the device is replaced.
- The local certificate has expired. For more information about local certificates, see "Configuring PKI."

Procedure

1. Enter system view.
   system-view
2. Destroy a local key pair.
   public-key local destroy { **dsa** | **ecdsa** | **rsa** } [**name** *key-name*]

Display and maintenance commands for public keys

Execute **display** commands in any view.

Task	Command
Display local public keys.	**display public-key local** { **dsa** | **ecdsa** | **rsa** } **public** [**name** *key-name*]
Display peer host public keys.	**display public-key peer** [**brief** | **name** *publickey-name*]

Examples of public key management

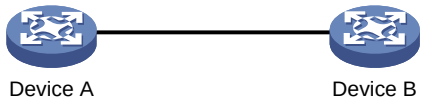
Example: Entering a peer host public key

Network configuration

As shown in Figure 2, to prevent illegal access, Device B authenticates Device A through a digital signature. Before configuring authentication parameters on Device B, use the following procedure to configure the public key of Device A on Device B:

- Create RSA key pairs on Device A and display the public keys of the RSA key pairs.
- Manually specify the RSA host public key of Device A on Device B.

Figure 2 Network diagram



Procedure

1. Configure Device A:

Create local RSA key pairs with the default names on Device A, and use the default key modulus length (1024 bits).

```
<DeviceA> system-view
[DeviceA] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.
```

Display all local RSA public keys.

```
[DeviceA] display public-key local rsa public
=========================================

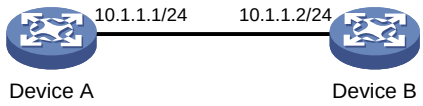
Example: Importing a public key from a public key file

Network configuration

As shown in Figure 3, Device B authenticates Device A through a digital signature. Before configuring authentication parameters on Device B, use the following procedure to configure the public key of Device A on Device B:

- Create RSA key pairs on Device A and export the RSA host public key to a file.
- Import the RSA host public key of Device A from the public key file to Device B.

Figure 3 Network diagram



Procedure

1. Configure Device A:

   # Create local RSA key pairs with the default names on Device A, and use the default key modulus length (1024 bits).

   ```
   <DeviceA> system-view
   [DeviceA] public-key local create rsa
   The range of public key modulus is (512 ~ 4096).
   If the key modulus is greater than 512, it will take a few minutes.
   Press CTRL+C to abort.
   Input the modulus length [default = 1024]:
   Generating Keys...
   ...
   Create the key pair successfully.
   ```

   AC41C80A15953FB22AA30203010001
```

Export the RSA host public key to file **devicea.pub**.

```
[DeviceA] public-key local export rsa ssh2 devicea.pub
```

Enable the FTP server, create an FTP user with username **ftp** and password **hello12345**, and configure the FTP user role as **network-admin**.

```
[DeviceA] ftp server enable
[DeviceA] local-user ftp
[DeviceA-luser-manage-ftp] password simple hello12345
[DeviceA-luser-manage-ftp] service-type ftp
[DeviceA-luser-manage-ftp] authorization-attribute user-role network-admin
[DeviceA-luser-manage-ftp] quit
```

2. Configure Device B:

Use FTP in binary mode to get public key file **devicea.pub** from Device A.

```
<DeviceB> ftp 10.1.1.1
Connected to 10.1.1.1 (10.1.1.1).
220 FTP service ready.
User(10.1.1.1:(none)):ftp
331 Password required for ftp.
Password:
230 User logged in.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> binary
200 TYPE is now 8-bit binary
ftp> get devicea.pub
227 Entering Passive Mode (10,1,1,1,118,252)
150 Accepted data connection
226 File successfully transferred
301 bytes received in 0.003 seconds (98.0 kbyte/s)
ftp> quit
221-Goodbye. You uploaded 0 and downloaded 1 kbytes.
```

```
221 Logout.
```

Import the host public key from key file **devicea.pub**.

```
<DeviceB> system-view
[DeviceB] public-key peer devicea import sshkey devicea.pub
```

Verifying the configuration

Verify that the peer host public key configured on Device B is the same as the key displayed on Device A.

```
[DeviceB] display public-key peer name devicea
=========================================

Configuring PKI

About PKI

Public Key Infrastructure (PKI) is an asymmetric key infrastructure to encrypt and decrypt data for securing network services.

PKI uses digital certificates to distribute and employ public keys, and provides network communication and e-commerce with security services such as user authentication, data confidentiality, and data integrity. For more information about public keys, see "Managing public keys."

PKI terminology

Digital certificate

A digital certificate is an electronic document signed by a CA that binds a public key with the identity of its owner.

A digital certificate includes the following information:

- Issuer name (name of the CA that issued the certificate).
- Subject name (name of the individual or group to which the certificate is issued).
- Identity information of the subject.
- Subject's public key.
- Signature of the CA.
- Validity period.

A digital certificate must comply with the international standards of ITU-T X.509, of which X.509 v3 is the most commonly used.

This chapter covers the following types of certificates:

- **CA certificate**—Certificate of a CA. Multiple CAs in a PKI system form a CA tree, with the root CA at the top. The root CA generates a self-signed certificate, and each lower level CA holds a CA certificate issued by the CA immediately above it. The chain of these certificates forms a chain of trust.
- **Registration authority (RA) certificate**—Certificate issued by a CA to an RA. RAs act as proxies for CAs to process enrollment requests in a PKI system.
- **Local certificate**—Digital certificate issued by a CA to a local PKI entity, which contains the entity's public key.
- **Peer certificate**—CA-signed digital certificate of a peer, which contains the peer's public key.

Fingerprint of root CA certificate

Each root CA certificate has a unique fingerprint, which is the hash value of the certificate content. The fingerprint of a root CA certificate can be used to authenticate the validity of the root CA.

Certificate revocation list

A certificate revocation list (CRL) is a list of serial numbers for certificates that have been revoked. A CRL is created and signed by the CA that originally issued the certificates.

The CA publishes CRLs periodically to revoke certificates. Entities that are associated with the revoked certificates should not be trusted.

The CA must revoke a certificate when any of the following conditions occurs:

- The certificate subject name is changed.
- The private key is compromised.
- The association between the subject and CA is changed. For example, when an employee terminates employment with an organization.

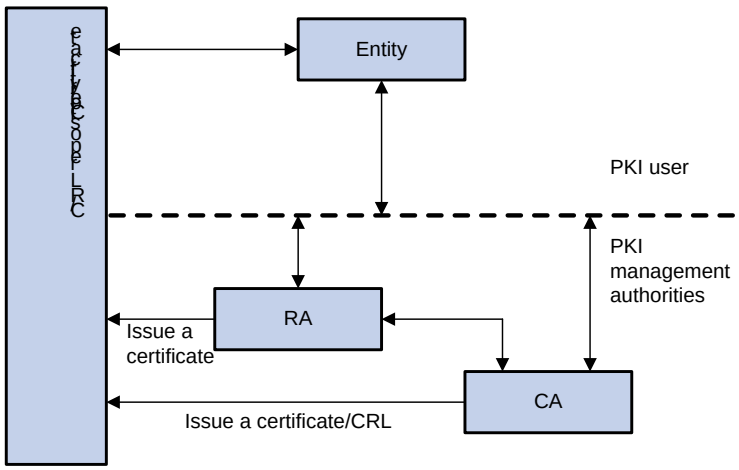
CA policy

A CA policy is a set of criteria that a CA follows to process certificate requests, to issue and revoke certificates, and to publish CRLs. Typically, a CA advertises its policy in a certification practice statement (CPS). You can obtain a CA policy through out-of-band means such as phone, disk, and email. Make sure you understand the CA policy before you select a trusted CA for certificate request because different CAs might use different policies.

PKI architecture

A PKI system consists of PKI entities, CAs, RAs and a certificate/CRL repository, as shown in Figure 1.

Figure 1 PKI architecture



PKI entity

A PKI entity is an end user using PKI certificates. The PKI entity can be an operator, an organization, a device like a router or a switch, or a process running on a computer. PKI entities use SCEP to communicate with the CA or RA.

CA

Certification authority that grants and manages certificates. A CA issues certificates, defines the certificate validity periods, and revokes certificates by publishing CRLs.

RA

Registration authority, which offloads the CA by processing certificate enrollment requests. The RA accepts certificate requests, verifies user identity, and determines whether to ask the CA to issue certificates.

The RA is optional in a PKI system. In cases when there is security concern over exposing the CA to direct network access, it is advisable to delegate some of the tasks to an RA. Then, the CA can concentrate on its primary tasks of signing certificates and CRLs.

Certificate/CRL repository

A certificate distribution point that stores certificates and CRLs, and distributes these certificates and CRLs to PKI entities. It also provides the query function. A PKI repository can be a directory server using the LDAP or HTTP protocol, of which LDAP is commonly used.

Retrieval, usage, and maintenance of a digital certificate

The following workflow describes the retrieval, usage, and maintenance of a digital certificate. This example uses a CA which has an RA to process certificate enrollment requests.

1. A PKI entity generates an asymmetric key pair and submits a certificate request to the RA.

   The certificate request contains the public key and its identity information.
2. The RA verifies the identity of the entity and sends a digital signature containing the identity information and the public key to the CA.
3. The CA verifies the digital signature, approves the request, and issues a certificate.
4. After receiving the certificate from the CA, the RA sends the certificate to the certificate repository and notifies the PKI entity that the certificate has been issued.
5. The PKI entity obtains the certificate from the certificate repository.
6. To establish a secure connection for communication, two PKI entities exchange local certificates to authenticate each other. The connection can be established only if both entities verify that the peer's certificate is valid.
7. You can remove the local certificate of a PKI entity and request a new one when any of the following conditions occur:
   - The local certificate is about to expire.
   - The certificate's private key is compromised.

PKI applications

The PKI technology can meet security requirements of online transactions. As an infrastructure, PKI has a wide range of applications. H3C's PKI system can provide certificate management for IPsec and SSL.

The following are some application examples.

VPN

A VPN is a private data communication network built on the public communication infrastructure. A VPN can use network layer security protocols (for example, IPsec) in conjunction with PKI-based encryption and digital signature technologies for confidentiality.

Secure emails

PKI can address the email requirements for confidentiality, integrity, authentication, and non-repudiation. A common secure email protocol is Secure/Multipurpose Internet Mail Extensions (S/MIME), which is based on PKI and allows for transfer of encrypted mails with signature.

Web security

PKI can be used in the SSL handshake phase to verify the identities of the communicating parties by digital certificates.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

PKI tasks at a glance

To configure PKI, perform the following tasks:

1. Configuring a PKI entity
2. Configuring a PKI domain
3. (Optional.) Specifying the storage path for certificates and CRLs
4. Requesting a certificate

   Choose one of the following tasks:
   - Enabling the automatic online certificate request mode
   - Manually submitting an online certificate request
   - Manually submitting a certificate request in offline mode
5. (Optional.) Aborting a certificate request
6. (Optional.) Obtaining certificates

   You can obtain the CA certificate, local certificates, and peer certificates related to a PKI domain from a CA and save them locally for higher lookup efficiency.
7. (Optional.) Verifying PKI certificates
8. (Optional.) Exporting certificates
9. (Optional.) Removing a certificate
10. (Optional.) Configuring a certificate-based access control policy

    Certificate-based access control policies allow you to authorize access to a device (for example, an HTTPS server) based on the attributes of an authenticated client's certificate.

Configuring a PKI entity

About PKI entities

A certificate applicant uses an entity to provide its identity information to a CA. A valid PKI entity must include one or more of following identity categories:

- Distinguished name (DN) of the entity, which further includes the common name, country code, locality, organization, unit in the organization, and state. If you configure the DN for an entity, a common name is required.
- FQDN of the entity.
- IP address of the entity.

Restrictions and guidelines

Follow these restrictions and guidelines when you configure a PKI entity:

- Whether the identity categories are required or optional depends on the CA policy. Follow the CA policy to configure the entity settings. For example, if the CA policy requires the entity DN, but you configure only the IP address, the CA rejects the certificate request from the entity.
- The SCEP add-on on the Windows 2000 CA server has restrictions on the data length of a certificate request. If a request from a PKI entity exceeds the data length limit, the CA server does not respond to the certificate request. In this case, you can use an out-of-band means to submit the request. Other types of CA servers, such as RSA servers and OpenCA servers, do not have such restrictions.

Procedure

1. Enter system view.

   `system-view`
2. Create a PKI entity and enter its view.

   `pki entity` *`entity-name`*
3. Set a common name for the entity.

   `common-name` *`common-name-sting`*

By default, the common name is not set.

4. Set the country code of the entity.
   country *country-code-string*
   By default, the country code is not set.
5. Set the locality of the entity.
   locality *locality-name*
   By default, the locality is not set.
6. Set the organization of the entity.
   organization *org-name*
   By default, the organization is not set.
7. Set the unit of the entity in the organization.
   organization-unit *org-unit-name*
   By default, the unit is not set.
8. Set the state where the entity resides.
   state *state-name*
   By default, the state is not set.
9. Set the FQDN of the entity.
   fqdn *fqdn-name-string*
   By default, the FQDN is not set.
10. Configure the IP address of the entity.
    ip { *ip-address* | **interface** *interface-type interface-number* }
    By default, the IP address is not configured.

Configuring a PKI domain

About PKI domain

A PKI domain contains enrollment information for a PKI entity. It is locally significant and is intended only for use by other applications like IKE and SSL.

PKI domain tasks at a glance

To configure a PKI domain, perform the following tasks:

1. Creating a PKI domain
2. Specifying the trusted CA
3. Specifying the PKI entity name
4. Specifying the certificate request reception authority
5. Specifying the certificate request URL
6. (Optional.) Setting the SCEP polling interval and maximum polling attempts
7. Specifying the LDAP server

   This task is required when either of the following conditions is met:

   - The device must obtain certificates from the CA by using the LDAP protocol.
   - An LDAP URL which does not contain the host name of the LDAP server is specified as the CRL repository URL.
8. Specifying the fingerprint for root CA certificate verification

This step is required if the auto certificate request mode is configured in the PKI domain.

If the manual certificate request mode is configured, you can skip this step and manually verify the fingerprint displayed during verification of the root CA certificate.

9. Specifying the key pair for certificate request
10. (Optional.) Specifying the intended purpose for the certificate
11. (Optional.) Specifying the source IP address for PKI protocol packets

Creating a PKI domain

1. Enter system view.
   system-view
2. Create a PKI domain and enter its view.
   pki domain *domain-name*

Specifying the trusted CA

About specifying the trusted CA

The PKI domain must have a CA certificate before you can request a local certificate. To obtain a CA certificate, the trusted CA name must be specified. The trusted CA name uniquely identifies the CA to be used if multiple CAs exist on the CA server.

Procedure

1. Enter system view.
   system-view
2. Enter PKI domain view.
   pki domain *domain-name*
3. Specify the trusted CA name.
   ca identifier *name*

   By default, no trusted CA name is specified.

Specifying the PKI entity name

1. Enter system view.
   system-view
2. Enter PKI domain view.
   pki domain *domain-name*
3. Specify the PKI entity name.
   certificate request entity *entity-name*

   By default, no PKI entity name is specified.

Specifying the certificate request reception authority

1. Enter system view.
   system-view
2. Enter PKI domain view.
   pki domain *domain-name*
3. Specify the certificate request reception authority.

certificate request from { **ca** | **ra** }

By default, no certificate request reception authority is specified.

Specifying the certificate request URL

1. Enter system view.

   system-view
2. Enter PKI domain view.

   pki domain *domain-name*
3. Specify the URL of the certificate request reception authority to which the device sends certificate requests.

   certificate request url *url-string*

   By default, the certificate request URL is not specified.

Setting the SCEP polling interval and maximum polling attempts

1. Enter system view.

   system-view
2. Enter PKI domain view.

   pki domain *domain-name*
3. Set the SCEP polling interval and maximum number of polling attempts.

   certificate request polling { **count** *count* | **interval** *interval* }

   By default, the device polls the CA server for the certificate request status every 20 minutes. The maximum number of polling attempts is 50.

Specifying the LDAP server

1. Enter system view.

   system-view
2. Enter PKI domain view.

   pki domain *domain-name*
3. Specify the LDAP server.

   ldap-server host *hostname* [**port** *port-number*]

   By default, no LDAP server is specified.

Specifying the fingerprint for root CA certificate verification

1. Enter system view.

   system-view
2. Enter PKI domain view.

   pki domain *domain-name*
3. Configure the fingerprint for verifying the root CA certificate.

   In non-FIPS mode:

   root-certificate fingerprint { **md5** | **sha1** } *string*

   In FIPS mode:

root-certificate fingerprint sha1 *string*

By default, no fingerprint is configured.

Specifying the key pair for certificate request

Restrictions and guidelines

You can specify a nonexistent key pair for certificate request. The PKI entity automatically creates the key pair before submitting a certificate request.

Procedure

1. Enter system view.

   system-view

2. Enter PKI domain view.

   pki domain *domain-name*

3. Specify the key pair for certificate request.
   - Specify an RSA key pair.

     public-key rsa { { **encryption name** *encryption-key-name* [**length** *key-length*] | **signature name** *signature-key-name* [**length** *key-length*] } * | **general name** *key-name* [**length** *key-length*] }
   - Specify an ECDSA key pair.

     In non-FIPS mode:

     public-key ecdsa name *key-name* [**secp192r1** | **secp256r1** | **secp384r1** | **secp521r1**]

     In FIPS mode:

     public-key ecdsa name *key-name* [**secp256r1** | **secp384r1** | **secp521r1**]
   - Specify a DSA key pair.

     public-key dsa name *key-name* [**length** *key-length*]

   By default, no key pair is specified.

Specifying the intended purpose for the certificate

About specifying the intended purpose for a certificate

An issued certificate contains the extensions which restrict the usage of the certificate to specific purposes. You can specify the intended purposes for a certificate, which will be included in the certificate request sent to the CA. However, the actual extensions contained in an issued certificate depend on the CA policy, and they might be different from those specified in the PKI domain. Whether an application will use the certificate during authentication depends on the application's policy.

Supported certificate extensions include:

- **ike**—Certificates carrying this extension can be used by IKE peers.
- **ssl-client**—Certificates carrying this extension can be used by SSL clients.
- **ssl-server**—Certificates carrying this extension can be used by SSL servers.

Procedure

1. Enter system view.

   system-view

2. Enter PKI domain view.

pki domain *domain-name*

3. Specify the intended use for the certificate.

   usage { **ike** | **ssl-client** | **ssl-server** } *

   By default, the certificate can be used by all supported applications, including IKE, SSL client, and SSL server.

Specifying the source IP address for PKI protocol packets

About specifying the source IP address for PKI protocol packets

This task is required if the CA policy requires that the CA server accept certificate requests from a specific IP address or subnet.

Procedure

1. Enter system view.

   system-view

2. Enter PKI domain view.

   pki domain *domain-name*

3. Specify a source IP address for the PKI protocol packets.

   IPv4:

   source ip { *ip-address* | **interface** *interface-type interface-number* }

   IPv6:

   source ipv6 { *ipv6-address* | **interface** *interface-type interface-number* }

   By default, the source IP address of PKI protocol packets is the IP address of their outgoing interface.

Specifying the storage path for certificates and CRLs

About specifying the storage path for certificates and CRLs

The device has a default storage path for certificates and CRLs. You can change the storage path and specify different paths for the certificates and CRLs.

After you change the storage path for certificates or CRLs, the certificate files and CRL files in the original path are moved to the new path. Certificate files use the .cer or .p12 file extension and CRL files use the .crl file extension.

Restrictions and guidelines

If you change the storage path, save the configuration before you reboot or shut down the device to avoid loss of certificates or CRLs.

Procedure

1. Enter system view.

   system-view

2. Specify the storage path for certificates and CRLs.

   pki storage { **certificates** | **crls** } *dir-path*

   By default, the device stores certificates and CRLs in the PKI directory on the storage media of the device.

Requesting a certificate

About certificate request configuration

To request a certificate, a PKI entity must provide its identity information and public key to a CA.

A certificate request can be submitted to a CA in offline or online mode.

- **Offline mode**—A certificate request is submitted by using an out-of-band method, such as phone, disk, or email.
- **Online mode**—A certificate request can be automatically or manually submitted to a CA through the Simple Certificate Enrollment Protocol (SCEP).

Restrictions and guidelines for certificate request configuration

When you request a local certificate in a PKI domain, follow these restrictions and guidelines:

- To prevent an existing local certificate from becoming invalid, do not perform the following tasks:
  - Create a key pair with the same name as the key pair contained in the certificate.

    To create a key pair, use the **`public-key local create`** command.
  - Destroy the key pair contained in the certificate.

    To destroy a key pair, use the **`public-key local destroy`** command.
- To manually request a new certificate in a PKI domain that already has a local certificate, use the following procedure:
  a. Use the **`pki delete-certificate`** command to delete the existing local certificate.
  b. Use the **`public-key local create`** command to generate a new key pair.
  c. Manually submit a certificate request.
- A PKI domain can have local certificates using only one type of cryptographic algorithms (DSA, ECDSA, or RSA). If DSA or ECDSA is used, a PKI domain can have only one local certificate. If RSA is used, a PKI domain can have one local certificate for signature, and one local certificate for encryption.

Prerequisites for certificate request configuration

Make sure the device is time synchronized with the CA server. If the device is not time synchronized with the CA server, the certificate request might fail because the certificate might be considered to be outside of the validity period. For information about configuring the system time, see *Fundamentals Configuration Guide*.

Enabling the automatic online certificate request mode

About automatic online certificate request mode

In auto request mode, a PKI entity with no local certificates automatically submits a certificate request to the CA when an application works with the PKI entity. For example, when IKE negotiation uses a digital signature for identity authentication, but no local certificate is available, the entity automatically submits a certificate request. It saves the certificate locally after obtaining the certificate from the CA.

A CA certificate must be present before you request a local certificate. If no CA certificate exists in the PKI domain, the PKI entity automatically obtains a CA certificate before sending a certificate request.

Restrictions and guidelines

In auto request mode, the device does not automatically request a new certificate if the current certificate is about to expire or has expired, which might cause service interruptions.

Procedure

1. Enter system view.
   system-view
2. Enter PKI domain view.
   pki domain *domain-name*
3. Enable the automatic online certificate request mode.
   certificate request mode auto [**password** { **cipher** | **simple** } *string*]
   By default, the manual request mode applies.
   If the CA policy requires a password for certificate revocation, specify the password in this command.

Manually submitting an online certificate request

About manual online certificate request mode

In manual request mode, you must execute the **pki request-certificate domain** command to request a local certificate in a PKI domain. The certificate will be saved in the domain after it is obtained from the CA.

Procedure

1. Enter system view.
   system-view
2. Enter PKI domain view.
   pki domain *domain-name*
3. Set the certificate request mode to manual.
   certificate request mode manual
   By default, the manual request mode applies.
4. Return to system view.
   quit
5. Obtain a CA certificate.
   See "Obtaining certificates."
   This step is required if the PKI domain does not have a CA certificate. The CA certificate is used to verify the authenticity and validity of the obtained local certificate.
6. Manually submit an SCEP certificate request.
   pki request-certificate domain *domain-name* [**password** *password*]
   This command is not saved in the configuration file.
   If the CA policy requires a password for certificate revocation, specify the password in this command.

Manually submitting a certificate request in offline mode

About certificate request submission in offline mode

Use this method if the CA does not support SCEP or if a network connection between the device and CA is not possible.

Procedure

1. Enter system view.

   system-view
2. Enter PKI domain view.

   pki domain *domain-name*
3. Set the certificate request mode to manual.

   certificate request mode manual

   By default, the manual request mode applies.
4. Return to system view.

   quit
5. Obtain the CA certificate.

   See "Obtaining certificates."

   This step is required if the PKI domain does not have a CA certificate. The CA certificate is used to verify the authenticity and validity of the obtained local certificate.
6. Print the certificate request in PKCS10 format on the terminal or save the certificate request to a PKCS10 file.

   pki request-certificate domain *domain-name* **pkcs10** [**filename** *filename*]

   This command is not saved in the configuration file.
7. Transfer certificate request information to the CA by using an out-of-band method.
8. Transfer the issued local certificate from the CA to the local device by using an out-of-band method.
9. Import the local certificate to the PKI domain.

   pki import domain *domain-name* { **der local filename** *filename* | **p12 local filename** *filename* | **pem local** } [**filename** *filename*] }

Aborting a certificate request

About aborting a certificate request

Before the CA issues a certificate, you can abort a certificate request and change its parameters, such as the common name, country code, or FQDN. You can use the **display pki certificate request-status** command to display the status of a certificate request.

Alternatively, you also can remove a PKI domain to abort the associated certificate request.

Procedure

1. Enter system view.

   system-view
2. Abort a certificate request.

   pki abort-certificate-request domain *domain-name*

   This command is not saved in the configuration file.

Obtaining certificates

About certificate obtaining

You can obtain the CA certificate, local certificates, and peer certificates related to a PKI domain from a CA and save them locally for higher lookup efficiency. To do so, use either the offline mode or the online mode:

- In offline mode, obtain the certificates by an out-of-band means like FTP, disk, or email, and then import them locally. Use this mode when the CRL repository is not specified, the CA server does not support SCEP, or the CA server generates the key pair for the certificates.
- In online mode, you can obtain the CA certificate through SCEP and obtain local certificates or peer certificates through LDAP.

Restrictions and guidelines

Follow these restrictions and guidelines when obtain certificates from a CA

- If a CA certificate already exists locally, you cannot obtain it again in online mode. If you want to obtain a new CA certificate, use the **pki delete-certificate** command to delete the existing CA certificate and local certificates first.
- If local or peer certificates already exist, you can obtain new local or peer certificates to overwrite the existing ones. If RSA is used, a PKI domain can have two local certificates, one for signature and the other for encryption.
- If CRL checking is enabled, obtaining a certificate triggers CRL checking. If the certificate to be obtained has been revoked, the certificate cannot be obtained.
- The device compares the validity period of a certificate with the local system time to determine whether the certificate is valid. Make sure the system time of the device is synchronized with the CA server.

Prerequisites

- Before you obtain local or peer certificates in online mode, make sure an LDAP server is correctly configured in the PKI domain.
- Before you import certificates in offline mode, complete the following tasks:
  - Use FTP or TFTP to upload the certificate files to the storage media of the device.

    If FTP or TFTP is not available, display and copy the contents of a certificate to a file on the device. Make sure the certificate is in PEM format because only certificates in PEM format can be imported.
  - Before you import a local certificate or peer certificate, obtain the CA certificate chain that signs the certificate.

    This step is required only if the CA certificate chain is neither available in the PKI domain nor contained in the certificate to be imported.
  - Before you import a local certificate that contains an encrypted key pair, contact the CA administrator to obtain the password required for importing the certificate.

Procedure

1. Enter system view.

   system-view
2. Obtain certificates.
   - Import certificates in offline mode.

     pki import domain *domain-name* { **der** { **ca** | **local** | **peer** } **filename** *filename* | **p12 local filename** *filename* | **pem** { **ca** | **local** | **peer** } [**filename** *filename*] }
   - Obtain certificates in online mode.

pki retrieve-certificate domain *domain-name* { **ca** | **local** | **peer** *entity-name* }

This command is not saved in the configuration file.

Verifying PKI certificates

About certification verification

A certificate is automatically verified when it is requested, obtained, or used by an application. If the certificate expires, if it is not issued by a trusted CA, or if it is revoked, the certificate cannot be used You can also manually verify a certificate.

You can enable or disable CRL checking in a PKI domain. CRL checking checks whether a certificate is in the CRL. If it is, the certificate has been revoked and its home entity is not trusted.

To use CRL checking, a CRL must be obtained from a CRL repository. The device selects a CRL repository in the following order:

1. CRL repository specified in the PKI domain by using the **crl url** command.
2. CRL repository in the certificate that is being verified.
3. CRL repository in the CA certificate or CRL repository in the upper-level CA certificate if the certificate being verified is a CA certificate

If no CRL repository is found after the selection process, the device obtains the CRL through SCEP. In this scenario, the CA certificate and the local certificates must have been obtained.

A certificate fails CRL checking in the following situations:

- A CRL cannot be obtained during CRL checking of the certificate.
- CRL checking verifies that the certificate has been revoked.

Restrictions and guidelines for certificate verification

When verifying the CA certificate of a PKI domain, the system needs to verify all the certificates in the CA certificate chain. To ensure a successful certificate verification process, the device must have all the PKI domains to which the CA certificates in the certificate chain belong.

The system verifies the CA certificates in the CA certificate chain as follows:

1. Identifies the parent certificate of the lowest-level certificate.

   Each CA certificate contains an issuer field that identifies the parent CA that issued the certificate.
2. Locates the PKI domain to which the parent certificate belongs.
3. Performs CRL checking in the PKI domain to check whether the parent certificate has been revoked. If it has been revoked, the certificate cannot be used.

   This step will not be performed when CRL checking is disabled in the PKI domain.
4. Repeats the previous steps for upper-level certificates in the CA certificate chain until the root CA certificate is reached.
5. Verifies that each CA certificate in the certificate chain is issued by the named parent CA, starting from the root CA.

Verifying certificates with CRL checking

1. Enter system view.

   system-view

2. Enter PKI domain view.
   pki domain *domain-name*
3. (Optional.) Specify the URL of the CRL repository.
   crl url *url-string*
   By default, the URL of the CRL repository is not specified.
4. Enable CRL checking.
   crl check enable
   By default, CRL checking is enabled.
5. Return to system view.
   quit
6. Obtain the CA certificate.
   See "Obtaining certificates."
   The PKI domain must have a CA certificate before you can verify certificates in it.
7. (Optional.) Obtain the CRL and save it locally.
   pki retrieve-crl domain *domain-name*
   To verify a non-root CA certificate and local certificates, the device automatically retrieves the CRL if the PKI domain has no CRL.
   The newly obtained CRL overwrites the old one, if any.
   The obtained CRL is issued by a CA in the CA certificate chain stored in the PKI domain.
8. Manually verify the validity of the certificates.
   pki validate-certificate domain *domain-name* { **ca** | **local** }

Verifying certificates without CRL checking

1. Enter system view.
   system-view
2. Enter PKI domain view.
   pki domain *domain-name*
3. Disable CRL checking.
   undo crl check enable
   By default, CRL checking is enabled.
4. Return to system view.
   quit
5. Obtain a CA certificate for the PKI domain.
   See "Obtaining certificates."
   The PKI domain must have a CA certificate before you can verify certificates in it.
6. Manually verify the certificate validity.
   pki validate-certificate domain *domain-name* { **ca** | **local** }
   This command is not saved in the configuration file.

Exporting certificates

About exporting certificates

You can export the CA certificate and the local certificates in a PKI domain to certificate files. The exported certificate files can then be imported back to the device or other PKI applications.

Restrictions and guidelines

To export all certificates in PKCS12 format, the PKI domain must have a minimum of one local certificate. If the PKI domain does not have any local certificates, the certificates in the PKI domain cannot be exported.

If you do not specify a file name when you export a certificate in PEM format, this command displays the certificate content on the terminal.

When you export a local certificate with RSA key pairs to a file, the certificate file name might be different from the file name specified in the command. The actual certificate file name depends on the purpose of the key pair contained in the certificate. For more information about the file naming rule, see the **pki export** command in *Security Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Export certificates.
   - Export certificates in DER format.

     pki export domain *domain-name* **der** { **all** | **ca** | **local** } **filename** *filename*
   - Export certificates in PKCS12 format.

     pki export domain *domain-name* **p12** { **all** | **local** } **passphrase** *p12-key* **filename** *filename*
   - Export certificates in PEM format.

     pki export domain *domain-name* **pem** { { **all** | **local** } [{ **3des-cbc** | **aes-128-cbc** | **aes-192-cbc** | **aes-256-cbc** | **des-cbc** } *pem-key*] | **ca** } [**filename** *filename*]

Removing a certificate

About certificate removal

You can remove certificates from a PKI domain in the following situations:

- Remove a CA certificate, local certificate, or peer certificate if the certificate has expired or is about to expire.
- Remove a local certificate if the certificate's private key is compromised, or if you want to request a new local certificate to replace the existing one.

Restrictions and guidelines

After you remove the CA certificate, the system automatically removes the local certificates, peer certificates, and CRLs from the domain.

To remove a local certificate and request a new certificate, perform the following tasks:

1. Remove the local certificate.
2. Use the **public-key local destroy** command to destroy the existing local key pair.
3. Use the **public-key local create** command to generate a new key pair.
4. Request a new certificate.

For more information about the **public-key local destroy** and **public-key local create** commands, see *Security Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Remove a certificate.

   pki delete-certificate domain *domain-name* { **ca** | **local** | **peer** [**serial** *serial-num*] }

   If you use the **peer** keyword without specifying a serial number, this command removes all peer certificates.

Configuring a certificate-based access control policy

About certificate-based access control policies

Certificate-based access control policies allow you to authorize access to a device (for example, an HTTPS server) based on the attributes of an authenticated client's certificate.

Access control rules and certificate attribute groups

A certificate-based access control policy is a set of access control rules (permit or deny statements), each associated with a certificate attribute group. A certificate attribute group contains multiple attribute rules, each defining a matching criterion for an attribute in the certificate issuer name, subject name, or alternative subject name field.

Certificate matching mechanism

If a certificate matches all attribute rules in a certificate attribute group associated with an access control rule, the system determines that the certificate matches the access control rule. In this scenario, the match process stops, and the system performs the access control action defined in the access control rule.

The following conditions describe how a certificate-based access control policy verifies the validity of a certificate:

- If a certificate matches a permit statement, the certificate passes the verification.
- If a certificate matches a deny statement or does not match any statements in the policy, the certificate is regarded invalid.
- If a statement is associated with a non-existing attribute group, or the attribute group does not have attribute rules, the certificate matches the statement.
- If the certificate-based access control policy specified for a security application (for example, HTTPS) does not exist, all certificates in the application pass the verification.

Procedure

1. Enter system view.

   system-view

2. Create a certificate attribute group and enter its view.

   pki certificate attribute-group *group-name*

3. Configure an attribute rule for issuer name, subject name, or alternative subject name.

   attribute *id* { **alt-subject-name** { **fqdn** | **ip** } | { **issuer-name** | **subject-name** } { **dn** | **fqdn** | **ip** } } { **ctn** | **equ** | **nctn** | **nequ**} *attribute-value*

   By default, not attribute rules are configured.

4. Return to system view.

   quit

5. Create a certificate-based access control policy and enter its view.

pki certificate access-control-policy *policy-name*

By default, no certificate-based access control policies exist.

6. Create a certificate access control rule.

   rule [*id*] { **deny** | **permit** } *group-name*

   By default, no certificate access control rules are configured, and all certificates can pass the verification.

   You can create multiple certificate access control rules for a certificate-based access control policy.

Display and maintenance commands for PKI

Execute **display** commands in any view.

Task	Command
Display certificate-based access control policy information.	**display pki certificate access-control-policy** [*policy-name*]
Display certificate attribute group information.	**display pki certificate attribute-group** [*group-name*]
Display the contents of a certificate.	**display pki certificate domain** *domain-name* { **ca** | **local** | **peer** [**serial** *serial-num*] }
Display certificate request status.	**display pki certificate request-status** [**domain** *domain-name*]

PKI configuration examples

You can use different software applications, such as Windows server, RSA Keon, and OpenCA, to act as the CA server.

If you use Windows server or OpenCA, you must install the SCEP add-on for Windows server or enable SCEP for OpenCA. In either case, when you configure a PKI domain, you must use the **certificate request from ra** command to specify the RA to accept certificate requests.

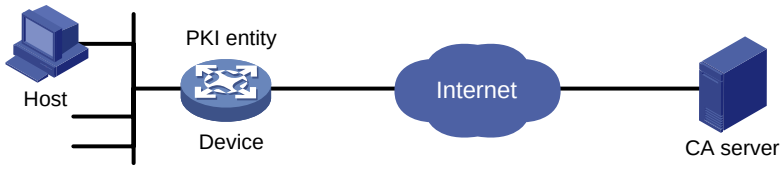
If you use RSA Keon, the SCEP add-on is not required. When you configure a PKI domain, you must use the **certificate request from ca** command to specify the CA to accept certificate requests.

Example: Requesting a certificate from an RSA Keon CA server

Network configuration

Configure the PKI entity (the device) to request a local certificate from the CA server.

Figure 2 Network diagram



Configuring the RSA Keon CA server

1. Create a CA server named **myca**:

   In this example, you must configure these basic attributes on the CA server:

   - **Nickname**—Name of the trusted CA.
   - **Subject DN**—DN attributes of the CA, including the common name (CN), organization unit (OU), organization (O), and country (C).

   You can use the default values for other attributes.

2. Configure extended attributes:

   Configure parameters in the **Jurisdiction Configuration** section on the management page of the CA server:

   - Select the correct extension profiles.
   - Enable the SCEP autovetting function to enable the CA server to automatically approve certificate requests without manual intervention.
   - Specify the IP address list for SCEP autovetting.

Configuring the device

1. Synchronize the system time of the device with the CA server for the device to correctly request certificates or obtain CRLs. (Details not shown.)
2. Create an entity named **aaa** and set the common name to **Device**.

   ```
   <Device> system-view
   [Device] pki entity aaa
   [Device-pki-entity-aaa] common-name Device
   [Device-pki-entity-aaa] quit
   ```

3. Configure a PKI domain:

   # Create a PKI domain named **torsa** and enter its view.

   ```
   [Device] pki domain torsa
   ```

   # Specify the name of the trusted CA. The setting must be the same as CA name configured on the CA server. This example uses **myca**.

   ```
   [Device-pki-domain-torsa] ca identifier myca
   ```

   # Configure the URL of the CA server. The URL format is **http://***host:port*/*Issuing Jurisdiction ID*, where *Issuing Jurisdiction ID* is a hexadecimal string generated on the CA server.

   ```
   [Device-pki-domain-torsa] certificate request url
   http://1.1.2.22:446/80f6214aa8865301d07929ae481c7ceed99f95bd
   ```

   # Configure the device to send certificate requests to **ca**.

   ```
   [Device-pki-domain-torsa] certificate request from ca
   ```

   # Set the PKI entity name to **aaa**.

   ```
   [Device-pki-domain-torsa] certificate request entity aaa
   ```

   # Specify the URL of the CRL repository.

   ```
   [Device-pki-domain-torsa] crl url ldap://1.1.2.22:389/CN=myca
   ```

   # Specify a 1024-bit general-purpose RSA key pair named **abc** for certificate request.

```
[Device-pki-domain-torsa] public-key rsa general name abc length 1024
[Device-pki-domain-torsa] quit
```

4. Generate the RSA key pair.

```
[Device] public-key local create rsa name abc
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512,it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.........................++++++
.....................................++++++
Create the key pair successfully.
```

5. Request a local certificate:

Obtain the CA certificate and save it locally.

```
[Device] pki retrieve-certificate domain torsa ca
The trusted CA's finger print is:
    MD5  fingerprint:EDE9 0394 A273 B61A F1B3 0072 A0B1 F9AB
    SHA1 fingerprint: 77F9 A077 2FB8 088C 550B A33C 2410 D354 23B2 73A8
Is the finger print correct?(Y/N):y
Retrieved the certificates successfully.
```

Submit a certificate request manually and set the certificate revocation password to **1111**. The certificate revocation password is required when an RSA Keon CA server is used.

```
[Device] pki request-certificate domain torsa password 1111
Start to request general certificate ...
……
Request certificate of domain torsa successfully
```

Verifying the configuration

Display information about the local certificate in PKI domain **torsa**.

```
[Device] display pki certificate domain torsa local
Certificate:
    Data:
        Version: 3 (0x2)

        1b:f5
```

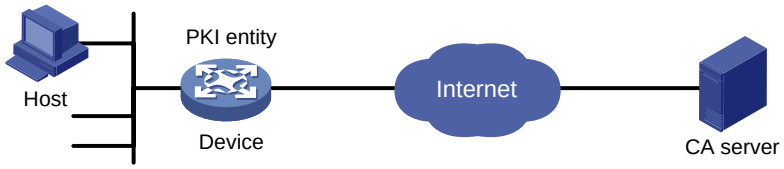
To display detailed information about the CA certificate, use the **display pki certificate domain** command.

Example: Requesting a certificate from a Windows Server 2003 CA server

Network configuration

Configure the PKI entity (the device) to request a local certificate from a Windows Server 2003 CA server.

Figure 3 Network diagram



Configuring the Windows Server 2003 CA server

1. Install the certificate service component:
   a. Select **Control Panel** > **Add or Remove Programs** from the start menu.
   b. Select **Add/Remove Windows Components** > **Certificate Services**.
   c. Click **Next** to begin the installation.
   d. Set the CA name. In this example, set the CA name to **myca**.
2. Install the SCEP add-on:

   By default, Windows Server 2003 does not support SCEP. You must install the SCEP add-on on the server for a PKI entity to register and obtain a certificate from the server. After the SCEP

add-on installation is complete, you will see a URL. Specify this URL as the certificate request URL on the device.

3. Modify the certificate service attributes:
   a. Select **Control Panel** > **Administrative Tools** > **Certificate Authority** from the start menu.

      If the certificate service component and SCEP add-on have been installed successfully, there should be two certificates issued by the CA to the RA.

   b. Right-click the CA server in the navigation tree and select **Properties** > **Policy Module**.
   c. Click **Properties**, and then select **Follow the settings in the certificate template, if applicable. Otherwise, automatically issue the certificate**.
4. Modify the Internet information services attributes:
   a. Select **Control Panel** > **Administrative Tools** > **Internet Information Services (IIS) Manager** from the start menu.
   b. Select **Web Sites** from the navigation tree.
   c. Right-click **Default Web Site** and select **Properties** > **Home Directory**.
   d. Specify the path for certificate service in the **Local path** field.
   e. Specify a unique TCP port number for the default website to avoid conflict with existing services. This example uses port 8080.

Configuring the device

1. Synchronize the device's system time with the CA server for the device to correctly request certificates. (Details not shown.)
2. Create an entity named **aaa** and set the common name to **test**.

```
<Device> system-view
[Device] pki entity aaa
[Device-pki-entity-aaa] common-name test
[Device-pki-entity-aaa] quit
```

3. Configure a PKI domain:

   # Create a PKI domain named **winserver** and enter its view.

```
[Device] pki domain winserver
```

   # Set the name of the trusted CA to **myca**.

```
[Device-pki-domain-winserver] ca identifier myca
```

   # Configure the certificate request URL. The URL format is **http://***host:port***/certsrv/mscep/mscep.dll**, where *host:port* is the host IP address and port number of the CA server.

```
[Device-pki-domain-winserver] certificate request url
http://4.4.4.1:8080/certsrv/mscep/mscep.dll
```

   # Configure the device to send certificate requests to **ra**.

```
[Device-pki-domain-winserver] certificate request from ra
```

   # Set the PKI entity name to **aaa**.

```
[Device-pki-domain-winserver] certificate request entity aaa
```

   # Configure a 1024-bit general-purpose RSA key pair named **abc** for certificate request.

```
[Device-pki-domain-winserver] public-key rsa general name abc length 1024
[Device-pki-domain-winserver] quit
```

4. Generate RSA key pair **abc**.

```
[Device] public-key local create rsa name abc
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512,it will take a few minutes.
Press CTRL+C to abort.
```

```
Input the modulus length [default = 1024]:
Generating Keys...
.........................++++++
.....................................++++++
Create the key pair successfully.
```

5. Request a local certificate:

Obtain the CA certificate and save it locally.

```
[Device] pki retrieve-certificate domain winserver ca
The trusted CA's finger print is:
    MD5  fingerprint:766C D2C8 9E46 845B 4DCE 439C 1C1F 83AB
    SHA1 fingerprint:97E5 DDED AB39 3141 75FB DB5C E7F8 D7D7 7C9B 97B4
Is the finger print correct?(Y/N):y
Retrieved the certificates successfully.
```

Submit a certificate request manually.

```
[Device] pki request-certificate domain winserver
Start to request general certificate ...
…
Request certificate of domain winserver successfully
```

Verifying the configuration

Display information about the local certificate in PKI domain **winserver**.

```
[Device] display pki certificate domain winserver local

```

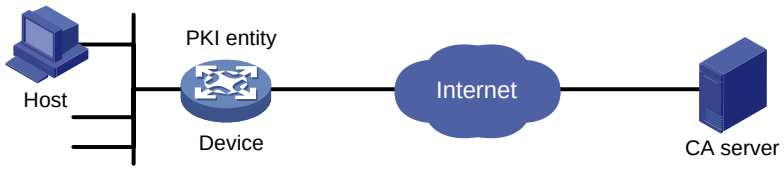
To display detailed information about the CA certificate, use the **display pki certificate domain** command.

Example: Requesting a certificate from an OpenCA server

Network configuration

Configure the PKI entity (the device) to request a local certificate from the CA server.

Figure 4 Network diagram



Configuring the OpenCA server

Configure the OpenCA server as instructed in related manuals. (Details not shown.)

Make sure the version of the OpenCA server is later than version 0.9.2 because the earlier versions do not support SCEP.

Configuring the device

1. Synchronize the device's system time with the CA server for the device to correctly request certificates. (Details not shown.)
2. Create a PKI entity named **aaa** and configure the common name, country code, organization name, and OU for the entity.

```
<Device> system-view
[Device] pki entity aaa
[Device-pki-entity-aaa] common-name rnd
[Device-pki-entity-aaa] country CN
[Device-pki-entity-aaa] organization test
[Device-pki-entity-aaa] organization-unit software
[Device-pki-entity-aaa] quit
```

3. Configure a PKI domain:

   # Create a PKI domain named **openca** and enter its view.

```
[Device] pki domain openca
```

   # Set the name of the trusted CA to **myca**.

```
[Device-pki-domain-openca] ca identifier myca
```

   # Configure the certificate request URL. The URL is in the format **http://***host***/cgi-bin/pki/scep**, where *host* is the host IP address of the OpenCA server.

```
[Device-pki-domain-openca] certificate request url
http://192.168.222.218/cgi-bin/pki/scep
```

   # Configure the device to send certificate requests to the RA.

```
[Device-pki-domain-openca] certificate request from ra
```

   # Specify PKI entity **aaa** for certificate request.

```
[Device-pki-domain-openca] certificate request entity aaa
```

   # Configure a 1024-bit general-purpose RSA key pair named **abc** for certificate request.

```
[Device-pki-domain-openca] public-key rsa general name abc length 1024
[Device-pki-domain-openca] quit
```

4. Generate RSA key pair **abc**.

```
[Device] public-key local create rsa name abc
The range of public key modulus is (512 ~ 4096).
```

```
If the key modulus is greater than 512,it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.....................++++++
.................................++++++
Create the key pair successfully.
```

5. Request a local certificate:

Obtain the CA certificate and save it locally.

```
[Device] pki retrieve-certificate domain openca ca
The trusted CA's finger print is:
    MD5  fingerprint:5AA3 DEFD 7B23 2A25 16A3 14F4 C81C C0FA
    SHA1 fingerprint:9668 4E63 D742 4B09 90E0 4C78 E213 F15F DC8E 9122
Is the finger print correct?(Y/N):y
Retrieved the certificates successfully.
```

Submit a certificate request manually.

```
[Device] pki request-certificate domain openca
Start to request general certificate ...
…
Request certificate of domain openca successfully
```

Verifying the configuration

Display information about the local certificate in PKI domain **openca**.

```
[Device] display pki certificate domain openca local

To display detailed information about the CA certificate, use the **display pki certificate domain** command.

Example: Configuring IKE negotiation with RSA digital signature from a Windows Server 2003 CA server

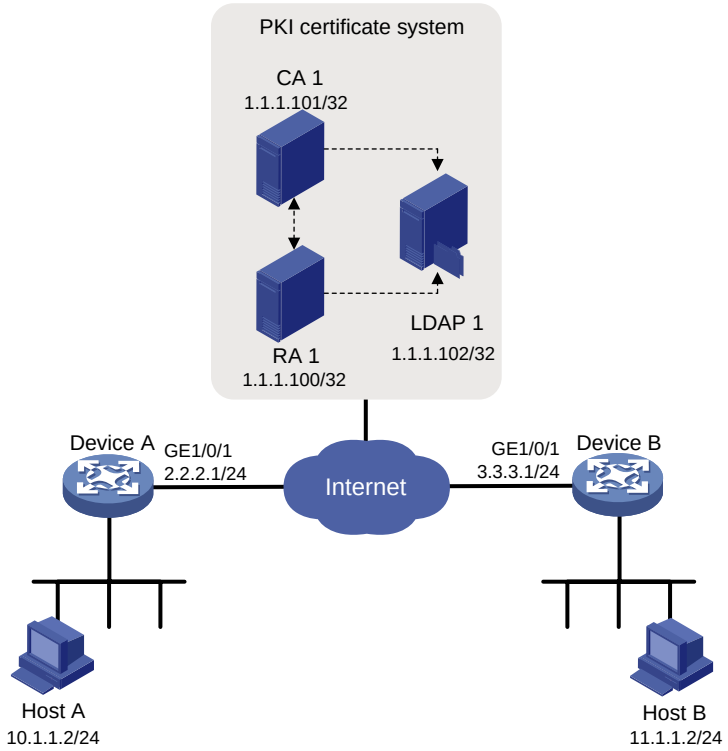
Network configuration

As shown in Figure 5, an IPsec tunnel is required to be established between Device A and Device B. The IPsec tunnel protects the traffic between Host A on subnet 10.1.1.0/24 and Host B on subnet 1.1.1.0/24.

Device A and Device B use IKE to set up SAs, and the IKE proposal uses RSA digital signature for identity authentication.

Device A and Device B use the same CA.

Figure 5 Network diagram



Configuring the Windows Server 2003 CA server

See "Example: Requesting a certificate from a Windows Server 2003 CA server."

Configuring Device A

Configure a PKI entity.

```
<DeviceA> system-view
[DeviceA] pki entity en
[DeviceA-pki-entity-en] ip 2.2.2.1
[DeviceA-pki-entity-en] common-name devicea
[DeviceA-pki-entity-en] quit
```

Configure a PKI domain.

```
[DeviceA] pki domain 1
[DeviceA-pki-domain-1] ca identifier CA1
[DeviceA-pki-domain-1] certificate request url http://1.1.1.100/certsrv/mscep/mscep.dll
```

```
[DeviceA-pki-domain-1] certificate request entity en
[DeviceA-pki-domain-1] ldap-server host 1.1.1.102
```

Configure the device to send certificate requests to **ra**.

```
[DeviceA-pki-domain-1] certificate request from ra
```

Configure a 1024-bit general-purpose RSA key pair named **abc** for certificate request.

```
[DeviceA-pki-domain-1] public-key rsa general name abc length 1024
[DeviceA-pki-domain-1] quit
```

Generate the RSA key pair.

```
[DeviceA] public-key local create rsa name abc
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512,it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.........................++++++
.....................................++++++
Create the key pair successfully.
```

Obtain the CA certificate and save it locally.

```
[DeviceA] pki retrieve-certificate domain 1 ca
```

Submit a certificate request manually.

```
[DeviceA] pki request-certificate domain 1
```

Create IKE proposal 1, and configure the authentication method as RSA digital signature.

```
[DeviceA] ike proposal 1
[DeviceA-ike-proposal-1] authentication-method rsa-signature
[DeviceA-ike-proposal-1] quit
```

Specify the PKI domain used in IKE negotiation for IKE profile **peer**.

```
[DeviceA] ike profile peer
[DeviceA-ike-profile-peer] certificate domain 1
```

Configuring Device B

Configure a PKI entity.

```
<DeviceB> system-view
[DeviceB] pki entity en
[DeviceB-pki-entity-en] ip 3.3.3.1
[DeviceB-pki-entity-en] common-name deviceb
[DeviceB-pki-entity-en] quit
```

Configure a PKI domain.

```
[DeviceB] pki domain 1
[DeviceB-pki-domain-1] ca identifier CA1
[DeviceB-pki-domain-1] certificate request url http://1.1.1.100/certsrv/mscep/mscep.dll
[DeviceB-pki-domain-1] certificate request entity en
[DeviceB-pki-domain-1] ldap-server host 1.1.1.102
```

Configure the device to send certificate requests to **ra**.

```
[DeviceB-pki-domain-1] certificate request from ra
```

Configure a 1024-bit general-purpose RSA key pair named **abc** for certificate request.

```
[DeviceB-pki-domain-1] public-key rsa general name abc length 1024
```

```
[DeviceB-pki-domain-1] quit
```

Generate the RSA key pair.

```
[DeviceB] public-key local create rsa name abc
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512,it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.........................++++++
.....................................++++++
Create the key pair successfully.
```

Obtain the CA certificate and save it locally.

```
[DeviceB] pki retrieve-certificate domain 1 ca
The trusted CA's finger print is:
    MD5  fingerprint:5C41 E657 A0D6 ECB4 6BD6 1823 7473 AABC
    SHA1 fingerprint:1616 E7A5 D89A 2A99 9419 1C12 D696 8228 87BC C266
Is the finger print correct?(Y/N):y
Retrieved the certificates successfully.
```

Submit a certificate request manually.

```
[DeviceB] pki request-certificate domain 1
Start to request general certificate ...
...
Certificate requested successfully.
```

Create IKE proposal 1, and configure the authentication method as RSA digital signature.

```
[DeviceB] ike proposal 1
[DeviceB-ike-proposal-1] authentication-method rsa-signature
[DeviceB-ike-proposal-1] quit
```

Specify the PKI domain used in IKE negotiation for IKE profile **peer**.

```
[DeviceB] ike profile peer
[DeviceB-ike-profile-peer] certificate domain 1
```

The configurations are for IKE negotiation with RSA digital signature. For information about how to configure IPsec SAs to be set up, see "Configuring IPsec."

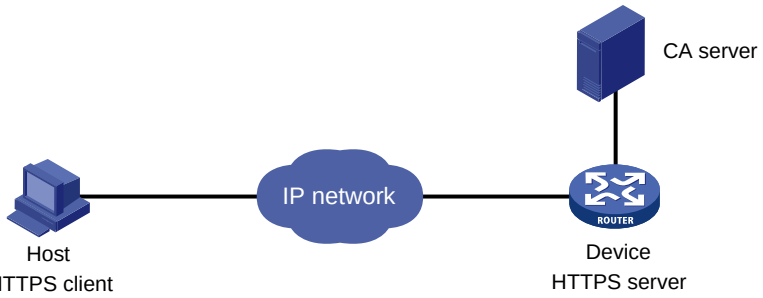
Example: Configuring a certificate-based access control policy

Network configuration

As shown in Figure 6, the host accesses the device through HTTPS.

Configure a certificate-based access control policy on the device to authenticate the host and verify the validity of the host's certificate.

Figure 6 Network diagram



Procedure

1. Create PKI domain **domain1** to be used by SSL. (Details not shown.)
2. Request an SSL server certificate for the device from the CA server. (Details not shown.)
3. Configure the HTTPS server:

   # Configure an SSL server policy named **abc**.

   ```
   <Device> system-view
   [Device] ssl server-policy abc
   [Device-ssl-server-policy-abc] pki-domain domain1
   [Device-ssl-server-policy-abc] client-verify enable
   [Device-ssl-server-policy-abc] quit
   ```

   # Apply SSL server policy **abc** to the HTTPS server.

   ```
   [Device] ip https ssl-server-policy abc
   ```

   # Enable the HTTPS server.

   ```
   [Device] ip https enable
   ```

4. Configure certificate attribute groups:

   # Create a certificate attribute group named **mygroup1** and add two attribute rules. The first rule defines that the DN in the subject DN contains the string of **aabbcc**. The second rule defines that the IP address of the certificate issuer is **10.0.0.1**.

   ```
   [Device] pki certificate attribute-group mygroup1
   [Device-pki-cert-attribute-group-mygroup1] attribute 1 subject-name dn ctn aabbcc
   [Device-pki-cert-attribute-group-mygroup1] attribute 2 issuer-name ip equ 10.0.0.1
   [Device-pki-cert-attribute-group-mygroup1] quit
   ```

   # Create a certificate attribute group named **mygroup2** and add two attribute rules. The first rule defines that the FQDN in the alternative subject name does not contain the string of **apple**. The second rule defines that the DN of the certificate issuer name contains the string of **aabbcc**.

   ```
   [Device] pki certificate attribute-group mygroup2
   [Device-pki-cert-attribute-group-mygroup2] attribute 1 alt-subject-name fqdn nctn
   apple
   [Device-pki-cert-attribute-group-mygroup2] attribute 2 issuer-name dn ctn aabbcc
   [Device-pki-cert-attribute-group-mygroup2] quit
   ```

5. Configure a certificate-based access control policy:

   # Create a certificate-based access control policy named **myacp**.

   ```
   [Device] pki certificate access-control-policy myacp
   ```

   # Define a statement to deny the certificates that match the attribute rules in certificate attribute group **mygroup1**.

   ```
   [Device-pki-cert-acp-myacp] rule 1 deny mygroup1
   ```

Define a statement to permit the certificates that match the attribute rules in certificate attribute group **mygroup2**.

```
[Device-pki-cert-acp-myacp] rule 2 permit mygroup2
[Device-pki-cert-acp-myacp] quit
```

Apply certificate-based access control policy **myacp** to the HTTPS server.

```
[Device] ip https certificate access-control-policy myacp
```

Verifying the configuration

On the host, access the HTTPS server through a Web browser.

The server first verifies the validity of the host's certificate according to the configured certificate-based access control policy. In the host's certificate, the subject DN is **aabbcc**, the IP address of the certificate issuer is **1.1.1.1**, and the FQDN of the alternative subject name is **banaba**.

The host's certificate does not match certificate attribute group **mygroup1** specified in **rule 1** of the certificate-based access control policy. The certificate continues to match against rule 2.

The host's certificate matches certificate attribute group **mygroup2** specified in **rule 2**. Because **rule 2** is a permit statement, the certificate passes the verification and the host can access the HTTPS server.

Example: Importing and exporting certificates

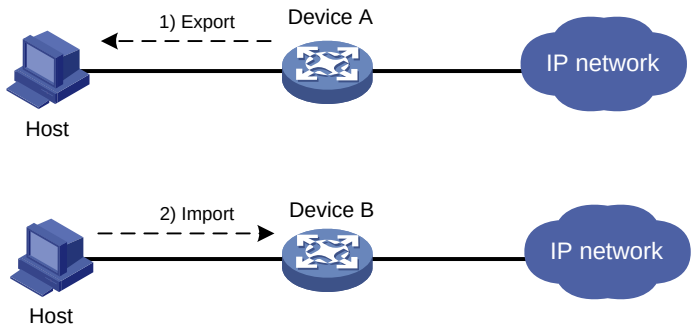
Network configuration

As shown in Figure 7, Device B will replace Device A in the network. PKI domain **exportdomain** on Device A has two local certificates containing the private key and one CA certificate. To make sure the certificates are still valid after Device B replaces Device A, copy the certificates on Device A to Device B as follows:

1. Export the certificates in PKI domain **exportdomain** on Device A to .pem certificate files.

   During the export, encrypt the private key in the local certificates using 3DES_CBC with the password 11111.
2. Transfer the certificate files from Device A to Device B through the FTP host.
3. Import the certificate files to PKI domain **importdomain** on Device B.

Figure 7 Network diagram



Procedure

1. Export the certificates on Device A:

   # Export the CA certificate to a .pem file.

   ```
   <DeviceA> system-view
   [DeviceA] pki export domain exportdomain pem ca filename pkicachain.pem
   ```

   # Export the local certificate to a file named **pkilocal.pem** in PEM format, and use 3DES_CBC to encrypt the private key with the password **111111**.

```
[DeviceA] pki export domain exportdomain pem local 3des-cbc 111111 filename
pkilocal.pem
```

Now, Device A has three certificate files in PEM format:

- A CA certificate file named **pkicachain.pem**.
- A local certificate file named **pkilocal.pem-signature**, which contains the private key for signature.
- A local certificate file named **pkilocal.pem-encryption**, which contains the private key for encryption.

Display local certificate file **pkilocal.pem-signature**.

```
[DeviceA] quit
<DeviceA> more pkilocal.pem-signature

To display detailed information about the CA certificate, use the **`display pki certificate domain`** command.

Troubleshooting PKI configuration

This section provides troubleshooting information for common problems with PKI.

Failed to obtain the CA certificate

Symptom

The CA certificate cannot be obtained.

Analysis

- The network connection is down, for example, because the network cable is damaged or the connectors have bad contact.
- No trusted CA is specified.
- The certificate request URL is incorrect or not specified.
- The system time of the device is not synchronized with the CA server.
- The CA server does not accept the source IP address specified in the PKI domain, or no source IP address is specified.
- The fingerprint of the root CA certificate is illegal.

Solution

1. Fix the network connection problems, if any.
2. Configure the trusted CA and all other required parameters in the PKI domain.
3. Use the **`ping`** command to verify that the CA server is reachable.

4. Synchronize the system time of the device with the CA server.
5. Specify the correct source IP address that the CA server can accept. For the correct settings, contact the CA administrator.
6. Verify the fingerprint of the CA certificate on the CA server.
7. If the problem persists, contact H3C Support.

Failed to obtain local certificates

Symptom

The local certificates can be obtained.

Analysis

- The network connection is down.
- The PKI domain does not have a CA certificate before you submit the local certificate request.
- The LDAP server is not configured or is incorrectly configured.
- No key pair is specified for certificate request in the PKI domain, or the specified key pair does not match the one contained in the local certificates to the obtained.
- No PKI entity is configured in the PKI domain, or the PKI entity configuration is incorrect.
- CRL checking is enabled, but the PKI domain does not have a CRL and cannot obtain one.
- The CA server does not accept the source IP address specified in the PKI domain, or no source IP address is specified.
- The system time of the device is not synchronized with the CA server.

Solution

1. Fix the network connection problems, if any..
2. Obtain or import the CA certificate.
3. Configure the correct LDAP server parameters.
4. Specify the key pair for certificate request, or remove the existing key pair, specify a new key pair, and submit a local certificate request again.
5. Check the registration policy on the CA or RA, and make sure the attributes of the PKI entity meet the policy requirements.
6. Obtain the CRL from the CRL repository.
7. Specify the correct source IP address that the CA server can accept. For the correct settings, contact the CA administrator.
8. Synchronize the system time of the device with the CA server.
9. If the problem persists, contact H3C Support.

Failed to request local certificates

Symptom

Local certificate requests cannot be submitted.

Analysis

- The network connection is down, for example, because the network cable is damaged or the connectors have bad contact.
- The PKI domain does not have a CA certificate before the local certificate request is submitted.
- The certificate request URL is incorrect or is not specified.

- The certificate request reception authority is incorrect or is not specified.
- Required PKI entity parameters are not configured or are incorrectly configured.
- No key pair is specified in the PKI domain for certificate request, or the key pair is changed during a certificate request process.
- Exclusive certificate request applications are running in the PKI domain.
- The CA server does not accept the source IP address specified in the PKI domain, or no source IP address is specified.
- The system time of the device is not synchronized with the CA server.

Solution

1. Fix the network connection problems, if any.
2. Obtain or import the CA certificate.
3. Use the **ping** command to verify that the registration server is reachable.
4. Use the **certificate request from** command to specify the correct certificate request reception authority.
5. Configure the PKI entity parameters as required by the registration policy on the CA or RA.
6. Specify the key pair for certificate request, or remove the existing key pair, specify a new key pair, and submit a local certificate request again.
7. Use the **pki abort-certificate-request domain** command to abort the certificate request.
8. Specify the correct source IP address that the CA server can accept. For the correct settings, contact the CA administrator.
9. Synchronize the system time of the device with the CA server.
10. If the problem persists, contact H3C Support.

Failed to obtain CRLs

Symptom

CRLs cannot be obtained.

Analysis

- The network connection is down, for example, because the network cable is damaged or the connectors have bad contact.
- The PKI domain does not have a CA certificate before you try to obtain CRLs.
- The URL of the CRL repository is not configured and cannot be obtained from the CA certificate or local certificates in the PKI domain.
- The specified URL of the CRL repository is incorrect.
- The device tries to obtain CRLs through SCEP, but it experiences the following problems:
  - The PKI domain does not have local certificates.
  - The key pairs in the certificates have been changed.
  - The PKI domain has incorrect URL for certificate request.
- The CRL repository uses LDAP for CRL distribution. However, the IP address or host name of the LDAP server is neither contained in the CRL repository URL nor configured in the PKI domain.
- The CA does not issue CRLs.
- The CA server does not accept the source IP address specified in the PKI domain, or no source IP address is specified.

Solution

1. Fix the network connection problems, if any.
2. Obtain or import the CA certificate.
3. If the URL of the CRL repository cannot be obtained, verify that the following conditions exist:
   - The URL for certificate request is valid.
   - A local certificate has been successfully obtained.
   - The local certificate contains a public key that matches the locally stored key pair.
4. Make sure the LDAP server address is contained in the CRL repository URL, or is configured in the PKI domain.
5. Make sure the CA server support publishing CRLs.
6. Specify a correct source IP address that the CA server can accept. For the correct settings, contact the CA administrator.
7. If the problem persists, contact H3C Support.

Failed to import the CA certificate

Symptom

The CA certificate cannot be imported.

Analysis

- CRL checking is enabled, but the device does not have a CRL in the PKI domain and cannot obtain one.
- The specified format in which the CA certificate file is to be imported does not match actual certificate file format.

Solution

1. Use the **`undo crl check enable`** command to disable CRL checking in the PKI domain.
2. Make sure the format of the imported file is correct.
3. If the problem persists, contact H3C Support.

Failed to import the local certificate

Symptom

The local certificate cannot be imported.

Analysis

- The PKI domain does not have a CA certificate, and the local certificate file to be imported does not contain the CA certificate chain.
- CRL checking is enabled, but the device does not have a CRL in the PKI domain and cannot obtain one.
- The specified format in which the local certificate file is to be imported does not match actual certificate file format.
- The device and the certificate do not have the local key pair.
- The certificate has been revoked.
- The certificate is out of the validity period.
- The system time is incorrect.

Solution

1. Obtain or import the CA certificate.
2. Use the **undo crl check enable** command to disable CRL checking, or obtain the correct CRL before you import certificates.
3. Make sure the format of the file to be imported is correct.
4. Make sure the certificate file contains the private key.
5. Make sure the certificate is not revoked.
6. Make sure the certificate is valid.
7. Configure the correct system time for the device.
8. If the problem persists, contact H3C Support.

Failed to export certificates

Symptom

Certificates cannot be exported.

Analysis

- The PKI domain does not have local certificates when you export all certificates in PKCS12 format.
- The specified export path does not exist.
- The specified export path is illegal.
- The public key of the local certificate to be exported does not match the public key of the key pair configured in the PKI domain.
- The storage space of the device is full.

Solution

1. Obtain or request local certificates first.
2. Use the **mkdir** command to create the required path.
3. Specify a correct export path.
4. Configure the correct key pair in the PKI domain.
5. Clear up the storage space of the device.
6. If the problem persists, contact H3C Support.

Failed to set the storage path

Symptom

The storage path for certificates or CRLs cannot be set.

Analysis

- The specified storage path does not exist.
- The specified storage path is illegal.
- The storage space of the device is full.

Solution

1. Use the **mkdir** command to create the path.
2. Specify a valid storage path for certificates or CRLs.
3. Clear up the storage space of the device.

4. If the problem persists, contact H3C Support.

Configuring IPsec

About IPsec

IP Security (IPsec) is defined by the IETF to provide interoperable, high-quality, cryptography-based security for IP communications. It is a Layer 3 VPN technology that transmits data in a secure channel established between two endpoints (such as two security gateways). Such a secure channel is usually called an IPsec tunnel.

IPsec framework

IPsec is a security framework that has the following protocols and algorithms:

- Authentication Header (AH).
- Encapsulating Security Payload (ESP).
- Internet Key Exchange (IKE).
- Algorithms for authentication and encryption.

AH and ESP are security protocols that provide security services. IKE performs automatic key exchange. For more information about IKE, see "Configuring IKE."

IPsec security services

IPsec provides the following security services for data packets in the IP layer:

- **Confidentiality**—The sender encrypts packets before transmitting them over the Internet, protecting the packets from being eavesdropped en route.
- **Data integrity**—The receiver verifies the packets received from the sender to make sure they are not tampered with during transmission.
- **Data origin authentication**—The receiver verifies the authenticity of the sender.
- **Anti-replay**—The receiver examines packets and drops outdated and duplicate packets.

Benefits of IPsec

IPsec delivers the following benefits:

- Reduced key negotiation overhead and simplified maintenance by supporting the IKE protocol. IKE provides automatic key negotiation and automatic IPsec security association (SA) setup and maintenance.
- Good compatibility. You can apply IPsec to all IP-based application systems and services without modifying them.
- Encryption on a per-packet rather than per-flow basis. Per-packet encryption allows for flexibility and greatly enhances IP security.

Security protocols

IPsec comes with two security protocols, AH and ESP. They define how to encapsulate IP packets and the security services that they can provide.

- AH (protocol 51) defines the encapsulation of the AH header in an IP packet, as shown in Figure 3. AH can provide data origin authentication, data integrity, and anti-replay services to

prevent data tampering, but it cannot prevent eavesdropping. Therefore, it is suitable for transmitting non-confidential data. The authentication algorithms supported by AH include HMAC-MD5 and HMAC-SHA1.

- ESP (protocol 50) defines the encapsulation of the ESP header and trailer in an IP packet, as shown in Figure 3. ESP can provide data encryption, data origin authentication, data integrity, and anti-replay services. Unlike AH, ESP can guarantee data confidentiality because it can encrypt the data before encapsulating the data to IP packets. ESP-supported encryption algorithms include DES, 3DES, and AES, and authentication algorithms include HMAC-MD5 and HMAC-SHA1.

Both AH and ESP provide authentication services, but the authentication service provided by AH is stronger. In practice, you can choose either or both security protocols. When both AH and ESP are used, an IP packet is encapsulated first by ESP and then by AH.

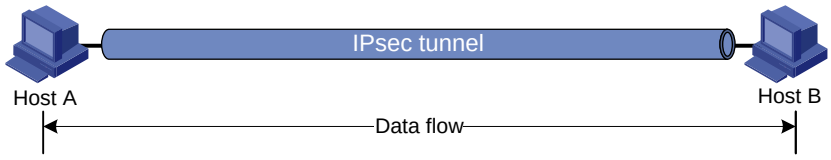
Encapsulation modes

IPsec supports the following encapsulation modes: transport mode and tunnel mode.

Transport mode

The security protocols protect the upper layer data of an IP packet. Only the transport layer data is used to calculate the security protocol headers. The calculated security protocol headers and the encrypted data (only for ESP encapsulation) are placed after the original IP header. You can use the transport mode when end-to-end security protection is required (the secured transmission start and end points are the actual start and end points of the data). The transport mode is typically used for protecting host-to-host communications, as shown in Figure 1.

Figure 1 IPsec protection in transport mode



Tunnel mode

The security protocols protect the entire IP packet. The entire IP packet is used to calculate the security protocol headers. The calculated security protocol headers and the encrypted data (only for ESP encapsulation) are encapsulated in a new IP packet. In this mode, the encapsulated packet has two IP headers. The inner IP header is the original IP header. The outer IP header is added by the network device that provides the IPsec service. You must use the tunnel mode when the secured transmission start and end points are not the actual start and end points of the data packets (for example, when two gateways provide IPsec but the data start and end points are two hosts behind the gateways). The tunnel mode is typically used for protecting gateway-to-gateway communications, as shown in Figure 2.

Figure 2 IPsec protection in tunnel mode

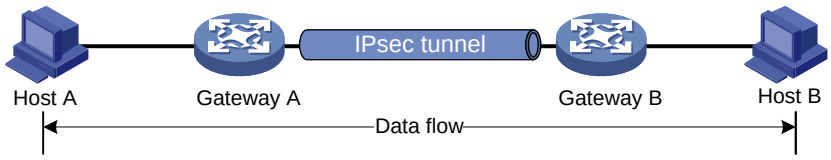


Figure 3 shows how the security protocols encapsulate an IP packet in different encapsulation modes.

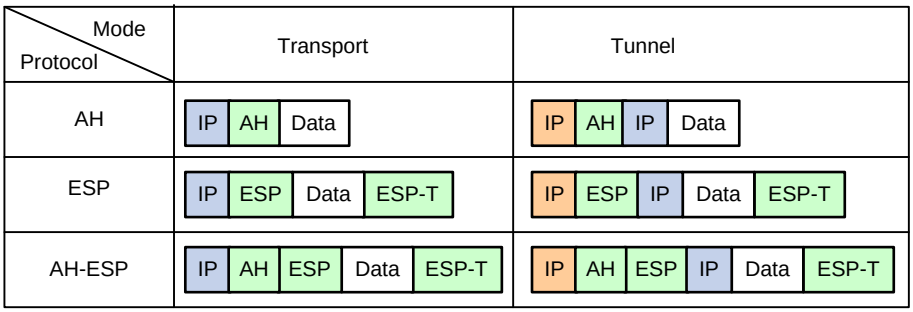
Figure 3 Security protocol encapsulations in different modes



Security association

A security association (SA) is an agreement negotiated between two communicating parties called IPsec peers. An SA includes the following parameters for data protection:

- Security protocols (AH, ESP, or both).
- Encapsulation mode (transport mode or tunnel mode).
- Authentication algorithm (HMAC-MD5 or HMAC-SHA1).
- Encryption algorithm (DES, 3DES, or AES).
- Shared keys and their lifetimes.

An SA is unidirectional. At least two SAs are needed to protect data flows in a bidirectional communication. If two peers want to use both AH and ESP to protect data flows between them, they construct an independent SA for each protocol in each direction.

An SA is uniquely identified by a triplet, which consists of the security parameter index (SPI), destination IP address, and security protocol identifier. An SPI is a 32-bit number. It is transmitted in the AH/ESP header.

An SA can be set up manually or through IKE.

- **Manual mode**—Configure all parameters for the SA through commands. This configuration mode is complex and does not support some advanced features (such as periodic key update), but it can implement IPsec without IKE. This mode is mainly used in small and static networks or when the number of IPsec peers in the network is small.
- **IKE negotiation mode**—The peers negotiate and maintain the SA through IKE. This configuration mode is simple and has good expansibility. As a best practice, set up SAs through IKE negotiations in medium- and large-scale dynamic networks.

A manually configured SA never ages out. An IKE-created SA has a lifetime, which comes in two types:

- **Time-based lifetime**—Defines how long the SA can be valid after it is created.
- **Traffic-based lifetime**—Defines the maximum traffic that the SA can process.

If both lifetime timers are configured for an SA, the SA becomes invalid when either of the lifetime timers expires. Before the SA expires, IKE negotiates a new SA, which takes over immediately after its creation.

Authentication and encryption

Authentication algorithms

IPsec uses hash algorithms to perform authentication. A hash algorithm produces a fixed-length digest for an arbitrary-length message. IPsec peers respectively calculate message digests for each packet. The receiver compares the local digest with that received from the sender. If the digests are

identical, the receiver considers the packet intact and the sender's identity valid. IPsec uses the Hash-based Message Authentication Code (HMAC) based authentication algorithms, including HMAC-MD5 and HMAC-SHA1. Compared with HMAC-SHA1, HMAC-MD5 is faster but less secure.

Encryption algorithms

IPsec uses symmetric encryption algorithms, which encrypt and decrypt data by using the same keys. The following encryption algorithms are available for IPsec on the device:

- **DES**—Encrypts a 64-bit plaintext block with a 56-bit key. DES is the least secure but the fastest algorithm.
- **3DES**—Encrypts plaintext data with three 56-bit DES keys. The key length totals up to 168 bits. It provides moderate security strength and is slower than DES.
- **AES**—Encrypts plaintext data with a 128-bit, 192-bit, or 256-bit key. AES provides the highest security strength and is slower than 3DES.

IPsec-protected traffic

IPsec tunnels can protect the following types of traffic:

- Packets that match specific ACLs.
- Packets routed to a tunnel interface.
- Packets of IPv6 routing protocols.

Two peers use security policies (IPsec policies or IPsec profiles) to protect packets between them. A security policy defines the range of packets to be protected by IPsec and the security parameters used for the protection. For more information about IPsec policies and IPsec profiles, see "IPsec policy and IPsec profile."

The following information describes how IPsec protects packets:

- When an IPsec peer identifies the packets to be protected according to the security policy, it sets up an IPsec tunnel and sends the packet to the remote peer through the tunnel. The IPsec tunnel can be manually configured beforehand, or it can be set up through IKE negotiation triggered by the packet. The IPsec tunnels are actually the IPsec SAs. The inbound packets are protected by the inbound SA, and the outbound packets are protected by the outbound SA.
- When the remote IPsec peer receives the packet, it drops, de-encapsulates, or directly forwards the packet according to the configured security policy.

ACL-based IPsec

To implement ACL-based IPsec, configure an ACL to define the data flows to be protected, specify the ACL in an IPsec policy, and then apply the IPsec policy to an interface. You can apply an IPsec policy to physical interfaces such as serial interfaces and Ethernet interfaces, or virtual interfaces such as tunnel interfaces and virtual template interfaces.

ACL-based IPsec works as follows:

- When packets sent by the interface match a permit rule of the ACL, the packets are protected by the outbound IPsec SA and encapsulated with IPsec.
- When the interface receives an IPsec packet destined for the local device, it searches for the inbound IPsec SA according to the SPI in the IPsec packet header for de-encapsulation. If the de-encapsulated packet matches a permit rule of the ACL, the device processes the packet. If the de-encapsulated packet does not match any permit rule of the ACL, the device drops the packet.

The device supports the following data flow protection modes:

- **Standard mode**—One IPsec tunnel protects one data flow. The data flow permitted by an ACL rule is protected by one IPsec tunnel that is established solely for it.

- **Aggregation mode**—One IPsec tunnel protects all data flows permitted by all the rules of an ACL. This mode is only used to communicate with old-version devices.
- **Per-host mode**—One IPsec tunnel protects one host-to-host data flow. One host-to-host data flow is identified by one ACL rule and protected by one IPsec tunnel established solely for it. This mode consumes more system resources when multiple data flows exist between two subnets to be protected.

IPv6 routing protocol-based IPsec

You can implement IPv6 routing protocol-based IPsec by binding an IPsec profile to an IPv6 routing protocol. All packets of the protocol are encapsulated with IPsec. Supported IPv6 routing protocols include OSPFv3 and RIPng.

All packets of the applications that are not bound to IPsec and the IPsec packets that failed to be de-encapsulated are dropped.

In one-to-many communication scenarios, you must configure the IPsec SAs for an IPv6 routing protocol in manual mode because of the following reasons:

- The automatic key exchange mechanism protects communications between two points. In one-to-many communication scenarios, automatic key exchange cannot be implemented.
- One-to-many communication scenarios require that all the devices use the same SA parameters (SPI and key) to receive and send packets. IKE negotiated SAs cannot meet this requirement.

IPsec policy and IPsec profile

IPsec policies and IPsec profiles define the parameters used to establish IPsec tunnels between two peers and the range of packets to be protected.

IPsec policy

An IPsec policy is a set of IPsec policy entries that have the same name but different sequence numbers.

An IPsec policy contains the following settings:

- An ACL that defines the range of data flows to be protected.
- An IPsec transform set that defines the security parameters used for IPsec protection.
- IPsec SA establishment mode.

  Supported IPsec SA establishment modes are manual configuration and IKE negotiation.
- Local and remote IP addresses that define the start and end points of the IPsec tunnel.

In the same IPsec policy, an IPsec policy entry with a smaller sequence number has a higher priority. When sending a packet, the interface applied with an IPsec policy looks through the IPsec policy's entries in ascending order of sequence numbers. If the packet matches the ACL of an IPsec policy entry, the interface encapsulates the packet according to the IPsec policy entry. If no match is found, the interface sends the packet out without IPsec protection.

When the interface receives an IPsec packet destined for the local device, it searches for the inbound IPsec SA according to the SPI in the IPsec packet header for de-encapsulation. If the de-encapsulated packet matches a permit rule of the ACL, the device processes the packet. If the de-encapsulated packet does not match a permit rule of the ACL, the device drops the packet.

IPsec profile

An IPsec profile has similar settings as an IPsec policy. It is uniquely identified by a name and does not support ACL configuration.

IPsec profiles can be classified into the following types:

- **Manual IPsec profile**—A manual IPsec profile is used to protect IPv6 routing protocols. It specifies the IPsec transform set used for protecting data flows, and the SPIs and keys used by the SAs.
- **IKE-based IPsec profile**—An IKE-based IPsec profile is applied to tunnel interfaces to protect tunneled traffic. It specifies the IPsec transform sets used for protecting data flows, and the IKE profile used for IKE negotiation.

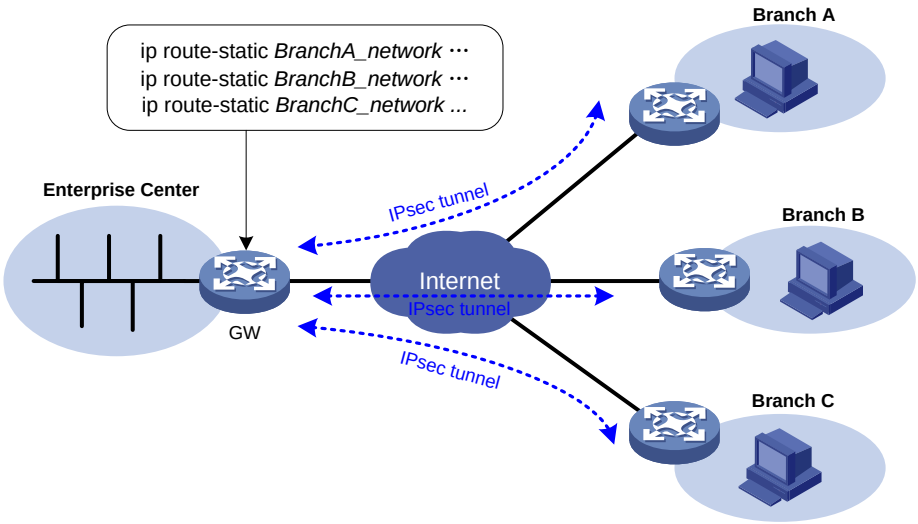
IPsec RRI

IPsec Reverse Route Injection (RRI) enables an IPsec tunnel gateway to automatically add and delete static routes destined for the protected private networks. It automatically adds the static routes when the IPsec SAs are established and deletes the static routes when the IPsec SAs are deleted. This greatly reduces the static route configuration work load on the gateway and increases the scalability of the IPsec VPN.

IPsec RRI is applicable to gateways that must provide many IPsec tunnels (for example, a headquarters gateway).

As shown in Figure 4, the traffic between the enterprise center and the branches are protected by IPsec. The gateway at the enterprise center is configured with static routes to route traffic to the IPsec-protected interfaces. It is difficult to add or modify static routes on the gateway at the enterprise center if the IPsec VPN has a large number of branches or if the network structure changes.

Figure 4 IPsec VPN



After you can enable IPsec RRI on the gateway, the gateway automatically adds a static route to the routing table each time an IPsec tunnel is established. The destination IP address is the protected private network, and the next hop is the remote IP address of the IPsec tunnel. Traffic destined for the peer end is routed to the IPsec tunnel interface and thereby protected by IPsec.

You can advertise the static routes created by IPsec RRI in the internal network, and the internal network device can use them to forward traffic in the IPsec VPN.

You can set preferences for the static routes created by IPsec RRI to implement flexible route management. For example, you can set the same preference for multiple routes to the same destination to implement load sharing, or you can set different preferences to implement route backup.

You can also set tags for the static routes created by IPsec RRI to implement flexible route control through routing policies.

Protocols and standards

- RFC 2401, *Security Architecture for the Internet Protocol*
- RFC 2402, *IP Authentication Header*
- RFC 2406, *IP Encapsulating Security Payload*
- RFC 4552, *Authentication/Confidentiality for OSPFv3*

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

Restrictions and guidelines: IPsec configuration

Typically, IKE uses UDP port 500 for communication, and AH and ESP use the protocol numbers 51 and 50, respectively. Make sure traffic of these protocols is not denied on the interfaces with IKE or IPsec configured.

Implementing ACL-based IPsec

ACLs for IPsec take effect only on traffic that is generated by the device and traffic that is destined for the device. They do not take effect on traffic forwarded through the device. For example, an ACL-based IPsec tunnel can protect log messages the device sends to a log server, but it does not protect data flows and voice flows that are forwarded by the device.

ACL-based IPsec tasks at a glance

To configure ACL-based IPsec, perform the following tasks:

1. Configuring an ACL
2. Configuring an IPsec transform set
3. Configuring an IPsec policy

   Choose one of the following tasks:
   - Configuring a manual IPsec policy
   - Configuring an IKE-based IPsec policy
4. Applying an IPsec policy to an interface
5. (Optional.) Configuring accessibility features for ACL-based IPsec
   - Enabling ACL checking for de-encapsulated packets
   - Configuring IPsec anti-replay
   - Configuring IPsec anti-replay redundancy
   - Binding a source interface to an IPsec policy
   - Enabling QoS pre-classify
   - Configuring the DF bit of IPsec packets
   - Configuring IPsec RRI
   - Configuring the global IPsec SA lifetime and idle timeout
   - Configuring IPsec fragmentation

- Setting the maximum number of IPsec tunnels

6. (Optional.) Configuring logging and SNMP notification for IPsec.
   - Enabling logging for IPsec packets
   - Configuring SNMP notifications for IPsec

Configuring an ACL

IPsec uses ACLs to identify the traffic to be protected.

Keywords in ACL rules

An ACL is a collection of ACL rules. Each ACL rule is a deny or permit statement. A permit statement identifies a data flow protected by IPsec, and a deny statement identifies a data flow that is not protected by IPsec. IPsec compares a packet against the ACL rules and processes the packet according to the first rule it matches.

- Each ACL rule matches both the outbound traffic and the returned inbound traffic. Suppose there is a rule **rule 0 permit ip source 1.1.1.0 0.0.0.255 destination 2.2.2.0 0.0.0.255**. This rule matches both traffic from 1.1.1.0 to 2.2.2.0 and traffic from 2.2.2.0 to 1.1.1.0.
- In the outbound direction, if a permit statement is matched, IPsec considers that the packet requires protection and continues to process it. If a deny statement is matched or no match is found, IPsec considers that the packet does not require protection and delivers it to the next module.
- In the inbound direction:
  - Non-IPsec packets that match a permit statement are dropped.
  - IPsec packets destined for the device itself are de-encapsulated. By default, the de-encapsulated packets are compared against the ACL rules. Only those that match a permit statement are processed. Other packets are dropped. If ACL checking for de-encapsulated IPsec packets is disabled, the de-encapsulated packets are not compared against the ACL rules and are directly processed by other modules.

When defining ACL rules for IPsec, follow these guidelines:

- Permit only data flows that need to be protected and use the **any** keyword with caution. With the **any** keyword specified in a permit statement, all outbound traffic matching the permit statement will be protected by IPsec. All inbound IPsec packets matching the permit statement will be received and processed, but all inbound non-IPsec packets will be dropped. This will cause all the inbound traffic that does not need IPsec protection to be dropped.
- Avoid statement conflicts in the scope of IPsec policy entries. When creating a deny statement, be careful with its match scope and match order relative to permit statements. The policy entries in an IPsec policy have different match priorities. ACL rule conflicts between them are prone to cause mistreatment of packets. For example, when configuring a permit statement for an IPsec policy entry to protect an outbound traffic flow, you must avoid the situation that the traffic flow matches a deny statement in a higher priority IPsec policy entry. Otherwise, the packets will be sent out as normal packets. If they match a permit statement at the receiving end, they will be dropped by IPsec.

The following example shows how an improper statement causes unexpected packet dropping. Only the ACL-related configuration is presented.

Assume Router A is connected to subnet 1.1.2.0/24 and Router B is connected to subnet 3.3.3.0/24, and the IPsec policy configuration on Router A and Router B is as follows:

- IPsec configuration on Router A:

```
acl advanced 3000
 rule 0 permit ip source 1.1.1.0 0.0.0.255 destination 2.2.2.0 0.0.0.255
 rule 1 deny ip
acl advanced 3001
```

```
 rule 0 permit ip source 1.1.2.0 0.0.0.255 destination 3.3.3.0 0.0.0.255
 rule 1 deny ip
#
ipsec policy testa 1 isakmp <---IPsec policy entry with a higher priority
 security acl 3000
 ike-profile aa
 transform-set 1
#
ipsec policy testa 2 isakmp <---IPsec policy entry with a lower priority
 security acl 3001
 ike-profile bb
 transform-set 1
```

- IPsec configuration on Router B:

```
acl advanced 3001
 rule 0 permit ip source 3.3.3.0 0.0.0.255 destination 1.1.2.0 0.0.0.255
 rule 1 deny ip
#
ipsec policy testb 1 isakmp
 security acl 3001
 ike-profile aa
 transform-set 1
```

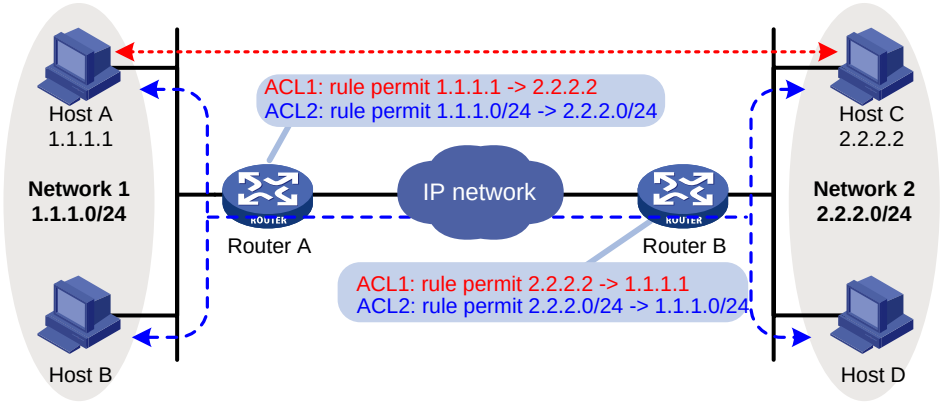
On Router A, apply the IPsec policy **testa** to the outbound interface of Router A. The IPsec policy contains two policy entries, **testa 1** and **testa 2**. The ACLs used by the two policy entries each contain a rule that matches traffic from 1.1.2.0/24 to 3.3.3.0/24. The one used in the policy entry **testa 1** is a deny statement and the one used in the policy entry **testa 2** is a permit statement. Because **testa 1** is matched prior to **testa 2**, traffic from 1.1.2.0/24 to 3.3.3.0/24 will match the deny statement and be sent as normal traffic. When the traffic arrives at Router B, the traffic matches rule 0 (a permit statement) in ACL 3001 used in the applied IPsec policy **testb**. Because non-IPsec traffic that matches a permit statement must be dropped on the inbound interface, Router B drops the traffic.

To make sure subnet 1.1.2.0/24 can access subnet 3.3.3.0/24, you can delete the deny rule in ACL 3000 on Router A.

Mirror image ACLs

To make sure SAs can be set up and the traffic protected by IPsec can be processed correctly between two IPsec peers, create mirror image ACLs on the IPsec peers. As shown in Figure 5, ACL rules on Router B are mirror images of the rules on Router A. In this way, SAs can be created successfully for the traffic between Host A and Host C and for the traffic between Network 1 and Network 2.

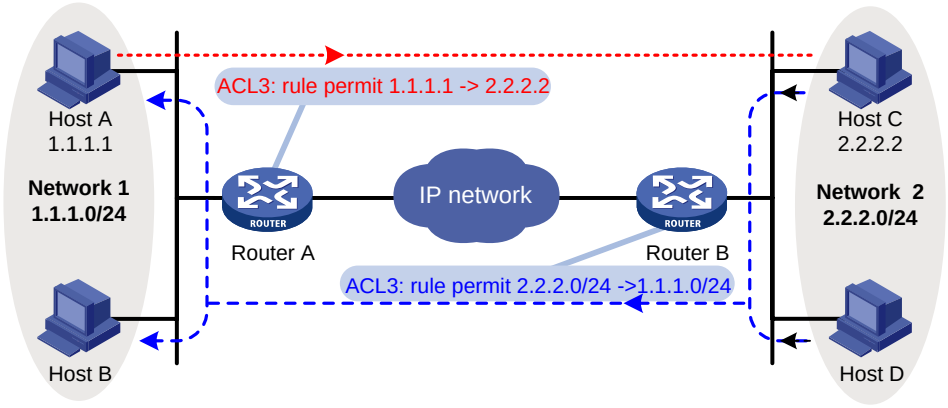
Figure 5 Mirror image ACLs



If the ACL rules on IPsec peers do not form mirror images of each other, SAs can be set up only when both of the following requirements are met:

- The range specified by an ACL rule on one peer is covered by its counterpart ACL rule on the other peer. As shown in Figure 6, the range specified by the ACL rule configured on Router A is covered by its counterpart on Router B.
- The peer with the narrower rule initiates SA negotiation. If a wider ACL rule is used by the SA initiator, the negotiation request might be rejected because the matching traffic is beyond the scope of the responder. As shown in Figure 6, the SA negotiation initiated by Host A to Host C is accepted but the SA negotiations from Host C to Host A, from Host C to Host B, and from Host D to Host A are rejected.

Figure 6 Non-mirror image ACLs



Configuring an IPsec transform set

About IPsec transform set

An IPsec transform set, part of an IPsec policy, defines the security parameters for IPsec SA negotiation, including the security protocol, encryption algorithms, and authentication algorithms.

Restrictions and guidelines

Changes to an IPsec transform set affect only SAs negotiated after the changes. To apply the changes to existing SAs, execute the reset ipsec sa command to clear the SAs so that they can be set up by using the updated parameters.

In FIPS mode, you must specify both the ESP encryption algorithm and the ESP authentication algorithm for an IPsec transform set that uses the ESP security protocol.

When you set the packet encapsulation mode (tunnel or transport) for an IPsec transform set, follow these guidelines:

- The transport mode applies only when the source and destination IP addresses of data flows match those of the IPsec tunnel.
- IPsec for IPv6 routing protocols supports only the transport mode.

When you configure the Perfect Forward Secrecy (PFS) feature in an IPsec transform set, follow these guidelines:

- In IKEv1, the security level of the DH group of the initiator must be higher than or equal to that of the responder. This restriction does not apply to IKEv2.
- The end without the PFS feature performs SA negotiation according to the PFS requirements of the peer end.

You can specify multiple authentication or encryption algorithms for the same security protocol. The algorithm specified earlier has a higher priority.

Some algorithms are available only for IKEv2. See Table 1.

Table 1 Algorithms available only for IKEv2

Type	Algorithms
Encryption algorithm	aes-ctr-128 aes-ctr-192 aes-ctr-256 camellia-cbc-128 camellia-cbc-192 camellia-cbc-256 gmac-128 gmac-192 gmac-256 gcm-128 gcm-192 gcm-256
Authentication algorithm	aes-xcbc-mac
PFS algorithm	dh-group19 dh-group20

Procedure

1. Enter system view.

   system-view

2. Create an IPsec transform set and enter its view.

   ipsec transform-set *transform-set-name*

3. Specify the security protocol for the IPsec transform set.

   protocol { **ah** | **ah-esp** | **esp** }

   By default, the ESP security protocol is used.

4. Specify the encryption algorithms for ESP. Skip this step if the **protocol ah** command is configured.

   In non-FIPS mode:

   esp encryption-algorithm { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** |

camellia-cbc-128 | **camellia-cbc-192** | **camellia-cbc-256** | **des-cbc** | **gmac-128** | **gmac-192** | **gmac-256** | **gcm-128** | **gcm-192** | **gcm-256** | **null** } *

By default, no encryption algorithm is specified for ESP.

In FIPS mode:

esp encryption-algorithm { **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** | **gmac-128** | **gmac-192** | **gmac-256** | **gcm-128** | **gcm-192** | **gcm-256** } *

By default, no encryption algorithm is specified for ESP.

5. Specify the authentication algorithms for ESP. Skip this step if the **protocol ah** command is configured.

   In non-FIPS mode:

   esp authentication-algorithm { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** } *

   By default, no authentication algorithm is specified for ESP.

   The **aes-xcbc-mac** algorithm is available only for IKEv2.

   In FIPS mode:

   esp authentication-algorithm { **sha1** | **sha256** | **sha384** | **sha512** } *

   By default, no authentication algorithm is specified for ESP.

6. Specify the authentication algorithms for AH. Skip this step if the **protocol esp** command is configured.

   In non-FIPS mode:

   ah authentication-algorithm { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** } *

   By default, no authentication algorithm is specified for AH.

   The **aes-xcbc-mac** algorithm is available only for IKEv2.

   In FIPS mode:

   ah authentication-algorithm { **sha1** | **sha256** | **sha384** | **sha512** } *

   By default, no authentication algorithm is specified for AH.

7. Specify the packet encapsulation mode.

   encapsulation-mode { **transport** | **tunnel** }

   By default, the security protocol encapsulates IP packets in tunnel mode.

8. (Optional.) Enable the PFS feature.

   In non-FIPS mode:

   pfs { **dh-group1** | **dh-group2** | **dh-group5** | **dh-group14** | **dh-group24** | **dh-group19** | **dh-group20** }

   In FIPS mode:

   pfs { **dh-group14** | **dh-group19** | **dh-group20** }

   By default, the PFS feature is disabled.

   For more information about PFS, see "Configuring IKE."

9. (Optional.) Enable the Extended Sequence Number (ESN) feature.

   esn enable [**both**]

   By default, the ESN feature is disabled.

Configuring a manual IPsec policy

In a manual IPsec policy, the parameters are configured manually, such as the keys, the SPIs, and the IP addresses of the two ends in tunnel mode.

Restrictions and guidelines

When you configure a manual IPsec policy, make sure the IPsec configuration at both ends of the IPsec tunnel meets the following requirements:

- The IPsec policies at the two ends must have IPsec transform sets that use the same security protocols, security algorithms, and encapsulation mode.
- The remote IPv4 address configured on the local end must be the same as the primary IPv4 address of the interface applied with the IPsec policy at the remote end. The remote IPv6 address configured on the local end must be the same as the first IPv6 address of the interface applied with the IPsec policy at the remote end.
- At each end, configure parameters for both the inbound SA and the outbound SA, and make sure the SAs in each direction are unique: For an outbound SA, make sure its triplet (remote IP address, security protocol, and SPI) is unique. For an inbound SA, make sure its SPI is unique.
- The local inbound SA must use the same SPI and keys as the remote outbound SA. The same is true of the local outbound SA and remote inbound SA.
- The keys for the IPsec SAs at the two tunnel ends must be configured in the same format. For example, if the local end uses a key in hexadecimal format, the remote end must also use a key in hexadecimal format. If you configure a key in both the character and the hexadecimal formats, only the most recent configuration takes effect.
- If you configure a key in character format for ESP, the device automatically generates an authentication key and an encryption key for ESP.

Procedure

1. Enter system view.

   system-view

2. Create a manual IPsec policy entry and enter its view.

   ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* **manual**

3. (Optional.) Configure a description for the IPsec policy.

   description *text*

   By default, no description is configured.

4. Specify an ACL for the IPsec policy.

   security acl [**ipv6**] { *acl-number* | **name** *acl-name* }

   By default, no ACL is specified for an IPsec policy.

   You can specify only one ACL for an IPsec policy.

5. Specify an IPsec transform set for the IPsec policy.

   transform-set *transform-set-name*

   By default, no IPsec transform set is specified for an IPsec policy.

   You can specify only one IPsec transform set for a manual IPsec policy.

6. Specify the remote IP address of the IPsec tunnel.

   remote-address { *ipv4-address* | **ipv6** *ipv6-address* }

   By default, the remote IP address of the IPsec tunnel is not specified.

7. Configure an SPI for the inbound IPsec SA.

   sa spi inbound { **ah** | **esp** } *spi-number*

   By default, no SPI is configured for the inbound IPsec SA.

8. Configure an SPI for the outbound IPsec SA.

   sa spi outbound { **ah** | **esp** } *spi-number*

   By default, no SPI is configured for the outbound IPsec SA.

9. Configure keys for the IPsec SA.
   - Configure an authentication key in hexadecimal format for AH.

     sa hex-key authentication { **inbound** | **outbound** } **ah** { **cipher** | **simple** } *string*
   - Configure an authentication key in character format for AH.

     sa string-key { **inbound** | **outbound** } **ah** { **cipher** | **simple** } *string*
   - Configure a key in character format for ESP.

     sa string-key { **inbound** | **outbound** } **esp** { **cipher** | **simple** } *string*
   - Configure an authentication key in hexadecimal format for ESP.

     sa hex-key authentication { **inbound** | **outbound** } **esp** { **cipher** | **simple** }
   - Configure an encryption key in hexadecimal format for ESP.

     sa hex-key encryption { **inbound** | **outbound** } **esp** { **cipher** | **simple** } *string*

   By default, no keys are configured for the IPsec SA.

   Configure keys correctly for the security protocol (AH, ESP, or both) you have specified in the IPsec transform set used by the IPsec policy.

Configuring an IKE-based IPsec policy

About IKE-based IPsec policy configuration

In an IKE-based IPsec policy, the parameters are automatically negotiated through IKE.

To configure an IKE-based IPsec policy, use one of the following methods:

- Directly configure it by configuring the parameters in IPsec policy view.
- Configure it by using an existing IPsec policy template with the parameters to be negotiated configured.

  A device using an IPsec policy that is configured in this way cannot initiate an SA negotiation, but it can respond to a negotiation request. The parameters not defined in the template are determined by the initiator. For example, in an IPsec policy template, the ACL is optional. If you do not specify an ACL, the IPsec protection range has no limit. So the device accepts all ACL settings of the negotiation initiator.

  When the remote end's information (such as the IP address) is unknown, this method allows the remote end to initiate negotiations with the local end.

The configurable parameters for an IPsec policy template are the same as those when you directly configure an IKE-based IPsec policy. The difference is that more parameters are optional for an IPsec policy template. Except the IPsec transform sets and the IKE profile, all other parameters are optional.

Restrictions and guidelines for IKE-based IPsec policy configuration

The IPsec policies at the two tunnel ends must have IPsec transform sets that use the same security protocols, security algorithms, and encapsulation mode.

The IPsec policies at the two tunnel ends must have the same IKE profile parameters.

An IKE-based IPsec policy can use a maximum of six IPsec transform sets. During an IKE negotiation, IKE searches for a fully matched IPsec transform set at the two ends of the IPsec tunnel. If no match is found, no SA can be set up, and the packets expecting to be protected will be dropped.

The remote IP address of the IPsec tunnel is required on an IKE negotiation initiator and is optional on the responder. The remote IP address specified on the local end must be the same as the local IP address specified on the remote end.

The IPsec SA uses the local lifetime settings or those proposed by the peer, whichever are smaller.

The IPsec SA can have both a time-based lifetime and a traffic-based lifetime. The IPsec SA expires when either lifetime expires.

If you specify both an IKEv1 profile and an IKEv2 profile for an IPsec policy, the IKEv2 profile is used preferentially. For more information about IKEv1 and IKEv2 profiles, see "Configuring IKE" and "Configuring IKEv2."

Directly configuring an IKE-based IPsec policy

1. Enter system view.

   system-view

2. Create an IKE-based IPsec policy entry and enter its view.

   ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* **isakmp**

3. (Optional.) Configure a description for the IPsec policy.

   description *text*

   By default, no description is configured.

4. Specify an ACL for the IPsec policy.

   security acl [**ipv6**] { *acl-number* | **name** *acl-name* } [**aggregation** | **per-host**]

   By default, no ACL is specified for an IPsec policy.

   You can specify only one ACL for an IPsec policy.

5. Specify IPsec transform sets for the IPsec policy.

   transform-set *transform-set-name*&<1-6>

   By default, no IPsec transform sets are specified for an IPsec policy.

6. Specify an IKE profile or IKEv2 profile for the IPsec policy.
   - Specify an IKE profile.

     ike-profile *profile-name*

     By default, no IKE profile is specified for an IPsec policy.
   - Specify an IKEv2 profile.

     ikev2-profile *profile-name*

     By default, no IKEv2 profile is specified for an IPsec policy.

7. Specify the local IP address of the IPsec tunnel.

   local-address { *ipv4-address* | **ipv6** *ipv6-address* }

   By default, the local IPv4 address of the IPsec tunnel is the primary IPv4 address of the interface to which the IPsec policy is applied. The local IPv6 address of the IPsec tunnel is the first IPv6 address of the interface to which the IPsec policy is applied.

   The local IP address specified by this command must be the same as the IP address used as the local IKE identity.

   In a VRRP network, the local IP address must be the virtual IP address of the VRRP group to which the IPsec-applied interface belongs.

8. Specify the remote IP address of the IPsec tunnel.

   remote-address { [**ipv6**] *host-name* | *ipv4-address* | **ipv6** *ipv6-address* }

   By default, the remote IP address of the IPsec tunnel is not specified.

9. (Optional.) Set the lifetime or idle timeout for the IPsec SA.

- Set the IPsec SA lifetime.

  sa duration { **time-based** *seconds* | **traffic-based** *kilobytes* }

  By default, the global SA lifetime is used.
- Set the IPsec SA idle timeout.

  sa idle-time *seconds*

  By default, the global IPsec SA idle timeout is used.

10. (Optional.) Enable the Traffic Flow Confidentiality (TFC) padding feature.

tfc enable

By default, the TFC padding feature is disabled.

Configuring an IKE-based IPsec policy by using an IPsec policy template

1. Enter system view.

system-view

2. Create an IPsec policy template and enter its view.

ipsec { **ipv6-policy-template** | **policy-template** } *template-name seq-number*

3. (Optional.) Configure a description for the IPsec policy template.

description *text*

By default, no description is configured.

4. (Optional.) Specify an ACL for the IPsec policy template.

security acl [**ipv6**] { *acl-number* | **name** *acl-name* } [**aggregation** | **per-host**]

By default, no ACL is specified for an IPsec policy template.

You can specify only one ACL for an IPsec policy template.

5. Specify IPsec transform sets for the IPsec policy template.

transform-set *transform-set-name*&<1-6>

By default, no IPsec transform sets are specified for an IPsec policy template.

6. Specify an IKE profile or IKEv2 profile for the IPsec policy template.
- Specify an IKE profile.

  ike-profile *profile-name*

  By default, no IKE profile is specified for an IPsec policy template.

  Make sure the specified IKE profile is not used by another IPsec policy or IPsec policy template.
- Specify an IKEv2 profile.

  ikev2-profile *profile-name*

  By default, no IKEv2 profile is specified for an IPsec policy template.

7. Specify the local IP address of the IPsec tunnel.

local-address { *ipv4-address* | **ipv6** *ipv6-address* }

The default local IPv4 address and IPv6 address is the primary IPv4 address and first IPv6 address of the interface where the IPsec policy is applied.

The local IP address specified by this command must be the same as the IP address used as the local IKE identity.

In a VRRP network, the local IP address must be the virtual IP address of the VRRP group to which the IPsec-applied interface belongs.

8. Specify the remote IP address of the IPsec tunnel.

remote-address { [**ipv6**] *host-name* | *ipv4-address* | **ipv6** *ipv6-address* }

By default, the remote IP address of the IPsec tunnel is not specified.

9. (Optional.) Set the lifetime and idle timeout for the IPsec SA.
   - Set the IPsec SA lifetime.
     sa duration { **time-based** *seconds* | **traffic-based** *kilobytes* }
     By default, the global SA lifetime is used.
   - Set the IPsec SA idle timeout.
     sa idle-time *seconds*
     By default, the global IPsec SA idle timeout is used.
10. (Optional.) Enable the Traffic Flow Confidentiality (TFC) padding feature.
    tfc enable
    By default, the TFC padding feature is disabled.
11. Return to system view.
    quit
12. Create an IPsec policy by using the IPsec policy template.
    ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* **isakmp template** *template-name*

Applying an IPsec policy to an interface

Restrictions and guidelines

You can apply an IPsec policy to interfaces to protect data flows.

- An IKE-based IPsec policy can be applied to multiple interfaces. As a best practice, apply an IKE-based IPsec policy to only one interface.
- A manual IPsec policy can be applied to only one interface.

To cancel the IPsec protection, remove the application of the IPsec policy.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an IPsec policy to the interface.
   ipsec apply { **ipv6-policy** | **policy** } *policy-name*
   By default, no IPsec policy is applied to an interface.
   On one interface, you can apply only one IPv4 IPsec policy and one IPv6 IPsec policy.

Enabling ACL checking for de-encapsulated packets

About ACL checking for de-encapsulated packets

This feature compares the de-encapsulated incoming IPsec packets against the ACL in the IPsec policy and discards those that do not match any permit rule of the ACL. This feature can protect networks against attacks using forged IPsec packets.

This feature applies only to tunnel-mode IPsec.

Procedure

1. Enter system view.

system-view

2. Enable ACL checking for de-encapsulated packets.

   ipsec decrypt-check enable

   By default, ACL checking for de-encapsulated packets is enabled.

Configuring IPsec anti-replay

About IPsec anti-replay

IPsec anti-replay protects networks against anti-replay attacks by using a sliding window mechanism called anti-replay window. This feature checks the sequence number of each received IPsec packet against the current IPsec packet sequence number range of the sliding window. If the sequence number is not in the current sequence number range, the packet is considered a replayed packet and is discarded.

IPsec packet de-encapsulation involves complicated calculation. De-encapsulation of replayed packets is not required, and the de-encapsulation process consumes large amounts of resources and degrades performance, resulting in DoS. IPsec anti-replay can check and discard replayed packets before de-encapsulation.

In some situations, service data packets are received in a different order than their original order. The IPsec anti-replay feature drops them as replayed packets, which impacts communications. If this happens, disable IPsec anti-replay checking or adjust the size of the anti-replay window as required.

Restrictions and guidelines

IPsec anti-replay does not affect manually created IPsec SAs. According to the IPsec protocol, only IKE-based IPsec SAs support anti-replay.

Set the anti-replay window size as small as possible to reduce the impact on system performance.

Failure to detect anti-replay attacks might result in denial of services. If you want to disable IPsec anti-replay, make sure you understand the impact of the operation on network security.

Procedure

1. Enter system view.

   system-view

2. Enable IPsec anti-replay.

   ipsec anti-replay check

   By default, IPsec anti-replay is enabled.

3. Set the size of the IPsec anti-replay window.

   ipsec anti-replay window *width*

   The default size is 64.

Configuring IPsec anti-replay redundancy

About IPsec anti-replay redundancy

This feature synchronizes the following information from the active device to the standby device at configurable packet-based intervals:

- Lower bound values of the IPsec anti-replay window for inbound packets.
- IPsec anti-replay sequence numbers for outbound packets.

This feature, used together with IPsec redundancy, ensures uninterrupted IPsec traffic forwarding and anti-replay protection when the active device fails.

Procedure

1. Enter system view.

   system-view

2. Enable IPsec redundancy.

   ipsec redundancy enable

   By default, IPsec redundancy is disabled.

3. Enter IPsec policy view or IPsec policy template view.
   - Enter IPsec policy view.

     ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* [**isakmp** | **manual**]

   - Enter IPsec policy template view.

     ipsec { **ipv6-policy-template** | **policy-template** } *template-name seq-number*

4. Set the anti-replay window synchronization interval for inbound packets and the sequence number synchronization interval for outbound packets.

   redundancy replay-interval inbound *inbound-interval* **outbound** *outbound-interval*

   By default, the active device synchronizes the anti-replay window every time it receives 1000 packets and synchronizes the sequence number every time it sends 100000 packets.

Binding a source interface to an IPsec policy

About source interface and IPsec policy binding

For high availability, a core device is usually connected to an ISP through two links, which operate in backup or load sharing mode. The two interfaces negotiate with their peers to establish IPsec SAs respectively. When one interface fails and a link failover occurs, the other interface needs to take some time to renegotiate SAs, resulting in service interruption.

To solve these problems, bind a source interface to an IPsec policy and apply the policy to both interfaces. This enables the two physical interfaces to use the same source interface to negotiate IPsec SAs. As long as the source interface is up, the negotiated IPsec SAs will not be removed and will keep working, regardless of link failover.

Restrictions and guidelines

Only the IKE-based IPsec policies can be bound to a source interface.

An IPsec policy can be bound to only one source interface.

A source interface can be bound to multiple IPsec policies.

If the source interface bound to an IPsec policy is removed, the IPsec policy becomes a common IPsec policy.

If no local address is specified for an IPsec policy that has been bound to a source interface, the IPsec policy uses the IP address of the bound source interface to perform IKE negotiation. If a local address is specified, the IPsec policy uses the local address to perform IKE negotiation.

Procedure

1. Enter system view.

   system-view

2. Bind a source interface to an IPsec policy.

   ipsec { **ipv6-policy** | **policy** } *policy-name* **local-address** *interface-type interface-number*

By default, no source interface is bound to an IPsec policy.

Enabling QoS pre-classify

About QoS pre-classify

When both an IPsec policy and a QoS policy are applied to an interface, QoS classifies packets by using the new headers added by IPsec. If you want QoS to classify packets by using the headers of the original IP packets, enable the QoS pre-classify feature.

Restrictions and guidelines

If you configure both IPsec and QoS on an interface, make sure the IPsec traffic classification rules match the QoS traffic classification rules. If the rules do not match, QoS might classify the packets of one IPsec SA to different queues, causing packets to be sent out of order. When IPsec anti-replay is enabled, IPsec will drop the incoming packets that are out of the anti-replay window, resulting in packet loss.

IPsec traffic classification rules are determined by the rules of the specified ACL. For more information about QoS policy and classification, see *ACL and QoS Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter IPsec policy view or IPsec policy template view.
   - Enter IPsec policy view.

     ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* [**isakmp** | **manual**]
   - Enter IPsec policy template view.

     ipsec { **ipv6-policy-template** | **policy-template** } *template-name seq-number*

3. Enable QoS pre-classify.

   qos pre-classify

   By default, QoS pre-classify is disabled.

Configuring the DF bit of IPsec packets

About DF bit configuration for IPsec packets

Perform this task to configure the Don't Fragment (DF) bit in the new IP header of IPsec packets in one of the following ways:

- **clear**—Clears the DF bit in the new header.
- **set**—Sets the DF bit in the new header.
- **copy**—Copies the DF bit in the original IP header to the new IP header.

You can configure the DF bit in system view and interface view. The interface-view DF bit setting takes precedence over the system-view DF bit setting. If the interface-view DF bit setting is not configured, the interface uses the system-view DF bit setting.

Restrictions and guidelines for DF bit configuration for IPsec packets

The DF bit setting takes effect only in tunnel mode, and it changes the DF bit in the new IP header rather than the original IP header.

Configure the same DF bit setting on the interfaces where the same IPsec policy bound to a source interface is applied.

If the DF bit is set, the devices on the path cannot fragment the IPsec packets. To prevent IPsec packets from being discarded, make sure the path MTU is larger than the IPsec packet size. As a best practice, clear the DF bit if you cannot make sure the path MTU is larger than the IPsec packet size.

Configuring the DF bit of IPsec packets on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the DF bit of IPsec packets on the interface.
   ipsec df-bit { **clear** | **copy** | **set** }
   By default, the interface uses the global DF bit setting.

Configuring the DF bit of IPsec packets globally

1. Enter system view.
   system-view
2. Configure the DF bit of IPsec packets globally.
   ipsec global-df-bit { **clear** | **copy** | **set** }
   By default, IPsec copies the DF bit in the original IP header to the new IP header.

Configuring IPsec RRI

Restrictions and guidelines

Enabling IPsec RRI for an IPsec policy deletes all existing IPsec SAs created by this IPsec policy. IPsec RRI creates static routes according to new IPsec SAs.

Disabling IPsec RRI for an IPsec policy deletes all existing IPsec SAs created by this IPsec policy and the associated static routes.

IPsec RRI is supported in both tunnel mode and transport mode.

If you change the preference value or tag value for an IPsec policy, the device deletes all IPsec SAs created by this IPsec policy, and the associated static routes. The change takes effect for future IPsec RRI-created static routes.

IPsec RRI does not generate a static route to a destination address to be protected if the destination address is not defined in the ACL used by an IPsec policy or an IPsec policy template. You must manually configure a static route to the destination address.

Procedure

1. Enter system view.
   system-view
2. Enter IPsec policy view or IPsec policy template view.
   - Enter IPsec policy view.
     ipsec { **policy** | **ipv6-policy** } *policy-name seq-number* **isakmp**
   - Enter IPsec policy template view.
     ipsec { **ipv6-policy-template** | **policy-template** } *template-name seq-number*
3. Enable IPsec RRI.
   reverse-route dynamic
   By default, IPsec RRI is disabled.

4. (Optional.) Set the preference value for the static routes created by IPsec RRI.
   reverse-route preference *number*
   The default value is 60.
5. (Optional.) Set the tag value for the static routes created by IPsec RRI.
   reverse-route tag *tag-value*
   The default value is 0.

Configuring IPsec for IPv6 routing protocols

IPsec protection for IPv6 routing protocols tasks at a glance

To configure IPsec protection for IPv6 routing protocols, perform the following tasks:

1. Configuring an IPsec transform set
2. Configuring a manual IPsec profile
3. Applying the IPsec profile to an IPv6 routing protocol
4. (Optional.) Configuring IPsec fragmentation
5. (Optional.) Setting the maximum number of IPsec tunnels
6. (Optional.) Enabling logging for IPsec packets
7. (Optional.) Configuring SNMP notifications for IPsec

Configuring a manual IPsec profile

About manual IPsec profile

A manual IPsec profile specifies the IPsec transform set used for protecting data flows, and the SPIs and keys used by the SAs.

Restrictions and guidelines

When you configure a manual IPsec profile, make sure the IPsec profile configuration at both tunnel ends meets the following requirements:

- The IPsec transform set specified in the IPsec profile at the two tunnel ends must have the same security protocol, encryption and authentication algorithms, and packet encapsulation mode.
- The local inbound and outbound IPsec SAs must have the same SPI and key.
- The IPsec SAs on the devices in the same scope must have the same key. The scope is defined by protocols. For OSPFv3, the scope consists of OSPFv3 neighbors or an OSPFv3 area. For RIPng, the scope consists of directly-connected neighbors or a RIPng process.
- The keys for the IPsec SAs at the two tunnel ends must be configured in the same format. For example, if the local end uses a key in hexadecimal format, the remote end must also use a key in hexadecimal format. If you configure a key in both the character and the hexadecimal formats, only the most recent configuration takes effect.
- If you configure a key in character format for ESP, the device automatically generates an authentication key and an encryption key for ESP.

Procedure

1. Enter system view.
   system-view
2. Create a manual IPsec profile and enter its view.
   ipsec profile *profile-name* **manual**

The **manual** keyword is not needed if you enter the view of an existing IPsec profile.

3. (Optional.) Configure a description for the IPsec profile.

   description *text*

   By default, no description is configured.

4. Specify an IPsec transform set.

   transform-set *transform-set-name*

   By default, no IPsec transform set is specified in an IPsec profile.

   The specified IPsec transform set must use the transport mode.

5. Configure an SPI for an SA.

   sa spi { **inbound** | **outbound** } { **ah** | **esp** } *spi-number*

   By default, no SPI is configured for an SA.

6. Configure keys for the IPsec SA.

   - Configure an authentication key in hexadecimal format for AH.

     sa hex-key authentication { **inbound** | **outbound** } **ah** { **cipher** | **simple** } *string*

   - Configure an authentication key in character format for AH.

     sa string-key { **inbound** | **outbound** } **ah** { **cipher** | **simple** } *string*

   - Configure a key in character format for ESP.

     sa string-key { **inbound** | **outbound** } **esp** { **cipher** | **simple** } *string*

   - Configure an authentication key in hexadecimal format for ESP.

     sa hex-key authentication { **inbound** | **outbound** } **esp** { **cipher** | **simple** }

   - Configure an encryption key in hexadecimal format for ESP.

     sa hex-key encryption { **inbound** | **outbound** } **esp** { **cipher** | **simple** } *string*

   By default, no keys are configured for the IPsec SA.

   Configure a key for the security protocol (AH, ESP, or both) you have specified.

Applying the IPsec profile to an IPv6 routing protocol

For information about the configuration procedure, see OSPFv3, and RIPng configuration in *Layer 3—IP Routing Configuration Guide*.

Configuring the global IPsec SA lifetime and idle timeout

About global IPsec SA lifetime and idle timeout

If the IPsec SA lifetime and idle timeout are not configured in an IPsec policy, IPsec policy template, or IPsec profile, the global settings are used.

When IKE negotiates IPsec SAs, it uses the local lifetime settings or those proposed by the peer, whichever are smaller.

An IPsec SA can have both a time-based lifetime and a traffic-based lifetime. The IPsec SA expires when either lifetime expires.

Procedure

1. Enter system view.

   system-view

2. Set the global IPsec SA lifetime or idle timeout.
   - Set the global IPsec SA lifetime.

     ipsec sa global-duration { **time-based** *seconds* | **traffic-based** *kilobytes* }

     By default, the time-based SA lifetime is 3600 seconds, and the traffic-based SA lifetime is 1843200 kilobytes.
   - Set the global SA idle timeout.

     ipsec sa idle-time *seconds*

     By default, the global IPsec SA idle timeout feature is disabled.

Configuring IPsec fragmentation

About IPsec fragmentation

Perform this task to configure the device to fragment packets before or after IPsec encapsulation.

If you configure the device to fragment packets before IPsec encapsulation, the device predetermines the encapsulated packet size before the actual encapsulation. If the encapsulated packet size exceeds the MTU of the output interface, the device fragments the packets before encapsulation. If a packet's DF bit is set, the device drops the packet and sends an ICMP error message.

If you configure the device to fragment packets after IPsec encapsulation, the device directly encapsulates the packets and fragments the encapsulated packets in subsequent service modules.

Restrictions and guidelines

This feature takes effect on IPsec protected IPv4 packets.

Procedure

1. Enter system view.

   system-view

2. Configure IPsec fragmentation.

   ipsec fragmentation { **after-encryption** | **before-encryption** }

   By default, the device fragments packets before IPsec encapsulation.

Setting the maximum number of IPsec tunnels

Restrictions and guidelines

To maximize concurrent performance of IPsec when memory is sufficient, increase the maximum number of IPsec tunnels. To ensure service availability when memory is insufficient, decrease the maximum number of IPsec tunnels.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of IPsec tunnels.

   ipsec limit max-tunnel *tunnel-limit*

The number of IPsec tunnels is not limited.

Enabling logging for IPsec packets

About IPsec packet logging

Perform this task to enable logging for IPsec packets that are discarded for reasons such as IPsec SA lookup failure, AH-ESP authentication failure, and ESP encryption failure. The log information includes the source and destination IP addresses, SPI value, and sequence number of a discarded IPsec packet, and the reason for the discard.

Procedure

1. Enter system view.

   `system-view`
2. Enable logging for IPsec packets.

   `ipsec logging packet enable`

   By default, logging for IPsec packets is disabled.

Configuring SNMP notifications for IPsec

About SNMP notifications for IPsec

After you enable SNMP notifications for IPsec, the IPsec module notifies the NMS of important module events. The notifications are sent to the device's SNMP module. For the notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

To generate and output SNMP notifications for a specific IPsec failure or event type, perform the following tasks:

1. Enable SNMP notifications for IPsec globally.
2. Enable SNMP notifications for the failure or event type.

Procedure

1. Enter system view.

   `system-view`
2. Enable SNMP notifications for IPsec globally.

   `snmp-agent trap enable ipsec global`

   By default, SNMP notifications for IPsec are disabled.
3. Enable SNMP notifications for the specified failure or event types.

   `snmp-agent trap enable ipsec` [**`auth-failure`** | **`decrypt-failure`** | **`encrypt-failure`** | **`invalid-sa-failure`** | **`no-sa-failure`** | **`policy-add`** | **`policy-attach`** | **`policy-delete`** | **`policy-detach`** | **`tunnel-start`** | **`tunnel-stop`**] *

   By default, SNMP notifications for all failure and event types are disabled.

Display and maintenance commands for IPsec

Execute **`display`** commands in any view and **`reset`** commands in user view.

Task	Command
Display IPsec policy information.	**display ipsec** { **ipv6-policy** | **policy** } [*policy-name* [*seq-number*]]
Display IPsec policy template information.	**display ipsec** { **ipv6-policy-template** | **policy-template** } [*template-name* [*seq-number*]]
Display IPsec profile information.	**display ipsec profile** [*profile-name*]
Display IPsec SA information.	**display ipsec sa** [**brief** | **count** | **interface** *interface-type interface-number* | { **ipv6-policy** | **policy** } *policy-name* [*seq-number*] | **profile** *profile-name* | **remote** [**ipv6**] *ip-address*]
Display IPsec statistics.	**display ipsec statistics** [**tunnel-id** *tunnel-id*]
Display IPsec transform set information.	**display ipsec transform-set** [*transform-set-name*]
Display IPsec tunnel information.	**display ipsec tunnel** { **brief** | **count** | **tunnel-id** *tunnel-id* }
Clear IPsec SAs.	**reset ipsec sa** [{ **ipv6-policy** | **policy** } *policy-name* [*seq-number*] | **profile** *policy-name* | **remote** { *ipv4-address* | **ipv6** *ipv6-address* } | **spi** { *ipv4-address* | **ipv6** *ipv6-address* } { **ah** | **esp** } *spi-num*]
Clear IPsec statistics.	**reset ipsec statistics** [**tunnel-id** *tunnel-id*]

IPsec configuration examples

Example: Configuring a manual mode IPsec tunnel for IPv4 packets

Network configuration

As shown in Figure 7, establish an IPsec tunnel between Switch A and Switch B to protect data flows between the switches. Configure the tunnel as follows:

- Specify the encapsulation mode as tunnel, the security protocol as ESP, the encryption algorithm as AES-CBC-192, and the authentication algorithm as HMAC-SHA1.
- Manually set up IPsec SAs.

Figure 7 Network diagram

Procedure

1. Configure Switch A:

Configure an IP address for VLAN-interface 1.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ip address 2.2.2.1 255.255.255.0
[SwitchA-Vlan-interface1] quit
```

Configure an IPv4 advanced ACL to identify the data flows between Switch A and Switch B.

```
[SwitchA] acl advanced 3101
[SwitchA-acl-ipv4-adv-3101] rule 0 permit ip source 2.2.2.1 0 destination 2.2.3.1 0
[SwitchA-acl-ipv4-adv-3101] quit
```

Create an IPsec transform set named **tran1**.

```
[SwitchA] ipsec transform-set tran1
```

Specify the encapsulation mode as **tunnel**.

```
[SwitchA-ipsec-transform-set-tran1] encapsulation-mode tunnel
```

Specify the security protocol as **ESP**.

```
[RouterA-ipsec-transform-set-tran1] protocol esp
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-192
[SwitchA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchA-ipsec-transform-set-tran1] quit
```

Create a manual IPsec policy entry. Specify the policy name as **map1** and set the sequence number to 10.

```
[SwitchA] ipsec policy map1 10 manual
```

Specify ACL 3101.

```
[SwitchA-ipsec-policy-manual-map1-10] security acl 3101
```

Specify IPsec transform set **tran1**.

```
[SwitchA-ipsec-policy-manual-map1-10] transform-set tran1
```

Specify the remote IP address of the IPsec tunnel as 2.2.3.1.

```
[SwitchA-ipsec-policy-manual-map1-10] remote-address 2.2.3.1
```

Configure inbound and outbound SPIs for ESP.

```
[SwitchA-ipsec-policy-manual-map1-10] sa spi outbound esp 12345
[SwitchA-ipsec-policy-manual-map1-10] sa spi inbound esp 54321
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchA-ipsec-policy-manual-map1-10] sa string-key outbound esp simple abcdefg
[SwitchA-ipsec-policy-manual-map1-10] sa string-key inbound esp simple gfedcba
[SwitchA-ipsec-policy-manual-map1-10] quit
```

Apply IPsec policy **map1** to VLAN-interface 1.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ipsec apply policy map1
```

2. Configure Switch B:

Configure an IP address for VLAN-interface 1.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ip address 2.2.3.1 255.255.255.0
[SwitchB-Vlan-interface1] quit
```

Configure an IPv4 advanced ACL to identify the data flows between Switch B and Switch A.

```
[SwitchB] acl advanced 3101
[SwitchB-acl-ipv4-adv-3101] rule 0 permit ip source 2.2.3.1 0 destination 2.2.2.1 0
[SwitchB-acl-ipv4-adv-3101] quit
```

Create an IPsec transform set named **tran1**.

```
[SwitchB] ipsec transform-set tran1
```

Specify the encapsulation mode as **tunnel**.

```
[SwitchB-ipsec-transform-set-tran1] encapsulation-mode tunnel
```

Specify the security protocol as **ESP**.

```
[SwitchB-ipsec-transform-set-tran1] protocol esp
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-192
[SwitchB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchB-ipsec-transform-set-tran1] quit
```

Create a manual IPsec policy entry. Specify the policy name as **use1** and set the sequence number to 10.

```
[SwitchB] ipsec policy use1 10 manual
```

Specify ACL 3101.

```
[SwitchB-ipsec-policy-manual-use1-10] security acl 3101
```

Specify IPsec transform set **tran1**.

```
[SwitchB-ipsec-policy-manual-use1-10] transform-set tran1
```

Specify the remote IP address of the IPsec tunnel as 2.2.2.1.

```
[SwitchB-ipsec-policy-manual-use1-10] remote-address 2.2.2.1
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-policy-manual-use1-10] sa spi outbound esp 54321
[SwitchB-ipsec-policy-manual-use1-10] sa spi inbound esp 12345
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-policy-manual-use1-10] sa string-key outbound esp simple gfedcba
[SwitchB-ipsec-policy-manual-use1-10] sa string-key inbound esp simple abcdefg
[SwitchB-ipsec-policy-manual-use1-10] quit
```

Apply IPsec policy **use1** to VLAN-interface 1.

```
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ipsec apply policy use1
```

Verifying the configuration

After the configuration is completed, an IPsec tunnel between Switch A and Switch B is established, and the traffic between the switches is IPsec-protected. This example uses Switch A to verify the configuration.

Use the **display ipsec sa** command to display IPsec SAs on Switch A.

```
[SwitchA] display ipsec sa
-------------------------------
Interface: Vlan-interface 1
-------------------------------

  -----------------------------
  IPsec policy: map1
  Sequence number: 10
  Mode: manual
  -----------------------------
```

```
Tunnel id: 549
Encapsulation mode: tunnel
Path MTU: 1443
Tunnel:
    local  address: 2.2.2.1
    remote address: 2.2.3.1
Flow:
    as defined in ACL 3101
[Inbound ESP SA]
  SPI: 54321 (0x0000d431)
  Transform set: ESP-ENCRYPT-AES-CBC-192 ESP-AUTH-SHA1
  No duration limit for this SA
[Outbound ESP SA]
  SPI: 12345 (0x00003039)
  Transform set: ESP-ENCRYPT-AES-CBC-192 ESP-AUTH-SHA1
  No duration limit for this SA
```

Example: Configuring an IKE-based IPsec tunnel for IPv4 packets

Network configuration

As shown in Figure 8, establish an IPsec tunnel between Switch A and Switch B to protect data flows between them. Configure the IPsec tunnel as follows:

- Specify the encapsulation mode as tunnel, the security protocol as ESP, the encryption algorithm as AES-CBC-192, and the authentication algorithm as HMAC-SHA1.
- Set up SAs through IKE negotiation.

Figure 8 Network diagram

Procedure

1. Configure Switch A:

Configure an IP address for VLAN-interface 1.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ip address 2.2.2.1 255.255.255.0
[SwitchA-Vlan-interface1] quit
```

Configure an IPv4 advanced ACL to identify data flows from Switch A to Switch B.

```
[SwitchA] acl number 3101
[SwitchA-acl-adv-3101] rule 0 permit ip source 2.2.2.1 0 destination 2.2.3.1 0
[SwitchA-acl-adv-3101] quit
```

Create an IPsec transform set named **tran1**.

```
[SwitchA] ipsec transform-set tran1
```

Specify the encapsulation mode as **tunnel**.

```
[SwitchA-ipsec-transform-set-tran1] encapsulation-mode tunnel
```

Specify the security protocol as **ESP**.

```
[SwitchA-ipsec-transform-set-tran1] protocol esp
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-192
[SwitchA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchA-ipsec-transform-set-tran1] quit
```

Create an IKE keychain named **keychain1**.

```
[SwitchA] ike keychain keychain1
```

Specify **12345zxcvb!@#$%ZXCVB** in plain text as the preshared key to be used with the remote peer at 2.2.3.1.

```
[SwitchA-ike-keychain-keychain1] pre-shared-key address 2.2.3.1 255.255.255.0 key
simple 12345zxcvb!@#$%ZXCVB
[SwitchA-ike-keychain-keychain1] quit
```

Create and configure the IKE profile named **profile1**.

```
[SwitchA] ike profile profile1
[SwitchA-ike-profile-profile1] keychain keychain1
[SwitchA-ike-profile-profile1] match remote identity address 2.2.3.1 255.255.255.0
[SwitchA-ike-profile-profile1] quit
```

Create an IKE-based IPsec policy entry. Specify the policy name as **map1** and set the sequence number to 10.

```
[SwitchA] ipsec policy map1 10 isakmp
```

Apply ACL 3101.

```
[SwitchA-ipsec-policy-isakmp-map1-10] security acl 3101
```

Apply IPsec transform set **tran1**.

```
[SwitchA-ipsec-policy-isakmp-map1-10] transform-set tran1
```

Specify the local and remote IP addresses of the IPsec tunnel as 2.2.2.1 and 2.2.3.1.

```
[SwitchA-ipsec-policy-isakmp-map1-10] local-address 2.2.2.1
[SwitchA-ipsec-policy-isakmp-map1-10] remote-address 2.2.3.1
```

Apply IKE profile **profile1**.

```
[SwitchA-ipsec-policy-isakmp-map1-10] ike-profile profile1
[SwitchA-ipsec-policy-isakmp-map1-10] quit
```

Apply IPsec policy **map1** to VLAN interface 1.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ipsec apply policy map1
```

2. Configure Switch B:

Configure an IP address for VLAN-interface 1.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ip address 2.2.3.1 255.255.255.0
[SwitchB-Vlan-interface1] quit
```

Configure an IPv4 advanced ACL to identify data flows from Switch B to Switch A.

```
[SwitchB] acl number 3101
[SwitchB-acl-adv-3101] rule 0 permit ip source 2.2.3.1 0 destination 2.2.2.1 0
[SwitchB-acl-adv-3101] quit
```

Create an IPsec transform set named **tran1**.

```
[SwitchB] ipsec transform-set tran1
```

Specify the encapsulation mode as **tunnel**.

```
[SwitchB-ipsec-transform-set-tran1] encapsulation-mode tunnel
```

Specify the security protocol as **ESP**.

```
[SwitchB-ipsec-transform-set-tran1] protocol esp
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-192
[SwitchB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchB-ipsec-transform-set-tran1] quit
```

Create an IKE keychain named **keychain1**.

```
[SwitchB] ike keychain keychain1
```

Specify **12345zxcvb!@#$%ZXCVB** in plain text as the preshared key to be used with the remote peer at 2.2.2.1.

```
[SwitchB-ike-keychain-keychain1] pre-shared-key address 2.2.2.1 255.255.255.0 key
simple 12345zxcvb!@#$%ZXCVB
[SwitchB-ike-keychain-keychain1] quit
```

Create and configure the IKE profile named **profile1**.

```
[SwitchB] ike profile profile1
[SwitchB-ike-profile-profile1] keychain keychain1
[SwitchB-ike-profile-profile1] match remote identity address 2.2.2.1 255.255.255.0
[SwitchB-ike-profile-profile1] quit
```

Create an IKE-based IPsec policy entry. Specify the policy name as **use1** and set the sequence number to 10.

```
[SwitchB] ipsec policy use1 10 isakmp
```

Apply ACL 3101.

```
[SwitchB-ipsec-policy-isakmp-use1-10] security acl 3101
```

Apply IPsec transform set **tran1**.

```
[SwitchB-ipsec-policy-isakmp-use1-10] transform-set tran1
```

Specify the local and remote IP addresses of the IPsec tunnel as 2.2.3.1 and 2.2.2.1.

```
[SwitchB-ipsec-policy-isakmp-use1-10] local-address 2.2.3.1
[SwitchB-ipsec-policy-isakmp-use1-10] remote-address 2.2.2.1
```

Apply IKE profile **profile1**.

```
[SwitchB-ipsec-policy-isakmp-use1-10] ike-profile profile1
[SwitchB-ipsec-policy-isakmp-use1-10] quit
```

Apply IPsec policy **use1** to VLAN-interface 1.

```
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ipsec apply policy use1
```

Verifying the configuration

Initiate a connection between Switch A and Switch B to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, the traffic between the two switches is IPsec-protected.

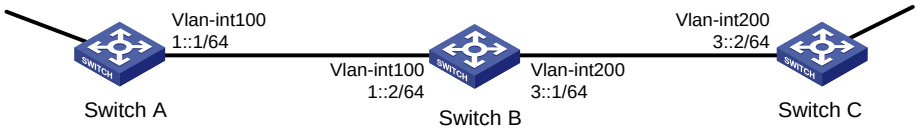
Example: Configuring IPsec for RIPng

Network configuration

As shown in Figure 9, Switch A, Switch B, and Switch C learn IPv6 routes through RIPng.

Establish an IPsec tunnel between the switches to protect the RIPng packets transmitted in between. Specify the security protocol as ESP, the encryption algorithm as 128-bit AES, and the authentication algorithm as HMAC-SHA1 for the IPsec tunnel.

Figure 9 Network diagram



Requirements analysis

To meet the network configuration requirements, perform the following tasks:

1. Configure basic RIPng.

   For more information about RIPng configurations, see *Layer 3—IP Routing Configuration Guide*.

2. Configure an IPsec profile.
   - The IPsec profiles on all the switches must have IPsec transform sets that use the same security protocol, authentication and encryption algorithms, and encapsulation mode.
   - The SPI and key configured for the inbound SA and those for the outbound SA must be the same on each switch.
   - The SPI and key configured for the SAs on all the switches must be the same.
3. Apply the IPsec profile to a RIPng process or to an interface.

Procedure

1. Configure Switch A:

   # Configure IPv6 addresses for interfaces. (Details not shown.)

   # Configure basic RIPng.

```
<SwitchA> system-view
[SwitchA] ripng 1
[SwitchA-ripng-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
```

   # Create and configure the IPsec transform set named **tran1**.

```
[SwitchA] ipsec transform-set tran1
[SwitchA-ipsec-transform-set-tran1] encapsulation-mode transport
[SwitchA-ipsec-transform-set-tran1] protocol esp
[SwitchA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[SwitchA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchA-ipsec-transform-set-tran1] quit
```

   # Create and configure the IPsec profile named **profile001**.

```
[SwitchA] ipsec profile profile001 manual
[SwitchA-ipsec-profile-manual-profile001] transform-set tran1
[SwitchA-ipsec-profile-manual-profile001] sa spi outbound esp 123456
[SwitchA-ipsec-profile-manual-profile001] sa spi inbound esp 123456
[SwitchA-ipsec-profile-manual-profile001] sa string-key outbound esp simple abcdefg
[SwitchA-ipsec-profile-manual-profile001] sa string-key inbound esp simple abcdefg
[SwitchA-ipsec-profile-manual-profile001] quit
```

   # Apply the IPsec profile to RIPng process 1.

```
[SwitchA] ripng 1
[SwitchA-ripng-1] enable ipsec-profile profile001
[SwitchA-ripng-1] quit
```

2. Configure Switch B:

Configure IPv6 addresses for interfaces. (Details not shown.)

Configure basic RIPng.

```
<SwitchB> system-view
[SwitchB] ripng 1
[SwitchB-ripng-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ripng 1 enable
[SwitchB-Vlan-interface200] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
```

Create and configure the IPsec transform set named **tran1**.

```
[SwitchB] ipsec transform-set tran1
[SwitchB-ipsec-transform-set-tran1] encapsulation-mode transport
[SwitchB-ipsec-transform-set-tran1] protocol esp
[SwitchB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[SwitchB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchB-ipsec-transform-set-tran1] quit
```

Create and configure the IPsec profile named **profile001**.

```
[SwitchB] ipsec profile profile001 manual
[SwitchB-ipsec-profile-manual-profile001] transform-set tran1
[SwitchB-ipsec-profile-manual-profile001] sa spi outbound esp 123456
[SwitchB-ipsec-profile-manual-profile001] sa spi inbound esp 123456
[SwitchB-ipsec-profile-manual-profile001] sa string-key outbound esp simple abcdefg
[SwitchB-ipsec-profile-manual-profile001] sa string-key inbound esp simple abcdefg
[SwitchB-ipsec-profile-manual-profile001] quit
```

Apply the IPsec profile to RIPng process 1.

```
[SwitchB] ripng 1
[SwitchB-ripng-1] enable ipsec-profile profile001
[SwitchB-ripng-1] quit
```

3. Configure Switch C:

Configure IPv6 addresses for interfaces. (Details not shown.)

Configure basic RIPng.

```
<SwitchC> system-view
[SwitchC] ripng 1
[SwitchC-ripng-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] ripng 1 enable
[SwitchC-Vlan-interface200] quit
```

Create and configure the IPsec transform set named **tran1**.

```
[SwitchC] ipsec transform-set tran1
[SwitchC-ipsec-transform-set-tran1] encapsulation-mode transport
[SwitchC-ipsec-transform-set-tran1] protocol esp
[SwitchC-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[SwitchC-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchC-ipsec-transform-set-tran1] quit
```

Create and configure the IPsec profile named **profile001**.

```
[SwitchC] ipsec profile profile001 manual
[SwitchC-ipsec-profile-manual-profile001] transform-set tran1
[SwitchC-ipsec-profile-manual-profile001] sa spi outbound esp 123456
[SwitchC-ipsec-profile-manual-profile001] sa spi inbound esp 123456
[SwitchC-ipsec-profile-manual-profile001] sa string-key outbound esp simple abcdefg
[SwitchC-ipsec-profile-manual-profile001] sa string-key inbound esp simple abcdefg
[SwitchC-ipsec-profile-manual-profile001] quit
```

Apply the IPsec profile to RIPng process 1.

```
[SwitchC] ripng 1
[SwitchC-ripng-1] enable ipsec-profile profile001
[SwitchC-ripng-1] quit
```

Verifying the configuration

After the configuration is completed, Switch A, Switch B, and Switch C learn IPv6 routing information through RIPng. IPsec SAs are set up successfully on the switches to protect RIPng packets. This example uses Switch A to verify the configuration.

Display the RIPng configuration. The output shows that IPsec profile **profile001** has been applied to RIPng process 1.

```
[SwitchA] display ripng 1
    RIPng process : 1
       Preference : 100
       Checkzero : Enabled
       Default Cost : 0
       Maximum number of load balanced routes : 8
       Update time   :   30 secs  Timeout time         :  180 secs
       Suppress time :  120 secs  Garbage-Collect time :  120 secs
       Update output delay:   20(ms)  Output count:    3
       Graceful-restart interval:   60 secs
       Triggered Interval : 5 50 200
       Number of periodic updates sent : 186
       Number of triggered updates sent : 1
       IPsec profile name: profile001
```

Display the established IPsec SAs.

```
[SwitchA] display ipsec sa
------------------------------
Global IPsec SA
------------------------------

  ----------------------------
  IPsec profile: profile001
  Mode: Manual
  ----------------------------
    Encapsulation mode: transport
    [Inbound ESP SA]
      SPI: 123456 (0x3039)
      Connection ID: 90194313219
      Transform set: ESP-ENCRYPT-AES-CBC-128 ESP-AUTH-SHA1
```

```
  No duration limit for this SA
[Outbound ESP SA]
  SPI: 123456 (0x3039)
  Connection ID: 64424509441
  Transform set: ESP-ENCRYPT-AES-CBC-128ESP-AUTH-SHA1
  No duration limit for this SA
```

Example: Configuring IPsec RRI

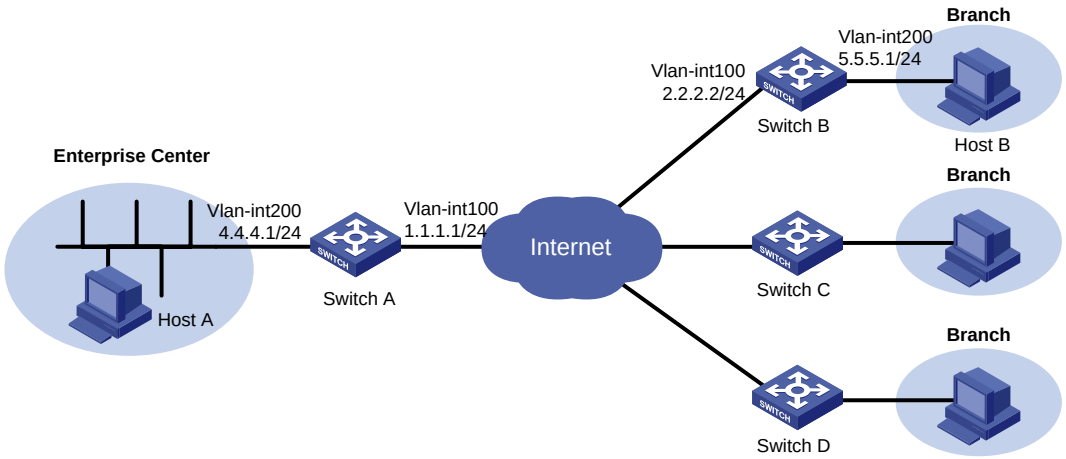
Network configuration

As shown in Figure 10, branches access the enterprise center through an IPsec VPN.

Configure the IPsec VPN as follows:

- Configure an IPsec tunnel between Switch A and each branch gateway (Switch B, Switch C, and Switch D) to protect traffic between subnets 4.4.4.0/24 and 5.5.5.0/24.
- Configure the tunnels to use security protocol ESP, encryption algorithm DES, and authentication algorithm SHA1-HMAC-96. Use IKE for IPsec SA negotiation.
- Configure IKE proposal to use the preshared key authentication method, encryption algorithm 3DES, and authentication algorithm HMAC-SHA1.
- Configure IPsec RRI on Switch A to automatically create static routes to the branches based on the established IPsec SAs.

Figure 10 Network diagram



Procedure

1. Assign IPv4 addresses to the interfaces on the switches according to Figure 10. (Details not shown.)
2. Configure Switch A:

   # Create an IPsec transform set named **tran1**, and specify **ESP** as the security protocol, **DES** as the encryption algorithm, and **HMAC-SHA-1-96** as the authentication algorithm.

   ```
   <SwitchA> system-view
   [SwitchA] ipsec transform-set tran1
   [SwitchA-ipsec-transform-set-tran1] encapsulation-mode tunnel
   [SwitchA-ipsec-transform-set-tran1] protocol esp
   [SwitchA-ipsec-transform-set-tran1] esp encryption-algorithm des
   [SwitchA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
   [SwitchA-ipsec-transform-set-tran1] quit
   ```

Create and configure the IKE profile named **profile1**.

```
[SwitchA] ike profile profile1
[SwitchA-ike-profile-profile1] keychain key1
[SwitchA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.255.0
[SwitchA-ike-profile-profile1] quit
```

Create an IPsec policy template named **temp1**. Specify IPsec transform set **tran1** and IKE profile **profile1** for the IPsec policy template.

```
[SwitchA] ipsec policy-template temp1 1
[SwitchA-ipsec-policy-template-temp1-1] transform-set tran1
[SwitchA-ipsec-policy-template-temp1-1] ike-profile profile1
```

Enable IPsec RRI, set the preference to 100 and the tag to 1000 for the static routes created by IPsec RRI.

```
[SwitchA-ipsec-policy-template-temp1-1] reverse-route dynamic
[SwitchA-ipsec-policy-template-temp1-1] reverse-route preference 100
[SwitchA-ipsec-policy-template-temp1-1] reverse-route tag 1000
[SwitchA-ipsec-policy-template-temp1-1] quit
```

Create an IKE-based IPsec policy entry by using IPsec policy template **temp1**. Specify the policy name as **map1** and set the sequence number to 10.

```
[SwitchA] ipsec policy map1 10 isakmp template temp1
```

Create an IKE proposal named **1**, and specify **3DES** as the encryption algorithm, **HMAC-SHA1** as the authentication algorithm, and **pre-share** as the authentication method.

```
[SwitchA] ike proposal 1
[SwitchA-ike-proposal-1] encryption-algorithm 3des-cbc
[SwitchA-ike-proposal-1] authentication-algorithm sha
[SwitchA-ike-proposal-1] authentication-method pre-share
[SwitchA-ike-proposal-1] quit
```

Create an IKE keychain named **key1** and specify **123** in plain text as the preshared key to be used with the remote peer at 2.2.2.2.

```
[SwitchA] ike keychain key1
[SwitchA-ike-keychain-key1] pre-shared-key address 2.2.2.2 key simple 123
[SwitchA-ike-keychain-key1] quit
```

Apply IPsec policy **map1** to VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipsec apply policy map1
[SwitchA-Vlan-interface100] quit
```

3. Configure Switch B:

Create an IPsec transform set named **tran1**, and specify **ESP** as the security protocol, **DES** as the encryption algorithm, and **HMAC-SHA-1-96** as the authentication algorithm.

```
[SwitchB] ipsec transform-set tran1
[SwitchB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[SwitchB-ipsec-transform-set-tran1] protocol esp
[SwitchB-ipsec-transform-set-tran1] esp encryption-algorithm des
[SwitchB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchB-ipsec-transform-set-tran1] quit
```

Configure IPv4 advanced ACL 3000 to identify traffic from subnet 5.5.5.0/24 to subnet 4.4.4.0/24.

```
[SwitchB] acl advanced 3000
[SwitchB-acl-ipv4-adv-3000] rule permit ip source 5.5.5.0 0.0.0.255 destination
4.4.4.0 0.0.0.255
```

```
[SwitchB-acl-ipv4-adv-3000] quit
```

Create and configure the IKE profile named **profile1**.

```
[SwitchB] ike profile profile1
[SwitchB-ike-profile-profile1] keychain key1
[SwitchB-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.255.0
[SwitchB-ike-profile-profile1] quit
```

Create an IKE-based IPsec policy entry named **map1** and configure the following settings for the policy entry:

- Set the sequence number to 10.
- Specify transform set **tran1** and ACL 3000.
- Specify the remote IP address for the tunnel as 1.1.1.1.
- Specify IKE profile **profile1**.

```
[SwitchB] ipsec policy map1 10 isakmp
[SwitchB-ipsec-policy-isakmp-map1-10] transform-set tran1
[SwitchB-ipsec-policy-isakmp-map1-10] security acl 3000
[SwitchB-ipsec-policy-isakmp-map1-10] remote-address 1.1.1.1
[SwitchB-ipsec-policy-isakmp-map1-10] ike-profile profile1
[SwitchB-ipsec-policy-isakmp-map1-10] quit
```

Create an IKE proposal named **1**, and specify **3DES** as the encryption algorithm, **HMAC-SHA1** as the authentication algorithm, and **pre-share** as the authentication method.

```
[SwitchB] ike proposal 1
[SwitchB-ike-proposal-1] encryption-algorithm 3des-cbc
[SwitchB-ike-proposal-1] authentication-algorithm sha
[SwitchB-ike-proposal-1] authentication-method pre-share
[SwitchB-ike-proposal-1] quit
```

Create an IKE keychain named **key1** and specify **123** in plain text as the preshared key to be used with the remote peer at 1.1.1.1.

```
[SwitchB] ike keychain key1
[SwitchB-ike-keychain-key1] pre-shared-key address 1.1.1.1 key simple 123
[SwitchB-ike-keychain-key1] quit
```

Apply IPsec policy **map1** to VLAN-interface 100.

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ipsec apply policy map1
[SwitchB-Vlan-interface100] quit
```

Make sure Switch B has a route to the peer private network, with the outgoing interface as VLAN-interface 100.

4. Configure Switch C and Switch D in the same way Switch B is configured.

Verifying the configuration

1. Verify that IPsec RRI can automatically create a static route from Switch A to Switch B:

Initiate a connection from subnet 5.5.5.0/24 to subnet 4.4.4.0/24. IKE negotiation is triggered to establish IPsec SAs between Switch A and Switch B. (Details not shown.)

Verify that IPsec SAs are established on Switch A.

```
[SwitchA] display ipsec sa
------------------------------
Interface: Vlan-interface100
------------------------------
```

```
----------------------------
IPsec policy: map1
Sequence number: 10
Mode: Template
----------------------------
  Tunnel id: 0
  Encapsulation mode: tunnel
  Perfect Forward Secrecy:
  Inside VPN:
  Extended Sequence Numbers enable: N
  Traffic Flow Confidentiality enable: N
  Path MTU: 1463
  Tunnel:
      local  address: 1.1.1.1
      remote address: 2.2.2.2
  Flow:
      sour addr: 4.4.4.0/255.255.255.0  port: 0  protocol: ip
      dest addr: 5.5.5.0/255.255.255.0  port: 0  protocol: ip

  [Inbound ESP SAs]
    SPI: 1014286405 (0x3c74c845)
    Connection ID: 90194313219
    Transform set: ESP-ENCRYPT-DES-CBC ESP-AUTH-SHA1
    SA duration (kilobytes/sec): 1843200/3600
    SA remaining duration (kilobytes/sec): 1843199/3590
    Max received sequence-number: 4
    Anti-replay check enable: Y
    Anti-replay window size: 64
    UDP encapsulation used for NAT traversal: N
    Status: Active

  [Outbound ESP SAs]
    SPI: 4011716027 (0xef1dedbb)
    Connection ID: 64424509441
    Transform set: ESP-ENCRYPT-DES-CBC ESP-AUTH-SHA1
    SA duration (kilobytes/sec): 1843200/3600
    SA remaining duration (kilobytes/sec): 1843199/3590
    Max sent sequence-number: 4
    UDP encapsulation used for NAT traversal: N
    Status: Active
```

Verify that IPsec RRI has created a static route to reach Switch B.

```
[SwitchA] display ip routing-table verbose
```

2. Verify that Switch A can automatically create static routes to Switch C and Switch D in the same way that you verify the IPsec RRI feature by using Switch A and Switch B. (Details not shown.)

Configuring IKE

Unless otherwise specified, the term "IKE" in this chapter refers to IKEv1.

About IKE

Built on a framework defined by ISAKMP, Internet Key Exchange (IKE) provides automatic key negotiation and SA establishment services for IPsec.

Benefits of IKE

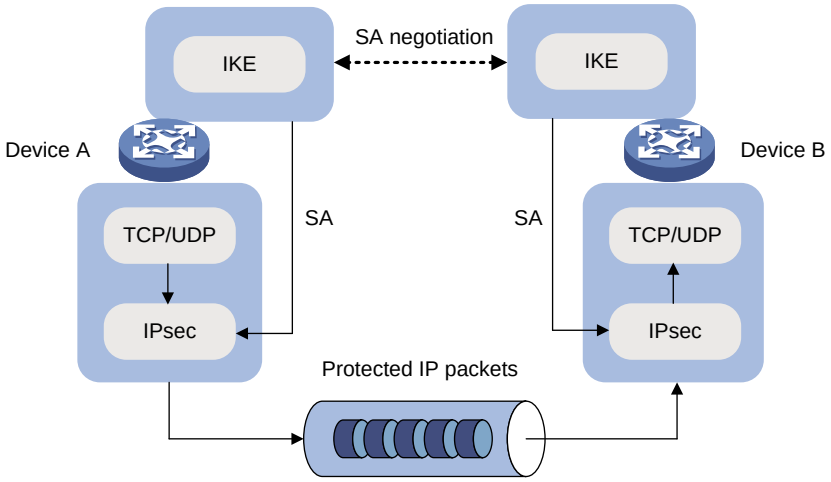
IKE provides the following benefits for IPsec:

- Automatically negotiates IPsec parameters.
- Performs DH exchanges to calculate shared keys, making sure each SA has a key that is independent of other keys.
- Automatically negotiates SAs when the sequence number in the AH or ESP header overflows, making sure IPsec can provide the anti-replay service by using the sequence number.

Relationship between IPsec and IKE

As shown in Figure 11, IKE negotiates SAs for IPsec and transfers the SAs to IPsec, and IPsec uses the SAs to protect IP packets.

Figure 11 Relationship between IKE and IPsec



IKE negotiation process

IKE negotiates keys and SAs for IPsec in two phases:

1. **Phase 1**—The two peers establish an IKE SA, a secure, authenticated channel for communication.
2. **Phase 2**—Using the IKE SA established in phase 1, the two peers negotiate to establish IPsec SAs.

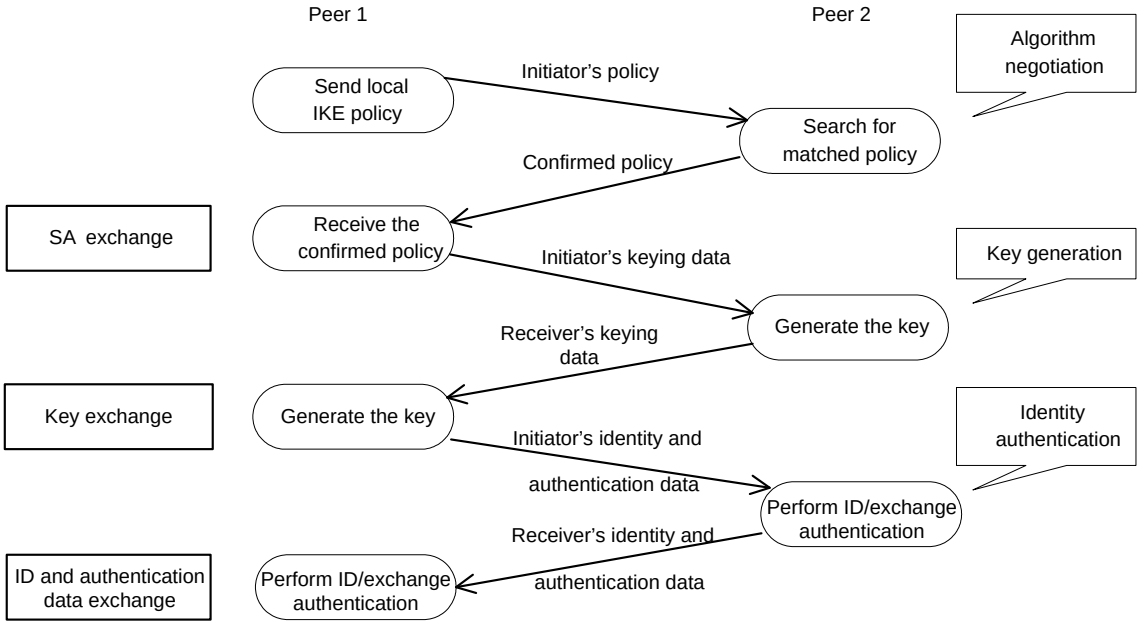
Phase 1 negotiation can use either main mode or aggressive mode.

IKE exchange process in main mode

As shown in Figure 12, the main mode of IKE negotiation in phase 1 involves three pairs of messages:

- **SA exchange**—Used for negotiating the IKE security policy.
- **Key exchange**—Used for exchanging the DH public value and other values, such as the random number. The two peers use the exchanged data to generate key data and use the encryption key and authentication key to ensure the security of IP packets.
- **ID and authentication data exchange**—Used for identity authentication.

Figure 12 IKE exchange process in main mode



IKE exchange process in aggressive mode

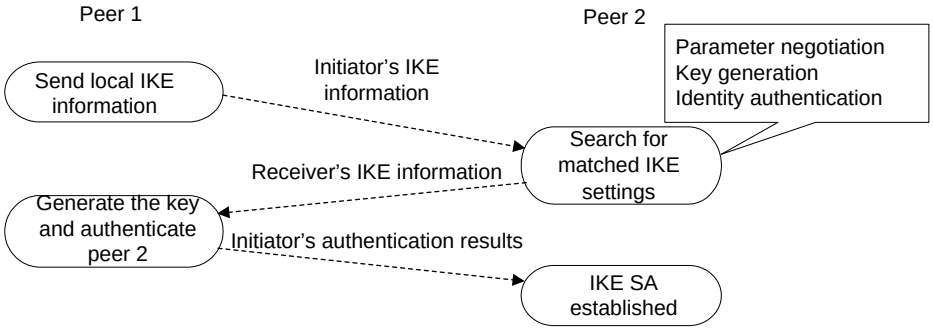
As shown in Figure 13, the process of phase 1 IKE negotiation in aggressive mode is as follows:

1. The initiator (peer 1) sends a message containing the local IKE information to peer 2. The message includes parameters used for IKE SA establishment, keying data, and peer 1's identity information.
2. Peer 2 chooses the IKE establishment parameters to use, generate the key, and authenticate peer 1's identity. Then it sends the IKE data to peer 1.
3. Peer 1 generates the key, authenticates peer 2's identity, and sends the results to peer 1.

After the preceding process, an IKE SA is established between peer 1 and peer 2.

The aggressive mode is faster than the main mode but it does not provide identity information protection. The main mode provides identity information protection but is slower. Choose the appropriate negotiation mode according to your requirements.

Figure 13 IKE exchange process in aggressive mode



IKE security mechanism

IKE has a series of self-protection mechanisms and supports secure identity authentication, key distribution, and IPsec SA establishment on insecure networks.

Identity authentication

The IKE identity authentication mechanism is used to authenticate the identity of the communicating peers. The device supports the following identity authentication methods:

- **Preshared key authentication**—Two communicating peers use the pre-configured shared key for identity authentication.
- **RSA signature authentication** and **DSA signature authentication**—Two communicating peers use the digital certificates issued by the CA for identity authentication.

The preshared key authentication method does not require certificates and is easy to configure. It is usually deployed in small networks.

The signature authentication methods provide higher security and are usually deployed in networks with the headquarters and some branches. When deployed in a network with many branches, a signature authentication method can simplify the configuration because only one PKI domain is required. If you use the preshared key authentication method, you must configure a preshared key for each branch on the Headquarters node.

DH algorithm

The DH algorithm is a public key algorithm. With this algorithm, two peers can exchange keying material and then use the material to calculate the shared keys. Due to the decryption complexity, a third party cannot decrypt the keys even after intercepting all keying materials.

PFS

The Perfect Forward Secrecy (PFS) feature is a security feature based on the DH algorithm. After PFS is enabled, an additional DH exchange is performed in IKE phase 2 to make sure IPsec keys have no derivative relations with IKE keys and a broken key brings no threats to other keys.

Protocols and standards

- RFC 2408, *Internet Security Association and Key Management Protocol (ISAKMP)*
- RFC 2409, *The Internet Key Exchange (IKE)*
- RFC 2412, *The OAKLEY Key Determination Protocol*
- Internet Draft, *draft-ietf-ipsec-isakmp-xauth-06*
- Internet Draft, *draft-dukes-ike-mode-cfg-02*

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

IKE tasks at a glance

To configure IKE, perform the following tasks:

1. (Optional.) Configuring an IKE profile
   a. Creating an IKE profile
   b. Configuring peer IDs for the IKE profile
   c. Specifying the IKE keychain or PKI domain
   d. Configuring the IKE phase 1 negotiation mode
   e. Specifying IKE proposals for the IKE profile
   f. Configuring the local ID for the IKE profile
   g. Configuring optional features for the IKE profile
2. Configuring an IKE proposal
3. Configuring an IKE keychain
4. (Optional.)Configuring the global identity information
5. (Optional.)Configuring the IKE keepalive feature
6. (Optional.)Configuring the IKE NAT keepalive feature
7. (Optional.)Configuring global IKE DPD
8. (Optional.)Enabling invalid SPI recovery
9. (Optional.)Setting the maximum number of IKE SAs
10. (Optional.)Configuring SNMP notifications for IKE

Prerequisites for IKE configuration

Determine the following parameters prior to IKE configuration:

- The algorithms to be used during IKE negotiation, including the identity authentication method, encryption algorithm, authentication algorithm, and DH group.
  - Different algorithms provide different levels of protection. A stronger algorithm provides more resistance to decryption but uses more resources.
  - A DH group that uses more bits provides higher security but needs more time for processing.
- The preshared key or PKI domain for IKE negotiation. For more information about PKI, see "Configuring PKI."
- The IKE-based IPsec policies for the communicating peers. If you do not specify an IKE profile in an IPsec policy, the device selects an IKE profile for the IPsec policy. If no IKE profile is configured, the globally configured IKE settings are used. For more information about IPsec, see "Configuring IPsec."

Configuring an IKE profile

Creating an IKE profile

About IKE profile

Perform this task to create an IKE profile.

An IKE profile is intended to provide a set of parameters for IKE negotiation.

Procedure

1. Enter system view.
   system-view
2. Create an IKE profile and enter its view.
   ike profile *profile-name*

Configuring peer IDs for the IKE profile

About peer ID configuration

Perform this task to configure the peer IDs for IKE profile matching. When the device needs to select an IKE profile for IKE negotiation with a peer, it compares the received peer ID with the peer IDs of its local IKE profiles. If a match is found, it uses the IKE profile with the matching peer ID for IKE negotiation.

Restrictions and guidelines

For an IKE profile, you can configure multiple peer IDs. A peer ID configured earlier has a higher priority.

Two IKE peers must both have or both not have peer IDs configured.

Procedure

1. Enter system view.
   system-view
2. Enter IKE profile view.
   ike profile *profile-name*
3. Configure a peer ID for the IKE profile.
   match remote { **certificate** *policy-name* | **identity** { **address** { { *ipv4-address* [*mask* | *mask-length*] | **range** *low-ipv4-address high-ipv4-address* } | **ipv6** { *ipv6-address* [*prefix-length*] | **range** *low-ipv6-address high-ipv6-address* } } | **fqdn** *fqdn-name* | **user-fqdn** *user-fqdn-name* } }

Specifying the IKE keychain or PKI domain

Restrictions and guidelines

Configure the IKE keychain or PKI domain for the IKE proposals to use. To use digital signature authentication, configure a PKI domain. To use preshared key authentication, configure an IKE keychain.

Procedure

1. Enter system view.

system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Specify the keychain for preshared key authentication or the PKI domain used to request a certificate for digital signature authentication.

   - Specify the keychain.

     keychain *keychain-name*

   - Specify the PKI domain.

     certificate domain *domain-name*

   By default, no IKE keychain or PKI domain is specified in an IKE profile.

Configuring the IKE phase 1 negotiation mode

Restrictions and guidelines

Specify the IKE phase 1 negotiation mode (main or aggressive) that the device uses as the initiator. When the device acts as the responder, it uses the IKE negotiation mode of the initiator.

Procedure

1. Enter system view.

   system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Specify the IKE negotiation mode for phase 1.

   In non-FIPS mode:

   exchange-mode { **aggressive** | **main** }

   In FIPS mode:

   exchange-mode main

   By default, IKE negotiation in phase 1 uses the main mode.

Specifying IKE proposals for the IKE profile

Restrictions and guidelines

Specify the IKE proposals that the device can use as the initiator. An IKE proposal specified earlier has a higher priority. When the device acts as the responder, it uses the IKE proposals configured in system view to match the IKE proposals received from the initiator. If no matching proposal is found, the negotiation fails.

Procedure

1. Enter system view.

   system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Specify IKE proposals for the IKE profile.

   proposal *proposal-number*&<1-6>

   By default, no IKE proposals are specified for an IKE profile and the IKE proposals configured in system view are used for IKE negotiation.

Configuring the local ID for the IKE profile

Restrictions and guidelines

For digital signature authentication, the device can use an ID of any type. If the local ID is an IP address that is different from the IP address in the local certificate, the device uses the FQDN (the device name configured by using the **sysname** command) instead.

For preshared key authentication, the device can use an ID of any type other than the DN.

Procedure

1. Enter system view.

   system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Configure the local ID.

   local-identity { **address** { *ipv4-address* | **ipv6** *ipv6-address* } | **dn** | **fqdn** [*fqdn-name*] | **user-fqdn** [*user-fqdn-name*] }

   By default, no local ID is configured for an IKE profile, and an IKE profile uses the local ID configured in system view. If the local ID is not configured in system view, the IKE profile uses the IP address of the interface to which the IPsec policy or IPsec policy template is applied as the local ID.

Configuring optional features for the IKE profile

1. Enter system view.

   system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Configure optional features as needed.

   - Configure IKE DPD.

     dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

     By default, IKE DPD is not configured for an IKE profile and an IKE profile uses the DPD settings configured in system view. If IKE DPD is not configured in system view either, the device does not perform dead IKE peer detection.

     The IKE DPD settings configured in the IKE profile view take precedence over those configured in system view.

   - Specify the local interface or IP address to which the IKE profile can be applied.

     match local address { *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } }

     By default, an IKE profile can be applied to any local interface or IP address.

     An IKE profile configured with this command has a higher priority over those not configured with this command.

   - Specify a priority for the IKE profile.

     priority *priority*

     By default, the priority of an IKE profile is 100.

     The device selects a local IKE profile for IKE negotiation as follows:

     – First, it selects an IKE profile with the **match local address** command configured.

     – If a tie exists, it selects the IKE profile with a smaller priority number.

- If a tie still exists, it selects the IKE profile configured earlier.

Configuring an IKE proposal

About IKE proposal

An IKE proposal defines a set of attributes describing how IKE negotiation in phase 1 should take place. You can create multiple IKE proposals with different priorities. The priority of an IKE proposal is represented by its sequence number. The lower the sequence number, the higher the priority.

Two peers must have at least one matching IKE proposal for successful IKE negotiation. During IKE negotiation:

- The initiator sends its IKE proposals to the peer.
  - If the initiator is using an IPsec policy with an IKE profile, the initiator sends all IKE proposals specified in the IKE profile to the peer. An IKE proposal specified earlier for the IKE profile has a higher priority.
  - If the initiator is using an IPsec policy with no IKE profile, the initiator sends all its IKE proposals to the peer. An IKE proposal with a smaller number has a higher priority.
- The peer searches its own IKE proposals for a match. The search starts from the IKE proposal with the highest priority and proceeds in descending order of priority until a match is found. The matching IKE proposals are used to establish the IKE SA. If all user-defined IKE proposals are found mismatching, the two peers use their default IKE proposals to establish the IKE SA.

Two matching IKE proposals have the same encryption algorithm, authentication method, authentication algorithm, and DH group. The SA lifetime takes the smaller one of the two proposals' SA lifetime settings.

Procedure

1. Enter system view.

   system-view

2. Create an IKE proposal and enter its view.

   ike proposal *proposal-number*

   By default, a default IKE proposal exists.

3. Configure a description for the IKE proposal.

   description

   By default, an IKE proposal does not have a description.

4. Specify an encryption algorithm for the IKE proposal.

   In non-FIPS mode:

   encryption-algorithm { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **des-cbc** }

   By default, the 56-bit DES encryption algorithm in CBC mode is used .

   In FIPS mode:

   encryption-algorithm { **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** }

   By default, the 128-bit AES encryption algorithm in CBC mode is used.

5. Specify an authentication method for the IKE proposal.

   authentication-method{ **dsa-signature** | **ecdsa-signature** | **pre-share** | **rsa-signature** }

   By default, the preshared key authentication method is used.

6. Specify an authentication algorithm for the IKE proposal.

   In non-FIPS mode:

authentication-algorithm { **md5** | **sha** | **sha256** | **sha384** | **sha512** }

By default, the HMAC-SHA1 authentication algorithm is used.

In FIPS mode:

authentication-algorithm { **sha** | **sha256** | **sha384** | **sha512** }

By default, the HMAC-SHA256 authentication algorithm is used.

7. Specify a DH group for key negotiation in phase 1.

   In non-FIPS mode:

   dh{ **group1** | **group14** | **group19** | **group2** | **group20** | **group24** | **group5** }

   DH group 1 (the 768-bit DH group) is used by default.

   In FIPS mode:

   dh{ **group14** | **group19** | **group20** | **group24** }

   DH group 14 (the 2048-bit DH group) is used by default.

8. (Optional.) Set the IKE SA lifetime for the IKE proposal.

   sa duration *seconds*

   By default, the IKE SA lifetime is 86400 seconds.

Configuring an IKE keychain

About IKE keychain

Perform this task when you configure the IKE to use the preshared key for authentication.

Follow these guidelines when you configure an IKE keychain:

- Two peers must be configured with the same preshared key to pass preshared key authentication.
- You can specify the local address configured in IPsec policy or IPsec policy template view (using the **local-address** command) for the IKE keychain to be applied. If no local address is configured, specify the IP address of the interface that uses the IPsec policy.
- The device determines the priority of an IKE keychain as follows:
  a. The device examines the existence of the **match local address** command. An IKE keychain with the **match local address** command configured has a higher priority.
  b. If a tie exists, the device compares the priority numbers. An IKE keychain with a smaller priority number has a higher priority.
  c. If a tie still exists, the device prefers an IKE keychain configured earlier.

Procedure

1. Enter system view.

   system-view

2. Create an IKE keychain and enter its view.

   ike keychain *keychain-name*

3. Configure a preshared key.

   In non-FIPS mode:

   pre-shared-key { **address** { *ipv4-address* [*mask* | *mask-length*] | **ipv6** *ipv6-address* [*prefix-length*] } | **hostname** *host-name* } **key** { **cipher** | **simple** } *string*

   In FIPS mode:

pre-shared-key { **address** { *ipv4-address* [*mask* | *mask-length*] | **ipv6** *ipv6-address* [*prefix-length*] } | **hostname** *host-name* } **key** [**cipher** *string*]

By default, no preshared key is configured.

4. (Optional.) Specify a local interface or IP address to which the IKE keychain can be applied.

   match local address { *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } }

   By default, an IKE keychain can be applied to any local interface or IP address.

5. (Optional.) Specify a priority for the IKE keychain.

   priority *priority*

   The default priority is 100.

Configuring the global identity information

Restrictions and guidelines

The global identity can be used by the device for all IKE SA negotiations, and the local identity (set by the **local-identity** command) can be used only by the device that uses the IKE profile.

When signature authentication is used, you can set any type of the identity information.

When preshared key authentication is used, you cannot set the DN as the identity.

Procedure

1. Enter system view.

   system-view

2. Configure the global identity to be used by the local end.

   ike identity { **address** { *ipv4-address* | **ipv6** *ipv6-address* } | **dn** | **fqdn** [*fqdn-name*] | **user-fqdn** [*user-fqdn-name*] }

   By default, the IP address of the interface to which the IPsec policy or IPsec policy template is applied is used as the IKE identity.

3. (Optional.) Configure the local device to always obtain the identity information from the local certificate for signature authentication.

   ike signature-identity from-certificate

   By default, the local end uses the identity information specified by **local-identity** or **ike identity** for signature authentication.

   Configure this command when the aggressive mode and signature authentication are used and the device interconnects with a Comware 5-based peer device. Comware 5 supports only DN for signature authentication.

Configuring the IKE keepalive feature

About the IKE keepalive feature

IKE sends keepalive packets to query the liveness of the peer. If the peer is configured with the keepalive timeout time, you must configure the keepalive interval on the local device. If the peer receives no keepalive packets during the timeout time, the IKE SA is deleted along with the IPsec SAs it negotiated.

Restrictions and guidelines

Configure IKE DPD instead of IKE keepalive unless IKE DPD is not supported on the peer. The IKE keepalive feature sends keepalives at regular intervals, which consumes network bandwidth and resources.

The keepalive timeout time configured on the local device must be longer than the keepalive interval configured at the peer. Since it seldom occurs that more than three consecutive packets are lost on a network, you can set the keepalive timeout three times as long as the keepalive interval.

Procedure

1. Enter system view.
   system-view
2. Set the IKE SA keepalive interval.
   ike keepalive interval *interval*
   By default, no keepalives are sent to the peer.
3. Set the IKE SA keepalive timeout time.
   ike keepalive timeout *seconds*
   By default, IKE SA keepalive never times out.

Configuring the IKE NAT keepalive feature

About the IKE NAT keepalive feature

If IPsec traffic passes through a NAT device, you must configure the NAT traversal feature. If no packet travels across an IPsec tunnel in a period of time, the NAT sessions are aged and deleted, disabling the tunnel from transmitting data to the intended end. To prevent NAT sessions from being aged, configure the NAT keepalive feature on the IKE gateway behind the NAT device to send NAT keepalive packets to its peer periodically to keep the NAT session alive.

Procedure

1. Enter system view.
   system-view
2. Set the IKE NAT keepalive interval.
   ike nat-keepalive *seconds*
   The default interval is 20 seconds.

Configuring global IKE DPD

About IKE DPD

DPD detects dead peers. It can operate in periodic mode or on-demand mode.

- **Periodic DPD**—Sends a DPD message at regular intervals. It features an earlier detection of dead peers, but consumes more bandwidth and CPU.
- **On-demand DPD**—Sends a DPD message based on traffic. When the device has traffic to send and is not aware of the liveness of the peer, it sends a DPD message to query the status of the peer. If the device has no traffic to send, it never sends DPD messages. As a best practice, use the on-demand mode.

The IKE DPD works as follows:

1. The local device sends a DPD message to the peer, and waits for a response from the peer.
2. If the peer does not respond within the retry interval specified by the **retry** *seconds* parameter, the local device resends the message.

3. If still no response is received within the retry interval, the local end sends the DPD message again. The system allows a maximum of two retries.
4. If the local device receives no response after two retries, the device considers the peer to be dead, and deletes the IKE SA along with the IPsec SAs it negotiated.
5. If the local device receives a response from the peer during the detection process, the peer is considered alive. The local device performs a DPD detection again when the triggering interval is reached or it has traffic to send, depending on the DPD mode.

Restrictions and guidelines

When DPD settings are configured in both IKE profile view and system view, the DPD settings in IKE profile view apply. If DPD is not configured in IKE profile view, the DPD settings in system view apply.

It is a good practice to set the triggering interval longer than the retry interval so that a DPD detection is not triggered during a DPD retry.

Procedure

1. Enter system view.

   system-view
2. Enable sending IKE DPD messages.

   ike dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

   By default, IKE DPD is disabled.

Enabling invalid SPI recovery

About invalid SPI recovery

An IPsec "black hole" occurs when one IPsec peer fails (for example, a peer can fail if a reboot occurs). One peer fails and loses its SAs with the other peer. When an IPsec peer receives a data packet for which it cannot find an SA, an invalid SPI is encountered. The peer drops the data packet and tries to send an SPI invalid notification to the data originator. This notification is sent by using the IKE SA. Because no IKE SA is available, the notification is not sent. The originating peer continues sending the data by using the IPsec SA that has the invalid SPI, and the receiving peer keeps dropping the traffic.

The invalid SPI recovery feature enables the receiving peer to set up an IKE SA with the originator so that an SPI invalid notification can be sent. Upon receiving the notification, the originating peer deletes the IPsec SA that has the invalid SPI. If the originator has data to send, new SAs will be set up.

Restrictions and guidelines

Use caution when you enable the invalid SPI recovery feature because using this feature can result in a DoS attack. Attackers can make a great number of invalid SPI notifications to the same peer.

Procedure

1. Enter system view.

   system-view
2. Enable invalid SPI recovery.

   ike invalid-spi-recovery enable

   By default, the invalid SPI recovery is disabled.

Setting the maximum number of IKE SAs

About maximum number of IKE SAs configuration

You can set the maximum number of half-open IKE SAs and the maximum number of established IKE SAs.

- The supported maximum number of half-open IKE SAs depends on the device's processing capability. Adjust the maximum number of half-open IKE SAs to make full use of the device's processing capability without affecting the IKE SA negotiation efficiency.
- The supported maximum number of established IKE SAs depends on the device's memory space. Adjust the maximum number of established IKE SAs to make full use of the device's memory space without affecting other applications in the system.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of half-open IKE SAs and the maximum number of established IKE SAs.

   ike limit { **max-negotiating-sa** *negotiation-limit* | **max-sa** *sa-limit* }

   By default, there is no limit to the maximum number of IKE SAs.

Configuring SNMP notifications for IKE

About SNMP notification configuration for IKE

After you enable SNMP notifications for IKE, the IKE module notifies the NMS of important module events. The notifications are sent to the device's SNMP module. For the notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

To generate and output SNMP notifications for a specific IKE failure or event type, perform the following tasks:

1. Enable SNMP notifications for IKE globally.
2. Enable SNMP notifications for the failure or event type.

Procedure

1. Enter system view

   system-view

2. Enable SNMP notifications for IKE globally.

   snmp-agent trap enable ike global

   By default, SNMP notifications for IKE are disabled.

3. Enable SNMP notifications for the specified failure or event types.

   snmp-agent trap enable ike [**attr-not-support** | **auth-failure** | **cert-type-unsupport** | **cert-unavailable** | **decrypt-failure** | **encrypt-failure** | **invalid-cert-auth** | **invalid-cookie** | **invalid-id** | **invalid-proposal** | **invalid-protocol** | **invalid-sign** | **no-sa-failure** | **proposal-add** | **proposal–delete** | **tunnel-start** | **tunnel-stop** | **unsupport-exch-type**] *

   By default, SNMP notifications for all failure and event types are disabled.

Display and maintenance commands for IKE

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display configuration information about all IKE proposals.	**display ike proposal**
Display information about the current IKE SAs.	**display ike sa** [**verbose** [**connection-id** *connection-id* | **remote-address** [**ipv6**] *remote-address*]]
Display IKE statistics.	**display ike statistics**
Delete IKE SAs.	**reset ike sa** [**connection-id** *connection-id*]
Clear IKE MIB statistics.	**reset ike statistics**

IKE configuration examples

Example: Configuring main-mode IKE with preshared key authentication

Network configuration

As shown in Figure 14, configure an IKE-based IPsec tunnel between Switch A and Switch B to secure the communication between the switches.

- Configure the two switches to use the default IKE proposal for the IKE negotiation.
- Configure the two switches to use the preshared key authentication method for the IKE negotiation.

Figure 14 Network diagram

Procedure

1. Make sure Switch A and Switch B can reach each other.
2. Configure Switch A:

   # Configure an IP address for VLAN-interface 1.

   ```
   <SwitchA> system-view
   [SwitchA] interface vlan-interface 1
   [SwitchA-vlan-interface1] ip address 1.1.1.1 255.255.0.0
   [SwitchA-vlan-interface1] quit
   ```

   # Configure IPv4 advanced ACL 3101 to identify the traffic from Switch A to Switch B.

   ```
   [SwitchA] acl advanced 3101
   ```

```
[SwitchA-acl-ipv4-adv-3101] rule 0 permit ip source 1.1.1.1 0 destination 2.2.2.2 0
[SwitchA-acl-ipv4-adv-3101] quit
```

Create an IPsec transform set named **tran1**.

```
[SwitchA] ipsec transform-set tran1
```

Set the packet encapsulation mode to **tunnel**.

```
[SwitchA-ipsec-transform-set-tran1] encapsulation-mode tunnel
```

Use the ESP protocol for the IPsec transform set.

```
[SwitchA-ipsec-transform-set-tran1] protocol esp
```

Specify the encryption and authentication algorithms.

```
[SwitchA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-192
[SwitchA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchA-ipsec-transform-set-tran1] quit
```

Create an IKE keychain named **keychain1**.

```
[SwitchA] ike keychain keychain1
```

Specify **12345zxcvb!@#$%ZXCVB** in plain text as the preshared key to be used with the remote peer at 2.2.2.2.

```
[SwitchA-ike-keychain-keychain1] pre-shared-key address 2.2.2.2 255.255.0.0 key
simple 12345zxcvb!@#$%ZXCVB
[SwitchA-ike-keychain-keychain1] quit
```

Create an IKE profile named **profile1**.

```
[SwitchA] ike profile profile1
```

Specify IKE keychain **keychain1**.

```
[SwitchA-ike-profile-profile1] keychain keychain1
```

Configure a peer ID with the identity type as IP address and the value as **2.2.2.2/16**.

```
[SwitchA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
[SwitchA-ike-profile-profile1] quit
```

Create an IKE-based IPsec policy entry. Specify the policy name as **map1** and set the sequence number to 10.

```
[SwitchA] ipsec policy map1 10 isakmp
```

Specify the remote IP address 2.2.2.2 for the IPsec tunnel.

```
[SwitchA-ipsec-policy-isakmp-map1-10] remote-address 2.2.2.2
```

Specify ACL 3101 to identify the traffic to be protected.

```
[SwitchA-ipsec-policy-isakmp-map1-10] security acl 3101
```

Specify IPsec transform set **tran1** for the IPsec policy.

```
[SwitchA-ipsec-policy-isakmp-map1-10] transform-set tran1
```

Specify IKE profile **profile1** for the IPsec policy.

```
[SwitchA-ipsec-policy-isakmp-map1-10] ike-profile profile1
[SwitchA-ipsec-policy-isakmp-map1-10] quit
```

Apply IPsec policy **map1** to VLAN-interface 1.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ipsec apply policy map1
```

3. Configure Switch B:

Configure an IP address for VLAN-interface 1.

```
<SwitchB> system-view
[SwitchB] interface Vlan-interface1
[SwitchB-Vlan-interface1] ip address 2.2.2.2 255.255.0.0
[SwitchB-Vlan-interface1] quit
```

Configure IPv4 advanced ACL 3101 to identify the traffic from Switch B to Switch A.

```
[SwitchB] acl number 3101
[SwitchB-acl-adv-3101] rule 0 permit ip source 2.2.2.2 0 destination 1.1.1.1 0
[SwitchB-acl-adv-3101] quit
```

Create an IPsec transform set named **tran1**.

```
[SwitchB] ipsec transform-set tran1
```

Set the packet encapsulation mode to **tunnel**.

```
[SwitchB-ipsec-transform-set-tran1] encapsulation-mode tunnel
```

Use the ESP protocol for the IPsec transform set.

```
[SwitchB-ipsec-transform-set-tran1] protocol esp
```

Specify the encryption and authentication algorithms.

```
[SwitchB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-192
[SwitchB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchB-ipsec-transform-set-tran1] quit
```

Create an IKE keychain named **keychain1**.

```
[SwitchB]ike keychain keychain1
```

Specify **12345zxcvb!@#$%ZXCVB** in plain text as the preshared key to be used with the remote peer at 1.1.1.1.

```
[SwitchB-ike-keychain-keychain1] pre-shared-key address 1.1.1.1 255.255.0.0 key
simple 12345zxcvb!@#$%ZXCVB
[SwitchB-ike-keychain-keychain1] quit
```

Create an IKE profile named **profile1**.

```
[SwitchB] ike profile profile1
```

Specify IKE keychain **keychain1**

```
[SwitchB-ike-profile-profile1] keychain keychain1
```

Configure a peer ID with the identity type as IP address and the value as **1.1.1.1/16**.

```
[SwitchB-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.0.0
[SwitchB-ike-profile-profile1] quit
```

Create an IKE-based IPsec policy entry. Specify the policy name as **use1** and set the sequence number to 10.

```
[SwitchB] ipsec policy use1 10 isakmp
```

Specify the remote IP address 1.1.1.1 for the IPsec tunnel.

```
[SwitchB-ipsec-policy-isakmp-use1-10] remote-address 1.1.1.1
```

Specify ACL 3101 to identify the traffic to be protected.

```
[SwitchB-ipsec-policy-isakmp-use1-10] security acl 3101
```

Specify IPsec transform set **tran1** for the IPsec policy.

```
[SwitchB-ipsec-policy-isakmp-use1-10] transform-set tran1
```

Specify IKE profile **profile1** for the IPsec policy.

```
[SwitchB-ipsec-policy-isakmp-use1-10] ike-profile profile1
[SwitchB-ipsec-policy-isakmp-use1-10] quit
```

Apply IPsec policy **use1** to VLAN-interface 1.

```
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ipsec apply policy use1
```

Verifying the configuration

Initiate a connection between Switch A and Switch B to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, the traffic between the two switches is IPsec-protected.

Example: Configuring an IKE-based IPsec tunnel for IPv4 packets

Network configuration

As shown in Figure 15, establish an IPsec tunnel between Switch A and Switch B to protect data flows between the switches. Configure the IPsec tunnel as follows:

- Specify the encapsulation mode as tunnel, the security protocol as ESP, the encryption algorithm as AES-CBC-192, and the authentication algorithm as HMAC-SHA1.
- Set up SAs through IKE negotiation.

Figure 15 Network diagram

Procedure

1. Configure Switch A:

   # Configure an IP address for VLAN-interface 1.

   ```
   <SwitchA> system-view
   [SwitchA] interface vlan-interface 1
   [SwitchA-Vlan-interface1] ip address 2.2.2.1 255.255.255.0
   [SwitchA-Vlan-interface1] quit
   ```

   # Configure an IPv4 advanced ACL to identify the data flows from Switch A to Switch B.

   ```
   [SwitchA] acl advanced 3101
   [SwitchA-acl-ipv4-adv-3101] rule 0 permit ip source 2.2.2.1 0 destination 2.2.3.1 0
   [SwitchA-acl-ipv4-adv-3101] quit
   ```

   # Create an IPsec transform set named **tran1**.

   ```
   [SwitchA] ipsec transform-set tran1
   ```

   # Specify the encapsulation mode as **tunnel**.

   ```
   [SwitchA-ipsec-transform-set-tran1] encapsulation-mode tunnel
   ```

   # Specify the security protocol as **ESP**.

   ```
   [SwitchA-ipsec-transform-set-tran1] protocol esp
   ```

   # Specify the ESP encryption and authentication algorithms.

   ```
   [SwitchA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-192
   [SwitchA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
   [SwitchA-ipsec-transform-set-tran1] quit
   ```

   # Create an IKE keychain named **keychain1**.

   ```
   [SwitchA] ike keychain keychain1
   ```

   # Specify **12345zxcvb!@#$%ZXCVB** in plain text as the preshared key to be used with the remote peer at 2.2.3.1.

   ```
   [SwitchA-ike-keychain-keychain1] pre-shared-key address 2.2.3.1 255.255.255.0 key
   simple 12345zxcvb!@#$%ZXCVB
   [SwitchA-ike-keychain-keychain1] quit
   ```

   # Create and configure an IKE profile named **profile1**.

   ```
   [SwitchA] ike profile profile1
   [SwitchA-ike-profile-profile1] keychain keychain1
   ```

```
[SwitchA-ike-profile-profile1] match remote identity address 2.2.3.1 255.255.255.0
[SwitchA-ike-profile-profile1] quit
```

Create an IKE-based IPsec policy entry. Specify the policy name as **map1** and set the sequence number to 10.

```
[SwitchA] ipsec policy map1 10 isakmp
```

Specify ACL 3101.

```
[SwitchA-ipsec-policy-isakmp-map1-10] security acl 3101
```

Specify IPsec transform set **tran1**.

```
[SwitchA-ipsec-policy-isakmp-map1-10] transform-set tran1
```

Specify the local and remote IP addresses of the IPsec tunnel as 2.2.2.1 and 2.2.3.1.

```
[SwitchA-ipsec-policy-isakmp-map1-10] local-address 2.2.2.1
[SwitchA-ipsec-policy-isakmp-map1-10] remote-address 2.2.3.1
```

Specify IKE profile **profile1**.

```
[SwitchA-ipsec-policy-isakmp-map1-10] ike-profile profile1
[SwitchA-ipsec-policy-isakmp-map1-10] quit
```

Apply IPsec policy **map1** to VLAN-interface 1.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ipsec apply policy map1
```

2. Configure Switch B:

Configure an IP address for VLAN-interface 1.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ip address 2.2.3.1 255.255.255.0
[SwitchB-Vlan-interface1] quit
```

Configure an IPv4 advanced ACL to identify the data flows from Switch B to Switch A.

```
[SwitchB] acl advanced 3101
[SwitchB-acl-ipv4-adv-3101] rule 0 permit ip source 2.2.3.1 0 destination 2.2.2.1 0
[SwitchB-acl-ipv4-adv-3101] quit
```

Create an IPsec transform set named **tran1**.

```
[SwitchB] ipsec transform-set tran1
```

Specify the encapsulation mode as **tunnel**.

```
[SwitchB-ipsec-transform-set-tran1] encapsulation-mode tunnel
```

Specify the security protocol as **ESP**.

```
[SwitchB-ipsec-transform-set-tran1] protocol esp
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-192
[SwitchB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchB-ipsec-transform-set-tran1] quit
```

Create an IKE keychain named **keychain1**.

```
[SwitchB] ike keychain keychain1
```

Specify **12345zxcvb!@#$%ZXCVB** in plain text as the preshared key to be used with the remote peer at 2.2.2.1.

```
[SwitchB-ike-keychain-keychain1] pre-shared-key address 2.2.2.1 255.255.255.0 key
simple 12345zxcvb!@#$%ZXCVB
[SwitchB-ike-keychain-keychain1] quit
```

Create and configure an IKE profile named **profile1**.

```
[SwitchB] ike profile profile1
```

```
[SwitchB-ike-profile-profile1] keychain keychain1
[SwitchB-ike-profile-profile1] match remote identity address 2.2.2.1 255.255.255.0
[SwitchB-ike-profile-profile1] quit
```

Create an IKE-based IPsec policy entry. Specify the policy name as **use1** and set the sequence number to 10.

```
[SwitchB] ipsec policy use1 10 isakmp
```

Specify ACL 3101.

```
[SwitchB-ipsec-policy-isakmp-use1-10] security acl 3101
```

Specify IPsec transform set **tran1**.

```
[SwitchB-ipsec-policy-isakmp-use1-10] transform-set tran1
```

Specify the local and remote IP addresses of the IPsec tunnel as 2.2.3.1 and 2.2.2.1.

```
[SwitchB-ipsec-policy-isakmp-use1-10] local-address 2.2.3.1
[SwitchB-ipsec-policy-isakmp-use1-10] remote-address 2.2.2.1
```

Specify IKE profile **profile1**.

```
[SwitchB-ipsec-policy-isakmp-use1-10] ike-profile profile1
[SwitchB-ipsec-policy-isakmp-use1-10] quit
```

Apply IPsec policy **use1** to VLAN-interface 1.

```
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ipsec apply policy use1
```

Verifying the configuration

Initiate a connection between Switch A and Switch B to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, the traffic between the two switches is IPsec-protected.

Troubleshooting IKE

IKE negotiation failed because no matching IKE proposals were found

Symptom

1. The IKE SA is in Unknown state.

```
<Sysname> display ike sa
    Connection-ID   Remote                Flag         DOI
-----------------------------------------------------------------
    1               192.168.222.5         Unknown      IPsec
Flags:
RD--READY RL--REPLACED FD-FADING RK-REKEY
```

2. When IKE event debugging and packet debugging are enabled, the following messages appear:

   IKE event debugging message:

```
The attributes are unacceptable.
```

   IKE packet debugging message:

```
Construct notification packet: NO_PROPOSAL_CHOSEN.
```

Analysis

Certain IKE proposal settings are incorrect.

Solution

1. Examine the IKE proposal configuration to see whether the two ends have matching IKE proposals.
2. Modify the IKE proposal configuration to make sure the two ends have matching IKE proposals.

IKE negotiation failed because no IKE proposals or IKE keychains are specified correctly

Symptom

1. The IKE SA is in Unknown state.

```
<Sysname> display ike sa
    Connection-ID   Remote                Flag         DOI
-----------------------------------------------------------------
    1               192.168.222.5         Unknown      IPsec
Flags:
RD--READY RL--REPLACED FD-FADING RK-REKEY
```

2. The following IKE event debugging or packet debugging message appeared:

   IKE event debugging message:

```
Notification PAYLOAD_MALFORMED is received.
```

   IKE packet debugging message:

```
Construct notification packet: PAYLOAD_MALFORMED.
```

Analysis

- If the following debugging information appeared, the matched IKE profile is not using the matched IKE proposal:

```
Failed to find proposal 1 in profile profile1.
```

- If the following debugging information appeared, the matched IKE profile is not using the matched IKE keychain:

```
Failed to find keychain keychain1 in profile profile1.
```

Solution

- Verify that the matched IKE proposal (IKE proposal 1 in this debugging message example) is specified for the IKE profile (IKE profile 1 in the example).
- Verify that the matched IKE keychain (IKE keychain 1 in this debugging message example) is specified for the IKE profile (IKE profile 1 in the example).

IPsec SA negotiation failed because no matching IPsec transform sets were found

Symptom

1. The **`display ike sa`** command shows that the IKE SA negotiation succeeded and the IKE SA is in RD state, but the **`display ipsec sa`** command shows that the expected IPsec SA has not been negotiated yet.
2. The following IKE debugging message appeared:

```
The attributes are unacceptable.
```

   Or:

```
Construct notification packet: NO_PROPOSAL_CHOSEN.
```

Analysis

Certain IPsec policy settings are incorrect.

Solution

1. Examine the IPsec configuration to see whether the two ends have matching IPsec transform sets.
2. Modify the IPsec configuration to make sure the two ends have matching IPsec transform sets.

IPsec SA negotiation failed due to invalid identity information

Symptom

1. The **display ike sa** command shows that the IKE SA negotiation succeeded and the IKE SA is in RD state, but the **display ipsec sa** command shows that the expected IPsec SA has not been negotiated yet.
2. The following IKE debugging message appeared:

   ```
   Notification INVALID_ID_INFORMATION is received.
   ```

   Or:

   ```
   Failed to get IPsec policy when renegotiating IPsec SA. Delete IPsec SA.
   Construct notification packet: INVALID_ID_INFORMATION.
   ```

Analysis

Certain IPsec policy settings of the responder are incorrect. Verify the settings as follows:

1. Use the **display ike sa verbose** command to verify that matching IKE profiles were found in IKE negotiation phase 1. If no matching IKE profiles were found and the IPsec policy is using an IKE profile, the IPsec SA negotiation fails.

   # Identify whether matching IKE profiles were found in IKE negotiation phase 1. The following output shows that no matching IKE profile was found:

   ```
   <Sysname> display ike sa verbose
      ----------------------------------------------
      Connection ID: 3
      Outside VPN:
      Inside VPN:
      Profile:
      Transmitting entity: Responder
      ----------------------------------------------
      Local IP: 192.168.222.5
      Local ID type: IPV4_ADDR
      Local ID: 192.168.222.5

      Remote IP: 192.168.222.71
      Remote ID type: IPV4_ADDR
      Remote ID: 192.168.222.71

      Authentication-method: PRE-SHARED-KEY
      Authentication-algorithm: MD5
      Encryption-algorithm: 3DES-CBC

      Life duration(sec): 86400
      Remaining key duration(sec): 85847
   ```

```
  Exchange-mode: Main
  Diffie-Hellman group: Group 1
  NAT traversal: Not detected
```

Identify whether the IPsec policy is using an IKE profile. The following output shows that an IKE profile is used by the IPsec policy.

```
[Sysname] display ipsec policy
-----------------------------------------
IPsec Policy: policy1
Interface: GigabitEthernet1/0/1
-----------------------------------------

  ----------------------------
  Sequence number: 1
  Mode: ISAKMP
  ----------------------------
  Description:
  Security data flow: 3000
  Selector mode: aggregation
  Local address: 192.168.222.5
  Remote address: 192.168.222.71
  Transform set:  transform1
  IKE profile: profile1
  SA duration(time based):
  SA duration(traffic based):
  SA idle time:
```

2. Verify that the ACL specified for the IPsec policy is correctly configured. If the flow range defined by the responder's ACL is smaller than that defined by the initiator's ACL, IPsec proposal matching will fail.

For example, if the initiator's ACL defines a flow from one network segment to another but the responder's ACL defines a flow from one host to another host, IPsec proposal matching will fail.

On the initiator:

```
[Sysname] display acl 3000
Advanced IPv4 ACL 3000, 1 rule,
ACL's step is 5
 rule 0 permit ip source 192.168.222.0 0.0.0.255 destination 192.168.222.0 0.0.0.255
```

On the responder:

```
[Sysname] display acl 3000
Advanced IPv4 ACL 3000, 1 rule,
ACL's step is 5
 rule 0 permit ip source 192.168.222.71 0 destination 192.168.222.5 0
```

3. Verify that the IPsec policy has a remote address and an IPsec transform set configured and that the IPsec transform set has all necessary settings configured.

If, for example, the IPsec policy has no remote address configured, the IPsec SA negotiation will fail:

```
[Sysname] display ipsec policy
-----------------------------------------
IPsec Policy: policy1
Interface: GigabitEthernet1/0/1
-----------------------------------------
```

```
  ----------------------------
  Sequence number: 1
  Mode: ISAKMP
  ----------------------------
  Security data flow: 3000
  Selector mode: aggregation
  Local address: 192.168.222.5
  Remote address:
  Transform set:  transform1
  IKE profile: profile1
  SA duration(time based):
  SA duration(traffic based):
  SA idle time:
```

Solution

1. If the IPsec policy specifies an IKE profile but no matching IKE profiles was found in IKE negotiation, perform one of the following tasks on the responder:
   - Remove the specified IKE profile from the IPsec policy.
   - Modify the specified IKE profile to match the IKE profile of the initiator.
2. If the flow range defined by the responder's ACL is smaller than that defined by the initiator's ACL, modify the responder's ACL so the ACL defines a flow range equal to or greater than that of the initiator's ACL.

   For example:

   ```
   [Sysname] display acl 3000
   Advanced IPv4 ACL 3000, 2 rules,
   ACL's step is 5
    rule 0 permit ip source 192.168.222.0 0.0.0.255 destination 192.168.222.0 0.0.0.255
   ```
3. Configure the missing settings (for example, the remote address).

Configuring IKEv2

About IKEv2

Internet Key Exchange version 2 (IKEv2) is an enhanced version of IKEv1. The same as IKEv1, IKEv2 has a set of self-protection mechanisms and can be used on insecure networks for reliable identity authentication, key distribution, and IPsec SA negotiation. IKEv2 provides stronger protection against attacks and higher key exchange ability and needs fewer message exchanges than IKEv1.

IKEv2 negotiation process

Compared with IKEv1, IKEv2 simplifies the negotiation process and is much more efficient.

IKEv2 defines three types of exchanges: initial exchanges, CREATE_CHILD_SA exchange, and INFORMATIONAL exchange.

As shown in Figure 16, IKEv2 uses two exchanges during the initial exchange process: IKE_SA_INIT and IKE_AUTH, each with two messages.

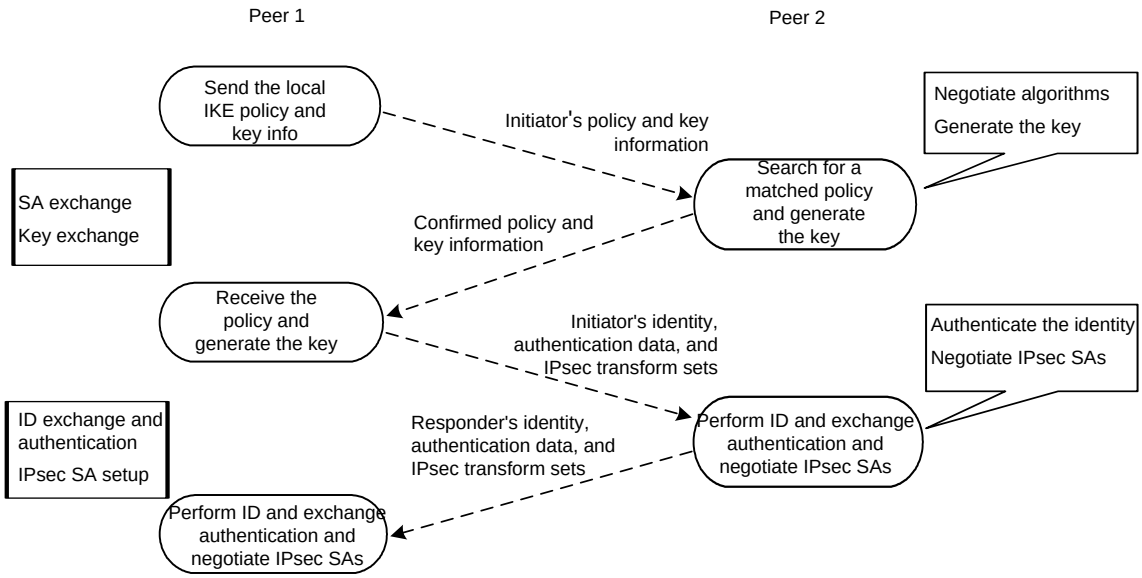
- **IKE_SA_INIT exchange**—Negotiates IKE SA parameters and exchanges keys.
- **IKE_AUTH exchange**—Authenticates the identity of the peer and establishes IPsec SAs.

After the four-message initial exchanges, IKEv2 sets up one IKE SA and one pair of IPsec SAs. For IKEv1 to set up one IKE SA and one pair of IPsec SAs, it must go through two phases that use a minimum of six messages.

To set up one more pair of IPsec SAs within the IKE SA, IKEv2 goes on to perform an additional two-message exchange—the CREATE_CHILD_SA exchange. One CREATE_CHILD_SA exchange creates one pair of IPsec SAs. IKEv2 also uses the CREATE_CHILD_SA exchange to rekey IKE SAs and Child SAs.

IKEv2 uses the INFORMATIONAL exchange to convey control messages about errors and notifications.

Figure 16 IKEv2 Initial exchange process



New features in IKEv2

DH guessing

In the IKE_SA_INIT exchange, the initiator guesses the DH group that the responder is most likely to use and sends it in an IKE_SA_INIT request message. If the initiator's guess is correct, the responder responds with an IKE_SA_INIT response message and the IKE_SA_INIT exchange is finished. If the guess is wrong, the responder responds with an INVALID_KE_PAYLOAD message that contains the DH group that it wants to use. The initiator then uses the DH group selected by the responder to reinitiate the IKE_SA_INIT exchange. The DH guessing mechanism allows for more flexible DH group configuration and enables the initiator to adapt to different responders.

Cookie challenging

Messages for the IKE_SA_INIT exchange are in plain text. An IKEv1 responder cannot confirm the validity of the initiators and must maintain half-open IKE SAs, which makes the responder susceptible to DoS attacks. An attacker can send a large number of IKE_SA_INIT requests with forged source IP addresses to the responder, exhausting the responder's system resources.

IKEv2 introduces the cookie challenging mechanism to prevent such DoS attacks. When an IKEv2 responder maintains a threshold number of half-open IKE SAs, it starts the cookie challenging mechanism. The responder generates a cookie and includes it in the response sent to the initiator. If the initiator initiates a new IKE_SA_INIT request that carries the correct cookie, the responder considers the initiator valid and proceeds with the negotiation. If the carried cookie is incorrect, the responder terminates the negotiation.

The cookie challenging mechanism automatically stops working when the number of half-open IKE SAs drops below the threshold.

IKEv2 SA rekeying

For security purposes, both IKE SAs and IPsec SAs have a lifetime and must be rekeyed when the lifetime expires. An IKEv1 SA lifetime is negotiated. An IKEv2 SA lifetime, in contrast, is configured. If two peers are configured with different lifetimes, the peer with the shorter lifetime always initiates the SA rekeying. This mechanism reduces the possibility that two peers will simultaneously initiate a rekeying. Simultaneous rekeying results in redundant SAs and SA status inconsistency on the two peers.

IKEv2 message retransmission

Unlike IKEv1 messages, IKEv2 messages appear in request/response pairs. IKEv2 uses the Message ID field in the message header to identify the request/response pair. If an initiator sends a request but receives no response with the same Message ID value within a specific period of time, the initiator retransmits the request.

It is always the IKEv2 initiator that initiates the retransmission, and the retransmitted message must use the same Message ID value.

Protocols and standards

- RFC 2408, *Internet Security Association and Key Management Protocol (ISAKMP)*
- RFC 4306, *Internet Key Exchange (IKEv2) Protocol*
- RFC 4718, *IKEv2 Clarifications and Implementation Guidelines*
- RFC 2412, *The OAKLEY Key Determination Protocol*
- RFC 5996, *Internet Key Exchange Protocol Version 2 (IKEv2)*

IKEv2 tasks at a glance

To configure IKEv2, perform the following tasks:

1. Configuring an IKEv2 profile
   a. Creating an IKEv2 profile
   b. Specifying the local and remote identity authentication methods
   c. Configuring the IKEv2 keychain or PKI domain
   d. Configuring the local ID for the IKEv2 profile
   e. Configuring peer IDs for the IKEv2 profile
   f. Configuring optional features for the IKEv2 profile
2. Configuring an IKEv2 policy
3. Configuring an IKEv2 proposal

   If you specify an IKEv2 proposal in an IKEv2 policy, you must configure the IKEv2 proposal.
4. Configuring an IKEv2 keychain

   This task is required when either end or both ends use the preshared key authentication method.
5. (Optional.) Enabling the cookie challenging feature

   The cookie challenging feature takes effect only on IKEv2 responders.
6. (Optional.) Configuring the IKEv2 DPD feature
7. (Optional.) Configuring the IKEv2 NAT keepalive feature

Prerequisites for IKEv2 configuration

Determine the following parameters prior to IKEv2 configuration:

- The strength of the algorithms for IKEv2 negotiation, including the encryption algorithms, integrity protection algorithms, PRF algorithms, and DH groups. Different algorithms provide different levels of protection. A stronger algorithm means better resistance to decryption of protected data but requires more resources. Typically, the longer the key, the stronger the algorithm.
- The local and remote identity authentication methods.
  - To use the preshared key authentication method, you must determine the preshared key.
  - To use the RSA digital signature authentication method, you must determine the PKI domain for the local end to use. For information about PKI, see "Configuring PKI."

Configuring an IKEv2 profile

Creating an IKEv2 profile

About IKEv2 profile

An IKEv2 profile is intended to provide a set of parameters for IKEv2 negotiation.

Procedure

1. Enter system view.

   `system-view`
2. Create an IKEv2 profile and enter its view.

   `ikev2 profile` *`profile-name`*

Specifying the local and remote identity authentication methods

Restrictions and guidelines

The local and remote identity authentication methods must both be specified and they can be different. You can specify only one local identity authentication method and multiple remote identity authentication methods.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Specify the local and remote identity authentication methods.

   authentication-method { **local** | **remote** } { **dsa-signature** | **ecdsa-signature** | **pre-share** | **rsa-signature** }

   By default, no local or remote identity authentication method is configured.

Configuring the IKEv2 keychain or PKI domain

Restrictions and guidelines

Configure the IKEv2 keychain or PKI domain for the IKEv2 profile to use. To use digital signature authentication, configure a PKI domain. To use preshared key authentication, configure an IKEv2 keychain.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Specify the keychain for preshared key authentication or the PKI domain used to request a certificate for digital signature authentication.

   - Specify the keychain.

     keychain *keychain-name*

   - Specify the PKI domain.

     certificate domain *domain-name* [**sign** | **verify**]

   By default, no IKEv2 keychain or PKI domain is specified for an IKEv2 profile.

Configuring the local ID for the IKEv2 profile

Restrictions and guidelines

For digital signature authentication, the device can use an ID of any type. If the local ID is an IP address that is different from the IP address in the local certificate, the device uses the FQDN as the local ID. The FQDN is the device name configured by using the **sysname** command.

For preshared key authentication, the device can use an ID of any type other than the DN.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Configure the local ID.

   identity local { **address** { *ipv4-address* | **ipv6** *ipv6-address* } | **dn** | **email** *email-string* | **fqdn** *fqdn-name* | **key-id** *key-id-string* }

   By default, no local ID is configured, and the device uses the IP address of the interface where the IPsec policy applies as the local ID.

Configuring peer IDs for the IKEv2 profile

About peer ID configuration

Perform this task to configure the peer ID for IKEv2 profile matching. When the device needs to select an IKEv2 profile for IKEv2 negotiation with a peer, it compares the received peer ID with the peer IDs of its local IKE profiles. If a match is found, it uses the IKEv2 profile with the matching peer ID for negotiation. IKEv2 profiles will be compared in descending order of their priorities.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Configure a peer ID.

   match remote { **certificate** *policy-name* | **identity** { **address** { { *ipv4-address* [*mask* | *mask-length*] | **range** *low-ipv4-address high-ipv4-address* } | **ipv6** { *ipv6-address* [*prefix-length*] | **range** *low-ipv6-address high-ipv6-address* } } | **fqdn** *fqdn-name* | **email** *email-string* | **key-id** *key-id-string* } }

   You must configure a minimum of one peer ID on each of the two peers.

Configuring optional features for the IKEv2 profile

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Configure optional features as needed.

   - Configure IKEv2 DPD.

     dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

     By default, IKEv2 DPD is not configured for an IKEv2 profile and an IKEv2 profile uses the DPD settings configured in system view. If IKEv2 DPD is not configured in system view either, the device does not perform dead IKEv2 peer detection.

   - Specify the local interface or IP address to which the IKEv2 profile can be applied.

     match local address { *interface-type interface-number* | *ipv4-address* | **ipv6** *ipv6-address* }

     By default, an IKEv2 profile can be applied to any local interface or local IP address.

Use this command to specify which address or interface can use the IKEv2 profile for IKEv2 negotiation. Specify the local address configured in IPsec policy or IPsec policy template view (using the **local-address** command) for this command. If no local address is configured, specify the IP address of the interface that uses the IPsec policy.

- Specify a priority for the IKEv2 profile.

  priority *priority*

  By default, the priority of an IKEv2 profile is 100.

  When the device needs to select an IKEv2 profile for IKEv2 negotiation with a peer, it compares the received peer ID with the peer ID of its local IKEv2 profiles in descending order of their priorities

- Set the IKEv2 SA lifetime for the IKEv2 profile.

  sa duration *seconds*

  By default, the IKEv2 SA lifetime is 86400 seconds.

  The local and remote ends can use different IKEv2 SA lifetimes and they do not negotiate the lifetime. The end with a smaller SA lifetime will initiate an SA negotiation when the lifetime expires.

- Set the IKEv2 NAT keepalive interval.

  nat-keepalive *seconds*

  By default, the global IKEv2 NAT keepalive setting is used.

  Configure this command when the device is behind a NAT gateway. The device sends NAT keepalive packets regularly to its peer to prevent the NAT session from being aged because of no matching traffic.

- Enable the configuration exchange feature.

  config-exchange { **request** | **set** { **accept** | **send** } }

  By default, all configuration exchange options are disabled.

  This feature applies to scenarios where the headquarters and branches communicate through virtual tunnels. It enables exchanges of IP address request and set messages between the IPsec gateway at a branch and the IPsec gateway at the headquarters.

Table 2 Parameter descriptions

Parameter	Description
request	Enables the IPsec gateway at a branch to submit IP address request messages to the IPsec gateway at the headquarters.
set accept	Enables the IPsec gateway at a branch to accept the IP addresses pushed by the IPsec gateway at the headquarters.
set send	Enables the IPsec gateway at the headquarters to push IP addresses to IPsec gateways at branches.

Configuring an IKEv2 policy

About IKEv2 policy selection mechanism

During the IKE_SA_INIT exchange, each end tries to find a matching IKEv2 policy, using the IP address of the local security gateway as the matching criterion.

- If IKEv2 policies are configured, IKEv2 searches for an IKEv2 policy that uses the IP address of the local security gateway. If no IKEv2 policy uses the IP address or the policy is using an incomplete proposal, the IKE_SA_INIT exchange fails.
- If no IKEv2 policy is configured, IKEv2 uses the system default IKEv2 policy **default**.

The device matches IKEv2 policies in the descending order of their priorities. To determine the priority of an IKEv2 policy:

1. First, the device examines the existence of the **match local address** command. An IKEv2 policy with the **match local address** command configured has a higher priority.
2. If a tie exists, the device compares the priority numbers. An IKEv2 policy with a smaller priority number has a higher priority.
3. If a tie still exists, the device prefers an IKEv2 policy configured earlier.

Procedure

1. Enter system view.

   system-view
2. Create an IKEv2 policy and enter its view.

   ikev2 policy *policy-name*

   By default, an IKEv2 policy named **default** exists.
3. Specify the local interface or address used for IKEv2 policy matching.

   match local address { *interface-type interface-number* | *ipv4-address* | **ipv6** *ipv6-address* }

   By default, no local interface or address is used for IKEv2 policy matching, and the policy matches any local interface or address.
4. Specify an IKEv2 proposal for the IKEv2 policy.

   proposal *proposal-name*

   By default, no IKEv2 proposal is specified for an IKEv2 policy.
5. Specify a priority for the IKEv2 policy.

   priority *priority*

   By default, the priority of an IKEv2 policy is 100.

Configuring an IKEv2 proposal

About IKEv2 proposal

An IKEv2 proposal contains security parameters used in IKE_SA_INIT exchanges, including the encryption algorithms, integrity protection algorithms, PRF algorithms, and DH groups. An algorithm specified earlier has a higher priority.

Restrictions and guidelines

A complete IKEv2 proposal must have at least one set of security parameters, including one encryption algorithm, one integrity protection algorithm, one PRF algorithm, and one DH group.

You can specify multiple IKEv2 proposals for an IKEv2 policy. A proposal specified earlier has a higher priority.

Procedure

1. Enter system view.

   system-view
2. Create an IKEv2 proposal and enter its view.

   ikev2 proposal *proposal-name*

   By default, an IKEv2 proposal named **default** exists.

   In non-FIPS mode, the default proposal uses the following settings:
   - Encryption algorithms AES-CBC-128 and 3DES.
   - Integrity protection algorithms HMAC-SHA1 and HMAC-MD5.

- PRF algorithms HMAC-SHA1 and HMAC-MD5.
- DH groups 2 and 5.

In FIPS mode, the default proposal uses the following settings:

- Encryption algorithms AES-CBC-128 and AES-CTR-128.
- Integrity protection algorithms HMAC-SHA1 and HMAC-SHA256.
- PRF algorithms HMAC-SHA1 and HMAC-SHA256.
- DH groups 14 and 19.

3. Specify the encryption algorithms.

   In non-FIPS mode:

   encryption { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** | **camellia-cbc-128** | **camellia-cbc-192** | **camellia-cbc-256** | **des-cbc** } *

   In FIPS mode:

   encryption { **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** } *

   By default, an IKEv2 proposal does not have any encryption algorithms.

4. Specify the integrity protection algorithms.

   In non-FIPS mode:

   integrity { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** } *

   In FIPS mode:

   integrity { **sha1** | **sha256** | **sha384** | **sha512** } *

   By default, an IKEv2 proposal does not have any integrity protection algorithms.

5. Specify the DH groups.

   In non-FIPS mode:

   dh { **group1** | **group14** | **group2** | **group24** | **group5** | **group19** | **group20** } *

   In FIPS mode:

   dh { **group14** | **group19** | **group20** } *

   By default, an IKEv2 proposal does not have any DH groups.

6. Specify the PRF algorithms.

   In non-FIPS mode:

   prf { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** } *

   In FIPS mode:

   prf { **sha1** | **sha256** | **sha384** | **sha512** } *

   By default, an IKEv2 proposal uses the integrity protection algorithms as the PRF algorithms.

Configuring an IKEv2 keychain

About IKEv2 keychain

An IKEv2 keychain specifies the preshared keys used for IKEv2 negotiation.

An IKEv2 keychain can have multiple IKEv2 peers. Each peer has a symmetric preshared key or an asymmetric preshared key pair, and information for identifying the peer (such as the peer's host name, IP address or address range, or ID).

An IKEv2 negotiation initiator uses the peer host name or IP address/address range as the matching criterion to search for a peer. A responder uses the peer host IP address/address range or ID as the matching criterion to search for a peer.

Procedure

1. Enter system view.
   system-view
2. Create an IKEv2 keychain and enter its view.
   ikev2 keychain *keychain-name*
3. Create an IKEv2 peer and enter its view.
   peer *name*
4. Configure a host name for the peer:
   hostname *name*
   By default, no host name is configured for an IKEv2 peer.
5. Configure a host IP address or address range for the peer:
   address { *ipv4-address* [*mask* | *mask-length*] | **ipv6** *ipv6-address* [*prefix-length*] }
   By default, no host IP address or address range is configured for an IKEv2 peer.
   You must configure different host IP addresses/address ranges for different peers.
6. Configure an ID for the peer:
   identity { **address** { *ipv4-address* | **ipv6** { *ipv6-address* } } | **fqdn** *fqdn-name* | **email** *email-string* | **key-id** *key-id-string* }
   By default, no identity information is configured for an IKEv2 peer.
7. Configure a preshared key for the peer.
   pre-shared-key [**local** | **remote**] { **ciphertext** | **plaintext** } *string*
   By default, an IKEv2 peer does not have a preshared key.

Configure global IKEv2 parameters

Enabling the cookie challenging feature

About the cookie challenging feature

Enable cookie challenging on responders to protect them against DoS attacks that use a large number of source IP addresses to forge IKE_SA_INIT requests.

Procedure

1. Enter system view.
   system-view
2. Enable IKEv2 cookie challenging.
   ikev2 cookie-challenge *number*
   By default, IKEv2 cookie challenging is disabled.

Configuring the IKEv2 DPD feature

About IKEv2 DPD

IKEv2 DPD detects dead IKEv2 peers in periodic or on-demand mode.

- **Periodic IKEv2 DPD**—Verifies the liveness of an IKEv2 peer by sending DPD messages at regular intervals.
- **On-demand IKEv2 DPD**—Verifies the liveness of an IKEv2 peer by sending DPD messages before sending data.
  - Before the device sends data, it identifies the time interval for which the last IPsec packet has been received from the peer. If the time interval exceeds the DPD interval, it sends a DPD message to the peer to detect its liveliness.
  - If the device has no data to send, it never sends DPD messages.

Restrictions and guidelines

If you configure IKEv2 DPD in both IKEv2 profile view and system view, the IKEv2 DPD settings in IKEv2 profile view apply. If you do not configure IKEv2 DPD in IKEv2 profile view, the IKEv2 DPD settings in system view apply.

Procedure

1. Enter system view.
   system-view
2. Configure global IKEv2 DPD.
   ikev2 dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }
   By default, global DPD is disabled.

Configuring the IKEv2 NAT keepalive feature

About the IKEv2 NAT keepalive feature

Configure this feature on the IKEv2 gateway behind the NAT device. The gateway then sends NAT keepalive packets regularly to its peer to keep the NAT session alive, so that the peer can access the device.

The NAT keepalive interval must be shorter than the NAT session lifetime.

This feature takes effect after the device detects the NAT device.

Procedure

1. Enter system view.
   system-view
2. Set the IKEv2 NAT keepalive interval.
   ikev2 nat-keepalive *seconds*
   By default, the IKEv2 NAT keepalive interval is 10 seconds.

Display and maintenance commands for IKEv2

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the IKEv2 policy configuration.	**display ikev2 policy** [*policy-name* | **default**]
Display the IKEv2 profile configuration.	**display ikev2 profile** [*profile-name*]

Task	Command
Display the IKEv2 proposal configuration.	**display ikev2 proposal** [*name* | **default**]
Display the IKEv2 SA information.	**display ikev2 sa** [**count** | [{ **local** | **remote** } { *ipv4-address* | **ipv6** *ipv6-address* }] [**verbose** [**tunnel** *tunnel-id*]]]
Display IKEv2 statistics.	**display ikev2 statistics**
Delete IKEv2 SAs and the child SAs negotiated through the IKEv2 SAs.	**reset ikev2 sa** [[{ **local** | **remote** } { *ipv4-address* | **ipv6** *ipv6-address* }] | **tunnel** *tunnel-id*] [**fast**]
Clear IKEv2 statistics.	**reset ikev2 statistics**

Troubleshooting IKEv2

IKEv2 negotiation failed because no matching IKEv2 proposals were found

Symptom

The IKEv2 SA is in IN-NEGO status.

```
<Sysname> display ikev2 sa
Tunnel ID   Local                      Remote                     Status
  ------------------------------------------------------------------------------
  5           123.234.234.124/500         123.234.234.123/500         IN-NEGO
Status:
IN-NEGO: Negotiating, EST: Established, DEL:Deleting
```

Analysis

Certain IKEv2 proposal settings are incorrect.

Solution

1. Examine the IKEv2 proposal configuration to see whether the two ends have matching IKEv2 proposals.
2. Modify the IKEv2 proposal configuration to make sure the two ends have matching IKEv2 proposals.

IPsec SA negotiation failed because no matching IPsec transform sets were found

Symptom

The **display ikev2 sa** command shows that the IKEv2 SA negotiation succeeded and the IKEv2 SA is in EST status. The **display ipsec sa** command shows that the expected IPsec SAs have not been negotiated yet.

Analysis

Certain IPsec policy settings are incorrect.

Solution

1. Examine the IPsec configuration to see whether the two ends have matching IPsec transform sets.
2. Modify the IPsec configuration to make sure the two ends have matching IPsec transform sets.

IPsec tunnel establishment failed

Symptom

The ACLs and IKEv2 proposals are correctly configured on both ends. The two ends cannot establish an IPsec tunnel or cannot communicate through the established IPsec tunnel.

Analysis

The IKEv2 SA or IPsec SAs on either end are lost. The reason might be that the network is unstable and the device reboots.

Solution

1. Use the **display ikev2 sa** command to examine whether an IKEv2 SA exists on both ends. If the IKEv2 SA on one end is lost, delete the IKEv2 SA on the other end by using the **reset ikev2 sa** command and trigger new negotiation. If an IKEv2 SA exists on both ends, go to the next step.
2. Use the **display ipsec sa** command to examine whether IPsec SAs exist on both ends. If the IPsec SAs on one end are lost, delete the IPsec SAs on the other end by using the **reset ipsec sa** command and trigger new negotiation.

Contents

Configuring SSH

About SSH

Secure Shell (SSH) is a network security protocol. Using encryption and authentication, SSH can implement secure remote access and file transfer over an insecure network.

SSH uses the typical client-server model to establish a channel for secure data transfer based on TCP.

SSH includes two versions: SSH1.x and SSH2.0 (hereinafter referred to as SSH1 and SSH2), which are not compatible. SSH2 is better than SSH1 in performance and security.

SSH applications

The device supports the following SSH applications:

- **Secure Telnet**—Stelnet provides secure and reliable network terminal access services. Through Stelnet, a user can securely log in to a remote server. Stelnet can protect devices against attacks, such as IP spoofing and plain text password interception. The device can act as an Stelnet server or an Stelnet client.
- **Secure File Transfer Protocol**—Based on SSH2, SFTP uses SSH connections to provide secure file transfer. The device can act as an SFTP server, allowing a remote user to log in to the SFTP server for secure file management and transfer. The device can also act as an SFTP client, enabling a user to log in from the device to a remote device for secure file transfer.
- **Secure Copy**—Based on SSH2, SCP offers a secure method to copy files. The device can act as an SCP server, allowing a user to log in to the device for file upload and download. The device can also act as an SCP client, enabling a user to log in from the device to a remote device for secure file transfer.
- **NETCONF over SSH**—Based on SSH2, it enables users to securely log in to the device through SSH and perform NETCONF operations on the device through the NETCONF-over-SSH connections. The device can act only as a NETCONF-over-SSH server. For more information about NETCONF, see *Network Management and Monitoring Configuration Guide*.

When acting as an SSH server or client, the device supports the following SSH versions:

- When acting as an Stelnet, SFTP, or SCP server, the device supports both SSH2 and SSH1 in non-FIPS mode and only SSH2 in FIPS mode.
- When acting as an SSH client, the device supports only SSH2.
- When acting as a NETCONF-over-SSH server, the device supports only SSH2.

How SSH works

This section uses SSH2 as an example to describe the stages to establish an SSH session.

Table 1 Stages to establish an SSH session

Stages	Description
Connection establishment	The SSH server listens to connection requests on port 22. After a client initiates a connection request, the server and the client establish a TCP connection.
Version negotiation	The two parties determine a version to use.

Stages	Description
Algorithm negotiation	SSH supports multiple algorithms. Based on the local algorithms, the two parties negotiate the following algorithms: • Key exchange algorithm for generating session keys. • Encryption algorithm for encrypting data. • Public key algorithm for the digital signature and authentication. • HMAC algorithm for protecting data integrity.
Key exchange	The two parties use the DH exchange algorithm to dynamically generate the session keys and session ID. • The session keys are used for protecting data transfer. • The session ID is used for identifying the SSH connection. In this stage, the client also authenticates the server.
Authentication	The SSH server authenticates the client in response to the client's authentication request.
Session request	After passing the authentication, the client sends a session request to the server to request the establishment of a session (or request the Stelnet, SFTP, SCP, or NETCONF service).
Interaction	After the server grants the request, the client and the server start to communicate with each other in the session. In this stage, you can paste commands in text format and execute them at the CLI. The text pasted at one time must be no more than 2000 bytes. As a best practice to ensure the correct execution of commands, paste commands that are in the same view. To execute commands of more than 2000 bytes, save the commands in a configuration file, upload the file to the server through SFTP, and use it to restart the server.

SSH authentication methods

This section describes authentication methods that are supported by the device when it acts as an SSH server.

Password authentication

The SSH server authenticates a client through the AAA mechanism. The password authentication process is as follows:

1. The client sends the server an authentication request that includes the encrypted username and password.
2. The server performs the following operations:
   a. Decrypts the request to get the username and password in plain text.
   b. Verifies the username and password locally or through remote AAA authentication.
   c. Informs the client of the authentication result.

If the remote AAA server requires the user to enter a password for secondary authentication, it send the SSH server an authentication response carrying a prompt. The prompt is transparently transmitted to the client to notify the user to enter a specific password. When the user enters the correct password, the AAA sever examines the password validity. If the password is valid, the SSH server returns an authentication success message to the client.

SSH1 clients do not support secondary password authentication initiated by the AAA server.

For more information about AAA, see "Configuring AAA."

Keyboard-interactive authentication

In keyboard-interactive authentication, the remote authentication server and user exchanges information for authentication as follows:

1. The remote authentication server sends a prompt to the SSH server in an authentication response.

   The prompt indicates the information required to be provided by the user.
2. The SSH server transparently transmits the prompt to the client terminal.
3. The user enters the required information as prompted.

This process repeats multiple times if the remote authentication server requires more interactive information. The remote authentication server returns an authentication success message after the user provides all required interactive information.

If the remote authentication server does not require interactive information, the keyboard-interactive authentication process is the same as the password authentication.

Publickey authentication

The server authenticates a client by verifying the digital signature of the client. The publickey authentication process is as follows:

1. The client sends the server a publickey authentication request that includes the username, public key, and public key algorithm name.

   If the digital certificate of the client is required in authentication, the client also encapsulates the digital certificate in the authentication request. The digital certificate carries the public key information of the client.
2. The server verifies the client's public key.
   - If the public key is invalid, the server informs the client of the authentication failure.
   - If the public key is valid, the server requests the digital signature of the client. After receiving the signature, the server uses the public key to verify the signature and informs the client of the authentication result.

When acting as an SSH server, the device supports using the public key algorithms DSA, ECDSA, and RSA to verify digital signatures.

When acting as an SSH client, the device supports using the public key algorithms DSA, ECDSA, and RSA to generate digital signatures.

For more information about public key configuration, see "Managing public keys."

Password-publickey authentication

The server requires SSH2 clients to pass both password authentication and publickey authentication. However, an SSH1 client only needs to pass either authentication.

Any authentication

The server requires clients to pass keyboard-interactive authentication, password authentication, or publickey authentication. Success with any one authentication method is sufficient to connect to the server.

SSH support for Suite B

Suite B contains a set of encryption and authentication algorithms that meet high security requirements. Table 2 lists all algorithms in Suite B.

The SSH server and client support using the X.509v3 certificate for identity authentication in compliance with the algorithm, negotiation, and authentication specifications defined in RFC 6239.

Table 2 Suite B algorithms

Security level	Key exchange algorithm	Encryption algorithm and HMAC algorithm	Public key algorithm
128-bit	ecdh-sha2-nistp256	AES128-GCM	x509v3-ecdsa-sha2-nistp256
192-bit	ecdh-sha2-nistp384	AES256-GCM	x509v3-ecdsa-sha2-nistp384
Both	ecdh-sha2-nistp256 ecdh-sha2-nistp384	AES128-GCM AES256-GCM	x509v3-ecdsa-sha2-nistp256 x509v3-ecdsa-sha2-nistp384

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode and non-FIPS mode. For more information about FIPS mode, see "Configuring FIPS."

Configuring the device as an SSH server

SSH server tasks at a glance

To configure an SSH server, perform the following tasks:

1. Generating local key pairs
2. (Optional.) Specifying the SSH service port
3. Enabling the SSH server
   - Enabling the Stelnet server
   - Enabling the SFTP server
   - Enabling the SCP server
   - Enabling NETCONF over SSH
4. Configuring the user lines for SSH login

   Required only for Stelnet and NETCONF-over-SSH servers.
5. Configuring a client's host public key

   Required for authentication method **publickey**, **password-publickey,** or **any**.
6. Configuring an SSH user
   - Required for authentication method **keyboard-interactive**, **publickey**, **password-publickey,** or **any**.
   - Optional for the **password** authentication method.
7. (Optional.) Configuring the SSH management parameters

   SSH management settings, such as authentication and connection control settings, help improve security of SSH connections.
8. (Optional.) Specifying a PKI domain for the SSH server
9. (Optional.) Disconnecting SSH sessions

Generating local key pairs

About local key pairs

The DSA, ECDSA, or RSA key pairs on the SSH server are required for generating the session keys and session ID in the key exchange stage. They can also be used by a client to authenticate the server. When a client authenticates the server, it compares the public key received from the server with the server's public key that the client saved locally. If the keys are consistent, the client uses the locally saved server's public key to decrypt the digital signature received from the server. If the decryption succeeds, the server passes the authentication.

To support SSH clients that use different types of key pairs, generate DSA, ECDSA, and RSA key pairs on the SSH server.

- **RSA key pairs**—The SSH server generates a server key pair and a host key pair for RSA. The RSA server key pair is only used in SSH1 to encrypt the session key for secure transmission of the session key. It is not used in SSH2, because no session key transmission is required in SSH2.
- **DSA key pair**—The SSH server generates only one DSA host key pair. SSH1 does not support the DSA algorithm.
- **ECDSA key pair**—The SSH server generates only one ECDSA host key pair.

Restrictions and guidelines

Local DSA, ECDSA, and RSA key pairs for SSH use default names. You cannot assign names to the key pairs.

If the device does not have RSA key pairs with default names, it automatically generates one RSA server key pair and one RSA host key pair when SSH starts. Both key pairs use their default names. The SSH application starts when you execute an SSH server command on the device.

The key modulus length must be less than 2048 bits when you generate the DSA key pair on the SSH server.

When you generate an ECDSA key pair, you can generate only a **secp256r1** or **secp384r1** ECDSA key pair.

The SSH server operating in FIPS mode supports only ECDSA and RSA key pairs. Do not generate a DSA key pair on the SSH server in FIPS mode.

Procedure

1. Enter system view.
   system-view
2. Generate local key pairs.
   public-key local create { **dsa** | **ecdsa** { **secp256r1** | **secp384r1** } | **rsa** }

Specifying the SSH service port

About the SSH service port

The default port of the SSH service is 22. You can specify another port for the SSH service to improve security of SSH connections.

Procedure

1. Enter system view.
   system-view
2. Specify the SSH service port.
   ssh server port *port-number*

CAUTION:

- If you modify the SSH port number when the SSH server is enabled, the SSH service is restarted and all SSH connections are terminated after the modification. SSH users must reconnect to the SSH server to access the server.
- If you set the SSH port to a well-known port number, the service that uses the well-known port number might fail to start. Well-known port numbers are in the range of 1 to 1024.

By default, the SSH service port is 22.

Enabling the Stelnet server

About enabling the Stelnet server

After you enable the Stelnet server on the device, a client can log in to the device through Stelnet.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enable the Stelnet server.
   ```
   ssh server enable
   ```
   By default, the Stelnet server is disabled.

Enabling the SFTP server

About enabling the SFTP server

After you enable the SFTP server on the device, a client can log in to the device through SFTP.

Restrictions and guidelines

When acting as an SFTP server, the device does not support SFTP connections initiated by SSH1 clients.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enable the SFTP server.
   ```
   sftp server enable
   ```
   By default, the SFTP server is disabled.

Enabling the SCP server

About enabling the SCP server

After you enable the SCP server on the device, a client can log in to the device through SCP.

Restrictions and guidelines

When acting as an SCP server, the device does not support SCP connections initiated by SSH1 clients.

Procedure

1. Enter system view.
   ```
   system-view
   ```

2. Enable the SCP server.

   scp server enable

   By default, the SCP server is disabled.

Enabling NETCONF over SSH

About enabling NETCONF over SSH

After you enable NETCONF over SSH on the device, a client can perform NETCONF operations on the device through a NETCONF-over-SSH connection.

Restrictions and guidelines

When acting as a server in the NETCONF-over-SSH connection, the device does not support connection requests initiated by SSH1 clients.

Procedure

1. Enter system view.

   system-view

2. Enable NETCONF over SSH.

   netconf ssh server enable

   By default, NETCONF over SSH is disabled.

   For more information about NETCONF over SSH commands, see *Network Management and Monitoring Command Reference*.

Configuring the user lines for SSH login

About user line configuration for SSH login

Depending on the SSH application, an SSH client can be an Stelnet client, SFTP client, SCP client, or NETCONF-over-SSH client.

Only Stelnet and NETCONF-over-SSH clients require the user line configuration. The user line configuration takes effect on the clients at the next login.

Procedure

1. Enter system view.

   system-view

2. Enter VTY user line view.

   line vty *number* [*ending-number*]

3. Set the login authentication mode to scheme.

   authentication-mode scheme

   By default, the authentication mode is **password**.

   For more information about this command, see *Fundamentals Command Reference*.

Configuring a client's host public key

About the client's host public key

In publickey authentication, the server compares the SSH username and the client's host public key received from the client with the locally saved SSH username and the client's host public key. If they are the same, the server checks the digital signature that the client sends. The client generates the digital signature by using the private key that is paired with the client's host public key.

For publickey authentication, password-publickey authentication, or any authentication, you must perform the following tasks:

1. Configure the client's DSA, ECDSA, or RSA host public key on the server.
2. Specify the associated host private key on the client to generate the digital signature.

   If the device acts as an SSH client, specify the public key algorithm on the client. The algorithm determines the associated host private key for generating the digital signature.

Client public key configuration methods

You can configure the client host public key by using the following methods:

- Manually enter the content of a client's host public key on the server.
  a. Display the host public key on the client and record the key.
  b. Type the client's host public key character by character on the server, or use the copy and paste method.

  The manually entered key must be in DER format without being converted. For the displayed key to meet the requirement when the client is an H3C device, use the **display public-key local public** command. The format of the public key displayed in any other way (for example, by using the **public-key local export** command) might be incorrect. If the key is not in correct format, the system discards the key.
- Import the client host public key from a public key file.
  a. Save the client public key file to the server. For example, transfer the client public key file to the server in binary mode through FTP or TFTP.
  b. Import the client public key from the locally saved public key file.

     During the import process, the server automatically converts the host public key to a string in PKCS format.

Restrictions and guidelines

As a best practice, configure no more than 20 SSH client's host public keys on an SSH server.

Import the client's host public key as a best practice.

Entering a client's host public key

1. Enter system view.

   system-view
2. Enter public key view.

   public-key peer *keyname*
3. Configure a client's host public key.

   Enter the content of the client's host public key character by character, or use the copy and paste method.

   When you enter the content of a client's host public key, you can use spaces and carriage returns between characters but the system does not save them. For more information, see "Managing public keys."
4. Exit public key view and save the key.

   peer-public-key end

Importing a client's host public key from the public key file

1. Enter system view.

   system-view
2. Import a client's public key from the public key file.

   public-key peer *keyname* **import sshkey** *filename*

Configuring an SSH user

About the SSH user

Configure an SSH user and a local user depending on the authentication method.

- If the authentication method is **publickey**, you must create an SSH user and a local user on the SSH server. The two users must have the same username, so that the SSH user can be assigned the correct working directory and user role.
- If the authentication method is **password**, you must perform one of the following tasks:
  - For local authentication, configure a local user on the SSH server.
  - For remote authentication, configure an SSH user on a remote authentication server, for example, a RADIUS server.

  You do not need to create an SSH user by using the **ssh user** command. However, if you want to display all SSH users, including the password-only SSH users, for centralized management, you can use this command to create them. If such an SSH user has been created, make sure you have specified the correct service type and authentication method.
- If the authentication method is **keyboard-interactive**, **password-publickey**, or **any**, you must create an SSH user on the SSH server and perform one of the following tasks:
  - For local authentication, configure a local user on the SSH server.
  - For remote authentication, configure an SSH user on a remote authentication server, for example, a RADIUS server.

  In either case, the local user or the SSH user configured on the remote authentication server must have the same username as the SSH user.

For information about configuring local users and remote authentication, see "Configuring AAA."

Restrictions and guidelines

If you change the authentication parameters for a logged-in SSH user, the change takes effect on the user at the next login.

When the device operates as an SSH server in FIPS mode, the device does not support authentication method **any** or **publickey**.

For an SFTP or SCP user, the working directory depends on the authentication method.

- If the authentication method is **publickey** or **password-publickey**, the working folder is specified by the **authorization-attribute** command in the associated local user view.
- If the authentication method is **keyboard-interactive** or **password**, the working directory is authorized by AAA.

For an SSH user, the user role also depends on the authentication method.

- If the authentication method is **publickey** or **password-publickey**, the user role is specified by the **authorization-attribute** command in the associated local user view.
- If the authentication method is **keyboard-interactive** or **password**, the user role is authorized by AAA.

For all authentication methods except keyboard-interactive authentication and password authentication, you must specify a client's host public key or digital certificate.

- For a client that sends the user's public key information directly to the server, specify the client's host public key on the server. The specified public key must already exist. For more information about public keys, see "Configuring a client's host public key." If you specify multiple client public keys, the device verifies the user identity by using the public keys in the order they are specified. The user is valid if the user passes one public key check.
- For a client that sends the user's public key information to the server through a digital certificate, specify the PKI domain on the server. This PKI domain verifies the client's digital certificate. For successful verification, the specified PKI domain must have the correct CA certificate. To

specify the PKI domain, use the **ssh user** or **ssh server pki-domain** command. For more information about configuring a PKI domain, see "Configuring PKI."

Procedure

1. Enter system view.

   system-view

2. Create an SSH user, and specify the service type and authentication method.

   In non-FIPS mode:

   ssh user *username* **service-type** { **all** | **netconf** | **scp** | **sftp** | **stelnet** } **authentication-type** { **keyboard-interactive** | **password** | { **any** | **password-publickey** | **publickey** } [**assign** { **pki-domain** *domain-name* | **publickey** *keyname*&<1-6> }] }

   In FIPS mode:

   ssh user *username* **service-type** { **all** | **netconf** | **scp** | **sftp** | **stelnet** } **authentication-type** { **keyboard-interactive** | **password** | **password-publickey** [**assign** { **pki-domain** *domain-name* | **publickey** *keyname*&<1-6> }] }

   An SSH server supports up to 1024 SSH users.

Configuring the SSH management parameters

Enabling the SSH server to support SSH1 clients

1. Enter system view.

   system-view

2. Enable the SSH server to support SSH1 clients.

   ssh server compatible-ssh1x enable

   By default, the SSH server does not support SSH1 clients.

   This command is not available in FIPS mode.

Enabling SSH algorithm renegotiation and key re-exchange

1. Enter system view.

   system-view

2. Enable SSH algorithm renegotiation and key re-exchange.

   ssh server key-re-exchange enable [**interval** *interval*]

   By default, SSH algorithm renegotiation and key re-exchange are disabled.

   This command is not available in FIPS mode.

   The command takes effect only on new SSH connections that are established after the command is configured, and it does not affect existing SSH connections.

Setting the minimum interval for updating the RSA server key pair

1. Enter system view.

   system-view

2. Set the minimum interval for updating the RSA server key pair.

   ssh server rekey-interval *interval*

   By default, the device does not update the RSA server key pair.

   This command is not available in FIPS mode.

   This configuration takes effect only on SSH1 clients.

Setting the SSH user authentication timeout timer

1. Enter system view.

   system-view

2. Set the SSH user authentication timeout timer.

   ssh server authentication-timeout *time-out-value*

   The default setting is 60 seconds.

   Perform this task to prevent malicious occupation of TCP connections. If a user does not finish the authentication when the timeout timer expires, the connection cannot be established.

Setting the maximum number of SSH authentication attempts

1. Enter system view.

   system-view

2. Set the maximum number of SSH authentication attempts.

   ssh server authentication-retries *retries*

   The default setting is 3.

   Perform this task to prevent malicious hacking of usernames and passwords. If the authentication method is **any**, the total number of publickey authentication attempts and password authentication attempts cannot exceed the upper limit.

Specifying an SSH login control ACL

1. Enter system view.

   system-view

2. Specify an SSH login control ACL.

   IPv4:

   ssh server acl { *advanced-acl-number* | *basic-acl-number* | **mac** *mac-acl-number* }

   IPv6:

   ssh server ipv6 acl { **ipv6** { *advanced-acl-number* | *basic-acl-number* } | **mac** *mac-acl-number* }

   This feature uses an ACL to filter SSH clients that initiate SSH connections to the server. By default, no ACLs are specified and all SSH users can initiate SSH connections to the server.

Enabling logging for SSH login attempts that are denied by the SSH login control ACL

1. Enter system view.

   system-view

2. Enable logging for SSH login attempts that are denied by the SSH login control ACL.

   ssh server acl-deny-log enable

   By default, logging is disabled for login attempts that are denied by the SSH login control ACL.

   This command enables SSH to generate log messages for SSH login attempts that are denied by the SSH login control ACL and send the messages to the information center.

Setting the DSCP value in the packets that the SSH server sends to SSH clients

1. Enter system view.

   system-view

2. Set the DSCP value in the packets that the SSH server sends to the SSH clients.

   IPv4:

   ssh server dscp *dscp-value*

   IPv6:

ssh server ipv6 dscp *dscp-value*

By default, the DSCP value of SSH packets is 48.

The DSCP value of a packet defines the priority of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Setting the SFTP connection idle timeout timer

1. Enter system view.

   system-view
2. Set the SFTP connection idle timeout timer.

   sftp server idle-timeout *time-out-value*

   By default, the SFTP connection idle timeout is 10 minutes.

   When the SFTP connection idle timeout timer expires, the system automatically tears the connection down and releases the connection resources.

Setting the maximum number of online SSH users

1. Enter system view.

   system-view
2. Set the maximum number of online SSH users.

   aaa session-limit ssh *max-sessions*

   The default setting is 32.

   When the number of online SSH users reaches the upper limit, the system denies new SSH connection requests. Changing the upper limit does not affect online SSH users.

   For more information about this command, see AAA commands in *Security Command Reference*.

Specifying a PKI domain for the SSH server

About specifying a PKI domain for the SSH server

The PKI domain specified for the SSH server has the following functions:

- The SSH server uses the PKI domain to send its certificate to the client in the key exchange stage.
- The SSH server uses the PKI domain to authenticate the client's certificate if no PKI domain is specified for the client authentication by using the **ssh user** command.

Procedure

1. Enter system view.

   system-view
2. Specify a PKI domain for the SSH server.

   ssh server pki-domain *domain-name*

   By default, no PKI domain is specified for the SSH server.

Disconnecting SSH sessions

About disconnecting SSH sessions

The device supports concurrent login sessions. To avoid an SSH login user interfering with your configuration, you can disconnect that SSH login user.

Procedure

Execute the following command in user view to disconnect SSH sessions:

free ssh { **user-ip** { *ip-address* | **ipv6** *ipv6-address* } [**port** *port-number*] | **user-pid** *pid-number* | **username** *username* }

Configuring the device as an Stelnet client

Stelnet client tasks at a glance

To configure an Stelnet client, perform the following tasks:

1. Generating local key pairs

   Only required for authentication method **publickey**, **password-publickey**, or **any**.
2. (Optional.) Specifying the source IP address for outgoing SSH packets
3. Establishing a connection to an Stelnet server
4. (Optional.) Deleting server public keys saved in the public key file on the Stelnet client
5. (Optional.) Establishing a connection to an Stelnet server based on Suite B

Generating local key pairs

About generating local key pairs

You must generate local key pairs on Stelnet clients when the Stelnet server uses the **publickey**, **password-publickey**, or **any** authentication method.

Restrictions and guidelines

Local DSA, ECDSA, and RSA key pairs for SSH use default names. You cannot assign names to the key pairs.

The key modulus length must be less than 2048 bits when you generate a DSA key pair.

When you generate an ECDSA key pair, you can generate only a **secp256r1** or **secp384r1** ECDSA key pair.

The Stelnet client operating in FIPS mode supports only ECDSA and RSA key pairs.

Procedure

1. Enter system view.

   system-view
2. Generate local key pairs.

   public-key local create { **dsa** | **ecdsa** { **secp256r1** | **secp384r1** } | **rsa** }

Specifying the source IP address for outgoing SSH packets

About specifying the source IP address for outgoing SSH packets

After you specify the source IP address for outgoing SSH packets on an Stelnet client, the client uses the specified IP address to communicate with the Stelnet server.

Restrictions and guidelines

As a best practice, specify the IP address of a loopback interface as the source address of outgoing SSH packets for the following purposes:

- Ensuring the communication between the Stelnet client and the Stelnet server.

- Improving the manageability of Stelnet clients in authentication service.

Procedure

1. Enter system view.

   system-view

2. Specify the source address for outgoing SSH packets.

   IPv4:

   ssh client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

   By default, an IPv4 Stelnet client uses the primary IPv4 address of the output interface in the matching route as the source address of the outgoing SSH packets.

   IPv6:

   ssh client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

   By default, an IPv6 Stelnet client automatically selects a source IPv6 address for outgoing SSH packets in compliance with RFC 3484.

Establishing a connection to an Stelnet server

About establishing a connection to an Stelnet server

Perform this task to enable the Stelnet client feature on the device and establish a connection to the Stelnet server. You can specify the public key algorithm and the preferred encryption, HMAC, and key exchange algorithms to be used during the connection.

To access the server, a client must use the server's host public key to authenticate the server. As a best practice, configure the server's host public key on the device in an insecure network. If the server's host public key is not configured on the client, the client will notify you to confirm whether to continue with the access.

- If you choose to continue, the client accesses the server and downloads the server's host public key. The downloaded public key will be used to authenticate the server in subsequent accesses.

  If the server public key is not specified the when you connect to the server, the device saves the server public key to the public key file. It does not save the server public key to the configuration file.
- If you choose to not continue, the connection cannot be established.

Restrictions and guidelines for establishing a connection to an Stelnet server

An Stelnet client cannot establish connections to both IPv4 and IPv6 Stelnet servers.

Establishing a connection to an IPv4 Stelnet server

Execute the following command in user view to establish a connection with an IPv4 Stelnet server:

In non-FIPS mode:

ssh2 *server* [*port-number*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1**

| **sha1-96** | **sha2-256** | **sha2-512** }] * [**dscp** *dscp-value* | **escape** *character* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

In FIPS mode:

ssh2 *server* [*port-number*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**escape** *character* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Establishing a connection to an IPv6 Stelnet server

Execute the following command in user view to establish a connection to an IPv6 Stelnet server:

In non-FIPS mode:

ssh2 ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**dscp** *dscp-value* | **escape** *character* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

In FIPS mode:

ssh2 ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**escape** *character* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Deleting server public keys saved in the public key file on the Stelnet client

About deleting server public keys saved in the public key file on the Stelnet client

When the Stelnet client switches to FIPS mode but the locally saved server public key does not comply with FIPS, the client cannot connect to the server. To connect to the server, delete the server public key saved on the client and make sure a FIPS-compliant public key has been generated on the server.

Procedure

1. Enter system view.
   system-view
2. Delete server public keys saved in the public key file on the Stelnet client.
   delete ssh client server-public-key [**server-ip** *ip-address*]

Establishing a connection to an Stelnet server based on Suite B

Execute the following command in user view to establish a connection to an Stelnet server based on Suite B:

IPv4:

ssh2 *server* [*port-number*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**dscp** *dscp-value* | **escape** *character* | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

IPv6:

ssh2 ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**dscp** *dscp-value* | **escape** *character* | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Configuring the device as an SFTP client

SFTP client tasks at a glance

To configure an SFTP client, perform the following tasks:

1. Generating local key pairs
   Only required for authentication method **publickey**, **password-publickey**, or **any**.
2. (Optional.) Specifying the source IP address for outgoing SFTP packets
3. Establishing a connection to an SFTP server
4. (Optional.) Deleting server public keys saved in the public key file on the SFTP client
5. (Optional.) Establishing a connection to an SFTP server based on Suite B
6. (Optional.) Working with SFTP directories
7. (Optional.) Working with SFTP files
8. (Optional.) Displaying help information
9. (Optional.) Terminating the connection with the SFTP server

Generating local key pairs

About generating local key pairs

You must generate local key pairs on SFTP clients when the SFTP server uses the **publickey**, **password-publickey**, or **any** authentication method.

Restrictions and guidelines

Local DSA, ECDSA, and RSA key pairs for SSH use default names. You cannot assign names to the key pairs.

The key modulus length must be less than 2048 bits when you generate a DSA key pair.

When you generate an ECDSA key pair, you can generate only a **secp256r1** or **secp384r1** ECDSA key pair.

The SFTP client operating in FIPS mode supports only ECDSA and RSA key pairs.

Procedure

1. Enter system view.
   system-view
2. Generate local key pairs.
   public-key local create { **dsa** | **ecdsa** { **secp256r1** | **secp384r1** } | **rsa** }

Specifying the source IP address for outgoing SFTP packets

About specifying the source IP address for outgoing SFTP packets

After you specify the source IP address for outgoing SFTP packets on an SFTP client, the client uses the specified IP address to communicate with the SFTP server.

Restrictions and guidelines

As a best practice, specify the IP address of a loopback interface as the source address of outgoing SFTP packets for the following purposes:

- Ensuring the communication between the SFTP client and the SFTP server.
- Improving the manageability of SFTP clients in authentication service.

Procedure

1. Enter system view.
   system-view
2. Specify the source address for outgoing SFTP packets.

   IPv4:

   sftp client source { **ip** *ip-address* | **interface** *interface-type interface-number* }

   By default, an SFTP client uses the primary IPv4 address of the output interface in the matching route as the source address of the outgoing SFTP packets.

   IPv6:

   sftp client ipv6 source { **ipv6** *ipv6-address* | **interface** *interface-type interface-number* }

   By default, an IPv6 SFTP client automatically selects a source IPv6 address for the outgoing SFTP packets in compliance with RFC 3484.

Establishing a connection to an SFTP server

About establishing a connection to an SFTP server

Perform this task to enable the SFTP client feature on the device and establish a connection to the SFTP server. You can specify the public key algorithm and the preferred encryption, HMAC, and key exchange algorithms to be used during the connection.

To access the server, a client must use the server's host public key to authenticate the server. As a best practice, configure the server's host public key on the device in an insecure network. If the server's host public key is not configured on the client, the client will notify you to confirm whether to continue with the access.

- If you choose to continue, the client accesses the server and downloads the server's host public key. The downloaded public key will be used to authenticate the server in subsequent accesses.

  If the server public key is not specified when you connect to the server, the device saves the server public key to the public key file. It does not save the server public key to the configuration file.
- If you choose to not continue, the connection cannot be established.

Restrictions and guidelines for establishing a connection to an SFTP server

An SFTP client cannot establish connections to both IPv4 and IPv6 SFTP servers.

Establishing a connection to an IPv4 SFTP server

Execute the following command in user view to establish a connection to an IPv4 SFTP server:

In non-FIPS mode:

sftp *server* [*port-number*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**dscp** *dscp-value* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

In FIPS mode:

sftp *server* [*port-number*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Establishing a connection to an IPv6 SFTP server

Execute the following command in user view to establish a connection to an IPv6 SFTP server:

In non-FIPS mode:

sftp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [**dscp** *dscp-value* | { **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

In FIPS mode:

sftp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Deleting server public keys saved in the public key file on the SFTP client

About deleting server public keys saved in the public key file on the SFTP client

When the SFTP client switches to FIPS mode but the locally saved server public key does not comply with FIPS, the client cannot connect to the server. To connect to the server, delete the server public key saved on the client and make sure a FIPS-compliant public key has been generated on the server.

Procedure

1. Enter system view.

   system-view

2. Delete server public keys saved in the public key file on the SFTP client.

   delete ssh client server-public-key [**server-ip** *ip-address*]

Establishing a connection to an SFTP server based on Suite B

Execute the following command in user view to establish a connection to an SFTP server based on Suite B:

IPv4:

sftp *server* [*port-number*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

IPv6:

sftp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**dscp** *dscp-value* | **escape** *character* | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Working with SFTP directories

About SFTP directory operations

After you establish a connection to an SFTP server, you can operate directories of the SFTP server.

Changing the working directory on the SFTP server

1. Enter SFTP client view.

   For more information, see "Establishing a connection to an SFTP server."
2. Change the working directory on the SFTP server.

   cd [*remote-path*]
3. (Optional.) Return to the upper-level directory.

   cdup

Displaying the current working directory on the SFTP server

1. Enter SFTP client view.

   For more information, see "Establishing a connection to an SFTP server."
2. Display the current working directory on the SFTP server.

   pwd

Displaying files under a directory

1. Enter SFTP client view.

   For more information, see "Establishing a connection to an SFTP server."
2. Display files under a directory.
   - **dir** [**-a** | **-l**] [*remote-path*]
   - **ls** [**-a** | **-l**] [*remote-path*]

   The **dir** command has the same function as the **ls** command.

Changing the name of a directory on the SFTP server

1. Enter SFTP client view.

   For more information, see "Establishing a connection to an SFTP server."
2. Change the name of a directory on the SFTP server.

   rename *oldname newname*

Creating a new directory on the SFTP server

1. Enter SFTP client view.

   For more information, see "Establishing a connection to an SFTP server."
2. Create a new directory on the SFTP server.

   mkdir *remote-path*

Deleting directories on the SFTP server

1. Enter SFTP client view.
   For more information, see "Establishing a connection to an SFTP server."
2. Delete one or more directories from the SFTP server.
   rmdir *remote-path*

Working with SFTP files

About SFTP file operations

After you establish a connection to an SFTP server, you can operate files on the SFTP server.

Changing the name of a file on the SFTP server

1. Enter SFTP client view.
   For more information, see "Establishing a connection to an SFTP server."
2. Change the name of a file on the SFTP server.
   rename *old-name new-name*

Downloading a file from the SFTP server and save it locally

1. Enter SFTP client view.
   For more information, see "Establishing a connection to an SFTP server."
2. Download a file from the SFTP server and save it locally.
   get *remote-file* [*local-file*]

Uploading a local file to the SFTP server

1. Enter SFTP client view.
   For more information, see "Establishing a connection to an SFTP server."
2. Upload a local file to the SFTP server.
   put *local-file* [*remote-file*]

Display files under a directory

1. Enter SFTP client view.
   For more information, see "Establishing a connection to an SFTP server."
2. Display files under a directory.
   - **dir** [**-a** | **-l**] [*remote-path*]
   - **ls** [**-a** | **-l**] [*remote-path*]

   The **dir** command has the same function as the **ls** command.

Deleting a file from the SFTP server

1. Enter SFTP client view.
   For more information, see "Establishing a connection to an SFTP server."
2. Delete a file from the SFTP server.
   - **delete** *remote-file*
   - **remove** *remote-file*

   The **delete** command has the same function as the **remove** command.

Displaying help information

About displaying help information

After you establish a connection to the SFTP server, you can display the help information of SFTP client commands, including the command syntax and parameter configuration.

Procedure

1. Enter SFTP client view.

   For more information, see "Establishing a connection to an SFTP server."
2. Display SFTP client command help information.
   - **`help`**
   - **`?`**

   The **`help`** command has the same function as the **`?`** command.

Terminating the connection with the SFTP server

1. Enter SFTP client view.

   For more information, see "Establishing a connection to an SFTP server."
2. Terminate the connection with the SFTP server and return to user view.
   - **`bye`**
   - **`exit`**
   - **`quit`**

   The three commands have the same function.

Configuring the device as an SCP client

SCP client tasks at a glance

To configure an SCP client, perform the following tasks:

1. Generating local key pairs

   Only required for the **publickey**, **password-publickey**, or **any** authentication method.
2. (Optional.) Specifying the source IP address for outgoing SCP packets
3. Establishing a connection to an SCP server
4. (Optional.) Deleting server public keys saved in the public key file on the SCP client
5. (Optional.) Establishing a connection to an SCP server based on Suite B

Generating local key pairs

About generating local key pairs

You must generate local key pairs on SCP clients when the SCP server uses the **publickey**, **password-publickey**, or **any** authentication method.

Restrictions and guidelines

Local DSA, ECDSA, and RSA key pairs for SSH use default names. You cannot assign names to the key pairs.

The key modulus length must be less than 2048 bits when you generate a DSA key pair.

When you generate an ECDSA key pair, you can generate only a **secp256r1** or **secp384r1** ECDSA key pair.

The SCP client operating in FIPS mode supports only ECDSA and RSA key pairs.

Procedure

1. Enter system view.

   system-view

2. Generate local key pairs.

   public-key local create { **dsa** | **ecdsa** { **secp256r1** | **secp384r1** } | **rsa** }

Specifying the source IP address for outgoing SCP packets

About specifying the source IP address for outgoing SCP packets

After you specify the source IP address for outgoing SCP packets on an SCP client, the client uses the specified IP address to communicate with the SCP server.

Restrictions and guidelines

As a best practice, specify the IP address of a loopback interface as the source address of outgoing SCP packets for the following purposes:

- Ensuring the communication between the SCP client and the SCP server.
- Improving the manageability of SCP clients in authentication service.

Procedure

1. Enter system view.

   system-view

2. Specify the source address for outgoing SCP packets.

   IPv4:

   scp client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

   By default, an SCP client uses the primary IPv4 address of the output interface in the matching route as the source address of the outgoing SCP packets.

   IPv6:

   scp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

   By default, an SCP client automatically selects an IPv6 address as the source address of the outgoing packets in compliance with RFC 3484.

Establishing a connection to an SCP server

About establishing a connection to an SCP server

Perform this task to enable the SCP client feature on the device, establish a connection to the SCP server, and transfer files with the server. You can specify the public key algorithm and the preferred encryption, HMAC, and key exchange algorithms to be used during the connection.

To access the server, a client must use the server's host public key to authenticate the server. As a best practice, configure the server's host public key on the device in an insecure network. If the server's host public key is not configured on the client, the client will notify you to confirm whether to continue with the access.

- If you choose to continue, the client accesses the server and downloads the server's host public key. The downloaded public key will be used to authenticate the server in subsequent accesses.

  If the server public key is not specified when you connect to the server, the device saves the server public key to the public key file. It does not save the server public key to the configuration file.
- If you choose to not continue, the connection cannot be established.

Restrictions and guidelines for establishing a connection to an SCP server

An SCP client cannot establish connections to both IPv4 and IPv6 SCP servers.

Establishing a connection to an IPv4 SCP server

Execute the following command in user view to connect to an IPv4 SCP server, and transfer files with the server:

In non-FIPS mode:

scp *server* [*port-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] * [**user** *username* [**password** *password*]]

In FIPS mode:

scp *server* [*port-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] * [**user** *username* [**password** *password*]]

Establishing a connection to an IPv6 SCP server

Execute the following command in user view to connect to an IPv6 SCP server, and transfer files with the server.

In non-FIPS mode:

scp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** |

aes128-cbc | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] * [**user** *username* [**password** *password*]]

In FIPS mode:

scp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | { **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } **pki-domain** *domain-name* } | **prefer-compress zlib** | **prefer-ctos-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-ctos-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } | **prefer-kex** { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } | **prefer-stoc-cipher** { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } | **prefer-stoc-hmac** { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** }] * [{ **public-key** *keyname* | **server-pki-domain** *domain-name* } | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] * [**user** *username* [**password** *password*]]

Deleting server public keys saved in the public key file on the SCP client

About deleting server public keys saved in the public key file on the SCP client

When the SCP client switches to FIPS mode but the locally saved server public key does not comply with FIPS, the client cannot connect to the server. To connect to the server, delete the server public key saved on the client and make sure a FIPS-compliant public key has been generated on the server.

Procedure

1. Enter system view.

   system-view

2. Delete server public keys saved in the public key file on the SCP client.

   delete ssh client server-public-key [**server-ip** *ip-address*]

Establishing a connection to an SCP server based on Suite B

Execute the following command in user view to establish a connection to an SCP server based on Suite B:

IPv4:

scp *server* [*port-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] * [**user** *username* [**password** *password*]]

IPv6:

scp ipv6 *server* [*port-number*] [**-i** *interface-type interface-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] **suite-b** [**128-bit** | **192-bit**] **pki-domain** *domain-name* [**server-pki-domain** *domain-name*] [**prefer-compress zlib**] [**source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] * [**user** *username* [**password** *password*]]

Specifying algorithms for SSH2

About algorithms for SSH2

The SSH2 client and server use the following types of algorithms for algorithm negotiation during the Stelnet, SFTP, or SCP session establishment:

- Key exchange algorithms.
- Public key algorithms.
- Encryption algorithms.
- MAC algorithms.

If you specify algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The client uses the specified algorithms to initiate the negotiation, and the server uses the matching algorithms to negotiate with the client. If multiple algorithms of the same type are specified, the algorithm specified earlier has a higher priority during negotiation.

Specifying key exchange algorithms for SSH2

1. Enter system view.

   system-view

2. Specify key exchange algorithms for SSH2.

   In non-FIPS mode:

   ssh2 algorithm key-exchange { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } *

   By default, SSH2 uses the **ecdh-sha2-nistp256**, **ecdh-sha2-nistp384**, **dh-group-exchange-sha1**, **dh-group14-sha1**, and **dh-group1-sha1** key exchange algorithms in descending order of priority for algorithm negotiation.

   In FIPS mode:

   ssh2 algorithm key-exchange { **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } *

   By default, SSH2 uses the **ecdh-sha2-nistp256**, **ecdh-sha2-nistp384**, and **dh-group14-sha1** key exchange algorithms in descending order of priority for algorithm negotiation.

Specifying public key algorithms for SSH2

1. Enter system view.

   system-view

2. Specify public key algorithms for SSH2.

   In non-FIPS mode:

ssh2 algorithm public-key { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } *

By default, SSH2 uses the **x509v3-ecdsa-sha2-nistp256**, **x509v3-ecdsa-sha2-nistp384**, **ecdsa-sha2-nistp256**, **ecdsa-sha2-nistp384**, **rsa**, and **dsa** public key algorithms in descending order of priority for algorithm negotiation.

In FIPS mode:

ssh2 algorithm public-key { **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } *

By default, SSH2 uses the **x509v3-ecdsa-sha2-nistp256**, **x509v3-ecdsa-sha2-nistp384**, **ecdsa-sha2-nistp256**, **ecdsa-sha2-nistp384**, and **rsa** public key algorithms in descending order of priority for algorithm negotiation.

Specifying encryption algorithms for SSH2

1. Enter system view.

   system-view

2. Specify encryption algorithms for SSH2.

   In non-FIPS mode:

   ssh2 algorithm cipher { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } *

   By default, SSH2 uses the **aes128-ctr**, **aes192-ctr**, **aes256-ctr**, **aes128-gcm**, **aes256-gcm**, **aes128-cbc**, **3des-cbc**, **aes256-cbc**, and **des-cbc** encryption algorithms in descending order of priority for algorithm negotiation.

   In FIPS mode:

   ssh2 algorithm cipher { **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** } *

   By default, SSH2 uses the **aes128-ctr**, **aes192-ctr**, **aes256-ctr**, **aes128-gcm**, **aes256-gcm**, **aes128-cbc**, and **aes256-cbc** encryption algorithms in descending order of priority for algorithm negotiation.

Specifying MAC algorithms for SSH2

1. Enter system view.

   system-view

2. Specify MAC algorithms for SSH2.

   In non-FIPS mode:

   ssh2 algorithm mac { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } *

   By default, SSH2 uses the **sha2-256**, **sha2-512, sha1**, **md5**, **sha1-96**, and **md5-96** MAC algorithms in descending order of priority for algorithm negotiation.

   In FIPS mode:

   ssh2 algorithm mac { **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } *

   By default, SSH2 uses the **sha2-256**, **sha2-512, sha1**, and **sha1-96** MAC algorithms in descending order of priority for algorithm negotiation.

Display and maintenance commands for SSH

Execute **display** commands in any view.

Task	Command
Display the public keys of the local key pairs.	**display public-key local** { **dsa** | **ecdsa** | **rsa** } **public** [**name** *publickey-name*]
Display information about peer public keys.	**display public-key peer** [**brief** | **name** *publickey-name*]
Display the source IP address configuration of the SCP client.	**display scp client source**
Display the source IP address configuration of the SFTP client.	**display sftp client source**
Display server public key information saved in the public key file on the SSH client.	**display ssh client server-public-key** [**server-ip** *ip-address*]
Display the source IP address configuration of the Stelnet client.	**display ssh client source**
Display SSH server status or sessions.	**display ssh server** { **session** | **status** }
Display SSH user information on the SSH server.	**display ssh user-information** [*username*]
Display algorithms used by SSH2 in the algorithm negotiation stage.	**display ssh2 algorithm**

For more information about the **display public-key local** and **display public-key peer** commands, see public key management commands in *Security Command Reference*.

Stelnet configuration examples

Unless otherwise noted, devices in the configuration examples operate in non-FIPS mode.

When the device acts as an Stelnet server operating in FIPS mode, only ECDSA and RSA key pairs are supported. Do not generate a DSA key pair on the Stelnet server.

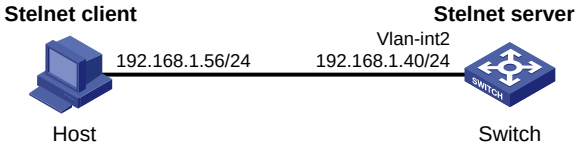
Example: Configuring the device as an Stelnet server (password authentication)

Network configuration

As shown in Figure 1:

- The switch acts as the Stelnet server and uses password authentication to authenticate the Stelnet client. The username and password of the client are saved on the switch.
- The host acts as the Stelnet client, using Stelnet client software (SSH2). After the user on the host logs in to the switch through Stelnet, the user can configure and manage the switch as a network administrator.

Figure 1 Network diagram



Procedure

1. Configure the Stelnet server:

   # Generate RSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.....................++++++
.................++++++
..++++++++
............++++++++
Create the key pair successfully.
```

   # Generate a DSA key pair.

```
[Switch] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.....................................+
...+................+..........+...+.
Create the key pair successfully.
```

   # Generate an ECDSA key pair.

```
[Switch] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

   # Enable the Stelnet server.

```
[Switch] ssh server enable
```

   # Assign an IP address to VLAN-interface 2. The Stelnet client uses this address as the destination for SSH connection.

```
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ip address 192.168.1.40 255.255.255.0
[Switch-Vlan-interface2] quit
```

   # Set the authentication mode to AAA for user lines.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
```

```
[Switch-line-vty0-63] quit
```

Create a local device management user named **client001**.

```
[Switch] local-user client001 class manage
```

Set the password to **hello12345** in plain text for local user **client001**.

```
[Switch-luser-manage-client001] password simple hello12345
```

Authorize local user **client001** to use the **SSH** service.

```
[Switch-luser-manage-client001] service-type ssh
```

Assign the **network-admin** user role to local user **client001**.

```
[Switch-luser-manage-client001] authorization-attribute user-role network-admin
[Switch-luser-manage-client001] quit
```

Create an SSH user named **client001**. Specify the service type as **stelnet** and the authentication method as **password** for the user.

```
[Switch] ssh user client001 service-type stelnet authentication-type password
```

2. Establish a connection to the Stelnet server:

There are different types of Stelnet client software, such as PuTTY and OpenSSH. This example uses an Stelnet client that runs PuTTY version 0.58.

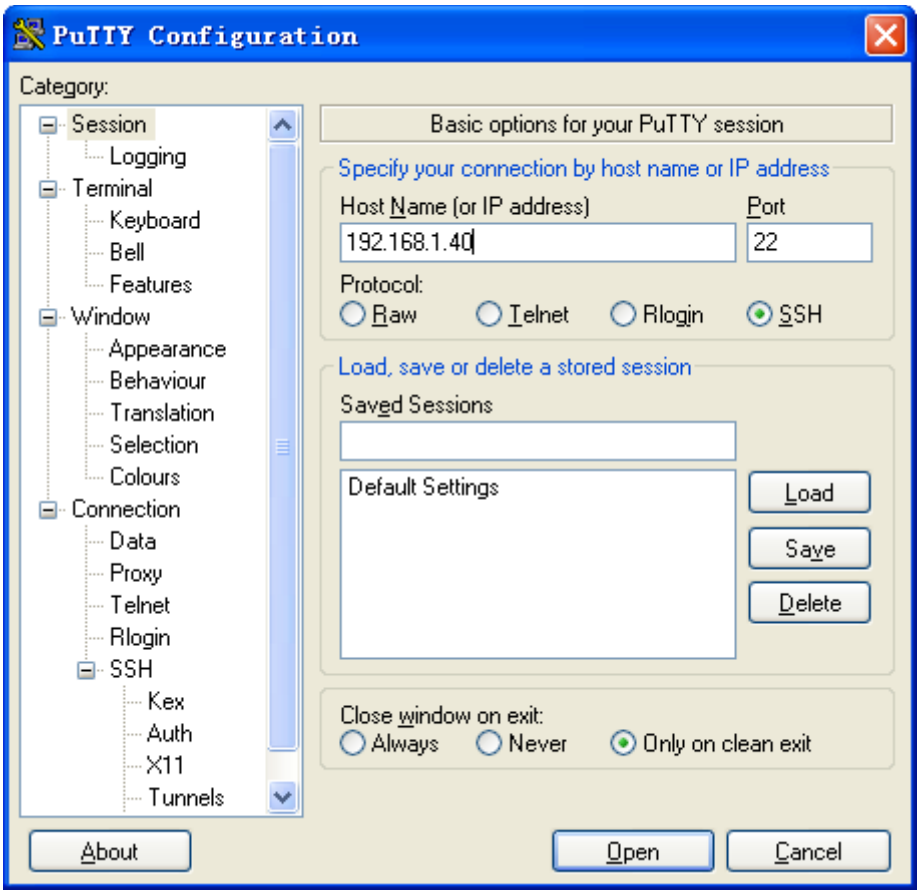
To establish a connection to the Stelnet server:

a. Launch PuTTY.exe to enter the interface shown in Figure 2.

b. In the **Host Name (or IP address)** field, enter IP address **192.168.1.40** of the Stelnet server.

c. Click **Open**.

Figure 2 Specifying the host name (or IP address)



d. Enter username **client001** and password **hello12345** to log in to the Stelnet server.

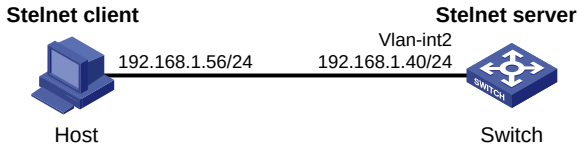
Example: Configuring the device as an Stelnet server (publickey authentication)

Network configuration

As shown in Figure 3:

- The switch acts as the Stelnet server, and it uses publickey authentication and the RSA public key algorithm.
- The host acts as the Stelnet client, using Stelnet client software (SSH2). After the user on the host logs in to the switch through Stelnet, the user can configure and manage the switch as a network administrator.

Figure 3 Network diagram



Procedure

In the server configuration, the client's host public key is required. Use the client software to generate RSA key pairs on the client before configuring the Stelnet server.

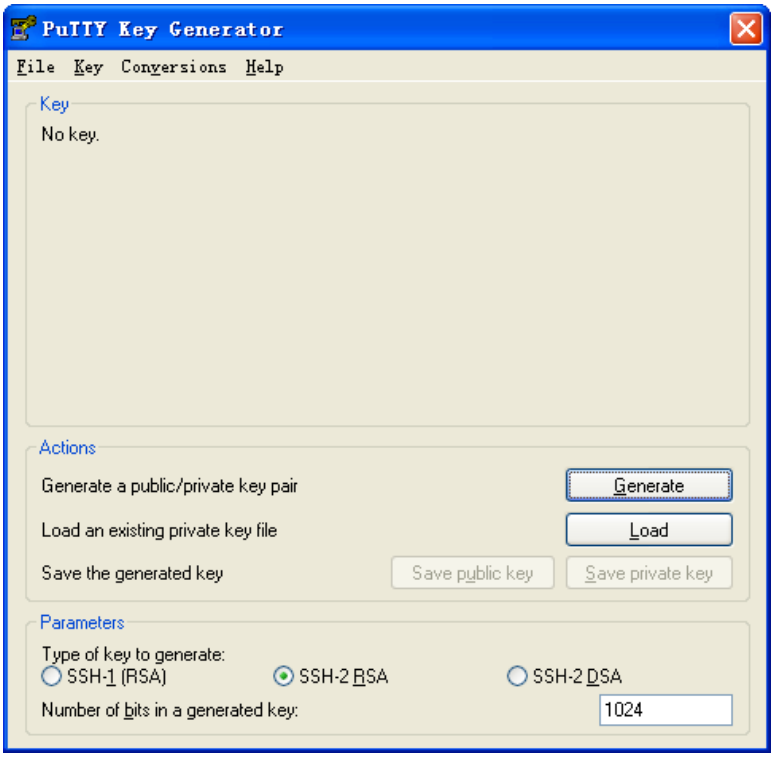
There are different types of Stelnet client software, such as PuTTY and OpenSSH. This example uses an Stelnet client that runs PuTTY version 0.58.

The configuration procedure is as follows:

1. Generate RSA key pairs on the Stelnet client:

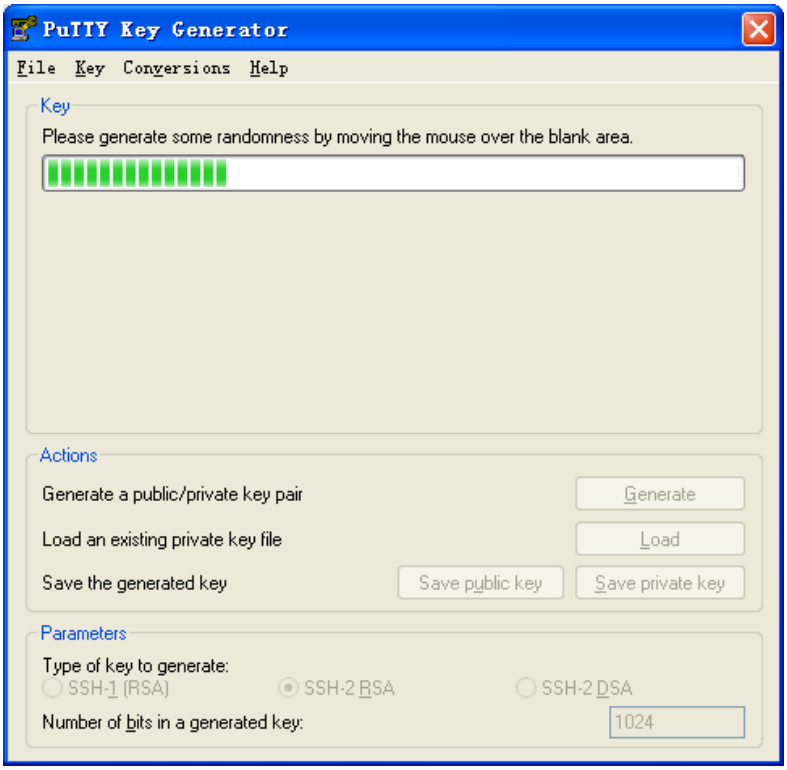
a. Run PuTTYGen.exe on the client, select **SSH-2 RSA** and click **Generate**.

Figure 4 Generating a key pair on the client



b. Continue moving the mouse during the key generating process, but do not place the mouse over the green progress bar shown in Figure 5. Otherwise, the progress bar stops moving and the key pair generating progress stops.

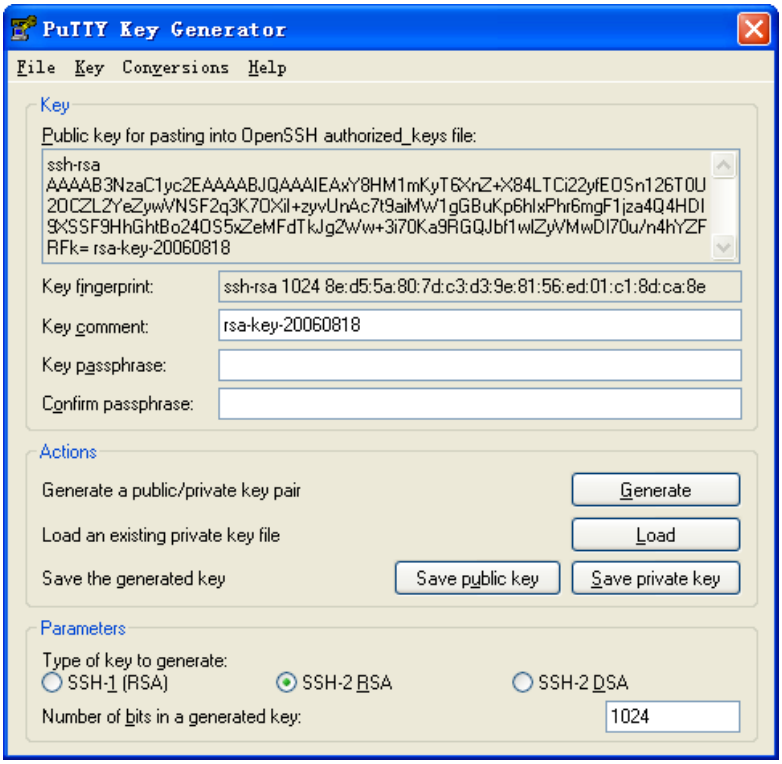
Figure 5 Generating process



c. After the key pair is generated, click **Save public key** to save the public key.

A file saving window appears.

Figure 6 Saving a key pair on the client



d. Enter a file name (**key.pub** in this example), and click **Save**.

e. On the page shown in Figure 6, click **Save private key** to save the private key.

A confirmation dialog box appears.

f. Click **Yes**.

A file saving window appears.

g. Enter a file name (**private.ppk** in this example), and click **Save**.

h. Transmit the public key file to the server through FTP or TFTP. (Details not shown.)

2. Configure the Stelnet server:

Generate RSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.....................++++++
.................++++++
..++++++++
............++++++++
Create the key pair successfully.
```

Generate a DSA key pair.

```
[Switch] public-key local create dsa
```

```
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.....................................+
...+.................+.........+...+
Create the key pair successfully.
```

Generate an ECDSA key pair.

```
[Switch] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

Enable the Stelnet server.

```
[Switch] ssh server enable
```

Assign an IP address to VLAN-interface 2. The Stelnet client uses this IP address as the destination for SSH connection.

```
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ip address 192.168.1.40 255.255.255.0
[Switch-Vlan-interface2] quit
```

Set the authentication mode to AAA for user lines.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Import the client's public key from the public key file **key.pub** and name it **switchkey**.

```
[Switch] public-key peer switchkey import sshkey key.pub
```

Create an SSH user named **client002**. Specify the authentication method as **publickey** for the user, and assign the public key **switchkey** to the user.

```
[Switch] ssh user client002 service-type stelnet authentication-type publickey assign
publickey switchkey
```

Create a local device management user named **client002**.

```
[Switch] local-user client002 class manage
```

Authorize local user **client002** to use the **SSH** service.

```
[Switch-luser-manage-client002] service-type ssh
```

Assign the **network-admin** user role to local user **client002**.

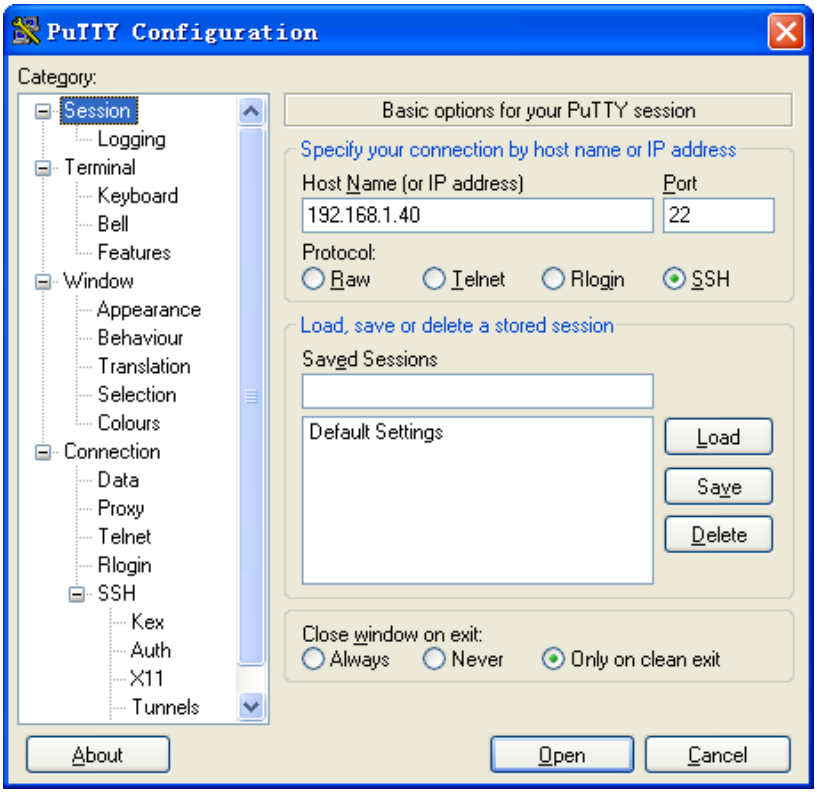
```
[Switch-luser-manage-client002] authorization-attribute user-role network-admin
[Switch-luser-manage-client002] quit
```

3. Specify the private key file and establish a connection to the Stelnet server:

a. Launch PuTTY.exe on the Stelnet client to enter the interface shown in Figure 7.

b. In the **Host Name (or IP address)** field, enter IP address **192.168.1.40** of the Stelnet server.

Figure 7 Specifying the host name (or IP address)

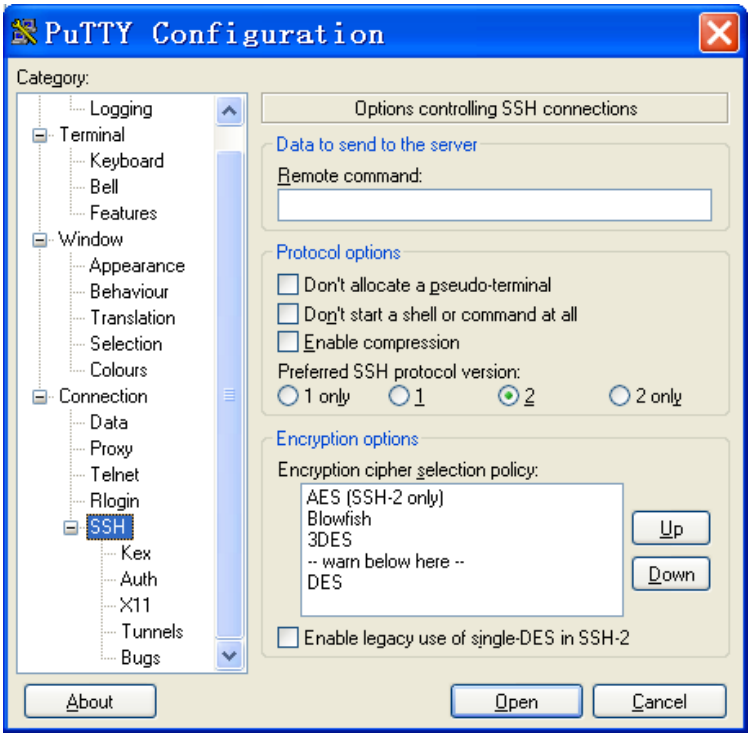


c. From the navigation tree, select **Connection** > **SSH**.

The window shown in Figure 8 appears.

d. Set **Preferred SSH protocol version** to **2**.

Figure 8 Setting the preferred SSH version



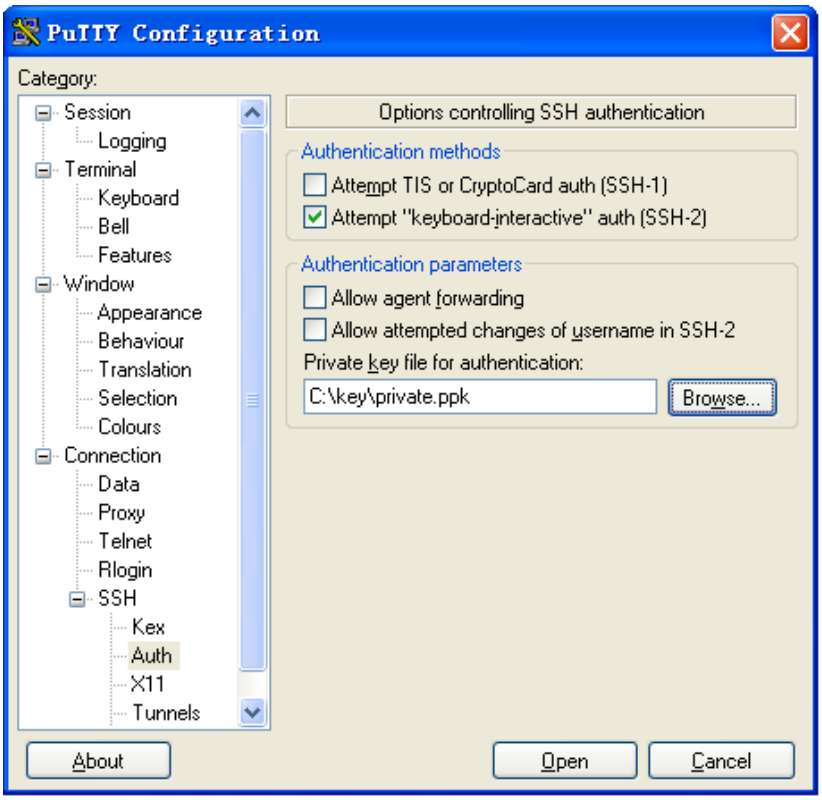
e. From the navigation tree, select **Connection** > **SSH** > **Auth**.

   The window shown in Figure 9 appears.

f. Click **Browse…** to open the file selection window, and then select the private key file (**private.ppk** in this example).

g. Click **Open**.

Figure 9 Specifying the private key file



h. Entering username **client002** to log in to the Stelnet server.

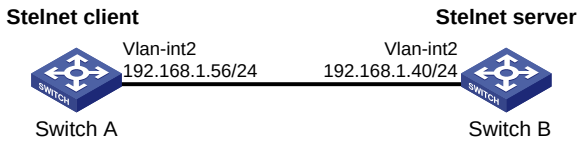
Example: Configuring the device as an Stelnet client (password authentication)

Network configuration

As shown in Figure 10:

- Switch B acts as the Stelnet server and uses password authentication to authenticate the Stelnet client. The username and password of the client are saved on Switch B.
- Switch A acts as the Stelnet client. After the user on Switch A logs in to Switch B through Stelnet, the user can configure and manage Switch B as a network administrator.

Figure 10 Network diagram



Procedure

1. Configure the Stelnet server:

Generate RSA key pairs.

```
<SwitchB> system-view
[SwitchB] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.....................++++++
.................++++++
..++++++++
............++++++++
Create the key pair successfully.
```

Generate a DSA key pair.

```
[SwitchB] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.................................+
...+.................+..........+...+
Create the key pair successfully.
```

Generate an ECDSA key pair.

```
[SwitchB] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

Enable the Stelnet server.

```
[SwitchB] ssh server enable
```

Assign an IP address to VLAN-interface 2. The Stelnet client uses this address as the destination address of the SSH connection.

```
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 192.168.1.40 255.255.255.0
[SwitchB-Vlan-interface2] quit
```

Set the authentication mode to AAA for user lines.

```
[SwitchB] line vty 0 63
[SwitchB-line-vty0-63] authentication-mode scheme
[SwitchB-line-vty0-63] quit
```

Create a local device management user named **client001**.

```
[SwitchB] local-user client001 class manage
```

Set the password to **hello12345** in plain text for local user **client001**.

```
[SwitchB-luser-manage-client001] password simple hello12345
```

Authorize local user **client001** to use the **SSH** service.

```
[SwitchB-luser-manage-client001] service-type ssh
```

Assign the **network-admin** user role to local user **client001**.

```
[SwitchB-luser-manage-client001] authorization-attribute user-role network-admin
[SwitchB-luser-manage-client001] quit
```

Create an SSH user named **client001**. Specify the service type as **stelnet** and the authentication method as **password** for the user.

```
[SwitchB] ssh user client001 service-type stelnet authentication-type password
```

2. Establish a connection to the Stelnet server:

Assign an IP address to VLAN-interface 2.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 192.168.1.56 255.255.255.0
[SwitchA-Vlan-interface2] quit
[SwitchA] quit
```

Before establishing a connection to the server, you can configure the server's host public key on the client to authenticate the server.

- To configure the server's host public key on the client, perform the following tasks:

  # Use the **display public-key local dsa public** command on the server to display the server's host public key. (Details not shown.)

  # Enter public key view of the client and copy the host public key of the server to the client.

```
[SwitchA] public-key peer key1
Enter public key view. Return to system view with "peer-public-key end" command.

******************************************************************************

<SwitchB>
```

After you enter password **hello12345**, you can access Switch B successfully. At the next connection attempt, the client authenticates the server by using the saved server's host public key on the client.

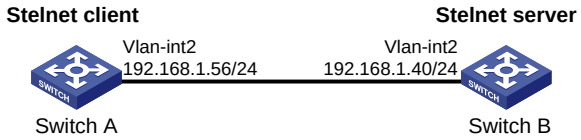
Example: Configuring the device as an Stelnet client (publickey authentication)

Network configuration

As shown in Figure 11:

- Switch B acts as the Stelnet server, and it uses publickey authentication and the DSA public key algorithm.
- Switch A acts as the Stelnet client. After the user on Switch A logs in to Switch B through Stelnet, the user can configure and manage Switch B as a network administrator.

Figure 11 Network diagram



Procedure

In the server configuration, the client's host public key is required. Generate a DSA key pair on the client before configuring the Stelnet server.

1. Configure the Stelnet client:

   # Assign an IP address to VLAN-interface 2.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 192.168.1.56 255.255.255.0
[SwitchA-Vlan-interface2] quit
```

   # Generate a DSA key pair.

```
[SwitchA] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.....................................+
...+.................+..........+...+
Create the key pair successfully.
```

   # Export the DSA host public key to a public key file named **key.pub**.

```
[SwitchA] public-key local export dsa ssh2 key.pub
[SwitchA] quit
```

   # Transmit the public key file **key.pub** to the server through FTP or TFTP. (Details not shown.)

2. Configure the Stelnet server:

   # Generate RSA key pairs.

```
<SwitchB> system-view
[SwitchB] public-key local create rsa
The range of public key modulus is (512 ~ 4096)
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
```

```
Input the modulus length [default = 1024]:
Generating Keys...
.....................++++++
.................++++++
..++++++++
............++++++++
Create the key pair successfully.
```

Generate a DSA key pair.

```
[SwitchB] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.................................+
...+.................+..........+...+
Create the key pair successfully.
```

Generate an ECDSA key pair.

```
[SwitchB] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

Enable the Stelnet server.

```
[SwitchB] ssh server enable
```

Assign an IP address to VLAN-interface 2. The Stelnet client uses this address as the destination address for SSH connection.

```
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 192.168.1.40 255.255.255.0
[SwitchB-Vlan-interface2] quit
```

Set the authentication mode to AAA for user lines.

```
[SwitchB] line vty 0 63
[SwitchB-line-vty0-63] authentication-mode scheme
[SwitchB-line-vty0-63] quit
```

Import the peer public key from the public key file **key.pub**, and name it **switchkey**.

```
[SwitchB] public-key peer switchkey import sshkey key.pub
```

Create an SSH user named **client002**. Specify the authentication method as **publickey** for the user. Assign the public key **switchkey** to the user.

```
[SwitchB] ssh user client002 service-type stelnet authentication-type publickey
assign publickey switchkey
```

Create a local device management user named **client002**.

```
[SwitchB] local-user client002 class manage
```

Authorize local user **client002** to use the **SSH** service.

```
[SwitchB-luser-manage-client002] service-type ssh
```

Assign the **network-admin** user role to local user **client002**.

```
[SwitchB-luser-manage-client002] authorization-attribute user-role network-admin
[SwitchB-luser-manage-client002] quit
```

3. Establish an SSH connection to the Stelnet server.

```
<SwitchA> ssh2 192.168.1.40 identity-key dsa
Username: client002
Press CTRL+C to abort.
Connecting to 192.168.1.40 port 22.
The server is not authenticated. Continue? [Y/N]:y
Do you want to save the server public key? [Y/N]:n
Enter a character ~ and a dot to abort.

**************************************************************************

* Without the owner's prior written consent,                             *
* no decompiling or reverse-engineering shall be allowed.                *
**************************************************************************

<SwitchB>
```

After you enter username **client002** and then enter **y** to continue accessing the server, you can log in to the server successfully.

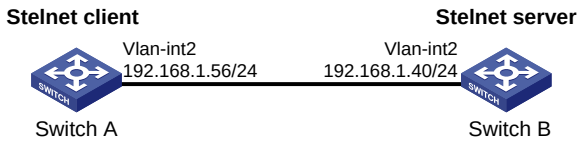
Example: Configuring Stelnet based on 128-bit Suite B algorithms

Network configuration

As shown in Figure 12:

- Switch B acts as the Stelnet Suite B server (SSH2), and it uses publickey authentication to authenticate the Stelnet client.
- Switch A acts as an Stelnet Suite B client (SSH2). After the user on Switch A logs in to Switch B through the Stelnet Suite B client software, the user can configure and manage Switch B as an administrator.

Figure 12 Network diagram



Procedure

1. Generate the client's certificate and the server's certificate. (Details not shown.)

   You must first configure the certificates of the server and the client because they are required for identity authentication between the two parties.

   In this example, the server's certificate file is **ssh-server-ecdsa256.p12** and the client's certificate file is **ssh-client-ecdsa256.p12**.

2. Configure the Stelnet client:

   You can modify the pkix version of the client software OpenSSH to support Suite B. This example uses an H3C switch as an Stelnet client.

   # Upload the server's certificate file **ssh-server-ecdsa256.p12** and the client's certificate file **ssh-client-ecdsa256.p12** to the Stelnet client through FTP or TFTP. (Details not shown.)

   # Create a PKI domain named **server256** for verifying the server's certificate and enter its view.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] pki domain server256
```

Disable CRL checking.

```
[SwitchA-pki-domain-server256] undo crl check enable
[SwitchA-pki-domain-server256] quit
```

Import local certificate file **ssh-server-ecdsa256.p12** to PKI domain **server256**.

```
[SwitchA] pki import domain server256 p12 local filename ssh-server-ecdsa256.p12
The system is going to save the key pair. You must specify a key pair name, which is
a case-insensitive string of 1 to 64 characters. Valid characters include a to z, A
to Z, 0 to 9, and hyphens (-).
Please enter the key pair name[default name: server256]:
```

Display information about local certificates in PKI domain **server256**.

```
[SwitchA] display pki certificate domain server256 local

```

Assign an IP address to VLAN-interface 2.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 192.168.1.56 255.255.255.0
[SwitchA-Vlan-interface2] quit
```

3. Configure the Stelnet server:

Upload the server's certificate file **ssh-server-ecdsa256.p12** and the client's certificate file **ssh-client-ecdsa256.p12** to the Stelnet server through FTP or TFTP. (Details not shown.)

Create a PKI domain named **client256** for verifying the client's certificate and import the file of the client's certificate to this domain. (Details not shown.)

Create a PKI domain named **server256** for the server's certificate and import the file of the server's certificate to this domain. (Details not shown.)

Specify Suite B algorithms for algorithm negotiation.

```
<SwitchB> system-view
[SwitchB] ssh2 algorithm key-exchange ecdh-sha2-nistp256
[SwitchB] ssh2 algorithm cipher aes128-gcm
[SwitchB] ssh2 algorithm public-key x509v3-ecdsa-sha2-nistp256
x509v3-ecdsa-sha2-nistp384
```

Specify **server256** as the PKI domain of the server's certificate.

```
[SwitchB] ssh server pki-domain server256
```

Enable the Stelnet server.

```
[SwitchB] ssh server enable
```

Assign an IP address to VLAN-interface 2.

```
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 192.168.1.40 255.255.255.0
[SwitchB-Vlan-interface2] quit
```

Set the authentication mode to AAA for user lines.

```
[SwitchB] line vty 0 63
[SwitchB-line-vty0-63] authentication-mode scheme
[SwitchB-line-vty0-63] quit
```

Create a local device management user named **client001**. Authorize the user to use the **SSH** service and assign the **network-admin** user role to the user.

```
[SwitchB] local-user client001 class manage
[SwitchB-luser-manage-client001] service-type ssh
[SwitchB-luser-manage-client001] authorization-attribute user-role network-admin
[SwitchB-luser-manage-client001] quit
```

Create an SSH user named **client001**. Specify the **publickey** authentication method for the user and specify **client256** as the PKI domain for verifying the client's certificate.

```
[SwitchB] ssh user client001 service-type stelnet authentication-type publickey
assign pki-domain client256
```

4. Establish an SSH connection to the Stelnet server based on the 128-bit Suite B algorithms:

Establish an SSH connection to the server at 192.168.1.40.

```
<SwitchA>  ssh2 192.168.1.40 suite-b 128-bit pki-domain client256 server-pki-domain
server256
Username: client001
Press CTRL+C to abort.
Connecting to 192.168.1.40 port 22.
Enter a character ~ and a dot to abort.

<SwitchB>
```

SFTP configuration examples

Unless otherwise noted, devices in the configuration examples operate in non-FIPS mode.

When the device acts as an SFTP server operating in FIPS mode, only ECDSA and RSA key pairs are supported. Do not generate a DSA key pair on the SFTP server.

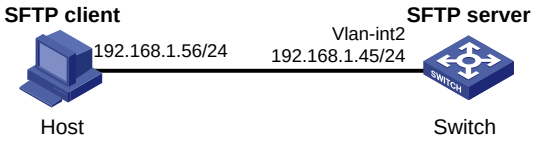
Example: Configuring the device as an SFTP server (password authentication)

Network configuration

As shown in Figure 13:

- The switch acts as the SFTP server and uses password authentication to authenticate the SFTP client. The username and password of the client are saved on the switch.
- The host acts as the SFTP client. After the user on the client logs in to the switch through SFTP, the user can perform file management and transfer operations on the switch as a network administrator.

Figure 13 Network diagram



Procedure

1. Configure the SFTP server:

   # Generate RSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
```

```
Generating Keys...
.....................++++++
.................++++++
..++++++++
............++++++++
Create the key pair successfully.
```

Generate a DSA key pair.

```
[Switch] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.................................+
...+.............+.........+...+
Create the key pair successfully.
```

Generate an ECDSA key pair.

```
[Switch] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

Enable the SFTP server.

```
[Switch] sftp server enable
```

Assign an IP address to VLAN-interface 2. The client uses this address as the destination for SSH connection.

```
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ip address 192.168.1.45 255.255.255.0
[Switch-Vlan-interface2] quit
```

Create a local device management user named **client002**.

```
[Switch] local-user client002 class manage
```

Set the password to **hello12345** in plain text for local user **client002**.

```
[Switch-luser-manage-client002] password simple hello12345
```

Authorize local user **client002** to use the **SSH** service.

```
[Switch-luser-manage-client002] service-type ssh
```

Assign the **network-admin** user role and working directory **flash:/** to local user **client002**.

```
[Switch-luser-manage-client002] authorization-attribute user-role network-admin
work-directory flash:/
[Switch-luser-manage-client002] quit
```

Create an SSH user named **client002**. Specify the authentication method as **password** and service type as **sftp** for the user.

```
[Switch] ssh user client002 service-type sftp authentication-type password
```

2. Establish a connection between the SFTP client and the SFTP server:

This example uses an SFTP client that runs PSFTP of PuTTy version 0.58. PSFTP supports only password authentication.

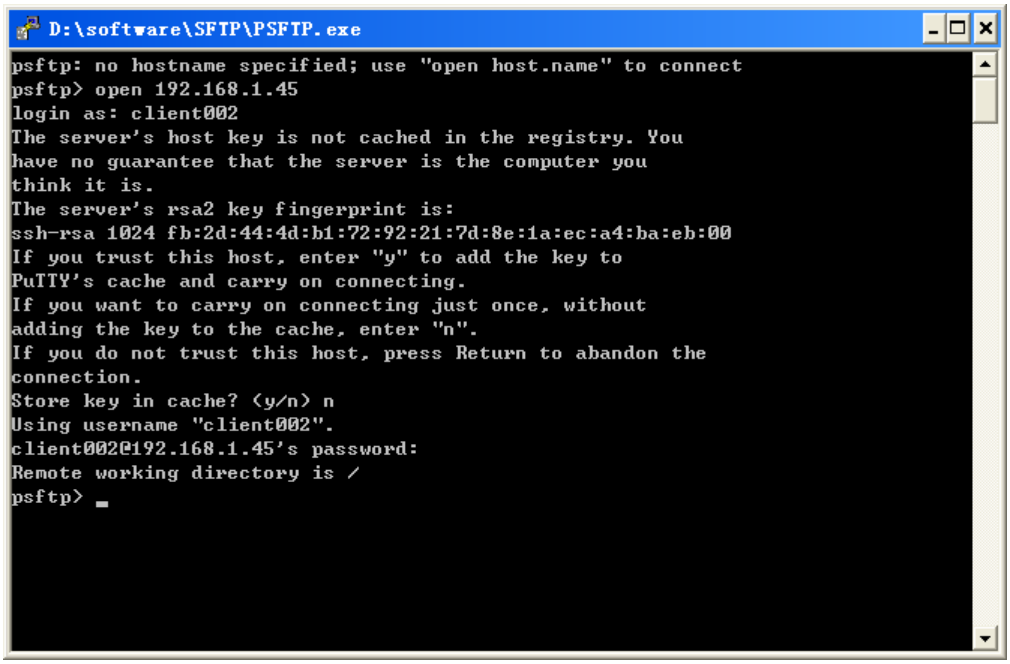
To establish a connection to the SFTP server:

a. Run the **psftp.exe** to launch the client interface shown in Figure 14, and enter the following command:

```
open 192.168.1.45
```

b. Enter username **client002** and password **hello12345** to log in to the SFTP server.

Figure 14 SFTP client interface



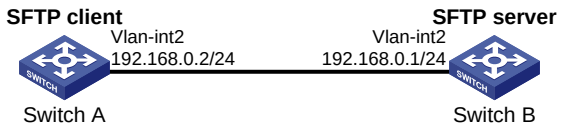
Example: Configuring the device as an SFTP client (publickey authentication)

Network configuration

As shown in Figure 15:

- Switch B acts as the SFTP server, and it uses publickey authentication and the RSA public key algorithm.
- Switch A acts as the SFTP client. After the user on Switch A logs in to Switch B through SFTP, the user can perform file management and transfer operations on Switch B as a network administrator.

Figure 15 Network diagram



Procedure

In the server configuration, the client's host public key is required. Generate RSA key pairs on the client before configuring the SFTP server.

1. Configure the SFTP client:

Assign an IP address to VLAN-interface 2.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 192.168.0.2 255.255.255.0
```

```
[SwitchA-Vlan-interface2] quit
```

Generate RSA key pairs.

```
[SwitchA] public-key local create rsa
The range of public key size is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.....................++++++
.................++++++
..++++++++
............++++++++
Create the key pair successfully.
```

Export the host public key to a public key file named **pubkey**.

```
[SwitchA] public-key local export rsa ssh2 pubkey
[SwitchA] quit
```

Transmit the public key file **pubkey** to the server through FTP or TFTP. (Details not shown.)

2. Configure the SFTP server:

Generate RSA key pairs.

```
<SwitchB> system-view
[SwitchB] public-key local create rsa
The range of public key size is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.....................++++++
.................++++++
..++++++++
............++++++++
Create the key pair successfully.
```

Generate a DSA key pair.

```
[SwitchB] public-key local create dsa
The range of public key size is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.................................+
...+.................+..........+...+
Create the key pair successfully.
```

Generate an ECDSA key pair.

```
[SwitchB] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

Enable the SFTP server.

```
[SwitchB] sftp server enable
```

Assign an IP address to VLAN-interface 2. The SSH client uses this address as the destination for SSH connection.

```
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 192.168.0.1 255.255.255.0
[SwitchB-Vlan-interface2] quit
```

Import the peer public key from the public key file **pubkey**, and name it **switchkey**.

```
[SwitchB] public-key peer switchkey import sshkey pubkey
```

Create an SSH user named **client001**. Specify the service type as **sftp** and the authentication method as **publickey** for the user. Assign the public key **switchkey** to the user.

```
[SwitchB] ssh user client001 service-type sftp authentication-type publickey assign
publickey switchkey
```

Create a local device management user named **client001**.

```
[SwitchB] local-user client001 class manage
```

Authorize local user **client001** to use the **SSH** service.

```
[SwitchB-luser-manage-client001] service-type ssh
```

Assign the **network-admin** user role and working directory **flash:/** to local user **client001**.

```
[SwitchB-luser-manage-client001] authorization-attribute user-role network-admin
work-directory flash:/
[SwitchB-luser-manage-client001] quit
```

3. Establish a connection to the SFTP server:

Establish a connection to the SFTP server and enter SFTP client view.

```
<SwitchA> sftp 192.168.0.1 identity-key rsa
Username: client001
Press CTRL+C to abort.
Connecting to 192.168.0.1 port 22.
The server is not authenticated. Continue? [Y/N]:y
Do you want to save the server public key? [Y/N]:n
sftp>
```

Display files under the current directory of the server, delete file **z**, and verify the result.

```
sftp> dir -l
-rwxrwxrwx   1 noone    nogroup      1759 Aug 23 06:52 config.cfg

-rwxrwxrwx   1 noone    nogroup       225 Sep 01 06:55 pub
drwxrwxrwx   1 noone    nogroup         0 Sep 02 06:30 new1
```

Change the name of directory **new1** to **new2** and verify the result.

```
sftp> rename new1 new2
sftp> dir -l
-rwxrwxrwx   1 noone    nogroup      1759 Aug 23 06:52 config.cfg
-rwxrwxrwx   1 noone    nogroup       225 Aug 24 08:01 pubkey2
-rwxrwxrwx   1 noone    nogroup       283 Aug 24 07:39 pubkey
drwxrwxrwx   1 noone    nogroup         0 Sep 01 06:22 new
-rwxrwxrwx   1 noone    nogroup       225 Sep 01 06:55 pub
drwxrwxrwx   1 noone    nogroup         0 Sep 02 06:33 new2
```

Download file **pubkey2** from the server and save it as a local file named **public**.

```
sftp> get pubkey2 public
Fetching / pubkey2 to public
/pubkey2                                      100% 225     1.4KB/s   00:00
```

Upload the local file **pu** to the server, save it as **puk**, and verify the result.

```
sftp> put pu puk
Uploading pu to / puk
sftp> dir -l
-rwxrwxrwx   1 noone    nogroup      1759 Aug 23 06:52 config.cfg
-rwxrwxrwx   1 noone    nogroup       225 Aug 24 08:01 pubkey2

-rwxrwxrwx   1 noone    nogroup       283 Sep 02 06:35 pub
-rwxrwxrwx   1 noone    nogroup       283 Sep 02 06:36 puk
sftp>
```

Exit SFTP client view.

```
sftp> quit
<SwitchA>
```

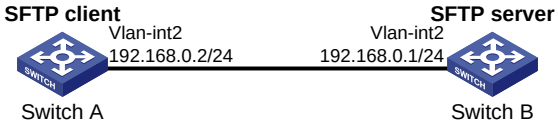
Example: Configuring SFTP based on 192-bit Suite B algorithms

Network configuration

As shown in Figure 16:

- Switch B acts as the SFTP Suite B server (SSH2), and it uses publickey authentication to authenticate the SFTP client.
- Switch A acts as an SFTP Suite B client (SSH2). After the user on Switch A logs in to Switch B based on the SFTP Suite B client software, the user can manage and transfer files on Switch B as an administrator.

Figure 16 Network diagram



Procedure

1. Generate the client's certificate and the server's certificate. (Details not shown.)

   You must first configure the certificates of the server and the client because they are required for identity authentication between the two parties.

   In this example, the server's certificate file is **ssh-server-ecdsa384.p12** and the client's certificate file is **ssh-client-ecdsa384.p12**.

2. Configure the SFTP client:

   You can modify the pkix version of the client software OpenSSH to support Suite B. This example uses an H3C switch as an SFTP client.

   # Upload the server's certificate file **ssh-server-ecdsa384.p12** and the client's certificate file **ssh-client-ecdsa384.p12** to the SFTP client through FTP or TFTP. (Details not shown.)

   # Create a PKI domain named **server384** for verifying the server's certificate and enter its view.

   ```
   <SwitchA> system-view
   [SwitchA] pki domain server384
   ```

   # Disable CRL checking.

   ```
   [SwitchA-pki-domain-server384] undo crl check enable
   [SwitchA-pki-domain-server384] quit
   ```

   # Import local certificate file **ssh-server-ecdsa384.p12** to PKI domain **server384**.

   ```
   [SwitchA] pki import domain server384 p12 local filename ssh-server-ecdsa384.p12
   The system is going to save the key pair. You must specify a key pair name, which is
   a case-insensitive string of 1 to 64 characters. Valid characters include a to z, A
   to Z, 0 to 9, and hyphens (-).
   Please enter the key pair name[default name: server384]:
   ```

   # Display information about local certificates in PKI domain **server384**.

   ```
   [SwitchA] display pki certificate domain server384 local
   Certificate:

```

Assign an IP address to VLAN-interface 2.

```
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 192.168.0.2 255.255.255.0
[SwitchA-Vlan-interface2] quit
[SwitchA] quit
```

3. Configure the SFTP server:

Upload the server's certificate file **ssh-server-ecdsa384.p12** and the client's certificate file **ssh-client-ecdsa384.p12** to the SFTP server through FTP or TFTP. (Details not shown.)

Create a PKI domain named **client384** for verifying the client's certificate and import the file of the client's certificate to this domain. (Details not shown.)

Create a PKI domain named **server384** for the server's certificate and import the file of the server's certificate to this domain. (Details not shown.)

Specify Suite B algorithms for algorithm negotiation.

```
[SwitchB] ssh2 algorithm key-exchange ecdh-sha2-nistp384
[SwitchB] ssh2 algorithm cipher aes256-gcm
[SwitchB] ssh2 algorithm public-key x509v3-ecdsa-sha2-nistp384
```

Specify **server384** as the PKI domain of the server's certificate.

```
[SwitchB] ssh server pki-domain server384
```

Enable the SFTP server.

```
[SwitchB] sftp server enable
```

Assign an IP address to VLAN-interface 2.

```
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 192.168.0.1 255.255.255.0
[SwitchB-Vlan-interface2] quit
```

Set the authentication mode to AAA for user lines.

```
[SwitchB] line vty 0 63
[SwitchB-line-vty0-63] authentication-mode scheme
[SwitchB-line-vty0-63] quit
```

Create a local device management user named **client001**. Authorize the user to use the **SSH** service and assign the **network-admin** user role to the user.

```
[SwitchB] local-user client001 class manage
[SwitchB-luser-manage-client001] service-type ssh
[SwitchB-luser-manage-client001] authorization-attribute user-role network-admin
[SwitchB-luser-manage-client001] quit
```

Create an SSH user named **client001**. Specify the **publickey** authentication method for the user and specify **client384** as the PKI domain for verifying the client's certificate.

```
[SwitchB] ssh user client001 service-type sftp authentication-type publickey assign
pki-domain client384
```

4. Establish an SFTP connection to the SFTP server based on the 192-bit Suite B algorithms:

Establish an SFTP connection to the server at 192.168.0.1.

```
<SwitchA> sftp 192.168.0.1 suite-b 192-bit pki-domain client384 server-pki-domain
server384
Username: client001
Press CTRL+C to abort.
Connecting to 192.168.0.1 port 22.
sftp>
```

SCP configuration examples

Unless otherwise noted, devices in the configuration examples operate in non-FIPS mode.

When the device acts as an SCP server operating in FIPS mode, only ECDSA and RSA key pairs are supported. Do not generate a DSA key pair on the SCP server.

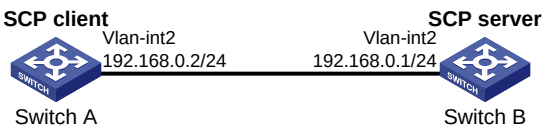
Example: Configuring SCP with password authentication

Network configuration

As shown in Figure 17:

- Switch B acts as the SCP server and uses password authentication to authenticate the SCP client. The client's username and password are saved on Switch B.
- Switch A acts as the SCP client. After the user on Switch A logs in to Switch B through SCP, the user can transfer files between switches as a network administrator.

Figure 17 Network diagram



Procedure

1. Configure the SCP server:

Generate RSA key pairs.

```
<SwitchB> system-view
[SwitchB] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.....................++++++
.................++++++
..++++++++
............++++++++
Create the key pair successfully.
```

Generate a DSA key pair.

```
[SwitchB] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.................................+
...+.................+..........+...+.
Create the key pair successfully.
```

Generate an ECDSA key pair.

```
[SwitchB] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

Enable the SCP server.

```
[SwitchB] scp server enable
```

Configure an IP address for VLAN-interface 2. The client uses this address as the destination for SCP connection.

```
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 192.168.0.1 255.255.255.0
[SwitchB-Vlan-interface2] quit
```

Create a local device management user named **client001**.

```
[SwitchB] local-user client001 class manage
```

Set the password to **hello12345** in plain text for local user **client001**.

```
[SwitchB-luser-manage-client001] password simple hello12345
```

Authorize local user **client001** to use the **SSH** service.

```
[SwitchB-luser-manage-client001] service-type ssh
```

Assign the **network-admin** user role to local user **client001**.

```
[SwitchB-luser-manage-client001] authorization-attribute user-role network-admin
[SwitchB-luser-manage-client001] quit
```

Create an SSH user named **client001**. Specify the service type as **scp** and the authentication method as **password** for the user.

```
[SwitchB] ssh user client001 service-type scp authentication-type password
```

2. Configure an IP address for VLAN-interface 2 on the SCP client.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 192.168.0.2 255.255.255.0
[SwitchA-Vlan-interface2] quit
[SwitchA] quit
```

3. Connect to the SCP server, download file **remote.bin** from the server, and save it as a local file named **local.bin**.

```
<SwitchA> scp 192.168.0.1 get remote.bin local.bin
Username: client001
Press CTRL+C to abort.
Connecting to 192.168.0.1 port 22.
The server is not authenticated. Continue? [Y/N]:y
Do you want to save the server public key? [Y/N]:n
client001@192.168.0.1's password:
remote.bin                                        100% 2875     2.8KB/s   00:00
```

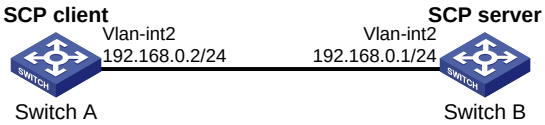
Example: Configuring SCP based on Suite B algorithms

Network configuration

As shown in Figure 18:

- Switch B acts as the SCP Suite B server (SSH2), and it uses publickey authentication to authenticate the SCP client.
- Switch A acts as an SCP Suite B client (SSH2). After the user on Switch A logs in to Switch B through the SCP Suite B client software, the user can transfer files between switches as a network administrator.

Figure 18 Network diagram



Procedure

1. Generate the client's certificates and the server's certificates. (Details not shown.)

   You must first configure the certificates of the server and the client because they are required for identity authentication between the two parties.

   In this example, the server's certificate files are **ssh-server-ecdsa256.p12** and **ssh-server-ecdsa384.p12**. The client's certificate files are **ssh-client-ecdsa256.p12** and **ssh-client-ecdsa384.p12**.

2. Configure the SCP client:

   You can modify the pkix version of the client software OpenSSH to support Suite B. This example uses an H3C switch as an SCP client.

   # Upload the server's certificate files (**ssh-server-ecdsa256.p12** and **ssh-server-ecdsa384.p12**) and the client's certificate files (**ssh-client-ecdsa256.p12** and **ssh-client-ecdsa384.p12**) to the SCP client through FTP or TFTP. (Details not shown.)

Create a PKI domain named **server256** for verifying the server's certificate **ecdsa256** and enter its view.

```
<SwitchA> system-view
[SwitchA] pki domain server256
```

Disable CRL checking.

```
[SwitchA-pki-domain-server256] undo crl check enable
[SwitchA-pki-domain-server256] quit
```

Import local certificate file **ssh-server-ecdsa256.p12** to PKI domain **server256**.

```
[SwitchA] pki import domain server256 p12 local filename ssh-server-ecdsa256.p12
The system is going to save the key pair. You must specify a key pair name, which is
a case-insensitive string of 1 to 64 characters. Valid characters include a to z, A
to Z, 0 to 9, and hyphens (-).
Please enter the key pair name[default name: server256]:
```

Display information about local certificates in PKI domain **server256**.

```
[SwitchA] display pki certificate domain server256 local
Certificate:

Assign an IP address to VLAN-interface 2.

```
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 192.168.0.2 255.255.255.0
[SwitchA-Vlan-interface2] quit
```

3. Configure the SCP server:

Upload the server's certificate files (**ssh-server-ecdsa256.p12** and **ssh-server-ecdsa384.p12**) and the client's certificate files (**ssh-client-ecdsa256.p12** and **ssh-client-ecdsa384.p12**) to the SCP server through FTP or TFTP. (Details not shown.)

Create a PKI domain named **client256** for verifying the client's certificate **ecdsa256** and import the file of this certificate to this domain. Create a PKI domain named **server256** for the server's certificate **ecdsa256** and import the file of this certificate to this domain. (Details not shown.)

Create a PKI domain named **client384** for verifying the client's certificate **ecdsa384** and import the file of this certificate to this domain. Create a PKI domain named **server384** for the server's certificate **ecdsa384** and import the file of this certificate to this domain. (Details not shown.)

Specify Suite B algorithms for algorithm negotiation.

```
<SwitchB> system-view
[SwitchB] ssh2 algorithm key-exchange ecdh-sha2-nistp256 ecdh-sha2-nistp384
[SwitchB] ssh2 algorithm cipher aes128-gcm aes256-gcm
[SwitchB] ssh2 algorithm public-key x509v3-ecdsa-sha2-nistp256
x509v3-ecdsa-sha2-nistp384
```

Enable the SCP server.

```
[SwitchB] scp server enable
```

Assign an IP address to VLAN-interface 2.

```
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 192.168.0.1 255.255.255.0
[SwitchB-Vlan-interface2] quit
```

Set the authentication mode to AAA for user lines.

```
[SwitchB] line vty 0 63
[SwitchB-line-vty0-63] authentication-mode scheme
```

```
[SwitchB-line-vty0-63] quit
```

Create a local device management user named **client001**. Authorize the user to use the **SSH** service and assign the **network-admin** user role to the user.

```
[SwitchB] local-user client001 class manage
[SwitchB-luser-manage-client001] service-type ssh
[SwitchB-luser-manage-client001] authorization-attribute user-role network-admin
[SwitchB-luser-manage-client001] quit
```

Create a local device management user named **client002**. Authorize the user to use the **SSH** service and assign the **network-admin** user role to the user.

```
[SwitchB] local-user client002 class manage
[SwitchB-luser-manage-client002] service-type ssh
[SwitchB-luser-manage-client002] authorization-attribute user-role network-admin
[SwitchB-luser-manage-client002] quit
```

4. Establish an SCP connection to the SCP server:

- Based on the 128-bit Suite B algorithms:

  # Specify **server256** as the PKI domain of the server's certificate.

  ```
  [SwitchB]ssh server pki-domain server256
  ```

  # Create an SSH user **client001**. Specify the **publickey** authentication method for the user and specify **client256** as the PKI domain for verifying the client's certificate.

  ```
  [SwitchB] ssh user client001 service-type scp authentication-type publickey assign pki-domain client256
  ```

  # Establish an SCP connection to the SCP server at 192.168.0.1 based on the 128-bit Suite B algorithms.

  ```
  <SwitchA> scp 192.168.0.1 get src.cfg suite-b 128-bit pki-domain client256 server-pki
  -domain server256
  Username: client001
  Press CTRL+C to abort.
  Connecting to 192.168.0.1 port 22.
  src.cfg                                       100% 4814     4.7KB/s   00:00
  <SwitchA>
  ```

- Based on the 192-bit Suite B algorithms:

  # Specify **server384** as the PKI domain of the server's certificate.

  ```
  [SwitchB] ssh server pki-domain server384
  ```

  # Create an SSH user **client002**. Specify the **publickey** authentication method for the user and specify **client384** as the PKI domain for verifying the client's certificate.

  ```
  [Switch] ssh user client002 service-type scp authentication-type publickey assign pki-domain client384
  ```

  # Establish an SCP connection to the SCP server at 192.168.0.1 based on the 192-bit Suite B algorithms.

  ```
  <SwitchA> scp 192.168.0.1 get src.cfg suite-b 192-bit pki-domain client384 server-pki
  -domain server384
  Username: client002
  Press CTRL+C to abort.
  Connecting to 192.168.0.1 port 22.
  src.cfg                                       100% 4814     4.7KB/s   00:00
  <SwitchA>
  ```

NETCONF over SSH configuration examples

Unless otherwise noted, devices in the configuration examples are in non-FIPS mode.

When the device acts as a NETCONF-over-SSH server operating in FIPS mode, only ECDSA and RSA key pairs are supported. Do not generate a DSA key pair on the NETCONF-over-SSH server.

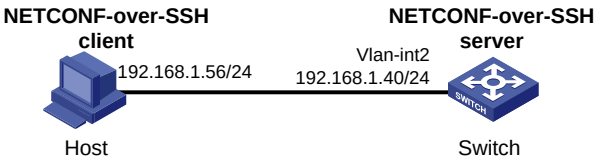
Example: Configuring NETCONF over SSH with password authentication

Network configuration

As shown in Figure 19:

- The switch acts as the NETCONF-over-SSH server and uses password authentication to authenticate the client. The client's username and password are saved on the switch.
- The host acts as the NETCONF-over-SSH client, using SSH2 client software. After the user on the host logs in to the switch through NETCONF over SSH, the user can perform NETCONF operations on the switch as a network administrator.

Figure 19 Network diagram



Procedure

Generate RSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:

Configuring SSL

About SSL

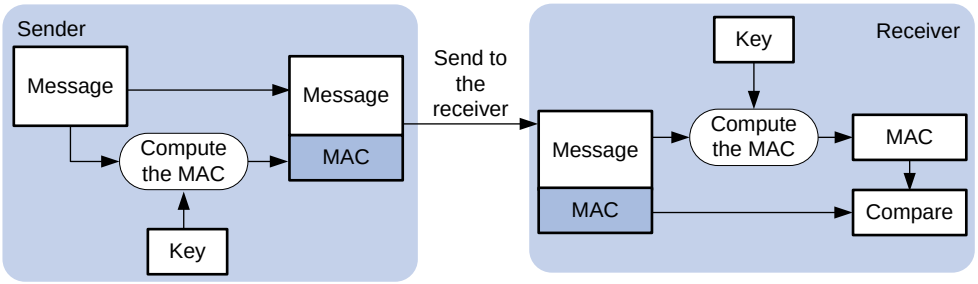
Secure Sockets Layer (SSL) is a cryptographic protocol that provides communication security for TCP-based application layer protocols such as HTTP. SSL has been widely used in applications such as e-business and online banking to provide secure data transmission over the Internet.

SSL security services

SSL provides the following security services:

- **Privacy**—SSL uses a symmetric encryption algorithm to encrypt data. It uses the asymmetric key algorithm of RSA to encrypt the key used by the symmetric encryption algorithm. For more information about RSA, see "Managing public keys."
- **Authentication**—SSL uses certificate-based digital signatures to authenticate the SSL server and client. The SSL server and client obtain digital certificates through PKI. For more information about PKI and digital certificates, see "Configuring PKI."
- **Integrity**—SSL uses the message authentication code (MAC) to verify message integrity. It uses a MAC algorithm and a key to transform a message of any length to a fixed-length message. Any change to the original message will result in a change to the calculated fixed-length message. As shown in Figure 1, the message integrity verification process is as follows:
  - **a.** The sender uses a MAC algorithm and a key to calculate a MAC value for a message. Then, it appends the MAC value to the message and sends the message to the receiver.
  - **b.** The receiver uses the same key and MAC algorithm to calculate a MAC value for the received message, and compares it with the MAC value appended to the message.
  - **c.** If the two MAC values match, the receiver considers the message intact. Otherwise, the receiver considers that the message was tampered with and it discards the message.

Figure 1 MAC algorithm diagram

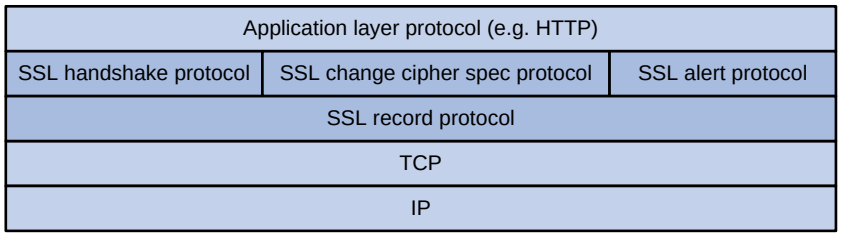


SSL protocol stack

The SSL protocol stack includes the following protocols:

- SSL record protocol at the lower layer.
- SSL handshake protocol, SSL change cipher spec protocol, and SSL alert protocol at the upper layer.

Figure 2 SSL protocol stack



The following describes the major functions of SSL protocols:

- **SSL record protocol**—Fragments data received from the upper layer, computes and adds MAC to the data, and encrypts the data.
- **SSL handshake protocol**—Negotiates the cipher suite used for secure communication, authenticates the server and client, and securely exchanges the keys between the server and client. The cipher suite that needs to be negotiated includes the symmetric encryption algorithm, key exchange algorithm, and MAC algorithm.
- **SSL change cipher spec protocol**—Notifies the receiver that subsequent packets are to be protected based on the negotiated cipher suite and key.
- **SSL alert protocol**—Sends alert messages to the receiving party. An alert message contains the alert severity level and a description.

SSL protocol versions

SSL protocol versions include SSL 2.0, SSL 3.0, TLS 1.0 (or SSL 3.1), TLS 1.1, and TLS 1.2. Because SSL 3.0 is known to be insecure, you can disable SSL 3.0 for the SSL server to ensure security.

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

Restrictions and guidelines: SSL configuration

By default, the SSL server can communicate with clients running all SSL protocol versions. When the server receives an SSL 2.0 Client Hello message from a client, it notifies the client to use a later version for communication.

SSL tasks at a glance

Configuring the SSL server

- Configuring an SSL server policy
- (Optional.) Disabling SSL protocol versions for the SSL server
- (Optional.) Disabling SSL session renegotiation

Configuring the SSL client

Configuring an SSL server policy

About SSL server policies

An SSL server policy is a set of SSL parameters used by the device when the device acts as the SSL server. An SSL server policy takes effect only after it is associated with an application such as HTTPS.

Procedure

1. Enter system view.

   system-view

2. Create an SSL server policy and enter its view.

   ssl server-policy *policy-name*

3. Specify a PKI domain for the SSL server policy.

   pki-domain *domain-name*

   By default, no PKI domain is specified for an SSL server policy.

   If SSL server authentication is required, you must specify a PKI domain and request a local certificate for the SSL server in the domain.

   For information about configuring a PKI domain, see "Configuring PKI."

4. Specify the cipher suites that the SSL server policy supports.

   In non-FIPS mode:

   ciphersuite { **dhe_rsa_aes_128_cbc_sha** | **dhe_rsa_aes_128_cbc_sha256** | **dhe_rsa_aes_256_cbc_sha** | **dhe_rsa_aes_256_cbc_sha256** | **ecdhe_ecdsa_aes_128_cbc_sha256** | **ecdhe_ecdsa_aes_128_gcm_sha256** | **ecdhe_ecdsa_aes_256_cbc_sha384** | **ecdhe_ecdsa_aes_256_gcm_sha384** | **ecdhe_rsa_aes_128_cbc_sha256** | **ecdhe_rsa_aes_128_gcm_sha256** | **ecdhe_rsa_aes_256_cbc_sha384** | **ecdhe_rsa_aes_256_gcm_sha384** | **exp_rsa_des_cbc_sha** | **exp_rsa_rc2_md5** | **exp_rsa_rc4_md5** | **rsa_3des_ede_cbc_sha** | **rsa_aes_128_cbc_sha** | **rsa_aes_128_cbc_sha256** | **rsa_aes_256_cbc_sha** | **rsa_aes_256_cbc_sha256** | **rsa_des_cbc_sha** | **rsa_rc4_128_md5** | **rsa_rc4_128_sha** } *

   In FIPS mode:

   ciphersuite { **ecdhe_ecdsa_aes_128_cbc_sha256** | **ecdhe_ecdsa_aes_256_cbc_sha384** | **ecdhe_ecdsa_aes_128_gcm_sha256** | **ecdhe_ecdsa_aes_256_gcm_sha384** | **ecdhe_rsa_aes_128_cbc_sha256** | **ecdhe_rsa_aes_128_gcm_sha256** | **ecdhe_rsa_aes_256_cbc_sha384** | **ecdhe_rsa_aes_256_gcm_sha384** | **rsa_aes_128_cbc_sha** | **rsa_aes_128_cbc_sha256** | **rsa_aes_256_cbc_sha** | **rsa_aes_256_cbc_sha256** } *

   By default, an SSL server policy supports all cipher suites.

5. (Optional.) Set the maximum number of sessions that the SSL server can cache and the session cache timeout time.

   session { **cachesize** *size* | **timeout** *time* } *

   By default, the SSL server can cache a maximum of 500 sessions, and the session cache timeout time is 3600 seconds.

6. Enable mandatory or optional SSL client authentication.

client-verify { **enable** | **optional** }

By default, SSL client authentication is disabled. The SSL server does not perform digital certificate-based authentication on SSL clients.

When authenticating a client by using the digital certificate, the SSL server verifies the certificate chain presented by the client. It also verifies that the certificates in the certificate chain (except the root CA certificate) are not revoked.

7. (Optional.) Enable the SSL server to send the complete certificate chain to the client during SSL negotiation.

   certificate-chain-sending enable

   By default, the SSL server sends the server certificate rather than the complete certificate chain to the client during negotiation.

Configuring an SSL client policy

About SSL client policies

An SSL client policy is a set of SSL parameters used by the device when the device acts as the SSL client. The SSL client uses the settings in the client policy to establish a connection to the server. An SSL client policy takes effect only after it is associated with an application.

Restrictions and guidelines

As a best practice to enhance system security, do not specify SSL 3.0 for the SSL client policy.

Procedure

1. Enter system view.

   system-view

2. Create an SSL client policy and enter its view.

   ssl client-policy *policy-name*

3. Specify a PKI domain for the SSL client policy.

   pki-domain *domain-name*

   By default, no PKI domain is specified for an SSL client policy.

   If SSL client authentication is required, you must specify a PKI domain and request a local certificate for the SSL client in the PKI domain.

   For information about configuring a PKI domain, see "Configuring PKI."

4. Specify the preferred cipher suite for the SSL client policy.

   In non-FIPS mode:

   prefer-cipher { **dhe_rsa_aes_128_cbc_sha** | **dhe_rsa_aes_128_cbc_sha256** | **dhe_rsa_aes_256_cbc_sha** | **dhe_rsa_aes_256_cbc_sha256** | **ecdhe_ecdsa_aes_128_cbc_sha256** | **ecdhe_ecdsa_aes_128_gcm_sha256** | **ecdhe_ecdsa_aes_256_cbc_sha384** | **ecdhe_ecdsa_aes_256_gcm_sha384** | **ecdhe_rsa_aes_128_cbc_sha256** | **ecdhe_rsa_aes_128_gcm_sha256** | **ecdhe_rsa_aes_256_cbc_sha384** | **ecdhe_rsa_aes_256_gcm_sha384** | **exp_rsa_des_cbc_sha** | **exp_rsa_rc2_md5** | **exp_rsa_rc4_md5** | **rsa_3des_ede_cbc_sha** | **rsa_aes_128_cbc_sha** | **rsa_aes_128_cbc_sha256** | **rsa_aes_256_cbc_sha** | **rsa_aes_256_cbc_sha256** | **rsa_des_cbc_sha** | **rsa_rc4_128_md5** | **rsa_rc4_128_sha** }

   The default preferred cipher suite in non-FIPS mode is **rsa_rc4_128_md5**.

   In FIPS mode:

   prefer-cipher { **ecdhe_ecdsa_aes_128_cbc_sha256** | **ecdhe_ecdsa_aes_128_gcm_sha256** | **ecdhe_ecdsa_aes_256_cbc_sha384** |

ecdhe_ecdsa_aes_256_gcm_sha384 | **ecdhe_rsa_aes_128_cbc_sha256** | **ecdhe_rsa_aes_128_gcm_sha256** | **ecdhe_rsa_aes_256_cbc_sha384** | **ecdhe_rsa_aes_256_gcm_sha384** | **rsa_aes_128_cbc_sha** | **rsa_aes_128_cbc_sha256** | **rsa_aes_256_cbc_sha** | **rsa_aes_256_cbc_sha256** }

The default preferred cipher suite in FIPS mode is **rsa_aes_128_cbc_sha**.

5. Specify the SSL protocol version for the SSL client policy.

   In non-FIPS mode:

   version { **ssl3.0** | **tls1.0** | **tls1.1** | **tls1.2** }

   In FIPS mode:

   version { **tls1.0** | **tls1.1** | **tls1.2** }

   By default, an SSL client policy uses TLS 1.0.

6. Enable the SSL client to authenticate servers through digital certificates.

   server-verify enable

   By default, SSL server authentication is enabled.

Disabling SSL protocol versions for the SSL server

About disabling SSL protocol versions for the SSL server

To enhance system security, you can disable the SSL server from using specific SSL protocol versions (SSL 3.0, TLS 1.0, and TLS 1.1) for session negotiation.

Restrictions and guidelines

Disabling an SSL protocol version does not affect the availability of earlier SSL protocol versions. For example, if you execute the **ssl version tls1.1 disable** command, TLS 1.1 is disabled but TLS 1.0 is still available for the SSL server.

Procedure

1. Enter system view.

   system-view

2. Disable SSL protocol versions for the SSL server.

   In non-FIPS mode:

   ssl version { **ssl3.0** | **tls1.0** | **tls1.1** } * **disable**

   By default, the SSL server supports SSL 3.0, TLS 1.0, TLS 1.1, and TLS 1.2.

   In FIPS mode:

   ssl version { **tls1.0** | **tls1.1** } * **disable**

   By default, the SSL server supports TLS 1.0, TLS 1.1, and TLS 1.2.

Disabling SSL session renegotiation

About disabling SSL session renegotiation

The SSL session renegotiation feature enables the SSL client and server to reuse a previously negotiated SSL session for an abbreviated handshake.

Disabling session renegotiation causes more computational overhead to the system but it can avoid potential risks.

Restrictions and guidelines

Disable SSL session renegotiation only when explicitly required.

Procedure

1. Enter system view.
   `system-view`
2. Disable SSL session renegotiation.
   `ssl renegotiation disable`
   By default, SSL session renegotiation is enabled.

Display and maintenance commands for SSL

Execute **`display`** commands in any view.

Task	Command
Display SSL client policy information.	**`display ssl client-policy`** [*`policy-name`*]
Display SSL server policy information.	**`display ssl server-policy`** [*`policy-name`*]

SSL server policy configuration examples

Example: Configuring an SSL server policy

Network configuration

As shown in Figure 3, users need to access and manage the device through the Web page.

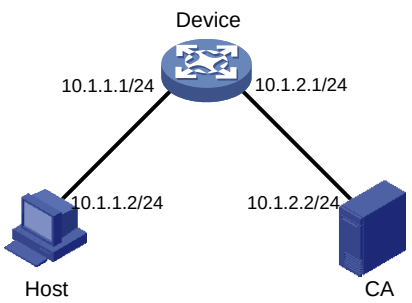
To protect the device and prevent data from being eavesdropped or tampered with, configure the device to be accessible through HTTPS only.

In this example, the CA server runs Windows Server and has the SCEP plug-in installed.

To meet the network requirements, perform the following tasks:

- Configure the device as the HTTPS server and request a server certificate for the device. For more information about HTTPS, see *Fundamentals Configuration Guide*.
- Request a client certificate for the host so that the device can authenticate the identity of the host.

Figure 3 Network diagram



Procedure

1. Make sure the device, the host, and the CA server can reach each other. (Details not shown.)
2. Configure the HTTPS server on the device:

   # Create a PKI entity named **en**. Set the common name and FQDN for the entity.

```
<Device> system-view
[Device] pki entity en
[Device-pki-entity-en] common-name http-server1
[Device-pki-entity-en] fqdn ssl.security.com
[Device-pki-entity-en] quit
```

   # Create PKI domain **1** and specify **CA server** as the name of the trusted CA. Set the URL of the registration server to **http://10.1.2.2/certsrv/mscep/mscep.dll**, the authority for certificate request to **RA**, and the entity for certificate request to **en**. Set the URL of the CRL repository to **http://10.1.2.2/CertEnroll/caserver.crl**.

```
[Device] pki domain 1
[Device-pki-domain-1] ca identifier CA server
[Device-pki-domain-1] certificate request url
http://10.1.2.2/certsrv/mscep/mscep.dll
[Device-pki-domain-1] certificate request from ra
[Device-pki-domain-1] certificate request entity en
[Device-pki-domain-1] crl url http://10.1.2.2/CertEnroll/caserver.crl
```

   # Configure a general-purpose RSA key pair named **abc** and set the key modulus length to 1024 bits.

```
[Device-pki-domain-1] public-key rsa general name abc length 1024
[Device-pki-domain-1] quit
```

   # Generate RSA key pair **abc**.

```
[Device] public-key local create rsa name abc
The range of public key size is (512 ~ 4096).
If the key modulus is greater than 512,it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.........................++++++
.....................................++++++
Create the key pair successfully.
```

   # Obtain the CA certificate.

```
[Device] pki retrieve-certificate domain 1 ca
The trusted CA's finger print is:
    MD5  fingerprint:7682 5865 ACC2 7B16 6F52 D60F D998 4484
    SHA1 fingerprint:DF6B C53A E645 5C81 D6FC 09B0 3459 DFD1 94F6 3DDE
Is the finger print correct?(Y/N):y
Retrieved the certificates successfully.
```

   # Request a server certificate for the device.

```
[Device] pki request-certificate domain 1
Start to request general certificate ...
Certificate requested successfully.
```

   # Create an SSL server policy named **myssl**.

```
[Device] ssl server-policy myssl
```

   # Specify PKI domain **1** for the SSL server policy.

```
[Device-ssl-server-policy-myssl] pki-domain 1
```

Enable client authentication.

```
[Device-ssl-server-policy-myssl] client-verify enable
[Device-ssl-server-policy-myssl] quit
```

Configure the HTTPS service to use SSL server policy **myssl**.

```
[Device] ip https ssl-server-policy myssl
```

Enable the HTTPS service.

```
[Device] ip https enable
```

Create a local user named **usera**. Set the password to **hello12345**, service type to **https**, and user role to **network-admin**.

```
[Device] local-user usera
[Device-luser-usera] password simple hello12345
[Device-luser-usera] service-type https
[Device-luser-usera] authorization-attribute user-role network-admin
```

3. Request a client certificate for the host:
   a. Launch IE on the host, and then enter **http://10.1.2.2/certsrv** in the address bar.
   b. Request a client certificate for the host. (Details not shown.)

Verifying the configuration

Perform the following tasks on the host:

1. Launch IE and enter **https://10.1.1.1** in the address bar.
2. Select the certificate issued by the CA server to the host.

   The login page of the device should appear.
3. Enter username **usera** and password **123**.

   Verify that now you can log in to the Web interface to access and manage the device.

Contents

Configuring attack detection and prevention

Overview

Attack detection and prevention enables a device to detect attacks by inspecting arriving packets, and to take prevention actions (such as packet dropping) to protect a private network.

Attacks that the device can prevent

This section describes the attacks that the device can detect and prevent.

TCP fragment attack

An attacker launches TCP fragment attacks by sending attack TCP fragments defined in RFC 1858:

- First fragments in which the TCP header is smaller than 20 bytes.
- Non-first fragments with a fragment offset of 8 bytes (FO=1).

Typically, packet filter detects the source and destination IP addresses, source and destination ports, and transport layer protocol of the first fragment of a TCP packet. If the first fragment passes the detection, all subsequent fragments of the TCP packet are allowed to pass through.

Because the first fragment of attack TCP packets does not hit any match in the packet filter, the subsequent fragments can all pass through. After the receiving host reassembles the fragments, a TCP fragment attack occurs.

To prevent TCP fragment attacks, enable TCP fragment attack prevention to drop attack TCP fragments.

Login dictionary attack

The login dictionary attack is an automated process to attempt to log in by trying all possible passwords from a pre-arranged list of values (the dictionary). Multiple login attempts can occur in a short period of time.

You can configure the login delay feature to slow down the login dictionary attacks. This feature enables the device to delay accepting another login request after detecting a failed login attempt for a user.

Configuring TCP fragment attack prevention

About TCP fragment attack prevention

The TCP fragment attack prevention feature detects the length and fragment offset of received TCP fragments and drops attack TCP fragments.

Restrictions and guidelines

TCP fragment attack prevention takes precedence over single-packet attack prevention. When both are used, incoming TCP packets are processed first by TCP fragment attack prevention and then by the single-packet attack defense policy.

Procedure

1. Enter system view.

   system-view

2. Enable TCP fragment attack prevention.

   attack-defense tcp fragment enable

   By default, TCP fragment attack prevention is enabled.

Enabling login delay

About login delay

The login delay feature delays the device from accepting a login request from a user after the user fails a login attempt. This feature can slow down login dictionary attacks.

The login delay feature is independent of the login attack prevention feature.

Procedure

1. Enter system view.

   system-view

2. Enable the login delay feature.

   attack-defense login reauthentication-delay *seconds*

   By default, the login delay feature is disabled. The device does not delay accepting a login request from a user who has failed a login attempt.

Contents

Configuring TCP attack prevention

About TCP attack prevention

TCP attack prevention can detect and prevent attacks that exploit the TCP connection establishment process.

Configuring Naptha attack prevention

About Naptha attack prevention

Naptha is a DDoS attack that targets operating systems. It exploits the resources consuming vulnerability in TCP/IP stack and network application process. The attacker establishes a large number of TCP connections in a short period of time and leaves them in certain states without requesting any data. These TCP connections starve the victim of system resources, resulting in a system breakdown.

After you enable Naptha attack prevention, the device periodically checks the number of TCP connections in each state (CLOSING, ESTABLISHED, FIN_WAIT_1, FIN_WAIT_2, and LAST_ACK). If the number of TCP connections in a state exceeds the limit, the device will accelerate the aging of the TCP connections in that state to mitigate the Naptha attack.

Procedure

1. Enter system view.

   system-view

2. Enable Naptha attack prevention.

   tcp anti-naptha enable

   By default, Naptha attack prevention is disabled.

3. (Optional.) Set the maximum number of TCP connections in a state.

   tcp state { **closing** | **established** | **fin-wait-1** | **fin-wait-2** | **last-ack** } **connection-limit** *number*

   By default, the maximum number of TCP connections in each state (CLOSING, ESTABLISHED, FIN_WAIT_1, FIN_WAIT_2, and LAST_ACK) is 50.

   To disable the device from accelerating the aging of the TCP connections in a state, set the value to 0.

4. (Optional.) Set the interval for checking the number of TCP connections in each state.

   tcp check-state interval *interval*

   By default, the interval for checking the number of TCP connections in each state is 30 seconds.

Contents

Configuring IP source guard

About IPSG

IP source guard (IPSG) prevents spoofing attacks by using an IPSG binding table to filter out illegitimate packets. This feature is typically configured on user-side interfaces.

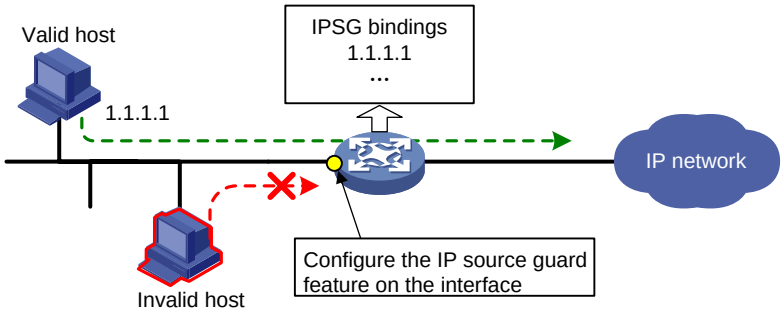
IPSG operating mechanism

The IPSG binding table contains bindings that bind IP address, MAC address, VLAN, or any combinations. IPSG uses the bindings to match an incoming packet. If a match is found, the packet is forwarded. If no match is found, the packet is discarded.

IPSG bindings can be static or dynamic.

As shown in Figure 1, IPSG forwards only the packets that match an IPSG binding.

Figure 1 IPSG application



Static IPSG bindings

Static IPSG bindings are configured manually. They are suitable for scenarios where few hosts exist on a LAN and their IP addresses are manually configured. For example, you can configure a static IPSG binding on an interface that connects to a server. This binding allows the interface to receive packets only from the server.

Static IPSG bindings on an interface implement the following functions:

- Filter incoming IPv4 or IPv6 packets on the interface.
- Cooperate with ARP attack detection in IPv4 for user validity checking. For information about ARP attack detection, see "Configuring ARP attack protection."
- Cooperate with ND attack detection in IPv6 for user validity checking. For information about ND attack detection, see "Configuring ND attack defense."

Static IPSG bindings can be global or interface-specific.

- **Global static binding**—Binds the IP address and MAC address in system view. The binding takes effect on all interfaces to filter packets for user spoofing attack prevention.
- **Interface-specific static binding**—Binds the IP address, MAC address, VLAN, or any combination of the items in interface view. The binding takes effect only on the interface to check the validity of users who are attempting to access the interface.

Dynamic IPSG bindings

IPSG automatically obtains user information from other modules to generate dynamic bindings. A dynamic IPSG binding can contain MAC address, IPv4 or IPv6 address, VLAN tag, ingress interface, and binding type. The binding type identifies the source module for the binding, such as DHCP snooping, DHCPv6 snooping, DHCP relay agent, or DHCPv6 relay agent.

For example, DHCP-based IPSG bindings are suitable for scenarios where hosts on a LAN obtain IP addresses through DHCP. IPSG is configured on the DHCP server, the DHCP snooping device, or the DHCP relay agent. It generates dynamic bindings based on the client bindings on the DHCP server, the DHCP snooping entries, or the DHCP relay entries. IPSG allows only packets from the DHCP clients to pass through.

Dynamic IPv4SG

Dynamic bindings generated based on different source modules are for different usages:

Interface types	Source modules	Binding usage
Layer 2 Ethernet port	DHCP snooping 802.1X	Packet filtering.
	ARP snooping	For cooperation with modules (such as the MFF module) to provide security services.
VLAN interface	DHCP relay agent	Packet filtering.
	DHCP server	For cooperation with modules (such as the authorized ARP module) to provide security services.

For more information about 802.1X, see "Configuring 802.1X." For information about ARP snooping, DHCP snooping, DHCP relay, and DHCP server, see *Layer 3—IP Services Configuration Guide*.

Dynamic IPv6SG

Dynamic IPv6SG bindings generated based on different source modules are for different usages:

Interface types	Source modules	Binding usage
Layer 2 Ethernet port	DHCPv6 snooping ND snooping 802.1X	Packet filtering.
VLAN interface	DHCPv6 relay agent	Packet filtering.

For more information about DHCPv6 snooping, see *Layer 3—IP Services Configuration Guide*. For more information about ND snooping, see IPv6 basics configuration in *Layer 3—IP Services Configuration Guide*. For more information about ND RA prefix entry recording, see IPv6 neighbor discovery in *Layer 3—IP Services Configuration Guide.* For more information about DHCPv6 relay agent, see *Layer 3—IP Services Configuration Guide*. For more information about DHCPv6 server, see *Layer 3—IP Services Configuration Guide.*

IPSG tasks at a glance

To configure IPv4SG, perform the following tasks:

1. Enabling IPv4SG
2. (Optional.) Configuring a static IPv4SG binding
3. (Optional.) Excluding IPv4 packets from IPSG filtering

To configure IPv6SG, perform the following tasks:

1. Enabling IPv6SG
2. (Optional.) Configuring a static IPv6SG binding

Configuring the IPv4SG feature

Enabling IPv4SG

About the IPv4SG feature on an interface

When you enable IPSG on an interface, the static and dynamic IPSG are both enabled.

- Static IPv4SG uses static bindings configured by using the **ip source binding** command. For more information, see "Configuring a static IPv4SG binding."
- Dynamic IPv4SG generates dynamic bindings from related source modules. IPv4SG uses the bindings to filter incoming IPv4 packets based on the matching criteria specified in the **ip verify source** command.

Restrictions and guidelines

To implement dynamic IPv4SG, make sure 802.1X, ARP snooping, DHCP snooping, DHCP relay agent, or DHCP server operates correctly on the network.

Enabling IPv4SG on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   The following interface types are supported:
   - Layer 2 Ethernet interface.
   - VLAN interface.
3. Enable IPv4SG on the interface.
   ip verify source { **ip-address** | **ip-address mac-address** | **mac-address** }
   By default, IPv4SG is disabled on an interface.
   ip verify source trust

Configuring a static IPv4SG binding

About static IPv4SG bindings

You can configure global static and interface-specific static IPv4SG bindings. Global static bindings take priority over interface-specific static and dynamic bindings. An interface first uses global static bindings to match packets. If no match is found, the interface uses the static and dynamic bindings on the interface to match packets.

Restrictions and guidelines

Global static bindings take effect on all interfaces on the device.

To configure a static IPv4SG binding for the ARP attack detection feature, make sure the following conditions are met:

- The **ip-address** *ip-address* option, the **mac-address** *mac-address* option, and the **vlan** *vlan-id* option must be specified.

- ARP attack detection must be enabled for the specified VLAN.

Configuring a global static IPv4SG binding

1. Enter system view.
   system-view
2. Configure a global static IPv4SG binding.
   ip source binding ip-address *ip-address* **mac-address** *mac-address*

Configuring a static IPv4SG binding on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   The following interface types are supported:
   - Layer 2 Ethernet interface.
   - VLAN interface.
3. Configure a static IPv4SG binding.
   ip source binding { **ip-address** *ip-address* | **ip-address** *ip-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]
   You can configure the same static IPv4SG binding on different interfaces.

Excluding IPv4 packets from IPSG filtering

About excluding IPv4 packets from IPSG filtering

By default, IPv4SG processes all incoming IPv4 packets on an interface and discards the packets that do not match IPSG bindings. To allow specific IPv4 packets that do not match any IPSG binding to pass through the interface, you can specify source items of the packets for IPSG filtering exemption. All IPv4 packets with the specified source items are forwarded without being processed by IPSG.

Procedure

1. Enter system view.
   system-view
2. Exclude IPv4 packets with the specified source items from IPSG filtering.
   ip verify source exclude vlan *start-vlan-id* [to *end-vlan-id*]
   By default, no excluded source items are configured.
   You can execute this command multiple times to specify multiple excluded VLANs. The specified excluded VLANs cannot overlap.

Configuring the IPv6SG feature

Enabling IPv6SG

About the IPv6SG feature on an interface

When you enable IPv6SG on an interface, the static and dynamic IPv6SG are both enabled.

- Static IPv6SG uses static bindings configured by using the **ipv6 source binding** command. For more information, see "Configuring a static IPv6SG binding."

- Dynamic IPv6SG generates dynamic bindings from related source modules. IPv6SG uses the bindings to filter incoming IPv6 packets based on the matching criteria specified in the **ipv6 verify source** command.

Restrictions and guidelines

To implement dynamic IPv6SG, make sure DHCPv6 snooping, DHCPv6 relay agent, or ND snooping operates correctly on the network.

Enabling IPv6SG on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   The following interface types are supported:
   - Layer 2 Ethernet interface.
   - VLAN interface.
3. Enable IPv6SG on the interface.
   ipv6 verify source { **ip-address** | **ip-address mac-address** | **mac-address** }
   By default, IPv6SG is disabled on an interface.

Configuring a static IPv6SG binding

About static IPv6SG bindings

You can configure global static and interface-specific static IPv6SG bindings. Global static bindings take priority over interface-specific static and dynamic bindings. An interface first uses global static bindings to match packets. If no match is found, the interface uses the static and dynamic bindings on the interface to match packets.

Restrictions and guidelines

Global static bindings take effect on all interfaces on the device.

To configure a static IPv6SG binding for the ND attack detection feature, the **vlan** *vlan-id* option must be specified, and ND attack detection must be enabled for the specified VLAN.

Configuring a global static IPv6SG binding

1. Enter system view.
   system-view
2. Configure a global static IPv6SG binding.
   ipv6 source binding ip-address *ipv6-address* **mac-address** *mac-address*

Configuring a static IPv6SG binding on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   The following interface types are supported:
   - Layer 2 Ethernet interface.
   - VLAN interface.
3. Configure a static IPv6SG binding.

ipv6 source binding { **ip-address** *ipv6-address* | **ip-address** *ipv6-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]

You can configure the same static IPv6SG binding on different interfaces.

Display and maintenance commands for IPSG

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv4SG bindings.	**display ip source binding** [**static** | [**arp-snooping-vlan** | **dhcp-relay** | **dhcp-server** | **dhcp-snooping** | **dot1x**]] [**ip-address** *ip-address*] [**mac-address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*] [**slot** *slot-number*]
Display source items that have been configured to be excluded from IPSG filtering.	**display ip verify source excluded** [**vlan** *start-vlan-id* [**to** *end-vlan-id*]] [**slot** *slot-number*]
Display IPv6SG address bindings.	**display ipv6 source binding** [**static** | [**dhcpv6-server** | **dhcpv6-snooping** | **dot1x**]] [**ip-address** *ipv6-address*] [**mac-address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*] [**slot** *slot-number*]
Display IPv6SG prefix bindings.	**display ipv6 source binding pd** [**prefix** *prefix/prefix-length*] [**mac-address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*] [**slot** *slot-number*]

IPSG configuration examples

Example: Configuring static IPv4SG

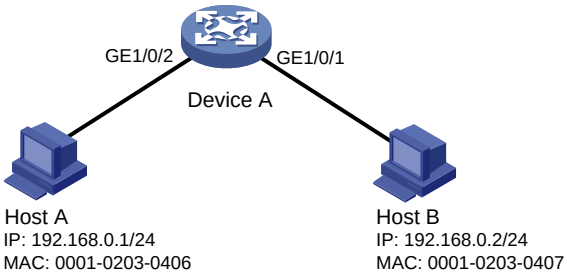
Network configuration

As shown in Figure 2, all hosts use static IP addresses.

Configure static IPv4SG bindings on Device A and Device B to meet the following requirements:

- All interfaces of Device A allow IP packets from Host A to pass.
- GigabitEthernet 1/0/1 of Device A allows IP packets from Host B to pass.

Figure 2 Network diagram



Procedure

Configure IP addresses for the interfaces. (Details not shown.)

Enable IPv4SG on GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ip verify source ip-address mac-address
[DeviceA-GigabitEthernet1/0/2] quit
```

Configure a static IPv4SG binding for Host A.

```
[DeviceA] ip source binding ip-address 192.168.0.1 mac-address 0001-0203-0406
```

Enable IPv4SG on GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip verify source ip-address mac-address
```

On GigabitEthernet 1/0/1, configure a static IPv4SG binding for Host B.

```
[DeviceA-GigabitEthernet1/0/1] ip source binding mac-address 0001-0203-0407
[DeviceA-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify that the static IPv4SG bindings are configured successfully on Device A.

```
<DeviceA> display ip source binding static
Total entries found: 2
IP Address      MAC Address    Interface              VLAN Type
192.168.0.1     0001-0203-0406 N/A                    N/A  Static
N/A             0001-0203-0407 GE1/0/1                N/A  Static
```

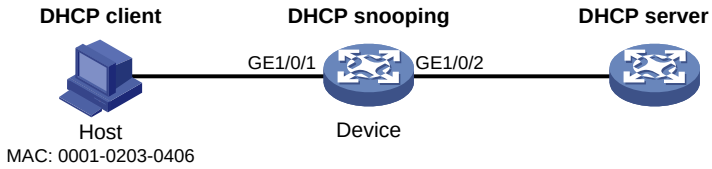
Example: Configuring DHCP snooping-based dynamic IPv4SG

Network configuration

As shown in Figure 3, the host (the DHCP client) obtains an IP address from the DHCP server. Perform the following tasks:

- Enable DHCP snooping on the device to make sure the DHCP client obtains an IP address from the authorized DHCP server. To generate a DHCP snooping entry for the DHCP client, enable recording of client information in DHCP snooping entries.
- Enable dynamic IPv4SG on GigabitEthernet 1/0/1 to filter incoming packets by using the IPv4SG bindings generated based on DHCP snooping entries. Only packets from the DHCP client are allowed to pass.

Figure 3 Network diagram



Procedure

1. Configure the DHCP server.

   For information about DHCP server configuration, see *Layer 3—IP Services Configuration Guide*.

2. Configure the device:

   # Configure IP addresses for the interfaces. (Details not shown.)

   # Enable DHCP snooping.

   ```
   <Device> system-view
   [Device] dhcp snooping enable
   ```

   # Configure GigabitEthernet 1/0/2 as a trusted interface.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] dhcp snooping trust
   [Device-GigabitEthernet1/0/2] quit
   ```

   # Enable IPv4SG on GigabitEthernet 1/0/1 and verify the source IP address and MAC address for dynamic IPSG.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip verify source ip-address mac-address
   ```

   # Enable recording of client information in DHCP snooping entries on GigabitEthernet 1/0/1.

   ```
   [Device-GigabitEthernet1/0/1] dhcp snooping binding record
   [Device-GigabitEthernet1/0/1] quit
   ```

Verifying the configuration

Display dynamic IPv4SG bindings generated based on DHCP snooping entries.

```
[Device] display ip source binding dhcp-snooping
Total entries found: 1
IP Address      MAC Address    Interface               VLAN Type
192.168.0.1     0001-0203-0406 GE1/0/1                 1    DHCP snooping
```

GigabitEthernet 1/0/1 will filter packets based on the IPv4SG binding.

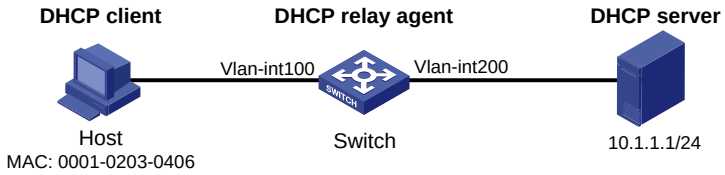
Example: Configuring DHCP relay agent-based dynamic IPv4SG

Network configuration

As shown in Figure 4, DHCP relay agent is enabled on the switch. The host obtains an IP address from the DHCP server through the DHCP relay agent.

Enable dynamic IPv4SG on VLAN-interface 100 to filter incoming packets by using the IPv4SG bindings generated based on DHCP relay entries.

Figure 4 Network diagram



Procedure

1. Configure dynamic IPv4SG:

   # Configure IP addresses for the interfaces. (Details not shown.)

   # Enable IPv4SG on VLAN-interface 100 and verify the source IP address and MAC address for dynamic IPSG.

   ```
   <Switch> system-view
   [Switch] interface vlan-interface 100
   [Switch-Vlan-interface100] ip verify source ip-address mac-address
   [Switch-Vlan-interface100] quit
   ```

2. Configure the DHCP relay agent:

   # Enable the DHCP service.

   ```
   [Switch] dhcp enable
   ```

   # Enable recording DHCP relay entries.

   ```
   [Switch] dhcp relay client-information record
   ```

   # Configure VLAN-interface 100 to operate in DHCP relay mode.

   ```
   [Switch] interface vlan-interface 100
   [Switch-Vlan-interface100] dhcp select relay
   ```

   # Specify the IP address of the DHCP server.

   ```
   [Switch-Vlan-interface100] dhcp relay server-address 10.1.1.1
   [Switch-Vlan-interface100] quit
   ```

Verifying the configuration

Display dynamic IPv4SG bindings generated based on DHCP relay entries.

```
[Switch] display ip source binding dhcp-relay
Total entries found: 1
IP Address      MAC Address    Interface               VLAN Type
192.168.0.1     0001-0203-0406 Vlan100                 100  DHCP relay
```

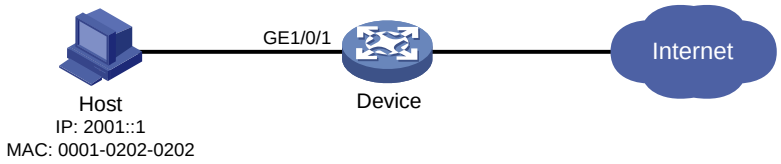
VLAN-interface 100 will filter packets based on the IPv4SG binding.

Example: Configuring static IPv6SG

Network configuration

As shown in Figure 5, configure a static IPv6SG binding on GigabitEthernet 1/0/1 of the device to allow only IPv6 packets from the host to pass.

Figure 5 Network diagram



Procedure

Enable IPv6SG on GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ipv6 verify source ip-address mac-address
```

On GigabitEthernet 1/0/1, configure a static IPv6SG binding for the host.

```
[Device-GigabitEthernet1/0/1] ipv6 source binding ip-address 2001::1 mac-address
0001-0202-0202
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify that the static IPv6SG binding is configured successfully on the device.

```
[Device] display ipv6 source binding static
Total entries found: 1
IPv6 Address         MAC Address    Interface             VLAN Type
2001::1              0001-0202-0202 GE1/0/1               N/A  Static
```

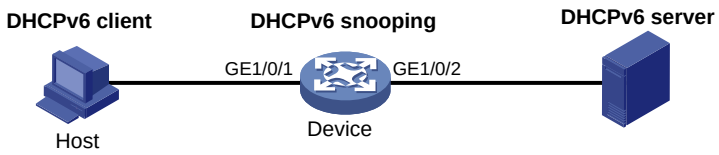
Example: Configuring DHCPv6 snooping-based dynamic IPv6SG address bindings

Network configuration

As shown in Figure 6, the host (the DHCPv6 client) obtains an IP address from the DHCPv6 server. Perform the following tasks:

- Enable DHCPv6 snooping on the device to make sure the DHCPv6 client obtains an IPv6 address from the authorized DHCPv6 server. To generate a DHCPv6 snooping entry for the DHCPv6 client, enable recording of client information in DHCPv6 snooping entries.
- Enable dynamic IPv6SG on GigabitEthernet 1/0/1 to filter incoming packets by using the IPv6SG bindings generated based on DHCPv6 snooping entries. Only packets from the DHCPv6 client are allowed to pass.

Figure 6 Network diagram



Procedure

1. Configure DHCPv6 snooping:

   # Enable DHCPv6 snooping globally.

   ```
   <Device> system-view
   [Device] ipv6 dhcp snooping enable
   ```

Configure GigabitEthernet 1/0/2 as a trusted interface.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] ipv6 dhcp snooping trust
[Device-GigabitEthernet1/0/2] quit
```

2. Enable IPv6SG:

   # Enable IPv6SG on GigabitEthernet 1/0/1 and verify the source IP address and MAC address for dynamic IPv6SG.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ipv6 verify source ip-address mac-address
```

   # Enable recording of client information in DHCPv6 snooping entries on GigabitEthernet 1/0/1.

```
[Device-GigabitEthernet1/0/1] ipv6 dhcp snooping binding record
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Display dynamic IPv6SG bindings generated based on DHCPv6 snooping entries.

```
[Device] display ipv6 source binding dhcpv6-snooping
Total entries found: 1
IPv6 Address         MAC Address    Interface              VLAN Type
2001::1              040a-0000-0001 GE1/0/1                1    DHCPv6 snooping
```

GigabitEthernet 1/0/1 will filter packets based on the IPv6SG binding.

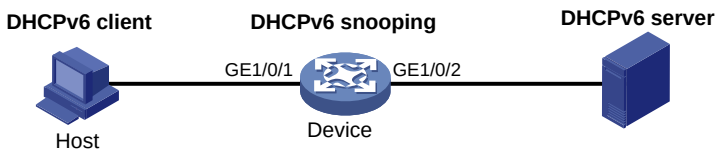
Example: Configuring DHCPv6 snooping-based dynamic IPv6SG prefix bindings

Network configuration

As shown in Figure 7, the host (the DHCPv6 client) obtains an IPv6 prefix from the DHCPv6 server. Perform the following tasks:

- Enable DHCPv6 snooping on the device to make sure the DHCPv6 client obtains an IPv6 prefix from the authorized DHCPv6 server. To generate a DHCPv6 snooping prefix entry for the DHCPv6 client, enable recording IPv6 prefix information in DHCPv6 snooping entries.
- Enable dynamic IPv6SG on GigabitEthernet 1/0/1 to filter incoming packets by using the IPv6SG bindings generated based on DHCPv6 snooping prefix entries. Only packets from the DHCPv6 client are allowed to pass.

Figure 7 Network diagram



Procedure

1. Configure DHCPv6 snooping.

   # Enable DHCPv6 snooping globally.

```
<Device> system-view
[Device] ipv6 dhcp snooping enable
```

   # Configure GigabitEthernet 1/0/2 as a trusted interface.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] ipv6 dhcp snooping trust
```

```
[Device-GigabitEthernet1/0/2] quit
```

Enable recording DHCPv6 snooping prefix entries on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ipv6 dhcp snooping pd binding record
```

2. Enable IPv6SG.

Enable IPv6SG on GigabitEthernet 1/0/1 and verify the source IP address and MAC address for dynamic IPv6SG.

```
[Device-GigabitEthernet1/0/1] ipv6 verify source ip-address mac-address
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Display dynamic IPv6SG bindings generated based on DHCPv6 snooping entries.

```
[Device] display ipv6 source binding pd
Total entries found: 1
IPv6 prefix          MAC address    Interface              VLAN
2001:410:1::/48      0010-9400-0004 GE1/0/1                1
```

GigabitEthernet 1/0/1 will filter packets based on the IPv6SG binding.

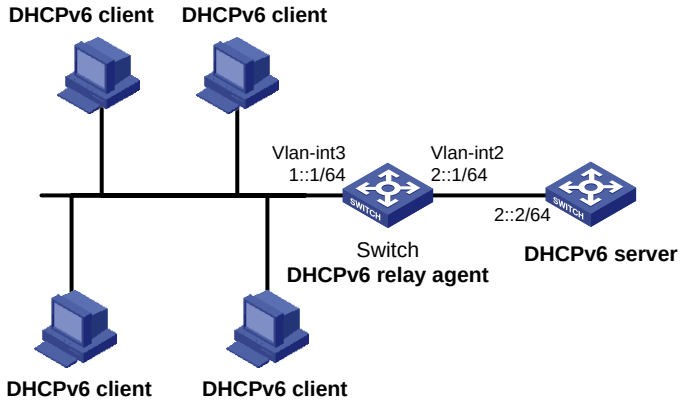
Example: Configuring DHCPv6 relay agent-based dynamic IPv6SG

Network configuration

As shown in Figure 8, DHCPv6 relay agent is enabled on the switch. The clients obtain IPv6 addresses from the DHCPv6 server through the DHCPv6 relay agent.

Enable dynamic IPv6SG on VLAN-interface 3 to filter incoming packets by using the IPv6SG bindings generated based on DHCPv6 relay entries.

Figure 8 Network diagram



Procedure

1. Configure the DHCPv6 relay agent:

Create VLAN 2 and VLAN 3, assign interfaces to the VLANs, and specify IP addresses for VLAN-interface 2 and VLAN-interface 3. (Details not shown.)

Enable the DHCPv6 relay agent on VLAN-interface 3.

```
[Switch] interface vlan-interface 3
[Switch-Vlan-interface3] ipv6 dhcp select relay
```

Enable recording of DHCPv6 relay entries on the interface.

```
[Switch-Vlan-interface3] ipv6 dhcp relay client-information record
```

Specify the DHCPv6 server address 2::2 on the relay agent.

```
[Switch-Vlan-interface3] ipv6 dhcp relay server-address 2::2
[Switch-Vlan-interface3] quit
```

2. Enable IPv6SG on VLAN-interface 3 and verify the source IP address and MAC address for dynamic IPv6SG.

```
<Switch> system-view
[Switch] interface vlan-interface 3
[Switch-Vlan-interface3] ipv6 verify source ip-address mac-address
[Switch-Vlan-interface3] quit
```

Verifying the configuration

Display dynamic IPv6SG bindings generated based on DHCPv6 relay entries.

```
[Switch] display ipv6 source binding dhcpv6-relay
Total entries found: 1
IP Address      MAC Address    Interface               VLAN Type
1::2            0001-0203-0406 Vlan3                   3    DHCPv6 relay
```

VLAN-interface 3 will filter packets based on the IPv6SG binding.

Configuring ARP attack protection

About ARP attack protection

The device can provide multiple features to detect and prevent ARP attacks and viruses in the LAN. An attacker can exploit ARP vulnerabilities to attack network devices in the following ways:

- Sends a large number of unresolvable IP packets to have the receiving device busy with resolving IP addresses until its CPU is overloaded. Unresolvable IP packets refer to IP packets for which ARP cannot find corresponding MAC addresses.
- Sends a large number of ARP packets to overload the CPU of the receiving device.
- Acts as a trusted user or gateway to send ARP packets so the receiving devices obtain incorrect ARP entries.

ARP attack protection tasks at a glance

All ARP attack protection tasks are optional.

- Preventing flood attacks
  - Configuring unresolvable IP attack protection
  - Configuring ARP packet rate limit
  - Configuring source MAC-based ARP attack detection
- Preventing user and gateway spoofing attacks
  - Configuring ARP packet source MAC consistency check
  - Configuring ARP active acknowledgement
  - Configuring authorized ARP
  - Configuring ARP attack detection
  - Configuring ARP packet validity check
  - Configuring ARP restricted forwarding
  - Ignoring ingress ports of ARP packets during user validity check
  - Enabling ARP attack detection logging
  - Configuring ARP scanning and fixed ARP
  - Configuring ARP gateway protection
  - Example: Configuring ARP gateway protection
  - Configuring ARP filtering

Configuring unresolvable IP attack protection

About unresolvable IP attack protection

If a device receives a large number of unresolvable IP packets from a host, the following situations can occur:

- The device sends a large number of ARP requests, overloading the target subnets.
- The device keeps trying to resolve the destination IP addresses, overloading its CPU.

To protect the device from such IP attacks, you can configure the following features:

- **ARP source suppression**—Stops resolving packets from an IP address if the number of unresolvable IP packets from the IP address exceeds the upper limit within 5 seconds. The device continues ARP resolution when the interval elapses. This feature is applicable if the attack packets have the same source addresses.
- **ARP blackhole routing**—Creates a blackhole route destined for an unresolved IP address. The device drops all matching packets until the blackhole route is deleted. A blackhole route is deleted when its aging timer is reached or the route becomes reachable.

  After a blackhole route is created for an unresolved IP address, the device immediately starts the first ARP blackhole route probe by sending an ARP request. If the resolution fails, the device continues probing according to the probe settings. If the IP address resolution succeeds in a probe, the device converts the blackhole route to a normal route. If an ARP blackhole route ages out before the device finishes all probes, the device deletes the blackhole route and does not perform the remaining probes.

  This feature is applicable regardless of whether the attack packets have the same source addresses.

Configuring ARP source suppression

1. Enter system view.

   system-view
2. Enable ARP source suppression.

   arp source-suppression enable

   By default, ARP source suppression is disabled.
3. Set the maximum number of unresolvable packets that the device can process per source IP address within 5 seconds.

   arp source-suppression limit *limit-value*

   By default, the maximum number is 10.

Configuring ARP blackhole routing

Restrictions and guidelines

Set the ARP blackhole route probe count to a big value, for example, 25. If the device fails to reach the destination IP address temporarily and the probe count is too small, all probes might finish before the problem is resolved. As a result, non-attack packets will be dropped. This setting can avoid such situation.

Procedure

1. Enter system view.

   system-view
2. Enable ARP blackhole routing.

   arp resolving-route enable

   By default, ARP blackhole routing is enabled.
3. (Optional.) Set the number of ARP blackhole route probes for each unresolved IP address.

   arp resolving-route probe-count *count*

   The default setting is three probes.
4. (Optional.) Set the interval at which the device probes ARP blackhole routes.

   arp resolving-route probe-interval *interval*

   The default setting is 1 second.

Display and maintenance commands for unresolvable IP attack protection

Execute **display** commands in any view.

Task	Command
Display ARP source suppression configuration information.	**display arp source-suppression**

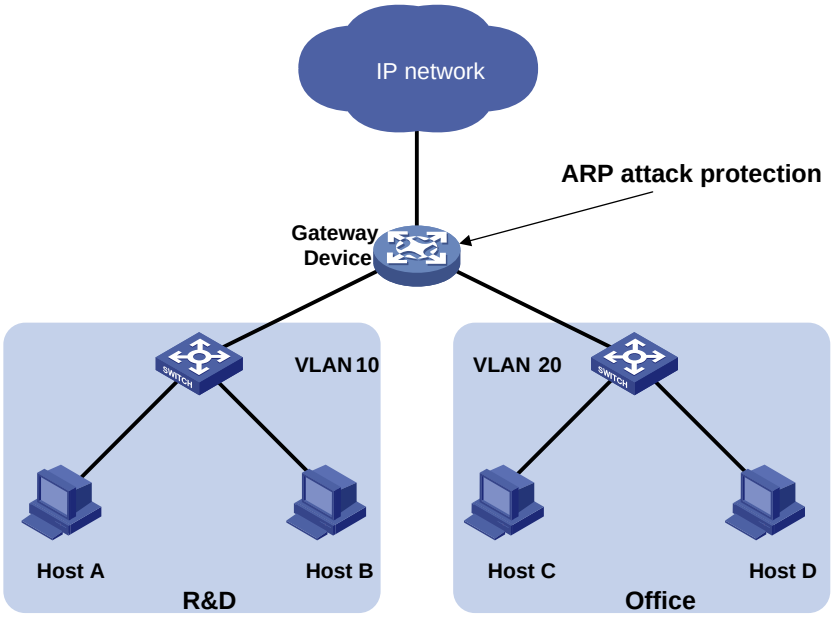
Example: Configuring unresolvable IP attack protection

Network configuration

As shown in Figure 1, a LAN contains two areas: an R&D area in VLAN 10 and an office area in VLAN 20. Each area connects to the gateway (Device) through an access switch.

A large number of ARP requests are detected in the office area and are considered an attack caused by unresolvable IP packets. To prevent the attack, configure ARP source suppression or ARP blackhole routing.

Figure 1 Network diagram



Procedure

- If the attack packets have the same source address, configure ARP source suppression:

  # Enable ARP source suppression.

  ```
  <Device> system-view
  [Device] arp source-suppression enable
  ```

  # Configure the device to process a maximum of 100 unresolvable packets per source IP address within 5 seconds.

  ```
  [Device] arp source-suppression limit 100
  ```

- If the attack packets have different source addresses, configure ARP blackhole routing:

  # Enable ARP blackhole routing.

```
[Device] arp resolving-route enable
```

Configuring ARP packet rate limit

About ARP packet rate limit

The ARP packet rate limit feature allows you to limit the rate of ARP packets delivered to the CPU. An ARP attack detection-enabled device will send all received ARP packets to the CPU for inspection. Processing excessive ARP packets will make the device malfunction or even crash. To solve this problem, configure ARP packet rate limit. When the receiving rate of ARP packets on the interface exceeds the rate limit, those packets are discarded.

You can enable sending notifications to the SNMP module or enable logging for ARP packet rate limit.

- If notification sending is enabled, the device sends the highest threshold-crossed ARP packet rate within the sending interval in a notification to the SNMP module. You must use the **snmp-agent target-host** command to set the notification type and target host. For more information about notifications, see *Network Management and Monitoring Command Reference*.
- If logging for ARP packet rate limit is enabled, the device sends the highest threshold-crossed ARP packet rate within the sending interval in a log message to the information center. You can configure the information center module to set the log output rules. For more information about information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

As a best practice, configure this feature when ARP attack detection, ARP snooping, or MFF is enabled, or when ARP flood attacks are detected.

If excessive notifications and log messages are sent for ARP packet rate limit, you can increase notification and log message sending interval.

If you enable notification sending and logging for ARP packet rate limit on a Layer 2 aggregate interface, the features apply to all aggregation member ports.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Enable SNMP notifications for ARP packet rate limit.
   snmp-agent trap enable arp [**rate-limit**]
   By default, SNMP notifications for ARP packet rate limit are disabled.
3. (Optional.) Enable logging for ARP packet rate limit.
   arp rate-limit log enable
   By default, logging for ARP packet rate limit is disabled.
4. (Optional.) Set the notification and log message sending interval.
   arp rate-limit log interval *interval*
   By default, the device sends notifications and log messages every 60 seconds.
5. Enter interface view.
   interface *interface-type interface-number*
   Supported interface types include Layer 2 Ethernet interface and Layer 2 aggregate interface.
6. Enable ARP packet rate limit.
   arp rate-limit [*pps*]
   By default, ARP packet rate limit is enabled.

Configuring source MAC-based ARP attack detection

About source MAC-based ARP attack detection

This feature checks the number of ARP packets delivered to the CPU. If the number of packets from the same MAC address within 5 seconds exceeds a threshold, the device generates an ARP attack entry for the MAC address. If the ARP logging feature is enabled, the device handles the attack by using either of the following methods before the ARP attack entry ages out:

- **Monitor**—Only generates log messages.
- **Filter**—Generates log messages and filters out subsequent ARP packets from the MAC address and data packets sourced from or destined for the MAC address.

To enable the ARP logging feature, use the **arp source-mac log enable** command. For information about the ARP logging feature, see ARP in *Layer 3—IP Services Configuration Guide*.

When an ARP attack entry ages out, ARP packets sourced from the MAC address in the entry can be processed correctly.

Restrictions and guidelines

When you change the handling method from monitor to filter, the configuration takes effect immediately. When you change the handling method from filter to monitor, the device continues filtering packets that match existing attack entries.

You can exclude the MAC addresses of some gateways and servers from this detection. This feature does not inspect ARP packets from those devices even if they are attackers.

Procedure

1. Enter system view.
   system-view
2. Enable source MAC-based ARP attack detection and specify the handling method.
   arp source-mac { **filter** | **monitor** }
   By default, this feature is disabled.
3. Set the threshold.
   arp source-mac threshold *threshold-value*
   By default, the threshold is 30.
4. Set the aging timer for ARP attack entries.
   arp source-mac aging-time *time*
   By default, the lifetime is 300 seconds.
5. (Optional.) Exclude specific MAC addresses from this detection.
   arp source-mac exclude-mac *mac-address*&<1-10>
   By default, no MAC address is excluded.
6. Enable logging for source MAC-based ARP attack detection.
   arp source-mac log enable
   By default, logging for source MAC-based ARP attack detection is disabled.

Display and maintenance commands for source MAC-based ARP attack detection

Execute **display** commands in any view.

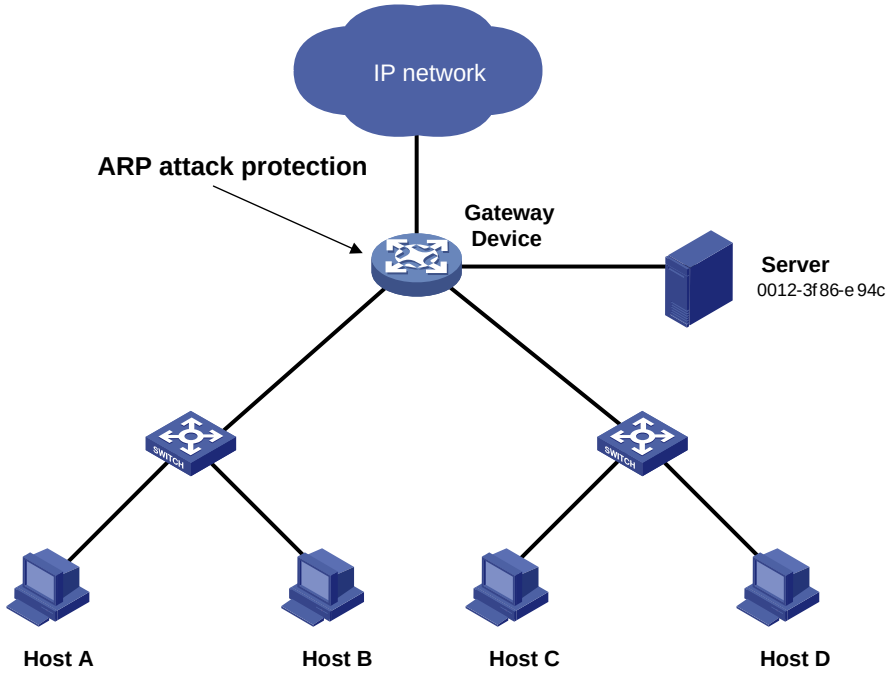
Task	Command
Display ARP attack entries detected by source MAC-based ARP attack detection.	**display arp source-mac** { **interface** *interface-type interface-number* [**slot** *slot-number*] | **slot** *slot-number* }

Example: Configuring source MAC-based ARP attack detection

Network configuration

As shown in Figure 2, the hosts access the Internet through a gateway (Device). If malicious users send a large number of ARP requests to the gateway, the gateway might crash and cannot process requests from the clients. To solve this problem, configure source MAC-based ARP attack detection on the gateway.

Figure 2 Network diagram



Procedure

Enable source MAC-based ARP attack detection, and specify the handling method as filter.

```
<Device> system-view
[Device] arp source-mac filter
```

Set the threshold to 30.

```
[Device] arp source-mac threshold 30
```

Set the lifetime for ARP attack entries to 60 seconds.

```
[Device] arp source-mac aging-time 60
```

Exclude MAC address 0012-3f86-e94c from this detection.

```
[Device] arp source-mac exclude-mac 0012-3f86-e94c
```

Configuring ARP packet source MAC consistency check

About ARP packet source MAC consistency check

This feature enables a gateway to filter out ARP packets whose source MAC address in the Ethernet header is different from the sender MAC address in the message body. This feature allows the gateway to learn correct ARP entries.

Procedure

1. Enter system view.
   system-view
2. Enable ARP packet source MAC address consistency check.
   arp valid-check enable
   By default, ARP packet source MAC address consistency check is disabled.

Configuring ARP active acknowledgement

About ARP active acknowledgement

Configure this feature on gateways to prevent user spoofing.

ARP active acknowledgement prevents a gateway from generating incorrect ARP entries.

In strict mode, a gateway performs more strict validity checks before creating an ARP entry:

- Upon receiving an ARP request destined for the gateway, the gateway sends an ARP reply but does not create an ARP entry.
- Upon receiving an ARP reply, the gateway determines whether it has resolved the sender IP address:
  - If yes, the gateway performs active acknowledgement. When the ARP reply is verified as valid, the gateway creates an ARP entry.
  - If no, the gateway discards the packet.

Procedure

1. Enter system view.
   system-view
2. Enable the ARP active acknowledgement feature.
   arp active-ack [**strict**] **enable**
   By default, this feature is disabled.
   For ARP active acknowledgement to take effect in strict mode, make sure ARP blackhole routing is enabled.

Configuring authorized ARP

About authorized ARP

Authorized ARP entries are generated based on the DHCP clients' address leases on the DHCP server or dynamic client entries on the DHCP relay agent. For more information about DHCP server and DHCP relay agent, see *Layer 3—IP Services Configuration Guide*.

Use this feature to prevent user spoofing and to allow only authorized clients to access network resources.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
   Only VLAN interfaces are supported.
3. Enable authorized ARP on the interface.
   `arp authorized enable`
   By default, authorized ARP is disabled.

Configuring ARP attack detection

About ARP attack detection

ARP attack detection enables access devices to block ARP packets from unauthorized clients to prevent user spoofing and gateway spoofing attacks.

ARP attack detection provides the following features:

- User validity check.
- ARP packet validity check.
- ARP restricted forwarding.
- ARP packet ingress port ignoring during user validity check
- ARP attack detection logging.

If both ARP packet validity check and user validity check are enabled, the former one applies first, and then the latter applies.

Do not configure ARP attack detection together with ARP snooping. Otherwise, ARP snooping entries cannot be generated.

Configuring user validity check

About user validity check

User validity check does not check ARP packets received on ARP trusted interfaces. This feature compares the sender IP and sender MAC in the ARP packet received on an ARP untrusted interface with the matching criteria in the following order:

1. User validity check rules.

- If a match is found, the device processes the ARP packet according to the rule.
- If no match is found or no user validity check rule is configured, proceeds to step 2.

2. Static IPSG bindings, 802.1X security entries, and DHCP snooping entries.
   - If a match is found, the device determines that the ARP packet is valid. Then, the device forwards the packet by searching for an entry that contains the target IP address.
     - If a match is found and the receiving interface is the same as the interface in the entry with a matching sender IP address, the device performs Layer 3 forwarding.
     - If a match is found but the receiving interface is different from the interface in the entry with a matching sender IP address, the device performs Layer 2 forwarding.
     - If no match is found, the device performs Layer 2 forwarding.
   - If no match is found, the device discards the ARP packet.

Static IP source guard bindings are created by using the **ip source binding** command. For more information, see "Configuring IP source guard."

DHCP snooping entries are automatically generated by DHCP snooping. For more information, see *Layer 3—IP Services Configuration Guide*.

802.1X security entries record the IP-to-MAC mappings for 802.1X clients. After a client passes 802.1X authentication and uploads its IP address to an ARP attack detection enabled device, the device automatically generates an 802.1X security entry. The 802.1X client must be enabled to upload its IP address to the device. For more information, see "Configuring 802.1X."

Restrictions and guidelines

When you configure user validity check, make sure one or more of the following items are configured:

- User validity check rules.
- Static IP source guard bindings.
- DHCP snooping.
- 802.1X.

If none of the items is configured, the device does not perform user validity check and cannot correctly forward all incoming ARP packets on ARP untrusted interfaces.

Specify an IP address, a MAC address, and a VLAN where ARP attack detection is enabled for an IP source guard binding. Otherwise, no ARP packets can match the IP source guard binding.

Configuring user validity check rules

1. Enter system view.

   system-view

2. Configure a user validity check rule.

   arp detection rule *rule-id* { **deny** | **permit** } **ip** { *ip-address* [*mask*] | **any** } **mac** { *mac-address* [*mask*] | **any** } [**vlan** *vlan-id*]

   By default, no user validity check rules are configured.

Enabling ARP attack detection in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable ARP attack detection.

   arp detection enable

   By default, ARP attack detection is disabled. The device does not perform user validity check.

4. (Optional.) Configure an interface that does not require ARP user validity check as a trusted interface.
   a. Return to system view.
      quit
   b. Enter interface view.
      interface *interface-type interface-number*
      Supported interface types include Layer 2 Ethernet interface and Layer 2 aggregate interface.
   c. Configure the interface as a trusted interface excluded from ARP attack detection.
      arp detection trust
      By default, an interface is untrusted.

Configuring ARP packet validity check

About ARP packet validity check

ARP packet validity check does not check ARP packets received on ARP trusted interfaces. To check ARP packets received on untrusted interfaces, you can specify the following objects to be checked:

- **src-mac**—Checks whether the sender MAC address in the message body is identical to the source MAC address in the Ethernet header. If they are identical, the packet is forwarded. Otherwise, the packet is discarded.
- **dst-mac**—Checks the target MAC address of ARP replies. If the target MAC address is all-zero, all-one, or inconsistent with the destination MAC address in the Ethernet header, the packet is considered invalid and discarded.
- **ip**—Checks the sender and target IP addresses of ARP replies, and the sender IP address of ARP requests. All-one or multicast IP addresses are considered invalid and the corresponding packets are discarded.

Prerequisites

Before you configure ARP packet validity check, you must first configure user validity check. For more information about user validity check configuration, see "Configuring user validity check."

Enabling ARP packet validity check

1. Enter system view.
   system-view
2. Enable ARP packet validity check and specify the objects to be checked.
   arp detection validate { **dst-mac** | **ip** | **src-mac** } *
   By default, ARP packet validity check is disabled.

Enabling ARP attack detection in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable ARP attack detection.
   arp detection enable
   By default, ARP attack detection is disabled. The device does not perform ARP packet validity check.

4. (Optional.) Execute the following commands in sequence to configure the interface that does not require ARP packet validity check as a trusted interface:
   a. Return to system view.
      quit
   b. Enter interface view.
      interface *interface-type interface-number*
      Supported interface types include Layer 2 Ethernet interface and Layer 2 aggregate interface.
   c. Configure the interface as a trusted interface excluded from ARP attack detection.
      arp detection trust
      By default, an interface is untrusted.

Configuring ARP restricted forwarding

About ARP restricted forwarding

ARP restricted forwarding does not take effect on ARP packets received on ARP trusted interfaces and forwards the ARP packets correctly. This feature controls the forwarding of ARP packets that are received on untrusted interfaces and have passed user validity check as follows:

- If the packets are ARP requests, they are forwarded through the trusted interface.
- If the packets are ARP replies, they are forwarded according to their destination MAC address. If no match is found in the MAC address table, they are forwarded through the trusted interface.

Restrictions and guidelines

ARP restricted forwarding does not apply to ARP packets that use multiport destination MAC addresses.

Prerequisites

Configure user validity check before you configure ARP restricted forwarding. For information about user validity check configuration, see "Configuring user validity check."

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable ARP restricted forwarding.
   arp restricted-forwarding enable
   By default, ARP restricted forwarding is disabled.

Ignoring ingress ports of ARP packets during user validity check

About ignoring ingress ports of ARP packets during user validity check

ARP attack detection performs user validity check on ARP packets from ARP untrusted interfaces. The sender IP and sender MAC in the received ARP packet are compared with the entries used for user validity check. In addition, user validity check compares the ingress port of the ARP packet with the port in the entries. If no matching port is found, the ARP packet is discarded. For more information about user validity check, see "Configuring user validity check."

You can configure the device to ignore the ingress ports of ARP packets during user validity check. If an ARP packet passes user validity check, the device directly performs Layer 2 forwarding for the packet. It no longer searches for a matching static IPSG binding, 802.1X security entry, or DHCP snooping entry by the target IP address of the ARP packet.

Procedure

1. Enter system view.
   system-view
2. Ignore ingress ports of ARP packets during user validity check.
   arp detection port-match-ignore
   By default, ingress ports of ARP packets are checked during user invalidity.

Enabling ARP attack detection logging

About ARP attack detection logging

The ARP attack detection logging feature enables a device to generate ARP attack detection log messages when illegal ARP packets are detected. An ARP attack detection log message contains the following information:

- Receiving interface of the ARP packets.
- Sender IP address.
- Total number of dropped ARP packets.

Procedure

1. Enter system view.
   system-view
2. Enable ARP attack detection logging.
   arp detection log enable [**interval** *interval* | **number** *number*]
   By default, ARP attack detection logging is disabled.

Display and maintenance commands for ARP attack detection

Execute **display** commands in any view and **reset** commands in user view.

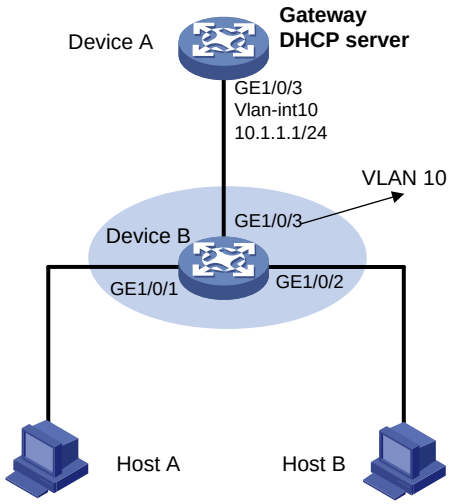
Task	Command
Display the VLANs enabled with ARP attack detection.	**display arp detection**
Display ARP attack source statistics.	**display arp detection statistics attack-source slot** *slot-number*
Display statistics for packets dropped by ARP attack detection.	**display arp detection statistics packet-drop** [**interface** *interface-type interface-number*]
Clear ARP attack source statistics.	**reset arp detection statistics attack-source** [**slot** *slot-number*]
Clear statistics for packets dropped by ARP attack detection.	**reset arp detection statistics packet-drop** [**interface** *interface-type interface-number*]

Example: Configuring user validity check

Network configuration

As shown in Figure 3, configure Device B to perform user validity check based on 802.1X security entries for connected hosts.

Figure 3 Network diagram



Procedure

1. Add all interfaces on Device B to VLAN 10, and specify the IP address of VLAN-interface 10 on Device A. (Details not shown.)
2. Configure the DHCP server on Device A, and configure DHCP address pool 0.

```
<DeviceA> system-view
[DeviceA] dhcp enable
[DeviceA] dhcp server ip-pool 0
[DeviceA-dhcp-pool-0] network 10.1.1.0 mask 255.255.255.0
```

3. Configure Host A and Host B as 802.1X clients and configure them to upload IP addresses for ARP attack detection. (Details not shown.)
4. Configure Device B:

   # Enable 802.1X.

```
<DeviceB> system-view
[DeviceB] dot1x
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] dot1x
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] dot1x
[DeviceB-GigabitEthernet1/0/2] quit
```

   # Add a local user **test**.

```
[DeviceB] local-user test
[DeviceB-luser-test] service-type lan-access
[DeviceB-luser-test] password simple test
[DeviceB-luser-test] quit
```

   # Enable ARP attack detection for VLAN 10 to check user validity based on 802.1X entries.

```
[DeviceB] vlan 10
[DeviceB-vlan10] arp detection enable
```

Configure the upstream interface as an ARP trusted interface. By default, an interface is an untrusted interface.

```
[DeviceB-vlan10] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] arp detection trust
[DeviceB-GigabitEthernet1/0/3] quit
```

Verifying the configuration

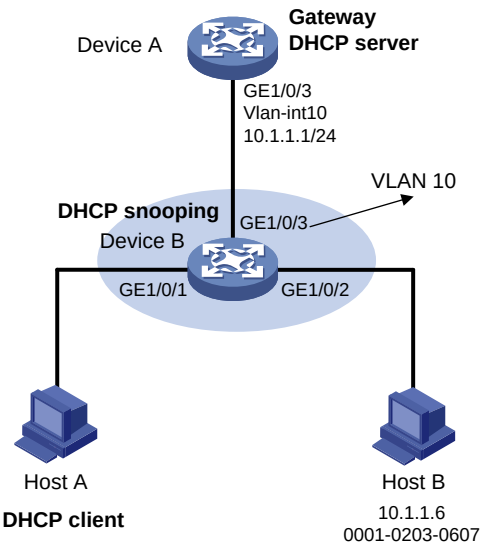
Verify that ARP packets received on interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are checked against 802.1X entries.

Example: Configuring user validity check and ARP packet validity check

Network configuration

As shown in Figure 4, configure Device B to perform ARP packet validity check and user validity check based on static IP source guard bindings and DHCP snooping entries for connected hosts.

Figure 4 Network diagram



Procedure

1. Add all interfaces on Device B to VLAN 10, and specify the IP address of VLAN-interface 10 on Device A. (Details not shown.)
2. Configure the DHCP server on Device A, and configure DHCP address pool 0.

```
<DeviceA> system-view
[DeviceA] dhcp enable
[DeviceA] dhcp server ip-pool 0
[DeviceA-dhcp-pool-0] network 10.1.1.0 mask 255.255.255.0
```

3. Configure Host A (DHCP client) and Host B. (Details not shown.)
4. Configure Device B:

Enable DHCP snooping.

```
<DeviceB> system-view
```

```
[DeviceB] dhcp snooping enable
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] dhcp snooping trust
[DeviceB-GigabitEthernet1/0/3] quit
```

Enable recording of client information in DHCP snooping entries on GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] dhcp snooping binding record
[DeviceB-GigabitEthernet1/0/1] quit
```

Enable ARP attack detection for VLAN 10.

```
[DeviceB] vlan 10
[DeviceB-vlan10] arp detection enable
```

Configure the upstream interface as a trusted interface. By default, an interface is an untrusted interface.

```
[DeviceB-vlan10] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] arp detection trust
[DeviceB-GigabitEthernet1/0/3] quit
```

Configure a static IP source guard binding entry on interface GigabitEthernet 1/0/2 for user validity check.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] ip source binding ip-address 10.1.1.6 mac-address
0001-0203-0607 vlan 10
[DeviceB-GigabitEthernet1/0/2] quit
```

Enable ARP packet validity check by checking the MAC addresses and IP addresses of ARP packets.

```
[DeviceB] arp detection validate dst-mac ip src-mac
```

Verifying the configuration

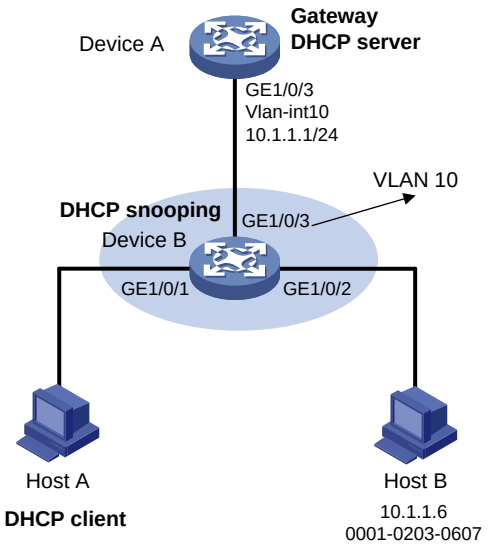
Verify that Device B first checks the validity of ARP packets received on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2. If the ARP packets are confirmed valid, Device B performs user validity check by using the static IP source guard bindings and finally DHCP snooping entries.

Example: Configuring ARP restricted forwarding

Network configuration

As shown in Figure 5, configure ARP restricted forwarding on Device B where ARP attack detection is configured. Port isolation configured on Device B can take effect for broadcast ARP requests.

Figure 5 Network diagram



Procedure

1. Configure VLAN 10, add interfaces to VLAN 10, and specify the IP address of VLAN-interface 10 on Device A. (Details not shown.)
2. Configure the DHCP server on Device A, and configure DHCP address pool 0.

```
<DeviceA> system-view
[DeviceA] dhcp enable
[DeviceA] dhcp server ip-pool 0
[DeviceA-dhcp-pool-0] network 10.1.1.0 mask 255.255.255.0
```

3. Configure Host A (DHCP client) and Host B. (Details not shown.)
4. Configure Device B:

   # Enable DHCP snooping, and configure GigabitEthernet 1/0/3 as a DHCP trusted interface.

```
<DeviceB> system-view
[DeviceB] dhcp snooping enable
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] dhcp snooping trust
[DeviceB-GigabitEthernet1/0/3] quit
```

   # Enable ARP attack detection for user validity check.

```
[DeviceB] vlan 10
[DeviceB-vlan10] arp detection enable
```

   # Configure GigabitEthernet 1/0/3 as an ARP trusted interface.

```
[DeviceB-vlan10] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] arp detection trust
[DeviceB-GigabitEthernet1/0/3] quit
```

   # Configure a static IP source guard entry on interface GigabitEthernet 1/0/2.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] ip source binding ip-address 10.1.1.6 mac-address
0001-0203-0607 vlan 10
[DeviceB-GigabitEthernet1/0/2] quit
```

   # Enable ARP packet validity check by checking the MAC addresses and IP addresses of ARP packets.

```
[DeviceB] arp detection validate dst-mac ip src-mac
```

Configure port isolation.

```
[DeviceB] port-isolate group 1
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port-isolate enable group 1
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port-isolate enable group 1
[DeviceB-GigabitEthernet1/0/2] quit
```

After the configurations are completed, Device B first checks the validity of ARP packets received on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2. If the ARP packets are confirmed valid, Device B performs user validity check by using the static IP source guard bindings and finally DHCP snooping entries. However, ARP broadcast requests sent from Host A can pass the check on Device B and reach Host B. Port isolation fails.

Enable ARP restricted forwarding.

```
[DeviceB] vlan 10
[DeviceB-vlan10] arp restricted-forwarding enable
[DeviceB-vlan10] quit
```

Verifying the configuration

Verify that Device B forwards ARP broadcast requests from Host A to Device A through the trusted interface GigabitEthernet 1/0/3. Host B cannot receive such packets. Port isolation operates correctly.

Configuring ARP scanning and fixed ARP

About ARP scanning and fixed ARP

ARP scanning is typically used together with the fixed ARP feature in small-scale and stable networks.

ARP scanning automatically creates ARP entries for devices in an address range. The device performs ARP scanning in the following steps:

1. Sends ARP requests for each IP address in the address range.
2. Obtains their MAC addresses through received ARP replies.
3. Creates dynamic ARP entries.

Fixed ARP converts existing dynamic ARP entries (including those generated through ARP scanning) to static ARP entries. These static ARP entries are of the same attributes as the ARP entries that are manually configured. This feature prevents ARP entries from being modified by attackers.

You can set the ARP packet sending rate if the scanning range has a large number of IP addresses. This setting can avoid high CPU usage and heavy network load caused by a burst of ARP traffic.

Restrictions and guidelines

IP addresses in existing ARP entries are not scanned.

Due to the limit on the total number of static ARP entries, some dynamic ARP entries might fail the conversion.

The **arp fixup** command is a one-time operation. You can use this command again to convert the dynamic ARP entries learned later to static.

To delete a static ARP entry converted from a dynamic one, use the **undo arp** *ip-address* command. You can also use the **reset arp all** command to delete all ARP entries or the **reset arp static** command to delete all static ARP entries.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Trigger an ARP scanning.
   arp scan [*start-ip-address* **to** *end-ip-address*] [**send-rate** *pps*]

   CAUTION:
   ARP scanning will take some time. To stop an ongoing scan, press **Ctrl** + **C**. Dynamic ARP entries are created based on ARP replies received before the scan is terminated.
4. Return to system view.
   quit
5. Convert existing dynamic ARP entries to static ARP entries.
   arp fixup

Configuring ARP gateway protection

About ARP gateway protection

Configure this feature on interfaces not connected with a gateway to prevent gateway spoofing attacks.

When such an interface receives an ARP packet, it checks whether the sender IP address in the packet is consistent with that of any protected gateway. If yes, it discards the packet. If not, it handles the packet correctly.

Restrictions and guidelines

You can enable ARP gateway protection for a maximum of eight gateways on an interface.

Do not configure both the **arp filter source** and **arp filter binding** commands on an interface.

If ARP gateway protection works with ARP attack detection, MFF, and ARP snooping, ARP gateway protection applies first.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*

   Supported interface types include Layer 2 Ethernet interface and Layer 2 aggregate interface.
3. Enable ARP gateway protection for the specified gateway.
   arp filter source *ip-address*

   By default, ARP gateway protection is disabled.

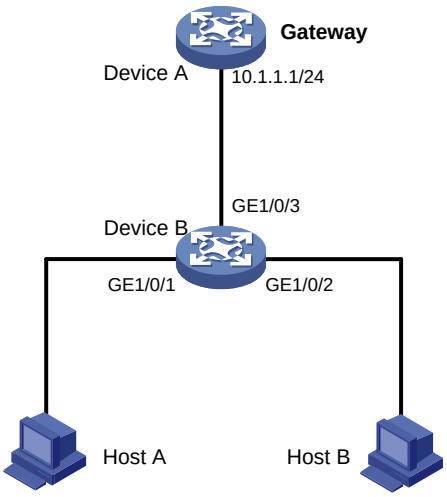
Example: Configuring ARP gateway protection

Network configuration

As shown in Figure 6, Host B launches gateway spoofing attacks to Device B. As a result, traffic that Device B intends to send to Device A is sent to Host B.

Configure Device B to block such attacks.

Figure 6 Network diagram



Procedure

Configure ARP gateway protection on Device B.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] arp filter source 10.1.1.1
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] arp filter source 10.1.1.1
```

Verifying the configuration

Verify that GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 discard the incoming ARP packets whose sender IP address is the IP address of the gateway.

Configuring ARP filtering

ARP filtering

The ARP filtering feature can prevent gateway spoofing and user spoofing attacks.

An interface enabled with this feature checks the sender IP and MAC addresses in a received ARP packet against permitted entries. If a match is found, the packet is handled correctly. If not, the packet is discarded.

Restrictions and guidelines

You can configure a maximum of eight permitted entries on an interface.

Do not configure both the **arp filter source** and **arp filter binding** commands on an interface.

If ARP filtering works with ARP attack detection, MFF, and ARP snooping, ARP filtering applies first.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   Supported interface types include Ethernet interface and Layer 2 aggregate interface.
3. Enable ARP filtering and configure a permitted entry.
   arp filter binding *ip-address mac-address*
   By default, ARP filtering is disabled.

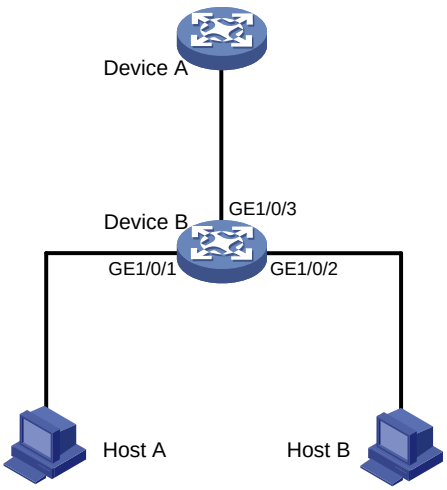
Example: Configuring ARP filtering

Network configuration

As shown in Figure 7, the IP and MAC addresses of Host A are 10.1.1.2 and 000f-e349-1233, respectively. The IP and MAC addresses of Host B are 10.1.1.3 and 000f-e349-1234, respectively.

Configure ARP filtering on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 of Device B to permit ARP packets from only Host A and Host B.

Figure 7 Network diagram



Procedure

Configure ARP filtering on Device B.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] arp filter binding 10.1.1.2 000f-e349-1233
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] arp filter binding 10.1.1.3 000f-e349-1234
```

Verifying the configuration

Verify that GigabitEthernet 1/0/1 permits ARP packets from Host A and discards other ARP packets.

Verify that GigabitEthernet 1/0/2 permits ARP packets from Host B and discards other ARP packets.

Contents

Configuring ND attack defense

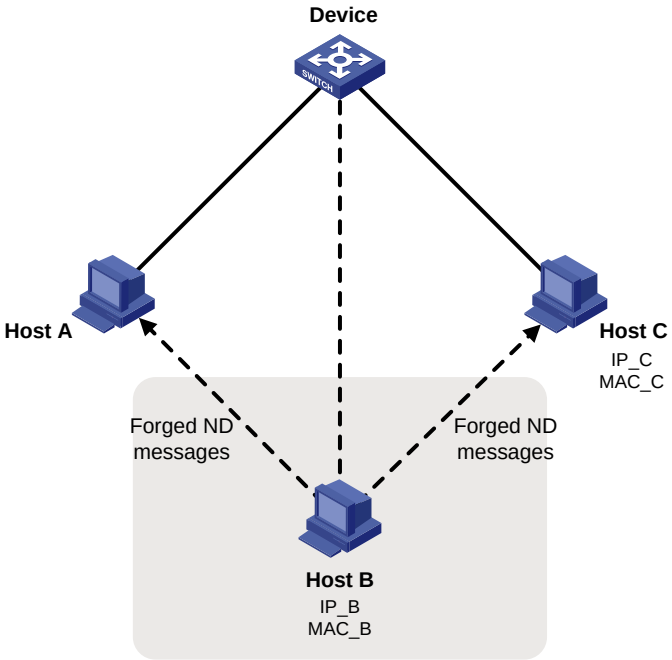
About ND attack defense

IPv6 Neighbor Discovery (ND) attack defense is able to identify forged ND messages to prevent ND attacks.

The IPv6 ND protocol does not provide any security mechanisms and is vulnerable to network attacks. As shown in Figure 1, an attacker can send the following forged ICMPv6 messages to perform ND attacks:

- Forged NS/NA/RS messages with an IPv6 address of a victim host. The gateway and other hosts update the ND entry for the victim with incorrect address information. As a result, all packets intended for the victim are sent to the attacking terminal.
- Forged RA messages with the IPv6 address of a victim gateway. As a result, all hosts attached to the victim gateway maintain incorrect IPv6 configuration parameters and ND entries.

Figure 1 ND attack diagram



ND attack defense tasks at a glance

All ND attack defense tasks are optional.

- Enabling source MAC consistency check for ND messages
- Configuring ND attack detection
- Configuring RA guard

Enabling source MAC consistency check for ND messages

About source MAC consistency check

The source MAC consistency check feature is typically configured on gateways to prevent ND attacks.

This feature checks the source MAC address and the source link-layer address for consistency for each arriving ND message.

- If the source MAC address and the source link-layer address are not the same, the device drops the packet.
- If the addresses are the same, the device continues learning ND entries.

The ND logging feature logs source MAC inconsistency events, and it sends the log messages to the information center. The information center can then output log messages from different source modules to different destinations. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`
2. Enable source MAC consistency check for ND messages.

   `ipv6 nd mac-check enable`

   By default, source MAC consistency check is disabled for ND messages.
3. (Optional.) Enable the ND logging feature.

   `ipv6 nd check log enable`

   By default, the ND logging feature is disabled.

   As a best practice, disable the ND logging feature to avoid excessive ND logs.

Configuring ND attack detection

About ND attack detection

ND attack detection checks incoming ND messages for user validity to prevent spoofing attacks. It is typically configured on access devices. It supports the following features:

- User validity check.
- ND attack detection logging.

ND attack detection defines the following types of interfaces:

- **ND trusted interface**—The device directly forwards ND messages or data packets received by ND trusted interfaces. It does not perform user validity check.
- **ND untrusted interface**—The device discards RA and redirect messages received by ND untrusted interfaces. For other types of ND messages received by the ND untrusted interfaces, the device checks the user validity.

ND attack detection compares the source IPv6 address and the source MAC address in an incoming ND message against security entries from other modules.

- If a match is found, the device verifies the user as legal in the receiving VLAN, and it forwards the packet.

- If no match is found, the device verifies the user as illegal, and it discards the ND message.

ND attack detection uses static IPv6 source guard binding entries, ND snooping entries, and DHCPv6 snooping entries for user validity check.

Static IPv6 source guard binding entries are created by using the **ipv6 source binding** command. For information about IPv6 source guard, see "Configuring IP source guard." For information about DHCPv6 snooping, see *Layer 3–IP Services Configuration Guide*. For information about ND snooping, see *Layer 3–IP Services Configuration Guide*.

Restrictions and guidelines

When you configure ND attack detection, follow these restrictions and guidelines:

- To prevent ND untrusted interfaces from dropping all received ND messages, make sure one or more of the these features are configured: IPv6 source guard static bindings, DHCPv6 snooping, and ND snooping.
- To make the IPv6 source guard static bindings effective for ND attack detection, you must perform the following operations:
  - Specify the **vlan** *vlan-id* option in the **ipv6 source binding** command.
  - Enable ND attack detection for the same VLAN.

Enabling ND detection in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable ND attack detection.
   ipv6 nd detection enable
   By default, ND attack detection is disabled.
4. (Optional.) Configure the interface as ND trusted interface:
   a. Return to system view.
      quit
   b. Enter Layer 2 Ethernet or aggregate interface view.
      interface *interface-type interface-number*
   c. Configure the interface as ND trusted interface.
      ipv6 nd detection trust
      By default, all interfaces are ND untrusted interfaces.

Enabling ND attack detection logging

About ND attack detection logging

This feature allows a device to generate logs when it detects invalid ND packets. The log information helps administrators locate and solve problems. Each log records the following information:

- Victim port numbers in a VLAN.
- Source IP address of the invalid ND packets.
- Source MAC address of the invalid ND packets.
- VLAN ID of the invalid ND packets.

- Total number of dropped ND packets.

Procedure

1. Enter system view.
   `system-view`
2. Enable ND attack detection logging.
   `ipv6 nd detection log enable`
   By default, ND attack detection logging is disabled.

Display and maintenance commands for ND attack detection

Execute **`display`** commands in any view and **`reset`** commands in user view.

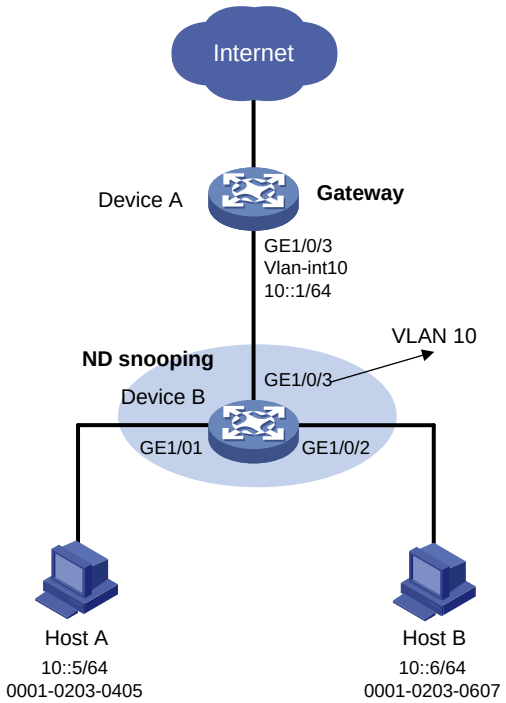
Task	Command
Display statistics for ND messages dropped by ND attack detection.	**`display ipv6 nd detection statistics`** [**`interface`** *`interface-type interface-number`*]
Clear ND attack detection statistics.	**`reset ipv6 nd detection statistics`** [**`interface`** *`interface-type interface-number`*]

Example: Configuring ND attack detection

Network configuration

As shown in Figure 2, configure ND attack detection on Device B to check user validity for ND messages from Host A and Host B.

Figure 2 Network diagram



Procedure

1. Configure Device A:

   # Create VLAN 10.

```
<DeviceA> system-view
[DeviceA] vlan 10
[DeviceA-vlan10] quit
```

   # Configure GigabitEthernet 1/0/3 to trunk VLAN 10.

```
[DeviceA] interface gigabitethernet 1/0/3
[DeviceA-GigabitEthernet1/0/3] port link-type trunk
[DeviceA-GigabitEthernet1/0/3] port trunk permit vlan 10
[DeviceA-GigabitEthernet1/0/3] quit
```

   # Assign IPv6 address 10::1/64 to VLAN-interface 10.

```
[DeviceA] interface vlan-interface 10
[DeviceA-Vlan-interface10] ipv6 address 10::1/64
[DeviceA-Vlan-interface10] quit
```

2. Configure Device B:

   # Create VLAN 10.

```
<DeviceB> system-view
[DeviceB] vlan 10
[DeviceB-vlan10] quit
```

   # Configure GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 to trunk VLAN 10.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port link-type access
[DeviceB-GigabitEthernet1/0/1] port access vlan 10
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port link-type access
[DeviceB-GigabitEthernet1/0/2] port access vlan 10
[DeviceB-GigabitEthernet1/0/2] quit
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] port link-type trunk
[DeviceB-GigabitEthernet1/0/3] port trunk permit vlan 10
[DeviceB-GigabitEthernet1/0/3] quit
```

   # Enable ND attack detection for VLAN 10.

```
[DeviceB] vlan 10
[DeviceB-vlan10] ipv6 nd detection enable
```

   # Enable ND snooping for IPv6 global unicast addresses and ND snooping for IPv6 link-local addresses in VLAN 10.

```
[DeviceB-vlan10] ipv6 nd snooping enable global
[DeviceB-vlan10] ipv6 nd snooping enable link-local
[DeviceB-vlan10] quit
```

   # Configure GigabitEthernet 1/0/3 as ND trusted interface.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] ipv6 nd detection trust
```

Verifying the configuration

Verify that Device B inspects all ND messages received by GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 based on the ND snooping entries. (Details not shown.)

Configuring RA guard

About RA guard

RA guard allows Layer 2 access devices to analyze and block unwanted and forged RA messages.

Upon receiving an RA message, the device makes the forwarding or dropping decision based on the role of the attached device or the RA guard policy.

1. If the role of the device attached to the receiving interface is **router**, the device forwards the RA message. If the role is **host**, the device drops the RA message.
2. If no attached device role is set, the device uses the RA guard policy applied to the VLAN of the receiving interface to match the RA message.
   - If the policy does not contain match criteria, the policy will not take effect and the device forwards the RA message.
   - If the RA message content matches every criterion in the policy, the device forwards the message. Otherwise, the device drops the message.

Specifying the role of the attached device

Restrictions and guidelines

Make sure your setting is consistent with the type of the attached device. If you are not aware of the device type, do not specify a role for the device.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Specify the role of the device attached to the interface.

   ipv6 nd raguard role { **host** | **router** }

   By default, the role of the device attached to the interface is not specified.

Configuring and applying an RA guard policy

About RA guard policy configuration

Configure an RA guard policy if you do not specify a role for the attached device or if you want to filter the RA messages sent by a router.

Procedure

1. Enter system view.

   system-view

2. Create an RA guard policy and enter its view.
   ipv6 nd raguard policy *policy-name*
3. Configure the RA guard policy.
   Choose the following tasks as needed:
   - Specify an ACL match criterion.
     if-match acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   - Specify a prefix match criterion.
     if-match prefix acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   - Specify a router preference match criterion.
     if-match router-preference maximum { **high** | **low** | **medium** }
   - Specify an M flag match criterion.
     if-match autoconfig managed-address-flag { **off** | **on** }
   - Specify an O flag match criterion.
     if-match autoconfig other-flag { **off** | **on** }
   - Specify a maximum or minimum hop limit match criterion.
     if-match hop-limit { **maximum** | **minimum** } *limit*

   By default, the RA guard policy is not configured.
4. Quit RA guard policy view.
   quit
5. Enter VLAN view.
   vlan *vlan-number*
6. Apply an RA guard policy to the VLAN.
   ipv6 nd raguard apply policy [*policy-name*]
   By default, no RA guard policy is applied to the VLAN.

Enabling the RA guard logging feature

About RA guard logging

This feature allows a device to generate logs when it detects forged RA messages. The log information helps administrators locate and solve problems. Each log records the following information:

- Name of the interface that received the forged RA message.
- Source IP address of the forged RA message.
- Number of RA messages dropped on the interface.

The RA guard logging feature sends the log messages to the information center. The information center can then output log messages from different source modules to different destinations. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable the RA guard logging feature.
   ipv6 nd raguard log enable
   By default, the RA guard logging feature is disabled.

Display and maintenance commands for RA guard

Execute **display** commands in any view.

Task	Command
Display the RA guard policy configuration.	**display ipv6 nd raguard policy** [*policy-name*]
Display RA guard statistics.	**display ipv6 nd raguard statistics** [**interface** *interface-type interface-number*]
Clear RA guard statistics.	**reset ipv6 nd raguard statistics** [**interface** *interface-type interface-number*]

Example: Configuring RA guard

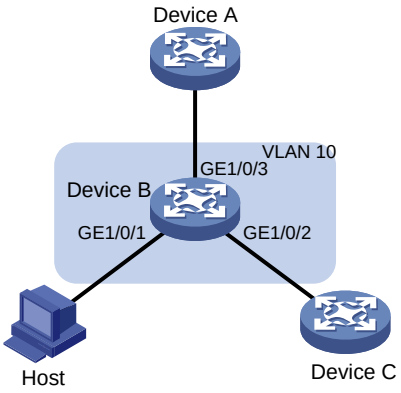
Network configuration

As shown in Figure 3, GigabitEthernet 1/0/1, GigabitEthernet 1/0/2, and GigabitEthernet 1/0/3 of Device B are in VLAN 10.

Configure RA guard on Device B to filter forged and unwanted RA messages.

- Configure an RA policy in VLAN 10 for GigabitEthernet 1/0/2 to filter all RA messages received from the unknown device.
- Specify **host** as the role of the host. All RA messages received on GigabitEthernet 1/0/1 are dropped.
- Specify **router** as the role of the Device A. All RA messages received on GigabitEthernet 1/0/3 are forwarded.

Figure 3 Network diagram



Procedure

Create an RA guard policy named **policy1**.

```
<DeviceB> system-view
[DeviceB] ipv6 nd raguard policy policy1
```

Set the maximum router preference to **high** for the RA guard policy.

```
[DeviceB-raguard-policy-policy1] if-match router-preference maximum high
```

Specify **on** as the M flag match criterion for the RA guard policy.

```
[DeviceB-raguard-policy-policy1] if-match autoconfig managed-address-flag on
```

Specify **on** as the O flag match criterion for the RA guard policy.

```
[DeviceB-raguard-policy-policy1] if-match autoconfig other-flag on
```

Set the maximum advertised hop limit to 120 for the RA guard policy.

```
[DeviceB-raguard-policy-policy1] if-match hop-limit maximum 120
```

Set the minimum advertised hop limit to 100 for the RA guard policy.

```
[DeviceB-raguard-policy-policy1] if-match hop-limit minimum 100
[DeviceB-raguard-policy-policy1] quit
```

Assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to VLAN 10.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port link-type access
[DeviceB-GigabitEthernet1/0/1] port access vlan 10
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port link-type access
[DeviceB-GigabitEthernet1/0/2] port access vlan 10
[DeviceB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 to trunk VLAN 10.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] port link-type trunk
[DeviceB-GigabitEthernet1/0/3] port trunk permit vlan 10
[DeviceB-GigabitEthernet1/0/3] quit
```

Apply the RA guard policy **policy1** to VLAN 10.

```
[DeviceB] vlan 10
[DeviceB-vlan10] ipv6 nd raguard apply policy policy1
[DeviceB-vlan10] quit
```

Specify **host** as the role of the device attached to GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipv6 nd raguard role host
[DeviceB-GigabitEthernet1/0/1] quit
```

Specify **router** as the role of the device attached to GigabitEthernet 1/0/3.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] ipv6 nd raguard role router
[DeviceB-GigabitEthernet1/0/3] quit
```

Verifying the configuration

Verify that the device forwards or drops RA messages received on GigabitEthernet 1/0/2 based on the RA guard policy. (Details not shown.)

Verify that the device drops RA messages received on GigabitEthernet 1/0/1. (Details not shown.)

Verify that the device forwards RA messages received on GigabitEthernet 1/0/3 to other interfaces in VLAN 10. (Details not shown.)

Configuring SAVI

About SAVI

Source Address Validation Improvement (SAVI) checks the validity of the source addresses of global unicast IPv6 packets. It implements the validity check by using the ND snooping, DHCPv6 snooping, ND attack detection, and IP source guard features. SAVI checks only global unicast addresses and forwards the packets that pass the validity check. Packets sourced from an invalid address are dropped.

SAVI application scenarios

DHCPv6-only

The hosts connected to the SAVI-enabled device obtain addresses only through DHCPv6. DHCPv6 messages, ND messages (RA and RR messages excluded), and IPv6 data packets are checked based on DHCPv6 snooping entries and static IPv6 source guard binding entries.

SLAAC-only

The hosts connected to the SAVI-enabled device obtain addresses only through Stateless Address Autoconfiguration (SLAAC). In this scenario, SAVI drops all DHCPv6 messages. Only ND messages and IPv6 data packets are checked based on DHCPv6 snooping entries and static IPv6 source guard binding entries.

DHCPv6+SLAAC

The hosts connected to the SAVI-enabled device obtain addresses through DHCPv6 and SLAAC. In this scenario, SAVI checks all DHCPv6 messages, ND messages, and IPv6 data packets based on DHCPv6 snooping entries, ND snooping entries, and static IPv6 source guard binding entries.

SAVI tasks at a glance

To configure SAVI, perform the following tasks:

1. Enabling SAVI
2. Configuring IPv6 source guard
3. Configuring DHCPv6 snooping
4. Configuring ND parameters
5. (Optional.) Setting the entry deletion delay
6. (Optional.) Enabling packet spoofing logging and filtering entry logging

Enabling SAVI

1. Enter system view.
   `system-view`
2. Enable SAVI.
   `ipv6 savi strict`
   By default, SAVI is disabled.

Configuring IPv6 source guard

1. Enable IPv6 source guard on an interface.
2. (Optional.) Configure static IPv6SG bindings.

For more information about IPv6 source guard configuration, see "Configuring IP source guard."

Configuring DHCPv6 snooping

Restrictions and guidelines

Enable only DHCPv6 snooping for the SLAAC-only scenario.

Procedure

1. Enable DHCPv6 snooping.
2. Specify DHCPv6 snooping trusted ports.
3. Enable recording client information in DHCPv6 snooping entries.

For more information about DHCPv6 snooping configuration, see *Layer 3—IP Services Configuration Guide*.

Configuring ND parameters

Restrictions and guidelines

Enable only ND attack detection for the DHCPv6-only scenario.

Procedure

1. Enable ND snooping for global unicast addresses.

   For more information about ND snooping, see IPv6 basics in *Layer 3—IP Services Configuration Guide*.
2. Enable ND attack detection.

   For more information about ND attack detection, see "Configuring ND attack defense."
3. Specify ND trusted ports.

   For more information about ND trusted ports, see "Configuring ND attack defense."

Setting the entry deletion delay

About the entry deletion delay

The entry deletion delay is the period of time that the device waits before deleting the DHCPv6 snooping entries and ND snooping entries for a down port.

Procedure

1. Enter system view.

   system-view
2. Set the entry deletion delay.

   ipv6 savi down-delay *delay-time*

   By default, the entry deletion delay is 30 seconds.

Enabling packet spoofing logging and filtering entry logging

About this task

Packet spoofing logging enables the device to generate log messages for the spoofed packets detected by SAVI.

Filtering entries are effective bindings used for filtering IPv6 packets by the source IPv6 address. Filtering entry logging enables the device to generate log messages for filtering entries. A log message contains the IPv6 address, MAC address, VLAN, and interface of a filtering entry.

The device sends packet spoofing and filtering entry log messages to the information center. With the information center, you can set log message filtering and output rules, including output destinations. For more information about using the information center, see *Network Management and Monitoring Configuration Guide*.

Software version and feature compatibility

This feature is supported only in Release 6328 and later.

Procedure

1. Enter system view.

   system-view

2. Enable packet spoofing logging.

   ipv6 savi log enable spoofing-packet [**interval** *interval* | **total-number** *number*] *

   By default, packet spoofing logging is disabled.

3. Enable filtering entry logging.

   ipv6 savi log enable filter-entry

   By default, filtering entry logging is disabled.

SAVI configuration examples

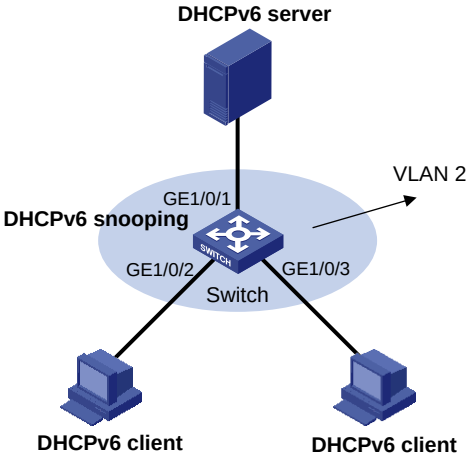
Example: Configuring DHCPv6-only SAVI

Network configuration

As shown in Figure 1, configure SAVI on the switch to meet the following requirements:

- Clients obtain IPv6 addresses only through DHCPv6.
- SAVI checks the source addresses of DHCPv6 messages, ND messages (RA and RR messages excluded), and IPv6 data packets on GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3.

Figure 1 Network diagram



Procedure

Enable SAVI.

```
<Switch> system-view
[Switch] ipv6 savi strict
```

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to VLAN 2.

```
[Switch] vlan 2
[Switch-vlan2] port gigabitethernet 1/0/1 gigabitethernet 1/0/2 gigabitethernet 1/0/3
[Switch-vlan2] quit
```

Enable DHCPv6 snooping.

```
[Switch] ipv6 dhcp snooping enable
```

Configure GigabitEthernet 1/0/1 as a DHCPv6 snooping trusted port.

```
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] ipv6 dhcp snooping trust
[Switch-GigabitEthernet1/0/1] quit
```

Enable recording DHCPv6 snooping entries on GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3.

```
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] ipv6 dhcp snooping binding record
[Switch-GigabitEthernet1/0/2] quit
[Switch] interface gigabitethernet 1/0/3
[Switch-GigabitEthernet1/0/3] ipv6 dhcp snooping binding record
[Switch-GigabitEthernet1/0/3] quit
```

Enable ND attack detection.

```
[Switch] vlan 2
[Switch-vlan2] ipv6 nd detection enable
[Switch-vlan2] quit
```

Enable IPv6 source guard on GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3.

```
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] ipv6 verify source ip-address mac-address
[Switch-GigabitEthernet1/0/2] quit
[Switch] interface gigabitethernet 1/0/3
[Switch-GigabitEthernet1/0/3] ipv6 verify source ip-address mac-address
[Switch-GigabitEthernet1/0/3] quit
```

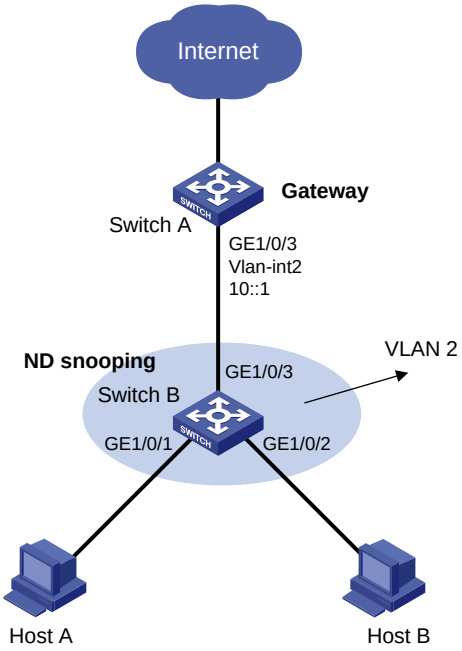
Example: Configuring SLAAC-only SAVI

Network configuration

As shown in Figure 2, configure SAVI on Switch B to meet the following requirements:

- Hosts obtain IPv6 addresses only through SLAAC.
- DHCPv6 messages are dropped on GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 in VLAN 2.
- SAVI checks the source addresses of ND messages and IPv6 data packets on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

Figure 2 Network diagram



Procedure

Enable SAVI.

```
<SwitchB> system-view
[SwitchB] ipv6 savi strict
```

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to VLAN 2.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1 gigabitethernet 1/0/2 gigabitethernet 1/0/3
[SwitchB-vlan2] quit
```

Enable ND snooping for global unicast addresses in VLAN 2.

```
[SwitchB] vlan 2
[SwitchB-vlan2] ipv6 nd snooping enable global
```

Enable ND attack detection for VLAN 2.

```
[SwitchB-vlan2] ipv6 nd detection enable
[SwitchB-vlan2] quit
```

Enable DHCPv6 snooping.

```
[SwitchB] ipv6 dhcp snooping enable
```

Configure GigabitEthernet 1/0/3 as an ND trusted port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] ipv6 nd detection trust
[SwitchB-GigabitEthernet1/0/3] quit
```

Enable IPv6 source guard on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] ipv6 verify source ip-address mac-address
[SwitchB-GigabitEthernet1/0/1] quit
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] ipv6 verify source ip-address mac-address
[SwitchB-GigabitEthernet1/0/2] quit
```

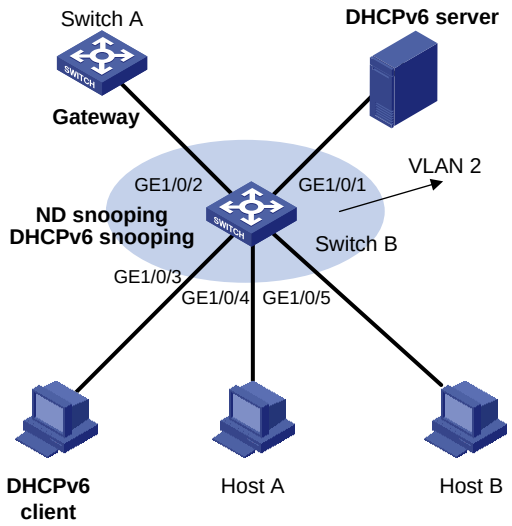
Example: Configuring DHCPv6+SLAAC SAVI

Network configuration

As shown in Figure 3, configure SAVI on Switch B to meet the following requirements:

- Hosts obtain IP addresses through DHCPv6 or SLAAC.
- SAVI checks the source addresses of DHCPv6 messages, ND messages, and IPv6 data packets on GigabitEthernet 1/0/3 through GigabitEthernet 1/0/5.

Figure 3 Network diagram



Procedure

Enable SAVI.

```
<SwitchB> system-view
[SwitchB] ipv6 savi strict
```

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to VLAN 2.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1 gigabitethernet 1/0/2 gigabitethernet 1/0/3
gigabitethernet 1/0/4 gigabitethernet 1/0/5
```

Enable DHCPv6 snooping.

```
[SwitchB] ipv6 dhcp snooping enable
```

Enable recording DHCPv6 snooping entries on GigabitEthernet 1/0/3 through GigabitEthernet 1/0/5.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] ipv6 dhcp snooping binding record
[SwitchB-GigabitEthernet1/0/3] quit
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] ipv6 dhcp snooping binding record
[SwitchB-GigabitEthernet1/0/4] quit
[SwitchB] interface gigabitethernet 1/0/5
[SwitchB-GigabitEthernet1/0/5] ipv6 dhcp snooping binding record
[SwitchB-GigabitEthernet1/0/5] quit
```

Configure GigabitEthernet 1/0/1 as a DHCPv6 snooping trusted port.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] ipv6 dhcp snooping trust
[SwitchB-GigabitEthernet1/0/1] quit
```

Enable ND snooping for global unicast addresses in VLAN 2.

```
[SwitchB] vlan 2
[SwitchB-vlan2] ipv6 nd snooping enable global
```

Enable ND attack detection for VLAN 2.

```
[SwitchB-vlan2] ipv6 nd detection enable
[SwitchB-vlan2] quit
```

Configure GigabitEthernet 1/0/2 as an ND trusted port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] ipv6 nd detection trust
[SwitchB-GigabitEthernet1/0/2] quit
```

Enable IPv6 source guard on GigabitEthernet 1/0/3 through GigabitEthernet 1/0/5.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] ipv6 verify source ip-address mac-address
[SwitchB-GigabitEthernet1/0/3] quit
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] ipv6 verify source ip-address mac-address
[SwitchB-GigabitEthernet1/0/4] quit
[SwitchB] interface gigabitethernet 1/0/5
[SwitchB-GigabitEthernet1/0/5] ipv6 verify source ip-address mac-address
```

Configuring MFF

About MFF

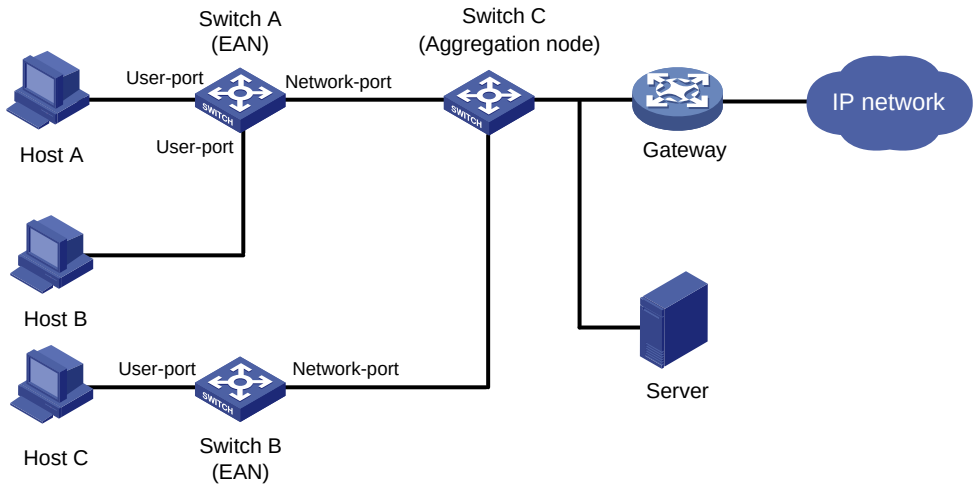
MAC-forced forwarding (MFF) implements Layer 2 isolation and Layer 3 communication between hosts in the same broadcast domain.

An MFF-enabled device intercepts ARP requests and returns the MAC address of a gateway (or server) to the senders. In this way, the senders are forced to send packets to the gateway for traffic monitoring and attack prevention.

MFF network model

As shown in Figure 1, hosts are connected to Switch C through Switch A and Switch B, which are called Ethernet access nodes (EANs). The MFF-enabled EANs forward packets from hosts to the gateway for further forwarding. The hosts are isolated at Layer 2, but they can communicate at Layer 3.

Figure 1 Network diagram for MFF



MFF works with any of the following features to implement traffic filtering and Layer 2 isolation on the EANs:

- ARP snooping (see *Layer 3—IP Services Configuration Guide*).
- IP source guard (see "Configuring IP source guard").
- ARP detection (see "Configuring ARP attack protection").
- VLAN mapping (see *Layer 2—LAN Switching Configuration Guide*).

Port roles

Two types of ports, user port and network port, exist in an MFF-enabled VLAN.

User port

An MFF user port is directly connected to a host and processes the following packets differently:

- Allows multicast packets to pass.
- Delivers ARP packets to the CPU.

- Processes unicast packets as follows:
  - If gateways' MAC addresses have been learned, the user port allows only the unicast packets with the gateways' MAC addresses as the destination MAC addresses to pass.
  - If no gateways' MAC addresses have been learned, the user port discards all received unicast packets.

Network port

An MFF network port is connected to any of the following networking devices:

- An access switch.
- A distribution switch.
- A gateway.
- A server.

A network port processes the following packets differently:

- Allows multicast packets to pass.
- Delivers ARP packets to the CPU.
- Denies broadcast packets other than DHCP and ARP packets.

Processing of ARP packets in MFF

An MFF-enabled device implements Layer 3 communication between hosts by intercepting ARP requests from the hosts and replies with the MAC address of a gateway. This mechanism helps reduce the number of broadcast messages.

The MFF device processes ARP packets as follows:

- After receiving an ARP request from a host, the MFF device sends the MAC address of the corresponding gateway to the host. In this way, hosts in the network have to communicate at Layer 3 through a gateway.
- After receiving an ARP request from a gateway, the MFF device sends the requested host's MAC address to the gateway if the corresponding entry is available. If the entry is not available, the MFF device forwards the ARP request.
- The MFF device forwards ARP replies between hosts and gateways.
- If the source MAC addresses of ARP requests from gateways are different from those recorded, the MFF device updates and broadcasts the IP and MAC addresses of the gateways.

MFF default gateway

MFF applies to only networks where the hosts' IP addresses are manually configured. Because the hosts cannot obtain the gateway information through DHCP, the default gateway must be specified by the **`mac-forced-forwarding default-gateway`** command. MFF maintains only one default gateway for each VLAN. MFF updates the MAC address of the default gateway upon receiving an ARP packet with a different sender MAC address from the default gateway.

Protocols and standards

RFC 4562, *MAC-Forced Forwarding*

MFF tasks at a glance

To configure MFF, perform the following tasks:

1. Enabling MFF
2. Configuring a network port
3. (Optional.) Enabling periodic gateway probe
4. Specifying the IP addresses of servers

   If servers exist in the network, you must perform this task to ensure communication between the servers and hosts.

Enabling MFF

Restrictions and guidelines

- An MFF-enabled device and a host cannot ping each other.
- When MFF works with static IP source guard bindings, you must configure VLAN IDs in the static bindings. Otherwise, IP packets allowed by IP source guard are permitted even if their destination MAC addresses are not the MAC address of the gateway.
- MFF is not supported in a network where VRRP load balancing mode is configured.

Prerequisites

For MFF to take effect, make sure ARP snooping is enabled on the VLAN where MFF is enabled.

Procedure

1. Enter system view.

   system-view
2. Enter VLAN view.

   vlan *vlan-id*
3. Enable MFF.

   mac-forced-forwarding default-gateway *gateway-ip*

   By default, MFF is disabled.

Configuring a network port

Restrictions and guidelines

In a VLAN with MFF enabled, you need to configure the following ports as network ports:

- Upstream ports connected to the gateway.
- Ports connected to other MFF devices.

Link aggregation is supported by network ports in an MFF-enabled VLAN, but it is not supported by user ports in the VLAN. You can add the network ports to link aggregation groups, but cannot add the user ports to link aggregation groups. For more information about link aggregation, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the port as a network port.

   mac-forced-forwarding network-port

   By default, the port is a user port.

Enabling periodic gateway probe

About periodic gateway probe

You can configure the MFF device to detect gateways every 30 seconds for the change of MAC addresses by sending forged ARP packets. The ARP packets use 0.0.0.0 as the sender IP address and bridge MAC address as the sender MAC address.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable periodic gateway probe.
   mac-forced-forwarding gateway probe
   By default, this feature is disabled.

Specifying the IP addresses of servers

About server IP address

Server IP addresses can be those of the interfaces on a router in a VRRP group and those of the servers collaborating with MFF, such as a RADIUS server.

When the MFF device receives an ARP request from a server, the device searches IP-to-MAC address entries it has stored. Then the device replies with the requested MAC address to the server.

As a result, packets from a host to a server are forwarded by the gateway. However, packets from a server to a host are not forwarded by the gateway.

MFF does not check whether the IP address of a server is on the same network segment as that of a gateway. Instead, it checks whether the IP address of a server is all-zero or all-one. An all-zero or all-one server IP address is invalid.

Restrictions and guidelines

If the server's interface connecting to the MFF device uses secondary IP addresses to send ARP packets, include all these IP addresses in the server IP address list.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify the IP addresses of servers.
   mac-forced-forwarding server *server-ip*&<1-10>
   By default, no server IP address is specified.

Display and maintenance commands for MFF

Execute **display** commands in any view.

Task	Command
Display MFF port configuration.	**display mac-forced-forwarding interface**
Display the MFF configuration for a VLAN.	**display mac-forced-forwarding vlan** *vlan-id*

MFF configuration examples

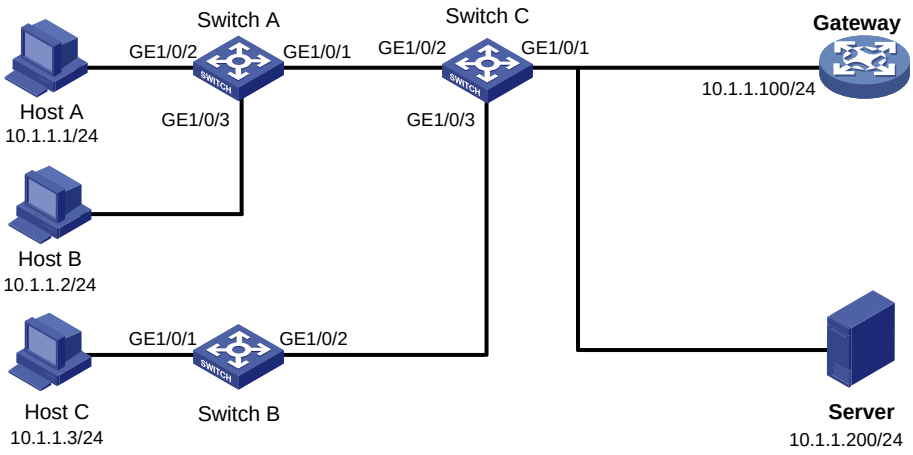
Example: Configuring MFF in a tree network

Network configuration

As shown in Figure 2, all the devices are in VLAN 100. Hosts A, B, and C are assigned IP addresses manually.

Configure MFF to isolate the hosts at Layer 2 and allow them to communicate with each other through the gateway at Layer 3.

Figure 2 Network diagram



Procedure

1. Configure the IP addresses of the hosts and the gateway, as shown in Figure 2.
2. Configure Switch A:

   # Configure MFF on VLAN 100.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] mac-forced-forwarding default-gateway 10.1.1.100
   ```

   # Specify the IP address of the server.

   ```
   [SwitchA-vlan100] mac-forced-forwarding server 10.1.1.200
   ```

   # Enable ARP snooping on VLAN 100.

   ```
   [SwitchA-vlan100] arp snooping enable
   [SwitchA-vlan100] quit
   ```

   # Configure GigabitEthernet 1/0/1 as a network port.

   ```
   [SwitchA] interface gigabitethernet 1/0/1
   [SwitchA-GigabitEthernet1/0/1] mac-forced-forwarding network-port
   ```
3. Configure Switch B:

Configure MFF on VLAN 100.

```
[SwitchB] vlan 100
[SwitchB-vlan100] mac-forced-forwarding default-gateway 10.1.1.100
```

Specify the IP address of the server.

```
[SwitchB-vlan100] mac-forced-forwarding server 10.1.1.200
```

Enable ARP snooping on VLAN 100.

```
[SwitchB-vlan100] arp snooping enable
[SwitchB-vlan100] quit
```

Configure GigabitEthernet 1/0/2 as a network port.

```
[SwitchB] interface gigabitethernet 1/0/2 1/0/6
[SwitchB-GigabitEthernet1/0/2] mac-forced-forwarding network-port
```

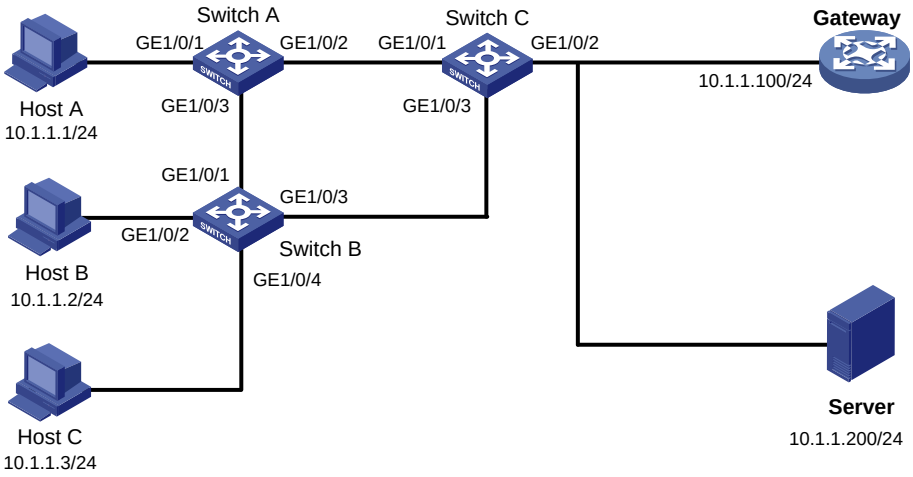
Example: Configuring MFF in a ring network

Network configuration

As shown in Figure 3, all the devices are in VLAN 100, and the switches form a ring. Hosts A, B, and C are assigned IP addresses manually.

Configure MFF to isolate the hosts at Layer 2 and allow them to communicate with each other through the gateway at Layer 3.

Figure 3 Network diagram



Procedure

1. Configure the IP addresses of the hosts and the gateway, as in shown in Figure 3.
2. Configure Switch A:

   # Enable STP globally to make sure STP is enabled on interfaces.

   ```
   [SwitchA] stp global enable
   ```

   # Configure MFF on VLAN 100.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] mac-forced-forwarding default-gateway 10.1.1.100
   ```

   # Specify the IP address of the server.

   ```
   [SwitchA-vlan100] mac-forced-forwarding server 10.1.1.200
   ```

   # Enable ARP snooping on VLAN 100.

   ```
   [SwitchA-vlan100] arp snooping enable
   ```

```
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 as network ports.

```
[SwitchA] interface gigabitethernet 1/0/2
[SwitchA-GigabitEthernet1/0/2] mac-forced-forwarding network-port
[SwitchA-GigabitEthernet1/0/2] quit
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mac-forced-forwarding network-port
```

3. Configure Switch B:

Enable STP globally to make sure STP is enabled on interfaces.

```
[SwitchB] stp global enable
```

Configure MFF on VLAN 100.

```
[SwitchB] vlan 100
[SwitchB-vlan100] mac-forced-forwarding default-gateway 10.1.1.100
```

Specify the IP address of the server.

```
[SwitchB-vlan100] mac-forced-forwarding server 10.1.1.200
```

Enable ARP snooping on VLAN 100.

```
[SwitchB-vlan100] arp snooping enable
[SwitchB-vlan100] quit
```

Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/3 as network ports.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] mac-forced-forwarding network-port
[SwitchB-GigabitEthernet1/0/1] quit
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] mac-forced-forwarding network-port
```

4. Enable STP on Switch C globally to make sure STP is enabled on interfaces.

```
<SwitchC> system-view
[SwitchC] stp global enable
```

Contents

Configuring crypto engines

About crypto engines

Crypto engines encrypt and decrypt data for service modules.

The device supports only one software crypto engine, which is a set of software encryption algorithms. The software crypto engine is always enabled.

When a service module requires data encryption/decryption, it sends the desired data to the crypto engine. After the crypto engine completes data encryption/decryption, it sends the data back to the service module.

Display and maintenance commands for crypto engines

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display crypto engine information.	**display crypto-engine**
Display crypto engine statistics.	**display crypto-engine statistics** [**engine-id** *engine-id* **slot** *slot-number*]
Clear crypto engine statistics.	**reset crypto-engine statistics** [**engine-id** *engine-id* **slot** *slot-number*]

Contents

Configuring FIPS

About FIPS

Federal Information Processing Standards (FIPS) was developed by the National Institute of Standards and Technology (NIST) of the United States. FIPS specifies the requirements for cryptographic modules.

FIPS security levels

FIPS 140-2 defines four levels of security, named Level 1 to Level 4, from low to high. The device supports Level 2.

Unless otherwise noted, the term "FIPS" refers to Level-2 FIPS 140-2 in this document.

FIPS functionality

In FIPS mode, the device has strict security requirements. It performs self-tests on cryptography modules to verify that the modules are operating correctly.

A FIPS device also meets the functionality requirements defined in Network Device Protection Profile (NDPP) of Common Criteria (CC).

FIPS self-tests

To ensure correct operation of cryptography modules, FIPS provides self-test mechanisms, including power-up self-tests and conditional self-tests.

If a power-up self-test fails, the device where the self-test process exists reboots. If a conditional self-test fails, the system outputs a self-test failure message.

NOTE:

If a self-test fails, contact H3C Support.

Power-up self-tests

The power-up self-test examines the availability of FIPS-allowed cryptographic algorithms.

The device supports the following types of power-up self-tests:

- Known-answer test (KAT)

  A cryptographic algorithm is run on data for which the correct output is already known. The calculated output is compared with the known answer. If they are not identical, the KAT test fails.

- Pairwise conditional test (PWCT)
  - **Signature and authentication test**—The test is run when a DSA, RSA, or ECDSA asymmetrical key pair is generated. The system uses the private key to sign the specific data, and then uses the public key to authenticate the signed data. If the authentication is successful, the test succeeds.
  - **Encryption and decryption test**—The test is run when an RSA asymmetrical key pair is generated. The system uses the public key to encrypt a plain text string, and then uses the private key to decrypt the encrypted text. If the decryption result is the same as the original plain text string, the test succeeds.

The power-up self-test examines the cryptographic algorithms listed in Table 1.

Table 1 Power-up self-tests list

Type	Operations
KAT	Tests the following algorithms: • SHA1, SHA224, SHA256, SHA384, and SHA512. • HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, and HMAC-SHA512. • AES. • RSA (signature and authentication). • ECDH. • DRBG. • GCM. • GMAC.
PWCT	Tests the following algorithms: • RSA (signature and authentication). • RSA (encryption and decryption). • DSA (signature and authentication). • ECDSA (signature and authentication).

Conditional self-tests

A conditional self-test runs when an asymmetrical cryptographic module or a random number generator module is invoked. Conditional self-tests include the following types:

- **PWCT signature and authentication**—This test is run when a DSA or RSA asymmetrical key pair is generated. The system uses the private key to sign the specific data, and then uses the public key to authenticate the signed data. If the authentication is successful, the test succeeds.
- **Continuous random number generator test**—Runs when a random number is generated. The system compares the generated random number with the previously generated random number. If the two numbers are the same, the test fails. This test also runs when a DSA or RSA asymmetrical key pair is generated.

Restrictions and guidelines: FIPS

Requirements for key pairs and passwords

Before you reboot the device to enter FIPS mode, the system automatically removes all key pairs configured in non-FIPS mode and all FIPS-incompliant digital certificates. FIPS-incompliant digital certificates are MD5-based certificates with a key modulus length less than 2048 bits. You cannot log in to the device through SSH after the device enters FIPS mode. To log in to the device in FIPS mode through SSH, log in to the device through a console port and create a key pair for the SSH server.

The password for entering the device in FIPS mode must comply with the password control policies, such as password length, complexity, and aging policy. When the aging timer for a password expires, the system prompts you to change the password. If you adjust the system time after the device enters FIPS mode, the login password might expire before the next login, because the original system time is typically much earlier than the actual time.

Configuration rollback guidelines

Configuration rollback is supported in FIPS mode and also during a switch between FIPS mode and non-FIPS mode. After a configuration rollback between FIPS mode and non-FIPS mode, perform the following tasks:

1. Delete the local user and configure a new local user. Local user attributes include password, user role, and service type.

2. Save the current configuration file.
3. Specify the current configuration file as the startup configuration file.
4. Reboot the device. The new configuration takes effect after the reboot. During this process, do not exit the system or perform other operations.

If a device enters FIPS or non-FIPS mode through automatic reboot, configuration rollback fails. To support configuration rollback, you must execute the **save** command after the device enters FIPS or non-FIPS mode.

IRF compatibility

All devices in an IRF fabric must be operating in the same mode, whether in FIPS mode or non-FIPS mode.

To enable FIPS mode for an IRF fabric, you must reboot the entire IRF fabric.

Feature changes in FIPS mode

After the system enters FIPS mode, the following feature changes occur:

- The user login authentication mode can only be scheme.
- The FTP/TFTP server and client are disabled.
- The Telnet server and client are disabled.
- The HTTP server is disabled.
- SNMPv1 and SNMPv2c are disabled. Only SNMPv3 is available.
- The SSL server supports only TLS1.0, TLS1.1, and TLS1.2.
- The SSH server does not support SSHv1 clients or DSA key pairs.
- The generated RSA and DSA key pairs must have a modulus length of 2048 bits.

  When the device acts as a server to authenticate a client through the public key, the key pair for the client must also have a modulus length of 2048 bits.
- The generated ECDSA key pairs must have a modulus length of more than 256 bits.

  When the device acts as a server to authenticate a client through the public key, the key pair for the client must also have a modulus length of more than 256 bits.
- SSH, SNMPv3, IPsec, and SSL do not support DES, 3DES, RC4, or MD5.
- The password control feature cannot be disabled globally. The **undo password-control enable** command does not take effect.
- An AAA shared key, IKE pre-shared key, or SNMPv3 authentication key must have at least 15 characters and must contain uppercase and lowercase letters, digits, and special characters.
- The password for a device management local user and password for switching user roles must comply with the password control policies. By default, the password must have at least 15 characters and must contain uppercase and lowercase letters, digits, and special characters.

Entering FIPS mode

About entering FIPS mode

For the device to enter FIPS mode, you can use one of the following methods:

- **Automatic reboot**—The system automatically performs the following operations:
  a. Prompts you to specify the username and password for the next login.
  b. Creates a default FIPS configuration file named **fips-startup.cfg**.
  c. Specifies the default FIPS configuration file as the startup configuration file.
  d. Reboots and loads the default FIPS configuration file to enter the FIPS mode.

- **Manual reboot**—You must complete the required configuration tasks and reboot the device manually.

Restrictions and guidelines

After you execute the **`fips mode enable`** command, the system prompts you to choose a reboot method.

- If you do not make a choice within 30 seconds or press **Ctrl**+**C**, the system enables FIPS mode and waits for you to manually complete the FIPS mode configuration tasks.
- If you select the automatic reboot method, you can press **Ctrl**+**C** to abort both the interactive FIPS mode configuration process and the **`fips mode enable`** command.

Using the automatic reboot method to enter FIPS mode

Prerequisites

To ensure login password effectiveness under the password control policies, set the correct system time.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable FIPS mode.

   ```
   fips mode enable
   ```

   By default, the FIPS mode is disabled.

3. After the reboot method choice prompt appears, enter **Y** within 30 minutes.

   The system starts the interactive FIPS mode configuration process.

CAUTION:

System reboot might interrupt ongoing services. Please perform the previous operations with caution.

4. Enter the login username and password as prompted.

   The password must have a minimum of 15 characters and must contain uppercase and lowercase letters, digits, and special characters. After you enter the username and password, the device performs the following operations:

   - Creates a device management local user that uses the entered username and password.
   - Assigns the user the terminal service and the network-admin user role.
   - Saves the running configuration and specifies the configuration file as the startup configuration file.
   - Reboots, loads the startup configuration file, and enters FIPS mode.

To log in to the device, you must enter the configured username and password. After login, you are identified as the FIPS mode crypto officer.

Using the manual reboot method to enter FIPS mode

Prerequisites

1. To ensure login password effectiveness under the password control policies, set the correct system time.

2. Configure the password control feature.
   a. Enable the password control feature globally.
   b. Configure password control policies.
      - Set the number of character types a password must contain to 4.
      - Set the minimum number of characters for each type to one character.
      - Set the minimum length for a user password to 15 characters.

   For more information about the password control feature, see password control in *Security Configuration Guide*.
3. Configure a local user.
   - Create a device management local user.
   - Specify a password that complies with the password control policies.
   - Assign the terminal service to the user.
   - Assign the network-admin user role to the user.

Procedure

1. Enter system view.

   `system-view`
2. Enable FIPS mode.

   `fips mode enable`

   By default, the FIPS mode is disabled.
3. After the reboot method choice prompt appears, enter **N**.

   The system enables FIPS mode and waits for you to complete the FIPS mode configuration tasks. Before rebooting the device to enter FIPS mode, do not execute any commands except for **`save`** and commands used to prepare for entering FIPS mode. If you execute any other commands, the commands might not take effect.

   CAUTION:
   - System reboot might interrupt ongoing services. Please perform the previous operations with caution.
   - If you select the manual reboot method to enter FIPS mode, you must manually complete the configurations for entering FIPS mode. If you fail to do so, the device enters FIPS mode after startup but you cannot log in to the device.
4. Save the running configuration and specify the configuration file as the startup configuration file.
5. Delete the .mdb startup configuration file.

   When loading a .mdb configuration file, the device loads all settings in the file. The settings that are not supported in FIPS mode might affect device operation.
6. Reboot the device.

   The device reboots, loads the startup configuration file, and enters FIPS mode. To log in to the device, you must enter the configured username and password. After login, you are identified as the FIPS mode crypto officer.

Manually triggering self-tests

About triggering self-tests

You can manually trigger FIPS self-tests to verify operation of cryptography modules anytime as required. The triggered self-tests are the same as the power-up self-tests.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Trigger self-tests.
   ```
   fips self-test
   ```

CAUTION:

A successful self-test requires that all cryptographic algorithms pass the self-test. If the self-test fails, the device where the self-test process exists reboots.

Exiting FIPS mode

About exiting FIPS mode

After you disable FIPS mode and reboot the device, the device operates in non-FIPS mode.

For the device to exit FIPS mode, you can use one of the following reboot methods:

- **Automatic reboot**—The system automatically creates a default non-FIPS configuration file named **non-fips-startup.cfg**, specifies the file as the startup configuration file, and reboots to enter non-FIPS mode. You can log in to the device without providing username or password.
- **Manual reboot**—You must manually complete the configuration tasks for entering non-FIPS mode, and then reboot the device. To log in to the device after the reboot, you must enter user information as required by the authentication mode settings.

  The following are the default authentication mode settings:
  - **VTY line**—Password authentication.
  - **AUX line**—Authentication is disabled.

  You can modify the authentication settings as needed.

Using the automatic reboot method to exit FIPS mode

1. Enter system view.
   ```
   system-view
   ```
2. Disable FIPS mode.
   ```
   undo fips mode enable
   ```
   By default, the FIPS mode is disabled.
3. Select the automatic reboot method.

CAUTION:

System reboot might interrupt ongoing services. Please perform the previous operations with caution.

Using the manual reboot method to exit FIPS mode

1. Enter system view.
   ```
   system-view
   ```
2. Disable FIPS mode.
   ```
   undo fips mode enable
   ```
   By default, the FIPS mode is disabled.
3. Select the manual reboot method.

CAUTION:

System reboot might interrupt ongoing services. Please perform the previous operations with caution.

4. Configure login authentication settings.
   - If you logged in to the device through SSH, perform the following tasks without disconnecting the current user line:
     - Set the authentication mode to **scheme** for VTY lines.
     - Specify the username and password. If you do not specify the username or password, the device uses the current username and password.
   - If you logged in to the device through a console port, configure login authentication settings for the current type of user lines as described in the following table:

Current login method	Login authentication requirements
Scheme	Set the authentication to scheme and specify the username and password. If you do not specify the username or password, the device uses the current username and password.
Password	Set the authentication to password and specify the password. If you do not specify the password, the device uses the current password.
None	Set the authentication to none.

5. Save the running configuration and specify the file as the startup configuration file.
6. Delete the .mdb startup configuration file.
7. Reboot the device.

Display and maintenance commands for FIPS

Execute **display** commands in any view.

Task	Command
Display the version number of the device algorithm base.	**display crypto version**
Display the FIPS mode state.	**display fips status**

FIPS configuration examples

Example: Entering FIPS mode through automatic reboot

Network configuration

Use the automatic reboot method to enter FIPS mode, and use a console port to log in to the device in FIPS mode.

Procedure

If you want to save the current configuration, execute the **save** command before you enable FIPS mode.

Enable FIPS mode and choose the automatic reboot method to enter FIPS mode. Set the username to **root** and the password to **12345zxcvb!@#$%ZXCVB**.

```
<Sysname> system-view
[Sysname] fips mode enable
FIPS mode change requires a device reboot. Continue? [Y/N]:y
Reboot the device automatically? [Y/N]:y
The system will create a new startup configuration file for FIPS mode. After you set the login username and password for FIPS mode, the device will reboot automatically.
Enter username(1-55 characters):root
Enter password(15-63 characters):
Confirm password:
Waiting for reboot... After reboot, the device will enter FIPS mode.
```

Verifying the configuration

After the device reboots, enter a username of **root** and a password of **12345zxcvb!@#$%ZXCVB**. The system prompts you to configure a new password. After you configure the new password, the device enters FIPS mode. The new password must be different from the previous password. It must include at least 15 characters, and contain uppercase and lowercase letters, digits, and special characters. For more information about the requirements for the password, see the system output.

```
Press ENTER to get started.
login: root
Password:
First login or password reset. For security reason, you need to change your password. Please enter your password.
old password:
new password:
confirm:
Updating user information. Please wait ... ...
…
<Sysname>
```

Display the FIPS mode state.

```
<Sysname> display fips status
FIPS mode is enabled.
```

Display the default configuration file.

```
<Sysname> more fips-startup.cfg
#
 password-control enable
#
local-user root class manage
 service-type terminal
 authorization-attribute user-role network-admin
#
 fips mode enable
#
return

<Sysname>
```

Example: Entering FIPS mode through manual reboot

Network configuration

Use the manual reboot method to enter FIPS mode, and use a console port to log in to the device in FIPS mode.

Procedure

Enable the password control feature globally.

```
<Sysname> system-view
[Sysname] password-control enable
```

Set the number of character types a password must contain to 4, and set the minimum number of characters for each type to one character.

```
[Sysname] password-control composition type-number 4 type-length 1
```

Set the minimum length of user passwords to 15 characters.

```
[Sysname] password-control length 15
```

Add a local user account for device management, including a username of **test**, a password of **12345zxcvb!@#$%ZXCVB**, a user role of **network-admin**, and a service type of **terminal**.

```
[Sysname] local-user test class manage
[Sysname-luser-manage-test] password simple 12345zxcvb!@#$%ZXCVB
[Sysname-luser-manage-test] authorization-attribute user-role network-admin
[Sysname-luser-manage-test] service-type terminal
[Sysname-luser-manage-test] quit
```

Enable FIPS mode, and choose the manual reboot method to enter FIPS mode.

```
[Sysname] fips mode enable
FIPS mode change requires a device reboot. Continue? [Y/N]:y
Reboot the device automatically? [Y/N]:n
Change the configuration to meet FIPS mode requirements, save the configuration to the
next-startup configuration file, and then reboot to enter FIPS mode.
```

Save the current configuration to the root directory of the storage medium, and specify it as the startup configuration file.

```
[Sysname] save
The current configuration will be written to the device. Are you sure? [Y/N]:y
Please input the file name(*.cfg)[flash:/startup.cfg]
(To leave the existing filename unchanged, press the enter key):
flash:/startup.cfg exists, overwrite? [Y/N]:y
Validating file. Please wait...
Saved the current configuration to mainboard device successfully.
[Sysname] quit
```

Delete the startup configuration file in binary format.

```
<Sysname> delete flash:/startup.mdb
Delete flash:/startup.mdb?[Y/N]:y
Deleting file flash:/startup.mdb...Done.
```

Reboot the device.

```
<Sysname> reboot
```

Verifying the configuration

After the device reboots, enter a username of **test** and a password of **12345zxcvb!@#$%ZXCVB**. The system prompts you to configure a new password. After you configure the new password, the

device enters FIPS mode. The new password must be different from the previous password. It must include at least 15 characters, and contain uppercase and lowercase letters, digits, and special characters. For more information about the requirements for the password, see the system output.

```
Press ENTER to get started.
login: test
Password:
First login or password reset. For security reason, you need to change your pass
word. Please enter your password.

new password:
confirm:
Updating user information. Please wait ... ...
…
<Sysname>
```

Display the FIPS mode state.

```
<Sysname> display fips status
FIPS mode is enabled.
```

Example: Exiting FIPS mode through automatic reboot

Network configuration

After logging in to the device in FIPS mode through a console port, use the automatic reboot method to exit FIPS mode.

Procedure

Disable FIPS mode.

```
[Sysname] undo fips mode enable
FIPS mode change requires a device reboot. Continue? [Y/N]:y
The system will create a new startup configuration file for non-FIPS mode and then reboot
automatically. Continue? [Y/N]:y
Waiting for reboot... After reboot, the device will enter non-FIPS mode.
```

Verifying the configuration

After the device reboots, you can enter the system.

```
<Sysname>
```

Display the FIPS mode state.

```
<Sysname> display fips status
FIPS mode is disabled.
```

Example: Exiting FIPS mode through manual reboot

Network configuration

After logging in to the device in FIPS mode through the console port with username **test** and password **12345zxcvb!@#$%ZXCVB**, use the manual reboot method to exit FIPS mode.

Procedure

Disable FIPS mode.

```
[Sysname] undo fips mode enable
FIPS mode change requires a device reboot. Continue? [Y/N]:y
```

```
The system will create a new startup configuration file for non-FIPS mode, and then reboot automatically. Continue? [Y/N]:n
Change the configuration to meet non-FIPS mode requirements, save the configuration to the next-startup configuration file, and then reboot to enter non-FIPS mode.
```

Save the current configuration to the root directory of the storage medium, and specify it as the startup configuration file.

```
[Sysname] save
The current configuration will be written to the device. Are you sure? [Y/N]:y
Please input the file name(*.cfg)[flash:/startup.cfg]
(To leave the existing filename unchanged, press the enter key):
flash:/startup.cfg exists, overwrite? [Y/N]:y
Validating file. Please wait...
Saved the current configuration to mainboard device successfully.
[Sysname] quit
```

Delete the startup configuration file in binary format.

```
<Sysname> delete flash:/startup.mdb
Delete flash:/startup.mdb?[Y/N]:y
Deleting file flash:/startup.mdb...Done.
```

Reboot the device.

```
<Sysname> reboot
```

Verifying the configuration

After the device reboots, authentication is disabled for console login by default. You can press **Enter** to enter non-FIPS mode without authentication.

```
Press ENTER to get started.
login: test
Password:
Last successfully login time:…
…
<Sysname>
```

Display the FIPS mode state.

```
<Sysname> display fips status
FIPS mode is disabled.

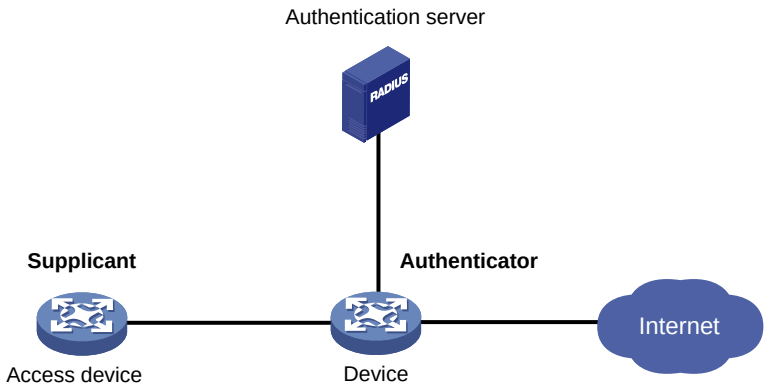
Configuring an 802.1X client

About 802.1X clients

As shown in Figure 1, the 802.1X client feature allows the access device to act as the supplicant in the 802.1X architecture. For information about the 802.1X architecture, see "802.1X overview."

Figure 1 802.1X client network diagram



802.1X client tasks at a glance

To configure an 802.1X client, perform the following tasks:

1. Enabling the 802.1X client feature
2. Configuring an 802.1X client username and password
3. Specifying an 802.1X client EAP authentication method
4. (Optional.) Configuring an 802.1X client MAC address
5. (Optional.) Specifying an 802.1X client mode for sending EAP-Response and EAPOL-Logoff packets
6. (Optional.) Configuring an 802.1X client anonymous identifier
7. Specifying an SSL client policy

   This task is required when you specify PEAP-MSCHAPv2, PEAP-GTC, TTLS-MSCHAPv2, or TTLS-GTC authentication as the 802.1X client EAP authentication method.

Enabling the 802.1X client feature

1. Enter system view.

   `system-view`
2. Enter Ethernet interface view.

   `interface` *`interface-type interface-number`*
3. Enable the 802.1X client feature.

   `dot1x supplicant enable`

   By default, the 802.1X client feature is disabled.

Configuring an 802.1X client username and password

Restrictions and guidelines

To ensure successful authentication, make sure the username and password configured on the device is consistent with the username and password configured on the authentication server.

Procedure

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Configure an 802.1X client username.
   dot1x supplicant username *username*
   By default, no 802.1X client username is configured.
4. Set an 802.1X client password.
   dot1x supplicant password { **cipher** | **simple** } *string*
   By default, no 802.1X client password is configured.

Specifying an 802.1X client EAP authentication method

About 802.1X client EAP authentication methods

The 802.1X clients on the device support the following EAP authentication methods:

- MD5-Challenge.
- PEAP-MSCHAPv2.
- PEAP-GTC.
- TTLS-MSCHAPv2.
- TTLS-GTC.

Restrictions and guidelines

The following matrix shows the restrictions for the selection of authentication methods on the 802.1X client and the authenticator:

Authentication method specified on the 802.1X client	Packet exchange method specified on the authenticator
MD5-Challenge	• EAP relay • EAP termination
• PEAP-MSCHAPv2 • PEAP-GTC • TTLS-MSCHAPv2 • TTLS-GTC	EAP relay

For information about 802.1X packet exchange methods, see "Configuring 802.1X."

Make sure the specified 802.1X client EAP authentication method is supported by the authentication server.

Procedure

1. Enter system view.

   system-view

2. Enter Ethernet interface view.

   interface *interface-type interface-number*

3. Specify an 802.1X client EAP authentication method.

   dot1x supplicant eap-method { **md5** | **peap-gtc** | **peap-mschapv2** | **ttls-gtc** | **ttls-mschapv2** }

   By default, an 802.1X client-enabled interface uses the MD5-Challenge EAP authentication.

Configuring an 802.1X client MAC address

About 802.1X client MAC addresses

The authenticator adds the MAC address of an authenticated 802.1X client to the MAC address table and then assigns access rights to the client.

If multiple Ethernet interfaces on the device act as 802.1X clients, configure a unique MAC address for each interface to ensure successful 802.1X authentication.

You can use either of the following methods to configure a unique MAC address for each interface:

- Execute the **mac-address** command in Ethernet interface view. For information about this command, see *Layer 2—LAN Switching Command Reference*.
- Configure an 802.1X client MAC address.

Procedure

1. Enter system view.

   system-view

2. Enter Ethernet interface view.

   interface *interface-type interface-number*

3. Configure an 802.1X client MAC address.

   dot1x supplicant mac-address *mac-address*

   By default, the 802.1X client on an Ethernet interface uses the interface's MAC address for 802.1X authentication. If the interface's MAC address is unavailable, the 802.1X client uses the device's MAC address for 802.1X authentication.

Specifying an 802.1X client mode for sending EAP-Response and EAPOL-Logoff packets

About specifying an 802.1X client mode for sending EAP-Response and EAPOL-Logoff packets

802.1X authentication supports unicast and multicast modes to send EAP-Response and EAPOL-Logoff packets. As a best practice, use multicast mode to avoid 802.1X authentication failures if the NAS device in the network does not support receiving unicast EAP-Response or EAPOL-Logoff packets.

Procedure

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Specify a mode for 802.1X authentication to send EAP-Response and EAPOL-Logoff packets.
   dot1x supplicant transmit-mode { **multicast** | **unicast** }
   By default, 802.1X authentication uses unicast mode to send EAP-Response and EAPOL-Logoff packets.

Configuring an 802.1X client anonymous identifier

About 802.1X client anonymous identifiers

At the first authentication phase, packets sent to the authenticator are not encrypted. The use of an 802.1X client anonymous identifier prevents the 802.1X client username from being disclosed at the first phase. The 802.1X client-enabled device sends the anonymous identifier to the authenticator instead of the 802.1X client username. The 802.1X client username will be sent to the authenticator in encrypted packets at the second phase.

If no 802.1X client anonymous identifier is configured, the device sends the 802.1X client username at the first authentication phase.

The configured 802.1X client anonymous identifier takes effect only if one of the following EAP authentication methods is used:

- PEAP-MSCHAPv2.
- PEAP-GTC.
- TTLS-MSCHAPv2.
- TTLS-GTC.

If the MD5-Challenge EAP authentication is used, the configured 802.1X client anonymous identifier does not take effect. The device uses the 802.1X client username at the first authentication phase.

Restrictions and guidelines

Do not configure the 802.1X client anonymous identifier if the vendor-specific authentication server cannot identify anonymous identifiers.

Procedure

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Configure an 802.1X client anonymous identifier.
   dot1x supplicant anonymous identify *identifier*
   By default, no 802.1X client anonymous identifier is configured.

Specifying an SSL client policy

About SSL client policies

If the PEAP-MSCHAPv2, PEAP-GTC, TTLS-MSCHAPv2, or TTLS-GTC authentication is used, the 802.1X authentication process is as follows:

- **The first phase**—The device acts as an SSL client to negotiate with the SSL server.

  The SSL client uses the SSL parameters defined in the specified SSL client policy to establish a connection with the SSL server for negotiation. The SSL parameters include a PKI domain, supported cipher suites, and the SSL version. For information about SSL client policy configuration, see "Configuring SSL."
- **The second phase**—The device uses the negotiated result to encrypt and transmit the interchanged authentication packets.

If the MD5-Challenge authentication is used, the device does not use an SSL client policy during the authentication process.

Procedure

1. Enter system view.

   system-view
2. Enter Ethernet interface view.

   interface *interface-type interface-number*
3. Specify an SSL client policy.

   dot1x supplicant ssl-client-policy *policy-name*

   By default, an 802.1X client-enabled interface uses the default SSL client policy.

Display and maintenance commands for 802.1X client

Execute **display** commands in any view.

Task	Command
Display 802.1X client information.	**display dot1x supplicant** [**interface** *interface-type interface-number*]

High Availability Configuration Guide

This command reference is applicable to the following switches and software versions:

H3C S5120V2-LI switch series (Release 6308P01 and later)
H3C S3100V3-SI switch series (Release 6309P01 and later)
H3C S5110V2 switch series (Release 6310 and later)
H3C S5110V2-SI switch series (Release 6310 and later)
H3C S5000V3-EI switch series (Release 6310 and later)
H3C S5000V5-EI switch series (Release 6319P01 and later)
H3C S5000E-X switch series (Release 6310 and later)
H3C S5130S-LI switch series (Release 6310 and later)
H3C MS4320V2 switch series (Release 6308P01 and later)
H3C MS4320 switch series (Release 6308P01 and later)
H3C MS4300V2 switch series (Release 6308P01 and later)
H3C MS4200 switch series (Release 6310 and later)
H3C WS5810-WiNet switch series (Release 6308P01 and later)
H3C WS5820-WiNet switch series (Release 6308P01 and later)
H3C WAS6000 switch series (Release 6308P01 and later)
H3C S5000X-EI switch series (Release 6329 and later)
H3C MS4320V3 switch series (Release 6329 and later)
H3C S5120V3-SI switch series (Release 6329 and later)
H3C S5120V3-LI switch series (Release 6329 and later)

New H3C Technologies Co., Ltd.

Software version: Release 63xx
Document version: 6W105-20230524

Preface

This configuration guide describes the high availability fundamentals and configuration procedures. The high availability technologies include fault detection and fault failover. Failure detection technologies focus on fault detection and isolation. Failover technologies focus on network recovery.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** >

Convention	Description
	Folder.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
ⓘ **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring Ethernet OAM

About Ethernet OAM

Ethernet Operation, Administration, and Maintenance (OAM) is a tool that monitors Layer 2 link status and addresses common link-related issues on the "last mile." Ethernet OAM improves Ethernet management and maintainability. You can use it to monitor the status of the point-to-point link between two directly connected devices.

Major functions of Ethernet OAM

Ethernet OAM provides the following functions:

- **Link performance monitoring**—Monitors the performance indices of a link, including packet loss, delay, and jitter, and collects traffic statistics of various types.
- **Fault detection and alarm**—Checks the connectivity of a link by sending OAM protocol data units (OAMPDUs) and reports to the network administrators when a link error occurs.
- **Remote loopback**—Checks link quality and locates link errors by looping back OAMPDUs.

Ethernet OAMPDUs

Ethernet OAM operates on the data link layer. Ethernet OAM reports the link status by periodically exchanging OAMPDUs between devices, so that the administrator can effectively manage the network.

Ethernet OAMPDUs include the following types shown in Table 1.

Table 1 Functions of different types of OAMPDUs

OAMPDU type	Function
Information OAMPDU	Used for transmitting state information of an Ethernet OAM entity, including the information about the local device and remote devices, and customized information, to the remote Ethernet OAM entity, and maintaining OAM connections.
Event Notification OAMPDU	Used by link monitoring to notify the remote OAM entity when it detects problems on the link in between.
Loopback Control OAMPDU	Used for remote loopback control. By inserting the information used to enable/disable loopback to a loopback control OAMPDU, you can enable/disable loopback on a remote OAM entity.

NOTE:

Throughout this document, an Ethernet OAM-enabled port is called an Ethernet OAM entity or an OAM entity.

How Ethernet OAM works

This section describes the working procedures of Ethernet OAM.

Ethernet OAM connection establishment

OAM connection establishment is also known as the Discovery phase, where an Ethernet OAM entity discovers the remote OAM entity to establish a session.

In this phase, two connected OAM entities exchange Information OAMPDUs to advertise their OAM configuration and capabilities to each other for a comparison. If their Loopback, link detection, and link event settings match, the OAM entities establish an OAM connection.

An OAM entity operates in active mode or passive mode. OAM entities in active mode initiate OAM connections, and OAM entities in passive mode wait and respond to the OAM connection requests. To set up an OAM connection between two OAM entities, you must set at least one entity to operate in active mode.

Table 2 shows the actions that a device can perform in different modes.

Table 2 Active Ethernet OAM mode and passive Ethernet OAM mode

Item	Active Ethernet OAM mode	Passive Ethernet OAM mode
Initiating OAM Discovery	Available	Unavailable
Responding to OAM Discovery	Available	Available
Transmitting Information OAMPDUs	Available	Available
Transmitting Event Notification OAMPDUs	Available	Available
Transmitting Information OAMPDUs without any TLV	Available	Available
Transmitting Loopback Control OAMPDUs	Available	Unavailable
Responding to Loopback Control OAMPDUs	Available	Available

After an Ethernet OAM connection is established, the Ethernet OAM entities exchange Information OAMPDUs at the handshake packet transmission interval to detect the availability of the Ethernet OAM connection. If an Ethernet OAM entity receives no Information OAMPDU within the Ethernet OAM connection timeout time, the Ethernet OAM connection is considered disconnected.

Link monitoring

Error detection in an Ethernet is difficult, especially when the physical connection in the network is not disconnected, but network performance is degrading gradually.

Link monitoring detects link faults in various environments. Ethernet OAM entities monitor link status by exchanging Event Notification OAMPDUs. When detecting one of the link error events listed in Table 3, an OAM entity sends an Event Notification OAMPDU to its peer OAM entity. The network administrator can keep track of network status changes by retrieving the log.

Table 3 Ethernet OAM link error events

Ethernet OAM link events	Description
Errored frame event	An errored frame event occurs when the number of detected error frames in the detection window (specified detection interval) exceeds the predefined threshold.
Errored frame period event	An errored frame period event occurs when the number of frame errors in the detection window (specified number of received frames) exceeds the predefined threshold.
Errored frame seconds event	An errored frame seconds event occurs when the number of errored frame seconds (the second in which an errored frame appears is called an errored frame second) detected on a port in the detection window (specified detection interval) reaches the predefined threshold.

Remote fault detection

Information OAMPDUs are exchanged periodically among Ethernet OAM entities across established OAM connections. When traffic is interrupted due to device failure or unavailability, the Ethernet OAM entity at the faulty end sends error information to its peer. The Ethernet OAM entity uses the flag field in Information OAMPDUs to indicate the error information (any critical link event type as shown in Table 4). You can use the log information to track ongoing link status and troubleshoot problems promptly.

Table 4 Critical link events

Type	Description	OAMPDU transmission frequencies
Link Fault	Peer link signal is lost.	Once per second.
Dying Gasp	An unexpected fault, such as power failure, occurred.	Non-stop.
Critical Event	An undetermined critical event happened.	Non-stop.

Remote loopback

Remote loopback is available only after the Ethernet OAM connection is established. With remote loopback enabled, the Ethernet OAM entity in active mode sends non-OAMPDUs to its peer. After receiving these frames, the peer does not forward them according to their destination addresses. Instead, it returns them to the sender along the original path.

Remote loopback enables you to check the link status and locate link failures. Performing remote loopback periodically helps to detect network faults promptly. Furthermore, performing remote loopback by network segments helps to locate network faults.

Protocols and standards

IEEE 802.3ah, *Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications*

Restrictions and guidelines: Ethernet OAM configuration

The device's support for sending and receiving Information OAMPDUs carrying critical link events is as follows:

- Can receive Information OAMPDUs carrying the critical link events listed in Table 4.
- Can send Information OAMPDUs carrying Link Fault events.
- Can send Information OAMPDUs carrying Dying Gasp events when the device is rebooted or relevant ports are manually shut down. Physical IRF ports, however, are unable to send this type of OAMPDUs.
- Cannot send Information OAMPDUs carrying Critical Events.

Ethernet OAM tasks at a glance

To configure Ethernet OAM, perform the following tasks:

1. Configuring basic Ethernet OAM functions
2. (Optional.) Configuring the Ethernet OAM connection detection timers

3. (Optional.) Configuring link event detection
   - Configuring errored symbol event detection
   - Configuring errored frame event detection
   - Configuring errored frame period event detection
   - Configuring errored frame seconds event detection
4. (Optional.) Configuring the action a port takes after it receives an Ethernet OAM event from the remote end
5. (Optional.) Configuring Ethernet OAM remote loopback
   - Enabling Ethernet OAM remote loopback for a port
   - Rejecting the Ethernet OAM remote loopback request from a remote port

Configuring basic Ethernet OAM functions

About Ethernet OAM modes

To set up an Ethernet OAM connection between two Ethernet OAM entities, you must set at least one entity to operate in active mode. An Ethernet OAM entity can initiate OAM connection only in active mode.

Restrictions and guidelines

To change the Ethernet OAM mode on an Ethernet OAM-enabled port, first disable Ethernet OAM on the port.

Procedure

1. Enter system view.
   `System-view`
2. Enter Layer 2 Ethernet port view.
   `interface` *`interface-type interface-number`*
3. Set the Ethernet OAM mode.
   `oam mode` { **`active`** | **`passive`** }
   The default is active Ethernet OAM mode.
4. Enable Ethernet OAM.
   `oam enable`
   Ethernet OAM is disabled by default.

Configuring the Ethernet OAM connection detection timers

About the Ethernet OAM connection detection timers

After an Ethernet OAM connection is established, the Ethernet OAM entities exchange Information OAMPDUs at the handshake packet transmission interval to detect the availability of the Ethernet OAM connection. If an Ethernet OAM entity receives no Information OAMPDU within the Ethernet OAM connection timeout time, the Ethernet OAM connection is considered disconnected.

By adjusting the handshake packet transmission interval and the connection timeout timer, you can change the detection time resolution for Ethernet OAM connections.

Restrictions and guidelines for configuring Ethernet OAM connection detection timers

When you configure Ethernet OAM, follow these restrictions and guidelines:

- You can configure this command in system view or port view. The configuration in system view takes effect on all ports, and the configuration in port view takes effect on the specified port. For a port, the configuration in port view takes precedence.
- After the timeout timer of an Ethernet OAM connection expires, the local OAM entity ages out and terminates its connection with the peer OAM entity. To keep the Ethernet OAM connections stable, set the connection timeout timer to be at least five times the handshake packet transmission interval.

Configuring the Ethernet OAM connection detection timers globally

1. Enter system view.
   System-view
2. Configure the Ethernet OAM handshake packet transmission interval.
   oam global timer hello *interval*
   The default is 1000 milliseconds.
3. Configure the Ethernet OAM connection timeout timer.
   oam global timer keepalive *interval*
   The default is 5000 milliseconds.

Configuring the Ethernet OAM connection detection timers on a port

1. Enter system view.
   System-view
2. Enter Layer 2 Ethernet port view.
   interface *interface-type interface-number*
3. Configure the Ethernet OAM handshake packet transmission interval.
   oam timer hello *interval*
   By default, an interface uses the value configured globally.
4. Configure the Ethernet OAM connection timeout timer.
   oam timer keepalive *interval*
   By default, an interface uses the value configured globally.

Configuring errored symbol event detection

Restrictions and guidelines for configuring errored symbol event detection

You can configure this function in system view or port view. The configuration in system view takes effect on all ports, and the configuration in port view takes effect on the specified port. For a port, the configuration in port view takes precedence.

Configuring errored symbol event detection globally

1. Enter system view.
   system-view
2. Configure the errored symbol event detection window.
   oam global errored-symbol-period window *window-value*
   By default, the errored symbol event detection window is 100000000.
3. Configure the errored symbol event triggering threshold.
   oam global errored-symbol-period threshold *threshold-value*
   By default, the errored symbol event triggering threshold is 1.

Configuring errored symbol event detection on a port

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet port view.
   interface *interface-type interface-number*
3. Configure the errored symbol event detection window.
   oam errored-symbol-period window *window-value*
   By default, an interface uses the value configured globally.
4. Configure the errored symbol event triggering threshold.
   oam errored-symbol-period threshold *threshold-value*
   By default, an interface uses the value configured globally.

Configuring errored frame event detection

Restrictions and guidelines for configuring errored frame event detection

You can configure this function in system view or port view. The configuration in system view takes effect on all ports, and the configuration in port view takes effect on the specified port. For a port, the configuration in port view takes precedence.

Configuring errored frame event detection globally

1. Enter system view.

system-view

2. Configure the errored frame event detection window.
   oam global errored-frame window *window-value*
   By default, the errored frame event detection window is 1000 milliseconds.
3. Configure the errored frame event triggering threshold.
   oam global errored-frame threshold *threshold-value*
   By default, the errored frame event triggering threshold is 1.

Configuring errored frame event detection on a port

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet port view.
   interface *interface-type interface-number*
3. Configure the errored frame event detection window.
   oam errored-frame window *window-value*
   By default, an interface uses the value configured globally.
4. Configure the errored frame event triggering threshold.
   oam errored-frame threshold *threshold-value*
   By default, an interface uses the value configured globally.

Configuring errored frame period event detection

Restrictions and guidelines for configuring errored frame period event detection

You can configure this function in system view or port view. The configuration in system view takes effect on all ports, and the configuration in port view takes effect on the specified port. For a port, the configuration in port view takes precedence.

Configuring errored frame period event detection globally

1. Enter system view.
   system-view
2. Configure the errored frame period event detection window.
   oam global errored-frame-period window *window-value*
   By default, the errored frame period event detection window is 10000000.
3. Configure the errored frame period event triggering threshold.
   oam global errored-frame-period threshold *threshold-value*
   By default, the errored frame period event triggering threshold is 1.

Configuring errored frame period event detection on a port

1. Enter system view.
   system-view

2. Enter Layer 2 Ethernet port view.
   interface *interface-type interface-number*
3. Configure the errored frame period event detection window.
   oam errored-frame-period window *window-value*
   By default, an interface uses the value configured globally.
4. Configure the errored frame period event triggering threshold.
   oam errored-frame-period threshold *threshold-value*
   By default, an interface uses the value configured globally.

Configuring errored frame seconds event detection

Restrictions and guidelines for configuring errored frame seconds event detection

- You can configure this function in system view or port view. The configuration in system view takes effect on all ports, and the configuration in port view takes effect on the specified port. For a port, the configuration in port view takes precedence.
- Make sure the errored frame seconds triggering threshold is less than the errored frame seconds detection window. Otherwise, no errored frame seconds event can be generated.

Configuring errored frame seconds event detection globally

1. Enter system view.
   system-view
2. Configure the errored frame seconds event detection window.
   oam global errored-frame-seconds window *window-value*
   By default, the errored frame seconds event detection window is 60000 milliseconds.
3. Configure the errored frame seconds event triggering threshold.
   oam global errored-frame-seconds threshold *threshold-value*
   By default, the errored frame seconds event triggering threshold is 1.

Configuring errored frame seconds event detection on a port

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet port view.
   interface *interface-type interface-number*
3. Configure the errored frame seconds event detection window.
   oam errored-frame-seconds window *window-value*
   By default, an interface uses the value configured globally.
4. Configure the errored frame seconds event triggering threshold.
   oam errored-frame-seconds threshold *threshold-value*
   By default, an interface uses the value configured globally.

Configuring the action a port takes after it receives an Ethernet OAM event from the remote end

About this feature

This feature enables a port to log events and automatically terminate the OAM connection and set the link state to down.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 Ethernet port view.

   interface *interface-type interface-number*

3. Configure the action the port takes after it receives an Ethernet OAM event from the remote end.

   oam remote-failure { **connection-expired** | **critical-event** | **dying-gasp** | **link-fault** } **action error-link-down**

   By default, the port only logs the Ethernet OAM event it receives from the remote end.

Enabling Ethernet OAM remote loopback for a port

△ **CAUTION:**

Use this feature with caution, because enabling Ethernet OAM remote loopback impacts other services.

About Ethernet OAM remote loopback

When you enable Ethernet OAM remote loopback on a port, the port sends Loopback Control OAMPDUs to a remote port. After receiving the Loopback Control OAMPDUs, the remote port enters the loopback state. The remote port then returns any packets sent from the local port except OAMPDUs. By observing how many of these packets return, you can calculate the packet loss ratio on the link and evaluate the link performance.

Restrictions and guidelines for enabling Ethernet OAM remote loopback

- Ethernet OAM remote loopback is available only after the Ethernet OAM connection is established. It can be performed only by Ethernet OAM entities operating in active Ethernet OAM mode.
- Remote loopback is available only on full-duplex links that support remote loopback at both ends.
- Ethernet OAM remote loopback must be supported by both the remote port and the sending port.
- Enabling Ethernet OAM remote loopback interrupts data communications. After Ethernet OAM remote loopback is disabled, all the ports involved will go down and then come up. Ethernet OAM remote loopback can be disabled by any of the following events:

  - Disabling Ethernet OAM.
  - Disabling Ethernet OAM remote loopback.
  - Timeout of the Ethernet OAM connection.
- Enabling internal loopback test on a port in remote loopback test can terminate the remote loopback test. For more information about loopback test, see *Layer 2—LAN Switching Configuration Guide*.
- You can enable Ethernet OAM remote loopback on a specific port in user view, system view, or Ethernet port view. The configuration effects are the same.

Enabling Ethernet OAM remote loopback for a port in system view

1. (Optional.) Enter system view.
   `system-view`
   You can also perform this task in user view.
2. Enable Ethernet OAM remote loopback for a port.
   `oam remote-loopback start interface` *`interface-type interface-number`*
   By default, Ethernet OAM remote loopback is disabled.

Enabling Ethernet OAM remote loopback for a port in interface view

1. Enter system view.
   `system-view`
2. Enter Layer 2 Ethernet port view.
   `interface` *`interface-type interface-number`*
3. Enable Ethernet OAM remote loopback on the port.
   `oam remote-loopback start`
   By default, Ethernet OAM remote loopback is disabled.

Rejecting the Ethernet OAM remote loopback request from a remote port

About this feature

The Ethernet OAM remote loopback feature impacts other services. To solve this problem, you can disable a port from being controlled by the Loopback Control OAMPDUs sent by a remote port. The local port then rejects the Ethernet OAM remote loopback request from the remote port.

Restrictions and guidelines

This feature does not affect the ongoing remote loopback test on the port. It takes effect when the next remote loopback starts on the port.

Procedure

1. Enter system view.
   `system-view`
2. Enter Layer 2 Ethernet port view.

interface *interface-type interface-number*

3. Reject the Ethernet OAM remote loopback request from a remote port.

   oam remote-loopback reject-request

   By default, a port does not reject the Ethernet OAM remote loopback request from a remote port.

Display and maintenance commands for Ethernet OAM

Execute **display** commands in any view and **reset** commands in user view:

Task	Command
Display information about an Ethernet OAM connection.	**display oam** { **local** | **remote** } [**interface** *interface-type interface-number*]
Display Ethernet OAM configuration.	**display oam configuration** [**interface** *interface-type interface-number*]
Display the statistics on critical events after an Ethernet OAM connection is established.	**display oam critical-event** [**interface** *interface-type interface-number*]
Display the statistics on Ethernet OAM link error events after an Ethernet OAM connection is established.	**display oam link-event** { **local** | **remote** } [**interface** *interface-type interface-number*]
Clear statistics on Ethernet OAM packets and Ethernet OAM link error events.	**reset oam** [**interface** *interface-type interface-number*]

Ethernet OAM configuration examples

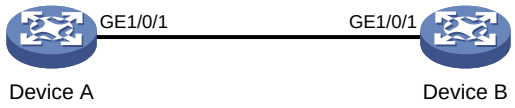
Example: Configuring Ethernet OAM

Network configuration

On the network shown in Figure 1, perform the following operations:

- Enable Ethernet OAM on Device A and Device B to auto-detect link errors between the two devices
- Determine the performance of the link between Device A and Device B by collecting statistics about the error frames received by Device A

Figure 1 Network diagram



Procedure

1. Configure Device A:

Configure GigabitEthernet 1/0/1 to operate in active Ethernet OAM mode, and enable Ethernet OAM for it.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] oam mode active
[DeviceA-GigabitEthernet1/0/1] oam enable
```

Set the errored frame event detection window to 20000 milliseconds, and set the errored frame event triggering threshold to 10.

```
[DeviceA-GigabitEthernet1/0/1] oam errored-frame window 200
[DeviceA-GigabitEthernet1/0/1] oam errored-frame threshold 10
[DeviceA-GigabitEthernet1/0/1] quit
```

2. Configure Device B:

Configure GigabitEthernet 1/0/1 to operate in passive Ethernet OAM mode (the default), and enable Ethernet OAM for it.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] oam mode passive
[DeviceB-GigabitEthernet1/0/1] oam enable
[DeviceB-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Use the **display oam critical-event** command to display the statistics of Ethernet OAM critical link events. For example:

Display the statistics of Ethernet OAM critical link events on all the ports of Device A.

```
[DeviceA] display oam critical-event
-----------[GigabitEthernet1/0/1] -----------
 Local link status   : UP
 Event statistics
   Link fault        : Not occurred
   Dying gasp        : Not occurred
   Critical event    : Not occurred
```

The output shows that no critical link event occurred on the link between Device A and Device B.

Use the **display oam link-event** command to display the statistics of Ethernet OAM link events. For example:

Display Ethernet OAM link event statistics of the local end of Device A.

```
[DeviceA] display oam link-event local
------------ [GigabitEthernet1/0/1] -----------
 Link status: UP
 OAM local errored frame event
   Event time stamp        : 5789 x 100 milliseconds
   Errored frame window    : 200 x 100 milliseconds
   Errored frame threshold : 10 error frames
   Errored frame           : 13 error frames
   Error running total     : 350 error frames
   Event running total     : 17 events
```

The output shows the following:

- 350 errors occurred after Ethernet OAM is enabled on Device A.

- 17 errors were caused by error frames.
- The link is unstable.

Contents

Configuring CFD

About CFD

Connectivity Fault Detection (CFD), which conforms to IEEE 802.1ag Connectivity Fault Management (CFM) and ITU-T Y.1731, is an end-to-end per-VLAN link layer OAM mechanism. CFD is used for link connectivity detection, fault verification, and fault location.

Basic CFD concepts

Maintenance domain

A maintenance domain (MD) defines the network or part of the network where CFD plays its role. An MD is identified by its MD name.

Maintenance association

A maintenance association (MA) is a part of an MD. You can configure multiple MAs in an MD as needed. An MA is identified by the MD name + MA name.

An MA serves the specified VLAN or no VLAN. An MA that serves a VLAN is considered to be carrying VLAN attribute. An MA that serves no VLAN is considered to be carrying no VLAN attribute.

Maintenance point

An MP is configured on a port and belongs to an MA. MPs include the following types: maintenance association end points (MEPs) and maintenance association intermediate points (MIPs).

MEPs define the boundary of the MA. Each MEP is identified by a MEP ID.

MEPs include inward-facing MEPs and outward-facing MEPs:

- An outward-facing MEP sends packets to its host port.
- An inward-facing MEP does not send packets to its host port. Rather, it sends packets to other ports on the device.

A MIP is internal to an MA. It cannot send CFD packets actively, but it can handle and respond to CFD packets. MIPs are automatically created by the device. By cooperating with MEPs, a MIP can perform a function similar to ping and traceroute.

MEP list

A MEP list is a collection of local MEPs allowed to be configured and the remote MEPs to be monitored in the same MA. It lists all the MEPs configured on different devices in the same MA. The MEPs all have unique MEP IDs. When a MEP receives from a remote device a continuity check message (CCM) carrying a MEP ID not in the MEP list of the MA, it drops the message.

The local device must send CCM messages carrying the Remote Defect Indication (RDI) flag bits. Otherwise, the peer device cannot sense certain failures. When a local MEP has not learned all remote MEPs in the MEP list, the MEPs in the MA might not carry the RDI flag bits in CCMs.

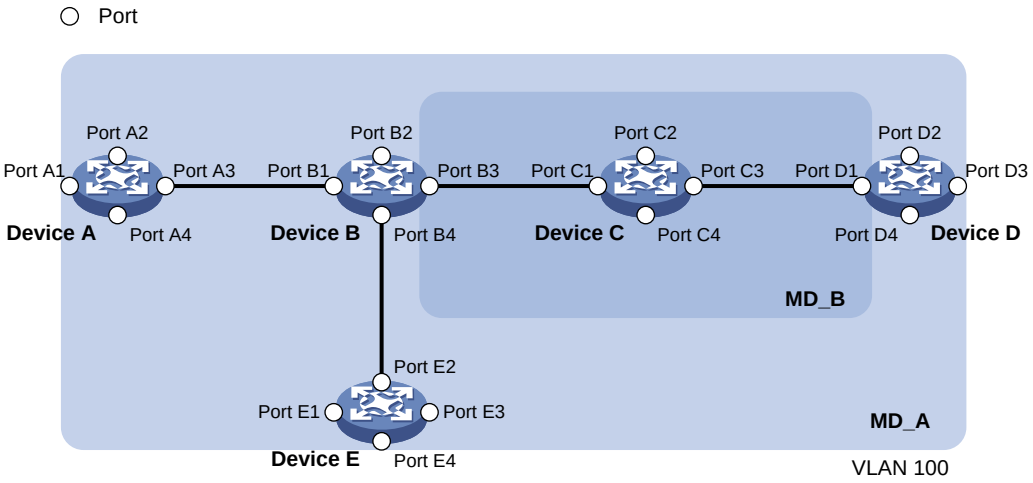
CFD levels

MD levels

To accurately locate faults, CFD introduces eight levels (from 0 to 7) to MDs. The bigger the number, the higher the level and the larger the area covered. Domains can touch or nest (if the outer domain has a higher level than the nested one) but cannot intersect or overlap.

MD levels facilitate fault location and make fault location more accurate. As shown in Figure 1, MD_A in light blue nests MD_B in dark blue. If a connectivity fault is detected at the boundary of MD_A, any of the devices in MD_A, including Device A through Device E, might fail. If a connectivity fault is also detected at the boundary of MD_B, the failure points can be any of Device B through Device D. If the devices in MD_B can operate correctly, at least Device C is operational.

Figure 1 Two nested MDs



CFD exchanges messages and performs operations on a per-domain basis. By planning MDs correctly in a network, you can use CFD to rapidly locate failure points.

MA and MP levels

The level of an MA equals the level of the MD to which the MA belongs.

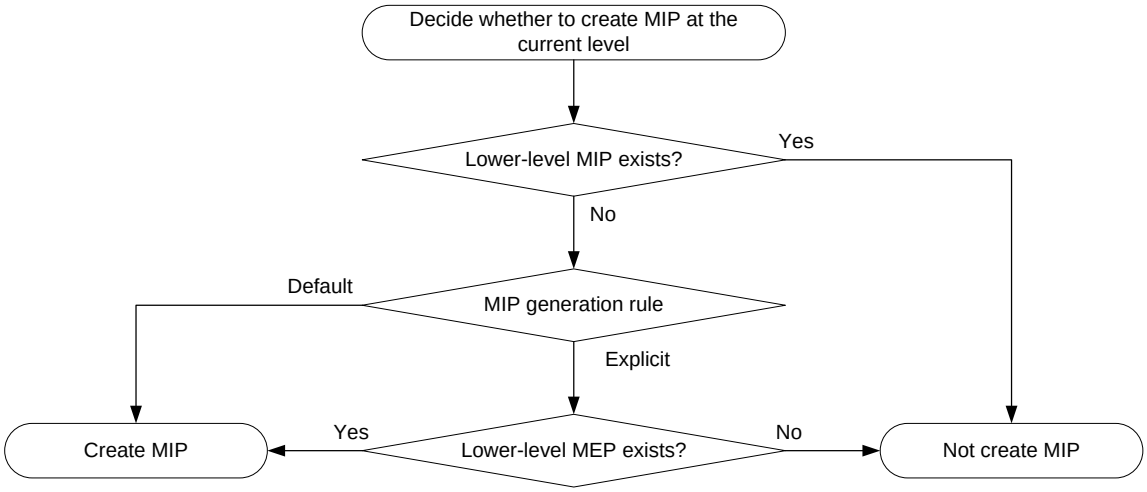
The level of a MEP equals the level of the MD to which the MEP belongs.

The level of a MIP is defined by its generation rule and the MD to which the MIP belongs. MIPs are generated on each port automatically according to the following MIP generation rules:

- **Default rule**—If no lower-level MIP exists on an interface, a MIP is created on the current level. A MIP can be created even if no MEP is configured on the interface.
- **Explicit rule**—If no lower-level MIP exists and a lower-level MEP exists on an interface, a MIP is created on the current level. A MIP can be created only when a lower-level MEP is created on the interface.

If a port has no MIP, the system will check the MAs in each MD (from low to high levels), and follow the procedure as described in Figure 2 to create or not to create MIPs at the current level.

Figure 2 Procedure of creating MIPs

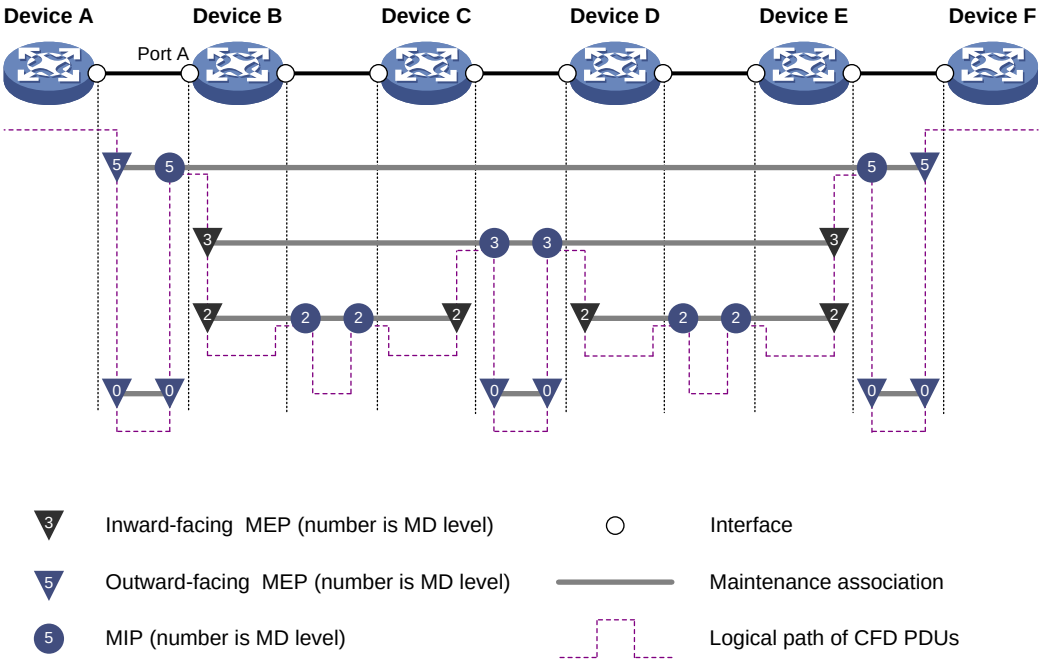


CFD grading example

Figure 3 demonstrates a grading example of the CFD module. Four levels of MDs (0, 2, 3, and 5) are designed. The bigger the number, the higher the level and the larger the area covered. MPs are configured on the ports of Device A through Device F. Port A of Device B is configured with the following MPs:

- A level 5 MIP.
- A level 3 inward-facing MEP.
- A level 2 inward-facing MEP.
- A level 0 outward-facing MEP.

Figure 3 CFD grading example



Packet processing of MPs

For an MA carrying VLAN attribute, MPs of the MA send packets only in the VLAN that the MA serves. The level of packets sent by an MP equals the level of the MD to which the MP belongs.

For an MA not carrying VLAN attribute, MPs of the MA can only be outward-facing MEPs. The level of packets sent by an outward-facing MEP equals the level of the MD to which the MEP belongs.

A MEP forwards packets at a higher level without any processing and only processes packets of its level or lower.

A MIP forwards packets of a different level without any processing and only processes packets of its level.

CFD functions

CFD functions, which are implemented through the MPs, include:

- Continuity check (CC).
- Loopback (LB).
- Linktrace (LT).
- Alarm indication signal (AIS).
- Loss measurement (LM).
- Delay measurement (DM).
- Test (TST).

Continuity check

Connectivity faults are usually caused by device faults or configuration errors. Continuity check examines the connectivity between MEPs. This function is implemented through periodic sending of CCMs by the MEPs. A CCM sent by one MEP is intended to be received by all the other MEPs in the same MA. If a MEP fails to receive the CCMs within 3.5 times the sending interval, the link is considered as faulty and a log is generated. When multiple MEPs send CCMs at the same time, the multipoint-to-multipoint link check is achieved. CCM frames are multicast frames.

Loopback

Similar to ping at the IP layer, loopback verifies the connectivity between a source device and a target device. To implement this function, the source MEP sends loopback messages (LBMs) to the target MEP. Depending on whether the source MEP can receive a loopback reply message (LBR) from the target MEP, the link state between the two can be verified.

LBM frames are multicast and unicast frames. The device can send and receive unicast LBM frames, and can receive multicast LBM frames but cannot send multicast LBM frames. LBR frames are unicast frames.

Linktrace

Linktrace is similar to traceroute. It identifies the path between the source MEP and the target MP. The source MEP sends the linktrace messages (LTMs) to the target MP. After receiving the messages, the target MP and the MIPs that the LTM frames pass send back linktrace reply messages (LTRs) to the source MEP. Based on the reply messages, the source MEP can identify the path to the target MP. LTM frames are multicast frames and LTRs are unicast frames.

AIS

The AIS function suppresses the number of error alarms reported by MEPs. If a local MEP does not receive any CCM frames from its peer MEP within 3.5 times the CCM transmission interval, it immediately starts sending AIS frames. The AIS frames are sent periodically in the opposite direction of CCM frames. When the peer MEP receives the AIS frames, it suppresses the error alarms locally, and continues to send the AIS frames. If the local MEP receives CCM frames within 3.5 times the

CCM transmission interval, it stops sending AIS frames and restores the error alarm function. AIS frames are multicast frames.

LM

The LM function measures the frame loss in a certain direction between a pair of MEPs. The source MEP sends loss measurement messages (LMMs) to the target MEP. The target MEP responds with loss measurement replies (LMRs). The source MEP calculates the number of lost frames according to the counter values of the two consecutive LMRs (the current LMR and the previous LMR). LMMs and LMRs are unicast frames.

DM

The DM function measures frame delays between two MEPs, including the following types:

- One-way frame delay measurement

  The source MEP sends a one-way delay measurement (1DM) frame, which carries the transmission time, to the target MEP. When the target MEP receives the 1DM frame, it does the following:

  - Records the reception time.
  - Calculates and records the link transmission delay and jitter (delay variation) according to the transmission time and reception time.

  1DM frames are unicast frames.

- Two-way frame delay measurement

  The source MEP sends a delay measurement message (DMM), which carries the transmission time, to the target MEP. When the target MEP receives the DMM, it responds with a delay measurement reply (DMR). The DMR carries the reception time and transmission time of the DMM and the transmission time of the DMR. When the source MEP receives the DMR, it does the following:

  - Records the DMR reception time.
  - Calculates the link transmission delay and jitter according to the DMR reception time and DMM transmission time.

  DMM frames and DMR frames are unicast frames.

TST

The TST function tests the bit errors between two MEPs. The source MEP sends a TST frame, which carries the test pattern, such as pseudo random bit sequence (PRBS) or all-zero, to the target MEP. When the target MEP receives the TST frame, it determines the bit errors by calculating and comparing the content of the TST frame. TST frames are unicast frames.

EAIS

Ethernet Alarm Indication Signal (EAIS) enables collaboration between the Ethernet port status and the AIS function. When a port on the device (not necessarily an MP) goes down, it immediately starts to send EAIS frames periodically to suppress the error alarms. When the port goes up again, it immediately stops sending EAIS frames. When the MEP receives the EAIS frames, it suppresses the error alarms locally, and continues to send the EAIS frames. If a MEP receives no EAIS frames within 3.5 times the EAIS frame transmission interval, the fault is considered cleared. The port stops sending EAIS frames and restores the error alarm function. EAIS frames are multicast frames.

Protocols and standards

- IEEE 802.1ag, *Virtual Bridged Local Area Networks Amendment 5: Connectivity Fault Management*
- ITU-T Y.1731, *OAM functions and mechanisms for Ethernet based networks*

Restrictions and guidelines: CFD configuration

When you configure CFD, follow these restrictions and guidelines:

- Configure CC before you use the MEP ID of the remote MEP to configure other CFD functions. This restriction does not apply when you use the MAC address of the remote MEP to configure other CFD functions.
- Do not configure a Layer 2 aggregate interface as an IPP if the following conditions exist:
  - The Layer 2 aggregate interface exists between an inward-facing MEP and a remote MEP.
  - The MAC address of the remote MEP is used for CFD functions.

  For information about IPPs, see DRNI configuration in *Layer 2—LAN Switching Configuration Guide*.
- Typically, a port blocked by the spanning tree feature cannot receive or send CFD messages except in the following cases:
  - The port is configured as an outward-facing MEP.
  - The port is configured as a MIP or inward-facing MEP, which can still receive and send CFD messages except CCM messages.

  For more information about the spanning tree feature, see *Layer 2—LAN Switching Configuration Guide*.

CFD tasks at a glance

To configure CFD, perform the following tasks:

1. Configuring basic CFD settings
   a. Enabling CFD
   b. Configuring service instances
   c. Configuring MEPs
   d. Configuring MIP auto-generation rules
2. Configuring CFD functions
   a. Configuring CC
   b. (Optional.) Configuring LB
   c. (Optional.) Configuring LT
   d. (Optional.) Configuring AIS
   e. (Optional.) Configuring LM
   f. (Optional.) Configuring one-way DM
   g. (Optional.) Configuring two-way DM
   h. (Optional.) Configuring TST
3. (Optional.) Configuring EAIS

Prerequisites for CFD

For CFD to work correctly, design the network by performing the following tasks:

- Grade the MDs in the entire network, and define the boundary of each MD.
- Assign a name for each MD. Make sure the devices in the same MD use the same MD name.
- Define the MA in each MD according to the VLAN you want to monitor.

- Assign a name for each MA. Make sure that the devices in the same MA in the same MD use the same MA name.
- Determine the MEP list of each MA in each MD. Make sure devices in the same MA maintain the same MEP list.
- At the edges of MD and MA, MEPs must be designed at the device port. MIPs can be designed on devices or ports that are not at the edges.

Configuring basic CFD settings

Enabling CFD

1. Enter system view.
   system-view
2. Enable CFD.
   cfd enable
   By default, CFD is disabled.

Configuring service instances

About service instances

Before configuring the MEPs and MIPs, you must first configure service instances. A service instance is a set of service access points (SAPs), and belongs to an MA in an MD.

The MD and MA define the level attribute and VLAN attribute of the messages handled by the MPs in a service instance. The MPs of the MA that carries no VLAN attribute do not belong to any VLAN.

Procedure

1. Enter system view.
   system-view
2. Create an MD.
   cfd md *md-name* [**index** *index-value*] **level** *level-value* [**md-id** { **dns** *dns-name* | **mac** *mac-address subnumber* | **none** }]
3. Create a service instance.
   cfd service-instance *instance-id* **ma-id** { **icc-based** *ma-name* | **integer** *ma-num* | **string** *ma-name* | **vlan-based** [*vlan-id*] } [**ma-index** *index-value*] **md** *md-name* [**vlan** *vlan-id*]

Configuring MEPs

About MEPs

CFD is implemented through various operations on MEPs. As a MEP is configured on a service instance, the MD level and VLAN attribute of the service instance become the attribute of the MEP.

Restrictions and guidelines

- You can specify an interface as the MEP for only one of the non-VLAN-specific MAs at the same level. In addition, the MEP must be outward facing.
- If a MEP in a non-VLAN-specific MA does not receive a CCM message within 3.5 CCM intervals from a remote MEP, the local MEP sets its interface to link down state. This behavior of the local MEP facilitates fast switchover for RRPP or Smart Link.

Prerequisites

Before you configure MEPs, you must configure service instances.

Procedure

1. Enter system view.
   system-view
2. Configure a MEP list.
   cfd meplist *mep-list* **service-instance** *instance-id*
   The created MEP must be included in the configured MEP list.
3. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
4. Create a MEP.
   cfd mep *mep-id* **service-instance** *instance-id* { **inbound** | **outbound** }

Configuring MIP auto-generation rules

About MIP auto-generation rules

As functional entities in a service instance, MIPs respond to various CFD frames, such as LTM and LBM frames. You can configure MIP auto-generation rules for the system to automatically create MIPs.

Any of the following events can cause MIPs to be created or deleted after you have configured the **cfd mip-rule** command:

- Enabling or disabling CFD.
- Creating or deleting MEPs on a port.
- Changes occur to the VLAN attribute of a port.
- The rule specified in the **cfd mip-rule** command changes.

Restrictions and guidelines

- An MA carrying no VLAN attribute is typically used to detect direct link status. The system cannot generate MIPs for such MAs.
- For an MA carrying VLAN attribute, the system does not generate MIPs if the same or a higher level MEP exists on the interface.

Procedure

1. Enter system view.
   system-view
2. Configure MIP auto-generation rules.
   cfd mip-rule { **default** | **explicit** } **service-instance** *instance-id*
   By default, no rules for generating MIPs are configured, and the system does not automatically create any MIP.

Configuring CFD functions

Configuring CC

About CC

After the CC function is configured, MEPs in an MA can periodically send CCM frames to maintain connectivity.

You must configure CC before you use the MEP ID of the remote MEP to configure other CFD functions. This restriction does not apply when you use the MAC address of the remote MEP to configure other CFD functions.

When the lifetime of a CCM frame expires, the link to the sending MEP is considered disconnected. When setting the CCM interval, use the settings described in Table 1.

Table 1 CCM interval field encoding

CCM interval field	Transmission interval	Maximum CCM lifetime
1	10/3 milliseconds	35/3 milliseconds
2	10 milliseconds	35 milliseconds
3	100 milliseconds	350 milliseconds
4	1 second	3.5 seconds
5	10 seconds	35 seconds
6	60 seconds	210 seconds
7	600 seconds	2100 seconds

NOTE:

- The value range for the interval field is 1 to 7. If you set the value to 1 or 2, the continuity check might work incorrectly due to hardware restrictions.
- The CCM messages with an interval field value of 1 to 3 are short-interval CCM messages. The CCM messages with an interval field value of 4 to 7 are long-interval CCM messages.

Restrictions and guidelines

When you configure the CCM interval, follow these restrictions and guidelines:

- Configure the same CCM interval field value for all MEPs in the same MA.
- After the CCM interval field is modified, the MEP must wait for another CCM interval before sending CCMs.
- If the device cannot process short-interval CCM messages, setting the CCM interval field value to smaller than 4 might cause the CC function to operate unsteadily.

Procedure

1. Enter system view.
   `system-view`
2. (Optional.) Set the CCM interval field.
   `cfd cc interval` *`interval-value`* **`service-instance`** *`instance-id`*
   By default, the interval field value is 4.
3. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   `interface` *`interface-type interface-number`*

4. Enable CCM sending on a MEP.

   cfd cc service-instance *instance-id* **mep** *mep-id* **enable**

   By default, CCM sending is disabled on a MEP.

Configuring LB

To verify the link state between the local MEP and the remote MEP, execute the following command in any view:

cfd loopback service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**number** *number*]

Configuring LT

About LT

LT can trace the path between source and target MEPs, and can locate link faults by automatically sending LT messages. The two functions are implemented in the following way:

- **Tracing path**—The source MEP first sends LTM messages to the target MEP. Based on the LTR messages in response to the LTM messages, the path between the two MEPs is identified.
- **LT messages automatic sending**—If the source MEP fails to receive CCM frames from the target MEP within 3.5 times the transmission interval, it considers the link faulty. The source MEP then sends LTM frames, with the TTL field set to the maximum value 255, to the target MEP. Based on the returned LTRs, the fault source is located.

Prerequisites

Before you configure LT on a MEP in an MA carrying VLAN attribute, create the VLAN to which the MA belongs.

Procedure

1. Identify the path between a source MEP and a target MEP.

   cfd linktrace service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**ttl** *ttl-value*] [**hw-only**]

   This command is available in any view.

2. Enter system view.

   system-view

3. Enable LT messages automatic sending.

   cfd linktrace auto-detection [**size** *size-value*]

   By default, LT messages automatic sending is disabled.

Configuring AIS

About AIS

The AIS function suppresses the number of error alarms reported by MEPs.

Restrictions and guidelines

If you enable AIS, the MEPs in a service instance cannot send AIS frames in the following conditions:

- No AIS frame transmission level is configured.
- The AIS frame transmission level is lower than the MD level of the service instance.

If you enable AIS and configure an AIS frame transmission level equal to the MD level of a service instance, the MEPs in the service instance:

- Can suppress error alarms.
- Cannot send AIS frames to MDs with higher level.

Procedure

1. Enter system view.
   system-view
2. Enable AIS.
   cfd ais enable
   By default, AIS is disabled.
3. Configure the AIS frame transmission level.
   cfd ais level *level-value* **service-instance** *instance-id*
   By default, the AIS frame transmission level is not configured.
   The AIS frame transmission level must be higher than the MD level of the service instance.
4. Configure the AIS frame transmission interval.
   cfd ais period *period-value* **service-instance** *instance-id*
   By default, the AIS frame transmission interval is 1 second.

Configuring LM

About LM

The LM function measures frame loss between MEPs. Frame loss statistics include the number of lost frames, the frame loss ratio, and the average number of lost frames for the source and target MEPs.

Procedure

To configure LM, execute the following command in any view:

cfd slm service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**dot1p** *dot1p-value*] [**number** *number*] [**interval** *interval*]

Configuring one-way DM

About one-way DM

The one-way DM function measures the one-way frame delay between two MEPs, and monitors and manages the link transmission performance.

Restrictions and guidelines

Follow these guidelines when you configure one-way DM on a MEP:

- One-way DM requires that the time setting at the transmitting MEP and the receiving MEP be the same. For the purpose of frame delay variation measurement, the requirement can be relaxed.
- To view the test result, use the **display cfd dm one-way history** command on the target MEP.

Procedure

To configure one-way DM, execute the following command in any view:

cfd dm one-way service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**number** *number*]

Configuring two-way DM

About two-way DM

The two-way DM function measures the two-way frame delay, average two-way frame delay, and two-way frame delay variation between two MEPs. It also monitors and manages the link transmission performance.

Procedure

To configure two-way DM, execute the following command in any view:

cfd dm two-way service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } **dot1p** *dot1p-value*] [**number** *number*] [**interval** *interval*]

Configuring TST

About TST

The TST function detects bit errors on a link, and monitors and manages the link transmission performance.

Restrictions and guidelines

To view the test result, use the **display cfd tst** command on the target MEP.

Procedure

To configure TST, execute the following command in any view:

cfd tst service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**number** *number*] [**length-of-test** *length*] [**pattern-of-test** { **all-zero** | **prbs** } [**with-crc**]]

Configuring EAIS

Restrictions and guidelines

Follow these guidelines when you configure EAIS on a MEP:

- You can configure EAIS on a device that does not support or is not configured with CFD. However, EAIS must collaborate with the CFD function in the network, so you must configure CFD in the network.
- You can configure EAIS on the member port of an aggregation group, but the configuration does not take effect. If you configure EAIS on the port and then add it to an aggregation group, the EAIS configuration immediately fails to take effect. After the port leaves the aggregation group, the EAIS configuration takes effect.
- If the intersection of the configured VLANs where the EAIS frames can be transmitted and the VLANs to which the port belongs is empty, no EAIS frame is sent. If the intersection contains more than 70 VLANs and the EAIS frame transmission interval is 1 second, the CPU usage will be too high. As a best practice, set the EAIS frame transmission interval to 60 seconds in this case.

Procedure

1. Enter system view.

   system-view

2. Enable port status-AIS collaboration.

   cfd ais-track link-status global

By default, port status-AIS collaboration is disabled.

3. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
4. Configure the EAIS frame transmission level.
   cfd ais-track link-status level *level-value*
   By default, the EAIS frame transmission level is not configured.
5. Configure the EAIS frame transmission interval.
   cfd ais-track link-status period *period-value*
   By default, the EAIS frame transmission interval is not configured.
6. Specify the VLANs where the EAIS frames can be transmitted.
   cfd ais-track link-status vlan *vlan-list*
   By default, the EAIS frames can only be transmitted within the default VLAN of the port.
   The EAIS frames are transmitted within the intersection of the VLANs specified with this command and the existing VLANs on the device.

Display and maintenance commands for CFD

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the AIS configuration and information on the specified MEP.	**display cfd ais** [**service-instance** *instance-id* [**mep** *mep-id*]]
Display the AIS configuration and information associated with the status of the specified port.	**display cfd ais-track link-status** [**interface** *interface-type interface-number*]
Display the one-way DM result on the specified MEP.	**display cfd dm one-way history** [**service-instance** *instance-id* [**mep** *mep-id*]]
Display LTR information received by a MEP.	**display cfd linktrace-reply** [**service-instance** *instance-id* [**mep** *mep-id*]]
Display the content of the LTR messages received as responses to the automatically sent LTMs.	**display cfd linktrace-reply auto-detection** [**size** *size-value*]
Display MD configuration information.	**display cfd md**
Display the attribute and running information of the MEPs.	**display cfd mep** *mep-id* **service-instance** *instance-id*
Display MEP lists in a service instance.	**display cfd meplist** [**service-instance** *instance-id*]
Display MP information.	**display cfd mp** [**interface** *interface-type interface-number*]
Display information about a remote MEP.	**display cfd remote-mep service-instance** *instance-id* **mep** *mep-id*
Display service instance configuration.	**display cfd service-instance** [*instance-id*]

Task	Command
Display CFD status.	**display cfd status**
Display the TST result on the specified MEP.	**display cfd tst** [**service-instance** *instance-id* [**mep** *mep-id*]]
Clear the one-way DM result on the specified MEP.	**reset cfd dm one-way history** [**service-instance** *instance-id* [**mep** *mep-id*]]
Clear the TST result on the specified MEP.	**reset cfd tst** [**service-instance** *instance-id* [**mep** *mep-id*]]

CFD configuration examples

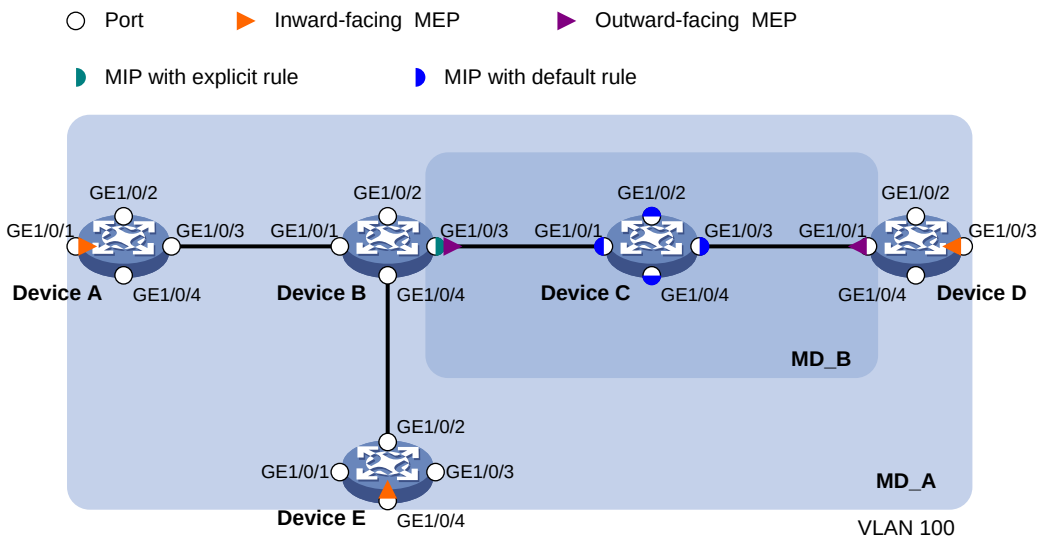
Example: Configuring CFD

Network configuration

As shown in Figure 4:

- The network comprises five devices and is divided into two MDs: MD_A (level 5) and MD_B (level 3). All ports belong to VLAN 100, and the MAs in the two MDs all serve VLAN 100. Assume that the MAC addresses of Device A through Device E are 0010-FC01-6511, 0010-FC02-6512, 0010-FC03-6513, 0010-FC04-6514, and 0010-FC05-6515, respectively.
- MD_A has three edge ports: GigabitEthernet 1/0/1 on Device A, GigabitEthernet 1/0/3 on Device D, and GigabitEthernet 1/0/4 on Device E. They are all inward-facing MEPs. MD_B has two edge ports: GigabitEthernet 1/0/3 on Device B and GigabitEthernet 1/0/1 on Device D. They are both outward-facing MEPs.
- In MD_A, Device B is designed to have MIPs when its port is configured with low level MEPs. Port GigabitEthernet 1/0/3 is configured with MEPs of MD_B, and the MIPs of MD_A can be configured on this port. You must configure the MIP generation rule of MD_A as explicit.
- The MIPs of MD_B are designed on Device C, and are configured on all ports. You must configure the MIP generation rule as default.
- Configure CC to monitor the connectivity among all the MEPs in MD_A and MD_B. Configure LB to locate link faults, and use the AIS and EAIS functions to suppress the error alarms that are reported.
- After the status information of the entire network is obtained, use LT, LM, one-way DM, two-way DM, and TST to detect link faults.

Figure 4 Network diagram



Procedure

1. Configure a VLAN and assign ports to it:

   On each device shown in Figure 4, create VLAN 100 and assign ports GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to VLAN 100.

2. Enable CFD:

   # Enable CFD on Device A.

   ```
   <DeviceA> system-view
   [DeviceA] cfd enable
   ```

   # Configure Device B through Device E in the same way Device A is configured. (Details not shown.)

3. Configure service instances:

   # Create MD_A (level 5) on Device A, and create service instance 1 (in which the MA is identified by a VLAN and serves VLAN 100).

   ```
   [DeviceA] cfd md MD_A level 5
   [DeviceA] cfd service-instance 1 ma-id vlan-based md MD_A vlan 100
   ```

   # Configure Device E in the same way Device A is configured. (Details not shown.)

   # Create MD_A (level 5) on Device B, and create service instance 1 (in which the MA is identified by a VLAN and serves VLAN 100).

   ```
   [DeviceB] cfd md MD_A level 5
   [DeviceB] cfd service-instance 1 ma-id vlan-based md MD_A vlan 100
   ```

   # Create MD_B (level 3), and create service instance 2 (in which the MA is identified by a VLAN and serves VLAN 100).

   ```
   [DeviceB] cfd md MD_B level 3
   [DeviceB] cfd service-instance 2 ma-id vlan-based md MD_B vlan 100
   ```

   # Configure Device D in the same way Device B is configured. (Details not shown.)

   # Create MD_B (level 3) on Device C, and create service instance 2 (in which the MA is identified by a VLAN and serves VLAN 100).

   ```
   [DeviceC] cfd md MD_B level 3
   [DeviceC] cfd service-instance 2 ma-id vlan-based md MD_B vlan 100
   ```

4. Configure MEPs:

On Device A, configure a MEP list in service instance 1, and create inward-facing MEP 1001 in service instance 1 on GigabitEthernet 1/0/1.

```
[DeviceA] cfd meplist 1001 4002 5001 service-instance 1
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] cfd mep 1001 service-instance 1 inbound
[DeviceA-GigabitEthernet1/0/1] quit
```

On Device B, configure a MEP list in service instances 1 and 2.

```
[DeviceB] cfd meplist 1001 4002 5001 service-instance 1
[DeviceB] cfd meplist 2001 4001 service-instance 2
```

Create outward-facing MEP 2001 in service instance 2 on GigabitEthernet 1/0/3.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] cfd mep 2001 service-instance 2 outbound
[DeviceB-GigabitEthernet1/0/3] quit
```

On Device D, configure a MEP list in service instances 1 and 2.

```
[DeviceD] cfd meplist 1001 4002 5001 service-instance 1
[DeviceD] cfd meplist 2001 4001 service-instance 2
```

Create outward-facing MEP 4001 in service instance 2 on GigabitEthernet 1/0/1.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] cfd mep 4001 service-instance 2 outbound
[DeviceD-GigabitEthernet1/0/1] quit
```

Create inward-facing MEP 4002 in service instance 1 on GigabitEthernet 1/0/3.

```
[DeviceD] interface gigabitethernet 1/0/3
[DeviceD-GigabitEthernet1/0/3] cfd mep 4002 service-instance 1 inbound
[DeviceD-GigabitEthernet1/0/3] quit
```

On Device E, configure a MEP list in service instance 1.

```
[DeviceE] cfd meplist 1001 4002 5001 service-instance 1
```

Create inward-facing MEP 5001 in service instance 1 on GigabitEthernet 1/0/4.

```
[DeviceE] interface gigabitethernet 1/0/4
[DeviceE-GigabitEthernet1/0/4] cfd mep 5001 service-instance 1 inbound
[DeviceE-GigabitEthernet1/0/4] quit
```

5. Configure MIPs:

Configure the MIP generation rule in service instance 1 on Device B as **`explicit`**.

```
[DeviceB] cfd mip-rule explicit service-instance 1
```

Configure the MIP generation rule in service instance 2 on Device C as **`default`**.

```
[DeviceC] cfd mip-rule default service-instance 2
```

6. Configure CC:

On Device A, enable the sending of CCM frames for MEP 1001 in service instance 1 on GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] cfd cc service-instance 1 mep 1001 enable
[DeviceA-GigabitEthernet1/0/1] quit
```

On Device B, enable the sending of CCM frames for MEP 2001 in service instance 2 on GigabitEthernet 1/0/3.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] cfd cc service-instance 2 mep 2001 enable
[DeviceB-GigabitEthernet1/0/3] quit
```

On Device D, enable the sending of CCM frames for MEP 4001 in service instance 2 on GigabitEthernet 1/0/1.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] cfd cc service-instance 2 mep 4001 enable
[DeviceD-GigabitEthernet1/0/1] quit
```

Enable the sending of CCM frames for MEP 4002 in service instance 1 on GigabitEthernet 1/0/3.

```
[DeviceD] interface gigabitethernet 1/0/3
[DeviceD-GigabitEthernet1/0/3] cfd cc service-instance 1 mep 4002 enable
[DeviceD-GigabitEthernet1/0/3] quit
```

On Device E, enable the sending of CCM frames for MEP 5001 in service instance 1 on GigabitEthernet 1/0/4.

```
[DeviceE] interface gigabitethernet 1/0/4
[DeviceE-GigabitEthernet1/0/4] cfd cc service-instance 1 mep 5001 enable
[DeviceE-GigabitEthernet1/0/4] quit
```

7. Configure AIS:

Enable AIS on Device B. Configure the AIS frame transmission level as 5 and AIS frame transmission interval as 1 second in service instance 2.

```
[DeviceB] cfd ais enable
[DeviceB] cfd ais level 5 service-instance 2
[DeviceB] cfd ais period 1 service-instance 2
```

8. Configure EAIS:

Enable port status-AIS collaboration on Device B.

```
[DeviceB] cfd ais-track link-status global
```

On GigabitEthernet 1/0/3 of Device B, configure the EAIS frame transmission level as 5 and the EAIS frame transmission interval as 60 seconds. Specify the VLANs where the EAIS frames can be transmitted as VLAN 100.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] cfd ais-track link-status level 5
[DeviceB-GigabitEthernet1/0/3] cfd ais-track link-status period 60
[DeviceB-GigabitEthernet1/0/3] cfd ais-track link-status vlan 100
[DeviceB-GigabitEthernet1/0/3] quit
```

Verifying the configuration

1. Verify the LB function when the CC function detects a link fault:

Enable LB on Device A to check the status of the link between MEP 1001 and MEP 5001 in service instance 1.

```
[DeviceA] cfd loopback service-instance 1 mep 1001 target-mep 5001
Loopback to MEP 5001 with the sequence number start from 1001-43404:
Reply from 0010-fc05-6515: sequence number=1001-43404 time=5ms
Reply from 0010-fc05-6515: sequence number=1001-43405 time=5ms
Reply from 0010-fc05-6515: sequence number=1001-43406 time=5ms
Reply from 0010-fc05-6515: sequence number=1001-43407 time=5ms
Reply from 0010-fc05-6515: sequence number=1001-43408 time=5ms
Sent: 5        Received: 5        Lost: 0
```

2. Verify the LT function after the CC function obtains the status information of the entire network:

Identify the path between MEP 1001 and MEP 5001 in service instance 1 on Device A.

```
[DeviceA] cfd linktrace service-instance 1 mep 1001 target-mep 5001
Linktrace to MEP 5001 with the sequence number 1001-43462:
MAC address               TTL     Last MAC         Relay action
0010-fc05-6515            63      0010-fc02-6512   Hit
```

3. Verify the LM function after the CC function obtains the status information of the entire network:

Test the frame loss from MEP 1001 to MEP 4002 in service instance 1 on Device A.

```
[DeviceA] cfd slm service-instance 1 mep 1001 target-mep 4002
Reply from 0010-fc04-6514
Far-end frame loss: 10    Near-end frame loss: 20
Reply from 0010-fc04-6514
Far-end frame loss: 40    Near-end frame loss: 40
Reply from 0010-fc04-6514
Far-end frame loss: 0     Near-end frame loss: 10
Reply from 0010-fc04-6514
Far-end frame loss: 30    Near-end frame loss: 30

Average
Far-end frame loss: 20    Near-end frame loss: 25
Far-end frame loss rate: 25.00%    Near-end frame loss rate: 32.00%
Send LMMs: 5        Received: 5        Lost: 0
```

4. Verify the one-way DM function after the CC function obtains the status information of the entire network:

Test the one-way frame delay from MEP 1001 to MEP 4002 in service instance 1 on Device A.

```
[DeviceA] cfd dm one-way service-instance 1 mep 1001 target-mep 4002
5 1DMs have been sent. Please check the result on the remote device.
```

Display the one-way DM result on MEP 4002 in service instance 1 on Device D.

```
[DeviceD] display cfd dm one-way history service-instance 1 mep 4002
Service instance: 1
MEP ID: 4002
Sent 1DM total number: 0
Received 1DM total number: 5
Frame delay: 10ms 9ms 11ms 5ms 5ms
Delay average: 8ms
Delay variation: 5ms 4ms 6ms 0ms 0ms
Variation average: 3ms
```

5. Verify the two-way DM function after the CC function obtains the status information of the entire network:

Test the two-way frame delay from MEP 1001 to MEP 4002 in service instance 1 on Device A.

```
[DeviceA] cfd dm two-way service-instance 1 mep 1001 target-mep 4002
Frame delay:
Reply from 0010-fc04-6514: 2406us
Reply from 0010-fc04-6514: 2215us
Reply from 0010-fc04-6514: 2112us
Reply from 0010-fc04-6514: 1812us
Reply from 0010-fc04-6514: 2249us
Average: 2158us
Sent DMMs: 5        Received: 5        Lost: 0

Frame delay variation: 191us 103us 300us 437us
Average: 257us
```

6. Verify the TST function after the CC function obtains the status information of the entire network:

Test the bit errors on the link from MEP 1001 to MEP 4002 in service instance 1 on Device A.

```
[DeviceA] cfd tst service-instance 1 mep 1001 target-mep 4002
5 TSTs have been sent. Please check the result on the remote device.
```

Display the TST result on MEP 4002 in service instance 1 on Device D.

```
[DeviceD] display cfd tst service-instance 1 mep 4002
Service instance: 1
MEP ID: 4002
Sent TST total number: 0
Received TST total number: 5
Received from 0010-fc01-6511, Bit True,  sequence number 0
Received from 0010-fc01-6511, Bit True,  sequence number 1
Received from 0010-fc01-6511, Bit True,  sequence number 2
Received from 0010-fc01-6511, Bit True,  sequence number 3
Received from 0010-fc01-6511, Bit True,  sequence number 4
```

Configuring DLDP

About DLDP

Physical layer detection mechanisms, such as auto-negotiation, can detect physical signals and faults. However, they cannot detect communication failures for unidirectional links where the physical layer is in connected state.

As a data link layer protocol, the Device Link Detection Protocol (DLDP) can do the following:

- Monitor status of the fiber link or twisted-pair link at the link layer.
- Cooperate with physical layer protocols to detect whether the link is correctly connected and whether the two ends of the link can exchange packets correctly.

When DLDP detects unidirectional links, it can automatically shut down the faulty port to avoid network problems. Alternatively, a user can manually shut down the faulty port.

Application scenario

A link becomes unidirectional when only one end of the link can receive packets from the other end.

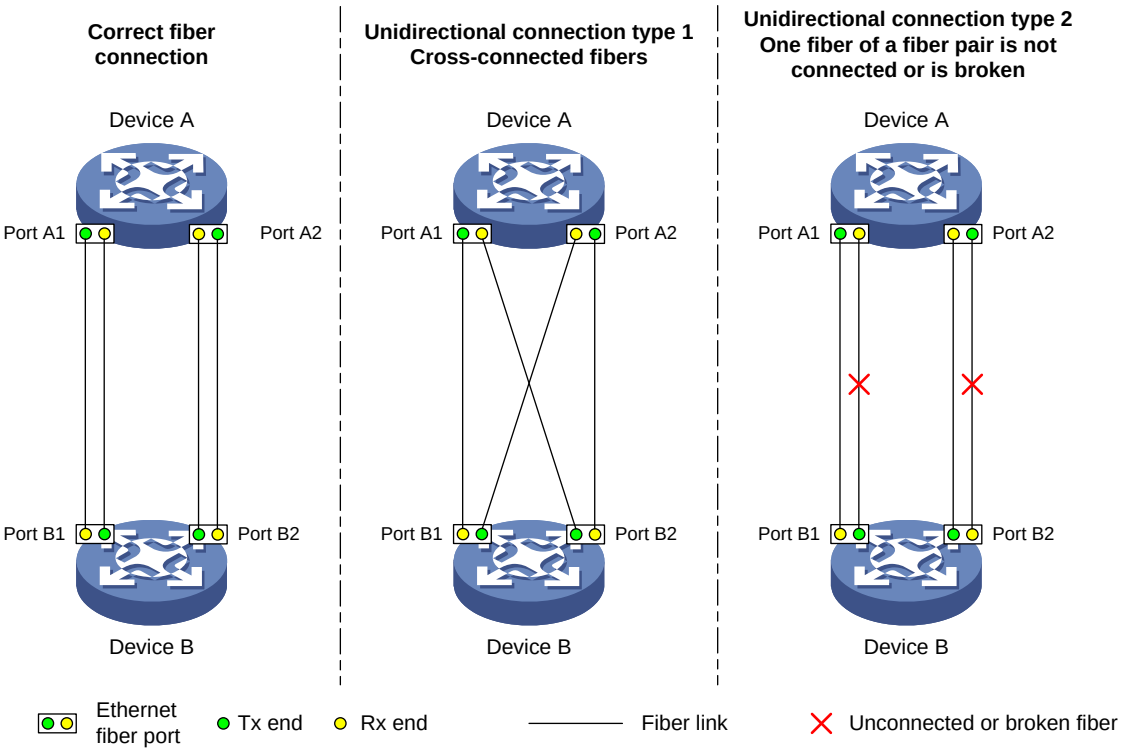
Unidirectional fiber links occur in the following cases:

- Fibers are cross-connected.
- A fiber is not connected at one end or one fiber of a fiber pair is broken.

Figure 1 shows a correct fiber connection and two types of unidirectional fiber connections.

When DLDP detects unidirectional links, it can automatically shut down the faulty port to avoid network problems. Alternatively, a user can manually shut down the faulty port.

Figure 1 Correct and incorrect fiber connections



Basic concepts

DLDP neighbor states

If port A can receive link-layer packets from port B on the same link, port B is a DLDP neighbor of port A. Two ports that can exchange packets are neighbors.

Table 1 DLDP neighbor states

DLDP timer	Description
Confirmed	The link to a DLDP neighbor is bidirectional.
Unconfirmed	The state of the link to a newly discovered neighbor is not determined.

DLDP port states

A DLDP-enabled port is called a DLDP port. A DLDP port can have multiple neighbors, and its state varies by the DLDP neighbor state.

Table 2 DLDP port states

State	Description
Initial	DLDP is enabled on the port, but is disabled globally.
Inactive	DLDP is enabled on the port and globally, and the link is physically down.
Bidirectional	DLDP is enabled on the port and globally, and at least one neighbor in Confirmed state exists.
Unidirectional	DLDP is enabled on the port and globally, and no neighbor in Confirmed state exists. In this state, a port does not send or receive packets other than DLDP packets any more.

DLDP timers

Table 3 DLDP timers

DLDP timer	Description
Advertisement timer	Advertisement packet sending interval (the default is 5 seconds and is configurable).
Probe timer	Probe packet sending interval. This timer is set to 1 second.
Echo timer	The Echo timer is triggered when a probe is launched for a new neighbor. The neighbor information is deleted when the timer expires. This timer is set to 10 seconds.
Entry timer	When a new neighbor joins, a neighbor entry is created and the corresponding Entry timer is triggered if the neighbor is in Confirmed state. When an Advertisement is received, the device updates the corresponding neighbor entry and the Entry timer. When the Entry timer expires, the Enhanced timer and Echo timer are triggered for the neighbor. The value of an Entry timer is three times that of the Advertisement timer.
Enhanced timer	Probe packet sending interval. This timer is set to 1 second. When the Entry timer expires, the Enhanced timer is triggered and probe packets are sent. At the same time, the Echo timer is triggered.
DelayDown timer	If a port is physically down, the device triggers the DelayDown timer, rather than removing the corresponding neighbor entry. The default DelayDown timer is 1 second and is configurable. When the DelayDown timer expires, the device removes the corresponding DLDP neighbor information if the port is down, and does not perform any

DLDP timer	Description
	operation if the port is up.
RecoverProbe timer	This timer is set to 2 seconds. A port in unidirectional state regularly sends RecoverProbe packets to detect whether a unidirectional link has been restored to bidirectional.

DLDP authentication mode

You can use DLDP authentication to prevent network attacks and illegal detecting.

Table 4 DLDP authentication mode

Authentication mode	Processing at the DLDP packet sending side	Processing at the DLDP packet receiving side
Non-authentication	The sending side sets the Authentication field of DLDP packets to 0.	The receiving side examines the authentication information of received DLDP packets and drops packets where the authentication information conflicts with the local configuration.
Plaintext authentication	The sending side sets the Authentication field to the password configured in plain text.	
MD5 authentication	The sending side encrypts the user configured password by using MD5 algorithm, and assigns the digest to the Authentication field.	

How DLDP works

Detecting one neighbor

When two devices are connected through an optical fiber or a network cable, enable DLDP to detect unidirectional links to the neighbor. The following illustrates the unidirectional link detection process in two cases:

- Unidirectional links occur before you enable DLDP.

  Figure 2 Cross-connected fibers

  As shown in Figure 2, before you enable DLDP, the optical fibers between Device A and Device B are cross-connected. After you enable DLDP, the four ports are all up and in unidirectional state, and they send RecoverProbe packets. Take Port A1 as an example to illustrate the unidirectional link detection process.

  a. Port A1 receives the RecoverProbe packet from Port B2, and returns a RecoverEcho packet.

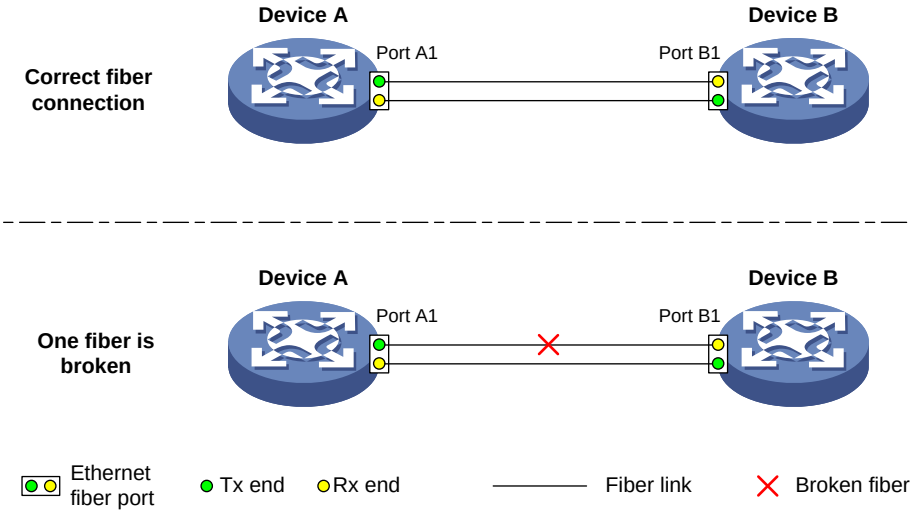
  b. Port B2 cannot receive any RecoverEcho packet from Port A1, so Port B2 cannot become the neighbor of Port A1.

  c. Port B1 can receive the RecoverEcho packet from Port A1, but Port B1 is not the intended destination, so Port B1 cannot become the neighbor of Port A1.

  The same process occurs on the other three ports. The four ports are all in unidirectional state.

- Unidirectional links occur after you enable DLDP.

Figure 3 Broken fiber



As shown in Figure 3, Device A and Device B are connected through an optical fiber. After you enable DLDP, Port A1 and Port B1 establish the bidirectional neighborship in the following way:

a. Port A1 that is physically up enters the unidirectional state and sends a RecoverProbe packet.

b. After receiving the RecoverProbe packet, Port B1 returns a RecoverEcho packet.

c. After Port A1 receives the RecoverEcho packet, it examines the neighbor information in the packet. If the neighbor information matches the local information, Port A1 establishes the neighborship with Port B1 and transits to bidirectional state. Port A1 then starts the Entry timer and periodically sends Advertisement packets.

d. After Port B1 receives the Advertisement packet, it establishes the Unconfirmed neighborship with Port A1. Port B1 then starts the Echo timer and Probe timer, and periodically sends Probe packets.

e. After receiving the Probe packet, Port A1 returns an Echo packet.

f. After Port B1 receives the Echo packet, it examines the neighbor information in the packet. If the neighbor information matches the local information, the neighbor state of Port A1 becomes Confirmed. Port B1 then transits to bidirectional state, starts the Entry timer, and periodically sends Advertisement packets.

The bidirectional neighborship between Port A1 and Port B1 is now established.

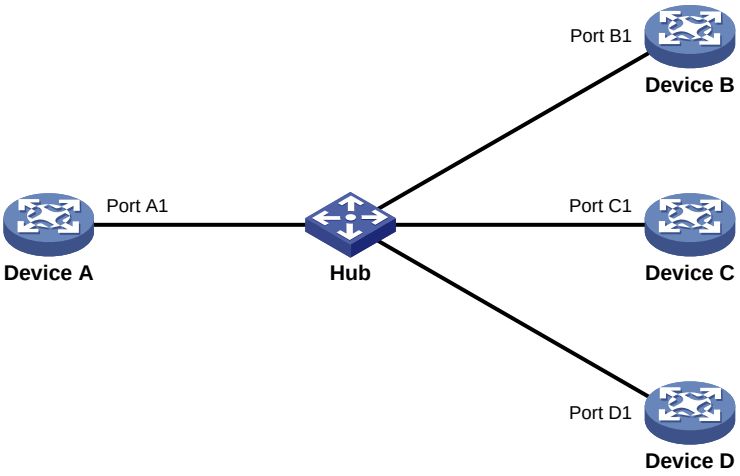
After that, when Port B1's Rx end fails to receive signals, Port B1 is physically down and enters the Inactive state. Because Port B1's Tx end can still send signals to Port A1, Port A1 stays up. After the Entry timer for Port B1 expires, Port A1 starts the Enhanced timer and Echo timer, and sends a probe packet to Port B1. Because Port A1's Tx line is broken, Port A1 cannot receive the Echo packet from Port B1 after the Echo timer expires. Port A1 then enters the unidirectional state, and sends a Disable packet to Port B1. At the same time, Port A1 deletes the neighborship with Port B1, and starts the RecoverProbe timer. Port B1 stays in Inactive state during this process.

When an interface is physically down, but the Tx end of the interface is still operating, DLDP sends a LinkDown packet to inform the peer to delete the relevant neighbor entry.

Detecting multiple neighbors

When multiple devices are connected through a hub, enable DLDP on all interfaces connected to the hub to detect unidirectional links among the neighbors. When no Confirmed neighbor exists, an interface enters the unidirectional state.

Figure 4 Network diagram



As shown in Figure 4, Device A through Device D are connected through a hub, and enabled with DLDP. When Port A1, Port B1, and Port C1 detect that the link to Port D1 fails, they delete the neighborship with Port D1, but stay in bidirectional state.

Restrictions and guidelines: DLDP configuration

When you configure DLDP, follow these configuration restrictions and guidelines:

- For DLDP to operate correctly, enable DLDP on both sides and make sure the following settings are consistent:
  - Interval to send Advertisement packets.
  - DLDP authentication mode.
  - Password.
- For DLDP to operate correctly, configure the full duplex mode for the ports at the two ends of the link, and configure the same speed for the two ports.

DLDP tasks at a glance

To configure DLDP, perform the following tasks:

1. Enabling DLDP
2. (Optional.) Setting the interval to send advertisement packets
3. (Optional.) Setting the DelayDown timer
4. (Optional.) Setting the port shutdown mode
5. (Optional.) Configuring DLDP authentication

Enabling DLDP

About enabling DLDP

After a port is enabled with DLDP, the port enters Initial state and then transitions to Unidirectional state. By default, DLDP blocks a port immediately when the port transitions to Unidirectional state. This behavior causes a traffic disruption that lasts until the port enters Bidirectional state when establishing a Confirmed neighbor.

You can set the delay time for DLDP to block a port upon an Initial-to-Unidirectional state transition. DLDP does not block the port until the delay time expires.

Procedure

1. Enter system view.

   system-view

2. Enable DLDP globally.

   dldp global enable

   By default, DLDP is globally disabled.

3. Enter Ethernet interface view.

   interface *interface-type interface-number*

4. Enable DLDP and set the delay time for DLDP to block the port upon an Initial-to-Unidirectional state transition.

   dldp enable [**initial-unidirectional-delay** *time*]

   By default, DLDP is disabled on a port, and when DLDP is enabled, a port is blocked immediately upon an Initial-to-Unidirectional state transition.

Setting the interval to send advertisement packets

About setting the interval to send advertisement packets

To make sure DLDP can detect unidirectional links before network performance deteriorates, set the advertisement interval appropriate for your network environment. As a best practice, use the default interval.

Procedure

1. Enter system view.

   system-view

2. Set the interval to send Advertisement packets.

   dldp interval *interval*

   By default, the interval is 5 seconds.

Setting the DelayDown timer

About setting the DelayDown timer

When the Tx line fails, some ports might go down and then come up again, causing optical signal jitters on the Rx line. To prevent the device from removing neighbor entries in such cases, set the DelayDown timer for the device. The device starts the DelayDown timer when a port goes down due to a Tx line failure. If the port remains down when the timer expires, the device removes the DLDP neighbor information. If the port comes up, the device takes no action.

Procedure

1. Enter system view.

   system-view

2. Set the DelayDown timer.

   dldp delaydown-timer *time*

   The default is 1 second.

   The DelayDown timer setting applies to all DLDP-enabled ports.

Setting the port shutdown mode

About port shutdown modes

On detecting a unidirectional link, DLDP shuts down the ports in one of the following modes:

- **Auto mode**—When DLDP detects a unidirectional link, it shuts down the unidirectional port. When the link becomes bidirectional, DLDP brings up the port that was shut down.
- **Manual mode**—When DLDP detects a unidirectional link, it does not shut down the port. You need to manually shut it down. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional. Use this mode to prevent normal links from being shut down because of false unidirectional link reports in the following cases:
  - The network performance is low.
  - The device is busy.
  - The CPU usage is high.
- **Hybrid mode**—When DLDP detects a unidirectional link, it shuts down the unidirectional port and stops link detection. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional.

Restrictions and guidelines

You can set the port shutdown mode for all interfaces in system view or for a single interface in interface view. The setting in interface view takes precedence over the setting in system view.

To enable remote OAM loopback on a DLDP port, set the port shutdown mode to **manual**. Otherwise, DLDP automatically shuts down the port when it receives a packet sent by itself. This causes remote OAM loopback failure. For more information about Ethernet OAM, see "Configuring Ethernet OAM."

Setting the global port shutdown mode

1. Enter system view.
   system-view
2. Set the global port shutdown mode.
   dldp unidirectional-shutdown { **auto** | **hybrid** | **manual** }
   The default mode is **auto**.

Setting the port shutdown mode for an interface

1. Enter system view.
   system-view
2. Enter Ethernet interface view.
   interface *interface-type interface-number*
3. Set the the port shutdown mode for the interface.
   dldp port unidirectional-shutdown { **auto** | **hybrid** | **manual** }
   By default, the global setting is used.

Configuring DLDP authentication

About DLDP authentication

You can guard your network against attacks and malicious probes by configuring an appropriate DLDP authentication mode, which can be plain text authentication or MD5 authentication. If your network is safe, you can choose not to authenticate.

Procedure

1. Enter system view.
   system-view
2. Configure a DLDP authentication mode.
   dldp authentication-mode { **md5** | **none** | **simple** }
   The default authentication mode is **none**.
3. Configure the password for DLDP authentication.
   dldp authentication-password { **cipher** | **simple** } *string*
   By default, no password is configured for DLDP authentication.
   If you do not configure the authentication password after you configure the authentication mode, the authentication mode is **none** no matter which authentication mode you configure.

Display and maintenance commands for DLDP

Execute **display** commands in any view and the **reset** command in user view.

Task	Command
Display the DLDP configuration globally and of a port.	**display dldp** [**interface** *interface-type interface-number*]
Display the statistics on DLDP packets passing through a port.	**display dldp statistics** [**interface** *interface-type interface-number*]
Clear the statistics on DLDP packets passing through a port.	**reset dldp statistics** [**interface** *interface-type interface-number*]

DLDP configuration examples

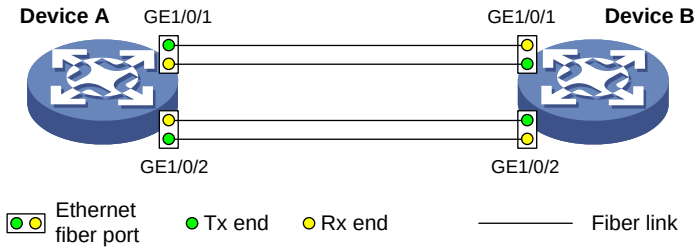
Example: Configuring the auto port shutdown mode

Network configuration

As shown in Figure 5, Device A and Device B are connected through two fiber pairs.

Configure DLDP to automatically shut down the faulty port upon detecting a unidirectional link, and automatically bring up the port after you clear the fault.

Figure 5 Network diagram



Procedure

1. Configure Device A:

Enable DLDP globally.

```
<DeviceA> system-view
[DeviceA] dldp global enable
```

Configure GigabitEthernet 1/0/1 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on the port.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] duplex full
[DeviceA-GigabitEthernet1/0/1] speed 1000
[DeviceA-GigabitEthernet1/0/1] dldp enable
[DeviceA-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on the port.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] duplex full
[DeviceA-GigabitEthernet1/0/2] speed 1000
[DeviceA-GigabitEthernet1/0/2] dldp enable
[DeviceA-GigabitEthernet1/0/2] quit
```

Set the global port shutdown mode to auto.

```
[DeviceA] dldp unidirectional-shutdown auto
```

2. Configure Device B:

Enable DLDP globally.

```
<DeviceB> system-view
[DeviceB] dldp global enable
```

Configure GigabitEthernet 1/0/1 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on it.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] duplex full
[DeviceB-GigabitEthernet1/0/1] speed 1000
[DeviceB-GigabitEthernet1/0/1] dldp enable
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on it.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] duplex full
[DeviceB-GigabitEthernet1/0/2] speed 1000
[DeviceB-GigabitEthernet1/0/2] dldp enable
[DeviceB-GigabitEthernet1/0/2] quit
```

Set the global port shutdown mode to auto.

```
[DeviceB] dldp unidirectional-shutdown auto
```

Verifying the configuration

Display the DLDP configuration globally and on all the DLDP-enabled ports of Device A.

```
[DeviceA] display dldp
 DLDP global status: Enabled
 DLDP advertisement interval: 5s
 DLDP authentication-mode: None
 DLDP unidirectional-shutdown mode: Auto
 DLDP delaydown-timer value: 1s
 Number of enabled ports: 2
```

```
Interface GigabitEthernet1/0/1
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 1
  Neighbor state: Confirmed
  Neighbor aged time: 11s
  Neighbor echo time: -

Interface GigabitEthernet1/0/2
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 2
  Neighbor state: Confirmed
  Neighbor aged time: 12s
  Neighbor echo time: -
```

The output shows that both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are bidirectional.

Enable the monitoring of logs on the current terminal on Device A. Set the lowest level of the logs that can be output to the current terminal to 6.

```
[DeviceA] quit
<DeviceA> terminal monitor
The current terminal is enabled to display logs.
<DeviceA> terminal logging level 6
```

The following log information is displayed on Device A:

```
<DeviceA>%Jul 11 17:40:31:089 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface Physical state on the interface GigabitEthernet1/0/1 changed to down.
%Jul 11 17:40:31:091 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface GigabitEthernet1/0/1 changed to down.
%Jul 11 17:40:31:677 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface Physical state on the interface GigabitEthernet1/0/2 changed to down.
%Jul 11 17:40:31:678 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface GigabitEthernet1/0/2 changed to down.
%Jul 11 17:40:38:544 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface Physical state on the interface GigabitEthernet1/0/1 l changed to up.
%Jul 11 17:40:38:836 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface Physical state on the interface GigabitEthernet1/0/2 changed to up.
```

The output shows the following:

- The port status of both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 is down and then up.
- The link status of both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 is always down.

Display the DLDP configuration globally and of all the DLDP-enabled ports.

```
<DeviceA> display dldp
 DLDP global status: Enabled
```

```
 DLDP advertisement interval: 5s
 DLDP authentication-mode: None
 DLDP unidirectional-shutdown mode: Auto
 DLDP delaydown-timer value: 1s
 Number of enabled ports: 2

Interface GigabitEthernet1/0/1
 DLDP port state: Unidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 0 (Maximum number ever detected: 1)

Interface GigabitEthernet1/0/2
 DLDP port state: Unidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 0 (Maximum number ever detected: 1)
```

The output shows that the DLDP port status of both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 is unidirectional. DLDP detects unidirectional links on them and automatically shuts down the two ports.

The unidirectional links are caused by cross-connected fibers. Correct the fiber connections. As a result, the ports shut down by DLDP automatically recover, and Device A displays the following log information:

```
<DeviceA>%Jul 11 17:42:57:709 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/1 changed to down.
%Jul 11 17:42:58:603 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/2 changed to down.
%Jul 11 17:43:02:342 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/1 changed to up.
%Jul 11 17:43:02:343 2012 DeviceA DLDP/6/DLDP_NEIGHBOR_CONFIRMED: A neighbor was confirmed on interface GigabitEthernet1/0/1. The neighbor's system MAC is 0023-8956-3600, and the port index is 1.
%Jul 11 17:43:02:344 2012 DeviceA DLDP/6/DLDP_LINK_BIDIRECTIONAL: DLDP detected a bidirectional link on interface GigabitEthernet1/0/1.
%Jul 11 17:43:02:353 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface GigabitEthernet1/0/1 changed to up.
%Jul 11 17:43:02:357 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/2 changed to up.
%Jul 11 17:43:02:362 2012 DeviceA DLDP/6/DLDP_NEIGHBOR_CONFIRMED: A neighbor was confirmed on interface GigabitEthernet1/0/2. The neighbor's system MAC is 0023-8956-3600, and the port index is 2.
%Jul 11 17:43:02:362 2012 DeviceA DLDP/6/DLDP_LINK_BIDIRECTIONAL: DLDP detected a bidirectional link on interface GigabitEthernet1/0/2.
%Jul 11 17:43:02:368 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface GigabitEthernet1/0/2 changed to up.
```

The output shows that the port status and link status of both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are now up and their DLDP neighbors are determined.

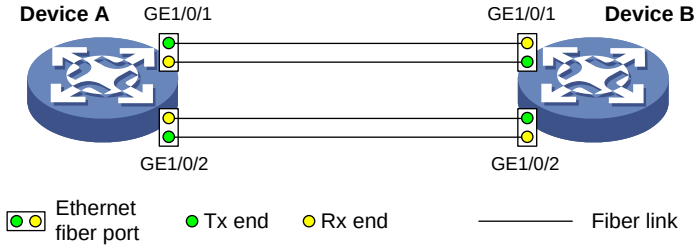
Example: Configuring the manual port shutdown mode

Network configuration

As shown in Figure 6, Device A and Device B are connected through two fiber pairs.

Configure DLDP to detect unidirectional links. When a unidirectional link is detected, the administrator must manually shut down the port.

Figure 6 Network diagram



Procedure

1. Configure Device A:

   # Enable DLDP globally.

   ```
   <DeviceA> system-view
   [DeviceA] dldp enable
   ```

   # Configure GigabitEthernet 1/0/1 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on the port.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] duplex full
   [DeviceA-GigabitEthernet1/0/1] speed 1000
   [DeviceA-GigabitEthernet1/0/1] dldp enable
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Configure GigabitEthernet 1/0/2 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on the port.

   ```
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] duplex full
   [DeviceA-GigabitEthernet1/0/2] speed 1000
   [DeviceA-GigabitEthernet1/0/2] dldp enable
   [DeviceA-GigabitEthernet1/0/2] quit
   ```

   # Set the global port shutdown mode to manual.

   ```
   [DeviceA] dldp unidirectional-shutdown manual
   ```

2. Configure Device B:

   # Enable DLDP globally.

   ```
   <DeviceB> system-view
   [DeviceB] dldp global enable
   ```

   # Configure GigabitEthernet 1/0/1 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on it.

   ```
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] duplex full
   [DeviceB-GigabitEthernet1/0/1] speed 1000
   [DeviceB-GigabitEthernet1/0/1] dldp enable
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

Configure GigabitEthernet 1/0/2 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on it.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] duplex full
[DeviceB-GigabitEthernet1/0/2] speed 1000
[DeviceB-GigabitEthernet1/0/2] dldp enable
[DeviceB-GigabitEthernet1/0/2] quit
```

Set the global port shutdown mode to manual.

```
[DeviceB] dldp unidirectional-shutdown manual
```

Verifying the configuration

Display the DLDP configuration globally and on all the DLDP-enabled ports of Device A.

```
[DeviceA] display dldp
 DLDP global status: Enabled
 DLDP advertisement interval: 5s
 DLDP authentication-mode: None
 DLDP unidirectional-shutdown mode: Manual
 DLDP delaydown-timer value: 1s
 Number of enabled ports: 2

Interface GigabitEthernet1/0/1
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 1
  Neighbor state: Confirmed
  Neighbor aged time: 11s
  Neighbor echo time: -

Interface GigabitEthernet1/0/2
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 2
  Neighbor state: Confirmed
  Neighbor aged time: 12s
  Neighbor echo time: -
```

The output shows that both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are in bidirectional state, which means both links are bidirectional.

Enable the monitoring of logs on the current terminal on Device A. Set the lowest level of the logs that can be output to the current terminal to 6.

```
[DeviceA] quit
<DeviceA> terminal monitor
The current terminal is enabled to display logs.
<DeviceA> terminal logging level 6
```

The following log information is displayed on Device A:

```
<DeviceA>%Jul 12 08:29:17:786 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/1 changed to down.
%Jul 12 08:29:17:787 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface GigabitEthernet1/0/1 changed to down.
%Jul 12 08:29:17:800 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/2 changed to down.
%Jul 12 08:29:17:800 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface GigabitEthernet1/0/2 changed to down.
%Jul 12 08:29:25:004 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/1 changed to up.
%Jul 12 08:29:25:005 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface GigabitEthernet1/0/1 changed to up.
%Jul 12 08:29:25:893 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/2 changed to up.
%Jul 12 08:29:25:894 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface GigabitEthernet1/0/2 changed to up.
```

The output shows that the port status and link status of both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are down and then up.

Display the DLDP configuration globally and of all the DLDP-enabled ports.

```
<DeviceA> display dldp
 DLDP global status: Enabled
 DLDP advertisement interval: 5s
 DLDP authentication-mode: None
 DLDP unidirectional-shutdown mode: Manual
 DLDP delaydown-timer value: 1s
 Number of enabled ports: 2

Interface GigabitEthernet1/0/1
 DLDP port state: Unidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 0 (Maximum number ever detected: 1)

Interface GigabitEthernet1/0/2
 DLDP port state: Unidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 0 (Maximum number ever detected: 1)
```

The output shows that the DLDP port status of both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 is unidirectional. DLDP detects unidirectional links on the two ports but does not shut them down.

The unidirectional links are caused by cross-connected fibers. Manually shut down the two ports:

Shut down GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] shutdown
```

The following log information is displayed on Device A:

```
[DeviceA-GigabitEthernet1/0/1]%Jul 12 08:34:23:717 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface GigabitEthernet1/0/1 changed to down.
```

```
%Jul 12 08:34:23:718 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface
GigabitEthernet1/0/1 changed to down.
%Jul 12 08:34:23:778 2012 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface
GigabitEthernet1/0/2 changed to down.
%Jul 12 08:34:23:779 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface
GigabitEthernet1/0/2 changed to down.
```

The output shows that the port status and link status of both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are now down.

Shut down GigabitEthernet 1/0/2.

```
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] shutdown
```

Correct the fiber connections and bring up the two ports:

Bring up GigabitEthernet 1/0/2.

```
[DeviceA-GigabitEthernet1/0/2] undo shutdown
```

The following log information is displayed on Device A:

```
[DeviceA-GigabitEthernet1/0/2]%Jul 12 08:46:17:677 2012 DeviceA IFNET/3/PHY_UPDOWN:
Physical state on the interface GigabitEthernet1/0/2 changed to up.

%Jul 12 08:48:25:952 2012 DeviceA DLDP/6/DLDP_NEIGHBOR_CONFIRMED: A neighbor was confirmed
on interface GigabitEthernet1/0/1. The neighbor's system MAC is 0023-8956-3600, and the
port index is 1.
%Jul 12 08:48:25:953 2012 DeviceA IFNET/5/LINK_UPDOWN: Line protocol state on the interface
GigabitEthernet1/0/1 changed to up.
%Jul 12 08:48:25:953 2012 DeviceA DLDP/6/DLDP_LINK_BIDIRECTIONAL: DLDP detected a
bidirectional link on interface GigabitEthernet1/0/1.
```

The output shows that the port status and link status of GigabitEthernet 1/0/1 are now up and its DLDP neighbors are determined.

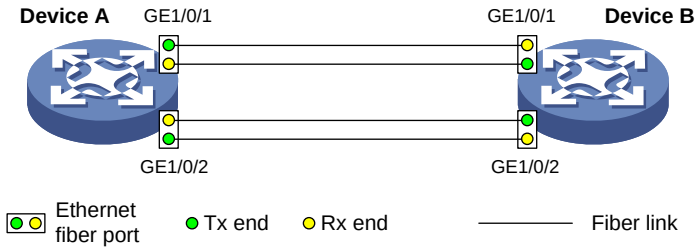
Example: Configuring the hybrid port shutdown mode

Network configuration

As shown in Figure 7Figure 6, Device A and Device B are connected through two fiber pairs.

Configure DLDP to detect unidirectional links. When a unidirectional link is detected, DLDP automatically shuts down the unidirectional port. The administrator needs to bring up the port after clearing the fault.

Figure 7 Network diagram



Procedure

1. Configure Device A:

Enable DLDP globally.

```
<DeviceA> system-view
[DeviceA] dldp enable
```

Configure GigabitEthernet 1/0/1 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on the port.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] duplex full
[DeviceA-GigabitEthernet1/0/1] speed 1000
[DeviceA-GigabitEthernet1/0/1] dldp enable
[DeviceA-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on the port.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] duplex full
[DeviceA-GigabitEthernet1/0/2] speed 1000
[DeviceA-GigabitEthernet1/0/2] dldp enable
[DeviceA-GigabitEthernet1/0/2] quit
```

Set the global port shutdown mode to hybrid.

```
[DeviceA] dldp unidirectional-shutdown hybrid
```

2. Configure Device B:

Enable DLDP globally.

```
<DeviceB> system-view
[DeviceB] dldp global enable
```

Configure GigabitEthernet 1/0/1 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on it.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] duplex full
[DeviceB-GigabitEthernet1/0/1] speed 1000
[DeviceB-GigabitEthernet1/0/1] dldp enable
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 to operate in full duplex mode and at 1000 Mbps, and enable DLDP on it.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] duplex full
```

```
[DeviceB-GigabitEthernet1/0/2] speed 1000
[DeviceB-GigabitEthernet1/0/2] dldp enable
[DeviceB-GigabitEthernet1/0/2] quit
```

Set the global port shutdown mode to hybrid.

```
[DeviceB] dldp unidirectional-shutdown hybrid
```

Verifying the configuration

Display the DLDP configuration globally and on all the DLDP-enabled ports of Device A.

```
[DeviceA] display dldp
 DLDP global status: Enabled
 DLDP advertisement interval: 5s
 DLDP authentication-mode: None
 DLDP unidirectional-shutdown mode: Hybrid
 DLDP delaydown-timer value: 1s
 Number of enabled ports: 2

Interface GigabitEthernet1/0/1
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 1
  Neighbor state: Confirmed
  Neighbor aged time: 11s
  Neighbor echo time: -

Interface GigabitEthernet1/0/2
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 DLDP initial-unidirectional-delay: 0s
 Number of the port’s neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 2
  Neighbor state: Confirmed
  Neighbor aged time: 12s
  Neighbor echo time: -
```

The output shows that both GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are in bidirectional state, which means both links are bidirectional.

Enable the monitoring of logs on the current terminal on Device A. Set the lowest level of the logs that can be output to the current terminal to 6.

```
[DeviceA] quit
<DeviceA> terminal monitor
The current terminal is enabled to display logs.
<DeviceA> terminal logging level 6
```

The following log information is displayed on Device A:

```
<DeviceA>%Jan  4 07:16:06:556 2011 DeviceA DLDP/5/DLDP_NEIGHBOR_AGED: A neighbor on
interface
```

```
GigabitEthernet1/0/1 was deleted because the neighbor was aged. The neighbor's system MAC
is 0023-8956-3600, and the port index is 162.
%Jan  4 07:16:06:560 2011 DeviceA DLDP/5/DLDP_NEIGHBOR_AGED: A neighbor on interface
GigabitEthernet1/0/2 was deleted because the neighbor was aged. The neighbor's system MAC
is 0023-8956-3600, and the port index is 165.
%Jan  4 07:16:06:724 2011 DeviceA IFNET/3/PHY_UPDOWN: Physical state on the interface
GigabitEthernet1/0/1 changed to down.

```

The output shows that the port status and link status of GigabitEthernet 1/0/2 are now up and its DLDP neighbors are determined.

Contents

Configuring RRPP

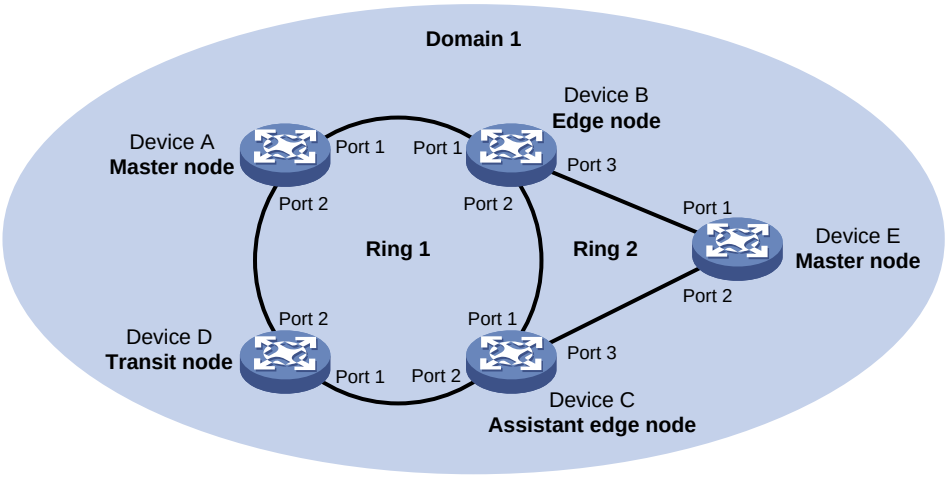
About RRPP

The Rapid Ring Protection Protocol (RRPP) is a link layer protocol designed for Ethernet rings. RRPP can prevent broadcast storms caused by data loops when an Ethernet ring is healthy. RRPP can also rapidly restore the communication paths between the nodes when a link is disconnected on the ring. Compared with the spanning tree protocol, the convergence time of RRPP is fast and independent of the number of nodes in the Ethernet ring. RRPP is applicable to large-diameter networks.

RRPP networking

Figure 1 shows a typical RRPP network with two Ethernet rings and multiple nodes. RRPP detects ring status and sends topology change information by exchanging Rapid Ring Protection Protocol Data Units (RRPPDUs) among the nodes.

Figure 1 RRPP networking diagram



RRPP domain

An RRPP domain is uniquely identified by a domain ID. The interconnected devices with the same domain ID and control VLANs constitute an RRPP domain. An RRPP domain contains the following elements:

- Primary ring and subring.
- Control VLAN.
- Master node, transit node, edge node, and assistant edge node.
- Primary port, secondary port, common port, and edge port.

As shown in Figure 1, Domain 1 is an RRPP domain, containing two RRPP rings: Ring 1 and Ring 2. All the nodes on the two RRPP rings belong to the RRPP domain.

RRPP ring

A ring-shaped Ethernet topology is called an RRPP ring. RRPP rings include primary rings and subrings. You can configure a ring as either the primary ring or a subring by specifying its ring level. The primary ring is of level 0, and a subring is of level 1. An RRPP domain contains one or multiple

RRPP rings, one serving as the primary ring and the others serving as subrings. A ring can be in one of the following states:

- **`Health state`**—All physical links on the Ethernet ring are connected.
- **`Disconnect state`**—Some physical links on the Ethernet ring are not connected.

As shown in Figure 1, Domain 1 contains two RRPP rings: Ring 1 and Ring 2. The level is set to 0 for Ring 1 and 1 for Ring 2. Ring 1 is configured as the primary ring, and Ring 2 is configured as a subring.

Control VLAN and protected VLAN

1. Control VLAN

   In an RRPP domain, a control VLAN is dedicated to transferring RRPPDUs. On a device, the ports accessing an RRPP ring belong to the control VLANs of the ring, and only these ports can join the control VLANs.

   An RRPP domain is configured with the following control VLANs:

   - One primary control VLAN, which is the control VLAN for the primary ring.
   - One secondary control VLAN, which is the control VLAN for subrings.

   After you specify a VLAN as the primary control VLAN, the system automatically configures the secondary control VLAN. The VLAN ID is the primary control VLAN ID plus one. All subrings in the same RRPP domain share the same secondary control VLAN. IP address configuration is prohibited on the control VLAN interfaces.

2. Protected VLAN

   A protected VLAN is dedicated to transferring data packets. Both RRPP ports and non-RRPP ports can be assigned to a protected VLAN.

Node role

Each device on an RRPP ring is a node. The role of a node is configurable. RRPP has the following node roles:

- **Master node**—Each ring has only one master node. The master node initiates the polling mechanism and determines the operations to be performed after a topology change.
- **Transit node**—On the primary ring, transit nodes refer to all nodes except the master node. On the subring, transit nodes refer to all nodes except the master node and the nodes where the primary ring intersects with the subring. A transit node monitors the state of its directly connected RRPP links and notifies the master node of the link state changes, if any. Based on the link state changes, the master node determines the operations to be performed.
- **Edge node**—A special node residing on both the primary ring and a subring at the same time. An edge node acts as a master node or transit node on the primary ring and as an edge node on the subring.
- **Assistant edge node**—A special node residing on both the primary ring and a subring at the same time. An assistant edge node acts as a master node or transit node on the primary ring and as an assistant edge node on the subring. This node works in conjunction with the edge node to detect the integrity of the primary ring and to perform loop guard.

As shown in Figure 1, Ring 1 is the primary ring and Ring 2 is a subring. Device A is the master node of Ring 1. Device B, Device C, and Device D are the transit nodes of Ring 1. Device E is the master node of Ring 2, Device B is the edge node of Ring 2, and Device C is the assistant edge node of Ring 2.

Port role

1. Primary port and secondary port

   Each master node or transit node has two ports connected to an RRPP ring, a primary port and a secondary port. You can determine the role of a port.

   In terms of functionality, the primary port and the secondary port of a master node have the following differences:

- The primary port and the secondary port are designed to play the role of sending and receiving Hello packets, respectively.
- When an RRPP ring is in Health state, the secondary port logically denies protected VLANs and permits only the packets from the control VLANs.
- When an RRPP ring is in Disconnect state, the secondary port forwards packets from protected VLANs.

In terms of functionality, the primary port and the secondary port of a transit node are the same. Both are designed for transferring protocol packets and data packets over an RRPP ring.

As shown in Figure 1, Device A is the master node of Ring 1. Port 1 and Port 2 are the primary port and the secondary port of the master node on Ring 1, respectively. Device B, Device C, and Device D are the transit nodes of Ring 1. Their Port 1 and Port 2 are the primary port and the secondary port on Ring 1, respectively.

2. Common port and edge port

The ports connecting the edge node and assistant edge node to the primary ring are common ports. The ports connecting the edge node and assistant edge node only to the subrings are edge ports. You can determine the role of a port.

As shown in Figure 1, Device B and Device C reside on Ring 1 and Ring 2. Device B's Port 1 and Port 2 and Device C's Port 1 and Port 2 access the primary ring, so they are common ports. Device B's Port 3 and Device C's Port 3 access only the subring, so they are edge ports.

RRPP ring group

To reduce Edge-Hello traffic, you can configure a group of subrings on the edge node or assistant edge node. You must configure a device as the edge node of these subrings, and another device as the assistant edge node of these subrings. Additionally, the subrings of the edge node and assistant edge node must connect to the same subring packet tunnels in major ring (SRPTs). Edge-Hello packets of the edge node of these subrings travel to the assistant edge node of these subrings over the same link.

An RRPP ring group configured on the edge node is an edge node RRPP ring group. An RRPP ring group configured on an assistant edge node is an assistant edge node RRPP ring group. Only one subring in an edge node RRPP ring group is allowed to send Edge-Hello packets.

RRPPDUs

RRPPDUs of subrings are transmitted as data packets in the primary ring, and RRPPDUs of the primary ring can only be transmitted within the primary ring. In the primary ring, Common-Flush-FDB packets and Complete-Flush-FDB packets of subrings are sent to the CPU on each node for processing.

Table 1 RRPPDU types and their functions

Type	Description
Hello	The master node sends Hello packets (also known as Health packets) to detect the integrity of a ring in a network.
Link-Down	When a port on the transit node, edge node, or assistant edge node fails, the node initiates Link-Down packets to notify the master node of the disconnection of the ring.
Common-Flush-FDB	When an RRPP ring transits to Disconnect state, the master node initiates Common-Flush-FDB (FDB stands for Forwarding Database) packets. It uses the packets to instruct the transit nodes, edge nodes, and assistant edge nodes to update their own MAC address entries and ARP/ND entries.
Complete-Flush-FDB	When an RRPP ring transits to Health state, the master node sends Complete-Flush-FDB packets for the following purposes: • Instruct the transit nodes, edge nodes, and assistant edge nodes to update their MAC address entries and ARP/ND entries.

	• Instruct the transit nodes to unblock temporarily blocked ports.
Edge-Hello	The edge node sends Edge-Hello packets to examine the SRPTs between the edge node and the assistant edge node.
Major-Fault	The assistant edge node sends Major-Fault packets to notify the edge node of SRPT failure when an SRPT between assistant edge node and edge node is disconnected.

RRPP timers

When RRPP determines the link state of an Ethernet ring, it uses the following timers:

Hello timer

The Hello timer specifies the interval at which the master node sends Hello packets out of the primary port.

Fail timer

The Fail timer specifies the maximum delay of Hello packets sent from the primary port to the secondary port of the master node. If the secondary port receives the Hello packets sent by the local master node before the Fail timer expires, the ring is in Health state. If the secondary port does not receive the Hello packets before the Fail timer expires, the ring transits to Disconnect state.

In an RRPP domain, a transit node learns the Fail timer value on the master node through the received Hello packets. This ensures that all nodes in the ring network have consistent Fail timer settings.

Link-up delay timer

This feature prevents frequent switchover of RRPP traffic forwarding paths caused by unstable RRPP port states. This feature behaves differently depending on whether you specify the **`distribute`** keyword in the **`linkup-delay-timer`** command.

- If you do not specify the **`distribute`** keyword, the master node starts the link-up delay timer when a faulty port comes up and the master node receives Hello packets from the secondary port.
  - If the master node can still receive Hello packets from the secondary port after the link-up delay timer expires, the master node performs the following operations:
    - Changes the RRPP ring state from Disconnect to Health.
    - Switches the traffic from the secondary port to the primary port.
  - If the master node cannot receive Hello packets from the secondary port after the Fail timer expires and before the link-up delay timer expires, the master node performs the following operations:
    - Stops the link-up delay timer.
    - Keeps the RRPP ring in Disconnect state.
- If you specify the **`distribute`** keyword, all nodes in the RRPP domain can learn the value of the link-up delay timer through Hello packets. When the faulty port comes up, the master node performs the following operations:
  - The hosting RRPP node blocks the faulty port (the faulty port cannot send or receive any packets).
  - Starts the link-up delay timer.

  If the port does not become faulty after the link-up delay timer expires, the hosting RRPP node sets the port state to up. The master node can receive Hello packets from its secondary port again. Then, the master node changes the RRPP ring state from Disconnect to Health and switches the traffic from the secondary port to the primary port.

If the port becomes faulty again before the link-up delay timer expires, the hosting RRPP node blocks the port and stops the link-up delay timer.

How RRPP works

Polling mechanism

The polling mechanism is used by the master node of an RRPP ring to examine the Health state of the ring network.

The master node sends Hello packets out of its primary port at the Hello interval. These Hello packets travel through each transit node on the ring in turn.

- If the ring is complete, the secondary port of the master node receives Hello packets before the Fail timer expires. The master node keeps the secondary port blocked.
- If the ring is disconnected, the secondary port of the master node fails to receive Hello packets before the Fail timer expires. The master node releases the secondary port from blocking protected VLANs. It sends Common-Flush-FDB packets to instruct all transit nodes to update their own MAC address entries and ARP/ND entries.

Link down alarm mechanism

In an RRPP domain, when the transit node, edge node, or assistant edge node finds that any of its ports is down, it immediately sends Link-Down packets to the master node. When the master node receives a Link-Down packet, it takes the following actions:

- Releases the secondary port from blocking protected VLANs.
- Sends Common-Flush-FDB packets to instruct all the transit nodes, edge nodes, and assistant edge nodes to update their MAC address entries and ARP/ND entries.

After each node updates its own entries, traffic is switched to the normal link.

Ring recovery

When the ports in an RRPP domain on the transit nodes, edge nodes, or assistant edge nodes come up again, the ring is recovered. However, the master node might detect the ring recovery after a period of time. A temporary loop might arise in the protected VLAN during this period. As a result, a broadcast storm occurs.

To prevent such cases, non-master nodes block the ports immediately when they find the ports accessing the ring are brought up again. The nodes block only the packets from the protected VLAN, and they permit only the packets from the control VLAN to pass through. The blocked ports are activated only when the nodes determine that no loop will be generated by these ports.

Broadcast storm suppression mechanism in case of SRPT failure in a multi-homed subring

As shown in Figure 5, Ring 1 is the primary ring, and Ring 2 and Ring 3 are subrings. When the two SRPTs between the edge node and the assistant edge node are down, the master nodes of Ring 2 and Ring 3 will open their secondary ports. A loop is generated among Device B, Device C, Device E, and Device F, causing a broadcast storm.

To avoid generating a loop, the edge node will temporarily block the edge port. The blocked edge port is activated only when the edge node determines that no loop will be generated when the edge port is activated.

RRPP ring group

In an edge node RRPP ring group, only the activated subring with the smallest domain ID and ring ID can send Edge-Hello packets. In an assistant edge node RRPP ring group, any activated subring that has received Edge-Hello packets will forward these packets to the other activated subrings. When an edge node RRPP ring group and an assistant edge node RRPP ring group are configured, the CPU workload is reduced because of the following reasons:

- Only one subring sends Edge-Hello packets on the edge node.

- Only one subring receives Edge-Hello packets on the assistant edge node.

As shown in Figure 5, Device B is the edge node of Ring 2 and Ring 3. Device C is the assistant edge node of Ring 2 and Ring 3. Device B and Device C need to send or receive Edge-Hello packets frequently. If more subrings are configured, Device B and Device C will send or receive a large number of Edge-Hello packets.

To reduce Edge-Hello traffic, perform the following tasks:

- Assign Ring 2 and Ring 3 to an RRPP ring group configured on the edge node Device B.
- Assign Ring 2 and Ring 3 to an RRPP ring group configured on the assistant edge node Device C.

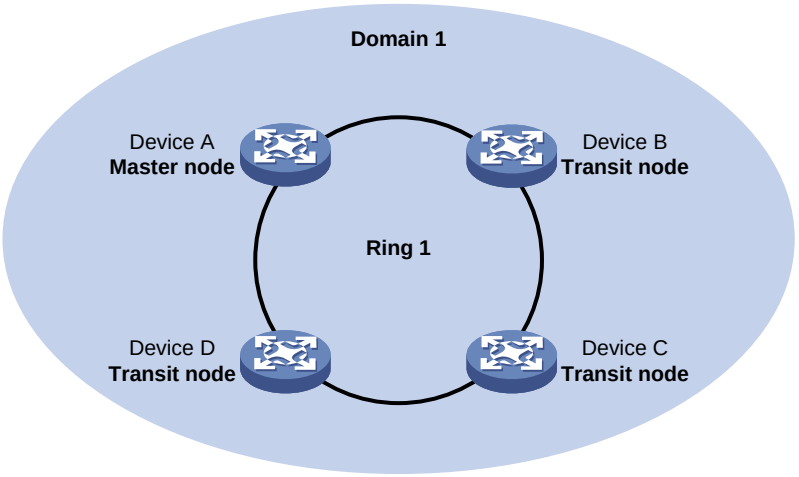
If all rings are activated, only Ring 2 on Device B sends Edge-Hello packets.

Typical RRPP networking

Single ring

As shown in Figure 2, only a single ring exists in the network topology. You need only define an RRPP domain.

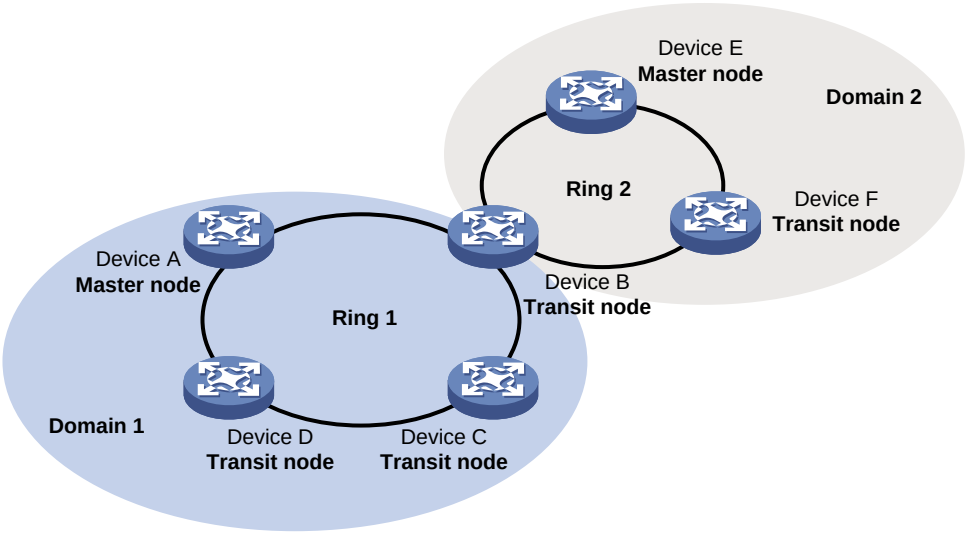
Figure 2 Schematic diagram for a single-ring network



Tangent rings

As shown in Figure 3, two or more rings exist in the network topology and only one common node exists between rings. You must define an RRPP domain for each ring.

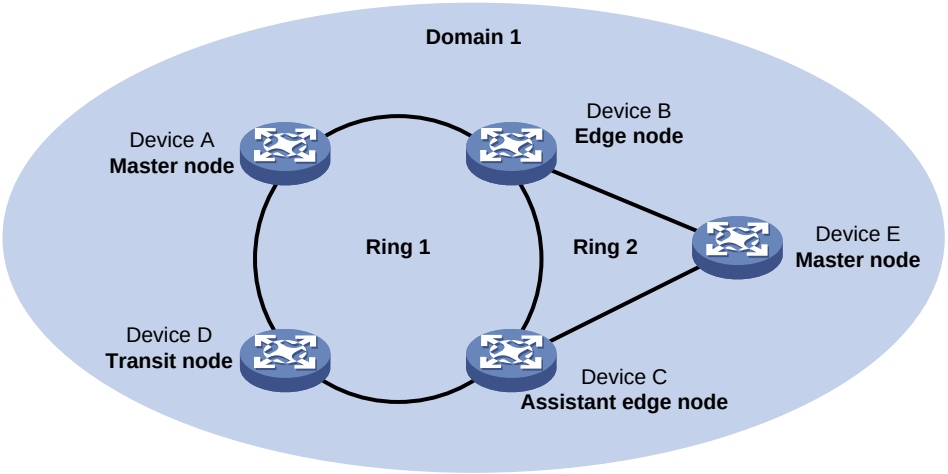
Figure 3 Schematic diagram for a tangent-ring network



Intersecting rings

As shown in Figure 4, two or more rings exist in the network topology and two common nodes exist between rings. You need only define an RRPP domain and configure one ring as the primary ring and the other rings as subrings.

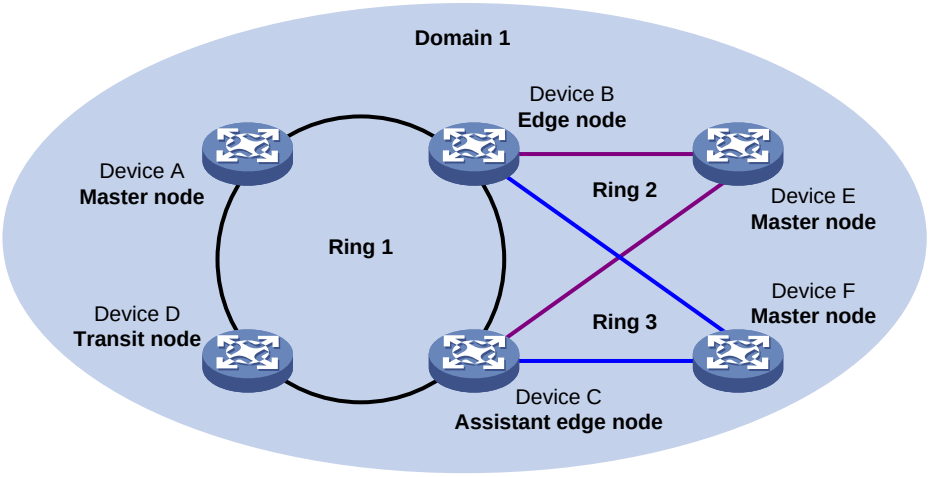
Figure 4 Schematic diagram for an intersecting-ring network



Dual-homed rings

As shown in Figure 5, two or more rings exist in the network topology and two similar common nodes exist between rings. You need only define an RRPP domain and configure one ring as the primary ring and the other rings as subrings.

Figure 5 Schematic diagram for a dual-homed-ring network



Protocols and standards

RFC 3619, *Extreme Networks' Ethernet Automatic Protection Switching (EAPS) Version 1*

Restrictions: Hardware compatibility with RRPP

The following switch series do not support RRPP:

- S5110V2-SI.
- S5000V3-EI.
- S5000V5-EI.
- S5000E-X.
- S5000X-EI.
- WAS6000.

Restrictions and guidelines: RRPP configuration

- RRPP does not have an auto election mechanism. You must configure each node in the ring network correctly for RRPP to monitor and protect the ring network.
- You can configure RRPP in the following order:
  - Create RRPP domains based on service planning.
  - Specify control VLANs and protected VLANs for each RRPP domain.
  - Determine the ring roles and node roles based on the traffic paths in each RRPP domain.

RRPP tasks at a glance

To configure RRPP, perform the following tasks:

1. Creating an RRPP domain

   Perform this task on devices you want to configure as nodes in the RRPP domain.
2. Configuring control VLANs

   Perform this task on all nodes in the RRPP domain.

3. Configuring protected VLANs

   Perform this task on all nodes in the RRPP domain.
4. Configuring RRPP rings
   a. Configuring RRPP ports

      Perform this task on each node's ports intended for accessing RRPP rings.
   b. Configuring RRPP nodes

      Perform this task on all nodes in the RRPP domain.
5. Activating an RRPP domain

   Perform this task on all nodes in the RRPP domain.
6. (Optional.) Configuring RRPP timers

   Perform this task on the master node in the RRPP domain.
   - Configuring the Hello timer and Fail timer
   - Configuring the link-up delay timer
7. (Optional.) Configuring an RRPP ring group

   Perform this task on the edge node and assistant edge node in the RRPP domain.
8. (Optional.) Enabling SNMP notifications for RRPP

Prerequisites for RRPP

Before you configure RRPP, you must physically construct a ring-shaped Ethernet topology.

Creating an RRPP domain

About creating an RRPP domain

When you create an RRPP domain, specify a domain ID to uniquely identify the RRPP domain. All devices in the same RRPP domain must be configured with the same domain ID.

Restrictions and guidelines

Perform this task on devices you want to configure as nodes in the RRPP domain.

Procedure

1. Enter system view.

   `system-view`
2. Create an RRPP domain and enter RRPP domain view.

   `rrpp domain` *`domain-id`*

Configuring control VLANs

Restrictions and guidelines

- Perform this task on all nodes in the RRPP domain.
- Before you configure RRPP rings in an RRPP domain, configure the same control VLANs for all nodes in the RRPP domain first. You need only configure the primary control VLAN for an RRPP domain. The system automatically configures the secondary control VLAN. It uses the primary control VLAN ID plus 1 as the secondary control VLAN ID. For the control VLAN configuration to succeed, make sure the IDs of the two control VLANs are consecutive and have not been previously assigned.

- Do not configure the default VLAN of a port accessing an RRPP ring as the control VLAN.
- For RRPPDUs to be correctly forwarded, do not enable QinQ or VLAN mapping on control VLANs.
- After you configure RRPP rings for an RRPP domain, you cannot delete or modify the primary control VLAN of the domain. You can only use the **undo control-vlan** command to delete a primary control VLAN.
- To transparently transmit RRPPDUs on a device not configured with RRPP, make sure only the two ports accessing the RRPP ring permit packets from the control VLANs. Otherwise, the packets from other VLANs might enter the control VLANs in transparent transmission mode and strike the RRPP ring.

Procedure

1. Enter system view.
   system-view
2. Enter RRPP domain view.
   rrpp domain *domain-id*
3. Configure the primary control VLAN for the RRPP domain.
   control-vlan *vlan-id*

Configuring protected VLANs

Restrictions and guidelines

- Perform this task on all nodes in the RRPP domain.
- Before you configure RRPP rings in an RRPP domain, configure the same protected VLANs for all nodes in the RRPP domain. All VLANs to which the RRPP ports are assigned must be protected by the RRPP domains.

Prerequisites

Before you configure protected VLANs, you must configure an MST region and the VLAN-to-instance mapping table. For more information about MST regions, see spanning tree configuration in *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter RRPP domain view.
   rrpp domain *domain-id*
3. Configure protected VLANs for the RRPP domain.
   protected-vlan reference-instance *instance-id-list*

Configuring RRPP rings

When you configure an RRPP ring, you must configure the ports connecting each node to the RRPP ring before configuring the nodes.

Prerequisites

Before you configure an RRPP ring, you must configure control VLANs and protected VLANs.

Configuring RRPP ports

Restrictions and guidelines

- Perform this task on each node's ports intended for accessing RRPP rings.
- Do not enable the OAM remote loopback function on an RRPP port. Otherwise, temporary broadcast storms might occur.
- To accelerate topology convergence, use the **link-delay** command to enable link status rapid report function on an RRPP port. Use this command to set the physical state change suppression interval to 0 seconds. For more information about the **link-delay** command, see *Layer 2—LAN Switching Command Reference*.
- Do not assign a port to both an aggregation group and an RRPP ring. If you do so, the port does not take effect on the RRPP ring.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
3. Configure the link type of the interface as trunk.
   port link-type trunk
   By default, the link type of an interface is access.
   For more information about the command, see *Layer 2—LAN Switching Command Reference*.
4. Assign the trunk port to the protected VLANs of the RRPP domain.
   port trunk permit vlan { *vlan-id-list* | **all** }
   By default, a trunk port allows only packets from VLAN 1 to pass through.
   RRPP ports always allow packets from the control VLANs to pass through.
   For more information about the command, see *Layer 2—LAN Switching Command Reference*.
5. Disable the spanning tree feature.
   undo stp enable
   By default, the spanning tree feature is enabled.
   For more information about the command, see *Layer 2—LAN Switching Command Reference*.

Configuring RRPP nodes

Restrictions and guidelines

- Perform this task on all nodes in the RRPP domain.
- If a device carries multiple RRPP rings in an RRPP domain, it can only be an edge node or an assistant edge node on a subring.
- When you configure an edge node or an assistant edge node, you must configure the primary ring before configuring the subrings.

Specifying a master node

1. Enter system view.
   system-view
2. Enter RRPP domain view.
   rrpp domain *domain-id*

3. Specify the current device as the master node of the ring, and specify the primary port and the secondary port.

   ring *ring-id* **node-mode master** [**primary-port** *interface-type interface-number*] [**secondary-port** *interface-type interface-number*] **level** *level-value*

Specifying a transit node

1. Enter system view.

   system-view

2. Enter RRPP domain view.

   rrpp domain *domain-id*

3. Specify the current device as a transit node of the ring, and specify the primary port and the secondary port.

   ring *ring-id* **node-mode transit** [**primary-port** *interface-type interface-number*] [**secondary-port** *interface-type interface-number*] **level** *level-value*

Specifying an edge node

1. Enter system view.

   system-view

2. Enter RRPP domain view.

   rrpp domain *domain-id*

3. Specify the current device as a master node or transit node of the primary ring, and specify the primary port and the secondary port.

   ring *ring-id* **node-mode** { **master** | **transit** } [**primary-port** *interface-type interface-number*] [**secondary-port** *interface-type interface-number*] **level** *level-value*

4. Specify the current device as the edge node of a subring, and specify the edge port.

   ring *ring-id* **node-mode edge** [**edge-port** *interface-type interface-number*]

Specifying an assistant edge node

1. Enter system view.

   system-view

2. Enter RRPP domain view.

   rrpp domain *domain-id*

3. Specify the current device as a master node or transit node of the primary ring, and specify the primary port and the secondary port.

   ring *ring-id* **node-mode** { **master** | **transit** } [**primary-port** *interface-type interface-number*] [**secondary-port** *interface-type interface-number*] **level** *level-value*

   By default, a device is not a node of the RRPP ring.

4. Specify the current device as the assistant edge node of the subring, and specify an edge port.

   ring *ring-id* **node-mode assistant-edge** [**edge-port** *interface-type interface-number*]

Activating an RRPP domain

Restrictions and guidelines

- Perform this task on all nodes in the RRPP domain.
- Before you activate an RRPP domain on the current device, enable the RRPP protocol and RRPP rings for the RRPP domain on the current device.
- Before you enable subrings on a device, you must enable the primary ring. Before you disable the primary ring on the device, you must disable all subrings. Otherwise, the system displays error prompts.
- To prevent Hello packets of subrings from being looped on the primary ring, enable the primary ring on its master node first. Then enable the subrings on their respective master nodes.

Procedure

1. Enter system view.
   `system-view`
2. Enable RRPP.
   `rrpp enable`
   By default, RRPP is disabled.
3. Enter RRPP domain view.
   `rrpp domain` *`domain-id`*
4. Enable the specified RRPP ring.
   `ring` *`ring-id`* **`enable`**
   By default, an RRPP ring is disabled.

Configuring RRPP timers

Restrictions and guidelines for RRPP timer configuration

Perform this task on the master node of an RRPP domain.

Configuring the Hello timer and Fail timer

Restrictions and guidelines

- The Fail timer must be greater than or equal to three times the Hello timer.
- In a dual-homed-ring network, to avoid temporary loops when the primary ring fails, make sure the value of *A* is greater than the value of *B*, where:
  - *A* is the difference between the Fail timer values on the master node of the subring and the master node of the primary ring.
  - *B* is twice the Hello timer value on the master node of the subring.

Procedure

1. Enter system view.
   `system-view`
2. Enter RRPP domain view.
   `rrpp domain` *`domain-id`*
3. Set the Hello timer and Fail timer for the RRPP domain.

timer hello-timer *hello-value* **fail-timer** *fail-value*

By default, the Hello timer value is 1 second and the Fail timer value is 3 seconds.

Configuring the link-up delay timer

Restrictions and guidelines

If the **distribute** keyword is not specified, the link-up delay timer value cannot be greater than the Fail timer value minus twice the Hello timer value.

If you specify the **distribute** keyword in an RRPP network implementing load balancing, you must configure the link-up delay timer for each RRPP domain for the timer to take effect. If you set different timer values for different RRPP domains, the smallest timer value takes effect.

Procedure

1. Enter system view.

   system-view
2. Enter RRPP domain view.

   rrpp domain *domain-id*
3. Set the Hello timer and Fail timer for the RRPP domain.

   linkup-delay-timer *delay-time* [**distribute**]

   By default, the link-up delay timer value is 0 seconds, and the **distribute** keyword is not specified.

Configuring an RRPP ring group

About configuring an RRPP ring group

To reduce Edge-Hello traffic, assign subrings with the same edge node and assistant edge node to an RRPP ring group. An RRPP ring group must be configured on both the edge node and the assistant edge node. It can only be configured on these two types of nodes.

Restrictions and guidelines

- Perform this task on the edge node and assistant edge node in the RRPP domain.
- You can assign a subring to only one RRPP ring group. The RRPP ring groups configured on the edge node and the assistant edge node must contain the same subrings. Otherwise, the RRPP ring group cannot operate correctly.
- The subrings in an RRPP ring group must share the same edge node and assistant edge node. The edge node and the assistant edge node must have the same SRPTs.
- Make sure a device is either the edge node or the assistant edge node on the subrings in an RRPP ring group.
- Make sure the RRPP ring groups on the edge node and the assistant edge node have the same configurations and activation status.
- Make sure all subrings in an RRPP ring group have the same SRPTs. If the SRPTs of these subrings are different, the RRPP ring group cannot operate correctly.

Procedure

1. Enter system view.

   system-view
2. Create an RRPP ring group and enter RRPP ring group view.

   rrpp ring-group *ring-group-id*

By default, no RRPP ring groups exist.

3. Assign the specified subrings to the RRPP ring group.

   domain *domain-id* **ring** *ring-id-list*

   By default, no subrings are assigned to an RRPP ring group.

Enabling SNMP notifications for RRPP

About enabling SNMP notifications for RRPP

To report critical RRPP events to an NMS, enable SNMP notifications for RRPP. For RRPP event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for RRPP.

   snmp-agent trap enable rrpp [**major-fault** | **multi-master** | **ring-fail** | **ring-recover**] *

   By default, SNMP notifications for RRPP are disabled.

Display and maintenance commands for RRPP

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display brief RRPP information.	**display rrpp brief**
Display RRPP group configuration information.	**display rrpp ring-group** [*ring-group-id*]
Display RRPPDU statistics.	**display rrpp statistics domain** *domain-id* [**ring** *ring-id*]
Display detailed RRPP information.	**display rrpp verbose domain** *domain-id* [**ring** *ring-id*]
Clear RRPPDU statistics.	**reset rrpp statistics domain** *domain-id* [**ring** *ring-id*]

RRPP configuration examples

Example: Configuring a single ring

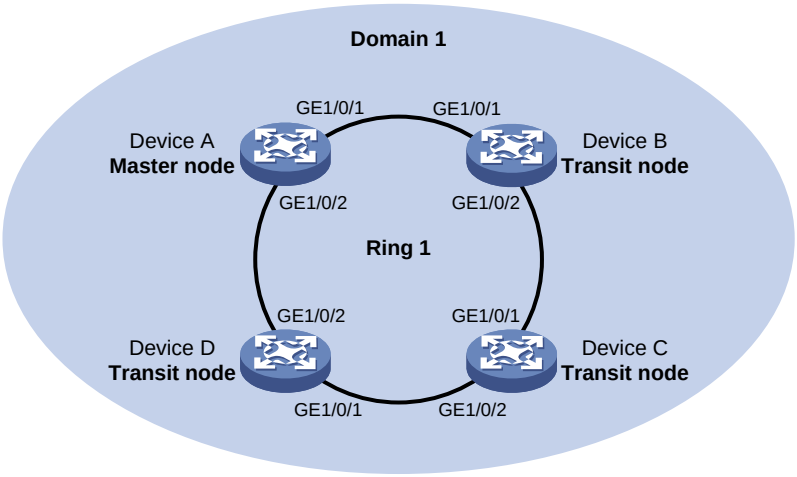
Network configuration

As shown in Figure 6:

- Device A, Device B, Device C, and Device D form RRPP domain 1. Specify the primary control VLAN of RRPP domain 1 as VLAN 4092. Specify the protected VLANs of RRPP domain 1 as VLANs 1 through 30.

- Device A, Device B, Device C, and Device D form primary ring 1.
- Specify Device A as the master node of primary ring 1, GigabitEthernet 1/0/1 as the primary port, and GigabitEthernet 1/0/2 as the secondary port.
- Specify Device B, Device C, and Device D as the transit nodes of primary ring 1. Specify GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port on Device B, Device C, and Device D.

Figure 6 Network diagram



Procedure

1. Configure Device A:

Create VLANs 1 through 30.

```
<DeviceA> system-view
[DeviceA] vlan 1 to 30
```

Map these VLANs to MSTI 1.

```
[DeviceA] stp region-configuration
[DeviceA-mst-region] instance 1 vlan 1 to 30
```

Activate the MST region configuration.

```
[DeviceA-mst-region] active region-configuration
[DeviceA-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] link-delay up 0
[DeviceA-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceA-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceA-GigabitEthernet1/0/1] port link-type trunk
```

Assign the port to VLANs 1 through 30.

```
[DeviceA-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceA-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] link-delay up 0
[DeviceA-GigabitEthernet1/0/2] link-delay down 0
```

```
[DeviceA-GigabitEthernet1/0/2] undo stp enable
[DeviceA-GigabitEthernet1/0/2] port link-type trunk
[DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceA-GigabitEthernet1/0/2] quit
```

Create RRPP domain 1.

```
[DeviceA] rrpp domain 1
```

Configure VLAN 4092 as the primary control VLAN of RRPP domain 1.

```
[DeviceA-rrpp-domain1] control-vlan 4092
```

Configure the VLANs mapped to MSTI 1 as the protected VLANs of RRPP domain 1.

```
[DeviceA-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device A as the master node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceA-rrpp-domain1] ring 1 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceA-rrpp-domain1] ring 1 enable
[DeviceA-rrpp-domain1] quit
```

Enable RRPP.

```
[DeviceA] rrpp enable
```

2. Configure Device B:

Create VLANs 1 through 30.

```
<DeviceB> system-view
[DeviceB] vlan 1 to 30
```

Map these VLANs to MSTI 1.

```
[DeviceB] stp region-configuration
[DeviceB-mst-region] instance 1 vlan 1 to 30
```

Activate the MST region configuration.

```
[DeviceB-mst-region] active region-configuration
[DeviceB-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] link-delay up 0
[DeviceB-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceB-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
```

Assign the port to VLANs 1 through 30.

```
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] link-delay up 0
[DeviceB-GigabitEthernet1/0/2] link-delay down 0
[DeviceB-GigabitEthernet1/0/2] undo stp enable
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceB-GigabitEthernet1/0/2] quit
```

Create RRPP domain 1.

```
[DeviceB] rrpp domain 1
```

Configure VLAN 4092 as the primary control VLAN of RRPP domain 1.

```
[DeviceB-rrpp-domain1] control-vlan 4092
```

Configure the VLANs mapped to MSTI 1 as the protected VLANs of RRPP domain 1.

```
[DeviceB-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device B as the transit node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceB-rrpp-domain1] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceB-rrpp-domain1] ring 1 enable
[DeviceB-rrpp-domain1] quit
```

Enable RRPP.

```
[DeviceB] rrpp enable
```

3. Configure Device C:

   Configure Device C in the same way Device B is configured.

4. Configure Device D:

   Configure Device D in the same way Device B is configured.

Verifying the configuration

Use the **display** commands to view RRPP configuration and operational information on each device.

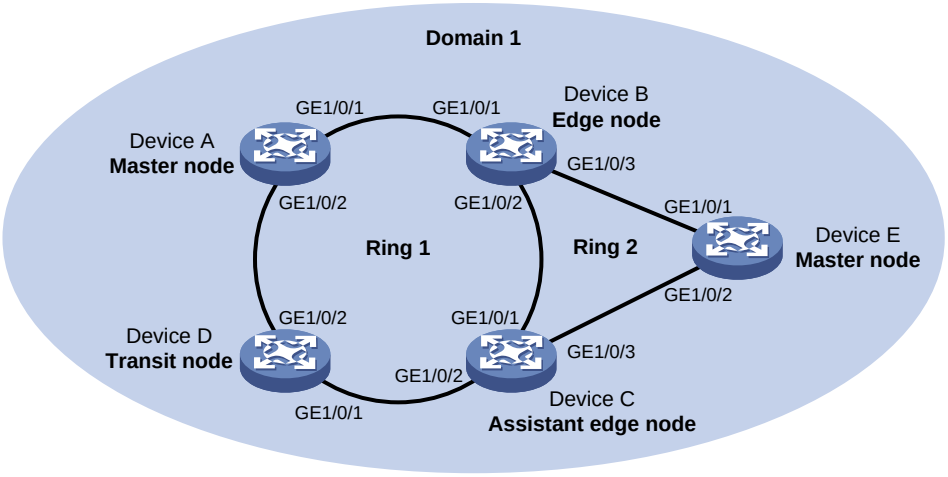
Example: Configuring intersecting rings

Network configuration

As shown in Figure 7:

- Device A, Device B, Device C, Device D, and Device E form RRPP domain 1. VLAN 4092 is the primary control VLAN of RRPP domain 1. RRPP domain 1 protects VLANs 1 through 30.
- Device A, Device B, Device C, and Device D form primary ring 1. Device B, Device C, and Device E form subring 2.
- Device A is the master node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 the secondary port.
- Device E is the master node of subring 2, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 the secondary port.
- Device B is the transit node of primary ring 1 and the edge node of subring 2, with GigabitEthernet 1/0/3 as the edge port.
- Device C is the transit node of primary ring 1 and the assistant edge node of subring 1, with GigabitEthernet 1/0/3 as the edge port.
- Device D is the transit node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 the secondary port.

Figure 7 Network diagram



Procedure

1. Configure Device A:

Create VLANs 1 through 30.

```
<DeviceA> system-view
[DeviceA] vlan 1 to 30
```

Map these VLANs to MSTI 1.

```
[DeviceA] stp region-configuration
[DeviceA-mst-region] instance 1 vlan 1 to 30
```

Activate the MST region configuration.

```
[DeviceA-mst-region] active region-configuration
[DeviceA-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] link-delay up 0
[DeviceA-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceA-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceA-GigabitEthernet1/0/1] port link-type trunk
```

Assign the port to VLANs 1 through 30.

```
[DeviceA-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceA-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] link-delay up 0
[DeviceA-GigabitEthernet1/0/2] link-delay down 0
[DeviceA-GigabitEthernet1/0/2] undo stp enable
[DeviceA-GigabitEthernet1/0/2] port link-type trunk
[DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceA-GigabitEthernet1/0/2] quit
```

Create RRPP domain 1.

```
[DeviceA] rrpp domain 1
```

Configure VLAN 4092 as the primary control VLAN of RRPP domain 1.

```
[DeviceA-rrpp-domain1] control-vlan 4092
```

Configure the VLANs mapped to MSTI 1 as the protected VLANs of RRPP domain 1.

```
[DeviceA-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device A as the master node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceA-rrpp-domain1] ring 1 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceA-rrpp-domain1] ring 1 enable
[DeviceA-rrpp-domain1] quit
```

Enable RRPP.

```
[DeviceA] rrpp enable
```

2. Configure Device B:

Create VLANs 1 through 30.

```
<DeviceB> system-view
[DeviceB] vlan 1 to 30
```

Map these VLANs to MSTI 1.

```
[DeviceB] stp region-configuration
[DeviceB-mst-region] instance 1 vlan 1 to 30
```

Activate the MST region configuration.

```
[DeviceB-mst-region] active region-configuration
[DeviceB-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] link-delay up 0
[DeviceB-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceB-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
```

Assign the port to VLANs 1 through 30.

```
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] link-delay up 0
[DeviceB-GigabitEthernet1/0/2] link-delay down 0
[DeviceB-GigabitEthernet1/0/2] undo stp enable
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] link-delay up 0
[DeviceB-GigabitEthernet1/0/3] undo stp enable
[DeviceB-GigabitEthernet1/0/3] port link-type trunk
[DeviceB-GigabitEthernet1/0/3] port trunk permit vlan 1 to 30
```

```
[DeviceB-GigabitEthernet1/0/3] quit
```

Create RRPP domain 1.

```
[DeviceB] rrpp domain 1
```

Configure VLAN 4092 as the primary control VLAN of RRPP domain 1.

```
[DeviceB-rrpp-domain1] control-vlan 4092
```

Configure the VLANs mapped to MSTI 1 as the protected VLANs of RRPP domain 1.

```
[DeviceB-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device B as a transit node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceB-rrpp-domain1] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceB-rrpp-domain1] ring 1 enable
```

Configure Device B as the edge node of subring 2, with GigabitEthernet 1/0/3 as the edge port. Enable ring 2.

```
[DeviceB-rrpp-domain1] ring 2 node-mode edge edge-port gigabitethernet 1/0/3
[DeviceB-rrpp-domain1] ring 2 enable
[DeviceB-rrpp-domain1] quit
```

Enable RRPP.

```
[DeviceB] rrpp enable
```

3. Configure Device C:

Create VLANs 1 through 30.

```
<DeviceC> system-view
[DeviceC] vlan 1 to 30
```

Map these VLANs to MSTI 1.

```
[DeviceC] stp region-configuration
[DeviceC-mst-region] instance 1 vlan 1 to 30
```

Activate the MST region configuration.

```
[DeviceC-mst-region] active region-configuration
[DeviceC-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] link-delay up 0
[DeviceC-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceC-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceC-GigabitEthernet1/0/1] port link-type trunk
```

Assign the port to VLANs 1 through 30.

```
[DeviceC-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceC-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] link-delay up 0
[DeviceC-GigabitEthernet1/0/2] link-delay down 0
[DeviceC-GigabitEthernet1/0/2] undo stp enable
[DeviceC-GigabitEthernet1/0/2] port link-type trunk
[DeviceC-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
```

```
[DeviceC-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceC] interface gigabitethernet 1/0/3
[DeviceC-GigabitEthernet1/0/3] link-delay up 0
[DeviceC-GigabitEthernet1/0/3] link-delay down 0
[DeviceC-GigabitEthernet1/0/3] undo stp enable
[DeviceC-GigabitEthernet1/0/3] port link-type trunk
[DeviceC-GigabitEthernet1/0/3] port trunk permit vlan 1 to 30
[DeviceC-GigabitEthernet1/0/3] quit
```

Create RRPP domain 1.

```
[DeviceC] rrpp domain 1
```

Configure VLAN 4092 as the primary control VLAN of RRPP domain 1.

```
[DeviceC-rrpp-domain1] control-vlan 4092
```

Configure the VLANs mapped to MSTI 1 as the protected VLANs of RRPP domain 1.

```
[DeviceC-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device C as a transit node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceC-rrpp-domain1] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceC-rrpp-domain1] ring 1 enable
```

Configure Device C as the assistant edge node of subring 2, with GigabitEthernet 1/0/3 as the edge port. Enable ring 2.

```
[DeviceC-rrpp-domain1] ring 2 node-mode assistant-edge edge-port gigabitethernet
1/0/3
[DeviceC-rrpp-domain1] ring 2 enable
[DeviceC-rrpp-domain1] quit
```

Enable RRPP.

```
[DeviceC] rrpp enable
```

4. Configure Device D:

Create VLANs 1 through 30.

```
<DeviceD> system-view
[DeviceD] vlan 1 to 30
```

Map these VLANs to MSTI 1.

```
[DeviceD] stp region-configuration
[DeviceD-mst-region] instance 1 vlan 1 to 30
```

Activate the MST region configuration.

```
[DeviceD-mst-region] active region-configuration
[DeviceD-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] link-delay up 0
[DeviceD-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceD-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceD-GigabitEthernet1/0/1] port link-type trunk
```

Assign the port to VLANs 1 through 30.

```
[DeviceD-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceD-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] link-delay up 0
[DeviceD-GigabitEthernet1/0/2] link-delay down 0
[DeviceD-GigabitEthernet1/0/2] undo stp enable
[DeviceD-GigabitEthernet1/0/2] port link-type trunk
[DeviceD-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceD-GigabitEthernet1/0/2] quit
```

Create RRPP domain 1.

```
[DeviceD] rrpp domain 1
```

Configure VLAN 4092 as the primary control VLAN of RRPP domain 1.

```
[DeviceD-rrpp-domain1] control-vlan 4092
```

Configure the VLANs mapped to MSTI 1 as the protected VLANs of RRPP domain 1.

```
[DeviceD-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device D as the transit node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceD-rrpp-domain1] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceD-rrpp-domain1] ring 1 enable
[DeviceD-rrpp-domain1] quit
```

Enable RRPP.

```
[DeviceD] rrpp enable
```

5. Configure Device E:

Create VLANs 1 through 30.

```
<DeviceE> system-view
[DeviceE] vlan 1 to 30
```

Map these VLANs to MSTI 1.

```
[DeviceE] stp region-configuration
[DeviceE-mst-region] instance 1 vlan 1 to 30
```

Activate the MST region configuration.

```
[DeviceE-mst-region] active region-configuration
[DeviceE-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceE] interface gigabitethernet 1/0/1
[DeviceE-GigabitEthernet1/0/1] link-delay up 0
[DeviceE-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceE-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceE-GigabitEthernet1/0/1] port link-type trunk
```

Assign the port to VLANs 1 through 30.

```
[DeviceE-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceE-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceE] interface gigabitethernet 1/0/2
```

```
[DeviceE-GigabitEthernet1/0/2] link-delay up 0
[DeviceE-GigabitEthernet1/0/2] link-delay down 0
[DeviceE-GigabitEthernet1/0/2] undo stp enable
[DeviceE-GigabitEthernet1/0/2] port link-type trunk
[DeviceE-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceE-GigabitEthernet1/0/2] quit
```

Create RRPP domain 1.

```
[DeviceE] rrpp domain 1
```

Configure VLAN 4092 as the primary control VLAN of RRPP domain 1.

```
[DeviceE-rrpp-domain1] control-vlan 4092
```

Configure the VLANs mapped to MSTI 1 as the protected VLANs of RRPP domain 1.

```
[DeviceE-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device E as the master node of subring 2, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 2.

```
[DeviceE-rrpp-domain1] ring 2 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 1
[DeviceE-rrpp-domain1] ring 2 enable
[DeviceE-rrpp-domain1] quit
```

Enable RRPP.

```
[DeviceE] rrpp enable
```

Verifying the configuration

Use the **display** commands to view RRPP configuration and operational information on each device.

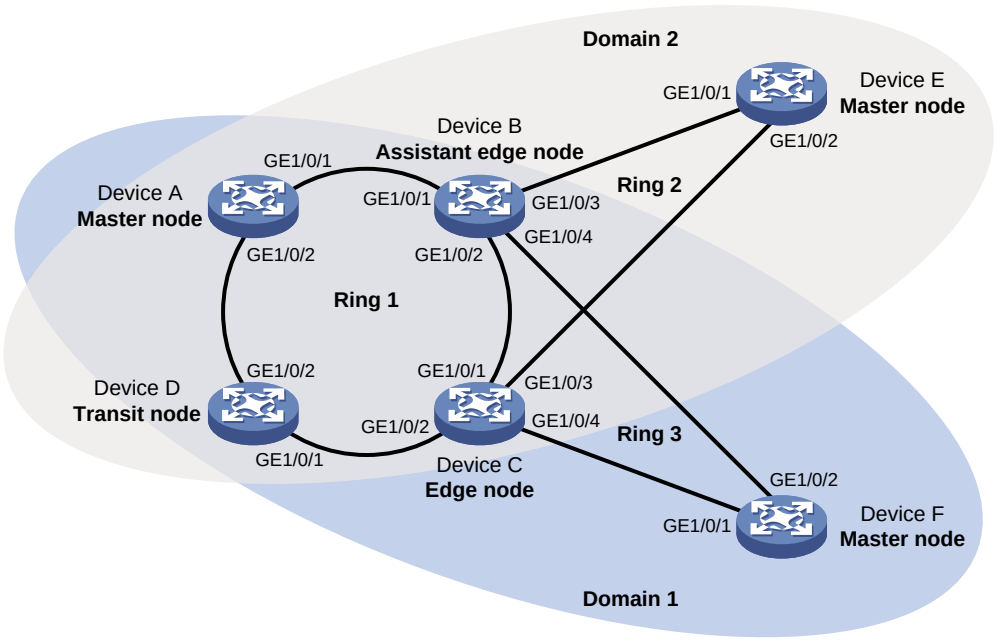
Example: Configuring load-balanced intersecting rings

Network configuration

As shown in Figure 8:

- Device A, Device B, Device C, Device D, and Device F form RRPP domain 1. VLAN 100 is the primary control VLAN of the RRPP domain. Device A is the master node of the primary ring, Ring 1. Device D is the transit node of Ring 1. Device F is the master node of the subring Ring 3. Device C is the edge node of the subring Ring 3. Device B is the assistant edge node of the subring Ring 3.
- Device A, Device B, Device C, Device D, and Device E form RRPP domain 2. VLAN 105 is the primary control VLAN of the RRPP domain. Device A is the master node of the primary ring, Ring 1. Device D is the transit node of Ring 1. Device E is the master node of the subring Ring 2. Device C is the edge node of the subring Ring 2. Device B is the assistant edge node of the subring Ring 2.
- Specify VLAN 11 as the protected VLAN of domain 1, and VLAN 12 the protected VLAN of domain 2. You can implement VLAN-based load balancing on Ring 1.
- Ring 2 and Ring 3 have the same edge node and assistant edge node, and the two subrings have the same SRPTs. You can add Ring 2 and Ring 3 to an RRPP ring group to reduce Edge-Hello traffic.

Figure 8 Network diagram



Procedure

1. Configure Device A:

   # Create VLANs 11 and 12.

   ```
   <DeviceA> system-view
   [DeviceA] vlan 11 to 12
   ```

   # Map VLAN 11 to MSTI 1 and VLAN 12 to MSTI 2.

   ```
   [DeviceA] stp region-configuration
   [DeviceA-mst-region] instance 1 vlan 11
   [DeviceA-mst-region] instance 2 vlan 12
   ```

   # Activate the MST region configuration.

   ```
   [DeviceA-mst-region] active region-configuration
   [DeviceA-mst-region] quit
   ```

   # Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] link-delay up 0
   [DeviceA-GigabitEthernet1/0/1] link-delay down 0
   ```

   # Disable the spanning tree feature on the port.

   ```
   [DeviceA-GigabitEthernet1/0/1] undo stp enable
   ```

   # Configure the port as a trunk port.

   ```
   [DeviceA-GigabitEthernet1/0/1] port link-type trunk
   ```

   # Remove the port from VLAN 1, and assign it to VLANs 11 and 12.

   ```
   [DeviceA-GigabitEthernet1/0/1] undo port trunk permit vlan 1
   [DeviceA-GigabitEthernet1/0/1] port trunk permit vlan 11 12
   ```

   # Configure VLAN 11 as the default VLAN.

   ```
   [DeviceA-GigabitEthernet1/0/1] port trunk pvid vlan 11
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

   ```
   [DeviceA] interface gigabitethernet 1/0/2
   ```

```
[DeviceA-GigabitEthernet1/0/2] link-delay up 0
[DeviceA-GigabitEthernet1/0/2] link-delay down 0
[DeviceA-GigabitEthernet1/0/2] undo stp enable
[DeviceA-GigabitEthernet1/0/2] port link-type trunk
[DeviceA-GigabitEthernet1/0/2] undo port trunk permit vlan 1
[DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 11 12
[DeviceA-GigabitEthernet1/0/2] port trunk pvid vlan 11
[DeviceA-GigabitEthernet1/0/2] quit
```

Create RRPP domain 1.

```
[DeviceA] rrpp domain 1
```

Configure VLAN 100 as the primary control VLAN of RRPP domain 1.

```
[DeviceA-rrpp-domain1] control-vlan 100
```

Configure the VLAN mapped to MSTI 1 as the protected VLAN of RRPP domain 1.

```
[DeviceA-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device A as the master node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceA-rrpp-domain1] ring 1 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceA-rrpp-domain1] ring 1 enable
[DeviceA-rrpp-domain1] quit
```

Create RRPP domain 2.

```
[DeviceA] rrpp domain 2
```

Configure VLAN 105 as the primary control VLAN of RRPP domain 2.

```
[DeviceA-rrpp-domain2] control-vlan 105
```

Configure the VLAN mapped to MSTI 2 as the protected VLAN of RRPP domain 2.

```
[DeviceA-rrpp-domain2] protected-vlan reference-instance 2
```

Configure Device A as the master node of primary ring 1, with GigabitEthernet 1/0/2 as the master port and GigabitEthernet 1/0/1 as the secondary port. Enable ring 1.

```
[DeviceA-rrpp-domain2] ring 1 node-mode master primary-port gigabitethernet 1/0/2
secondary-port gigabitethernet 1/0/1 level 0
[DeviceA-rrpp-domain2] ring 1 enable
[DeviceA-rrpp-domain2] quit
```

Enable RRPP.

```
[DeviceA] rrpp enable
```

2. Configure Device B:

Create VLANs 11 and 12.

```
<DeviceB> system-view
[DeviceB] vlan 11 to 12
```

Map VLAN 11 to MSTI 1 and VLAN 12 to MSTI 2.

```
[DeviceB] stp region-configuration
[DeviceB-mst-region] instance 1 vlan 11
[DeviceB-mst-region] instance 2 vlan 12
```

Activate the MST region configuration.

```
[DeviceB-mst-region] active region-configuration
[DeviceB-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] link-delay up 0
```

```
[DeviceB-GigabitEthernet1/0/1] link-delay down 0
```
Disable the spanning tree feature on the port.
```
[DeviceB-GigabitEthernet1/0/1] undo stp enable
```
Configure the port as a trunk port.
```
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
```
Remove the port from VLAN 1, and assign it to VLANs 11 and 12.
```
[DeviceB-GigabitEthernet1/0/1] undo port trunk permit vlan 1
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 11 12
```
Configure VLAN 11 as the default VLAN.
```
[DeviceB-GigabitEthernet1/0/1] port trunk pvid vlan 11
[DeviceB-GigabitEthernet1/0/1] quit
```
Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.
```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] link-delay up 0
[DeviceB-GigabitEthernet1/0/2] link-delay down 0
[DeviceB-GigabitEthernet1/0/2] undo stp enable
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] undo port trunk permit vlan 1
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan 11 12
[DeviceB-GigabitEthernet1/0/2] port trunk pvid vlan 11
[DeviceB-GigabitEthernet1/0/2] quit
```
Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/3.
```
[DeviceB] interface gigabitethernet 1/0/3
[DeviceB-GigabitEthernet1/0/3] link-delay up 0
[DeviceB-GigabitEthernet1/0/3] link-delay down 0
```
Disable the spanning tree feature on the port.
```
[DeviceB-GigabitEthernet1/0/3] undo stp enable
```
Configure the port as a trunk port.
```
[DeviceB-GigabitEthernet1/0/3] port link-type trunk
```
Remove the port from VLAN 1, and assign it to VLAN 12.
```
[DeviceB-GigabitEthernet1/0/3] undo port trunk permit vlan 1
[DeviceB-GigabitEthernet1/0/3] port trunk permit vlan 12
```
Configure VLAN 12 as the default VLAN.
```
[DeviceB-GigabitEthernet1/0/3] port trunk pvid vlan 12
[DeviceB-GigabitEthernet1/0/3] quit
```
Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/4.
```
[DeviceB] interface gigabitethernet 1/0/4
[DeviceB-GigabitEthernet1/0/4] link-delay up 0
[DeviceB-GigabitEthernet1/0/4] link-delay down 0
```
Disable the spanning tree feature on the port.
```
[DeviceB-GigabitEthernet1/0/4] undo stp enable
```
Configure the port as a trunk port.
```
[DeviceB-GigabitEthernet1/0/4] port link-type trunk
```
Remove the port from VLAN 1, and assign it to VLAN 11.
```
[DeviceB-GigabitEthernet1/0/4] undo port trunk permit vlan 1
[DeviceB-GigabitEthernet1/0/4] port trunk permit vlan 11
```
Configure VLAN 11 as the default VLAN.

```
[DeviceB-GigabitEthernet1/0/4] port trunk pvid vlan 11
[DeviceB-GigabitEthernet1/0/4] quit
```

Create RRPP domain 1.

```
[DeviceB] rrpp domain 1
```

Configure VLAN 100 as the primary control VLAN of RRPP domain 1.

```
[DeviceB-rrpp-domain1] control-vlan 100
```

Configure the VLAN mapped to MSTI 1 as the protected VLAN of RRPP domain 1.

```
[DeviceB-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device B as a transit node of primary ring 1 in RRPP domain 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceB-rrpp-domain1] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceB-rrpp-domain1] ring 1 enable
```

Configure Device B as the assistant edge node of subring 3 in RRPP domain 1, with GigabitEthernet 1/0/4 as the edge port. Enable subring 3.

```
[DeviceB-rrpp-domain1] ring 3 node-mode assistant-edge edge-port gigabitethernet
1/0/4
[DeviceB-rrpp-domain1] ring 3 enable
[DeviceB-rrpp-domain1] quit
```

Create RRPP domain 2.

```
[DeviceB] rrpp domain 2
```

Configure VLAN 105 as the primary control VLAN of RRPP domain 2.

```
[DeviceB-rrpp-domain2] control-vlan 105
```

Configure the VLAN mapped to MSTI 2 as the protected VLAN of RRPP domain 2.

```
[DeviceB-rrpp-domain2] protected-vlan reference-instance 2
```

Configure Device B as the transit node of primary ring 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceB-rrpp-domain2] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceB-rrpp-domain2] ring 1 enable
```

Configure Device B as the assistant edge node of subring 2 in RRPP domain 2, with GigabitEthernet 1/0/3 as the edge port. Enable subring 2.

```
[DeviceB-rrpp-domain2] ring 2 node-mode assistant-edge edge-port gigabitethernet
1/0/3
[DeviceB-rrpp-domain2] ring 2 enable
[DeviceC-rrpp-domain2] quit
```

Enable RRPP.

```
[DeviceB] rrpp enable
```

3. Configure Device C:

Create VLANs 11 and 12.

```
<DeviceC> system-view
[DeviceC] vlan 11 to 12
```

Map VLAN 11 to MSTI 1 and VLAN 12 to MSTI 2.

```
[DeviceC] stp region-configuration
[DeviceC-mst-region] instance 1 vlan 11
[DeviceC-mst-region] instance 2 vlan 12
```

Activate the MST region configuration.

```
[DeviceC-mst-region] active region-configuration
[DeviceC-mst-region] quit
```
Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.
```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] link-delay up 0
[DeviceC-GigabitEthernet1/0/1] link-delay down 0
```
Disable the spanning tree feature on the port.
```
[DeviceC-GigabitEthernet1/0/1] undo stp enable
```
Configure the port as a trunk port.
```
[DeviceC-GigabitEthernet1/0/1] port link-type trunk
```
Remove the port from VLAN 1, and assign it to VLANs 11 and 12.
```
[DeviceC-GigabitEthernet1/0/1] undo port trunk permit vlan 1
[DeviceC-GigabitEthernet1/0/1] port trunk permit vlan 11 12
```
Configure VLAN 11 as the default VLAN.
```
[DeviceC-GigabitEthernet1/0/1] port trunk pvid vlan 11
[DeviceC-GigabitEthernet1/0/1] quit
```
Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.
```
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] link-delay up 0
[DeviceC-GigabitEthernet1/0/2] link-delay down 0
[DeviceC-GigabitEthernet1/0/2] undo stp enable
[DeviceC-GigabitEthernet1/0/2] port link-type trunk
[DeviceC-GigabitEthernet1/0/2] undo port trunk permit vlan 1
[DeviceC-GigabitEthernet1/0/2] port trunk permit vlan 11 12
[DeviceC-GigabitEthernet1/0/2] port trunk pvid vlan 11
[DeviceC-GigabitEthernet1/0/2] quit
```
Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/3.
```
[DeviceC] interface gigabitethernet 1/0/3
[DeviceC-GigabitEthernet1/0/3] link-delay up 0
[DeviceC-GigabitEthernet1/0/3] link-delay down 0
```
Disable the spanning tree feature on the port.
```
[DeviceC-GigabitEthernet1/0/3] undo stp enable
```
Configure the port as a trunk port.
```
[DeviceC-GigabitEthernet1/0/3] port link-type trunk
```
Remove the port from VLAN 1, and assign it to VLAN 12.
```
[DeviceC-GigabitEthernet1/0/3] undo port trunk permit vlan 1
[DeviceC-GigabitEthernet1/0/3] port trunk permit vlan 12
```
Configure VLAN 12 as the default VLAN.
```
[DeviceC-GigabitEthernet1/0/3] port trunk pvid vlan 12
[DeviceC-GigabitEthernet1/0/3] quit
```
Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/4.
```
[DeviceC] interface gigabitethernet 1/0/4
[DeviceC-GigabitEthernet1/0/4] link-delay up 0
[DeviceC-GigabitEthernet1/0/4] link-delay down 0
```
Disable the spanning tree feature on the port.
```
[DeviceC-GigabitEthernet1/0/4] undo stp enable
```
Configure the port as a trunk port.

```
[DeviceC-GigabitEthernet1/0/4] port link-type trunk
```

Remove the port from VLAN 1, and assign it to VLAN 11.

```
[DeviceC-GigabitEthernet1/0/4] undo port trunk permit vlan 1
[DeviceC-GigabitEthernet1/0/4] port trunk permit vlan 11
```

Configure VLAN 11 as the default VLAN.

```
[DeviceC-GigabitEthernet1/0/4] port trunk pvid vlan 11
[DeviceC-GigabitEthernet1/0/4] quit
```

Create RRPP domain 1.

```
[DeviceC] rrpp domain 1
```

Configure VLAN 100 as the primary control VLAN of RRPP domain 1.

```
[DeviceC-rrpp-domain1] control-vlan 100
```

Configure the VLAN mapped to MSTI 1 as the protected VLAN of RRPP domain 1.

```
[DeviceC-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device C as the transit node of primary ring 1 in RRPP domain 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceC-rrpp-domain1] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceC-rrpp-domain1] ring 1 enable
```

Configure Device C as the edge node of subring 3 in RRPP domain 1, with GigabitEthernet 1/0/4 as the edge port. Enable subring 3.

```
[DeviceC-rrpp-domain1] ring 3 node-mode edge edge-port gigabitethernet 1/0/4
[DeviceC-rrpp-domain1] ring 3 enable
[DeviceC-rrpp-domain1] quit
```

Create RRPP domain 2.

```
[DeviceC] rrpp domain 2
```

Configure VLAN 105 as the primary control VLAN of RRPP domain 2.

```
[DeviceC-rrpp-domain2] control-vlan 105
```

Configure the VLAN mapped to MSTI 2 as the protected VLAN of RRPP domain 2.

```
[DeviceC-rrpp-domain2] protected-vlan reference-instance 2
```

Configure Device C as the transit node of primary ring 1 in RRPP domain 2, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceC-rrpp-domain2] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceC-rrpp-domain2] ring 1 enable
```

Configure Device C as the edge node of subring 2 in RRPP domain 2, with GigabitEthernet 1/0/3 as the edge port. Enable subring 2.

```
[DeviceC-rrpp-domain2] ring 2 node-mode edge edge-port gigabitethernet 1/0/3
[DeviceC-rrpp-domain2] ring 2 enable
[DeviceC-rrpp-domain2] quit
```

Enable RRPP.

```
[DeviceC] rrpp enable
```

4. Configure Device D:

Create VLANs 11 and 12.

```
<DeviceD> system-view
[DeviceD] vlan 11 to 12
```

Map VLAN 11 to MSTI 1 and VLAN 12 to MSTI 2.

```
[DeviceD] stp region-configuration
[DeviceD-mst-region] instance 1 vlan 11
[DeviceD-mst-region] instance 2 vlan 12
```

Activate the MST region configuration.

```
[DeviceD-mst-region] active region-configuration
[DeviceD-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] link-delay up 0
[DeviceD-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceD-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceD-GigabitEthernet1/0/1] port link-type trunk
```

Remove the port from VLAN 1, and assign it to VLANs 11 and 12.

```
[DeviceD-GigabitEthernet1/0/1] undo port trunk permit vlan 1
[DeviceD-GigabitEthernet1/0/1] port trunk permit vlan 11 12
```

Configure VLAN 11 as the default VLAN.

```
[DeviceD-GigabitEthernet1/0/1] port trunk pvid vlan 11
[DeviceD-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] link-delay up 0
[DeviceD-GigabitEthernet1/0/2] link-delay down 0
[DeviceD-GigabitEthernet1/0/2] undo stp enable
[DeviceD-GigabitEthernet1/0/2] port link-type trunk
[DeviceD-GigabitEthernet1/0/2] undo port trunk permit vlan 1
[DeviceD-GigabitEthernet1/0/2] port trunk permit vlan 11 12
[DeviceD-GigabitEthernet1/0/2] port trunk pvid vlan 11
[DeviceD-GigabitEthernet1/0/2] quit
```

Create RRPP domain 1.

```
[DeviceD] rrpp domain 1
```

Configure VLAN 100 as the primary control VLAN of RRPP domain 1.

```
[DeviceD-rrpp-domain1] control-vlan 100
```

Configure the VLAN mapped to MSTI 1 as the protected VLAN of RRPP domain 1.

```
[DeviceD-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device D as the transit node of primary ring 1 in RRPP domain 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceD-rrpp-domain1] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceD-rrpp-domain1] ring 1 enable
[DeviceD-rrpp-domain1] quit
```

Create RRPP domain 2.

```
[DeviceD] rrpp domain 2
```

Configure VLAN 105 as the primary control VLAN of RRPP domain 2.

```
[DeviceD-rrpp-domain2] control-vlan 105
```

Configure the VLAN mapped to MSTI 2 as the protected VLAN of RRPP domain 2.

```
[DeviceD-rrpp-domain2] protected-vlan reference-instance 2
```

Configure Device D as the transit node of primary ring 1 in RRPP domain 2, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable ring 1.

```
[DeviceD-rrpp-domain2] ring 1 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[DeviceD-rrpp-domain2] ring 1 enable
[DeviceD-rrpp-domain2] quit
```

Enable RRPP.

```
[DeviceD] rrpp enable
```

5. Configure Device E:

Create VLAN 12.

```
<DeviceE> system-view
[DeviceE] vlan 12
```

Map VLAN 12 to MSTI 2.

```
[DeviceE-vlan12] quit
[DeviceE] stp region-configuration
[DeviceE-mst-region] instance 2 vlan 12
```

Activate the MST region configuration.

```
[DeviceE-mst-region] active region-configuration
[DeviceE-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceE] interface gigabitethernet 1/0/1
[DeviceE-GigabitEthernet1/0/1] link-delay up 0
[DeviceE-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceE-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceE-GigabitEthernet1/0/1] port link-type trunk
```

Remove the port from VLAN 1, and assign it to VLAN 12.

```
[DeviceE-GigabitEthernet1/0/1] undo port trunk permit vlan 1
[DeviceE-GigabitEthernet1/0/1] port trunk permit vlan 12
```

Configure VLAN 12 as the default VLAN.

```
[DeviceE-GigabitEthernet1/0/1] port trunk pvid vlan 12
[DeviceE-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceE] interface gigabitethernet 1/0/2
[DeviceE-GigabitEthernet1/0/2] link-delay up 0
[DeviceE-GigabitEthernet1/0/2] link-delay down 0
[DeviceE-GigabitEthernet1/0/2] undo stp enable
[DeviceE-GigabitEthernet1/0/2] port link-type trunk
[DeviceE-GigabitEthernet1/0/2] undo port trunk permit vlan 1
[DeviceE-GigabitEthernet1/0/2] port trunk permit vlan 12
[DeviceE-GigabitEthernet1/0/2] port trunk pvid vlan 12
[DeviceE-GigabitEthernet1/0/2] quit
```

Create RRPP domain 2.

```
[DeviceE] rrpp domain 2
```

Configure VLAN 105 as the primary control VLAN of RRPP domain 2.

```
[DeviceE-rrpp-domain2] control-vlan 105
```

Configure the VLAN mapped to MSTI 2 as the protected VLAN of RRPP domain 2.

```
[DeviceE-rrpp-domain2] protected-vlan reference-instance 2
```

Configure Device E as the master mode of subring 2 in RRPP domain 2, with GigabitEthernet 1/0/2 as the primary port and GigabitEthernet 1/0/1 as the secondary port. Enable ring 2.

```
[DeviceE-rrpp-domain2] ring 2 node-mode master primary-port gigabitethernet 1/0/2
secondary-port gigabitethernet 1/0/1 level 1
[DeviceE-rrpp-domain2] ring 2 enable
[DeviceE-rrpp-domain2] quit
```

Enable RRPP.

```
[DeviceE] rrpp enable
```

6. Configure Device F:

Create VLAN 11.

```
<DeviceF> system-view
[DeviceF] vlan 11
[DeviceF-vlan11] quit
```

Map VLAN 11 to MSTI 1.

```
[DeviceF] stp region-configuration
[DeviceF-mst-region] instance 1 vlan 11
```

Activate the MST region configuration.

```
[DeviceF-mst-region] active region-configuration
[DeviceF-mst-region] quit
```

Set the physical state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceF] interface gigabitethernet 1/0/1
[DeviceF-GigabitEthernet1/0/1] link-delay up 0
[DeviceF-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceF-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port.

```
[DeviceF-GigabitEthernet1/0/1] port link-type trunk
```

Remove the port from VLAN 1, and assign it to VLAN 11.

```
[DeviceF-GigabitEthernet1/0/1] undo port trunk permit vlan 1
[DeviceF-GigabitEthernet1/0/1] port trunk permit vlan 11
```

Configure VLAN 11 as the default VLAN.

```
[DeviceF-GigabitEthernet1/0/1] port trunk pvid vlan 11
[DeviceF-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceF] interface gigabitethernet 1/0/2
[DeviceF-GigabitEthernet1/0/2] link-delay up 0
[DeviceF-GigabitEthernet1/0/2] link-delay down 0
[DeviceF-GigabitEthernet1/0/2] undo stp enable
[DeviceF-GigabitEthernet1/0/2] port link-type trunk
[DeviceF-GigabitEthernet1/0/2] undo port trunk permit vlan 1
[DeviceF-GigabitEthernet1/0/2] port trunk permit vlan 11
[DeviceF-GigabitEthernet1/0/2] port trunk pvid vlan 11
[DeviceF-GigabitEthernet1/0/2] quit
```

Create RRPP domain 1.

```
[DeviceF] rrpp domain 1
```

Configure VLAN 100 as the primary control VLAN of RRPP domain 1.

```
[DeviceF-rrpp-domain1] control-vlan 100
```

Configure the VLAN mapped to MSTI 1 as the protected VLAN of RRPP domain 1.

```
[DeviceF-rrpp-domain1] protected-vlan reference-instance 1
```

Configure Device F as the master node of subring 3 in RRPP domain 1, with GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Enable subring 3.

```
[DeviceF-rrpp-domain1] ring 3 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 1
[DeviceF-rrpp-domain1] ring 3 enable
[DeviceF-rrpp-domain1] quit
```

Enable RRPP.

```
[DeviceF] rrpp enable
```

7. Configure RRPP ring group settings on Device B and Device C:

Create RRPP ring group 1 on Device B, and add subrings 2 and 3 to the RRPP ring group.

```
[DeviceB] rrpp ring-group 1
[DeviceB-rrpp-ring-group1] domain 2 ring 2
[DeviceB-rrpp-ring-group1] domain 1 ring 3
```

Create RRPP ring group 1 on Device C, and add subrings 2 and 3 to the RRPP ring group.

```
[DeviceC] rrpp ring-group 1
[DeviceC-rrpp-ring-group1] domain 2 ring 2
[DeviceC-rrpp-ring-group1] domain 1 ring 3
```

Verifying the configuration

Use the **`display`** commands to view RRPP configuration and operational information on each device.

Troubleshooting RRPP

The primary node cannot receive Hello packets when the link state is normal

Symptom

When the link state is normal, the master node cannot receive Hello packets, and it unblocks the secondary port.

Analysis

The following are possible causes:

- One or more nodes on the RRPP ring are not enabled with RRPP.
- The domain IDs or control VLANs are not the same for all nodes on the RRPP ring.
- The port on the RRPP ring does not work correctly.

Solution

To resolve the problem:

1. Use the **`display rrpp brief`** command to determine whether RRPP is enabled for all nodes. If it is not, use the **`rrpp enable`** command and the **`ring enable`** command to enable RRPP and RRPP rings for all nodes.

2. Use the **display rrpp brief** command to determine whether the domain ID and primary control VLAN ID are the same for all nodes. If they are not, set the same domain ID and primary control VLAN ID for the nodes.
3. Use the **display rrpp verbose** command to examine the link state of each port in each ring.
4. Use the **debugging rrpp** command on each node to determine whether a port receives or transmits Hello packets. If it does not, Hello packets are lost.
5. If the problem persists, contact H3C Support.

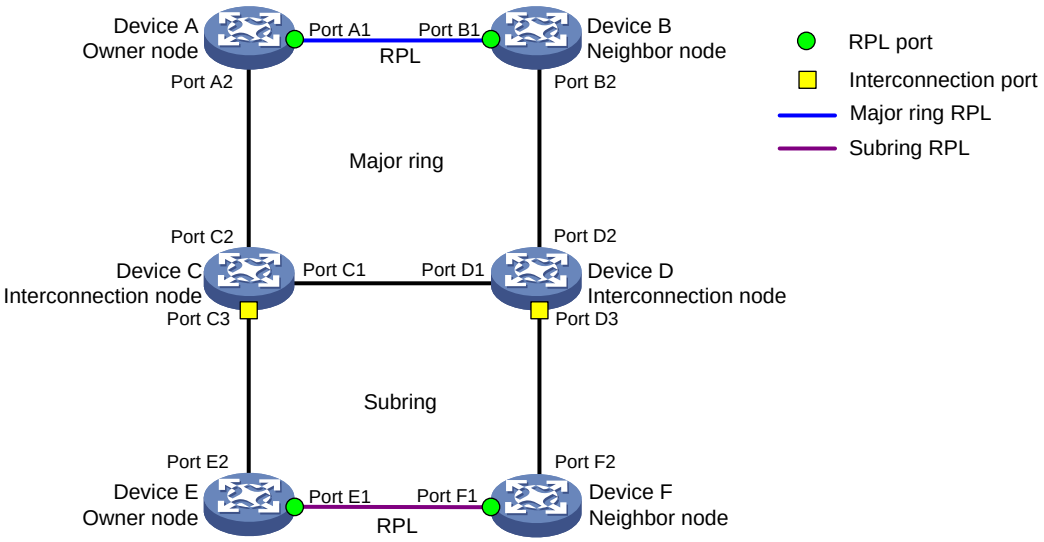
Configuring ERPS

About ERPS

Ethernet Ring Protection Switching (ERPS) is a robust link layer protocol that ensures a loop-free topology and implements quick link recovery.

ERPS structure

Figure 1 ERPS ring structure



Rings

ERPS rings can be divided into major rings and subrings. An ERPS network consists of one major ring or multiple major rings, and multiple subrings. By default, a ring is a major ring. You can configure a ring as a subring manually.

As shown in Figure 1, a major ring is a closed ring formed by Device A, Device B, Device C, and Device D. A subring is an open ring formed by the link Device C<—>Device E<—>Device F<—>Device D.

RPL

An ERPS ring is composed of many nodes. Some nodes use ring protection links (RPLs) to prevent loops on the ERPS ring. As shown in Figure 1, the link between Device A and Device B and the link between Device E and Device F are RPLs.

Nodes

ERPS nodes include owner nodes, neighbor nodes, interconnection nodes, and normal nodes.

- The owner node and neighbor node block and unblock ports on the RPL to prevent loops and switch traffic. An RPL connects an owner node and a neighbor node.
- Interconnection nodes connect different rings. Interconnection nodes reside on subrings and forward service packets but not protocol packets.
- Normal nodes forward both service packets and protocol packets.

As shown in Figure 1, on the major ring, Device A is the owner node and Device B is the neighbor node. On the subring, Device E is the owner node and Device F is the neighbor node. Devices C and D are interconnection nodes.

Ports

Each node consists of two ERPS ring member ports: Port 0 and port 1. ERPS ring member ports have the following types:

- **RPL port**—Port on an RPL link.
- **Interconnection port**—Port that connects a subring to a major ring.
- **Normal port**—Default type of a port that forwards both service packets and protocol packets.

As shown in Figure 1, ports A1, B1, E1, and F1 are RPL ports. Ports C3 and D3 are interconnection ports. Other ports are normal ports.

Instances

An ERPS ring supports multiple ERPS instances. An ERPS instance is a logical ring to process service and protocol packets. Each ERPS instance has its own owner node and maintains its own state and data. An ERPS instance is uniquely identified by the ring ID and VLAN ID of ERPS packets. The ring ID indicates the ring of ERPS packets. It can be represented by the last byte in the destination MAC address of the packets. The VLAN ID indicates the ERPS instance of the packets.

ERPS protocol packets

ERPS protocol packets are Ring Automatic Protection Switching (R-APS) packets. You can configure the R-APS packet level. A node does not process R-APS packets whose levels are greater than the level of the packets sent by the node. On a ring, the levels of R-APS packets must be the same for all nodes in an ERPS instance.

Table 1 R-APS packet types and functions

Packet type	Function
No request, RPL block (NR-RB)	When the link is stable, an owner node in idle state periodically sends NR-RB packets to inform other nodes that the RPL ports are blocked. The nodes that receive the NR-RB packets unblock available ports and update MAC address entries.
No request (NR)	After the link fault is cleared, the node that detects the recovery periodically sends NR packets. When the owner node receives the NR packets, it starts the WTR timer. The node stops sending NR packets after receiving NR-RB packets from the owner node.
Signal fail (SF)	When a link fails to send or receive signals, the node that detects the fault periodically sends SF packets. When the owner node and neighbor node receive the FS packets, they unblock the RPL ports. The node stops sending SF packets after the fault is cleared.
Manual switch (MS)	A port configured with the MS mode is blocked and periodically sends MS packets. When other nodes receive the MS packets, they unblock available ports and update MAC address entries.
Forced switch (FS)	A port configured with the FS mode is blocked and periodically sends FS packets. When other nodes receive the FS packets, they unblock all ports and update MAC address entries.
Flush	If the topology of a subring changes, the interconnection ports on the subring broadcasts flush packets. All nodes that receive the flush packets update MAC address entries.

NOTE:

- Typically R-APS packets are transmitted within a ring. The flush packets sourced from the subring can be forwarded to the major ring.
- Service packets can be transmitted between different rings.

ERPS node states

Table 2 ERPS states

State	Description
Init	State for a non-interconnection node that has less than two ERPS ring member ports or for an interconnection node that does not have ERPS ring member ports.
Idle	Stable state when all non-RPL links are available. In this state, the owner node blocks the RPL port and periodically sends NR-RB packets. The neighbor node blocks the RPL port. All nodes enter the idle state after the owner node enters the idle state.
Protection	State when a non-RPL link is faulty. In this state, the RPL link is unblocked to forward traffic. All nodes enter the protection state after a node enters the protection state.
MS	State when traffic paths are manually switched. All nodes enter the MS state after a node is configured with the MS mode.
FS	State when traffic paths are forcibly switched. All nodes enter the FS state after a node is configured with the FS mode.
Pending	Transient state between the previous states.

ERPS timers

Hold-off timer

The hold-off timer starts when the port detects a link fault. The port reports the link fault if the fault persists when the timer expires.

This timer delays the fault report time and affects the link switching performance.

Guard timer

The guard timer starts when the port detects a link recovery. The port does not process R-APS packets before the timer expires.

This timer prevents R-APS packets from impacting the network and affects the link switching performance when multiple points of failures exist.

WTR timer

In revertive mode, the WTR timer starts when the owner node in protection state receives NR packets. The RPL is unblocked and the recovered node is blocked before the timer expires. The owner node blocks the RPL and sends NR-RB packets when the timer expires. If the port receives SF packets before the timer expires, the timer stops and the RPL remains unblocked.

This timer prevents intermittent link failures from impacting the network.

WTB timer

In revertive mode, the WTB timer starts when the owner node in MS or FS state receives NR packets. The RPL is unblocked and the recovered node sends NR packets before the timer expires. The owner node blocks the RPL and sends NR-RB packets when the timer expires. If the port receives SF packets before the timer expires, the timer stops and the RPL remains unblocked.

This timer prevents the RPL ports from being blocked and unblocked frequently.

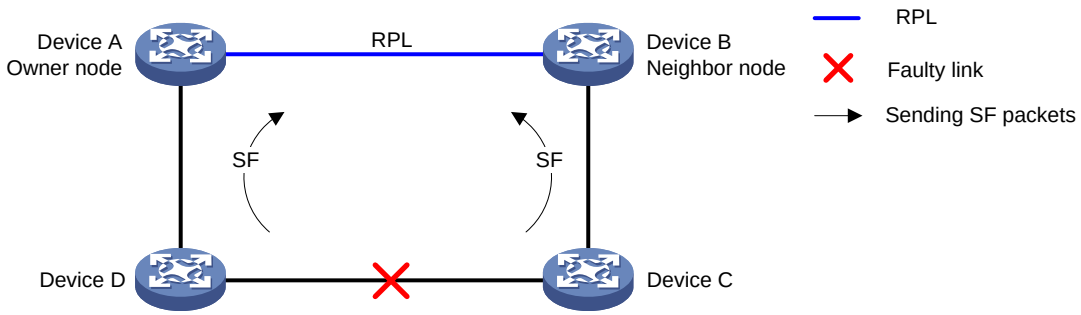
ERPS operation mechanism

ERPS uses the detection mechanism defined in ITU-T G.8032/Y.1344 to locate the point of failure and identify unidirectional or bidirectional faults.

ERPS uses the SF packets to report signal failures on a link and the NR packets to report link recovery. When a node detects a link status change, the node sends three packets first and then sends subsequent packets every five seconds.

Link-down report mechanism

Figure 2 Link-down report mechanism



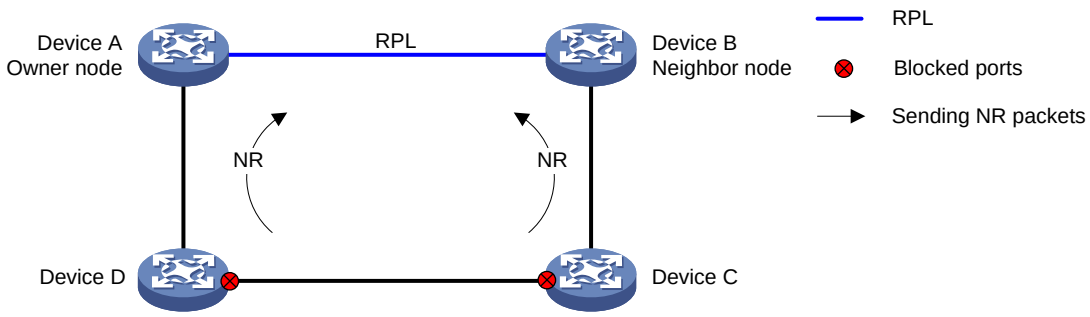
As shown in Figure 2, the link-down report mechanism uses the following process:

1. Device C and Device D detect the link failure and perform the following operations:
   a. Block the ports on both side of the faulty link.
   b. Periodically send SF packets to other nodes.
2. Device A and Device B receive the SF packets and perform the following operations:
   a. Unblock RPL ports.
   b. Update the MAC address entries.

Service packets are switched to the RPL link.

Link recovery mechanism

Figure 3 Link recovery mechanism



As shown in Figure 3, the link recovery mechanism uses the following process:

1. Device C and Device D detect the link recovery and perform the following operations:
   a. Block the recovered ports.
   b. Start the guard timer.
   c. Send NR packets.
2. When Device A (owner node) receives the NR packets, it does not perform any operations if it is in non-revertive mode. If Device A is in revertive mode, it performs the following operations:

a. Starts the WTR timer.

b. Blocks the RPL port and periodically sends NR-RB packets when the WTR timer expires.

3. When other nodes receive the NR-RB packets, they perform the following operations:

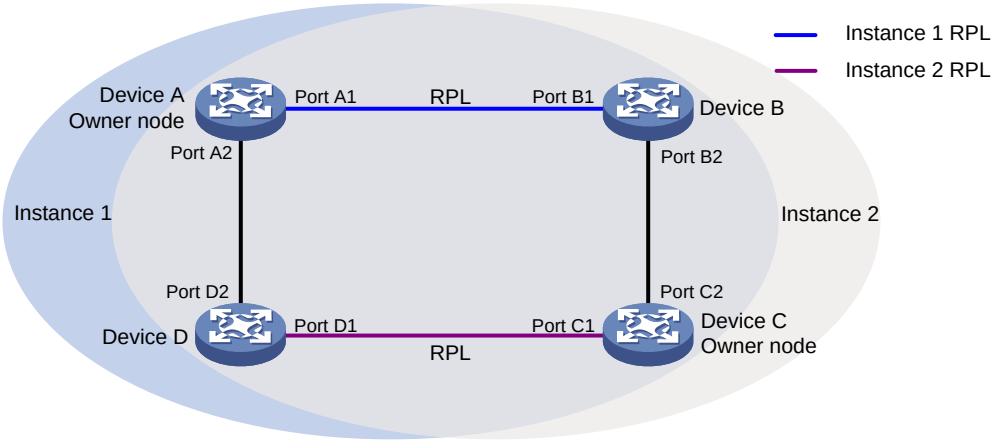
a. Device B (neighbor port) blocks the RPL port.

b. Device C and Device D unblock the recovered ports.

Service packets are switched to the recovered link.

Multi-instance load balancing mechanism

Figure 4 Multi-instance load balancing mechanism



An ERPS ring topology might carry traffic from multiple VLANs. Traffic from different VLANs can be load balanced among different ERPS instances.

ERPS uses the following types of VLANs:

- **Control VLAN**—Carries ERPS protocol packets. Each ERPS instance has its own control VLAN.
- **Protected VLAN**—Carries data packets. Each ERPS instance has its own protected VLAN. Protected VLANs are configured by using the mappings between VLANs and MSTIs.

As shown in Figure 4, the ERPS ring is configured with instance 1 and instance 2. For instance 1, the owner node is Device A, and the RPL is the link between Device A and Device B. For instance 2, the owner node is Device C, and the RPL is the link between Device C and Device D. Traffic from different VLANs can be load balanced among different links.

Manual configuration mechanism

ERPS supports the following manual configuration modes:

- **MS**—Use the **`erps switch manual`** command to block an ERPS ring member port. A port in MS mode is blocked and sends MS packets. The nodes that receive the MS packets unblock available ports. If the nodes in MS mode receive an SF packet, they unblock the blocked ports.
- **FS**—Use the **`erps switch force ring`** command to block an ERPS ring member port. A port in FS mode is blocked and sends FS packets. The nodes that receive the FS packets unblock available ports. If the nodes in FS mode receive an SF packet, they do not unblock the blocked ports.

Collaboration mechanism

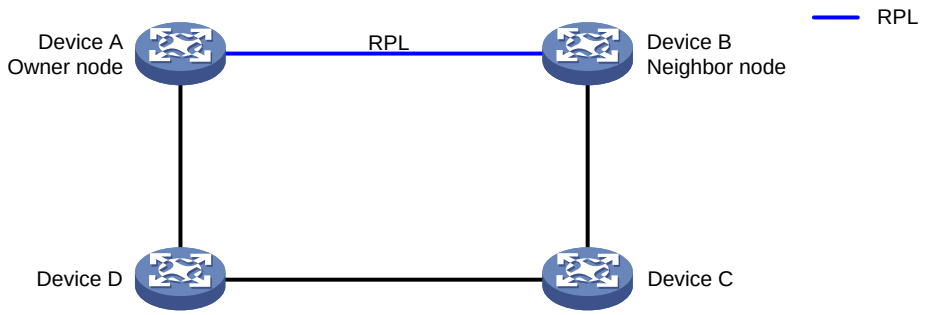
To detect and clear link faults typically for a fiber link, use ERPS with CFD and Track. You can associate ERPS ring member ports with the continuity check function of CFD through track entries. For more information about CFD and Track, see "Configuring CFD" and "Configuring Track."

ERPS network diagrams

One major ring

The network has one major ring.

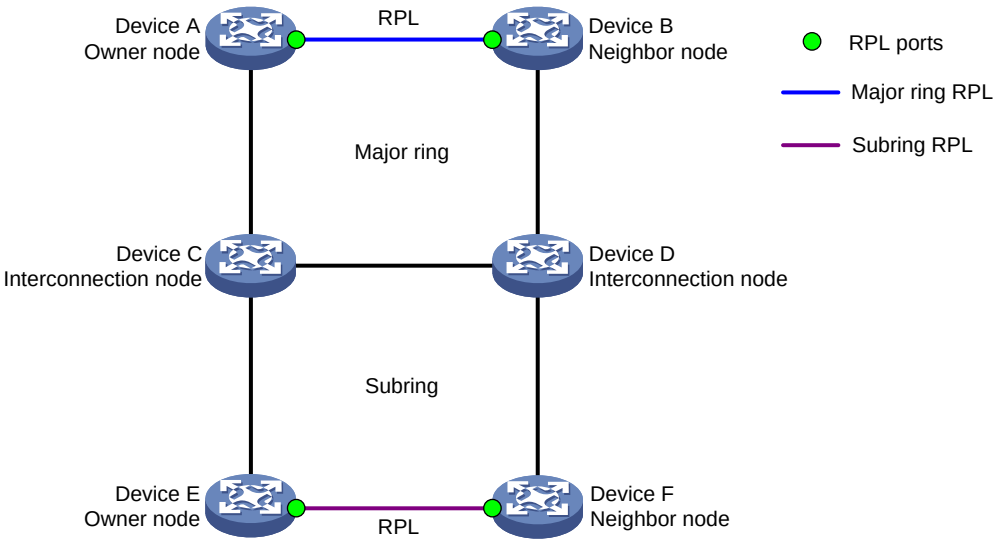
Figure 5 Network diagram



One major ring connecting one subring

The network has one major ring and one subring.

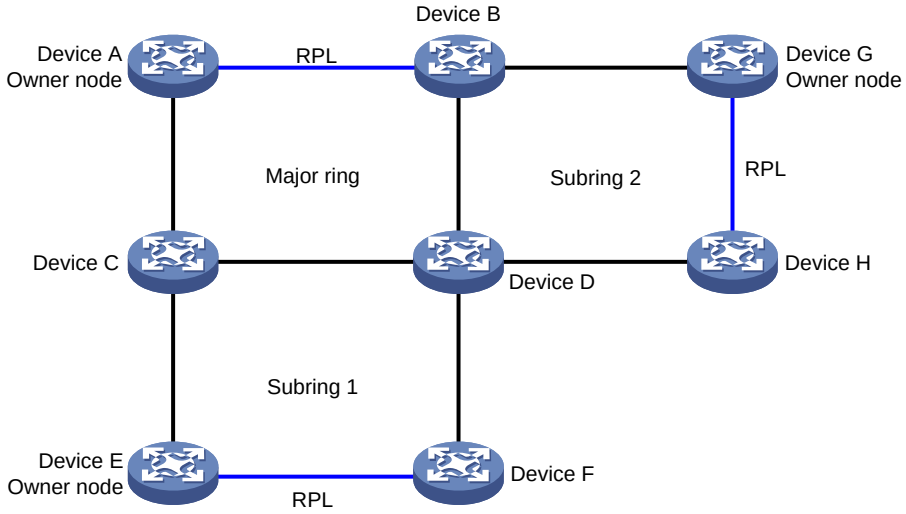
Figure 6 Network diagram



One major ring connecting multiple subrings

The network has three or more rings. Each subring is connected to the major ring by two interconnection nodes.

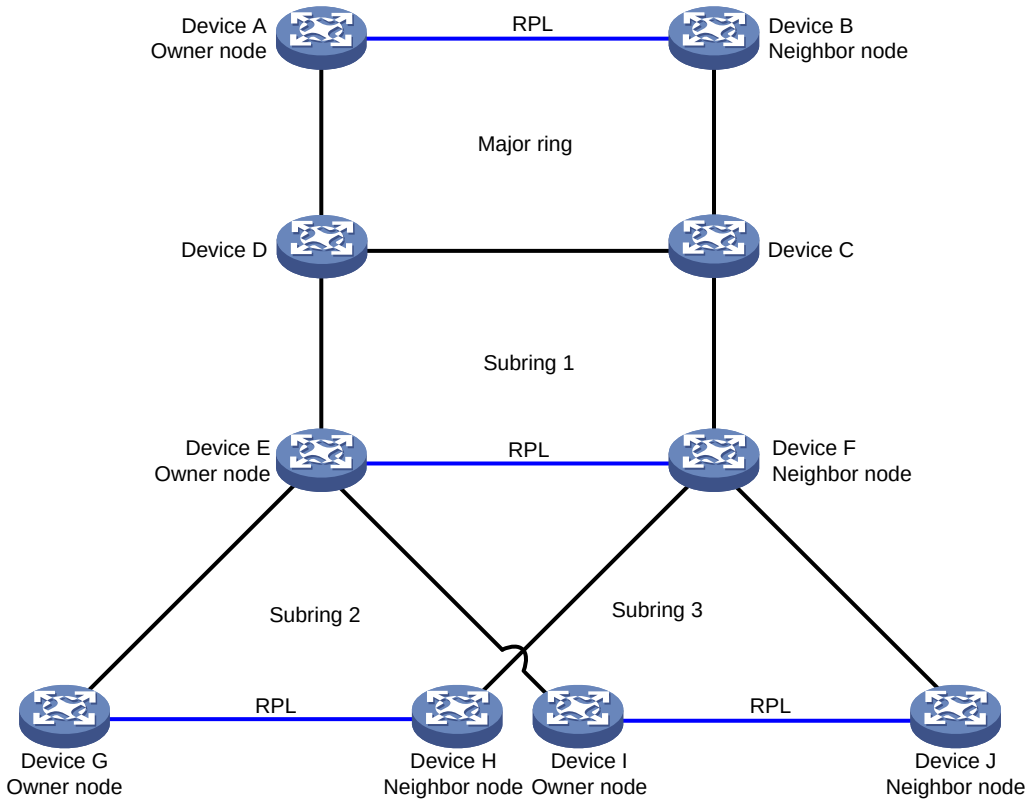
Figure 7 Network diagram



One subring connecting multiple subrings

The network has three or more rings. As shown in Figure 8, subring 1 is connected to the major ring. Other subrings are connected to subring 1 by two interconnection nodes.

Figure 8 Network diagram



One subring connecting multiple rings

The network has three or more rings. A minimum of one subring is connected to two rings. As shown in Figure 9, one interconnection node on subring 2 is connected to the major ring; and another interconnection node is connected to subring 1. As shown in Figure 10, subring 3 is connected to subring 1 and subring 2.

Protocols and standards

- ITU-T G.8032, *Recommendation ITU-T G.8032/Y.1344, Ethernet ring protection switching*
- IEEE 802.1D, *IEEE Std 802.1D™-2004, IEEE Standard for Local and Metropolitan Area Networks—Media Access Control (MAC) Bridges*
- IEEE 802.3, *IEEE Std 802.3-2008, IEEE Standard for Information technology*

Restrictions and guidelines: ERPS configuration

ERPS does not provide an election mechanism. To implement ring detection and protection, configure all nodes correctly.

ERPS tasks at a glance

To configure ERPS, perform the following tasks:

1. Enabling ERPS globally
   Perform this task on devices you want to configure as ERPS nodes.
2. Configuring an ERPS ring
   Perform this task on all nodes on an ERPS ring.
   a. Creating an ERPS ring
   b. Configuring ERPS ring member ports
   c. Configuring control VLANs
   d. Configuring protected VLANs
   e. Configuring the node role
3. Enabling ERPS for an instance
   Perform this task on all nodes on an ERPS ring.
4. (Optional.) Enabling R-APS packets to carry the ring ID in the destination MAC address
   Perform this task on all nodes on an ERPS ring.
5. (Optional.) Configuring R-APS packet levels
6. (Optional.) Setting ERPS timers
   Perform this task on the owner node on an ERPS ring.
7. (Optional.) Setting the non-revertive mode
   Perform this task on the owner node on an ERPS ring.
8. (Optional.) Setting a switchover mode
   Perform this task on the nodes that you want to block their ports.
9. (Optional.) Associating a ring with a subring
   Perform this task on the interconnection node on an ERPS ring.
10. (Optional.) Enabling flush packet transparent transmission
    Perform this task on the interconnection node on an ERPS ring.
11. (Optional.) Associating an ERPS ring member port with a track entry
12. (Optional.) Removing the MS mode and FS mode settings for an ERPS ring

Prerequisites

Before you configure ERPS, complete the following tasks:

- Establish the Ethernet ring topology.
- Determine the ERPS rings, ERPS instances, control VLANs, protected VLANs, and node roles.

Enabling ERPS globally

Restrictions and guidelines

- Perform this task on devices you want to configure as ERPS nodes.
- For ERPS to take effect for an instance, enable it globally first.

Procedure

1. Enter system view.

system-view

2. Enable ERPS globally.

   erps enable

   By default, ERPS is disabled globally.

Configuring an ERPS ring

Creating an ERPS ring

Restrictions and guidelines

- Perform this task on all nodes on an ERPS ring.
- A ring ID uniquely identifies an ERPS ring. All nodes on an ERPS ring must be configured with the same ring ID.

Procedure

1. Enter system view.

   system-view

2. Create an ERPS ring.

   erps ring *ring-id*

3. (Optional.) Configure the ring type.

   ring-type sub-ring

   By default, an ERPS ring is a major ring.

Configuring ERPS ring member ports

Restrictions and guidelines

- Perform this task on each node's ports intended for accessing ERPS rings.
- ERPS ring member ports automatically allow packets from the control VLAN to pass through.
- Do not enable Ethernet OAM remote loopback for ERPS ring member ports. This feature might cause a broadcast storm. For more information about Ethernet OAM, see "Configuring Ethernet OAM."
- For faster topology convergence, use the **link-delay** command on ERPS ring member ports to set the physical state change suppression interval to 0 seconds. For more information about the **link-delay** command, see *Layer 2—LAN Switching Command Reference*.
- You must configure ERPS ring member ports as trunk ports.
- Do not assign an interface to both an aggregation group and an ERPS ring. If you do so, the interface does not take effect on the ERPS ring and cannot be displayed by using the **display erps detail** command.

Configuring ERPS ring member port attributes

1. Enter system view.

   system-view

2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.

   interface *interface-type interface-number*

3. Configure the port as a trunk port.

   port link-type trunk

By default, a port is an access port.

For more information about this command, see *Layer 2—LAN Switching Command Reference*.

4. Assign the trunk port to protected VLANs.

   port trunk permit vlan { *vlan-id-list* | **all** }

   By default, a trunk port is assigned only to VLAN 1.

   For more information about this command, see *Layer 2—LAN Switching Command Reference*.

5. Disable the spanning tree feature.

   undo stp enable

   By default, the spanning tree feature is enabled.

   For more information about this command, see *Layer 2—LAN Switching Command Reference*.

Configuring an ERPS ring member port

1. Enter system view.

   system-view

2. Enter ERPS ring view.

   erps ring *ring-id*

3. Configure an ERPS ring member port.

   { **port0** | **port1** } **interface** *interface-type interface-number*

   By default, an ERPS ring does not have ERPS ring member ports.

Configuring control VLANs

Restrictions and guidelines

- Perform this task on all nodes on an ERPS ring.
- The control VLAN must be a VLAN that has not been created on the device.
- Configure the same control VLAN for all nodes in an ERPS instance.
- Do not configure the default VLAN of an ERPS ring member port as the control VLAN.
- Do not enable QinQ or VLAN mapping on control VLANs. If you do, ERPS packets cannot be correctly forwarded and received.
- Make sure the ERPS instance has been configured. After the ERPS instance is enabled, the control VLAN cannot be changed.
- For a device not configured with ERPS to transparently transmit ERPS packets, make sure only the two ports accessing the ERPS ring permit packets from the control VLAN. If other ports on the device permit packets from the control VLAN, the packets from other VLANs might enter the control VLAN and strike the ERPS ring.

Procedure

1. Enter system view.

   system-view

2. Enter ERPS ring view.

   erps ring *ring-id*

3. Enable ERPS instance view.

   instance *instance-id*

4. Configure a control VLAN.

   control-vlan *vlan-id*

Configuring protected VLANs

Restrictions and guidelines

- Perform this task on all nodes on an ERPS ring.
- Configure the same protected VLAN for all nodes of an ERPS instance. To implement load balancing, configure different protected VLANs for different ERPS instances.

Prerequisites

Before you configure protected VLANs, you must configure an MST region and the VLAN-to-instance mapping table. For more information about MST regions, see spanning tree configuration in *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter ERPS ring view.
   erps ring *ring-id*
3. Enable ERPS instance view.
   instance *instance-id*
4. Configure the protected VLANs.
   protected-vlan reference-instance *instance-id-list*

Configuring the node role

Restrictions and guidelines

- Perform this task on all nodes on an ERPS ring.
- For the owner node to work correctly, you must configure only one owner node for an ERPS ring.
- You can only configure the interconnection node for subrings.

Procedure

1. Enter system view.
   system-view
2. Enter ERPS ring view.
   erps ring *ring-id*
3. Enter ERPS instance view.
   instance *instance-id*
4. Configure the node role.
   node-role { { **owner** | **neighbor** } **rpl** | **interconnection** } { **port0** | **port1** }
   By default, a node is a normal node.

Enabling ERPS for an instance

Restrictions and guidelines

- Perform this task on all nodes on an ERPS ring.

- You can enable ERPS for an instance only when it is configured with a control VLAN and a protected VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter ERPS ring view.
   erps ring *ring-id*
3. Enter ERPS instance view.
   instance *instance-id*
4. Enable ERPS for the instance.
   instance enable
   By default, ERPS is disabled for an instance.

Enabling R-APS packets to carry the ring ID in the destination MAC address

About this feature

Perform this task to configure the ring ID as the last byte of the destination MAC address for R-APS packets. The ring of R-APS packets can be identified by their destination MAC addresses.

Restrictions and guidelines

Perform this task on all nodes on an ERPS ring.

Procedure

1. Enter system view.
   system-view
2. Enter ERPS ring view.
   erps ring *ring-id*
3. Enable R-APS packets to carry the ring ID in the destination MAC address.
   r-aps ring-mac
   By default, R-APS packets do not carry ring IDs in their destination MAC addresses. The last byte of the destination MAC address is 1.

Configuring R-APS packet levels

Restrictions and guidelines

Perform this task on all nodes on an ERPS ring.

On a ring, the levels of R-APS packets must be the same for all nodes in an ERPS instance.

A node does not process R-APS packets whose levels are greater than the level of R-APS packets sent by the node.

Procedure

1. Enter system view.
   system-view
2. Enter ERPS ring view.

erps ring *ring-id*

3. Enter ERPS instance view.
   instance *instance-id*
4. Configure the R-APS packet level.
   r-aps level *level-value*
   By default, the level for R-APS packets is 7.

Setting ERPS timers

Restrictions and guidelines

Perform this task on the owner node on an ERPS ring.

Procedure

1. Enter system view.
   system-view
2. Enter ERPS ring view.
   erps ring *ring-id*
3. Enter ERPS instance view.
   instance *instance-id*
4. Set the guard timer.
   timer guard *guard-value*
   By default, the guard timer is 500 milliseconds.
5. Set the hold-off timer.
   timer hold-off *hold-off-value*
   By default, the hold-off timer is 0 milliseconds.
6. Set the WTR timer.
   timer wtr *wtr-value*
   By default, the WTR timer is 5 minutes.

Setting the non-revertive mode

About setting the non-revertive mode

Perform this task if you do not want to switch back to the recovered link after the link fault is cleared.

Restrictions and guidelines

Perform this task on the owner node on an ERPS ring.

Procedure

1. Enter system view.
   system-view
2. Enter ERPS ring view.
   erps ring *ring-id*
3. Enter ERPS instance view.
   instance *instance-id*
4. Set the non-revertive mode.

revertive-operation non-revertive

By default, revertive mode is used.

Setting a switchover mode

Restrictions and guidelines

Perform this task on the nodes that you want to block their ports.

Procedure

1. Enter system view.

   system-view

2. Set a switchover mode.

   erps switch { **force** | **manual** } **ring** *ring-id* **instance** *instance-id* { **port0** | **port1** }

   By default, no switchover mode is not set.

Associating a ring with a subring

About associating a ring with a subring

On a multi-ring network, perform this task if you want to advertise topology changes in a subring to a ring.

Restrictions and guidelines

Perform this task on the interconnection node on an ERPS ring.

Procedure

1. Enter system view.

   system-view

2. Enter ERPS ring view.

   erps ring *ring-id*

3. Configure the ERPS ring as a subring.

   ring-type sub-ring

   By default, an ERPS ring is a major ring.

4. Enter ERPS instance view.

   instance *instance-id*

5. Associate a ring with the subring.

   sub-ring connect ring *ring-id* **instance** *instance-id*

   By default, a subring is not associated with any rings.

Enabling flush packet transparent transmission

About enabling flush packet transparent transmission

This feature enables the interconnection nodes to forward flush packets for topology changes in the subring to the ring associated with the subring. The associated ring can flush the MAC address table quickly to speed up convergence.

Restrictions and guidelines

Perform this task on the interconnection node on an ERPS ring.

To use this feature, you must also associate a subring on the interconnection node with the ring.

Procedure

1. Enter system view.
   system-view
2. Enable flush packet transparent transmission.
   erps tcn-propagation
   By default, flush packet transparent transmission is disabled.

Associating an ERPS ring member port with a track entry

Restrictions and guidelines

Before you associate a port with a track entry, make sure the port has joined an ERPS instance.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   interface *interface-type interface-number*
3. Associate an ERPS ring member port with a track entry.
   port erps ring *ring-id* **instance** *instance-id* **track** *track-entry-index*
   By default, an ERPS ring member port is not associated with any track entries.

Removing the MS mode and FS mode settings for an ERPS ring

About removing the MS mode and FS mode settings

After you configure this task, the owner node can ignore the WTR timer and immediately switch traffic to the recovered link upon link recovery.

This task also switches an ERPS ring in non-revertive mode to revertive mode.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view or Layer 2 aggregate interface view.
   erps clear ring *ring-id* **instance** *instance-id*

Displaying and maintaining ERPS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display brief ERPS information.	**display erps**
Display detailed ERPS information.	**display erps detail ring** *ring-id* [**instance** *instance-id*]
Display ERPS packet statistics.	**display erps statistics** [**ring** *ring-id* [**instance** *instance-id*]]
Clear ERPS packet statistics.	**reset erps statistics ring** *ring-id* [**instance** *instance-id*]

ERPS configuration examples

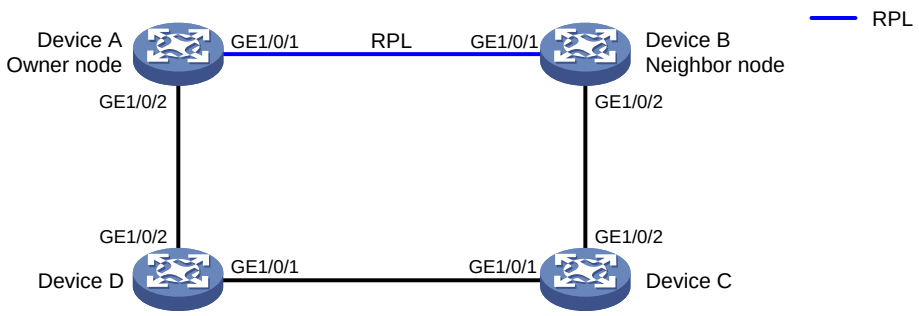
Example: Configuring one ring

Network configuration

As shown in Figure 11, perform the following tasks to eliminate loops on the network:

- Configure the ring as ERPS ring 1.
- Configure VLAN 100 as the control VLAN for ERPS ring 1.
- Configure VLANs 1 to 30 as the protected VLANs for ERPS ring 1.
- Configure Device A as the owner node, GigabitEthernet 1/0/1 as ERPS ring member port 0 and the RPL port, and GigabitEthernet 1/0/2 as ERPS ring member port 1.
- Configure Device B as the neighbor node, GigabitEthernet 1/0/1 as ERPS ring member port 0 and the RPL port, and GigabitEthernet 1/0/2 as ERPS ring member port 1.
- Configure Device C and Device D as normal nodes, GigabitEthernet 1/0/1 as ERPS ring member port 0, and GigabitEthernet 1/0/2 as ERPS ring member port 1.

Figure 11 Network diagram



Procedure

1. Configure Device A.

   # Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

   ```
   <DeviceA> system-view
   [DeviceA] vlan 1 to 30
   [DeviceA] stp region-configuration
   [DeviceA-mst-region] instance 1 vlan 1 to 30
   [DeviceA-mst-region] active region-configuration
   ```

```
[DeviceA-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] link-delay up 0
[DeviceA-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceA-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceA-GigabitEthernet1/0/1] port link-type trunk
[DeviceA-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceA-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] link-delay up 0
[DeviceA-GigabitEthernet1/0/2] link-delay down 0
[DeviceA-GigabitEthernet1/0/2] undo stp enable
[DeviceA-GigabitEthernet1/0/2] port link-type trunk
[DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceA-GigabitEthernet1/0/2] quit
```

Create ERPS ring 1.

```
[DeviceA] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceA-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceA-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Enable R-APS packets to carry ring ID in the destination MAC address.

```
[DeviceA-erps-ring1] r-aps ring-mac
```

Create ERPS instance 1.

```
[DeviceA-erps-ring1] instance 1
```

Configure the node role.

```
[DeviceA-erps-ring1-inst1] node-role owner rpl port0
```

Configure the control VLAN.

```
[DeviceA-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceA-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceA-erps-ring1-inst1] instance enable
[DeviceA-erps-ring1-inst1] quit
[DeviceA-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceA] cfd enable
[DeviceA] cfd md MD_A level 5
```

Create service instance 1, in which the MA is identified by a VLAN and serves VLAN 1.

```
[DeviceA] cfd service-instance 1 ma-id vlan-based md MD_A vlan 1
```

Configure a MEP list in service instance 1, create outward-facing MEP 1001 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceA] cfd meplist 1001 1002 service-instance 1
[DeviceA] interface gigabitethernet 1/0/1
```

```
[DeviceA-GigabitEthernet1/0/1] cfd mep 1001 service-instance 1 outbound
[DeviceA-GigabitEthernet1/0/1] cfd cc service-instance 1 mep 1001 enable
[DeviceA-GigabitEthernet1/0/1] quit
```

Create service instance 2, in which the MA is identified by a VLAN and serves VLAN 2.

```
[DeviceA] cfd service-instance 2 ma-id vlan-based md MD_A vlan 2
```

Configure a MEP list in service instance 2, create outward-facing MEP 2001 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceA] cfd meplist 2001 2002 service-instance 2
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] cfd mep 2001 service-instance 2 outbound
[DeviceA-GigabitEthernet1/0/2] cfd cc service-instance 2 mep 2001 enable
[DeviceA-GigabitEthernet1/0/2] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 1001 in service instance 1.

```
[DeviceA] track 1 cfd cc service-instance 1 mep 1001
```

Associate GigabitEthernet 1/0/1 with track entry 1 and bring up the port.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 1
[DeviceA-GigabitEthernet1/0/1] undo shutdown
[DeviceA-GigabitEthernet1/0/1] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 2001 in service instance 2.

```
[DeviceA] track 2 cfd cc service-instance 2 mep 2001
```

Associate GigabitEthernet 1/0/2 with track entry 2 and bring up the port.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 2
[DeviceA-GigabitEthernet1/0/2] undo shutdown
[DeviceA-GigabitEthernet1/0/2] quit
```

Enable ERPS.

```
[DeviceA] erps enable
```

2. Configure Device B.

Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

```
<DeviceB> system-view
[DeviceB] vlan 1 to 30
[DeviceB] stp region-configuration
[DeviceB-mst-region] instance 1 vlan 1 to 30
[DeviceB-mst-region] active region-configuration
[DeviceB-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] link-delay up 0
[DeviceB-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceB-GigabitEthernet1/0/1] undo stp enable
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
```

```
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] link-delay up 0
[DeviceB-GigabitEthernet1/0/2] link-delay down 0
[DeviceB-GigabitEthernet1/0/2] undo stp enable
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceB-GigabitEthernet1/0/2] quit
```

Create ERPS ring 1.

```
[DeviceB] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceB-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceB-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Enable R-APS packets to carry ring ID in the destination MAC address.

```
[DeviceB-erps-ring1] r-aps ring-mac
```

Create ERPS instance 1.

```
[DeviceB-erps-ring1] instance 1
```

Configure the node role.

```
[DeviceB-erps-ring1-inst1] node-role neighbor rpl port0
```

Configure the control VLAN.

```
[DeviceB-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceB-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceB-erps-ring1-inst1] instance enable
[DeviceB-erps-ring1-inst1] quit
[DeviceB-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceB] cfd enable
[DeviceB] cfd md MD_A level 5
```

Create service instance 1, in which the MA is identified by a VLAN and serves VLAN 1.

```
[DeviceB] cfd service-instance 1 ma-id vlan-based md MD_A vlan 1
```

Configure a MEP list in service instance 1, create outward-facing MEP 1002 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceB] cfd meplist 1001 1002 service-instance 1
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] cfd mep 1002 service-instance 1 outbound
[DeviceB-GigabitEthernet1/0/1] cfd cc service-instance 1 mep 1002 enable
[DeviceB-GigabitEthernet1/0/1] quit
```

Create service instance 3, in which the MA is identified by a VLAN and serves VLAN 3.

```
[DeviceB] cfd service-instance 3 ma-id vlan-based md MD_A vlan 3
```

Configure a MEP list in service instance 3, create outward-facing MEP 3002 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceB] cfd meplist 3001 3002 service-instance 3
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] cfd mep 3002 service-instance 3 outbound
```

```
[DeviceB-GigabitEthernet1/0/2] cfd cc service-instance 3 mep 3002 enable
[DeviceB-GigabitEthernet1/0/2] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 1002 in service instance 1.

```
[DeviceB] track 1 cfd cc service-instance 1 mep 1002
```

Associate GigabitEthernet 1/0/1 with track entry 1 and bring up the port.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 1
[DeviceB-GigabitEthernet1/0/1] undo shutdown
[DeviceB-GigabitEthernet1/0/1] quit
```

Create track entry 3 and associate it with the CC function of CFD for MEP 3002 in service instance 3.

```
[DeviceB] track 3 cfd cc service-instance 3 mep 3002
```

Associate GigabitEthernet 1/0/2 with track entry 3 and bring up the port.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 2
[DeviceB-GigabitEthernet1/0/2] undo shutdown
[DeviceB-GigabitEthernet1/0/2] quit
```

Enable ERPS.

```
[DeviceB] erps enable
```

3. Configure Device C.

Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

```
<DeviceC> system-view
[DeviceC] vlan 1 to 30
[DeviceC] stp region-configuration
[DeviceC-mst-region] instance 1 vlan 1 to 30
[DeviceC-mst-region] active region-configuration
[DeviceC-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] link-delay up 0
[DeviceC-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceC-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceC-GigabitEthernet1/0/1] port link-type trunk
[DeviceC-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceC-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] link-delay up 0
[DeviceC-GigabitEthernet1/0/2] link-delay down 0
[DeviceC-GigabitEthernet1/0/2] undo stp enable
[DeviceC-GigabitEthernet1/0/2] port link-type trunk
[DeviceC-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceC-GigabitEthernet1/0/2] quit
```

Create ERPS ring 1.

```
[DeviceC] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceC-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceC-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Enable R-APS packets to carry ring ID in the destination MAC address.

```
[DeviceC-erps-ring1] r-aps ring-mac
```

Create ERPS instance 1.

```
[DeviceC-erps-ring1] instance 1
```

Configure the control VLAN.

```
[DeviceC-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceC-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceC-erps-ring1-inst1] instance enable
[DeviceC-erps-ring1-inst1] quit
[DeviceC-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceC] cfd enable
[DeviceC] cfd md MD_A level 5
```

Create service instance 3, in which the MA is identified by a VLAN and serves VLAN 3.

```
[DeviceC] cfd service-instance 3 ma-id vlan-based md MD_A vlan 3
```

Configure a MEP list in service instance 3, create outward-facing MEP 3001 in service instance 3, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceC] cfd meplist 3001 3002 service-instance 3
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] cfd mep 3001 service-instance 3 outbound
[DeviceC-GigabitEthernet1/0/2] cfd cc service-instance 3 mep 3001 enable
[DeviceC-GigabitEthernet1/0/2] quit
```

Create service instance 4, in which the MA is identified by a VLAN and serves VLAN 4.

```
[DeviceC] cfd service-instance 4 ma-id vlan-based md MD_A vlan 4
```

Configure a MEP list in service instance 4, create outward-facing MEP 4001 in service instance 4, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceC] cfd meplist 4001 4002 service-instance 4
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] cfd mep 4001 service-instance 4 outbound
[DeviceC-GigabitEthernet1/0/1] cfd cc service-instance 4 mep 4001 enable
[DeviceC-GigabitEthernet1/0/1] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 3001 in service instance 3.

```
[DeviceC] track 1 cfd cc service-instance 3 mep 3001
```

Associate GigabitEthernet 1/0/2 with track entry 1 and bring up the port.

```
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 1
[DeviceC-GigabitEthernet1/0/2] undo shutdown
[DeviceC-GigabitEthernet1/0/2] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 4001 in service instance 4.

```
[DeviceC] track 2 cfd cc service-instance 4 mep 4001
```

Associate GigabitEthernet 1/0/1 with track entry 3 and bring up the port.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 2
[DeviceC-GigabitEthernet1/0/1] undo shutdown
[DeviceC-GigabitEthernet1/0/1] quit
```

Enable ERPS.

```
[DeviceC] erps enable
```

4. Configure Device D.

Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

```
<DeviceD> system-view
[DeviceD] vlan 1 to 30
[DeviceD] stp region-configuration
[DeviceD-mst-region] instance 1 vlan 1 to 30
[DeviceD-mst-region] active region-configuration
[DeviceD-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] link-delay up 0
[DeviceD-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceD-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceD-GigabitEthernet1/0/1] port link-type trunk
[DeviceD-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceD-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] link-delay up 0
[DeviceD-GigabitEthernet1/0/2] link-delay down 0
[DeviceD-GigabitEthernet1/0/2] undo stp enable
[DeviceD-GigabitEthernet1/0/2] port link-type trunk
[DeviceD-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceD-GigabitEthernet1/0/2] quit
```

Create ERPS ring 1.

```
[DeviceD] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceD-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceD-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Enable R-APS packets to carry ring ID in the destination MAC address.

```
[DeviceD-erps-ring1] r-aps ring-mac
```

Create ERPS instance 1.

```
[DeviceD-erps-ring1] instance 1
```

Configure the control VLAN.

```
[DeviceD-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceD-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceD-erps-ring1-inst1] instance enable
[DeviceD-erps-ring1-inst1] quit
[DeviceD-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceD] cfd enable
[DeviceD] cfd md MD_A level 5
```

Create service instance 2, in which the MA is identified by a VLAN and serves VLAN 2.

```
[DeviceD] cfd service-instance 2 ma-id vlan-based md MD_A vlan 2
```

Configure a MEP list in service instance 2, create outward-facing MEP 2002 in service instance 2, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceD] cfd meplist 2001 2002 service-instance 2
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] cfd mep 2002 service-instance 2 outbound
[DeviceD-GigabitEthernet1/0/2] cfd cc service-instance 2 mep 2002 enable
[DeviceD-GigabitEthernet1/0/2] quit
```

Create service instance 4, in which the MA is identified by a VLAN and serves VLAN 4.

```
[DeviceD] cfd service-instance 4 ma-id vlan-based md MD_A vlan 4
```

Configure a MEP list in service instance 4, create outward-facing MEP 4002 in service instance 4, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceD] cfd meplist 4001 4002 service-instance 4
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] cfd mep 4002 service-instance 4 outbound
[DeviceD-GigabitEthernet1/0/1] cfd cc service-instance 4 mep 4002 enable
[DeviceD-GigabitEthernet1/0/1] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 2002 in service instance 2.

```
[DeviceD] track 1 cfd cc service-instance 2 mep 2002
```

Associate GigabitEthernet 1/0/2 with track entry 1 and bring up the port.

```
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 1
[DeviceD-GigabitEthernet1/0/2] undo shutdown
[DeviceD-GigabitEthernet1/0/2] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 4002 in service instance 4.

```
[DeviceD] track 2 cfd cc service-instance 4 mep 4002
```

Associate GigabitEthernet 1/0/1 with track entry 2 and bring up the port.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 2
[DeviceD-GigabitEthernet1/0/1] undo shutdown
[DeviceD-GigabitEthernet1/0/1] quit
```

Enable ERPS.

```
[DeviceD] erps enable
```

Verifying the configuration

Display information about ERPS instance 1 for Device A.

```
[DeviceA] display erps detail ring 1
 Ring ID              : 1
 Port0                : GigabitEthernet1/0/1
```

```
Port1                 : GigabitEthernet1/0/2
Subring               : No
Default MAC           : No
Instance ID           : 1
Node role             : Owner
Node state            : Idle
Connect(ring/instance): -
Control VLAN          : 100
Protected VLAN        : Reference-instance 1
Guard timer           : 500 ms
Hold-off timer        : 0 ms
WTR timer             : 5 min
Revertive operation   : Revertive
Enable status         : Yes, Active status : Yes
R-APS level           : 7
Port                  PortRole                PortStatus
--------------------------------------------------------------------------------
Port0                 RPL                     Block
Port1                 Non-RPL                 Up
```

The output shows the following information:

- Device A is the owner node.
- The ERPS ring is in idle state.
- The RPL port is blocked.
- The non-RPL port is unblocked.

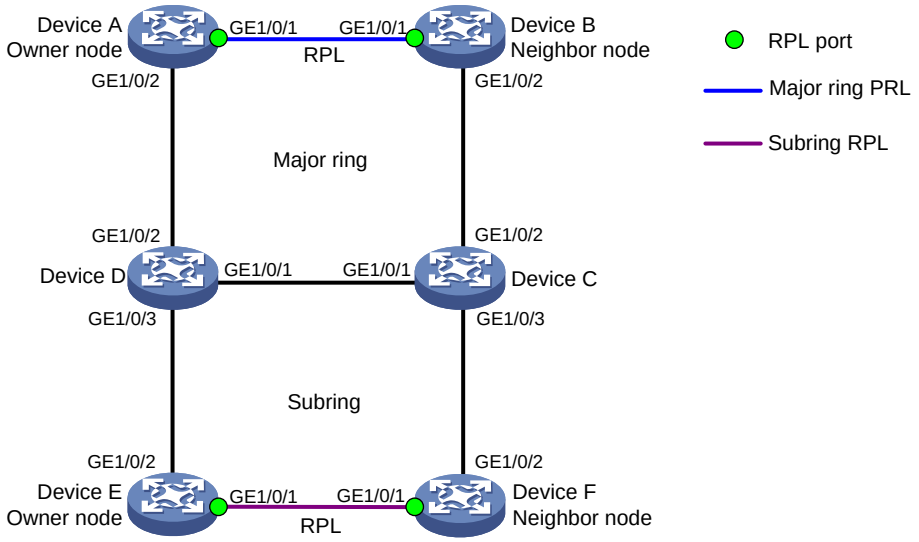
Example: Configuring one subring

Network configuration

As shown in Figure 12, perform the following tasks to eliminate loops on the network:

- Configure VLAN 100 and VLAN 200 as the control VLANs for the major ring and the subring, respectively.
- Configure VLANs 1 to 30 as the protected VLANs for the major ring and subring.
- Configure Device A as the owner node for the major ring, GigabitEthernet 1/0/1 as ERPS ring member port 0 and the RPL port, and GigabitEthernet 1/0/2 as ERPS ring member port 1.
- Configure Device B as the neighbor node for the major ring, GigabitEthernet 1/0/1 as ERPS ring member port 0 and the RPL port, and GigabitEthernet 1/0/2 as ERPS ring member port 1.
- Configure Devices C and D as interconnection nodes, GigabitEthernet 1/0/1 as ERPS ring member port 0, GigabitEthernet 1/0/2 as ERPS ring member port 1, and GigabitEthernet 1/0/3 as the interconnection port.
- Configure Device E as the owner node for the subring, GigabitEthernet 1/0/1 as ERPS ring member port 0 and the RPL port, and GigabitEthernet 1/0/2 as ERPS ring member port 1.
- Configure Device F as the neighbor node for the subring, GigabitEthernet 1/0/1 as ERPS ring member port 0 and the RPL port, and GigabitEthernet 1/0/2 as ERPS ring member port 1.

Figure 12 Network diagram



Procedure

1. Configure Device A.

   # Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

   ```
   <DeviceA> system-view
   [DeviceA] vlan 1 to 30
   [DeviceA] stp region-configuration
   [DeviceA-mst-region] instance 1 vlan 1 to 30
   [DeviceA-mst-region] active region-configuration
   [DeviceA-mst-region] quit
   ```

   # Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] link-delay up 0
   [DeviceA-GigabitEthernet1/0/1] link-delay down 0
   ```

   # Disable the spanning tree feature on the port.

   ```
   [DeviceA-GigabitEthernet1/0/1] undo stp enable
   ```

   # Configure the port as a trunk port and assign it to VLANs 1 to 30.

   ```
   [DeviceA-GigabitEthernet1/0/1] port link-type trunk
   [DeviceA-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

   ```
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] link-delay up 0
   [DeviceA-GigabitEthernet1/0/2] link-delay down 0
   [DeviceA-GigabitEthernet1/0/2] undo stp enable
   [DeviceA-GigabitEthernet1/0/2] port link-type trunk
   [DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
   [DeviceA-GigabitEthernet1/0/2] quit
   ```

   # Create ERPS ring 1.

   ```
   [DeviceA] erps ring 1
   ```

   # Configure ERPS ring member ports.

```
[DeviceA-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceA-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Create ERPS instance 1.

```
[DeviceA-erps-ring1] instance 1
```

Configure the node role.

```
[DeviceA-erps-ring1-inst1] node-role owner rpl port0
```

Configure the control VLAN.

```
[DeviceA-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceA-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceA-erps-ring1-inst1] instance enable
[DeviceA-erps-ring1-inst1] quit
[DeviceA-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceA] cfd enable
[DeviceA] cfd md MD_A level 5
```

Create service instance 1, in which the MA is identified by a VLAN and serves VLAN 1.

```
[DeviceA] cfd service-instance 1 ma-id vlan-based md MD_A vlan 1
```

Configure a MEP list in service instance 1, create outward-facing MEP 1001 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceA] cfd meplist 1001 1002 service-instance 1
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] cfd mep 1001 service-instance 1 outbound
[DeviceA-GigabitEthernet1/0/1] cfd cc service-instance 1 mep 1001 enable
[DeviceA-GigabitEthernet1/0/1] quit
```

Create service instance 2, in which the MA is identified by a VLAN and serves VLAN 2.

```
[DeviceA] cfd service-instance 2 ma-id vlan-based md MD_A vlan 2
```

Configure a MEP list in service instance 2, create outward-facing MEP 2001 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceA] cfd meplist 2001 2002 service-instance 2
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] cfd mep 2001 service-instance 2 outbound
[DeviceA-GigabitEthernet1/0/2] cfd cc service-instance 2 mep 2001 enable
[DeviceA-GigabitEthernet1/0/2] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 1001 in service instance 1.

```
[DeviceA] track 1 cfd cc service-instance 1 mep 1001
```

Associate GigabitEthernet 1/0/1 with track entry 1 and bring up the port.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 1
[DeviceA-GigabitEthernet1/0/1] undo shutdown
[DeviceA-GigabitEthernet1/0/1] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 2001 in service instance 2.

```
[DeviceA] track 2 cfd cc service-instance 2 mep 2001
```

Associate GigabitEthernet 1/0/2 with track entry 2 and bring up the port.

```
[DeviceA] interface gigabitethernet 1/0/2
```

```
[DeviceA-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 2
[DeviceA-GigabitEthernet1/0/2] undo shutdown
[DeviceA-GigabitEthernet1/0/2] quit
```

Enable ERPS.

```
[DeviceA] erps enable
```

2. Configure Device B.

Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

```
<DeviceB> system-view
[DeviceB] vlan 1 to 30
[DeviceB] stp region-configuration
[DeviceB-mst-region] instance 1 vlan 1 to 30
[DeviceB-mst-region] active region-configuration
[DeviceB-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] link-delay up 0
[DeviceB-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceB-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] link-delay up 0
[DeviceB-GigabitEthernet1/0/2] link-delay down 0
[DeviceB-GigabitEthernet1/0/2] undo stp enable
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceB-GigabitEthernet1/0/2] quit
```

Create ERPS ring 1.

```
[DeviceB] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceB-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceB-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Create ERPS instance 1.

```
[DeviceB-erps-ring1] instance 1
```

Configure the node role.

```
[DeviceB-erps-ring1-inst1] node-role neighbor rpl port0
```

Configure the control VLAN.

```
[DeviceB-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceB-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceB-erps-ring1-inst1] instance enable
```

```
[DeviceB-erps-ring1-inst1] quit
[DeviceB-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceB] cfd enable
[DeviceB] cfd md MD_A level 5
```

Create service instance 1, in which the MA is identified by a VLAN and serves VLAN 1.

```
[DeviceB] cfd service-instance 1 ma-id vlan-based md MD_A vlan 1
```

Configure a MEP list in service instance 1, create outward-facing MEP 1002 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceB] cfd meplist 1001 1002 service-instance 1
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] cfd mep 1002 service-instance 1 outbound
[DeviceB-GigabitEthernet1/0/1] cfd cc service-instance 1 mep 1002 enable
[DeviceB-GigabitEthernet1/0/1] quit
```

Create service instance 3, in which the MA is identified by a VLAN and serves VLAN 3.

```
[DeviceB] cfd service-instance 3 ma-id vlan-based md MD_A vlan 3
```

Configure a MEP list in service instance 3, create outward-facing MEP 3002 in service instance 2, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceB] cfd meplist 3001 3002 service-instance 3
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] cfd mep 3002 service-instance 3 outbound
[DeviceB-GigabitEthernet1/0/2] cfd cc service-instance 3 mep 3002 enable
[DeviceB-GigabitEthernet1/0/2] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 1002 in service instance 1.

```
[DeviceB] track 1 cfd cc service-instance 1 mep 1002
```

Associate GigabitEthernet 1/0/1 with track entry 1 and bring up the port.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 1
[DeviceB-GigabitEthernet1/0/1] undo shutdown
[DeviceB-GigabitEthernet1/0/1] quit
```

Create track entry 3 and associate it with the CC function of CFD for MEP 3002 in service instance 3.

```
[DeviceB] track 3 cfd cc service-instance 3 mep 3002
```

Associate GigabitEthernet 1/0/2 with track entry 3 and bring up the port.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 2
[DeviceB-GigabitEthernet1/0/2] undo shutdown
[DeviceB-GigabitEthernet1/0/2] quit
```

Enable ERPS.

```
[DeviceB] erps enable
```

3. Configure Device C.

Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

```
<DeviceC> system-view
[DeviceC] vlan 1 to 30
[DeviceC] stp region-configuration
[DeviceC-mst-region] instance 1 vlan 1 to 30
```

```
[DeviceC-mst-region] active region-configuration
[DeviceC-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] link-delay up 0
[DeviceC-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceC-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceC-GigabitEthernet1/0/1] port link-type trunk
[DeviceC-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceC-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] link-delay up 0
[DeviceC-GigabitEthernet1/0/2] link-delay down 0
[DeviceC-GigabitEthernet1/0/2] undo stp enable
[DeviceC-GigabitEthernet1/0/2] port link-type trunk
[DeviceC-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceC-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceC] interface gigabitethernet 1/0/3
[DeviceC-GigabitEthernet1/0/3] link-delay up 0
[DeviceC-GigabitEthernet1/0/3] link-delay down 0
[DeviceC-GigabitEthernet1/0/3] undo stp enable
[DeviceC-GigabitEthernet1/0/3] port link-type trunk
[DeviceC-GigabitEthernet1/0/3] port trunk permit vlan 1 to 30
[DeviceC-GigabitEthernet1/0/3] quit
```

Create ERPS ring 1.

```
[DeviceC] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceC-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceC-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Create ERPS instance 1.

```
[DeviceC-erps-ring1] instance 1
```

Configure the control VLAN.

```
[DeviceC-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceC-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceC-erps-ring1-inst1] instance enable
[DeviceC-erps-ring1-inst1] quit
[DeviceC-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceC] cfd enable
[DeviceC] cfd md MD_A level 5
```

Create service instance 3, in which the MA is identified by a VLAN and serves VLAN 3.

```
[DeviceC] cfd service-instance 3 ma-id vlan-based md MD_A vlan 3
```

Configure a MEP list in service instance 3, create outward-facing MEP 3001 in service instance 3, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceC] cfd meplist 3001 3002 service-instance 3
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] cfd mep 3001 service-instance 3 outbound
[DeviceC-GigabitEthernet1/0/2] cfd cc service-instance 3 mep 3001 enable
[DeviceC-GigabitEthernet1/0/2] quit
```

Create service instance 4, in which the MA is identified by a VLAN and serves VLAN 4.

```
[DeviceC] cfd service-instance 4 ma-id vlan-based md MD_A vlan 4
```

Configure a MEP list in service instance 4, create outward-facing MEP 4001 in service instance 4, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceC] cfd meplist 4001 4002 service-instance 4
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] cfd mep 4001 service-instance 4 outbound
[DeviceC-GigabitEthernet1/0/1] cfd cc service-instance 4 mep 4001 enable
[DeviceC-GigabitEthernet1/0/1] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 3001 in service instance 3.

```
[DeviceC] track 1 cfd cc service-instance 3 mep 3001
```

Associate GigabitEthernet 1/0/2 with track entry 1 and bring up the port.

```
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 1
[DeviceC-GigabitEthernet1/0/2] undo shutdown
[DeviceC-GigabitEthernet1/0/2] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 4001 in service instance 4.

```
[DeviceC] track 2 cfd cc service-instance 4 mep 4001
```

Associate GigabitEthernet 1/0/1 with track entry 2 and bring up the port.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 2
[DeviceC-GigabitEthernet1/0/1] undo shutdown
[DeviceC-GigabitEthernet1/0/1] quit
```

Create ERPS ring 2.

```
[DeviceC] erps ring 2
```

Configure ERPS ring member ports.

```
[DeviceC-erps-ring2] port0 interface gigabitethernet 1/0/3
```

Configure ERPS ring 2 as the subring.

```
[DeviceC-erps-ring2] ring-type sub-ring
```

Create ERPS instance 1.

```
[DeviceC-erps-ring2] instance 1
```

Configure the node role.

```
[DeviceC-erps-ring2-inst1] node-role interconnection port0
```

Configure the control VLAN.

```
[DeviceC-erps-ring2-inst1] control-vlan 110
```

Configure the protected VLANs.

```
[DeviceC-erps-ring2-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceC-erps-ring2-inst1] instance enable
[DeviceC-erps-ring2-inst1] quit
[DeviceC-erps-ring2] quit
```

Create service instance 5, in which the MA is identified by a VLAN and serves VLAN 5.

```
[DeviceC] cfd service-instance 5 ma-id vlan-based md MD_A vlan 5
```

Configure a MEP list in service instance 5, create outward-facing MEP 5001 in service instance 3, and enable CCM sending on GigabitEthernet 1/0/3.

```
[DeviceC] cfd meplist 5001 5002 service-instance 5
[DeviceC] interface gigabitethernet 1/0/3
[DeviceC-GigabitEthernet1/0/3] cfd mep 5001 service-instance 5 outbound
[DeviceC-GigabitEthernet1/0/3] cfd cc service-instance 5 mep 5001 enable
[DeviceC-GigabitEthernet1/0/3] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 5001 in service instance 3.

```
[DeviceC] track 1 cfd cc service-instance 5 mep 5001
```

Associate GigabitEthernet 1/0/3 with track entry 1 and bring up the port.

```
[DeviceC] interface gigabitethernet 1/0/3
[DeviceC-GigabitEthernet1/0/3] port erps ring 2 instance 1 track 1
[DeviceC-GigabitEthernet1/0/3] undo shutdown
[DeviceC-GigabitEthernet1/0/3] quit
```

Enable ERPS.

```
[DeviceC] erps enable
```

4. Configure Device D.

Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

```
<DeviceD> system-view
[DeviceD] vlan 1 to 30
[DeviceD] stp region-configuration
[DeviceD-mst-region] instance 1 vlan 1 to 30
[DeviceD-mst-region] active region-configuration
[DeviceD-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] link-delay up 0
[DeviceD-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceD-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceD-GigabitEthernet1/0/1] port link-type trunk
[DeviceD-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceD-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] link-delay up 0
[DeviceD-GigabitEthernet1/0/2] link-delay down 0
[DeviceD-GigabitEthernet1/0/2] undo stp enable
[DeviceD-GigabitEthernet1/0/2] port link-type trunk
[DeviceD-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
```

```
[DeviceD-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceD] interface gigabitethernet 1/0/3
[DeviceD-GigabitEthernet1/0/3] link-delay up 0
[DeviceD-GigabitEthernet1/0/3] link-delay down 0
[DeviceD-GigabitEthernet1/0/3] undo stp enable
[DeviceD-GigabitEthernet1/0/3] port link-type trunk
[DeviceD-GigabitEthernet1/0/3] port trunk permit vlan 1 to 30
[DeviceD-GigabitEthernet1/0/3] quit
```

Create ERPS ring 1.

```
[DeviceD] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceD-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceD-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Create ERPS instance 1.

```
[DeviceD-erps-ring1] instance 1
```

Configure the control VLAN.

```
[DeviceD-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceD-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceD-erps-ring1-inst1] instance enable
[DeviceD-erps-ring1-inst1] quit
[DeviceD-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceD] cfd enable
[DeviceD] cfd md MD_A level 5
```

Create service instance 2, in which the MA is identified by a VLAN and serves VLAN 2.

```
[DeviceD] cfd service-instance 2 ma-id vlan-based md MD_A vlan 2
```

Configure a MEP list in service instance 2, create outward-facing MEP 2002 in service instance 2, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceD] cfd meplist 2001 2002 service-instance 2
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] cfd mep 2002 service-instance 2 outbound
[DeviceD-GigabitEthernet1/0/2] cfd cc service-instance 2 mep 2002 enable
[DeviceD-GigabitEthernet1/0/2] quit
```

Create service instance 4, in which the MA is identified by a VLAN and serves VLAN 4.

```
[DeviceD] cfd service-instance 4 ma-id vlan-based md MD_A vlan 4
```

Configure a MEP list in service instance 4, create outward-facing MEP 4002 in service instance 4, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceD] cfd meplist 4001 4002 service-instance 4
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] cfd mep 4002 service-instance 4 outbound
[DeviceD-GigabitEthernet1/0/1] cfd cc service-instance 4 mep 4002 enable
[DeviceD-GigabitEthernet1/0/1] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 2002 in service instance 2.

```
[DeviceD] track 1 cfd cc service-instance 2 mep 2002
```

Associate GigabitEthernet 1/0/2 with track entry 1 and bring up the port.

```
[DeviceD] interface gigabitethernet 1/0/2
[DeviceD-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 1
[DeviceD-GigabitEthernet1/0/2] undo shutdown
[DeviceD-GigabitEthernet1/0/2] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 4002 in service instance 4.

```
[DeviceD] track 2 cfd cc service-instance 4 mep 4002
```

Associate GigabitEthernet 1/0/1 with track entry 2 and bring up the port.

```
[DeviceD] interface gigabitethernet 1/0/1
[DeviceD-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 2
[DeviceD-GigabitEthernet1/0/1] undo shutdown
[DeviceD-GigabitEthernet1/0/1] quit
```

Create ERPS ring 2.

```
[DeviceD] erps ring 2
```

Configure ERPS ring member ports.

```
[DeviceD-erps-ring2] port0 interface gigabitethernet 1/0/3
```

Configure ERPS ring 2 as the subring.

```
[DeviceD-erps-ring2] ring-type sub-ring
```

Create ERPS instance 1.

```
[DeviceD-erps-ring2] instance 1
```

Configure the node role.

```
[DeviceD-erps-ring2-inst1] node-role interconnection port0
```

Configure the control VLAN.

```
[DeviceD-erps-ring2-inst1] control-vlan 110
```

Configure the protected VLANs.

```
[DeviceD-erps-ring2-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceD-erps-ring2-inst1] instance enable
[DeviceD-erps-ring2-inst1] quit
[DeviceD-erps-ring2] quit
```

Create service instance 6, in which the MA is identified by a VLAN and serves VLAN 6.

```
[DeviceD] cfd service-instance 6 ma-id vlan-based md MD_A vlan 6
```

Configure a MEP list in service instance 6, create outward-facing MEP 6002 in service instance 3, and enable CCM sending on GigabitEthernet 1/0/3.

```
[DeviceD] cfd meplist 6001 6002 service-instance 6
[DeviceD] interface gigabitethernet 1/0/3
[DeviceD-GigabitEthernet1/0/3] cfd mep 6002 service-instance 6 outbound
[DeviceD-GigabitEthernet1/0/3] cfd cc service-instance 6 mep 6002 enable
[DeviceD-GigabitEthernet1/0/3] quit
```

Create track entry 3 and associate it with the CC function of CFD for MEP 6002 in service instance 6.

```
[DeviceD] track 3 cfd cc service-instance 6 mep 6002
```

Associate GigabitEthernet 1/0/3 with track entry 3 and bring up the port.

```
[DeviceD] interface gigabitethernet 1/0/3
[DeviceD-GigabitEthernet1/0/3] port erps ring 2 instance 1 track 3
[DeviceD-GigabitEthernet1/0/3] undo shutdown
[DeviceD-GigabitEthernet1/0/3] quit
```

Enable ERPS.

```
[DeviceD] erps enable
```

5. Configure Device E.

Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

```
<DeviceE> system-view
[DeviceE] vlan 1 to 30
[DeviceE] stp region-configuration
[DeviceE-mst-region] instance 1 vlan 1 to 30
[DeviceE-mst-region] active region-configuration
[DeviceE-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceE] interface gigabitethernet 1/0/1
[DeviceE-GigabitEthernet1/0/1] link-delay up 0
[DeviceE-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceE-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceE-GigabitEthernet1/0/1] port link-type trunk
[DeviceE-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceE-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceE] interface gigabitethernet 1/0/2
[DeviceE-GigabitEthernet1/0/2] link-delay up 0
[DeviceE-GigabitEthernet1/0/2] link-delay down 0
[DeviceE-GigabitEthernet1/0/2] undo stp enable
[DeviceE-GigabitEthernet1/0/2] port link-type trunk
[DeviceE-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceE-GigabitEthernet1/0/2] quit
```

Create ERPS ring 2.

```
[DeviceE] erps ring 2
```

Configure ERPS ring member ports.

```
[DeviceE-erps-ring2] port0 interface gigabitethernet 1/0/1
[DeviceE-erps-ring2] port1 interface gigabitethernet 1/0/2
```

Configure ERPS ring 2 as the subring.

```
[DeviceE-erps-ring2] ring-type sub-ring
```

Create ERPS instance 1.

```
[DeviceE-erps-ring2] instance 1
```

Configure the node role.

```
[DeviceE-erps-ring2] node-role owner rpl port0
```

Configure the control VLAN.

```
[DeviceE-erps-ring2-inst1] control-vlan 110
```

Configure the protected VLANs.

```
[DeviceE-erps-ring2-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceE-erps-ring2-inst1] instance enable
[DeviceE-erps-ring2-inst1] quit
```

```
[DeviceE-erps-ring2] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceE] cfd enable
[DeviceE] cfd md MD_A level 5
```

Create service instance 6, in which the MA is identified by a VLAN and serves VLAN 6.

```
[DeviceE] cfd service-instance 6 ma-id vlan-based md MD_A vlan 6
```

Configure a MEP list in service instance 6, create outward-facing MEP 6001 in service instance 6, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceE] cfd meplist 6001 6002 service-instance 6
[DeviceE] interface gigabitethernet 1/0/2
[DeviceE-GigabitEthernet1/0/2] cfd mep 6001 service-instance 6 outbound
[DeviceE-GigabitEthernet1/0/2] cfd cc service-instance 6 mep 6001 enable
[DeviceE-GigabitEthernet1/0/2] quit
```

Create service instance 7, in which the MA is identified by a VLAN and serves VLAN 7.

```
[DeviceE] cfd service-instance 7 ma-id vlan-based md MD_A vlan 7
```

Configure a MEP list in service instance 7, create outward-facing MEP 7001 in service instance 7, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceE] cfd meplist 7001 7002 service-instance 7
[DeviceE] interface gigabitethernet 1/0/1
[DeviceE-GigabitEthernet1/0/1] cfd mep 7001 service-instance 7 outbound
[DeviceE-GigabitEthernet1/0/1] cfd cc service-instance 7 mep 7001 enable
[DeviceE-GigabitEthernet1/0/1] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 6001 in service instance 6.

```
[DeviceE] track 1 cfd cc service-instance 6 mep 6001
```

Associate GigabitEthernet 1/0/2 with track entry 1 and bring up the port.

```
[DeviceE] interface gigabitethernet 1/0/2
[DeviceE-GigabitEthernet1/0/2] port erps ring 2 instance 1 track 1
[DeviceE-GigabitEthernet1/0/2] undo shutdown
[DeviceE-GigabitEthernet1/0/2] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 7001 in service instance 7.

```
[DeviceE] track 2 cfd cc service-instance 7 mep 7001
```

Associate GigabitEthernet 1/0/1 with track entry 2 and bring up the port.

```
[DeviceE] interface gigabitethernet 1/0/1
[DeviceE-GigabitEthernet1/0/1] port erps ring 2 instance 1 track 2
[DeviceE-GigabitEthernet1/0/1] undo shutdown
[DeviceE-GigabitEthernet1/0/1] quit
```

Enable ERPS.

```
[DeviceE] erps enable
```

6. Configure Device F.

Create VLANs 1 to 30, map these VLANs to MSTI 1, and activate the MST region configuration.

```
<DeviceF> system-view
[DeviceF] vlan 1 to 30
[DeviceF] stp region-configuration
[DeviceF-mst-region] instance 1 vlan 1 to 30
[DeviceF-mst-region] active region-configuration
```

```
[DeviceF-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceF] interface gigabitethernet 1/0/1
[DeviceF-GigabitEthernet1/0/1] link-delay up 0
[DeviceF-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceF-GigabitEthernet1/0/1] undo stp enable
[DeviceF-GigabitEthernet1/0/1] port link-type trunk
```

Configure the port as a trunk port and assign it to VLANs 1 to 30.

```
[DeviceF-GigabitEthernet1/0/1] port trunk permit vlan 1 to 30
[DeviceF-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceF] interface gigabitethernet 1/0/2
[DeviceF-GigabitEthernet1/0/2] link-delay up 0
[DeviceF-GigabitEthernet1/0/2] link-delay down 0
[DeviceF-GigabitEthernet1/0/2] undo stp enable
[DeviceF-GigabitEthernet1/0/2] port link-type trunk
[DeviceF-GigabitEthernet1/0/2] port trunk permit vlan 1 to 30
[DeviceF-GigabitEthernet1/0/2] quit
```

Create ERPS ring 2.

```
[DeviceF] erps ring 2
```

Configure ERPS ring member ports.

```
[DeviceF-erps-ring2] port0 interface gigabitethernet 1/0/1
[DeviceF-erps-ring2] port1 interface gigabitethernet 1/0/2
```

Configure ERPS ring 2 as the subring.

```
[DeviceF-erps-ring2] ring-type sub-ring
```

Create ERPS instance 1.

```
[DeviceF-erps-ring2] instance 1
```

Configure the node role.

```
[DeviceF-erps-ring2] node-role neighbor rpl port0
```

Configure the control VLAN.

```
[DeviceF-erps-ring2-inst1] control-vlan 110
```

Configure the protected VLANs.

```
[DeviceF-erps-ring2-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceF-erps-ring2-inst1] instance enable
[DeviceF-erps-ring2-inst1] quit
[DeviceF-erps-ring2] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceF] cfd enable
[DeviceF] cfd md MD_A level 5
```

Create service instance 5, in which the MA is identified by a VLAN and serves VLAN 5.

```
[DeviceF] cfd service-instance 5 ma-id vlan-based md MD_A vlan 5
```

Configure a MEP list in service instance 5, create outward-facing MEP 5002 in service instance 5, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceF] cfd meplist 5001 5002 service-instance 5
[DeviceF] interface gigabitethernet 1/0/2
```

```
[DeviceF-GigabitEthernet1/0/2] cfd mep 5002 service-instance 5 outbound
[DeviceF-GigabitEthernet1/0/2] cfd cc service-instance 5 mep 5002 enable
[DeviceF-GigabitEthernet1/0/2] quit
```

Create service instance 7, in which the MA is identified by a VLAN and serves VLAN 7.

```
[DeviceF] cfd service-instance 7 ma-id vlan-based md MD_A vlan 7
```

Configure a MEP list in service instance 7, create outward-facing MEP 7002 in service instance 7, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceF] cfd meplist 7001 7002 service-instance 7
[DeviceF] interface gigabitethernet 1/0/1
[DeviceF-GigabitEthernet1/0/1] cfd mep 7002 service-instance 7 outbound
[DeviceF-GigabitEthernet1/0/1] cfd cc service-instance 7 mep 7002 enable
[DeviceF-GigabitEthernet1/0/1] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 5001 in service instance 5.

```
[DeviceF] track 1 cfd cc service-instance 5 mep 5002
```

Associate GigabitEthernet 1/0/2 with track entry 1 and bring up the port.

```
[DeviceF] interface gigabitethernet 1/0/2
[DeviceF-GigabitEthernet1/0/2] port erps ring 2 instance 1 track 1
[DeviceF-GigabitEthernet1/0/2] undo shutdown
[DeviceF-GigabitEthernet1/0/2] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 7002 in service instance 7.

```
[DeviceF] track 2 cfd cc service-instance 7 mep 7002
```

Associate GigabitEthernet 1/0/1 with track entry 2 and bring up the port.

```
[DeviceF] interface gigabitethernet 1/0/1
[DeviceF-GigabitEthernet1/0/1] port erps ring 2 instance 1 track 2
[DeviceF-GigabitEthernet1/0/1] undo shutdown
[DeviceF-GigabitEthernet1/0/1] quit
```

Enable ERPS.

```
[DeviceF] erps enable
```

Verifying the configuration

Display information about ERPS instance 1 for Device A.

```
[Device A] display erps detail ring 1
 Ring ID               : 1
 Port0                 : GigabitEthernet1/0/1
 Port1                 : GigabitEthernet1/0/2
 Subring               : Yes
 Default MAC           : No
 Instance ID           : 1
 Node role             : Owner

```

```
Enable status          : Yes, Active status : Yes
R-APS level            : 7
Port                   PortRole                PortStatus
--------------------------------------------------------------------------------
Port0                  RPL                     Block
Port1                  Non-RPL                 Up
```

The output shows the following information:

- Device A is the owner node.
- The ERPS ring is in idle state.
- The RPL port is blocked.
- The non-RPL port is unblocked.

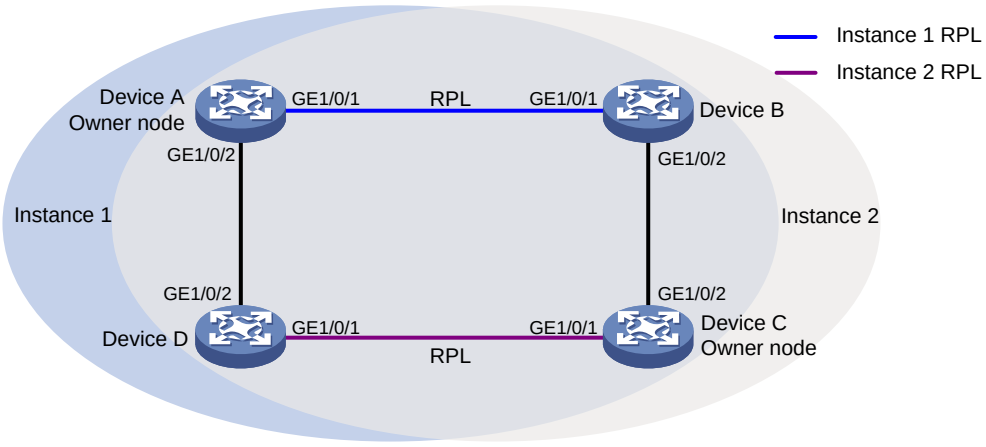
Example: Configuring one-ring multi-instance load balancing

Network configuration

As shown in Figure 13, perform the following tasks to improve network resource utilization and implement load balancing among links:

- Configure ERPS instances 1 and 2 on the ERPS ring.
- For ERPS instance 1, configure the following items:
  - Configure Device A as the owner node.
  - Configure the link between Devices A and Device B as the RPL.
  - Configure VLAN 100 as the control VLAN.
  - Configure VLANs 1 to 30 as the protected VLANs.
- For ERPS instance 2, configure the following items:
  - Configure Device A as the owner node.
  - Configure the link between Devices C and Device D as the RPL.
  - Configure VLAN 100 as the control VLAN.
  - Configure VLANs 31 to 60 as the protected VLANs.

Figure 13 Network diagram



Procedure

1. Configure Device A.

Create VLANs 1 to 60, map VLANs 1 to 30 to MSTI 1, map VLANs 31 to 60 to MSTI 2, and activate the MST region configuration.

```
<DeviceA> system-view
[DeviceA] vlan 1 to 60
[DeviceA] stp region-configuration
[DeviceA-mst-region] instance 1 vlan 1 to 30
[DeviceA-mst-region] instance 2 vlan 31 to 60
[DeviceA-mst-region] active region-configuration
[DeviceA-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] link-delay up 0
[DeviceA-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceA-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 60.

```
[DeviceA-GigabitEthernet1/0/1] port link-type trunk
[DeviceA-GigabitEthernet1/0/1] port trunk permit vlan 1 to 60
[DeviceA-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] link-delay up 0
[DeviceA-GigabitEthernet1/0/2] link-delay down 0
[DeviceA-GigabitEthernet1/0/2] undo stp enable
[DeviceA-GigabitEthernet1/0/2] port link-type trunk
[DeviceA-GigabitEthernet1/0/2] port trunk permit vlan 1 to 60
[DeviceA-GigabitEthernet1/0/2] quit
```

Create ERPS ring 1.

```
[DeviceA] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceA-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceA-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Create ERPS instance 1.

```
[DeviceA-erps-ring1] instance 1
```

Configure the node role.

```
[DeviceA-erps-ring1-inst1] node-role owner rpl port0
```

Configure the control VLAN.

```
[DeviceA-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceA-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceA-erps-ring1-inst1] instance enable
[DeviceA-erps-ring1-inst1] quit
[DeviceA-erps-ring1] quit
```

Create ERPS instance 2.

```
[DeviceA-erps-ring1] instance 2
```

Configure the control VLAN.

```
[DeviceA-erps-ring1-inst2] control-vlan 110
```

Configure the protected VLANs.

```
[DeviceA-erps-ring1-inst2] protected-vlan reference-instance 2
```

Enable ERPS for instance 2.

```
[DeviceA-erps-ring1-inst2] instance enable
[DeviceA-erps-ring1-inst2] quit
[DeviceA-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceA] cfd enable
[DeviceA] cfd md MD_A level 5
```

Create service instance 1, in which the MA is identified by a VLAN and serves VLAN 1.

```
[DeviceA] cfd service-instance 1 ma-id vlan-based md MD_A vlan 1
```

Configure a MEP list in service instance 1, create outward-facing MEP 1001 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceA] cfd meplist 1001 1002 service-instance 1
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] cfd mep 1001 service-instance 1 outbound
[DeviceA-GigabitEthernet1/0/1] cfd cc service-instance 1 mep 1001 enable
[DeviceA-GigabitEthernet1/0/1] quit
```

Create service instance 2, in which the MA is identified by a VLAN and serves VLAN 2.

```
[DeviceA] cfd service-instance 2 ma-id vlan-based md MD_A vlan 2
```

Configure a MEP list in service instance 2, create outward-facing MEP 2001 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceA] cfd meplist 2001 2002 service-instance 2
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] cfd mep 2001 service-instance 2 outbound
[DeviceA-GigabitEthernet1/0/2] cfd cc service-instance 2 mep 2001 enable
[DeviceA-GigabitEthernet1/0/2] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 1001 in service instance 1.

```
[DeviceA] track 1 cfd cc service-instance 1 mep 1001
```

Associate GigabitEthernet 1/0/1 with track entry 1 and bring up the port for ERPS instances 1 and 2.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 1
[DeviceA-GigabitEthernet1/0/1] port erps ring 1 instance 2 track 1
[DeviceA-GigabitEthernet1/0/1] undo shutdown
[DeviceA-GigabitEthernet1/0/1] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 2001 in service instance 2.

```
[DeviceA] track 2 cfd cc service-instance 2 mep 2001
```

Associate GigabitEthernet 1/0/2 with track entry 2 and bring up the port for ERPS instances 1 and 2.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 2
[DeviceA-GigabitEthernet1/0/2] port erps ring 1 instance 2 track 2
[DeviceA-GigabitEthernet1/0/2] undo shutdown
[DeviceA-GigabitEthernet1/0/2] quit
```

Enable ERPS.

```
[DeviceA] erps enable
```

2. Configure Device B.

Create VLANs 1 to 60, map VLANs 1 to 30 to MSTI 1, map VLANs 31 to 60 to MSTI 2, and activate the MST region configuration.

```
<DeviceB> system-view
[DeviceB] vlan 1 to 60
[DeviceB] stp region-configuration
[DeviceB-mst-region] instance 1 vlan 1 to 30
[DeviceB-mst-region] instance 2 vlan 31 to 60
[DeviceB-mst-region] active region-configuration
[DeviceB-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] link-delay up 0
[DeviceB-GigabitEthernet1/0/1] link-delay down 0
```

Disable the spanning tree feature on the port.

```
[DeviceB-GigabitEthernet1/0/1] undo stp enable
```

Configure the port as a trunk port and assign it to VLANs 1 to 60.

```
[DeviceB-GigabitEthernet1/0/1] port link-type trunk
[DeviceB-GigabitEthernet1/0/1] port trunk permit vlan 1 to 60
[DeviceB-GigabitEthernet1/0/1] quit
```

Configure GigabitEthernet 1/0/2 in the same way GigabitEthernet 1/0/1 is configured.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] link-delay up 0
[DeviceB-GigabitEthernet1/0/2] link-delay down 0
[DeviceB-GigabitEthernet1/0/2] undo stp enable
[DeviceB-GigabitEthernet1/0/2] port link-type trunk
[DeviceB-GigabitEthernet1/0/2] port trunk permit vlan 1 to 60
[DeviceB-GigabitEthernet1/0/2] quit
```

Create ERPS ring 1.

```
[DeviceB] erps ring 1
```

Configure ERPS ring member ports.

```
[DeviceB-erps-ring1] port0 interface gigabitethernet 1/0/1
[DeviceB-erps-ring1] port1 interface gigabitethernet 1/0/2
```

Create ERPS instance 1.

```
[DeviceB-erps-ring1] instance 1
```

Configure the node role.

```
[DeviceB-erps-ring1-inst1] node-role neighbor rpl port0
```

Configure the control VLAN.

```
[DeviceB-erps-ring1-inst1] control-vlan 100
```

Configure the protected VLANs.

```
[DeviceB-erps-ring1-inst1] protected-vlan reference-instance 1
```

Enable ERPS for instance 1.

```
[DeviceB-erps-ring1-inst1] instance enable
[DeviceB-erps-ring1-inst1] quit
[DeviceB-erps-ring1] quit
```

Create ERPS instance 2.

```
[DeviceB-erps-ring1] instance 2
```

Configure the control VLAN.

```
[DeviceB-erps-ring1-inst2] control-vlan 110
```

Configure the protected VLANs.

```
[DeviceB-erps-ring1-inst2] protected-vlan reference-instance 2
```

Enable ERPS for instance 2.

```
[DeviceB-erps-ring1-inst2] instance enable
[DeviceB-erps-ring1-inst2] quit
[DeviceB-erps-ring1] quit
```

Enable CFD, and create a level-5 MD named **MD_A**.

```
[DeviceB] cfd enable
[DeviceB] cfd md MD_A level 5
```

Create service instance 1, in which the MA is identified by a VLAN and serves VLAN 1.

```
[DeviceB] cfd service-instance 1 ma-id vlan-based md MD_A vlan 1
```

Configure a MEP list in service instance 1, create outward-facing MEP 1002 in service instance 1, and enable CCM sending on GigabitEthernet 1/0/1.

```
[DeviceB] cfd meplist 1001 1002 service-instance 1
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] cfd mep 1002 service-instance 1 outbound
[DeviceB-GigabitEthernet1/0/1] cfd cc service-instance 1 mep 1002 enable
[DeviceB-GigabitEthernet1/0/1] quit
```

Create service instance 3, in which the MA is identified by a VLAN and serves VLAN 3.

```
[DeviceB] cfd service-instance 3 ma-id vlan-based md MD_A vlan 3
```

Configure a MEP list in service instance 3, create outward-facing MEP 3002 in service instance 3, and enable CCM sending on GigabitEthernet 1/0/2.

```
[DeviceB] cfd meplist 3001 3002 service-instance 3
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] cfd mep 3002 service-instance 3 outbound
[DeviceB-GigabitEthernet1/0/2] cfd cc service-instance 3 mep 3002 enable
[DeviceB-GigabitEthernet1/0/2] quit
```

Create track entry 1 and associate it with the CC function of CFD for MEP 1002 in service instance 1.

```
[DeviceB] track 1 cfd cc service-instance 1 mep 1002
```

Associate GigabitEthernet 1/0/1 with track entry 1 and bring up the port for ERPS instances 1 and 2.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port erps ring 1 instance 1 track 1
[DeviceB-GigabitEthernet1/0/1] port erps ring 1 instance 2 track 1
[DeviceB-GigabitEthernet1/0/1] undo shutdown
[DeviceB-GigabitEthernet1/0/1] quit
```

Create track entry 2 and associate it with the CC function of CFD for MEP 3002 in service instance 3.

```
[DeviceB] track 2 cfd cc service-instance 3 mep 3002
```

Associate GigabitEthernet 1/0/2 with track entry 2 and bring up the port for ERPS instances 1 and 2.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port erps ring 1 instance 1 track 2
```

```
[DeviceB-GigabitEthernet1/0/2] port erps ring 1 instance 2 track 2
[DeviceB-GigabitEthernet1/0/2] undo shutdown
[DeviceB-GigabitEthernet1/0/2] quit
```

Enable ERPS.

```
[DeviceB] erps enable
```

3. Configure Device C.

Create VLANs 1 to 60, map VLANs 1 to 30 to MSTI 1, map VLANs 31 to 60 to MSTI 2, and activate the MST region configuration.

```
<DeviceC> system-view
[DeviceC] vlan 1 to 60
[DeviceC] stp region-configuration
[DeviceC-mst-region] instance 1 vlan 1 to 30
[DeviceC-mst-region] instance 2 vlan 31 to 60
[DeviceC-mst-region] active region-configuration
[DeviceC-mst-region] quit
```

Set the link state change suppression interval to 0 seconds on GigabitEthernet 1/0/1.

```
[DeviceC] interface gigabitethernet 1/0/1
