Conventions

1. Conversions

Convention	Description
Bold font	Commands, command options, and keywords are in **bold** font.
Italic font	Arguments for which you supply values are in *italic* font.
[ ]	Elements in square brackets are optional.
{ x | y | z }	Alternative keywords are grouped in braces and separated by vertical bars.
[x | y | z]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
&<1-n>	The argument before the sign (&) can be input for consecutive 1- n times.
//	Double slashes at the beginning of a line of code indicate a comment line.

2. Signs

The signs used in this document are described as follows:

Warning

An alert that calls attention to important rules and information that if not understood or followed can result in data loss or equipment damage.

Caution

An alert that calls attention to essential information that if not understood or followed can result in function failure or performance degradation.

Note

An alert that contains additional or supplementary information that if not understood or followed will not lead to serious consequences.

Specification

An alert that contains a description of product or version support.

3. Note

The manual offers configuration information (including model, port type and command line interface) for indicative purpose only. In case of any discrepancy or inconsistency between the manual and the actual version, the actual version prevails.

Basic Configuration Commands

1 CLI Commands

Command	Function
alias	Configure an alias for a command.
cli-python	Load and unload the Python script of CLI.
language character-set	Configure the character set encoding format for the device.
privilege	Configure the privilege level of a command.
show aliases	Display all command aliases or the command aliases in specific command modes.

1.1 alias

Function

Run the **alias** command to configure an alias for a command.

Run the **no** form of this command to delete the custom alias of a command. Then, the default alias of a command that has a default alias can be restored.

Run the **default** form of this command to restore the default configuration for a command that has a default alias.

Default aliases are available for some commands in global configuration mode or privileged EXEC mode by default.

Syntax

alias *mode command-alias original-command*

no alias *mode* [*command-alias*]

default alias *mode* [*command-alias*]

Parameter Description

mode: Name of the configuration mode of the command represented by an alias in the system.

command-alias: Command alias.

original-command: Actual command syntax represented by the alias.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- In privileged EXEC mode, the actual commands whose default aliases are h, p, s, u, and un are **help**, **ping**, **show**, **undebug**, and **undebug** respectively.
- A default command alias cannot be deleted by using the **no alias exec** command.
- You can configure a command alias to replace a command with one word. For example, you can create an alias to represent the front part of a command, and then enter the part other than the alias of the command.
- The command represented by an alias is in a command mode that already exists in the current system. In global configuration mode, you can run the **alias ?** command to list all command modes that can be configured with aliases.

```
Hostname(config)# alias ?
aaa-gs              AAA server group mode
acl                 acl configure mode
bgp                 Configure bgp Protocol
config              globle configure mode
```

- The system provides help information for command aliases. An asterisk (*) is displayed in front of an alias

and the help information is displayed in the following format:

```
*command-alias=original-command
```

For example, in privileged EXEC mode, the default command alias "s" represents the keyword **show**. If you enter "s?", help information of the keywords and aliases starting with "s" is displayed.

```
Hostname# s?
*s=show  show  start-chat  start-terminal-service
```

- If the command represented by an alias contains more than one word, the command is displayed in a pair of quotation marks. For example, in privileged EXEC mode, configure the alias "sv" to replace the **show version** command.

```
Hostname# s?
*s=show  *sv="show version" show  start-chat
start-terminal-service
```

- An alias must start with the first character of a command line and no space is allowed before the alias. As shown in the example above, if you enter a space in front of the command, the alias becomes an invalid alias.

```
Hostname# s?
show  start-chat  start-terminal-service
```

- The system also provides help information of command parameters for a command alias. For example, if you configure the command alias "ia" in interface configuration mode to represent **ip address**, and enter **ia ?** in the interface configuration mode, the following notification is displayed.

```
Hostname(config-if)# ia ?
A.B.C.D  IP address
dhcp     IP Address via DHCP
Hostname(config-if)# ip address
```

Information of the parameters following the **ip address** command is provided and the command alias is replaced with the actual command.

- An alias must be entered in full when it is used; otherwise, it cannot be identified.
- You can use the **show aliases** command to display alias configuration in the system.

Examples

The following example configures the command alias "def-route" to represent the route configuration command **ip route 0.0.0.0 0.0.0.0 192.168.1.1** in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# alias config def-route ip route 0.0.0.0 0.0.0.0 192.168.1.1
Hostname(config)# def-route?
*def-route="ip route 0.0.0.0 0.0.0.0 192.168.1.1"
Hostname(config)# end
Hostname# show aliases config
globle configure mode alias:
def-route          ip route 0.0.0.0 0.0.0.0 192.168.1.1
```

Notifications

A command alias cannot be longer than19 characters. Otherwise, the following notification is displayed.

```
% Overly long alias name truncated after 19 characters.
```

The actual command string represented by an alias cannot be longer than 255 characters. Otherwise, the following notification is displayed.

```
% Command alias string too long.
```

A maximum of 100 aliases are supported in a single command mode. Otherwise, the following notification is displayed.

```
% Can't add more than 100 command aliases in single mode.
```

If an alias fails to be added due to various reasons (for example, insufficient memory), the following notification is displayed.

```
% Adding command alias fail.
```

Common Errors

N/A

Platform Description

On the command line interface (CLI), configure one word as the alias of one command. Enter this word. If it can replace this command, the configured alias is valid.

Related Commands

- **show aliases**

1.2 cli-python

Function

Run the **cli-python** command to load and unload the Python script of CLI.

Syntax

cli-python { **insmod** | **rmmod** } *python-filename*

Parameter Description

insmod *python-filename*: Loads the Python script of CLI. *python-filename* indicates the full name of the Python script file.

rmmod *python-filename*: Unloads the Python script of CLI. *python-filename* indicates the full name of the Python script file.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to upload the Python script file to the root directory of flash disk of the device and /data under shell, and run the Python loading command to load the Python script.

Examples

The following example loads the **Hostname.Py** script.

```
Hostname> enable
Hostname# cli-python insmod Hostname.py
% Python script module "Hostname.py" insert success.
```

1.3 language character-set

Function

Run the **language character-set** command to configure the character set encoding format for the device.

Hybrid formats are supported by default.

Syntax

language character-set { **default** | **GBK** | **UTF-8** }

Parameter Description

default: Sets the character set encoding format to the default format (hybrid formats supported).

GBK: Sets the character set encoding format to GBK.

UTF-8: Sets the character set encoding format to UTF-8.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When hybrid formats exist in current running configurations, you must manually delete running configurations containing the encoding format different from the target format before modifying the character set encoding format.

Examples

The following example sets the character set encoding format of the device to UTF-8.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# language character-set UTF-8
This may take some time to build configuration, Continue? (yes[no]): y
```

1.4 privilege

Function

Run the **privilege** command to configure the privilege level of a command.

Run the **no** form of this command to restore the privilege level of the command to the default value.

Syntax

privilege *mode* [**all**] { **level** *level* | **reset** } *command-string*

no privilege *mode* [**all**] [**level** *level*] *command-string*

Parameter Description

mode: Name of the configuration mode of the command. Whether this parameter is supported depends on the actual product version.

all: Changes the privilege levels of all subcommands contained in a specific command to the same level.

level *level*: Specifies the privilege level of a command or a subcommand. The range is from 0 to 15.

reset: Restores the command privilege level to the default value.

command-string: Command string to be assigned with a privilege level.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

- In global configuration mode, you can use the **privilege ?** command to display all CLI command modes, to which a privilege level is assigned. The number of command modes that can be assigned with a privilege level varies with products. Some command modes are described as follows:
  - config: Indicates the global configuration mode.
  - exec: Indicates the privileged EXEC mode.
  - interface: Indicates the interface configuration mode.
  - ip-dhcp-pool: Indicates the Dynamic Host Configuration Protocol (DHCP) address pool configuration mode.
  - keychain: Indicates the keychain configuration mode.
  - keychain-key: Indicates the keychain-key configuration mode.
  - time-range: Indicates the time-range configuration mode.
- Select a command which is supported for users at a higher privilege level (for example, privilege level 14) but is not supported for users at a lower privilege level (for example, privilege level 1), and then specify a lower privilege level for command execution. Switch the user to a lower privilege level. If this command can be executed, the permission is assigned.

Examples

The following example sets the password for users at privilege level 1 to access CLI to **test**, and sets the permission for running the **reload** command to reset the device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# privilege exec level 1 reload
```

The following example verifies that users at privilege level 1 can access CLI to use the **reload** command.

```
Hostname> reload ?
LINE    Reason for reload
<cr>
```

The following example assigns the permission to run all subcommands of the **reload** command to users at privilege level 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# privilege exec all level 1 reload
```

The following example verifies that users at privilege level 1 can access CLI to use all subcommands of the **reload** command.

```
Hostname> reload ?
LINE    Reason for reload
at                  reload at a specific time/date
cancel              cancel pending reload scheme
```

```
in                  reload after a time interval
```

1.5 show aliases

Function

Run the **show aliases** command to display all command aliases or the command aliases in specific command modes.

Syntax

show aliases [*mode*]

Parameter Description

mode: Command mode of the command represented by an alias.

Command Modes

All modes except user EXEC mode

Default Level

14

Usage Guidelines

If no command mode is entered, all command aliases you have set are displayed.

Examples

The following example displays the command aliases in privileged EXEC mode.

```
Hostname> enable
Hostname# show aliases exec
exec mode alias:
h                   help
p                   ping
s                   show
u                   undebug
un                  undebug
```

1 ZAM Commands

Command	Function
show zam	Display the current configurations and status of ZAM.
zam	Enable the ZAM function.

1.1 show zam

Function

Run the **show zam** command to display the current configurations and status of ZAM.

Syntax

show zam

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

1

Usage Guidelines

N/A

Examples

The following example displays the current configurations and status of ZAM.

```
Hostname> enable
Hostname# show zam
ZAM state          : enable
ZAM status         : Now is idle
Server ip           :NULL
Usb path            :NULL
Interface name       :NULL
Interface type       :UNKNOWN
Succ Interface name   :NULL
Script URL          :NULL
```

Table 1-1 Output Fields of the show zam Command

Field	Description
ZAM state	Whether ZAM is enabled or disabled.
ZAM status	Current status of ZAM.
Server ip	IP address of the TFTP server.
Usb path	USB path.
Interface name	Interface name.
Interface type	Interface type.

Field	Description
Succ Interface name	Last fetched interface name.
Script URL	Script URL.

1 Basic Management Commands

Command	Function
banner	Configure a prompt.
boot config	Modify the storage path and name of the startup configuration file.
calendar set	Configure the hardware time of the system.
checkpoint	Configure a checkpoint.
clear checkpoint database	Clear checkpoints and related data.
clear telnet ip-block	Clear entries about blocked IP addresses and authentication failures.
clock read-calendar	Configure the system to synchronize the software time with the hardware time.
clock set	Configure the software time of the system.
clock summer-time	Configure the DST.
clock timezone	Configure a time zone.
clock update-calendar	Configure the system to synchronize the hardware time with the software time.
configure	Enter the global configuration mode.
cpu high-watermark set	Configure the maximum threshold for the total CPU usage of all control cores and enable CPU usage monitoring.
disconnect	Close a suspended telnet client session.
do telnet	Log in to the telnet server.
enable	Enter the privileged EXEC mode or switch a role.
enable default role	Configure the default role for running the enable commands.
enable password	Configure passwords for different privilege levels.
enable secret	Configure secure encrypted passwords for different privilege levels.
enable service	Enable a specified service.

end	Exit the current mode and return to the privileged EXEC mode.
exec-banner	Enable EXEC prompt information display for a specific line.
exec-timeout	Set the connection timeout time of the device on a line.
execute	Run commands in the batch file.
exit	Exit the configuration mode and return to the upper-level mode or exit the command line interface (CLI) from the privileged EXEC mode.
Help	Display a brief description of the help system.
hostname	Specify or modify the host name of the device.
ip telnet access-class	Configure an access control list (ACL) for the telnet server.
ip telnet ip-block	Configure the maximum number of consecutive authentication failures, beyond which an IP address is blocked on the telnet server, and to specify the period for awakening the blocked IP address.
ip telnet source-interface	Specify the IP address of an interface as the source IP address of a telnet connection.
ipv6 telnet access-class	Configure an IPv6 ACL for a telnet server.
lock	Set a temporary password on a terminal to lock the terminal CLI to prevent access while keeping the session.
lockable	Enable the locking feature for terminals connected to the current line.
login	Configure simple login password verification for a line.
login access non-aaa	Enable non-AAA authentication for a line when the AAA service is enabled.
login local	Configure local user authentication for a line.
login privilege log	Configure the logging function for privilege level increase or role switching.
memory history clear	Clear historical memory usage records.
memory low-watermark set	Enable the monitoring of memory usage threshold.

motd-banner	Enable MOTD information display for a specific line.
password	Configure a password for line-based login.
prompt	Configure a CLI prompt.
reload	Restart the device immediately.
reload at	Configure the scheduled restart function.
reload cancel	Cancel scheduled restart.
reload in	Configure the countdown restart function.
rollback running-config checkpoint	Roll back the running configurations of the device to configurations of a checkpoint.
secret	Configure an MD5/SHA-256 irreversible encrypted password for line-based login.
session	Connect to a supervisor module or service card in a virtual switching unit (VSU) environment.
session-timeout	Configure the timeout time for sessions established to a remote terminal on the current line.
show boot config	Display the saving paths and names of startup configuration files.
show calendar	Display the hardware time of the system.
show checkpoint	Display information about a single checkpoint or a summary of all checkpoints.
show clock	Display the software time of the system.
show cpu	Display CPU usage information of system tasks on control cores and non-virtual cores.
show debugging	Check whether the debugging function of the device is enabled.
show hostname	Display the host name of the device.
show language character-set	Display the character set encoding format of the device.
show line	Display configurations of a line.
show memory	Display memory information.
show memory vsd	Display memory information.

show pci-bus	Display information about devices mounted on the Peripheral Component Interconnect (PCI) bus.
show processes cpu	Display system tasks.
show processes cpu detailed	Display details about a specific task.
show reload	Display system restart configuration.
show running-config	Display the running configurations of the device system or configurations of an interface.
show service	Display the service status (enabled/disabled).
show sessions	Display information about connected telnet clients.
show startup-config	Display device configurations stored in the non-volatile random-access memory (NVRAM).
show sysmon grpc info	Display information about the gRPC function registered in the system monitoring process.
show telnet ip-block	Display information about blocked IP addresses and authentication failures.
show this	Display effective system configurations in current mode.
show usb-bus	Display information about devices mounted on the USB bus.
show version	Display the system version.
telnet	Log in to the telnet server.
username	Configure a local user account and optional authorization information.
username export	Export user information to a text file.
username import	Import user information from a text file.
write	Save system configurations (running-config) to a specific position.

1.1 banner

Function

Run the **banner** command to configure a prompt.

Run the **no** form of this command to remove this configuration.

No prompt is configured by default.

Syntax

banner { **exec** | **incoming** | **login** | **motd** | **privilege-mode** | **prompt-timeout** | **slip-ppp** } *c message c*

no banner { **exec** | **incoming** | **login** | **motd** | **privilege-mode** | **prompt-timeout** | **slip-ppp** }

Parameter Description

exec: Configures a prompt for the access to the user EXEC mode of a line.

incoming: Configures a prompt for the establishment of reverse telnet connections.

login: Configures the login banner information.

motd: Configures the message of the day (MOTD) information.

privilege-mode: Configures a prompt for the access to the privileged EXEC mode.

prompt-timeout: Configures a prompt for login authentication timeout.

slip-ppp: Configures a prompt for SLIP/PPP line connection.

c: Configures a delimiter between the command keyword and the prompt.

message: Configures prompt content, which must contain no delimiters.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Any prompt configured by this command applies to all lines. Characters following the second delimiter are invalid and are discarded.

When a user logs in to the device, the MOTD information (configured using **banner motd**) and login banner information (configured using **banner login**) first appear. Upon login, the incoming prompt (**banner incoming**) is displayed in case of a reverse telnet connection and the EXEC prompt information (**banner exec**) is displayed in case of other connections.

Examples

The following example sets the prompt displayed when a user enters the user EXEC mode to **Welcome to use this device**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# banner exec $ Welcome to use this device. $
```

Related Commands

- **exec-banner**
- **motd-banner**

1.2 boot config

Function

Run the **boot config** command to modify the storage path and name of the startup configuration file.

Run the **no** form of this command to remove this configuration.

The startup configuration file is stored in **Flash:/** and named **config.text** by default.

Syntax

boot config { **flash:***filename* | **usb0:***filename* }

no boot config

Parameter Description

flash: Saves the startup configuration file to the extended flash memory.

usb0: Saves the startup configuration file to Universal Serial Bus (USB) 0. This option is supported only when the device has one USB port with a USB flash drive inserted.

filename: Name of the startup configuration file.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- The name of the startup configuration file must follow a slash (/), for example, **flash:/Hostname.text** or **usb0:/Hostname.text**.
- The name of the startup configuration file can be a path. If the path does not exist, the **write** command fails to save the configurations. For example, if the name of the startup configuration file is set to **flash:/Hostname/Hostname.text** or **usb0:/Hostname/Hostname.text**, in which the folders **flash:/Hostname** and **usb0:/Hostname** must exist. In master-slave mode, the paths of all devices must exist.

- To save the startup configuration file to a USB flash drive, the device must offer a USB port with a USB flash drive inserted. Otherwise, the **write** command fails to save the configurations. In master-slave mode, all devices must have a USB flash drive inserted.

Examples

The following example sets the storage path of the startup configuration file to **flash:/Hostname.text**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# boot config flash:/Hostname.text
```

1.3 calendar set

Function

Run the **calendar set** command to configure the hardware time of the system.

The default hardware time of the device is **1970-01-01 00:00:00**.

Syntax

calendar set *hh:mm:ss* [*MM* [*DD* [*YY*]]]

Parameter Description

hh:mm:ss: Hardware time of the system. *hh* indicates hours, *mm* indicates minutes, and *ss* indicates -seconds.

MM: Month. The range is from 1 to 12. If it is not specified, the current month of the system is used.

DD: Day. The range is from 1 to 31. If it is not specified, the current day of the system is used.

YY: Year. The range is from 1970 to 2037. If it is not specified, the current year of the system is used.

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

- The time parameter *hour* is a mandatory field. Even if the parameter value is modified, the hour value

consistent with the current hour needs to be entered. Other parameters can be omitted if they do not need to be modified. The current system values are used for omitted parameters. For example, if the current hardware time is "2012-02-29 09:33:44" and you want to change the month and hour but keep the values of other parameters, run the **calendar set** *12 5* command to change the current time to **2012-05-29 12:33:44**.

- The hardware time of the system is used as the Coordinated Universal Time (UTC), while the software time of the system refers to the local time of the device.
- This command is supported only by virtual switch device (VSD) 0 only. In multi-VSD mode, this command is invalid.

Examples

The following example sets the hardware time of the system to 2020-01-01 18:23:06.

```
Hostname> enable
Hostname# calendar set 18:23:06 1 1 2020
Set hardware time: 18:23:06 GMT Wed, Jan 1, 2020
Hostname#
```

1.4 checkpoint

Function

Run the **checkpoint** command to configure a checkpoint.

Run the **no** form of this command to remove this configuration.

No checkpoint is configured by default.

Syntax

checkpoint [*checkpoint-name*] [**description** *description*]

no checkpoint *checkpoint-name*

Parameter Description

checkpoint-name: Checkpoint name. The value is a string of 1 to 80 characters.

description *description*: Configures checkpoint description. *description* indicates the description of the checkpoint, which cannot be longer than 80 characters.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

When a checkpoint is created, the system collects and saves a copy of the current configurations. Up to 10 rollback checkpoints can be created at the same system layer.

If no checkpoint name is specified in the command, the system automatically specifies a name.

Examples

The following example configures a checkpoint that uses the default name.

```
Hostname> enable
Hostname# checkpoint
.
user-checkpoint-1 created Successfully

Done
```

1.6 clear telnet ip-block

Function

Run the **clear telnet ip-block** command to clear entries about blocked IP addresses and authentication failures.

Syntax

clear telnet ip-block { **all** | [*ipv4-address* | *ipv6-address*] }

Parameter Description

all: Clears all entries about blocked IP addresses and authentication failures.

ipv4-address: Entries about specific blocked source IPv4 addresses and authentication failures.

ipv6-address: Entries about specific blocked source IPv6 addresses and authentication failures.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

After entries about blocked IP addresses are cleared, these blocked IP addresses are awakened immediately and users using these IP addresses can log in to the device through the telnet client.

Examples

The following example clears all entries about blocked IP addresses and authentication failures.

```
Hostname> enable
Hostname# clear telnet ip-block all
```

1.7 clock read-calendar

Function

Run the **clock read-calendar** command to configure the system to synchronize the software time with the hardware time.

The system is not configured to synchronize the software time with the hardware time by default.

Syntax

clock read-calendar

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.

After you run this command, the system will synchronize the software time with the current hardware time according to the time zone and daylight saving time (DST) configuration of the device.

Examples

The following example configures the system to synchronize the software time with the hardware time.

```
Hostname> enable
Hostname# clock read-calendar
Set the system clock from the hardware time.
```

1.8 clock set

Function

Run the **clock set** command to configure the software time of the system.

The default software time is **1970-01-01 00:00:00**.

Syntax

clock set *hh:mm*:*ss* [*MM* [*DD* [*YY*]]]

Parameter Description

hh:mm:*ss*: Software time of the system. *hh* indicates hours, *mm* indicates minutes, and *s* indicates seconds.

MM: Month. The range is from 1 to 12. If it is not specified, the current month of the system is used.

DD: Day. The range is from 1 to 31. If it is not specified, the current day of the system is used.

YY: Year. The range is from 1970 to 2037. If it is not specified, the current year of the system is used.

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

The time parameter *hour* is a mandatory field. Even if the parameter value is modified, the hour value consistent with the current hour needs to be entered. Other parameters can be omitted if they do not need to be modified. The current system values are used for omitted parameters. For example, if the current software time is "2020-02-29 09:33:44" and you want to change the month and hour but keep the values of other parameters, run the **clock set** *1 2 5* command to change the current time to **2020-05-29 12:33:44**.

This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.

Examples

The following example sets the software time of the system to **2020-01-02 18:23:06**.

```
Hostname> enable
```

```
Hostname# clock set 18:23:06 1 2 2020
Set system clock: 18:23:06 UTC Thu, Jan 2, 2020
```

1.9 clock summer-time

Function

Run the **clock summer-time** command to configure the DST.

Run the **no** form of this command to remove this configuration.

Syntax

clock summer-time *summer-time-zone* **start** *start-month* [*week* | **last**] *start-date hh:mm* **end** *end-month* [*week* | **last**] *end-date hh:mm* [**ahead** *hours-offset* [*minutes-offset*]]

no clock summer-time

Parameter Description

summer-time-zone: DST name. The value is a case-insensitive string of 3 to 31 characters containing only English letters.

start: Specifies the start time for the DST to take effect.

start-month: Start month of the DST. The value is **January**, **February**, **March**, **April**, **May**, **June**, **July**, **August**, **September**, **October**, **November**, or **December**. The value is case-insensitive, and you are allowed to enter an incomplete word, for example, **Febr** or **FebRu**.

week: Start week in the specified start month. The range is from 1 to 5.

last: Specifies the last week in a month.

start-date: Start day in the specified start month. The value is **Sunday**, **Monday**, **Tuesday**, **Wednesday**, **Thursday**, **Friday**, or **Saturday**. The value is case-insensitive, and you are allowed to enter an incomplete word, for example, **Wed** or **WeDne**.

hh:*mm*: Specified time.

end: Specifies the end time for the DST to take effect.

end-month: End month of the DST. The value is **January**, **February**, **March**, **April**, **May**, **June**, **July**, **August**, **September**, **October**, **November**, and **December**. The value is case-insensitive, and you are allowed to enter an incomplete word, for example, **Febr** or **FebRu**.

ahead: Specifies how much time that the DST is ahead of the standard time during the effective period of the DST. If it is not specified, the DST is one hour ahead of the standard time by default.

hours-offset: Hours ahead of the standard time. The range is from 0 to 12. You are not allowed to set it to **00:00**.

minutes-offset: Minutes ahead of the standard time. The range is from 0 to 59. If *hours-offset* is set to **0**, *minutes-offset* cannot be set to **0**.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.

Examples

Assume that a time zone is named ABC and the standard time is 8:15 ahead of the UTC time, namely, GMT+08:15. The following example sets the DST to start from the first Saturday in February to the third Monday in May, and 01:20 ahead of the standard time. In this case, the DST is 09:35 ahead of the UTC time, but non-DST time is still 08:15 ahead of the UTC time.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# clock timezone ABC 8 15
Set time zone name: ABC (GMT+08:15)
Hostname(config)# end
Hostname# show clock
16:39:16 ABC Wed, Feb 29, 2012
Hostname# show calendar
08:24:35 GMT Wed, Feb 29, 2012
Hostname# configure terminal
Hostname(config)# clock summer-time TZA start Feb 1 sat 2:00 end May 3 Monday 18:30
ahead 1 20
*May 10 03:45:58: %SYS-CLOCKUPDATE: Set summer-time: TZA from February the 1st Saturday
at 2:00 TO May the 3rd Monday at 18:30, ahead 1 hour 20 minute
Set summer-time: TZA from February the 1st Saturday at 2:00 TO May the 3rd Monday at
18:30, ahead 1 hour 20 minute
Hostname(config)# end
Hostname# show clock
18:00:08 TZA Wed, Feb 29, 2012
```

1.10 clock timezone

Function

Run the **clock timezone** command to configure a time zone.

Run the **no** form of this command to remove this configuration.

The UTC time is set for all time zones by default.

Syntax

clock timezone *timezone hours-offset* [*minutes-offset*]

no clock timezone

Parameter Description

timezone: Time zone name. The value is a case-insensitive string of 3 to 31 characters containing only English letters.

hours-offset: Hours of the specified time difference. It indicates the time that the time zone is faster or slower than the hardware time (UTC time). The range is from –12 to 12. A negative number indicates that the time zone is slower than the hardware time, while a positive number indicates that the time zone is faster than the hardware time. If the time zone is slower than the UTC time, add "–" before *hours-offset*.

minutes-offset: Minutes of the specified time difference. The range is from 0 to 59.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.

Examples

The following example sets the time zone name to **CST** and the software time to be 8 hours faster than the hardware time.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# clock timezone CST 8
Set time zone name: CST (GMT+08:00)
Hostname# show clock
18:00:17 CST Wed, Dec 5, 2012
```

1.13 cpu high-watermark set

Function

Run the **cpu high-watermark set** command to configure the maximum threshold for the total CPU usage of all control cores and enable CPU usage monitoring.

Run the **no** form of this command to disable CPU usage monitoring.

Run the **default** form of this command to restore the default configuration.

The default CPU usage range is from **75%** to **85%**.

Syntax

cpu high-watermark set [[**up** *up-value*] [**down** *down-value*]]

no cpu high-watermark set

default cpu high-watermark set

Parameter Description

watermark-up-value: Upper limit of the CPU usage. The range is from 1% to 99%.

watermark-down-value: Lower limit of the CPU usage. The range is from 1% to 99%.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

- This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.
- You can use this command to configure the maximum threshold for CPU usage and enable CPU usage monitoring. When detecting that the CPU usage exceeds the allowed threshold range, the system prints a prompt.

Examples

The following example enables CPU usage monitoring and sets the lower limit of the CPU usage to 70% and upper limit to 90%.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# cpu high-watermark set up 90 down 70
Open cpu watermark monitor
Set system cpu high-watermark up 90%, down 70%
```

Notifications

When the CPU usage range is from 85% to 91% and the CPU usage exceeds the upper limit, the following alarm information is printed:

```
*Mar 11 09:59:01: %SYSMON-4-CPU_WATERMARK_HIGH: Warning! System cpu usage above high watermark(1%), current cpu usage 92%
```

```
*Mar 11 09:59:01: %SYSMON-4-CPU_WATERMARK_HIGH: TOP 1: pid is 7368, task name is
bcmL2X.0, run in core 0, cpu usage  4.2%
*Mar 11 09:59:01: %SYSMON-4-CPU_WATERMARK_HIGH: TOP 2: pid is 7369, task name is
bcmCNTR.0, run in core 1, cpu usage  2.7%
*Mar 11 09:59:01: %SYSMON-4-CPU_WATERMARK_HIGH: TOP 3: pid is 7561, task name is
monitor_procps, run in core 0, cpu usage  1.0%
*Mar 11 09:59:05: %SYSMON-4-CPU_WATERMARK_HIGH: (*2/0) Warning! System cpu usage above
high watermark(1%), current cpu usage 92%
*Mar 11 09:59:05: %SYSMON-4-CPU_WATERMARK_HIGH: (*2/0) TOP 1: pid is 7368, task name
is bcmL2X.0, run in core 0, cpu usage  4.2%
*Mar 11 09:59:05: %SYSMON-4-CPU_WATERMARK_HIGH: (*2/0) TOP 2: pid is 7369, task name
is bcmCNTR.0, run in core 1, cpu usage  2.7%
*Mar 11 09:59:05: %SYSMON-4-CPU_WATERMARK_HIGH: (*2/0) TOP 3: pid is 7561, task name
is monitor_procps, run in core 0, cpu usage  1.0%
```

When the CPU usage is below the lower limit, the following alarm clearance information is printed:

```
*Mar 11 10:01:12: %SYSMON-5-CPU_WATERMARK: Withdraw warning! System cpu usage below
high watermark(75%), current cpu usage 20%
*Mar 11 10:01:18: %SYSMON-5-CPU_WATERMARK: (*2/0) Withdraw warning! System cpu usage
below high watermark(75%), current cpu usage 20%
```

Function

Run the **disconnect** command to close a suspended telnet client session.

Syntax

disconnect *session-id*

Parameter Description

session-id: ID of the suspended telnet client session.

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

You can run this command with a telnet client session ID specified to close the specified telnet client session.

Examples

The following example closes telnet client session 1.

```
Hostname> enable
Hostname# disconnect 1
```

1.15 do telnet

Function

Run the **do telnet** command to log in to the telnet server.

Syntax

do telnet [**oob**] { *hostname* | *ipv4-address* | *ipv6-address* } [*port-number*] [**/source** { **ip** *ipv4-address* | **ipv6** *ipv6-address* | **interface** *interface-type interface-name* }] [**via** *mgmt-name*]

Parameter Description

oob: Connects to a remote telnet server through out-of-band communication (over the MGMT port typically).

hostname: Host name of the telnet server.

ipv4-address: IPv4 host address of the telnet server.

ipv6-address: IPv6 host address of the telnet server.

port-number: TCP port number of the telnet server. The range is from 0 to 65535, and the default value is **23**.

/source: Specifies the source IP address or source interface used by the telnet client.

ip *ipv4-address*: Specifies the source IPv4 address used by the telnet client.

ipv6 *ipv6-address*: Specifies the source IPv6 address used by the telnet client.

interface *interface-type interface-name*: Specifies the source interface used by the telnet client. *interface-type interface-name* indicates the specified interface type and ID.

via *mgmt-name*: Specifies the MGMT port used by the telnet client for the **oob** parameter. *mgmt-name* indicates the MGMT port number.

Command Modes

User EXEC mode, privileged EXEC mode, and interface configuration mode

Default Level

1

Usage Guidelines

N/A

Examples

The following example sets the IPv4 address of the telnet server to **192.168.1.1**, the TCP port number to the default value, the source interface to **Gi 0/1**, and the VRF table to **vpn1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# do telnet 192.168.1.1 /source interface gigabitethernet 0/1 /vrf
vpn1
```

1.16 enable

Function

Run the **enable** command to enter the privileged EXEC mode or switch a role.

Syntax

enable [[*privilege-level*] | [**role** *role-name*]]

Parameter Description

privilege-level: Privilege level.

role-name: Role name.

Command Modes

User EXEC mode

Default Level

0

Usage Guidelines

This command is used to switch from the user EXEC mode to the privileged EXEC mode by default. If privilege level is specified, the current privilege level is raised to the specified level.

When the RBAC function is enabled, this command can be used to switch the terminal role. If no role is specified, the system switches to role **network-admin** by default.

Examples

The following example raises the current privilege level to level 14.

```
Hostname> enable 14
Password:
```

1.17 enable default role

Function

Run the **enable default role** command to configure the default role for running the **enable** commands.

Run the **no** form of this command to restore the role for running the **enable** commands to the default role.

The default role for running **enable** commands is **network-admin**.

Syntax

enable default role *role-name*

no enable default role

Parameter Description

role-name: Role name.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

- The **enable** commands include **enable** (for role switching), **enable password**, and **enable secret**. If no role is specified, these three commands are used to set the role configured by this command.
- This command is set only when the RBAC function is enabled.

Examples

The following example sets the role for running the **enable** commands to **network-operator**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# enable default role network-operator
```

1.18 enable password

Function

Run the **enable password** command to configure passwords for different privilege levels.

Run the **no** form of this command to remove this configuration.

Syntax

enable password { [**level** *password-level*] | [**role** *role-name*] } { [**0**] *password* | **7** *encrypted-password* }

no enable password { [**level** *password-level*] | [**role** *role-name*] }

Parameter Description

password-level: Privilege level of a user.

role-name: Role name.

0: Sets the entered password to a plaintext string.

password: Plaintext password used to enter the configuration layer of the privileged EXEC mode. The value is a string of 1 to 126 characters.

7 *encrypted-password*: Configures the entered password as a ciphertext string.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

A valid password is defined as follows:

- It contains 1 to 26 characters including uppercase letters, lowercase letters, and digits.
- Preamble spaces are allowed in front of the password, but are ignored. Intermediate and trailing spaces are recognized.

Generally, the encryption type is specified only when a password encrypted by the device is copied and pasted.

When the RBAC function is enabled and no role is specified, this command is used to set a password for role **network-admin** by default.

Caution

- Encrypted passwords cannot be restored but can be reconfigured.
- If you specify an encryption type but enter a plaintext password, you are not allowed to enter the privileged EXEC mode again.

Examples

The following example sets a password of role **network-operator** to the plaintext string **passwword10**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# enable password password10
Hostname(config)# enable password role network-operator
```

Notifications

1.19 enable secret

Function

Run the **enable secret** command to configure secure encrypted passwords for different privilege levels.

Run the **no** form of this command to remove this configuration.

Syntax

enable secret { [**level** *secret-level*] | [**role** *role-name*] } { [**0**] *password* | **5** *encrypted-secret* }

no enable secret { [**level** *secret-level*] | [**role** *role-name*] }

Parameter Description

secret-level: Privilege level of a user.

role-name: Role name.

0: Sets the output password to a plaintext string.

password: Plaintext password used to enter the configuration layer of the privileged EXEC mode. The value is a string of 1 to 126 characters.

5 *encrypted-secret*: Configures the password encryption mode. **5** indicates that a password encrypted using the MD5 irreversible encryption algorithm is saved as an encrypted password.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

Authentication passwords configured using the **Enable** command are classified into passwords and secrets.

- Passwords are simple encrypted passwords set for privilege levels 1 to 15.
- Secrets are secure encrypted passwords set for privilege levels 1 to 15.

Passwords must be stored in encryption mode. Passwords are simply encrypted, and secrets are securely encrypted.

If a privilege level has both a password and a secret, the password does not take effect.

If you configure a password for a non-15 level, a warning is displayed and the password is automatically converted into a secret.

If the password and secret set for level 15 are the same, a warning is displayed.

When the RBAC function is enabled and no role is specified, this command is used to set a password for role **network-admin** by default.

Examples

The following example sets the secure encrypted password to the plaintext string **secret10**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# enable secret 0 secret10
```

1.20 enable service

Function

Run the **enable service** command to enable a specified service.

Run the **no** form of this command to disable the specific service.

The Simple Network Management Protocol (SNMP) agent service is enabled and the telnet server, Secure Shell (SSH) server, and Web server services are disabled by default.

Syntax

enable service { **ssh-server** | **telnet-server** | **web-server** [**http** | **https** | **all**] | **snmp-agent** }

no enable service { **ssh-server** | **telnet-server** | **web-server** [**http** | **https** | **all**] | **snmp-agent** }

Parameter Description

ssh-server: Enables the SSH server service.

telnet-server: Enables the telnet server service.

web-server [**http** | **https** | **all**]: Enables the Web server service. **http** indicates that only the Hypertext Transfer Protocol (HTTP) service is enabled. **https** indicates that only the Hypertext Transfer Protocol Secure (HTTPS) service is enabled. **all** indicates that both the HTTP and HTTPS services are enabled.

snmp-agent: Enables the SNMP agent service.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the **ssh-server** command is run, both the IPv4 and IPv6 services of the SSH server are enabled.

When the **telnet-server** command is run, both the IPv4 and IPv6 services of the telnet server are enabled.

When the **web-server** [**http** | **https** | **all**] command is run, both the IPv4 and IPv6 services of the web server are enabled.

When the **snmp-agent** command is run, both the IPv4 and IPv6 services of the SNMP agent are enabled.

Examples

The following example enables the SSH server service.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# enable service ssh-server
```

1.22 exec-banner

Function

Run the **exec-banner** command to enable EXEC prompt information display for a specific line.

Run the **no** form of this command to remove this configuration.

EXEC prompt information display is enabled for all lines by default.

Syntax

exec-banner

no exec-banner

Parameter Description

N/A

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

If the **banner exec** command is configured on the device, EXEC prompts are displayed for all lines by default. To disable EXEC prompt information for a specific line, run the **no exec-banner** command.

Caution

This command does not support **banner incoming**. That is, if **banner incoming** is configured for the device, incoming prompts are displayed for reverse telnet connections of all lines. You cannot disable the incoming prompts on a specific line.

Examples

The following example disables welcome information display for line 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 1
```

```
Hostname(config-line)# no exec-banner
```

1.23 exec-timeout

Function

Run the **exec-timeout** command to set the connection timeout time of the device on a line.

Run the **no** form of this command to remove this configuration.

The default connection timeout time of the device on a line is 10 minutes.

Syntax

exec-timeout *exec-timeout-minutes* [*exec-timeout-seconds*]

no exec-timeout

Parameter Description

exec-timeout-minutes: Timeout time, in minutes. The range is from 0 to 35791.

exec-timeout-seconds: Timeout time, in seconds. The range is from 0 to 2147483.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

The connection timeout time of the device on a line is the sum of the configured minutes and seconds. If a connection does not have any input or output information within the timeout time, the device interrupts this connection and restores the line to the idle state.

Examples

The following example sets the connection timeout time of the device on VTY 0 to 5 minutes and 30 seconds.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0
```

```
Hostname(config-line)# exec-timeout 5 30
```

1.24 execute

Function

Run the **execute** command to run commands in the batch file.

Syntax

execute { [**flash**:] *filename* }

Parameter Description

filename: Path where the batch file is stored.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

When the **execute** command is run, the device reads and executes character strings in the batch file line by line. When the file contains multiple commands, a line feed is required between different commands.

Examples

The following example uses the **execute** command to run commands in the batch file and sets the IP address of interface GigabitEthernet 0/1 to **192.168.21.158/24**.

```
Hostname> enable
Hostname# execute flash:mybin/config.text
executing script file mybin/config.text ......
executing done
Hostname# configure terminal
Hostname(config)# interface gigabitEthernet gigabitethernet 0/1
Hostname(config-if-gigabitethernet 0/1)# ip address 192.168.21.158 24
Hostname(config-if-gigabitethernet 0/1)# end
```

1.26 Help

Function

Run the **help** command to display a brief description of the help system.

Syntax

Help

Parameter Description

N/A

Command Modes

All modes

Default Level

1

Usage Guidelines

During configuration, you can use a question mark (?) to display all commands in the current configuration mode or keywords and variables of parameters carried in a command.

Examples

The following example displays brief description of the help system.

```
Hostname> enable
Hostname# help
Help may be requested at any point in a command by entering
a question mark '?'. If nothing matches, the help list will
be empty and you must backup until entering a '?' shows the
available options.
Two styles of help are provided:
1. Full help is available when you are ready to enter a
   command argument (e.g. 'show ?') and describes each possible
   argument.
2. Partial help is provided when an abbreviated argument is entered
   and you want to know what arguments match the input
   (e.g. 'show pr?'.)
```

The following example displays all commands that can be run in interface configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-gigabitethernet 0/1)# ?
Interface configuration commands:
  arp            ARP interface subcommands
  bandwidth       Set bandwidth informational parameter
  carrier-delay    Specify delay for interface transitions
  dampening       Enable event dampening
  default         Set a command to its defaults
  description     Interface specific description
  dldp           Exec data link detection command
  duplex          Configure duplex operation
  efm            Config efm for an interface
  end            Exit from interface configuration mode
  exit           Exit from interface configuration mode
  expert          Expert extended ACL
  flowcontrol     Set the flow-control value for an interface
  full-duplex     Force full duplex operation
  global          Global ACL
  gvrp           GVRP configure command
  half-duplex     Force half duplex operation
  help           Description of the interactive help system
  ip             Interface Internet Protocol config commands
  ipv6           Internet Protocol Version 6
  isis           Intermediate System - Intermediate System (IS-IS)
  l2             Config L2 attribute
  label-switching  Enable interface process mpls packet
  lacp           LACP interface subcommands
  lldp           Link Layer Discovery Protocol
  load-interval    Specify interval for load calculation for an interface
  mac            Mac extended ACL
  mac-address     Set mac-address
  mpls           Multi-Protocol Label Switching
  mtu            Set the interface Maximum Transmission Unit (MTU)
  no             Negate a command or set its defaults
  ntp            Configure NTP
  port-group      Aggregateport/port bundling configuration
  redirect        Redirect packets
  rmon           Rmon command
  security        Configure the Security
  show           Show running system information
  shutdown        Shutdown the selected interface
  snmp           Modify SNMP interface parameters
  speed          Configure speed operation
  switchport      Set switching mode characteristics
```

```
 vrf            Multi-af VPN Routing/Forwarding parameters on the interface
 vrrp           VRRP interface subcommands
 xconnect        Xconnect commands
```

The following example displays keywords and variables of parameters carried in the **access-list 1 permit** command.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# access-list 1 permit ?
 A.B.C.D  Source address
 any     Any source host
 host    A single source host

1.27 hostname

Function

Run the **hostname** command to specify or modify the host name of the device.

Run the **no** form of this command to restore the host name of the device to the default value.

The default host name is **Ruijie**.

Syntax

hostname *hostname*

Parameter Description

hostname: Host name of the device. The value is a string of up to 63 characters containing only letters, digits, and hyphens (-).

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The host name is used to identify a device and acts as the username of the local device in dialing and Challenge-Handshake Authentication Protocol (CHAP) authentication scenarios.

Examples

The following example sets the host name of the device to **Beijing_Hostname**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# hostname Beijing_Hostname
Beijing_Hostname(config)#
```

1.28 ip telnet access-class

Function

Run the **ip telnet access-class** command to configure an access control list (ACL) for the telnet server.

Run the **no** form of this command to remove this configuration.

Syntax

ip telnet access-class { *acl-number* | *acl-name* }

no ip telnet access-class

Parameter Description

acl-number: ACL ID. Value range:

Standard ACLs for IP addresses: 1–99 or 1300–1999; extended ACLs for IP addresses: 100–199 or 2000–2699; extended ACLs for MAC addresses: 700–799; expert extended ACLs: 2700–2899

acl-name: ACL name. The value is a case-sensitive string of 1 to 99 characters.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

In line configuration mode, an ACL applies only to a specific line. However, an ACL of the telnet server is effective to all connections to the telnet server.

Examples

The following example filters all connections to the telnet server by the keyword **testv4**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip telnet access-class testv4
```

Notifications

1.29 ip telnet ip-block

Function

Run the **ip telnet ip-block** command to configure the maximum number of consecutive authentication failures, beyond which an IP address is blocked on the telnet server, and to specify the period for awakening the blocked IP address.

Run the **no** form of this command to remove this configuration.

The IP address blocking function is enabled on the telnet server by default. The maximum number of consecutive authentication failures is 6, the period for resetting the authentication failure count is 5 minutes, and blocked IP addresses are awakened 5 minutes after their blocking.

Syntax

ip telnet ip-block { **disable** | **failed-times** *failed-times* **period** *period-time* | **reactive** *reactive-period-time* }

no ip telnet ip-block { **disable** | **failed-times** *failed-times* **period** *period-time* | **reactive** *reactive-period-time* }

Parameter Description

disable*:* Disables the IP address blocking function of the telnet server.

failed-times *failed-times*: Configures the maximum number of consecutive authentication failures, beyond which an IP address is blocked. The range is from 1 to 10. The default value is **6**.

period *period-time*: Configures the period for counting the number of consecutive authentication failures, in minutes. The range is from 1 to 120. The default value is **5**.

reactive *reactive-period-time*: Configures the period for awakening blocked IP addresses, in minutes. The range is from 1 to 1000. The default value is **5**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the IP address blocking function is enabled and the number of consecutive authentication failures for telnet login reaches the configured limit in the authentication failure count period, the source IP address blocking is triggered. That is, the telnet client that uses this source IP address is not allowed to log in to the device to prevent the device from being attacked. Only after the period for awakening blocked IP addresses expires, the telnet client can log in to the device.

Examples

The following example sets the maximum number of consecutive authentication failures, beyond which an IP address is blocked on the telnet server to **3**, the period for resetting the authentication failure count to 3 minutes, and the period for awakening blocked IP addresses to 3 minutes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip telnet ip-block failed-times 3 period 3
Hostname(config)# ip telnet ip-block reactive 3
```

1.30 ip telnet source-interface

Function

Run the **ip telnet source-interface** command to specify the IP address of an interface as the source IP address of a telnet connection.

Run the **no** form of this command to remove this configuration.

Syntax

ip telnet source-interface *interface-type interface-name*

Parameter Description

source-interface *interface-type interface-name*: Specifies the IP address configured on an interface as the source IP address of a telnet connection. *interface-type interface-name* indicates the interface type and interface ID.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When you connect to a telnet server through telnet, the IP address configured by this command is used if no source interface or source IP address is specified for this connection.

Examples

The following example specifies the IP address of interface Loopback 1 as the source IP address of the global telnet connection.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip telnet source-interface Loopback 1
```

1.31 ipv6 telnet access-class

Function

Run the **ipv6 telnet access-class** command to configure an IPv6 ACL for a telnet server.

Run the **no** form of this command to remove this configuration.

Syntax

ipv6 telnet access-class { *acl-number* | *ipv6-acl-name* }

no ipv6 telnet access-class

Parameter Description

acl-number: ACL ID. Value range:

Standard ACLs for IP addresses: 1–99 or 1300–1999; extended ACLs for IP addresses: 100–199 or 2000–2699; extended ACLs for MAC addresses: 700–799; expert extended ACLs: 2700–2899

ipv6-acl-name: IPv6 ACL name.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to configure an IPv6 ACL for all connections to a telnet server. In line configuration mode, an IPv6 ACL applies only to a specific line. However, an IPv6 ACL of a telnet server is effective to all connections to the telnet server.

Examples

The following example filters all connections to the telnet server by the keyword **testv6**.

1.32 lock

Function

Run the **lock** command to set a temporary password on a terminal to lock the terminal CLI to prevent access while keeping the session.

Syntax

lock

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

Before running this command, run the **lockable** command in line configuration mode to enable the terminal locking feature. After running this command, configure a temporary password for unlocking.

Examples

The following example sets the temporary password for locking the CLI of virtual terminal 1 to **<password>**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 1
Hostname(config-line)# lockable
Hostname(config-line)# end

1.34 login

Function

Run the **login** command to configure simple login password verification for a line.

Run the **no** form of this command to remove this configuration.

The simple login password verification function is disabled for the console line and enabled for the virtual terminal lines by default.

Syntax

login

no login

Parameter Description

N/A

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

This command is used to configure simple password verification during login authentication, that is, the password configured for the virtual terminal or console port, only when the authentication, authorization, and accounting (AAA) service is disabled.

Examples

The following example configures login password verification for virtual terminal 0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no aaa new-model
Hostname(config)# line vty 0
Hostname(config-line)# password 0 password10

1.37 login privilege log

Function

Run the **login privilege log** command to configure the logging function for privilege level increase or role switching.

Run the **no** form of this command to remove this configuration.

The prompt output function is disabled by default.

Syntax

login privilege log

no login privilege log

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can use this command to monitor privilege level increase or role switching of terminal users. The configuration is valid for all terminals.

Examples

The following example enables the logging function of privilege level increase.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# login privilege log
```

If the privilege level increase fails, the device prints the following log:

```
Hostname>enable 10
Password:
Password:
Password:
% Access denied
Hostname>
*Sep 10 11:34:19: %SYS-PRIV_AUTH_FAIL: Authentication to privilege level 10 from
console failed
```

If the privilege level increase is successful, the device prints the following log:

```
Hostname>enable 10
Password:
Hostname#
```

```
*Sep 10 11:34:20: %SYS-PRIV_AUTH_SUCCESS: Authentication to privilege level 10 from
console success
```

If the logging and RBAC functions are enabled and role switching to **network-admin** fails, the device prints the following log

```
Hostname> enable
Hostname# enable role network-admin
Password:
Password:
Password:
% Access denied
Hostname>
*Sep 10 11:34:19: %SYS-PRIV_AUTH_FAIL: Authentication to role network-admin from
console failed
```

If the logging and RBAC functions are enabled and role switching to **network-admin** is successful, the device prints the following log:

```
Hostname> enable
Hostname# enable role network-admin
Password:
Hostname#
*Sep 10 11:34:20: %SYS-PRIV_AUTH_SUCCESS: Authentication to role network-admin from

1.39 memory low-watermark set

Function

Run the **memory low-watermark set** command to enable the monitoring of memory usage threshold.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The default memory usage threshold is **90%**.

Syntax

memory low-watermark set *memory-threshold*

no memory low-watermark set

default memory low-watermark set

Parameter Description

memory-threshold: Memory usage threshold. The range is from 1% to 100%.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

N/A

Examples

The following example sets the memory usage threshold to **80%** and enables the monitoring function of memory usage.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# memory low-watermark set 80
```

Notifications

When the memory usage is higher than the threshold, the system prints the following alarm information:

```
*Mar 11 09:58:45: %SYSMON-4-MEM_HIGH: The current memory usage 90%
*Mar 11 09:58:45: %SYSMON-4-MEM_HIGH: (*2/0) The current memory usage 90%
```

When the memory usage is lower than the threshold, the system prints the following alarm clearance information:

```
*Mar 11 10:11:17: %SYSMON-5-MEM_RECOVER: The current memory usage 58%
*Mar 11 10:11:16: %SYSMON-5-MEM_RECOVER: (*2/0) The current memory usage 58%

reload in { [*hh* :] *mm*] }

Parameter Description

[*hh* :] *mm*: Countdown restart time. *hh* indicates hours. If it is not specified, it is set to **0** by default. *mm* indicates minutes.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

If the device is in a cluster, all in-service devices in the cluster will be restarted according to the countdown timer after this command is run.

Examples

The following example configures the device to restart after 1 hour and 20 minutes.

```
Hostname> enable
```

```
Hostname# reload in 1:20
% Set reload ok.
% Reload scheduled for 16:05:38 Beijing Mon Aug 19 2019 (in 1 hour and 20 minutes),
will be cancled after system halt.
```

1.47 rollback running-config checkpoint

Function

Run the **rollback running-config checkpoint** command to roll back the running configurations of the device to configurations of a checkpoint.

Syntax

rollback running-config checkpoint *checkpoint-name* [**display-differences** | **ignore-results**]

Parameter Description

checkpoint-name: Checkpoint name. The value is a string of 1 to 80 characters.

display-differences: Displays configuration differences upon rollback. Configuration differences are displayed by default.

ignore-results: Ignores the execution results without configuration differences displayed upon rollback.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to roll back the running configurations of the device to configurations of a specific checkpoint. Only one user can create checkpoints and roll back configurations on a device at a time. When the **display-differences** and **ignore-results** parameters are not configured, configuration differences are displayed.

Before rollback, you can run the **show running-config** command to display the current configurations. After rollback, you can run the **show running-config** command to check whether the checkpoint configurations are applied.

If an "Increased configuration:" message is displayed after rollback, configurations increase from the checkpoint configurations. This is because some commands cannot be reversed or fail to be reversed. For details, see the command manuals of specific functions, and manually reserve these commands.

If a "Decreased configuration:" message is displayed after rollback, configurations decrease from the checkpoint configurations. This is because some commands fail to be executed during rollback. For details, see the command manuals of specific functions, and manually run these commands.

Examples

The following example rolls back the running configurations to configurations of checkpoint user-1.

```
Hostname> enable
Hostname# rollback running-config checkpoint user-checkpoint-1 ignore-results
...
Rollback configuration successfully.
```

Notifications

If configuration rollback is successful, the following notification is displayed:

```
...
Rollback configuration successfully.
```

If configuration differences exist upon rollback, the following notification is displayed:

```
..
Rollback configuration completed.

Increased configuration:
+ spanning-tree mode rstp          //The plus sign (+) indicates increased
configuration commands from the checkpoint configurations.
Decreased configuration:
- username admin password admin     // The minus sign (-) indicates decreased
configuration commands from the checkpoint configurations.
```

If configuration rollback fails, the following notification is displayed:

```
...
Rollback configuration failed.
```

1.48 secret

Function

Run the **secret** command to configure an MD5/SHA-256 irreversible encrypted password for line-based login.

Run the **no** form of this command to remove this configuration.

No encrypted password is configured for line-based login by default.

Syntax

secret { [**0**] *password* | **5** *encrypted-secret* }

no secret

Parameter Description

0: Specifies a plaintext password. After it is configured, MD5 irreversible encryption is used.

password: Plaintext password for line-based login. The value is a string of 1 to 25 characters.

5 *encrypted-secret*: **5** specifies a password encrypted using the MD5 irreversible encryption algorithm. The password is saved as an encrypted password after configuration.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

This command is used to configure an MD5/SHA-256 irreversible encrypted password for authenticating remote users who attempt to log in to the device through a line. When both a password and secret are configured for a line, the secret is preferentially matched during user login. If secret matching fails, the password is matched. If the matching of both the secret and password fails, the login fails.

Caution

- If the value **5** is selected for the encryption type, the entered ciphertext password must contain 24 characters with the 1st, 3rd, and 8th characters set to the dollar sign ($).

Examples

The following example configures an MD5 irreversible encrypted password for login through virtual terminal 0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0
Hostname(config-line)# algorithm-type md5
Hostname(config-line)# secret secretvty0
```

Notifications

After this password is configured, virtual terminal 0 uses MD5 irreversible encryption for the password and the effect is as follows:

```
secret 5 $1$X834$wvx6y794uAD8svzD
```

1.49 session

Function

Run the **session** command to connect to a supervisor module or service card in a virtual switching unit (VSU) environment.

Syntax

session { **master** | **device** *device-number* }

session { **device** *device-number* | **master** }

Parameter Description

master: Specifies the slave device to connect to the master device or the slave supervisor module to connect to the master supervisor module.

device *device-number*: Specifies the device ID. *device-number* indicates the device ID.

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

This command is used in a multi-node VSU environment.

Examples

The following example specifies the slave device to connect to the master device in a VSU environment.

```
Hostname> enable
Hostname# session master
```

The following example connects sessions to device 1 in a multi-node VSU environment.

```
Hostname> enable
Hostname# session device 1
```

1.50 session-timeout

Function

Run the **session-timeout** command to configure the timeout time for sessions established to a remote terminal on the current line.

Run the **no** form of this command to remove this configuration.

The default session timeout time is 0 minute for remote terminals. That is, the sessions never time out.

Syntax

session-timeout *session-timeout-time* [**output**]

no session-timeout

Parameter Description

session-timeout-time: Timeout time of sessions to a remote terminal in minutes. The range is from 0 to 35791. **0** indicates that a session never times out.

output: Specifies output data as a timeout criterion.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

If a session established to a remote terminal on a line does not have any input or output within the specified time upon configuration of this command, the device closes this session and restores the line to the idle state.

Examples

The following example sets the timeout time of sessions on virtual terminal 0 to 5 minutes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0
Hostname(config-line)# session-timeout 5 output
```

1.55 show cpu

Function

Run the **show cpu** command to display CPU usage information of system tasks on control cores and non-virtual cores.

Syntax

show cpu [**core**]

Parameter Description

core: Displays CPU usage information of each core on all boards.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

- This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.
- If the system is equipped with a virtual core, you can run the **show processes cpu** command to display the CPU usage of the virtual core.

Examples

The following example displays CPU usage of system tasks on control cores and non-virtual cores.

```
Hostname> enable
Hostname# show cpu
================================================
CPU Using Rate Information
CPU utilization in five seconds:  4.80%
CPU utilization in one minute:  4.10%
CPU utilization in five minutes:  4.00%

1.59 show line

Function

Run the **show line** command to display configurations of a line.

Syntax

show line { **console** *console-line-number* | **vty** *vty-line-number* | *line-number* }

Parameter Description

console *console-line-number*: Displays configurations of the console line. *console-line-number* indicates the console line ID. The value is **0**.

vty *vty-line-number*: Displays configurations of a virtual terminal line. *vty-line-number* indicates the virtual terminal line ID. The range is from 0 to 35.

line-number: ID of the specified line . The range is from 0 to 5.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays configurations of the console line.

```
Hostname> enable
Hostname# show line console 0
CON    Type    speed   Overruns
* 0    CON     9600    45927
Line 0, Location: "", Type: "vt100"
Length: 24 lines, Width: 79 columns
Special Chars: Escape  Disconnect  Activation
            ^^x    none       ^M
Timeouts:     Idle EXEC    Idle Session
            never       never
History is enabled, history size is 10.
Total input: 53564 bytes
Total output:  395756 bytes
Data overflow:  27697 bytes
stop rx interrupt:  0 times
```

Table 1-7 Output Fields of the show line Command

Field	Description
CON	Terminal type. **CON** indicates the console. **0** indicates the terminal line ID. The ID with an asterisk (*) indicates the terminal line that is being used.
Type	Terminal type, including **CON**, **AUX**, **TTY**, and **VTY**.
speed	Asynchronous speed
Overruns	Count of overrun errors received by the driver
Line 0	Terminal line ID
Location: ""	Line location
Type: "vt100"	Compatible terminal standard of a line
Special Chars	Special characters of a terminal, including the **Escape**, **Disconnect**, and **Activation** characters
Timeouts	Timeout time of a terminal session. **never** indicates that a session never times out.
History	Historical command recording function and the maximum number of recorded historical commands.
Total input	Count of data received from the driver
Total output	Count of data sent to the driver
Data overflow	Count of received data that overflows
stop rx interrupt	Count of RX interrupts of the driver

1.60 show memory

Function

Run the **show memory** command to display memory information.

Syntax

show memory [**history** | **low-watermark** | *process-id* | *process-name* | **slot** | **sorted total**]

Parameter Description

history: Displays historical memory usage records.

low-watermark: Displays the memory usage lower threshold.

process-id: Task ID.

process-name: Task name.

slot: Displays the memory usage information of all in-service devices in the system (without process usage information).

sorted total: Sorts tasks based on the memory usage.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

Each time the **show memory history** command is run, the number of displayed entries increases by one. Up to 10 entries are displayed. You can run the **memory history clear** command to clear historical entries.

Examples

The following example displays the memory usage of each task and its ranking by total memory usage.

```
Hostname> enable
Hostname# show memory sorted total
System Memory: 508324K total, 481560K used, 26764K free, 348200K available, 50.5% used
rate
Swap:        128000K total, 128000K free
Used detail:  149112K active, 247776K inactive, 30460K mapped, 50460K slab, 3752K
others

1.61 show memory vsd

Function

Run the **show memory vsd** command to display memory information.

Syntax

show memory vsd *vsd_id*

Parameter Description

vsd_id: ID of the specified VSD. The range is from 0 to 16.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.

You can run the **show vsd** command to display the ID of each VSD.

Examples

The following example displays the memory usage of tasks under VSD 1.

```

1.63 show processes cpu

Function

Run the **show processes cpu** command to display system tasks.

Syntax

show processes cpu [**history** [**table**] | [**5sec** | **1min** | **5min** | **15min**] [**nonzero**]]

Parameter Description

history: Displays the CPU usage of control core tasks within the last 60 seconds, 60 minutes, and 72 hours in histogram.

table: Displays the CPU usage of control core tasks within the last 60 seconds, 60 minutes, and 72 hours in table.

5sec: Displays tasks in descending order of the CPU usage within the last 5 seconds.

1min: Displays tasks in descending order of the CPU usage within the last 1 minute.

5min: Displays tasks in descending order of the CPU usage within the last 5 minutes.

15min: Displays tasks in descending order of the CPU usage within the last 15 minutes.

nonzero: Not displays information about the tasks whose CPU usage is 0.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.

Examples

The following example displays tasks in ascending order of their IDs.

```
Hostname> enable
Hostname# show processes cpu
System Uptime: 19:08.6
CPU utilization for five seconds:1.2%; one minute:0.8%; five minutes:0.8%
set system cpu watermark (open): high 80%(85%~75%)
Tasks Statistics: 375 total, 10 running, 365 sleeping, 0 stopped, 0 zombie
  Pid Vsd S   PRI  P      5Sec      1Min      5Min     15Min Process
    1   0 S    20  0   0.0(0.0)   0.0(0.0)   0.0(0.0)   0.0(0.0) init
    2   0 S    20  1   0.0(0.0)   0.0(0.0)   0.0(0.0)   0.0(0.0) kthreadd

    4   0 S    20  0   0.0(0.0)   0.0(0.0)   0.0(0.0)   0.0(0.0) ksoftirqd/0
    5   0 S  -100  1   0.0(0.0)   0.0(0.0)   0.0(0.0)   0.0(0.0) migration/1
--More--
```

Table 1-11 Output Fields of the show processes cpu Command

Field	Description
System Uptime	Total running time of the device, accurate to seconds
CPU Utilization	Total CPU usage of control core tasks within the last 5 seconds, 1 minute, and 5 minutes
Virtual CPU usage	Total CPU usage of virtual core tasks within the last 5 seconds, 1 minute, and 5 minutes
Tasks Statistics	Task statistics, including the total number of tasks and the task status
set system cpu watermark	CPU usage threshold and status of the control core tasks

Table 1-12 Description of the Task Running Status in the Output of the show processes cpu Command

Task Running Status	Description
running	Running task
sleeping	Suspended task
stopped	Stopped task
zombie	Terminated task, but not reclaimed by the system

Table 1-13 Description of Task Information in the Output of the show processes cpu Command

Field	Description

Field	Description
Pid	Task ID
Vsd	VSD ID
S	Task statuses, including **R** (running), **T** (stopped), **S** (sleeping), **D** (waiting), and **Z** (zombie)
PRI	Task priority
P	CPU core on which a task runs
5sec/1min/5min/15min	CPU usage of a task within the last 5 seconds, 1 minute, 5 minutes, and 15 minutes. The value in the round brackets is the CPU usage that is not divided by the total number of cores of the same type as the core where the task runs.
Process	Task name. Only the first 15 characters are displayed. The remaining characters are truncated.

The following example displays the CPU usage of a control core task within the last 60 seconds, 60 minutes, and 72 hours in histogram.

```
Hostname> enable
Hostname# show processes cpu history
           system cpu percent usage(%) [last 300 second]

        system cpu percent usage(%) per 1minute (last 2 minute)
--------------------------------------------------------------------------------
```

In the preceding output information:

The first histogram displays the CPU usage of the control core tasks within 300 seconds. Each segment on the x-coordinate indicates 5 seconds, and each segment on the y-coordinate indicates 5%. "*" indicates the CPU usage at the moment of a second. The first segment nearest to 0 on the x-coordinate indicates the CPU usage within the last 5 seconds, in percentage (%).

The second histogram displays the CPU usage of the control core tasks within the last 60 minutes, in percentage (%). Every segment on the x-coordinate indicates 1 minute.

The third histogram displays the CPU usage of the control core tasks within the last 72 hours, in percentage (%). Every segment on the x-coordinate indicates 1 hour.

The following example displays the CPU usage of tasks on core 0 within the last 60 seconds, 60 minutes, and 72 hours in table.

```
Hostname> enable
Hostname # show processes cpu history table
```

```
            system cpu percent usage(%) [last 300 second]

#-------------------------#
```

In the preceding output information:

The first table lists the CPU usage within 300 seconds. The first segment indicates the CPU usage within the last 5 seconds, in percentage (%). Each segment indicates 5 seconds.

The second table lists the CPU usage within the last 60 minutes, in percentage (%). Each segment indicates 1 minute.

The third table lists the CPU usage within the last 72 hours, in percentage (%). Each segment indicates 1 hour.

The following example displays the CPU usage of control core tasks every 5 minutes in the last week that exceeds the CPU usage threshold.

```
Hostname> enable

1.64 show processes cpu detailed

Function

Run the **show processes cpu detailed** command to display details about a specific task.

Syntax

show processes cpu detailed { *process-id* | *process*-name }

Parameter Description

process-id: ID of a specified task.

process-name: Name of a specified task.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

This command is supported by VSD 0 only. In multi-VSD mode, this command is invalid.

Examples

The following example displays details about a task with the specified name.

```
Hostname> enable
Hostname# show processes cpu detailed demo
Process Id    : 1820
Process Name  : demo
Vsdid        : 0
Process Ppid  : 1
State        : R(running)
On CPU       : 0
Priority     : 20
Age Time     : 24:06.5
Run Time     : 00:01.0
Cpu Usage    :
   Last  5 sec    0.3%(0.6%)
   Last  1 min    0.3%(0.6%)
   Last  5 min    0.3%(0.6%)
   Last 15 min    0.3%(0.6%)
Tty          : ?
Code Usage    : 209.6KB.
```

If the specified task name is not unique, the system displays the following information:

```
Hostname> enable
Hostname# show processes cpu detailed demo
duplicate process, choose one by id not name.
name: demo, id: 1089, state: S(sleeping)
name: demo, id: 1091, state: R(running)
process name: monitor_procps, do NOT exist, or NOT only one.
```

The following example displays details about a task with the specified ID.

```
Hostname> enable
Hostname# show process cpu detailed 1715
Process Id    : 130
Process Name  : crypto
Vsdid        : 0
Process Ppid  : 2
State        : S(sleeping)
On CPU       : 0
Priority     : 0
Age Time     : 03:41:09.9
Run Time     : 00:00.0
Cpu Usage    :
   Last  5 sec    0.0%(  0.0%)
```

```
   Last  1 min    0.0%(  0.0%)
   Last  5 min    0.0%(  0.0%)
   Last 15 min    0.0%(  0.0%)
Tty          : ?
Code Usage    : 0.0KB.
```

Table 1-14 Output Fields of the show processes cpu detailed Command

Field	Description
Process Id	Task ID
Vsdid	ID of the VSD to which the task belongs
Process Name	Task name
Process Ppid	Parent process task ID
State	Task running status
On CPU	CPU where the task is running
Priority	Task priority
Age Time	Duration of the task from startup to now
Run Time	Execution duration of the task from startup to now
Cpu Usage	CPU usage of the task within the last 5 seconds, 1 minute, 5 minutes, and 15 minutes The value in the round brackets is the CPU usage that is not divided by the total number of cores of the same type as the core where the task runs. For example, the demo task is running on core 0, which is a control core and the system has two control cores. In this case, the CPU usage is 0.3% (0.6%).
Tty	TTY ID, in the format of "Master device ID, slave device ID". If the TTY ID is **0**, a question mark (?) is displayed.
Code Usage	Size occupied by the task code segment

1.66 show running-config

Function

Run the **show running-config** command to display the running configurations of the device system or configurations of an interface.

Syntax

show running-config [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Specifies the interface type and ID.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays configurations of interface GigabitEthernet 0/1.

```
Hostname> enable

1.69 show startup-config

Function

Run the **show startup-config** command to display device configurations stored in the non-volatile random-access memory (NVRAM).

Syntax

show startup-config

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

The configurations stored in the NVRAM, namely, startup-config, are executed during device startup.

startup-config indicates configurations in the default configuration file **/config.text** embedded in the flash memory of the device by default.

Examples

The following example displays device configurations stored in the NVRAM.

```
Hostname> enable
version CS86_RGOS 12.6(2)B0103, Release(10151616)
hostname Hostname
!
vlan 1

1.71 show telnet ip-block

Function

Run the **show telnet ip-block** command to display information about blocked IP addresses and authentication failures.

Syntax

show telnet ip-block { **all** | **list** }

Parameter Description

all: Displays information about all blocked IP addresses and authentication failures.

list: Displays information about blocked IP addresses.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display information about all blocked IP addresses and authentication failures, including the source IPv4 or IPv6 addresses, IP address status, and number of authentication failures

or IP address blocking information, including the source IPv4 or IPv6 addresses and remaining time for awakening the blocked IP addresses.

Examples

The following example displays information about all blocked IP addresses and authentication failures.

```
Hostname> enable
Hostname# show telnet ip-block all
-------------------------------------------------------------------------
IP Address                                State      Auth-fail Count
-------------------------------------------------------------------------
172.30.31.16                               AUTH FAILED    3
172.30.31.17                               BLOCKED        6
-------------------------------------------------------------------------
```

Table 1-18 Output Fields of the show telnet ip-block all Command

Field	Description
IP Address	Source IPv4 or IPv6 address
State	Status • **AUTH FAILED**: Authentication fails but the blocking conditions are not met. • **BLOCKED**: Blocking conditions are met.
Auth-fail Count	Number of authentication failures

The following example displays information about blocked IP address.

```
Hostname> enable
Hostname# show telnet ip-block list
-------------------------------------------------------------------------
IP Address                                UnBlock Interval (Seconds)
-------------------------------------------------------------------------
172.30.31.17                               296
-------------------------------------------------------------------------
```

Table 1-19 Output Fields of the show telnet ip-block list Command

Field	Description
IP Address	Source IPv4 or IPv6 address
UnBlock Interval (Seconds)	Remaining time for awakening blocked IP addresses, in seconds

1.72 show this

Function

Run the **show this** command to display effective system configurations in current mode.

Syntax

show this

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

In range mode, this command can be used to display configurations in current mode. For example, after you perform the following operations, you can run this command to display effective configurations in the current mode.

- Run the **line** *first-line last-line* command to specify a line scope and enter the line configuration mode.
- Run the **vlan range** command to configure multiple Virtual Local Area Networks (VLANs) and enter the VLAN range configuration mode.
- Run the **vlan range** command to configure multiple interfaces and enter the interface range configuration mode.

> **Note**
>
> If the number of VLANs or interfaces exceeds 50 in VLAN range configuration mode or interface range configuration mode, this command only displays configurations of the first 50 VLANs or interfaces.

Examples

The following example displays effective configurations of GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-gigabitethernet 0/1)# show this
Building configuration...
 !
 spanning-tree link-type point-to-point
 spanning-tree mst 0 port-priority 0
 !
end
```

1.75 telnet

Function

Run the **telnet** command to log in to the telnet server.

Syntax

telnet [**oob**] { *hostname* | *ipv4-address* | *ipv6-address* } [*port-number*] [**/source** { **ip** *ipv4-address* | **ipv6** *ipv6-address* | **interface** *interface-type interface-name* }] [**via** *mgmt-name*]

Parameter Description

oob: Connects to a remote telnet server through out-of-band communication (over the MGMT port typically).

hostname: Host name of the telnet server.

ipv4-address: IPv4 host address of the telnet server.

ipv6-address: IPv6 host address of the telnet server.

port-number: TCP port number of the telnet server. The range is from 0 to 65535, and the default value is **23**.

/source: Specifies the source IP address or source interface used by the telnet client.

ip *ipv4-address*: Specifies the source IPv4 address used by the telnet client. *ipv4-address* indicates an IPv4 address.

ipv6 *ipv6-address*: Specifies the source IPv6 address used by the telnet client. *ipv6-address* indicates an IPv6 address.

interface *interface-type interface-name*: Specifies the source interface used by the telnet client. *interface-type interface-name* indicates the specified interface type and ID.

via *mgmt-name*: Specifies the MGMT port used by the telnet client for the **oob** parameter. *mgmt-name* indicates the MGMT port number.

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

N/A

Examples

The following example sets the IPv4 address of the telnet server to **192.168.1.1**, the TCP port number to the default value, the source interface to **Gi 0/1**, and the VRF table to **vpn1**.

```
Hostname> enable
Hostname# telnet 192.168.1.1 /source interface gigabitethernet 0/1 /vrf vpn1
```

The following example sets the IPv6 address of the telnet server to **2AAA:BBBB::CCCC**.

```
Hostname> enable
Hostname# telnet 2AAA:BBBB::CCCC
```

The following example sets the IPv4 address of the telnet server to **192.168.1.1** and uses MGMT 0 for the **oob** parameter.

```
Hostname> enable
Hostname# telnet oob 192.168.1.1 via mgmt 0
```

1.76 username

Function

Run the **username** command to configure a local user account and optional authorization information.

Run the **no** form of this command to remove this configuration.

No local user account or authorization information is configured by default.

Syntax

username *username* [**login mode** { **console** | **ssh** | **telnet** | **ftp** }] [**online amount** *amount-number*] [**permission** *oper-mode path*] { [**privilege** *privilege-level*] | [**role** *text-string*] } [**reject remote-login**] [**web-auth**] [**pwd-modify**] [**nopassword** | **password** [**0** | **7**] *text-string* | **secret** [**0** | **5** | **8**] *text-string*]

no username *name*

Parameter Description

username: Account username.

login mode { **console** | **ssh** | **telnet** | **ftp** }: Restricts the account login method. **console** indicates that the account login method is restricted to console. **ssh** indicates that the account login method is restricted to SSH. **telnet** indicates that the account login method is restricted to telnet. **ftp** indicates that the account login method is restricted to FTP.

online amount *amount-number*: Configures the number of concurrently online accounts. *amount-number* indicates the number of concurrently online accounts. The range is from 0 to 1586. The default value is **0**, that is, the number of concurrently online accounts is not limited.

permission *oper-mode path*: Configures the operation permission of an account on a specific file. *oper-mode* indicates the operation mode. **n** indicates no operation behavior. **r** indicates the read permission. **w** indicates the write permission. **x** indicates the execution permission. **rw** indicates the read and write permissions. **rx** indicates the read and execution permissions. **wx** indicates the write and execution permissions. **rwx** indicates the read, write, and execution permissions. *path* indicates the path of the file or directory, on which an operation permission takes effect.

privilege *privilege-level*: Configures the privilege level of an account. *privilege-level* indicates the privilege level of an account. The range is from 0 to 15.

reject remote-login: Bans remote login.

web-auth: Allows only Web authentication.

pwd-modify: Allows the Web authentication user who uses this account to change the password. This parameter is available only after **web-auth** is configured.

nopassword: Configures no password for the account.

password [**0** | **7**] *text-string*: Configures a simple password for the account. **0** indicates that a plaintext password is entered. **7** indicates that a ciphertext password is entered. No plaintext password is entered by default. *text-string* indicates the password text.

secret [**0** | **5** | **8**] *text-string*: Configures a secure password for the account. The password configured by this command is stored as a ciphertext password after irreversible encryption. **0** indicates that a plaintext password is entered, **5** indicates that a password encrypted using the MD5 algorithm is entered, **8** indicates that a password encrypted using the SHA-256 algorithm is entered. A plaintext password is entered by default.

role *text-string*: Adds roles to the local user when the RBAC mode is enabled. A maximum of 64 roles can be added.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

- This command is used to create a local user database for authentication.
- The encryption type **7** is specified only when encrypted passwords are copied and pasted.
- If the value **7** is specified as the encryption type, the entered ciphertext string must consist of an even number of characters.

Examples

The following example configures a username and password and binds the account to privilege level 15.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# username test privilege 15 password 0 pw15
```

The following example configures a dedicated username and password for Web authentication.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# username user1 web-auth password 0 pw
```

The following example configures user **test** to have the permissions to read and write all files and directories.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# username test permission rw /
```

The following example configures user **test** to have the permissions to read, write, and execute all files and directories except the **config.text** file.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# username test permission n /config.text
Hostname(config)# username test permission rwx /
```

1.79 write

Function

Run the **write** command to save system configurations (running-config) to a specific position.

Syntax

write [**auto-save interval** *interval-time* | **memory** [**auto-save interval** *interval-time*] | **terminal**]

Parameter Description

auto-save interval *interval-time*: Sets the interval for automatic saving in seconds. The range is from 600 to 86400. The default value is **3600**.

memory: Writes system configurations to the NVRAM. It is equivalent to the **copy running-config startup-config** command.

terminal: Displays system configurations. It is equivalent to the **show running-config** command.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

If there is a device to save the configuration file, the system automatically creates a specified file and writes system configurations to the file.

In the absence of such a device, for example, as the startup configuration file is specified to be in a portable storage device, such as a USB flash drive or SD card but the device is not loaded during the execution of the **write** [**memory**] command, the system asks you whether to save the current configurations to the default startup configuration file **config.text** and performs corresponding operations.

Examples

The following example saves system configurations to the device.

```
Hostname> enable
Hostname# write
Building configuration...
[OK]
```

1 RBAC Commands

Command	Function
description	Configure the description of a role.
feature	Add a feature to a feature group.
interface policy deny	Prohibit a role from operating all interface resources.
permit interface	Allow a role to operate a specific interface resource.
permit vlan	Allow a role to operate a specific VLAN resource.
permit vrf	Allow a role to operate a specific VRF resource.
role enable	Enable the RBAC function.
role feature-group name	Configure a feature group and enter the specified feature group configuration mode.
role name	Configure a role and enter a specified role configuration mode.
rule	Configure rule permissions for a role.
show role	Show information about a specific role or all roles.
show role feature	Display the basic information or details about a specific feature or all features.
show role feature-group	Display the basic information or details about a specific feature group or all feature groups.
vlan policy deny	Prohibit a role from operating all VLAN resources on a device.
vrf policy deny	Prohibit a role from operating all VRF resources.

1.1 description

Function

Run the **description** command to configure the description of a role.

Run the **no** form of this command to restore the default description of a role.

Run the **default** form of this command to restore the default configuration.

By default, a predefined role is provided with a default description while a user-defined role is provided with no description.

Syntax

description *description*

no description

default description

Parameter Description

description: Description of a role. It is a string of 1 to 128 characters.

Command Modes

Role configuration mode

Default Level

15

Usage Guidelines

This command is used to configure the description of a role.

Examples

The following example configures description "admin role" for role **admin-role**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# description admin role
```

1.2 feature

Function

Run the **feature** command to add a feature to a feature group.

Run the **no** form of this command to remove this configuration.
Run the **default** form of this command to restore the default configuration.

By default, a predefined feature group contains default features while a user-defined feature group contains no feature.

Syntax

feature *feature-name*

no feature *feature-name*

default feature *feature-name*

Parameter Description

feature-name: The feature to be added to a specified feature group. *feature-name* indicates the name of a feature predefined in the system and is case-sensitive.

Command Modes

Feature group configuration mode

Default Level

15

Usage Guidelines

This command is used to add a feature to a feature group.

Examples

The following example adds feature **aaa** to feature group **test-group**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role feature-group name test-group
Hostname(config-role-featuregrp)# feature aaa
```

Function

Run the **interface policy deny** command to prohibit a role from operating all interface resources.

Run the **no** form of this command to allow a role to operate all interface resources .

Run the **default** form of this command to restore the default configuration.

By default, a role has the permission to operate all interface resources.

Syntax

interface policy deny

no interface policy deny

default interface policy deny

Parameter Description

N/A

Command Modes

Role configuration mode

Default Level

15

Usage Guidelines

This command is used to prohibit a role from creating, deleting or applying all interface resources.

Examples

The following example prohibits the role **admin-role** from operating all interface resources.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# interface policy deny
```

1.4 permit interface

Function

Run the **permit interface** command to allow a role to operate a specific interface resource.

Run the **no** form of this command to prohibit a role from operating a specific interface resource or all interface resources.

Run the **default** form of this command to restore the default configuration.

By default, a role is prohibited from operating all interface resources.

Syntax

permit interface *interface-type interface-number-list*

no permit interface [*interface-type interface-number-list*]

default permit interface [*interface-type interface-number-list*]

Parameter Description

interface *interface-type interface-number-list*: Specifies the interface type and interface number list. An interface number list contains one or more interface numbers. Interface numbers are separated by a comma (,). You can specify an interface number range by connecting the first and the last interface numbers with a hyphen (-).

Command Modes

Role interface configuration mode

Default Level

15

Usage Guidelines

This command is used to allow a role to operate interface resources.

Examples

The following example allows role **admin-role** to operate GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# interface policy deny
Hostname(config-role-interface)# permit interface gigabitethernet 0/1
```

The following example allows role **admin-role** to operate GigabitEthernet 0/2, GigabitEthernet 0/4, and GigabitEthernet 0/6.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# interface policy deny
Hostname(config-role-interface)# permit interface gigabitethernet 0/2, 0/4, 0/6
```

1.5 permit vlan

Function

Run the **permit vlan** command to allow a role to operate a specific VLAN resource.

Run the **no** form of this command to prohibit a role from operating a specific VLAN resource or all VLAN resources.

Run the **default** form of this command to restore the default configuration.

By default, a role is prohibited from operating all VLAN resources.

Syntax

permit vlan *vlan-list*

no permit vlan [*vlan-list*]

default permit vlan [*vlan-list*]

Parameter Description

vlan-list: VLAN list. The value range is from 1 to 4094. The VLAN list can contain one or more VLANs. VLAN IDs are separated by a comma (,). You can specify a VLAN range by connecting the first and the last VLAN IDs with a hyphen (-).

Command Modes

Role VLAN configuration mode

Default Level

15

Usage Guidelines

This command is used to allow a role to operate VLAN resources.

Examples

The following example allows the role **admin-role** to operate VLAN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# vlan policy deny
Hostname(config-role-vlan)# permit vlan 1
```

The following example allows the role **admin-role** to operate VLAN 1, VLAN 3, and VLAN 5.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# vlan policy deny
Hostname(config-role-vlan)# permit vlan 1,3,5

Run the **permit vrf** command to allow a role to operate a specific VRF resource.

Run the **no** form of this command to prohibit a role from operating a specific VRF resource or all VRF resources.

Run the **default** form of this command to restore the default configuration.

By default, a role is prohibited from operating all VRF resources.

Syntax

permit vrf *vrf-name*

no permit vrf [*vrf-name*]

default permit vrf [*vrf-name*]

Parameter Description

vrf-name: VRF instance name.

Command Modes

Role VRF configuration mode

Default Level

15

Usage Guidelines

This command allows a role to operate VRF resources on a device.

Examples

The following example allows the role **admin-role** to operate VRF instance **test** .

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# vrf policy deny

1.8 role feature-group name

Function

Run the **role feature-group name** command to configure a feature group and enter the specified feature group configuration mode.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

By default, feature groups **L2** and **L3** are predefined in the system, and these feature groups contain features.

Syntax

role feature-group name *group-name*

no role feature-group name *group-name*

default role feature-group name *group-name*

Parameter Description

group-name: Name of a feature group. It is a case-sensitive string of 1 to 32 characters.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

This command is used to create a feature group and enter the feature group configuration mode.

The system predefines feature groups **L2** and **L3**. **L2** contains all commands for functions related to L2 protocols, and **L3** contains all commands for functions related to L3 protocols. The predefined feature groups cannot be deleted or modified. Users can customize up to 64 feature groups and configure features for the feature groups.

Examples

The following example configures feature group **test-group** for a role, and enters the feature group configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role feature-group name test-group
Hostname(config-role-featuregrp)#
```

1.9 role name

Function

Run the **role name** command to configure a role and enter a specified role configuration mode.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

By default, the system predefines 18 roles, including **network-admin**, **network-operator**, and **priv-***n* (0–15). Each role is granted with specific operation permissions.

Syntax

role name *role-name*

no role name *role-name*

default role name *role-name*

Parameter Description

role-name: Name of a role. It is a case-sensitive string of 1 to 64 characters.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

This command is used to create a role and enter the role configuration mode.

The system predefines 18 roles, including **network-admin**, **network-operator**, and **priv-***n* (0–15).

System predefined roles cannot be deleted by running the **no** command. The default permission of only the **priv-***n* (0–13) role can be restored by running the **default** command.

Permissions can be added to the **priv-***n* (0–13) role only. System predefined permissions cannot be deleted, and permissions of other roles cannot be modified.

Users can customize up to 64 roles and configure permissions for the roles.

Examples

The following example configures role **admin-role** and enters the role configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)#
```

1.10 rule

Function

Run the **rule** command to configure rule permissions for a role.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

By default, predefined roles have predefined rule permissions while user-defined roles have no rule permissions.

Syntax

rule *rule-number* { **permit** | **deny** } { **command** *command-string* | { **read** | **write** | **execute** }* { **feature** [*feature-name*] | **feature-group** *feature-group-name* } }

no rule { *rule-number* | **all** }

default rule { *rule-number* | **all** }

Parameter Description

rule-number: Rule ID. The value range is from 1 to 256.

permit: Allows the user to execute the specified command.

Deny: Prohibits the user from executing the specified command.

command *command-string*: Configures command-based rules. *command-string* indicates a case-sensitive command string of 1 to 128 characters. It can be a specific command or multiple commands that are separated by a semicolon (;). It can also be a type of commands represented by an asterisk (*) wildcard. *command-string* can contain spaces and all printable characters.

read: Indicates a read command, that is, a type of commands that can display system configurations and maintenance information, such as the **show**, **dir**, and **more** commands.

write: Indicates a write command, that is, a type of commands that can configure the system, for example, the **logging on** command.

execute: Indicates an execution command, that is, a type of commands that can execute a specific program or function, for example, the **ping** command.

feature *feature-name*: Configures feature-based rules. *feature-name* indicates the name of a feature predefined in the system and is case-sensitive. If no feature name is specified, the command applies to all features.

feature-group *feature-group-name*: Configures feature group-based rules. *feature-group-name* indicates the name of a feature group. It is a case-sensitive string of 1 to 32 characters.

all: Specifies all permission rules.

Command Modes

Role configuration mode

Default Level

15

Usage Guidelines

This command is used to configure rule permissions for a role. Note:

- During rule configuration, if the specified rule number does not exist, create a rule; otherwise, modify the rule corresponding to the rule number. The modified rule supports newly authenticated users only.
- A user role is allowed to create multiple rules, and permissions executable by this role is a union set of these rules. If permissions defined by these rules conflict with each other, rules with larger serial numbers prevail. For example, if command A is prohibited by rule 1, and command B is prohibited by rule 2, but command A is allowed by rule 3, rule 2 and rule 3 finally take effect. Specifically, command A is allowed and command B is prohibited.
- Predefined rules for predefined roles cannot be deleted or modified. If there is a conflict between system predefined rules and user-defined rules, user-defined rules prevail.
- Up to 256 rules can be configured for each role. A maximum of 1024 rules are configured for all roles on the device.

To configure command-based rules, follow the rules below:

- Division of segments
  - To describe a multi-level mode command, divide the command character string into multiple segments by a semicolon (;). Each segment represents one or a series of commands. The command in the latter segment is used to execute the mode of a command in the preceding segment.
  - A segment must contain at least one printable character.
- Use of semicolons
  - To describe a multi-level mode command, divide the command segments with a semicolon. For example, the character string **config ; logging on** is used to grant a permission over the **logging on** command in configuration mode.
  - The semicolon in the last command segment indicates that the permission is granted over the current mode command. For example, the character string **config ; interface *** grants a permission over only the command in interface configuration mode.
  - The absence of a semicolon in the last command segment indicates that permissions are granted over the current command mode and all commands in this mode. For example, the character string **config ; interface *** is used to grant permissions over all commands in interface mode.
- Use of asterisks
  - Each command segment can contain at least one asterisk (*). An asterisk resides either in the middle or at both ends of a command segment. Each asterisk serves to fuzzily match a command. For example, the character string **config ; *** is used to grant permissions over all commands in configuration mode. The character string **config ; logging * flush** is used to grant a permission over a command starting with **logging** and ending with **flush** in configuration mode. The character string **config ; logging *** is used to grant permissions over all the commands starting with **logging** in configuration mode.

- When an asterisk resides in the middle of a command segment and the asterisk is used to match the command, the command is matched up to only the first asterisk in the middle, and the subsequent command segments are all considered matched. An execution command must be fully matched.

- Matching of keyword prefixes
  - A prefix matching algorithm is used for the matching between the command keyword and the command character string. That is, if the first several consecutive characters or all characters of a keyword in the command line match the keyword defined in a rule, the command line matches this rule. Therefore, a command character string may include a partial or complete command keyword. For example, if the rule **rule 1 deny command show ssh** is effective, the **show ssh** and **show ssh-session** commands are disabled.

Examples

The following example configures role **admin-role**, which has rule permissions to run all commands in configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# rule 1 permit command config ; *
```

The following example configures role **admin-role**, which has the permission to read feature **aaa**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# role name admin-role
Hostname(config-role)# rule 2 permit read feature aaa
```

1.11 show role

Function

Run the **show role** command to show information about a specific role or all roles.

Syntax

show role [**name** *role-name*]

Parameter Description

name *role-name*: Displays information about a specific role.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display information about a specific role or all roles.

Examples

The following example displays information about the role **network-admin**.

```
Hostname> enable
Hostname# show role name network-admin
Role: network-admin
  Description: Predefined network admin role has access to all commands
  Interface policy: permit (default)
  VLAN policy: permit (default)
  Vrf policy: permit (default)
  ------------------------------------------------------------------
  Rule    Perm   Type  Scope       Entity
  ------------------------------------------------------------------
  sys-1   permit      command      *
  R:Read W:Write X:Execute
```

Table 1-1 Output Fields of the show role name Command

Field	Description
Role	Name of a role.
Description	Description of a role.
Interface policy	Allows a role to operate all interface resources.
VLAN policy	Allows a role to operate all VLAN resources.
Vrf policy	Allows a role to operate all VRF resources.
Rule	Rule ID.
Perm	Allow or prohibit.
Type	Command type. This field is set to **RWX**, indicating that the permissions to read, write, and execute are granted to the command.

Scope	Configures rules. This field is set to the following values: • **command**: command-based rules • **feature**: feature-based rules • **feature-group**: feature-group-based rules
Entity	Rule entity.

1.12 show role feature

Function

Run the **show role feature** command to display the basic information or details about a specific feature or all features.

Syntax

show role feature [{ **detail** | **name** *feature-name* }]

Parameter Description

detail: Displays the details about all features.

name *feature-name*: Displays the basic information about a specific feature.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the basic information or details about a specific feature or all features.

Examples

The following example displays the basic information about all features.

```
Hostname> enable
Hostname# show role feature
Feature: aaa                          (Aaa related commands)
Feature: bfd                          (Bfd related commands)
```

```
Feature: bgp                          (Bgp related commands)

1.13 show role feature-group

Function

Run the **show role feature-group** command to display the basic information or details about a specific feature group or all feature groups.

Syntax

show role feature-group [{ **detail** | **name** *group-name* [**detail**] }]

Parameter Description

detail: Displays the details about all feature groups.

name *group-name*: Displays the basic information about a specific feature group.

detail: Displays the details about a specific feature group.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the basic information or details about a specific feature group or all feature groups.

Examples

The following example displays the basic information about the feature group **test**.

```
Hostname> enable
Hostname# show role feature-group name test
Feature group: test
Feature: aaa                          (Aaa related commands)
Feature: snmpd                        (Snmpd related commands)
Feature: syslogd                      (Syslogd related commands)

1 Line Commands

Command	Function
absolute-timeout	Configure the absolute timeout time for a line.
access-class	Configure an IPv4 access control list (ACL) for login control.
accounting commands	Enable the command accounting method list for a line.
accounting exec	Configure the user EXEC accounting method list for a line.
activation-character	Configure a character to activate a null terminal session.
authorization exec	Enable EXEC authorization for a line.
autocommand	Enable automatic command execution for a line.
clear line	Clear the connection status of a line.
databits	Configure the number of data bits per character for asynchronous lines in flow communication mode.
disconnect-character	Configure the hotkey for disconnecting terminal connections.
escape-character	Configure the character for exiting a line.
exec	Allow users to access the command line interface (CLI) through the configured line.
exec-character-bits	Configure the CLI character encoding format for asynchronous lines.
flowcontrol	Configure the flow control mode for asynchronous lines.
history	Enable historical command recording or configure the number of recorded historical commands for a line.
ipv6 access-class	Configure an IPv6 ACL for login control.
length	Configure the maximum number of lines displayed on a single screen on a specified line terminal.

line	Enter the specified line configuration mode.
line maximum-vty	Configure the allowed maximum number of VTY connections.
line vty	Increase the number of available VTY connections.
location	Configure a location description for a specific line.
monitor	Enable logging on terminals.
parity	Configure the parity bit for asynchronous lines.
privilege level	Configure the privilege level for line-based login.
refuse-message	Configure the prompt for refusing line-based login.
role	Configure a role for a line.
show history	Display historical command records of a line.
show line	Display configurations of a line.
show privilege	Display the privilege level of a line.
show users	Display login user information of a line.
speed	Configure the baud rate for a specific line terminal.
start-character	Configure the start character for software flow control for asynchronous lines.
stop-character	Configure the stop character for software flow control for asynchronous lines.
stopbits	Configure the number of stop bits in each byte transmitted through asynchronous lines.
terminal-type	Configure the type of terminals simulated by an asynchronous line terminal.
terminal databits	Configure the number of data bits per character for the current terminal in flow communication mode.
terminal escape-character	Configure the character for exiting the current terminal.
terminal exec-character-bits	Configure the CLI character encoding format for the current terminal.
terminal flowcontrol	Configure the flow control mode for the current terminal.

terminal history	Enable historical command recording or configure the number of recorded historical commands for the line connected to the current terminal.
terminal length	Configure the maximum number of lines displayed in a single screen on the current terminal.
terminal location	Configure location description of the current terminal.
terminal parity	Configure the parity bit for the asynchronous line corresponding to the current terminal.
terminal speed	Configure the baud rate for the current terminal.
terminal start-character	Configure the start character for software flow control for the current terminal.
terminal stop-character	Configure the stop character for software flow control for the current terminal.
terminal stopbits	Configure the number of stop bits in each byte transmitted through the current terminal.
terminal terminal-type	Configure other types of terminals simulated on the current terminal.
terminal width	Configure the maximum number of columns displayed in a single line on the current terminal, that is, the line width.
timeout login response	Configure the authentication timeout time for line-based login.
transport input	Configure the communication protocols supported by a line.
vacant-message	Configure a prompt for line-based logout.
width	Configure the maximum number of columns displayed in a single line for the specified line, that is, the line width.

1.1 absolute-timeout

Function

Run the **absolute-timeout** command to configure the absolute timeout time for a line.

Run the **no** form of this command to restore the default configuration.

No absolute timeout time is configured for a line by default.

Syntax

absolute-timeout *absolute-timeout-time*

no absolute-timeout

Parameter Description

absolute-timeout-time: Absolute timeout time of a line in minutes. The range is from 0 to 60, and the default value is **10**.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

After absolute timeout time is configured for a line, the line is disconnected once the specified time expires no matter whether you are operating the terminal. Before the line is disconnected, the system displays the remaining time after which the terminal will exit.

```
Terminal will be login out after 20 second
```

Examples

The following example sets the absolute timeout time of the console line to 2 minutes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# absolute-timeout 2
```

1.2 access-class

Function

Run the **access-class** command to configure an IPv4 access control list (ACL) for login control.

Run the **no** form of this command to remove this configuration.

No IPv4 ACL is configured for login control by default.

Syntax

access-class { *acl-number* | *acl-name* } { **in** | **out** }

no access-class { *acl-number* | *acl-name* } { **in** | **out** }

Parameter Description

acl-number: ACL ID. Value range:
Standard IP ACLs: 1–99 or 1300–1999; Extended IP ACLs: 100–199 or 2000–2699

acl-name: ACL name.

in: Filters inbound connections.

out: Filters outbound connections.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example configures an ACL numbered 20 to filter connections from virtual type terminal (VTY) lines 0 to 5.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0 5
Hostname(config-line)# access-class 20 in
```

1.3 accounting commands

Function

Run the **accounting commands** command to enable the command accounting method list for a line.

Run the **no** form of this command to remove this configuration.

No command accounting method list is configured for a line by default.

Syntax

accounting commands { **default** | *list-name* }

no accounting commands

Parameter Description

default: Specifies the name of the default authentication method list.

list-name: Name of the optional method list.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

- When this command is used together with Authentication, Authorization and Accounting (AAA) authentication, you need to configure AAA command accounting methods and then apply the methods to the terminal line for command accounting.
- When the role-based access control (RBAC) function is enabled, no privilege level needs to be configured for command accounting.

Examples

The following example enables command accounting for VTY 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# aaa new-model
Hostname(config)# aaa accounting commands default start-stop group tacacs+
Hostname(config)# line vty 1
Hostname(config-line)# accounting commands default
```

1.4 accounting exec

Function

Run the **accounting exec** command to configure the user EXEC accounting method list for a line.

Run the **no** form of this command to remove this configuration.

No user EXEC accounting method list is configured for a line by default.

Syntax

accounting exec { **default** | *list-name* }

no accounting exec

Parameter Description

default: Specifies the name of the default authentication method list.

list-name: Name of the optional method list.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

When this command is used together with AAA authentication, you need to configure AAA user access accounting methods and then apply the methods to the VTY lines for user access accounting.

Examples

The following example sets the user EXEC accounting method list to the default method list for VTY 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# aaa new-model
Hostname(config)# aaa accounting exec default start-stop group radius
Hostname(config)# line vty 1
Hostname(config-line)# accounting exec default
```

1.5 activation-character

Function

Run the **activation-character** command to configure a character to activate a null terminal session.

Run the **no** form of this command to remove this configuration.

The default character for activating a terminal session is the carriage return character (ASCII value 13).

Syntax

activation-character *ascii-value*

no activation-character

Parameter Description

ascii-value: ASCII value of the hotkey character for activating a terminal session. The range is from 0 to 127.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

If auto-selection of the terminal session activation character is enabled for the current line, the hotkey character for activating a terminal session must be set to the default value.

Examples

The following example sets the character for activating a terminal session of the console port to **Ctrl+Y** (ASCII value 25).

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# activation-character 25
Hostname(config-line)# end
Hostname# exit
Press CTRL+y to get started
Hostname>
```

1.6 authorization exec

Function

Run the **authorization exec** command to enable EXEC authorization for a line.

Run the **no** form of this command to remove this configuration.

The EXEC authorization function is disabled by default.

Syntax

authorization exec { **default** | *list-name* }

no authorization exec

Parameter Description

default: Specifies the name of the default authentication method list.

list-name: Name of the optional method list.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

When this command is used together with AAA authentication, you need to configure AAA EXEC authorization methods and then apply the methods to the VTY lines for EXEC authorization.

Examples

The following example enables EXEC authorization for VTY 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# aaa new-model
Hostname(config)# aaa authorization exec default group radius
Hostname(config)# line vty 1
Hostname(config-line)# authorization exec default
```

1.7 autocommand

Function

Run the **autocommand** command to enable automatic command execution for a line.

Run the **no** form of this command to disable this feature.

The automatic command execution function is disabled by default.

Syntax

autocommand *autocommand-command*

no autocommand

Parameter Description

autocommand-command: Command lines that are automatically executed.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

After a user acts as a dumb terminal to connect to the device through an asynchronous serial port, the user can remotely log in to the specified host by running the **telnet** command or obtain the specified application-based terminal service by running the **autocommand** command.

Examples

The following example enables automatic command execution for VTY 0 and automatically establishes a telnet connection to the terminal whose IP address is 192.168.21.100.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0
Hostname(config-line)# autocommand telnet 192.168.21.100
```

1.8 clear line

Function

Run the **clear line** command to clear the connection status of a line.

Syntax

clear line { **console** *console-line-number* | **vty** *vty-line-number* | *line-number* }

Parameter Description

console *console-line-number*: Clears the console connection status of a line. The value is 0.

vty *vty-line-number*: Clears the connection status of a VTY line. The range is from 0 to 35.

line-number: Line whose connection status is to be cleared. The range is from 0 to 36.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

When this command is used to clear the connection status of a line, the terminal connected to the line is forcibly disconnected, and the line is restored to the idle state and can connect to a terminal again.

Examples

The following example clears the connection status of VTY 13. Client connections (such as telnet and SSH connections) on the VTY line are disconnected immediately.

```
Hostname> enable
Hostname# clear line vty 13
```

1.9 databits

Function

Run the **databits** command to configure the number of data bits per character for asynchronous lines in flow communication mode.

Run the **no** form of this command to restore the default configuration.

The default number of data bits per character for asynchronous lines in flow communication mode is **8**.

Syntax

databits *bit*

no databits

Parameter Description

bit: Number of data bits per character. The range is from 5 to 8.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

The asynchronous hardware (such as an asynchronous serial port and AUX port) of the device generates seven data bits with parity check in flow communication mode. If parity is generated, specify seven data bits per character. If no parity is generated, specify eight data bits per character. Only early devices support five or six data bits, which are seldom used.

Examples

The following example sets the number of data bits per character for the asynchronous line corresponding to the console port in flow communication mode to **7**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# databits 7
```

1.10 disconnect-character

Function

Run the **disconnect-character** command to configure the hotkey for disconnecting terminal connections.

Run the **no** form of this command to restore the default configuration.

The default hotkey for disconnecting terminal connections is **Ctrl+D** (ASCII value 4).

Syntax

disconnect-character *ascii-value*

no disconnect-character

Parameter Description

ascii-value: ASCII value of the hotkey for disconnecting terminal connections. The range is from 0 to 255.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the hotkey for disconnecting terminal connections based on requirements. The hotkey for disconnecting terminal connections cannot be common ASCII values (such as a–z, A–Z, and 0–9). Otherwise, the terminal service may be abnormal.

Examples

The following example sets the hotkey for disconnecting terminal connections on VTY lines 0 to 5 to **Ctrl+E** (ASCII value 5).

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0 5
Hostname(config-line)# disconnect-character 5
```

1.11 escape-character

Function

Run the **escape-character** command to configure the character for exiting a line.

Run the **no** form of this command to restore the default configuration.

The default character for exiting a line is **Ctrl+Shift+6** (ASCII value 30).

Syntax

escape-character *escape-value*

no escape-character

Parameter Description

escape-value: ASCII value of the user-defined character for exiting a line. The range is from 0 to 255.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

If the **escape-character** *escape-value* command is configured, you can press the combination keys specified by *escape-value* and then press **x** to terminate the current session and return to the source session that creates the current session.

Examples

The following example sets the character for exiting VTY 0 to **Ctrl+W** (ASCII value 23).

```
Hostname> enable
Hostname# configure terminal

1.12 exec

Function

Run the **exec** command to allow users to access the command line interface (CLI) through the configured line.

Run the **no** form of this command to remove this configuration.

Users are allowed to access the CLI through configured lines by default.

Syntax

exec

no exec

Parameter Description

N/A

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

After the **no exec** command is configured, users cannot access the CLI through the configured line. Instead, users can access CLI only through the other lines.

Examples

The following example prevents users from accessing the CLI through VTY 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 1
Hostname(config-line)# no exec
```

1.13 exec-character-bits

Function

Run the **exec-character-bits** command to configure the CLI character encoding format for asynchronous lines.

Run the **no** form of this command to restore the default configuration.

The default CLI character encoding format is a full 8-bit ASCII character set.

Syntax

exec-character-bits { **7** | **8** }

no exec-character-bits

Parameter Description

7: Selects a 7-bit ASCII character set as the CLI character set.

8: Selects an 8-bit ASCII character set as the CLI character set.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

To enter Chinese characters or display Chinese characters, images, or other international characters in the CLI, run the **exec-character-bits 8** command.

Examples

The following example sets the CLI character encoding format for the asynchronous line corresponding to the console port to a 7-bit character set.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# exec-character-bits 7
```

1.14 flowcontrol

Function

Run the **flowcontrol** command to configure the flow control mode for asynchronous lines.

Run the **no** form of this command to restore the default configuration.

No flow control is configured for asynchronous lines by default.

Syntax

flowcontrol { **hardware** | **none** | **software** }

no flowcontrol { **hardware** | **none** | **software** }

Parameter Description

hardware: Configures hardware flow control.

none: Configures no flow control.

software: Configures software flow control.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

- The device provides the following two flow control modes:
  - Software flow control, also called soft flow controls, which uses the control keys for operations. The start and stop characters for this mode are configured by the **start-character** and **stop-character** commands respectively. The default start character is **Ctrl+Q** (XON, ASCII value 17), and the default stop character is **Ctrl+S** (XOFF, ASCII value 19).
  - Hardware flow control, also called hard flow control, which uses hardware for operations.
- By running this command, you can configure the flow control mode to keep the Tx rate of one end the same as the Rx rate of the peer end.
- Since terminals cannot receive data while sending data, flow control can prevent data loss.
- When high-speed data processing devices communicate with low-speed data processing devices (for example, a printer communicates with a network port), you also need to configure flow control to prevent data loss.

Examples

The following example configures software flow control for the asynchronous line corresponding to the console port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# flowcontrol software
```

1.15 history

Function

Run the **history** command to enable historical command recording or configure the number of recorded historical commands for a line.

Run the **no history** command to disable the historical command recording function.

Run the **no history size** command to restore the default number of recorded historical commands.

The historical command recording function is enabled by default, and the default number of recorded historical commands is **10**.

Syntax

history [**size** *size*]

no history

no history size

Parameter Description

size *size*: Configures the number of recorded historical commands for a line. *size* indicates the number of recorded historical commands of a line. The range is from 0 to 256.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the number of recorded historical commands to **20** for lines 0 to 5.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0 5
Hostname(config-line)# history size 20

1.16 ipv6 access-class

Function

Run the **ipv6 access-class** command to configure an IPv6 ACL for login control.

Run the **no** form of this command to remove this configuration.

No IPv6 ACL is configured for login control by default.

Syntax

ipv6 access-class { *acl-number* | *acl-name* } { **in** | **out** }

no ipv6 access-class { *acl-number* | *acl-name* } { **in** | **out** }

Parameter Description

acl-number: ACL ID. Value range:
Standard IP ACLs: 1–99 or 1300–1999; Extended IP ACLs: 100–199 or 2000–2699

acl-name: ACL name.

in: Filters inbound connections.

out: Filters outbound connections.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example configures an ACL named **test** to filter outbound IPv6 connections of VTY lines 0 to 4.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0 4
Hostname(config-line)# ipv6 access-class test out

1.17 length

Function

Run the **length** command to configure the maximum number of lines displayed on a single screen on a specified line terminal.

Run the **no** form of this command to restore the default configuration.

The maximum number of lines displayed on a single screen is **24** by default.

Syntax

length *screen-length*

no length

Parameter Description

screen-length: Maximum number of lines displayed on a single screen. The range is from 0 to 512. The value **0** indicates that the number of lines displayed on a single screen is not limited.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the maximum number of lines displayed on a single screen to **10** for VTY 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 1
Hostname(config-line)# length 10
```

1.18 line

Function

Run the **line** command to enter the specified line configuration mode.

Syntax

line { **console** | **vty** } *first-line* [*last−line*]

Parameter Description

console: Specifies the console port.

vty: Specifies a virtual terminal line, which supports a telnet or SSH connection.

first-line: ID of the first line.

last-line: ID of the last line. If it is not specified, you access only the first line.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example enters the line configuration mode of VTY lines 1 to 3.

```
Hostname> enable
Hostname# configure terminal

1.19 line maximum-vty

Function

Run the **line maximum-vty** command to configure the allowed maximum number of VTY connections.

Run the **no** form of this command to restore the default configuration.

The allowed maximum number of VTY connections is **36** by default.

Syntax

line maximum-vty *max-number*

no line maximum-vty

Parameter Description

max-number: Allowed maximum number of VTY connections. The range is from 0 to 36.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- This command is used to configure the allowed maximum number of VTY connections. If the allowed maximum number of VTY terminals is set to **0**, all remote connections (including telnet, SSH, and session connections) fail. If the allowed maximum number of VTY connections is smaller than the number of online remote connections, the configuration fails and a prompt is displayed.
- The allowed maximum number of VTY connections and the number of available VTY connections are separately managed. A remote connection is established successfully only when both conditions are met.

Examples

The following example sets the allowed maximum number of VTY connections to **3**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line maximum-vty 3
```

1.23 parity

Function

Run the **parity** command to configure the parity bit for asynchronous lines.

Run the **no** form of this command to restore the default configuration.

No parity bit is configured for asynchronous lines by default.

Syntax

parity { **even** | **none** | **odd** }

no parity

Parameter Description

even: Specifies even parity check.

none: Specifies no parity check.

odd: Specifies odd parity check.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

When using certain hardware (such as a console port) for communication, you usually need to configure a parity bit.

Examples

The following example configures even parity check for the asynchronous line corresponding to the console port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# parity even
```

1.24 privilege level

Function

Run the **privilege level** command to configure the privilege level for line-based login.

Run the **no** form of this command to restore the default configuration.

The default privilege level for line-based login is **1**.

Syntax

privilege level *privilege-level*

no privilege level

Parameter Description

privilege-level: Privilege level for line-based login. The range is from 0 to 15.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

This command is unavailable when the RBAC function is enabled.

Examples

The following example sets the privilege level of login through VTY lines 0-4 to **14**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0 4
Hostname(config-line)# privilege level 14

1.25 refuse-message

Function

Run the **refuse-message** command to configure the prompt for refusing line-based login.

Run the **no** form of this command to remove this configuration.

No prompt is configured for refusing line-based login by default.

Syntax

refuse-message [*c message c*]

no refuse-message

Parameter Description

c message c: Prompt for refusing line-based login. *c* indicates the prompt delimiter, which is any character. *message* indicates the prompt content. Delimiters are not allowed in the prompt content.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

- This command is used to configure the prompt for refusing line-based login. Any characters following the ending delimiter are dropped.
- When a user is refused to log in to the device, a prompt appears, indicating that the current line refuses the user's login.

Examples

The following example sets the prompt for refusing line-based login to **Illegal users are not allowed to log in to the device**.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config-line)#refuse-message @ Illegal users are not allowed to log in to the device @

1.26 role

Function

Run the **role** command to configure a role for a line.

Run the **no** form of this command to remove this configuration.

A role is configured for each line by default. The default role for the console line is **network-admin**, and the default role for VTY lines is **network-operator**.

Syntax

role *role-name*

no role *role-name*

Parameter Description

role-name: Role name.

Command Modes

Line configuration mode

Default Level

15

Usage Guidelines

- This command is used to configure a role for a line.
- Each line can be configured with 1 to 64
- roles. The last role cannot be deleted. If it is deleted, a failure prompt is displayed.

Examples

The following example configures role **priv-0** for VTY 1.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# line vty 1
Hostname(config-line)# role priv-0
```

1.28 show line

Function

Run the **show line** command to display configurations of a line.

Syntax

show line { **console** *console-line-number* | **vty** *vty-line-number* | *line-number* }

Parameter Description

console *console-line-number*: Displays configurations of the console line. The *console-line number* value is 0.

vty *vty-line-number*: Displays configurations of a VTY line. *vty-line-num* indicates the VTY line ID. The range is from 0 to 35.

line-number: Line number. The range is from 0 to 36.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays configurations of the console line.

```
Hostname> enable
Hostname# show line console 0
```

```
CON    Type    speed   Overruns
* 0    CON     9600    45927
Line 0, Location: "", Type: "vt100"

1.32 start-character

Function

Run the **start-character** command to configure the start character for software flow control for asynchronous lines.

Run the **no** form of this command to restore the default configuration.

The default start character for software flow control for asynchronous lines is **Ctrl+Q** (ASCII value 17).

Syntax

start-character *ascii-value*

no start-character

Parameter Description

ascii-value: ASCII value of the start character for software flow control for asynchronous lines. The range is from 0 to 255.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

After software flow control is enabled for an asynchronous line, the start character indicates the start of data transmission.

Examples

The following example sets the start character for software flow control for the asynchronous line corresponding to the console port to **Ctrl+Y** (ASCII value 25).

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# start-character 25
```

Run the **stop-character** command to configure the stop character for software flow control for asynchronous lines.

Run the **no** form of this command to restore the default configuration.

The default stop character for software flow control for asynchronous lines is **Ctrl+S** (ASCII value 19).

Syntax

stop-character *ascii-value*

no stop-character

Parameter Description

ascii-value: ASCII value of the stop character for software flow control for asynchronous lines. The range is from 0 to 255.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

After software flow control is enabled for an asynchronous line, the stop character indicates the end of data transmission.

Examples

The following example sets the stop character for software flow control for the asynchronous line corresponding to the console port to **Ctrl+Z** (ASCII value 26).

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# stop-character 26

1.34 stopbits

Function

Run the **stopbits** command to configure the number of stop bits in each byte transmitted through asynchronous lines.

Run the **no** form of this command to restore the default configuration.

The default number of stop bits in each byte transmitted through asynchronous lines is **2**.

Syntax

stopbits { **1** | **2** }

no stopbits

Parameter Description

1: Configures one stop bit.

2: Configures two stop bits.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

You should configure the stop bits for communication between an asynchronous line and the connected asynchronous device (such as a conventional numb terminal and modem).

Examples

The following example sets the number of stop bits in each byte transmitted through the asynchronous line corresponding to the console port to **1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# stopbits 1
```

1.35 terminal-type

Function

Run the **terminal-type** command to configure the type of terminals simulated by an asynchronous line terminal.

Run the **no** form of this command to restore the default configuration.

The default terminal type is **vt100**.

Syntax

terminal-type *terminal-type-string*

no terminal-type

Parameter Description

terminal-type-string: Description of the terminal type, such as **vt100** and **ansi**.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

You can run the **terminal-type vt100** command to restore the default terminal type. In telnet connection scenarios, you can run this command to configure other types of terminals simulated on the terminal connected to a line as required. Upon telnet connection, one end negotiates with the other end about the terminal type based on its terminal type configuration (telnet option negotiation ID: 0x18). For details, see RFC 854.

Examples

The following example sets the type of terminals simulated by the asynchronous line terminal corresponding to the console port to **ansi**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# terminal-type ansi
```

1.37 terminal escape-character

Function

Run the **terminal escape-character** command to configure the character for exiting the current terminal.

Run the **no** form of this command to restore the default configuration.

The default character for exiting the current terminal is **Ctrl+Shift+6** (ASCII value 30).

Syntax

terminal escape-character *escape-value*

terminal no escape-character

Parameter Description

escape-value: ASCII value in decimal notation of the user-defined character for exiting the current terminal. The range is from 0 to 255.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

If the **escape-character** *escape-value* command is configured, you can press the combination keys specified by *escape-value* and then press **x** to terminate the current session and return to the source session that creates the current session.

Examples

The following example sets the character for exiting the current terminal to **Ctrl+W** (ASCII value 23).

```
Hostname> enable
Hostname# terminal escape-character 23
```

Function

Run the **terminal exec-character-bits** command to configure the CLI character encoding format for the current terminal.

Run the **no** form of this command to restore the default configuration.

The default CLI character encoding format is a full 8-bit ASCII character set.

Syntax

terminal exec-character-bits { **7** | **8** }

terminal no exec-character-bits

Parameter Description

7: Selects a 7-bit ASCII character set as the CLI character set.

8: Selects an 8-bit ASCII character set as the CLI character set.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

If you need to enter Chinese characters or display Chinese characters, images, or other international characters in the CLI, run the **terminal exec-character-bits 8** command.

Examples

The following example sets the CLI character encoding format for the current terminal to a 7-bit character set.

```
Hostname> enable
Hostname# terminal exec-character-bits 7
```

1.39 terminal flowcontrol

Function

Run the **terminal flowcontrol** command to configure the flow control mode for the current terminal.

Run the **no** form of this command to restore the default configuration.

No flow control is configured for the current terminal by default.

Syntax

terminal flowcontrol { **hardware** | **none** | **software** }

terminal no flowcontrol { **hardware** | **none** | **software** }

Parameter Description

hardware: Configures hardware flow control.

none: Configures no flow control.

software: Configures software flow control.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example configures software flow control for the current terminal.

```
Hostname> enable
Hostname# terminal flowcontrol software
```

1.40 terminal history

Function

Run the **terminal history** command to enable historical command recording or configure the number of recorded historical commands for the line connected to the current terminal.

Run the **terminal no history** command to disable the historical command recording function for the line connected to the current terminal.

Run the **terminal no history size** command to restore the default number of recorded historical commands for the line connected to the current terminal.

The historical command recording function is enabled by default, and the default number of recorded historical commands is **10**.

Syntax

terminal history [**size** *size*]

terminal no history

terminal no history size

Parameter Description

size *size*: Configures the maximum number of recorded historical commands for a line. *size* indicates the maximum number of recorded historical commands of a line. The range is from 0 to 256.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the number of recorded historical commands for the line connected to the current terminal to **20**.

```
Hostname> enable
Hostname# terminal history size 20
```

1.41 terminal length

Function

Run the **terminal length** command to configure the maximum number of lines displayed in a single screen on the current terminal.

Run the **no** form of this command to restore the default configuration.

The maximum number of lines displayed in a single screen is **24** by default.

Syntax

terminal length *screen-length*

terminal no length

Parameter Description

screen-length: Maximum number of lines displayed in a single screen. The range is from 0 to 512. The value **0** indicates that the number of lines displayed in a single screen is not limited.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the maximum number of lines displayed in a single screen on the current terminal to **10**.

```
Hostname> enable
Hostname# terminal length 10
```

1.42 terminal location

Function

Run the **terminal location** command to configure location description of the current terminal.

Run the **no** form of this command to restore the default configuration.

No location description is configured for the current terminal by default.

Syntax

terminal location *location*

terminal no location

Parameter Description

location: Location description of the current terminal.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets location description of the current terminal to **Switch's Line Vty 0**.

```

1.43 terminal parity

Function

Run the **terminal parity** command to configure the parity bit for the asynchronous line corresponding to the current terminal.

Run the **no** form of this command to restore the default configuration.

No parity bit is configured for the asynchronous line corresponding to the current terminal by default.

Syntax

terminal parity { **even** | **none** | **odd** }

terminal no parity

Parameter Description

even: Specifies even parity check.

none: Specifies no parity check.

odd: Specifies odd parity check.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

When using certain hardware (such as a console port) for communication, you usually need to configure a parity bit.

Examples

The following example configures even parity check for the asynchronous line corresponding to the current terminal.

```
Hostname> enable
Hostname# terminal parity even
```

1.44 terminal speed

Function

Run the **terminal speed** command to configure the baud rate for the current terminal.

Run the **no** form of this command to restore the default configuration.

The default baud rate of the current terminal is 9600 bps.

Syntax

terminal speed *baudrate*

terminal no speed

Parameter Description

baudrate: Baud rate of a line terminal in bps. The range is from 9600 to 115200. For serial interfaces, the baud rate is **9600**, **19200**, **38400**, **57600**, or **115200**.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the baud rate of the current terminal to 115,200 bps.

```
Hostname> enable
Hostname# terminal speed 115200

1.47 terminal stopbits

Function

Run the **terminal stopbits** command to configure the number of stop bits in each byte transmitted through the current terminal.

Run the **no** form of this command to restore the default configuration.

The default number of stop bits in each byte transmitted through the current terminal is **2**.

Syntax

terminal stopbits { **1** | **2** }

terminal no stopbits

Parameter Description

1: Configures one stop bit.

2: Configures two stop bits.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the number of stop bits in each byte transmitted through the current terminal to **1**.

1.51 transport input

Function

Run the **transport input** command to configure the communication protocols supported by a line.

Run the **no** form of this command to restore the default configuration.

All communication protocols are supported by default. That is, both SSH and telnet are supported.

Syntax

transport input { **all** | **ssh** | **telnet** | **none** }

no transport input { **all** | **ssh** | **telnet** | **none** }

Parameter Description

all: Specifies that all communication protocols are supported in a line.

ssh: Specifies that the SSH protocol is supported for communication in a line.

telnet: Specifies that the telnet protocol is supported for communication in a line.

none: Specifies that no protocol is supported for communication in a line.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example allows only the telnet protocol in VTY lines 0 to 4.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 0 5
Hostname(config-line)# transport input ssh
```

1.52 vacant-message

Function

Run the **vacant-message** command to configure a prompt for line-based logout.

Run the **no** form of this command to remove this configuration.

No prompt information is configured for line-based logout by default.

Syntax

vacant-message [*c message c*]

no vacant-message

Parameter Description

c message c: Prompt for logout. *c* indicates the prompt delimiter, which can be any character. *message* indicates the prompt content. Delimiters are not allowed in the prompt content.

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

- This command is used to configure the prompt for line-based logout. Any characters following the ending delimiter are dropped.
- When a user logs out of the device, a prompt appears, indicating that the current line logs out.

Examples

The following example sets the prompt for line-based logout through VTY 1 to **Exit device**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line vty 1
Hostname(config-line)# vacant-message @ Exit device @

1 File System Commands

Command	Function
cd	Change the current path or file system.
copy	Copy files between file systems.
delete	Delete one file.
dir	Display the file list in one file system.
eject	Unmount the USB device.
erase	Erase the file system.
file	Display information about a file.
file prompt	Configure the file operation prompt mode.
mkdir	Create a directory.
more	Display the content of a file.
pwd	Display the full path to the current working directory.
rename	Rename a current file or directory.
rmdir	Delete an empty directory.
show disk	Display information about the USB flash drive/flash disk.
show file systems	Display information about a file system.
show mount	Display information about the file system mounted on the device.
tftp-client source	Specify a source IP address or source interface to be used for communication between the TFTP client and the TFTP server.
verify	Compute, display, and verify Message Digest 5 (MD5) information.

1.1 cd

Function

Run the **cd** command to change the current path or file system.

The default file system is **flash:**. If no path name is specified, the current path of the specified file system is the root path.

Syntax

cd [*filesystem*:] [*directory*]

Parameter Description

filesystem:: URL of the file system, followed by a colon (:). File systems include **flash:**, **usb:**, and **tmp:**.

directory: Path name. A path starting with "/" is an absolute path. Otherwise, it is a relative path.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

N/A

Examples

The following example changes the current file system to USB:.

```
Hostname> enable
Hostname# pwd
flash:/
Hostname# cd usb:
Hostname# pwd
usb:/
```

Notifications

Related Commands

- **pwd**

1.2 copy

Function

Run the **copy** command to copy files between file systems.

Syntax

copy *src-url dst-url* [*vrf_name*]

copy *src-url dst-url*

Parameter Description

src-url: URL of the source file. The file can be local or remote.

dst -url: URL of the target file. The file can be local or remote.

vrf_name: Specifies the VRF. Whether this parameter is supported depends on the actual product version.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

When the file to be copied exists on the target URL, the target file system determines the action, for example, reporting an error, overwriting the file, or asking users to make the choice.

Table 1-1 Description of URL Parameters

Parameter	Description
running-config	Specifies the running configuration file.
startup-config	Specifies the configuration file for initialization.
flash:	Specifies the local flash file system.
tftp:	Specifies the URL of the Trivial File Transfer Protocol (TFTP) network server, with the syntax as follows: **tftp:**[[//location] /directory] /filename
oob_tftp: [**via mgmt** { *number* }] **oob_tftp:**	Specifies the URL of the TFTP network server connected with the out-of-band port. If there are multiple MGMT ports, you can select one. Specifies the URL of the TFTP network server connected with the out-of-band port.
ftp	Specifies the URL of the File Transfer Protocol (FTP) network server, with the syntax as follows: **ftp**:[[//[*uname* [:*passwd*] @] *location*] /*directory* **/filename**

Parameter	Description
oob_ftp: [**via mgmt.** { number }] **oob_ftp:**	Specifies the URL of the FTP network server connected with the out-of-band port. If there are multiple MGMT ports, you can select one. Specifies the URL of the FTP network server connected with the out-of-band port.
http	Specifies the URL of the Hypertext Transfer Protocol (HTTP) network server, with the syntax as follows: **http**:[[//*location*] */directory*] **/filename**
oob_http: [**via mgmt.** { *number* }] **oob_http:**	Specifies the URL of the HTTP network server connected with the out-of-band port, If there are multiple MGMT ports, you can select one. Specifies the URL of the HTTP network server connected with the out-of-band port.

Examples

The following example copies the file **netconfig** on the device with the IP address of 192.168.64.2 to **netconfig** on the flash disk.

```
Hostname> enable
Hostname# copy tftp://192.168.64.2/netconfig flash:/netconfig
Do you want to overwrite [/data/netconfig]? [Y/N]:y
Press Ctrl+C to quit

1.12 rename

Function

Run the **rename** command to rename a current file or directory.

Syntax

rename *src-url dst-url*

Parameter Description

src-url:-url: Path or file name of the source file or directory to be renamed.

dst-url:-url: Path or file name of the renamed destination file or directory.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

N/A

Examples

The following example renames the file **fstab** in the root directory of the flash disk as **new-fstab**.

```
Hostname> enable
Hostname# dir
Directory of flash:/
1   -rw-       336   Jan 03 2012 18:53:42  fstab
2   -rw-      4096   Jan 03 2012 12:32:09  rc.d
3   -rw-   10485760   Jan 03 2012 18:13:37  rpmdb

1.13 rmdir

Function

Run the **rmdir** command to delete an empty directory.

The default file system is **flash:**.

Syntax

rmdir [*filesystem*:] *directory*

Parameter Description

filesystem:: URL of the file system, followed by a colon (:). File systems include **flash:**, **usb:**, and **tmp:**.

directory: Name of a folder under the file system URL.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

N/A

Examples

The following example deletes empty directory **test**.

```
Hostname> enable
Hostname# mkdir newdir
Hostname# dir
Directory of flash:/

1.14 show disk

Function

Run the **show disk** command to display information about the USB flash drive/flash disk.

Syntax

show disk [**usb** | **flash**]

Parameter Description

usb: Displays information about the USB flash drive.

flash: Displays information about the flash disk.

Command Modes

All modes except the user EXEC mode

Default Level

1

Usage Guidelines

N/A

Examples

The following example displays information about the flash disk.

```
Hostname> enable
Hostname# show disk flash
Nand flash size: 512MB
Nor flash size: 1MB
```

Table 1-3 Output Fields of the show disk flash Command

Field	Description
Nand flash size	Size of the NAND flash memory.
Nor flash size	Size of the NOR flash memory.

1.17 tftp-client source

Function

Run the **tftp-client source** command to specify a source IP address or source interface to be used for communication between the TFTP client and the TFTP server.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No source IP address or source interface is configured for communication between the TFTP client and the TFTP server by default.

Syntax

tftp-client source { **ip** *ipv4-address* | **ipv6** *ipv6-address* | *interface-type interface-number* }

no tftp-client source { **ip** *ipv4-address* | **ipv6** *ipv6-address* | *interface-type interface-number* }

default tftp-client source { **ip** *ipv4-address* | **ipv6** *ipv6-address* | *interface-type interface-number* }

Parameter Description

ipv4-address: IPv4 source address.

ipv6-address: IPv6 source address.

interface-type interface-number: Interface type and interface number.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example specifies 192.168.23.236 as the IP address to be used for communication between the TFTP client and the TFTP server.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# tftp-client source ip 192.168.23.236
```

Notifications

If the configured IP address or interface is not a local address, an error will be reported. Otherwise, the binding will be successful without any prompt.

Common Errors

1.18 verify

Function

Run the **verify** command to compute, display, and verify Message Digest 5 (MD5) information.

The default file system is **flash:**.

Syntax

verify [**/md5** *md5-value*] *filesystem:* [*file-url*]

Parameter Description

/md5: Computes and displays the MD5 value of a file.

md5-value: MD5 value of the file, which will be compared with the computed MD5 value.

filesystem:: URL of the file system, followed by a colon (:). File systems include **flash:**, **usb:**, and **tmp:**.

file-url: Path name. A path starting with "/" is an absolute path. Otherwise, it is a relative path.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

N/A

Examples

The following example computes the MD5 value of **flash:/gcc** and makes a comparison.

```
Hostname> enable
Hostname# verify /md5 8b072de7db7affd8b2ef824e7e4d716c flash:/gcc
%SUCCESS verifying flash:/gcc = 8b072de7db7affd8b2ef824e7e4d716c
Hostname# verify /md5 8b072de7db7affd8b2ef824e7e4d71 flash:/gcc
%Error verifying flash:/gcc
Computed signature = 8b072de7db7affd8b2ef824e7e4d716c
Submitted signature = 8b072de7db7affd8b2ef824e7e4d71

1 HTTP Commands

Command	Function
enable service web-server	Enable the Hypertext Transfer Protocol (HTTP) and Hypertext Transfer Protocol Secure (HTTPS) service.
http check-version	Detect upgrade files on an HTTP server.
http port	Configure a port for the HTTP service.
http secure-port	Configure a port for the HTTPS service.
http update	Configure a file for manual upgrade.
http update mode	Configure the manual upgrade mode for HTTP upgrade.
http update server	Configure the server address and port number for HTTP upgrade.
http update set oob	Configure HTTP upgrade using the MGMT port.
http update source_ip	Configure the source IP address for HTTP upgrade.
http update time	Configure HTTP automatic detection time.
show web-server https certificate information	Display information about the HTTPS service certificate.
show web-server status	Display the configuration and status of the Web service.
webmaster level	Configure a username and a password for Web login and authentication.
web-server http redirect-to-https	Configure automatic HTTP redirection to HTTPS.
web-server https certificate	Install an HTTPS certificate.
web-server https generate self-signed-certificate	Generate an HTTPS service self-signed certificate again.

1.1 enable service web-server

Function

Run the **enable service web-server** command to enable the Hypertext Transfer Protocol (HTTP) and Hypertext Transfer Protocol Secure (HTTPS) service.

Run the **no** form of this command to disable the HTTP and HTTPS service.

Run the **default** form of this command to restore the default configuration of the HTTP and HTTPS service.

The HTTP and HTTPS services are disabled by default.

Syntax

enable service web-server [**all** | **http** | **https**]

no enable service web-server [**all** | **http** | **https**]

default enable service web-server [**all** | **http** | **https**]

Parameter Description

all | **http** | **https**: Enables the service. Here, **all** indicates that both the HTTP and HTTPS services are enabled; **http** indicates that only the HTTP service is enabled; **https** indicates that only the HTTPS service is enabled. Both the HTTP and HTTPS services are enabled by default.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- If no keyword is configured or the **all** keyword is configured at the end of the command, both the HTTP and HTTPS services are enabled; if the **http** keyword is configured, only the HTTP service is enabled; if the **https** keyword is configured, only the HTTPS service is enabled.
- The **no enable service web-server** command or the **default enable service web-server** command is configured to disable the HTTP service. If no keyword is entered at the end of the **no enable service web-server** or **default enable service web-server** command, both the HTTP and HTTPS services are disabled.

Examples

The following example enables both the HTTP and HTTPS services.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# enable service web-server all
```

Notifications

If the port is 80 and the HTTP service fails, the following notification will be displayed:

```
%notice:Failed to open tcp listen, port=[80].
```

Common Errors

If the port is occupied by other modules, the Web service may not be enabled.

Platform Description

N/A

Related Commands

N/A

1.2 http check-version

Function

Run the **http check-version** command to detect upgrade files on an HTTP server.

Detecting available upgrade files on an HTTP server is enabled by default.

Syntax

http check-version [**extend**]

Parameter Description

extend: Detects upgrade files on more than one HTTP server.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example detects upgrade files on an HTTP server.

```
Hostname> enable
Hostname# http check-version
Business modules need to be updated: character-db, route-db
app name:web
   app-name          version         filename
----- -----------------
character-db    2014.02.09.14.02.09 app_sub_1.exe
character-db    2014.02.09.14.02.09 app_file_list.txt
character-db    2014.02.09.14.02.09 app_sub_3.exe
character-db    2014.02.09.14.02.09 app_sub_2.exe
route-db       2013.12.01.00      route-choose.db
```

Notifications

If no service module is registered with the upgrade module, the following notification will be displayed:

```
%notice: No bussiness modules registration.
```

If the device cannot establish a connection with the server or the communication with the server fails, the following notification will be displayed:

```
%notice: Communicate with the server failed.
```

If the memory of the device is insufficient, the following notification will be displayed:

```
%warning: Out of memory, application memory failure.
```

If the format of the response packet of the server is incorrect, the following notification will be displayed:

```
%notice: The server response message format is wrong.
```

If the service module is being upgraded or has not registered a version number, the following notification will be displayed:

```
%notice: Suspend, some business modules are upgrading or haven't registered release.
```

If the versions of all service modules are the latest, the following notification will be displayed:

```
%notice: All bussiness modules are the latest versions.
```

Common Errors

Communication with the server fails during running of this command, possibly because the network fails or the DNS service is not enabled.

Platform Description

N/A

Related Commands

N/A

1.3 http port

Function

Run the **http port** command to configure a port for the HTTP service.

Run the **no** form of this command to restore the default port number.

The default port number of the HTTP service is **80**.

Syntax

http port *port-number*

no http port

Parameter Description

port-number: Port number of the HTTP service. The range is 80 and from 1025 to 65535.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the port number of the HTTP service to 8080.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# http port 8080
```

Notifications

1.4 http secure-port

Function

Run the **http secure-port** command to configure a port for the HTTPS service.

Run the **no** form of this command to restore the default port number.

The default port number of the HTTPS service is **443**.

Syntax

http secure-port *port-number*

no http secure-port

Parameter Description

port-number: Port number of the HTTPS service. The range is 443 and from 1025 to 65535.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the port number of the HTTPS service to 4443.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# http secure-port 4443
```

1.5 http update

Function

Run the **http update** command to configure a file for manual upgrade.

No file for manual upgrade is configured by default.

Syntax

http update [**extend**] { **all** | *module* }

Parameter Description

extend: Configures multiple servers.

all: Upgrades all the service modules.

Module: Name of the service module to be upgraded. More names can be entered and are separated by spaces.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example manually downloads the latest upgrade file **route-db** from the remote server.

```
Hostname> enable
```

```
Hostname# http update route-db
Downloading updated files, please wait...
Press Ctrl+C to quit
route-db: download and notify successfully.
```

Notifications

If no service module is registered with the upgrade module, the following notification will be displayed:

```
%notice: No bussiness modules registration.
```

If the specified service module is not registered, the following notification will be displayed:

```
%notice: The bussiness modules haven't registered.
```

If the current upgrade module is being upgraded, the following notification will be displayed:

```
%notice: There are business modules in the upgrading, please wait for a moment.
```

If the device cannot establish a connection with the server or the communication with the server fails, the following notification will be displayed:

```
%notice: Communicate with the server failed.
```

If the memory of the device is insufficient, the following notification will be displayed:

```
%warning: Out of memory, application memory failure.
```

If the format of the response packet of the server is incorrect, the following notification will be displayed:

```
%notice: The server response message format is wrong.
```

If the service module is being upgraded or has not registered a version number, the following notification will be displayed:

```
%notice: Suspend, some business modules are upgrading or haven't registered release.
```

If the versions of all service modules are the latest, the following notification will be displayed:

```
%notice: All bussiness modules are the latest versions.
```

Common Errors

Communication with the server fails during running of this command, possibly because the network fails or the DNS service is not enabled.

Platform Description

N/A

Related Commands

N/A

1.6 http update mode

Function

Run the **http update mode** command to configure the manual upgrade mode for HTTP upgrade.

Run the **no** form of this command to switch to the automatic upgrade mode.

The default HTTP upgrade mode is manual upgrade.

Syntax

http update mode manual

no http update mode

Parameter Description

manual: Specifies the manual upgrade mode.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After the **no http update mode** command is run to switch the HTTP upgrade mode to automatic upgrade mode, the system detects upgrade files on the server by default, automatically downloads the files, and performs an upgrade when the scheduled timer expires.

Examples

The following example configures automatic upgrade mode for HTTP upgrade.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# http update mode manual
```

Notifications

N/A

Common Errors

N/A

Platform Description

1.7 http update server

Function

Run the **http update server** command to configure the server address and port number for HTTP upgrade.

Run the **no** form of this command to remove this configuration and restore the default configuration.

The default server address for HTTP upgrade is **0.0.0.0** and the default port number is **80**.

Syntax

http update server { *host-name* | *ipv4-address* } [**port** *port-number* | **extend** | **uri**]

no http update server

Parameter Description

host-name: Domain name of the server.

ipv4-address: Server address.

port *port-number*: Configures the server port number. Here, *port-number* indicates the port number. The range is from 1 to 65535.

extend: Configures multiple servers.

uri: Configures URI. URI indicates the local path for storing the Web package.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- The server address may not be configured because the local upgrade record file records the addresses of possible upgrade servers.
- The DNS feature needs to be enabled on the device and the DNS address needs to be configured by default.
- The server address does not support IPv6.
- During an HTTP upgrade, the device connects to the server address configured by this command. If the server address cannot be connected, the device attempts to connect to server addresses recorded in the local file in turn. If none of them are connected, the upgrade cannot be performed.

Examples

The following example sets the address of the HTTP upgrade server to 10.83.132.1 and the port number to 90.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# http update server 10.83.132.1 port 90
```

1.8 http update set oob

Function

Run the **http update set oob** command to configure HTTP upgrade using the MGMT port.

Run the **no** form of this command to configure HTTP upgrade using a common port and restore the default configuration.

The upgrade using a common port instead of a MGMT port is configured by default.

Syntax

http update set oob

no http update set oob

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is available on only the devices that support the MGMT port.

Examples

The following example configures HTTP upgrade using the MGMT port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# http update set oob
```

1.9 http update source_ip

Function

Run the **http update source_ip** command to configure the source IP address for HTTP upgrade.

Run the **no** form of this command to restore the default configuration, that is, no source IP address is specified.

Syntax

http update source_ip *ipv4-address*

no http update source_ip

Parameter Description

ipv4-address: IPv4 source address.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to configure a source IP address for HTTP upgrade.

Examples

The following example sets the source IP address bound for HTTP upgrade to 192.168.1.1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# http update source_ip 192.168.1.1
```

1.10 http update time

Function

Run the **http update time** command to configure HTTP automatic detection time.

Run the **no** form of this command to remove the configured HTTP automatic detection time and restore the default configuration.

The HTTP automatic detection time is random in the range from 00:00 to 23:59 by default.

Syntax

http update time daily *hh*:*mm*

no http update time

Parameter Description

hh:*mm*: Upgrade time, in the format of hour:minute (24-hour system). Here, *hh* indicates hours, and *mm* indicates minutes.

range *hh:mm hh:mm*: Time span for automatic upgrade.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the automatic HTTP detection time.

The device connects to the Web server as scheduled to check for available upgrade files. You can view obtained files on the Web page.

Examples

The following example sets the HTTP automatic detection time to 23:40.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# http update time daily 23:40
```

1.12 show web-server status

Function

Run the **show web-server status** command to display the configuration and status of the Web service.

Syntax

show web-server status

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the configuration and status of the Web service.

```
Hostname> enable
Hostname# show web-server status
http server status : enabled
http server port : 80
https server status: enabled
https server port: 443
http redirect to https: false
```

Table 1-2 Output Fields of the show web-server status Command

Field	Description
http server status	HTTP service status
http server port	HTTP service port
https server status	HTTPS service status
https server port	HTTPS service port
http redirect to https	Whether automatic HTTP redirection to HTTPS is enabled

1.13 webmaster level

Function

Run the **webmaster level** command to configure a username and a password for Web login and authentication.

Run the **no** form of this command to restore the default configuration.

The privilege level bound to a user is 0, username is **admin**, and plaintext password is **admin** by default.

Syntax

webmaster level *privilege-level* **username** *username* { **password** [**0** | **7**] *password* | **secret** [**0** | **8**] *secret* }

no webmaster level *privilege-level* [**username** *username*]

Parameter Description

privilege-level:-level: privilege level bound to a user.

username: Username.

0 | **7**: Specifies the encryption type of a password. The value **0** indicates no encryption and **7** indicates simple encryption. The default value is **0**.

password: User password. Enter the ciphertext when the encryption type is **7**; otherwise, enter the plaintext.

0 | **8**: Specifies the encryption type of a password. The value **0** indicates no encryption and **8** indicates encryption using the SHA-256 algorithm. The default value is **0**.

secret: User password. Enter the SHA-256 ciphertext when the encryption type is **8**; otherwise, enter the plaintext.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- After logging in to the Web server, you need to be authenticated before logging in to the Web page.
- This command is used to configure a username and a password for logging in to the Web page.

- The **no webmaster level** *privilege-level* command is run to delete all the usernames and passwords of the specified permission level.
- The **no webmaster level** *privilege-level* **username** *name* command is run to delete the specified username and password.
- Usernames and passwords involve three permission levels: Up to 10 usernames and passwords are configured for each permission level.
- The system creates account **admin** by default. The account cannot be deleted and only its password can be changed. The administrator account **admin** corresponds to the level 0 privilege. Account **admin** owns all the function privileges on the Web client and can edit other management accounts and authorize the accounts to access pages. New accounts correspond to the level 1 privilege.

Examples

The following example sets the privilege level bound to a user for logging in to the Web page to **0**, username to **Hostname**, and password to **admin**, and configures SHA-256 encryption.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# webmaster level 0 username Hostname secret admin
```

Notifications

When the default account **admin** is deleted, the following notification will be displayed:

```
%notice: Cannot cancel the default user configure!
```

When the number of configured usernames exceeds 10 at each permission level, the following notification will be displayed:

```
%notice: configure webmaster level %d server reached max 10, add failed.
```

When the configured username reaches or exceeds 32 characters, the following notification will be displayed:

```
%notice: Username too long. Please enter less than 32 characters.
```

1.14 web-server http redirect-to-https

Function

Run the **web-server http redirect-to-https** command to configure automatic HTTP redirection to HTTPS.

Run the **no** form of this command to restore the default configuration.

Run the **default** form of this command to restore the default configuration.

Automatic HTTP redirection to HTTPS is disabled by default.

Syntax

web-server http redirect-to-https

no web-server http redirect-to-https

no web-server http redirect-to-https

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- When a user uses a browser to access the Web management system through HTTP upon configuration of HTTP redirection to HTTPS, the Web server address automatically redirects to HTTPS.
- The **no web-server http redirect-to-https** or **default web-server http redirect-to-https** command is used to disable automatic HTTP redirection to HTTPS.
- HTTP automatically redirects to HTTPS only when the HTTP and HTTPS services are enabled..
- If an IP address to be accessed is a Network Address Port Translation (NAPT) address, the redirection function may fail. In this case, to access the device through HTTP, disable the NAPT feature; to access the device through HTTPS, use HTTPS directly.

Examples

The following example configures HTTP redirection to HTTPS when a user accesses the Web page through HTTP.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# web-server http redirect-to-https
```

Notifications

If the HTTPS service is not enabled when HTTP redirection to HTTPS is configured, the following notification will be displayed:

```
%notice: available unless https is enabled.
```

Common Errors

1.15 web-server https certificate

Function

Run the **web-server https certificate** command to install an HTTPS certificate.

Run the **no** form of this command to restore the default configuration.

No HTTPS service certificate is installed by default.

Syntax

web-server https certificate { **pem** *cert-filename* **private-key** *key-filename* | **pfx** *cert-filename* } [**password** *password-text*]

no web-server https certificate

Parameter Description

pem: Imports the certificate file and private key file in the pem format.

pfx: Imports the certificate file in the pfx format from which a private key is exported.

Cert-filename:-filename: Name of the certificate file under the **flash:** drive.

Key-filename:-filename: Name of the private key file under the **flash:** drive.

password-text: Decryption password of the private key file or decryption password of the private key exported from the pfx certificate.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- Run the **copy** command to copy the certificate/private key file to the **flash:** partition before running the **web-server https certificate** command to install the HTTPS service certificate. After installation, you can delete the certificate/private key file from the **flash:** partition.
- You can run the **no web-server https certificate** command to remove the installed HTTPS service certificate. After deletion, the HTTPS service will use the self-signed certificate.
- This command is not displayed in the configuration.
- After the HTTPS service certificate is installed, the browser may require you to add the trust certificate again before you continue access to the Web management page of the device. You are advised to open the Web management page again after closing the browser.

Examples

The following example configures the device to install the HTTP certificate: Install the certificate file **usercert.pfx** under the **flash:** partition. The password for exporting the certificate file is 123456.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# web-server https certificate pfx usercert.pfx password 123456
```

```
*Feb 28 14:38:37: %HTTPD-CERT_CHANGE: HTTPS certificate changed.
% The certificate was successfully installed.
```

Notifications

When the certificate is installed, the following notification will be displayed:

```
% The certificate was successfully installed.
```

When the size of the file name exceeds 64 bytes, the following notification will be displayed:

```
% Operation failed: filename too long, should be less than 64 bytes.
```

When the certificate fails to match the private key file, the following notification will be displayed:

```
% Operation failed: certificate does not matched with private key.
```

When the certificate file does not exist or is empty, the following notification will be displayed:

```
% Operation failed: certificate file not found or is empty.
```

When the private key file does not exist or is empty, the following notification will be displayed:

```
% Operation failed: private key file not found or is empty.
```

When the password is incorrect, the following notification will be displayed:

```
% Operation failed: please input correct password.
```

When an error is reported during parsing of the certificate file or private key file, the following notification will be displayed:

```
% Operation failed: verify file failed.
```

When the certificate is not installed but the certificate deletion command is run, the following notification will be displayed:

```
% Operation failed: no certificate installed.
```

When the certificate is deleted, the following notification will be displayed:

```
% The installed certificate was successfully deleted.
```

1.16 web-server https generate self-signed-certificate

Function

Run the **web-server https generate self-signed-certificate** command to generate an HTTPS service self-signed certificate again.

The HTTPS service uses the self-signed certificate by default.

Syntax

web-server https generate self-signed-certificate

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- This command is an interactive command. After running this command, enter the information to generate a self-signed certificate as prompted including the number of RSA key modulus digits and certificate username, or press **Ctrl+C** to cancel the operation.
- If the device is installed with a third-party HTTPS service certificate, the device uses the HTTPS certificate preferentially. The re-generated self-signed certificate does not replace the current HTTPS service certificate.
- When the **show running-config** command is run, this command is not displayed.
- After the HTTPS service certificate is generated again, the browser may require you add the trust certificate again before you continue access to the Web management page of the device. You are advised to open the Web management page again after closing the browser.

Examples

The following example generates an HTTPS service self-signed certificate again.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# web-server https generate self-signed-certificate
RSA key modulus bits (1024~4096) [2048]:
Common Name (e.g. server IP) [Self-Signed-600B16C2]:
% Generate self-signed certificate successfully.
```

Notifications

When the modulus length of the entered RSA key is not in the range from 1024 to 4096 or is not a number, the following notification will be displayed:

```
% Invalid number.
```

If you press **Ctrl+C** when an input prompt is displayed, the operation will be canceled and the following notification will be displayed:

```
% Operation cancelled.
```

When the length of the entered certificate username exceeds 64 bytes, the following notification will be displayed:

```
% Input too long, should not exceed 64 bytes.
```

When a self-signed certificate is generated, the following notification will be displayed:

```
% Generate self-signed certificate successfully.
```

1 Syslog Commands

Command	Function
clear logging	Clear the logs from the memory buffer.
logging	Configure a syslog server for receiving logs.
logging buffered	Configure parameters (log severity level and buffer size) of the memory buffer for storing logs.
logging console	Configure the level of logs displayed on the console.
logging count	Enable log statistics collection.
logging delay-send file flash:	Configure the name of the log file that is buffered on the local device in the case of delayed reporting.
logging delay-send interval	Configure the interval for delayed log reporting.
logging delay-send server	Configure the IP address of the server and the reporting method for delayed log reporting.
logging delay-send terminal	Enable delayed log reporting to the console and remote terminal.
logging facility	Configure the facility value of logs.
logging file	Save logs to files. Log files can be stored in the hard disk, extended flash space, USB flash drive, or SD card.
logging file numbers	Configure the number of system log files that are written into the extended flash space.
logging flash flush	Immediately write logs in the system buffer into the flash space.
logging flash interval	Configure the interval at which you write system logs into the extended flash space.
logging filter direction	Filter the logs sent to a direction.
logging filter type	Configure the log filtering type.
logging filter rule	Configure the log filtering rule.
logging life-time level	Configure the storage time of log files in the extended flash space.

logging monitor	Configure the level of logs that are displayed in the window of the monitor terminal.
logging on	Allow the display of logs on different devices.
* MERGEFORMAT	Configure a level-based log reporting policy.
logging rate-limit	Enable logging rate limiting to limit the logs that are output per second.
logging rd on	Enable log redirection in a virtual switching unit (VSU) environment, to redirect the logs of the slave or standby device to the active device.
logging rd rate-limit	Enable log redirection rate limiting in a VSU environment to limit the logs that are redirected from the slave or standby device to the active device per second.
logging server	Configure a syslog server for receiving logs.
logging source interface	Set the source interface for log packets.
logging source ip	Configure the source IPv4 address for log packets.
logging source ipv6	Configure the source IPv6 address for log packets.
logging statistic enable	Enable periodical log reporting.
logging statistic mnemonic interval	Configure the interval of periodical log reporting.
logging statistic terminal	Enable periodical log reporting (system performance statistics logs) to the console and the remote terminal.
logging synchronous	Enable the synchronization of user input and log output to prevent interruption of user input.
logging trap	Configure the severity level of logs that are sent to the syslog server.
* MERGEFORMAT	Enable user login/logout logging.
logging userinfo command-log	Enable user operation logging.
logging performance switch	Enable performance log output.
service log-format rfc5424	Switch to the RFC5424 log format.
show logging	Display the log parameter configurations and log statistics as well as the log packets in the memory buffer. Log packets are displayed based on the timestamp from earliest to latest.

show logging config	Display the log parameter configurations and log statistics.
show logging count	Display the number of times logs are generated by each module and the last generation time.
show logging reverse	Display the log parameter configurations and log statistics as well as the log packets in the memory buffer. Log messages are displayed based on the timestamp from latest to earliest.
terminal monitor	Enable log display in the window of the current monitor terminal.

1.1 clear logging

Function

Run the **clear logging** command to clear the logs from the memory buffer.

Syntax

clear logging

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

This command is used to clear log packets from the memory buffer, but cannot clear the log packet statistics.

Examples

The following example clears log packets from the memory buffer.

```
Hostname> enable
Hostname# clear logging
```

Notifications

1.2 logging

Function

Run the **logging** command to configure a syslog server for receiving logs.

Run the **no** form of this command to remove this configuration.

Run the **no logging udp-port** command to restore the default configuration.

No syslog server is configured by default.

Syntax

logging { *ipv4-address* | **ipv6** *ipv6-address* } [**vrf** *vrf-name*] [**udp-prot** *port-number*] [**facility** *facility-type*] [**level** *inform-level*]

no logging { *ipv4-address* | **ipv6** *ipv6-address* } [**vrf** *vrf-name*] [**udp-prot**]

Parameter Description

ipv4-address: IPv4 address of the syslog server that receives logs.

vrf *vrf-name*: Specifies the VPN routing and forwarding table (VRF) instance connected to the syslog server. Here, *vrf-name* indicates the name of the instance.

ipv6 *ipv6-address*: Specifies the IPv6 address of the syslog server that receives logs. Here, *ipv6-address* indicates the IPv6 address of the syslog server.

udp-port *port-number*: Specifies the port number of the syslog server. Here, *port-number* indicates the port number. The range is from 1 to 65535 and the default value is **514**.

facility *facility-type*: Facility value of logs that are received by the syslog server. If the RFC5424 log format is disabled, the default facility value for logs sent to the server is **local7 (23)**. If the RFC5424 log format is enabled, such default facility value is **local0 (16)**.

level *inform-level*: Level of logs that are received by the syslog server. The value range is from 0 to 7. The default level of logs sent to the log server is information (level 6). The severity level can be a level name or a digit.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to configure a syslog server to receive logs of the device. Up to five syslog servers can be configured for a user. Logs are sent to all the configured syslog servers at the same time.

Examples

The following example configures a syslog server with IP address 10.1.1.100 and port 8099.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging 202.101.11.1 udp-port 8099
```

The following example configures a syslog server with IPv6 address AAAA:BBBB::FFFF.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging ipv6 AAAA:BBBB::FFFF
```

Notifications

When more than five syslog servers are configured, the following notification will be displayed:

```
You can't configure more than 5 syslog servers!
```

Common Errors

N/A

Platform Description

N/A

Related Commands

N/A

1.3 logging buffered

Function

Run the **logging buffered** command to configure parameters (log severity level and buffer size) of the memory buffer for storing logs.

Run the **no** form of this command to prohibit recording logs in the memory buffer.

Run the **default** form of this command to restore the default configuration.

The buffer size is 1 mega-byte and the log severity level is **7** by default.

Syntax

logging buffered [*buffer-size*] [*severity-level*]

no logging buffered

default logging buffered

Parameter Description

buffer-size: Buffer size in bytes. The value range is from 4096 to 10485760 (4 Kb to 10 Mb) and the default value is **1048576** (1 Mb).

severity-level: Log severity level. The value range is from 0 to 7. The severity level can be a level name or a digit. For details about the severity levels of logs, see Table 1-1.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- The memory buffer space is used cyclically. If the memory buffer of specified size is fully occupied, the earliest logs are overwritten. The **show logging** command is used to display logs in the memory buffer.
- Logs in the memory buffer are stored temporarily. When the device restarts or runs the **clear logging** command, logs in the buffer are cleared. Logs should be written into the extended flash space or sent to a syslog server to track problems.
- After the system has run for a long time, modifying the log buffer size, especially a larger one, may fail, and a failure prompt will appear. The general cause is that the continuous memory space for allocation is insufficient after the system has run for a long time. You are advised to modify the log buffer size when the

system starts up.

- The logs are classified into eight levels. A smaller value indicates a higher log severity level. Logs of level 0 have the highest severity level. After the level of logs that can be displayed on the device is set, logs with a level equal to or lower than the set level will be displayed. For details, see Table 1-1.

Table 1-1 Details of Log Severity Levels

Keyword	Level	Description
Emergencies	0	Indicates that an emergency occurs and the system cannot run normally.
Alerts	1	Indicates that corrective measures must be taken immediately.
Critical	2	Indicates a critical circumstance.
Errors	3	Indicates an error message.
Warnings	4	Indicates a warning.
Notifications	5	Indicates a common but important message that requires attention.
Informational	6	Indicates an informational message.
Debugging	7	Indicates debugging information.

Examples

The following example allows only the logs of level 6 or below to be recorded in a memory buffer of 10,000 bytes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging buffered 10000 6
```

1.4 logging console

Function

Run the **logging console** command to configure the level of logs displayed on the console.

Run the **no** form of this command to prohibit you from printing log packets on the console.

The default level of logs that can be displayed on the console is **7** (debugging information).

Syntax

logging console [*severity-level*]

no logging console

Parameter Description

severity-level: Severity level of log packets. The value range is from 0 to 7. Here, the severity level can be a level name or a digit. For details about the severity levels of logs, see Table 1-1.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- After a log severity level is configured, log packets with the level equal to or lower than the configured severity level will be displayed on the console.
- The **show logging** command is used to display the log parameter configuration and relevant log statistics.

Examples

The following example sets the level of logs that can be displayed on the console to 6.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging console informational
```

1.5 logging count

Function

Run the **logging count** command to enable log statistics collection.

Run the **no** form of this command to clear the log statistics and disable log statistics collection.

Log statistics collection is disabled by default.

Syntax

logging count

no logging count

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to enable log statistics collection. Statistics collection starts when the command is run. When the **no logging count** command is run, statistics collection is disabled and the statistics are cleared.

Examples

The following example enables log statistics collection.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging count
```

1.6 logging delay-send file flash:

Function

Run the **logging delay-send file flash:** command to configure the name of the log file that is buffered on the local device in the case of delayed reporting.

Run the **no** form of this command to restore the default configuration.

The default format of the log file name is file size_device IP address_index.txt.

Syntax

logging delay-send file flash:*delay-send-filename*

no logging delay-send file

Parameter Description

delay-send-filename: Name of the log file for delayed reporting.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- The configured file name cannot contain any dot (.) because the system automatically adds the index and the suffix (**.txt**) to the file name when generating a locally buffered file. The index increases each time a new file is generated. In addition, the file name cannot contain characters prohibited by your file system, such as \, /, :, *, ", <, >, and |. For example, the configured file name is **log_server**, the current file index is 5, the file size is 1000 bytes, and the IP address of the device that sends the log file is 10.2.3.5. The name of the log file sent to the remote server is **log_server_1000_10.2.3.5_5.txt** while the name of the log file stored on the device is **log_server_5.txt**.
- If the source IP address is an IPv6 address, the colon (:) in the IPv6 address must be replaced by the hyphen (-) because the colon (:) is prohibited by the file system. For example, the file name is **log_server**, the current file index is 6, the file size is 1000 bytes, and the source IPv6 address of the device sending the log file is 2001::1. The name of the log file sent to the remote server is **log_server_1000_2001-1_6.txt** while the name of the log file stored on the device is **log_server_6.txt**.

Examples

The following example sets the name of the log file for delayed reporting to **log_server**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# service log-format rfc5424
Hostname(config)# logging delay-send file flash: log_server
```

1.7 logging delay-send interval

Function

Run the **logging delay-send interval** command to configure the interval for delayed log reporting.

Run the **no** form of this command to restore the default configuration.

The default interval for delayed log reporting is 3600s.

Syntax

logging delay-send interval *delay-send-interval*

no logging delay-send interval

Parameter Description

delay-send-interval: Interval for delayed log reporting in seconds. The value range is from 600 to 65535.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the interval for delayed log reporting to 600s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# service log-format rfc5424
Hostname(config)# logging delay-send interval 600
```

1.8 logging delay-send server

Function

Run the **logging delay-send server** command to configure the IP address of the server and the reporting method for delayed log reporting.

Run the **no** form of this command to remove this configuration.

Delayed log reporting is disabled by default.

Syntax

logging delay-send server [**oob**] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* | } [**vrf** *vrf-name*] [**via** *mgmt-name*] **mode** { **ftp user** *username* **password** [**0** | **7**] *password* | **tftp** }**no logging delay-send server** [**oob**] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* } [**vrf** *vrf-name*] [**via** *mgmt-name*]

Parameter Description

oob: Indicates that the data is sent to the server through the MGMT interface of the device, that is, the data is sent to the server in the form of out-of-band communication. This parameter is available only when the device has an MGMT interface.

hostname: Domain name of the server receiving logs.

ipv-address:-address: IPv4 address of the server receiving logs.

ipv6 *ipv6-address*: Specifies the IPv6 address of the server receiving logs. *ipv6-address* indicates the IPv6 address of the server.

vrf *vrf-name*: Specifies the VPN routing and forwarding table (VRF) instance connected to the log server. *vrf-name* indicates the instance name.

via *mgmt-name*: Specifies the MGMT interface used by the syslog server when the **oob** option is included in the command.

username: Username of the FTP server.

password [**0** | **7**] *password*: Configures the password of the FTP server. **0** indicates using a plaintext password; **7** indicates using a simply encrypted ciphertext password; *password* indicates the ciphertext.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

At most five File Transfer Protocol (FTP) or Trivial File Transfer Protocol (TFTP) servers can be configured, and each server can be configured only as the FTP server or TFTP server. Logs are simultaneously sent to all the configured FTP or TFTP servers.

Examples

The following example configures an FTP server with IP address 192.168.23.12, username of **admin**, and password of **admin**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)#service log-format rfc5424
Hostname(config)# logging delay-send server 192.168.23.12 mode ftp user admin password
admin
```

The following example configures a TFTP server withIPv6 address 2000::1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)#service log-format rfc5424
Hostname(config)# logging delay-send server ipv6 2000::1 mode tftp
```

1.10 logging facility

Function

Run the **logging facility** command to configure the facility value of logs.

Run the **no** form of this command to restore the facility value to the default value (**23**).

When the RFC5424 log format is enabled, the default facility value is 16 (Local0, Local use); otherwise, the default facility value is **23** (Local7, Local use).

Syntax

logging facility *facility-type*

no logging facility

Parameter Description

facility-type: Syslog facility value. For the specific values, see *Usage Guidelines*.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The facility value of logs is used to construct the priority of logs. The calculation formula is as follows:

Priority = Facility value × 8 + Severity.

As one part of log packets, the calculated log priority is sent to the log server. The log server can be used to identify different log sources, and search and filter logs of log sources. For description of the possible facility values of Syslog, see Table 1-2.

Table 1-2 Description of Syslog Facility Values

Numerical Code	Facility
0 (kern)	Kernel messages
1 (user)	User-level messages
2 (mail)	Mail system
3 (daemon)	System daemons
4 (auth1)	Security/Authorization message
5 (syslog)	Messages generated internally by syslogd
6 (lpr)	Line printer system
7 (news)	USENET news
8 (uucp)	Unix-to-Unix copy system
9 (clock1)	Clock daemon
10 (auth2)	Security/Authorization message
11 (ftp)	FTP daemon
12 (ntp)	NTP daemon
13 (logaudit)	Log audit
14 (logalert)	Log alert
15 (clock2)	Clock daemon
16 (local0)	Local use
17 (local1)	Local use
18 (local2)	Local use
19 (local3)	Local use
20 (local4)	Local use
21 (local5)	Local use
22 (local6)	Local use
23 (local7)	Local use

Examples

The following example sets the facility value of syslog to **kern**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging facility kern
```

1.11 logging file

Function

Run the **logging file** command to save logs to files. Log files can be stored in the hard disk, extended flash space, USB flash drive, or SD card.

Run the **no** form of this command to remove the configuration.

Logs are not recorded in the extended flash space by default.

Syntax

logging file { **flash:***filename* **| usb0:***filename* } [*max-file-size*] [*inform-level*]

no logging file

Parameter Description

flash:: Saves log files to the extended flash drive (when there is flash2, the log files will be saved to flash2).

usb0:: Saves log files to USB0. This parameter is available only when the device has one USB port with a USB flash drive inserted. Whether this parameter is supported depends on the actual product version.

filename: Name of a log file. The name does not contain the file name extension, which is always **txt**.

max-file-size: Maximum size of a log file in bytes. The value range is from 131072 to 6291456 (128 kilobytes to 6 megabytes) and the default value is **131072** (128 kilobytes).

inform-level: Level of the logs that can be recorded in log files. The level can be a level name or a digit. The default level of logs that can be written into the extended flash space is **6**. For the levels of logs, see "Usage Guidelines".

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- If there is no syslog server or logs should not be transmitted on the network for security reasons, you can save the logs to the extended flash space.
- To record the logs in extended flash space, you must purchase an extended flash disk separately. Otherwise, **logging file flash** will be automatically hidden and cannot be configured. If no FLASH2 is available, **logging file flash2** is hidden automatically and cannot be configured. Otherwise, the logs are recorded in FLASH2 after **logging file flash** is configured.
- The log file name extension is fixed to **txt**. If other types of file name extensions are configured, the system prompts a configuration failure.

Examples

The following example records the logs in the extended flash space, with the file name of **syslog.txt**, file size of 128 KB, and log level of 6.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging file flash:syslog
```

Notifications

If the length of a configured log file name exceeds 20 characters, for example, 21 characters, an error is prompted.

```
%Error: The file length must not be longer then 20, Current file length 21.
```

Common Errors

1.12 logging file numbers

Function

Run the **logging file numbers** command to configure the number of system log files that are written into the extended flash space.

Run the **no** form of this command to remove this configuration and restore the default configuration.

The default number of system log files is **16**.

Syntax

logging file numbers *file-numbers*

no logging file numbers

Parameter Description

file-numbers: Number of log files. The value range is from 2 to 16.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The system will not delete the generated log files after the number of log files is modified. Therefore, to save the extended flash space, you need to manually delete the log files generated in the system (before deletion, you can transfer the log files to an external server through TFTP). For example, 16 log files will be created by default after the function of writing logs into log files is enabled. If the device has generated 16 log files and if you want to change the number of log files to 2, new logs are overridden or overwritten in the log files with the index of 0 and 1 by turns. The existing log files with the index of 2 to 16 are retained. You can manually delete them.

Examples

The following example sets the number of log files to 8.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging file numbers 8
```

1.13 logging flash flush

Function

Run the **logging flash flush** command to immediately write logs in the system buffer into the flash space.

Syntax

logging flash flush

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- The **logging flash flush** command takes effect once after it configures the function above. Upon the configuration, logs in the buffer will be immediately written into the flash space.
- After the function is enabled to write logs into the flash space, the logs generated in the device will be saved in the log buffer of the system temporarily. They are not written into the flash space unless the buffer is fully occupied or the timer expires. But this command allows you to immediately write them into the flash space.

Examples

The following example immediately writes the logs in the system buffer into the flash space.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging flash flush
```

1.14 logging flash interval

Function

Run the **logging flash interval** command to configure the interval at which you write system logs into the extended flash space.

Run the **no** form of this command to remove this configuration and restore the default configuration.

Logs are written into the flash space at an interval of 3600s by default.

Syntax

logging flash interval *log-write-flash-interval*

no logging flash interval

Parameter Description

log-write-flash-interval: Interval at which you write logs into the flash space in seconds. The value range is from 1 to 51840.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To prevent the system from writing logs into the flash space frequently, do not set the interval to a small value .

Examples

The following example sets the interval at which you write logs into the flash space to 5 min.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging flash interval 300
```

1.15 logging filter direction

Function

Run the **logging filter direction** command to filter the logs sent to a direction.

Run the **no** form of this command to remove this configuration.

Logs sent to all the directions are filtered by default, namely, **all** is set.

Syntax

logging filter direction { **all** | **buffer** | **file** | **server** | **terminal** }

no logging filter direction { **all** | **buffer** | **file** | **server** | **terminal** }

Parameter Description

all: Filters the logs sent to all the directions (including the directions of the console, virtual type terminal (VTY), log buffer, log file, and log server).

buffer: Filters the logs sent to the log buffer (the logs displayed by the **show logging** command).

file: Filters the logs sent to log files.

server: Filters the logs sent to the log server.

terminal: Filters the logs sent to the console and VTY terminal, including telnet and Secure Shell (SSH).

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- To filter the logs in all the directions (including the directions of the console, VTY terminal, log buffer, log file, and log server) after they match filtering rules, configure the **all** keyword.
- When you filter the logs sent to a specific direction only, for example, the filtered logs are not sent to the terminal interface but must be written into log files or sent to a log server, you only need to configure the command to filter the logs sent to the terminal.

Examples

The following example filters the logs sent to the terminal, including the console and VTY terminal.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging filter direction terminal
```

1.16 logging filter type

Function

Run the **logging filter type** command to configure the log filtering type.

Run the **no** form of this command to restore the log filtering type.

The default filtering type is **filter-only**.

Syntax

logging filter type { **contains-only** | **filter-only** }

no logging filter type

Parameter Description

contains-only: Displays only the logs that contain keywords specified in the filtering rules.

filter-only: Filters and displays the logs that contain keywords specified in the filtering rules.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- Too many logs from one module may result in spamming on the terminal CLI. If you do not care about them, you can apply **filter-only** on the device to filter such logs.
- To display some logs only, you can apply **contains-only** on the device to display only the logs that match filtering rules on the terminal. Then, you can check whether any event occurs.
- If the filtering direction and filtering type instead of filtering rules are configured, the configurations do not take effect, that is, logs are not filtered.
- The **filter-only** and **contains-only** filtering types are mutually exclusive, that is, you can configure only one filtering type at a time.

Examples

The following example sets the log filtering type to **contains-only**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging filter type contains-only
```

1.17 logging filter rule

Function

Run the **logging filter rule** command to configure the log filtering rule.

Run the **no** form of this command to remove this configuration.

No log filtering rule is configured by default, that is, logs are not filtered.

Syntax

logging filter rule { **exact-match module** *module-name* **mnemonic** *mnemonic-name* **level** *inform-level* | **single-match** { **level** *inform-level* | **mnemonic** *mnemonic-name* | **module** *module-name* } }

no logging filter rule { **exact-match module** *module-name* **mnemonic** *mnemonic-name* **level** *inform-level* | **single-match** { **level** *inform-level* | **mnemonic** *mnemonic-name* | **module** *module-name* } }

Parameter Description

exact-match: Configures exact matching.

single-match: Configures single matching.

module *module-name*: Specifies the name of the module whose logs need to be filtered.

mnemonic *mnemonic-name*: Specifies the mnemonic name of the logs to be filtered.

level *inform-level*: Specifies the level of the logs to be filtered.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- To filter a specific log, use the **exact-match** rule. You must specify the specific module name, mnemonic name, and log level.
- To filter some types of logs, use the **single-match** rule. You must specify the module name, log level, or mnemonic name.
- If the same module name, mnemonic name, or log level is configured in both the **single-match** and **exact-match** rules, the **single-match** rule prevails over the **exact-match** rule.

Examples

The following example sets the log filtering rule to **exact-match**, module name to **LOGIN**, log level to **5**, and mnemonic to **LOGOUT**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging filter rule exact-match module LOGIN mnemonic LOGOUT level
5
```

1.18 logging life-time level

Function

Run the **logging life-time level** command to configure the storage time of log files in the extended flash space.

Run the **no** form of this command to remove this configuration.

No storage time is configured by default. The storage time depends on the size of the configured log files.

Syntax

logging life-time level *inform-level life-time-days*

no logging life-time level *level*

Parameter Description

inform-level: Log level. The value range is from 0 to 7.

life-time-days: Number of storage days for log files in days. The value range is from 7 to 365.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- Because the sizes of extended flash space and the importance of logs at various levels are different, you are advised to configure different storage days for logs of various levels.
- When the time-based log storage function is enabled, the original log storage function based on file size becomes invalid, and the log files are stored in the **syslog/** directory of the extended flash space.

Examples

The following example sets the storage time of the logs of level 6 to 10 days.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging life-time level 6 10
```

1.19 logging monitor

Function

Run the **logging monitor** command to configure the level of logs that are displayed in the window of the monitor terminal.

Run the **no** form of this command to prohibit the window of the monitor terminal from printing log packets.

The default level of logs that are displayed in the window of the monitor terminal is **7** (debugging information).

Syntax

logging monitor [*severity-level*]

no logging monitor

Parameter Description

severity-level: Severity level of a log packet. The level can be a level name or a digit. For details about the severity levels of logs, see Table 1-1.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To display logs in the VTY window, run the **terminal monitor** command. The **logging monitor** command is used to define the level of logs that are displayed in the VTY window. For details about the severity levels of logs, see Table 1-1.

Examples

The following example sets the level of logs that are displayed in the VTY window to 6.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging monitor informational
```

1.21 logging policy

Function

Run the **logging policy** command to configure a level-based log reporting policy.

Run the **no** form of this command to remove a level-based log reporting policy. No level-based log reporting policy is configured by default.

Syntax

logging policy module *module-name* [**not-lesser-than**] *policy-level* **direction** { **all** | **server** | **file** | **console** | **monitor** | **buffer** }

no logging policy module *module-name* [**not-lesser-than**] *policy-level* **direction** { **all** | **server** | **file** | **console** | **monitor** | **buffer** }

no logging policy

Parameter Description

module-name: Module name of a level-based log reporting policy.

not-lesser-than: Configures log filtering rules for a level-based log reporting policy. When this parameter is specified, the logs of a specified level or higher are sent to the specified destination, and the other logs are filtered. When this option is not specified, the logs of a specified level or lower are sent to the specified destination, and the other logs are filtered.

policy-level: Level of logs, for which a level-based log reporting policy needs to be configured.

all: Applies the level-based log reporting policy to the logs sent in all the directions.

server: Applies the level-based log reporting policy to the logs sent to the log server only.

file: Applies the level-based log reporting policy to the logs sent to log files only.

console: Applies the level-based log reporting policy to the logs sent to the console only.

monitor: Applies the level-based log reporting policy to the logs sent to the remote terminal only.

buffer: Applies the level-based log reporting sent to the logs saved in the buffer only.

Command Modes

1.22 logging rate-limit

Function

Run the **logging rate-limit** command to enable logging rate limiting to limit the logs that are output per second.

Run the **no** form of this command to disable the logging rate limiting.

Logging rate limiting is disabled by default.

Syntax

logging rate-limit { *number* | **all** *number* | **console** { *number* | **all** *number* } } [**except** [*severity-level*]]

no logging rate-limit

Parameter Description

number: Number of logs that are processed per second. The value range is from 1 to 10000.

all: Configures rate limit for all the logs, including those of levels 0 to 7.

console: Configures the maximum number of logs that are displayed on the console per second.

except: Applies no rate limit to the logs of the specified severity level or lower. The default severity level is error (level 3), that is, no rate limit is applied to the logs of level 3 or lower.

severity-level: Severity level of logs. A smaller value indicates a higher severity level. The value range is from 0 to 7.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to prevent the output of massive logs.

Examples

The following example sets the maximum number of logs of all levels (including debugging information) that are processed per second to 10 but does not control logs of the warning level and higher.

```
Hostname> enable

1.24 logging rd rate-limit

Function

Run the **logging rd rate-limit** command to enable log redirection rate limiting in a VSU environment to limit the logs that are redirected from the slave or standby device to the active device per second.

Run the **no** form of this command to disable log redirection rate limiting.

The log redirection limits the maximum number of logs to be redirected per second to **200** by default.

Syntax

logging rd rate-limit *number* [**except** [*severity-level*]]

no logging rd rate-limit

Parameter Description

number: Maximum number of logs that are redirected per second. The value range is from 1 to 10000.

except: Applies no rate limit to the logs of the specified severity level or lower. The default severity level is error (level 3), that is, no rate limit is applied to the logs of level 3 or lower.

severity-level: Severity level of logs. A smaller value indicates a higher severity level. The value range is from 0 to 7.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to prevent the redirection of massive logs from the slave or standby device to the active device.

Examples

The following example sets the maximum number of all logs (including debugging information) that are redirected from the slave or standby device to the active device per second to 10 but does not control logs of the warning level and higher.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging rd rate-limit 10 except warnings
```

1.25 logging server

Function

Run the **logging server** command to configure a syslog server for receiving logs.

Run the **no** form of this command to remove this configuration.

Run the **no logging server udp-port** command to restore the default configuration.

No syslog server is configured by default.

Syntax

logging server [**oob**] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* } [**via** *mgmt-name*] [**udp-prot** *port-number*] [**vrf** *vrf-name*] [**facility** *facility-type*] [**level** *inform-level*]

no logging server [**oob**] { *hostname* | *ipv4-address* [**vrf** *vrf-name*] | **ipv6** *ipv6-address* } [**via** *mgmt-name*]

no logging server { *hostname* | *ipv4-address* [**vrf** *vrf-name*] | **ipv6** *ipv6-address* } [**via** *mgmt-name*] **udp-prot**

Parameter Description

oob: Specifies out-of-band communication for the log server (sending logs to the log server through the MGMT interface). This option is available only when the device has an MGMT interface.

hostname: Domain name of the syslog server that receives logs.

ipv4-address: IPv4 address of the syslog server that receives logs.

vrf *vrf-name*: Specifies the name of the VRF instance connected to the syslog server.

ipv6 *ipv6-address*: Specifies the IPv6 address of the syslog server that receives logs.

via *mgmt-name*: Specifies the MGMT port used by the syslog server when the **oob** option is contained in the command.

udp-port *port-number*: Specifies the port number of the syslog server. The value range is from 1 to 65535, and the default value is **514**.

facility *facility-type*: Facility value of logs that are received by the syslog server. If the RFC5424 log format is disabled, the default facility value for logs sent to the server is **local7 (23)**. If the RFC5424 log format is enabled, such default facility value is **local0 (16)**.

level *inform-level*: Level of logs that are received by the syslog server. The value range is from 0 to 7. The default level of logs sent to the log server is information (level 6). The severity level can be a level name or a digit.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- Up to five syslog servers are configured on one device. The logs on the device are sent to all the configured syslog servers at the same time.
- In this command, the **via** parameter is available only when the **oob** parameter is configured. But the **vrf** parameter is unavailable.
- The IPv6 server does not support **vrf** or **oob**.

Examples

The following example configures a syslog server with IP address10.1.1.100 and port 8099.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging server 202.101.11.1 udp-port 8099
```

The following example configures a syslog server with IPv6 address AAAA:BBBB::FFFF.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging server ipv6 AAAA:BBBB::FFFF
```

Notifications

When more than five syslog servers are already configured on the device, the following notification will be displayed:

```
You can't configure more than 5 syslog servers!
```

1.26 logging source interface

Function

Run the **logging source interface** command to set the source interface for log packets.

Run the **no** form of this command to remove this configuration.

No log source address is configured, and the source IP address of the log packets sent to the server is the IP address of the interface that sends the packets by default.

Syntax

logging source [**interface**] *interface-type interface-number*

no logging source [**interface**]

Parameter Description

interface-type: Interface type.

interface-number: Interface number.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

By default, the source IP address of log packets sent to the syslog server is the IP address of the interface that sends the packets. To track and manage log packets, the administrator runs this command to set the source IP address of all log packets to the IP address of an interface. Thus, the administrator can identify the device that sends the log packets based on the unique IP address. If this source interface is not configured on the device or no IP address is configured for the source interface, the source IP address of the log packets is still the IP address of the interface that sends the packets.

Examples

The following example sets the source IP address of system log packets to the address of interface Loopback 0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging source interface loopback 0
```

1.27 logging source ip

Function

Run the **logging source ip** command to configure the source IPv4 address for log packets.

Run the **no** form of this command to remove this configuration.

No source IPv4 address is configured for log packets by default.

Syntax

logging source ip *ipv4-address*

no logging source ip

Parameter Description

ipv4-address: Source IPv4 address of log packets sent to the IPv4 syslog server.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

By default, the source IPv4 address of log packets sent to the syslog server is the IPv4 address of the interface that sends the packets. To track and manage log packets, the administrator runs this command to set the source IPv4 address of all log packets to a fixed IPv4 address. Thus, the administrator can identify the device that sends the log packets based on the unique IPv4 address. If this IPv4 address is not configured on the device, the source IPv4 address of the log packets is still the IPv4 address of the interface that sends the packets.

Examples

The following example sets the source IP address of system log packets to 192.168.1.1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging source ip 192.168.1.1
```

1.28 logging source ipv6

Function

Run the **logging source ipv6** command to configure the source IPv6 address for log packets.

Run the **no** form of this command to remove this configuration.

No source IPv6 address is configured for log packets by default.

Syntax

logging source ipv6 *ipv6-address*

no logging source ipv6

Parameter Description

ipv6-address: Source IPv6 address of log packets sent to the IPv6 syslog server.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

By default, the source IPv6 address of log packets sent to the syslog server is the IPv6 address of the interface that sends the packets. To track and manage log packets, the administrator runs this command to set the source IPv6 address of all log packets to a fixed IPv6 address. Thus, the administrator can identify the device that sends the log packets based on the unique IPv6 address. If this IPv6 address is not configured on the device, the source IPv6 address of the log packets is still the IPv6 address of the interface that sends the packets.

Examples

The following example sets the source IPv6 address of system log packets to 1::1/64.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging source ipv6 1::1
```

1.29 logging statistic enable

Function

Run the **logging statistic enable** command to enable periodical log reporting.

Run the **no** form of this command to disable periodical log reporting.

Periodical log reporting is disabled by default.

Syntax

logging statistic enable

no logging statistic enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After this command is used to enable periodical log reporting, the system outputs a series of performance statistics at an interval so that the log server can monitor the system performance.

Examples

The following example enables periodical log reporting.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging statistic enable
```

1.30 logging statistic mnemonic interval

Function

Run the **logging statistic mnemonic interval** command to configure the interval of periodical log reporting.

Run the **no** form of this command to restore the default configuration.

The interval of periodical logging is 15 min by default.

Syntax

logging statistic mnemonic *mnemonic* **interval** *logging-statistic-interval*

no logging statistic mnemonic *mnemonic*

Parameter Description

mnemonic: Mnemonic string for periodical log reporting, used to identify a statistical object of system performance.

logging-statistic-interval: Interval of periodical log reporting in minutes. The value range is 0, 15, 30, 60, and 120, where **0** indicates disabling periodical log reporting for the statistical object.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the interval of periodical log reporting for statistical object MATCH to 30 min.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging statistic mnemonic MATCH interval 30
```

1.32 logging synchronous

Function

Run the **logging synchronous** command to enable the synchronization of user input and log output to prevent interruption of user input.

Run the **no** form of this command to disable this feature.

The synchronization of user input and log output is disabled by default.

Syntax

logging synchronous

no logging synchronous

Parameter Description

N/A

Command Modes

Line configuration mode

Default Level

14

Usage Guidelines

Run this command to enable the synchronization of user input and log output to prevent interruption of user input. If the port UP-DOWN log is displayed during input of the **configure terminal** command, the input command is output again:

```
Hostname# configure terminal
Oct  9 23:40:55 %LINK-CHANGED: Interface GigabitEthernet 0/1, changed state to down
Oct  9 23:40:55 %LINEPROTO-UPDOWN: Line protocol on Interface GigabitEthernet 0/1,
changed state to DOWN
```

Examples

The following example enables the synchronization of user input and log output on the console.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# line console 0
Hostname(config-line)# logging synchronous
```

1.33 logging trap

Function

Run the **logging trap** command to configure the severity level of logs that are sent to the syslog server.

Run the **no** form of this command to disable the function of sending log packets to the syslog server.

The default severity level of logs sent to the syslog server is **6** (informational message).

Syntax

logging trap [*severity-level*]

no logging trap

Parameter Description

severity-level: Severity level of logs. The range is from 0 to 7. The severity level can be a level name or a digit.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- To send logs to the syslog server, first configure the **logging server** command, and then use the **logging trap** command to specify the severity level of the logs to be sent. For details about the severity levels of logs, see Table 1-1.
- When the device independently configures the severity level of logs to be received by the log server, the severity level configured separately for the log server prevails.

Examples

The following example sets the severity level of logs sent to syslog server 202.101.11.22 to 6.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging server 202.101.11.22
Hostname(config)# logging trap informational
```

1.34 logging userinfo

Function

Run the **logging userinfo** command to enable user login/logout logging.

Run the **no** form of this command to disable user login/logout logging.

User login/logout logging is disabled by default.

Syntax

logging userinfo

no logging userinfo

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After user login/logout logging enabled, a log will prompt the device administrator when a user connects to the device. The log format is as follows:

```
Mar 22 14:05:45 %LOGIN-LOGIN_SUCCESS: User login from vty0 (192.168.23.68) OK.
```

Examples

The following example enables user login/logout logging.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging user-info
```

1.35 logging userinfo command-log

Function

Run the **logging userinfo command-log** command to enable user operation logging.

Run the **no** form of this command to disable user operation logging.

User operation logging is disabled by default.

Syntax

logging userinfo command-log

no logging userinfo command-log

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- After user operation logging is enabled, a log will be displayed to prompt the device administrator when a user modifies device configurations. The log format is as follows:

```
Mar 22 14:10:40 %CLI-EXEC_CMD: Configured from vty0 (192.168.23.68) command-log:
logging server 192.168.23.68.
```

- If the 5424 log format is configured using the **service log-format rfc5424** command, you need to configure the **logging delay-send terminal** command before you output the operation logs to the terminal (because delayed log reporting is registered for the operation logs).

Examples

The following example enables user operation logging.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging userinfo command-log
The security log has been recorded, this command does not need to be opened.
```

1.36 logging performance switch

Function

Run the **logging performance switch** command to enable performance log output.

Run the **no** form of this command to disable performance log output.

Performance log output is disabled by default.

Syntax

logging performance switch

no logging performance switch

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When performance log output is enabled, the log output through the performance logging interface is transmitted through the performance log channel (that is, the logs are sent to the log server only; this mechanism usually does not need to be configured, and it is designed for the service that outputs many logs to the server rapidly).

Examples

The following example enables performance log output.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging performance switch
```

1.37 service log-format rfc5424

Function

Run the **service log-format rfc5424** command to switch to the RFC5424 log format.

Run the **no** form of this command to switch to the original log format.

The default syslog format is **RFC3164**.

Syntax

service log-format rfc5424

no service log-format rfc5424

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

- After the system is switched to the RFC5424 log format, the **service sequence-numbers**, **service sysname**, **service timestamps**, **service private-syslog**, and **service standard-syslog** commands that are applicable to the original log format fail and are hidden.
- When the system is switched to the original log format, the **logging delay-send**, **logging policy**, and **logging statistic** commands that are applicable to the RFC5424 log format fail and are hidden.
- Before and after log format switching, the output of the **show logging** and **show logging config** commands changes.

Examples

The following example sets the log format to RFC5424.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# service log-format rfc5424
```

1.41 show logging reverse

Function

Run the **show logging reverse** command to display the log parameter configurations and log statistics as well as the log packets in the memory buffer. Log messages are displayed based on the timestamp from latest to earliest.

Syntax

show logging reverse [**timestamp** *YY/MM/DD hh:mm:ss*]

Parameter Description

timestamp: Configures the timestamp, that is, the end time of the logs to be queried.

YY: Year in the timestamp.

MM: Month in the timestamp.

DD: Day in the timestamp.

hh:mm:ss: Hour, minute, and second in the timestamp.

Command Modes

All modes except the user EXEC mode

Default Level

1

Usage Guidelines

- This command is used to display the log parameter configurations and log statistics as well as the log packets in the memory buffer. Log messages are displayed based on the timestamp from latest to earliest.
- The command is also used to display the logs from the current time to the input time. The log packets are displayed based on the timestamp from latest to earliest.

Examples

The following example displays log packets based on the timestamp from latest to earliest when the RFC5424 log format is not enabled.

```
Hostname> enable
Hostname# show logging reverse
Syslog logging: enabled
  Console logging: level debugging, 15495 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 15496 messages logged
  Standard format: false
  Timestamp debug messages: datetime
  Timestamp log messages: datetime
  Sequence-number log messages: enable
  Sysname log messages: enable
  Count log messages: enable
  Trap logging: level informational, 15242 message lines logged,0 fail
    logging to  202.101.11.22
    logging to  192.168.200.112
Log Buffer (Total 131072 Bytes): have written 1336,
015492: *Sep 19 02:46:28: Hostname %LINEPROTO-UPDOWN: Line protocol on Interface
FastEthernet 0/24, changed state to up.
015491: *Sep 19 02:46:28: Hostname %LINK-UPDOWN: Interface FastEthernet 0/24, changed
state to up.
015490: *Sep 19 02:46:26: Hostname %LINEPROTO-UPDOWN: Line protocol on Interface
FastEthernet 0/24, changed state to down.
015489: *Sep 19 02:46:26: Hostname %LINK-UPDOWN: Interface FastEthernet 0/24, changed
state to down.
015488: *Sep 19 02:46:13: Hostname %LINEPROTO-UPDOWN: Line protocol on Interface
FastEthernet 0/24, changed state to up.
015487: *Sep 19 02:46:13: Hostname %LINK-UPDOWN: Interface FastEthernet 0/24, changed
state to up.
```

Table 1-8 Output Fields of the show logging reverse Command with the RFC5424 Log Format Disabled

Field	Description
Syslog logging	Logging function ● "enabled" is displayed when the function is enabled. ● "disabled" is displayed when the function is disabled.
Console logging	Level of the logs displayed on the console as well as log statistics
Monitor logging	Level of the logs displayed in the VTY window as well as log statistics
Buffer logging	Level of the logs recorded in the memory buffer as well as log statistics
Standard format	Standard log format

Field	Description
Timestamp debug messages	Timestamp format of debugging information
Timestamp log messages	Timestamp format of logs
Sequence-number log messages	Sequence number function
Sysname log messages	Whether to enable the function of adding a system name to logs
Count log messages	Log statistics collection
Trap logging	Level of the logs sent to the syslog server as well as log statistics
Log Buffer	Log packets recorded in the memory buffer

The following example displays log packets based on the timestamp from latest to earliest when the RFC5424 log format is enabled.

```
Hostname> enable
Hostname# show logging reverse
Syslog logging: enabled
  Console logging: level debugging, 4740 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 4745 messages logged
  Statistic log messages: disable
  Statistic log messages to terminal: disable
  Delay-send file name:syslog_ftp_server, Current write index:3, Current send index:3,
Cycle:10 seconds
Count log messages: enable
  Trap logging: level informational, 2641 message lines logged,4155 fail
    logging to  192.168.23.89
    logging to  2000::1
  Delay-send logging: 2641 message lines logged
    logging to  192.168.23.89  by tftp
Log Buffer (Total 4096 Bytes): have written 4096, Overwritten 3292
<134>1 2013-07-24T12:29:34.343763Z Hostname SYS 6 SHELL_CMD [USER@4881

1.42 terminal monitor

Function

Run the **terminal monitor** command to enable log display in the window of the current monitor terminal.

Run the **terminal no monitor** command to disable this feature.

Log display in the window of the current monitor terminal is disabled by default.

Syntax

terminal monitor

terminal no monitor

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is only used to configure a temporary attribute for the current VTY terminal. The temporary attribute is not stored permanently. After the VTY terminal session ends, the system will adopt the default configuration, and the temporary attribute will fail. This command is also run on the console but does not take effect.

Examples

The following example enables log display in the current VTY window.

```
Hostname> enable
Hostname# terminal monitor
```

1 Software Upgrade Commands

Command	Function
check version	Display the version matching of each device.
show upgrade auto-sync	Display the auto-sync upgrade configuration in the device.
show upgrade file	Display information about the installation package file stored in the file system of the device.
show upgrade history	Display the upgrade history.
show upgrade status	Display the upgrade status of each board of the device and the installation status of the patch package.
upgrade	Install and upgrade the installation package in the local file system.
upgrade auto-sync package	Configure the check scope for auto-sync upgrade of the device system.
upgrade auto-sync policy	Configure an auto-sync upgrade policy for the system.
upgrade auto-sync range	Configure the auto-sync upgrade range for the system.
upgrade sync-server	Configure the auto-sync upgrade range of the system.
clear install storage	Clear all the patch packages not running currently and corresponding database information.
install add	Download a patch package and add the patch information to the database.
install activate	Activate a patch temporarily to make it take effect.
install commit	Activate a patch permanently to make the patch still effective after the device is restarted.
install deactivate	Roll back a patch to the unactivated state.
install remove	Remove an unactivated patch package and delete the patch information from the database.

install auto-sync	Enable the patch auto-sync function on the device. The configuration is valid for only newly connected devices.
show install auto-sync	Display all the patch packages that need auto-sync on the device.
show install	Display information about all the patches of the current device.
patch active	Activate the installation package of a function component.
patch running	Activate a patch permanently to make the patch still effective after the device is restarted.
patch auto-running	Activate a patch and make it take effect automatically and permanently. Namely, the patch is still effective even after the device is restarted.
patch deactive	Roll back a patch to the unactivated state.
patch delete	Remove an unactivated patch package and delete the patch information from the database.
show patch	Display information about the latest patch of the current device.
show patch detail	Display details about patches of the device.

1.1 check version

Function

Run the **check version** command to display the version matching of each device.

Syntax

check version

Parameter Description

N/A

Command Modes

1.2 show upgrade auto-sync

Function

Run the **show upgrade auto-sync** command to display the auto-sync upgrade configuration in the device.

Syntax

show upgrade auto-sync

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

N/A

Examples

The following example displays the auto-sync upgrade information of the system.

```
Hostname> enable
Hostname# show upgrade auto-sync
   auto-sync policy: coordinate
   auto-sync range:  vsu
auto-sync package: flash:/main_1.0.0.0f328e91.bin
```

Table 1-1 Output Fields of the show upgrade auto-sync Command

Field	Description
auto-sync policy	Configured auto-sync upgrade policy: ● coordinate: Synchronizes the software of all the other members to the version of the system upgrade package stored in the supervisor module. ● none: No auto-sync upgrade is performed.
auto-sync range	Range of auto-sync upgrade
auto-sync package	Path of the upgrade package for auto-sync upgrade

1.3 show upgrade file

Function

Run the **show upgrade file** command to display information about the installation package file stored in the file system of the device.

Syntax

show upgrade file *url*

Parameter Description

url: Local path where the installation package file is stored.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

After you download an installation package file to the local file system, you can run this command to display the main information of the installation package beforehand.

Caution

This command does not support the rack package.

Examples

The following example displays information about an installation package file.

```
Hostname> enable
Hostname# show upgrade file flash: RG-CS86_RGOS 12.6(2)B0103-FULL_install.bin
Name               : main
Version            : 1.0.0.2f1c4dd8
Package type        : unknown
Size               : 166440370
Build time          : Fri 23 Nov 2018 09:01:43 UTC
Description         : main upgrade package
Package files       :
       /fdt.img
       /initrd.img
       /kernel.img
       /rboot-CS86.bin
       /rootfs.sqsh
```

```
      /u-boot-CS86_spi.bin
```

Table 1-2 Output Fields of the show upgrade file Command

Field	Description
Name	Name of an installation package: ● main: Installation package of the main program ● bios: BIOS installation package ● cpld: Installation package for the CPLD and FPGA firmware
Version	Version of the installation package
Package type	Type of the installation package: ● distribute component: installation package for rack-type devices ● main component: Main installation package ● bios component: BIOS installation package ● cpld component: Installation package for the CPLD and FPGA firmware
Size	Size of the installation package, in bytes
Build time	Compilation time
Description	Description of the installation package
Package files	List of files in the installation package

1.6 upgrade

Function

Run the **upgrade** command to install and upgrade the installation package in the local file system.

Syntax

upgrade [**boot**] { *url* | **download** { **oob_ftp:**//*path* [**via mgmt** interface-number] | **oob_tftp:**//*path* [**via mgmt** { i*nterface-number* }] | **ftp:**//*path* [**vrf** *vrf-name*] | **tftp:**//*path* [**vrf** *vrf-name*] } [**slot** *slot-number*] } [**force**]

Parameter Description

boot: Upgrades the boot on the device, including **Uboot** and **Rboot**.

url: Local path of the installation package on the device, which is **flash:**, **tmp:**, or **usb0:**. This parameter indicates that the installation package stored in the device is used for upgrade.

force: Indicates that upgrade is performed forcibly when the target upgrade version is the same as the version of the system.

path: Path of the installation package on the File Transfer Protocol (FTP) or Trivial File Transfer Protocol (TFTP) server. This parameter indicates that the installation package is downloaded from the server, and then the device will upgrade itself automatically.

vrf *vrf-name*: Downloads the installation package from the specified Virtual Routing and Forwarding (VRF) table.

slot *slot-number*: Upgrades a specified board.

via mgmt *interface-number*: Specifies an MGMT interface if the installation package is transmitted through **oob_tftp** or **oob_ftp** and there are multiple MGMT interfaces. Here, *interface-number* indicates the specified MGMT interface number.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

This command supports installation packages of all the subsystems, installation packages of rack-type devices, and patch installation packages. Before running this command, run the **copy** command to copy the function package to the file system of the device.

The **vrf** parameter is mutually exclusive to the **oob_tftp** and **oob_ftp** parameters.

Examples

The following example sets the upgrade path of the device system to the installation package in the USB flash drive.

```
Hostname> enable
Hostname# upgrade usb0: RG-CS86_RGOS12.6(2)B0103-FULL_install.bin
< The terminal is locked by upgrade module >
Upgrade start
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!10%
< you can press Ctrl+C to unlock terminal >
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!20%
< you can press Ctrl+C to unlock terminal >
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!30%
< you can press Ctrl+C to unlock terminal >
!!!!!!!!!!!!!!!!!!!!!!!!!!!!100%
Upgrade success
< The terminal is unlocked by upgrade module >
[Slot 0]
      Device type    : CS86
      Status         : success
```

The following example upgrades the patch package under the flash path in the device.

```
Hostname# upgrade flash:cmpnt_upgrade_server_99.0.0.0_mips64.deb
< The terminal is locked by patch module >
Upgrade start
!!!!!!!!!!  20%
!!!!!!!!!!  40%
!!!!!!!!!!  60%
!!!!!!!!!!  80%
!!!!!!!!!!  90%
!!!!!!!!!!  90%
!!       100%
Upgrade finish
< The terminal is unlocked by patch module >
Operate result information:
-------------------------------------
Slot         Result       Comment
```

0 Success NoneNotifications

When upgrade succeeds, the following notification will be displayed:

```
Upgrade success
```

When an installation package is invalid or damaged, the following notification will be displayed. You need to obtain an installation package again and run the upgrade command.

```
Invalid package file
```

When the device does not support that installation package, the following notification will be displayed. You need to obtain the installation package again and run the upgrade command.

```
Device don't support
```

When the device does not need to be upgraded, the following notification will be displayed:

```
The version in device is newer or the same
```

When the upgrade space is insufficient, the following notification will be displayed:

```
No enough space for decompress
```

Related Commands

- **show version** (basic configuration/basic management command)

1.7 upgrade auto-sync package

Function

Run the **upgrade auto-sync package** command to configure the check scope for auto-sync upgrade of the device system.

By default, the check scope for auto-sync upgrade of the system is the path of the upgrade package used in the previous system upgrade.

Syntax

upgrade auto-sync package *url*

Parameter Description

url: Local path of the used upgrade package in the device during the auto-sync upgrade of the device.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

When new members join the system, the upgrade function module determines the location of the installation package according to this path. Each time the system is upgraded, the upgrade function module automatically records the path of the installation package used for this upgrade and uses it for auto-sync upgrade. You can also run the **upgrade auto-sync package** command to manually set a path.

Examples

The following example sets the auto-sync upgrade path of the device system to the upgrade package in the USB flash drive.

```
Hostname> enable
Hostname# upgrade auto-sync package usb0:/main_1.0.0.0f328e91.bin
```

1.8 upgrade auto-sync policy

Function

Run the **upgrade auto-sync policy** command to configure an auto-sync upgrade policy for the system.

The default auto-sync upgrade policy of the system is **coordinate.**

Syntax

upgrade auto-sync policy [**compatible** | **coordinate** | **none**]

Parameter Description

none: Performs no auto-sync upgrade and disables the patch package auto-sync.

compatible: Checks whether auto-sync is needed based on the sequential order of versions and enables patch package auto-sync.

coordinate: Synchronizes the version of the system upgrade package stored on the supervisor module to this version, and enables patch package auto-sync.

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

Before using this command, you need to confirm whether the upgrade package is ready.

Examples

The following example configures the auto-sync upgrade policy for the device as **compatible**.

```
Hostname> enable
Hostname# upgrade auto-sync policy coordinate
```

- **show upgrade auto-sync**

1.10 upgrade sync-server

Function

Run the **upgrade sync-server** command to configure the auto-sync upgrade range of the system.

Syntax

upgrade sync-server [**open** | **close**]

Parameter Description

open: Enables the auto-sync service so that the version of the supervisor module is synchronized to the line card when a line card without the main program is added to the chassis.

close: Disables the auto-sync service so that the version of the supervisor module is not synchronized to the line card when a line card without the main program is added to the chassis.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

When the auto-sync upgrade range of the system is set to **open**, the line card without main program is automatically upgraded to the version consistent with the supervisor module after being inserted into the chassis in hot swap mode.

Examples

The following example enables the auto-sync service.

```
Hostname> enable
Hostname# upgrade sync-server open
```

1.11 clear install storage

This command must be used with caution, because no patch is rolled back to the previous state after this command is run.

Function

Run the **clear install storage** command to clear all the patch packages not running currently and corresponding database information.

Syntax

clear install storage [**slot** { **0 | all** }]

Parameter Description

slot-number: Slot number of a line card. It is used for rack-type devices. The value range of this parameter depends on the actual product.

0: Specifies the current device.

all: Specifies all devices.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

This command is used to clear all the patch packages that are not currently running, and delete the patch information from the database. After this command is run, none of the installed patches can be deactivated.

Examples

The following example clears all the patch packages from the device.

```
Hostname> enable
Hostname# clear install storage
Running this command will cause system fail to deactivate. continue?[Y/N]y

Notifications

- After running this command, you can use the **show install** command to display the patch information. If the state is installed, the patch information is added.
- When an error is reported during running of the command, the format is the same as that in the above guidelines, and the result is **Fail** or **Skip**. The comments are described as follows:

  If an installed patch package is reinstalled, the following notification will be displayed:

  ```
  This package already add, don't need to add again!
  ```

  When the space for installing a patch package is insufficient, the following notification will be displayed:

  ```
  No space left on device!
  ```

  When a patch package does not match the device, the following notification will be displayed:

  ```
  Package architecture not match!
  ```

  When the device fails to meet the installation conditions of a patch package, the following notification will be displayed:

  ```
  Package depends not satisfy!
  ```

1.13 install activate

Function

Run the **install activate** command to activate a patch temporarily to make it take effect.

Syntax

install activate *package_name* [**slot** { **0 | all** }]

Parameter Description

package_name: Name of the patch package file to be activated.

0: Specifies the current device.

all: Specifies all devices.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

- This command is used to activate the installation package of a function component.
- Only the installed patches can be activated.
- If an activated patch package does not take effect, the cause is that the version of each component in the current patch package is earlier than or the same as that of the component running in the current device. This is normal.
- If a patch in the device is activated but not confirmed, the patch package will be rolled back to the previous state after the device is restarted. If you confirm that the problem is solved after a patch package is activated, run the **install commit** command immediately.

Examples

The following example activates a patch temporarily to make it take effect.

```
Hostname> enable

```

Notifications

When an error is reported during running of the command, the format is the same as that in the above guidelines, and the result is **Fail** or **Skip**. The comments are described as follows:

When a component package file does not exist, the device does not support the entered patch file name, or a patch package is not installed, the following notification will be displayed:

```
Package maybe not exist, please check!
```

When you deactivate an unactivated patch package, the following notification will be displayed (you need to activate a patch package before deactivating it):

```
Package is not activate or running, not allow deactivate!
```

When the device space is insufficient, the following notification will be displayed:

```
No space left on device!
```

- **show patch**

1.24 patch delete

Function

Run the **patch delete** command to remove an unactivated patch package and delete the patch information from the database.

Syntax

patch delete [**slot** { **0 | all** }]

Parameter Description

0: Specifies the current device.

all**: Specifies all devices. Command Modes**

Privileged EXEC mode

Default Level

15

Usage Guidelines

When no parameter is set in this command, it is used to delete unactivated patch packages and database information of all the device members from the device.

Examples

The following example removes unactivated patch packages and deletes the patch information from database.

```
Hostname> enable
Hostname# patch delete
< The terminal is lock >
Operating, please wait for a moment
!!!!!!!!!!  20%
!!!!!!!!!!  40%
!!!!!!!!!!  60%

1 Time Range Commands

Command	Function
absolute	Configure an absolute time range.
periodic	Configure a period.
show time-range	Display information about a time range.
time-range	Create a time range and enter the time range configuration mode.

1.1 absolute

Function

Run the **absolute** command to configure an absolute time range.

Run the **no** form of this command to delete an existing absolute time range.

No absolute time range is configured by default. In this case, the maximum time range is used.

Syntax

absolute { **start** *hh:mm DD/MM/YY* | **end** *hh:mm DD/MM/YY* } *

no absolute

Parameter Description

start *hh:mm DD/MM/YY*: Configures the start time of a time range. Here, *hh* indicates the hour, *mm* indicates the minute, *DD* indicates the day, *MM* indicates the month, and *YY* indicates the year.

end *hh:mm DD/MM/YY*: Configures the end time of a time range. Here, *hh* indicates the hour, *mm* indicates the minute, *DD* indicates the day, *MM* indicates the month, and *YY* indicates the year.

Command Modes

Time range configuration mode

Default Level

14

Usage Guidelines

To enable a function in an absolute time range, run the **absolute** command to configure a time range that includes start time and end time.

Examples

The following example configures a time range named **no-http** and configures an absolute time range from 00:00 on January 1, 2013 to 23:59 on December 31, 2014 in time range configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# time-range no-http
Hostname(config-time-range)# absolute start 0:0 1 Jan 2013 end 23:59 31 Dec 2014
```

Related Commands

- **show time-range**

1.2 periodic

Function

Run the **periodic** command to configure a period.

Run the **no** form of this command to delete an existing period.

No period is configured by default. The current time is considered to be within a period.

Syntax

periodic *day-of-the-week time* **to** [*day-of-the-week*] *time*

no periodic *day-of-the-week time* **to** [*day-of-the-week*] *time*

Parameter Description

day-of-the-week: Day when a period starts or ends in a week.

time: Time when a period starts or ends.

Command Modes

Time range configuration mode

Default Level

14

Usage Guidelines

- To enable a function in a period, run the **periodic** command to configure a period.
- Before modifying a period for a service, you are advised to disassociate the time range. After the period is modified, associate the time range again.

Examples

The following example configures a time range named **no-http** and configures a period from Monday 01:01 to Tuesday 02:02 in time range configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# time-range no-http
Hostname(config-time-range)# periodic Monday 1:1 to Tuesday 2:2
```

1.4 time-range

Function

Run the **time-range** command to create a time range and enter the time range configuration mode.

Run the **no** form of this command to delete an existing time range.

No time range is configured by default.

Syntax

time-range *time-range-name*

no time-range *time-range-name*

Parameter Description

time-range-name: Name of a time range to be created.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

When some services run based on time, for example, to make an access control list (ACL) take effect only on Monday, first create a time range and then configure Monday for time control in time range configuration mode.

Examples

The following example configures a time range named **no-http**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# time-range no-http
Hostname(config-time-range)#
```

1 Supervisor Module Redundancy Commands

Command	Function
auto-sync time-period	Configure an interval for automatically synchronizing configuration files in case of redundancy of dual supervisor modules or a VSU consisting of box-type devices deployed in stacking mode.
redundancy	Enter the redundancy configuration mode.
redundancy forceswitch	Perform master/slave switchover manually.
redundancy reload	Reset a device.
show redundancy states	Display the redundancy status of the current device.

1.1 auto-sync time-period

Function

Run the **auto-sync time-period** command to configure an interval for automatically synchronizing configuration files in case of redundancy of dual supervisor modules or a VSU consisting of box-type devices deployed in stacking mode.

Run the **no** form of this command to disable automatic synchronization of such dual supervisor modules or a VSU.

Run the **default** form of this command to restore the interval for automatically synchronizing configuration files to the default value.

Automatic synchronization is enabled by default, the **startup-config** and **running-config** files are automatically synchronized, and the automatic synchronization interval is 1 hour.

Syntax

auto-sync time-period *synchronization-interval-time*

no auto-sync time-period

default auto-sync time-period

Parameter Description

synchronization-interval-time: Automatic synchronization interval, in seconds. The value range is from 1 to 2678400.

Command Modes

Redundancy configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the automatic synchronization interval to 60s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# redundancy
Hostname(config-red)# auto-sync time-period 60
Redundancy auto-sync time-period: enabled (60 seconds).
Hostname(config-red)# exit
```

1.3 redundancy forceswitch

Function

Run the **redundancy forceswitch** command to perform master/slave switchover manually.

Syntax

redundancy forceswitch

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

When this command is run on the master device, the master device is reset and the slave device becomes the new master device.

The following conditions must be met for the hot-backup switchover:

- The operation is performed on the master device and a slave device exists.
- The hot backup of all VSDs in the system is in the real-time state.
- The hot-backup switchover of all VSDs in the system is not temporarily disabled by service entities.
- When this command is run, the system with multiple VSDs determines whether each VSD allows master/slave switchover in the hot backup state. If a VSD does not allow such switchover, this command is not run; otherwise, such switchover is forcibly performed on all VSDs in the hot backup state.

Examples

The following example configures the device to switch over between the master and slave devices.

```
Hostname> enable
Hostname# redundancy forceswitch
This operation will reload the master unit and force switchover to the slave unit.
Are you sure to continue? [N/y] y
```

Notifications

When the slave device does not exist during switchover, the following notification will be displayed:

```
% Redundancy Switchover Request can only take effect while peer Supervisor is Ready.
```

When batch hot backup between the master device and the slave device in a VSD is not switched over, the following notification will be displayed:

```
% Redundancy Switchover failed: Some VSD's redundancy state is temporarily
non-realtime.
```

When the master/slave switchover of a VSD is disabled during switchover, the following notification will be displayed:

```
% Redundancy Switchover failed: Some VSD's redundancy switchover is temporarily
disabled by elements.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

N/A

1.4 redundancy reload

Function

Run the **redundancy reload** command to reset a device.

Syntax

redundancy reload { **peer** | **shelf** [*switch-id*] }

Parameter Description

peer: Resets only the slave device.

shelf: Resets both the master and slave devices in standalone mode. In VSU mode, the ID of the device to be reset must be specified.

switch-id: ID of a device in a VSU. This parameter supports VSU mode.

Note

This parameter does not support standalone mode. In VSU mode, you must enter it in the **redundancy reload shelf** command.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

- In standalone mode, the command for resetting a device is **redundancy reload shelf**, that is, the whole device is reset.
- In VSU mode, the command for resetting a device is **redundancy reload shelf** *switchid*, that is, the device with a specified device ID is reset.
  - If the master device is reset and the hot backup of the system is not real-time, the whole VSU system is reset.
  - If only the slave device is reset, data forwarding is not affected. During the resetting of the slave device,

data forwarding is not interrupted or user session information is not lost.

Examples

The following example resets device 2 in VSU mode.

```
Hostname> enable
Hostname# redundancy reload shelf 2
This operation will reload the device 2. Are you sure to continue? [N/y] y
Preparing to reload device 2!
```

Notifications

When only one device exists, the following notification will be displayed:

```
% Privileged command reload peer can only execute in Duplex Supervisor mode.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

N/A

1.5 show redundancy states

Function

Run the **show redundancy states** command to display the redundancy status of the current device.

Syntax

show redundancy states

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

- Only 1:1 hot backup is supported (hot backup for the global master device and global slave device) in VSU mode. Other devices are used as candidate devices and do not participate in hot backup.
- If other VSDs are configured in the system, the hot backup status of other VSDs is displayed under VSD 0 of the global master and slave devices.

Examples

The following example displays the redundancy status of the current master device.

```
Hostname> enable
Hostname# show redundancy states
Redundancy switching function: enabled
Redundancy role: master
Redundancy state: realtime
Auto-sync time-period: 3600 s
Redundancy management role: master
Redundancy control role: active
Redundancy control state: realtime
Auto-sync time-period: 3600 s
```

The following example displays the redundancy status of the current slave device.

```
Hostname-STANDBY > enable
Hostname-STANDBY# show redundancy states
Redundancy role: slave
Redundancy state: realtime
Redundancy management role: slave
Redundancy control role: standby
Redundancy control state: realtime
Data backup state: NA
```

The following example displays the redundancy status of the current candidate device.

```
Hostname-Candidate > enable
Hostname-Candidate # show redundancy states
Redundancy role: candidate
Redundancy state: none
Redundancy management role: candidate
Redundancy control role: standby
Redundancy control state: realtime
```

The following example displays the redundancy status of the current master device when VSD1 and VSD2 are configured.

```
Hostname> enable
Hostname# show redundancy states
Redundancy switching function: enabled
Redundancy role: master
Redundancy state: realtime
Auto-sync time-period: 3600 s
Redundancy management role: master
Redundancy control role: active
Redundancy control state: realtime
Auto-sync time-period: 3600 s
VSD vsd1 redundancy state: realtime
VSD vsd2 redundancy state: realtime
```

Table 1-1 Output Fields of the show redundancy states Command

Field	Description
role	Role of a device
state	Status of the device
Auto-sync time-period	Interval for automatically synchronizing configuration files, which is displayed on only the master device. If **disabled** is displayed, automatic synchronization is disabled.
VSD <vsd name> redundancy state	Hot backup state of a VSD, which is displayed under only VSD 0 of the master and slave devices.
Redundancy switching function	Function of forcible redundancy switching of the device. If **enabled** is displayed, the function is enabled; if **disabled** is displayed, the function is disabled.

1 Hot Swapping Commands

Command	Function
sysmac	Specify a MAC address for the system.
remove configuration device	Remove the existing configurations of a VSU member device (this command is available only in VSU mode, and this operation takes effect after the device is restarted).
show alarm	Display current system-level alarms.
show manuinfo	Display the asset information of all independent components in the current system.
show sysmac	Display the current system MAC address of a device.
show version module detail	Display the details of a module.
show version slots	Display the online status of a module.

1.1 sysmac

Function

Run the **sysmac** command to specify a MAC address for the system.

Run the **no** form of this command to delete the MAC address retained in the configuration file.

No MAC address is specified for the system by default.

Syntax

sysmac *mac-address*

no sysmac

Parameter Description

mac-address: MAC address.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Generally, the MAC address used by the system is stored in the supervisor module or flash memory of the chassis. In virtual switching unit (VSU) mode, however, the system automatically saves the used MAC address in the configuration file to avoid interruption caused by the change of the MAC address. If a valid MAC address exists in the configuration file after restart, the MAC address is used preferentially. The **no sysmac** command is run to delete the MAC address in the configuration file and restore the MAC address that is stored in the flash memory by default.

In gateway mode (the **auth-mode gateway** command is configured in the system), the gateway MAC address is bound on some peripheral devices. If the gateway is replaced, users can run the **sysmac** command to set the MAC address of the gateway to the MAC address of the new gateway. Thus, you do not need to modify configurations of downstream devices with the gateway MAC address bound. The **sysmac** command is available only when the system is configured to work in gateway mode.

After an MAC address is specified for the system or the MAC address stored in the configuration file is deleted, be sure to save the configurations and restart the system so that the configurations take effect.

The **sysmac** command is available only when the system is configured to work in gateway mode. In other modes, this command is visible but not configurable.

Examples

The following example deletes the MAC address stored in the configuration file.

```
Hostname> enable
Hostname# no sysmac
```

The following example sets the MAC address of the system to 00d0.f822.33e2.

```
Hostname> enable
```

```
Hostname# sysmac 00d0.f822.33e2
```

1.2 remove configuration device

Function

Run the **remove configuration device** command to remove the existing configurations of a VSU member device (this command is available only in VSU mode, and this operation takes effect after the device is restarted).

Syntax

remove configuration device *device-id*

Parameter Description

device-id: Chassis ID.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To remove the existing configurations of a member device in the VSU system, run this command. This command is saved, and then takes effect after the system is restarted.

Examples

The following example removes the configurations of device 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# remove configuration device 1
```

Function

Run the **show alarm** command to display current system-level alarms.

Syntax

show alarm

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to display current system-level alarms, including board startup failure, device temperature, power supply, fan, and inter-board data forwarding path.

Examples

N/A

Notifications

When this command is run to display current system-level alarms, the following notification will be displayed:

```
Hostname> enable
Hostname# show alarm
Dev  Module         Level    Info
1    DEV           Warning  Some fans are absent.
1    DEV           Critical Some cards are in cannot-startup state.
```

Table 1-1 Output Fields of the show alarm Command

Field	Description
Dev	ID of a device giving an alarm

Field	Description
Module	Name of the service module that reports the alarm
Level	Alarm levels, including **Critical** and **Warning**
Info	Description of the alarm causes, for example, the system power is insufficient, the fan is removed, or a board cannot be started.

1.4 show manuinfo

Function

Run the **show manuinfo** command to display the asset information of all independent components in the current system.

Syntax

show manuinfo

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the asset information of all independent components in the system for asset management. The components include the chassis, fans, power supply, supervisor modules, and line cards. The displayed information about each component includes the number, slot ID, name, serial number, software and hardware versions, and MAC address. Different information is displayed for each type of device, and only the actually supported information is displayed.

Examples

The following example displays asset information in standalone mode.

```
Hostname> enable
Hostname# show manuinfo
Device 1
   Location:                Chassis
```

```
   Device name:              RG S12006

1.6 show version module detail

Function

Run the **show version module detail** command to display the details of a module.

Syntax

show version module detail [*slot-num*]

show version module detail [*device-id / slot-num*]

Parameter Description

device-id: Chassis ID. This parameter is optional (in VSU mode, to enter a slot ID, you must also enter the chassis ID of the module).

slot-num: Slot ID (optional).

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the details of a module.

Examples

The following example displays the details of the module in slot 0.

```
Hostname# enable
Hostname# show version module detail 2
Device  : 1
Slot    : 0
Soft Status:  master
Online Module
Type    :
Ports   : 0
Hardware version :
Software version :
BOOT version     :
Serial number    :
```

1.7 show version slots

Function

Run the **show version slots** command to display the online status of a module.

Syntax

show version slots [*slot-num*]

show version slots [*device-id* / *slot-num*]

Parameter Description

device-id: Chassis ID. This parameter is optional (in VSU mode, to enter a slot ID, you must also enter the chassis ID of the module).

slot-num: Slot ID (optional).

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the online status of a module.

Examples

The following example displays the online status of a module.

```
Hostname# enable
Hostname# show version slots
Dev  Slot  Port Configured Module   Online Module    Software Status

1 Process Restarting Commands

Command	Function
cmdk restart	Restart a specified process of the board in a specified slot on a specified device.
cmdk start	Start a specified process of the board in a specified slot on a specified device.
cmdk stop	Stop a specified process of the board in a specified slot on a specified device.
cmdk detail	Display the process of the board in a specified slot on a specified device.
debug cmdk	Enable or disable the CMDK debugging mode.

1.1 cmdk restart

Function

Run the **cmdk restart** command to restart a specified process of the board in a specified slot on a specified device.

Syntax

cmdk device *device-id* **slot** *slot-id* **module** *module-name* **restart**

Parameter Description

device-id: Device ID. The default value is **1**.

slot-id: Slot ID of a board.

module-name: Module name.

Table 1-1 Definitions of Slot IDs in the Command String

Slot	Slot ID
Supervisor Module 1	M1
Supervisor Module 2	M2
Interface board	Slot ID corresponding to the interface board. The value range is from 1 to 8.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

- This command is run on only the master device.
- You can run the **show version slot** command to query the device ID and slot ID of a board.

Examples

The following example restarts the span process of the board in slot 0 on device 1.

```
Hostname> enable
Hostname# cmdk device 1 slot 0 module span restart
Hostname# This operation will reset the span. Are you sure to continue? [N/y]y
```

Notifications

For the names of modules that can be restarted, see Table 1-2.

Table 1-2 Names of Modules That Can Be Restarted

Module Name	Description
aaad	Function of the AAA service
acld	Function of the ACL service
aclk	Kernel function of the ACL service
bfd	Function of the BFD service
bgp	Function of the BGP service
bridge	Function of the bridge service
ce.cap.sw	Capability framework
ce.cli.cpp.dp	CPP CLI function
ce.cpp.dp	Unified data plane of CPP
ce.ddos.sw	Defense against DDoS attacks
ce.ebrg.dp	Virtual bridge management
ce.emac.dp	Unified MAC data plane
ce.fp.sw	Basic policy service
ce.l2ofd.sw	Monitoring whether L2 user traffic is online
ce.mmu.dp	Data plane maintenance of MMU supervisor module
ce.nacm.sw	Access control management
ce.ofdpa.sw	OpenFlow data plane adaptation
ce.proxy.brg.dp	Bridge agent module
ce.proxy.traf	Traffic agent module
ce.qinq.dp	Data plane maintenance of QinQ Supervisor Module
ce.qos.sw	Data plane maintenance of QoS Supervisor Module
ce.tran.cap.sw	Cards notifying that the DM capability is ready (related to pre-installation)
ce.virvlan.dp	VLAN management
ce_ap	AP aggregation port service
ce_dad	DAD dual active device detection
ce_ddm	Data plane management of switching equipment
ce_efm	Express forwarding management

Module Name	Description
ce_lspan	Local mirror
ce_mgmt	MGMT port service maintenance
ce_mlag	Data plane service of MLAG
ce_ptm_core	Port management core module
ce_ptm_mib	Port management MIB processing module
ce_ptm_split	Port management split port
ce_ptm_trnscr	Supervisor module interface plug-in management
ce_sflow	Traffic sampling function
cli-proxy	Function of the CLI configuration agent service
cli-server	Function of the CLI configuration service
dhcp6c	Function of the DHCPv6 client service
dhcpc	Function of the DHCP client service
dm_app_pd	Device management framework
dm_dp	Device management core protocol
dm_kernel_sw	Device management kernel module - switching product
dns_client	Function of the DNS client service
efmp_frame	Function of the fast forwarding service
efmp_proxy	Function of the fast forwarding agent service
fe.cap.sw	Line card capability framework
fe.cpp.sw	Line card CPP module
fe.ebrg.sw	Line card virtual bridge
fe.emac.sw	Line card MAC management
fe.fp.sw	FP security entry maintenance service
fe.mmu.sw	MMU cache management service
fe.ofdpa.sw	Line card OpenFlow data plane module
fe.qinq.sw	QinQ data plane service
fe.qos.sw	QoS data plane service
fe.virvlan.sw	VLAN data plane service

Module Name	Description
fe_ap	Line card aggregation port management module
fe_bfd	BFD service
fe_dad	DAD dual active device detection service
fe_ddm	Device management module on the line card data plane
fe_efm	Line card express forwarding
fe_mlag	Forwarding plane service of MLAG
fe_ptm_core	Interface management core service
fe_ptm_mib	Interface MIB service
fe_ptm_split	Interface splitting service
fe_ptm_trnscr	Line card interface plug-in management
fe_ptm_virpt	Virtual port management
fe_span	SPAN service
ftp_server	Function of the FTP server service
ftpc_cli	Function of the FTP client service
igmp	Function of IGMP multicast group management service
igmp_snp	Function of IGMP multicast detection
ipv4	IPV4 function
ipv6	IPv6 function
isis	Function of ISIS routing protocol
ldpd	Function of LDP
lldpdemo	LLDP control plane function
lsm_ko	Function of interface status management kernel
lsm_rpc_agent	Function of interface status management agent
lsmdemo	Function of interface status management guard
mlag-services	Service whole set related to MLAG
mld	Function of MLD multicast group management
mld_snp	Function of MLD multicast detection
mstp	STP control plane

Module Name	Description
nsm	Function of the network service
nsm_proxy	Network service kernel agent
ntp	Function of the NTP service
ospf	Function of the OSPF service
ospfv3	Function of the OSPFv3 service
pbr	Function of the PBR service
qosd	Function of the QoS service
rdnd-proxy	Hot standby framework proxy module
reup	REUP protocol control plane
rg_syslogd	Function of the syslog service
rg-lacp	Function of the LACP service
rg-mlag	Control plane service of MLAG
rg-rdnd	Hot standby management framework
rg-snmpd	Function of the SNMP service
rg-span	Control plane function of the mirroring function
rg-sshc	Function of the SSH Client service
rg-sshd	Function of the SSH Server service
rg-sysmon	Function of the equipment monitoring service
rg-sysmon-pre	Function of the equipment monitoring service
rg-telnetc	Function of the Telnet Client service
rg-telnetd	Function of the Telnet Server service
rip	Function of the RIP service
ripng	Function of the RIPng service
rpi	Function of the routing policy service
S80psh_server	Function of the equipment self-healing service
sccd	Function of the security control center service
snooping	Functions of the DHCP detection service (DHCP snooping, IP source guard, port security, ARP-CHECK, DAI, gateway ARP anti-spooling, and global IP address + MAC address binding)

Module Name	Description
ss_proxy	Proxy process of SS
ssa_sdk	Switching chip driver
ssa_sdk_78ccm	Supervisor module switching chip driver
tcpip	TCP/IP function
tftpd	Function of the TFTP service
tftp-server	Function of the TFTP server service
tipc	Communication protocol
tipc-tap	Module for interworking with the TIPC protocol, device management, and TIPC driver
urpf	A unicast reverse routing lookup technology used to prevent network attacks based on source address spoofing
v6snooping	Function of the DHCPv6 spoofing service (DHCPv6 Snooping and IPv6 Source Guard)
vrrp	Function of the VRRP service
vrrp_plus	Function of the VRRP+ service
xe.cpp.dp	CPP all deployment module on the unified data plane

1.2 cmdk start

Function

Run the **cmdk start** command to start a specified process of the board in a specified slot on a specified device.

Syntax

cmdk device *device-id* **slot** *slot-id* **module** *module-name* **start**

Parameter Description

device-id: Device ID. The default value is **1**.

slot-id: Slot ID of a board.

module-name: Module name.

Table 1-3 Definitions of Slot IDs in the Command String

Slot	Slot ID
Supervisor Module 1	M1
Supervisor Module 2	M2
Interface board	Slot ID corresponding to the interface board. The value range is from 1 to 8.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

- This command is run on only the master device.
- You can run the **show version slot** command to query the device ID and user slot ID.

Examples

The following example starts the span process of the board in slot 0 on device 1.

```
Hostname> enable
Hostname# cmdk device 1 slot 0 module span start
Hostname# This operation will reset the span. Are you sure to continue? [N/y]y

1.3 cmdk stop

Function

Run the **cmdk stop** command to stop a specified process of the board in a specified slot on a specified device.

Syntax

cmdk device *device-id* **slot** *slot-id* **module** *module-name* **stop**

Parameter Description

device-id: Device ID. The default value is **1**.

slot-id: Slot ID of a board.

module-name: Module name.

Table 1-4 Definitions of Slot IDs in the Command String

Slot	Slot ID
Supervisor Module 1	M1
Supervisor Module 2	M2
Interface board	Slot ID corresponding to the interface board. The value range is from 1 to 8.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

- This command is run on only the master device.
- You can run the **show version slot** command to query the device ID and user slot ID.

Examples

The following example stops the span process of the board card in slot 0 on device 1.

```
Hostname> enable
Hostname# cmdk device 1 slot 0 module span stop
Hostname# This operation will reset the span. Are you sure to continue? [N/y]y

1 Python Commands

Command	Function
Python	Debug a Python script.

1.1 Python

Function

Run the **python** command to debug a Python script.

No Python-related operation (for example, debugging a Python script or running the **Python** command) is performed by default.

Syntax

python [*file-name* | *args*]

Parameter Description

file-name: Name of a script file. The default directory for search is **flash:**. **flash:** can be added to the directory.

args: Script file parameter.

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

The **copy** command is run to upload a Python script to a device.

When no parameter is included in this command, the Python console is accessed.

Examples

The following example runs a Python script named **hello.py**.

```
Hostname> enable
Hostname# python hello.py
Could not find platform dependent libraries <exec_prefix>
Consider setting $PYTHONHOME to <prefix>[:<exec_prefix>]
hello,word!
Device#
```

Notifications

N/A

Common Errors

N/A

Platform Description

Because Python occupies too much space in the flash memory, the help and license interfaces used to display the version and license information in Python are removed. But this does not affect other functions of help and license.

1 License Management Commands

Command	Function
license copy	Back up license files.
license grace-period	Configure the grace period before a license expires.
license install	Install a license.
license auto-install	Automatically match and install a license.
license uninstall	Uninstall a license.
license auto-uninstall	Uninstall a license.
license unbind	Unbind a license.
license update	Update a license.
show license all-license	Display the list of all installed license files in the device.
show license dev-license	Display the list of license files on each device in the system.
show license file	Display the information about a specified license file on the device.
show license hostid	Display the host ID used for licensing.
show license dev-hostid	Display the host ID used for licensing.
show license usage	Display the usage of the current license in the system.
show license unbind-code	Display the verification code of a license unbound from the local device.
show license dev-unbind-code	Display the verification code of a license unbound from each device in the system.

1.1 license copy

Function

Run the **license copy** command to back up license files.

No license file is backed up by default.

Syntax

license { **copy-all** | **copy-file** *filename* } { **flash:** | **usb0:** } [*target-filename*]

Parameter Description

copy-all: Backs up all permanent license files in the system.

copy-file: Backs up the license file specified by *filename* in the system. *filename* is the name of a license file or a feature that has been installed in the system. When *filename* is a feature name, all the installed license files for this feature are backed up.

flash: Specifies the location of a license file in the internal flash file system.

usb0: Specifies the location of a license file in the USB file system.

target-filename: Name of a license file.

Command Modes

Privileged EXEC mode

Default Level

4

Usage Guidelines

- **copy-file** is used to back up either a single license file or all license files for a feature.
- When all license files in the system are backed up, a .tar file is generated.
- You can run the **dir** command to view the generated license file package. After decompressing the package, compare the license files with the license file names displayed in the **installed license** fields of permanently licensed features in the command output of the **show license all-license** command to check whether licenses are correctly backed up.
  - The **installed license** field is available only for multi-instance licenses. The name of a file internally backed up in the multi-instance license system is determined by the ID of the multi-instance license.
  - One single-instance license file exists at most in the system at a time. Therefore, the internally backed up single-instance license file is named after the feature.

Examples

The following example backs up all license files in the system to the **rg-license-lics** path (mandatory) of the USB flash drive. The license file package is named **lics.tar**.

```
Hostname> enable
Hostname# license copy-all usb0:rg-license-lics/lics.tar
Success to copy all permanent license.
```

Notifications

When you want to back up all license files but there is no license file for backup in the system, the following notification will be displayed:

```
Copy failed, there's no permanent license in the system.
```

When all license files in the system are backed up, the following notification will be displayed:

```
Success to copy all permanent license.
```

When the specified feature or license file is not on the device, the following notification will be displayed:

```
Copy failed, there’s no such service or license installed in the system.
```

When the specified license file is temporary, the following notification will be displayed:

```
Copy failed, the license is temporary.
```

When the specified license file is backed up, the following notification will be displayed:

```
Success to copy license vsd.lic.
```

Common Errors

- The specified license or file does not exist in the system.
- The backup fails as the specified license to be backed up is temporary.

Platform Description

N/A

Related Commands

N/A

1.2 license grace-period

Function

Run the **license grace-period** command to configure the grace period before a license expires.

The grace period before a license expires is 180 days by default.

Syntax

license grace-period *filename days*

Parameter Description

filename: Name of a license feature.

days: Grace period (in days) before a license expires. The range is from 0 to 365.

Command Modes

Privileged EXEC mode

Default Level

4

Usage Guidelines

- A grace period is set for an evaluation license only but not a permanent license.
- When a license is going to expire in 100 days, a warning message is generated at regular intervals.
  - When the expiration time of a license is less than the grace period, a warning is generated once a day.
  - The day before a license expires, a warning is generated every hour. A warning is sent in the form of a log or SNMP trap message.

Examples

The following example configures the temporary license for the installed VSD feature in the system and sets the grace period to 100 days.

```
Hostname> enable
Hostname# license grace-period LIC-VSD 100
Success to set alarm starting point of license LIC-VSD.
```

Notifications

When the grace period is successfully set, the following notification will be displayed:

```
Success to set alarm starting point of license LIC-VSD.
```

When the specified license does not exist in the system, the following notification will be displayed:

```
There's no license abc in the system.
```

Common Errors

The specified license does not exist in the system.

1.3 license install

Function

Run the **license install** command to install a license.

Syntax

license install { **flash:** | **usb0:** } *filename*

Parameter Description

flash: Specifies the location of a license file in the internal flash file system.

usb0: Specifies the location of a license file in the USB file system.

filename: Name of a license file.

Command Modes

Privileged EXEC mode

Default Level

4

Usage Guidelines

- The name of a license file can be modified.
- In a VSU environment, run the **license install** command on the master device to install a license on all devices, or run this command on a non-master device to install a license locally.

Examples

The following example installs a license file for the VSD feature.

```
Hostname> enable
Hostname# license install usb0:vsd.lic
License file install success, service name: LIC-VSD.
```

Notifications

When the license file does not exist, the following notification will be displayed:

```
Install failed: no such file or directory.
```

When the license file is invalid, the following notification will be displayed:

```
Install failed: the install license may be wrong.
```

When a license file later than the one to be installed already exists in the system, the following notification will be displayed:

```
Install failed: the system already has a same license which is newer.
```

When a license file is repeatedly installed, the following notification will be displayed:

```
Install failed: the license has been installed before.
```

When a license is temporary and a permanent license for the same feature already exists in the system, the following notification will be displayed:

```
Install failed: The system already has a same permanent license.
```

When a license (the license for the VSD feature above) is installed, the following notification will be displayed:

```
License file install success, service name: LIC-VSD.
```

When a license (the license for the VSD feature above) is installed and converted into a permanent one, the following notification will be displayed:

```
License file install success, service name: LIC-VSD.
The license turns to be permanent.
```

When a license (the license for the VSD feature above) is installed and is to be expired in less than 30 days, the following notification will be displayed:

```
License file install success, service name: LIC-VSD.;
The installed license is approaching deadline, less than 30 days.
```

Common Errors

- The specified license file does not exist.
- The license file is invalid.

- The SN of the license file does not match that of the device.
- The pre-installed license is earlier than that in the system.
- A license file is repeatedly installed.
- The pre-installed license is temporary but the system has installed a permanent license.

Platform Description

N/A

Related Commands

N/A

1.4 license auto-install

Function

Run the **license auto-install** command to automatically match and install a license.

Syntax

license auto-install { **flash:** | **usb0:** } *filename*

Parameter Description

flash:: Specifies the location of a license file in the internal flash file system.

usb0:: Specifies the location of a license file in the USB file system.

filename: Name of a license file.

Command Modes

Privileged EXEC mode

Default Level

4

Usage Guidelines

- The name of a license file can be modified.
- This command is used in a VSU environment.
  - In a VSU environment, this command is used to install a license on a matched board only.
  - In a non-VSU environment, this command has the same function as the **license install** command.

Examples

The following example installs a license for the FC feature.

```
Hostname> enable
Hostname# license install usb0:fc.lic
License file install success, dev 2 install it, service name: LIC-FC-BLADE-S.
```

Notifications

When the license file does not exist, the following notification will be displayed:

```
Install failed: no such file or directory.
```

When the license file is invalid, the following notification will be displayed:

```
Install failed: the install license may be wrong.
```

When a license file later than the one to be installed already exists on the device, the following notification will be displayed:

```
Install failed: device 2 already has a same license which is newer.
```

When a license file is repeatedly installed, the following notification will be displayed:

```
Install failed: the license has been installed to device 2 before.
```

When a license is temporary and a permanent license for the same feature already exists on the device, the following notification will be displayed:

```
Install failed: device 2 already has a same permanent license.
```

When a license (the license for the FC feature above) is installed for a specific device, the following notification will be displayed:

```
License file install success, device 2 installed it, service name: LIC-FC-BLADE-S.
```

When a license (the license for the FC feature above) is installed for a specific device and converted into a permanent one, the following notification will be displayed:

```
License file install success, device 2 installed it, service name: LIC-FC-BLADE-S .
The license turns to be permanent.
```

When a license is installed (the license for the FC feature above) for a specific device and is to be expired in less than 30 days, the following notification will be displayed:

```
License file install success, device 2 installed it, service name: LIC-FC-BLADE-S .;
The installed license is approaching deadline, less than 30 days.
```

Common Errors

- The specified license file does not exist.
- The license file is invalid.
- No device matches the license file in the environment.
- The pre-installed license is earlier than that in the system.
- A license file is repeatedly installed.
- The pre-installed license is temporary but the system has installed a permanent license.

Platform Description

1.5 license uninstall

Function

Run the **license uninstall** command to uninstall a license.

Syntax

license uninstall *license* [*filename*]

Parameter Description

all: Uninstalls all license files in the system.

license: Name of the license to be uninstalled.

filename: Name of the file to be uninstalled.

Command Modes

Privileged EXEC mode

Default Level

4

Usage Guidelines

- If the licensed feature is running, the uninstallation does not take effect immediately.
- An uninstalled license is not restored. It is recommended that you back up the license file before uninstalling it.

Examples

The following example uninstalls the VSD license in the system.

```
Hostname> enable
Hostname# license uninstall LIC-VSD
Uninstall LIC-VSD success.
```

Notifications

When the specified license file (named **defd**) does not exist on the device, the following notification will be displayed:

```
Uninstall failed: there's no license defd in the system.
```

When the specified license file (named **123.lic**) for the specified feature (LIC-WLAN-AP-32) does not exist on the device, the following notification will be displayed:

```
Uninstall failed: there's no license 123.lic of service LIC-WLAN-AP-32 in the system.
```

When a single license file of a single-instance licensed feature is uninstalled, the following notification will be displayed:

```
Uninstall failed: single instance license does not support license based uninstalling.
```

When a license is uninstalled (for the VSD feature), the following notification will be displayed:

```
Uninstall LIC-VSD success.
```

When a single license file (named **AP32_1.lic**) of a licensed feature is (LIC-WLAN-AP-32) uninstalled, the following notification will be displayed:

```
Uninstall license AP32_1.lic of service LIC-WLAN-AP-32 success.
```

Common Errors

- No license is installed for the specified feature on the device.

- The specified license file for the specified feature does not exist on the device.
- A license file for a single-instance feature is pre-uninstalled (a single license file is not uninstalled in a single-instance license scenario).

Platform Description

N/A

Related Commands

1.6 license auto-uninstall

Function

Run the **license auto-uninstall** command to uninstall a license.

Syntax

license auto-uninstall *device-id license* [*filename*]

Parameter Description

device-id: ID of the device that stores the file to be uninstalled.

license: Name of the license to be uninstalled.

filename: Name of the file to be uninstalled.

Command Modes

Privileged EXEC mode

Default Level

4

Usage Guidelines

- If the licensed feature is running, the uninstallation will not take effect immediately.
- An uninstalled license is not restored. It is recommended that you back up the license file before uninstalling it.

Examples

The following example uninstalls the FC license in the system.

```
Hostname> enable
Hostname# license auto-uninstall 2 LIC-FC-BLADE-S
License file uninstall LIC-FC-BLADE-S of device 2 success.
```

Notifications

When the specified license (named **defd**) does not exist on the specified device (device 2, the same as below), the following notification will be displayed:

```
Uninstall failed: there's no license defd in the device 2.
```

When the specified license file (named **123.lic**) for the specified feature (LIC-WLAN-AP-32) does not exist on the specified device, the following notification will be displayed:

```
Uninstall failed: there's no license 123.lic of service LIC-WLAN-AP-32 in device 2.
```

When a single license file of a single-instance licensed feature is uninstalled, the following notification will be displayed:

```
Uninstall failed: single instance license does not support license based uninstalling.
```

When a license is uninstalled (for the FC feature), the following notification will be displayed:

```
Uninstall LIC-FC-BLADE-S in device 2 success.
```

When a single license file (named **AP32_1.lic**) of a licensed feature is (LIC-WLAN-AP-32) uninstalled, the following notification will be displayed:

```
Uninstall license AP32_1.lic of service LIC-WLAN-AP-32 in device 2 success.
```

Common Errors

- No license is installed for the specified feature on the specified device.
- The specified license file for the specified feature does not exist on the specified device.
- A license file for a single-instance feature is pre-uninstalled (a single license file is not uninstalled in a single-instance license scenario).
- The specified device does not exist.

1.7 license unbind

Function

Run the **license unbind** command to unbind a license.

Syntax

license unbind *pak*

Parameter Description

pak: License code

Command Modes

Privileged EXEC mode

Default Level

4

Usage Guidelines

- This command is used to unbind a license file from a device. You must run this command to unbind the

license from the device before removing the binding on the website.

- Upon unbinding, you obtain a verification code, which is needed for the unbinding on the website.

Examples

The following example unbinds the license with the license code of LIC-FCOE00000012268888.

```
Hostname> enable
Hostname# license unbind LIC-FCOE00000012268888
Success to unbind license LIC-FCOE00000012268888.
The verification string is
775719468737BA269825589557F558657575B5D5D5D5D785782598859765A8355855.
```

Notifications

When the system has no matched license, the following notification will be displayed:

```
Unbind failed: not match license found.
```

Common Errors

The system has no matched license.

1.8 license update

Function

Run the **license update** command to update a license.

Syntax

license update { **flash:** | **usb0:** } *filename*

Parameter Description

flash:: Specifies the location of a license file in the internal flash file system.

usb0:: Specifies the location of a license file in the USB file system.

filename: Name of a license file.

Command Modes

Privileged EXEC mode

Default Level

4

Usage Guidelines

N/A

Examples

The following example updates the temporary license for VSD to a permanent one.

```
Hostname> enable
Hostname# license update usb0:vsd_perm.lic
License file update success, temporary license LIC-VSD changes into permanent.
```

Notifications

When the license file does not exist, the following notification will be displayed:

```
Update failed: No such file or directory.
```

When the license file is invalid, the following notification will be displayed:

```
Update failed: the update license may be wrong.
```

When the pre-installed license is earlier than that in the system, the following notification will be displayed:

```
Update failed: the new installed license is older than the system one
```

When a license has been installed, the following notification will be displayed:

```
Update failed: the license has been installed before.
```

When a temporary license cannot replace a permanent one, the following notification will be displayed:

```
Update failed: the period license cannot replace permanent license.
```

When no license has been installed for the feature of the pre-installed license, the following notification will be displayed:

```
Update failed: now the system does not have the license.
Try "license install" instead.
```

When an evaluation license is updated and converted into a permanent one (the license for the VSD feature), the following notification will be displayed:

```
Update success, temporary license LIC-VSD changes into permanent.
```

Common Errors

- The license file is specific to the current device.
- An earlier license is used to replace a later one.
- The updated license has been installed.
- A temporary license is used to replace a permanent one.
- No license has been installed for the feature during the license update.

1.2 usb remove

Function

Run the **usb remove** command to remove the USB flash disk.

Syntax

usb remove *device-id*

Parameter Description

device_id: Device ID of the specified USB flash disk. You can run the **show usb** command to display the device ID.

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

Before pulling out the USB flash disk, please run the **usb remove** command to remove the USB flash disk from the system. Otherwise, USB storage data may be corrupt.

If the USB flash disk is removed successfully, the system will show a prompt and you can pull out the device. If the USB flash disk fails to be removed, please wait a moment and try again.

Examples

The following example removes USB flash disk **0**.

```
Hostname> enable
Hostname# usb remove 0
OK, now you can pull out the device 0.
```

Notifications

If the USB flash disk is removed successfully, the following notification will be displayed:

```
OK, now you can pull out the device 0.
```

Virtualization Commands

1 VSU Commands

Command	Function
dad relay enable	Enable the forwarding of dual-active detection (DAD) packets based on aggregation port (AP).
dual-active bfd interface	Configure a BFD-based DAD port.
dual-active detection	Enable the DAD.
dual-active exclude interface	Configure an excluded port in Recovery mode for dual-active devices.
dual-active interface	Configure an AP-based DAD port.
port-member interface	Configure a VSL member port.
led-blink	Configure quick blinking location.
show switch id	Display the ID of the local device.
show switch virtual	Display the information summary of a device.
show switch virtual balance	Display the traffic balancing mode.
show switch virtual config	Display the VSU configurations.
show switch virtual dual-active	Display DAD information.
show switch virtual link	Display the VSL information.
show switch virtual role	Display the information about device roles.
show switch virtual topology	Display the information about the VSU device topology.
switch	Configure the device ID.
switch cfg_mode	Specify the manner of saving the VSU configuration file.
switch convert mode	Configure the standalone or VSU mode.
switch crc errors	Configure the CRC error detection parameter.
switch description	Configure a device name.
switch domain	Modify the domain ID of a device in VSU mode.
switch priority	Configure a device priority.
switch renumber	Modify a device ID.

switch virtual aggregateport-lff enable	Enable AP-based LFF.
switch virtual domain	Configure a VSU domain ID or enter the VSU domain configuration mode.
switch virtual ecmp-lff enable	Enable ECMP-based LFF.
vsl-port	Enter the VSL port configuration mode.
recovery auto-restart enable	Enable the automatic restart function of dual-active devices after a link fault is rectified in the recovery mode.

1.1 dad relay enable

Function

Run the **dad relay enable** command to enable the forwarding of dual-active detection (DAD) packets based on aggregation port (AP).

Run the **no** form of this command to disable the forwarding of AP-based DAD packets.

The forwarding of AP-based DAD packets is disabled by default.

Syntax

dad relay enable

no dad relay enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to enable the AP-based DAD in a VSU network and runs on a forwarding device connected to the VSU members.

Configure this command on an AP only.

Examples

The following example enables the forwarding of DAD packets on aggregate port 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface aggregateport 1
Hostname(config-if-AggregatePort 1)# dad relay enable
```

Notifications

N/A

Common Errors

The DAD packets must be forwarded on an AP.

Platform Description

N/A

Related Commands

- **dual-active detection**

- **show switch virtual dual-active**

1.2 dual-active bfd interface

Function

Run the **dual-active bfd interface** command to configure a BFD-based DAD port.

Run the **no** form of this command to delete a BFD-based DAD port.

Syntax

dual-active bfd interface *interface-type interface-number*

no dual-active bfd interface *interface-type interface-number*

Parameter Description

interface-type interface-number: Type and number of the BFD-based detection port.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

This command is configured only in VSU mode.

The BFD-based detection port must be a directly connected physical port and be configured as a layer-3 routed port.

The BFD-based detection link must connect different devices (the active and standby devices only).

Examples

The following example configures the port GigabitEthernet 0/1 as the BFD-based DAD port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# dual-active bfd interface GigabitEthernet 0/1
```

Notifications

N/A

Common Errors

The detection port is not a routed port.

Platform Description

N/A

Related Commands

- **show switch virtual dual-active**

1.3 dual-active detection

Function

Run the **dual-active detection** command to enable the DAD.

Run the **no** form of this command to disable the DAD.

The DAD is disabled by default.

Syntax

dual-active detection { **aggregateport** | **bfd** }

no dual-active detection { **aggregateport** | **bfd** }

Parameter Description

aggregateport: Enables AP-based DAD.

bfd: Enables BFD-based DAD.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

This command is configured only in VSU mode.

If the **aggregateport** parameter is specified**,** the forwarding of AP-based DAD packets must also be enabled.

Examples

The following example enables the BFD-based DAD.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# dual-active detection bfd
```

The following example enables the AP-based DAD.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# dual-active detection aggregateport
```

Notifications

N/A

Common Errors

N/A

Platform Description

N/A

Related Commands

- **show switch virtual dual-active**

1.4 dual-active exclude interface

Function

Run the **dual-active exclude interface** command to configure an excluded port in Recovery mode for dual-active devices.

Run the **no** form of this command to delete an excluded port in Recovery mode for dual-active devices.

Syntax

dual-active exclude interface *interface-type interface-number*

no dual-active exclude interface *interface-type interface-number*

Parameter Description

interface-type interface-number: Type and number of an excluded port in Recovery mode for dual-active devices.

Command Modes

config-vs-domain configuration mode

Default Level

14

Usage Guidelines

This command is configured only in VSU mode.

Excluded ports must be routed ports but not VSL ports.

You can configure multiple excluded ports.

Examples

The following example configures the port GigabitEthernet 0/1 as an excluded port in Recovery mode for dual-active devices.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# dual-active exclude interface GigabitEthernet 0/1
```

Notifications

N/A

Common Errors

- A VSL port is configured as an excluded port.
- An excluded port is not a routed port.

Platform Description

N/A

Related Commands

- **show switch virtual dual-active**

1.5 dual-active interface

Function

Run the **dual-active interface** command to configure an AP-based DAD port.

Run the **no** form of this command to delete an AP-based DAD port.

Syntax

dual-active interface *interface-type interface-number* [**vlan** *vlan-id*]

no dual-active interface *interface-type interface-number* [**vlan** *vlan-id*]

Parameter Description

interface-type interface-number: Type and number of a port (which must be an AP).

vlan-id: VLAN ID (VID) of a used AP. The value range is from 1 to 4094.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

Only one AP-based DAD port is configured. You must create an AP before configuring it as a detection port. The latter detection port overwrites the previous one.

When the AP is a trunk port and the native VLAN is beyond the VLAN range allowed by the AP-based detection port, configure a detection VLAN for the AP-based detection port. The configured detection VLAN must fall within the VLAN range allowed by the trunk port and have been correctly created on the device.

Examples

The following example configures aggregate port 1 as a DAD port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# dual-active interface aggregateport 1
```

The following example configures aggregate port 1 as a DAD port. This AP is a trunk port. The allowed VLAN range is from 2 to 10, and the detection VLAN is 10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface aggregateport 1
```

```
Hostname(config-if-AggregatePort 1)# switchport mode trunk
Hostname(config-if-AggregatePort 1)# switchport trunk allowed vlan only 2-10
Hostname(config-if-AggregatePort 1)# exit
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# dual-active interface aggregateport 1 vlan 10
```

Notifications

N/A

Common Errors

- The detection port is not an AP.
- The AP is configured as a trunk port with an allowed VLAN range, but no VLAN is configured for the detection port.

Platform Description

N/A

Related Commands

- **show switch virtual dual-active**

1.6 port-member interface

Function

Run the **port-member interface** command to configure a VSL member port.

Run the **no** form of this command to delete a VSL member port.

Syntax

port-member interface *interface-type interface-number*

no port-member interface *interface-type interface-number*

Parameter Description

interface-type interface-number: Type and number of the port. The port type parameter must be a 10G port or above. The port name parameter is 2-dimensional in standalone mode, for example, the value is GigabitEthernet 0/1. It is 3-dimensional in VSU mode, for example, the value is GigabitEthernet 1/0/1.

Command Modes

VSL interface configuration mode

Default Level

14

Usage Guidelines

This command is available in both VSU and standalone modes. You must save the command configurations.

The VSL port type must be a 10G port or above.

The four 10G ports split from a 40G port cannot be configured as VSL ports.

If a common port is configured as an NLB reflex port, it can serve as a VSL port only after the service is deleted.

If the VSU topology is split when a VSL port is switched to a common port, the VSL port must not be deleted. You can disconnect the physical port and then delete the VSL port.

Examples

The following example adds/deletes the VSL member port TenGigabitEthernet 0/1 in standalone mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vsl-port
Hostname(config-vsl-port)# port-member interface TenGigabitEthernet 0/1
Hostname(config-vsl-port)# no port-member interface TenGigabitEthernet 0/1
```

The following example adds/deletes the VSL member port TenGigabitEthernet 1/0/1 in VSU mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vsl-port
Hostname(config-vsl-port)# port-member interface TenGigabitEthernet 1/0/1
Hostname(config-vsl-port)# no port-member interface TenGigabitEthernet 1/0/1
```

Notifications

N/A

Common Errors

- The VSL member ports must be 10G ports or ports with higher bandwidth for some models.
- If a port is configured as an NLB reflex port, this port can be switched to a VSL member port only after the NLB reflex port configuration is deleted.

Platform Description

The VSL port type must be a 10G port or above.

Related Commands

- **show switch virtual link**

1.7 led-blink

Function

Run the **led-blink** command to configure quick blinking location.

Quick blinking location is disabled by default.

Syntax

led-blink { **enable** | **disable** } [**device** *switch-id*]

Parameter Description

enable: Enables quick blinking location.

disable: Disables quick blinking location.

switch-id: ID of the device to be configured with quick blinking location. The value range is from 1 to 2.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

In standalone mode, you can enable or disable quick blinking location only, but not specify the **device** keyword.

In VSU mode, you can specify *switch-id* to enable/disable quick blinking location for a specified device. If **device** is not specified, quick blinking location of all devices in the VSU environment is enabled/disabled.

Quick blinking location is automatically disabled 30 minutes after it is started.

The configuration takes effect immediately and is not saved. If you perform an active/standby switch or restart the device, quick blinking location is disabled.

Examples

The following example enables quick blinking location for the local device in standalone mode.

```
Hostname> enable
Hostname# led-blink enable
```

The following example enables quick blinking location for device 2 in VSU mode.

```
Hostname> enable
Hostname# led-blink enable device 2
```

The following example enables quick blinking location for all devices in VSU mode.

```
Hostname> enable
Hostname# led-blink enable
```

1.12 show switch virtual dual-active

Function

Run the **show switch virtual dual-active** command to display DAD information.

Syntax

show switch virtual dual-active { **aggregateport** | **bfd** | **summary** }

Parameter Description

aggregateport: Indicates the AP-based DAD configuration information.

bfd: Indicates the BFD-based DAD configuration information.

summary: Indicates the information summary of the DAD.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the information summary of the DAD.

```
Hostname> enable
Hostname# show switch virtual dual-active summary
BFD dual-active detection enabled: Yes
Aggregateport dual-active detection enabled: No
Interfaces excluded from shutdown in recovery mode:
GigabitEthernet 1/0/3
GigabitEthernet 1/0/4
In dual-active recovery mode: No
```

The following example displays the BFD-based DAD configuration information.

```
Hostname> enable
Hostname# show switch virtual dual-active bfd
BFD dual-active detection enabled: Yes
BFD dual-active interface configured:
GigabitEthernet 1/0/1: UP
GigabitEthernet 2/0/2: UP
```

The following example displays the AP-based DAD configuration information.

```
Hostname> enable
Hostname# show switch virtual dual-active aggregateport
Aggregateport dual-active detection enabled: Yes
Aggregateport dual-active interface configured:
AggregatePort 1: UP
: GigabitEthernet 1/0/1: UP
: GigabitEthernet 2/0/1: UP
: GigabitEthernet 1/0/2: UP
: GigabitEthernet 2/0/2: UP
DAD relay enable AP list:
AggregatePort 1
```

Table 1-4 Output Fields of the show switch virtual dual-active Command

Field	Description
BFD dual-active detection enabled	Indicates whether the BFD-based DAD is enabled.
Aggregateport dual-active detection enabled	Indicates whether the AP-based DAD is enabled.
Interfaces excluded from shutdown in recovery mode	Indicates excluded ports in Recovery mode for dual-active devices.
BFD dual-active interface configured	Configures the BFD-based DAD port.
Aggregateport dual-active interface configured	Configures the AP-based DAD port.

Field	Description
DAD relay enable AP list	Indicates the list of ports for forwarding DAD packets

1.13 show switch virtual link

Function

Run the **show switch virtual link** command to display the VSL information.

Syntax

show switch virtual link [**port**]

Parameter Description

port: Checks the status of a VSL member port.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the VSL information.

```
Hostname> enable
Hostname# show switch virtual link
VSL-AP  State  Peer-VSL    Rx      Tx        Uptime
1/1     UP     2/1       100000   100000    1d,4h,29m
2/1     UP     1/1       100000   100000    1d,4h,29m
```

Table 1-5 Output Fields of the show switch virtual link Command

Field	Description
VSL-AP	VSL AP list
State	Status of a member port. The available values include: ● **DOWN**: The port is in the link down state. ● **DISABLE**: A Cyclic Redundancy Check (CRC) error occurs on the port. ● **UP**: The port is in the link up state, but no valid VSL-AP member port is detected at the peer end. ● **OK**: The port is in the link up state, and a valid VSL-AP member port is detected at the peer end.
Peer-VSL	VSL-AP member port at the peer end.
Rx	Size of a received packet, in bytes.
Tx	Size of a transmitted packet, in bytes.
Uptime	AP connection duration

The following example displays the VSL port information.

```
Hostname> enable
Hostname# show switch virtual link port
switch 1:
Port                       AP  State  Peer-port          Rx    Tx    Uptime
TenGigabitEthernet 1/0/1   1   OK     TenGigabitEthernet 2/0/1 9000  9000  0d,0h,20m
TenGigabitEthernet 1/0/2   2   OK     TenGigabitEthernet 2/0/2 9000  9000  0d,0h,20m
Switch 2:
Port                       AP  State  Peer-port           Rx    Tx    Uptime
TenGigabitEthernet 2/0/1   1   OK     TenGigabitEthernet 1/0/1 9000  9000  0d,0h,20m
TenGigabitEthernet 2/0/2   2   OK     TenGigabitEthernet 1/0/2 9000  9000  0d,0h,20m
```

Table 1-6 Output Fields of the show switch virtual link port Command

1.14 show switch virtual role

Function

Run the **show switch virtual role** command to display the information about device roles.

Syntax

show switch virtual role

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command has the same function as the **show switch virtual** command.

Examples

The following example displays device roles in standalone mode.

```
Hostname> enable
Hostname# show switch virtual role
Current system is running in "STANDALONE" mode.
```

The following example displays device roles in VSU mode.

```
Hostname> enable
Hostname# show switch virtual role
Switch_id  Domain_id   Priority   Position  Status    Role        Description
1(1)       1(1)       100(100)   LOCAL     OK        ACTIVE      switch-1
2(2)       1(1)       100(100)   REMOTE    OK        CANDIDATE   switch-2

1.16 switch

Function

Run the **switch** command to configure the device ID.

Run the **no** form of this command to restore the device ID to its default value.

The default device ID is 1.

Syntax

switch *switch-id*

no switch

Parameter Description

switch-id: ID of a device in VSU mode. The value range is from 1 to 2.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

A device ID is used to uniquely identify a member device of a VSU. In VSU mode, the name format of an interface is changed from "slot/port" to "switch/slot/port", where "switch" indicates the ID of the device to which the interface belongs.

If two active devices exist or if two devices are just started up with no role assigned and the devices share the same priority, the device with a smaller device ID is elected as the active one.

This command is used to modify the device ID in standalone mode only. In VSU mode, you need to run the **switch** *switch-id* **renumber** *new-switch-id* command to modify the device ID. The modified ID takes effect only after the device is restarted in both standalone mode and VSU mode.

Examples

The following example sets the ID of a device in VSU device domain 1 to 2 in standalone mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch 2
```

1.17 switch cfg_mode

Function

Run the **switch cfg_mode** command to specify the manner of saving the VSU configuration file.

Run the **no** form of this command to restore the default configuration.

By default, the VSU configuration file of a device is separately saved and named **config_vsu.dat**.

Syntax

switch cfg_mode { **normal** | **single** }

no switch cfg_mode

Parameter Description

normal: Indicates that the VSU configuration file is separately saved and named as **config_vsu.dat**.

single: Indicates that the VSU configuration file is not separately saved and is named **config.text**.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

Examples

The following example saves the VSU configuration file to the **config.text** file in standalone mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch cfg_mode single
```

1.18 switch convert mode

Function

Run the **switch convert mode** command to configure the standalone or VSU mode.

A device works in standalone mode by default.

Syntax

switch convert mode { **virtual** | **standalone** } [*switch-id*]

Parameter Description

virtual: Indicates the VSU mode.

standalone: Indicates the standalone mode.

switch-id: Device ID. The value range is from 1 to 2.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

After you run the **switch convert mode virtual** command, the device automatically backs up each VSD global configuration file in standalone mode into a file named **vsd.standalone.text.***VSD serial number.* Then, the device clears each VSD global configuration file **config.text**, prompts you to choose whether to overwrite the VSD global configuration file **config.text** with **vsd.standalone.text.***VSD serial number*, saves the VSU configurations and restarts.

After you run the **switch convert mode standalone** command, the active device backs up each VSD global configuration file in VSU mode into a file named **vsd.virtual_switch.text.***VSD serial number.* Then, the device clears each VSD global configuration file **config.text**, prompts you to choose whether to overwrite the VSD global configuration file **config.text** with **vsd.virtual_switch.text.***VSD serial number*, and finally restarts.

This command can be run in either standalone mode or VSU mode. When this command is run in standalone mode, the work mode of the local device is switched. When this command is run in VSU mode with *switch-id* specified, the work mode of the device corresponding to *switch-id* is switched; if *switch-id* is not specified, the work mode of the active device is switched. You are advised to switch the work mode of the standby device and that of the active device.

Examples

The following example switches to the VSU mode from the standalone mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch convert mode virtual
```

The following example switches standby device 2 and active device 1 to the standalone mode successively from the VSU mode.

```
Hostname> enable
Hostname# switch convert mode standalone 2
Hostname# switch convert mode standalone 1
```

Notifications

When you switch the VSU mode to the standalone mode:

The following notification will be displayed, asking you whether to back up **config.text** as **standalone.text**, delete **config.text**, and then restart the device:

```
Convert mode will backup and delete config file, and reload the switch. Are you sure
to continue[yes/no]
```

The following notification will be displayed, asking you whether to restore **config.text** from the backup file:

```
Do you want to recover config file from back file in standalong mode (press 'ctrl +
c' to cancel) [yes/no]:n
```

When you switch the standalone mode to the VSU mode:

The following notification will be displayed, asking you whether to back up **config.text** as **virtual_switch.text**, delete **config.text**, and then restart the device:

```
Convert mode will backup and delete config file, and reload the switch. Are you sure
to continue[yes/no]
```

The following notification will be displayed, asking you whether to restore **config.text** from the backup file:

```
Do you want to recover config file from back file in standalong mode (press 'ctrl +
c' to cancel) [yes/no]:
```

1.19 switch crc errors

Function

Run the **switch crc errors** command to configure the CRC error detection parameter.

Run the **no** form of this command to restore the default configuration.

By default, one CRC error occurrence is recorded if the number of CRC errors incremented between two checks is 3 or more. If 10 consecutive CRC error occurrences is recorded, take actions.

Syntax

switch crc errors *error-number* **times** *time-number*

no switch crc

Parameter Description

error-number: Threshold of CRC errors incremented between two checks. One CRC error occurrence is recorded if the number of CRC errors exceeds this threshold.

time-number: Number of consecutive CRC error occurrences.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example configures the CRC error detection rule as follows: One CRC error occurrence is recorded if the number of CRC errors incremented between two checks is 10 or more. If 5 consecutive CRC error occurrences are recorded, the port is considered abnormal.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch crc errors 10 times 5
```

1.20 switch description

Function

Run the **switch description** command to configure a device name.

Run the **no** form of this command to delete a device name.

No device name is configured by default.

Syntax

switch *switch-id* **description** *device-name*

no switch *switch-id* **description**

Parameter Description

switch-id: ID of the device to be configured with a name. The value range is from 1 to 2.

device-name: Device name, containing up to 32 characters.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

This command is available in both the standalone mode and VSU mode. The configuration takes effect immediately.

Examples

The following example sets the name of device 1 to **buildingA**.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch 1 description buildingA
```

1.21 switch domain

Function

Run the **switch domain** command to modify the domain ID of a device in VSU mode.

Run the **no** form of this command to restore the domain ID of a device in VSU mode to its default value.

The default device domain ID is 100 in VSU mode.

Syntax

switch *switch-id* **domain** *new-domain-id*

no switch *switch-id* **domain**

Parameter Description

switch-id: ID of the running device in VSU mode. The value range is from 1 to 2.

new-domain-id: New domain ID. The value range is from 1 to 255.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

This command is available only in VSU mode and the configuration takes effect only after device restart.

Examples

The following example modifies the domain ID of device 1 to 10 in VSU mode.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch 1 domain 10
```

The following example restores the domain ID of device 2 to its default value (**100**) in VSU mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# no switch 2 domain

1.22 switch priority

Function

Run the **switch priority** command to configure a device priority.

Run the **no** form of this command to restore the device priority to its default value.

The default device priority is **100**.

Syntax

switch *switch-id* **priority** *priority*

no switch *switch-id* **priority**

Parameter Description

switch-id: ID of the device to be configured with a priority. The value range is from 1 to 2.

priority: Device priority. The value range is from 1 to 255.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

A larger value indicates a higher priority. The device with a higher priority is elected as the active device.

You can run this command in the standalone or VSU mode. The changed priority takes effect only after device restart.

This command does not change the value of *switch-id*. In VSU mode, *switch-id* indicates the ID of the running device. If the device ID does not exist, the configuration does not take effect.

Examples

The following example sets the priority of device 1 to 200 in standalone mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch 1 priority 200
```

The following example sets the priority of device 1 to 200 and restores the priority of device 2 to the default value (**100**) in VSU mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch 1 priority 200
Hostname(config-vs-domain)# no switch 2 priority
```

1.23 switch renumber

Function

Run the **switch renumber** command to modify a device ID.

Run the **no** form of this command to restore the device ID to its default value.

The default device ID is **1**.

Syntax

switch *switch-id* **renumber** *new-switch-id* [**force**]

no switch *switch-id*

Parameter Description

switch-id: ID of the running device in VSU mode. The value range is from 1 to 2.

new-switch-id: Modified device ID. The value range is from 1 to 2.

force: Specifies whether to forcibly modify the device ID.

Warning

A confirmation message is displayed when the **force** parameter is added. If you enter **yes**, the VSU configuration is saved immediately and the device is restarted to validate the new device ID.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

This command is available only in VSU mode and the configuration takes effect only after device restart.

Examples

The following example changes the ID of the running device 1 to 2 in VSU mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch 1 renumber 2
```

The following example restores the ID of the running device 2 to its default value (**1**) in VSU mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# no switch 2
```

The following example forcibly modifies the ID of the running device 1 to 2 in VSU mode. Upon the modification, a confirmation message is displayed. You can enter **yes** to immediately save the configuration and restart the device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)# switch 1 renumber 2 force
```

Notifications

When the device ID is modified, the following notification will be displayed:

```
Renumber switch id may lead to loss of configuration and restart to connect other VSU
switch, do you want to continue? [no/yes]
```

Function

Run the **switch virtual domain** command to configure a VSU domain ID or enter the VSU domain configuration mode.

Run the **no** form of this command to delete the VSU domain ID.

The default VSU domain ID is **100**.

Syntax

switch virtual domain *domain-id*

no switch virtual domain

Parameter Description

domain-id: VSU domain ID. The value range is from 1 to 255.

Command Modes

VSU domain configuration mode

Default Level

14

Usage Guidelines

Only devices with the same domain ID compose a VSU. The domain ID must be unique in the LAN.

Examples

The following example sets the VSU domain ID to 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# switch virtual domain 1
Hostname(config-vs-domain)#
```

Interface Commands

1 Ethernet Interface Commands

Command	Function
bandwidth	Configure the bandwidth of an Ethernet interface.
carrier-delay	Configure the carrier delay of an Interface.
clear counters	Clear the interface counter.
clear link-state-change statistics	Clear the statistics about the link state change times of the interface.
define interface-range	Configure batch interface macro names.
description	Configure the interface description.
duplex	Configure the duplex mode of an interface.
errdisable recovery	Recover a port from the errdisable state.
ethernet-port counter sample-period	Configure the sampling period of Ethernet interface statistics.
ethernet-subport counter route-sample-period	Configure the sampling period of Ethernet sub-interface statistics.
fec mode	Configure the forward error correction (FEC) mode of an interface.
fiber antifake enable	Enable the optical module antifake detection function.
flowcontrol	Configure interface flow control.
flow-statistics include-interframe enable	Enable the function of including interframe gaps in interface packet rate statistics.
interface	Enter the interface configuration mode.
interface range	Batch configure interfaces.
load-interval	Configure the interval of load calculation for an interface.
logging	Configure interface information printing.
mtu	Configure the maximum transmission unit (MTU) of an interface.

mtu forwarding	Configure the forwarding plane MTU.
negotiation mode	Configure the interface auto negotiation mode.
physical-port dither protect	Configure port flapping protection.
port speed-mode	Configure the working rate mode of the 25 Gbps port.
protected-ports route-deny	Configure L3 routing blocking between protected ports.
show interfaces	View the details of an interface.
show interfaces counters	View the statistics of packets received and sent by an interface.
show interfaces counters rate physical-layer	View the packet receiving and sending rate information of an interface at the physical layer.
show interfaces link-state-change statistics	View the change time and count of the interface link state.
show interfaces mtu forwarding	View information about the forwarding plane MTU.
show interfaces status	View the status information of an interface.
show interfaces status err-disabled	View the errdisable status information of an interface.
show interfaces transceiver	View the optical module information of an interface.
show interfaces usage	View the bandwidth usage of an interface.
show mgmt virtual	View the information of the virtual management port.
show split summary	View the splitting/combining information of an interface.
shutdown	Shut down a specific interface.
snmp trap link-status	Enable the LinkTrap notification sending function for interface status change.
snmp-server if-index persist	Enable the interface index persistence function.
speed	Configure the rate of an interface.
split interface	Configure the interface splitting function.
statistics	Enable the interface traffic statistics collection and IP traffic statistics collection functions.
switchport	Configure the L2 mode for an interface.
switchport protected	Configure a port as protected port.

system mtu	Configure the MTU of the system.

1.1 bandwidth

Function

Run the **bandwidth** command to configure the bandwidth of an Ethernet interface.

Run the **no** form of this command to restore the default configuration.

No interface bandwidth is configured by default.

Syntax

bandwidth *kilobits*

no bandwidth

Parameter Description

kilobits: Interface bandwidth, in kilobits. The value range is from 1 to 2147483647.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The **bandwidth** command cannot actually affect the bandwidth of an interface. It allows the user to inform the system of the bandwidth of the interface. The bandwidth of the Ethernet interface is determined according to the rate of the actual port link by default. If necessary, the user can specify the bandwidth. **Bandwidth** is only a routing parameter and does not affect the real bandwidth of the interface of the physical link.

Examples

The following example configures the bandwidth parameter of the interface GigabitEthernet 0/1 to 64 Kbps.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# bandwidth 64
```

Notifications

1.2 carrier-delay

Function

Run the **carrier-delay** command to configure the carrier delay of an Interface.

Run the **no** form of this command to restore the default configuration.

The default carrier delay of an interface is 2s.

Syntax

carrier-delay { [**milliseconds**] *delay-interval* | **up** [**milliseconds**] *up-interval* **down** [**milliseconds**] *down-interval* }

no carrier-delay

Parameter Description

milliseconds: Millisecond-level delay, in milliseconds. The value range is from 0 to 60000, and the value must be an integral multiple of 100.

Delay-interval: Second-level carrier delay of the interface, in seconds. The value range is from 0 to 60.

up *up-interval*: Second-level delay after which the state of the data carrier detect (DCD) signal changes from **Down** to **Up**, in seconds. The value range is from 0 to 60.

down *down-interval*: Second-level delay after which the state of the DCD signal changes from **Up** to **Down**, in seconds. The value range is from 0 to 60.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The carrier delay refers to the delay after which the DCD signal changes from **Down** to **Up** or from **Up** to **Down**. If the DCD status changes during the delay, the system will ignore this change to avoid re-negotiation on the upper data link layer.

If the DCD carrier is interrupted for a long time, the carrier delay should be set longer to accelerate route summarization and convergence of the routing table. On the contrary, if the DCD carrier interruption time is shorter than the route summarization time, the carrier delay should be set to a greater value to avoid route flapping.

Examples

The following example sets the carrier delay of the interface to 5s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# carrier-delay 5
```

The following example sets the carrier delay of the interface to 100 milliseconds.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# carrier-delay milliseconds 100
```

The following example sets the delay after which the state of the DCD changes from **Down** to **Up** to 100 milliseconds and that after which the state of the DCD changes from **Up** to **Down** to 200 milliseconds.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# carrier-delay up milliseconds 100 down
milliseconds 200
```

1.3 clear counters

Function

Run the **clear counters** command to clear the interface counter.

Syntax

clear counters [*interface-type interface-number*]

Parameter Description

interface-type interface-number: Type and number of the interface.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

You can run the **show interfaces** command to view the statistics of the interface and run the **clear counters** command to clear the statistics of the interface in the privileged EXEC mode. If no interface is specified, all the interface counters will be cleared.

If you run the command to clear all the interface counters, it is possible that the statistics of the aggregate port (AP) are not cleared. In this case, run the **clear counters** command again, and a shorter statistics sampling period will increase the probability of such a problem.

Examples

The following example clears the counter of the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# clear counters GigabitEthernet 0/1
```

Notifications

N/A

Platform Description

1.4 clear link-state-change statistics

Function

Run the **clear link-state-change statistics** command to clear the statistics about the link state change times of the interface.

Syntax

clear link-state-change statistics *interface-type interface-number*

Parameter Description

interface-type interface-number: Type and number of the interface.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

You can view the link state change statistics of the interface using the **show interfaces link-state-change** command and clear the statistics about the link state change times of the interface using the **clear link-state-change statistics** command in the privileged EXEC mode. If no interface is specified, all the interface counters will be cleared.

Examples

The following example clears the link state change statistics of the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# clear link-state-change statistics GigabitEthernet 0/1
```

1.6 description

Function

Run the **description** command to configure the interface description.

Run the **no** form of this command to delete the configured interface description.

Syntax

description *interface-description*

no description

Parameter Description

interface-description: Interface description.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The **show interfaces** command is used to display the interface description and other information.

Examples

The following example configures the description of the interface GigabitEthernet 0/1 as **GBIC-1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# description GBIC-1
```

Notifications

If the length of the interface description exceeds 80 characters, an error is displayed.

```
% The length of description is up to 80!
```

1.7 duplex

Function

Run the **duplex** command to configure the duplex mode of an interface.

Run the **no** form of this command to restore the default configuration.

The interface is in auto-negotiation mode.

Syntax

duplex { **auto** | **full** | **half** }

no duplex

Parameter Description

Auto: Auto negotiation.

full: Full duplex.

Half: Half duplex.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The duplex mode of an interface is related to the interface type. You can run the **show interfaces** command to view the duplex configuration of the interface.

Examples

The following example configures the full duplex mode for the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# duplex full
```

1.8 errdisable recovery

Function

Run the **errdisable recovery** command to recover a port from the errdisable state.

The port errdisable recovery function is disabled by default.

Syntax

errdisable recovery [**interval** *interval* | **cause** *link-state*]

Parameter Description

interval *interval*: Interval of automatic recovery, in seconds. If the parameter is not configured, it indicates manual recovery. Automatic recovery is unavailable. The value range is from 30 to 86400.

cause *link-state*: Recovers the interface that is set to the errdisable state by the Rapid Ethernet Uplink Protection Protocol (REUP) link tracking group function.

Command Modes

Global configuration mode

Privileged EXEC mode

Interface configuration mode

Default Level

14

Usage Guidelines

When a violation occurs, you can run the **show interfaces status err-disable** command to view the cause. After the network fault is eliminated, you can run this command to recover the interface.

The interval of automatic recovery cannot be configured in privileged EXEC mode.

Specific errdisable recovery cannot be configured in interface configuration mode.

Examples

The following example configures global port errdisable recovery.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# errdisable recovery
```

The following example recovers the port that is set to the errdisable state by the REUP link tracking group function.

```
Hostname> enable
Hostname # errdisable recovery cause link-state
```

The following example recovers the port GigabitEthernet 0/1 from the errdisable state and sets the interval of automatic recovery to 60s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# errdisable recovery interval 60
```

1.9 ethernet-port counter sample-period

Function

Run the **ethernet-port counter sample-period** command to configure the sampling period of Ethernet interface statistics.

The default sampling period of Ethernet interface statistics is 5s.

Syntax

ethernet-port counter sample-period [*interval*]

Parameter Description

Interval: Sampling interval of Ethernet interface statistics, in seconds. The value range is from 1 to 100.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Note that a shorter sampling period indicates higher system resource consumption. After completing the configuration, check the CPU usage.

Examples

The following example configures the sampling period of Ethernet interface statistics to 1s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ethernet-port counter sample-period 1
```

1.10 ethernet-subport counter route-sample-period

Function

Run the **ethernet**-**subport counter route**-**sample**-**period** command to configure the sampling period of Ethernet sub-interface statistics.

Run the **no** form of this command to restore the default configuration.

The default sampling period of Ethernet sub-interface statistics is 5s.

Syntax

ethernet-**subport counter route**-**sample**-**period** [*interval*]

no ethernet-**subport counter route**-**sample**-**period**

Parameter Description

Interval: Sampling interval of Ethernet sub-interface statistics, in seconds. The value range is from 1 to 60.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Note that a shorter sampling period indicates higher system resource consumption. After completing the configuration, check the CPU usage.

Examples

The following example configures the sampling period of Ethernet sub-interface statistics to 1s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ethernet-subport counter route-sample-period 1
```

1.11 fec mode

Function

Run the **fec mode** command to configure the forward error correction (FEC) mode of an interface.

Run the **no** form of this command to restore the default configuration.

By default, the FEC mode of an interface depends on the interface type, and a specific FEC mode is subject to the actual product.

Syntax

fec mode { **rs** | **base-r** | **none** | **auto** }

no fec mode

Parameter Description

rs: Enables the FEC function as Reed-Solomon (RS)-FEC.

base-r: Enables the FEC function as BASE-R FEC.

none: Disables the FEC function.

auto: Indicates that the FEC mode is adaptive, that is, whether the FEC function is enabled or disabled is determined by the inserted optical module and its rate.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When the FEC function is enabled at one end of the link, it must be also enabled at the other end.

On the premise of not affecting the negotiation status of the two ends, you are advised to:

- disable the FEC function on the QSFP28-100G-LR4 optical module, on which the FEC function is disabled by default;
- enable the FEC function on QSFP28 modules (except QSFP28-100G-LR4), on which the FEC function is enabled by default.

Examples

The following example enables the FEC function as RS-FEC for the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# fec mode rs
```

The following example enables the FEC function as BASE-R FEC for the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# fec mode base-r
```

1.12 fiber antifake enable

Function

Run the **fiber antifake enable** command to enable the optical module antifake detection function.

Run the **no** form of this command to disable the optical module antifake detection function.

The optical module antifake detection function is disabled by default.

Syntax

fiber antifake { **ignore** | **enable** }

no fiber antifake enable

Parameter Description

ignore: Disables the optical module antifake detection function.

enable: Enables the optical module antifake detection function.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

An optical module alarm is printed when the optical module antifake detection function is enabled, and the system detects insertion of an optical module not supplied by Ruijie Networks. The optical module antifake detection function can be configured only for specific batches of optical modules. A false alarm may be reported for Ruijie optical modules of earlier versions.

Examples

The following example enables the optical module antifake detection function for the device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# fiber antifake enable
```

Notifications

The following notification is displayed when an optical module not supplied by Ruijie Networks is inserted into the interface GigabitEthernet 0/50:

```
*Aug 6 10:11:51: %OPTICAL_MODULE-WARNING: The Optical Module(Serial Number:
G1GD3B900102B) inserted into interface GigabitEthernet 0/50 is not original Optical
Module.
```

1.13 flowcontrol

Function

Run the **flowcontrol** command to configure interface flow control.

Run the **no** form of this command to restore the default configuration.

Flow control is disabled by default.

Syntax

flowcontrol { **auto** | **off** | **on** | **receive** { **auto** | **off** | **on** } | **send** { **auto** | **off** | **on** } }

no flowcontrol

Parameter Description

auto: Automatic flow control.

off: Disables flow control.

on: Enables flow control.

receive: Receiving direction of asymmetric flow control.

send: Sending direction of asymmetric flow control.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

You can run the **show interfaces** command to check whether the configuration takes effect.

Examples

The following example enables the flow control function on the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# flowcontrol on
```

1.15 interface

Function

Run the **Interface** command to enter the interface configuration mode.

Syntax

interface *interface-type interface-number*

Parameter Description

interface-type interface-number: Type and number of the interface.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can run this command to enter the interface configuration mode. Then you can modify the interface configuration.

For a virtual interface, you do not need to enter the slot number when entering the interface number. Instead, you can directly enter the number of the virtual interface, for example, interface looback 0.

The support to parameters varies for the L2 and L3 interfaces. The actual support conditions of products prevail.

Examples

The following example enters the configuration mode of the physical port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)#
```

The following example enters the configuration mode of the logical interface VLAN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)#
```

1.16 interface range

Function

Run the **Interface range** command to batch configure interfaces.

The function is not configured by default.

Syntax

Interface range { *interface-type interface-range-string* } | **macro** *macro-name* }

Parameter Description

interface-type: Type of the interface. The interface can be an Ethernet physical port or a loopback interface.

interface-range-string: Range of interface number, for example, **0/1-5** or **0/1, 0/3-4**.

macro *macro-name*: Defines a macro to indicate the interface range. Here, **macro-name** is the name of the macro.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Before using a macro, you need to run the **define interface-range** command to define the interface range as *macro-name* in global configuration mode, and then run the **interface range macro** *macro-name* command to apply the macro.

Examples

The following example batch sets the interface description of GigabitEthernet 0/1, GigabitEthernet 0/2, and GigabitEthernet 0/4 to **Office-201**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface range GigabitEthernet 0/1-2,0/4
Hostname(config-if-range)# description Office-201
```

The following example defines the interface macro name of GigabitEthernet 0/1 and GigabitEthernet 0/2 as **BW100**, and batch sets the bandwidth parameter to 100 Kbps.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# define interface-range BW100 GigabitEthernet 0/1-2
Hostname(config)# interface range macro BW100
Hostname(config-if-range)# bandwidth 100
```

1.17 load-interval

Function

Run the **load-interval** command to configure the interval of load calculation for an interface.

Run the **no** form of this command to restore the default configuration.

The default interval of load calculation for an interface is 10s.

Syntax

load-interval *interval*

no load-interval

Parameter Description

interval: Interval of load calculation for the interface, in seconds. The value range is from 5 to 600.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

You can run this command to specify the time interval for calculating the load of packet input and output for an interface. Generally, the numbers of input/output packets and bits per second are calculated every 10 seconds. For example, if this parameter is changed to 180 seconds on the interface GigabitEthernet 0/1, the following is displayed after you run the **show interface gigabitEthernet 0/1** command:

```
3 minutes input rate 15 bits/sec, 0 packets/sec
3 minutes output rate 14 bits/sec, 0 packets/sec
```

Examples

The following example sets the interval of load calculation for the interface GigabitEthernet 0/1 to 180s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# load-interval 180
```

1.18 logging

Function

Run the **logging** command to configure interface information printing.

Run the **no** form of this command to delete the interface information printing configuration.
The interface information printing function is disabled by default.

Syntax

logging [**link**-**updown** | **error**-**frame** | **link**-**dither** | **res**-**lack**-**frame** | **crc**-**frame**]

no logging [**link**-**updown** | **error**-**frame** | **link**-**dither** | **res**-**lack**-**frame** | **crc**-**frame**]

Parameter Description

link-updown: Prints the information when the interface state changes.

error-frame: Prints the information when the interface receives error frames.

link-dither: Prints the information when the interface flaps.

res-lack-frame: Prints the information when the interface drops the received frames due to insufficient resources.

crc-frame: Prints the notification displayed when the interface receives cyclic redundancy check (CRC) error packets.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can decide whether to enable interface information printing. The function is enabled by default. Notifications displayed when the interface state changes, the interface receives an error frame or flaps, the interface drops the received frame due to insufficient resources, and the interface receives a CRC error packet will be printed. The notifications will not be printed after you run the **no logging** [**link**-**updown** | **error**-**frame** | **link**-**dither** | **res**-**lack**-**frame** | **crc**-**frame**] command.

Examples

The following example prints the interface state change information.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# logging link-updown
```

Notifications

When the interface state changes, the following notification will be displayed:

```
%LINK-UPDOWN: Interface GigabitEthernet 0/0, changed state to up.
%LINEPROTO-UPDOWN: Line protocol on Interface GigabitEthernet 0/0, changed state to
up.
```

When the interface receives error frames, the following notification will be displayed:

```
%PORT-ERR_FRAME: Received error frames on interface GigabitEthernet 0/0. Please check
the physical link.
```

When the interface flaps, the following notification will be displayed:

```
%LINK-DITHER: The state of Interface GigabitEthernet 0/1 is astable. Please check the physical link.
%LINK-DITHER: The state of interface GigabitEthernet 0/1 is astable and the interface will be shutdown.Please check the physical link
```

When the interface drops the received frames due to insufficient resources, the following notification will be displayed:

```
% PORT-DROP_FRAME: No more ingress buffer frames has been detected on interface GigabitEthernet 0/1. (no buffer frames: 10)
```

When the interface receives CRC error packets, the following notification will be displayed:

```
%PORT-CRC_FRAME: Detected CRC alignment errors on interface TenGigabitEthernet 1/0/7. (crc frames: 15)
```

Common Errors

1.19 mtu

Function

Run the **mtu** command to configure the maximum transmission unit (MTU) of an interface.

By default, the MTU of an interface is 1500 bytes.

Syntax

mtu *mtu-value*

Parameter Description

mtu-value: MTU value, in bytes. The value range is related to the interface type, for example, the MTU value of a 1000 Mb port ranges from 64 to 9216.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the MTU of an interface, that is, the maximum length of a data frame at the link layer.

When the interface is configured with the default MTU, it will also be displayed using the **show run** command. After being configured, the valid MTU of the interface does not change with the MTU configuration of the system.

The set MTU may affect the throughput and delay of the network. Moreover, the set MTU generally depends on the service application and bandwidth size. If multiple services are used in a mixed manner, one service, for example, voice transmission, may impose a high requirement on real-time performance and features a small data length, while another service, for example, FTP data transmission, has no requirement on real-time performance but features a large data length, which occupies more bandwidth resources. In this case, setting a smaller MTU is conducive to the average allocation of bandwidth among different service data.

This command will cause a problem to the RSR30 series products. The on-board Gigabit Ethernet interface of the RSR30 series products does not count the data not exceeding 1518 bytes as super long frames. Therefore, when the configured MTU value is less than 1518 bytes, the interface cannot count the Ethernet frame of the Ethernet packet with a length greater than that of MTU but less than 1518 bytes as a super long frame (the interface packet on the CLI command line is counted as giant type).

Examples

The following example sets the MTU of the interface GigabitEthernet 0/1 to 9000.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# mtu 9000
```

1.20 mtu forwarding

Function

Run the **mtu forwarding** command to configure the forwarding plane MTU.

The default value of the forwarding plane MTU is 1500 bytes.

Syntax

mtu forwarding *number*

Parameter Description

number: Forwarding plane MTU, in bytes. The value range is from 64 to 9216.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command only takes effect on all the physical ports.

After the command is configured, the protocol plane MTU will be inconsistent with the forwarding plane MTU, which may cause problems such as flow interruption and protocol exception in some scenarios. For example, in the IPv6 scenario, if the global **mtu forwarding** configuration is smaller than the default MTU configured for the interface, the IPv6 packet cannot be sent and received normally, and the network will be interrupted. You are advised to use the **system mtu** command instead of this command unless there are special scenario requirements.

Examples

The following example sets the forwarding plane MTU to 9000.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mtu forwarding 9000
```

1.21 negotiation mode

Function

Run the **negotiation mode** command to configure the interface auto negotiation mode.

Run the **no** form of this command to restore the default configuration.

The auto negotiation mode is disabled by default.

Syntax

negotiation mode { **on** | **off** }

no negotiation mode

Parameter Description

on: Enables the auto negotiation mode.

off: Disables the auto negotiation mode.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The auto negotiation state of an interface is not completely equivalent to the auto negotiation mode. The auto negotiation state of an interface is jointly determined by the interface rate, duplex mode, flow control mode, and auto negotiation mode.

Examples

The following example enables the auto negotiation mode for the interface GigabitEthernet 1/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# negotiation mode on
```

1.22 physical-port dither protect

Function

Run the **physical**-**port dither protect** command to configure port flapping protection.

Run the **no** form of this command to disable port flapping protection.

The port flapping protection function is enabled by default.

Syntax

physical-**port dither protect**

no physical-port dither protect

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can decide whether to enable the flapping protection function for the port link. The flapping protection function is enabled by default, that is, the **physical-port dither protect** command is configured. When the port flaps for more than the specified times, the port is shut down for port protection. After the **no physical-port dither protect** command is configured, only the notification is displayed, and the port will not be shut down.

The command detects flapping every 2s or 10s. If it is detected that the port flaps six times within 2s, the system displays a notification. The port is shut down after the notification is displayed for consecutive ten times (that is, port flapping is detected continuously within 20s). If flapping is detected every 10s and flapping occurs for more than consecutive ten times, a notification is displayed but the port is not shut down.

Examples

The following example disables the port flapping protection function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no physical-port dither protect
```

Notifications

When it is detected that the port flaps six times every 2s or flaps ten times within 10s, the following notification will be displayed:

```
%LINK-DITHER: The state of Interface GigabitEthernet 0/1 is astable. Please check the physical link.
```

When the port flaps ten times within 20s and the last flapping occurs, the following notification will be displayed:

```
%LINK-DITHER: The state of interface GigabitEthernet 0/1 is astable and the interface will be shutdown.Please check the physical link.
```

1.23 port speed-mode

Function

Run the **port speed-mode** command to configure the working rate mode of the 25 Gbps port.

The port works in 25 Gbps rate mode by default.

Syntax

port speed-mode { **25G** | **10G** }

Parameter Description

25G: Indicates that the 25 Gbps port works in the 25 Gbps rate mode.

10G: Indicates that the 25 Gbps port works in the 10 Gbps rate mode.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Only the 25 Gbps port supports this command. The four consecutive 25 Gbps ports in the same slot need to be configured to work in the same rate mode.

Only the 25 Gbps ports with the same rate mode are allowed to join the same aggregation group.

Running the **default interface** command does not clear the port speed-mode configuration on the 25 Gbps port.

Examples

The following example sets the rate mode of the interface TFGigabitEthernet 0/1 to 10 Gbps.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface TFGigabitEthernet 0/1
Hostname(config-if-TFGigabitEthernet 0/1)# port speed-mode 10G
```

1.25 show interfaces

Function

Run the **show interfaces** command to view the details of an interface.

Syntax

show interfaces [*interface-type interface-number*] [**description** [**up** | **down**] | **switchport** | **trunk**]

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the details of all interfaces are displayed.

description: Interface description, including the link status.

up: Displays the statistics of the interface in **Up** state.

down: Displays the statistics of the interface in **Down** state.

switchport: L2 interface information. This parameter is effective only for a L2 interface.

trunk: Trunk port information. This parameter is effective for a physical port or an AP.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command without any parameter can be used to display the basic interface information.

The support to parameters varies for the L2 and L3 interfaces. The actual support conditions of specific interfaces prevail.

Examples

The following example displays the interface information of GigabitEthernet 0/1 in trunk mode.

```
Hostname> enable
Hostname# show interfaces GigabitEthernet 0/1
Index(dec):1 (hex):1
GigabitEthernet 0/1 is DOWN, line protocol is DOWN
  Hardware is Broadcom 5464 GigabitEthernet, address is 00d0.f865.de9b (bia
00d0.f865.de9b)
  Interface address is: no ip address
  Interface IPv6 address is:
    No IPv6 address
  MTU 1500 bytes, BW 1000000 Kbit
  Encapsulation protocol is Ethernet-II, loopback not set
  Keepalive interval is 10 sec , set
  Carrier delay is 2 sec
  Ethernet attributes:
    Last link state change time: 2012-12-22 14:00:48
    Time duration since last link state change: 3 days, 2 hours, 50 minutes, 50 seconds
    Priority is 0
    Medium-type is Copper
    Admin duplex mode is AUTO, oper duplex is Unknown
```

```
  Admin speed is AUTO, oper speed is Unknown
  Flow receive control admin status is OFF,flow send control admin status is OFF
  Flow receive control oper status is Unknown,flow send control oper status is Unknown
  Storm Control: Broadcast is OFF, Multicast is OFF, Unicast is OFF
Bridge attributes:
  Port-type: trunk
  Native vlan:1
  Allowed vlan lists:1-4094
  Active vlan lists:1, 3-4
Queueing strategy: FIFO
  Output queue 0/0, 0 drops;
  Input queue 0/75, 0 drops
Rxload is 1/255,Txload is 1/255
5 minutes input rate 0 bits/sec, 0 packets/sec
5 minutes output rate 0 bits/sec, 0 packets/sec
  0 packets input, 0 bytes, 0 no buffer, 0 dropped
  Received 0 broadcasts, 0 runts, 0 giants
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 abort
  0 packets output, 0 bytes, 0 underruns , 0 dropped
  0 output errors, 0 collisions, 0 interface resets
```

Table 1-1 Output Fields of the show interface Command

Field	Description
Index	Indicates the interface index information, including the decimal and hexadecimal formats.
GigabitEthernet/line protocol	Indicates the interface link status/protocol status information.
Hardware	Indicates the interface hardware type.
address	Indicates the MAC address of the interface.
Interface address	Indicates the IP address of the interface.
ARP type	Indicates the ARP type.
ARP Timeout	Indicates the ARP timeout.
Interface IPv6 address	Indicates the IPv6 address of the interface.
MTU	Indicates the MTU of the interface.
BW	Indicates the interface bandwidth.
Encapsulation protocol	Indicates the interface encapsulation protocol.
loopback	Indicates whether loopback is set for the interface.
Keepalive interval	Indicates the keepalive packet sending interval of the interface.

Field	Description
Carrier delay	Indicates the carrier delay of the interface, in seconds.
Medium-type	Indicates the interface medium type.
Last link state change time	Indicates the time when the interface is up/down last time.
Time duration since last link state change	Indicates the duration of the interface status.
Priority	Indicates the interface priority.
Admin duplex mode/oper duplex	Indicates the duplex mode/operational duplex status of the interface.
Admin speed/oper speed	Indicates the rate mode/operational rate status of the interface.
Flow control admin/oper status	Indicates the flow control mode/operational flow control status of the interface.
Queuing strategy	Indicates the queuing strategy of the interface.
Output/Input/drops	Indicates the quantities of packets received/sent/dropped by the interface.
Rxload/Txload	Indicates the load rate of packets received/sent by the interface.
5 minutes input rate bit/sec packets/sec	Indicates the packet receiving rate of the interface, in bits/sec and packets/sec.
5 minutes output rate bit/sec packets/sec	Indicates the packet sending rate of the interface, in bits/sec and packets/sec.
packets input, bytes, no buffer	Indicates the statistics of the packets received by the interface and the error packets.
Received broadcasts, runts, giants	Indicates the statistics of the broadcast/multicast packets received by the interface, small packets dropped, and large packets dropped.
input errors, CRC, frame, overrun, abort	Indicates the statistics of packet receiving errors of the interface.
packets output, bytes, underruns	Indicates the statistics of packets sent by the interface, and processing failures due to fast transmission.
output errors, collisions, interface resets	Indicates the statistics of packet sending errors of the interface, retransmission times due to collisions, and interface resetting times.

The following example displays the interface information of GigabitEthernet 0/1 in access mode.

```
Hostname> enable
```

```
Hostname# show interfaces GigabitEthernet 0/1
Index(dec):1 (hex):1
GigabitEthernet 0/1 is DOWN, line protocol is DOWN
  Hardware is Broadcom 5464 GigabitEthernet, address is 00d0.f865.de9b (bia
00d0.f865.de9b)
  Interface address is: no ip address
  Interface IPv6 address is:
    No IPv6 address
  MTU 1500 bytes, BW 1000000 Kbit
  Encapsulation protocol is Ethernet-II, loopback not set
  Keepalive interval is 10 sec , set
  Carrier delay is 2 sec
  Ethernet attributes:
    Last link state change time: 2012-12-22 14:00:48
    Time duration since last link state change: 3 days, 2 hours, 50 minutes, 50 seconds
    Lastchange time:0 Day: 0 Hour: 0 Minute:13 Second
    Priority is 0
    Medium-type is Copper
    Admin duplex mode is AUTO, oper duplex is Unknown
    Admin speed is AUTO, oper speed is Unknown
    Flow receive control admin status is OFF,flow send control admin status is OFF
    Flow receive control oper status is Unknown,flow send control oper status is Unknown
    Storm Control: Broadcast is OFF, Multicast is OFF, Unicast is OFF
  Bridge attributes:
    Port-type: access
    Vlan id : 2
  Queueing strategy: FIFO
    Output queue 0/0, 0 drops;
    Input queue 0/75, 0 drops
  Rxload is 1/255, Txload is 1/255
  5 minutes input rate 0 bits/sec, 0 packets/sec
  5 minutes output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer, 0 dropped
    Received 0 broadcasts, 0 runts, 0 giants
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 abort
    0 packets output, 0 bytes, 0 underruns , 0 dropped
    0 output errors, 0 collisions, 0 interface resets
```

The following example displays the interface information of GigabitEthernet 0/1 in hybrid mode.

```
Hostname> enable
Hostname# show interfaces GigabitEthernet 0/1
Index(dec):1 (hex):1
GigabitEthernet 0/1 is DOWN, line protocol is DOWN
  Hardware is Broadcom 5464 GigabitEthernet
  Interface address is: no ip address
  Interface IPv6 address is:
    No IPv6 address
```

```
 MTU 1500 bytes, BW 1000000 Kbit
 Encapsulation protocol is Ethernet-II, loopback not set
 Keepalive interval is 10 sec , set
 Carrier delay is 2 sec
 Ethernet attributes:
   Last link state change time: 2012-12-22 14:00:48
   Time duration since last link state change: 3 days, 2 hours, 50 minutes, 50 seconds
   Lastchange time:0 Day: 0 Hour: 0 Minute:13 Second
   Priority is 0
   Medium-type is Copper

   Flow receive control admin status is OFF,flow send control admin status is OFF
   Flow receive control oper status is Unknown,flow send control oper status is Unknown
   Storm Control: Broadcast is OFF, Multicast is OFF, Unicast is OFF
 Bridge attributes:
   Port-type: hybrid
   Tagged vlan id:2
   Untagged vlan id:none
 Queueing strategy: FIFO
   Output queue 0/0, 0 drops;
   Input queue 0/75, 0 drops
 Rxload is 1/255 ,Txload is 1/255
 5 minutes input rate 0 bits/sec, 0 packets/sec
 5 minutes output rate 0 bits/sec, 0 packets/sec
   0 packets input, 0 bytes, 0 no buffer, 0 dropped
   Received 0 broadcasts, 0 runts, 0 giants
   0 input errors, 0 CRC, 0 frame, 0 overrun, 0 abort
   0 packets output, 0 bytes, 0 underruns , 0 dropped
   0 output errors, 0 collisions, 0 interface resets
```

The following example displays the L2 information of the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interfaces GigabitEthernet 0/1 switchport
Interface              Switchport Mode     Access Native Protected VLAN lists
GigabitEthernet 0/1     enabled    ACCESS    2     1     Disabled  ALL
```

Figure 1-1 Output Fields of the show interface switchport Command

Field	Description
Interface	Indicates the interface name.
Switchport Mode	Indicates whether the switching mode is set.
Access	Indicates that the VLAN is accessed
Native	Indicates the native VLAN.

Protected	Indicates whether interface protection is enabled.
VLAN lists	Indicates the VLAN list.

1.26 show interfaces counters

Function

Run the **show interfaces counters** command to view the statistics of packets received and sent by an interface.

Syntax

show interfaces [*interface-type interface-number*] **counters** [**increment** | **errors** | **rate** | **summary**] [**up** | **down**] [**nozero**]

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the statistics of all interfaces are displayed.

increment: Displays the statistics of packets added in the previous sampling interval.

errors: Displays the statistics of error packets.

drops: Displays the statistics of dropped packets.

rate: Displays the packet sending/receiving rate of the interface.

summary: Displays a summary of interface packets.

up: Displays the statistics of the interface in **Up** state.

down: Displays the statistics of the interface in **Down** state.

nozero: Displays the statistics of the interface with some statistical values of interface packet quantity not equal to 0.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface name is specified, the packet statistics of all the interfaces are displayed.

Examples

The following example displays the statistics of the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interfaces GigabitEthernet 0/1 counters
Interface : GigabitEthernet 0/1
5 minute input rate: 9144 bits/sec, 9 packets/sec
5 minute output rate: 1280 bits/sec, 1 packets/sec
Rxload             : 1%
InOctets           : 17310045
InPkts             : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)
InUcastPkts         : 100
InMulticastPkts     : 100
InBroadcastPkts     : 800
Txload             : 1%
OutOctets          : 1282535
OutPkts            : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)
OutUcastPkts        : 100
OutMulticastPkts    : 100
OutBroadcastPkts    : 800
Undersize packets   : 0
Oversize packets    : 0
collisions         : 0
Fragments          : 0
Jabbers            : 0
CRC alignment errors : 0
AlignmentErrors     : 0
FCSErrors          : 0
dropped packet events (due to lack of resources): 0
packets received of length (in octets):
  64:46264
  65-127: 47427
  128-255: 3478
  256-511: 658
  512-1023: 18016
  1024-1518: 125
Packet increment in last sampling interval(5 seconds):
  InOctets           : 10000
  InPkts             : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)

```

```
OutUcastPkts        : 100
OutMulticastPkts    : 100
```

Table 1-2 Output Fields of the show interfaces counters Command

Field	Description
Interface	Indicates the interface name.
5 minute input rate: bits/sec, packets/sec	Indicates the interface packet receiving rate.
5 minute output rate: bits/sec, packets/sec	Indicates the interface packet sending rate.
Rxload	Indicates the receiving bandwidth usage.
InOctets	Indicates the number of bytes in received packets.
InPkts	Indicates the sum of the received unicast, multicast, and broadcast packets. The percentages of unicast, multicast, and broadcast packets are in the brackets.
InUcastPkts	Indicates the number of unicast packets received by the interface.
InMulticastPkts	Indicates the number of multicast packets received by the interface.
InBroadcastPkts	Indicates the number of broadcast packets received by the interface.
Txload	Indicates the transmission bandwidth usage.
OutOctets	Indicates the number of bytes of total packets sent by the interface.
OutPkts	Indicates the sum of the sent unicast, multicast, and broadcast packets. The percentages of unicast, multicast, and broadcast packets are in the brackets.
OutUcastPkts	Indicates the number of unicast packets sent by the interface.
OutMulticastPkts	Indicates the number of multicast packets sent by the interface.
OutBroadcastPkts	Indicates the number of broadcast packets sent by the interface.
Undersize packets	Indicates the number of packets in the correct format and with a length less than 64 bytes.
Oversize packets	Indicates the number of packets in the correct format and with a length greater than the actually configured MTU value.
collisions	Indicates the number of packets in collision during transmission.
Fragments	Indicates the number of packets with a length less than 64 bytes and with CRC or alignment errors.

Field	Description
Jabbers	Indicates the number of packets with a length greater than 1518 bytes and with CRC or alignment errors.
CRC alignment errors	Indicates the number of received packets with CRC errors.
AlignmentErrors	Indicates the number of received packets with alignment errors.
FCSErrors	Indicates the number of received packets with FCS errors.
dropped packet events	Indicates the number of packet loss events of the interface.
packets received of length	Indicates the length of the received packets.
Packet increment in last sampling interval(5 seconds)	Indicates the incremental statistics of the packets in the previous sampling interval (5 seconds).
InOctets	Indicates the number of received bytes.
InPkts	Indicates the number of received packets.
InUcastPkts	Indicates the number of received unicast packets.
InMulticastPkts	Indicates the number of received multicast packets.
InBroadcastPkts	Indicates the number of received broadcast packets.
OutOctets	Indicates the number of sent bytes.
OutPkts	Indicates the number of sent packets.
OutUcastPkts	Indicates the number of sent unicast packets.
OutMulticastPkts	Indicates the number of sent multicast packets.

The following example displays the incremental statistics of the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interfaces GigabitEthernet 0/1 counters increment
Interface : GigabitEthernet 0/1
Packet increment in last sampling interval(5 seconds):
  InOctets           : 10000
  InPkts             : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)
  InUcastPkts         : 100
  InMulticastPkts     : 100
  InBroadcastPkts     : 800
  OutOctets          : 10000
  OutPkts            : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)
  OutUcastPkts        : 100
  OutMulticastPkts    : 100
```

The following example displays the statistics of the error packets on the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interfaces GigabitEthernet 0/1 counters errors
Interface    UnderSize          OverSize           Collisions         Fragments
Gi0/1       0                 0                 0                 0
Interface    Jabbers            CRC-Align-Err       Align-Err          FCS-Err
Gi0/1       0                 0                 0                 0
```

The following example displays the packet sending/receiving rate information on the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interface gigabitEthernet 0/1 counters rate
Interface    Sampling Time        Input Rate          Input Rate          Output Rate
Output Rate
                              (bits/sec)          (packets/sec)       (bits/sec)
(packets/sec)
---- ------- ----------------------------
Gi0/1       5 seconds           23391              23                124
0
```

The following example displays the summary of the packets on the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interface gigabitEthernet 0/1 counters summary
Interface     InOctets           InUcastPkts         InMulticastPkts
InBroadcastPkts
Gi0/1        1475788005         1389               45880503           11886621
Interface     OutOctets          OutUcastPkts        OutMulticastPkts
OutBroadcastPkts
Gi0/1        6667915            6382               31629              13410
```

The following example displays the statistics of the dropped packets on the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interface gigabitEthernet 0/1 counters drops
Interface : GigabitEthernet 0/1
 Input dropped packets                : 2453
 Input no buffer packets              : 0
 Input qos dropped packets            : 0
 Output dropped packets               : 0
 Output no buffer packets             : 0
 Forwarding entry dropped packets       : 2453
```

Table 1-3 Output Fields of the show interfaces counters drops Command

Field	Description
Input dropped	Indicates the number of received packets that are dropped, excluding the packets dropped due to QoS restrictions or insufficient resources.
Input no buffer	Indicates the number of received packets that are dropped due to insufficient resources.

Field	Description
Input qos dropped	Indicates the number of received packets that are dropped due to QoS receiving restrictions.
Output dropped packets	Indicates the number of packets dropped during transmission.
Output no buffer	Indicates the number of packets that cannot be sent successfully due to lack of resources.
Forwarding entry dropped	Indicates the total number of packets dropped during forwarding, including packets dropped at the ingress and egress. Some products may not support this field. The calculation formula is: Number of packets dropped at the ingress + Number of packets dropped at the egress - Number of no buffer packets at the ingress - Number of no buffer packets at the egress - Number of CRC error packets

1.27 show interfaces counters rate physical-layer

Function

Run the **show interfaces counters rate physical-layer** command to view the packet receiving and sending rate information of an interface at the physical layer.

Syntax

show interfaces [*interface-type interface-number*] **counters rate physical-layer** [**up** | **down**] [**nozero**]

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the statistics of all interfaces are displayed.

up: Displays the statistics of the interface in **Up** state.

down: Displays the statistics of the interface in **Down** state.

nozero: Displays the statistics of the interface with some statistical values not equal to 0.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface name is specified, the packet sending and receiving rate information of all the interfaces at the physical layer are displayed.

Examples

The following example displays the packet sending and receiving rate information of the interface GigabitEthernet 0/1 at the physical layer.

```
Hostname> enable
Hostname# show interface GigabitEthernet 0/1 counters rate physical-layer
Interface    Sampling Time        Input Rate          Input Rate          Output Rate
Output Rate
                              (bits/sec)          (packets/sec)       (bits/sec)
(packets/sec)
Te0/1       5 seconds           655557576             301267            655557132
```

Table 1-4 Output Fields of the show interface usage Command

Field	Description
Interface	Indicates the interface name.
Sampling Time	Specifies the interface packet sampling time.
Input Rate(bits/sec)	Specifies the physical layer packet receiving rate of the interface.
Input Rate(packets/sec)	Specifies the physical layer packet receiving rate of the interface.
Output Rate(bits/sec)	Specifies the physical layer packet sending rate of the interface.
Output Rate(packets/sec)	Specifies the physical layer packet sending rate of the interface.

1.28 show interfaces link-state-change statistics

Function

Run the **show interfaces link-state-change statistics** command to view the change time and count of the interface link state.

Syntax

show interfaces [*interface-type interface-number*] **link-state-change statistics**

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the details of all interfaces are displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface name is specified, the link state change information of all the interfaces are displayed.

Examples

The following example displays the link state change information of an interface.

```
Hostname> enable
Hostname# show int link-state-change statistics
Interface   Link state  Link state change times   Last change time    Link-dither
begin   Link-dither end
---- ------------ -------  -------  -----
Te0/1       down       0     2018-05-05 11:07:45  none              none
```

Table 1-5 Output Fields of show int link-state-change statistics Command

Field	Description
Interface	Indicates the interface name.
Link state	Indicates the current link state of the interface.
Link state change times	Indicates the link state change times of the interface. You can run the **clear link-state-change statistics** *interface-type interface-number* command to clear it.
Last change time	Indicates the last link state change time of the interface.

Field	Description
Link-dither begin	Indicates the start time of the last detected frequent link flapping. The value **none** indicates that no frequent link flapping occurs.
Link-dither end	Indicates the end time of the last detected frequent link flapping. The value **none** indicates that no frequent link flapping occurs. Condition of frequent link flapping: the link of the port flaps six times in 2s (the same as the condition of port flapping protection). After frequent port flapping (six times in 2s) is detected, the detection time is recorded as the start time of frequent flapping (**Link-dither begin**), and the detection continues in 2s. If no frequent port flapping is detected in 2s, or after the port is shut down by flapping protection, the detection time is recorded as the end time of frequent flapping (**Link-dither end**).

1.29 show interfaces mtu forwarding

Function

Run the **show interfaces mtu forwarding** command to view information about the forwarding plane MTU.

Syntax

show interfaces [*interface-type interface-number*] **mtu forwarding**

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the statistics of all interfaces are displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface name is specified, the state information of all the interfaces are displayed.

The IP MTU of L2 interface is displayed as **NA**.

Examples

The following example displays the information about the forwarding plane MTU of the interface GigabitEthernet 1/1/1.

```
Hostname> enable
Hostname# show interface GigabitEthernet 0/1 mtu forwarding
Interface                   Mtu    IP Mtu
GigabitEthernet 0/1         1500   NA
```

Table 1-6 Output Fields of the show interface mtu forwarding Command

Field	Description
Interface	Indicates the interface name.
Mtu	Indicates the MTU of the interface.
IP Mtu	For the forwarding plane MTU of the interface, the IP MTU of L2 interface is displayed as **NA**.

1.30 show interfaces status

Function

Run the **show interfaces status** command to view the status information of an interface.

Syntax

show interfaces [*interface-type interface-number*] **status**

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the details of all interfaces are displayed.

status: Displays status information of the interface, including the rate and duplex mode.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface name is specified, the state information of all the interfaces is displayed.

Examples

The following example displays the status information of the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interfaces GigabitEthernet 0/1 status
Interface                          Status    Vlan   Duplex   Speed     Type
---------------------------------------- --------  ----   -------  ---------- ------
GigabitEthernet 0/1                  up       1     Full     1000M     copper
```

Table 1-7 Output Fields of the show interface status Command

Field	Description
Interface	Indicates the interface name.
Status	Indicates the interface link status.
Vlan	Indicates the VLAN ID of the interface.
Duplex	Indicates the duplex mode.
Speed	Indicates the interface rate.
Type	Indicates the interface medium type.

1.31 show interfaces status err-disabled

Function

Run the **show interfaces status err-disabled** command to view the errdisable status information of an interface.

Syntax

show interfaces [*interface-type interface-number*] **status err-disabled**

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the statistics of all interfaces are displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface name is specified, the port errdisable status information of all the interfaces is displayed.

Examples

The following example displays the port errdisable status information of the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show interface gigabitEthernet 0/1 status err-disabled
Interface                      Status          Reason
GigabitEthernet 0/1            err-disabled    BPDU Guard
```

Table 1-8 Output Fields of the show interface status err-disabled Command

Field	Description
Interface	Indicates the interface name.
Status	Indicates the errdisable status; **err-disable** is displayed in the case of a violation; otherwise no content is displayed.
Reason	Indicates the reason for the violation; no content is displayed if there is no violation.

1.32 show interfaces transceiver

Function

Run the **show interfaces transceiver** command to view the optical module information of an interface.

Syntax

show interfaces [*interface-type interface-number*] **transceiver** [**alarm** | **diagnosis**]

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the details of all interfaces are displayed.

transceiver: Displays the basic information of the optical module.

alarm: Displays the current fault alarms of the optical module. If no fault occurs, **None** is displayed.

diagnosis: Displays the current measurement value of the diagnostic parameter of the optical module.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command without any parameter can be used to display the optical module information of all the interfaces.

Examples

The following example displays the optical module information of the 10 Gigabit interface tenGigabitEthernet 0/49.

```
Hostname> enable
Hostname# show interfaces tenGigabitEthernet 0/49 transceiver
Transceiver Type    :  10GBASE-SR-SFP+
Connector Type      :  LC
Wavelength(nm)      :  850
Transfer Distance   :
   50/125 um OM2 fiber
      -- 300m
   62.5/125 um OM1 fiber
      -- 300m
Digital Diagnostic Monitoring  : YES
Vendor Serial Number          : M1102232386

Current diagnostic parameters[AP:Average Power]:
Temp(Celsius)   Voltage(V)      Bias(mA)           RX power(dBm)       TX power(dBm)
43(OK)          3.27(OK)        6.24(OK)           -3.92(OK)[AP]       -1.90(OK)

Transceiver current alarm information:
None
```

Table 1-9 Output Fields of the show interface transceiver Command

Field	Description
Transceiver Type	Indicates the type of the transmit end.
Connector Type	Indicates the type of the connector.
Wavelength(nm)	Indicates the optical wavelength.
Digital Diagnostic Monitoring	Indicates self-diagnosis monitoring.
Vendor Serial Number	Indicates serial number of the vendor.

The following example displays the current fault alarms of the optical module of the 10 Gigabit interface tenGigabitEthernet 0/49.

```
Hostname> enable
Hostname# show interfaces tenGigabitEthernet 0/49 transceiver alarm
tengigabitEthernet 0/49 transceiver current alarm information:
RX loss of signal
```

Table 1-10 Output Fields of the show interface transceiver alarm Command

Field	Description
RX loss	Indicates loss of received packets.

The following example displays the current measurement value of the diagnostic parameter of the optical module for the 10 Gigabit interface tenGigabitethernet 0/49.

```
Hostname> enable
Hostname# show interfaces tenGigabitEthernet 0/49 transceiver diagnosis
Current diagnostic parameters[AP:Average Power]:
Temp(Celsius)   Voltage(V)     Bias(mA)          RX power(dBm)      TX power(dBm)
38(OK)         3.20(OK)       0.04(OK)          -40.00(alarm)[AP]  -40.00(alarm)
```

Table 1-11 Output Fields of the show interface transceiver diagnosis Command

Field	Description
Temp(Celsius)	Indicates the temperature.
Voltage(V)	Indicates the voltage.
Bias(mA)	Indicates the current.
RX power(dBm)	Indicates the receive power.
TX power(dBm)	Indicates the transmit power.

1.33 show interfaces usage

Function

Run the **show interfaces usage** command to view the bandwidth usage of an interface.

Syntax

show interfaces [*interface-type interface-number*] **usage** [**up** | **down**]

Parameter Description

interface-type interface-number: Type and number of the interface. If the interface type and number are not specified, the statistics of all interfaces are displayed.

up: Displays the bandwidth usage of the interface in **Up** state.

down: Displays the bandwidth usage of the interface in **Down** state.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface name is specified, the bandwidth usage information of all the interfaces is displayed. The bandwidth here refers to the actual link bandwidth rather than the configured bandwidth value on the interface.

The support to parameters varies for the L2 and L3 interfaces. The actual support conditions of specific interfaces prevail.

Examples

The following example displays the bandwidth usage information of the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Interface                Bandwidth    Average Usage     Output Usage    Input
Usage
GigabitEthernet 0/0        1000 Mbit    0.002822759%      0.001183280%
0.004462237%
```

Table 1-12 Output Fields of the show interface usage Command

Field	Description
Interface	Indicates the interface name.
Bandwidth	Indicates the bandwidth of the interface link, that is, the maximum rate of the link.
Average Usage	Indicates the current bandwidth usage.
Input Usage	Indicates the receiving bandwidth usage.
Output Usage	Indicates the transmission bandwidth usage.

1.34 show mgmt virtual

Function

Run the **show mgmt virtual** command to view the information of the virtual management port.

Syntax

show mgmt virtual

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the information of the virtual management port.

```
Hostname> enable
```

```
Hostname# show mgmt virtual
Mgmt 0
Virtual MGMT Member:
   1/M1/MGMT0: Active
```

Table 1-13 Output Fields of the show mgmt virtual Command

Field	Description
Virtual MGMT Member	Indicates the members of the management port.
1/M1/MGMT0	Indicates the management port 0.
Active	Indicates the active status of the management port.

1.35 show split summary

Function

Run the **show split summary** command to view the splitting/combining information of an interface.

Syntax

show split summary

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

You can run this command to view the splitting/combining information of all the splittable interfaces.

Examples

The following example displays the splitting/combining information of an interface.

```
Hostname> enable
```

```
Hostname# show split summary
Port         SpliteStatus SplitPorts
Hu1/1        merged      Hu1/1:1    Hu1/1:2    Hu1/1:3    Hu1/1:4
Hu1/2        merged      Hu1/2:1    Hu1/2:2    Hu1/2:3    Hu1/2:4
Hu1/3        merged      Hu1/3:1    Hu1/3:2    Hu1/3:3    Hu1/3:4
Hu1/4        merged      Hu1/4:1    Hu1/4:2    Hu1/4:3    Hu1/4:4
Hu1/5        merged      Hu1/5:1    Hu1/5:2    Hu1/5:3    Hu1/5:4
Hu1/6        merged      Hu1/6:1    Hu1/6:2    Hu1/6:3    Hu1/6:4
Hu1/7        merged      Hu1/7:1    Hu1/7:2    Hu1/7:3    Hu1/7:4
Hu1/8        merged      Hu1/8:1    Hu1/8:2    Hu1/8:3    Hu1/8:4
Hu3/25       merged      Hu3/25:1   Hu3/25:2   Hu3/25:3   Hu3/25:4
Hu3/26       merged      Hu3/26:1   Hu3/26:2   Hu3/26:3   Hu3/26:4
```

Table 1-14 Output Fields of the show split summary Command

Field	Description
Port	Indicates the main interface splittable.
SpliteStatus	Indicates the current splitting/combining status.
SplitPorts	Indicates the member interfaces after the splittable interface is split.

1.36 shutdown

Function

Run the **shutdown** command to shut down a specific interface.

Run the **no** form of this command to enable the interface.

The interface is in **Up** state by default.

Syntax

shutdown

no shutdown

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

You can run the command to shut down interfaces (including Ethernet ports, APs, and SVIs). Other configurations of the interfaces still exists, but does not work. You can run the **show interfaces** command to view the interface status.

Running this command on an interface means disabling the interface. On the synchronous serial interface, the DTR and RTS will be directly set to invalid. If the external modem is provided with a DTR or RTS signal indicator, the indicator will be turned off. The indicator at the synchronous interface of the device will also go out.

Note

To prevent unwanted link flapping caused by frequent operation of the **shutdown/no shutdown** command, there should be a certain time interval (which must be greater than the carrier delay of the interface) before/after configuring the **shutdown**/**no shutdown** command twice on an interface.

Examples

The following example shuts down the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# shutdown
```

1.37 snmp trap link-status

Function

Run the **snmp trap link-status** command to enable the LinkTrap notification sending function for interface status change.

Run the **no** form of this command to restore the default configuration.

The LinkTrap notification sending function for interface status changes is enabled by default.

Syntax

snmp trap link-status

no snmp trap link-status

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

You can run the command to configure the link trap sending function for the interfaces (including Ethernet ports, APs, and SVIs). When the function is enabled, the SNMP module sends link traps if the link status changes on the interface.

Examples

The following example disables the LinkTrap notification sending function on the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no snmp trap link-status
```

1.38 snmp-server if-index persist

Function

Run the **snmp-server if-index persist** command to enable the interface index persistence function.

The interface index persistence function is disabled by default.

Syntax

snmp-server if-index persist

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After the **snmp-server if-index persist** command is executed, the indexes of all the current interfaces are saved during configuration saving, and the indexes remain unchanged after the device is restarted.

Examples

The following example enables the interface index persistence function. In other words, the interface index remains unchanged after the device is restarted.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# snmp-server if-index persist
```

1.39 speed

Function

Run the **speed** command to configure the rate of an interface.

Run the **no** form of this command to restore the default configuration.

The interface rate is adaptive by default.

Syntax

speed [**10** | **100** | **1000** | **10G** | **40G** | **auto**]

no speed

Parameter Description

10: The interface rate of 10 Mbps.

100: The interface rate of 100 Mbps.

1000: The interface rate of 1000 Mbps.

10G: The interface rate of 10 Gbps.

40G: The interface rate of 40 Gbps.

Auto: Indicates that the rate of the interface is adaptive.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If an interface is an AP member port, the rate of this interface is determined by the rate of the AP. When the interface exits the AP, it uses its own rate configuration. You can run the **show interfaces** command to view the rate configuration. The rate options available to an interface vary with the type of the interface. For example, you cannot set the rate of a small form-factor pluggable (SFP) interface to 10 Mbps.

You need to set **duplex** in addition to **speed** when using the interface auto-negotiation function, that is, the duplex mode and 10/100 Mbps rate adaptation. The following table describes usage of the **duplex** and **speed** commands.

Table 1-15 Correspondence between duplex and rate

duplex	speed	Work Mode
Full	10	Forced to work in 10M full duplex mode.
Full	100	Forced to work in 100M full duplex mode.
Half	10	Forced to work in 10M full duplex mode.
Half	100	Forced to work in 100M full duplex mode.
Auto	auto	The Ethernet interface works in adaptive mode.

Examples

The following example sets the rate of the interface GigabitEthernet 0/1 to 100 Mbps.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# speed 100
```

Notifications

1.41 statistics

Function

Run the **statistics** command to enable the interface traffic statistics collection and IP traffic statistics collection functions.

Run the **no** form of this command to disable the interface traffic statistics collection and IP traffic statistics collection functions.

The IP traffic statistics collection function is disabled for all the interfaces by default.

Syntax

statistics { **enable** | **ip enable** }

no statistics { **enable** | **ip enable** }

Parameter Description

enable: Enables the interface traffic statistics collection function.

ip enable: Enables the IP traffic statistics collection function of the interface.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

You can run the **show interface** *port-name* command to view the statistical results, and the **clear counter** command to clear the statistics.

The interface traffic statistics collection and IP traffic statistics collection functions can be enabled for the virtual interfaces such as sub-interfaces and SVIs. The IP traffic statistics collection function can be enabled for the Ethernet interface and Ethernet AP.

Support for interface statistics collection varies with different products. For example, only the IP traffic statistics collection function can be enabled for some products.

The **statistics enable** and **route-sample enable** commands have the same function. The **show running-config** command is used to display all the configurations.

If the **ip-sample enable** command has been configured, when the **statistics enable** command is configured, the configuration made by **ip-sample enable** is automatically cleared first, the interface IP traffic statistics collection function is disabled, and the interface traffic statistics collection function is still enabled.

If the **ip-sample enable** command has been configured, when the **statistics ip enable** command is configured, the configuration made by **ip-sample enable** will be automatically cleared first, the interface traffic statistics collection function is disabled, and the interface IP traffic statistics collection function is still enabled.

Examples

The following example enables the IP traffic statistics collection function for an Ethernet interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# statistics ip enable
```

1.42 switchport

Function

Run the **switchport** command to configure the L2 mode for an interface.

Run the **no** form of this command to configure the L3 mode for an interface.

All the interface are in the L2 mode by default.

Syntax

switchport

no switchport

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command takes effect only for the interfaces associated with physical ports. The **switchport** command shuts down the interface and then restarts it, during which the device sends a message indicating the connection status. If an interface is switched from L2 mode to L3 mode, all the L2 attributes of the interface are deleted.

Examples

The following example configures the L3 mode for the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no switchport
```

Notifications

1.43 switchport protected

Function

Run the **switchport protected** command to configure a port as protected port.

A protected port is not configured for the port by default.

Syntax

switchport protected

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When the ports on the device need to be isolated from each other, these ports can be set as protected ports. In this case, only the L2 communication is blocked, and the L3 route is still accessible. You can run the global command **protected-ports route-deny** to block the L3 route.

Examples

The following example configures the port GigabitEthernet 0/1 as protected port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport protected
```

Notifications

N/A

Common Errors

N/A

Platform Description

This command is not supported on the AP of the CB line card.

Related Commands

N/A

1.44 system mtu

Function

Run the **system mtu** command to configure the MTU of the system.

The MTU of the system is not configured by default.

Syntax

system mtu *mtu-value*

Parameter Description

mtu-value: MTU value, in bytes. The value range is related to the interface type, for example, the value range for a 1000 Mbps port is from 64 to 9216. The default value is 1500.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Configuring the MTU of the system will update the MTU effective values of all the Ethernet interfaces (including the APs) of the system. However, if the interface is configured with an MTU, the MTU configured for the interface will take effect.

Examples

The following example sets the system MTU to 9000.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# system mtu 9000
```

Notifications

1 Aggregate Port Commands

Command	Function
aggregate bfd-detect	Enable the bidirectional forwarding detection (BFD) function of an aggregate port (AP) member port.
aggregateport algorithm mode	Configure the load balancing algorithm mode for all APs.
aggregateport capacity mode	Configure the capacity mode of an AP.
aggregateport load-balance	Configure the global load balancing algorithm of APs or the load balancing algorithm of a specified AP.
aggregateport member linktrap	Enable the LinkTrap notification sending function of member ports of an AP.
aggregateport member minimum	Configure the minimum number of member ports of an AP or the action to be triggered when the number of member ports of an AP is less than the minimum number.
aggregateport primary-port	Configure a member port of an AP as a preferred port.
clear lacp counters	Clear the Link Aggregation Control Protocol (LACP) packet statistics from an LACP AP member port.
debug lacp	Enable the LACP debugging function.
hash-disturb	Configure a load balancing hash disturbance factor.
hash-symmetrical	Configure the load balancing hash synchronization factor.
interface aggregateport	Configure the Ethernet AP or enter the interface configuration mode of Ethernet AP.
ipv4 field	Configure the load balancing mode of IPv4 packets in the specified enhanced load balancing profile.
ipv6 field	Configure the load balancing mode of IPv6 packets in the specified enhanced load balancing profile.
l2 field	Configure the load balancing mode of L2 packets in the specified enhanced load balancing profile.
lacp device	Configure the device ID of LACP.

lacp individual-port enable	Enable the LCAP independent port function.
lacp individual-timeout period	Configure the timeout period of an LACP independent port.
lacp port-priority	Configure the port priority of an LACP AP member port.
lacp short-timeout	Configure the timeout mode of an LACP AP member port to the short timeout mode.
lacp short-timeout period	Configure the timeout period of the LACP system in short timeout mode.
lacp system-id	Configure the LACP system ID.
lacp system-priority	Configure the LACP system priority.
load-balance-profile	Rename the enhanced load balancing profile and enter the enhanced load balancing profile mode.
port-group	Configure an Ethernet physical port as a member port of a static AP.
show aggregateport load-balance	View the global load balancing information of an AP.
show aggregateport summary	Display the configuration of an AP.
show aggregateport capacity	Display the capacity mode and capacity usage of the current AP.
show lacp counters	Display the packet statistics of an LACP AP member port.
show lacp summary	Display the state of an LACP AP.
show load-balance-profile	Display the configuration of the enhanced load balancing mode.

1.1 aggregate bfd-detect

Function

Run the **aggregate bfd-detect** command to enable the bidirectional forwarding detection (BFD) function of an aggregate port (AP) member port.

Run the **no** form of this command to disable the BFD function of an AP member port.

The BFD function of an AP member port is disabled by default.

Syntax

aggregate bfd-detect { **ipv4** *source-ipv4-address destination-ipv4-address* | **ipv6** *source-ipv6-address destination-ipv6-address* }

no aggregate bfd-detect { **ipv4** | **ipv6** }

Parameter Description

ipv4: Enables IPv4 BFD. You can enable IPv4 BFD when the IPv4 address is used on the AP.

Ipv6: Enables IPv6 BFD. You can enable IPv6 BFD when the IPv6 address is used on the AP.

source-ipv4-address: Source IPv4 address, that is, the IP address configured on the AP.

destination-ipv4-address: Destination IPv4 address, that is, the IP address configured on the peer AP.

source-ipv6-address: Source IPv6 address, that is, the IP address configured on the AP.

destination-ipv6-address: Destination IPv6 address, that is, the IP address configured on the peer AP.

Command Modes

AP interface configuration mode

Default Level

14

Usage Guidelines

To enable the BFD function of an AP member port, you need to configure BFD parameters. For details, see “BFD” in “Configuring Reliability”.

When a device supports both IPv4 BFD and IPv6 BFD, IPv4 BFD and IPv6 BFD can be enabled at the same time on the AP.

Note

After the BFD function is enabled for the link aggregation group on the AP, BFD sessions are automatically set up on the member ports in forwarding state in the AP.

Examples

The following example enables the BFD function for the member ports of AP1, and configures the local IP address for BFD as 1.0.0.1, the remote IP address as 1.0.0.2, the minimum sending interval as 50 milliseconds, the minimum receiving interval as 50 milliseconds, and the detection timeout multiplier as 3.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface aggregateport 1
Hostname(config-if-Aggregateport 1)# ip address 1.0.0.1
Hostname(config-if-Aggregateport 1)# aggregate bfd-detect ipv4 1.0.0.1 1.0.0.2
Hostname(config-if-Aggregateport 1)# bfd interval 50 min_rx 50 multiplier 3
```

Notifications

When the source IP address or destination IP address is invalid, the following notification will be displayed:

```
% Invalid IP address.
```

1.2 aggregateport algorithm mode

Function

Run the **aggregateport algorithm mode** command to configure the load balancing algorithm mode for all APs.

Run the **no** form of this command to restore the default value of the load balancing algorithm mode for all APs.

The type number of the algorithm mode is 11 by default.

Syntax

aggregateport algorithm mode *algorithm-number*

no aggregateport algorithm mode

Parameter Description

algorithm-number: Type number of the algorithm mode. The value ranges from 3 to 11.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

(Optional) This command is configured when the load balancing algorithm mode needs to be changed.

You can run the **no aggregateport algorithm mode** command to restore the default algorithm mode.

Examples

The following example sets the load balancing algorithm mode to 3.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# aggregateport algorithm mode 3
```

Notifications

When the algorithm mode fails to be configured, the following notification will be displayed:

```
Set algorithm mode failed.
```

1.3 aggregateport capacity mode

Function

Run the **aggregateport capacity mode** command to configure the capacity mode of an AP.

Run the **no** form of this command to restore the default value of the capacity mode of an AP.

By default, the maximum number of an AP is 128, and the maximum number of member ports per aggregateport is 8.

Syntax

aggregateport capacity mode *capacity-mode*

no aggregateport capacity mode

Parameter Description

capacity-mode: Capacity mode to be configured. The supported capacity mode is 128*8.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the capacity mode configuration is supported, the system provides several configurable capacity modes for users.

Examples

The following example sets the maximum number of APs to 128, and the maximum number of member ports of an AP to 8.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# aggregateport capacity mode 128*8
```

Notifications

When the existing maximum AP number of the current system exceeds the maximum number of APs to be configured, the following notification will be displayed:

```
% Set aggregateport capacity mode failed.aggregateport 129 have been created, cannot set maximum aggregateport number to128.
```

When the current number of member ports in AP 1 exceeds the maximum number of member ports to be configured, the following notification will be displayed:

```
% Set aggregateport capacity mode failed. current aggregateport member count of aggregateport 1 more than 9.
```

When the link aggregation capacity mode has been configured and you need to save the configuration and restart the system to enable the configuration, the following notification will be displayed:

```
% Warning: please save configuration and restart the device for the configuration to take effect!
```

Common Errors

1.4 aggregateport load-balance

Function

Run the **aggregateport load-balance** command to configure the global load balancing algorithm of APs or the load balancing algorithm of a specified AP.

Run the **no** form of this command to restore the default value of the global load balancing algorithm of APs or restore the load balancing algorithm of a specified AP to the global load balancing algorithm.

By default, for a device on which an AP is created as a L2 AP by default, load is distributed according to the source MAC addresses and destination MAC addresses of the incoming packets. For a device on which an AP is created as a L3 AP by default, load is distributed according to the source IP addresses and destination IP addresses of the incoming packets. For the device that is provided with a CB type line card and supports the enhanced load balancing mode, the AP sets the corresponding packet type field according to the enhanced load balancing profile to distribute load.

Syntax

aggregateport load-balance { **dst-mac** | **src-mac** | **src-dst-mac** | **dst-ip** | **src-ip** | **src-dst-ip** | **src-dst-ip-l4port** | **enhanced profile** *profile-name*

no aggregateport load-balance

Parameter Description

dst-mac: Indicates that load is distributed according to the destination MAC addresses of incoming packets. On each link of the AP, packets with the same destination MAC address are sent to the same port, and packets with different destination MAC addresses are distributed to different ports.

src-mac: Indicates that load is distributed according to the source MAC addresses of the incoming packets. On each link of the AP, packets with different source MAC addresses are distributed to different ports, and packets with the same source MAC address use the same port.

src-dst-ip: Indicates that the load is distributed according to the source IP address and destination IP address. Packets with different source IP addresses and destination IP addresses are forwarded through different ports. Packets with the same source IP address and destination IP address are forwarded through the same link. You are advised to adopt this load balancing mode under L3 conditions.

dst-ip: Indicates that load is distributed according to the destination IP addresses of the incoming packets. On each link of the AP, packets with the same destination IP address are sent to the same port, and packets with different destination IP addresses are distributed to different ports.

src-ip: Indicates that load is distributed according to the source IP addresses of the incoming packets. On each link of the AP, packets with different source IP addresses are distributed to different ports, and packets with the same source IP address use the same port.

src-dst-mac: Indicates that load is distributed according to the source MAC addresses and destination MAC addresses. Packets with different source MAC addresses and destination MAC addresses are forwarded through different ports. Packets with the same source MAC address and destination MAC address are forwarded through the same link.

src-dst-ip-l4port: Indicates that load is distributed according to the source IP address and the destination IP address, as well as the source L4 port number and the destination L4 port number.

enhanced profile *profile-name*: Configures the corresponding packet type field according to **profile-name** to distribute load.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

The load balancing algorithm is configured in the interface configuration mode of the specified AP. After the configuration takes effect, the newly configured load balancing algorithm will operate on the AP. You `can use the **no aggregateport load-balance** command in the interface configuration mode of the AP to disable the load balancing algorithm configured on this AP. After that, the global load balancing algorithm configured on the current device for link aggregation takes effect.

Examples

The following example configures a destination MAC address-based load balancing algorithm for link aggregation.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# aggregateport load-balance dst-mac
```

The following example configures a destination MAC address-based load balancing algorithm on AP 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface aggregateport 1
Hostname(config-if-AggregatePort 1)# aggregateport load-balance dst-mac
```

Platform Description

Specification

The **src-dst-ip-l4port** and **src-dst-ip-src-dst-l4port** commands both indicate the load balancing mode based on the source and destination IP addresses and L4 source and destination port numbers of packets. The **src-dst-ip-l4port** command is applicable to all the products supporting this load balancing mode, while the **src-dst-ip-src-dst-l4port** command is applicable only to some products.

1.5 aggregateport member linktrap

Function

Run the **aggregateport member linktrap** command to enable the LinkTrap notification sending function of member ports of an AP.

Run the **no** form of this command to disable the LinkTrap notification sending function of member ports of an AP.

The LinkTrap notification sending function of member ports of an AP is disabled by default.

Syntax

aggregateport member linktrap

no aggregateport member linktrap

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

In interface configuration mode, you cannot use the [**no**] **snmp trap link-status** command to enable or disable the LinkTrap notification sending function of member ports of an AP. Instead, in global configuration mode, you can use the [**no**] **aggregateport member linktrap** command to enable this function.

Examples

The following example enables the LinkTrap notification sending function of member ports of an AP.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# aggregateport member linktrap
```

1.6 aggregateport member minimum

Function

Run the **aggregateport member minimum** command to configure the minimum number of member ports of an AP or the action to be triggered when the number of member ports of an AP is less than the minimum number.

Run the **no** form of this command to delete the minimum number of member ports of an AP or the action to be triggered when the number of member ports of an AP is less than the minimum number.

By default, the minimum number of member ports of an AP is 1, and no action is configured.

Syntax

aggregateport member minimum { *port-number* | **action shutdown** }

no aggregateport member minimum [**action**]

Parameter Description

port-number: Minimum number of member ports. The value range is from 1 to 8.

shutdown: Indicates that the AP will be shut down if the number of member ports of an AP is less than the minimum number.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

(Optional) This command is configured to specify the minimum number of the member ports of an aggregation group.

For a static AP, the same configuration is required for the peer end; otherwise it may cause the local AP to be **Down** and the peer AP to be **Up**.

Examples

The following example sets the minimum number of member ports of AP 1 to 2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface aggregatePort 1
Hostname(config-if-AggregatePort 1)# aggregateport member minimum 2
```

1.7 aggregateport primary-port

Function

Run the **aggregateport primary-port** command to configure a member port of an AP as a preferred port.

Run the **no** form of this command to restore the default value of the preferred member port of an AP.

No preferred port is configured by default.

Syntax

aggregateport primary-port

no aggregateport primary-port

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Only one preferred port can be configured for one AP.

Examples

The following example configures the member port GigabitEthernet 0/1 of AP 1 as the preferred port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# port-group 1 mode active
Hostname(config-if-GigabitEthernet 0/1)# aggregateport primary-port
```

Notifications

When a non-member port is configured as the preferred port, the following notification will be displayed:

```
% The interface gigabitEthernet 0/1 is not aggregateport member.
```

When more than two preferred ports are configured for one AP, the following notification will be displayed:

```
% Already specified gigabitEthernet 0/1 as primary port for aggregateport 1
```

1.8 clear lacp counters

Function

Run the **clear lacp counters** command to clear the Link Aggregation Control Protocol (LACP) packet statistics from an LACP AP member port.

Syntax

clear lacp counters [*key-number* | *interface-type interface-number*]

Parameter Description

key-name: Number of the specified LACP AP. The value range is from 1 to 128.

interface-type interface-number: Interface type and interface number of the specified LACP AP member port.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

You can run the **show lacp counters** command in privileged EXEC mode to view the LACP packet statistics, and run the **clear lacp counters** command in privileged EXEC mode to clear the LACP packet statistics. You can specify the interface number of a specific member port or AP. If no interface is specified, the LACP packet statistics of all the LACP AP member ports will be cleared.

Examples

The following example clears the LACP packet statistics of the member port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname# clear lacp counters GigabitEthernet 0/1
```

1.9 debug lacp

Function

Run the **debug lacp** command to enable the LACP debugging function.

Run the **no** form of this command to disable the LACP debugging function.

The debugging function is enabled by default.

Syntax

debug lacp { **cache-database** | **cli** | **ef-packet** | **thread** | **pkt-agent** | **pkt-statis** | **pkt-thread** | **packet** | **event** | **ha** | **realtime** | **stm** | **timer** | **all** }

no debug lacp { **cache-database** | **cli** | **ef-packet** | **thread** | **pkt-agent** | **pkt-statis** | **pkt-thread** | **packet** | **event** | **ha** | **realtime** | **stm** | **timer** | **all** }

Parameter Description

cache-database: Database operation debugging.

cli: Command processing debugging.

ef-packet: LACP packet linkage path debugging.

thread: Process scheduling debugging.

pkt-agent: Agent thread packet debugging.

pkt-statis: Packet statistics debugging.

pkt-thread: Agent thread scheduling debugging.

packet: LACP packet sending and receiving debugging.

event: LACP event processing debugging.

ha: Master-slave backup processing debugging.

realtime: Debugging information record file.

stm: State machine debugging.

timer: Internal timer debugging.

all: Enables all LACP debugging.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example enables the LACP packet sending and receiving debugging functions.

```
Hostname> enable
Hostname# configure terminal
Hostname# debug lacp packet

1.10 hash-disturb

Function

Run the **hash-disturb** command to configure a load balancing hash disturbance factor.

Run the **no** form of this command to disable the load balancing hash disturbance function.

The load balancing hash disturbance function is disabled by default.

Syntax

hash-disturb *factor-string*

no hash-disturb

Parameter Description

factor-string: Disturbance factor.

Command Modes

Enhanced load balancing profile configuration mode

Default Level

14

Usage Guidelines

(Optional) You can run this command when an AP needs to be specified for multiple devices of the same type to balance packets of the same type, and run the **no hash-disturb** command to disable the hash disturbance function.

It is not guaranteed that either configuration affects the balancing effect. If there is no expected effect, the other value can be configured.

Examples

The following example configures hash disturbance factor A.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# load-balance-profile
Hostname(config-load-balance-profile)# hash-disturb A
```

Notifications

When the hash disturbance factor fails to be configured, the following notification will be displayed:

```
% Set hash-disturb failed.
```

Common Errors

1.11 hash-symmetrical

Function

Run the **hash-symmetrical** command to configure the load balancing hash synchronization factor.

Run the **no** form of this command to disable the load balancing hash synchronization function.

The load balancing hash synchronization factor is not configured by default.

Syntax

hash-symmetrical { **ipv4** | **ipv6** }

no hash-symmetrical { **ipv4** | **ipv6** }

Parameter Description

ipv4: Indicates that the load balancing hash synchronization function is enabled for IPv4 packets.

ipv6: Indicates that the load balancing hash synchronization function is enabled for IPv6 packets.

Command Modes

Enhanced load balancing profile configuration mode

Default Level

14

Usage Guidelines

You can run the **hash-symmetrical** { **ipv4** | **ipv6** } command to enable the hash synchronization function when the same path needs to be specified for the uplink and downlink streams of a certain packet type..

Examples

The following example disables the hash synchronization function for IPv6 packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# load-balance-profile
Hostname(config-load-balance-profile)# no hash-symmetrical ipv6
```

Notifications

When the balancing hash synchronization function for IPv4 packets fails to be enabled, the following notification will be displayed:

```
% Set hash-symmetrical ipv4 failed.
```

When the balancing hash synchronization function for IPv6 packets fails to be enabled, the following notification will be displayed:

```
% Set hash-symmetrical ipv6 failed.
```

Common Errors

1.12 interface aggregateport

Function

Run the **interface aggregateport** command to configure the Ethernet AP or enter the interface configuration mode of Ethernet AP.

Run the **no** form of this command to delete an Ethernet AP.

No AP is configured by default.

Syntax

interface aggregateport *ap-number*

no interface aggregateport *ap-number*

Parameter Description

ap-number: Number of an AP. The value ranges from 1 to 128,.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

If an AP has been created, the system automatically enters the interface configuration mode of the AP when the **interface aggregateport** command is configured. If no AP is created, an AP will be created first when the **interface aggregateport** command is configured. If the AP is created successfully, the system will enter the interface configuration mode of the AP.

Examples

The following example creates AP 1 and enters its interface configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interfaces aggregateport 1
Hostname(config-if-Aggregateport 1)#
```

1.13 ipv4 field

Function

Run the **ipv4 field** command to configure the load balancing mode of IPv4 packets in the specified enhanced load balancing profile.

Run the **no** form of this command to restore the default configuration.

The load balancing mode of IPv4 packets is a combination of **src-ip**, **dst-ip**, **l4-src-port** and **l4-dst-port** by default.

Syntax

ipv4 field [**src-ip**] [**dst-ip**] [**protocol**] [**l4-src-port**] [**l4-dst-port**] [**src-port**] [**dst-port**]

no ipv4 field

Parameter Description

src-ip: Indicates that the load is distributed according to the source IP addresses of incoming IPv4 packets.

dst-ip: Indicates that the load is distributed according to the destination IP addresses of incoming IPv4 packets.

protocol: Indicates that the load is distributed according to the protocol types of incoming IPv4 packets.

l4-src-port: Indicates that the load is distributed according to the L4 source port numbers of incoming IPv4 packets.

l4-dst-port: Indicates that the load is distributed according to the L4 destination port numbers of incoming IPv4 packets.

src-port: Indicates that the load is distributed according to the source port numbers of incoming IPv4 packets.

Command Modes

Enhanced load balancing profile configuration mode

Default Level

14

Usage Guidelines

You need to create an enhanced load balancing profile before running this command.

Examples

The following example sets the load balancing mode of IPv4 packets in the enhanced load balancing profile APL to **src-ip**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# load-balance-profile apl
Hostname(config-load-balance-profile)# ipv4 field src-ip
```

1.14 ipv6 field

Function

Run the **ipv6 field** command to configure the load balancing mode of IPv6 packets in the specified enhanced load balancing profile.

Run the **no** form of this command to restore the default configuration.

The load balancing mode of IPv6 packets is a combination of **src-ip**, **dst-ip**, **l4-src-port** and **l4-dst-port** by default.

Syntax

ipv6 field [**src-ip**] [**dst-ip**] [**protocol**] [**l4-src-port**] [**l4-dst-port**] [**src-port**]

no ipv6 field

Parameter Description

src-ip: Indicates that the load is distributed according to the source IP addresses of incoming IPv6 packets.

dst-ip: Indicates that the load is distributed according to the destination IP addresses of incoming IPv6 packets.

protocol: Indicates that the load is distributed according to the protocol types of incoming IPv6 packets.

l4-src-port: Indicates that the load is distributed according to the L4 source port numbers of incoming IPv6 packets.

l4-dst-port: Indicates that the load is distributed according to the L4 destination port numbers of incoming IPv6 packets.

src-port: Indicates that the load is distributed according to the source port numbers of incoming IPv6 packets.

Command Modes

Enhanced load balancing profile configuration mode

Default Level

14

Usage Guidelines

You need to create an enhanced load balancing profile before running this command.

Examples

The following example sets the load balancing mode of IPv6 packets in the enhanced load balancing profile APL to **src-ip**.

```
Hostname> enable
Hostname# configure terminal

1.15 l2 field

Function

Run the **l2 field** command to configure the load balancing mode of L2 packets in the specified enhanced load balancing profile.

Run the **no** form of this command to restore the default configuration.

The load balancing mode of L2 packets is a combination of **src-mac** and **dst-mac** by default.

Syntax

l2 field [**src-mac**] [**dst-mac**] [**src-port**]

no l2 field

Parameter Description

src-mac: Indicates that the load is distributed according to the source MAC addresses of incoming L2 packets.

dst-mac: Indicates that the load is distributed according to the destination MAC addresses of incoming L2 packets.

src-port: Indicates that the load is distributed according to the source port numbers of incoming L2 packets.

Command Modes

Enhanced load balancing profile configuration mode

Default Level

14

Usage Guidelines

You need to create an enhanced load balancing profile before running this command.

Examples

The following example sets the load balancing mode of L2 packets to **src-mac** and **src-port**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# load-balance-profile apl
Hostname(config-load-balance-profile)# l2 field src-mac src-port

1.16 lacp device

Function

Run the **lacp device** command to configure the device ID of LACP.

Run the **no** form of this command to cancel the configured device ID.

The device ID is 0 by default.

Syntax

lacp device *device-id*

no lacp device

Parameter Description

device-id: Device ID of LACP. The value range is from 0 to 3.

Command Modes

AP interface configuration mode

Default Level

14

Usage Guidelines

(Optional) You can run this command when the LACP ports of multiple (a maximum of four) independent devices need to negotiate with the LACP port of a specific device.

This command must be used together with the **lacp system-id** command

Examples

The following example sets the device ID of AP 1 to 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface aggregatePort 1
Hostname(config-if-AggregatePort 1)# lacp device 1

1.17 lacp individual-port enable

Function

Run the **lacp individual-port enable** command to enable the LCAP independent port function.

Run the **no** form of this command to restore the default configuration.

The LACP independent port function is disabled by default.

Syntax

lacp individual-port enable

no lacp individual-port enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

(Optional) You can run this command to convert an LACP AP member port to a common physical port when the LACP AP member port cannot perform LACP negotiation.

This command is used to enable the independent port function. After the function is enabled, when a member port fails to receive the LACP packet sent by the peer end within the timeout period of the independent port and the negotiation fails, the member port enters the independent port state (that is, is converted to a common physical port).

Examples

The following example enables GigabitEthernet 0/1 as an independent port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# port-group 1 mode active
Hostname(config-if-GigabitEthernet 0/1)# lacp individual-port enable
```

1.18 lacp individual-timeout period

Function

Run the **lacp individual-timeout period** command to configure the timeout period of an LACP independent port.

Run the **no** form of this command to restore the default configuration.

The timeout period of an LACP independent port is 90s by default.

Syntax

lacp individual-timeout period *time*

no lacp individual-timeout period

Parameter Description

time: Timeout period of the independent port, in seconds. The value range is from 10 to 90.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

(Optional) You can run this command to adjust the timeout period of an independent port for the LACP independent port function.

This command is used to configure the timeout period for the independent port function. Its configuration affects only ports with the LACP independent port function enabled.

Configuring the timeout period of an independent port will not affect existing independent ports.

A member port that fails to receive the LACP packet sent by the peer end within the timeout period of an independent port enters the independent port state (that is, is converted to a common physical port).

In long timeout mode, the LACP packet is sent every 30s. The timeout period should be longer than 30s so as not to affect the normal LACP negotiation. You are advised to configure the timeout period at least twice the period of LACP packet sending. In short timeout mode, the timeout period is not limited.

Examples

The following example sets the timeout period of an independent port to 60s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# lacp individual-timeout period 60
```

1.19 lacp port-priority

Function

Run the **lacp port-priority** command to configure the port priority of an LACP AP member port.

Run the **no** form of this command to restore the port priority of the LACP AP member port.

The priority of the LACP AP member port is 32768 by default.

Syntax

lacp port-priority *Priority*

no lacp port-priority

Parameter Description

Priority: LACP port priority of the port. The value range is from 0 to 65535. A smaller value indicates a higher priority.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the LACP port priority of GigabitEthernet 0/1 to 4096.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# lacp port-priority 4096

1.20 lacp short-timeout

Function

Run the **lacp short-timeout** command to configure the timeout mode of an LACP AP member port to the short timeout mode.

Run the **no** form of this command to restore the timeout mode of the LACP AP member port to the long timeout mode.

The timeout mode of an LACP AP member port is long timeout by default.

Syntax

lacp short-timeout

no lacp short-timeout

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

In long timeout mode, the port sends an LACP packet every 30 seconds, and a timeout occurs if no packet is received within 90 seconds.

In short timeout mode, the port sends an LACP packet every 1 second, and a timeout occurs if no packet is received within 3 seconds.

Examples

The following example configures the LACP port timeout mode of GigabitEthernet 0/1 to the short timeout mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# lacp short-timeout

Function

Run the **lacp system-id** command to configure the LACP system ID.

Run the **no** form of this command to restore the default LACP system ID.

The LACP system ID is the system ID (MAC address) of the device by default.

Syntax

lacp system-id *system-id*

no lacp system-id

Parameter Description

system-id: LACP system ID of the port, a valid unicast MAC address.

Command Modes

AP interface configuration mode

Default Level

14

Usage Guidelines

(Optional) You can run this command when the LACP ports of multiple (a maximum of four) independent devices need to negotiate with the LACP port of a specific device.

The command must be used together with the **lacp device** command.

Examples

The following example sets the LACP system ID to 0000.1236.54ab.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface aggregatePort 1

1.24 load-balance-profile

Function

Run the **load-balance-profile** command to rename the enhanced load balancing profile and enter the enhanced load balancing profile mode.

Run the **default** form of this command to restore the current profile to the default load balancing configuration, with the profile name unchanged.

The name of the enhanced load balancing profile is **default** by default.

Syntax

load-balance-profile *profile-name*

default load-balance-profile *profile-name*

Parameter Description

profile-name: Profile name, which includes a maximum of 31 characters.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

By default, the device is configured with an enhanced load balancing profile named **default**, which cannot be configured or deleted. You can directly enter the default enhanced load balancing profile mode using the **load-balance-profile default** command, or rename the enhanced load balancing profile using the **load-balance-profile** *profile-name* command.

Examples

The following example creates and enters an enhanced load balancing profile named APL.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# load-balance-profile apl
Hostname(config-load-balance-profile)#
```

1.25 port-group

Function

Run the **port-group** command to configure an Ethernet physical port as a member port of a static AP.

Run the **port-group mode** command to configure a physical port as a member port of an LACP AP.

Run the **no** form of this command to delete the AP member attribute of the port.

By default, the Ethernet physical port does not belong to any static AP or LACP AP.

Syntax

port-group *port-group-number*

port-group *key-number* **mode** { **active** | **passive** }

no port-group

Parameter Description

port-group-number: Number of the member port group of the static AP, that is, the interface number of the static AP. The value ranges from 1 to 128.

key-number: Number of the member port group of the LACP AP, that is, the interface number of the LACP AP. The value ranges from 1 to 128.

active: Indicates that the port will initiate LACP aggregation operation.

passive: Indicates that the port will not actively initiate LACP aggregation operation, but will passively participate in LACP aggregation operation after receiving LACP packets from a neighbor.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When you run the **port-group** command to add a port to an AP, if the AP does not exist, it will be automatically created. When the layer of the physical port is different from that of the AP, the physical port cannot be added to the AP.

Examples

The following example configures GigabitEthernet 0/1 as a member port of static AP 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# port-group 1
```

The following example configures GigabitEthernet 0/1 as a member port of LACP AP 1 and sets the aggregation mode to active mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# port-group 1 mode active

Syntax

show aggregateport [*aggregate-port-number*] **summary**

Parameter Description

aggregate-port-number:-port-number: Number of the AP. The value range is from 1 to 128. If the port number is not specified, the information of all APs will be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface number of an AP is specified, the information of all APs will be displayed.

If the system does not support configuring the load balancing mode based on AP, the **Load-balance** field will not be displayed.

Examples

The following example displays the configuration of AP 1.

```
Hostname> enable
Hostname# show aggregateport 1 summary
AggregatePort  MaxPorts       SwitchPort Mode    Load balance              Ports
Ag1          8             Enabled    ACCESS  dst-mac                   Gi0/1
```

Table 1-2 Output Fields of the show aggregateport summary Command

Field	Description
AggregatePort	Indicates the interface name of the AP.
MaxPorts	Indicates the maximum number of ports that can be supported in an AP.
SwitchPort	Indicates whether the AP is a L2 port. **Enabled** indicates that it is a L2 port, and **Disabled** indicates that it is not a L2 port.
Mode	Indicates L2 port attributes of the AP, including **ACCESS**, **TRUNK**, **TUNNEL**, **HYBRID**,

Field	Description
	UPLINK, **HOST**, and **PROMIS**. When the AP is not a L2 port, the field is blank.
Load balance	Indicates the load balancing mode of the AP.
Ports	Indicates the name of the AP member port.

1.28 show aggregateport capacity

Function

Run the **show aggregateport capacity** command to display the capacity mode and capacity usage of the current AP.

Syntax

show aggregateport capacity

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the capacity mode and capacity usage of the current AP.

```
Hostname> enable
Hostname# show aggregateport capacity
AggregatePort Capacity Information:
```

```
Configuration Capacity Mode: 128*8.
Effective Capacity Mode    : 128*8.
Available Capacity         : 128*8.
Total Number: 128, Used: 1, Available: 127.
```

Table 1-3 Output Fields of the show aggregateport capacity Command

Field	Description
Configuration Capacity Mode	Indicates the currently configured capacity mode
Effective Capacity Mode	Indicates the currently effective capacity mode.
Available Capacity	Indicates the currently available capacity mode.
Total Number	Indicates the maximum number of available APs in the current system. **Used** indicates the number of used APs, and **Available** indicates the number of remaining available APs.

1.29 show lacp counters

Function

Run the **show lacp counters** command to display the packet statistics of an LACP AP member port.

Syntax

show lacp counters [*key-number*]

Parameter Description

key- number: Number of the specified LACP AP. The value range is from 1 to 128. If the port number is not specified, the information of all ports will be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If **key-number** is not specified, the LACP packet statistics of all the LACP AP member ports will be displayed.

Examples

The following example displays the LACP packet statistics of member ports of LACP AP 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# show lacp counters 1
LACP PDU Pakcet Statistics
Aggregate port 1:
Port        InPkts    OutPkts
Gi0/1        6121     6132
```

Table 1-4 Output Fields of the show lacp counters Command

Field	Description
Aggregate port 2	Indicates the AP ID.
Port	Indicates the LACP AP member port name.
InPkts	Indicates the number of LACP PDU packets received by the member port.
OutPkts	Indicates the number of LACP PDU packets sent by the member port.

1.30 show lacp summary

Function

Run the **show lacp summary** command to display the state of an LACP AP.

Syntax

show lacp summary [*key-number*]

Parameter Description

key-number: Number of a specified LACP AP. The value range is from 1 to 128. If the port number is not specified, the information of all LACP APs will be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If **key-number** is not specified, the state information of all LACP APs will be displayed.

Examples

The following example displays the state information of LACP AP 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# show lacp summary 1
System Id:32768,00d0.f8fb.0002
Flags:  S - Device is requesting Slow LACPDUs
F - Device is requesting Fast LACPDUs.
A - Device is in active mode.       P - Device is in passive mode.
Aggregate port 1:
Local information:
LACP port      Oper    Port    Port
Port    Flags    State    Priority       Key    Number  State
Gi0/1    SA       bndl       4096        0x3    0x1     0x3d
Gi0/2    SA       bndl       4096        0x3    0x2     0x3d
Gi0/3    SA       bndl       4096        0x3    0x3     0x3d
Partner information:

Gi0/3    SA       61440    00d0.f800.0002   0x3    0x3    0x3d
```

Table 1-5 Output Fields of the show lacp summary Command

Field	Description
System Id	Indicates the system ID, namely, the system MAC address.
Aggregate port 1	Indicates the name of the AP.
Local information	Indicates the information about the local LACP AP member port.
Port	Indicates the LACP AP member port name.

Field	Description
Flags	Indicates the configuration of member ports. For details, see the description of SFAP in the displayed notification.
State	Indicates the member port negotiation state: **bndl** indicates successful negotiation, **susp** indicates negotiation failure, and **down** indicates the **Down** state of the port link.
LACP port Priority	Indicates the port priority of the LACP AP member port.
Oper Key	Indicates the aggregation group number of the LACP AP member port.
Port Number	Indicates the number of the LACP AP member port.
Port State	Indicates the port state details of the LACP AP member port.
Partner information	Indicates the information about the peer LACP AP member port.
Port	Indicates the name of the local port connected to the peer end.
Flags	Indicates the configuration of the peer LACP AP member port, which is the same as the above **Flags**.
LACP port Priority	Indicates the port priority of the peer LACP AP member port, which is the same as the above **LACP port Priority**.
Dev ID	Indicates the ID of the device system where the peer LACP AP member port is, that is, the MAC address of the peer device.
Oper Key	Indicates the aggregation group number of the peer LACP AP member port, which is the same as the above **Oper Key**.
Port Number	Indicates the number of the peer LACP AP member port, which is the same as the above **Port Number**.
Port State	Indicates the port state details of the peer LACP AP member port, which is the same as the above **Port State**.

1.31 show load-balance-profile

Function

Run the **show load-balance-profile** command to display the configuration of the enhanced load balancing mode.

Syntax

show load-balance-profile [*profile-name*]

Parameter Description

profile-name: Profile name.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If *profile-name* is not specified, the information of all the enhanced load balancing profiles will be displayed.

Examples

The following example displays the enhanced load balancing configuration of the profile module0.

```
Hostname> enable
Hostname# show load-balance-profile module0
Load-balance-profile: module0
Packet   Hash Field:
     IPv4: src-ip dst-ip
    IPv6: src-ip dst-ip
    L2  : src-mac dst-mac
```

Table 1-6 Output Fields of the show load-balance-profile Command

Field	Description
Load-balance-profile	Indicates the name of the enhanced load balancing profile.
IPv4	Indicates the balancing configuration of IPv4 packets in the enhanced load balancing profile.
IPv6	Indicates the balancing configuration of IPv6 packets in the enhanced load balancing profile.
L2	Indicates the balancing configuration of L2 packets in the enhanced load balancing profile.

1 MAC Address Commands

Command	Function
clear mac-address-table dynamic	Clear dynamic Media Access Control Address (MAC) address entries.
clear mac-address-table flapping record	Clear the MAC address flapping records.
mac-address-learning (global mode)	Enable the MAC address learning function in global configuration mode.
mac-address-learning (interface mode)	Enable the MAC address learning function in interface configuration mode.
mac-address-table aging-time	Configure the aging time for dynamic MAC address entries.
mac-address-table filtering	Configure a filtering MAC address entry for a specified VLAN.
mac-address-table notification	Enable the MAC address change notification function in global configuration mode.
mac-address-table static	Configure a static MAC address entry.
max-dynamic-mac-count	Configure the upper limit of dynamic MAC addresses learned from a VLAN or an interface.
max-dynamic-mac-count exceed-action	Set the packet forwarding rule to be used after the number of dynamic MAC addresses learned from a VLAN or an interface reaches the upper limit.
show mac-address-learning	Display the MAC address learning capability in interface configuration mode.
show mac-address-table	Display all types of MAC address entries.
show mac-address-table aging-time	Display the aging time of dynamic MAC address entries.
show mac-address-table count	Display statistics about MAC address entries in a MAC address table.
show mac-address-table dynamic	Display dynamic MAC address entries.
show mac-address-table filtering	Display filtering MAC address entries.
show mac-address-table flapping record	Display dynamic MAC address flapping records.

show mac-address-table max-dynamic-mac-count	Display the upper limit of learned dynamic MAC addresses.
show mac-address-table interface	Display static or dynamic MAC address entries for a specified interface.
show mac-address-table notification	Display MAC address change notifications.
show mac-address-table static	Display the static MAC address entries.
show mac-address-table evpn	Display the MAC address entries for an EVPN.
show mac-address-table mlag	Display the MAC address entries for an MLAG.
show mac-address-table vlan	Display all types of MAC address entries for a specified VLAN.
show mac-address-table vsi	Display all types of MAC address entries for a specified VSI.
show mac-address-table vni	Display all types of MAC address entries for a specified VNI.
show mac-address-table all	Display all types of MAC address entries.
snmp trap mac-notification	Enable the MAC address change notification function for an interface.
mac-address-table warning-interval	Configure the interval for reporting MAC address table usage alarms.
mac-address-table warning-threshold	Configure the upper and lower limits for reporting MAC address table usage alarms.
mac-address-table flapping-logging	Enable MAC address flapping detection.
mac-address-table flapping action	Enable the MAC address flapping protection policy.

1.1 clear mac-address-table dynamic

Function

Run the **clear mac-address-table dynamic** command to clear dynamic Media Access Control Address (MAC) address entries.

Syntax

clear mac-address-table dynamic [**address** *mac-address*] [**interface** *interface-type interface-number*] [**vlan** *vlan-id*]

Parameter Description

dynamic: Clears all dynamic MAC address entries.

address *mac-address*: Clears a specified dynamic MAC address entry.

interface *interface-type interface-number*: Clears dynamic MAC addresses on the specified interface.

vlan *vlan-id*: Clears all dynamic MAC addresses in a specified VLAN. *vlan-id*: ID of a specified virtual local area network (VLAN). The value range is from 1 to 4094.

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

You can use the **show mac-address-table dynamic** command to display all information in a dynamic MAC address table.

Examples

The following example clears all dynamic MAC address entries.

```
Hostname> enable
Hostname# clear mac-address-table dynamic
```

Notifications

1.3 mac-address-learning (global mode)

Function

Run the **mac-address-learning** command to enable the MAC address learning function in global configuration mode.

Run the **no** form of **mac-address-learning** command to disable the MAC address learning function in global configuration mode.

Run the **default** form of this command to restore the default configuration.

MAC address learning is enabled in global configuration mode by default.

Syntax

mac-address-learning { **enable** | **disable** }

default mac-address-learning

Parameter Description

enable: Enables the MAC address learning function in global configuration mode.

disable: Disables the MAC address learning function in global configuration mode.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the MAC address learning function is enabled in global configuration mode, the status of the MAC address learning function on an interface is subject to the configuration of the interface. When the MAC address learning function is disabled in global configuration mode, all interfaces do not learn MAC addresses.

Examples

The following example disables MAC address learning in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address-learning disable
```

Notifications

1.4 mac-address-learning (interface mode)

Function

Run the **mac-address-learning** command to enable the MAC address learning function in interface configuration mode.

Run the **no** form of this command to disable the MAC address learning function in interface configuration mode.

Run the **default** form of this command to restore the default configuration.

The MAC address learning function is enabled in interface configuration mode by default.

Syntax

mac-address-learning

no mac-address-learning

default mac-address-learning

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Do not disable the MAC address learning function on an interface where the security function is enabled. If the MAC address learning function is disabled, the security function becomes unavailable on the interface.

If you run the **default interface** command in global configuration mode for an interface that includes L2 sub-interfaces, it is forbidden to restore the MAC address learning function on the interface to the default configuration.

Examples

The following example disables the MAC address learning function on TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# no mac-address-learning
```

Notifications

1.5 mac-address-table aging-time

Function

Run the **mac-address-table aging-time** command to configure the aging time for dynamic MAC address entries.

Run the **no** form of this command to restore the default configuration.

Run the **default** form of this command to restore the default configuration.

The aging time for dynamic MAC address entries is 300 seconds by default.

Syntax

mac-address-table aging-time *time*

no mac-address-table aging-time

default mac-address-table aging-time

Parameter Description

time: Aging time of dynamic MAC address entries, in seconds. The value ranges from 10 to 1000000. The value **0** indicates no aging.

Command Modes

Global configuration mode

Default Level

14

Examples

The following example sets the aging time of dynamic MAC address entries to 400s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address-table aging-time 400
```

Notifications

N/A

Common Errors

1.6 mac-address-table filtering

Function

Run the **mac-address-table filtering** command to configure a filtering MAC address entry for a specified VLAN.

Run the **no** form of this command to delete a filtering MAC address entry.

Run the **default** form of this command to delete a filtering MAC address entry.

No filtering MAC address entry is configured by default.

Syntax

mac-address-table filtering *mac-address* **vlan** *vlan-id*

no mac-address-table filtering *mac-address* **vlan** *vlan-id*

default mac-address-table filtering *mac-address* **vlan** *vlan-id*

Parameter Description

mac-address: Filtering MAC address entry.

vlan *vlan-id*: Specifies a VLAN for which MAC addresses are to be filtered out. *vlan-id*: ID of the specified VLAN. The value range is from 1 to 4094.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After this function is configured, packets with the source or destination MAC address matching the MAC address in the filtering MAC address entry are discarded.

You cannot configure a multicast address as a filtering MAC address. You can use the **show mac-address-table filtering** command to display filtering MAC address settings.

Examples

The following example configures the MAC address 0000.0202.0303 as a filtering MAC address entry for VLAN 3.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address-table filtering 0000.0202.0303 vlan 3
```

Notifications

When an invalid MAC address is configured in a filtering MAC address entry, the following notification will be displayed:

```
Can not set this filter address.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

- **show mac-address-table filtering**

1.7 mac-address-table notification

Function

Run the **mac-address-table notification** command to enable the MAC address change notification function in global configuration mode.

Run the **no** form of this command to restore the default configuration.

Run the **default** form of this command to restore the default configuration.

The MAC address change notification function is disabled in global configuration mode by default.

Syntax

mac-address-table notification [**interval** *interval* | **history-size** *size*]

no mac-address-table notification [**interval** | **history-size**]

default mac-address-table notification [**interval** | **history-size**]

Parameter Description

interval *interval*: Specifies the interval for sending MAC address Trap messages. The value range is from 1 to 3600 in seconds, and the default value is **1**.

history-size *size*: Specifies the maximum number of entries in the history table for MAC address entry change notifications. The value range is from 1 to 1200, and the default value is **50**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The MAC address change notification function applies to dynamic MAC address entries and security MAC address entries only. No Trap notification is generated for static MAC address entries and filtering MAC address entries.

You can run the **snmp**-**server enable traps mac**-**notification** command in global configuration mode to send MAC address Trap messages to the Network Management Station (NMS).

Examples

The following example enables the MAC address change notification function in global configuration mode, sets the interval for sending MAC address Traps to 40s, and sets the maximum number of MAC address change notification history records to 100.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address-table notification
Hostname(config)# mac-address-table notification interval 40
Hostname(config)# mac-address-table notification history-size 100
```

Notifications

Related Commands

- **snmp-server enable traps mac-notification** (network management and monitoring/SNMP)
- **snmp-server host** (network management and monitoring/SNMP)
- **snmp trap mac-notification**

1.8 mac-address-table static

Function

Run the **mac-address-table static** command to configure a static MAC address entry.

Run the **no** form of this command to delete a static MAC address entry.

Run the **default** form of this command to delete a static MAC address entry.

No static MAC address entry is configured by default.

Syntax

mac-address-table static *mac-address* **vlan** *vlan-id* **interface** *interface-type interface-number*

no mac-address-table static *mac-address* **vlan** *vlan-id* **interface** *interface-type interface-number*

default mac-address-table static *mac-address* **vlan** *vlan-id* **interface** *interface-type interface-number*

Parameter Description

mac-address: Destination MAC address in a static MAC address entry.

vlan *vlan-id*: Specifies a VLAN to which an egress interface belongs. *vlan-id*: ID of the specified VLAN. The value range is from 1 to 4094.

interface *interface-type interface-number*: Specifies an egress interface for packets whose MAC address matches the static MAC address entry.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Static MAC addresses have the same function as learned dynamic MAC addresses. Compared with dynamic MAC addresses, static MAC addresses never age and they must be manually configured and deleted. Static

MAC addresses are not cleared after device reset. You can use the **show mac-address-table static** command to display static MAC address table settings.

You cannot configure a multicast address as a static MAC address.

Examples

The following example configures a static MAC address entry and sets the destination MAC address to 00e1-00e2-00e3 and the egress interface to TenGigabitEthernet 0/1 in VLAN 2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address static 00e1-00e2-00e3 vlan 2 interface
TenGigabitEthernet 0/1
```

Notifications

N/A

Common Errors

N/A

Platform Description

N/A

Related Commands

- **show mac-address-table static**

1.9 max-dynamic-mac-count

Function

Run the **max-dynamic-mac-count** command to configure the upper limit of dynamic MAC addresses learned from a VLAN or an interface.

Run the **no** form of this command to restore the default configuration.

Run the **default** form of this command to restore the default configuration.

No upper limit of dynamic MAC addresses learned from a VLAN or an interface is configured by default.

Syntax

max-dynamic-mac-count *count*

no max-dynamic-mac-count

default max-dynamic-mac-count

Parameter Description

count: Upper limit of dynamic MAC addresses learned from a specified VLAN or interface. The value range is from 1 to 65535.

Command Modes

VLAN configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

After you run this command, the device will disable the MAC address learning function for the interface or VLAN if the number of dynamic MAC addresses learned from the interface or VLAN reaches the upper limit.

If the number of MAC addresses learned from the interface or VLAN is greater than the upper limit, the device will stop learning MAC addresses from the interface or VLAN and will not start learning again until the number drops below the limit as aged addresses entries are deleted.

You can run the **show mac-address-table max-dynamic-mac-count** command to display the upper limit of dynamic MAC addresses learned from the interface or VLAN and the learning result.

If you run the **default interface** command in global configuration mode for an interface that includes L2 subinterfaces, the upper limit of the MAC addresses learned from the interface cannot be restored to the default configuration.

Examples

The following example sets the upper limit of MAC addresses learned from VLAN 1 to 160.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 1
Hostname(config-vlan)# max-dynamic-mac-count 160
```

The following example sets the upper limit of MAC addresses learned from tenGigabitEthernet 0/1 to 160.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# max-dynamic-mac-count 160
```

Notifications

N/A

Common Errors

Platform Description

N/A

Related Commands

- **max-dynamic-mac-count exceed-action**
- **show mac-address-table max-dynamic-mac-count**

1.10 max-dynamic-mac-count exceed-action

Function

Run the **max-dynamic-mac-count exceed-action** command to set the packet forwarding rule to be used after the number of dynamic MAC addresses learned from a VLAN or an interface reaches the upper limit.

Run the **no** form of this command to restore the default configuration.

By default, the device can continue forwarding packets whose source MAC address does not exist in the MAC address entries of the device when the number of learned MAC addresses reaches the upper limit.

Syntax

max-dynamic-mac-count exceed-action { *forward* | *discard* }

no max-dynamic-mac-count exceed-action { *forward* | *discard* }

Parameter Description

forward: The device can continue forwarding packets whose source MAC address does not exist in the MAC address entries of the device after the number of learned dynamic MAC addresses reaches the upper limit, without learning the source MAC address.

discard: The device discards packets whose source MAC address does not exist in the MAC address entries of the device after the number of learned dynamic MAC addresses reaches the upper limit.

Command Modes

VLAN configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

Run the command to determine whether to forward packets whose source MAC addresses are not in the MAC address table after the number of MAC addresses reaches the upper limit.

If you run the **default interface** command in global configuration mode for an interface that includes L2 subinterfaces, the packet forwarding rule applied to the interface cannot be restored to the default configuration.

Examples

The following example sets the upper limit of MAC addresses learned from VLAN 1 to 160 and enables forwarding of packets in this VLAN even when the number of MAC addresses learned from the VLAN reaches 160.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 1
Hostname(config-vlan)# max-dynamic-mac-count 160
Hostname(config-vlan)# max-dynamic-mac-count exceed-action forward
```

The following example sets the upper limit of MAC addresses learned from TenGigabitEthernet 0/1 to 160 and enables forwarding of packets on this interface even when the number of MAC addresses learned from the interface reaches 160.

```
Hostname> enable
Hostname#configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# max-dynamic-mac-count 160
Hostname(config-if-TenGigabitEthernet 0/1)# max-dynamic-mac-count exceed-action
forward
```

1.12 show mac-address-table

Function

Run the **show mac-address-table** command to display all types of MAC address entries.

Syntax

show mac-address-table [**address** *mac-address*] [[**vlan** *vlan-id*] [**interface** *interface-type interface-number*] | **vsi** *vsi-id* | **vni** *vni-id*]

Parameter Description

address *mac-address*: Displays the MAC address entry of a specified MAC address.

vlan *vlan-id*: Displays the MAC address entries for a specified VLAN. *vlan-id*: ID of the specified VLAN. The value range is from 1 to 4094.

interface *interface-type interface-number*: Displays the MAC address entries for a specified interface.

vsi-id: Displays the MAC address entries for a specified virtual switch interface (VSI). *vsi-id*: ID of the specified VSI. The value range is from 1 to 2147483647.

vni-id: Displays the MAC address entries for a specified virtual network interface (VNI). *vni-id:*-id: ID of the specified VNI. The value range is from 1 to 16777215.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

You can use this command to display all types of MAC address entries for a specified VLAN, interface, VSI, and VNI.

Examples

The following example displays the MAC address entry corresponding to the MAC address 00d0.f800.1001.

```
Hostname> enable
Hostname # show mac-address-table address 00d0.f800.1001
Vlan       MAC Address         Type     Interface            Live Time
------  ---------------- -------- ------------------- ---- -------------
1          00d0.f800.1001      STATIC  TenGigabitEthernet 0/1
```

The following example displays all MAC address entries.

```
Hostname> enable
Hostname# show mac-address-table
Vlan       MAC Address         Type     Interface            Live Time
------  ---------------- -------- ------------------- ---- -------------
1          00d0.f800.1001      STATIC   TenGigabitEthernet 0/1  -
1          00d0.f800.1002      DYNAMIC  TenGigabitEthernet 0/1  1d 00:21:22
1          00d0.f800.1003      OTHER    TenGigabitEthernet 0/1  -
1          00d0.f800.1004      FILTER   Not available        -
```

Table 1-2 Output Fields of the show mac-address-table Command

Field	Description
Vlan	VLAN to which the MAC address belongs.
MAC Address	MAC address
Type	Type of the MAC address: ● **STATIC**: static MAC address ● **DYNAMIC**: dynamic MAC address ● **FILTER**: filtering MAC address ● **OTHER**: MAC address of a user authenticated via 802.1X, MAB, or Web-based authentication

Interface	Interface to which the MAC address belongs
Live Time	Keep-alive time of the MAC address

The following example displays the MAC address entries that contain the source MAC address 1234.2222.3333 in VSI 1.

```
Hostname> enable
Hostname# show mac-address-table address 1234.2222.3333 vsi 1
VLAN/VSI/VNI   MAC Address         Type     Learned-From           Live Time
-------------- ------------------ ------- ---------------------- -------------
-/1/-         1234.2222.3333      STATIC   TenGigabitEthernet 0/1    -
```

Table 1-3 Output Fields of the show mac-address-table vsi/vni Command

Field	Description
VLAN/VSI/VNI	VLAN/VSI/VNI to which the MAC address belongs
MAC Address	MAC address
Type	Type of the MAC address: ● **STATIC**: static MAC address ● **DYNAMIC**: dynamic MAC address ● **FILTER**: filtering MAC address ● **OTHER**: MAC address of a user authenticated via 802.1X, MAB, or Web-based authentication
Learned-From	Interface to which the MAC address belongs

1.14 show mac-address-table count

Function

Run the **show mac-address-table count** command to display statistics about MAC address entries in a MAC address table.

Syntax

show mac-address-table count [**interface** *interface-type interface-number* | **vlan** *vlan-id*]

Parameter Description

interface *interface-type interface-number*: Displays statistics about all MAC address entries for a specified interface.

vlan *vlan-id*: Displays statistics about all MAC address entries for a specified VLAN. *vlan-id*: ID of the specified VLAN. The value range is from 1 to 4094.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If you do not specify any parameter in this command, statistics about all MAC address entries are displayed.

Examples

The following example displays the numbers of various types of MAC address entries.

```
Hostname> enable
Hostname# show mac-address-table count
Dynamic Address Count  : 1
EVPN   Address Count  : 0
MLAG   Address Count  : 0
Static  Address Count  : 1
Filtering Address Count: 1
Other   Address Count  : 0
Total Mac Addresses   : 3
Total Mac Address Space Available: 63997
```

The following example displays the number of MAC address entries for VLAN 1.

```
Hostname> enable
Hostname# show mac-address-table count vlan 1
Dynamic Address Count  : 7
Static  Address Count  : 0
Filter  Address Count  : 0
Other   Address Count  : 0
Total Mac Addresses   : 7
```

The following example displays the number of MAC address entries for TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# show mac-address-table count interface tenGigabitEthernet 0/1
Dynamic Address Count  : 10
Static  Address Count  : 0
Filter  Address Count  : 0
Other   Address Count  : 0
Total Mac Addresses   : 10
```

Table 1-5 Output Fields of the show mac-address-table count Command

Field	Description
Dynamic Address Count	Number of dynamic MAC addresses
Static Address Count	Number of static MAC addresses
Filter Address Count	Number of filtering MAC addresses
Other Address Count	MAC address of a user authenticated via 802.1X, MAB, or WEB authentication
EVPN Address Count	Number of EVPN MAC addresses

1.15 show mac-address-table dynamic

Function

Run the **show mac-address-table dynamic** command to display dynamic MAC address entries.

Syntax

show mac-address-table dynamic [**address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*]

Parameter Description

address *mac-address*: Displays a specified dynamic MAC address entry.

vlan *vlan-id*: Displays all dynamic MAC addresses for a specified VLAN. *vlan-id*: ID of the specified VLAN. The value range is from 1 to 4094.

interface *interface-type interface-number*: Displays all dynamic MAC addresses for a specified interface.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If you do not specify any parameter in this command, all dynamic MAC address entries are displayed.

Examples

The following example displays all dynamic MAC address entries.

```
Hostname> enable
Hostname# show mac-address-table dynamic
Vlan    MAC Address     Type     Interface            Live Time

1.16 show mac-address-table filtering

Function

Run the **show mac-address-table filtering** command to display filtering MAC address entries.

Syntax

show mac-address-table filtering [**address** *mac-address*] [**vlan** *vlan-id* | **vni** *vni-id* | **vsi** *vsi-id*]

Parameter Description

mac-address: Specified filtering MAC address.

vlan *vlan-id*: Displays a filtering MAC address for a specified VLAN. *vlan-id*: ID of the specified VLAN. The value range is from 1 to 4094.

vni-id: ID of a specified VNI for which filtering MAC addresses are to be displayed. The value range is from 1 to 16777215.

vsi-id: ID of a specified VSI for which filtering MAC addresses are to be displayed. The value range is from 1 to 2147483647.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays the MAC address filtering table.

```
Hostname> enable
Hostname# show mac-address-table filtering
Vlan       MAC Address         Type    Interface            Live Time

1.17 show mac-address-table flapping record

Function

Run the **show mac-address-table flapping record** command to display dynamic MAC address flapping records.

Syntax

show mac-address-table flapping record

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

You can use the **mac-address-table flapping-logging** command to enable the MAC address flapping detection function and then use the **show mac-address-table flapping record** command to display the MAC address flapping records.

Examples

The following example displays the dynamic MAC address flapping records.

```
Hostname> enable
Hostname# show mac-address-table flapping record
 Mac address flapping detect status      : on
 Mac address flapping detect interval    : 1s
 Mac address flapping syslog supress time : 1800s
 Mac address flapping record max count   : 300
 Mac address flapping record total count  : 5
Move-Time             VLAN MAC-Address    Original-Port Move-Ports    Status
--------------------------------------------------------------------------------
 2020.11.14 12:10:46   1    0001.1111.1111 te0/2         te0/1         Normal

 2020.11.14 12:11:13   1    0001.1111.1111 te0/2         te0/1         Normal
```

Table 1-8 Output Fields of the show mac-address-table flapping record Command

Field	Description

Field	Description
Move-Time	Specifies the time at which the dynamic MAC address flapping occurs.
VLAN	Specifies the VLAN where the dynamic MAC address flapping occurs.
MAC-Address	MAC address
Original-Port	Specifies the interface from which the dynamic MAC address is learned before MAC address flapping.
Move-Ports	Specifies the interface from which the dynamic MAC address is learned after MAC address flapping.
Status	Specifies the currently valid flapping protection policy. ● **Normal**: No flapping protection policy is set. ● **ERR-DOWN**: The interface is disabled after MAC address flapping.

1.18 show mac-address-table max-dynamic-mac-count

Function

Run the **show mac-address-table max-dynamic-mac-count** command to display the upper limit of learned dynamic MAC addresses.

Syntax

show mac-address-table max-dynamic-mac-count { **interface** *interface-type interface-number* | **vlan** *vlan-id* }

Parameter Description

interface *interface-type interface-number*: Displays the upper limit of dynamic MAC addresses learned from a specified interface.

vlan *vlan-id*: Displays the upper limit of dynamic MAC addresses learned from a specified VLAN. *vlan-id*: ID of the specified VLAN. The value range is from 1 to 4094.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays the dynamic MAC address learning results of all VLANs for which an upper limit of learned dynamic MAC addresses is specified.

```
Hostname> enable
Hostname# show mac-address-table max-dynamic-mac-count vlan
Vlan Limit   MAC count Learning
---- ------ ---------- ------
1    160       6        YES
```

The following example displays the dynamic MAC address learning result of VLAN 1.

```
Hostname> enable
Hostname# show mac-address-table max-dynamic-mac-count vlan 1
Vlan Limit   MAC count Learning
---- ------ ---------- ------
1    160       6        YES
```

The following example displays the dynamic MAC address learning results of all interfaces for which an upper limit of learned dynamic MAC addresses is specified.

```
Hostname> enable
Hostname# show mac-address-table max-dynamic-mac-count interface
Interface             Limit   MAC count Learning
---- ------ ---------- ------
TenGigabitEthernet 0/1     160     6         YES
```

The following example displays the dynamic MAC address learning result of TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# show mac-address-table max-dynamic-mac-count interface tenGigabitEthernet
0/1
Interface             Limit   MAC count Learning

1.19 show mac-address-table interface

Function

Run the **show mac-address-table interface** command to display static or dynamic MAC address entries for a specified interface.

Syntax

show mac-address-table interface *interface-type interface-number*

Parameter Description

interface *interface-type interface-number*: Displays the MAC address entries for a specified interface.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

You can use this command to display all static and dynamic MAC address entries for a specified interface.

Examples

The following example displays all MAC addresses for TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# show mac-address-table interface tenGigabitEthernet 0/1
Vlan       MAC Address         Type    Interface           Live Time
---------- ------------------- ------- ------------------- -------------

1.20 show mac-address-table notification

Function

Run the **show mac-address-table notification** command to display MAC address change notifications.

Syntax

show mac-address-table notification [**interface** [*interface-type interface-number*] | **history**]

Parameter Description

interface *interface-type interface-number*: Displays configurations of the MAC address change notification function for a specified interface. If no interface is specified, the configurations of the MAC address change notification function for all interfaces are displayed.

history: Displays the history table for MAC address change notifications.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If you do not specify any parameter in this command, the global configurations of the MAC address change notification function are displayed.

Examples

The following example displays the global configurations of the MAC address change notification function.

```
Hostname> enable
Hostname# show mac-address-table notification
MAC Notification Feature : Enabled
Interval(Sec): 300
Maximum History Size : 50
Current History Size : 0
```

Table 1-11 Output Fields of the show mac-address-table notification Command

Field	Description
Interval(Sec)	Interval for generating MAC address change notifications
Maximum History Size	Maximum number of entries in the history table for MAC address change notifications.
Current History Size	Number of current records in the history table for MAC address change notifications.

The following example displays the configurations of the MAC address change notification function for TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# show mac-address-table notification interface tenGigabitEthernet 0/1

1.21 show mac-address-table static

Function

Run the **show mac-address-table static** command to display the static MAC address entries.

Syntax

show mac-address-table static [**address** *mac-address*] [**interface** *interface-type interface-number*] [**vlan** *vlan-id*]

Parameter Description

mac-address: Displays the static MAC address entry of a specified MAC address.

interface *interface-type interface-number*: Displays the MAC address entries for a specified interface.

vlan *vlan-id*: Displays the static MAC address entries for a specified VLAN. *vlan-id*: ID of the specified VLAN. The value range is from 1 to 4094.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If you do not specify any parameter in this command, all static MAC address entries are displayed.

Examples

The following example displays all static MAC address entries.

```
Hostname> enable
Hostname# show mac-address-table static
Vlan    MAC Address     Type        Interface            Live Time

Syntax

show mac-address-table vsi *vsi-id*

Parameter Description

vsi-id: ID of a VSI for which MAC address entries are to be displayed. The value range is from 1 to 2147483647.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays all types of MAC address entries for VSI 1.

```
Hostname> enable
Hostname# show mac-address-table vsi 1
VLAN/VSI/VNI   MAC Address         Type    Learned-From               Live Time
-------------- ------------------- ------- -------------------------- -------------
/1/-         1234.2222.3333        STATIC   TenGigabitEthernet 0/1          -
```

Table 1-17 Output Fields of the show mac-address-table vsi Command

Field	Description
VLAN/VSI/VNI	VLAN/VSI/VNI to which the MAC address belongs
MAC Address	MAC address
Type	Type of the MAC address: ● **STATIC**: static MAC address ● **DYNAMIC**: dynamic MAC address
Learned-From	Interface to which the MAC address belongs

1.26 show mac-address-table vni

Function

Run the **show mac-address-table vni** command to display all types of MAC address entries for a specified VNI.

Syntax

show mac-address-table vni *vni-id*

Parameter Description

vni-id: ID of a specified VNI for which the MAC address entries are to be displayed. The value range is from 1 to 16777215.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays all types of MAC address entries for VNI 1.

```
Hostname> enable
Hostname# show mac-address-table vni 1
VLAN/VSI/VNI   MAC Address     Type    Learned-From            Live Time
-------------- ---------------- ------- ---------------------- -------------

1.28 snmp trap mac-notification

Function

Run the **snmp trap mac-notification** command to enable the MAC address change notification function for an interface.

Run the **no** form of this command to disable the MAC address change notification function.

Run the **default** form of this command to disable the MAC address change notification function.

The MAC address change notification function is disabled by default.

Syntax

snmp trap mac-notification { **added** | **removed** }

no snmp trap mac-notification { **added** | **removed** }

default snmp trap mac-notification { **added** | **removed** }

Parameter Description

added: Enables the MAC address addition notification function.

removed: Enables the MAC address deletion notification function.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

After the MAC address change notification function is enabled on a device, the device generates a MAC address change notification message when the device learns a new MAC address or has aged a learned MAC address.

You can run the **show mac-address-table notification** command to display configurations of the MAC address change notification function.

Examples

The following example enables the Trap notification message function on TenGigabitEthernet 0/1 for sending a notification message upon MAC address addition.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# snmp trap mac-notification added
```

The following example enables the Trap notification message function on TenGigabitEthernet 0/1 for sending a notification message upon MAC address deletion.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# snmp trap mac-notification removed
```

1.29 mac-address-table warning-interval

Function

Run the **mac-address-table warning-interval** command to configure the interval for reporting MAC address table usage alarms.

Run the **no** form of this command to restore the default configuration.

Run the **default** form of this command to restore the alarm interval to the default value.

The interval for reporting MAC address table usage alarms is 3600s (one hour) by default.

Syntax

mac-address-table warning-interval *interval*

no mac-address-table warning-interval

default mac-address-table warning-interval

Parameter Description

interval: Alarm interval. The value is **0** or ranges from 10 to 7200. The value **0** indicates that the MAC address table usage alarm function is disabled.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the interval for reporting MAC address table usage alarms to 1800s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address-table warning-interval 1800
```

Notifications

1.30 mac-address-table warning-threshold

Function

Run the **mac-address-table warning-threshold** command to configure the upper and lower limits for reporting MAC address table usage alarms.

Run the **no** form of this command to restore the default configuration.

Run the **default** form of this command to restore the default configuration.

By default, the upper and lower limits for reporting MAC address table usage alarms are 80% and 70%, respectively.

Syntax

mac-address-table warning-threshold upper-limit *upper-limit-value* **lower-limit** *lower-limit-value*

no mac-address-table warning-threshold

default mac-address-table warning-threshold

Parameter Description

upper-limit-value: Upper limit for reporting MAC address table usage alarms. The value range is from 1 to 100.

lower-limit-value: Lower limit for reporting MAC address table usage alarms. The value range is from 1 to 100.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The value of *lower-limit-value* must be smaller than that of *upper-limit-value*.

If an alarm indicating that the usage exceeds the upper limit is reported, the MAC address table usage exceeds the normal standard. In this case, you are advised to offload the network traffic or expand the capacity.

Examples

The following example sets the upper and lower limits for reporting MAC address table usage alarms to 90% and 30%, respectively.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address-table warning-threshold upper-limit 90 lower-limit 30
```

1.31 mac-address-table flapping-logging

Function

Run the **mac-address-table flapping-logging** command to enable MAC address flapping detection.

Run the **no** form or the **default** form of this command to disable MAC address flapping detection.

MAC address flapping detection is disabled by default.

Syntax

mac-address-table flapping-logging

no mac-address-table flapping-logging

default mac-address-table flapping-logging

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

By enabling MAC address flapping detection, you can effectively monitor MAC address flapping events on the L2 network. Each time a MAC address flapping event occurs, the device reports a log alarm message.

Examples

The following example enables MAC address flapping detection.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address-table flapping-logging
```

Notifications

N/A

Common Errors

N/A

Platform Description

Related Commands

- **mac-address-table flapping action**

1.32 mac-address-table flapping action

Function

Run the **mac-address-table flapping action** command to enable the MAC address flapping protection policy.

Run the **no** form of this command to disable the MAC address flapping protection policy.

Run the **default** form of this command to disable the MAC address flapping protection policy.

The MAC address flapping protection policy is disabled by default.

Syntax

mac-address-table flapping action { **error-down** | **priority** *priority-number* }

no mac-address-table flapping action { **error-down** | **priority** }

default mac-address-table flapping action { **error-down** | **priority** }

Parameter Description

error-down: Specifies the policy applied to an interface: disabling an interface when a MAC address flapping event occurs on this interface.

priority *priotiry-number*: Specifies the priority of the error-down policy on an interface. The value range is from 0 to 5, and the default value is **0**. A larger value means a higher priority.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This function takes effect only when MAC address flapping detection is enabled.

When the device detects a MAC address flapping event between two interfaces with different priorities, the device reports an alarm message and disables the low-priority interface.

If you run the **default interface** command in global configuration mode for an interface that includes L2 subinterfaces, the MAC flapping protection policy applied to the interface is restored to the default configuration.

Examples

The following example enables MAC address flapping detection and disables TenGigabitEthernet 0/1 when a MAC address flapping event occurs in this interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# mac-address-table flapping-logging
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# mac-address-table flapping action
error-down
```

1 VLAN Commands

Command	Function
add interface	Add one access port or a group of access ports to the current virtual local area network (VLAN).
interface vlan	Create a switch virtual interface (SVI) for a VLAN and enter the SVI configuration mode.
name	Configure a name for a VLAN.
show vlan	Display member port information of a VLAN.
switchport access vlan	Add an access port to a specified VLAN.
switchport hybrid allowed vlan	Configure tagged and untagged allowed VLANs for a hybrid port.
switchport hybrid native vlan	Configure a native VLAN for a hybrid port.
switchport mode	Configure the L2 interface mode.
switchport trunk allowed vlan	Configure allowed VLANs for a trunk port or an uplink port.
switchport trunk native vlan	Configure a native VLAN for a trunk or uplink port.
vlan	Create a VLAN or enter the VLAN configuration mode.

1.1 add interface

Function

Run the **add interface** command to add one access port or a group of access ports to the current virtual local area network (VLAN).

Run the **no** form of this command to restore the current VLAN (other than VLAN 1) of one access port or a group of access ports to VLAN 1.

Run the **default** form of this command to delete one access port or a group of access ports from the current VLAN.

All L2 Ethernet interfaces belong to VLAN 1 by default, and no port exists in new VLANs.

Syntax

add interface { *interface-type interface-number* | **range** *interface-type interface-range* }

no add interface { *interface-type interface-number* | **range** *interface-type interface-range* }

default add interface { *interface-type interface-number* | **range** *interface-type interface-range* }

Parameter Description

interface *interface-type interface-number*: Specifies an interface in format of *interface-type [slot /] int.* The values are L2 Ethernet interfaces or L2 aggregation ports (APs).

range *interface-type interface-range*: Specifies a group of interfaces in format of *interface-type [slot /] intmin – intmax,int*. The values are L2 Ethernet interfaces or L2 APs.

Command Modes

VLAN configuration mode

Default Level

14

Usage Guidelines

This command takes effect to access ports only. If the interface is, for example, a trunk port, run the **switchport trunk allowed vlan** { **add** *vlan-list* | **remove** *vlan-list* } command to modify the allowed VLANs list of the interface.

If the interface is not an L2 access port, run the **switchport** command to configure the interface as an L2 interface, and run the **switchport mode access** command to configure the interface as an access port.

The configuration effect of this command is equivalent to that of the **switchport access vlan** *vlan-id* command that configures a VLAN for an interface in interface configuration mode. If both commands are configured, the later one prevails.

You must run the **interface aggregateport** *ap-number* command to create an AP before adding the AP to a VLAN. When you use this command to add an L2 AP to the current VLAN, the configuration takes effect to the L2 AP only.

Examples

The following example adds an access port GigabitEthernet 0/10 to VLAN 20 and displays the status and information about GigabitEthernet 0/10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 20
Hostname(config-vlan)# add interface gigabitethernet 0/10
Hostname(config-vlan)# show interface gigabitethernet 0/10 switchport
Interface             Switchport  Mode     Access  Native  Protected VLAN lists
--------------------   ----------  ------   ------  ------  ---------  ----------
GigabitEthernet 0/10   enabled     ACCESS   20    1     Disabled  ALL
```

The following example adds a group of access ports to VLAN 20 and displays the member port information of the VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 20
Hostname(config-vlan)# add interface range gigabitethernet 0/1-10,0/12-14,0/15
Hostname# show vlan
VLAN Name        Status            Ports
---------        ------            ----------------------------
1    VLAN0001    STATIC            Gi0/11,Gi0/16,Gi0/17,Gi0/18
                                   Gi0/19,Gi0/20,Gi0/21,Gi0/22
                                   Gi0/23,Gi0/24
20   VLAN0020    STATIC              Gi0/1,Gi0/2,Gi0/3,Gi0/4
                                   Gi0/5,Gi0/6,Gi0/7,Gi0/8
                                   Gi0/9,Gi0/10,Gi0/12,Gi0/13,
                                   Gi0/14,Gi0/15
```

The following example adds AggregatePort 10 to VLAN 20 and displays the information about AggregatePort 10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interfaces aggregateport 10
Hostname(config-if-AggregatePort 1)# show interface aggregateport 10 switchport
Interface          Switchport    Mode    Access   Native    Protected   VLAN lists
----------------    ----------    -----    ------   ------    --------
-----------
AggregatePort 10    enabled       ACCESS   1       1        Disabled    ALL
Hostname(config-if-AggregatePort 1)# exit
Hostname(config)# vlan 20
Hostname(config-vlan)# add interface aggregateport 10
Hostname(config-vlan)# show interface aggregateport 10 switchport
Interface          Switchport    Mode    Access   Native    Protected   VLAN lists
----------------    ----------    -----    ------   ------    --------
-----------
```

```
AggregatePort 10    enabled       ACCESS   20      1        Disabled    ALL
Hostname(config-vlan)# show vlan
VLAN Name        Status             Ports
---------        ------             ---------------------------------
1    VLAN0001    STATIC             Gi0/11,Gi0/16,Gi0/17,Gi0/18
                                    Gi0/19,Gi0/20,Gi0/21,Gi0/22
                                    Gi0/23,Gi0/24
20   VLAN0020     STATIC             Gi0/1,Gi0/2,Gi0/3,Gi0/4
                                    Gi0/5,Gi0/6,Gi0/7,Gi0/8
                                    Gi0/9,Gi0/10,Gi0/12,Gi0/13,
                                    Gi0/14,Gi0/15,Ag10
```

1.5 switchport access vlan

Function

Run the **switchport access vlan** command to add an access port to a specified VLAN.

Run the **no** form of this command to restore the current VLAN of the access port to VLAN 1.

Run the **default** form of this command to restore the current VLAN of the access port to the default VLAN.

The access port belongs to VLAN 1 by default.

Syntax

switchport access vlan *vlan-id*

no switchport access vlan

default switchport access vlan

Parameter Description

vlan *vlan-id*: Specifies the ID of a VLAN to which an access port is to be added. The value range is from 1 to 4094. Only one VLAN can be configured.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If the specified VLAN already exists, the port is added to the VLAN. If the specified VLAN does not exist, the system automatically creates this VLAN and adds the interface to the VLAN.

If the interface to be added is a trunk port, the port cannot be added to the specified VLAN.

Examples

The following example adds the access port GigabitEthernet 0/1 to VLAN 2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport access vlan 2
```

1.6 switchport hybrid allowed vlan

Function

Run the **switchport hybrid allowed vlan** command to configure tagged and untagged allowed VLANs for a hybrid port.

Run the **no** form of this command to restore the allowed VLANs of a hybrid port to default values.

Run the **default** form of this command to restore the allowed VLANs of a hybrid port to default values.

By default, the allowed VLANs of the hybrid port are tagged VLANs 2 to 4094 and untagged VLAN 1.

Syntax

switchport hybrid allowed vlan { [**add**] **tagged** | [**add**] **untagged** | **only tagged** | **remove** } *vlan-list*

no switchport hybrid allowed vlan

default switchport hybrid allowed vlan

Parameter Description

vlan-list: VLAN list. The value range is from 1 to 4094. The list can contain one or more VLANs. VLAN IDs are separated by commas (,). Continuous VLAN IDs are represented by connecting the first and the last VLAN IDs with a hyphen (-).

[**add**] **tagged** *vlan-list*: Adds the VLANs in *vlan-list* to the tagged allowed VLAN list of the hybrid port. Packets of the specified VLANs sent by the port are tagged. The native VLAN cannot be added to the tagged allowed VLAN list. The **add** parameter is optional. The command function is not affected by this parameter.

[**add**] **untagged** *vlan-list*: Adds the VLANs in *vlan-list* to the untagged allowed VLAN list of the hybrid port. Packets of the specified VLANs sent by the port are untagged. The native VLAN must be added to the untagged allowed VLAN list. The **add** parameter is optional. The command function is not affected by this parameter.

only tagged *vlan-list*: Adds the VLANs in *vlan-list* to the tagged allowed VLAN list of the hybrid port and removes other tagged VLANs from the allowed VLAN list. Other untagged VLANs are not affected.

remove *vlan-list*: Removes the VLANs in *vlan-list* from the allowed VLAN list of the hybrid port. The native VLAN can be removed as well.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example configures the L2 interface GigabitEthernet 0/1 as a hybrid port and removes the default allowed VLANs 1 to 4094.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode hybrid
Hostname(config-if-GigabitEthernet 0/1)# show interface gigabitethernet 0/1
switchport
Interface           Switchport   Mode    Access   Native   Protected   VLAN lists
------------------   ----------   ------   ------   ------   ---------   -------
GigabitEthernet 0/1   enabled     HYBRID   1       1       Disabled    ALL
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid allowed vlan remove 1-4094
Hostname(config-if-GigabitEthernet 0/1)# show interface gigabitethernet 0/1
switchport
Interface          Switchport        Mode     Access   Native    Protected   VLAN
lists
------------------   ----------   ------   ------   ------   ---------   -------
GigabitEthernet 0/1   enabled   HYBRID     1        1       Disabled
```

The following example adds VLAN 20 and VLAN 30 to the allowed VLAN list of the hybrid port and forwards packets of VLAN 20 and VLAN 30 in untagged mode.

```
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid allowed vlan untagged 20
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid allowed vlan add untagged
30
```

The following example adds VLAN 40 and VLAN 50 to the allowed VLAN list of the hybrid port and forwards packets of VLAN 40 and VLAN 50 in tagged mode.

```
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid allowed vlan tagged 40
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid allowed vlan tagged 50
```

The following example configures the native VLAN of the hybrid port GigabitEthernet 0/1 as VLAN 2.

```
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid native vlan 2
Hostname(config-if-GigabitEthernet 0/1)# show interface gigabitethernet 0/1
switchport
Interface     Switchport        Mode     Access   Native    Protected   VLAN lists
---------     ----------     ---------   ------     ------   ---------  -----------
GigabitEthernet 0/1   enabled   HYBRID     1         2       Disabled   20,30,40,50
```

The following example retains VLAN 20 as the allowed VLAN for the hybrid port, deletes other VLANs (VLAN 30, VLAN 40, and VLAN 50), and forwards packets of VLAN 20 in tagged mode.

```
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid allowed vlan only tagged
20
```

The following example deletes the allowed VLAN 20 from the hybrid port.

```
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid allowed vlan remove 20
```

1.7 switchport hybrid native vlan

Function

Run the **switchport hybrid native vlan** command to configure a native VLAN for a hybrid port.

Run the **no** form of this command to restore the native VLAN to VLAN 1.

Run the **default** form of this command to restore the native VLAN to VLAN 1.

The native VLAN of the hybrid port is VLAN 1 by default.

Syntax

switchport hybrid native vlan *vlan-id*

no switchport hybrid native vlan

default switchport hybrid native vlan

Parameter Description

vlan-id: Native VLAN of the hybrid port. The value range is from 1 to 4094. Only one VLAN can be configured.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Packets of the native VLAN sent by the hybrid port are untagged. Packets of an allowed VLAN (other than the native VLAN) sent by the hybrid port can be tagged or untagged.

When the hybrid port receives an untagged packet, the hybrid port considers that the packet comes from the native VLAN of this port.

Examples

The following example configures the native VLAN of the hybrid port GigabitEthernet 0/1 as VLAN 2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode hybrid
Hostname(config-if-GigabitEthernet 0/1)# switchport hybrid native vlan 2
Hostname(config-if-GigabitEthernet 0/2)# show interface gigabitethernet 0/2
switchport
Interface          Switchport Mode     Access Native Protected VLAN lists
-------------------- ---------- --------- ------ ------ --------- ----------
GigabitEthernet 0/1  enabled    HYBRID    1      2     Disabled  ALL
```

Notifications

N/A

Common Errors

No native VLAN is created before it is configured. In this case, VLAN configuration is not completed though the returned value is correct.

Platform Description

N/A

Related Commands

- **switchport mode**

1.8 switchport mode

Function

Run the **switchport mode** command to configure the L2 interface mode.

Run the **no** form of this command to restore the L2 interface mode to the default value.

Run the **default** form of this command to restore the L2 interface mode to the default value.

The L2 interface mode is **access** by default.

Syntax

switchport mode { **access** | **trunk** | **hybrid** | **uplink** }

no switchport mode

default switchport mode

Parameter Description

access: Configures the L2 interface mode as **access**.

trunk: Configures the L2 interface mode as **trunk**.

hybrid: Configures the L2 interface mode as **hybrid**.

Uplink: Configures the L2 interface mode as **uplink**.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

- Before you configure the L2 interface mode as **access**, **trunk**, **hybrid**, or **uplink**, ensure that the interface is an L2 interface. You can run the **switchport** command to configure an interface as an L2 interface, and run the **no switchport** command to configure an interface as an L3 interface. When you configure an interface as an L2/L3 interface, all attributes of the interface are restored to the default values in this interface mode.
- If the L2 interface mode is **access**, this interface can be assigned to one VLAN only. Therefore, the native VLAN is the allowed VLAN, and this VLAN is VLAN 1 by default. You can run the **switchport access vlan** command to assign this interface to a specified VLAN. Packets sent by the access port are untagged.
- If the L2 interface mode is **trunk**, this interface has one native VLAN, and this VLAN is VLAN 1 by default. You can run the **switchport trunk native vlan** command to configure the native VLAN for the interface. The allowed VLANs are VLANs 1 to 4094 by default, namely, all VLANs. You can run the **switchport trunk allowed vlan** command to configure allowed VLANs for the interface. The native VLAN can be excluded from the allowed VLANs. In this case, data of the native VLAN cannot be forwarded by the port. Packets of the native VLAN forwarded by the trunk port are untagged, and packets of other allowed VLANs are tagged.
- If the L2 interface mode is **uplink**, this interface has one native VLAN, and this VLAN is VLAN 1 by default. You can run the **switchport trunk native vlan** command to configure a native VLAN for the interface. The allowed VLANs are VLANs 1 to 4094 by default, namely, all VLANs. You can run the **switchport trunk allowed vlan** command to configure allowed VLANs for the interface. Unlike the trunk port, the uplink port

forwards tagged packets.

- If the L2 interface mode is **hybrid**, this interface has one native VLAN, and this VLAN is VLAN 1 by default. You can run the **switchport hybrid native vlan** command to configure a native VLAN for the interface. The allowed VLANs are VLANs 1 to 4094 by default, namely, all VLANs. You can run the **switchport hybrid allowed vlan** command to configure allowed VLANs for the interface. Packets of the native VLAN sent by the hybrid port are untagged. Unlike the trunk port, the hybrid port can forward tagged and untagged packets of allowed VLANs other than the native VLAN.
- You can run the **show interface** [*interface id*] **switch** command to display interface configurations.

Examples

The following example configures GigabitEthernet 0/1 as an L2 interface and then configures the interface as an access port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport
Hostname(config-if-GigabitEthernet 0/1)# switchport mode access
```

The following example configures the L2 interface GigabitEthernet 0/1 as a trunk port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode trunk
```

The following example configures the L2 interface GigabitEthernet 0/1 as an uplink port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode uplink
```

The following example configures the L2 interface GigabitEthernet 0/1 as a hybrid port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode hybrid
```

Related Commands

- **switchport access vlan**

1.9 switchport trunk allowed vlan

Function

Run the **switchport trunk allowed vlan** command to configure allowed VLANs for a trunk port or an uplink port.

Run the **no** form of this command to restore the allowed VLANs of the trunk or uplink port to default values.

Run the **default** form of this command to restore the allowed VLANs of the trunk or uplink port to default values.

The allowed VLANs of the trunk port are VLANs 1 to 4094 and the allowed VLANs of the uplink port are VLANs 1 to 4094 by default.

Syntax

switchport trunk allowed vlan { **all** | { **add** | **remove** | **except** | **only** } *vlan-list* }

no switchport trunk allowed vlan

default switchport trunk allowed vlan

Parameter Description

all: Adds all VLANs to the allowed VLAN list of the trunk port.

vlan-list: VLAN list. The value range is from 1 to 4094. The list can contain one or more VLANs. VLAN IDs are separated by commas (,). Continuous VLAN IDs are represented by connecting the first and the last VLAN IDs with a hyphen (-).

add *vlan-list*: Adds the VLANs in *vlan-list* to the allowed VLAN list of the trunk port.

remove *vlan-list*: Removes the VLANs in *vlan-list* from the allowed VLAN list of the trunk port.

except *vlan-list*: Adds all the VLANs other than those in *vlan-list* to the allowed VLAN list of the trunk port.

only *vlan-list*: Adds the VLANs in *vlan-list* to the allowed VLAN list of the trunk port and removes other VLANs from the allowed VLAN list.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

You can configure an allowed VLAN list for the trunk or uplink port to direct traffic of the specified VLANs to pass through this trunk or uplink port.

You can run the **show interfaces** command to display interface configurations.

Examples

The following example removes VLAN 2 from the allowed VLAN list of the trunk port GigabitEthernet 0/10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/10
Hostname(config-if-GigabitEthernet 0/10)# switchport mode trunk
Hostname(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan remove 2
```

The following example adds VLANs other than VLAN 10 to the allowed VLAN list of the trunk port GigabitEthernet 0/10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/10
Hostname(config-if-GigabitEthernet 0/10)# switchport mode trunk
Hostname(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan except 10
```

The following example adds only VLAN 10 to the allowed VLAN list of the trunk port GigabitEthernet 0/10 and removes other VLANs from the allowed list of the port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/10
Hostname(config-if-GigabitEthernet 0/10)# switchport mode trunk
Hostname(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan only 10
```

The following example removes VLAN 10 from the allowed VLAN list of the uplink port GigabitEthernet 0/10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/10
Hostname(config-if-GigabitEthernet 0/10)# switchport mode uplink
Hostname(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan remove 10
```

The following example adds VLANs other than VLAN 10 to the allowed VLAN list of the uplink port GigabitEthernet 0/10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/10
Hostname(config-if-GigabitEthernet 0/10)# switchport mode uplink
Hostname(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan except 10
```

The following example adds only VLAN 10 to the allowed VLAN list of the uplink port GigabitEthernet 0/10 and removes other VLANs from the allowed list of the port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/10
Hostname(config-if-GigabitEthernet 0/10)# switchport mode uplink
Hostname(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan only 10
```

1.10 switchport trunk native vlan

Function

Run the **switchport trunk native vlan** command to configure a native VLAN for a trunk or uplink port.

Run the **no** form of this command to restore the native VLAN of a port to VLAN 1.

Run the **default** form of this command to restore the native VLAN of a port to VLAN 1.

The native VLAN of a trunk or uplink port is VLAN 1 by default.

Syntax

switchport trunk native vlan *vlan-id*

no switchport trunk native vlan

default switchport trunk native vlan

Parameter Description

vlan-id: ID of the configured native VLAN. The value range is from 1 to 4094. Only one VLAN can be configured.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

After you configure a native VLAN for the trunk port, when the trunk port receives an untagged packet, the trunk port considers that the packet comes from the native VLAN of this port.

Packets of the native VLAN sent by the port are untagged.

Examples

The following example configures the native VLAN of the trunk port GigabitEthernet 0/10 as VLAN 10.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# interface gigabitethernet 0/10
Hostname(config-if-GigabitEthernet 0/10)# switchport mode trunk
Hostname(config-if-GigabitEthernet 0/10)# switch trunk native vlan 10
```

The following example configures the native VLAN of the uplink port GigabitEthernet 0/10 as VLAN 10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/10
Hostname(config-if-GigabitEthernet 0/10)# switchport mode uplink
Hostname(config-if-GigabitEthernet 0/10)# switch trunk native vlan 10
```

1 Private VLAN Commands

Command	Function
debug bridge pvlan	Enable the private VLAN (PVLAN) debugging function.
private-vlan	Configure a common static VLAN as a PVLAN and configure the PVLAN as a primary or secondary VLAN.
show vlan private-vlan	Display the PVLAN configurations.
switchport mode private-vlan	Configure a port as a host or promiscuous port of a PVLAN.

1.1 debug bridge pvlan

Function

Run the **debug bridge pvlan** command to enable the private VLAN (PVLAN) debugging function.

Run the **no** form of this command to disable this feature.

The PVLAN debugging function is disabled by default.

Syntax

debug bridge pvlan

no debug bridge pvlan

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

Debugging information includes all errors occurring during the configuration of a PVLAN, prompt messages, and causes of VLAN and port configuration failures.

After you enable this function, you can view the configuration of the PVLAN function, packet processing by virtual interfaces, and debugging information in the case of a packet processing failure debug information, which helps you locate and diagnose faults.

Examples

The following example enables the PVLAN debug function.

```
Hostname> enable
Hostname# debug bridge pvlan
```

The following example disables the PVLAN debug function.

```
Hostname> enable
Hostname# no debug bridge pvlan
```

Debugging Information

PVLAN configuration debugging information

Debugging information: The VLAN pair (4-6) is invalid.

Explanation: When you try to associate a port with a PVLAN pair or remove the association, the PVLAN pair does not have a valid L2 association.

Cause: The specified PVLAN pair does not have a valid L2 association.

Handling suggestion: Ensure that the specified PVLAN pair has a valid L2 association.

1.2 private-vlan

Function

Run the **private-vlan** command to configure a common static VLAN as a PVLAN and configure the PVLAN as a primary or secondary VLAN.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

A VLAN is a common VLAN and has no PVLAN attribute by default.

Syntax

private-vlan { **community** | **isolated** | **primary** }

no private-vlan { **community** | **isolated** | **primary** }

default private-vlan { **community** | **isolated** | **primary** }

Parameter Description

community: Configures the VLAN as a community VLAN of the secondary VLAN.

isolated: Configures the VLAN as an isolated VLAN of the secondary VLAN.

primary: Configures the VLAN as a primary VLAN.

Command Modes

VLAN mode

Default Level

14

Usage Guidelines

If VLAN 1 contains non-host and non-promiscuous ports, when you configure VLAN 1 as a PVLAN, an error is displayed. It is not recommended to configure VLAN 1 as a PVLAN.

You can use the **show vlan private-vlan** { **community** | **isolated** | **primary** } command to display configurations of different types of VLANs in a PVLAN.

Examples

The following example configures VLAN 90 as a primary VLAN, VLAN 91 as an isolated VLAN, and VLAN 92 as a community VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 90
Hostname(config-vlan)# private-vlan primary
Hostname(config-vlan)# exit
Hostname(config)# vlan 91
Hostname(config-vlan)# private-vlan isolated
Hostname(config-vlan)# exit
Hostname(config)# vlan 92
Hostname(config-vlan)# private-vlan community
Hostname(config-vlan)# exit
```

The following example cancels the attributes of the primary VLAN and secondary VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 90
Hostname(config-vlan)# no private-vlan primary
Hostname(config-vlan)# exit
Hostname(config)# vlan 91
Hostname(config-vlan)# no private-vlan isolated
Hostname(config)# vlan 92
Hostname(config-vlan)# no private-vlan community
```

The following example restores the default configurations of a VLAN, that is, restores the PVLAN to a common VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 90
Hostname(config-vlan)# default private-vlan primary
Hostname(config-vlan)# exit
Hostname(config)# vlan 91
Hostname(config-vlan)# default private-vlan isolated
Hostname(config-vlan)# exit
Hostname(config)# vlan 92
Hostname(config-vlan)# default private-vlan community
```

Notifications

When you try to use the **no private-vlan** command to restore a PVLAN to a common static VLAN and the { **community** | **isolated** | **primary** } parameter in the command is inconsistent with the PVLAN mode of the PVLAN, the following notification will be displayed:

```
Types of private VLANs do not match
```

When you try to configure a VLAN that contains a non-host or non-promiscuous port as a PVLAN, the following notification will be displayed:

```
Setting failure for some ports are not allowed to private vlan
```

When you try to configure a VLAN that has been configured as a MAC VLAN as a PVLAN, the following notification will be displayed:

```
Can't set VLAN as non static vlan when mac vlan enabled.
```

When you try to configure a VLAN that is bound to an L3 SVI as a community VLAN, the following notification will be displayed:

```
The VLAN with svi can not be set to secondary VLAN
```

Common Errors

A dynamic VLAN is configured as a PVLAN.

Platform Description

```

Table 1-1 Output Fields of the show vlan private-vlan Command

Field	Description
VLAN	VLAN ID
Type	VLAN attribute ● **primary**: Primary VLAN ● **isolated**: Isolated VLAN ● **community**: Community VLAN
Status	L2 association status of a PVLAN ● **inactive**: No L2 association is configured for a PVLAN. ● **active**: An L2 association has been configured for a PVLAN.
Routed	L3 interface status of the primary VLAN or L3 association status of a secondary VLAN ● Disabled: No L3 interface is created for the primary VLAN or no L3 association is configured between the primary VLAN and a secondary VLAN. ● Enabled: An L3 interface has been created for the primary VLAN or an L3 association has been configured between the primary VLAN and a secondary VLAN.
Ports	Ports that are added to a PVLAN
Associated VLANs	Secondary VLANs that are L2 associated with the primary VLAN or a primary VLAN that is L2 associated with secondary VLANs

1.4 switchport mode private-vlan

Function

Run the **switchport mode private-vlan** command to configure a port as a host or promiscuous port of a PVLAN.

Run the **no switchport mode** command to restore the port to an access port.

Run the **default switchport mode** command to restore the port to an access port.

A port is an access port by default.

Syntax

switchport mode private-vlan { **host** | **promiscuous** }

no switchport mode

default switchport mode

Parameter Description

host: Configures a port as a host port of a PVLAN. A port connected to a host is configured as a host port.

promiscuous: Configures a port as a promiscuous port of a PVLAN. A port connected to a gateway or server is configured as a promiscuous port.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If a port is configured as a host port and associated with a PVLAN pair by using the **switchport private-vlan host-association** *pvid svid* command, the host port can be added to a secondary VLAN. A host port in an isolated VLAN is called an isolated port, and a host port in a community VLAN is called a community port.

If a port is configured as a promiscuous port and associated with a PVLAN pair by using the **switchport private-vlan mapping** *pvid { svlist* **| add** *svlist* | **remove** *svlist* } command, the port can be added to the primary VLAN. In this case, the port is a promiscuous port.

Examples

The following example configures GigabitEthernet 0/1 as a host port of a PVLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode private-vlan host
```

The following example configures GigabitEthernet 0/2 as a promiscuous port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/2
Hostname(config-if-GigabitEthernet 0/2)# sw mode private-vlan promiscuous
```

The following example restores GigabitEthernet 0/1 from a host port to an access port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no switchport mode
```

Notifications

When the MAC VLAN function is enabled on GigabitEthernet 0/1 and you try to configure the interface as a host or promiscuous port, the following notification will be displayed:

```
Can't change port mode since mac vlan has been enabled.
Operation is not supported on interface GigabitEthernet 0/1: it is not supported by
the hardware!
```

Common Errors

N/A

Platform Description

1 Super VLAN Commands

Command	Function
bcast vlan	Configure a broadcast virtual local area network (VLAN) for a super VLAN.
proxy-arp	Enable the proxy Address Resolution Protocol (ARP) function for a VLAN.
show supervlan	Display configurations of a super VLAN and its sub VLANs.
subvlan	Configure an existing common VLAN as a sub VLAN of a super VLAN.
subvlan-address-range	Configure an IP address range for a sub VLAN.
supervlan	Configure a super VLAN.

1.1 bcast vlan

Function

Run the **bcast vlan** command to configure a broadcast virtual local area network (VLAN) for a super VLAN.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No broadcast VLAN is configured in a super VLAN by default.

Syntax

bcast vlan *sub-vlan-id*

no bcast vlan

default bcast vlan

Parameter Description

bcast vlan *sub-vlan-id*: Specifies the ID of a sub VLAN that is configured as a broadcast VLAN. The value range is from 1 to 4094. The VLAN to be configured as a broadcast VLAN must be a sub VLAN of the super VLAN. Only one broadcast VLAN can be configured for a super VLAN.

Command Modes

VLAN mode

Default Level

14

Usage Guidelines

A broadcast VLAN is configured in super VLAN configuration mode. If no broadcast VLAN is configured for a super VLAN, broadcast packets of the super VLAN are sent to all sub VLANs of the super VLAN. If a broadcast VLAN is configured, broadcast packets of the super VLAN are sent to only this broadcast VLAN.

Examples

The following example configures VLAN 2 as a super VLAN, VLANs 10, 20 and 30 as sub VLANs, and VLAN 10 as the broadcast VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan range 10,20,30
Hostname(config-vlan-range)# exit
Hostname(config)# vlan 2
Hostname(config-vlan)# supervlan
Hostname(config-vlan)# subvlan 10,20,30
Hostname(config-vlan)# bcast vlan 10
```

The following example removes the broadcast VLAN from VLAN 2.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# vlan 2
Hostname(config-vlan)# no bcast vlan
```

1.2 proxy-arp

Function

Run the **proxy-arp** command to enable the proxy Address Resolution Protocol (ARP) function for a VLAN.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The proxy ARP function of a VLAN is enabled by default.

Syntax

proxy-arp

no proxy-arp

default proxy-arp

Parameter Description

N/A

Command Modes

VLAN mode

Default Level

14

Usage Guidelines

The proxy ARP function must be enabled for a super VLAN and its sub VLANs.

Examples

The following example enables the proxy ARP function.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# vlan 2
Hostname(config-vlan)# proxy-arp
```

The following example disables the proxy ARP function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
Hostname(config-vlan)# no proxy-arp
```

- **show supervlan**

1.3 show supervlan

Function

Run the **show supervlan** command to display configurations of a super VLAN and its sub VLANs.

Syntax

show supervlan [**id** *super-vlan-id*]

Parameter Description

id *super-vlan-id*: Displays configuration of a specified super VLAN. The value range is from 1 to 4094. The specified VLAN ID must be the ID of the super VLAN. Only one VLAN ID can be specified. If the **id** *super-vlan-id* parameter is not specified, the configurations of all super VLANs and sub VLANs are displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

You can use this command to view mappings between a super VLAN and its sub VLANs and other information.

Examples

The following example displays configurations of super VLAN 2.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# show supervlan id 2
supervlan id  supervlan arp-proxy  bcast vlan  subvlan id  subvlan arp-proxy  subvlan
ip range
------------  -------------------  ----------  ----------  -----------------
----------------
2           ON                10         10        ON   192.168.196.10 -
192.168.196.50
                                       20        ON   192.168.196.60 -
192.168.196.100
                                       30        ON   192.168.196.110 -
192.168.196.150
```

The following example displays configurations of all super VLANs.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# show supervlan
supervlan id  supervlan arp-proxy  bcast vlan  subvlan id  subvlan arp-proxy  subvlan
ip range
------------  -------------------  ----------  ----------  -----------------
----------------
2           ON                10         10        ON   192.168.196.10 -
192.168.196.50
                                       20        ON   192.168.196.60 -
192.168.196.100
                                       30        ON   192.168.196.110 -
192.168.196.150
6           ON                          7-8       ON
```

Table 1-1 Output Fields of the show supervlan Command

Field	Description
supervlan id	VLAN ID of a super VLAN
supervlan arp-proxy	Whether the proxy ARP function of the super VLAN is enabled ● **ON**: Enabled ● **OFF**: Disabled
bcast vlan	Broadcast VLAN of the super VLAN
subvlan id	VLAN ID of a sub VLAN
subvlan arp-proxy	Whether the proxy ARP function of the sub VLAN is enabled ● **ON**: Enabled ● **OFF**: Disabled
subvlan ip range	IP address range of the sub VLAN

1.4 subvlan

Function

Run the **subvlan** command to configure an existing common VLAN as a sub VLAN of a super VLAN.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No common VLAN is configured as a sub VLAN of a super VLAN by default.

Syntax

subvlan [*vlan-id-list*]

no subvlan [*vlan-id-list*]

default subvlan [*vlan-id-list*]

Parameter Description

vlan-id-list: VLAN IDs that are configured as sub VLANs. The value range is from 2 to 4094. The specified VLAN must exist. VLAN 1 cannot be configured as a sub VLAN. The VLAN list contains one or more VLANs. When multiple VLANs are contained, separate VLAN IDs by a comma (,) or connect the first and last VLAN IDs with a hyphen (-) to represent continuous VLAN IDs.

Command Modes

VLAN mode

Default Level

14

Usage Guidelines

You must enter the super VLAN configuration mode to add sub VLANs. If multiple common VLANs need to use the same network segment, configure them as sub VLANs of a super VLAN.

Examples

The following example configures VLAN 2 as a super VLAN and adds sub VLANs 10, 20 and 30 to the super VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
```

```
Hostname(config-vlan)# supervlan
Hostname(config-vlan)# subvlan 10,20,30
```

The following example removes sub VLAN 20 from super VLAN 2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
Hostname(config-vlan)# no subvlan 20
```

The following example removes sub VLAN 30 from super VLAN 2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
Hostname(config-vlan)# default subvlan 30
```

The following example removes all sub VLANs from super VLAN 2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
Hostname(config-vlan)# default subvlan
```

Notifications

When you configure sub VLANs not in super VLAN configuration mode, the following notification will be displayed:

```
vlan 2 is not a supervlan
```

If the VLAN to be configured is a dynamic VLAN rather than a static VLAN, the following notification will be displayed

```
The vlan is dynamic vlan
```

If an SVI has been configured for a super VLAN, the system assigns an L3 interface invisible to users to each sub VLAN of the super VLAN. When you add a sub VLAN to the super VLAN, the configuration may fail due to system resource deficiency. The following notification will be displayed:

```
the vlan can't be set as subvlan for lack of resources.
```

If an SVI has been configured for a VLAN, when you try to configure this VLAN as a sub VLAN of a super VLAN, the following notification will be displayed:

```
Following reason prevent some vlan to be set as supervlan 2's subvlan
The vlan has created interface
```

Common Errors

(1) An inexistent VLAN is configured as a sub VLAN.

(2) Sub VLANs are not configured in super VLAN configuration mode.

(3) A sub VLAN is added to more than one super VLAN.

(4) An L3 interface has been configured for a VLAN and then the VLAN is configured as a sub VLAN. The operation will fail.

(5) A dynamic VLAN is configured as a sub VLAN.

Platform Description

1.5 subvlan-address-range

Function

Run the **subvlan-address-range** command to configure an IP address range for a sub VLAN.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No IP address range is specified for a sub VLAN by default.

Syntax

subvlan-address-range *start-ip-address end-ip-address*

no subvlan-address-range

default subvlan-address-range

Parameter Description

start-ip-address: Start IP address. The value range must be in the same network segment as the gateway of the super VLAN.

end-ip-address: End IP address. The value range must be in the same network segment as the gateway of the super VLAN.

Command Modes

VLAN mode

Default Level

14

Usage Guidelines

After an IP address range is configured for a sub VLAN, users in the sub VLAN cannot communicate when their IP addresses are out of this range.

Examples

The following example configures an IP address range for a sub VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
Hostname(config-vlan)# subvlan-address-range 192.168.23.1 192.168.23.5
```

Notifications

N/A

Common Errors

(1) A dynamic VLAN is configured as a super VLAN.

(2) The configured IP address range is not in the same network segment as the gateway of the super VLAN.

Platform Description

N/A

Related Commands

- **show supervlan**

1.6 supervlan

Function

Run the **supervlan** command to configure a super VLAN.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No common VLAN is configured as a super VLAN by default.

Syntax

supervlan

no supervlan

default supervlan

Parameter Description

N/A

Command Modes

VLAN mode

Default Level

14

Usage Guidelines

Only existent VLANs can be configured as super VLANs. VLAN 1 cannot be configured as a super VLAN.

A super VLAN cannot be configured as a sub VLAN of another super VLAN. A sub VLAN of a super VLAN cannot be configured as a super VLAN.

No physical port can be added to a super VLAN.

After a super VLAN is configured, you must configure an SVI and an IP address for this SVI so that users in sub VLANs of the super VLAN can communicate. No SVI can be configured for a sub VLAN.

Examples

The following example configures VLAN 2 as a super VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
Hostname(config-vlan)# supervlan
```

Notifications

If you configure a sub VLAN of a super VLAN as a new super VLAN, the following notification will be displayed:

```
the vlan is other supervlan's subvlan
```

Common Errors

1 Voice VLAN Commands

Command	Function
show voice vlan	Display the configuration and current status of a voice VLAN, including the port on which the voice VLAN function is enabled and the work mode of the voice VLAN.
show voice vlan oui	Display source MAC address entries used by voice VLAN to identify voice packets on the current device.
voice vlan	Configure an existent common VLAN as a voice VLAN.
voice vlan aging	Configure aging time for a port in a voice VLAN in global configuration mode. The aging time indicates the time that the port resides in the voice VLAN when the port fails to receive voice traffic.
voice vlan cos	Configure the CoS value for voice traffic in a voice VLAN in global configuration mode.
voice vlan dscp	Configure the DSCP value for voice traffic in a voice VLAN in global configuration mode.
voice vlan enable	Enable the voice VLAN function on a port.
voice vlan mac-address	Configure a voice traffic OUI to be identified by voice VLAN in global configuration mode.
voice vlan mode auto	Set the voice VLAN of a port to work in automatic mode.
voice vlan security enable	Enable the security mode for a voice VLAN in global configuration mode.

1.1 show voice vlan

Function

Run the **show voice vlan** command to display the configuration and current status of a voice VLAN, including the port on which the voice VLAN function is enabled and the work mode of the voice VLAN.

Syntax

show voice vlan

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays the configuration and current status of a voice VLAN on a device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# show voice vlan
Voice VLAN status      : ENABLE
Voice VLAN ID         : 2
Voice VLAN security mode: Security
Voice VLAN aging time   : 5 minutes
Voice VLAN cos        : 6
Voice VLAN dscp       : 46
Current voice vlan enabled port mode:
PORT                            MODE
GigabitEthernet 0/1               Auto
```

Table 1-1 Output Fields of the show voice vlan Command

Field	Description
Voice VLAN status	Whether the voice VLAN function is enabled on a port ● **Enable**: Enabled ● **Disable**: Disabled
Voice VLAN ID	ID of a voice VLAN

Field	Description
Voice VLAN security mode	Security mode of the voice VLAN
Voice VLAN aging time	Aging time of the voice VLAN. The value range is from 5 to 10000, in minutes, and the default value is **1440**.
Voice VLAN cos	Class of Service (CoS) value of voice traffic in the voice VLAN. The value range is from 0 to 7, and the default value is **6**. A larger value indicates a higher priority.
Voice VLAN dscp	Differentiated Services Code Point (DSCP) value of voice traffic in the voice VLAN. The value range is from 0 to 63, and the default value is **46**. A larger value indicates a higher priority.
PORT	Port on which the voice VLAN function is enabled
MODE	Work mode of the port on which the voice VLAN function is enabled

1.2 show voice vlan oui

Function

Run the **show voice vlan oui** command to display source MAC address entries used by voice VLAN to identify voice packets on the current device.

Syntax

show voice vlan oui

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

You can use this command to display the source MAC address entries used to identify voice packets, including the Organizationally Unique Identifier (OUI), OUI mask, and description.

Examples

The following example displays the source MAC address entries used by voice VLAN to identify voice packets on the current device, including the OUI, OUI mask, and description.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# show voice vlan oui
OUI           Mask          Description
0001.e300.0000  ffff.ff00.0000  Siemensphone
0003.6b00.0000  ffff.ff00.0000  Ciscophone
0004.0d00.0000  ffff.ff00.0000  Avayaphone
0060.b900.0000  ffff.ff00.0000  Philips/NECphone
00d0.1e00.0000  ffff.ff00.0000  Pingtelphone
00e0.7500.0000  ffff.ff00.0000  Polycomphone
00e0.bb00.0000  ffff.ff00.0000  3comphone
```

Table 1-2 Output Fields of the show voice vlan oui Command

Field	Description
OUI	OUI. If the source MAC address in a voice packet matches the OUI, the packet is assigned to the voice VLAN.
Mask	OUI mask, which indicates the valid length of the OUI and is expressed by a mask.
Description	Description of the OUI, which describes the name of a voice device.

1.3 voice vlan

Function

Run the **voice vlan** command to configure an existent common VLAN as a voice VLAN.

Run the **no** form of this command to delete all voice VLANs.

No voice VLAN is configured by default.

Syntax

voice vlan *vlan-id*

no voice vlan

Parameter Description

vlan-id: ID of a voice VLAN. The value range is from 2 to 4094. Only one VLAN can be configured as a voice VLAN on a device.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can run the **show voice vlan** command to display the configuration and current status of a voice VLAN.

Caution

- You must create a VLAN before configuring a voice VLAN.
- VLAN 1 is the default VLAN and does not need to be created, but VLAN 1 cannot be configured as a voice VLAN.
- A VLAN cannot be configured as a voice VLAN and a super VLAN at the same time.
- If 802.1x automatic VLAN hopping is enabled on an access port, do not configure the issued VLAN ID as the voice VLAN ID to ensure that 802.1x automatic VLAN hopping functions properly.
- Do not configure a VLAN as a remote VLAN of the remote switched port analyzer (RSPAN) and a voice VLAN at the same time. Otherwise, the RSPAN and voice VLAN functions may be affected.
- Only one voice VLAN can be configured. You must disable the voice VLAN function by running the **no voice vlan** command before you modify the voice VLAN ID.

Examples

The following example creates VLAN 2 and configures VLAN 2 as a voice VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
Hostname(config-vlan)# exit
Hostname(config)# voice vlan 2
```

Notifications

N/A

Common Errors

See "Usage Guidelines."

Platform Description

1.4 voice vlan aging

Function

Run the **voice vlan aging** command to configure aging time for a port in a voice VLAN in global configuration mode. The aging time indicates the time that the port resides in the voice VLAN when the port fails to receive voice traffic.

Run the **no** form of this command to restore the default configuration.

The default aging time of a port in a voice VLAN is 1440 minutes.

Syntax

voice vlan aging *age*

no voice vlan aging

Parameter Description

age: Aging time of a port in a voice VLAN. The value range is from 5 to 10000, in minutes.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can configure the aging time for a port in a voice VLAN on the device. After the MAC address in a voice packet ages, if the device still fails to receive any voice packet from the input port in the specified aging time, the device removes the port from the voice VLAN.

Note

The aging time takes effect in the automatic mode only and starts after the source MAC address in a voice packet ages.

You can run the **show voice vlan** command to display the configuration and current status of a voice VLAN.

Examples

The following example sets the aging time for a port in a voice VLAN to 10 minutes in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# voice vlan aging 10
```

1.5 voice vlan cos

Function

Run the **voice vlan cos** command to configure the CoS value for voice traffic in a voice VLAN in global configuration mode.

Run the **no** form of this command to restore the default configuration.

The default CoS value of voice traffic in a voice VLAN is **6**.

Syntax

voice vlan cos *cos-value*

no voice vlan cos

Parameter Description

cos-value: CoS value of voice traffic in a voice VLAN. The value range is from 0 to 7. A larger value indicates a higher priority.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can modify the CoS and DSCP values for voice traffic in a voice VLAN on the device to improve the priority of voice traffic and ensure the quality of voice calls.

The CoS value indicates the L2 priority and is saved in the L2 header of a packet. It is filled in the **PRI** field of the IEEE 802.1Q VLAN tag.

The CoS value of a common VLAN packet is **0**, which indicates the lowest priority. The default CoS value of voice traffic in a voice VLAN is **6**, which indicates a higher priority than common VLAN packets.

You can run the **show voice vlan** command to display the configuration and current status of a voice VLAN.

Examples

The following example sets the CoS value for voice traffic in a voice VLAN to **5**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# voice vlan cos 5
```

1.6 voice vlan dscp

Function

Run the **voice vlan dscp** command to configure the DSCP value for voice traffic in a voice VLAN in global configuration mode.

Run the **no** form of this command to restore the default configuration.

The default DSCP value of voice traffic in a voice VLAN is **46**.

Syntax

voice vlan dscp *dscp-value*

no voice vlan dscp

Parameter Description

dscp-value: DSCP value of voice traffic in a voice VLAN. The value range is from 0 to 63. A larger value indicates a higher priority.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can modify the CoS and DSCP values for voice traffic in a voice VLAN on the device to improve the priority of voice traffic and ensure the quality of voice calls.

The DSCP value indicates the IP priority (IP PRE) and is saved in the L3 header of a packet. For an IPv4 packet, the DSCP value is filled in the first six bits (bit 0 to bit 5) in the **ToS** field of the IPv4 packet header. For an IPv6 packet, the DSCP value is filled in the first six bits in the **Traffic Class** field of the IPv6 packet header.

The DSCP value of a common IP packet is **0**, which indicates the lowest priority. The default DSCP value of voice traffic in a voice VLAN is **46**, which indicates a higher priority than common VLAN packets.

You can run the **show voice vlan** command to display the configuration and current status of a voice VLAN.

Examples

The following example sets the DSCP value for voice traffic in a voice VLAN to **40**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# voice vlan dscp 40
```

1.7 voice vlan enable

Function

Run the **voice vlan enable** command to enable the voice VLAN function on a port.

Run the **no** form of this command to disable this feature.

The voice VLAN function is disabled on a port by default.

Syntax

voice vlan enable

no voice vlan enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The voice VLAN function must be enabled on a physical port by default. The voice VLAN function can be enabled on an access port, a trunk port, a hybrid port, an uplink port, a host port of PVLAN, and a promiscuous port of PVLAN.

Note

Even if the voice VLAN function is not enabled in global configuration mode, you can also enable the voice VLAN function on a port but the configuration does not take effect.

When a voice VLAN works in automatic mode, the device identifies the source MAC address in a packet and compares the OUI field in the MAC address with the OUI configured on the device. If they match, the device automatically adds the input port of the voice packet to the voice VLAN, issues a policy to change the priority of the voice packet to the voice traffic priority specified for the voice VLAN, and maintains the port in the voice VLAN according to the aging mechanism. Therefore, do not manually add the port to the voice VLAN in automatic mode. Ensure that the voice VLAN is not in the allowed VLAN list of the port. Otherwise, the voice VLAN function cannot be enabled on the port.

When a voice VLAN works in manual mode, you are required to manually add the port to the voice VLAN and then enable the voice VLAN function on the port. The device identifies the source MAC address in a packet and compares the OUI field in the MAC address with the OUI configured on the device. If they match, the device delivers a policy to change the priority of the voice packet to the voice traffic priority specified for the voice VLAN.

You can run the **show voice vlan** command to display the configuration and current status of a voice VLAN.

Examples

The following example connects a PC and a VoIP telephone to GigabitEthernet 0/1 in serial mode. In this case, the voice VLAN works in automatic mode. VLAN 5 is created to transmit PC data traffic, and VLAN 2 is created as a voice VLAN to transmit voice traffic. GigabitEthernet 0/1 is configured as a trunk port, VLAN 5 is added to the allowed VLAN list of the port, voice VLAN 2 is excluded from the VLAN list, and the voice VLAN function is enabled on GigabitEthernet 0/1.

The voice VLAN function must be enabled on GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 5
```

```
Hostname(config-vlan)# exit
Hostname(config)# vlan 2
Hostname(config-vlan)# exit
Hostname(config)# voice vlan 2
Hostname(config)# voice vlan mac-address 0012.3400.0000 mask ffff.ff00.0000
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode trunk
Hostname(config-if-GigabitEthernet 0/1)# switchport trunk native vlan 5
Hostname(config-if-GigabitEthernet 0/1)# switchport trunk allowed vlan remove 2
Hostname(config-if-GigabitEthernet 0/1)# voice vlan mode auto
Hostname(config-if-GigabitEthernet 0/1)# voice vlan enable
Hostname(config-if-GigabitEthernet 0/1)# exit
Hostname(config)# voice vlan aging 10
Hostname(config)# voice vlan security enable
Hostname(config)# voice vlan cos 7
Hostname(config)# voice vlan dscp 47
```

The following example connects only a VoIP telephone to GigabitEthernet 0/1. In this case, the voice VLAN can be set to work in manual mode; VLAN 2 is created and VLAN 2 is configured as a voice VLAN; the port is added to voice VLAN 2 and the voice VLAN function is enabled on GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 2
Hostname(config-vlan)# exit
Hostname(config)# voice vlan 2
Hostname(config)# voice vlan mac-address 0012.3400.0000 mask ffff.ff00.0000
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode access
Hostname(config-if-GigabitEthernet 0/1)# switchport access vlan 2
Hostname(config-if-GigabitEthernet 0/1)# no voice vlan mode auto
Hostname(config-if-GigabitEthernet 0/1)# voice vlan enable
Hostname(config-if-GigabitEthernet 0/1)# exit
Hostname(config)# voice vlan security enable
Hostname(config)# voice vlan cos 7
Hostname(config)# voice vlan dscp 47
```

Notifications

A port is configured to work in voice VLAN automatic mode but the voice VLAN is contained in the allowed VLAN list of the port. When you try to enable the voice VLAN function on the port, the following notification will be displayed:

```
Can't enable voice VLAN because the port is in voice VLAN and auto mode has been set.
```

1.8 voice vlan mac-address

Function

Run the **voice vlan mac-address** command to configure a voice traffic OUI to be identified by voice VLAN in global configuration mode.

Run the **no** form of this command to remove this configuration.

No OUI of any voice device is configured by default.

Syntax

voice vlan mac-address *mac-address* **mask** *oui-mask* [**description** *text*]

no voice vlan mac-address *mac-address*

Parameter Description

mac-address: Source MAC address in a voice packet. This field follows the format of *H.H.H*.

mask *oui-mask*: Valid length of an OUI, which is expressed by a mask. This field follows the format of *H.H.H*.

description *text*: Description of an OUI.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

A voice device identifies a vendor according to the first three bytes of the MAC address. Voice VLAN perform the logical "AND" operation on the source MAC address in a received packet and the OUI mask to obtain the OUI of the packet transmission device, so as to judge whether the packet is a voice packet.

The voice VLAN OUI cannot be a multicast address, and the configured mask should not contain non-consecutive 1's.

You can use the **show voice vlan oui** command to display the OUI for identifying a packet as a voice packet on the current device, OUI mask, and description.

Examples

The following example sets the voice traffic OUI to be identified by voice VLAN to 0012.3400.0000, mask to ffff.ff00.0000, and vendor to Company-A in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# voice vlan mac-address 0012.3400.0000 mask ffff.ff00.0000
description Company-A
```

1.9 voice vlan mode auto

Function

Run the **voice vlan mode auto** command to set the voice VLAN of a port to work in automatic mode.

Run the **no** form of this command to set the voice VLAN of a port to work in manual mode.

By default, the voice VLAN of a port works in automatic mode.

Syntax

voice vlan mode auto

no voice vlan mode auto

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The voice VLAN can work in automatic mode or manual mode, depending on the port configuration. The voice VLAN work modes of ports are independent of each other. Different voice VLAN work modes can be configured for different ports. The methods of adding ports to voice VLANs vary with the work mode. You can configure the voice VLAN work mode of a port based on the type of VoIP telephone connected to the port and the port type.

Caution

- If the voice VLAN function is enabled on a port and the voice VLAN works in manual mode, you must manually add the port to the voice VLAN to ensure that the voice VLAN function can take effect.
- If the voice VLAN on a port works in automatic mode, the device automatically adds the port to the voice VLAN. Do not configure the native VLAN of the port as a voice VLAN. Remove the voice VLAN from the allowed static VLAN list of the port before enabling the voice VLAN in automatic mode. After the automatic

mode is enabled, you are not allowed to add the port to or remove the port from the voice VLAN by running the **switchport trunk allowed vlan remove 2** command.

- The trunk or hybrid port of this device can transmit packets of all VLANs by default. You need to remove the voice VLAN from the allowed static VLAN list of the port and then enable the voice VLAN function. The purpose is to ensure that ports not connected to voice devices will not be added to the voice VLAN and the ports left unused for a long time will not stay in the voice VLAN.
- After the voice VLAN function is enabled on a port, you are not allowed to manually switch the port between the manual mode and automatic mode. To change the voice VLAN work mode, you must first disable the voice VLAN function on the port.

You can run the **show voice vlan** command to display the configuration and current status of a voice VLAN.

Examples

The following example connects a PC and a VoIP telephone to GigabitEthernet 0/1 in serial mode. In this case, the voice VLAN works in automatic mode. VLAN 5 is created to transmit PC data traffic, and VLAN 2 is created as a voice VLAN to transmit voice traffic. GigabitEthernet 0/1 is configured as a trunk port.

(1) The following example sets the MAC address for identifying voice packets to 0012.3400.0000, mask to ffff.ff00.0000, and vendor to Company A in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# voice vlan mac-address 0012.3400.0000 mask ffff.ff00.0000
description Company A
```

(2) The following example creates VLAN 5 to transmit data traffic and creates VLAN 2 as a voice VLAN to transmit voice traffic.

```
Hostname(config)# vlan 5
Hostname(config-vlan)# exit
Hostname(config)# vlan 2
Hostname(config-vlan)# exit
Hostname(config)# voice vlan 2
```

(3) The following example configures GigabitEthernet 0/1 as a trunk port, configures VLAN 5 as the native VLAN, and removes voice VLAN 2 from the allowed static VLAN list of the port.

```
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode trunk
Hostname(config-if-GigabitEthernet 0/1)# switchport trunk native vlan 5
Hostname(config-if-GigabitEthernet 0/1)# switchport trunk allowed vlan remove 2
```

(4) The following example sets the voice VLAN of the port to work in automatic mode. When the port receives a packet with the MAC address matching the voice VLAN OUI, the port automatically adds the voice VLAN to the allowed VLAN list of the port and forwards the voice packet over the voice VLAN.

```
Hostname(config-if-GigabitEthernet 0/1)# voice vlan mode auto
```

(5) The following example enables the voice VLAN function on the port.

```
Hostname(config-if-GigabitEthernet 0/1)# voice vlan enable
Hostname(config-if-GigabitEthernet 0/1)# exit
```

Notifications

When you configure a voice VLAN to work in automatic mode and then try to change the allowed VLAN list of the port, the following notification will be displayed.

```
Can't change allowed VLAN since voice VLAN has been enabled and auto mode has been set.
```

1.10 voice vlan security enable

Function

Run the **voice vlan security enable** command to enable the security mode for a voice VLAN in global configuration mode.

Run the **no** form of this command to disable the security mode of the voice VLAN and restore the voice VLAN to the common mode.

The security mode of a voice VLAN is enabled by default, that is, the voice VLAN works in security mode.

Syntax

voice vlan security enable

no voice vlan security enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To better isolate voice traffic from data traffic during transmission, you can enable the security mode of a voice VLAN. After the security mode is enabled, the device checks the source MAC address in each packet. When the source MAC address in the packet matches the OUI of the voice VLAN, the device allows this packet to be transmitted over the voice VLAN. Otherwise, the device discards this packet.

Caution

Do not transmit voice data and service data over the voice VLAN at the same time. If you want to transmit both voice data and service data over the voice VLAN, confirm that the security mode of the voice VLAN function is disabled.

Note

In security mode, the device checks the source MAC addresses of only untagged packets and packets with a voice VLAN tag. For packets with non-voice VLAN tags, the device forwards or discards these packets according to the common VLAN rules, irrespective of the security mode of the voice VLAN.

You can run the **show voice vlan** command to display the configuration and current status of a voice VLAN.

Examples

The following example disables the security mode of a voice VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no voice vlan security enable
```

1.1 bridge-frame forwarding protocol gvrp

Function

Run the **bridge-frame forwarding protocol gvrp** command to enable the transparent transmission function of packets of Generic Attribute Registration Protocol (GARP) VLAN registration protocol (GVRP) bridge protocol data unit (BPDU).

Run the **no** form of this command to disable the transparent transmission function of GVRP BPDU packets.

The transparent transmission function of GVRP BPDU packets is disabled by default.

Syntax

bridge-frame forwarding protocol gvrp

no bridge-frame forwarding protocol gvrp

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

According to the IEEE 802.1Q standard, GVRP BPDU uses the dedicated address 0180.c200.0021 as the destination MAC address; the device compliant with the IEEE 802.1Q standard will not forward the packets with the destination MAC address 0180.c200.0021. However, in the actual network deployment, devices are required to transparently transmit GVRP BPDU packets in some cases. For example, when GVRP is disabled for a device, GVRP BPDU packets need to be transparently transmitted so that another device interconnected to such a device through GVRP BPDU can normally calculate the GVRP topology.

GVRP transparent transmission takes effect only when GVRP is disabled. If GVRP is enabled, devices do not transparently transmit GVRP BPDU packets.

Examples

The following example enables the transparent transmission function of GVRP BPDU packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# bridge-frame forwarding protocol gvrp
```

1.7 gvrp timer

Function

Run the **gvrp timer** command to configure the GVRP timer.

Run the **no** form of this command to restore the default configuration.

By default, the maximum delay before a port sends a join or leave message is 200 ms, the waiting time from receiving a leave message by the port to deleting the port from the VLAN is 600 ms, and the minimum time interval for the port to send a LeaveAll message is 10,000 ms.

Syntax

gvrp timer { **join** *hold* | **leave** *leave* | **leaveall** *leaveall* }

no gvrp timer

Parameter Description

join *hold*: Configures the maximum delay before a port sends a join or leave message in milliseconds. The value range is from 1 to 200, and the default value is 200. The actual sending interval is in the range from 0 to *hold*.

leave *leave*: Configures the waiting time from receiving a leave message by the port to deleting the port from the VLAN in milliseconds. The value range is from 600 to 9999, and the default value is 600. If the port receives a join message again in this period, the port will not be deleted from the VLAN and the timer will expire; if the join message is not received before the timer times out, the state of the port changes to **Empty** and the port is deleted from the VLAN member list.

leaveall *leaveall*: Configures the minimum time interval for the port to send a LeaveAll message in milliseconds. The value range is from （ *leave*+1 ） to 2147483647, and the default value is 10000. If the port timer times out, the LeaveAll message is sent, and the actual sending interval ranges from *leaveall* to the sum of *leaveall* and *hold*; the LeaveAll message is also sent to the local port to trigger the Leave timer to start counting; if the port receives the LeaveAll message before the timer times out, the timer restarts timing.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

The three timers are subject to this relationship: 3 x Hold ≤ Leave ≤ LeaveAll.

Examples

The following example sets the maximum delay before the GVRP port sends an advertisement to 300 ms.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# gvrp timer join 300
```

Function

Run the **l2protocol-tunnel gvrp tunnel-dmac** command to configure the tunnel address for transmitting the user's GVRP BPDU.

Run the **no** form of this command to restore the default configuration.

The default tunnel address for transmitting the user's GVRP BPDU is 01d0.f800.0006.

Syntax

l2protocol-tunnel gvrp tunnel-dmac *gvrp-dmac-address*

no l2protocol-tunnel gvrp tunnel-dmac

Parameter Description

gvrp-dmac-address: Tunnel address for transmitting GVRP packets of the user network. The value range is from 01d0.f800.0006 and 011a.a900.0006, and the default value is 01d0.f800.0006.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

To avoid impact on the SP network by GVRP packets of the user network, when GVRP packets of the user network enter an edge device of the SP network, the edge device changes the destination MAC address of the packets from the GVRP dedicated address (0180.c200.0006) to the tunnel address (01d0.f800.0006 by default) before forwarding on the SP network. After the packets are forwarded to an edge device at the other end, the destination MAC address is restored from the tunnel address (01d0.f800.0006 by default) to the GVRP

dedicated address (0180.c200.0006), and the packets are forwarded to the user network at the other end. In this way, the GVRP packets of the user network are transmitted through the tunnel of the SP network.

Examples

The following example sets the tunnel address for transmitting the user's GVRP BPDU to 011a.a900.0006.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# l2protocol-tunnel gvrp tunnel-dmac 011a.a900.0006
```

Notifications

When the configured GVRP tunnel address is not in the above address range, the following notification will be displayed:

```
Optional at the following addresses: 01d0.f800.0006,011a.a900.0006.
```

Function

Run the **show gvrp statistics** command to display the GVRP statistics.

Syntax

show gvrp statistics { *interface-type interface-number* | **all** }

Parameter Description

interface-type interface-number: GVRP statistics of the specified port.

all: Displays the GVRP statistics of all the ports.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays the GVRP statistics of the port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# show gvrp statistics gigabitethernet 0/1
Interface      GigabitEthernet 0/1
RecValidGvrpPdu        0
RecInvalidGvrpPdu      0
RecJoinEmpty    0
RecJoinIn      0
RecEmpty       0
RecLeaveEmpty   0
RecLeaveIn     0
RecLeaveAll    0
SentGvrpPdu    0

1 QinQ Commands

Command	Function
dot1q outer-vid register inner-vid	Configure a policy of adding an outer VID based on the inner VID of packets.
dot1q-tunnel cos remark-cos	Configure a priority mapping policy and modify the outer priority based on the inner priority of input packets.
frame-tag tpid	Configure TPID of packets.
inner-priority-trust enable	Configure a priority replication policy and replicate the inner priority of input packets as outer priority.
l2protocol-tunnel	Enable the layer-2 protocol tunneling function globally.
l2protocol-tunnel enable	Enable the layer-2 protocol tunneling function on an interface.
l2protocol-tunnel tunnel-dmac	Configure a layer-2 protocol tunnel address.
show dot1q-tunnel	Display the dot1q-tunnel configuration of an interface.
show frame-tag tpid	Display the TPID configuration of an interface.
show inner-priority-trust	Display the priority replication configuration of an interface.
show interfaces dot1q-tunnel	Display the configuration of allowed VLANs and native VLANs of a dot1q-tunnel port.
show interfaces remark	Display the priority mapping configuration of an interface.
show l2protocol-tunnel	Display the configuration of layer-2 protocol transparent transmission.
show registration-table	Display the policy of adding the outer VID based on the inner VID of packets.
show translation-table	Display the inner and outer VID modification policy.
switchport dot1q-tunnel allowed vlan	Configure allowed VLANs of the dot1q-tunnel port.
switchport dot1q-tunnel native vlan	Configure the native VLAN of dot1q-tunnel.

switchport mode dot1q-tunnel	Configure an interface as a dot1q-tunnel port.

1.1 dot1q outer-vid register inner-vid

Function

Run the **dot1q outer-vid register inner-vid** command to configure a policy of adding an outer VID based on the inner VID of packets.

Run the **no** form of this command to delete a policy of adding an outer VID based on the inner VID of packets.

Run the **default** form of this command to restore the default configuration.

No policy of adding an outer VID based on the inner VID of packets is configured by default.

Syntax

dot1q outer-vid *svid* **register inner-vid** *cvid-list*

no dot1q outer-vid *svid* **register inner-vid** *cvid-list*

default dot1q outer-vid *svid* **register inner-vid** *cvid-list*

Parameter Description

svid: Outer VLAN ID added for input packets. It is a VLAN ID of the SP network, and the value range is from 1 to 4094.

cvid-list: Inner VLAN ID list of input packets, which can include one or more VLANs. When multiple VLANs are included, they are separated by commas. You can also specify a VLAN range by connecting the start VLAN ID and end VLAN ID using an en dash (–). It contains VLAN IDs of the client network, and the value range is from 1 to 4094.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to configure a C-Tag-based QinQ encapsulation policy. It can be configured only on the dot1q-tunnel and hybrid ports.

You can run the **show registration-table** [**interface** *interface-type interface-number*] command to display the related configuration on the interface.

Examples

The following example adds the outer VID 30 on the dot1q-tunnel port GigabitEthernet 0/1 when the inner VID of input packets ranges from 11 to 20.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 30
Hostname(config-vlan)# exit
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode dot1q-tunnel
```

```
Hostname(config-if-GigabitEthernet 0/1)# dot1q outer-vid 30 register inner-vid 11-20
```

The following example adds the outer VLAN ID 10 on the hybrid port GigabitEthernet 0/2 when the inner VID of input packets ranges from 1 to 10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vlan 10
Hostname(config-vlan)# exit
Hostname(config)# interface gigabitethernet 0/2
Hostname(config-if-GigabitEthernet 0/2)# switchport mode hybrid
Hostname(config-if-GigabitEthernet 0/2)# dot1q outer-vid 10 register inner-vid 1-10
```

Notifications

If this command is configured when the destination VLAN is not created in advance, the following notification will be displayed:

```
The destination vlan 30 shall be exist,undynamic and not supervlan.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

1.2 dot1q-tunnel cos remark-cos

Function

Run the **dot1q-tunnel cos remark-cos** command to configure a priority mapping policy and modify the outer priority based on the inner priority of input packets.

Run the **no** form of this command to delete a priority mapping policy.

Run the **default** form of this command to restore the default configuration.

No policy of mapping the outer priority based on the inner priority of input packets is configured by default.

Syntax

dot1q-tunnel cos *inner-cos-value* **remark-cos** *outer-cos-value*

no dot1q-tunnel cos *inner-cos-value* **remark-cos**

default dot1q-tunnel cos *inner-cos-value* **remark-cos** *outer-cos-value*

Parameter Description

inner-cos-value: Inner priority of input packets. The value range is from 0 to 7. A larger value indicates a higher priority.

outer-cos-value: Outer priority of input packets. The value range is from 0 to 7. A larger value indicates a higher priority.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When a priority mapping policy is configured, the CoS value of the outer tag can be set to different values based on the packet priority. In this case, important services can be preferentially transmitted and processed.

You can run the **show interface** [**interface** *interface-type interface-number*] **remark** command to display the related configuration on the interface.

Examples

The following example configures a priority mapping policy on the dot1q-tunnel port GigabitEthernet 0/1, and maps the CoS value of outer VLAN tag priority to 5 when the CoS value of inner VLAN tag priority of input packets is 3.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode dot1q-tunnel
Hostname(config-if-GigabitEthernet 0/1)# dot1q-Tunnel cos 3 remark-cos 5
```

Notifications

When the interface is not configured as the dot1q-tunnel mode and priority mapping configuration is not supported, the following notification will be displayed:

```
Only support the tunnel-mode switchport.
```

Common Errors

1.3 frame-tag tpid

Function

Run the **frame-tag tpid** command to configure TPID of packets.

Run the **no** form of this command to delete the configured TPID value and restore the default configuration.

Run the **default** form of this command to restore the default configuration.

The default TPID value is 0x8100.

Syntax

frame-tag tpid *tpid*

no frame-tag tpid

default frame-tag tpid

Parameter Description

tpid: Packet type value. The value range is from 0 to ffff in hexadecimal. The common value is 0x8100 or 0x9100. The default value 0x8100 indicates IEEE 802.1Q frame.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If the TPID value of a third-party device is not the default value 0x8100 defined in IEEE 802.1Q, the TPID value needs to be configured on the port connected to the third-party device to keep consistency and compatibility with the third-party device.

Run the **show frame-tag tpid** command to display the configuration.

Examples

The following example sets the packet type value to 0x9100 on the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# frame-tag tpid 0x9100
```

Notifications

When no TPID value is displayed, the following notification will be displayed, indicating that TPID is the default value 0x8100:

```
Hostname# show frame-tag tpid
Ports   tpid
```

Common Errors

N/A

Platform Description

1.4 inner-priority-trust enable

Function

Run the **inner-priority-trust enable** command to configure a priority replication policy and replicate the inner priority of input packets as outer priority.

Run the **no** form of this command to delete the priority replication policy.

Run the **default** form of this command to restore the default priority.

The priority replication function is disabled by default.

Syntax

inner-priority-trust enable

no inner-priority-trust enable

default inner-priority-trust enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If a priority replication policy is configured, the client VLAN tag priority can be replicated to the outer VLAN tag priority so that the client packets are encapsulated with the outer VLAN tag and have the same priority as the client VLAN tag. In this case, the client packets can be preferentially processed and transmitted in the SP network.

Run the **show inner-priority-trust** command to display the configuration.

Examples

The following example configures a priority replication policy and replicates the inner tag priority of input packets of the interface GigabitEthernet 0/1 as the outer tag priority.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-gigabitethernet 0/1)# switchport mode dot1q-tunnel
Hostname(config-if-gigabitethernet 0/1)# inner-priority-trust enable
```

Notifications

When the interface is not configured as the dot1q-tunnel mode and priority replication configuration is not supported, the following notification will be displayed:

```
Only support the tunnel-mode switchport.
```

Common Errors

Function

Run the **l2protocol-tunnel** command to enable the layer-2 protocol tunneling function globally.

Run the **no** form of this command to disable the layer-2 protocol tunneling function globally.

Run the **default** form of this command to restore the default configuration.

The layer-2 protocol tunneling function is disabled globally by default.

Syntax

l2protocol-tunnel { **stp** | **gvrp** }

no l2protocol-tunnel { **stp** | **gvrp** }

default l2protocol-tunnel { **stp** | **gvrp** }

Parameter Description

stp: Enables a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) tunnel.

gvrp: Enables a GARP VLAN registration protocol (GVRP) BPDU tunnel.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The layer-2 protocol tunneling function takes effect only when it is enabled globally and on the interface at the same time.

You can run the **show l2protocol-tunnel** { **gvrp** | **stp** } command display the configuration.

Examples

The following example enables the layer-2 protocol (GVRP and STP) tunneling function globally.

```

1.13 show l2protocol-tunnel

Function

Run the **show l2protocol-tunnel** command to display the configuration of layer-2 protocol transparent transmission.

Syntax

show l2protocol-tunnel { **gvrp** | **stp** }

Parameter Description

gvrp: Displays the configuration of a GVRP BPDU tunnel.

stp: Displays the configuration of an STP BPDU tunnel.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays the configuration of STP transparent transmission.

```
Hostname> enable
Hostname# show l2protocol-tunnel stp
L2protocol-tunnel: stp Disable
L2protocol-tunnel destination mac address: 01d0.f800.0005
```

The following example displays the configuration of GVRP transparent transmission.

```
Hostname> enable
Hostname# show l2protocol-tunnel gvrp
L2protocol-tunnel: Gvrp Enable
L2protocol-tunnel destination mac address:01d0.f800.0006
GigabitEthernet 0/1 l2protocol-tunnel gvrp enable
GigabitEthernet 0/2 l2protocol-tunnel gvrp enable
```

Table 1-6 Output Fields of the show l2protocol-tunnel Command

Field	Description
L2protocol-tunnel	Indicates the enabling status of layer-2 protocol tunneling. ● **Enable**: Indicates that layer-2 protocol tunneling is enabled. ● **Disable**: Indicates that layer-2 protocol tunneling is disabled.
L2protocol-tunnel destination mac address	Indicates the MAC address of layer-2 protocol tunneling.
l2protocol-tunnel gvrp enable	Indicates the port on which layer-2 protocol tunneling is enabled.

1.14 show registration-table

Function

Run the **show registration-table** command to display the policy of adding the outer VID based on the inner VID of packets.

Syntax

show registration-table [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Specifies the interface of which the policy of adding the outer VID based on the inner VID of packets will be displayed. If this parameter is not specified, the policy of outer VID based on the inner VID of packets on all interfaces will be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays the policy of adding the outer VLAN based on the inner VLAN tag on all the interfaces.

```
Hostname> enable
Hostname# show registration-table
Ports    Type         Outer-VID   Inner-VID-list
------   ----------    ----------  --------------
Gi0/1     Add-outer     10         1-3,5-10
Gi0/1     Add-outer     20         11-20
```

Table 1-7 Output Fields of the show registration-table Command

Field	Description
Ports	Indicates the interface name.
Type	Indicates the type of the protocol-based selective QinQ policy.
Outer-VID	Indicates the added outer VLAN.
Inner-VID-list	Indicates the list of inner VLANs complying with the policy.

1.15 show translation-table

Function

Run the **show translation-table** command to display the inner and outer VID modification policy.

Syntax

show translation-table [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Specifies the interface of which the inner VID and outer VID modification policy will be displayed. If this parameter is not specified, the inner VID and outer VID modification policy on all interfaces will be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays the inner VID and outer VID modification policy.

```
Hostname> enable
Hostname# show translation-table
Ports       Type      Relay-VID  Old-local  Local\inner-VID-list
---------   ---------  ---------  ---------  ---------------------
Gi0/1       Inner-CVID 8         N/A       10-20
Gi0/1       Local-SVID 1001      N/A       30-60
Gi0/1       In+Out     8         20        50
```

Table 1-8 Output Fields of the show translation-table Command

Field	Description
Ports	Indicates the interface name.
Type	Indicates the type of the protocol-based selective QinQ policy.
Relay-VID	Indicates the VLAN ID after the outer/inner tag of input packets is modified.
Old-local	Indicates the VLAN ID of outer tag before modification.
Local\inner-VID-list	Indicates the outer/inner VLAN list before modification.

1.16 switchport dot1q-tunnel allowed vlan

Function

Run the **switchport dot1q-tunnel allowed vlan** command to configure allowed VLANs of the dot1q-tunnel port.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

The allowed VLAN of dot1q-tunnel port is untagged VLAN 1.

Syntax

switchport dot1q-tunnel allowed vlan { [**add**] **tagged** *svid-list* | [**add**] **untagged** *svid-list* | **remove** *svid-list* }

no switchport dot1q-tunnel allowed vlan

default switchport dot1q-tunnel allowed vlan

Parameter Description

svid-list: VLANs on the SP network. It can contain one or more VLANs. Multiple VLANs are separated by commas. You can also specify a VLAN range by connecting the start VLAN ID and end VLAN ID using an en dash (–).

[**add**] **tagged** *svid-list*: Configures a tagged VLAN allowed by the interface. When output from the interface, packets of this VLAN carry the SP's VLAN tag. No matter whether the **add** parameter is added, the function is consistent.

[**add**] **untagged** *svid-list*: Configures an untagged VLAN allowed by the interface. When output from the interface, packets of this VLAN do not carry the SP's VLAN tag. No matter whether the **add** parameter is added, the function is consistent.

remove *svid-list*: Deletes a VLAN allowed by the interface.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Run the **show interface dot1q-tunnel** command to display the configuration.

Examples

The following example configures GigabitEthernet 0/1 as dot1q-tunnel port, native VLAN of the interface as VLAN 8. The allowed VLANs of GigabitEthernet 0/1 are untagged VLAN 8 and tagged VLANs 3–6.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode dot1q-tunnel
Hostname(config-if-GigabitEthernet 0/1)# switchport dot1q-tunnel native vlan 8
```

```
Hostname(config-if-GigabitEthernet 0/1)# switchport dot1q-tunnel allowed vlan
untagged 8
Hostname(config-if-GigabitEthernet 0/1)# switchport dot1q-tunnel allowed vlan tagged
3-6
```

1.17 switchport dot1q-tunnel native vlan

Function

Run the **switchport dot1q-tunnel native vlan** command to configure the native VLAN of dot1q-tunnel.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the configuration.

The default native VLAN of the dot1q-tunnel port is VLAN 1.

Syntax

switchport dot1q-tunnel native vlan *svid*

no switchport dot1q-tunnel native vlan

default switchport dot1q-tunnel native vlan

Parameter Description

svid: Specifies a VLAN in the SP network as the native VLAN of the dot1q-tunnel port. The value range is from 1 to 4094. Only one native VLAN can be configured.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Run the **show interface dot1q-tunnel** command to display the configuration.

Examples

The following example configures GigabitEthernet 0/1 as dot1q-tunnel port, native VLAN of the interface as VLAN 8. The allowed VLANs of GigabitEthernet 0/1 are untagged VLAN 8 and tagged VLANs 3–6.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode dot1q-tunnel
Hostname(config-if-GigabitEthernet 0/1)# switchport dot1q-tunnel native vlan 8
Hostname(config-if-GigabitEthernet 0/1)# switchport dot1q-tunnel allowed vlan

1.18 switchport mode dot1q-tunnel

Function

Run the **switchport mode dot1q-tunnel** command to configure an interface as a dot1q-tunnel port.

Run **no switchport mode** command to remove this configuration.

Run the **default switchport mode** command to restore the default configuration.

The interface is an access port by default.

Syntax

switchport mode dot1q-tunnel

no switchport mode

default switchport mode

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

All frames entering the QinQ edge device, regardless of whether they carry IEEE 802.1Q tags, will be encapsulated with one layer of tag. This process is called QinQ encapsulation. The ingress of QinQ edge device is called dot1q-tunnel port, or tunnel port for short. In the basic QinQ, the VLAN ID of an outer tag is the native VLAN of the dot1q-tunnel port. In the selective QinQ, outer tag encapsulation can be implemented according to different encapsulation policies.

Before configuring an encapsulation policy, you need to configure an edge interface as dot1q-tunnel port, and configure native VLAN and allowed VLAN for it.

- If the mode of a layer-2 interface is **dot1q-tunnel**, only one native VLAN is available, and it is VLAN 1 by default. You can use the **switchport dot1q-tunnel native vlan** command to configure the native VLAN as SP VLAN.
- By default, only one allowed VLAN exists and it must be VLAN 1. You can use the **switchport dot1q-tunnel allowed vlan** { [**add**] **tagged** *vlan-list* | [**add**] **untagged** *vlan-list* | **remove** *vlan-list*} command to configure allowed VLANs. The value range is 1 to 4094. The list can contain one or more allowed VLANs. When the packets of all the client VLANs are marked with a unified outer tag, only one allowed VLAN is required; when client VLANs need to be divided into different groups and client packets in different groups are to be marked with different outer tags, multiple allowed VLANs need to be configured.
- The native VLAN must be added to the allowed VLAN list of the interface in an untagged form so that the packets of the SP network can be sent back to the client network after the SP VLAN tags are stripped.
- In the basic QinQ application, the VLANs of the client network do not need to be added to the allowed VLAN list of the tunnel port. In the selective QinQ application, the VLANs of the client network are added to the allowed VLAN list of the interface in the tagged or untagged form.

Run the **show vlan** command to display the configuration.

Examples

The following example configures GigabitEthernet 0/1 as a dot1q-tunnel port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# switchport mode dot1q-tunnel
```

1 MSTP Commands

Command	Function
bpdu src-mac-check	Enable the bridge protocol data unit (BPDU) source MAC address check on an interface.
bridge-frame forwarding protocol bpdu	Enable BPDU transparent transmission.
clear spanning-tree counters	Clear statistics on sent and received STP packets.
clear spanning-tree detected-protocols	Clear the original protocol and force the device to migrate to the RSTP protocol.
clear spanning-tree mst topochange record	Clear STP topology change information.
instance	Create/enter an instance and move a VLAN from the original instance to the instance.
l2protocol-tunnel stp	Enable the global STP BPDU tunnel function.
l2protocol-tunnel stp enable	Enable the STP BPDU tunnel function on an interface.
l2protocol-tunnel stp tunnel-dmac	Configure the tunnel address for transmitting STP BPDUs from a customer network.
name	Configure a name for an MST region.
revision	Configure a revision number for an MST region.
show l2protocol-tunnel stp	Display the configuration of a BPDU tunnel.
show spanning-tree	Display the global spanning tree configuration and status information.
show spanning-tree interface	Display the spanning tree configuration and status information of an interface.
show spanning-tree mst	Display the MST region configuration.
show spanning-tree mst topochange record	Display spanning tree topology change records.
spanning-tree	Enable the STP function or configure STP global time parameters.
spanning-tree autoedge	Enable the autoedge function on a designated port.
spanning-tree bpdufilter	Enable the BPDU filter function on an interface so that the interface neither sends nor receives BPDUs, but works in forwarding state.

spanning-tree bpduguard	Enable or disable the BPDU guard function on an interface so that the interface enters error-disabled state when receiving a BPDU.
spanning-tree compatible enable	Enable the spanning tree compatibility mode on an interface.
spanning-tree guard loop	Enable the loop guard function on an interface.
spanning-tree guard none	Disable the guard function on an interface.
spanning-tree guard root	Enable the root guard function on an interface.
spanning-tree ignore tc	Enable the TC filter function on an interface so that the interface diffuses only TC packets generated by itself and does not diffuse received TC packets.
spanning-tree link-type	Forcibly set the connection type of an interface to point-to-point or shared.
spanning-tree loopguard default	Enable the global loop guard function.
spanning-tree mode	Set the spanning tree mode to STP, RSTP, or MSTP.
spanning-tree mst configuration	Enter the MST configuration mode.
spanning-tree mst cost	Configure a port path cost.
spanning-tree mst port-priority	Configure a port priority.
spanning-tree mst priority	Configure a bridge priority.
spanning-tree pathcost method	Configure the method of calculating the default port path cost.
spanning-tree portfast	Configure an interface as an edge port and enable the interface to rapidly enter forwarding state.
spanning-tree portfast bpdufilter default	Enable the global BPDU filter function.
spanning-tree portfast bpduguard default	Enable the global BPDU guard function.
spanning-tree portfast default	Configure all interfaces as edge ports and enable them to rapidly enter forwarding state.
spanning-tree reset	Restore spanning tree parameters to default values.
spanning-tree tc-guard	Enable the TC guard function on an interface.
spanning-tree tc-protection	Enable the global TC protection function.
spanning-tree tc-protection tc-guard	Enable the global TC guard function.

1.1 bpdu src-mac-check

Function

Run the **bpdu src-mac-check** command to enable the bridge protocol data unit (BPDU) source MAC address check on an interface.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The BPDU source MAC address check function is disabled on an interface by default.

Syntax

bpdu src-mac-check *H.H.H*

no bpdu src-mac-check

default bpdu src-mac-check

Parameter Description

H.H.H: Source MAC address to be matched by BPDUs.

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

The Spanning Tree protocol (STP) functions available in interface configuration mode can be configured and take effect only on L2 switching ports. Otherwise, the configuration will fail. If an interface is not an L2 switching port, run the **switchport** command to convert it into an L2 switching port.

If the peer device connects to the local device in a point-to-point manner and the MAC address of the peer device is certain, the BPDU source MAC address check function can be configured on the local device. After this function is enabled, the device receives only BPDU frames matching the designated source MAC address and discards all the other BPDU frames. In addition, when the device encounters BPDU packet attacks, illegitimate BPDU packets can be identified and discarded to prevent the Multiple Spanning Tree Protocol (MSTP) function failure due to the attacks.

Only one BPDU source MAC check address can be configured for one interface.

Examples

The following example enables the BPDU source MAC address check function on port TenGigabitEthernet t 0/1 to receive only BPDU frames whose source MAC address is 00d0.f800.1e2f.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# bpdu src-mac-check 00d0.f800.1e2f
```

Notifications

N/A

Common Errors

An interface is not configured as an L2 switching port, and as a result, the BPDU source MAC address check function fails to be configured.

1.2 bridge-frame forwarding protocol bpdu

Function

Run the **bridge-frame forwarding protocol bpdu** command to enable BPDU transparent transmission.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

BPDU transparent transmission is disabled by default.

Syntax

bridge-frame forwarding protocol bpdu

no bridge-frame forwarding protocol bpdu

default bridge-frame forwarding protocol bpdu

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

IEEE 802.1Q uses the destination MAC address (0180.c200.0000) of BPDUs as the reserved address. When a device supporting IEEE 802.1Q receives a frame with the destination address of 0180.c200.0000, it recognizes the frame as a BPDU and will not forward it.

However, in the actual network deployment, some BPDU frames need to be transparently transmitted by devices. For example, STP is disabled on device A but enabled on devices B and C that are connected through device A. In this case, device A needs to transparently transmit BPDU frames so that devices B and C can normally perform STP calculation.

BPDU transparent transmission takes effect only when STP is disabled. When STP is enabled on a device, the device will not transparently transmit BPDU frames.

Examples

The following example enables the BPDU transparent transmission function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# bridge-frame forwarding protocol bpdu
```

1.3 clear spanning-tree counters

Function

Run the **clear spanning-tree counters** command to clear statistics on sent and received STP packets.

Syntax

clear spanning-tree counters [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Clears statistics on STP packets sent and received by this specified interface.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

This command is used to clear statistics on sent and received STP packets.

Examples

The following example clears statistics on sent and received STP packets.

```
Hostname> enable
Hostname# clear spanning-tree counters
```

The following example clears statistics on STP packets sent and received by interface TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# clear spanning-tree counters interface tenGigabitEthernet 0/1
```

1.4 clear spanning-tree detected-protocols

Function

Run the **clear spanning-tree detected-protocols** command to clear the original protocol and force the device to migrate to the RSTP protocol.

Syntax

clear spanning-tree detected-protocols [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Specifies an interface.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

When finding that the peer device supports the Rapid Spanning Tree Protocol (RSTP), the administrator can configure this command to force all interfaces to send RSTP BPDUs and check the version of received BPDU frames so that the two interconnected devices migrate to RSTP. This function is also called protocol migration.

Examples

The following example clears the original protocol and forces the device to migrate to RSTP.

```
Hostname> enable
Hostname# clear spanning-tree detected-protocols
```

1.5 clear spanning-tree mst topochange record

Function

Run the **clear spanning-tree mst topochange record** command to clear STP topology change information.

Syntax

clear spanning-tree mst *instance-id* **topochange record**

Parameter Description

instance-id: Instance ID. The value range is from 0 to 64. Only instance **0** is valid for STP and RSTP.

Command Modes

Privileged EXEC mode

Default Level

15

Usage Guidelines

N/A

Examples

The following example displays the spanning tree topology change records, clears the topology change information of STP instance **0**, and then displays the spanning tree topology change records again.

```
Hostname> enable
Hostname# show spanning-tree mst 0 topochange record
Topology change information on mst 0:
 Time             Interface          Old status   New status   Type
2013.5.1 4:18:46   TE0/6              Learning     Forwarding   Normal
Hostname# clear spanning-tree mst 0 topochange record
Hostname# show spanning-tree mst 0 topochange record
%There's no topology change information has been record on mst 0.

1.6 instance

Function

Run the **instance** command to create/enter an instance and move a VLAN from the original instance to the instance.

Run the **no** form of this command to delete an instance (not instance **0**) or move a VLAN in an instance (not instance **0**) to instance **0**.

Run the **default** form of this command to delete an instance (not instance **0**) and move all the VLANs in the instance (not instance **0**) to instance **0**.

Only instance **0** exists and all VLANs belong to instance **0** by default.

Syntax

instance *instance-id* **vlan** *vlan-range*

no instance *instance-id* [**vlan** *vlan-range*]

default instance *instance-id*

Parameter Description

instance-id: Instance ID. The value range is from 0 to 64.

vlan *vlan-range*: Indicates the VLAN list. The value range of a VLAN ID is from 1 to 4094. The VLAN list can contain one or more VLANs. You can separate VLAN IDs by commas (,) or connect continuous VLAN IDs by using a hyphen (-).

Command Modes

MST configuration mode

Default Level

15

Usage Guidelines

If a device has a small physical memory (such as 64 MB), creating 64 instances may result in memory insufficiency when devices are stacked. You are advised to control the number of created instances in the case of stacking.

Instance **0** can be neither created nor deleted. Custom instances 1–64 can be created and deleted. You cannot delete VLANs from instance **0** but can delete those from custom instances. Deleting a VLAN from a custom instance will move the VLAN to instance **0**.

In the **instance** *instance-id* **vlan** *vlan-range* command, the value range of *instance-id* is from 0 to 64.

In the **no instance** *instance-id* [**vlan** *vlan-range*] and **default instance** *instance-id* commands, the value of *instance-id* cannot be **0** and its value range is from 1 to 64.

The **no instance** *instance-id* command (without the **vlan** *vlan-range* parameter) command has the same function as the **default instance** *instance-id* command, that is, delete an instance (not instance **0**) and move all the VLANs in the instance (not instance **0**) to instance **0**.

The **no instance** *instance-id* **vlan** *vlan-range* command (carrying the **vlan** *vlan-range* parameter) can move a VLAN in an instance (not instance **0**) to instance **0**. If there are multiple VLANs in the specified instance, you can carry the **vlan** *vlan-range* parameter in this command to move the specified VLANs to instance **0**. Moving all VLANs in an instance to instance **0** will delete the instance.

Examples

The following example enters the MST configuration mode, moves VLAN 3 and VLANs 5–10 to instance **1**, and displays the multiple spanning tree (MST) region configuration.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# instance 1 vlan 3, 5-10
Hostname(config-mst)# show spanning-tree mst configuration
Multi spanning tree protocol : Enable
Name    :
Revision : 0
Instance  Vlans Mapped
--------  ----------------
0       1-2,4,11-4094
1       3,5-10
```

The following example moves VLAN 3 from instance **1** to instance **0**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# no instance 1 vlan 3
```

The following example deletes instance **1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# no instance 1
```

Notifications

When you move a VLAN to an instance, the following notification will be displayed:

```
%Warning:you must create vlans before configuring instance-vlan relationship.
```

1.7 l2protocol-tunnel stp

Function

Run the **l2protocol-tunnel stp** command to enable the global STP BPDU tunnel function.

Run the **no** form of this command to disable this feature.

The global STP BPDU tunnel function is disabled by default.

Syntax

l2protocol-tunnel stp

no l2protocol-tunnel stp

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

In 802.1Q in 802.1Q (QinQ) application, after the STP BPDU tunnel function is enabled, STP packets from the customer network can be transparently transmitted through tunnels of the service provider network. In this way, the STP calculations of the customer network and service provider network are performed separately without mutual interference. 01D0.f800.0005 is the default BPDU tunnel address.

The STP BPDU tunnel function needs to be enabled in both global configuration mode and interface configuration mode so that STP packets can be transparently transmitted through tunnels.

Examples

The following example enables the STP BPDU tunnel function in both global configuration mode and interface configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# l2protocol-tunnel stp
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# l2protocol-tunnel stp enable
Hostname(config-if-TenGigabitEthernet 0/1)# show l2protocol-tunnel stp
L2protocol-tunnel: stp Enable
L2protocol-tunnel destination mac address: 01d0.f800.0005
```

```

In QinQ application, after the STP BPDU tunnel function is enabled, STP packets from the customer network can be transparently transmitted through tunnels of the service provider network. In this way, the STP calculations of the customer network and service provider network are performed separately without mutual interference. 01D0.f800.0005 is the default BPDU tunnel address.

The STP BPDU tunnel function needs to be enabled in both global configuration mode and interface configuration mode so that STP packets can be transparently transmitted through tunnels.

Examples

The following example enables the STP BPDU tunnel function in both global configuration mode and interface configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# l2protocol-tunnel stp
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# switchport mode dot1q-tunnel
Hostname(config-if-TenGigabitEthernet 0/1)# l2protocol-tunnel stp enable
Hostname(config-if-TenGigabitEthernet 0/1)# show l2protocol-tunnel stp
L2protocol-tunnel: stp Enable
L2protocol-tunnel destination mac address: 01d0.f800.0005
TenGigabitEthernet 0/1 l2protocol-tunnel stp enable
```

1.9 l2protocol-tunnel stp tunnel-dmac

Function

Run the **l2protocol-tunnel stp tunnel-dmac** command to configure the tunnel address for transmitting STP BPDUs from a customer network.

Run the **no** form of this command to remove this configuration.

The default tunnel address for transmitting STP BPDUs from a customer network is 01d0.f800.0005.

Syntax

l2protocol-tunnel stp tunnel-dmac *mac-address*

no l2protocol-tunnel stp tunnel-dmac

Parameter Description

mac-address: Tunnel address for transmitting STP BPDUs from a customer network. The value range is 01d0.f800.0005 (default), 011a.a900.0005, 010f.e200.0003, 0100.0ccd.cdd0, 0100.0ccd.cdd1, and 0100.0ccd.cdd2.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

After an STP packet from a customer network is transmitted to a provider edge (PE) of a service provider network, the PE changes the destination MAC address of the packet from the BPDU dedicated address (0180.c200.0000) to the tunnel address (01d0.f800.0005 by default) and forwards the packet in the service provider network. When the packet reaches a PE at the other end, the PE restores the destination MAC address of the packet from the tunnel address (01d0.f800.0005 by default) to the BPDU dedicated address (0180.c200.0000) and forwards the packet to the peer customer network. The BPDU tunnel function is used to transmit STP packets from a customer network through tunnels in a service provider network so that STP calculations of the customer network and service provider network are performed separately without mutual interference.

Examples

The following example sets the tunnel address for transmitting STP BPDUs from a customer network to 011a.a900.0005.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# l2protocol-tunnel stp tunnel-dmac 011a.a900.0005
```

Notifications

When the configured tunnel address for transmitting STP BPDUs from a customer network is not within the above range, the following notification will be displayed:

```
Optional at the following addresses: 01d0.f800.0005, 011a.a900.0005, 010f.e200.0003
or 0100.0ccd.cdd0-d2.
```

1.10 name

Function

Run the **name** command to configure a name for an MST region.

Run the **no** form of this command to remove this configuration.

The default name of an MST region is an empty string.

Syntax

name *name*

no name

Parameter Description

name: Name of an MST region. The value is a string of up to 32 bytes.

Command Modes

MST configuration mode

Default Level

15

Usage Guidelines

The **show spanning-tree mst configuration** command is used to display information about the current MST region, including the name of the MST region.

Examples

The following example enters the MST configuration mode and sets the name of an MST region to Region 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# name region1
```

1.11 revision

Function

Run the **revision** command to configure a revision number for an MST region.

Run the **no** form of this command to remove this configuration.

The default revision number of an MST region is **0**.

Syntax

revision *version*

no revision

Parameter Description

version: Revision number of an MST region. The value range is from 0 to 65535.

Command Modes

MST configuration mode

Default Level

15

Usage Guidelines

The **show spanning-tree mst configuration** command is used to display information about the current MST region, including the revision number of the MST region.

Examples

The following example enters the MST configuration mode and sets the revision number of an MST region to 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# revision 1
```

1.13 show spanning-tree

Function

Run the **show spanning-tree** command to display the global spanning tree configuration and status information.

Syntax

show spanning-tree [**forward-time** | **hello-time** | **max-age** | **max-hops** | **mst** *instance-id* | **pathcost method** | **tx-hold-count**]

show spanning-tree [**counters** | **inconsistentports** | **summary**]

show spanning-tree [**v-stp information**]

Parameter Description

forward-time: Displays the port status change interval (**Bridge Forward Delay**).

hello-time: Displays the interval for periodically sending BPDUs (**Bridge Hello Time**).

max-age: Displays the maximum timeout time of a BPDU (**Bridge Max Age**).

mst *instance-id*: Displays the global spanning tree configuration of a specified instance.

max-hops: Specifies the maximum hop count of BPDUs.

pathcost method: Displays the path cost calculation method.

tx-hold-count: Displays the maximum number of BPDUs that can be sent per second.

counters: Displays statistics on sent and received STP packets.

inconsistentports: Displays ports blocked due to root guard or loop guard.

summary: Displays the spanning tree topology and port forwarding status.

v-stp information: Displays information about the V-STP function.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

Packets with the timeout time out of **max-age** will be discarded.

Forward-time indicates the interval for STP to transition from the listening state to the learning state or from the learning state to the forwarding state. After port role election is complete, a port waits for twice the period of **Forward Delay** before entering the forwarding state.

The restrictive relationship among the values of **forward-time, hello-time, and max-age** is as follows: 2 × (**Hello Time** + 1s) ≤ **Max Age** ≤ 2 × (**Forward Delay** – 1s). The values must meet this condition. Otherwise, the topology may be unstable.

A device selects an interface with the minimum sum of root path costs as the root port. Configuring **pathcost method** (the default value is **long**) will affect the port path cost and further affect the topology of the entire network.

The **show spanning-tree** command displays spanning tree information only after the **spanning-tree** command is run to enable STP.

Examples

The following example displays the global spanning tree configuration. All information will be displayed if no parameter is carried in the command. If parameters [**forward-time** | **hello-time** | **max-age** | **max-hops** | **mst** *instance-id* | **pathcost method** | **tx-hold-count**] are carried, specified global configuration will be displayed.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree
Hostname(config)# show spanning-tree

Table 1-2 Output Fields of the show spanning-tree Command

Field	Description
StpVersion	STP version ● MSTP ● RSTP ● STP
SysStpStatus	STP status ● ENABLED ● DISABLED
Max Age	Aging time of STP BPDUs. The default value is **20**.
Hello Time	Interval for STP to send two adjacent BPDUs. The default value is **2**.
Forward Delay	Duration of STP in the listening and learning states. The default value is **15**.
BridgeMaxAge	Aging time of BPDUs on this device. The default value is **20**.
BridgeHelloTime	Interval for the device to send two adjacent BPDUs. The default value is **2**.
BridgeForwardDelay	Duration of STP in the listening and learning states on this device. The default value is **15**.
MaxHops	Maximum hop count of BPDUs. The default value is **20**.
PathCostMethod	Path cost calculation method ● **long**: Uses the path cost specified in IEEE 802.1t.

Field	Description
	● **long standard**: Calculates the cost value by using a formula according to IEEE 802.1t. ● **short**: Uses the path cost specified in IEEE 802.1d.
TxHoldCount	Maximum number of BPDUs that can be sent per second
BPDUGuard	Status of the global BPDU guard function ● Enabled ● Disabled
BPDUFilter	Status of the global BPDU filter function ● Enabled ● Disabled
LoopGuardDef	Status of the global loop guard function ● Enabled ● Disabled
BridgeAddr	Bridge address of the device
Priority	Bridge priority of the device
TimeSinceTopologyChange	Time that has elapsed since the last topology change, in the format of "d:h:m:s", that is, "day:hour:minute:second".
TopologyChanges	Number of topology change times
DesignatedRoot	ID of a designated bridge
RootCost	Root path cost
RootPort	Root port
CistRegionRoot	Bridge ID of a region root
CistPathCost	Path cost from the region root to CIST root

The following example displays ports that are blocked due to root guard or loop guard.

```
Hostname> enable
Hostname# show spanning-tree inconsistentports

1.14 show spanning-tree interface

Function

Run the **show spanning-tree interface** command to display the spanning tree configuration and status information of an interface.

Syntax

show spanning-tree [**mst** *instance-id*] **interface** *interface-type interface-number* [**bpdufilter** | **bpduguard** | **link-type** | **portfast**]

show spanning-tree [**mst** *instance-id*] *port-index*

Parameter Description

mst *instance-id*: Displays the configuration and status information of an interface in a specified instance.

interface *interface-type interface-number*: Displays the spanning tree configuration and status information of an interface by interface type and interface number (for example, TenGigabitEthernet 0/1).

port-index: Displays the spanning tree configuration and status information of an interface by interface number (for example, 1). The value range is from 0 to 65535. The actual value cannot exceed the maximum port ID. TenGigabitEthernet 0/1 is 1 and *port-index* of port TenGigabitEthernet 0/2 is 2.

bpdufilter: Displays whether the BPDU filter function is enabled on an interface.

bpduguard: Displays whether the BPDU guard is enabled on an interface.

link-type: Displays the connection type of an interface.

portfast: Displays whether the fast forwarding function is enabled on an interface and whether the interface is an edge port.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

For an interface in up state, you can run the **show spanning-tree interface** *interface-type interface-number* command without any parameter to display all characteristic states of the interface. For an interface in down state, the above command cannot display all characteristic states but you can run the [**bpdufilter** | **bpduguard** | **link-type** | **portfast**] command with parameters contained in the command to display required information.

Examples

The following example displays the statuses of interfaces TenGigabitEthernet 0/1 and TenGigabitEthernet 0/2.

```
Hostname> enable
Hostname(config)# show interface description
Interface               Status   Administrative Description
------------------------ -------- -------------- -----------
TenGigabitEthernet 0/1       up      up
TenGigabitEthernet 0/2       down    up
Hostname(config)# exit
```

The following example displays the spanning tree configuration of port TenGigabitEthernet 0/1 (the port status is up).

```
Hostname# show spanning-tree interface tenGigabitEthernet 0/1

PortAdminPortFast : Disabled

```

The following example displays the spanning tree configuration of port TenGigabitEthernet 0/2 (the port status is down).

```
Hostname# show spanning-tree interface tenGigabitEthernet 0/2
no spanning tree info available for TenGigabitEthernet 0/2.
Hostname# show spanning-tree interface tenGigabitEthernet 0/2 bpdufilter
PortBPDUFilter : Disabled
Hostname# show spanning-tree interface tenGigabitEthernet 0/2 portfast
PortAdminPortFast :Disabled
Hostname# show spanning-tree interface tenGigabitEthernet 0/2 bpduguard
PortBPDUGuard : Disabled
Hostname# show spanning-tree interface tenGigabitEthernet 0/2 link-type
PortAdminLinkType : auto
```

Table 1-7 Output Fields of the show spanning-tree interface Command

Field	Description
PortAdminPortFast	Whether a fast forwarding port is configured
PortOperPortFast	Whether the port is in fast forwarding state
PortAdminAutoEdge	Whether an autoedge port is configured
PortOperAutoEdge	Whether the port is in autoedge state
PortAdminLinkType	Link type configured for the port
PortOperLinkType	Actual link type of the port
PortBPDUGuard	Status of the BPDU guard function of the port
PortBPDUFilter	Status of the BPDU filter function of the port
PortGuardmode	Port guard mode
MST *instance-id* vlans mapped	VLAN list mapped to an instance

Field	Description
PortState	Port forwarding status in an instance
PortPriority	Port priority in an instance
PortDesignatedRoot	Designated root bridge of the port in an instance
PortDesignatedCost	External root path cost of the port in an instance
PortDesignatedBridge	Designated bridge of the port in an instance
PortDesignatedPortPriority	Priority of the designated port in an instance
PortDesignatedPort	Designated port in an instance
PortForwardTransitions	Number of times that the port transitions to the forwarding state in an instance
PortAdminPathCost	Path cost configured for the port in an instance
PortOperPathCost	Actual path cost of the port in an instance
Inconsistent states	Root or loop inconsistent state of the port in an instance
PortRole	Port role

Notifications

When you view all spanning tree information of a port in down state, the following notification will be displayed:

```
no spanning tree info available for TenGigabitEthernet 0/2.
```

When you enter a value in the range of 0 to 65535 but beyond the port ID in the *port-index* parameter, the following notification will be displayed:

```
no spanning tree info available for the interface.
```

1.16 show spanning-tree mst topochange record

Function

Run the **show spanning-tree mst topochange record** command to display spanning tree topology change records.

Syntax

show spanning-tree mst *instance-id* **topochange record**

Parameter Description

instance-id: ID of a specified instance whose spanning tree topology changes need to be displayed. The value range is from 0 to 64. Instance **0** exists by default and instances 1–64 can be customized.

Command Modes

All modes except the user EXEC mode

Default Level

15

Usage Guidelines

This command is used to display topology changes of an interface by instance, including the interface experiencing a status change, status change time, old status, new status, and cause for the status change.

Examples

The following example displays the spanning tree topology change records of instance 0.

```
Hostname> enable
Hostname# show spanning-tree mst 0 topochange record
Topology change information on mst 0:
 Time              Interface        Old status   New status    Type
2013.5.1 4:18:46     Te0/1           Learning     Forwarding    Normal
```

Table 1-9 Output Fields of the show spanning-tree mst topochange record Command

Field	Description
Time	Topology change time of an interface
Port	Interface experiencing the topology change
Old status	Old spanning tree status of the interface ● **Discarding**: Discarded state ● **Learning**: Learning state ● **Forwarding**: Forwarding state
New status	New spanning tree status of the interface ● **Discarding**: Discarded state ● **Learning**: Learning state ● **Forwarding**: Forwarding state
Type	Cause for the topology change of the interface. The possible causes are as follows: ● **Normal**: Normal status change of the interface, for example, status change when the interface is up/down. ● **LoopGuard Block**: The interface enters blocking state due to loop inconsistency. ● **RootGuard Block**: The interface enters blocking state due to root inconsistency. ● **Inferior Block**: The interface enters blocking state because it receives a BPDU of a lower priority. ● **LoopGuard Unblock**: The interface recovers from loop inconsistency and enters forwarding state. ● **RootGuard Unblock**: The interface recovers from root inconsistency and enters forwarding state. ● **Inferior Unblock**: The interface does not receive BPDUs of a lower priority and enters forwarding state.

Notifications

When a specified instance does not have topology change, the following notification will be displayed ([dec] indicates the instance ID):

```
%There's no topology change information has been record on mst [ dec ].
```

1.17 spanning-tree

Function

Run the **spanning-tree** command to enable the STP function or configure STP global time parameters.

Run the **no** form of this command to disable this feature or remove this configuration.

Run the **default** form of this command to restore the default configuration.

The STP function is enabled by default.

The STP function is disabled by default.

Syntax

spanning-tree [**forward-time** *forward* | **hello-time** *hello* | **max-age** *age* | **max-hops** *hop-count* | **timer-factor** *factor* | **tx-hold-count** *count*]

no spanning-tree [**forward-time** | **hello-time** | **max-age** | **max-hops** | **tx-hold-count**]

default spanning-tree [**forward-time** | **hello-time** | **max-age** | **max-hops** | **tx-hold-count** }

spanning-tree [**forward-time** *forward* | **hello-time** *hello* | **max-age** *age* | **max-hops** *hop-count* | **tx-hold-count** *count*]

no spanning-tree [**forward-time** | **hello-time** | **max-age** | **max-hops** | **tx-hold-count**]

default spanning-tree [**forward-time** | **hello-time** | **max-age** | **max-hops** | **tx-hold-count** }

Parameter Description

forward-time *forward*: Specifies the port status change interval, in seconds. After port role election is complete, STP waits for twice the period of **Forward Delay** before entering the forwarding state, that is, the interval for STP to transition from listening state to learning state and from learning state to forwarding state. The value range is from 4 to 30. The default value is **15**.

hello-time *hello*: Specifies the interval for the device to periodically send BPDUs, in seconds. The value range is from 1 to 10. The default value is **2**.

max-age *age*: Specifies the maximum timeout time of BPDUs, in seconds. Packets beyond **max age** will be discarded. The value range is from 6 to 40. The default value is **20**.

max-hops *hop-count*: Specifies the maximum hop count of BPDU frames of all MSTIs, that is, the number of devices that BPDUs of MSTIs can pass through before the BPDUs are discarded. The value range is from 1 to 40, and the default value is **20**.

tx-hold-count *count*: Configures the maximum number of BPDUs that can be sent per second. The value range is from 1 to 10, and the default value is **3**.

timer-factor *factor*: Configures the packet receiving timeout factor. Timeout time = Timeout factor (indicated by *factor*) × Hello Time. If a device fails to receive a BPDU from the upstream device within the timeout time, it re-calculates the spanning tree. The value range is from 1 to 30, and the default value is **20**.

timer-factor *factor*: Configures the packet receiving timeout factor. The timeout time is calculated as follows: Timeout time = Timeout factor (indicated by *factor*) × Hello Time. If a device fails to receive a BPDU from the upstream device within the timeout time, it re-calculates the spanning tree. The value range is from 1 to 30, and the default value is **3**.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

The restrictive relationship among the values of **forward-time, hello-time, and max-age** is as follows: 2 × (**Hello Time** + 1s) ≤ **Max Age** ≤ 2 × (**Forward Delay** – 1s). The values must meet this condition. Otherwise, the topology may be unstable.

In an MST region, the BPDU sent by the root bridge contains the **Hot Count** field. The BPDU hop count decreases by 1 each time the BPDU passes through one device from the root bridge till the hop count becomes 0, indicating that the BPDU will be discarded by the receiving device due to timeout. In general, the default value of **max-hops** does not need to be changed for a network with the scale less than 20 hops, but needs to be changed to match the actual network situation when the network scale is greater than 20 hops. Changing the maximum hop count will affect all instances.

You can run the **show spanning-tree** command to display the STP global configuration.

Examples

The following example enables the MSTP function and sets **Forward Delay** to 10s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree
Hostname(config)# spanning-tree forward-time 10
```

The following example sets the maximum number of BPDUs that can be sent per second to 5.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree tx-hold-count 5
```

The following example sets the timeout factor to 4.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)#spanning-tree timer-factor ?
  <1-30>  Range of timer factor  (default value: 3)
Hostname(config)# spanning-tree timer-factor 4
```

The following example sets the maximum hop count of BPDUs to 30 for all instances on the device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree max-hops 30
```

Notifications

When the **spanning-tree** command is configured to enable the STP protocol, the following notification will be displayed:

```
Enable spanning-tree.
```

STP and the Transparent Interconnection of Lots of Links (TRILL) protocol of data centers are mutually exclusive. When STP is enabled after TRILL is enabled, the following notification will be displayed:

```
% Error! You must disable TRILL first.
```

1.18 spanning-tree autoedge

Function

Run the **spanning-tree autoedge** command to enable the autoedge function on a designated port.

Run the **spanning-tree autoedge disabled** command to disable this feature.

The autoedge function of a designated port is enabled by default.

Syntax

spanning-tree autoedge [**disabled**]

Parameter Description

disabled: Disables the autoedge function of an interface.

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

In a spanning tree topology, each LAN connects to the root bridge through a designated port of the upstream node. After this command is configured, if a designated port fails to receive a BPDU from the downstream port within a period of time (3s), it deems that the device connected to this port is a terminal, automatically deems

itself as an edge port, and enters forwarding state. If receiving a BPDU, the port identified as an edge port will be automatically identified as a non-edge port.

Caution

The autoedge function can be enabled only on designated ports.

RSTP and MSTP support the autoedge function but STP does not support the function.

If BPDU filter has been enabled on a port, the port directly enters forwarding state and is not automatically identified as an edge port.

You can run the **show spanning-tree interface** *interface-type interface-number* command to display the spanning tree configuration of an interface. When the value of the **PortAdminAutoEdge** field is **Enabled**, this function is enabled. The value **Disabled** indicates that this function is disabled.

Examples

The following example disables the autoedge function of port TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree autoedge disabled
```

1.19 spanning-tree bpdufilter

Function

Run the **spanning-tree bpdufilter** command to enable the BPDU filter function on an interface so that the interface neither sends nor receives BPDUs, but works in forwarding state.

Run the **spanning-tree bpdufilter disabled** command to disable this feature.

The BPDU filter function is disabled on an interface by default.

Syntax

spanning-tree bpdufilter { **enabled | disabled** }

Parameter Description

enabled: Enables the BPDU filter function on an interface.

disabled: Disables the BPDU filter function on an interface.

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

BPDU filter is a method of preventing BPDU attacks. When BPDU filter is enabled, a port neither sends nor receives BPDUs, but directly enters forwarding state. If a port receives a BPDU, it transitions to disabled state and the BPDU filter function automatically fails.

BPDU filter can be enabled globally or on interfaces.

- The **spanning-tree portfast bpdufilter default** command is used to enable the global BPDU filter function. The global BPDU filter function takes effect only on edge ports. Edge ports can be automatically identified by the system, and you can also run the **spanning-tree portfast** command to configure edge ports. When the autoedge function conflicts with the port fast configuration, the port fast configuration prevails.
- The **spanning-tree bpdufilter enabled** command is used to enable the BPDU filter function on an interface. The function takes effect on the interface regardless of whether the interface is an edge port.

Note

In general, when a port running STP transitions from listening state to learning state and then to forwarding state, it needs to wait for twice the period of **Forward-Delay** (2 × 15 = 30s by default). If a device port directly connects to a network terminal, you can enable the BPDU filter function to enable the port to work in forwarding state.

You can run the **show spanning-tree interface** *interface-type interface-number* **bpdufilter** command to display the spanning tree configuration of an interface. If the value of the **PortBPDUFilter** field is **Enabled**, this function is enabled, and the value **Disabled** indicates that this function is disabled.

Examples

The following example enables the BPDU filter function on port TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree bpdufilter enabled
```

1.20 spanning-tree bpduguard

Function

Run the **spanning-tree bpduguard** command to enable or disable the BPDU guard function on an interface so that the interface enters error-disabled state when receiving a BPDU.

The BPDU guard function is disabled on an interface by default.

Syntax

spanning-tree bpduguard { **enable** | **disabled** }

Parameter Description

enable: Enables the BPDU guard function on an interface.

disabled: Disables the BPDU guard function on an interface.

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

If a user illegally connects to a network device to an interface, to which a terminal should be connected, the network device may send BPDUs, causing a network topology change. If an interface with BPDU guard enabled receives a BPDU, it starts the BPDU guard mechanism, enters the error-disabled state, and is disabled, indicating that a network exception occurs.

An interface in error-disabled state can be restored automatically or manually. The **errdisable recovery** [**interval** *seconds*] command is used to configure the interval for automatically restoring a port from error-disabled state, in seconds. The value range is from 30 to 86400. The **errdisable recovery** command is used to manually restore a port from error-disabled state.

BPDU guard can be enabled globally or on interfaces.

- The **spanning-tree portfast bpduguard default** command is used to enable global BPDU guard, which takes effect only on edge ports. Edge ports can be automatically identified by the system, and you can also run the **spanning-tree portfast** command to configure edge ports. When the autoedge function conflicts with port fast configuration, the port fast configuration prevails.

- The **spanning-tree bpduguard enable** command is used to enable BPDU guard, which takes effect on interfaces regardless of whether they are edge ports.

You can run the **show spanning-tree interface** *interface-type interface-number* **bpduguard** command to display the spanning tree configuration of an interface. If the value of the **PortBPDUFilter** field is **Enabled**, this function is enabled, and the value **Disabled** indicates that this function is disabled.

Examples

The following example enables the BPDU guard function on port TenGigabitEthernet 0/1 and sets the auto-recovery time to 60s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree bpduguard enable
Hostname(config-if-TenGigabitEthernet 0/1)# errdisable recovery interval 60
```

Notifications

When an interface with BPDU guard enabled receives a BPDU, the following notification will be displayed ([char] indicates the interface name):

```
SPANTREE-BLOCK_BPDUGUARD: Received BPDU on port [ char ] with BPDU Guard enabled.
Disabling port.
```

1.21 spanning-tree compatible enable

Function

Run the **spanning-tree compatible enable** command to enable the spanning tree compatibility mode on an interface.

Run the **no** form of this command to disable this feature.

The spanning tree compatibility mode is enabled on an interface by default.

The spanning tree compatibility mode is disabled on an interface by default.

Syntax

spanning-tree compatible enable

no spanning-tree compatible enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

After the spanning tree compatibility mode is enabled on an interface, STP calculates whether the interface participates in the calculation of a specified instance based on the VLAN, to which the interface belongs, and the mapping between the VLAN and the instance. When the interface sends a BPDU, only the MSTI configuration message of the instance calculated by the interface, is carried to ensure compatibility with other devices.

For example, instances 1 and 2 exist on a device. Port GigabitEthernet 0/1 belongs only to VLAN 10, and VLAN 10 belongs to instance 1. If the spanning tree compatibility mode is enabled on port GigabitEthernet 0/1, the BPDU sent by port GigabitEthernet 0/1 carries only information of instance 0 (the port participates in calculation of this instance by default) and instance 1, with no information of instance 2.

Examples

The following example creates instance 1 and instance 2, associates instance 1 with VLAN 10 and instance 2 with VLAN 20, adds port TenGigabitEthernet 0/1 to VLAN 10, enables the spanning tree compatibility mode on port TenGigabitEthernet 0/1, and adds port TenGigabitEthernet 0/2 to VLAN 20. After configuration, BPDUs sent by port TenGigabitEthernet 0/1 will not carry information about instance 2 and port TenGigabitEthernet 0/2 will not participate in the spanning tree calculation of instance 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# instance 1 vlan 10
Hostname(config-mst)# instance 2 vlan 20
Hostname(config-mst)# exit
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# switchport mode access
Hostname(config-if-TenGigabitEthernet 0/1)# switchport access vlan 10
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree compatible enable
Hostname(config-if-TenGigabitEthernet 0/1)# exit
Hostname(config)# interface Gigabitethernet 0/2
Hostname(config-if-TenGigabitEthernet 0/2)# switchport
Hostname(config-if-GTenGigabitEthernet 0/2)# switchport mode access
Hostname(config-if-TenGigabitEthernet 0/2)# switchport access vlan 20
Hostname(config-if-TenGigabitEthernet 0/2)# spanning-tree compatible enable
```

Run the **no** function to disable this feature.

The loop guard function is disabled on an interface by default.

Syntax

spanning-tree guard loop

no spanning-tree guard loop

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

The root port or backup port of a non-root bridge may fail to receive BPDUs due to the unidirectional link failure, and the root port becomes a designated port and enters forwarding state. As a result, loops occur in the network. To prevent this situation, you can configure loop guard on a non-root bridge.

After loop guard is enabled, when the root port or backup port fails to receive BPDUs and changes to a designated port, the port will remain in discarding state until it receives a BPDU for spanning tree calculation.

Loop guard can be enabled globally or on interfaces.

- The **spanning-tree loopguard default** command is used to globally enable the loop guard function on all interfaces.
- The **spanning-tree guard loop** command is used to enable the loop guard function on an interface.

Loop guard and root guard are mutually exclusive on an interface and they cannot take effect at the same time.

Examples

The following example enables the loop guard function on port TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-GTenGigabitEthernet 0/1)# spanning-tree guard loop
```

Notifications

When loop guard is configured after root guard is configured, the following notification will be displayed ([chars] indicates the interface name):

```
SPANTREE-ROOTGUARD_CONFIG_CHANGE: Root Guard disabled on port [ chars ].
```

Run the **no** form of this command to disable the root guard function on an interface.

The root guard function is disabled on an interface by default.

Syntax

spanning-tree guard root

no spanning-tree guard root

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

In the network design, the root bridge and backup root bridge are usually classified into the same region. Designated ports on a root bridge may receive configuration BPDUs with a higher priority due to a

misconfiguration or malicious attacks, and the root bridge loses the current root bridge role. As a result, an incorrect network topology change is incurred. To prevent this situation, you can configure the root guard function on designated ports of the root bridge.

After the root guard function is enabled, the device ports are designated ports on all instances. If a port receives a high-priority BPDU, the port enters blocking state due to root-inconsistent. If the port fails to receive a high-priority BPDU within a period of time, it returns to the normal state.

Loop guard and root guard are mutually exclusive on an interface and they cannot take effect at the same time.

Examples

The following example enables the root guard function on port TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport

1.25 spanning-tree ignore tc

Function

Run the **spanning-tree ignore tc** command to enable the TC filter function on an interface so that the interface diffuses only TC packets generated by itself and does not diffuse received TC packets.

Run the **no** function to disable this feature.

The TC filter function is disabled on an interface by default.

Syntax

spanning-tree ignore tc

no spanning-tree ignore tc

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

TC diffusion: When the downstream network topology changes, a port generates a TC packet (that is, TCN BPDU) to notify the upstream device of the spanning tree change. After receiving a TCN BPDU, a port copies the BPDU and forwards it to upstream devices till the root bridge receives the BPDU. After receiving a TC packet, a device deletes dynamic MAC addresses and ARP entries that have been learned. If a device encounters TC packet attacks, it frequently performs the deletion operation, which occupies excessive device resources. After TC packet attacks are diffused to the whole network, the performance of devices throughout the network will be affected. Therefore, TC protection, TC guard, and TC filter arise to solve this problem.

- TC protection: This function restricts a device to perform only one deletion operation within a period of time (generally 4s) after receiving TC packets, and monitors whether any TCN BPDU is received in this period. If the device receives TCN BPDUs in this period, it performs another deletion operation after the period expires. This can prevent the device from frequently deleting MAC address entries and ARP entries. TC protection can be enabled or disabled only globally.
- TC guard: After TC guard is configured on a port, the port will neither diffuse TC packets generated by itself in the case of a topology change nor diffuse received downstream TC packets. TC guard can effectively control possible TC attacks in the network and retain the network stability. Especially on L3 devices, this function can effectively prevent interruption of core routes caused by the access device flapping. TC guard can be enabled or disabled globally or on interfaces.
- TC filter: TC guard blocks the diffusion of TC packets. When a topology change occurs, the device does not clear dynamic MAC addresses learned by interfaces, which may result in data forwarding errors. Hence, the TC filter function emerges. After TC filter is enabled on an interface, the interface does not process received downstream TC packets but processes only TC packets generated by itself due to topology changes. This function solves the problem of core route interruption caused by frequent up/down state switching of edge ports. It also ensures that core routing entries are updated in time when a topology change occurs. TC filter can be enabled or disabled only on interfaces.

Examples

The following example enables the TC filter function on port TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree ignore tc
```

1.26 spanning-tree link-type

Function

Run the **spanning-tree link-type** command to forcibly set the connection type of an interface to point-to-point or shared.

Run the **no** form of this command to restore the default configuration.

The default connection type of an interface is auto mode. If an interface works in full-duplex mode, the connection type is point-to-point. If an interface works in half-duplex mode, the connection type is shared.

Syntax

spanning-tree link-type { **point-to-point** | **shared** }

no spanning-tree link-type

Parameter Description

point-to-point: Forcibly sets the connection type of an interface to point-to-point.

shared: Forcibly sets the connection type of an interface to shared.

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

A designated port of RSTP can perform a Proposal/Agreement handshake with the connected bridge and rapidly enter forwarding state, to implement fast convergence. In this way, the port does not need to wait for twice the period of **Forward Delay** before entering forwarding state. Only interfaces using the point-to-point connection support fast convergence via handshake. You are advised to configure the point-to-point connection for devices, so as to give full play to the devices. If the connection type is not configured, the device automatically sets the port connection type based on the port duplex status.

You can run the **show spanning-tree interface** *interface-type interface-number* **link-type** command to display the spanning tree configuration of an interface. When the **PortAdminLinkType** field is set to **Auto**, the connection type of an interface is auto mode. The value **point-to-point** indicates that the connection type of an interface is forcibly set to point-to-point, and **shared** indicates that the connection type of an interface is forcibly set to non-point-to-point.

Examples

The following example forcibly sets the connection type of port TenGigabitEthernet 0/1 to point-to-point.

```
Hostname> enable
Hostname# show spanning-tree interface gtenGigabitEthernet 0/1 link-type
PortAdminLinkType : auto
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree link-type point-to-point
Hostname(config-if-TenGigabitEthernet 0/1)# end
Hostname# show spanning-tree interface tenGigabitEthernet 0/1 link-type
PortAdminLinkType : point-to-point
```

Run the **no** form of this command to restore the default configuration.

Syntax

spanning-tree mst configuration

no spanning-tree mst configuration

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

This command is used to enable the MSTP protocol. Devices that have the same configuration name, revision number, and instance mappings constitute an MST region. Configuration names, revision numbers, and instance mappings are recorded in the **MST CFG ID** field of MST BPDUs and they can be configured.

- Configuration name: Identifies an MST region. The value is a string of up to 32 characters and the default value is empty.
- Revision number: Identifies an MST region. The value is a 2-byte non-negative integer and the default value is **0**.
- Instance mapping: Indicates mappings between instances and VLANs. One MST region can contain multiple MSTIs. Instance **0** exists by default and instances 1–64 can be created. This device supports VLANs 1–4094. VLANs belong to instance **0** except those that have been assigned to instances.

MST regions are independent of each other. If a port on a device receives a BPDU with **MST CFG ID** same as that of the MST BPDU of the device, the device deems that the peer device and the device belong to the same MST region. Otherwise, the device deems that the peer device belongs to a different MST region. The load sharing advantage of MSTP can be reflected only after multiple devices are configured to the same MST region. Therefore, MST regions need to be properly divided and devices in the same MST region need to have the same **MST CFG ID**.

Examples

The following example enters the MST configuration mode, configures an MST region named region1, configures instance 1 to include VLAN 3 and VLANs 5–10, and displays the MST region configuration.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# instance 1 vlan 3, 5-10
Hostname(config-mst)# name region1
Hostname(config-mst)# revision 1
Hostname(config-mst)# show spanning-tree mst configuration
Multi spanning tree protocol : Enable
Name    : region1
Revision : 1
```

```
Instance  Vlans Mapped
--------  ---------------
0       1-2,4,11-4094
1       3,5-10

1.30 spanning-tree mst cost

Function

Run the **spanning-tree mst cost** command to configure a port path cost.

Run the **no** command to restore the default configuration.

A device automatically calculates the port path cost based on the link rate of an interface by default.

Syntax

spanning-tree [**mst** *instance-id*] **cost** *cost*

no spanning-tree [**mst** *instance-id*] **cost**

Parameter Description

mst *instance-id*: Specifies the ID of an instance so that the port path cost can be configured based on this instance. The value range is from 0 to 64, and the default value is **0**.

cost *cost*: Specifies the port path cost. The value range is from 1 to 200000000. The port path cost is automatically calculated based on the link rate of an interface in accordance with IEEE 802.1t Long by default. For example, as shown in Table 1-10, the path cost of an interface with the rate of 1000 Mbps is 20,000, the path cost of an interface with the rate of 100 Mbps is 200,000, and the path cost of an interface with the rate of 10 Mbps is 2,000,000.

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

In the spanning tree calculation, devices elect roles by comparing elements in the priority vector <root ID, root path cost, bridge ID, port ID>. A smaller value indicates a higher priority. The devices compare the root ID (bridge ID of each device initially) to elect the root bridge. All ports on the root bridge are designated ports. On a non-root bridge, the device elects the root port by comparing elements in the priority vector. On a network segment that directly connects two ports, the designated port is elected by comparing elements in the priority vector. Finally, non-designated ports are blocked.

The root path cost is the sum of path costs of all ports in the path from a device to the root. When the administrator needs to control the spanning tree topology, the port path cost can be modified to affect the root path cost value.

You can run the **show spanning-tree mst interface** *interface-type interface-number* command to verify the above configuration.

Examples

The following example sets the port path cost of port TenGigabitEthernet 0/1 to 400 in instance 3.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree mst 3 cost 400
```

1.31 spanning-tree mst port-priority

Function

Run the **spanning-tree mst port-priority** command to configure a port priority.

Run the **no** form of this command to restore the default configuration.

The default port priority is 128.

Syntax

spanning-tree [**mst** *instance-id*] **port-priority** *port-priority*

no spanning-tree [**mst** *instance-id*] **port-priority**

Parameter Description

mst *instance-id*: Specifies the ID of an instance so that the instance-based port priority can be configured. The value range is from 0 to 64, and the default value is **0**.

port-priority *port-priority*: Specifies the port priority. The value range is multiples of 16, that is, 0, 16, 32, 48, 64, 80, 96, 112, 128 (default value), 144, 160, 176, 192, 208, 224, and 240, totaling 16 integers.

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

In the spanning tree calculation, devices elect roles by comparing elements in the priority vector <root ID, root path cost, bridge ID, port ID>. A smaller value indicates a higher priority. The devices compare the root ID (bridge ID of each device initially) to elect the root bridge. All ports on the root bridge are designated ports. On a non-root bridge, the device elects the root port by comparing elements in the priority vector. On a network segment that directly connects two ports, the designated port is elected by comparing elements in the priority vector. Finally, non-designated ports are blocked.

A port ID consists of two bytes, with the first byte of *port-priority* and the second byte of port ID.

When the administrator needs to control the spanning tree topology, he can configure *port-priority* to change the port ID.

You can run the **show spanning-tree mst interface** *interface-type interface-number* command to verify the above configuration.

Examples

The following example sets the port priority of port TenGigabitEthernet 0/1 in instance 20 to 0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree mst 20 port-priority 0

1.32 spanning-tree mst priority

Function

Run the **spanning-tree mst priority** command to configure a bridge priority.

Run the **no** command to restore the default configuration.

The default bridge priority is **32768**.

Syntax

spanning-tree [**mst** *instance-id*] **priority** *priority*

no spanning-tree [**mst** *instance-id*] **priority**

Parameter Description

mst *instance-id*: Specifies the ID of an instance so that the bridge priority can be configured based on this instance. The value range is from 0 to 64, and the default value is **0**.

priority *priority*: Specifies the bridge priority. The value range is multiples of 4096, that is, 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768 (default value), 36864, 40960, 45056, 49152, 53248, 57344, and 61440, totaling 16 integers.

Command Modes

Usage Guidelines

In the spanning tree calculation, devices elect roles by comparing elements in the priority vector <root ID, root path cost, bridge ID, port ID>. A smaller value indicates a higher priority. The devices compare the root ID (bridge ID of each device initially) to elect the root bridge. All ports on the root bridge are designated ports. On a non-root bridge, the device elects the root port by comparing elements in the priority vector. On a network segment that directly connects two ports, the designated port is elected by comparing elements in the priority vector. Finally, non-designated ports are blocked.

A bridge ID consists of eight bytes, with the first two bytes of the bridge priority (indicated by *priority*) and the last six bytes used for the MAC address of the bridge.

When the administrator needs to control the spanning tree topology, *priority* can be changed to change the bridge ID.

After running the **spanning-tree** command to enable STP, you can run the **show spanning-tree** and **show spanning-tree summary** commands to verify the above configuration.

Examples

The following example sets the bridge priority of instance 20 to 8192 in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst 20 priority 8192
```

Notifications

When the configured bridge priority is not a multiple of 4096, the following notification will be displayed:

```
bridge priority must be IN increments of 4096
```

1.33 spanning-tree pathcost method

Function

Run the **spanning-tree pathcost method** command to configure the method of calculating the default port path cost.

Run the **no** form of this command to restore the default configuration.

The port path cost is calculated according to IEEE 802.1t Long by default.

Syntax

spanning-tree pathcost method { **long** | **long standard** | **short** }

no spanning-tree pathcost method

Parameter Description

long: Sets and calculates the port path cost according to IEEE 802.1t Long.

long standard: Sets and calculates the port path cost according to IEEE 802.1t Long Standard.

short: Sets and calculates the port path cost according to IEEE 802.1d Short.

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

The methods of calculating the default port path costs specified in standards are listed in Table 1-10. Be sure to adopt a consistent port path cost standard for the entire network.

IEEE 802.1d Short: The range of the port path cost is from 1 to 65535. Aggregate port cost = Physical port cost × 95%.

IEEE 802.1t Long: The range of the port path cost is from 1 to 200000000. Aggregate port cost = Physical port cost × 95%.

IEEE 802.1t Long Standard: The range of the port path cost is from 1 to 200000000. Aggregate port cost = Physical port cost/Linkupcnt. At this moment, the cost value of the aggregate port will change with the number of member ports, which will lead to the network topology change. For configurations of aggregate ports and the Link Aggregation Control Protocol (LACP), see *Link Aggregation Port*.

- When an aggregate port is a static aggregate port, **Linkupcnt** refers to the number of member ports in Link Up state.
- When an aggregate port is an LACP aggregate port, **Linkupcnt** refers to the number of member ports participating in the aggregate port data forwarding.
- When no member port of an aggregate port is in Link Up state or forwarding data, the value of **Linkupcnt** is **1**.

Table 1-10 Port Path Costs Calculated Based on the Link Rate

Port Rate	Port	IEEE 802.1d Short	IEEE 802.1t Long	IEEE 802.1t Long Standard
10 Mbps	Common port	100	2000000	2000000
	Aggregate port	95	1900000	2000000/Linkupcnt
100 Mbps	Common port	19	200000	200000
	Aggregate port	18	190000	200000/Linkupcnt
1000 Mbps	Common port	4	20000	20000
	Aggregate port	3	19000	20000/Linkupcnt
10000 Mbps	Common port	2	2000	2000
	Aggregate port	1	1900	20000/Linkupcnt

You can run the **show spanning-tree pathcost method** command to display the configuration.

Examples

The following example sets the port path cost calculation method to **Long Standard**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree pathcost method long standard
```

1.34 spanning-tree portfast

Function

Run the **spanning-tree portfast** command to configure an interface as an edge port and enable the interface to rapidly enter forwarding state.

Run the **spanning-tree portfast disabled** command to remove this configuration.

Interfaces are non-edge ports by default.

Syntax

spanning-tree portfast

spanning-tree portfast disabled

Parameter Description

disabled: Restores an interface to a non-edge port and disables the fast forwarding function of the interface.

Command Modes

Interface configuration mode

Default Level

15

Usage Guidelines

If you are sure that a device interface is directly connected to a network terminal, you can manually configure the interface as an edge port. An edge port can enter forwarding state rapidly without waiting for twice the period of **Forward Delay**. The global BPDU guard and BPDU filter functions take effect only on edge ports.

- The **spanning-tree portfast default** command is used to configure the port fast attribute for all interfaces.
- The **spanning-tree portfast** command is used to configure the port fast attribute for a specific interface.

You can run the **show spanning-tree interface** *interface-type interface-number* **portfast** command to display the spanning tree configuration of an interface. If the value of the **PortAdminPortFast** field is **Enabled**, this function is enabled, and the value **Disabled** indicates that this function is disabled.

Examples

The following example configures port TenGigabitEthernet 0/1 as an edge port and enables the port to rapidly enter forwarding state.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport
```

```
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree portfast
```

Notifications

When an interface is manually configured as an edge port, the following notification will be displayed:

```
%Warning: portfast should only be enabled on ports connected to a single host. Connecting
hubs, switches, bridges to this interface when portfast is enabled,can cause temporary
loops.
```

1.35 spanning-tree portfast bpdufilter default

Function

Run the **spanning-tree portfast bpdufilter default** command to enable the global BPDU filter function.

Run the **no** form of this command to disable the global BPDU filter function.

The global BPDU filter function is disabled by default.

Syntax

spanning-tree portfast bpdufilter default

no spanning-tree portfast bpdufilter default

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

BPDU filter is a method of preventing BPDU attacks. When BPDU filter is enabled, a port neither sends nor receives BPDUs, but directly enters forwarding state. If a port receives a BPDU, it transitions to disabled state and the BPDU filter function automatically fails.

BPDU filter can be enabled globally or on interfaces.

- The **spanning-tree portfast bpdufilter default** command is used to enable the global BPDU filter function. The global BPDU filter function takes effect only on edge ports. Edge ports can be automatically identified by

the system, and you can also run the **spanning-tree portfast** command to configure edge ports. When the autoedge function conflicts with the port fast configuration, the port fast configuration prevails.

- The **spanning-tree bpdufilter enabled** command is used to enable the BPDU filter function on an interface. The function takes effect on the interface regardless of whether the interface is an edge port.

Note

In general, when a port running STP transitions from listening state to learning state and then to forwarding state, it needs to wait for twice the period of **Forward-Delay** (2 × 15 = 30s by default). If a device port directly connects to a network terminal, you can enable the BPDU filter function to enable the port to work in forwarding state.

You can run the **show spanning-tree** command to display the configuration.

Examples

The following example enables the global BPDU filter function and configures port TenGigabitEthernet 0/1 as an edge port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree portfast bpdufilter default
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree portfast
```

1.36 spanning-tree portfast bpduguard default

Function

Run the **spanning-tree portfast bpduguard default** command to enable the global BPDU guard function.

Run the **no** form of this command to disable this feature.

The global BPDU guard function is disabled by default.

Syntax

spanning-tree portfast bpduguard default

no spanning-tree portfast bpduguard default

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

15

Usage Guidelines

If a user illegally connects to a network device to an interface, to which a terminal should be connected, the network device may send BPDUs, causing a network topology change. If an interface with BPDU guard enabled receives a BPDU, it starts the BPDU guard mechanism, enters error-disabled state, and is disabled, indicating that an error occurs. An interface in error-disabled state can be restored automatically or manually. You can run the **errdisable recovery** [**interval** *seconds*] command to configure the interval for automatically restoring a port, in seconds. The value range is from 30 to 86400. If the command carries no parameter, the port needs to be manually restored.

BPDU guard can be enabled globally or on interfaces.

- The **spanning-tree portfast bpduguard default** command is used to enable global BPDU guard, which takes effect only on edge ports. Edge ports can be automatically identified by the system, and you can also run the **spanning-tree portfast** command to configure edge ports. When the autoedge function conflicts with port fast configuration, the port fast configuration prevails.
- The **spanning-tree bpduguard enabled** command is used to enable BPDU guard, which takes effect on interfaces regardless of whether they are edge ports.

You can run the **show spanning-tree interface** *interface-type interface-number* **bpduguard** command to display the spanning tree configuration of an interface. If the value of the **PortBPDUFilter** field is **Enabled**, this function is enabled, and the value **Disabled** indicates that this function is disabled.

Examples

The following example enables the global BPDU guard function, configures port TenGigabitEthernet 0/1 as an edge port, and sets the auto-recovery time to 60s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree portfast bpduguard default
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# spanning-tree portfast
Hostname(config-if-TenGigabitEthernet 0/1)# errdisable recovery interval 60

Usage Guidelines

TC diffusion: When the downstream network topology changes, a port generates a TC packet (that is, TCN BPDU) to notify the upstream device of the spanning tree change. After receiving a TCN BPDU, a port copies the BPDU and forwards it to upstream devices till the root bridge receives the BPDU. After receiving a TC packet, a device deletes dynamic MAC addresses and ARP entries that have been learned. If a device encounters TC packet attacks, it frequently performs the deletion operation, which occupies excessive device resources. After TC packet attacks are diffused to the whole network, the performance of devices throughout the network will be affected. Therefore, TC protection, TC guard, and TC filter arise to solve this problem.

- TC protection: This function restricts a device to perform only one deletion operation within a period of time (generally 4s) after receiving TC packets, and monitors whether any TCN BPDU is received in this period. If the device receives TCN BPDUs in this period, it performs another deletion operation after the period

expires. This can prevent the device from frequently deleting MAC address entries and ARP entries. TC protection can be enabled or disabled only globally.

- TC guard: After TC guard is configured on a port, the port will neither diffuse TC packets generated by itself in the case of a topology change nor diffuse received downstream TC packets. TC guard can effectively control possible TC attacks in the network and retain the network stability. Especially on L3 devices, this function can effectively prevent interruption of core routes caused by the access device flapping. TC guard can be enabled or disabled globally or on interfaces.
- TC filter: TC guard blocks the diffusion of TC packets. When a topology change occurs, the device does not clear dynamic MAC addresses learned by interfaces, which may result in data forwarding errors. Hence, the TC filter function emerges. After TC filter is enabled on an interface, the interface does not process received downstream TC packets but processes only TC packets generated by itself due to topology changes. This function solves the problem of core route interruption caused by frequent up/down state switching of edge ports. It also ensures that core routing entries are updated in time when a topology change occurs. TC filter can be enabled or disabled only on interfaces.

Examples

The following example enables the TC guard function on port TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport

1 ERPS Commands

Command	Function
associate sub-ring raps-vlan	Associate major rings of Ethernet intersecting rings with subrings.
erps enable	Enable the global ERPS function.
erps monitor link-state by oam	Monitor the logical status of ERPS links through OAM.
erps raps-vlan	Create an Ethernet ring R-APS VLAN and enter the R-APS VLAN configuration mode.
protected-instance	Configure the VLANs protected by an Ethernet ring.
ring-port	Add ports to an ERPS ring.
rpl-port	Configure the RPL port for an ERPS ring.
show erps	Display the parameters and state of ERPS.
state enable	Enable the ERPS function for a specified ring.
sub-ring tc-propagation	Enable the subring topology change notification.
timer	Configure ERPS timers.

1.1 associate sub-ring raps-vlan

Function

Run the **associate sub-ring raps-vlan** command to associate major rings of Ethernet intersecting rings with subrings.

Run the **no** form of this command to remove this configuration.

A major ring of Ethernet intersecting rings is not associated with its subrings by default.

Syntax

associate sub-ring raps-vlan *vlan-list*

no associate sub-ring raps-vlan *vlan-list*

Parameter Description

vlan-list: R-APS VLAN list of subrings. The value range is from 1 to 4094. The VLAN list can contain one or more VLANs. When multiple VLANs are contained, separate VLAN IDs by a comma (,) or connect continuous VLAN IDs with a hyphen (-).

Command Modes

R-APS VLAN configuration mode

Default Level

14

Usage Guidelines

This command needs to be configured on all nodes in an Ethernet Ring Protection Switching (ERPS) major ring so that ERPS packets of its subrings can be transmitted in the major ring.

The association aims to ensure that ERPS packets of the subrings can be transmitted in other Ethernet rings. You can also use the command provided by the VLAN module to configure a VLAN and its member ports so that ERPS packets of subrings can be transmitted in the major ring and are not leaked to user networks.

Examples

The following example associates the major ring R-APS VLAN 4093 with the subring R-APS VLAN 100 in an Ethernet.

(1) The following example configures the links of ports (TenGigabitEthernet 0/1 and TenGigabitEthernet 0/2) in the major ring to work in trunk mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/1)# exit
Hostname(config)# interface tenGigabitEthernet 0/2
Hostname(config-if-TenGigabitEthernet 0/2)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/2)# exit
```

(2) The following example configures R-APS VLAN 4093, adds the ports to the Ethernet ring, specifies the ring protection link (RPL) port and RPL owner, and enables the ERPS function.

```
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps 4093)# ring-port west tenGigabitEthernet 0/1 east
tenGigabitEthernet 0/2
Hostname(config-erps 4093)# rpl-port east rpl-owner
Hostname(config-erps 4093)# state enable
Hostname(config-erps 4093)# exit
```

(3) The following example enables the ERPS function globally.

```
Hostname(config)# erps enable
```

(4) The following example configures the link mode for the subring port, configures R-APS VLAN 100, adds TenGigabitEthernet 0/3 to the Ethernet ring, and enables the ERPS function.

```
Hostname(config)# erps raps-vlan 100
Hostname(config)# interface tenGigabitEthernet 0/3
Hostname(config-if-TenGigabitEthernet 0/3)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/3)# exit
Hostname(config)# erps raps-vlan 100
Hostname(config-erps 100)# ring-port west tenGigabitEthernet 0/3 east
virtual-channel
Hostname(config-erps 100)# state enable
Hostname(config-erps 100)# exit
```

(5) The following example associates the major ring R-APS VLAN 4093 with the subring R-APS VLAN 100.

```
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps4093)# associate sub-ring raps-vlan 100
```

1.2 erps enable

Function

Run the **erps enable** command to enable the global ERPS function.

Run the **no** form of this command to disable this feature.

The global ERPS function is disabled by default.

Syntax

erps enable

no erps enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

ERPS, also known as G.8032, is a ring protection protocol specially designed for the link layer in an Ethernet ring. It eliminates loops in the link layer in an Ethernet ring and prevents broadcast storms caused by data loops by blocking the specified ports. ERPS can rapidly recover the communication between nodes in the event that a link is disconnected in the Ethernet ring. ERPS has the L2 convergence time less than 50 ms, while the L2 convergence time is 50s for the Spanning Tree Protocol (STP) with similar functions, and nearly 1s for the Rapid Spanning Tree Protocol (RSTP) and Multiple Spanning Tree Protocol (MSTP).

ERPS takes effect in a specified ring only after ERPS is enabled globally and for the ring.

Run the **state enable** command to enable the ERPS function for a specified ring.

Examples

The following example enables the ERPS function globally.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# erps enable
```

The following example enables the ERPS function for a specified ring in R-APS VLAN configuration mode.

```
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps4093)# state enable
```

1.3 erps monitor link-state by oam

Function

Run the **erps monitor link-state by oam** command to monitor the logical status of ERPS links through OAM.

Run the **no** form of this command to directly monitor the physical status of ERPS links.

The physical status of ERPS links is directly monitored by default.

Syntax

erps monitor link-state by oam vlan *vlan-id*

no erps monitor link-state by oam

Parameter Description

vlan-id: ID of the VLAN that uses OAM to monitor the link status. The value range is from 1 to 4094.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

There are two methods of monitoring the ERPS link status.

- The physical status of ERPS links is directly monitored: up or down. This method is highly efficient.
- The logic status of ERPS links is monitored through OAM: unidirectional failure, bidirectional failure, or normal. This method is less efficient and the convergence time may be longer when the topology changes.

Examples

The following example monitors the logical status of ERPS links through OAM.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# erps monitor link-state by oam vlan 100
```

1.4 erps raps-vlan

Function

Run the **erps raps-vlan** command to create an Ethernet ring R-APS VLAN and enter the R-APS VLAN configuration mode.

Run the **no** form of this command to remove this configuration.

No R-APS VLAN is configured by default.

Syntax

erps raps-vlan *vlan-id*

no erps raps-vlan *vlan-id*

Parameter Description

vlan-id: ID of an R-APS VLAN. The value range is from 1 to 4094.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

An R-APS VLAN must be an unused VLAN on a device. VLAN 1 cannot be configured as an R-APS VLAN.

In an Ethernet ring, different devices must be configured with the same R-APS VLAN.

If a device with ERPS disabled needs to transparently transmit ERPS packets, ensure that only the two ports connecting the device to an ERPS ring allow packets from the ERPS ring to pass. Otherwise, packets from other VLANs may be transparently transmitted to the R-APS VLAN, causing impact on the ERPS ring.

Examples

The following example configures the R-APS VLAN 4093 for an Ethernet ring.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps4093)#
```

1.5 protected-instance

Function

Run the **protected-instance** command to configure the VLANs protected by an Ethernet ring.

Run the **no** form of this command to configure an Ethernet ring to protect all VLANs.

An Ethernet ring protects all VLANs by default.

Syntax

protected-instance *instance-id-list*

no protected-instance

Parameter Description

instance-id-list: List of the instances protected by an Ethernet ring. The VLAN group corresponding to an instance needs to be configured to configure the protected VLANs for an Ethernet ring. The value range is from 0 to 64. The instance list can contain one or more instances. When multiple instances are configured, separate the instances by a comma (,) and separate continuous instances with a hyphen (-).

Command Modes

R-APS VLAN configuration mode

Default Level

14

Usage Guidelines

Instances protected by an Ethernet ring can implement load balancing.

Examples

The following example configures ERPS 1 and ERPS 2 on a device to implement load balancing. In ERPS 1, the R-APS VLAN is VLAN 100, and protected data VLANs are 1-99 and 101-2000. In ERPS 2, the R-APS VLAN is VLAN 4093, and protected data VLANs are 2001-4092 and 4094. The load balancing is configured as follows.

The following example sets the protected VLANs of the Ethernet ring ERPS1 R-APS VLAN 100 to VLANs 1-99 and 101-2000 in instance 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# instance 1 vlan 100,1-99,101-2000
Hostname(config-mst)# exit
```

```
Hostname(config)# erps raps-vlan 100
Hostname(config-erps 100)# protected-instance 1
Hostname(config-erps 100)# exit
```

The following example sets the protected VLANs of the Ethernet ring ERPS2 R-APS VLAN 4093 to VLAN 2001-4092 and 4094 in instance 2.

```
Hostname(config)# spanning-tree mst configuration
Hostname(config-mst)# instance 2 vlan 4093,2001-4092,4094
Hostname(config-mst)# exit
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps 4093)# protected-instance 2
```

1.6 ring-port

Function

Run the **ring-port** command to add ports to an ERPS ring.

Run the **no** form of this command to remove this configuration.

No member port is configured in an ERPS ring by default.

Syntax

ring-port west { *interface-type interface-number* | **virtual-channel** } **east** { *interface-type interface-number* | **virtual-channel** }

no ring-port

Parameter Description

west *interface-type interface-number*: Configures a port as the west port of an ERPS ring.

west virtual-channel: Configures a virtual channel as the west port of an ERPS subring.

east *interface-type interface-number*: Configures a port as the east port of an ERPS ring.

east virtual-channel: Configures a virtual channel as the east port of an ERPS subring.

Command Modes

R-APS VLAN configuration mode

Default Level

14

Usage Guidelines

The trunk attributes of a port cannot be modified after the port is added to an ERPS ring.

virtual-channel is only used to configure a port for an ERPS subring.

The ports running ERPS are not involved in the STP calculation. ERPS, Rapid Ethernet Ring Protection (RERP), and Rapid Ethernet Uplink Protection (REUP) do not share ports.

Examples

The following example configures the link mode for Ethernet ring ports.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/1)# exit
Hostname(config)# interface tenGigabitEthernet 0/2
Hostname(config-if-TenGigabitEthernet 0/2)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/2)# exit
```

The following example configures TenGigabitEthernet 0/1 as the west port and TenGigabitEthernet 0/2 as the east port, and adds them to R-APS VLAN 4093.

```
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps 4093)# ring-port west tenGigabitEthernet 0/1 east
tenGigabitEthernet 0/2
```

1.7 rpl-port

Function

Run the **rpl-port** command to configure the RPL port for an ERPS ring.

Run the **no** form of this command to remove this configuration.

No RPL port is configured in an ERPS ring by default.

Syntax

rpl-port { **west** | **east** } **rpl-owner**

no rpl-port

Parameter Description

west: Specifies the west port as the RPL port.

east: Specifies the east port as the RPL port.

Default Level

14

Command Modes

R-APS VLAN configuration mode

Usage Guidelines

Each ring must be configured with only one RPL and only one RPL owner node.

For non-RPL owner nodes, the RPL port does not need to be configured. If you need to perform the RPL port, configure it on the port connected to the RPL.

Examples

The following example configures the link mode for Ethernet ring ports in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/1)# exit
Hostname(config)# interface tenGigabitEthernet 0/2
Hostname(config-if-TenGigabitEthernet 0/2)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/2)# exit
```

The following example adds the ports to an Ethernet ring in R-APS VLAN configuration mode.

```
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps 4093)# ring-port west tenGigabitEthernet 0/1 east
tenGigabitEthernet 0/2
```

The following example configures the RPL port and RPL owner node.

```
Hostname(config-erps 4093)# rpl-port west rpl-owner
```

no state enable

Parameter Description

N/A

Command Modes

R-APS VLAN configuration mode

Default Level

14

Usage Guidelines

ERPS takes effect in a specified ring only after ERPS is enabled both globally and for the ring.

Examples

The following example configures the link mode for Ethernet ring ports in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/1)# exit
Hostname(config)# interface tenGigabitEthernet 0/2
Hostname(config-if-TenGigabitEthernet 0/2)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/2)# exit
```

The following example adds the ports to an Ethernet ring in R-APS VLAN configuration mode.

```
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps 4093)# ring-port west tenGigabitEthernet 0/1 east
tenGigabitEthernet 0/2
```

The following example enables the ERPS function for the specified ring.

```
Hostname(config-erps 4093)# state enable
```

The following example enables the ERPS function globally.

```
Hostname(config-erps 4093)# exit

1.10 sub-ring tc-propagation

Function

Run the **sub-ring tc-propagation** command to enable the subring topology change notification.

Run the **no** form of this command to disable this feature.

The topology change notification is disabled by default.

Syntax

sub-ring tc-propagation enable

no sub-ring tc-propagation

Parameter Description

N/A

Command Modes

R-APS VLAN configuration mode

Default Level

14

Usage Guidelines

This command is configured only on intersecting nodes. After this function is enabled, when the subring topology changes, the intersecting nodes send a topology change notification.

Examples

The following example configures the link mode for Ethernet ring ports in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/1)# exit
Hostname(config)# interface tenGigabitEthernet 0/2
```

```
Hostname(config-if-TenGigabitEthernet 0/2)# switchport mode trunk
Hostname(config-if-TenGigabitEthernet 0/2)# exit
```

The following example enters the R-APS VLAN configuration mode and configures ports that need to be added to the Ethernet ring and participate in ERPS calculation.

```
Hostname(config)# erps raps-vlan 4093
Hostname(config-erps4093)# ring-port west tenGigabitEthernet 0/1 east
tenGigabitEthernet 0/2
```

The following example configures an Ethernet subring.

```
Hostname(config)# erps raps-vlan 100
Hostname(config)# interface tenGigabitEthernet 0/3
Hostname(config-if-TenGigabitEthernet 0/3)# switchport mode trunk
Hostname(config-if-GTenGigabitEthernet 0/3)# exit
Hostname(config)# erps raps-vlan 100
Hostname(config-erps 100)# ring-port west tenGigabitEthernet 0/3 east virtual-channel
```

The following example associates the subring with the other Ethernet ring.

```
Hostname(config-erps 100)# associate sub-ring raps-vlan 4093
```

The following example enables the subring topology change notification.

```
Hostname(config-erps 100)# sub-ring tc-propagation enable
```

1.11 timer

Function

Run the **timer** command to configure ERPS timers.

Run the **no** form of this command to restore the default configuration.

By default, the time from a failure to the protection switching of a device is 0 milliseconds, the time from failure recovery to a response to SF R-APS packets is 500 milliseconds, and the time from failure recovery and reblocking of the RPL owner port is 2 minutes.

Syntax

timer { **holdoff-time** *holdoff* | **guard-time** *guard* | **wtr-time** *wtr* }

no timer { **holdoff-time** | **guard-time** | **wtr-time** }

Parameter Description

holdoff-time *holdoff*: Indicates the Holdoff timer, which controls the time from a failure to protection switching of a device, in 100 milliseconds. The value range is from 0 to 100. The default value is **0**. When a failure occurs, the Holdoff timer is started. After the timer times out, if the failure persists, the system reports the failure to ERPS.

guard-time *guard*: Indicates the Guard timer, which controls the time from failure recovery to a response to SF R-APS packets, in 10 milliseconds. The value range is from 1 to 200. The default value is **50**, indicating 500 milliseconds. When a device or link fails, the device will firstly recover the failure, and then send the No Request Ring Auto Protection Switching (NR R-APS) packet to other devices, and start the Guard timer at the same time. The device will respond to the R-APS packet after the timer times out. This timer is used to prevent the device from receiving expired SF R-APS packets.

wtr-time *wtr*: Indicates the Wait to Restore (WTR) timer, which controls the time from failure recovery to reblocking of the RPL owner port, in minutes. The value range is from 1 to 12. The default value is **2**. When an Ethernet ring is in good conditions, the RPL owner port is blocked to prevent loops in the network. If a device or link fails in an Ethernet ring, the RPL owner port will be unblocked. If these device or link failures are recovered, the RPL owner port can be blocked again after a certain period of time. The purpose is to prevent link flapping caused by some ports not recovered to the up state during link recovery.

Command Modes

R-APS VLAN configuration mode

Default Level

14

Usage Guidelines

The Holdoff timer is used to minimize frequent ERPS topology switching due to intermittent link failures. After you configure the Holdoff timer, ERPS performs topology switching only if the link failure still persists after the timer times out.

The Guard timer is used to prevent a device from receiving expired R-APS messages. When the device detects that a link failure is cleared, it sends link recovery packets and starts the Guard timer. Before the Guard timer expires, all packets except Flush packets indicating a subring topology change will be discarded.

The WTR timer is effective only for RPL owner nodes. It is used to avoid ring status misjudgment by the RPL owner node. When an RPL owner node detects that a failure is cleared, it will not perform topology switching immediately but only if the Ethernet ring is recovered after the WTR timer times out. If a ring failure is detected again before the timer expires, the RPL owner node cancels the timer and does not perform topology switching.

Examples

The following example displays the default values of the ERPS timers before configuration in R-APS VLAN configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# erps raps-vlan 4093
```

```
Hostname(config-erps 4093)# show erps

lldp compliance vendor	Enable the compatibility with the neighbor discovery of vendors' devices.
lldp enable	Enable the LLDP function.
lldp encapsulation snap	Set the LLDP packet encapsulation format to Subnetwork Access Protocol (SNAP).
lldp error-detect	Enable the LLDP error detection function.
lldp fast-count	Configure the number of LLDP packets that can be transmitted rapidly.
lldp hold-multiplier	Configure the time to live (TTL) multiplier for LLDP packets.
lldp ignore pvid-error-detect	Enable the function of ignoring the port VLAN ID (PVID) detection.
lldp location civic-location identifier	Configure the civic address in LLDP-MED TLVs.
lldp location elin identifier	Configure the emergency telephone number to be encapsulated in the Location Identification TLV.
lldp management-address-tlv	Configure the management address to be advertised in an LLDP packet.
lldp mode	Configure the LLDP work mode.
lldp network-policy profile	Create an LLDP network policy and enter the LLDP network policy configuration mode.
lldp notification remote-change enable	Enable the LLDP trap function.
lldp timer notification-interval	Configure the LLDP trap transmission interval.
lldp timer reinit-delay	Configure an LLDP interface initialization delay.

lldp timer tx-delay	Configure an LLDP packet transmission delay.
lldp timer tx-interval	Configure an LLDP packet transmission interval.
lldp tlv-enable	Configure the types of TLVs to be advertised.
show lldp local-information	Display the LLDP information on the local device, which will be organized as TLVs and sent to neighbors.
show lldp location	Display the LLDP civic address or emergency telephone number of the local device.
show lldp neighbors	Display the LLDP information of a neighbor received by an interface.
show lldp network-policy	Display the LLDP network policy configuration of the local device.
show lldp statistics	Display the LLDP statistics.
show lldp status	Display the LLDP status.
show lldp tlv-config	Display the configuration of TLVs to be advertised by an interface.
voice vlan	Configure an LLDP network policy, in which the application type is specified for a voice VLAN.

1.1 civic-location

Function

Run the **civic-location** command to configure Link Layer Discovery Protocol (LLDP) civic address information.

Run the **no** form of this command to remove this configuration.

No address information is configured by default.

Syntax

{ **country** | **state** | **county** | **city** | **division** | **neighborhood** | **street-group** | **leading-street-dir** | **trailing-street-suffix** | **street-suffix** | **number** | **street-number-suffix** | **landmark** | **additional-location-information** | **name** | **postal-code** | **building** | **unit** | **floor** | **room** | **type-of-place** | **postal-community-name** | **post-office-box** | **additional-code** } *ca-word*

no { **country** | **state** | **county** | **city** | **division** | **neighborhood** | **street-group** | **leading-street-dir** | **trailing-street-suffix** | **street-suffix** | **number** | **street-number-suffix** | **landmark** | **additional-location-information** | **name** | **postal-code** | **building** | **unit** | **floor** | **room** | **type-of-place** | **postal-community-name** | **post-office-box** | **additional-code** }

Parameter Description

Parameters of this command consist of two parts: address type indicated by *ca-type* and address information indicated by *ca-word***.** The **civic-location** keyword is not reflected in the configuration command. The configuration starts directly with the *ca-type* parameter. Run the *ca-type ca-word* command to configure the device address, or run the **no** form of this command to delete the corresponding address information.

- Optional parameters for *ca-type* include the following:

  country (country);

  state (state, the CA type is 1);

  county (county, the CA type is 2);

  city (city, the CA type is 3);

  division (district, the CA type is 4);

  neighborhood (community, the CA type is 5);

  street-group (street, the CA type is 6);

  leading-street-dir (street No., the CA type is 16);

  trailing-street-suffix (street No., the CA type is 17);

  street-suffix (street No., the CA type is 18);

  number (street No., the CA type is 19);

  street-number-suffix (street No., the CA type is 20);

  landmark (landmark, the CA type is 21);

  additional-location-information (additional address, the CA type is 22);

  name (name, the CA type is 23);

  postal-code (postal code, the CA type is 24);

building (building, the CA type is 25);

unit (unit, the CA type is 26);

floor (floor, the CA type is 27);

room (room, the CA type is 28);

type-of-place (place type, the CA type is 29);

postal-community-name (post office, the CA type is 30);

post-office-box (post office box, the CA type is 31);

additional-code (additional code, the CA type is 32).

- Fill specific information in *ca-word*.

  When the address type is **country**, only two characters can be used to represent a country. For example, CH represents China.

Command Modes

LLDP civic address configuration mode

Default Level

14

Usage Guidelines

Run the **lldp location civic-location identifier** *id* command to enter the LLDP civic address configuration mode.

In LLDP civic address configuration mode, run the **civic-location** command to configure the civic address information for the device.

Examples

The following example configures the LLDP civic address information, in which **LLDP Civic Address ID** is set to **1**, **Country** is set to **CH**, and **City** is set to **Fuzhou**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# lldp location civic-location identifier 1
Hostname(config-lldp-civic)# country CH
Hostname(config-lldp-civic)# city Fuzhou
```

1.2 clear lldp statistics

Function

Run the **clear lldp statistics** command to clear LLDP statistics.

Syntax

clear lldp statistics [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Specifies the interface type and number.

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

When the **interface** parameter is specified, this command will clear the LLDP statistics of the specified interface.

Examples

The following example clears the LLDP statistics of TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# clear lldp statistics interface tenGigabitEthernet 0/1
Hostname# show lldp statistics interface tenGigabitEthernet 0/1
Lldp statistics information of port [TenGigabitEthernet 0/1]
The number of lldp frames transmitted      : 0
The number of frames discarded            : 0
The number of error frames                : 0
The number of lldp frames received         : 0
The number of TLVs discarded              : 0
The number of TLVs unrecognized           : 0
The number of neighbor information aged out : 0
```

1.3 clear lldp table

Function

Run the **clear lldp table** command to clear the neighbor information of LLDP.

Syntax

clear lldp table [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Specifies the interface type and number.

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

When the **interface** parameter is specified, this command will clear the LLDP neighbor information of the specified interface. When the **interface** parameter is not specified, this command will clear the LLDP neighbor information of all interfaces.

Examples

The following example clears the LLDP neighbor information of TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# clear lldp table interface tenGigabitEthernet 0/1
Hostname# show lldp neighbors interface tenGigabitEthernet 0/1
Hostname# show lldp neighbors interface tenGigabitEthernet 0/1
Capability codes:
    (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
    (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other
System Name        Local Intf        Port ID              Capability   Aging-time

1.4 device-type

Function

Run the **device-type** command to configure a device type.

Run the **no** form of this command to remove this configuration.

No device type is configured by default.

Syntax

device-type *device-type*

no device-type

Parameter Description

device-type: Device type. The value range is from 0 to 2. The value **0** indicates that the device type is DHCP server, **1** indicates that the device type is switch, and **2** indicates that the device type is LLDP- MED terminal. The default value is empty.

Command Modes

LLDP civic address configuration mode

Default Level

14

Usage Guidelines

After entering the LLDP civic address configuration mode, configure the device type.

Examples

The following example sets the device type to switch and displays the configuration result.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# lldp location civic-location identifier 1
Hostname(config-lldp-civic)# device-type 1
Hostname(config-lldp-civic)# show lldp location civic-location identifier 1
civic location information:
--------------------------
Identifier          :1
device type         :1
```

1.6 lldp enable

Function

Run the **lldp enable** command to enable the LLDP function.

Run the **no** form of this command to disable this feature.

The LLDP function is enabled by default.

Syntax

lldp enable

no lldp enable

Parameter Description

N/A

Command Modes

Global configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

LLDP takes effect only after it is enabled globally and on an interface.

Examples

The following example disables the LLDP function globally and on an interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no lldp enable
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# no lldp enable
```

Notifications

N/A

Common Errors

The LLDP function is enabled on an interface but disabled globally. As a result, the LLDP function does not take effect.

An interface can learn a maximum of five neighbors.

If a neighbor does not support LLDP but it is connected to an LLDP-supported device in the downlink direction, an interface may learn information about the device that is not directly connected to the interface because the neighbor may forward LLDP packets.

Platform Description

1.7 lldp encapsulation snap

Function

Run the **lldp encapsulation snap** command to set the LLDP packet encapsulation format to Subnetwork Access Protocol (SNAP).

Run the **no** form of this command to restore the default configuration.

The default LLDP packet encapsulation format is Ethernet II.

Syntax

lldp encapsulation snap

no lldp encapsulation snap

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The same LLDP packet encapsulation format must be configured on a device and its neighbors to ensure their normal communication.

Examples

The following example sets the LLDP packet encapsulation format to SNAP.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# lldp encapsulation snap
```

1.8 lldp error-detect

Function

Run the **lldp error-detect** command to enable the LLDP error detection function.

Run the **no** form of this command to disable this feature.

The LLDP error detection function is enabled by default.

Syntax

lldp error-detect

no lldp error-detect

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

LLDP error detection function includes detecting the VLAN configuration at both ends of a link, interface status, aggregate port configuration, MTU configuration, and loops. When LLDP detects an error, an alarm is generated to alert administrators.

The LLDP error detection function relies on the specific Type, Length, Value (TLV) in LLDP packets exchanged between devices at both ends of a link. Therefore, a device needs to advertise correct TLVs to ensure that LLDP error detection functions properly.

Examples

The following example enables the LLDP error detection function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# lldp error-detect
```

Related Commands

- **lldp enable**

1.9 lldp fast-count

Function

Run the **lldp fast-count** command to configure the number of LLDP packets that can be transmitted rapidly.

Run the **no** form of this command to remove this configuration.

By default, three LLDP packets are transmitted rapidly.

Syntax

lldp fast-count *fast-count-value*

no lldp fast-count

Parameter Description

fast-count-value: Number of LLDP packets that can be transmitted rapidly. The value range is from 1 to 10, and the default value is **3**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When LLDP discovers a new neighbor or the LLDP work mode is changed from disabled or Rx to TxRx or Tx, the fast transmission mechanism is started so that the neighbor quickly learns the information of the device. The fast transmission mechanism shortens the LLDP packet transmission interval to 1s, sends a certain number of LLDP packets continuously, and then restores the normal transmission interval.

Examples

The following example sets the number of LLDP packets that can be transmitted rapidly to **5**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# lldp fast-count 5
```

Notifications

Related Commands

- **lldp enable**

1.10 lldp hold-multiplier

Function

Run the **lldp hold-multiplier** command to configure the time to live (TTL) multiplier for LLDP packets.

Run the **no** form of this command to remove this configuration.

The default TTL multiplier of LLDP packets is **4**.

Syntax

lldp hold-multiplier *ttl-value*

no lldp hold-multiplier

Parameter Description

ttl-value: TTL multiplier of LLDP packets. The value range is from 2 to 10, and the default value is **4**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

In an LLDP packet, the value of TTL TLV is calculated using the following formula: TTL TLV = TTL multiplier × Packet transmission interval + 1. You can control the TTL of the local device information on neighbors by adjusting the TTL multiplier.

Examples

The following example sets the TTL multiplier to 5.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# lldp hold-multiplier 5
```

1.14 lldp management-address-tlv

Function

Run the **lldp management-address-tlv** command to configure the management address to be advertised in an LLDP packet.

Run the **no** form of this command to remove this configuration.

By default, the management address to be advertised in an LLDP packet is the IPv4 address of the minimum VLAN supported by the interface. If no IPv4 address is configured for the VLAN with the minimum ID, LLDP keeps searching the other VLANs with the minimum ID until a qualified IPv4 address is obtained. If no IPv4 address is found, LLDP searches the IPv6 address of the minimum VLAN supported by the interface. If no IPv6 address is found, the local address 127.0.0.1 is used as the management address to be advertised.

Syntax

lldp management-address-tlv { *ipv4-address* | *ipv6-address* }

no lldp management-address-tlv

Parameter Description

ipv4-address: IPv4 management address to be advertised in an LLDP packet.

ipv6-address: IPv6 management address to be advertised in an LLDP packet.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example sets the management address to be advertised in an LLDP packet to **192.168.1.1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# lldp management-address-tlv 192.168.1.1

Related Commands

- **lldp enable**

1.15 lldp mode

Function

Run the **lldp mode** command to configure the LLDP work mode.

Run the **no** form of this command to remove this configuration.

The default LLDP work mode is **TxRx**, that is, an interface transmits and receives LLDPDUs.

Syntax

lldp mode { **tx** | **rx** | **txrx** }

no lldp mode

Parameter Description

tx: Only transmits LLDPDUs.

rx: Only receives LLDPDUs.

txrx: Transmits and receives LLDPDUs.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

After the LLDP work mode of an interface is disabled, the interface neither transmits nor receives LLDP packets.

To make LLDP take effect on an interface, make sure to enable LLDP globally and set the LLDP work mode of the interface to **Tx**, **Rx** or **TxRx**.

Examples

The following example sets the LLDP work mode of an interface to **Tx**, that is, the interface can only transmit LLDPDUs.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# lldp mode tx
```

Function

Run the **lldp timer notification-interval** command to configure the LLDP trap transmission interval.

Run the **no** form of this command to remove this configuration.

The default LLDP trap transmission interval is 5 seconds.

Syntax

lldp timer notification-interval *trap*

no lldp timer notification-interval

Parameter Description

trap: LLDP trap transmission interval, in seconds. The value range is from 5 to 3600, and the default value is **5**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can configure an LLDP trap transmission interval to prevent frequent transmission of LLDP trap messages. LLDP changes detected within this interval will be transmitted to the NMS server through traps.

Examples

The following example sets the LLDP trap transmission interval to 10 seconds.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# lldp timer notification-interval 10
```

Function

Run the **lldp tlv-enable** command to configure the types of TLVs to be advertised.

Run the **no** form of this command to remove this configuration.

By default, if a device supports the Data Center Bridging Capability Exchange protocol (DCBX), interfaces are allowed to transmit all types of TLVs except IEEE 802.3 organizationally specific TLVs and LLDP-MED TLVs. If a device does not support DCBX, interfaces are allowed to transmit all types of TLVs except the Location Identification TLV. The default transmission policy is none for the Network Policy TLV in LLDP-MED TLVs.

Syntax

lldp tlv-enable *tlv-type subtype*

no lldp tlv-enable *tlv-type subtype*

Parameter Description

tlv-type: TLV type. The value range is **basic-tlv**, **dot1-tlv**, **dot3-tlv**, and **med-tlv**. One of these types must be configured.

subtype: Sub-type. One sub-type must be configured. The sub-type varies with *tlv-type*.

- The value range of *subtype* for **basic-tlv** (basic management TLVs) is as follows:
  - **all**: Advertises all optional TLVs of this type.
  - **port-description**: Indicates the Port Description TLV.
  - **system-capability**: Indicates the System Capabilities TLV.
  - **system-description**: Indicates the System Description TLV.
  - **system-name**: Indicates the System Name TLV.
- The value range of *subtype* for **dot1-tlv** (802.1 organizationally specific TLVs) is as follows:
  - **all**: Advertises all optional TLVs of this type.
  - **port-vlan-id:** Indicates the Port VLAN ID TLV.
  - **protocol-vlan-id** [*vlan-id*]: Indicates the Port And Protocol VLAN ID TLV. Where, *vlan-id* indicates the port protocol VLAN ID. The value range is from 1 to 4094.
  - **vlan-name** [*vlan-id*]: Indicates the VLAN Name TLV. Where, *vlan-id* indicates the VLAN ID. The value range is from 1 to 4094.
- The value range of *subtype* for **dot3-tlv** (802.3 organizationally specific TLVs) is as follows:
  - **all**: Advertises all optional TLVs of this type.
  - **link-aggregation**: Indicates the Link Aggregation TLV.
  - **mac-physic**: Indicates the MAC/PHY Configuration/Status TLV.
  - **max-frame-size**: Indicates the Maximum Frame Size TLV.
  - **power**: Indicates the Power Via MDI TLV.
- The value range of *subtype* for **med-tlv** (LLDP MED TLVs) is as follows:
  - **all**: Advertises all types of LLDP-MED TLVs other than the **Location** Identification TLV.
  - **capability**: Indicates the LLDP-MED Capabilities TLV.
  - **inventory:** Indicates the inventory management TLV, which contains the hardware version, firmware version, software version, SN, manufacturer name, module name, and asset identifier.
  - **location** { **civic-location | elin** } **identifier** *id*: Indicates the Location Identification TLV. **civic-location**

indicates the civic address information of the network connectivity device to be encapsulated, **elin** indicates the emergency telephone number to be encapsulated, and **identifier** *id* indicates the policy ID, with the value range from 1 to 1024.

- **network-policy profile** [*profile-num*]: Indicates the Network Policy TLV. Where, *profile-num* indicates the network policy ID. The value range is from 1 to 1024.
- **power-over-ethernet**: Indicates the Extended Power-via-MDI TLV.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

- If you configure the **all** parameter for the basic management TLVs, IEEE 802.1 organizationally specific TLVs, and IEEE 802.3 organizationally specific TLVs, all optional TLVs of these types are advertised.
- If you configure the **all** parameter for the LLDP-MED TLVs, all LLDP-MED TLVs except the Location Identification TLV are advertised.
- If you want to configure the LLDP-MED **capability** TLV, configure the LLDP IEEE 802.3 **mac-physic** TLV first. If you want to cancel the LLDP IEEE 802.3 **mac-physic** TLV, cancel the LLDP-MED **capability** TLV first.
- If you want to configure LLDP-MED TLVs, configure the LLDP-MED **capability** TLV before configuring other types of LLDP-MED TLVs. If you want to cancel the advertisement of LLDP-MED TLVs, cancel the LLDP-MED **capability** TLV before canceling other types of LLDP-MED TLVs. If a device is connected to an IP phone in the downlink direction and the IP phone supports LLDP-MED, you can configure the Network Policy TLV to deliver policies to the IP phone.

Examples

The following example configures the advertisement of all optional IEEE 802.1 organizationally specific TLVs.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface tenGigabitEthernet 0/1
Hostname(config-if-TenGigabitEthernet 0/1)# lldp tlv-enable dot1-tlv all
```

The following example applies the LLDP network policy 1 to TenGigabitEthernet 0/1.

```
Hostname(config-if-TenGigabitEthernet 0/1)# lldp tlv-enable med-tlv network-policy
profile 1
```

The following example applies the LLDP civic address configuration to TenGigabitEthernet 0/1.

```
Hostname(config-if-TenGigabitEthernet 0/1)# lldp tlv-enable med-tlv location
civic-location identifier 1
```

The following example applies the emergency telephone number to TenGigabitEthernet 0/1.

```
Hostname(config-if-TenGigabitEthernet 0/1)# lldp tlv-enable med-tlv location elin
identifier 1
```

Related Commands

- **lldp enable**

1.23 show lldp local-information

Function

Run the **show lldp local-information** command to display the LLDP information on the local device, which will be organized as TLVs and sent to neighbors.

Syntax

show lldp local-information [**global** | **interface** *interface-type interface-number*]

Parameter Description

global: Displays the global LLDP information to be transmitted.

interface *interface-type interface-number*: Displays the LLDP information of a specified interface type and number to be transmitted.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If no parameter is specified, all the LLDP information will be displayed, including the global and interface LLDP information.

Examples

The following example displays LLDP information on the local device, which will be organized as TLVs and sent to neighbors.

```
Hostname> enable
Hostname# show lldp local-information
Global LLDP local-information:

Table 1-1 Output Fields of the show lldp local-information Command

Field	Description
Chassis ID type	Chassis ID type, used to identify the **Chassis ID** field.
Chassis ID	Device ID, represented using a MAC address.
System name	Device name.
System description	Device description, including the hardware version, software version, and operating system information.
System capabilities supported	Functions supported by the system.
System capabilities enabled	Functions enabled in the system.
LLDP-MED capabilities	LLDP-MED capabilities supported by the system.
Device class	MED device type. There are two types: network connectivity device and terminal device. ● Network connectivity device: Network connection device. ● Class I: General terminal device. ● Class II: Media terminal device, which supports the capabilities of class I devices and media streaming. ● Class III: Communication terminal device, which supports the capabilities of class I and class II devices, and IP communication.
HardwareRev	Hardware version.
FirmwareRe	Firmware version.
SoftwareRev	Software version.
SerialNum	Serial number.
Manufacturer name	Manufacturer.
Asset tracking identifier	Asset identifier.
Port ID type	Port ID type.
Port ID	Port ID.
Port description	Port descriptor.
Management address subtype	Management address type.
Management address	Management address.

Field	Description
Interface numbering subtype	Management address interface type.
Interface number	Management address interface ID.
Object identifier	Management address object identifier.
Port VLAN ID	Port VLAN ID.
Port and protocol VLAN ID	Port and protocol VLAN ID.
PPVID Supported	Whether the port and protocol VLAN is supported. ● Yes: Supported. ● No: Not supported.
PPVID Enabled	Whether the port and protocol VLAN is enabled. ● Yes: Enabled. ● No: Disabled.
VLAN name of VLAN 1	Name of VLAN 1.
Protocol Identity	Protocol identifier.
Auto-negotiation supported	Whether auto-negotiation is supported. ● Yes: Supported. ● No: Not supported.
Auto-negotiation enabled	Whether auto-negotiation is enabled. ● Yes: Enabled. ● No: Disabled.

Field	Description
PMD auto-negotiation advertised	Auto-negotiation capability advertised by the interface: ● 1000BASE-T(FD) ● 1000BASE-T(HD) ● 1000BASE-X, -LX, -SX, -CX(FD) ● 1000BASE-X, -LX, -SX, -CX(HD) ● Asymmetric and Symmetric PAUSE(FD) ● Symmetric PAUSE(FD) ● Asymmetric PAUSE(FD) ● PAUSE(FD) ● 100BASE-T2(FD) ● 100BASE-T2(HD) ● 100BASE-TX(FD) ● 100BASE-TX(HD) ● 100BASE-T4 ● 10BASE-T(FD) ● 10BASE-T(HD) ● Other: Capability other than values above.
Operational MAU type	Interface auto-negotiation rate and duplex mode.
PoE support	Whether PoE is supported. ● Yes: Supported. ● No: Not supported.
Link aggregation supported	Whether link aggregation is supported. ● Yes: Supported. ● No: Not supported.
Link aggregation enabled	Whether link aggregation is enabled. ● Yes: Enabled. ● No: Disabled.
Aggregation port ID	Link aggregation port ID.
Maximum frame Size	Maximum frame length supported by an interface.
Power-via-MDI device type	Device type, including power sourcing equipment (PSE) and powered device (PD).
Power-via-MDI power source	Power supply type.

Field	Description
Power-via-MDI power priority	Power supply priority.
Power-via-MDI power value	Interface power.
Model name	Module name.

Related Commands

- **lldp enable**

1.24 show lldp location

Function

Run the **show lldp location** command to display the LLDP civic address or emergency telephone number of the local device.

Syntax

show lldp location { **civic-location** | **elin-location** } { **identifier** *id* | **interface** *interface-type interface-number* | **static** }

Parameter Description

civic-location: Indicates the encapsulated civic address information of the network connectivity device.

elin-location: Indicates the encapsulated emergency telephone number.

identifier *id*: Displays the address or emergency telephone number configured by users in a policy of a specified policy ID. The value range is from 1 to 1024.

interface *interface-type interface-number*: Displays the address or emergency telephone number on a specified interface. *interface-type interface-number* indicates the interface type and number.

static: Displays all addresses or emergency telephone numbers configured by users.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If a policy ID is specified, the specific address or emergency telephone number will be displayed.

If an interface type and number are specified, the address and emergency telephone configured for this interface will be displayed.

If no parameter is specified, all addresses or emergency telephone numbers will be displayed.

Examples

The following example displays the LLDP civic address configured for the local device.

```
Hostname> enable
Hostname# show lldp location civic-location static
Civic location information
------------------------------------------------
Identifier              : 1
County                  : CH
City Division           : fuzhou
Leading street direction: 44
Street number           : 68
Landmark                : 233
Name                    : liuy
Building                : 19bui
Floor                   : 1
Room                    : 33
City                    : fuzhou
Country                 : 86
Additional location     : aaa
Ports                   : Te0/1
-----------------------------------
Identifier              : tee
-----------------------------------
```

The following example displays the emergency telephone number of the local device.

```
Hostname# show lldp location elin-location static
Elin location information
--------------------------
Identifier : t
Elin      : iiiiiiiiii
Ports     : Te1/0/3

1.25 show lldp neighbors

Function

Run the **show lldp neighbors** command to display the LLDP information of a neighbor received by an interface.

Syntax

show lldp neighbors [**interface** *interface-type interface-number*] [**detail**]

Parameter Description

interface *interface-type interface-number*: Displays the LLDP information of a neighbor received by a specified interface. If this parameter is not specified, the LLDP information received by all interfaces is displayed.

detail: Displays the details about a neighbor. If this parameter is not specified, the neighbor summary is displayed.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If no parameter is specified, the LLDP summaries of neighbors received by all interfaces are displayed.

Examples

The following example displays the LLDP details of neighbors received by all interfaces.

```
Hostname> enable
Hostname# show lldp neighbors detail
------------------------------------------------------------------
LLDP neighbor-information of port [TenGigabitEthernet 0/1]

Table 1-2 Output Fields of the show lldp neighbors Command

Field	Description
Neighbor index	Neighbor index.

Field	Description
Device type	Neighbor type.
Update time	Last update time of neighbor information.
Aging time	Aging time of neighbor information, namely, the number of seconds after which the neighbor information will be deleted due to aging.
Chassis ID type	Chassis ID type.
Chassis ID	Device ID, represented using a MAC address.
System name	Device name.
System description	Device description, including the hardware version, software version, and operating system information.
System capabilities supported	Functions supported by the system.
System capabilities enabled	Functions enabled in the system.
Management address subtype	Management address type.
Management address	Management address.
Interface numbering subtype	Management address interface type.
Interface number	Management address interface ID.
Object identifier	Management address object identifier.
Device class	MED device type. There are two types: network connectivity device and terminal device. ● Network connectivity device: Network connection device. ● Class I: General terminal device. ● Class II: Media terminal device, which supports the capabilities of class I devices and media streaming. ● Class III: Communication terminal device, which supports the capabilities of class I and class II devices, and IP communication.
HardwareRev	Hardware version.
FirmwareRev	Firmware version.
SoftwareRev	Software version.
SerialNum	Serial number.

Field	Description
Manufacturer name	Manufacturer.
Asset tracking identifier	Asset identifier.
Port ID type	Port ID type.
Port ID	Port ID.
Port description	Port descriptor.
Port VLAN ID	Port VLAN ID.
Port and protocol VLAN ID	Port and protocol VLAN ID.
PPVID Supported	Whether the port and protocol VLAN is supported. ● Yes: Supported. ● No: Not supported.
PPVID Enabled	Whether the port and protocol VLAN is enabled. ● Yes: Enabled. ● No: Disabled.
VLAN name of VLAN 1	Name of VLAN 1.
Protocol Identity	Protocol identifier.
Auto-negotiation supported	Whether auto-negotiation is supported. ● Yes: Supported. ● No: Not supported.
Auto-negotiation enabled	Whether auto-negotiation is enabled. ● Yes: Enabled. ● No: Disabled.

Field	Description
PMD auto-negotiation advertised	Auto-negotiation capability advertised by the interface: ● 1000BASE-T(FD) ● 1000BASE-T(HD) ● 1000BASE-X, -LX, -SX, -CX(FD) ● 1000BASE-X, -LX, -SX, -CX(HD) ● Asymmetric and Symmetric PAUSE(FD) ● Symmetric PAUSE(FD) ● Asymmetric PAUSE(FD) ● PAUSE(FD) ● 100BASE-T2(FD) ● 100BASE-T2(HD) ● 100BASE-TX(FD) ● 100BASE-TX(HD) ● 100BASE-T4 ● 10BASE-T(FD) ● 10BASE-T(HD) ● Other: Capability other than values above.
Operational MAU type	Interface auto-negotiation rate and duplex mode.
PoE support	Whether PoE is supported. ● Yes: Supported. ● No: Not supported.
Link aggregation supported	Whether link aggregation is supported. ● Yes: Supported. ● No: Not supported.
Link aggregation enabled	Whether link aggregation is enabled. ● Yes: Enabled. ● No: Disabled.
Aggregation port ID	Link aggregation port ID.
Maximum frame Size	Maximum frame length supported by an interface.
Power-via-MDI device type	Device type. ● PSE: Power sourcing equipment. ● PD: Powered device.

Field	Description
Power-via-MDI power source	Power supply type.
Power-via-MDI power priority	Power supply priority.
Power-via-MDI power value	Interface power.

Related Commands

- **lldp enable**

1.26 show lldp network-policy

Function

Run the **show lldp network-policy** command to display the LLDP network policy configuration of the local device.

Syntax

show lldp network-policy { **profile** [*profile-num*] | **interface** *interface-type interface-number* }

Parameter Description

profile *profile-num*: Displays the configuration of a specified network policy. The value range of a policy ID is from 1 to 1024.

interface *interface-type interface-number*: Displays the network policy configuration of a specified interface.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If no parameter is specified, the information about all network policies is displayed.

Examples

The following example displays the LLDP network policy configuration of the local device.

```
Hostname> enable
Hostname# show lldp network-policy profile
network-policy information:
------------------------------------------
Network Policy Profile 1
   voice vlan 2 cos 4 dscp 6

1.27 show lldp statistics

Function

Run the **show lldp statistics** command to display the LLDP statistics.

Syntax

show lldp statistics [**global** | **interface** *interface-type interface-number*]

Parameter Description

global: Displays the global LLDP statistics.

interface *interface-type interface-number*: Displays the LLDP statistics of a specified interface.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If no parameter is specified, the global LLDP statistics and LLDP statistics of all interfaces are displayed.

Examples

The following example displays the LLDP statistics of all interfaces.

```
Hostname> enable
Hostname# show lldp statistics
lldp statistics global Information:
Neighbor information last changed time     : 1hour 52minute 22second
The number of neighbor information inserted : 2
The number of neighbor information deleted  : 0
```

```
The number of neighbor information dropped  : 0
The number of neighbor information age out  : 1
Lldp statistics information of port [TenGigabitEthernet 0/1]
The number of lldp frames transmitted      : 26
The number of frames discarded            : 0
The number of error frames                : 0
The number of lldp frames received         : 12
The number of TLVs discarded              : 0
The number of TLVs unrecognized           : 0
The number of neighbor information aged out : 0
```

Table 1-3 Output Fields of the show lldp statistics Command

Field	Description
lldp statistics global Information	LLDP global statistics.
Neighbor information last change time	Last update time of neighbor information.
The number of neighbor information inserted	Number of times that neighbor information is updated.
The number of neighbor information deleted	Number of times that neighbor information is deleted.
The number of neighbor information dropped	Number of times that neighbor information is discarded.
The number of neighbor information aged out	Number of timeout times of neighbor information.
Lldp statistics information of port [GigabitEthernet 0/1]	LLDP statistics on the port GigabitEthernet 0/1.
The number of lldp frames transmitted	Number of LLDP frames that are transmitted by the interface.
The number of frames discarded	Number of LLDP frames that are discarded by the interface.
The number of error frames	Number of LLDP error frames occurring on the interface.
The number of lldp frames received	Number of LLDP frames that are received by the interface.
The number of TLVs discarded	Number of LLDP TLVs that are discarded by the interface.
The number of TLVs unrecognized	Number of LLDP TLVs that cannot be recognized by the interface.
The number of neighbor information aged out	Number of timeout times of neighbor information on the interface.

1.28 show lldp status

Function

Run the **show lldp status** command to display the LLDP status.

Syntax

show lldp status [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Displays the LLDP status of a specified interface.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If the **interface** is not specified, the LLDP statuses of all interfaces are displayed.

Examples

The following example displays the LLDP statuses of all interfaces.

```
Hostname> enable
Hostname# show lldp status
Global status of LLDP               : Enable
Neighbor information last changed time : 1hour 52minute 22second
Transmit interval                   : 30s
Hold multiplier                     : 4
Reinit delay                        : 2s
Transmit delay                      : 2s
Notification interval               : 5s

Table 1-4 Output Fields of the show lldp status Command

Field	Description
Global status of LLDP	Whether the global LLDP function is enabled. ● Enable: Enabled. ● Disable: Disabled.
Neighbor information last changed time	Last update time of neighbor information.
Transmit interval	LLDP packet transmission interval.
Hold multiplier	TTL multiplier.
Reinit delay	Interface initialization delay.
Transmit delay	LLDP packet transmission delay.
Notification interval	LLDP trap transmission interval.
Fast start counts	Number of LLDP packets that are transmitted rapidly.
Port status of LLDP	Whether the LLDP function is enabled on an interface. ● Enable: Enabled. ● Disable: Disabled.
Port state	Interface link state. ● UP: The link is up. ● DOWN: The link is down.
Port encapsulation	LLDP packet encapsulation format.
Operational mode	LLDP work mode.
Notification enable	Whether the LLDP trap function is enabled on an interface. ● Yes: Enabled. ● No: Disabled.
Error detect enable	Whether the error detection function is enabled on an interface. ● Yes: Enabled. ● No: Disabled.
Number of neighbors	Number of neighbors.
Number of MED neighbors	Number of MED neighbors.

1.29 show lldp tlv-config

Function

Run the **show lldp tlv-config** command to display the configuration of TLVs to be advertised by an interface.

Syntax

show lldp tlv-config [**interface** *interface-type interface-number*]

Parameter Description

interface *interface-type interface-number*: Displays the LLDP TLV configuration of a specified interface.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If the **interface** parameter is not specified, the LLDP TLV configuration of all interfaces is displayed.

Examples

The following example displays the configuration of TLVs to be advertised by interface TenGigabitEthernet 0/1.

```
Hostname> enable
Hostname# show lldp tlv-config interface tenGigabitEthernet 0/1
LLDP tlv-config of port [TenGigabitEthernet 0/1]
-------------------------------------------------------------
             NAME             STATUS DEFAULT
-------------------------------------------------------------
Basic optional TLV:
Port Description TLV            YES    YES
System Name TLV                YES    YES
System Description TLV          YES    YES
System Capabilities TLV         YES    YES
Management Address TLV          YES    YES
IEEE 802.1 extend TLV:
```

```
Port VLAN ID TLV                YES    YES
Port And Protocol VLAN ID TLV    YES    YES
VLAN Name TLV                  YES    YES
IEEE 802.3 extend TLV:
MAC-Physic TLV                 YES    YES
Power via MDI TLV               YES    YES
Link Aggregation TLV            YES    YES
Maximum Frame Size TLV          YES    YES
LLDP-MED extend TLV:

1.30 voice vlan

Function

Run the **voice vlan** command to configure an LLDP network policy, in which the application type is specified for a voice VLAN.

Run the **no** form of this command to remove this configuration.

Run the **default** { **voice | voice-signaling** } **vlan** command to restore the default configuration.

No voice VLAN policy is configured by default.

Syntax

{ **voice** | **voice-signaling** } **vlan** { { { *vlan-id* | **dot1p** } [**cos** *cos* | **dscp** *dscp*] } | **untagged** | **none** }

no { **voice** | **voice-signaling** } **vlan**

default { **voice | voice-signaling** } **vlan**

Parameter Description

voice: Applies a policy to a voice VLAN.

voice-signaling: Specifies the voice-signaling application type. The function is the same as that of the **voice** command.

{ *vlan-id* | **dot1p** } [**cos** *cos* | **dscp** *dscp*]: Configures the transmission of tagged frames in a voice VLAN.

vlan-id: ID of the VLAN where the voice stream is transmitted. The value range is from 1 to 4094. This VLAN ID will be added to voice packets.

dot1p: Sets the VLAN ID in the VLAN tag to 0. This tag frame contains only the following priority information: *cos* and *dscp*.

cos *cos*: Configures the Class of Service (CoS) value for the voice stream in a voice VLAN. The value range is from 0 to 7, and the default value is **5**. A larger value indicates a higher priority. The CoS value is 0 for a common VLAN packet, indicating the lowest priority. By default, the CoS value of the voice stream packets transmitted to a voice VLAN is raised to 6, higher than the priority of a common VLAN packet. The CoS value indicates the L2 priority and is saved in the L2 header of a packet. It is filled in the **PRI** field of the IEEE 802.1Q VLAN tag.

dscp *dscp*: Configures the Differentiated Services Code Point (DSCP) for the voice stream in a voice VLAN. The value range is from 0 to 63, and the default value is **46**. A larger value indicates a higher priority. The DSCP value is 0 for a common IP packet, indicating the lowest priority. By default, the DSCP value of the voice stream packets transmitted to a voice VLAN is 46, higher than the priority of a common IP packet. The DSCP value indicates the IP priority (IP PRE) and is saved in the L3 header of a packet. For an IPv4 packet, the DSCP value is filled in the first six bits (bit 0 to bit 5) in the **ToS** field of the IPv4 packet header. For an IPv6 packet, the DSCP value is filled in the first six bits in the **Traffic Class** field of the IPv6 packet header.

untagged: Configures a VoIP device to transmit untagged frames. In this case, the VLAN ID and CoS value are ignored.

none: Indicates that no network policy is delivered, and the VoIP device determines the frames to be sent according to its configuration.

Command Modes

LLDP network-policy configuration mode

Default Level

14

Usage Guidelines

Configure an LLDP network policy after entering the LLDP network policy configuration mode.

If a device is connected to an IP phone in the downlink direction and the IP phone supports LLDP-MED, you can configure the Network Policy TLV to deliver a policy to the IP phone so that the IP phone changes the voice stream tag and QoS. The configuration procedure is as follows:

(1) Enable the voice VLAN function, and add the interface connected to the IP phone to the voice VLAN statically. For configuration details, see "Configuring Voice VLAN" in "Ethernet Switch."

(2) Configure the interface connected to the IP phone as an QoS trust interface (you are advised to use the DSCP trust mode). For configuration details, see "Configuring QoS" in "ACL and QoS."

(3) If 802.1x authentication is enabled on this interface, you also need to configure a secure channel to allow packets in the voice VLAN to pass. For details, see "Configuring ACL" in "ACL and QoS".

(4) If the IP phone does not support LLDP-MED, be sure to enable the voice VLAN function and add the MAC address of the IP phone to the voice VLAN OUI list manually.

Examples

The following example configures LLDP network policy 1, in which tagged frames need to be transmitted, the VLAN ID is set to 3, CoS is set to 4, and DSCP is set to 40.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# lldp network-policy profile 1
Hostname(config-lldp-network-policy)# voice-signaling vlan 3 cos 4
Hostname(config-lldp-network-policy)# voice-signaling vlan 3 dscp 40
Hostname(config-lldp-network-policy)# exit
```

The following example configures LLDP network policy 2, in which untagged frames need to be transmitted.

```
Hostname(config)# lldp network-policy profile 2
Hostname(config-lldp-network-policy)# voice vlan untagged
```

1 ARP Commands

Command	Function
arp	Configure static Address Resolution Protocol (ARP) mapping entries.
arp-learning enable	Enable the ARP learning function.
arp anti-ip-attack	Configure the number of IP packets for triggering the discarding of ARP entries.
arp any-ip	Enable the any IP ARP function.
arp cache interface-limit	Set a limit on the number of ARP entries that can be learned by an interface.
arp fast-aging enable	Enable the fast ARP entry aging on an interface.
arp gratuitous-arp-learning enable	Enable the function of learning gratuitous ARP requests.
arp gratuitous-send interval	Enable the function of sending gratuitous ARP requests at intervals.
arp oob	Configure a static ARP entry for a management interface.
arp proxy-resolved	Configure the master VRRP device to judge the existence of the ARP entry corresponding to a destination IP address when the device responds to an ARP request as a proxy ARP.
arp rate-statistic enable	Enable the ARP packet rate statistics collection.
arp rate-statistic compute interval	Configure the interval for collecting ARP packet rate statistics.
arp resolve vlan	Configure ARP to actively send broadcast resolution requests to a specified sub VLAN in a super VLAN.
arp retry interval	Specify the ARP request retransmission interval.
arp retry times	Configure the number of times that an ARP request can be transmitted consecutively.
arp scan	Enable ARP scanning.
arp scan auto	Enable scheduled automatic ARP scanning.

arp scan interval	Configure the interval for scheduled automatic ARP scanning.
arp scan rate	Configure the rate of scheduled automatic ARP scanning.
arp suppress-auth-vlan-req	Restrain the device from sending ARP requests to authenticated VLANs.
arp switch-over resolve	Actively send ARP requests to terminals after active and standby VSU switchover.
arp timeout	Configure the timeout time for dynamic ARP entries in the ARP cache.
arp trusted	Configure the maximum number of trusted ARP entries.
arp trust-monitor enable	Enable ARP trust monitoring.
arp trusted aging	Enable trusted ARP aging.
arp trust user-vlan	Enable VLAN translation when a trusted ARP entry is added.
arp unresolve	Configure the maximum number of unresolved ARP entries.
arp strict-learning enable	Enable strict dynamic ARP learning.
arp filter gratuitous	Enable gratuitous ARP filtering.
arp filter acl	Enable ARP-based access control list (ACL) filtering.
arp filter smac-illegal	Enable the function of checking the source MAC addresses of ARP packets.
arp filter dmac-illegal	Enable the function of checking the destination MAC addresses of ARP packets.
arp warning-limit	Configure the ARP alarm rate limit.
clear arp-cache	Clear dynamic ARP mapping records in the ARP cache.
clear arp-cache trusted	Clear trusted ARP entries in the ARP cache.
clear arp-cache packet statistics	Clear ARP packet statistics.
ip proxy-arp	Enable proxy ARP on an interface.
local-proxy-arp	Enable local proxy ARP.
service trustedarp	Enable trusted ARP.

show arp	Display the ARP cache.
show arp oob	Display the ARP cache on a management interface.
show arp counter	Display the number of ARP entries in the ARP cache.
show arp detail	Display the details about the ARP cache.
show arp packet statistics	Display ARP packet statistics.
show arp rate-statistic	Display the ARP packet rate statistics.
show arp timeout	Display the aging time of dynamic ARP entries.
show arp flapping record	Display ARP flapping records.
show ip arp	Display the ARP cache.
show arp anti-attack statistics	Display the statistics on illegal ARP packets.

1.1 arp

Function

Run the **arp** command to configure static Address Resolution Protocol (ARP) mapping entries.

Run the **no** form of this command to remove this configuration.

No ARP static entry is configured by default.

Syntax

arp [**vrf** *vrf-name*] *ip-address mac-address arp-type*

no arp [**vrf** *vrf-name*] *ip-address*

Parameter Description

vrf *vrf-name*: Specifies a virtual routing and forwarding (VRF) instance. No VRF instance is specified by default. Static ARP entries are applied globally.

ip-address: IP address corresponding to a MAC address. The IP address is expressed in dotted decimal notation.

mac-address: Data link layer (DLL) address, consisting of 48 bits.

arp-type: ARP encapsulation type. For an Ethernet interface, the keyword is **arpa**.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

Users can manually specify mappings between IP and MAC addresses to prevent the device from learning incorrect ARP entries.

After a static ARP entry is configured on a Layer 3 device, the device must learn the physical port corresponding to the MAC address in the entry before it performs Layer 3 routing.

Examples

The following example configures a static ARP entry for a host on the Ethernet by setting the IP address to 1.1.1.1 and the MAC address to 4e54.3800.0002.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp 1.1.1.1 4e54.3800.0002 arpa
```

The following example configures a static ARP entry for a host on the Ethernet by setting the IP address to 1.1.1.1 and the MAC address to 4e54.3800.0002, and specifying a description of ABC.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp 1.1.1.1 4e54.3800.0002 arpa description ABC
```

Notifications

A VRF instance named xyz does not exist or the **address-family ipv4** command is not configured. When a static ARP entry is added to or deleted from the VRF instance, the following notification will be displayed:

```
% ARP:vrf xyz does not exist. Create first.
% ARP:vrf xyz ipv4 address-family is not enable. Enable first.
```

When a nonexistent static ARP entry or a reserved entry is deleted, the following notification will be displayed:

```
Cannot remove ARP. ARP entry does not exist or reserved.
```

When the ARP cache is fully occupied or the corresponding IP address is the local IP address, a static ARP entry fails to be added and the following notification will be displayed:

```
Cannot add static ARP.
```

1.2 arp-learning enable

Function

Run the **arp-learning enable** command to enable the ARP learning function.

Run the **no** form of this command to disable this feature.

The ARP learning function is enabled by default.

Syntax

arp-learning enable

no arp-learning enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

If this function is disabled on an interface, the interface does not learn dynamic ARP entries. Functions such as any IP ARP and authorized ARP detection will not take effect, either.

Examples

The following example disables the dynamic ARP learning function on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no arp-learning enable
```

1.3 arp anti-ip-attack

Function

Run the **arp anti-ip-attack** command to configure the number of IP packets for triggering the discarding of ARP entries.

Run the **no** form of this command to restore the default configuration.

The default number of IP packets for triggering the discarding of ARP entries is 3.

Syntax

arp anti-ip-attack *attack-num*

no arp anti-ip-attack

Parameter Description

attack-num: Number of IP packets for triggering the discarding of ARP entries. The value range is from 0 to 100, and the default value is **3**. The value **0** indicates that ARP-based IP guard is disabled.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

When receiving unresolved IP packets, the device sends them to the CPU for address resolution, that is, ARP learning, instead of forwarding them through the hardware. If a large number of such packets are sent to the CPU, the CPU will be congested, affecting services on the device.

After ARP-based IP guard is enabled, the device will count the number of received ARP packets based on the destination IP address. When the number of packets with the same destination IP address exceeds a certain threshold, the device deems it as a CPU attack and will send a drop entry to the hardware. Then the hardware will not send subsequent ARP packets with this destination IP address to the CPU. After the address resolution is complete, the device updates the entry to the forwarding state and continues to forward the packets with this destination IP address.

This function requires routing resources on the device hardware. Therefore, if hardware resources are sufficient, set *attack-num* to a smaller value. If hardware resources are insufficient, set *attack-num* to a larger value or disable this function.

Examples

The following example sets the number of IP packets for triggering the discarding of ARP entries to 5.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp anti-ip-attack 5
```

The following example disables ARP-based IP guard.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp anti-ip-attack 0
```

1.4 arp any-ip

Function

Run the **arp any-ip** command to enable the any IP ARP function.

Run the **no** form of this command to disable this feature.

The any IP ARP function is disabled by default.

Syntax

arp any-ip

no arp any-ip

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

The any IP ARP function allows users to access the Internet with any IP address. This applies when a user uses a laptop in a hotel and wants to access the Internet without changing the configured IP address and gateway.

This function is not applicable in the following two scenarios, in which a user must modify the configuration before the user can access the Internet.

- The user's IP address is on the same network segment as the interface directly connected to the device. However, the configured gateway IP address is not the IP address configured for the interface directly connected to the device.
- The user's IP address is not on the same network segment as the interface directly connected to the device, but on the network segment of another interface. That means an IP address conflict occurs.

  As the user's IP address is not on the same network segment as the interface directly connected to the device, the dynamic ARP entry and direct route are generated only when the user initiates an ARP request. Therefore, in some scenarios (including but not limited to the following ones), the user will not be able to access the Internet unless the ARP entry is cleared and the gateway address is relearned on the user host.

  - The device acts as a proxy to respond to ARP requests. After the user host learns the MAC address of the device, the administrator deletes the dynamic ARP entry from the device. As a result, the user's dynamic ARP entry and direct route are removed and the user cannot receive the reply packet.
  - The device acts as a proxy to respond to ARP requests. After the user host learns the MAC address of the device, any IP ARP is disabled and then enabled again on the interface. When the any IP ARP function is disabled on the interface, the user's dynamic ARP entries and direct routes are immediately deleted. As a result, the user cannot receive the reply.

Caution

If static ARP entries or the ARP entries involving the Virtual Router Redundancy Protocol (VRRP) IP addresses exist, dynamic ARP entries generated by any IP ARP will be overwritten or fail to be added, and any IP ARP does not take effect.

Examples

The following example enables any IP ARP on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# arp any-ip
```

1.5 arp cache interface-limit

Function

Run the **arp cache interface-limit** command to set a limit on the number of ARP entries that can be learned by an interface.

Run the **no** form of this command to restore the default configuration.

No limit is set for the number of ARP entries that can be learned by an interface by default.

Syntax

arp cache interface-limit *limit*

no arp cache interface-limit

Parameter Description

limit: Maximum number of ARP entries that can be learned by an interface, including static ARP entries and dynamic ARP entries. The value range is from 0 to 16000. The default value is **0**, indicating no limit on the number of ARP entries that can be learned by an interface.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

Limiting the number of ARP entries that can be learned by an interface can protect the device against malicious ARP attacks that can result in excessive ARP entries and CPU resource consumption. The configured *limit* value must be equal to or greater than the number of the ARP entries that have been learned by the interface. Otherwise, the configuration does not take effect. The configuration is subject to the ARP entry capacity supported by the device.

Examples

The following example sets the limit on the number of ARP entries that can be learned by port GigabitEthernet 0/1 to 300.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# arp cache interface-limit 300
```

1.6 arp fast-aging enable

Function

Run the **arp fast-aging enable** command to enable the fast ARP entry aging on an interface.

Run the **no** form of this command to restore the default configuration.

The fast ARP entry aging function is disabled by default.

Syntax

arp fast-aging enable

no arp fast-aging enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

Dynamic ARP entries start aging one hour after the aging of their corresponding MAC addresses. If this feature is configured, after their corresponding MAC address age, the dynamic ARP entries age immediately. Pay attention to the following points:

- This command can be configured only on switch virtual interfaces (SVIs).
- When the conversion of ARP entries into host routes is enabled on the device, you are advised to enable this function at the same time, to help achieve fast route convergence.

Examples

The following example enables fast ARP entry aging on interface VLAN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# arp fast-aging enable
```

- **arp gratuitous-send interval**

1.8 arp gratuitous-send interval

Function

Run the **arp gratuitous-send interval** command to enable the function of sending gratuitous ARP requests at intervals.

Run the **no** form of this command to disable this feature.

The function of sending gratuitous ARP requests at intervals is disabled by default.

Syntax

arp gratuitous-send interval *interval* [*number*]

no arp gratuitous-send

Parameter Description

interval: Interval for sending gratuitous ARP requests, in seconds. The value range is from 1 to 3600.

number: Number of gratuitous ARP requests to be sent. The value range is from 1 to 100, and the default value is **1**.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

When a network interface of a device acts as the gateway of downlink devices, if a downlink device pretends to be the gateway, you can enable the function of sending gratuitous ARP requests at intervals on the interface to advertise the MAC address of the real gateway.

Examples

The following example sends a gratuitous ARP request to interface VLAN 1 every second.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# arp gratuitous-send interval 1 1
```

The following example disables the function of sending gratuitous ARP requests to interface VLAN 1 at intervals.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# no arp gratuitous-send

1.9 arp oob

Function

Run the **arp oob** command to configure a static ARP entry for a management interface.

Run the **no** form of this command to remove this configuration.

No static ARP entry of any management interface is configured in the ARP cache by default.

Syntax

arp oob [*mgmt-name*] *ip-address mac-address arp-type*

no arp oob [*mgmt-name*] *ip-address*

Parameter Description

mgmt-name: Management interface bound to a static ARP entry when multiple management interfaces are supported. The first management interface of a device is bound when *mgmt-name* is not specified.

ip-address: IP address corresponding to a MAC address. The IP address is expressed in dotted decimal notation.

mac-address: DLL address, consisting of 48 bits.

arp-type: ARP encapsulation type. For an Ethernet interface, the keyword is **arpa**.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example configures a static ARP entry for the host management interface on the Ethernet. The IP address is set to 1.1.1.1 and the MAC address is set to 4e54.3800.0002.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp oob 1.1.1.1 4e54.3800.0002 arpa
```

Notifications

When the ARP cache is fully occupied or the corresponding IP address is the local IP address, a static ARP entry fails to be added and the following notification will be displayed:

```
Cannot add static ARP.
```

Common Errors

1.10 arp proxy-resolved

Function

Run the **arp proxy-resolved** command to configure the master VRRP device to judge the existence of the ARP entry corresponding to a destination IP address when the device responds to an ARP request as a proxy ARP.

Run the **no** form of this command to remove this configuration.

By default, the master VRRP device judges the existence of the ARP entry corresponding to a destination IP address when the device responds to an ARP request as a proxy ARP.

Syntax

arp proxy-resolved

no arp proxy-resolved

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

After the **arp proxy-resolved** command is configured, the master VRRP device, upon receiving an ARP request, first judges whether the ARP entry corresponding to the destination IP address exists. If yes, the master VRRP device acts as a proxy ARP to give a reply. If no, the master VRRP device does not act as a proxy ARP. In addition, the gateway automatically broadcasts the ARP request for the destination IP address. This prevents the case that the gateway fails to act as a proxy to respond to an ARP request of the destination IP address due to absence of the ARP entry corresponding to the destination IP address.

After the **no arp proxy-resolved** command is configured, if the proxy conditions are met, the master VRRP device directly acts as a proxy upon receiving an ARP request, without judging whether the ARP entry corresponding to the destination IP address has been resolved.

Examples

The following example configures the master VRRP device not to judge the existence of the ARP entry corresponding to a destination IP address when the device acts as a proxy ARP.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no arp proxy-resolved
```

1.12 arp rate-statistic compute interval

Function

Run the **arp rate-statistic compute interval** command to configure the interval for collecting ARP packet rate statistics.

Run the **no** form of this command to remove this configuration.

The default interval for collecting ARP packet rate statistics is 5 seconds.

Syntax

arp rate-statistic compute interval *interval*

no arp rate-statistic compute interval

Parameter Description

interval: Sampling interval, in seconds. The value range is from 1 to 2147483647.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example sets the interval for collecting ARP packet rate statistics to 10 seconds.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp rate-statistic compute interval 10
```

1.13 arp resolve vlan

Function

Run the **arp resolve vlan** command to configure ARP to actively send broadcast resolution requests to a specified sub VLAN in a super VLAN.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

ARP does not actively send broadcast resolution requests to a specified sub VLAN in a super VLAN by default.

Syntax

arp resolve vlan { *vlan-list* | **none** }

no arp resolve vlan { *vlan-list* | **none** }

default arp resolve vlan

Parameter Description

vlan-list: Sub VLAN segment. When ARP is configured to actively send broadcast resolution requests to VLANs in the sub VLAN segments in a super VLAN, ARP will only send ARP broadcast packets to these VLANs. The start and end VLANs in a sub VLAN segment are connected by a hyphen (-), and multiple sub VLAN segments are separated by commas (,), for example, 1, 3-5.

none: Indicates that no ARP broadcast requests will be sent to any sub VLAN in a super VLAN.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

In a super VLAN scenario, when the device actively sends ARP resolution requests, the ARP resolution requests are broadcast to the entire super VLAN by default. If there are many sub VLANs in the super VLAN, the packets will be replicated in large quantities, which will affect the performance of the device.

Most terminals (such as PCs or servers) request ARP information of the gateway before accessing the network. Therefore, there is no need to actively broadcast the ARP resolution requests to the sub VLANs where these terminals reside. For dumb terminals that do not actively send gratuitous ARP packets, this command can be deployed in a specified *vlan-list* to enable the device to actively send ARP resolution requests to these VLANs.

Caution

After the **arp resolve vlan** *vlan-list* command is run, the device will only send ARP broadcast requests to the VLANs specified in *vlan-list* in the super VLAN, and other sub VLANs not in *vlan-list* will not receive ARP broadcast requests. In particular, if an authentication-exempt VLAN is configured and the authentication-exempt VLAN is not in *vlan-list* of **arp resolve vlan**, ARP requests will not be broadcast to the authentication-exempt VLAN.

Examples

The following example configures ARP to actively send broadcast resolution requests to sub VLANs 0-20 and 25-30 in the super VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp resolve vlan 10-20,25-30
```

The following example cancels sending resolution requests to VLANs 10-20.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no arp resolve vlan 10-20
```

The following example configures the device not to actively send ARP resolution requests to any sub VLAN in the super VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp resolve vlan none
```

1.14 arp retry interval

Function

Run the **arp retry interval** command to specify the ARP request retransmission interval.

Run the **no** form of this command to restore the default configuration.

The default ARP request retransmission interval is 1 second.

Syntax

arp retry interval *interval*

no arp retry interval

Parameter Description

interval: ARP request retransmission interval, in seconds. The value range is from 1 to 3600.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

2

Usage Guidelines

The ARP request retransmission interval can be configured globally and on a Layer 3 interface. The configuration in interface configuration mode takes priority over that in global configuration mode. For example, when the ARP request retransmission interval is set to 5 seconds in global configuration mode and set to 2 seconds on SVI 1, the ARP request retransmission interval of SVI 1 is 2 seconds. The ARP request retransmission interval of other interfaces (including new interfaces) is subject to global configuration, that is, 5 seconds.

The shorter the retransmission interval is, the faster the resolution is, and the more bandwidth will be consumed. If the network resources are insufficient, you are advised to set the ARP request retransmission interval to a larger value to reduce the consumption of network bandwidths. Generally, the interval should not be greater than the aging time of dynamic ARP entries.

Examples

The following example sets the ARP request retransmission interval to 30 seconds in global configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp retry interval 30
```

The following example sets the ARP request retransmission interval of SVI 1 to 18 seconds.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# arp retry interval 18
```

Related Commands

- **arp retry times**

1.15 arp retry times

Function

Run the **arp retry times** command to configure the number of times that an ARP request can be transmitted consecutively.

Run the **no** form of this command to restore the default configuration.

The default number of times that an ARP request can be transmitted consecutively is 5. That is, if no ARP reply packet is received, the device sends the ARP request packets for another four times.

Syntax

arp retry times *times*

no arp retry times

Parameter Description

times: Number of times that the same ARP request can be transmitted. The value range is from 1 to 100, and the default value is **5**. When the value is set to **1**, an ARP request is sent once, and will not be retransmitted.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

2

Usage Guidelines

The number of times that an ARP request can be transmitted consecutively can be configured globally and on a Layer 3 interface. The configuration in interface configuration mode takes priority over that in global configuration mode. For example, when the number of times that an ARP request can be transmitted consecutively is set to 1 in global configuration mode and set to 3 on SVI 1, the number of times that an ARP request can be transmitted is 3 for SVI 1. The number of times that an ARP request can be transmitted on other interfaces (including new interfaces) is subject to global configuration, that is, 1.

The more times an ARP packet can be transmitted consecutively, the more likely the resolution will succeed, and the more bandwidth will be consumed. If the network resources are insufficient, you are advised to set the number of times to a smaller value to reduce the consumption of network bandwidths.

Examples

The following example sets the number of times that an ARP request packet can be transmitted consecutively to 1 in global configuration mode, that is, ARP request packets will not be retransmitted.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp retry times 1
```

The following example sets the number of times that an ARP request packet can be transmitted consecutively to 2 in global configuration mode, that is, an ARP request packet will be retransmitted once.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# arp retry times 2
```

The following example sets the number of times that an ARP request packet can be transmitted consecutively to 5 for SVI 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# arp retry times 5
```

1.16 arp scan

Function

Run the **arp scan** command to enable ARP scanning.

Run the **no** form of this command to disable this feature.

ARP scanning is disabled by default.

Syntax

arp scan [*start-ip-address end-ip-address*]

no arp scan [*start-ip-address end-ip-address*]

Parameter Description

start-ip-address: Start IP address of the ARP scanning range. The start IP address must be smaller than or equal to the end IP address.

end-ip-address: End IP address of the ARP scanning range. The end IP address must be greater than or equal to the start IP address.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

This function is usually used together with the Web-based dynamic-to-static ARP entry conversion function.

By configuring the IP address range for ARP scanning, users can scan neighbors in this range, thereby reducing the waiting time. The number of hosts in the ARP scanning range must not exceed 1,024.

The start and end IP addresses of the ARP scanning range must be on the same network segment as the interface IP address that may serve as the master or slave IP address.

If the start and end IP addresses are not specified, only the neighbors on the same network segment as the master IP address of the interface are scanned. The subnet mask of the master IP address must consist of at least 22 bits.

ARP scanning configuration takes effect only once. It cannot be saved and will lose effect the next time. ARP scanning takes effect when the Layer 3 interface is up (that is, the link is up and an IP address is configured).

Examples

The following example enables ARP scanning on port GigabitEthernet 0/1 without specifying the IP address range.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# arp scan
```

The following example enables ARP scanning on port GigabitEthernet 0/0 with the IP address range specified.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/0
Hostname(config-if-GigabitEthernet 0/0)# arp scan 1.1.1.1 1.1.1.10
```

Notifications

When a start IP address or end IP address is not a valid host address, or the start IP address is greater than the end IP address, or the start IP address and end IP address are not on the same network segment as the interface IP address, the following notification will be displayed:

```
%notice: Invalid ip address range.
```

When the number of hosts in a specified range is greater than 1,024, the following notification will be displayed:

```
%notice: Failed to scan because ip address range is larger than 1024.
```

When no Layer 3 interface is up, the following notification will be displayed:

```
%notice: Failed to scan because this interface is not up.
```

Common Errors

- The start IP address is greater than the end IP address.
- The start IP address and the end IP address are not on the same network segment as the IP interface address.

Platform Description

This command is supported only on egress gateways (EGs), network provider edges (NPEs), and network border routers (NBRs).

Related Commands

- **arp scan auto**

1.17 arp scan auto

Function

Run the **arp scan auto** command to enable scheduled automatic ARP scanning.

Run the **no** form of this command to disable this feature.

The scheduled automatic ARP scanning function is disabled by default.

Syntax

arp scan auto [*start-ip-address end-ip-address*]

no arp scan auto [*start-ip-address end-ip-address*]

Parameter Description

start-ip-address: Start IP address of the ARP scanning range. The start IP address must be smaller than or equal to the end IP address.

end-ip-address: End IP address of the ARP scanning range. The end IP address must be greater than or equal to the start IP address.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

The scheduled automatic ARP scanning function is enabled by default, and scheduled automatic ARP scanning is performed once every 5 minutes. It takes effect only on interfaces in the up state.

By configuring the IP address range for ARP scanning, users can scan neighbors in this range, thereby reducing the waiting time. The number of hosts in the ARP scanning range must not exceed 1,024.

The IP addresses of neighbors with ARP entries available will not be scanned.

Up to 30 instances can be configured.

Examples

The following example enables scheduled automatic ARP scanning on VLAN 1, with the IP address range from 1.1.1.1 to 1.1.1.10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# arp scan auto 1.1.1.1 1.1.1.10
```

Notifications

When a start IP address or end IP address is not a valid host address, or the start IP address is greater than the end IP address, the following notification will be displayed:

```
Invalid ip address range.
```

When the number of hosts in a specified range is greater than 1,024, the following notification will be displayed:

```
Failed to scan because ip address range is larger than 1024.
```

When more than 30 instances are configured, the following notification will be displayed:

```
The number of arp auto-scan ip exceed 30.
```

Common Errors

- The start IP address is greater than the end IP address.
- The number of hosts in a specified range is greater than 1,024.

1.18 arp scan interval

Function

Run the **arp scan interval** command to configure the interval for scheduled automatic ARP scanning.

Run the **no** form of this command to restore the default configuration.

The default interval of scheduled automatic ARP scanning is 5 minutes.

Syntax

arp scan interval *time*

no arp scan interval

Parameter Description

time: Interval of scheduled ARP scanning, in minutes. The range is from 1 to 30.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

The interval is the duration between the end of scanning on all interfaces and the start of the next scanning.

Examples

The following example sets the interval of scheduled ARP scanning to 1 minute.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp scan interval 1
```

1.19 arp scan rate

Function

Run the **arp scan rate** command to configure the rate of scheduled automatic ARP scanning.

Run the **no** form of this command to remove this configuration.

The default scheduled automatic ARP scanning rate is **20** IP addresses per second.

Syntax

arp scan rate *rate-value*

no arp scan rate

Parameter Description

rate-value: Rate of scheduled automatic ARP scanning, in IP addresses per second. The value range is from 1 to 100.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

The scanning rate is the number of IP addresses that the device scans and successfully learns the ARP packets from per second. For example, when the rate is set to 100, the device scans a maximum of 100 IP addresses per second.

If scanning has be done on all the required network segments and ARP packets have been successfully learned, the next scanning rate is 0.

Examples

The following example sets the rate of scheduled automatic ARP scanning to 8 0 IP addresses per second.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp scan rate 80
```

1.20 arp suppress-auth-vlan-req

Function

Run the **arp suppress-auth-vlan-req** command to restrain the device from sending ARP requests to authenticated VLANs.

Run the **no** form of this command to remove this configuration.

ARP requests are not sent to authenticated VLANs by default.

Syntax

arp suppress-auth-vlan-req

no arp suppress-auth-vlan-req

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

This configuration is supported only on SVIs.

In gateway authentication mode, all sub VLANs in a super VLAN are authenticated VLANs by default. Users in an authenticated VLAN have to pass authentication before accessing the network. After authentication, a static ARP entry is generated on the device. Therefore, when accessing an authenticated user, the device does not need to send ARP requests to the authenticated VLAN. If the device attempts to access users in an authentication-exempt VLAN, it only needs to send ARP requests to the authentication-exempt VLAN.

In gateway authentication mode, the device does not send ARP requests to authenticated VLANs by default. If the device needs to access authentication-exempt users in an authenticated VLAN, disable this function.

Examples

The following example enables the function of sending ARP requests to authenticated VLANs on VLAN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# no arp suppress-auth-vlan-req
```

1.21 arp switch-over resolve

Function

Run the **arp switch-over resolve** command to actively send ARP requests to terminals after active and standby VSU switchover.

Run the **no** form of this command to remove this configuration.

ARP requests are not actively sent to terminals after active and standby VSU switchover by default.

Syntax

arp switch-over resolve

no arp switch-over resolve

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

This function can be enabled to quickly update ARP entries of a downlink device after active and standby VSU switchover, especially when the downlink device is similar to a server with dual network interface cards. When the slave device becomes the master, it will actively send ARP requests to SVIs (instead of interfaces not in a super VLAN) of up to 1000 downlink terminals to trigger the terminals to reply to these ARP requests. Then, the device can update the ARP and MAC tables.

Examples

The following example actively sends ARP requests to terminals after active and standby VSU switchover.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp switch-over resolve
```

1.22 arp timeout

Function

Run the **arp timeout** command to configure the timeout time for dynamic ARP entries in the ARP cache.

Run the **no** form of this command to restore the default configuration.

The default timeout time of dynamic ARP entries in the ARP cache is **3600** seconds.

Syntax

arp timeout *time*

no arp timeout

Parameter Description

time: Timeout time, in seconds. The value range is from 0 to 2147483.

Command Modes

Interface configuration mode

Global configuration mode

Default Level

2

Usage Guidelines

The ARP timeout configuration only applies to the dynamic mappings between IP and MAC addresses. When the ARP timeout time is set to a smaller value, the mapping table stored in the ARP cache is more accurate but ARP consumes more network bandwidth. Unless otherwise specified, the ARP timeout time does not need to be configured.

The ARP aging time can be configured globally and on a specified interface. The configuration in interface configuration mode takes priority over that in global configuration mode. For example, when the ARP aging time is set to 3,000 seconds in global configuration mode and to 1,800 seconds on interface 1, the ARP aging time of interface 1 is 1800s. The ARP aging time of other interfaces (including new interfaces) is subject to the global ARP aging time, that is, 3,000s.

Examples

The following example sets the timeout time of dynamic ARP entries learned by port GigabitEthernet 0/1 to 120s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# arp timeout 120
```

The following example sets the ARP aging time to 3,000 seconds globally. If no aging time is configured for an interface, the ARP aging time is 3000 seconds for all Layer 3 interfaces.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp timeout 3000
```

1.23 arp trusted

Function

Run the **arp trusted** command to configure the maximum number of trusted ARP entries.

Run the **no** form of this command to restore the default configuration.

The maximum number of trusted ARP entries is **8000** by default.

Syntax

arp trusted *number*

no arp trusted

Parameter Description

number: Maximum number of trusted ARP entries. The value range is from 10 to 14976.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

Enable trusted ARP before configuring this function. Trusted ARP entries and other entries share the memory. If trusted ARP entries occupy much space, dynamic ARP entries may not have sufficient space. Set the number based on the actual requirement. Do not set it to an excessively large value.

The maximum value of the *number* parameter can be the capacity of the ARP table minus 1,024.

Examples

The following example sets the maximum number of trusted ARP entries to 1,000.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp trusted 1000
```

1.24 arp trust-monitor enable

Function

Run the **arp trust-monitor enable** command to enable ARP trust monitoring.

Run the **no** form of this command to disable this feature.

ARP trust monitoring is disabled by default.

Syntax

arp trust-monitor enable

no arp trust-monitor enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

ARP trust monitoring is used to prevent excessive useless ARP entries generated due to ARP spoofing from occupying device resources. After ARP trust monitoring is enabled on a Layer 3 interface and the device receives an ARP request from this interface:

(1) If the corresponding entry does not exist, the device creates a dynamic ARP entry and performs neighbor unreachability detection (NUD) after 1 to 5 seconds. That is, the device ages the newly learned ARP entry and unicasts an ARP request. If the device receives an ARP update packet from the peer within the aging time, it stores the entry. Otherwise, it deletes the entry.

(2) If the corresponding ARP entry exists and the MAC address is not updated, the device does not perform NUD.

(3) If the MAC address in the existing dynamic ARP entry is updated, the device performs NUD.

Since this function adds a strict confirmation procedure in the ARP learning process, it affects the efficiency of ARP learning.

After this function is disabled, the device does not perform NUD for learning or updating ARP entries.

Examples

The following example enables ARP trust detection on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# arp trust-monitor enable
```

Function

Run the **arp trust user-vlan** command to enable VLAN translation when a trusted ARP entry is added.

Run the **no** form of this command to remove this configuration.

The VLAN translation is disabled when a trusted ARP entry is added by default.

Syntax

arp trust user-vlan *vlan-id* **translated-vlan** *vlan-id*

no arp trust user-vlan *vlan-id* **translated-vlan** *vlan-id*

Parameter Description

user-vlan *vlan-id*: Indicates the VLAN ID set for a server.

translated-vlan *vlan-id*: Indicated the VLAN ID after translation.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

Enable trusted APR before configuring this function.

Configure this command only when the VLAN delivered by the server differs from the valid VLAN in the trusted ARP entry.

Examples

The following example enables VLAN translation when a trusted ARP entry is added. A server delivers VLAN 3 but actually, trusted ARP takes effect on VLAN 5.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp trust user-vlan 3 translated-vlan 5
```

1.27 arp unresolve

Function

Run the **arp unresolve** command to configure the maximum number of unresolved ARP entries.

Run the **no** form of this command to restore the default configuration.

The maximum number of unresolved ARP entries that can be held in an ARP cache is **16000** by default.

Syntax

arp unresolve *unresolved-number*

no arp unresolve

Parameter Description

unresolved-number: Maximum number of unresolved ARP entries. The value range is from 1 to 16000.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

In a local area network (LAN), ARP attacks and scanning may cause a large number of unresolved ARP entries generated on the gateway. As a result, the gateway fails to learn the MAC addresses of the hosts. To prevent this situation, if a large number of unresolved entries exist in the ARP cache and remain in the cache after a while, you are advised to use this command to limit the number of unresolved ARP entries.

Examples

The following example sets the maximum number of unresolved ARP entries on the device to 500.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp unresolve 500
```

1.28 arp strict-learning enable

Function

Run the **arp strict-learning enable** command to enable strict dynamic ARP learning.

Run the **no** form of this command to disable this feature.

Strict dynamic ARP learning is disabled by default.

Syntax

arp strict-learning enable

no arp strict-learning enable

Parameter Description

N/A

Command Modes

Global configuration mode

Interface configuration mode

Default Level

2

Usage Guidelines

After strict dynamic ARP learning is enabled, only the reply packets in response to the ARP request packets actively sent by the device can trigger the device to learn ARP entries.

The strict dynamic ARP learning can be configured globally and on an interface. The configuration in interface configuration mode takes priority over that in global configuration mode.

Examples

The following example enables strict dynamic ARP learning globally.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp strict-learning enable
```

The following example disables strict dynamic ARP learning globally.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no arp strict-learning enable
```

The following example enables strict dynamic ARP learning on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/10)# arp strict-learning enable
```

The following example disables strict dynamic ARP learning on port GigabitEthernet 0/1.

```

Usage Guidelines

After this function is enabled, a device will filter out ARP packets whose source MAC addresses is not consistent with the Ethernet source MAC address.

Examples

The following example enables the function of checking the source MAC addresses of ARP packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp filter smac-illegal
```

1.33 arp warning-limit

Function

Run the **arp warning-limit** command to configure the ARP alarm rate limit.

Run the **no** form of this command to restore the default configuration.

The default ARP alarm rate limit interval is 50 seconds and the default upper limit of alarms allowed within this interval is 10.

Syntax

arp warning-limit interval *interval* **times** *time*

no arp warning-limit

Parameter Description

interval *interval*: Specifies the ARP alarm rate limit interval, in seconds. The value range is 1 to 180. The default value is **50**.

times *time*: Specifies the upper limit of alarms allowed within the ARP alarm rate limit interval. The value range is from 1 to 1,024, and the default value is **10**.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

This command can be used to adjust the printing rate of ARP syslog alarms. The actual ARP alarm rate may be lower than the configured rate, depending on system performance.

Examples

The following example sets the ARP alarm rate limit interval to 60 seconds and the upper limit of alarms allowed within this interval to 100.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# arp warning-limit interval 60 times 100
```

1.34 clear arp-cache

Function

Run the **clear arp-cache** command to clear dynamic ARP mapping records in the ARP cache.

Syntax

clear arp-cache [[**vrf** *vrf-name* | **oob**] [*ip-address* [*mask*]] | [**interface** *interface-type interface-number*]]

Parameter Description

vrf *vrf-name*: Deletes dynamic ARP entries of a specified VRF instance. If this parameter is not specified, it indicates the public network instance.

oob: Configures out-of-band management.

ip-address: IP address whose dynamic ARP entries are to be deleted. All dynamic ARP entries are deleted by default.

mask: Subnet mask. After this parameter is specified, dynamic ARP entries in the subnet will be deleted and the preceding IP address must be set to a subnet ID. Dynamic ARP entries specified in the *ip-address* parameter are deleted by default.

interface *interface-type interface-number*: Clears the dynamic ARP entries of a specified interface. Dynamic ARP entries of all interfaces are deleted by default.

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

In gateway authentication mode, dynamic ARP entries in authenticated VLANs will not be cleared.

On devices enabled with the Network Foundation Protection Policy (NFPP), only one ARP packet is received for each MAC address (or IP address) per second by default. If the **clear arp-cache** command is run twice within 1 second, the second reply may be filtered out and the ARP resolution may fail.

Examples

The following example clears all dynamic ARP entries in the ARP cache.

```
Hostname> enable
Hostname# clear arp-cache
```

The following example clears dynamic entry 1.1.1.1 in the ARP cache.

```
Hostname> enable
Hostname# clear arp-cache 1.1.1.1
```

The following example deletes dynamic ARP entries of SVI 1.

```
Hostname> enable
Hostname# clear arp-cache interface Vlan 1
```

1.35 clear arp-cache trusted

Function

Run the **clear arp-cache trusted** command to clear trusted ARP entries in the ARP cache.

Syntax

clear arp-cache [**vrf** *vrf-name* | **oob**] **trusted** [*ip-address* [*mask*]]

Parameter Description

vrf *vrf-name*: Deletes dynamic ARP entries of a specified VRF instance. If this parameter is not specified, it indicates the public network instance.

oob: Configures out-of-band management.

ip-address: IP address whose trusted ARP entries are to be deleted. All trusted ARP entries are deleted by default.

mask: Subnet mask. After this parameter is specified, trusted ARP entries in the subnet will be deleted and the preceding IP address must be set to a subnet ID. Trusted ARP entries specified in the *ip-address* parameter are deleted by default.

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example clears all trusted ARP entries in the ARP cache.

```
Hostname> enable
Hostname# clear arp-cache trusted
```

The following example clears trusted ARP entries with the IP address of 1.1.1.1 in the ARP cache.

```
Hostname> enable
Hostname# clear arp-cache trusted 1.1.1.1
```

1.36 clear arp-cache packet statistics

Function

Run the **clear arp-cache packet statistics** command to clear ARP packet statistics.

Syntax

clear arp-cache packet statistics [*interface-type interface-number*]

Parameter Description

interface-type interface-number: Interface type and interface number.

Command Modes

Privileged EXEC mode

Default Level

2

Usage Guidelines

After ARP packet statistics are cleared, packet statistic starts from 0 again.

Examples

The following example clears ARP packet statistics.

```
Hostname> enable
Hostname# clear arp-cache packet statistics
```

The following example clears ARP packet statistics on VLAN 1.

```
Hostname> enable
Hostname# clear arp-cache packet statistics vlan 1
```

1.37 ip proxy-arp

Function

Run the **ip proxy-arp** command to enable proxy ARP on an interface.

Run the **no** form of this command to disable this feature.

Proxy ARP is disabled by default.

Syntax

ip proxy-arp

no ip proxy-arp

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

The device enabled with proxy ARP can help a host obtain MAC addresses of IP hosts in other networks or subnets. When a proxy device receives an ARP request whose sender's source IP address is in a different network from the destination IP address, if the device knows the route to the destination IP address, it sends an ARP reply containing its own Ethernet MAC address.

By default, proxy ARP is disabled on Layer 3 devices.

Examples

The following example enables proxy ARP on port GigabitEthernet 0/1.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip proxy-arp
```

1.38 local-proxy-arp

Function

Run the **local-proxy-arp** command to enable local proxy ARP.

Run the **no** form of this command to disable this feature.

Local proxy ARP is disabled by default.

Syntax

local-proxy-arp

no local-proxy-arp

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

After local proxy ARP is enabled, the device can help hosts obtain the MAC addresses of other hosts in the same subnet. For example, when port protection is enabled on the device, users connected to different ports of the device are isolated at Layer 2. After local proxy ARP is enabled and the device receives an ARP request, the device acts as a proxy and sends an ARP reply containing its own Ethernet MAC address. In this case, different users communicate with each other through Layer 3 routes.

Examples

The following example enables local proxy ARP in VLAN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# local-proxy-arp
```

1.39 service trustedarp

Function

Run the **service trustedarp** command to enable trusted ARP.

Run the **no** form of this command to disable this feature.

Trusted ARP is disabled by default.

Syntax

service trustedarp

no service trustedarp

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

When a user goes online on a GPRS support node (GSN) client, the authentication server obtains the user's real mapping between IP and MAC addresses through the access switch, and adds trusted ARP entries on the user's gateway switch. This process is transparent to the network administrator and does not require extra work from them.

Trusted ARP entries have characteristics of both static and dynamic ARP entries, with a priority higher than that of dynamic ARP entries and lower than that of static ARP entries. Trusted ARP entries have an aging mechanism similar to that of dynamic ARP entries. Before an ARP entry ages, the device actively sends an ARP request to detect whether the corresponding host exists. If the host sends a reply, the device regards the host

active and updates the aging time of the ARP entry. Otherwise, the device deletes the ARP entry. Trusted ARP entries have characteristics of static ARP entries. The device will not dynamically update the MAC addresses and interfaces in the trusted ARP entries by learning ARP packets.

Since trusted ARP entries come from authentic sources and will not be updated, they can efficiently prevent ARP spoofing targeting the gateway.

Examples

The following example enables trusted ARP.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# service trustedarp
```

1.40 show arp

Function

Run the **show arp** command to display the ARP cache.

Syntax

show arp [*interface-type interface-number* | **trusted** [*ip-address* [*mask*]] | [**vrf** *vrf-name*] [*ip-address* [*mask*] | *mac-address* | **complete** | **incomplete** | **static**]

Parameter Description

interface-type interface-number: *interface-type* indicates the interface type and *interface-number* indicates the interface number. After the parameter is specified, the ARP entries of a specified Layer 3 interface or Layer 2 interface are displayed.

vrf *vrf-name*: Displays the ARP entries of a specified VRF instance.

trusted: Displays trusted ARP entries. Currently, only the global VRF instance supports trusted ARP entries.

ip-address: IP address whose ARP entries need to be displayed. If keyword **trusted** is specified, only the trusted ARP entries are displayed. Otherwise, the non-trusted ARP entries are displayed.

mask: Subnet mask. After this parameter is specified, ARP entries within the IP subnet will be displayed. If keyword **trusted** is specified, only the trusted ARP entries are displayed. Otherwise, the non-trusted ARP entries are displayed.

mac-address: MAC address whose ARP entries need to be displayed.

complete: Displays all resolved dynamic ARP entries.

incomplete: Displays all unresolved dynamic ARP entries.

static: Displays all static ARP entries and their sources.

Internet  192.168.23.57    <static>  0000.0000.0020  arpa   VLAN 100   DHCP-Snooping
2  static arp entries exist.
```

Table 1-1 Output Fields of the show arp Command

Field	Description
Protocol	Protocol. **Internet** indicates the Internet protocol.
Address	IPv4 address.
Age(min)	Duration of an entry. ● For a local IP address, "--" is displayed. ● For a static entry, "static" is displayed. ● For a dynamic entry, the duration of the entry is displayed in minutes.
Hardware	Hardware address, that is, a 48-bit MAC address consisting of three parts separated by dots (.), with each part containing 16 bits. The address is expressed in hexadecimal notation.
Type	Type of a hardware address. It is ARPA for all Ethernet addresses.
Interface	Layer 3 interface corresponding to an ARP entry. Nothing is displayed if the IP address of a static ARP is not in any directly connected network segment of the device.
Origin	Source of a static ARP entry. ● **Configure** indicates that the entry is manually configured. ● **Authentication** indicates that the entry is generated via authentication.

1.43 show arp detail

Function

Run the **show arp detail** command to display the details about the ARP cache.

Syntax

show arp detail [*interface-type interface-number* | **trusted** [*ip-address* [*mask*]] | [**vrf** *vrf-name*] [*ip-address* [*mask*] | *mac-address* | **complete** | **incomplete | static**] | **subvlan** { **min-max** *min-value max-value* | *subvlan-number* }]

Parameter Description

interface-type interface-number: *interface-type* indicates the interface type and *interface-number* indicates the interface number. After the parameter is specified, the ARP entries of a specified Layer 3 interface or Layer 2 interface are displayed.

vrf *vrf-name*: Displays ARP entries of a specified VRF instance.

trusted: Displays trusted ARP entries. Currently, only the global VRF instance supports trusted ARP entries.

ip-address: IP address whose ARP entries need to be displayed.

mask: Subnet mask. After this parameter is specified, ARP entries of a specified network segment will be displayed.

mac-address: MAC address whose ARP entries need to be displayed.

complete: Displays all resolved dynamic ARP entries.

incomplete: Displays all unresolved dynamic ARP entries.

static: Displays all static ARP entries.

subvlan: Displays ARP entries of a specified sub VLAN.

min-max: Displays the maximum and minimum values of sub VLAN IDs corresponding to ARP entries in a specified sub VLAN range.

min-value: Minimum value of sub VLAN IDs corresponding to ARP entries in a specified sub VLAN range.

max-value: Maximum value of sub VLAN IDs corresponding to ARP entries in a specified sub VLAN range.

subvlan-number: Sub VLAN ID. After this parameter is specified, ARP entries of a specified single sub VLAN will be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

1

Usage Guidelines

This command is used to display the details about the ARP cache, including the type of ARP entries (dynamic, static, local, or trusted entries) and the Layer 2 ports.

Note

If the entered *min-value* is greater than *max-value*, no error is displayed, and ARP entries in the specified sub VLAN range are displayed.

Examples

The following example displays the details about the ARP cache.

```
Hostname> enable
Hostname# show arp detail
IP Address     MAC Address      Type      Age(min)   Interface  Port     SubVlan   Gid

1.45 show arp rate-statistic

Function

Run the **show arp rate-statistic** command to display the ARP packet rate statistics.

Syntax

show arp rate-statistic [*interface-type interface-number*]

Parameter Description

interface-type interface-number: Interface type and interface ID. After this parameter is specified, the statistics on ARP packets of a specified interface will be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

This command is used to display the ARP packet rate statistics (including received ARP requests, received ARP replies, received other ARP packets, sent ARP requests, and sent ARP replies).

Examples

The following example displays the ARP packet rate statistics of all interfaces.

```
Hostname> enable
Hostname(config)# show arp rate-statistic
Interface Sampling Received    Received    Received    Sent        Sent
Name      time     Requests(pps) Replies(pps) Others(pps) Requests(pps) Replies(pps)
```

```
--------     ----     ----     ----     ----     ---
TenGigabitEthernet 0/15    1    0     0         0        1      0
Mgmt 0                   1    7     0         0        0      0
```

The following example displays the ARP packet rate statistics of SVI 1.

```
Hostname> enable
Hostname(config)# show arp rate-statistic interface vlan 1
Interface Sampling Received    Received    Received    Sent         Sent
Name      time    Requests(pps) Replies(pps) Others(pps) Requests(pps) Replies(pps)
--------      ----     ----     ----     ----     ----     ---
VLAN 1     1         0              0           0            0            0
```

Table 1-6 Output Field of the show arp rate-statistic Command

Field	Description
Interface Name	Interface name.
Sampling time	Sampling time.
Received Requests(pps)	Rate of received ARP requests.
Received Replies(pps)	Rate of received ARP replies.
Received Others(pps)	Rate of received other ARP packets.
Sent Requests(pps)	Rate of sent ARP requests.
Sent Replies(pps)	Rate of sent ARP replies.

1.47 show arp flapping record

Function

Run the **show arp flapping record** command to display ARP flapping records.

Syntax

show arp flapping record [*ipv4-address*]

Parameter Description

***ipv4-address*: ARP records of the specified IPv4 address. Command Modes**

All modes except the user EXEC mode

Default Level

1

Usage Guidelines

ARP flapping occurs when a device learns an entry with the same IP address twice but the MAC addresses are different.

Examples

The following example displays ARP flapping records.

```
Hostname> enable
Hostname# show arp flapping record
Hostname> enable
Hostname# show arp flapping record
Arp flapping recorded:
  Arp flapping record max count: 10240
  Arp flapping record current count: 2
  Arp flapping record history count: 2
  Move-Time                ip-address        Original-Mac        Move-Mac

1.48 show ip arp

Function

Run the **show ip arp** command to display the ARP cache.

Syntax

show ip arp [**vrf** *vrf-name*]

Parameter Description

vrf *vrf-name*: Displays the ARP entries of a specified VRF instance.

Command Modes

All modes except the user EXEC mode

Default Level

1

Usage Guidelines

N/A

Examples

The following example displays the ARP cache.

```
Hostname> enable
Hostname# show ip arp
```

```
Protocol Address      Age(min)Hardware       Type
Interface
Internet 192.168.7.233  23   0007.e9d9.0488  ARPA GigabitEthernet 0/0

1.49 show arp anti-attack statistics

Function

Run the **show arp anti-attack statistics** command to display the statistics on illegal ARP packets.

Syntax

show arp anti-attack statistics

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

1

Usage Guidelines

N/A

Examples

The following example displays the statistics on illegal ARP packets.

```
Hostname> enable
Hostname# show arp anti-attack statistics
Number of ARP packet(s) dropped by strict learning:       55
Number of ARP packet(s) dropped by sender-mac checking:    5
Number of ARP packet(s) dropped by target-mac checking:    66
Number of ARP packet(s) dropped by gratuitous checking:    101
Number of ARP packet(s) dropped by acl checking:          7
Number of ARP packet(s) dropped by hardware-type checking:  2
Number of ARP packet(s) dropped by hardware-size checking:  9
Number of ARP packet(s) dropped by protocol-type checking:  78
Number of ARP packet(s) dropped by protocol-size checking:  11
Number of ARP packet(s) dropped by opcode checking:       35
Number of ARP packet(s) dropped by ip checking:           0
```

Table 1-10 Output Field of the show arp anti-attack statistics Command

Field	Description
Number of ARP packet(s) dropped by strict learning	Number of illegal ARP packets that are dropped due to strict learning.
Number of ARP packet(s) dropped by sender-mac checking	Number of illegal ARP packets that are dropped due to source MAC address check carried by the sender.
Age (Number of ARP packet(s) dropped by target-mac checking)	Number of illegal ARP packets that are dropped due to destination MAC address check.

Field	Description
Number of ARP packet(s) dropped by gratuitous checking	Number of illegal ARP packets that are dropped due to gratuitous ARP check.
Number of ARP packet(s) dropped by acl checking	Number of illegal ARP packets that are dropped due to ACL check.
Number of ARP packet(s) dropped by hardware-type checking	Number of illegal ARP packets that are dropped due to hardware type check.
Number of ARP packet(s) dropped by hardware-size checking	Number of illegal ARP packets that are dropped due to hardware size check.
Number of ARP packet(s) dropped by protocol-type checking	Number of illegal ARP packets that are dropped due to protocol type check.
Number of ARP packet(s) dropped by protocol-size checking	Number of illegal ARP packets that are dropped due to protocol size check.
Number of ARP packet(s) dropped by opcode checking	Number of illegal ARP packets that are dropped due to operation code check.

1 IPv4 Basics Commands

Command	Function
gateway	Configure the default gateway for a management interface.
ip address	Configure an IP address for an interface.
ip address mix	Configure an IP address combination.
ip address negotiate	Configure an interface to obtain the IP address through the Point to Point Protocol (PPP) negotiation.
ip broadcast-address	Configure a broadcast address for an interface.
ip icmp error-interval	Configure the transmission rate of Internet Control Message Protocol (ICMP) error packets.
ip icmp timestamp	Configure the timestamp query function.
ip directed-broadcast	Enable the translation of the IP directed broadcast mode to the physical broadcast mode.
ip mask-reply	Enable the function of sending ICMP mask reply messages.
ip mtu	Configure the maximum transmission unit (MTU) for an IP packet.
ip redirects	Enable the function of sending ICMP redirection messages.
ip redirect-drop	Enable the routed port protection function.
ip source-route	Enable the function of processing IP source routing information.
ip ttl	Configure a time to live (TTL) value for unicast packets sent by the device.
ip ttl-expires enable	Enable the device to send a TTL timeout message.
ip unnumbered	Enable an unnumbered interface to borrow an IP address.
ip unreachables	Enable the function of sending ICMP destination unreachable messages.

show ip interface	Display the IP status of an interface.
show ip packet queue	Display statistics on sent and received IP packets in the protocol stack.
show ip packet statistics	Display the statistics on IP packets.
show ip raw-socket	Display all the IPv4 raw sockets.
show ip sockets	Display all IPv4 sockets.
show ip udp	Display all IPv4 UDP sockets.
show ip udp statistics	Display the number of IPv4 UDP sockets.

1.1 gateway

Function

Run the **gateway** command to configure the default gateway for a management interface.

Run the **no** form of this command to remove this configuration.

No default gateway is configured for a management interface by default.

Syntax

gateway *ip-address*

no gateway

Parameter Description

ip-address: Default gateway of a management interface for Internet Protocol version 4 (IPv4) communication.

Command Modes

MGMT interface mode

Default Level

2

Usage Guidelines

The type of a management interface is MGMT and the interface number is fixed to 0.

Examples

The following example sets the default gateway of a MGMT interface to 1.1.1.1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface mgmt 0
Hostname(config-if-Mgmt 0)# gateway 1.1.1.1
```

Notifications

When the configured IP address is illegal, the following notification will be displayed:

```
% 0.0.0.0 is not a valid host address.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

- **show ip interface**

1.2 ip address

Function

Run the **ip address** command to configure an IP address for an interface.

Run the **no** form of this command to remove this configuration.

No IP address is configured for an interface by default.

Syntax

ip address *ip-address mask* [**secondary**]

no ip address [*ip-address mask* [**secondary**]

Parameter Description

ip-address: IP address consisting of 32 bits, with 8 bits for each group. The IP address is expressed in dotted decimal notation.

mask: Network mask consisting of 32 bits. Value **1** indicates the mask bit and **0** indicates the host bit. Every 8 bits form one group. The network mask is expressed in dotted decimal notation.

secondary: Configures an IP address as a secondary IP address.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

A device can receive and send IP packets only after the device is configured with an IP address.

A network mask is also a 32-bit value and identifies the bits occupied by the network part of an IP address. In a network mask, the bits whose values are ones are for the network part, and the bits whose values are zeros are for host addresses. For example, for class A networks, the network mask is 255.0.0.0. Subnetting allows you to divide a network into several subnets. You can use some bits of the host address as the network ID to decrease the host capacity and increase the number of networks. In this case, network masks are called subnet masks.

The device supports multiple IP addresses on one interface, of which one is the primary IP address and the others are secondary IP addresses. Theoretically, the number of secondary IP addresses is not limited. However, secondary IP addresses must belong to different networks and secondary IP addresses must be in different networks from primary IP addresses. In network construction, secondary IP addresses are often used in the following circumstances:

- A network does not have enough host addresses. For example, when the number of hosts exceeds 254 in a local area network (LAN), one class C network is not enough and another class C network is needed. In this case, two networks need to be connected. Therefore, more IP addresses are needed.
- Many old networks are based on Layer 2 bridged networks without subnetting. You can use secondary IP addresses to upgrade the network to a routing network. For each subnet, one device is configured with one IP address.
- When two subnets of one network are isolated by another network, in consideration that one subnet cannot

be configured on two or more interfaces of a device, you can connect the isolated subnets by creating a subnet on the isolated network and configuring a secondary address.

Examples

The following example sets the primary IP address to 10.10.10.1, subnet mask to 255.255.255.0, and default gateway to 10.10.10.254, for port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip address 10.10.10.1 255.255.255.0 gateway
10.10.10.254
```

Notifications

Do not set the mask to all ones or zeros (32-bit mask is supported for loopback interfaces). Otherwise, the following notification will be displayed:

```
Invalid IP mask.
```

Do not configure a secondary IP address if a primary IP address is not configured. Otherwise, the following notification will be displayed:

```
Cannot add IP address.
```

Common Errors

- A secondary IP address is configured when no primary IP address is configured.
- Network segments of different IP addresses overlap on the same interface.

Platform Description

N/A

Related Commands

- **ip default-gateway** (IP routing/static routing)

1.3 ip address mix

Function

Run the **ip address mix** command to configure an IP address combination.

Run the **no** form of this command to remove this configuration.

No IP address combination is configured for an interface by default.

Syntax

ip address mix { **dhcp** | *ip-address network-mask* }

no ip address mix { **dhcp** | *ip-address network-mask* }

Parameter Description

dhcp: Obtains a dynamic IP address through the Dynamic Host Configuration Protocol (DHCP).

ip-address: IP address consisting of 32 bits, with 8 bits for each group. The IP address is expressed in dotted decimal notation.

network-mask: Network mask, consisting of 32 bits, with 8 bits for each group. Value **1** indicates the mask bit and **0** indicates the host bit. The network mask is expressed in dotted decimal notation.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

The IP address combination configuration command can be configured only on switch virtual interfaces (SVIs) and MGMT interfaces.

The IP address combination configuration command, static IP configuration command, and dynamic IP configuration command are mutually exclusive. However, the IP address combination configuration command can be used to configure both static IP addresses and DHCP to obtain dynamic IP addresses.

- When the IP address combination configuration command is used to configure a static IP address, if an IP address in the same network segment is already configured, the configuration fails.
- When the IP address combination configuration command is used to configure both a static IP address and a dynamic IP address, if the dynamic IP address obtained through DHCP does not conflict with the network segment of the static IP address, the dynamic IP address is the primary IP address and the static IP address is a secondary IP address. If the dynamic IP address obtained through DHCP conflicts with the network segment of the static IP address, an IP address will be obtained again, during which the static IP address is a primary IP address.

Examples

The following example sets the IP address combination to 192.168.23.110/24 and DHCP on SVI 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# ip address mix dhcp
Hostname(config-if-VLAN 1)# ip address mix 192.168.23.110 255.255.255.0
```

Notifications

N/A

Common Errors

- The IP address combination configuration command is configured after the static or dynamic IP command is configured.
- This command is used on non-SVI interfaces and non-MGMT interfaces.

Platform Description

N/A

Related Commands

- **show ip interface**

1.4 ip address negotiate

Function

Run the **ip address negotiate** command to configure an interface to obtain the IP address through the Point to Point Protocol (PPP) negotiation.

Run the **no** form of this command to remove this configuration.

No interface is configured to obtain an IP address through the PPP negotiation by default.

Syntax

ip address negotiate

no ip address negotiate

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

When **ip address negotiate** is configured on an interface, **peer default ip address** needs to be configured on the peer.

Examples

The following example configures the interface Dialer 1 to obtain an IP address through the PPP negotiation.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface dialer 1
Hostname(config-if-dialer 1)# ip address negotiate
```

Notifications

- **encapsulation ppp** (interfaces/Ethernet interfaces)

1.5 ip broadcast-address

Function

Run the **ip broadcast-address** command to configure a broadcast address for an interface.

Run the **no** form of this command to remove this configuration.

The default IP broadcast address is 255.255.255.255.

Syntax

ip broadcast-address *ip-address*

no ip broadcast-address

Parameter Description

ip-address: Broadcast address of an IP network.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

Generally, the destination address of IP broadcast packets is all ones, which is expressed as 255.255.255.255. Users can define other IP addresses as broadcast addresses to receive the broadcast packets with the address 255.255.255.255 and user-defined broadcast packets.

Examples

The following example sets the broadcast address of port GigabitEthernet 0/1 to 1.1.1.1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip broadcast-address 1.1.1.1
```

Notifications

Do not configure a broadcast address if no primary IP address is configured for an interface. Otherwise, the following notification will be displayed:

```
Cannot set broadcast address. No primary address exist.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

1.6 ip icmp error-interval

Function

Run the **ip icmp error-interval** command to configure the transmission rate of Internet Control Message Protocol (ICMP) error packets.

Run the **no** form of this command to restore the default configuration.

Ten ICMP error packets are transmitted within 100 ms by default.

Syntax

ip icmp error-interval [**df**] *interval* [*bucket-size*]

no ip icmp error-interval [**df**] *interval* [*bucket-size*]

Parameter Description

df: Configures the transmission rate of ICMP destination unreachable packets triggered by the don't fragment (DF) bit in the IP header.

interval: Refresh cycle of a token bucket, in ms. The value range is from 0 to 2147483647, and the default value is **100**. When the value is **0**, the transmission rate of ICMP error packets is not limited.

bucket-size: Number of tokens contained in a token bucket. The value range is from 1 to 200 and the default value is **10**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This function limits the transmission rate of ICMP error packets by using the token bucket algorithm to prevent denial of service (DoS) attacks.

If an IP packet needs to be fragmented but the DF bit in the header is set to 1, the device sends an ICMP destination unreachable message to the source host. This ICMP error packet is used to discover the path MTU. If there are too many other ICMP error packets, the ICMP destination unreachable packet may not be sent. As a result, the path MTU discovery function fails. To avoid this problem, you should limit the transmission rate of ICMP destination unreachable packets and other ICMP error packets respectively.

Since the precision of the timer is 10 milliseconds, you are advised to set the refresh cycle of a token bucket to an integer multiple of 10 milliseconds. If the refresh cycle is set to a value greater than 0 and smaller than 10 milliseconds, the refresh cycle that actually takes effect is 10 milliseconds. For example, if the transmission rate is set to 1 packet per 5 milliseconds, two ICMP errors are actually sent per 10 milliseconds. If the refresh cycle is not an integral multiple of 10 milliseconds, the refresh cycle that actually takes effect is automatically converted into an integral multiple of 10 milliseconds. For example, if the transmission rate is set to 3 packets per 15 milliseconds, two ICMP errors are actually sent per 10 milliseconds.

Examples

The following example sets the transmission rate of ICMP destination unreachable packets triggered by the DF bit in the IP header to 100 packets per second.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip icmp error-interval DF 1000 100
```

The following example sets the transmission rate of other ICMP error packets to 10 packets per second.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip icmp error-interval 1000 10
```

Notifications

Platform Description

N/A

Related Commands

- **ip icmp timestamp**

1.7 ip icmp timestamp

Function

Run the **ip icmp timestamp** command to configure the timestamp query function.

Run the **no** form of this command to remove this configuration.

The timestamp query function is enabled by default.

Syntax

ip icmp timestamp

no ip icmp timestamp

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

RFC792 requires the system to return its current time after receiving an ICMP timestamp query.

To prevent attackers from obtaining the system time through this protocol and attacking some time-based protocols, you can disable the timestamp query function. Then the device directly discards received ICMP timestamp query requests.

Examples

The following example disables the timestamp query function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip icmp timestamp
```

1.8 ip directed-broadcast

Function

Run the **ip directed-broadcast** command to enable the translation of the IP directed broadcast mode to the physical broadcast mode.

Run the **no** form of this command to disable this feature.

The function of translating the IP directed broadcast mode into the physical broadcast mode is disabled by default.

Syntax

ip directed-broadcast [*acl-number*]

no ip directed-broadcast

Parameter Description

acl-number: No. of an access control list (ACL). The value range is from 1 to 199 and 1300 to 2699. After an ACL is defined, conversion is performed only for directed broadcast packets that match the ACL. No ACL is defined by default and translation is performed for all broadcast packets in subnets.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

IP directed broadcast packets refer to the IP packets destined for a broadcast address in an IP subnet. However, the node that generates the packets is not a member of the destination subnet.

After receiving IP directed broadcast packets, the devices not directly connected to the destination subnet forward the broadcast packets in the same way as that for unicast packets. After directed broadcast packets reach the device directly connected to the destination subnet, the device translates the directed broadcast mode into limited broadcast mode (with a destination IP address being 255.255.255.255) and broadcasts the packets to all hosts on the destination subnet at the link layer.

After the function of translating the directed broadcast mode into the physical broadcast mode is enabled on a specified interface, the interface can forward the directed broadcast packets from the directly connected network. This command affects only the final transmission of directed broadcast packets within destination subnet and will not affect the forwarding of other directed broadcast packets.

On an interface, you can also define an ACL to forward desired directed broadcast packets. After an ACL is defined, only data packets that match the ACL are subject to the translation from the directed broadcast mode to physical broadcast mode.

If the **no ip directed-broadcast** command is run on an interface, the device will discard directed broadcast packets received from the directly connected network.

Examples

The following example enables the translation from directed broadcast mode to physical broadcast mode on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip directed-broadcast
```

1.9 ip mask-reply

Function

Run the **ip mask-reply** command to enable the function of sending ICMP mask reply messages.

Run the **no** form of this command to disable this feature.

The function of sending ICMP mask reply messages is enabled by default.

Syntax

ip mask-reply

no ip mask-reply

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

When a network device sends an ICMP mask request message to obtain the mask of a subnet, the network device that receives the ICMP mask request message returns a mask reply message.

Examples

The following example enables the function of sending ICMP mask reply messages on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip mask-reply
```

1.10 ip mtu

Function

Run the **ip mtu** command to configure the maximum transmission unit (MTU) for an IP packet.

Run the **no** form of this command to restore the default configuration.

The default MTU of an IP packet is 1500 bytes.

Syntax

ip mtu *mtu*

no ip mtu

Parameter Description

mtu: MTU of an IP packet, in bytes. The value range is from 68 to 1500.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

If the size of an IP packet exceeds the IP MTU value, the packet will be fragmented. For all devices on the same physical network segment, the IP MTU configured for the interconnected interfaces must be the same.

If the MTU value of an interface is set by running the **mtu** command, the IP MTU value will be automatically kept the same as that of interfaces. However, if the IP MTU value is adjusted, the MTU value of interfaces will not change accordingly.

Examples

The following example sets the IP MTU of port GigabitEthernet 0/1 to 512 bytes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip mtu 512
```

1.11 ip redirects

Function

Run the **ip redirects** command to enable the function of sending ICMP redirection messages.

Run the **no** form of this command to disable this feature.

The function of sending ICMP redirection messages is enabled by default.

Syntax

ip redirects

no ip redirects

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

When a route is less than optimal, a device may send packets through an interface that receives the packets. If the function of sending ICMP redirection messages is enabled, when the device sends the packets from the interface that receives the packets, the device sends an ICMP redirection message to the source to inform that the gateway reachable to the destination address is another device on the same subnet. In this way, the source sends subsequent packets along the optimal path.

Examples

The following example disables the function of sending ICMP redirection messages on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no ip redirects
```

1.12 ip redirect-drop

Function

Run the **ip redirect-drop** command to enable the routed port protection function.

Run the **no** command to disable this feature.

The routed port protection function is disabled by default.

Syntax

ip redirect-drop

no ip redirect-drop

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

The routed port protection function is enabled on an interface to prevent packets from being transmitted through the same interface that receives the packets.

Examples

The following example enables the routed port protection function on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip redirect-drop
```

1.13 ip source-route

Function

Run the **ip source-route** command to enable the function of processing IP source routing information.

Run the **no** form of this command to disable this feature.

The function of processing IP source routing information is enabled by default.

Syntax

ip source-route

no ip source-route

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

When a device receives an IP packet, it checks the options such as the strict source route, loose source route, and record route in the IP packet header. These options are detailed in RFC 791. If the device detects that the packet enables one option, it performs an action accordingly; if the device detects an invalid option, it sends an ICMP parameter error message to the source and then discards the packet.

After the source route option is enabled, you can test the throughput of a specific network or help the packet bypass the failed network. However, this may cause network attacks such as source address spoofing and IP spoofing.

Examples

The following example disables the function of processing IP source routing information.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip source-route
```

1.14 ip ttl

Function

Run the **ip ttl** command to configure a time to live (TTL) value for unicast packets sent by the device.

Run the **no** form of this command to remove this configuration.

The default TTL value of the unicast packets sent by the device is 64.

Syntax

ip ttl *ttl*

no ip ttl

Parameter Description

ttl: TTL value of the unicast packets sent by the device. The value range is from 1 to 255.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

When an IP packet is transmitted from the source address to the destination address through routers, if a TTL value is set, the TTL value decreases by 1 each time the IP packet passes through a router. When the TTL value drops to zero, the router discards the packet. TTL prevents infinite transmission of useless packets and waste of bandwidth.

Examples

The following example sets the TTL of unicast packets sent by the device to 100.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip ttl 100
```

- **show ip interface**

1.15 ip ttl-expires enable

Function

Run the **ip ttl-expires enable** command to enable the device to send a TTL timeout message.

Run the **no** form of this command to disable this feature.

The function of sending TTL timeout messages is enabled by default.

Syntax

ip ttl-expires enable

no ip ttl-expires enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

When forwarding an IP packet whose TTL expires, a device responds to the source end with a TTL timeout error message.

To prevent attacks from other devices after the device is located through traceroute, you can disable the function of sending TTL timeout error messages on the device. When this function is disabled, the device will no longer make a response when receiving a TTL timeout message.

Examples

The following example disables the function of sending TTL timeout messages on the device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip ttl-expires enable
```

1.16 ip unnumbered

Function

Run the **ip unnumbered** command to enable an unnumbered interface to borrow an IP address.

Run the **no** form of this command to remove this configuration.

No unnumbered interface is configured to borrow an IP address by default.

Syntax

ip unnumbered *interface-type interface-number*

no ip unnumbered

Parameter Description

interface-type interface-number: Interface type and interface number.

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

An unnumbered interface is an interface that is enabled with the IP protocol but has no IP address assigned. An unnumbered interface needs to be associated with an interface configured with an IP address for communication. For an IP packet generated by an unnumbered interface, the source IP address of the packet is the IP address of the associated interface. In addition, the routing protocol process decides whether to send a route update packet to the unnumbered interface based on the associated IP address. If you want to use an unnumbered interface, pay attention to the following limitations:

- An Ethernet interface cannot be configured as an unnumbered interface.
- When the Serial Line Internet Protocol (SLIP), High-Level Data Link Control (HDLC), PPP, Link Access Procedure, Balanced (LAPB), or frame relay is configured on a serial interface, the serial interface can be configured as an unnumbered interface. When frame relay is configured, only a point-to-point subinterface can be configured as an unnumbered interface. An X.25 interface cannot be configured as an unnumbered interface.

- The ping tool cannot be used to check whether an unnumbered interface is working properly because an unnumbered interface has no IP address.
- You can monitor the status of an unnumbered interface remotely through the Simple Network Management Protocol (SNMP).
- Network startup cannot be carried out through an unnumbered interface.

Examples

The following example configures the unnumbered interface Virtual-ppp 1 to associate with the interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface virtual-ppp 1
Hostname(config-if-Virtual-ppp 1)# ip unnumbered gigabitethernet 0/1
```

1.17 ip unreachables

Function

Run the **ip unreachables** command to enable the function of sending ICMP destination unreachable messages.

Run the **no** form of this command to disable this feature.

The function of sending ICMP destination unreachable messages is enabled by default.

Syntax

ip unreachables

no ip unreachables

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

2

Usage Guidelines

If a device receives a unicast packet destined for itself and finds that it cannot process the upper layer protocol of the packet, the device returns an ICMP protocol unreachable message to the data source.

If the device does not know a route to forward packets, it also returns an ICMP host unreachable message to the data source.

This command affects all ICMP destination unreachable messages.

Examples

The following example disables the function of sending ICMP destination unreachable messages on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no ip unreachables
```

1.18 show ip interface

Function

Run the **show ip interface** command to display the IP status of an interface.

Syntax

show ip interface [*interface-type interface-number* | **brief**]

Parameter Description

interface-type interface-number: Interface type and interface number.

brief: Displays the basic IP configurations of an L3 interface, including primary/secondary IP addresses and interface status.

Command Modes

All modes except the user EXEC mode

Default Level

1

Usage Guidelines

If an interface can receive and transmit a data packet, the interface is available, and the device software will create a direct route in the routing table. If the interface becomes unavailable, the software will delete the direct route from the routing table.

If an interface is available, the status of the line protocol will be displayed as "up". If only a physical line is available, the status of the interface will be displayed as "up".

The displayed result may be different depending on the interface type because some options are specific to certain interfaces.

Examples

The following example displays the IP status of all interfaces.

```
Hostname> enable
Hostname# show ip interface brief
Interface          IP-Address(Pri)  IP-Address(Sec) Status Protocol
GigabitEthernet 0/10  2.2.2.2/24     3.3.3.3/24    down   down
GigabitEthernet 0/11  no address     no address    down   down
VLAN 1                1.1.1.1/24     no address    down   down
```

Table 1-1 Output Fields of the show ip interface brief Command

Field	Description
Interface	Interface name.
IP-Address(Pri)	Primary IP address and mask of an interface.
IP-Address(Sec)	Secondary IP address and mask of an interface.
Status	Link status of an interface. ● **Up**: Indicates that an interface is up. ● **Down**: Indicates that an interface is down. **administratively down**: A user runs the **shutdown** command to forcibly shut down an interface.
Protocol	IPv4 protocol status of an interface.

The following example displays the IP status of interface VLAN 1.

```
Hostname> enable
Hostname# show ip interface vlan 1
VLAN 1
```

```
  IP interface state is: DOWN
  IP interface type is: BROADCAST
  IP interface MTU is: 1500
  IP address is:
    1.1.1.1/24 (primary)
  IP address negotiate is: OFF
  Forward direct-broadcast is: OFF
  ICMP mask reply is: ON
  Send ICMP redirect is: ON
  Send ICMP unreachabled is: ON
  Proxy ARP is: OFF
ARP packet input number:          0
    Request packet:               0
    Reply packet:                 0
    Unknown packet:               0
TTL invalid packet number:          0
ICMP packet input number:          0
    Echo request:                 0
    Echo reply:                   0
    Unreachable:                  0
    Source quench:                0
    Routing redirect:                0
```

Table 1-2 Output Fields of the show ip interface Command

Field	Description
IP interface state is	Status of a network interface. ● **Down**: Indicates that an interface is unavailable, with the hardware status or line protocol status being down. **Up**: Indicates that an interface is available, with both the hardware status and line protocol status being up.
IP interface type is	Interface type, such as broadcast and point-to-point.
IP interface MTU is	MTU value set for an interface.
IP address is	IP address and mask of an interface.
IP address negotiate is	Whether the IP address of an interface is obtained by negotiation.
Forward direct-broadcast is	Whether an interface forwards directed broadcast packets.
ICMP mask reply is	Whether an interface sends an ICMP mask reply packet.
Send ICMP redirect is	Whether an interface sends an ICMP redirection packet.
Send ICMP unreachable is	Whether an interface sends an ICMP unreachable packet.

Field	Description
Proxy ARP is	Whether proxy ARP is enabled.
ARP packet input number	Total number of ARP packets received on an interface, including: ● **Request packet**: Indicates ARP request packets. ● **Reply packet**: Indicates ARP reply packets. ● **Unknown packet**: Indicates unknown packets.
TTL invalid packet number	Number of invalid TTL packets received on an interface.
ICMP packet input number	Total number of ICMP packets received on an interface, including: ● **Echo request**: Indicates echo request packets. ● **Echo reply**: Indicates echo reply packets. ● **Unreachable**: Indicates unreachable packets. ● **Source quench**: Indicates source quench packets. ● **Routing redirect**: Indicates routing redirection packets.

1.19 show ip packet queue

Function

Run the **show ip packet queue** command to display statistics on sent and received IP packets in the protocol stack.

Syntax

show ip packet queue

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

This command is used to display statistics on sent and received IP packets in the protocol stack.

Examples

The following example displays the statistics on sent and received IP packets in the protocol stack.

```
Hostname> enable
Hostname# show ip packet queue
Receive 31925 packets(fragment=0):
  IP packet receive queue: length 0, max 1542, overflow 0.
  Receive 13 ICMP echo packets, 25 ICMP reply packets .
  Discards:
    Failed to alloc skb: 0.
    Receive queue overflow: 0.
    Unknow protocol drops: 0.
    ICMP rcv drops: 0. for skb check fail.
    ICMP rcv drops: 0. for skb is broadcast.
Sent packets:
  Success: 15644
  Generate 13 and send 8 ICMP reply packets, send 26 ICMP echo packets.
  It records 187 us as max time in ICMP reply process.
Failed to alloc efbuf: 0
  Dropped by EFMP: 0
  NoRoutes: 887
  Get vrf fails: 0
  Cannot assigned address drops: 0
  Failed to encapsulate ethernet head: 0
ICMP error queue: length 0, max 1542, overflow 0.
```

Table 1-3 Output Fields of the show ip packet queue Command

Field	Description
IP packet receive queue	IP packet receiving queue in the protocol stack.
Discards	Packets that are dropped during receiving.
Failed to alloc skb	Number of packets dropped due to the receiving thread allocation failure.
Receive queue overflow	Number of packets that are dropped due to queue overflow.
Unknow protocol drops	Number of packets that are dropped because there is no corresponding protocol available for receiving.
ICMP rcv drops: x. for skb check fail.	The number of packets with ICMP checksum error is x.

Field	Description
ICMP rcv drops: x. for skb is broadcast.	The number of broadcast packets dropped by ICMP is x.
Sent packets	Statistics on sent IP packets.
Success	Number of packets successfully sent by the upper layer.
It records x us as max time in ICMP reply process.	The maximum time in the ICMP reply process is x μs.
Failed to alloc efbuf	Failure count of conversion from the socket buffer into expedited forwarding buffer.
Dropped by EFMP	Statistics on transmission failures.
NoRoutes	Number of packets dropped due to a lack of routes.
Get vrf fails	Count of the failures of getting the VRF instance bound to an interface.
Cannot assigned address drops	Number of packets dropped due to address allocation failures.
Failed to encapsulate ethernet head	Number of packets that fail in the Layer 2 header encapsulation.
ICMP error queue	Receiving queue of ICMP error packets.

1.23 show ip udp

Function

Run the **show ip udp** command to display all IPv4 UDP sockets.

Syntax

show ip udp [**local-port** *port-number* | **peer-port** *port-number*]

Parameter Description

local-port *port-number*: Specifies a local port number.

peer-port *port-number*: Specifies a peer port number.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

This command is used to display all IPv4 UDP sockets. You can know the UDP port that provides services for external devices.

Examples

The following example displays all IPv4 UDP sockets.

```
Hostname> enable
Hostname# show ip udp
Number Local Address        Peer Address         Process name

1.24 show ip udp statistics

Function

Run the **show ip udp statistics** command to display the number of IPv4 UDP sockets.

Syntax

show ip udp statistics

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

N/A

Examples

The following example displays the number of IPv4 UDP sockets.

```
Hostname> enable
Hostname# show ip udp statistics
Number of IPv4 UDP sockets is 4.
```

Table 1-8 Output Fields of the show ip udp Command

Field	Description
Number of IPv4 UDP sockets is x	Total number of IPv4 UDP sockets is x.

1 DHCP Commands

Command	Function
address range	Configure the network segment of a class.
address-manage	Enter the AM rule configuration mode.
bootfile	Configure the boot image file name that a DHCP server assigns to a DHCP client.
class	Configure the class associated with a DHCP address pool.
clear match ip	Clear the matching rules in AM rules.
clear ip dhcp binding	Clear the DHCP IP address binding table.
clear ip dhcp conflict	Clear DHCP address conflict records.
clear ip dhcp history	Clear historical DHCP address records.
clear ip dhcp server detect	Clear rogue DHCP server detection records.
clear ip dhcp server rate	Clear statistics about the processing rate of DHCP server packets on related modules.
clear ip dhcp server statistics	Clear statistics of a DHCP server.
clear ip dhcp relay statistics	Clear statistics of a DHCP relay agent.
client-identifier	Configure a unique DHCP client ID.
client-name	Configure a DHCP client name.
default-router	Configure the default gateway that a DHCP server assigns to a DHCP client.
dns-server	Configure the Domain Name System (DNS) server that a DHCP server assigns to a DHCP client.
domain-name	Configure the domain name that a DHCP server assigns to a DHCP client.
force-no-router	Forcibly disable gateway assignment to a DHCP client.
hardware-address	Configure a hardware address for a DHCP client.
host	Configure the IP address and network mask of a DHCP client.

ip dhcp arp-probe	Enable the ARP entry check function.
ip dhcp class	Configure a class and enter the global class configuration mode.
ip dhcp dns dynamic	Configure preferential assignment of the DNS server address obtained from an external DHCP server to clients when the device works in DHCP client or Point-to-Point Protocol over Ethernet (PPPoE) mode.
ip dhcp excluded-address	Configure excluded addresses that will not be assigned to a client by a DHCP server.
ip dhcp force-send-nak	Enable compulsory NAK reply.
ip dhcp monitor-vrrp-state	Enable Virtual Router Redundancy Protocol (VRRP) monitoring to ensure that a DHCP server processes request packets of DHCP clients only from the VRRP interface in Master state.
ip dhcp ping packets	Configure the number of times that a DHCP server pings a conflicted IP address.
ip dhcp ping timeout	Configure the timeout time of a ping operation for detecting address conflicts.
ip dhcp pool	Create a DHCP address pool and enter the DHCP address pool configuration mode.
ip dhcp refresh arp	Refresh trusted ARP entries.
ip dhcp relay check server-id	Enable the Server-ID check function so that a DHCP relay agent forwards DHCP request packets only to the DHCP server specified by the Server-ID field.
ip dhcp relay force-send-reply-pack	Enable the function of forcing a DHCP relay agent to send a reply packet.
ip dhcp relay information option82	Enable DHCP Option 82.
ip dhcp relay information option82 user-defined circuit-id	Customize the Circuit ID sub-option in DHCP Option 82.
ip dhcp relay information option82 user-defined remote-id	Customize the Remote ID sub-option in DHCP Option 82.
ip dhcp relay information option82 user-defined mac-format	Configure the format of the MAC address string in a sub-option of DHCP Option 82.
ip dhcp relay multiple-giaddr	Enable the function of configuring multiple gateway IP addresses on a DHCP relay agent.

ip dhcp relay suppression	Enable DHCP relay suppression.
ip dhcp relay source	Configure the source address of DHCP relay packets.
ip dhcp save-history-enable	Enable the function of saving historical leases to the database.
ip dhcp server arp-detect	Enable go-offline detection.
ip dhcp server detect	Enable rogue server detection.
ip dhcp smart-relay	Enable the automatic gateway switchover function.
ip dhcp use class	Enable address assignment based on class rules.
ip helper-address	Configure a DHCP server IP address globally or on an interface of a DHCP relay agent.
lease	Configure the lease time of an IP address assigned by a DHCP server to a DHCP client.
lease-threshold	Configure an alarm threshold for a DHCP address pool.
match ip	Configure an AM rule.
match ip default	Configure the default AM rule.
match ip loose	Enable the loose mode for AM rules.
netbios-name-server	Configure the NetBIOS Windows Internet Name Service (WINS) server that a DHCP server assigns to a DHCP client.
netbios-node-type	Configure the NetBIOS node type that a DHCP server assigns to a DHCP client.
network	Configure the primary network segment for dynamic assignment in a DHCP address pool.
next-server	Configure the boot server list that a DHCP server assigns to a DHCP client.
option	Define DHCP server options.
pool-status	Configure whether to enable a DHCP address pool.
relay agent information	Enter the Option 82 matching information configuration mode from the global class configuration mode.
relay-information hex	Configure Option 82 matching information.

remark	Configure identification information of a class.
service dhcp	Enable the DHCP Server or DHCP Relay function.
show ip dhcp binding	Display DHCP address binding information.
show ip dhcp conflict	Display IP address conflict records of a DHCP server.
show ip dhcp database	Display the running status of the database backup function of a DHCP server.
show ip dhcp dns dynamic	Display the DNS server address obtained from an external DHCP server when the device works in PPPoE or DHCP client mode.
show ip dhcp history	Display historical lease records.
show ip dhcp identifier	Display the address pool ID and address usage of a DHCP server.
show ip dhcp pool	Display the address pool status and utilization of a DHCP server.
show ip dhcp relay-statistics	Display statistics of a DHCP relay agent.
show ip dhcp server detect	Display the list of detected rogue servers.
show ip dhcp server statistics	Display statistics of a DHCP server.
show ip dhcp socket	Display the socket index used by a DHCP server.
update arp	Enable a DHCP server to add trusted ARP entries during address assignment.

1.1 address range

Function

Run the **address range** command to configure the network segment of a class.

Run the **no** form of this command to remove this configuration.

The default network segment of a class is the network segment of an address pool.

Syntax

address range *low-ip-address high-ip-address*

no address range

Parameter Description

low-ip-address: Start address of a network segment.

high-ip-address: End address of a network segment.

Command Modes

Address pool class configuration mode

Usage Guidelines

This command is configured on a Dynamic Host Configuration Protocol (DHCP) server.

Each class corresponds to one network segment. Network segments are assigned in ascending order, and the network segments of multiple classes can overlap. If a class is associated with an address pool but no network segment is configured for the class, the default network segment of the class is the same as the network segment of the address pool.

Examples

The following example sets the network segment of class 1 associated with DHCP address pool mypool0 to 172.16.1.1 to 172.16.1.8.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# class class1
Hostname(config-dhcp-pool-class)# address range 172.16.1.1 172.16.1.8
```

- **show ip dhcp pool**

1.2 address-manage

Function

Run the **address-manage** command to enter the AM rule configuration mode.

Syntax

address-manage

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server in super virtual local area network (VLAN) scenarios.

Examples

The following example enters the AM rule configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# address-manage
Hostname(config-address-manage)#
```

Notifications

1.3 bootfile

Function

Run the **bootfile** command to configure the boot image file name that a DHCP server assigns to a DHCP client.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No boot image file name is configured by default.

Syntax

bootfile *file-name*

no bootfile

default bootfile

Parameter Description

file-name: Boot image file name.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

Some DHCP clients need to download the operating system or configuration file in the boot process. A DHCP server must provide the image file name required during boot for the DHCP clients to download the file from the corresponding server, such as the Trivial File Transfer Protocol (TFTP) server. The **next-server** command is used to define the servers for boot image file download.

Examples

The following example sets the boot image file name assigned to DHCP clients with IP addresses from DHCP address pool mypool0 to **router.conf**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# bootfile router.conf
```

1.4 class

Function

Run the **class** command to configure the class associated with a DHCP address pool.

Run the **no** form of this command to remove this configuration.

No class is associated with a DHCP address pool by default.

Syntax

class *class-name*

no class *class-name*

Parameter Description

class-name: Class name. The value is a case-sensitive string of 1 to 64 characters.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

In each DHCP address pool, Option 82 information is used to map address segments and classify them into different classes. A DHCP address pool can be associated with multiple classes. Each class corresponds to a different network segment.

During address assignment, a DHCP server first determines an available address pool based on the network segment of a client. Then, it determines the class of the client based on Option 82, and assigns an IP address from the network segment corresponding to the class. When a request packet matches multiple classes in the address pool, the DHCP server assigns an IP address from the network segments corresponding to the classes based on the class configuration sequence. If the number of assigned IP addresses of a class reaches the limit, the DHCP server assigns an IP address based on the next matching class. Each class corresponds to one network segment. Network segments are assigned in ascending order, and the network segments of multiple classes can overlap. If a class is associated with an address pool but no network segment is configured for the class, the default network segment of the class is the same as the network segment of the address pool.

Examples

The following example associates address pool mypool0 with class 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# class class1
```

1.5 clear match ip

Function

Run the **clear match ip** command to clear the matching rules in AM rules.

Syntax

clear match ip [*interface-type interface-number* | **loose**]

Parameter Description

interface-type interface-number: Interface type and interface number.

loose: Specifies the loose mode for AM rules.

Command Modes

AM rule configuration mode

Default Level

14

Usage Guidelines

If the loose mode is configured, clients that match no AM rule can obtain IP addresses in the way same as the case with no AM rule configured.

Examples

The following example clears all matching rules in AM rules.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# address-manage
Hostname(config-address-manage)# clear match ip
```

Notifications

1.6 clear ip dhcp binding

Function

Run the **clear ip dhcp binding** command to clear the DHCP IP address binding table.

Syntax

clear ip dhcp binding { * | *ip-address* }

Parameter Description

*: Clears all DHCP IP address binding records.

ip-address: IP address for which binding records are to be cleared.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

This command can clear records of automatically bound IP addresses only. To clear records of manually bound IP addresses, run the **no ip dhcp pool** command.

Examples

The following example clears the DHCP binding table of IP address 192.168.12.100.

```
Hostname> enable
Hostname# clear ip dhcp binding 192.168.12.100
```

Notifications

1.7 clear ip dhcp conflict

Function

Run the **clear ip dhcp conflict** command to clear DHCP address conflict records.

Syntax

clear ip dhcp conflict { * | *ip-address* }

Parameter Description

*: Clears all DHCP address conflict records.

ip-address: IP address for which conflict records are to be cleared.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

A DHCP server uses the ping mechanism to detect address conflicts, and a DHCP client uses free Address Resolution Protocol (ARP) packets to detect address conflicts.

Examples

The following example clears all DHCP address conflict records.

```
Hostname> enable
Hostname# clear ip dhcp conflict *
```

Notifications

N/A

Platform Description

1.8 clear ip dhcp history

Function

Run the **clear ip dhcp history** command to clear historical DHCP address records.

Syntax

clear ip dhcp history { * | *mac-address* }

Parameter Description

*: Clears all historical DHCP address records.

mac-address: MAC address for which historical DHCP address records are to be cleared.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

A DHCP server saves information about all assigned IP addresses. This command is used to clear all historical address records.

Examples

The following example clears all historical DHCP address records.

```
Hostname> enable
Hostname# clear ip dhcp history *
```

Notifications

1.9 clear ip dhcp server detect

Function

Run the **clear ip dhcp server detect** command to clear rogue DHCP server detection records.

Syntax

clear ip dhcp server detect { * | *ip-address* }

Parameter Description

*: Clears all rogue DHCP server detection records.

ip-address: IP address for which rogue server detection records are to be cleared.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

A DHCP server saves addresses of detected rogue servers. This command is used to clear rogue server detection records.

Examples

The following example clears all rogue DHCP server detection records.

```
Hostname> enable
Hostname# clear ip dhcp server detect *
```

1.13 client-identifier

Function

Run the **client-identifier** command to configure a unique DHCP client ID.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No DHCP client ID is configured by default.

Syntax

client-identifier [*unique-identifier*]

no client-identifier

default client-identifier

Parameter Description

unique-identifier: ID of a DHCP client, in hexadecimal notation with characters separated by dots (.), for example, 0100.d0f8.2233.b467.6967.6162.6974.4574.6865.726e.6574.302f.31.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

Some DHCP clients use an ID instead of a hardware address to apply for an IP address from a DHCP server. A client ID consists of the media type, Media Access Control (MAC) address, and interface name. For example, if the MAC address is 00d0.f822.33b4 and interface name is GigabitEthernet 0/1, the client identifier is

0100.d0f8.2233.b467.6967.6162.6974.4574.6865.726e.6574.302f.31. **01** indicates Ethernet, and

67.6967.6162.6974.4574.6865.726e.6574.302f.31 is the hexadecimal code of GigabitEthernet 0/1. For details about media codes, see "Address Resolution Protocol Parameters" in RFC 1700.

This command can be used only when IP addresses are statically configured.

Examples

The following example configures the ID of an Ethernet DHCP client whose MAC address is 00d0.f822.33b4.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# client-identifier
0100.d0f8.2233.b467.6967.6162.6974.4574.6865.726e.6574.302f.31
```

1.14 client-name

Function

Run the **client-name** command to configure a DHCP client name.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No DHCP client name is configured by default.

Syntax

client-name *client-name*
no client-name
default client-name

Parameter Description

client-name: Name of a DHCP client. A client name can use any standard American Standard Code for Information Interchange (ASCII) character set. A client name should not contain the domain name. For example, a DHCP client name can be set to **river** but cannot be set to **river.i-net.com.cn**.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

This command can be used only when IP addresses are manually bound. A client name should not contain the domain name.

Examples

The following example sets the name of a client with an IP address from DHCP address pool mypool0 to **river**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# client-name river
```

1.15 default-router

Function

Run the **default-router** command to configure the default gateway that a DHCP server assigns to a DHCP client.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No default gateway is configured by default.

Syntax

default-router *ip-address*&<1-8>

no default-router

default default-router

Parameter Description

ip-address&<1-8>: Gateway IP address of a DHCP client. **<1-8>** indicates that up to eight gateway IP addresses can be entered, and the IP addresses are separated by spaces.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

Generally, a DHCP client needs to obtain the default gateway information from a DHCP server. The DHCP server must specify at least one gateway IP address for a DHCP client, and the gateway IP address must be in the same network segment as the address assigned to the client.

Examples

The following example sets the default gateway for DHCP clients with IP addresses from DHCP address pool mypool0 to **192.168.12.1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# default-router 192.168.12.1
```

Notifications

When an invalid address is configured, the following notification will be displayed:

```
Hostname(dhcp-config)# default-router 225.2.2.2
```

```
% Error: ip address (225.2.2.2) is not valid!
```

Common Errors

- Non-unicast addresses are configured.
- More than eight valid addresses are configured.

1.16 dns-server

Function

Run the **dns-server** command to configure the Domain Name System (DNS) server that a DHCP server assigns to a DHCP client.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No DNS server is configured by default.

Syntax

dns-server *ip-address&*<1-8>

no dns-server

default dns-server

Parameter Description

ip-address&<1-8>: IP address of a DNS server. **<1-8>** indicates that up to eight DNS server IP addresses can be entered, and the IP addresses are separated by spaces.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

When multiple DNS servers are defined, the first defined DNS server has the highest priority. A DHCP client selects the next DNS server only when it fails to communicate with the first defined DNS server.

When the device also serves as a DHCP client, it can transfer the obtained DNS server information to another DHCP client.

Examples

The following example sets the DNS server IP address for DHCP clients with addresses from DHCP address pool mypool0 to **192.168.12.3**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# dns-server 192.168.12.3
```

Notifications

When an invalid address is configured, the following notification will be displayed:

```
Hostname(dhcp-config)# dns-server 225.2.2.2
% Error: ip address (225.2.2.2) is not valid!
```

Common Errors

- Non-unicast addresses are configured.
- More than eight valid addresses are configured.

Function

Run the **domain-name** command to configure the domain name that a DHCP server assigns to a DHCP client.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No domain name is configured by default.

Syntax

domain-name *domain-name*

no domain-name

default domain-name

Parameter Description

domain-name: Domain name of a DHCP client.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

After a DHCP client obtains a specified domain name, it can directly use its host name to access a host whose name contains the same domain name.

Examples

The following example sets the domain name assigned to DHCP clients with addresses from DHCP address pool mypool0 to **i-net.com.cn**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# domain-name i-net.com.cn
```

Notifications

When a domain name is configured for a DHCP client, the following notification will be displayed:

```
Hostname(dhcp-config)# domain-name Hostname.com.cn
```

Run the **default** form of this command to restore the default configuration.

No DHCP client hardware address is configured by default.

Syntax

hardware-address *hardware-address* [*type*]

no hardware-address

default hardware-address

Parameter Description

hardware-address: MAC address of a DHCP client.

type: Hardware platform protocol of a DHCP client. The value can be a character string or number. Character string options include **ethernet** and **ieee802**. Number options include **1** (10M Ethernet) and **6** (IEEE 802). If no option is defined, the default option is **ethernet**.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

This command can be used only when IP addresses are manually bound.

Examples

The following example sets the MAC address of a DHCP client with an address from DHCP address pool mypool0 to **00d0.f838.bf3d**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0

No IP address or network mask is configured for a DHCP client by default.

Syntax

host *ip-address* [*netmask*]

no host

default host

Parameter Description

ip-address: IP address of a DHCP client host.

netmask: Network mask of a DHCP client host.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

If no network mask is defined, the DHCP server uses the natural mask of the IP address as the network mask. The natural mask is 255.0.0.0 for class A addresses, 255.255.0 for class B addresses, and 255.255.255.0 for class C addresses.

This command can be used only when IP addresses are manually bound.

Examples

The following example sets the IP address and network mask of a DHCP client with an address from DHCP address pool mypool0 to **192.168.12.91** and **255.255.255.240**, respectively.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# host 192.168.12.91 255.255.255.240
```

Notifications

When an invalid address is configured, the following notification will be displayed:

```
Hostname(dhcp-config)# host 225.2.2.2 255.0.0.0
% Error: ip address 225.2.2.2 is not valid!
```

Common Errors

- An invalid address is configured.

1.21 ip dhcp arp-probe

Function

Run the **ip dhcp arp-probe** command to enable the ARP entry check function.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The ARP entry check function is disabled by default.

Syntax

ip dhcp arp-probe

no ip dhcp arp-probe

default ip dhcp arp-probe

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The ARP entry check function can be used with the ping mechanism to detect IP address conflicts and prevent IP address conflicts with clients configured with static IP addresses. If a client configured with a static IP address exists and L2 isolation is configured in an environment and the ping mechanism for IP address conflict detection becomes invalid (for example, a firewall is enabled on the client), this IP address may be assigned to another client that dynamically applies for an address, resulting in an IP address conflict.

The ARP entry check function can be enabled only in the preceding scenario. If ARP attacks exist, this function cannot be enabled. Otherwise, the DHCP address assignment service is affected. As a result, it takes a long time for a client to apply for an IP address or a client cannot apply for an IP address.

Examples

The following example enables the ARP entry check function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp arp-probe
```

1.22 ip dhcp class

Function

Run the **ip dhcp class** command to configure a class and enter the global class configuration mode.

Run the **no** form of this command to remove this configuration.

No class is configured by default.

Syntax

ip dhcp class *class-name*

no ip dhcp class *class-name*

Parameter Description

class-name: Class name. The value is a case-sensitive string of 1 to 64 characters.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

After this command is executed, the system enters the global class configuration mode. In this configuration mode, you can configure Option 82 and the identifier of a class.

Examples

The following example configures a global class named **myclass** and enters the global class configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp class myclass
Hostname(config-dhcp-class)#
```

1.23 ip dhcp dns dynamic

Function

Run the **ip dhcp dns dynamic** command to configure preferential assignment of the DNS server address obtained from an external DHCP server to clients when the device works in DHCP client or Point-to-Point Protocol over Ethernet (PPPoE) mode.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

Preferential assignment of the DNS server address obtained from an external DHCP server is not configured by default.

Syntax

ip dhcp dns dynamic

no ip dhcp dns dynamic

default ip dhcp dns dynamic

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

When the device works in PPPoE or DHCP client mode, a DNS server address can be automatically obtained from an external DHCP server and be configured on the DHCP server of the local device, so that users do not need to perform DNS configuration. When the device serves as a DHCP server, it preferentially assigns clients with the DNS server address obtained from the external DHCP server.

Examples

The following example preferentially assigns the DNS server address obtained from an external DHCP server to clients when the device works in PPPoE or DHCP client mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp dns dynamic
```

Notifications

N/A

Common Errors

When the device works in PPPoE or DHCP client mode, it does not obtain a DNS server address from an external DHCP server.

Platform Description

Related Commands

N/A

1.24 ip dhcp excluded-address

Function

Run the **ip dhcp excluded-address** command to configure excluded addresses that will not be assigned to a client by a DHCP server.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No excluded IP address is configured by default. A DHCP server assigns all addresses from an IP address pool to DHCP clients.

Syntax

ip dhcp excluded-address *low-ip-address* [*high-ip-address*]

no ip dhcp excluded-address *low-ip-address* [*high-ip-address*]

default ip dhcp excluded-address *low-ip-address* [*high-ip-address*]

Parameter Description

low-ip-address: Excluded IP address or the start IP address of an excluded IP address range.

high-ip-address: End address of an excluded IP address range. The default value is the address defined by the *low-ip-address* parameter.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

If no excluded IP address is configured, a DHCP server assigns all IP addresses from an IP address pool to DHCP clients. This command is used to reserve some IP addresses for specific hosts and prevent these addresses being assigned to other DHCP clients. Excluded IP addresses help a DHCP server shorten the time for detecting IP address conflicts during address assignment.

Examples

The following example sets an excluded address range to 192.168.12.100 to 192.168.12.150.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp excluded-address 192.168.12.100 192.168.12.150
```

Notifications

When an invalid excluded address is configured, the following notification will be displayed:

```
Hostname(config)# ip dh excluded-address 225.1.1.1
% Error: Ip address 225.1.1.1 or 225.1.1.1 is not valid!
```

When a non-existent excluded address is deleted, the following notification will be displayed:

```
Hostname(config)# no ip dhcp excluded-address 20.1.1.1
% Range [20.1.1.1, 20.1.1.1] is not in the database.
```

Common Errors

- An invalid excluded address is configured.
- A non-existent excluded address is deleted.

1.25 ip dhcp force-send-nak

Function

Run the **ip dhcp force-send-nak** command to enable compulsory NAK reply.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

Compulsory NAK reply is enabled by default.

Syntax

ip dhcp force-send-nak

no ip dhcp force-send-nak

default ip dhcp force-send-nak

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

A DHCP client preferentially applies for the previously used IP address after a restart. The DHCP client sends a DHCP REQUEST packet to renew the IP address lease. If the IP address is unavailable, the DHCP server sends an NAK packet for the client to re-send a DHCP DISCOVER packet to apply for a new IP address. If the corresponding IP address lease record does not exist on the DHCP server, the client sends DHCP REQUEST packet repeatedly until the request times out. In wireless applications, compulsory NAK reply is provided for clients to re-send DHCP DISCOVER packets to apply for IP addresses quickly.

Examples

The following example disables compulsory NAK reply.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip dhcp force-send-nak
```

Common Errors

1.26 ip dhcp monitor-vrrp-state

Function

Run the **ip dhcp monitor-vrrp-state** command to enable Virtual Router Redundancy Protocol (VRRP) monitoring to ensure that a DHCP server processes request packets of DHCP clients only from the VRRP interface in Master state.

Run the **no** form of this command to disable this feature. In this case, a DHCP server processes all DHCP request packets.

Run the **default** form of this command to restore the default configuration.

VRRP monitoring is disabled for an interface by default.

Syntax

ip dhcp monitor-vrrp-state

no ip dhcp monitor-vrrp-state

default ip dhcp monitor-vrrp-state

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

This command can be configured only on L3 interfaces.

For an interface configured with a VRRP address and VRRP monitoring, a DHCP server processes request packets of DHCP clients only from the interface in Master state and discards other packets. If no VRRP address is configured, the DHCP server does not monitor the VRRP status and processes all DHCP request packets.

Examples

The following example enables VRRP monitoring to ensure that a DHCP server processes request packets of DHCP clients only from the VRRP interface in Master state.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# ip dhcp monitor-vrrp-state
```

Notifications

When VRRP monitoring is configured on an L2 interface, the following notification will be displayed:

```
Hostname(config-if-GigabitEthernet 0/2)# ip dhcp monitor-vrrp-state
% Invalid input detected at '^' marker.
```

Common Errors

- VRRP monitoring is configured on an L2 interface.

1.27 ip dhcp ping packets

Function

Run the **ip dhcp ping packets** command to configure the number of times that a DHCP server pings a conflicted IP address.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

A DHCP server pings a conflicted IP address two times by default.

Syntax

ip dhcp ping packets [*ping-times*]

no ip dhcp ping packets

default ip dhcp ping packets

Parameter Description

Ping-times: Number of times that a DHCP server pings a conflicted IP address. The value range is from 0 to 10. The value **0** indicates that the ping operation is disabled.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

When a DHCP server attempts to assign an IP address from a DHCP address pool, it uses the ping mechanism to check whether the IP address is occupied by another host. If yes, the DHCP server records the IP address. If not, the DHCP server assigns the IP address to a DHCP client.

Examples

The following example sets the number of times that a DHCP server pings a conflicted IP address to **3**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp ping packets 3
```

1.28 ip dhcp ping timeout

Function

Run the **ip dhcp ping timeout** command to configure the timeout time of a ping operation for detecting address conflicts.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

The default timeout time of a ping operation for detecting address conflicts is 500 ms.

Syntax

ip dhcp ping timeout *time*

no ip dhcp ping timeout

default ip dhcp ping timeout

Parameter Description

time: Duration that a DHCP server waits for a ping operation response, in milliseconds. The value range is from 100 to 10000.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

Examples

The following example sets the timeout time of a ping operation for detecting address conflicts to 600 ms.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp ping timeout 600
```

1.29 ip dhcp pool

Function

Run the **ip dhcp pool** command to create a DHCP address pool and enter the DHCP address pool configuration mode.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No DHCP address pool is configured by default.

Syntax

ip dhcp pool *pool-name*

no ip dhcp pool *pool-name*

default ip dhcp pool *pool-name*

Parameter Description

pool-name: Address pool name.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

This command is used to enter the DHCP address pool configuration mode. In DHCP address pool configuration mode, you can configure the IP address range, DNS server address, and default gateway.

Examples

The following example creates a DHCP address pool named **mypool0** and enters the DHCP address pool configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)#
```

1.31 ip dhcp relay check server-id

Function

Run the **ip dhcp relay check server-id** command to enable the **Server-ID** check function so that a DHCP relay agent forwards DHCP request packets only to the DHCP server specified by the **Server-ID** field.

Run the **no** form of this command to disable this feature.

The **Server-ID** check function is disabled by default.

Syntax

ip dhcp relay check server-id

no ip dhcp relay check server-id

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP relay agent.

In a DHCP relay application environment, multiple DHCP servers are configured for each network device to provide server backup, thereby ensuring normal network operation. When a DHCP client has selected a DHCP server to send a DHCP REQUEST packet, a **Server-ID** option is carried in the packet. To reduce server load in specific environments, enable the **Server-ID** check function on the DHCP relay agent, so as to send the DHCP REQUEST packet to a DHCP server specified in this option.

In this case, the DHCP relay agent sends DHCP request packets only to the specified server. If this function is not configured, the DHCP relay agent sends DHCP request packets to all configured DHCP servers.

Examples

The following example enables the **Server-ID** check function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp relay check server-id
```

The following example disables the **Server-ID** check function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip dhcp relay check server-id
```

1.32 ip dhcp relay force-send-reply-pack

Function

Run the **ip dhcp relay force-send-reply-pack** command to enable the function of forcing a DHCP relay agent to send a reply packet.

Run the **no** form of this command to disable this feature.

The function of forcing a DHCP relay agent to send a reply packet is disabled by default.

Syntax

ip dhcp relay force-send-reply-pack

no ip dhcp relay force-send-reply-pack

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP relay agent.

After the function of forcing a DHCP relay agent to send a reply packet is enabled, a DHCP relay agent forcibly specifies a gateway interface to send a reply packet if it fails to find a MAC address egress. When this command is not configured, the DHCP relay agent discards packets if it fails to find a MAC address egress.

Examples

The following example enables the function of forcing a DHCP relay agent to send a reply packet.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp relay force-send-reply-pack
```

1.33 ip dhcp relay information option82

Function

Run the **ip dhcp relay information option82** command to enable DHCP Option 82.

Run the **no** form of this command to disable this feature.

DHCP Option 82 is disabled by default.

Syntax

ip dhcp relay information option82

no ip dhcp relay information option82

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP relay agent.

When this function is enabled and the device serves as a DHCP relay agent, the device adds Option 82 to a DHCP request packet to be forwarded to a DHCP server. The encapsulation format of **Circuit ID** is "slot(1):port(1):dev_name(<=64)" and that of Remote ID is "user_mac(6):iftype(1):port_name(<=64):vid(2)".

Examples

The following example enables DHCP Option 82.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp relay information option82
```

1.34 ip dhcp relay information option82 user-defined circuit-id

Function

Run the **ip dhcp relay information option82 user-defined circuit-id** command to customize the **Circuit ID** sub-option in DHCP Option 82.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

Customization of **Circuit ID** in DHCP Option 82 is disabled by default.

Syntax

ip dhcp relay information option82 user-defined circuit-id *circuit-id-text*

no ip dhcp relay information option82 user-defined circuit-id

default ip dhcp relay information option82 user-defined circuit-id

Parameter Description

circuit-id-text: User-defined **Circuit ID** content. The value is a case-sensitive string of 1 to 255 characters.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When DHCP Option 82 is enabled in user-defined mode, this command is used to customize **Circuit ID** in Option 82.

When defining the format of Option 82, you can use the keywords described in the following table. The format string behind the keywords can be set to the hexadecimal encapsulation format, ASCII encapsulation format, or hexadecimal and ASCII hybrid encapsulation format.

Table 1-1 Circuit ID Format String

Keyword	Name	Format			Description
		ASCII	Hexadecimal	Number of Occupied Hexadecimal Bytes	
hostname	Host name	√	×	-	Example: Hostname
devicename	Device model	√	×	-	Example: S5750C-48GT4XS-H
portname	Interface name	√	×	-	Example: GigabitEthernet 0/1
portsname	Interface name abbreviation	√	×	-	Example: Te0/2.5
porttype	Interface type	√	√	1 B	Example: ● When ASCII is used to represent 1, the padding value is **0x31**. ● When hexadecimal is used to represent 1, the padding value is **0x01**.
sysmac	Interface MAC address	√	√	6 B	Example: ● ASCII: 2222.2222.2222 ● Hexadecimal: 0x22 0x22 0x22 0x22 0x22 0x22
slot	Slot ID	√	√	1 B	Example: ● When ASCII is used to represent 0, the padding value is **0x30**. ● When hexadecimal is used to represent 0, he padding value is **0x00**.

Keyword	Name	Format			Description
		ASCII	Hexadecimal	Number of Occupied Hexadecimal Bytes	
port	Port number	√	√	1 B	Example: ● When ASCII is used to represent 2, the padding value is **0x32**. ● When hexadecimal is used to represent 2, the padding value is **0x02**.
subport	Sub-port number	√	√	2 B	Example: ● When ASCII is used to represent 5, the padding value is **0x35**. ● When hexadecimal is used to represent 5, the padding value is **0x0005**.
svlan	Outer VLAN	√	√	2 B	Example: ● When ASCII is used to represent 5, the padding value is **0x35**. ● When hexadecimal is used to represent 5, the padding value is **0x0005**.
cvlan	Inner VLAN	√	√	2 B	Example: ● When ASCII is used to represent 5, the padding value is **0x35**. ● When hexadecimal is

Keyword	Name	Format			Description
		ASCII	Hexadecimal	Number of Occupied Hexadecimal Bytes	
					used to represent 5, the padding value is **0x0005**.
length	Length of content following the length keyword	×	√	1 B	Example: When hexadecimal is used to represent 5, the padding value is **0x05**.

Note: √ indicates that a keyword supports the corresponding encapsulation format, × indicates that a keyword does not support the corresponding encapsulation format, and - indicates meaningless.

Special characters are described as follows:

- % followed by keywords defined above indicates the format of the keywords. When the percent symbol (%) needs to be contained in the input string, enter %%, which will be converted into a single common percent symbol (%) during parsing.
- The backslash (\) indicates an escape character, and the special character following the backslash (\) indicates the special character itself. For example, \\ indicates the backslash (\) and \" indicates the quotation mark (").
- The double quotation marks ("") indicate that data enclosed is encapsulated in string format. Data without or outside the double quotation marks is encapsulated in hexadecimal format.
- Strings in ASCII format can contain 0 to 9, a to z, A to Z, and the following symbols: !, @, #, $, %, ^, &, *, (), _, +, |, -, =, \, [], {}, ;, :, '", /, ?, ., ,, <>, `.
- For characters %\" in ASCII format, add the prefix (\) in front of the characters. In ASCII format, only keywords and several specific symbols are converted and other data remains unchanged.
- If there is no escape character '\' in front of '%' in configuration commands, the key value in the information field must be added behind. Otherwise, the configuration is incorrect and an error is prompted. If the character '\' needs to be configured, enter "\\".
- For strings in hexadecimal format, digits are encapsulated into Option 82 directly in hexadecimal notation. When hexadecimal data is used, strings begin with 0X or 0x. When the number of valid characters in the hexadecimal data is an odd, add one 0 to the frontmost. When decimal data is used, the data ranges from 0 to 255 and occupies one byte. You can use spaces to enter multiple pieces of decimal data consecutively.
- Blank characters in hexadecimal notation are ignored.
- If the user-defined mode is configured but no corresponding user-defined format is configured, each sub-option of Option 82 is padded in standard mode.

Examples

The following example sets the content of **Circuit ID** in Option 82 to *host name-interface name*.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp relay information option82 user-defined circuit-id
"%hostname-%portname"
```

Notifications

N/A

Common Errors

The user-defined string does not meet configuration requirements.

- The double quotation marks ("") indicate that data enclosed is encapsulated in string format. Data without or outside the double quotation marks is encapsulated in hexadecimal format.
- Strings in ASCII format can contain 0 to 9, a to z, A to Z, and the following symbols: !, @, #, $, %, ^, &, *, (), _, +, |, -, =, \, [], {}, ;, :, '", /, ?, ., ,, <>, `.
- For characters %\" in ASCII format, add the prefix (\) in front of the characters. In ASCII format, only keywords and several specific symbols are converted and other data remains unchanged.
- If there is no escape character '%' in front of '%' in configuration commands, the key value in the information field must be added behind. Otherwise, the configuration is incorrect and an error is prompted. If the character '\' needs to be configured, enter "\\".
- For strings in hexadecimal format, digits are encapsulated into Option 82 directly in hexadecimal notation. When hexadecimal data is used, strings begin with 0X or 0x. When the number of valid characters in the hexadecimal data is an odd, add one 0 to the frontmost. When decimal data is used, the data ranges from 0 to 255 and occupies one byte. You can use spaces to enter multiple pieces of decimal data consecutively.
- Blank characters in hexadecimal notation are ignored.
- If the user-defined mode is configured but no corresponding user-defined format is configured, each sub-option of Option 82 is padded in standard mode.

Examples

The following example sets the content of **Remote ID** in Option 82 to *host name-interface name*.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp relay information option82 user-defined remote-id
"%hostname-%portname"
```

Notifications

N/A

Common Errors

The user-defined string does not meet configuration requirements.

1.36 ip dhcp relay information option82 user-defined mac-format

Function

Run the **ip dhcp relay information option82 user-defined mac-format** command to configure the format of the MAC address string in a sub-option of DHCP Option 82.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

The default MAC address format is H.H.H.

Syntax

ip dhcp relay information option82 user-defined mac-format *mac-format-type*

no ip dhcp relay information option82 user-defined mac-format

default ip dhcp relay information option82 user-defined mac-format

Parameter Description

mac-format-type: Format of the MAC address string in user-defined mode. The value range is from 0 to 2, and the default value is **0**. **0** indicates the H.H.H format, **1** indicates the H-H-H format, and **2** indicates the H:H:H:H:H:H format.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When DHCP Option 82 is enabled in user-defined mode, this command is used to convert keyword **%sysmac** in ASCII encapsulation format in a sub-option of Option 82 to a MAC address string in corresponding format.

Examples

The following example sets the format of the MAC address string in a sub-option of DHCP Option 82 to H-H-H.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp relay information option82 user-defined mac-format 1
```

1.37 ip dhcp relay multiple-giaddr

Function

Run the **ip dhcp relay multiple-giaddr** command to enable the function of configuring multiple gateway IP addresses on a DHCP relay agent.

Run the **no** form of this command to disable this feature.

The function of configuring multiple gateway IP addresses on a DHCP relay agent is disabled by default.

Syntax

ip dhcp relay multiple-giaddr

no ip dhcp relay multiple-giaddr

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP relay agent.

After the function of configuring multiple gateway IP addresses is enabled, a DHCP relay agent can use multiple interface IP addresses to send address applications to a DHCP server. Generally, the primary IP address is used as the gateway IP address, and the DHCP server assigns a network segment based on the gateway IP address. When a client fails to apply for an IP address over the gateway by using the primary IP address, it applies for an IP address over the gateway by using a secondary IP address.

After the automatic gateway switchover function is enabled, the DHCP relay agent adds another address to the **giaddr** field if it does to receive a reply packet for three consecutive DISCOVER packets.

Examples

The following example enables the function of configuring multiple gateway IP addresses on a DHCP relay agent.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp relay multiple-giaddr
```

1.38 ip dhcp relay suppression

Function

Run the **ip dhcp relay suppression** command to enable DHCP relay suppression.

Run the **no** form of this command to disable this feature.

DHCP relay suppression is disabled on all interfaces by default.

Syntax

no ip dhcp relay suppression

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP relay agent.

After you configure this command on an interface, DHCP request packets received over the interface are filtered out, but the other DHCP requests are forwarded.

Examples

The following example enables DHCP relay suppression on interface GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip dhcp relay suppression
```

1.39 ip dhcp relay source

Function

Run the **ip dhcp relay source** command to configure the source address of DHCP relay packets.

Run the **no** form of this command to remove this configuration.

No source address is configured for DHCP relay packets by default.

Syntax

ip dhcp relay source *ip-address*

no ip dhcp relay source

Parameter Description

ip-address: Source address of DHCP relay packets.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP relay agent.

In some networks, multiple DHCP relay agents use the same interface IP address. In this case, you need to run this command on the DHCP relay agent to add another interface IP address to the source address field and **Giaddr** field of DHCP relay packets. Only one source IP address can be specified for DHCP relay packets on an interface.

Examples

The following example configures the source address of DHCP relay packets on GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip dhcp relay source 1.1.1.1
```

1.40 ip dhcp save-history-enable

Function

Run the **ip dhcp save-history-enable** command to enable the function of saving historical leases to the database.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The function of saving historical leases to the database is disabled by default.

Syntax

ip dhcp save-history-enable

no ip dhcp save-history-enable

default ip dhcp save-history-enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

N/A

Usage Guidelines

This command is configured on a DHCP server.

With this function enabled, after a DHCP server assigns an IP address to a client and the client goes offline, the DHCP server saves the IP address lease of the client to the database. When the client goes online again, the DHCP server assigns this address to the client again. Historical leases are saved when a DHCP process restarts or the device performs a hot backup switchover.

Examples

The following example enables the function of saving historical leases to the database.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp save-history-enable
```

Function

Run the **ip dhcp server arp-detect** command to enable go-offline detection.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

Go-offline detection is disabled by default.

Syntax

ip dhcp server arp-detect

no ip dhcp server arp-detect

default ip dhcp server arp-detect

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

Go-offline detection enables a DHCP server to check whether a client is offline. If a user goes offline and does not go online again within a period of time, the DHCP server reclaims the IP address assigned to the user.

Examples

The following example enables go-offline detection.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp server arp-detect
```

1.43 ip dhcp smart-relay

Function

Run the **ip dhcp smart-relay** command to enable the automatic gateway switchover function.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The automatic gateway switchover function is disabled by default.

Syntax

ip dhcp smart-relay

no ip dhcp smart-relay

default ip dhcp smart-relay

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP relay agent.

After the function of configuring multiple gateway IP addresses on a DHCP relay agent is enabled, the primary IP address is used as the gateway IP address and the DHCP server assigns a network segment based on the gateway IP address. When a client fails to apply for an IP address over the gateway by using the primary IP address, it applies for an IP address over the gateway by using a secondary IP address after 24s.

After the automatic gateway switchover function is enabled, the DHCP relay agent adds another address to the **giaddr** field if it does not receive a reply packet for three consecutive DISCOVER packets. The relay gateway address switching sequence starts from the primary IP address to secondary IP addresses (secondary IP addresses are traversed based on their configuration sequence) until an IP address is obtained successfully.

Examples

The following example enables the automatic gateway switchover function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp smart-relay
```

1.45 ip helper-address

Function

Run the **ip helper-address** command to configure a DHCP server IP address globally or on an interface of a DHCP relay agent.

Run the **no** form of this command to remove this configuration.

No DHCP server IP address is configured for a DHCP relay agent by default.

Syntax

ip helper-address { **cycle-mode** | [**vrf** *vrf-name*] *ip-address* }

no ip helper-address { **cycle-mode** | [**vrf** *vrf-name*] *ip-address* }

Parameter Description

cycle-mode: Forwards DHCP request packets to all DHCP servers.

vrf *vrf-name*: Specifies the virtual routing and forwarding (VRF) instance to which the specified DHCP server belongs. The default value is the VRF instance of the interface over which packets are sent.

ip-address: DHCP server IP address.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP relay agent.

After a DHCP server IP address is configured, the DHCP relay agent forwards DHCP request packets to a DHCP server and DHCP reply packets to DHCP clients.

The DHCP server address can be globally configured or configured on an L3 interface. A maximum of 20 DHCP server addresses can be globally configured or configured on each L3 interface. When an interface receives a DHCP request packet, the DHCP server list on the interface prevails over that configured globally. If the interface is not configured with the DHCP server list, the global DHCP server list takes effect.

A DHCP relay agent supports the VRF-based relay function. To configure the function, add VRF parameters before the server address.

In global configuration mode, the **cycle-mode** parameter of the DHCP relay agent can be configured. If **cycle-mode** is configured, the DHCP relay agent forwards packets from DHCP clients to all DHCP servers configured on L3 interfaces or VRFs. If **cycle-mode** is not configured, the DHCP relay agent forwards packets from DHCP clients only to the first DHCP server meeting the preceding rules. **cycle-mode** is configured only in global configuration mode but takes effect in both global and interface configuration modes. **cycle-mode** is configured by default.

Examples

The following example sets the DHCP server IP address on VLAN 1 to **192.168.11.1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# ip helper-address 192.168.11.1
```

The following example sets the global DHCP server IP address to **192.168.100.1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip helper-address 192.168.100.1
```

The following example enables a DHCP relay agent to forward DHCP request packets to all DHCP servers.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# ip helper-address cycle-mode
```

Notifications

N/A

Common Errors

- The **ip helper-address** command is configured on an L2 interface.
- The DHCP Relay function is disabled when the **ip helper-address** command is configured.
- A DHCP client is configured to obtain an IP address through a DHCP relay agent and directly from a DHCP server. As a result, the DHCP client fails to obtain a correct IP address.

1.46 lease

Function

Run the **lease** command to configure the lease time of an IP address assigned by a DHCP server to a DHCP client.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

The default lease time is permanent for addresses in a static address pool and one day for addresses in other address pools.

Syntax

lease { *days* [*hours*] [*minutes*] | **infinite** }

no lease

default lease

Parameter Description

days: Lease time, in days. The value range is from 0 to 365. The default value is **1**.

hours: Lease time, in hours. You must define days before hours. The value range is from 0 to 23. The default value is **0**.

minutes: Lease time, in minutes. You must define days and hours before minutes. The value range is from 0 to 59. The default value is **0**.

infinite: Specifies a permanent lease.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

When a lease time is to expire, a DHCP client sends a request for lease renewal. Generally, a DHCP server allows lease renewal and the IP address remains unchanged. The lease time ranges from 1 minute to 365 days, 23 hours, and 59 minutes.

Examples

The following example sets the lease time of IP addresses assigned to DHCP clients from address pool mypool0 to 1 hour.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# lease 0 1
```

The following example sets the lease time of IP addresses assigned to DHCP clients from address pool mypool0 to 1 minute.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# lease 0 0 1
```

1.47 lease-threshold

Function

Run the **lease-threshold** command to configure an alarm threshold for a DHCP address pool.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

The default alarm threshold is 90% for the address pool.

Syntax

lease-threshold *threshold-percentage*

no lease-threshold

default lease-threshold

Parameter Description

threshold-percentage: Alarm threshold of an address pool, in percentage (%). The value range is from 60 to 100.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

When the IP address usage of an address pool reaches the threshold, a DHCP server generates syslog alarms. The IP address usage is the ratio of assigned IP addresses to available IP addresses in an address pool. If the number of assigned IP addresses exceeds the alarm threshold, one alarm is generated every 5 minutes.

Examples

The following example sets the alarm threshold of DHCP address pool mypool0 to **80%**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# lease-threshold 80
```

1.48 match ip

Function

Run the **match ip** command to configure an AM rule.

Run the **no** form of this command to remove this configuration.

No AM rule is configured by default.

Syntax

match ip *ip-address mask* [*interface-type interface-number*] [**add** | **remove**] **vlan** *vlan-id*

no match ip *ip-address mask* [*interface-type interface-number*] [**add** | **remove**] **vlan** *vlan-id*

clear match ip [*interface-type interface-number*]

Parameter Description

ip-address: Network address.

mask: Address mask.

interface-type interface-number: Interface type and interface number.

add: Adds a specified VLAN.

remove: Removes a specified VLAN.

vlan *vlan-id*: Specifies the index of a VLAN.

Command Modes

AM rule configuration mode

Default Level

14

Usage Guidelines

In super VLAN scenarios, a client that meets requirements of client matching rule in a DHCP static address pool is assigned with an address from this static address pool regardless of a sub VLAN of the client. During address assignment based on AM rules, an address is assigned to the client regardless of the sub VLAN or DHCP server port from which DHCP requests are received, as long as the assigned address takes effect in the corresponding VLAN.

AM rules take effect only for static address assignment and are invalid to dynamic address assignment.

Examples

The following example configures an AM rule: For DHCP clients from GigabitEthernet 0/1 in VLAN 10, the network number is set to **192.168.11.0** and the mask is set to **255.255.255.0**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# address-manage
Hostname(config-address-manage)# match ip 192.168.11.0 255.255.255.0 gigabitethernet
0/1 vlan 10
```

1.49 match ip default

Function

Run the **match ip default** command to configure the default AM rule.

Run the **no** form of this command to remove this configuration.

No default AM rule is configured by default.

Syntax

match ip default *ip-address mask*

no match ip default *ip-address mask*

Parameter Description

ip-address: Network address.

mask: Address mask.

Command Modes

AM rule configuration mode

Default Level

14

Usage Guidelines

After this command is configured, the DHCP server assigns an IP address from the default range to a DHCP client if no AM matching rule is configured on the interface over which the DHCP request is sent. If this command is not configured, IP addresses are assigned through the regular process.

Examples

The following example configures the default AM rule: the network number is 192.168.12.0, and the mask is 255.255.255.0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# address-manage
Hostname(config-address-manage)# match ip default 192.168.12.0 255.255.255.0
```

1.50 match ip loose

Function

Run the **match ip loose** command to enable the loose mode for AM rules.

Run the **no** form of this command to disable this feature.

The loose mode of AM rules is disabled by default.

Syntax

match ip loose

no match ip loose

Parameter Description

N/A

Command Modes

AM rule configuration mode

Default Level

14

Usage Guidelines

After AM rules based on VLAN or VLAN + port are configured, IP addresses within a specified range are assigned to clients that match these rules. Clients that fail to match the rules cannot obtain IP addresses. You can run the **match ip loose** command to enable the loose mode for AM rules. In this case, clients that match no AM rule can obtain IP addresses in the way same as the case with no AM rule configured.

Examples

The following example enables the loose mode for AM rules.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# address-manage
Hostname(config-address-manage)# match ip loose
```

1.51 netbios-name-server

Function

Run the **netbios-name-server** command to configure the NetBIOS Windows Internet Name Service (WINS) server that a DHCP server assigns to a DHCP client.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No NetBIOS WINS server is configured by default.

Syntax

netbios-name-server *ip-address&*<1-8>

no netbios-name-server

default netbios-name-server

Parameter Description

ip-address&<1-8>: IP address of a NetBIOS WINS server. **<1-8>** indicates that up to eight NetBIOS WINS server IP addresses can be entered, and the IP addresses are separated by spaces.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

When multiple NetBIOS WINS servers are defined, the first defined NetBIOS WINS server has the highest priority. A DHCP client selects the next NetBIOS WINS server only when it fails to communicate with the first defined NetBIOS WINS server.

Examples

The following example sets the NetBIOS WINS server IP address assigned to DHCP clients with addresses from DHCP address pool mypool0 to **192.168.12.3**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# netbios-name-server 192.168.12.3
```

Notifications

When an invalid address is configured, the following notification will be displayed:

```
Hostname(dhcp-config)# netbios-name-server 225.2.2.2
%Error: ip address (225.2.2.2) is not valid!
```

Common Errors

- Non-unicast addresses are configured.
- More than eight valid addresses are configured.

1.52 netbios-node-type

Function

Run the **netbios-node-type** command to configure the NetBIOS node type that a DHCP server assigns to a DHCP client.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No NetBIOS node type is configured by default.

Syntax

netbios-node-type *type*

no netbios-node-type

default netbios-node-type

Parameter Description

Type: NetBIOS node type, which can be defined as:

- A hexadecimal number, ranging from 0 to FF. Only the following values are available:
  - **1**: Broadcast node
  - **2**: Peer-to-peer node
  - **4**: Mixed node
  - **8**: Hybrid node
- A character string:
  - **b-node**: Broadcast node
  - **p-node**: Peer-to-peer node
  - **m-node**: Mixed node
  - **h-node**: Hybrid node

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

NetBIOS node types for Microsoft DHCP clients include the following:

- Broadcast: Parses NetBIOS names in broadcast mode.
- Peer-to-peer: Requests the WINS server to parse NetBIOS names.
- Mixed: Requests name parsing in broadcast mode and connects to the WINS server to parse names.
- Hybrid: Requests the WINS server to parse NetBIOS names, and parses NetBIOS names in broadcast mode if no response is received.

The default node type of a DHCP client running a Microsoft operating system is broadcast or hybrid. If no WINS server is configured, the client is a broadcast node. Otherwise, it is a hybrid node. You are advised to set the NetBIOS node type to hybrid.

Examples

The following example sets the NetBIOS node type to hybrid in DHCP address pool mypool0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# netbios-node-type h-node
```

Function

Run the **Network** command to configure the primary network segment for dynamic assignment in a DHCP address pool.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No primary network segment for dynamic assignment in a DHCP address pool is configured by default.

Syntax

network *network-number mask* [*low-ip-address high-ip-address*]

no network

default network

Parameter Description

network-number: Network number of IP addresses in a DHCP address pool.

mask: Network mask of IP addresses in a DHCP address pool. If no mask is defined, the natural mask is applied.

low-ip-address: Start IP address.

high-ip-address: End IP address.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

This command is used to define a subnet and subnet mask of an address pool to provide a DHCP server with a range of addresses. Unless excluded addresses are configured, the DHCP server assigns all addresses from an address pool to DHCP clients. The IP addresses in a pool are assigned in order. If an address is assigned or exists in the target network segment, the next address is checked until a valid address is assigned.

To display address assignment information, run the **show ip dhcp binding** command. To display address conflict detection information, run the **show ip dhcp conflict** command.

Examples

The following example sets the network number and mask of DHCP address pool mypool0 to **192.168.12.0** and **255.255.255.240**, respectively.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# network 192.168.12.0 255.255.255.240
```

Notifications

When an invalid address is configured, the following notification will be displayed:

```
Hostname(dhcp-config)# network 238.5.5.5 255.0.0.0
238.5.5.5 / 255.0.0.0 is an invalid network
```

Common Errors

Non-unicast addresses are configured.

Related Commands

- **show ip dhcp binding**

1.54 next-server

Function

Run the **next-server** command to configure the boot server list that a DHCP server assigns to a DHCP client.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No boot server list is configured by default.

Syntax

next-server *ip-address&*<1-8>

no next-server

default next-server

Parameter Description

ip-address&<1-8>: IP address of a boot server. **<1-8>** indicates that up to eight boot server IP addresses can be entered, and the IP addresses are separated by spaces. At least one boot server needs to be configured.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

When multiple boot servers are defined, the first defined boot server has the highest priority. A DHCP client selects the next boot server only when it fails to communicate with the first defined boot server.

Examples

The following example sets the boot server for a DHCP client with an address from DHCP address pool mypool0 to **192.168.12.4**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# next-server 192.168.12.4
```

Notifications

When an invalid address is configured, the following notification will be displayed:

```
Hostname(dhcp-config)# next-server 238.5.5.5
% Error: ip address(238.5.5.5) is invalid!
```

Common Errors

- Non-unicast addresses are configured.
- More than eight boot server addresses are configured.

Function

Run the **option** command to define DHCP server options.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No DHCP server option is defined by default.

Syntax

option *code* { **ascii** *string* | **hex** *string* | **ip** *ip-address*&<1-16> }

no option

default option

Parameter Description

code: Code of a DHCP option.

ascii *string*: Defines an ASCII character string. The value is a case-sensitive string of 1 to 255 characters.

hex *string*: Defines a hexadecimal character string. The character length must be an even number. The value is a string of 2 to 240 characters.

ip *ip-address*&<1-16>: Defines an IP address. **<1-16>** indicates that up to 16 IP addresses can be entered, and the IP addresses are separated by spaces.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

DHCP provides a mechanism to send configuration information to hosts in a TCP/IP network. DHCP packets contain options, which are variable and can be defined as required. DHCP clients must be able to receive DHCP packets that carry option information of at least 312 bytes. The fixed data field in DHCP packets is also an option.

When this command is executed for an option multiple times in an address pool, the last configuration prevails.

The values of well-known options are fixed. Do not configure options 3, 6, 15, 44, 46, 50–55, 57–59, 61, 82, and 119.

Read the standard protocol file carefully to ensure correct configuration. For example, Option 33 is used to set static routes. This option contains one or more groups of static routes (including the destination address and gateway address). During configuration, enter an even number of IP addresses and do not set the destination IP address to **0.0.0.0**.

Examples

The following example defines Option 19 in address pool mypool0. This option determines whether a DHCP client enables IP packet forwarding. The value **0** indicates that IP packet forwarding is disabled, and the value **1** indicates that IP packet forwarding is enabled. In this example, the DHCP client enables IP packet forwarding.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# option 19 hex 01
```

The following example defines Option 33 in address pool mypool0. This option provides static route information to DHCP clients. DHCP clients obtain two static routes. For one route, the destination address is 172.16.12.0,

and the gateway address is 192.168.12.12. For the other route, the destination address is 172.16.16.0, and the gateway address is 192.168.12.16.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# option 33 ip 172.16.12.0 192.168.12.12 172.16.16.0
192.168.12.16
```

Notifications

When an invalid static route address is configured, the following notification will be displayed:

```
Hostname(dhcp-config)# option 56 ip 2.2.2.2 225.5.5.5
% Error: ip address 225.5.5.5 is not valid!
```

When an invalid hexadecimal character string is configured, the following notification will be displayed:

```
Hostname(dhcp-config)# option 253 hex abcdef_
% DHCP could not parse the hexadecimal string. Check character 6 (_).
```

Common Errors

- Non-unicast addresses are configured.
- More than eight static route addresses are configured.
- An invalid hexadecimal character string is configured.

1.56 pool-status

Function

Run the **pool-status** command to configure whether to enable a DHCP address pool.

A created address pool is automatically enabled by default.

Syntax

pool-status { **enable** | **disable** }

Parameter Description

enable: Enables an address pool.

disable: Disables an address pool.

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

You can run this command to enable or disable an address pool temporarily when using a DHCP server.

Examples

The following example disables address pool mypool0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# pool-status disable
```

1.57 relay agent information

Function

Run the **relay agent information** command to enter the Option 82 matching information configuration mode from the global class configuration mode.

Run the **no** form of this command to remove this configuration.

Syntax

relay agent information

no relay agent information

Parameter Description

N/A

Command Modes

Global class configuration mode

Usage Guidelines

This command is configured on a DHCP server.

After this command is executed, the system enters the Option 82 matching information configuration mode. In this configuration mode, you can configure multiple Option 82 matching options for a class.

Examples

The following example configures a class named **myclass** and enters the Option 82 matching information configuration mode.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# ip dhcp class myclass
Hostname(config-dhcp-class)# relay agent information
Hostname(config-dhcp-class-relayinfo)#
```

1.58 relay-information hex

Function

Run the **relay-information hex** command to configure Option 82 matching information.

Run the **no** form of this command to remove this configuration.

No Option 82 matching information is configured by default.

Syntax

relay-information hex *hex-string*

no relay-information hex *hex-string*

Parameter Description

hex-string: Hexadecimal character string. The number of contained characters must be even. The value is a string of no more than 240 characters. If an asterisk (*) is added at the end of a character string, fuzzy match is used. Otherwise, exact match is used.

Command Modes

Option 82 information configuration mode under the global class configuration mode

Usage Guidelines

This command is configured on a DHCP server.

Examples

The following example configures a global class named **myclass**, which can match multiple pieces of Option 82 information.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp class myclass
Hostname(config-dhcp-class)# relay agent information
Hostname(config-dhcp-class-relayinfo)# relay-information hex 0102256535
Hostname(config-dhcp-class-relayinfo)# relay-information hex 010225654565
Hostname(config-dhcp-class-relayinfo)# relay-information hex 060225654565
```

```
Hostname(config-dhcp-class-relayinfo)# relay-information hex 060223*
```

1.59 remark

Function

Run the **remark** command to configure identification information of a class.

Run the **no** form of this command to remove this configuration.

No identification information is configured for a class by default.

Syntax

remark *class-remark*

no remark

Parameter Description

class-remark: Identification information of a class. The value is a string of 1 to 240 characters, and spaces are allowed.

Command Modes

Global class configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

Examples

The following example sets the identification information of a global class named **myclass** to **used in #1 build**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp class myclass
Hostname(config-dhcp-class)# remark used in #1 build
```

1.60 service dhcp

Function

Run the **service dhcp** command to enable the DHCP Server or DHCP Relay function.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The DHCP Server and DHCP Relay functions are disabled by default.

Syntax

service dhcp

no service dhcp

default service dhcp

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

A DHCP server can automatically assign IP addresses and provide network configurations such as the DNS server address and default gateway address to DHCP clients.

A DHCP relay agent can forward DHCP packets between a DHCP client and a DHCP server.

The **service dhcp** command is used to enable both the DHCP Server and DHCP Relay functions. However, a device cannot function as a DHCP server and relay at the same time. When a device is configured with a valid address pool, it acts as a server. Otherwise, it serves as a relay.

Examples

The following example enables the DHCP Server function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# service dhcp
```

1.61 show ip dhcp binding

Function

Run the **show ip dhcp binding** command to display DHCP address binding information.

Syntax

show ip dhcp binding [*ip-address*]

Parameter Description

ip-address: IP address for which binding information is displayed. If this parameter is not configured, all binding information is displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server.

If no IP address is defined, binding information of all IP addresses is displayed. If an IP address is defined, binding information of this IP address is displayed.

Examples

The following example displays DHCP address binding information.

```
Hostname> enable
Hostname# show ip dhcp binding
Total number of clients   : 4
Expired clients          : 3
Running clients          : 1
IP address       Hardware address      Lease expiration          Type
20.1.1.1         2000.0000.2011        000 days 23 hours 59 mins   Automatic
```

Table 1-3 Output Fields of the show ip dhcp binding Command

Field	Description
IP address	IP address assigned to a DHCP client
Hardware address	Hardware address of a DHCP client

Field	Description
Lease expiration	Lease expiration time ● **Infinite**: There is no time limitation. ● **IDLE**: The current address is idle because the lease of the address is not renewed or a DHCP client releases the IP address actively.
Type	Address binding type ● **Automatic**: IP addresses are automatically assigned. ● **Manual**: IP addresses are manually assigned.

1.72 update arp

Function

Run the **update arp** command to enable a DHCP server to add trusted ARP entries during address assignment.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No trusted ARP entry is added during DHCP address assignment by default.

Syntax

update arp

no update arp

default update arp

Parameter Description

N/A

Command Modes

DHCP address pool configuration mode

Default Level

14

Usage Guidelines

This command is configured on a DHCP server. After this command is configured for an address pool, the DHCP server adds trusted ARP entries when assigning IP addresses from the address pool. A trusted ARP entry has a higher priority than a dynamic ARP entry and is not overridden by a dynamic ARP entry.

Examples

The following example enables a DHCP server to add trusted ARP entries when assigning addresses from address pool mypool0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp pool mypool0
Hostname(dhcp-config)# update arp
```

1 DHCP Client Commands

Command	Function
ip address dhcp	Enable an Ethernet, Point-to-Point Protocol (PPP), High-Level Data Link Control (HDLC), or frame relay (FR) interface to obtain IP addresses through Host Configuration Protocol (DHCP).
show dhcp lease	Display lease information of a DHCP client.

1.1 ip address dhcp

Function

Run the **ip address dhcp** command to enable an Ethernet, Point-to-Point Protocol (PPP), High-Level Data Link Control (HDLC), or frame relay (FR) interface to obtain IP addresses through Host Configuration Protocol (DHCP).

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No interface can obtain an IP address through DHCP by default.

Syntax

ip address dhcp

no ip address dhcp

default ip address dhcp

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When a DHCP client requests an IP address from a DHCP server, it also requires the DHCP server to provide the following configuration parameters:

- **DHCP Option 1**: Subnet mask of the client
- **DHCP Option 3**: Gateway in the same subnet
- **DHCP Option 6**: Domain name server (DNS) information
- **DHCP Option 15**: Host domain name
- **DHCP Option 44**: Windows Internet Name Service (WINS) server information

Examples

The following example enables GigabitEthernet 0/1 to obtain an IP address automatically.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1) ip address dhcp
```

Notifications

N/A

Common Errors

The DHCP Client function is enabled on an L2 interface.

1 DHCP Snooping Commands

Command	Function
clear ip dhcp snooping binding	Clear all dynamic users in the Dynamic Host Configuration Protocol (DHCP) snooping binding database.
ip dhcp snooping	Enable DHCP Snooping globally.
ip dhcp snooping bootp-bind	Enable DHCP Snooping to support Bootstrap Protocol (BOOTP) binding.
ip dhcp snooping check-giaddr	Enable DHCP Snooping to support relay request packet processing.
ip dhcp snooping database write-delay	Write all dynamic user information in the DHCP Snooping binding database to a flash memory at a scheduled time.
ip dhcp snooping database write-to-flash	Write dynamic user information in the DHCP Snooping binding database to flash in real time.
ip dhcp snooping information option	Add Option 82 to DHCP request packets.
ip dhcp snooping information option format remote-id	Set the Remote ID sub-option to a user-defined string or the host name when Option 82 is in extended mode.
ip dhcp snooping monitor	Enable DHCP Snooping monitoring globally.
ip dhcp snooping station-move aging	Enable DHCP Snooping to fast age terminal migration entries.
ip dhcp snooping station-move permit	Enable DHCP Snooping to support binding entry migration.
ip dhcp snooping suppression	Configure an interface in the suppression state so as to discard all DHCP packets sent to the interface.
ip dhcp snooping trust	Configure an interface as a DHCP Snooping trusted port.
ip dhcp snooping verify mac-address	Enable source MAC address verification.
ip dhcp snooping vlan	Enable DHCP Snooping on a specified VLAN.
ip dhcp snooping vlan information option change-vlan-to vlan	Set the VLAN filed in Circuit ID of Option 82 in extended mode to a specified VLAN.

ip dhcp snooping vlan information option format-type circuit-id string	Set Circuit ID to user-defined content for forwarding when Option 82 is in extended mode.
ip dhcp snooping vlan max-user	Configure the maximum number of users bound to a VLAN.
renew ip dhcp snooping database	Import information in the current backup file to the DHCP Snooping binding database.
show ip dhcp snooping	Display the DHCP Snooping configurations.
show ip dhcp snooping binding	Display user information in the DHCP Snooping binding database.

1.1 clear ip dhcp snooping binding

Function

Run the **clear ip dhcp snooping binding** command to clear all dynamic users in the Dynamic Host Configuration Protocol (DHCP) snooping binding database.

Syntax

clear ip dhcp snooping binding [*ip-address*] [*mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*]

Parameter Description

ip-address: IP address of a user.

mac-address: Media Access Control (MAC) address of a user.

vlan-id: Virtual local area network (VLAN) ID of a user.

interface-type interface-number: Interface of a user.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

After this command is run, all DHCP users who access the interface with IP Source Guard enabled need to re-apply for IP addresses. Otherwise, they cannot access the Internet.

Examples

The following example clears all dynamic users in the DHCP Snooping binding database.

```
Hostname> enable
Hostname# clear ip dhcp snooping binding
```

Notifications

N/A

Platform Description

N/A

1.2 ip dhcp snooping

Function

Run the **ip dhcp snooping** command to enable DHCP Snooping globally.

Run the **no** form of this command to disable this function.

DHCP Snooping is disabled globally by default.

Syntax

ip dhcp snooping

no ip dhcp snooping

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After DHCP Snooping is enabled globally, you can run the **show ip dhcp snooping** command to check whether this function is enabled.

Examples

The following example enables DHCP Snooping globally.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping
```

Notifications

When this command is run to enable DHCP Snooping after DHCP Snooping monitoring is enabled globally, the following notification will be displayed:

```
% Failed to execute command, because of "Conflict with DHCP snooping monitor".
```

Common Errors

N/A

Platform Description

N/A

Related Commands

N/A

1.3 ip dhcp snooping bootp-bind

Function

Run the **ip dhcp snooping bootp-bind** command to enable DHCP Snooping to support Bootstrap Protocol (BOOTP) binding.

Run the **no** form of this command to disable this function.

DHCP Snooping does not support BOOTP binding by default.

Syntax

ip dhcp snooping bootp-bind

no ip dhcp snooping bootp-bind

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After being enabled, DHCP Snooping snoops and forwards only BOOTP packets by default. After a BOOTP client successfully applies for an IP address, DHCP Snooping adds the BOOTP user to the static binding database.

Examples

The following example enables DHCP Snooping to support BOOTP binding.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping bootp-bind
```

Notifications

N/A

Common Errors

N/A

Platform Description

Related Commands

N/A

1.4 ip dhcp snooping check-giaddr

Function

Run the **ip dhcp snooping check-giaddr** command to enable DHCP Snooping to support relay request packet processing.

Run the **no** form of this command to disable this function.

DHCP Snooping does not support relay request packet processing by default.

Syntax

ip dhcp snooping check-giaddr

no ip dhcp snooping check-giaddr

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After this function is enabled, services (IP Source Guard and Dot1x authentication) using DHCP Snooping binding entries generated based on relay requests cannot be deployed. Otherwise, users fail to access the Internet.

After this function is enabled, the **ip dhcp snooping verify mac-address** command cannot be configured. Otherwise, DHCP relay request packets are discarded, and users fail to obtain addresses.

Examples

The following example enables DHCP Snooping to support relay request packet processing.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping check-giaddr
```

Notifications

1.5 ip dhcp snooping database write-delay

Function

Run the **ip dhcp snooping database write-delay** command to write all dynamic user information in the DHCP Snooping binding database to a flash memory at a scheduled time.

Run the **no** form of this command to disable this function.

The function of writing all dynamic user information in the DHCP Snooping binding database to a flash memory at a scheduled time is not configured by default.

Syntax

ip dhcp snooping database write-delay *time*

no ip dhcp snooping database write-delay

Parameter Description

time: Period for saving database records, in seconds. The value range is from 600 to 86400.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to write dynamic user information in the DHCP Snooping binding database to a flash memory at a scheduled time. This prevents user information loss after the device restarts, and there is no need to re-obtain IP addresses to restore communication.

Note

A high saving frequency reduces the lifespan of the flash.

Examples

The following example writes all dynamic user information in the DHCP Snooping binding database to a flash memory every 3600s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping database write-delay 3600
```

Notifications

N/A

Common Errors

The configured period exceeds the limit.

Platform Description

N/A

Related Commands

N/A

1.6 ip dhcp snooping database write-to-flash

Function

Run the **ip dhcp snooping database write-to-flash** command to write dynamic user information in the DHCP Snooping binding database to flash in real time.

Syntax

ip dhcp snooping database write-to-flash

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Wireless user information is not written to flash.

If a device is upgraded from a non-QinQ version to a QinQ version (or vice versa), binding entries cannot be restored because the two versions correspond to different flashes.

Examples

The following example writes dynamic user information in the DHCP Snooping binding database to flash in real time.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping database write-to-flash
```

Notifications

N/A

Common Errors

N/A

Platform Description

1.7 ip dhcp snooping information option

Function

Run the **ip dhcp snooping information option** command to add Option 82 to DHCP request packets.

Run the **no** form of this command to remove this configuration.

Option 82 is not added to DHCP request packets by default.

Syntax

ip dhcp snooping information option [**standard-format** | **user-defined**]

no ip dhcp snooping information option [**standard-format** | **user-defined**]

Parameter Description

standard-format: Uses the standard format for Option 82.

user-defined: Uses the user-defined format for Option 82.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to add Option 82 to DHCP request packets so that a DHCP server assigns addresses based on Option 82.

When enabled, Option 82 is in extended mode by default.

Caution

Option 82 for DHCP Snooping is exclusive to that for DHCP Relay.

Examples

The following example adds Option 82 to DHCP request packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping information option
```

Notifications

N/A

Common Errors

Option 82 for DHCP Snooping and that for DHCP Relay are enabled at the same time. As a result, Option 82 in the DHCP packets is incorrect.

Platform Description

N/A

Related Commands

N/A

1.8 ip dhcp snooping information option format remote-id

Function

Run the **ip dhcp snooping information option format remote-id** command to set the **Remote ID** sub-option to a user-defined string or the host name when Option 82 is in extended mode.

Run the **no** form of this command to remove this configuration.

Remote ID in Option 82 is not set to a user-defined string or host name by default.

Syntax

ip dhcp snooping information option format remote-id { **string** *ascii-string* | **hostname** }

no ip dhcp snooping information option format remote-id

Parameter Description

string *ascii-string*: Sets **Remote ID** in Option 82 to a user-defined string.

hostname: Sets **Remote ID** in Option 82 to the host name.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When DHCP Option 82 is enabled in extended mode, this command is used to customize the content of **Remote ID** in Option 82.

Examples

The following example sets **Remote ID** in Option 82 to the host name.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping information option format remote-id hostname
```

Notifications

When the value of the *ascii-string* parameter exceeds 63 characters, the following notification will be displayed:

```
% Failed to execute command, because of "Remote-ID string cannot exceed 63 characters".
```

Common Errors

N/A

Platform Description

N/A

Related Commands

N/A

1.9 ip dhcp snooping monitor

Function

Run the **ip dhcp snooping monitor** command to enable DHCP Snooping monitoring globally.

Run the **no** form of this command to disable this function.

DHCP Snooping monitoring is disabled globally by default.

Syntax

ip dhcp snooping monitor

no ip dhcp snooping monitor

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After the DHCP Snooping monitoring function is enabled, DHCP Snooping only copies DHCP packets and generates binding entries based on the interaction status, but does not check the validity of the packets.

The DHCP Snooping monitoring and DHCP Snooping functions are mutually exclusive.

After the DHCP Snooping monitoring function is enabled, if the VLAN field in the **show ip dhcp snooping binding** command is set to **0**, VLAN information is not carried in binding entries generated for routed ports.

Examples

The following example enables DHCP Snooping monitoring globally.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping monitor
```

Notifications

When DHCP Snooping monitoring is configured after DHCP Snooping is enabled globally, the following notification will be displayed:

```
% Failed to execute command, because of "Conflict with DHCP snooping".
```

Common Errors

N/A

Platform Description

N/A

Related Commands

1.10 ip dhcp snooping station-move aging

Function

Run the **ip dhcp snooping station-move aging** command to enable DHCP Snooping to fast age terminal migration entries.

Run the **no** form of this command to disable this function.

Fast aging of client migration entries is enabled for DHCP Snooping by default.

Syntax

ip dhcp snooping station-move aging

no ip dhcp snooping station-move aging

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When a terminal is migrated between different sub VLANs of the same super VLAN and a binding entry is generated in the new sub VLAN, this command is used to enable DHCP Snooping to fast age binding entries in other sub VLANs.

Examples

The following example disables fast aging of terminal migration entries.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip dhcp snooping station-move aging
```

Notifications

N/A

Common Errors

N/A

Platform Description

1.11 ip dhcp snooping station-move permit

Function

Run the **ip dhcp snooping station-move permit** command to enable DHCP Snooping to support binding entry migration.

Run the **no** form of this command to disable this function.

DHCP Snooping does not support binding entry migration by default.

Syntax

ip dhcp snooping station-move permit

no ip dhcp snooping station-move permit

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When no DHCP request for an IP address is initiated after terminal migration, this command is used to enable DHCP Snooping to find the latest binding entries in the super VLAN based on the target sub VLAN and generates binding entries of the target sub VLAN.

Examples

The following example enables DHCP Snooping to support binding entry migration.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping station-move permit
```

Notifications

1.12 ip dhcp snooping suppression

Function

Run the **ip dhcp snooping suppression** command to configure an interface in the suppression state so as to discard all DHCP packets sent to the interface.

Run the **no** form of this command to remove this configuration.

No interface is configured in the suppression state by default.

Syntax

ip dhcp snooping suppression

no ip dhcp snooping suppression

Parameter Description

N/A

Command Modes

Interface configuration mode

Wireless security configuration mode

Default Level

14

Usage Guidelines

This command is used to reject all DHCP packets on an untrusted port, that is, to forbid all users on this port to apply for addresses via DHCP.

This command can be configured only on L2 switching ports or aggregation ports (APs).

Examples

The following example configures GigabitEthernet 0/1 in the suppression state.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip dhcp snooping suppression
```

Notifications

When this command is configured on a DHCP trusted port, the following notification will be displayed:

```
% Failed to execute command, because of "Security config conflict".
```

When this command is not configured on an L2 switching port, AP, or L2 encapsulation sub-interface for wired access, the following notification will be displayed:

```
% Failed to execute command, because of "Configure is not supported on current interface".
```

Common Errors

N/A

Platform Description

N/A

Related Commands

N/A

1.13 ip dhcp snooping trust

Function

Run the **ip dhcp snooping trust** command to configure an interface as a DHCP Snooping trusted port.

Run the **no** form of this command to remove this configuration.

All interfaces are DHCP Snooping untrusted ports by default.

Syntax

ip dhcp snooping trust

no ip dhcp snooping trust

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to configure interfaces connected to legitimate DHCP servers as trusted ports. DHCP response packets received on trusted ports are forwarded normally, while those received on untrusted ports are discarded.

This command can be configured only on L2 switching ports, APs, or encapsulation sub-interfaces.

Caution

Generally, uplink interfaces, that is, interfaces connected to trusted DHCP servers are configured as trusted ports.

Examples

The following example configures GigabitEthernet 0/1 as a DHCP Snooping trusted port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip dhcp snooping trust
```

Notifications

When an interface configured with other access security control options is configured as a DHCPv6 Snooping trusted port, the following notification will be displayed:

```
% Failed to execute command, because of "Security config conflict".
```

When this command is not configured on an L2 switching port, AP, or L2 encapsulation sub-interface, the following notification will be displayed:

```
% Failed to execute command, because of "Configure is not supported on current interface".
```

Common Errors

N/A

Platform Description

1.14 ip dhcp snooping verify mac-address

Function

Run the **ip dhcp snooping verify mac-address** command to enable source MAC address verification.

Run the **no** form of this command to disable this function.

Source MAC address verification is disabled by default.

Syntax

ip dhcp snooping verify mac-address

no ip dhcp snooping verify mac-address

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After source MAC address verification is enabled, the MAC addresses in link layer headers and the **CLIENT MAC** fields in DHCP request packets from untrusted ports are checked for consistence. If the verification fails, packets are discarded.

Examples

The following example enables source MAC address verification.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping verify mac-address
```

Notifications

N/A

Common Errors

1.15 ip dhcp snooping vlan

Function

Run the **ip dhcp snooping vlan** command to enable DHCP Snooping on a specified VLAN.

Run the **no** form of this command to disable this function.

After DHCP Snooping is enabled globally, it takes effect to all VLANs by default.

Syntax

ip dhcp snooping vlan { *vlan-range* | { *vlan-min* [*vlan-max*] } }

no ip dhcp snooping vlan { *vlan-range* | *vlan-min* [*vlan-max*] }

Parameter Description

vlan-range: Range of VLANs to which DHCP Snooping takes effect. The value is a character string, for example 1, 3–5, 7, and 9–11.

vlan-min: Minimum ID of a VLAN to which DHCP Snooping takes effect. The value range is from 1 to 4094.

vlan-max: Maximum ID of a VLAN to which DHCP Snooping takes effect. The value range is from 1 to 4094.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to enable or disable DHCP Snooping for a specified VLAN. This function takes effect only when DHCP Snooping is enabled globally.

Examples

The following example enables DHCP Snooping for VLAN 1000.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping vlan 1000
```

The following example enables DHCP Snooping for VLAN 1 to VLAN 10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dhcp snooping vlan 1-10
```

Notifications

When the configured VLAN ID is beyond the range of 1 to 4094, the following notification will be displayed:

```
% Failed to execute command, because of "Not supported vlan range".
```

Common Errors

1.16 ip dhcp snooping vlan information option change-vlan-to vlan

Function

Run the **ip dhcp snooping vlan information option change-vlan-to vlan** command to set the VLAN filed in **Circuit ID** of Option 82 in extended mode to a specified VLAN.

Run the **no** form of this command to remove this configuration.

When Option 82 is in extended mode, the VLAN in **Circuit ID** is not configured as the specified VLAN by default.

Syntax

ip dhcp snooping vlan *vlan-id* **information option change-vlan-to vlan** *vlan-id*

no ip dhcp snooping vlan *vlan-id* **information option**

Parameter Description

vlan-id: VLAN ID. The value range is from 1 to 4094.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When DHCP Option 82 is enabled in extended mode, this command is used to change the value of the VLAN field in **the Circuit ID** of Option 82 to a specified VLAN.

Examples

The following example changes VLAN 4094 in **Circuit ID** of Option 82 to VLAN 4093 when Option 82 is added to DHCP request packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip dhcp snooping vlan 4094 information option
change-vlan-to vlan 4093
```

1.17 ip dhcp snooping vlan information option format-type circuit-id string

Function

Run the **ip dhcp snooping vlan information option format-type circuit-id string** command to set **Circuit ID** to user-defined content for forwarding when Option 82 is in extended mode.

Run the **no** form of this command to remove this configuration.

When Option 82 is in extended mode, **Circuit ID** is not set to user-defined content for forwarding by default.

Syntax

ip dhcp snooping vlan *vlan-id* **information option format-type circuit-id string** *ascii-string*

no ip dhcp snooping vlan *vlan-id* **information option**

Parameter Description

vlan-id: ID of the VLAN where DHCP request packets are from.

ascii-string: User-defined **Circuit ID** content. The value is a string of 3 to 63 bytes in ASCII format.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When DHCP Option 82 is enabled in extended mode, this command is used to customize **Circuit ID** in Option 82.

Examples

The following example sets **Circuit ID** of Option 82 to port-name when Option 82 is added to DHCP request packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip dhcp snooping vlan 4094 information option
format-type circuit-id string port-name
```

Notifications

When the user-defined character string is not 3 to 63 characters, the following notification is displayed:

```
% Failed to execute command, because of "Circuit-ID string must be 3 to 63 characters".
```

Common Errors

1.18 ip dhcp snooping vlan max-user

Function

Run the **ip dhcp snooping vlan max-user** command to configure the maximum number of users bound to a VLAN.

Run the **no** form of this command to remove this configuration.

The maximum number of users bound to a VLAN is not configured by default.

Syntax

ip dhcp snooping vlan *vlan-range* **max-user** *user-number*

no ip dhcp snooping vlan *vlan-range* **max-user** *user-number*

Parameter Description

vlan-range: Range of VLANs to which DHCP Snooping takes effect.

user-number: Maximum number of allowed users. The value range is from 1 to 26624.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the maximum number of users bound based on the interface and VLAN, so as to prevent forge DHCP packets in accordance with the network topology.

Examples

The following example binds a maximum of 30 users to VLANs 1 to 10 and VLAN 20 on interface 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip dhcp snooping vlan 1-10,20 max-user 30
```

Notifications

When an interface from a specified VLAN is a DHCP Snooping trusted port, the following notification will be displayed:

```
% Failed to execute command, because of "Security configuration conflict in interface
GigabitEthernet 0/1".
```

When the number of users bound to a VLAN on a specified interface exceeds the maximum number of allowed users configured in the command, the following notification will be displayed:

```
% Failed to execute command, because of "New max address number little more than the
current".
```

1.19 renew ip dhcp snooping database

Function

Run the **renew ip dhcp snooping database** command to import information in the current backup file to the DHCP Snooping binding database.

Syntax

renew ip dhcp snooping database

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to import information in the current backup file to the DHCP Snooping binding database.

Note

- Lease expiration records in the backup file are ignored.
- Only records that do not exist in the database are added.

Examples

The following example imports information in the current backup file to the DHCP Snooping binding database.

```
Hostname> enable
Hostname# renew ip dhcp snooping database
```

DHCP snooping Support bootp bind status       :   DISABLE
Interface                                    Trusted          Rate limit(pps)
GigabitEthernet 0/1                            YES             unlimited
Default                                      No
```

Table 1-1 Output Fields of the show ip dhcp snooping Command

Field	Description
Switch DHCP snooping status	Indicates whether DHCP Snooping is enabled globally.
DHCP snooping verify hardware address status	Status of the switch for verifying the source MAC address in DHCP Snooping packets.
DHCP snooping database write-delay time	Interval for writing data to a backup file.
DHCP snooping option 82 status	Indicates whether Option 82 is added to DHCP request packets.

DHCP snooping Support Bootp bind status	Indicates whether to enable DHCP Snooping to support BOOTP binding.
Interface	Interface name.
Trusted	Indicates whether an interface is a trusted port.
Rate limit	Rate limit for DHCP packets on an interface.

Examples

The following example displays user information in the DHCP Snooping binding database.

```
Hostname> enable
Hostname# show ip dhcp snooping binding
Total number of bindings: 1
NO.   MACADDRESS        IPADDRESS      LEASE(SEC)   TYPE         VLAN  INTERFACE
1     0000.0000.0001    1.1.1.1        78128       DHCP-Snooping 1
GigabitEthernet 0/1
```

Table 1-2 Output Fields of the show ip dhcp snooping binding Command

Field	Description
Total number of bindings	Current number of bindings in the DHCP Snooping binding database.
No.	Record number.
MACADDRESS	MAC address of a user.
IPADDRESS	IP address of a user.
LEASE (SEC)	Lease time of a record.
TYPE	Record type.
VLAN	VLAN of a user.
INNER-VLAN	ID of the inner VLAN of a user. This field is applicable to products that support QinQ VLAN tag termination.
INTERFACE	Interface to which a user's terminal connects.

1 DNS Commands

Command	Function
clear host	Clear the dynamic domain name cache entries.
clear dns proxy host	Clear the dynamic domain name cache entries on the DNS proxy.
ip domain-lookup	Enable DNS for domain name resolution, or enable DNS for domain name resolution and specify the source interface and IP address for domain name resolution.
ip host	Configure a static mapping between a host name and an IP address.
ip name-server	Configure an IPv4/IPv6 address for a DNS server.
ipv6 host	Configure a static mapping between a host name and an IPv6 address.
ip dns proxy cache	Enable the function of caching dynamic entries on the DNS proxy.
ip dns proxy enable	Enable the DNS proxy function.
ip dns proxy host	Configure a static mapping between a host name and an IP address on the DNS proxy.
ip dns proxy nameserver	Configure the IP address of a DNS server on the DNS proxy.
ip dns proxy port-range	Configure the range of a port used for query in upper-level DNS servers.
ip dns proxy ttl	Configure the time to live (TTL) of the reply packet in response to a static entry.
show hosts	Display the DNS configuration.
show dns proxy hosts	Display the entries on the DNS proxy.
show dns proxy statistics	Display the DNS proxy packet statistics.

1.1 clear host

Function

Run the **clear host** command to clear the dynamic domain name cache entries.

Syntax

clear host [* | *host-name*]

Parameter Description

host-name: Name of a host whose dynamic domain name entries need to be deleted.

*****: Deletes all dynamic domain name entries.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

Mapping records in the domain name cache are sourced from the following:

- Static configuration by running the **ip host** or **ipv6 host** command;
- Dynamic learning through DNS.

This command can be used to delete domain name records dynamically learned through DNS.

Examples

The following example clears all the dynamic domain name cache entries.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)#clear host *
```

1.2 clear dns proxy host

Function

Run the **clear dns proxy host** command to clear the dynamic domain name cache entries on the DNS proxy.

Syntax

clear dns proxy host [* | *host-name*]

Parameter Description

host-name: Name of a host whose dynamic domain name cache entries need to be deleted.

*****: Deletes all dynamic domain name entries.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

Mapping records in the domain name cache are sourced from the following:

- Static configuration by running the **ip dns proxy host** command;
- Dynamic learning through DNS.

This command can be used to delete domain name records dynamically learned through DNS.

Examples

The following example deletes all the dynamic domain name cache entries.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# clear dns proxy host *
```

1.3 ip domain-lookup

Function

Run the **ip domain-lookup** command to enable DNS for domain name resolution, or enable DNS for domain name resolution and specify the source interface and IP address for domain name resolution.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The DNS domain name resolution function is enabled and the function of domain name resolution using a specified source interface or IP address is disabled by default.

Syntax

ip domain-lookup [**oob** [**via** *mgmt-name*] | [**vrf** *vrf-name*] [**source** { *interface-type interface-number* | **ip** *ipv4-address* | **ipv6** *ipv6-address* }]]

no ip domain-lookup [**oob** [**via** *mgmt-name*] | [**vrf** *vrf-name*] **source**]

default ip domain-lookup [**oob** [**via** *mgmt-name*] | [**vrf** *vrf-name*] **source**]

Parameter Description

oob: Configures out-of-band management.

via *mgmt-name*: Specifies the outbound management interface of packets.

vrf *vrf-name*: Specifies a VRF instance. If this parameter is not specified, it indicates the public network instance.

source: Specifies the source interface or source IP address for domain name resolution.

interface-type interface-number: L3 interface type and interface number.

ip *ipv4-address*: IPv4 address.

ipv6 *ipv6-address*: IPv6 address.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

By default, no source interface is specified, and the source IP address of a DNS query packet is decided through the routing process.

If a source interface is specified in the command, when an IPv4 DNS query packet is sent, the primary IPv4 address of the source interface is used as the source address of the DNS query packet. When an IPv6 DNS query packet is sent, the first effective IPv6 address of the source interface is used as the source address of the DNS query packet. If no address is configured for a source interface, a DNS query packet fails to be sent.

If an IPv4 source address is specified in the command, when an IPv4 DNS query packet is sent, the configured IPv4 address serves as the source address of the IPv4 DNS query packet, and the sending of an IPv6 DNS query packet will fail. If an IPv6 source address is specified in the command, when an IPv6 DNS query packet is sent, the configured IPv6 address serves as the source address of the IPv6 DNS query packet, and the sending of an IPv4 DNS query packet will fail.

Caution

An effective IPv6 address is a unicast address and it cannot be either a local link address or a loopback address.

Examples

The following example disables the DNS domain name resolution and disables the function of domain name resolution using a specified source interface or IP address.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip domain-lookup
```

Notifications

When the configured interface is not an L3 interface, the following notification will be displayed:

```
% Error: AggregatePort 1 is not l3 layer!
```

When the configured address is an illegitimate IPv4 address, for example, a loopback address, the following notification will be displayed:

```
% Invalid ip(1.1.1.1) address!
```

When the configured address is an illegitimate IPv6 address, for example, a local-link address or a loopback address, the following notification will be displayed:

```
% Invalid ipv6(0000::1) address!
```

Common Errors

- The configured source interface for DNS domain name resolution is an L2 interface and this command cannot be successfully configured.
- The configured source IP address for DNS domain name resolution is not a unicast address and this command cannot be successfully configured.

Platform Description

N/A

Related Commands

1.4 ip host

Function

Run the **ip host** command to configure a static mapping between a host name and an IP address.

Run the **no** form of this command to remove this configuration.

No static mapping between a host name and an IP address is configured by default.

Syntax

ip host [**oob**] *host-name* [*telnet-port*] *ip-address* [**via** *mgmt-name*]

ip host [**vrf** *vrf-name*] *host-name* [*telnet-port*] *ip-address*

no ip host [**oob**] *host-name* [*telnet-port*] *ip-address* [**via** *mgmt-name*]

no ip host [**vrf** *vrf-name*] *host-name* [*telnet-port*] *ip-address*

Parameter Description

oob: Configures out-of-band management.

vrf *vrf-name*: Configures a VRF instance.

host-name: Host name of a device.

telnet-port: Telnet port of a device. The value range is from 0 to 65535. The default value is 0.

ip-address: IP address of a device.

via *mgmt-name*: Specifies the outbound management interface of packets.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example configures the static mapping between host name www.test.com and IP address 192.168.5.243.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip host www.test.com 192.168.5.243
```

1.5 ip name-server

Function

Run the **ip name-server** command to configure an IPv4/IPv6 address for a DNS server.

Run the **no** form of this command to remove this configuration.

No DNS server is configured by default.

Syntax

ip name-server [**oob**] { *ipv4-address*&<1-6> | *ipv6-address*&<1-6> } [**via** *mgmt-name*]

ip name-server [**vrf** *vrf-name*] { *ipv4-address*&<1-6> | *ipv6-address*&<1-6> }

no ip name-server [**oob**] { *ipv4-address* | *ipv6-address* } [**via** *mgmt-name*]

no ip name**-**server **[** vrf ***vrf-name*** **] { *ipv4-address* | *ipv6-address* } [** via ***mgmt-name* **]Parameter Description**

oob: Configures out-of-band management.

ipv4-address&<1-6>: IPv4 address of a DNS server. &<1-6> indicates that the IPv4 addresses of up to six DNS servers can be configured.

ipv6-address&<1-6>: IPv6 address of a DNS server. &<1-6> indicates that the IPv6 addresses of up to six DNS servers can be configured.

vrf *vrf-name*: Specifies a VRF instance.

via *mgmt-name*: Specifies the outbound management interface of packets when the **oob** parameter is set.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Dynamic domain name resolution can be performed only after a DNS server is configured.

This command is used to configure the IPv4/IPv6 addresses for DNS servers. Each time this command is run, the device will add one DNS server. When a domain name cannot be obtained from the first server, the device tries to send a DNS request to subsequent servers until it receives a correct reply.

The system supports up to six DNS servers. If the *ipv4-address* or *ipv6-address* parameter is specified when you delete a DNS server, only the specified server will be deleted. Otherwise, the IP addresses of all DNS servers will be deleted.

Examples

The following example sets the IPv4 address of a DNS server to 192.168.5.134 and the management interface to 0.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip name-server 192.168.5.134 via mgmt 0
```

1.6 ipv6 host

Function

Run the **ipv6 host** command to configure a static mapping between a host name and an IPv6 address.

Run the **no** form of this command to remove this configuration.

No static mapping between a host name and an IPv6 address is configured by default.

Syntax

ipv6 host [**oob**] *host-name* [*telnet-port*] *ipv6-address* [**via** *mgmt-name*]

ipv6 host [**vrf** *vrf-name*] *host-name* [*telnet-port*] *ipv6-address*

no ipv6 host [**oob**] *host-name* [*telnet-port*] *ipv6-address* [**via** *mgmt-name*]

no ipv6 host [**vrf** *vrf-name*] *host-name* [*telnet-port*] *ipv6-address*

Parameter Description

oob: Configures out-of-band management.

vrf *vrf-name*: Configures a VRF instance.

host-name: Host name of a device.

ipv6-address: IPv6 address of a device.

via *mgmt-name*: Specifies the outbound management interface of packets.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example configures the static mapping between host name www.test6.com and IPv6 address 2001:0DB8:700:20:1::12.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 host www.test6.com 2001:0DB8:700:20:1::12
```

- **clear host**

1.7 ip dns proxy cache

Function

Run the **ip dns proxy cache** command to enable the function of caching dynamic entries on the DNS proxy.

Run the **no** form of this command to disable this feature.

The function of caching dynamic entries on the DNS proxy is enabled by default.

Syntax

ip dns proxy cache

no ip dns proxy cache

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When processing a request packet from the DNS client, the DNS proxy searches for the domain name-IP mapping in the local cache first. If the required domain name-IP mapping is found, the DNS proxy directly returns it to the client. If the required domain name-IP mapping is not found, the DNS resolver searches an external DNS server for the IP address mapped to the domain name and returns a reply packet to the client.

Examples

The following example disables the function of caching dynamic entries on the DNS proxy.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip dns proxy cache
```

Notifications

N/A

Common Errors

N/A

Platform Description

Related Commands

- ip dns proxy enable

1.8 ip dns proxy enable

Function

Run the **ip dns proxy enable** command to enable the DNS proxy function.

Run the **no** form of this command to disable this feature.

DNS proxy is disabled by default.

Syntax

ip dns proxy enable

no ip dns proxy enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

DNS proxy is generally deployed on the front-end egress gateway between a DNS server and a PC, and acts as a proxy of the DNS server to process users' DNS domain name resolution requests.

Examples

The following example disables the DNS proxy function.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip dns proxy enable
```

1.9 ip dns proxy host

Function

Run the **ip dns proxy host** command to configure a static mapping between a host name and an IP address on the DNS proxy.

Run the **no** form of this command to remove this configuration.

No static mapping between a host name and an IP address is configured on the DNS proxy by default.

Syntax

ip dns proxy host *host-name* { *ipv4-address* | *ipv6-address* }

no ip dns proxy host *host-name* { *ipv4-address* | *ipv6-address* }

Parameter Description

host-name: Host name of a device.

ipv4-address: IPv4 address of a device.

Ipv6-address: IPv6 address of a device.

Command Modes

Global configuration mode

Usage Guidelines

N/A

Examples

The following example configures a static mapping between host name www.test.com and IP address 192.168.5.243 on the DNS proxy.

1.10 ip dns proxy nameserver

Function

Run the **ip dns proxy nameserver** command to configure the IP address of a DNS server on the DNS proxy.

Run the **no** form of this command to remove this configuration.

No DNS server is configured on the DNS proxy by default.

Syntax

ip dns proxy nameserver { *ipv4-address* | *ipv6-address* }

no ip dns proxy nameserver [*ipv4-address* | *ipv6-address*]

Parameter Description

ipv4-address: IPv4 address of a DNS server.

ipv6-address: IPv6 address of a DNS server.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Each time this command is run, the device will add one DNS server. When a domain name cannot be obtained from the first server, the device tries to send a DNS request to subsequent servers until it receives a correct reply.

The system supports up to six DNS servers. If the *ipv4-address* or *ipv6-address* parameter is specified when you delete a DNS server, only the specified server will be deleted. Otherwise, the IP addresses of all DNS servers will be deleted.

Examples

The following example sets the IPv4 address of a DNS server to 192.168.5.134 on the DNS proxy.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dns proxy nameserver 192.168.5.134
```

The following example sets the IPv6 address of a DNS server to 2001::1 on the DNS proxy.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dns proxy nameserver 2001::1
```

1.11 ip dns proxy port-range

Function

Run the **ip dns proxy port-range** command to configure the range of a port used for query in upper-level DNS servers.

Run the **no** form of this command to restore the default configuration.

The default port range is from 55000 to 58000.

Syntax

ip dns proxy port-range *port-min port-max*

no ip dns proxy port-range

Parameter Description

port-min: Minimum value of the port range. The value range is from 1025 to 65535. The default value is 55000.

port-max: Maximum value of the port range. The value range is from 1025 to 65535. The default value is 58000.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command can be used to adjust the range of a port used for query in upper-level DNS servers.

If the port range is too small, the concurrent processing performance of the device is affected. On the contrary, if the port range is too large, excessive flow table entry resources will be occupied and the egress device needs to adjust the flow table restriction synchronously.

Examples

The following example configures the range of a port used for query in the upper-level DNS servers to 30000 to 35000.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip dns proxy port-range 30000 35000
```

1.12 ip dns proxy ttl

Function

Run the **ip dns proxy ttl** command to configure the time to live (TTL) of the reply packet in response to a static entry.

Run the **no** form of this command to restore the default configuration.

The default TTL of the reply packet in response to a static entry is 3,600 seconds.

Syntax

ip dns proxy ttl *ttl*

no ip dns proxy ttl

Parameter Description

ttl: TTL of the reply packet in response to a static entry, in seconds. The value range is from 10 to 65535, and the default value is 3600.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

1 IPv6 Basics Commands

Command	Function
clear ipv6 neighbors	Clear dynamically learned neighbor discovery (ND) entries.
ipv6 address	Configure an IPv6 address.
ipv6 address autoconfig	Enable IPv6 stateless address auto-configuration on an interface.
ipv6 icmp error-interval	Configure the transmission rate of other ICMPv6 error messages.
ipv6 enable	Enable the IPv6 protocol on an interface.
ipv6 gateway	Configure the IPv6 default gateway for a management interface.
ipv6 general-prefix	Configure an IPv6 general prefix.
ipv6 hop-limit	Configure the hop limit for unicast packets.
ipv6 icmp source	Configure a specified source address for sending ICMPv6 packets.
ipv6 mtu	Configure the MTU for IPv6 packets.
ipv6 nd cache interface-limit	Configure the maximum number of neighbor cache entries that can be learned by an interface.
ipv6 nd dad attempts	Configure the number of neighbor solicitation (NS) packets to be sent consecutively during duplicate address detection (DAD).
ipv6 nd dad learning enable	Enable an interface to learn ND entries via DAD NS packets.
ipv6 nd dad retry	Configure the DAD interval.
ipv6 nd log enable	Enable ND logging.
ipv6 nd log rate	Configure the ND logging rate.
ipv6 nd managed-config-flag	Configure the Managed address configuration flag bit in the RA packets.
ipv6 nd max-opt	Configure the number of ND options supported by the device.

ipv6 nd ns-interval	Configure the NS packet retransmission interval.
ipv6 nd other-config-flag	Configure the Other stateful configuration flag bit in the RA packets.
ipv6 nd prefix	Configure the address prefix to be contained in the RA packets.
ipv6 nd packet rate-statistics interval	Configure the interval for collecting ND packet rate statistics.
ipv6 nd ra dns server suppress	Configure RA packets not to carry the RDNSS option.
ipv6 nd ra dns server sequence	Configure the address of the DNS recursive query server in RA packets.
ipv6 nd ra dns search-list suppress	Configure RA packets not to carry the DNSSL option.
ipv6 nd ra dns search-list sequence	Configure the DNS suffix to be contained in an RA packet.
ipv6 nd ra-hoplimit	Configure the hop limit for RA packets to be sent by an interface.
ipv6 nd ra-interval	Configure the interval for sending RA packets on an interface.
ipv6 nd ra-lifetime	Configure the router lifetime in RA packets to be sent on an interface.
ipv6 nd ra-mtu	Configure the MTU for RA packets to be sent on an interface.
ipv6 nd ra-url	Configure the Uniform Resource Locator (URL) for RA packets to be sent on an interface.
ipv6 nd ra-url	Configure the URL option type value for RA packets to be sent.
ipv6 nd reachable-time	Configure the duration in which the device considers a neighbor reachable.
ipv6 nd resolve vlan	Configure the device to actively send NS packets to a specific sub VLAN in a super VLAN.
ipv6 nd stale-time	Configure the duration in which a neighbor keeps in stale state.
ipv6 nd suppress-auth-vlan-ns	Configure an interface not to send NS packets to an authenticated VLAN.
ipv6 nd suppress-ra	Configure an interface not to send RA packets.

ipv6 nd unresolved	Configure the maximum number of unresolved ND entries.
ipv6 neighbor	Configure a static neighbor entry.
ipv6 ns-linklocal-src	Configure the link-local address as the source address for sending NS packets.
ipv6 redirects	Enable the ICMPv6 redirection function.
ipv6 source-route	Configure the device to forward IPv6 packets carrying the routing header.
local-proxy-nd enable	Enable the local ND proxy function on an interface.
show ipv6 address	Display the information about an IPv6 address.
show ipv6 general-prefix	Display the prefix information in a general prefix.
show ipv6 interface	Display the information about an IPv6 interface.
show ipv6 nd	Display the statistics on IPv6 ND packets.
show ipv6 neighbors	Display IPv6 neighbor tables.
show ipv6 neighbors statistics	Display the statistics on IPv6 neighbor tables.
show ipv6 packet statistics	Display the statistics on IPv6 packets.
show ipv6 raw-socket	Displays all IPv6 raw sockets.
show ipv6 routers	Display neighbor router information and RA packets.
show ipv6 sockets	Display all IPv6 raw sockets.
show ipv6 udp	Display all IPv6 UDP sockets.
show ipv6 udp statistics	Display the statistics on IPv6 UDP sockets.

1.1 clear ipv6 neighbors

Function

Run the **clear ipv6 neighbors** command to clear dynamically learned neighbor discovery (ND) entries.

Syntax

clear ipv6 neighbors [**vrf** *vrf-name*] [**oob**] [*interface-type interface-number*]

Parameter Description

vrf *vrf-name*: Specifies the name of a virtual routing and forwarding (VRF) instance. If this parameter is not specified, it indicates the public network instance.

oob: Clears all the ND entries dynamically learned via the Neighbor Discovery Protocol (NDP) on the management interface.

interface-type interface-number: Interface type and interface number. After this parameter is specified, the dynamic ND entries of a specified interface will be deleted.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

Static ND entries will not be cleared.

When this command is run in gateway authentication mode, the device will not delete dynamic ND entries in authenticated VLANs.

Examples

The following example clears all the dynamically learned ND entries.

```
Hostname> enable
Hostname# clear ipv6 neighbors
```

The following example clears all the dynamically learned ND entries on the management interface.

```
Hostname> enable
Hostname# clear ipv6 neighbors oob
```

The following example clears all the dynamically learned ND entries on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# clear ipv6 neighbors gigabitEthernet 0/1
```

1.2 ipv6 address

Function

Run the **ipv6 address** command to configure an IPv6 address.

Run the **no** form of this command to remove this configuration.

No IPv6 address is configured by default.

Syntax

ipv6 address *ipv6-address*/*prefix-length*

no ipv6 address *ipv6-address*/*prefix-length*

ipv6 address *ipv6-prefix*/*prefix-length* **eui-64**

no ipv6 address *ipv6-prefix*/*prefix-length* **eui-64**

ipv6 address *prefix-name sub-bits*/*prefix-length* [**eui-64**]

no ipv6 address *prefix-name sub-bits*/*prefix-length* [**eui-64**]

no ipv6 address

Parameter Description

ipv6-address: IPv6 address, which must comply with the address format defined in RFC 4291. Separated by a colon (:), each address field consists of 16 bits and is represented by hexadecimal digits.

ipv6-prefix: IPv6 address prefix, which must comply with the address format defined in RFC 4291. Separated by a colon (:), each address field consists of 16 bits and is represented by hexadecimal digits.

prefix-length: Length of an IPv6 address prefix, that is, the network address part in an IPv6 address.

prefix-name: Name of a general prefix. This specified general prefix is used to generate an interface address.

sub-bits: Subprefix bits and host bits. This value is combined with the prefix in the general prefix to generate an interface address. This value must be represented in the form of colon hexadecimal notation as documented in RFC 4291.

eui-64: Indicates that the generated IPv6 address consists of the configured address prefix and 64-bit interface ID.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If an IPv6 interface is created and the link is in up state, the system automatically generates a link-local address for this interface.

The IPv6 address of an interface can also be generated using the general prefix mechanism. That is, IPv6 address = General prefix + Sub prefix + Host bits. The general prefix can be configured by running the **ipv6 general-prefix** command or learned by the prefix discovery (PD) function of the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) client. For details, see "Configuring DHCPv6" in the *IP Configuration Guide*. The sub prefix + host bits are specified by the *sub-bits/prefix-length* parameter in this command.

Caution

- If an interface is bound to a multiprotocol VRF instance configured with no IPv6 address family, no IPv6 address can be configured for this interface. You can configure an IPv6 address for this interface only after configuring an IPv6 address family for the multiprotocol VRF instance.
- Anycast addresses (such as 1000:1::100/120 and 1000::/64) cannot be configured as interface IPv6 addresses. Exceptionally, anycast addresses with a subnet prefix of 127 or greater can be configured.

Examples

The following example sets the IPv6 address to 2001:1::1/64 for port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 address 2001:1::1/64
```

The following example configures an address for port GigabitEthernet 0/1 by using the general prefix my-prefix and setting the subprefix bits and host bits to 0:0:0:7272::72/64.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 address my-prefix 0:0:0:7272::72/64
```

Note

Assume that the prefix configured by using the general prefix my-prefix is 2001:1111:2222::/48. The generated interface IPv6 address is 2001:1111:2222:7272::72/64.

1.3 ipv6 address autoconfig

Function

Run the **ipv6 address autoconfig** command to enable IPv6 stateless address auto-configuration on an interface.

Run the **no** form of this command to disable this feature.

The IPv6 stateless address auto-configuration is disabled on an interface by default.

Syntax

ipv6 address autoconfig [**default**]

no ipv6 address autoconfig

Parameter Description

default: Generates a default route for the address that is automatically configured under stateless conditions. Only one L3 interface on a device can use the **default** keyword. No default route is generated by default.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Caution

If an interface is bound to a multiprotocol VRF instance not configured with the IPv6 address family, the IPv6 stateless address auto-configuration cannot be enabled on the interface. You can enable the IPv6 stateless address auto-configuration on this interface only after configuring an IPv6 address family for the multiprotocol VRF instance.

Stateless address auto-configuration means that, when a device receives a router advertisement (RA) packet, an interface address in EUI-64 format can be automatically generated using prefix information in the RA packet.

If the RA packet received contains **other-config-flag**, the interface will get other configuration parameters such as the IPv6 address of the domain name system (DNS) server and the IPv6 address of the Network Time Protocol (NTP) server through DHCPv6.

Examples

The following example enables the IPv6 stateless address auto-configuration on port GigabitEthernet 0/1 and generates a default route.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 address autoconfig default
```

1.4 ipv6 icmp error-interval

Function

Run the **ipv6 icmp error-interval** command to configure the transmission rate of other ICMPv6 error messages.

Run the **no** form of this command to restore the default configuration.

Ten ICMPv6 error messages are transmitted in 100 ms by default.

Syntax

ipv6 icmp error-interval [**too-big**] *interval* [*bucket-size*]

no ipv6 icmp error-interval [**too-big**] *interval* [*bucket-size*]

Parameter Description

too-big: Specifies the transmission rate of ICMPv6 Packet Too Big messages.

interval: Refresh cycle of a token bucket, in ms. The value range is from 0 to 2147483647, and the default value is **100**. If the value is **0**, the transmission rate of ICMPv6 error messages is not restricted.

bucket-size: Number of tokens contained in a token bucket. The value range is from 1 to 200, and the default value is **10**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To prevent denial of service (DoS) attacks, you can use the token bucket algorithm to restrict the transmission rate of ICMPv6 error messages.

If the length of an IPv6 packet to be forwarded exceeds the IPv6 maximum transmission unit (MTU) of the outbound interface, the router discards this IPv6 packet and sends an ICMPv6 Packet Too Big message to the source IPv6 address. This error message is mainly used for IPv6 PMTUD. When there are too many other

ICMPv6 error messages, the ICMPv6 Packet Too Big message cannot be sent, causing the failure of IPv6 PMTUD. Therefore, you are advised to restrict the transmission rate of ICMPv6 Packet Too Big messages and other ICMPv6 error packets separately.

Note

Although ICMPv6 Redirect packets are not a type of ICMPv6 error messages, the device limit the transmission rate of other ICMPv6 error messages, together with ICMPv6 Redirect packets.

Since the precision of the timer is 10 milliseconds, you are advised to set the refresh cycle of a token bucket to an integer multiple of 10 milliseconds. If the refresh cycle is set to a value greater than 0 and smaller than 10 milliseconds, the refresh cycle that actually takes effect is 10 milliseconds. For example, if the transmission rate is set to 1 packet per 5 milliseconds, two ICMP error packets are actually sent per 10 milliseconds. If the refresh cycle is not an integral multiple of 10 milliseconds, the refresh cycle that actually takes effect is automatically converted into an integral multiple of 10 milliseconds. For example, if the transmission rate is set to 3 packets per 15 milliseconds, two ICMP error packets are actually sent per 10 milliseconds.

Examples

The following example sets the transmission rate of ICMPv6 Packet Too Big messages to 100 pps.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 icmp error-interval too-big 1000 100
```

The following example sets the transmission rate of other ICMPv6 error messages to 10 pps.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 icmp error-interval 1000 10
```

1.5 ipv6 enable

Function

Run the **ipv6 enable** command to enable the IPv6 protocol on an interface.

Run the **no** form of this command to disable this feature.

The IPv6 protocol is disabled on an interface by default.

Syntax

ipv6 enable

no ipv6 enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

There are two ways to enable the IPv6 function on an interface:

- Configure the **ipv6 enable** command on an interface;
- Directly configure an IPv6 address on an interface.

Caution

If an interface is bound to a multiprotocol VRF instance configured with no IPv6 address family, IPv6 cannot be enabled on this interface. You can enable IPv6 on this interface only after configuring an IPv6 address family for the multiprotocol VRF instance.

If an IPv6 address is configured on an interface, IPv6 is automatically enabled on this interface and cannot be disabled even when you run the **no ipv6 enable** command.

Examples

The following example enables the IPv6 function on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 enable
```

1.6 ipv6 gateway

Function

Run the **ipv6 gateway** command to configure the IPv6 default gateway for a management interface.

No IPv6 default gateway is configured for a management interface by default.

Syntax

ipv6 gateway *ipv6-address*

Parameter Description

ipv6-address: IPv6 default gateway address of a management interface.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The type of a management interface is MGMT and the interface number is fixed to 0.

Examples

The following example sets the IPv6 default gateway of a management interface to 2001:1::1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface mgmt 0
Hostname(config-if-MGMT 0)# ipv6 gateway 2001:1::1
```

1.7 ipv6 general-prefix

Function

Run the **ipv6 general-prefix** command to configure an IPv6 general prefix.

Run the **no** form of this command to remove this configuration.

No IPv6 general prefix is configured by default.

Syntax

ipv6 general-prefix *prefix-name ipv6-prefix/prefix-length*

no ipv6 general-prefix *prefix-name ipv6-prefix/prefix-length*

Parameter Description

prefix-name: Name of a general prefix.

ipv6-prefix/prefix-length: Network prefix value and prefix length of the general prefix.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

A general prefix can facilitate network numbering. The prefix defined in a general prefix can be referenced by a longer specific prefix. When the general prefix changes, the specific prefixes that reference the general prefix will change accordingly. When a network ID changes, only the general prefix needs to be changed.

A general prefix can contain several prefixes.

Examples

The following example configures a general prefix named my-prefixIPv6, with the network prefix value of 2001:1111:2222::/48.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 general-prefix my-prefix 2001:1111:2222::/48
```

1.8 ipv6 hop-limit

Function

Run the **ipv6 hop-limit** command to configure the hop limit for unicast packets.

Run the **no** form of this command to restore the default configuration.

The default hop limit for unicast packets is 64.

Syntax

ipv6 hop-limit *hop*

no ipv6 hop-limit

Parameter Description

hop: Hop limit value. The value range is from 1 to 255.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is effective to unicast packets only.

Examples

The following example sets the hop limit for unicast packets to 100.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 hop-limit 100
```

1.9 ipv6 icmp source

Function

Run the **ipv6 icmp source** command to configure a specified source address for sending ICMPv6 packets.

Run the **no** form of this command to restore the default configuration.

No specified source address is configured for ICMPv6 packets by default.

Syntax

ipv6 icmp source [**vrf** *vrf-name*] *ipv6-address*

no ipv6 icmp source

Parameter Description

vrf *vrf-name*: Specifies a VRF instance.

ipv6-address: IPv6 address used to send packets.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

In a network with a large number of IPv6 addresses configured, it is complex for receivers to recognize the device, from which an ICMPv6 packet is sent. To simplify the judgment, you can configure a specified source address for ICMPv6 packets. You can choose a specified address, like the address of the loopback interface, as the source address of ICMPv6 packets.

Examples

The following example sets the source address of ICMPv6 reply packets to 1001::1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 icmp souce 1001::1
```

1.10 ipv6 mtu

Function

Run the **ipv6 mtu** command to configure the MTU for IPv6 packets.

Run the **no** form of this command to restore the default configuration.

The MTU value of IPv6 packets is the same as the value configured by running the **mtu** command on an interface by default.

Syntax

ipv6 mtu *mtu*

no ipv6 mtu

Parameter Description

mtu: MTU of IPv6 packets. The value range is from 1280 to 1500.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If the size of an IPv6 packet exceeds the IPv6 MTU size, the packet will be fragmented.

For all devices in the same physical network segment, the IPv6 MTU of interconnected interfaces must be the same.

Examples

The following example sets the IPv6 MTU of port gigabitEthernet 0/1 to 1400 bytes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 mtu 1400
```

1.11 ipv6 nd cache interface-limit

Function

Run the **ipv6 nd cache interface-limit** command to configure the maximum number of neighbor cache entries that can be learned by an interface.

Run the **no** form of this command to restore the default configuration.

The number of neighbor cache entries that can be learned by an interface is not limited by default.

Syntax

ipv6 nd cache interface-limit *limit*

no ipv6 nd cache interface-limit

Parameter Description

limit: Maximum number of neighbor cache entries that can be learned by an interface, including static and dynamic neighbor cache entries. The value range is from 1 to 8000.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Restricting the number of neighbor cache entries that can be learned by an interface can prevent malicious neighbor attacks. If this number is not restricted, a large number of neighbor cache entries will be generated on the device, occupying excessive memory space. The configured value must be equal to or greater than the number of the neighbor cache entries learned by the current interface. Otherwise, the configuration does not take effect. The configuration is subject to the ND entry capacity supported by the device.

Examples

The following example sets the maximum number of neighbor cache entries that can be learned by port GigabitEthernet 0/1 to 100.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd cache interface-limit 100
```

1.12 ipv6 nd dad attempts

Function

Run the **ipv6 nd dad attempts** command to configure the number of neighbor solicitation (NS) packets to be sent consecutively during duplicate address detection (DAD).

Run the **no** form of this command to restore the default configuration.

The default number of NS packets to be sent consecutively during DAD is **1**.

Syntax

ipv6 nd dad attempts *attempts*

no ipv6 nd dad attempts

Parameter Description

attempts: Number of NS packets. The value range is from 0 to 600, and the default value is **1**. When the parameter is set to **0**, DAD is not enabled for the IPv6 address of this interface.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

You need to enable DAD before configuring an IPv6 address for an interface. At this moment, the address is in tentative state. If no address conflict is detected by DAD, this address can be correctly used. If an address conflict is detected and the interface ID of this address is an EUI-64 ID, duplicate link-layer addresses exist on this link. In this case, the system automatically disables this interface to prevent IPv6-related operations on this interface. At the time, you must configure a new address for the interface and disable and then enable the interface to start DAD again.

When an interface changes from the down state to the up state, DAD is re-enabled on this interface.

Examples

The following example configures three NS packets to be sent consecutively during DAD on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd dad attempts 3
```

1.13 ipv6 nd dad learning enable

Function

Run the **ipv6 nd dad learning enable** command to enable an interface to learn ND entries via DAD NS packets.

Run the **no** form of this command to restore the default configuration.

The function of learning ND entries via DAD NS packets by an interface is disabled by default.

Syntax

ipv6 nd dad learning enable

no ipv6 nd dad learning enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

After this function is configured on an interface, the interface will create an ND entry in stale state when receiving a DAD NS packet.

By default, a general interface is disabled to learn ND entries via DAD NS packets but interfaces in a super VLAN are allowed to do so.

Examples

The following example enables the function of learning ND entries via DAD NS packets on VLAN 1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface VLAN 1
Hostname(config-if-VLAN 1)# ipv6 nd dad learning enable
```

1.14 ipv6 nd dad retry

Function

Run the **ipv6 nd dad retry** command to configure the DAD interval.

Run the **no** form of this command to restore the default configuration.

The default DAD interval is 60s.

Syntax

ipv6 nd dad retry *retry*

no ipv6 nd dad retry

Parameter Description

retry: DAD interval after an address conflict is detected, in seconds. The value range is from 0 to 7200. If this value is set to **0**, the repeated DAD is disabled.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You need to enable DAD before configuring an IPv6 address on an interface. If an address conflict is detected, the device will not receive IPv6 packets destined for this address.

With this command, the software will conduct DAD again on the conflicting address at the configured interval. If no address conflict is detected, this address can be normally used.

Examples

The following example sets the DAD interval to 10s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd dad retry 10
```

Function

Run the **ipv6 nd ns-interval** command to configure the NS packet retransmission interval.

Run the **no** form of this command to restore the default configuration.

The default NS packet retransmission interval of an interface is not specified when the interval is filled in the RA packets, and 1000 ms when it is used to control the interval for the device to transmit NS packets.

Syntax

ipv6 nd ns-interval *interval*

no ipv6 nd ns-interval

Parameter Description

interval: NS packet retransmission interval, in milliseconds. The value range is from 1000 to 4294967295, and the default value is **1000**.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The configured value is advertised in an RA packet and is also used on the device.

Examples

The following example sets the NS packet retransmission interval to 2s on SVI 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# ipv6 nd ns-interval 2000

Function

Run the **ipv6 nd prefix** command to configure the address prefix to be contained in the RA packets.

Run the **no** form of this command to remove this configuration.

By default, the prefix in an RA packet on an interface is the prefix configured using the **ipv6 address** command on the interface.

Syntax

ipv6 nd prefix { *ipv6-prefix*/*prefix-length* | **default** } [*valid-lifetime* { **infinite** | *preferred-lifetime* } | **at** *valid-date preferred-date* | **infinite** { **infinite** | *preferred-lifetime* }] [**no-advertise**] | [[**off-link**] [**no-autoconfig**] | **pool** *pool-name* | **preference** { **high** | **medium** | **low** } [**proxy**]]

no ipv6 nd prefix { *ipv6-prefix/prefix-length* | **default** }

Parameter Description

ipv6-prefix/*prefix-length*: IPv6 address prefix and prefix length, which must comply with the address representation format in RFC 4291.

valid-lifetime: Lifetime of a prefix considered valid by a host after the host receives the prefix in an RA packet, in seconds. The value range is from 0 to 4294967295. The default value is **2592000** seconds, that is, 30 days.

preferred-lifetime: Preferred lifetime of a prefix considered valid by a host after the host receives the prefix in an RA packet, in seconds. The value range is from 0 to 4294967295. The default value is **604800** seconds, that is, 7 days.

valid-date preferred-date: End time, before which the prefix in an RA packet is considered valid. The end time uses the format of dd+mm+yyyy+hh+mm.

preferred-date: Preferred end time, before which the prefix in an RA packet is considered valid. The end time uses the format of dd+mm+yyyy+hh+mm.

infinite: Indicates that it is permanently valid.

default: Configures the default parameter settings.

no-advertise: Indicates that the prefix is not advertised by a router.

off-link: If the prefix of the destination address in an IPv6 packet sent by a host matches the configured prefix, the destination address is considered on the same link (on-link) and directly reachable. This parameter indicates that this prefix is not used for on-link determination.

no-autoconfig: Indicates that the prefix in an RA packet received by a host cannot be used for address auto-configuration.

pool *pool-name*: Configures a specific prefix pool to be bound to an interface to ensure that different IPv6 prefixes are allocated to different users.

preference: Sets the routing priority. The value is **high**, **medium**, or **low**. The default value is **medium**.

proxy: Enables the ND proxy based on the prefix.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command can be used to configure parameters for each prefix individually and determine whether to advertise a prefix.

By default, the prefix in an RA packet on an interface is the prefix configured using the **ipv6 address** command on the interface. To add other prefixes, run this command.

The **ipv6 nd prefix default** command is used to configure the default parameters on this interface. That is, if no parameter is specified when a prefix is added, the parameters configured using the **ipv6 nd prefix default** command will be used as the parameters of the new prefix. The default parameter configurations are abandoned once a parameter is specified for the prefix. That is, the use of the **ipv6 nd prefix default** command will not modify the configuration specified for a prefix, but only modify the configuration of a prefix that fully uses default parameter configurations.

The value of **at** *valid-date preferred-date* can be specified for a prefix in two ways: (1) specifying a fixed time length for each prefix in an RA packet; (2) specifying the end time. The valid lifetime of the prefix in each RA packet decreases till it becomes 0.

If no parameter is specified when a prefix is added, the default parameter configurations will apply. That is, this prefix is also not available for address auto-configuration.

Examples

The following example configures the prefix of an address included in an RA packet to 2001::/64 and valid lifetime to 2,592000 seconds on VLAN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# ipv6 nd prefix 2001::/64 infinite 2592000
```

The following example configures the prefix of an address included in an RA packet not to be used for address auto-configuration on VLAN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# ipv6 nd default no-autoconfig
```

1.22 ipv6 nd packet rate-statistics interval

Function

Run the **ipv6 nd packet rate-statistics interval** command to configure the interval for collecting ND packet rate statistics.

Run the **no** form of this command to restore the default configuration.

The ND packet rate statistics collection is disabled by default.

Syntax

ipv6 nd packet rate-statistics interval *interval*

no ipv6 nd packet rate-statistics interval

Parameter Description

interval: Sampling interval, in seconds. The value range is from 60 to 86400.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This configuration can modify the interval for collecting ND packet rate statistics. For example, if the interval is set to 60, the ND packet rate is calculated once every 60 seconds.

Examples

The following example sets the interval for collecting ND packet rate statistics to 60 seconds.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd packet rate-statistics interval 60
```

1.23 ipv6 nd ra dns server suppress

Function

Run the **ipv6 nd ra dns server suppress** command to configure RA packets not to carry the RDNSS option.

Run the **no** form of this command to remove this configuration.

An RA packet does not carry the RDNSS option by default.

Syntax

ipv6 nd ra dns server suppress

no ipv6 nd ra dns server suppress

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The RDNSS option can provide IPv6 terminals with the address of the DNS recursive query server.

Examples

The following example configures RA packets to carry the RDNSS option on SVI 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# no ipv6 nd ra dns server suppress
```

1.24 ipv6 nd ra dns server sequence

Function

Run the **ipv6 nd ra dns server sequence** command to configure the address of the DNS recursive query server in RA packets.

Run the **no** form of this command to remove this configuration.

The address of the DNS recursive query server in RA packets is not configured by default.

Syntax

ipv6 nd ra dns server *ipv6-address* { *valid-lifetime* | **infinite** } **sequence** *number*

no ipv6 nd ra dns server *ipv6-address* { *valid-lifetime* | **infinite** } **sequence** *number*

Parameter Description

ipv6-address: IPv6 address, which must comply with the address format defined in RFC 4291. Separated by a colon (:), each address field consists of 16 bits and is represented by hexadecimal digits.

valid-lifetime: Lifetime of the RDNSS option considered valid by a host after the host receives the RDNSS option in an RA packet, in seconds. The value range is from 0 to 4294967295. When the parameter is set to **0**, the RDNSS option is no longer used.

infinite: Indicates that it is permanently valid.

sequence *number*: Indicates a sequence number, which represents the serial number of the same RDNSS option in an RA packet. The value range is from 0 to 7.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Only one option can be configured with the same sequence number under the same interface, and the same IPv6 address can only be used by one sequence number.

When configured, the RDNSS options are advertised through RA packet, and are organized in the descending order of sequence numbers.

Examples

The following example configures RA packets to carry the RDNSS options, sets the address of the DNS recursive query server to 2018::1 and be permanently valid, and sets the sequence number to 0 on VLAN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)#interface vlan 1
Hostname(config-if-VLAN 1)# no ipv6 nd ra dns server suppress
Hostname(config-if-VLAN 1)# ipv6 nd ra dns server 2018::1 infinite sequence 0
Hostname(config-if-VLAN 1)# ipv6 nd ra dns server 2020::1 1000 sequence 1
```

1.26 ipv6 nd ra dns search-list sequence

Function

Run the **ipv6 nd ra dns search-list sequence** command to configure the DNS suffix to be contained in an RA packet.

Run the **no** form of this command to remove this configuration.

The DNS suffix to be contained in an RA packet is not configured by default.

Syntax

ipv6 nd ra dns search-list *ipv6-domain-name* { *valid-lifetime* | **infinite** } **sequence** *number*

no ipv6 nd ra dns search-list *ipv6-domain-name* { *valid-lifetime* | **infinite** } **sequence** *number*

Parameter Description

ipv6-domain-name: DNS suffix. It is a string of 1 to 64 characters.

valid-lifetime: Lifetime of the DNSSL option considered valid by a host after the host receives the DNSSL option in an RA packet, in seconds. The value range is from 0 to 4294967295. The default value is **1800**. When the value is set to **0**, it is no longer used.

infinite: Indicates that it is permanently valid.

number: Indicates a sequence number, which represents the serial number of the same DNSSL option in an RA packet.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Only one domain name option can be configured with the same sequence number under the same interface, and the same domain name can only be used by one sequence number.

When configured, the DNSSL option is advertised through RA packets, and are organized in the descending order of sequence numbers.

Examples

The following example enables RA packets to carry the DNSSL option, sets the DNS suffix to text.com.cn, configures the suffix to be permanently valid, and sets the sequence number to 0 on SVI 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)#interface vlan 1
Hostname(config-if-VLAN 1)# no ipv6 nd ra dns search-list suppress
Hostname(config-if-VLAN 1)# ipv6 nd ra dns search-list test.com.cn infinite sequence
0

1.28 ipv6 nd ra-interval

Function

Run the **ipv6 nd ra-interval** command to configure the interval for sending RA packets on an interface.

Run the **no** form of this command to restore the default configuration.

The default interval for sending RA packets on an interface is 600s.

Syntax

ipv6 nd ra-interval { *interval* | **min-max** *min-interval max-interval* }

no ipv6 nd ra-interval

Parameter Description

interval: Interval for sending RA packets, in seconds. The value range is from 3 to 1800.

min-max: Sets the maximum and minimum intervals for sending RA packets.

min-interval: Minimum interval for sending RA packets, in seconds. The value range is from 3 to 1800.

max-interval: Maximum interval for sending RA packets, in seconds. The value range is from 4 to 1800.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When a device acts as a default routing device, the configured interval value cannot be greater than the lifetime of a router.

In addition, to prevent network bandwidth from being consumed by other devices sending RA packets at the same time on the link, the actual interval will fluctuate around this value by ±20%.

If **min-max** is specified, then the actual interval will be randomly selected between the minimum and maximum values.

Examples

The following example sets the interval for sending RA packets to 110 seconds on port GigabitEthernet 0/1.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd ra-interval 110
```

The following example sets the interval for sending RA packets to a value in the range of 110 seconds to 120 seconds on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd ra-interval min-max 110 120
```

1.29 ipv6 nd ra-lifetime

Function

Run the **ipv6 nd ra-lifetime** command to configure the router lifetime in RA packets to be sent on an interface.

Run the **no** form of this command to restore the default configuration.

The default router lifetime in RA packets to be sent on an interface is 1800 seconds.

Syntax

ipv6 nd ra-lifetime *lifetime*

no ipv6 nd ra-lifetime

Parameter Description

lifetime: Lifetime of a device acting as a default device of this interface, in seconds. The value range is from 0 to 9000.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The router lifetime (**Ra-lifetime**) field exists in each RA packet. This value indicates the amount of time that a host in the link where the interface is located can use the device as the default device. If this parameter is set to **0**, the device is no longer used as the default device. If this parameter is set to a non-zero value, this value must be greater than or equal to the interval for sending RA packets (**Ra-interval**).

Examples

The following example sets the lifetime in RA packets to 2000 seconds on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd ra-lifetime 2000
```

Function

Run the **ipv6 nd ra-mtu** command to configure the MTU for RA packets to be sent on an interface.

Run the **no** form of this command to restore the default configuration.

The default MTU of RA packets is the IPv6 MTU value of a network interface.

Syntax

ipv6 nd ra-mtu *ra-mtu*

no ipv6 nd ra-mtu

Parameter Description

ra-mtu: Value of the MTU field in an RA packet, in bytes. The value range is from 0 to 1500.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If this parameter is set to **0**, an RA packet does not carry the MTU option.

Examples

The following example sets the MTU of RA packets to be sent to 1400 bytes on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd ra-mtu 1400
```

1.33 ipv6 nd reachable-time

Function

Run the **ipv6 nd reachable-time** command to configure the duration in which the device considers a neighbor reachable.

Run the **no** form of this command to restore the default configuration.

The default duration in which the device considers a neighbor reachable is 30000 ms (30s).

Syntax

ipv6 nd reachable-time *time*

no ipv6 nd reachable-time

Parameter Description

time: Duration in which the device considers a neighbor reachable, in milliseconds. The value range is from 0 to 3600000.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

A device detects unreachable neighbors based on the configuration. A shorter duration indicates that the device detects unreachable neighbors more quickly but more network bandwidth and device resources will be consumed. Therefore, you are not advised to set the duration to a very small value.

The configured value is advertised in an RA packet and is also used on the device. If the value is **0**, the duration is not specified on the device and the default value is used.

Examples

The following example sets the duration in which a neighbor is considered reachable to 1000 seconds on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd reachable-time 1000000
```

1.34 ipv6 nd resolve vlan

Function

Run the **ipv6 nd resolve vlan** command to configure the device to actively send NS packets to a specific sub VLAN in a super VLAN.

Run the **no** form of this command to disable this feature.

Run **default** form of this command to restore the default configuration.

The device is not configured to actively send NS packets to a specific sub VLAN in a super VLAN by default.

Syntax

ipv6 nd resolve vlan { *vlan-list* | **none** }

no ipv6 nd resolve vlan { *vlan-list* | **none** }

default ipv6 nd resolve vlan

Parameter Description

vlan-list: Sub VLAN segment, to which the device actively sends NS packets in the Super VLAN. After this parameter is configured, NS requests are sent to these VLAN lists only. The start and end VLANs in a sub VLAN segment are connected by a hyphen (-), and multiple sub VLAN segments are separated by commas (,), for example, 1, 3-5.

none: Indicates that no NS packet will be sent to any sub VLAN in a super VLAN.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

If there are many sub VLANs in a super VLAN, when actively broadcasting and resolving ND requests, the device will send NS packets to the entire super VLAN by default, and the packets will be replicated in large quantities, which will affect the performance of the device.

Most terminals (such as PCs or servers) request the ND tables of the gateway before accessing the network. Therefore, there is no need to actively send NS packets to the sub VLANs where these terminals reside. For dumb terminals (that do not actively send NA packets), this command can be deployed in the VLAN segment specified in *vlan-list*, to enable the device to actively send NS packets to these VLANs in an effort to generate ND entries with reachable state.

Caution

If an authentication-exempt VLAN is configured and the authentication-exempt VLAN is not in the VLAN list configured by running the **ipv6 nd resolve vlan** command, NS packets will not be actively broadcast to the authentication-exempt VLAN.

Examples

The following example configures the device to actively send NS packets to specific sub VLANs 10-20 and 25-30 in a super VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd resolve vlan 10-20, 25-30
```

The following example configures the device not to send NS packets to any sub VLAN in a super VLAN.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd resolve vlan none
```

1.35 ipv6 nd stale-time

Function

Run the **ipv6 nd stale-time** command to configure the duration in which a neighbor keeps in stale state.

Run the **no** form of this command to restore the default configuration.

The default duration in which a neighbor keeps in stale state is 3600s.

Syntax

ipv6 nd stale-time *time*

no ipv6 nd stale-time

Parameter Description

time: Duration in which a neighbor keeps in stale state, in seconds. The value range is from 0 to 86400.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

This command can be used to modify the duration of the stale state. After the duration expires, neighbor unreachability detection (NUD) is performed. A shorter duration indicates that the device detects unreachable neighbors more quickly but more network bandwidth and device resources will be consumed. Therefore, you are not advised to set the duration to a very small value.

This command can be configured on an interface or in global configuration mode. The configuration configured on an interface takes priority over that configured in global configuration mode. That is, if the duration is configured on an interface, the duration configured on the interface applies. Otherwise, the global configuration will apply.

Examples

The following example sets the duration in which a neighbor keeps in stale state to 600s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd stale-time 600
```

The following example sets the duration in which a neighbor keeps in stale state to 600s on SVI 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface VLAN 1
Hostname(config-if-VLAN 1)# ipv6 nd stale-time 600
```

1.38 ipv6 nd unresolved

Function

Run the **ipv6 nd unresolved** command to configure the maximum number of unresolved ND entries.

Run the **no** form of this command to restore the default configuration.

The maximum number of unresolved ND entries is 0 by default, indicating no restriction. That is, the number of unresolved ND entries is subject to the ND entry capacity supported by the device.

Syntax

ipv6 nd unresolved *number*

no ipv6 nd unresolved

Parameter Description

number: Maximum number of unresolved ND entries. The value range is from 1 to 8000.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To prevent malicious scanning attacks from causing the generation of a large number of unresolved ND entries and occupying entry resources, you can restrict the number of unresolved ND entries.

Examples

The following example sets the maximum number of unresolved ND entries to 200.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd unresolved 200
```

1.39 ipv6 neighbor

Function

Run the **ipv6 neighbor** command to configure a static neighbor entry.

Run the **no** form of this command to remove this configuration.

No static neighbor entry is configured by default.

Syntax

ipv6 neighbor *ipv6-address interface-type interface-number mac-address*

no ipv6 neighbor *ipv6-address interface-type interface-number*

Parameter Description

ipv6-address: IPv6 address of a neighbor, which must comply with the address representation format in RFC 4291.

interface-type interface-number: Type and number of the interface to which the neighbor resides.

mac-address: Link address of a neighbor, that is, 48-bit MAC address.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is similar to the **arp** command. A static neighbor entry can be configured on IPv6-enabled interfaces only. If the neighbor entry to be configured has been learned through NDP and stored in the neighbor table, the dynamic neighbor entry will be automatically converted into a static one. An effective static neighbor entry will be always reachable.

An invalid static neighbor entry refers to a static neighbor entry with the configured IPv6 address not matching the address configured on the interface (not within any IPv6 network segment of this interface, or in conflict with the address of this interface). In this case, packets will not be forwarded through the MAC address specified in the static neighbor entry. An invalid static neighbor entry is inactive. You can run the **show ipv6 neighbor static** to display the validity status of this static neighbor entry.

Examples

The following example configures a static neighbor entry on VLAN 1, with the IP address of 2001::1 and MAC address of 00d0.f811.1111.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 neighbor 2001::1 vlan 1 00d0.f811.1111
```

1.40 ipv6 ns-linklocal-src

Function

Run the **ipv6 ns-linklocal-src** command to configure the link-local address as the source address for sending NS packets.

Run the **no** form of this command to remove this configuration.

The link-local address is always used as the source address for sending NS packets by default.

Syntax

ipv6 ns-linklocal-src

no ipv6 ns-linklocal-src

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The **no ipv6 ns-linklocal-src** command is used to cancel configuring the link-local address as the source address for sending NS packets. Instead, a link-local address or global unicast address is used based on the destination IPv6 address according to RFC 3484.

Examples

The following example configures not to use the link-local address as the source address for sending NS packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ipv6 ns-linklocal-src
```

1.41 ipv6 redirects

Function

Run the **ipv6 redirects** command to enable the ICMPv6 redirection function.

Run the **no** form of this command to disable this feature.

The ICMPv6 redirection function is enabled by default.

Syntax

ipv6 redirects

no ipv6 redirects

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example enables the ICMPv6 redirection function on port GigabitEthernet 0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 redirects
```

1.42 ipv6 source-route

Function

Run the **ipv6 source-route** command to configure the device to forward IPv6 packets carrying the routing header.

Run the **no** command to forbid the device from forwarding IPv6 packets carrying the routing header.

IPv6 packets carrying the routing header are not forwarded by default.

Syntax

ipv6 source-route

no ipv6 source-route

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Since the Type 0 routing header may cause the device vulnerable to DoS attacks, the device is forbidden from forwarding IPv6 packets carrying the routing header by default. However, the device still processes IPv6 packets that carry the Type 0 routing header and are finally destined for the device itself.

Examples

The following example configures the device to forward IPv6 packets carrying the routing header.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 source-route
```

1.43 local-proxy-nd enable

Function

Run the **local-proxy-nd enable** command to enable the local ND proxy function on an interface.

Run the **no** form of this command to disable this feature

Local ND proxy is disabled on an interface by default.

Syntax

local-proxy-nd enable [**force**]

no local-proxy-nd enable

Parameter Description

force: Forcibly enables local ND proxy. That is, an interface always serves as a proxy to respond to NS packets regardless of whether the destination device exists.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If L2 access isolation or inter-subnet isolation (such as sub VLANs) is configured, after local ND proxy is enabled on the gateway, the gateway serves as a proxy to process NS packets from downlink users and replies with NA packets containing the gateway's MAC address. Thus, the traffic of communication among these users is forwarded by the gateway atL3.

Examples

The following example enables local ND proxy on SVI 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface VLAN 1
Hostname(config-if-VLAN 1)# local-proxy-nd enable
```

The following example enables forcible local ND proxy on SVI 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface VLAN 1
Hostname(config-if-VLAN 1)# local-proxy-nd enable force
```

1.44 show ipv6 address

Function

Run the **show ipv6 address** command to display the information about an IPv6 address.

Syntax

show ipv6 address [*interface-type interface-number*]

Parameter Description

interface-type interface-number: Interface type and interface number. All IPv6 addresses are displayed by default.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays all configured IPv6 addresses.

```
Hostname> enable
Hostname# show ipv6 addr
Global unicast address limit: 1024, Global unicast address count: 2
Tentative address count: 3,Duplicate address count: 0
Preferred address count: 0,Deprecated address count: 0
 GigabitEthernet 0/5
   2003:1::23/64                        Tentative
 Preferred lifetime: INFINITE, Valid lifetime: INFINITE
   fe80::2d0:f8ff:fefb:deb2/64               Tentative
 Preferred lifetime: INFINITE, Valid lifetime: INFINITE
   2005:1::1111/64                       Tentative
```

```
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
```

The following example displays the IPv6 address configured on port GigabitEthernet 0/1.

```
 Hostname> enable
Hostname# show ipv6 addr gi 0/1
Global unicast address count: 2
Tentative address count: 3,Duplicate address count: 0
Preferred address count: 0,Deprecated address count: 0
   2003:1::23/64                         Tentative
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
   fe80::2d0:f8ff:fefb:deb2/64                Tentative
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
   2005:1::1111/64                        Tentative
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
```

Table 1-1 Output Fields of the show ipv6 address Command

Field	Description
Global unicast address count	Number of global unicast IPv6 address configured on this interface.
Tentative address count	Number of tentative addresses.
Duplicate address count	Number of duplicate addresses.
Preferred address count	Number of preferred addresses.
Deprecated address count	Number of expired addresses.
Preferred lifetime	Preferred lifetime.
Valid lifetime	Valid lifetime.

1.45 show ipv6 general-prefix

Function

Run the **show ipv6 general-prefix** command to display the prefix information in a general prefix.

Syntax

show ipv6 general-prefix

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

After this command is ran, general prefixes that are manually configured and learned by the DHCPV6 client are displayed.

Examples

The following example displays the prefix information in a general prefix.

```
Hostname> enable
Hostname# show ipv6 general-prefix
There is 1 general prefix.
Ipv6 general prefix my-prefix, acquired via Manual configuration
       2001:1111:2222::/48
       2001:1111:3333::/48
```

Table 1-2 Output Fields of the show ipv6 general-prefix Command

Field	Description
There is	Number of current general prefixes.
IPv6 general prefix	Name of a general prefix.
acquired via	Prefix acquisition method.
Prefix/len	Prefix list.

1.46 show ipv6 interface

Function

Run the **show ipv6 interface** command to display the information about an IPv6 interface.

Syntax

show ipv6 interface [[*interface-type interface-number*] [**ra-info**] | **brief** [*interface-type interface-number*]]

Parameter Description

interface-type interface-number: Interface type and interface number. If this parameter is not specified, the information about all IPv6 interfaces is displayed.

ra-info: Displays the parameter information of RA packets on this interface.

brief: Displays the brief information of an interface, including status and address information.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command can be used to display address configuration, ND configuration, and statistics of an IPV6 interface.

Examples

The following example displays the information about an IPv6 interface.

```
Hostname> enable
Hostname# show ipv6 interface vlan 1
Interface vlan 1 is Up, ifindex: 2001
address(es):
Mac Address: 00:00:00:00:00:01
INET6: fe80::200:ff:fe00:1 , subnet is fe80::/64
INET6: 2001::1 , subnet is 2001::/64 [TENTATIVE]
Joined group address(es):
ff01:1::1
ff02:1::1
ff02:1::2
ff02:1::1:ff00:1
MTU is 1500 bytes
ICMP error messages limited to one every 10 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND retransmit interval is 1000 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds<240--160>
ND router advertisements live for 1800 seconds
```

The command output displays the following line: INET6: 2001::1, subnet is 2001::/64 [TENTATIVE]. The flag bits in [ ] after the IPv6 address are defined as follows.

Table 1-3 Output Fields of the show ipv6 interface vlan 1 Command

Field	Description
ANYCAST	Anycast address.
TENTATIVE	DAD is being performed on the address. This address is tentative before the detection ends.
DUPLICATED	A duplicate address has been detected for this address.
DEPRECATED	This address reaches the preferred lifetime, and the address becomes deprecated.
NODAD	No DAD will be performed on this address.
AUTOIFID	The interface identifier for this address is automatically generated by the system, usually, an EUI-64 identifier.
PRE	Automatically configured stateless address.
GEN	Address generated by general prefix.

The following example displays the parameter information of RA packets on the IPv6 interface.

```
Hostname> enable
Hostname# show ipv6 interface vlan 1 ra-info
vlan 1: DOWN
RA timer is stopped
waits: 0, initcount: 3
statistics: RA(out/in/inconsistent): 4/0/0, RS(input): 0
Link-layer address: 00:00:00:00:00:01
Physical MTU: 1500
ND router advertisements live for 1800 seconds
ND router advertisements are sent every 200 seconds<240--160>
Flags: !M!O, Adv MTU: 1500
ND advertised reachable time is 0 milliseconds
ND advertised retransmit time is 0 milliseconds
ND advertised CurHopLimit is 64
Prefixes: (total: 1)
fec0:1:1:1::/64(Def,Auto,vltime:2592000,pltime:604800, flags: LA)
```

Table 1-4 Output Fields of the show ipv6 interface vlan 1 ra-info Command

Field	Description
RA timer is stopped (on)	Whether the RA packet sending timer is started.
waits	Number of RS packets that have been received but not responded to.
initcount	Number of RA packets initially sent when the RA timer restarts.

Field	Description
RA (out/in/inconsistent)	RA packets. ● **Out**: Indicates the number of RA packets sent. ● **In**: Indicates the number of RA packets received. ● **Inconsistent**: Indicates the number of received RA packets with parameters inconsistent with those advertised by the router itself.
RS (input)	Number of RS packets received.
Link-layer address	Link layer address of this interface.
Physical MTU	Link MTU of this interface.
!M | M	● **!M** indicates that the **Managed-config-flag** option is not carried in an RA packet. ● **M** indicates that the **Managed-config-flag** option is carried in an RA packet.
!O | O	● **!O** indicates that the **Other-config-flag** option is not carried in an RA packet. ● **O** indicates that the **Other-config-flag** option is carried in an RA packet.
total	Number of prefixes on this interface.
fec0:1:1:1::/64	Specific prefix.
Def	Default prefix configuration is used for this prefix.
Auto | CFG	● **Auto** indicates that this prefix is automatically generated since the corresponding IPv6 address is configured on an interface. ● **CFG** indicates that this prefix is manually configured.
!Adv	This prefix will not be advertised.
vltime	Valid lifetime of this prefix, in seconds.
pltime	Preferred lifetime of this prefix, in seconds.
L | !L	● **L** indicates that the prefix is On-link. ● **!L** indicates that the prefix is Off-link.
A | !A	● **A** indicates that the prefix can be automatically configured. ● **!A** indicates that the prefix cannot be automatically configured.

The following example displays the brief information of an IPv6 interface.

```
Hostname> enable
Hostname# show ipv6 interface brief
```

```
GigabitEthernet 0/1         [down/down]
       2222::2
       FE80::1614:4BFF:FE5C:ED3A
```

Table 1-5 Output Fields of the show ipv6 interface brief Command

Field	Description
GigabitEthernet 0/1	Interface name.
down/down	Link status or IPv6 protocol status of an interface.
2222::2	Primary IPv6 address of an interface.
FE80::1614:4BFF:FE5C:ED3A	Secondary IPv6 address of an interface.

1.47 show ipv6 nd

Function

Run the **show ipv6 nd** command to display the statistics on IPv6 ND packets.

Syntax

show ipv6 nd [**interface** *interface-type interface-number*] **statistics**

Parameter Description

interface *interface-type interface-number*: Specifies the type and number of an IPv6 interface. After this parameter is configured, ND packet statistics of this interface will be displayed.

statistics: Displays the statistics on ND packets.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the statistics on IPv6 ND packets of SVI 1.

```
Hostname> enable
Hostname# show ipv6 nd interface vlan 1 statistics
interface VLAN 1 is Up, ifindex: 4097, vrf_id 0
 ipv6 interface packet statics:
 stat-type             Router Solicitations           Router advertisements
Neighbor solicitations         Neighbor advertisements
 Received              0                            0                             0
0
 Send                 0                            0                             1
0
 Rate(receive, pps)      0                            0                             0
0
 Rate(send, pps)         0                            0                             0
0
 Interval time: 60s
```

Table 1-6 Output Fields of the show ipv6 nd Command

Field	Description
stat-type	Statistics type: RS/RA/NS/NA packets.
Received	Statistics on received packets.
Send	Statistics on sent packets.
Rate	Packet transmission/receiving rate, in PPS.
Interval time	Sampling interval of ND packets.

1.48 show ipv6 neighbors

Function

Run the **show ipv6 neighbors** command to display IPv6 neighbor tables.

Syntax

show ipv6 neighbors [**vrf** *vrf-name*] [**verbose**] [*interface-type interface-number*] [*ipv6-address*] [**static**] [**oob**]

Parameter Description

vrf *vrf-name*: Specifies a VRF instance.

verbose: Displays detailed neighbor information.

interface-type interface-number: Interface type and interface number. After this parameter is configured, the neighbor table of an interface will be displayed. The neighbor tables of all interfaces are displayed by default.

ipv6-address: IPv6 address. After this parameter is configured, information about a specified neighbor will be displayed.

static: Displays the status of a static neighbor entry.

oob: Displays the IPv6 neighbors of the management interface.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the neighbor table on SVI 1.

```
Hostname> enable
Hostname# show ipv6 neighbors vlan 1
Ipv6 Address Linklayer Addr   Interface
fa::1        00d0.0000.0002   vlan 1
fe80::200:ff:fe00:2  00d0.0000.0002  vlan 1
```

The following example displays details about a neighbor

```
Hostname> enable
Hostname# show ipv6 neighbors verbose
Ipv6 Address  Linklayer Addr Interface
2001::1      00d0.f800.0001 vlan 1
       State: Reach/H Age: - asked: 0
fe80::200:ff:fe00:1    00d0.f800.0001 vlan 1
       State: Reach/H Age: - asked: 0
```

Table 1-7 Output Fields of the show ipv6 neighbors Command

Field	Description
IPv6 Address	IPv6 address of a neighbor.

Field	Description
Linklayer Addr	Link address, that is, MAC address. If this address is not obtained, "incomplete" is displayed.
Interface	Interface where the neighbor resides.
State	Status of the neighbor. ● **INCMP** (Incomplete) indicates that the address resolution of the neighbor is underway, the NS packet has been sent, but no reply packet is received from the neighbor. ● **REACH** (Reachable) indicates that the device is reachable to the neighbor and no additional action is required to send packets to the neighbor. ● **STALE** indicates that the time that the neighbor considered reachable has elapsed. In this state, no additional action is required on the device until a packet is sent to the neighbor. Then, the device performs NUD. ● **DELAY** indicates that a packet is sent to the neighbor in stale state. The neighbor changes from STALE state to DELAY state. If no notification indicating that the neighbor is reachable is received within DELAY_FIRST_PROBE_TIME seconds (5 seconds), then the neighbor will change from DELAY state to PROBE state, and an NS packet will be sent to the neighbor to officially start NUD. ● **PROBE** indicates that NUD has been started to detect the neighbor reachability. NS packets are sent to the neighbor every RetransTimer milliseconds until reply packets are received or the number of NS packets sent reaches the limit MAX_UNICAST_SOLICIT (three NS packets). ● **?** indicates unknown state. ● **/R** indicates that the neighbor is deemed as a device. ● **/H** indicates that the neighbor is deemed as a host.
Age	Amount of time that a neighbor is considered reachable. ● **-** indicates that a neighbor is always reachable. Static neighbor entries will rely on whether they are actually reachable. ● **expired** indicates the amount of time that a neighbor is considered reachable has elapsed and NUD is to be triggered.
Asked	Number of NS packets sent to a neighbor during the resolution of the neighbor's link address.

The following example displays the status of static neighbor entries.

```
Hostname> enable
Hostname# show ipv6 neighbors static
Ipv6 Address    Linklayer Addr  Interface              State
2001:1::1       00d0.f822.33ab  GigabitEthernet 0/14   ACTIVE
2001:2::2       00d0.f822.33ac  VLAN 1                 INACTIVE
```

Table 1-8 Output Fields of the show ipv6 neighbors static Command

Field	Description
IPv6 Address	IPv6 address of a static neighbor entry.
Linklayer Addr	Link address, that is, MAC address.
Interface	Interface where the neighbor resides.
State	Status of a static neighbor entry. The value of **State** includes: ● **ACTIVE**, indicating that a static neighbor entry is active. ● **INACTIVE**, indicating that a static neighbor entry is inactive. When the IPv6 address configured for a static neighbor entry does not match that on the interface (not within any address segment of this interface, or in conflict with the address of this interface), the static neighbor entry is inactive, that is, packets will not be forwarded through the MAC address specified in the static neighbor entry.

1.49 show ipv6 neighbors statistics

Function

Run the **show ipv6 neighbors statistics** command to display the statistics on IPv6 neighbor tables.

Syntax

show ipv6 neighbors [**vrf** *vrf-name*] **statistics** [**all**]

Parameter Description

vrf *vrf-name*: Specifies the name of a VRF instance.

all: Displays the statistics on all IPv6 neighbor tables.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the statistics on global IPv6 neighbor tables.

```
Hostname> enable
Hostname# show ipv6 neighbor statistics
Memory: 0 bytes
Entries: 0
  Static: 0,Dynamic: 0,Local: 0
  Incomplete:0, Reachable:0, Stale:0, Delay:0, Probe:0
```

The following example displays the statistics on all IPv6 neighbor tables.

```
Hostname> enable
Hostname# show ipv6 neighbor statistics all
Ipv6 neighbor table count: 1
Static neighbor count: 0(0 active, 0 inactive)
Total
Memory: 0 bytes
Entries: 0
  Static: 0,Dynamic: 0,Local: 0
  Incomplete:0, Reachable:0, Stale:0, Delay:0, Probe:0;
Global
Memory: 0 bytes
Entries: 0
  Static: 0,Dynamic: 0,Local: 0
  Incomplete:0, Reachable:0, Stale:0, Delay:0, Probe:0;
```

Table 1-9 Output Fields of the show ipv6 neighbors statistics Command

Field	Description
IPv6 neighbor table count	Number of neighbor tables
Static neighbor count	Number of static neighbor entries.
active	Number of active neighbor entries.
inactive	Number of inactive neighbor entries.
Memory	Memory usage.
Entries	Number of neighbor entries.
Static	Number of static entries.
Dynamic	Number of dynamic entries.
Local	Number of entries corresponding to the local IPv6 address.
Incomplete	Number of unresolved entries.

Field	Description
Reachable	Number of reachable neighbor entries.
Stale	Number of entries in stale state.
Delay	Number of entries in the delay state.
Probe	Number of entries in the probe state.

1.50 show ipv6 packet statistics

Function

Run the **show ipv6 packet statistics** command to display the statistics on IPv6 packets.

Syntax

show ipv6 packet statistics [**total** | *interface-type interface-number*]

Parameter Description

total: Specifies the sum of the statistics on all interfaces. If this parameter is not specified, the sum of the statistics of all interfaces as well as the statistics of each interface are displayed.

interface-type interface-number: Interface type and interface number.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the sum of the statistics on IPv6 packets and the statistics of each interface.

```
Hostname> enable
Hostname# show ipv6 pack statistics
Total
```

```
 Received 0 packets, 0 bytes
   Unicast:0,Multicast:0
   Discards:0
     HdrErrors:0(HoplimitExceeded:0,Others:0)
     NoRoutes:0
     Others:0
 Sent 0 packets, 0 bytes
   Unicast:0,Multicast:0
 GigabitEthernet 0/5
 Received 0 packets, 0 bytes
   Unicast:0,Multicast:0
   Discards:0
     HdrErrors:0(HoplimitExceeded:0,Others:0)
     NoRoutes:0
     Others:0
 Sent 0 packets, 0 bytes
   Unicast:0,Multicast:0
```

The following example displays the sum of the statistics on IPv6 packets.

```
Hostname> enable
Hostname# show ipv6 pack statistics total
Total
 Received 0 packets, 0 bytes
   Unicast:0,Multicast:0
   Discards:0
     HdrErrors:0(HoplimitExceeded:0,Others:0)
     NoRoutes:0
     Others:0
 Sent 0 packets, 0 bytes
   Unicast:0,Multicast:0
```

Table 1-10 Output Fields of the show ipv6 pack statistics Command

Field	Description
Total	Sum of the statistics on IPv6 packets of all interfaces.
Received	Number of received IPv6 packets, in bytes.
Unicast	Number of IPv6 unicast packets.
Multicast	Number of IPv6 multicast packets.
Discards	Number of discarded IPv6 packets.
HdrErrors	Number of IPv6 packets discarded due to header error.
HoplimitExceeded	Number of packets discarded due to hop limit overrange during forwarding.
Others	Number of other IPv6 packets discarded due to header error.

Field	Description
NoRoutes	Number of IPv6 packets discarded due to no routing.
Others	Number of IPv6 packets discarded due to other reasons.
Sent	Number of sent IPv6 packets, in bytes.
Unicast	Number of unicast packets.
Multicast	Number of multicast packets.

1.52 show ipv6 routers

Function

Run the **show ipv6 routers** command to display neighbor router information and RA packets.

Syntax

show ipv6 routers [*interface-type interface-number*]

Parameter Description

interface-type interface-number: Interface type and interface number. After this parameter is specified, RA packets received by a specified interface will be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If no interface is specified, then the information about RA packets received by this device is displayed.

Examples

The following example displays neighbor router information and RA packets.

```
Hostname> enable
Hostname# show ipv6 routers
Router FE80::2D0:F8FF:FEC1:C6E1 on VLAN 2, last update 62 sec
  Hops 64, Lifetime 1800 sec, ManagedFlag=0, OtherFlag=0, MTU=1500
  Preference=MEDIUM
  Reachable time 0 msec, Retransmit time 0 msec
  Prefix 6001:3::/64 onlink autoconfig
    Valid lifetime 2592000 sec, preferred lifetime 604800 sec
  Prefix 6001:2::/64 onlink autoconfig
Valid lifetime 2592000 sec, preferred lifetime 604800 sec
```

Table 1-12 Output Fields of the show ipv6 routers Command

Field	Description
Router	Neighbor router, which is described using the IPv6 address and the network interface receiving RA packets.
last update	Time that has elapsed since the last RA packet is received.
Hops	Hop count of RA packets.
Lifetime	Lifetime of the router.
ManagedFlag	Managed flag of the router.
OtherFlag	Other flag of the router.
MTU	MTU of the interface sending RA packets on the router.
Reachable time	Amount of time that the router is considered reachable.
Retransmit time	RA packet retransmission time of the router.
Prefix	Prefix of RA packets.
Valid lifetime	Lifetime of a prefix.
preferred lifetime	Preferred lifetime of a prefix.

1.53 show ipv6 sockets

Function

Run the **show ipv6 sockets** command to display all IPv6 raw sockets.

Syntax

show ipv6 sockets

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display all IPv6 sockets and thus obtain the UDP port and TCP port that provide services for external devices.

Examples

The following example displays all IPv6 sockets.

```
Hostname> enable
Hostname# show ipv6 sockets
Number Process name    Type   Protocol  LocalIP:Port  ForeignIP:Port  State
1     vrrp.elf        RAW    ICMPv6    :::58         :::0            *
2     tcpip.elf       RAW    ICMPv6    :::58         :::0            *
3     vrrp.elf        RAW    VRRP     :::112         :::0            *
4     rg-snmpd        DGRAM  UDP      :::161         :::0            *
5     rg-snmpd        DGRAM  UDP      :::162         :::0            *
6     dhcp6.elf       DGRAM  UDP      :::547         :::0            *
7     rg-sshd         STREAM TCP      :::22          :::0           LISTEN
8     rg-telnetd      STREAM TCP       :::23          :::0           LISTEN
Total: 8
```

Table 1-13 Output Fields of the show ipv6 sockets Command

Field	Description
Number	Serial number.
Process name	Process name.

Field	Description
Type	Socket type. ● **RAW** indicates a raw socket. ● **DGRAM** indicates the packet type. ● **STREAM** indicates the stream type.
Protocol	Protocol number.
LocalIP:Port	Local IPv6 address and port.
ForeignIP:Port	Peer IPv6 address and port.
State	Status (only for IPv6 TCP sockets).
Total	Total number of sockets.

1.54 show ipv6 udp

Function

Run the **show ipv6 udp** command to display all IPv6 UDP sockets.

Syntax

show ipv6 udp [**local-port** *port-number*] [**peer-port** *port-number*]

Parameter Description

local-port *port-number*: Specifies a local port number.

peer-port *port-number*: Specifies a peer port number.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display all IPv6 UDP sockets and thus learn the UDP port that provides services for external devices.

Examples

The following example displays all IPv6 UDP sockets.

```
Hostname> enable
Hostname# show ipv6 udp
Number Local Address   Peer Address   Process name
1      :::161          :::0         rg-snmpd
2      :::162          :::0         rg-snmpd
3      :::547          :::0         dhcp6.elf
```

1 DHCPv6 Commands

Command	Function
bootfile-url	Configure the boot file Uniform Resource Locator (URL) that a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server assigns to a DHCPv6 client.
clear ipv6 dhcp binding	Clear bindings on a DHCPv6 server.
clear ipv6 dhcp conflict	Clear conflicted addresses on a DHCPv6 server.
clear ipv6 dhcp relay statistics	Clear statistics of different types of packets on a DHCPv6 relay agent.
clear ipv6 dhcp server statistics	Clear statistics of different types of packets on a DHCPv6 server.
dns-server	Configure the Domain Name System (DNS) server address to be assigned from a DHCPv6 server to a DHCPv6 client.
domain-name	Configure the domain name to be assigned from a DHCPv6 server to a DHCPv6 client.
excluded-address	Configure excluded network segments on a DHCPv6 server.
iana-address prefix	Configure the IA_NA address prefix to be assigned from a DHCPv6 server to a DHCPv6 client.
ipv6 dhcp pool	Create a DHCPv6 address pool and enter the DHCPv6 address pool configuration mode.
ipv6 dhcp relay destination	Enable the DHCPv6 Relay function and specify a destination address.
ipv6 dhcp relay option interface-id format user-defined	Configure the Interface ID option on a DHCPv6 relay agent.
ipv6 dhcp relay option mac-str-format	Configure the format of the MAC address in the user-defined Option on a DHCPv6 relay agent.
ipv6 dhcp relay option remote-id enable	Add the Remote ID option to DHCPv6 relay packets.
ipv6 dhcp relay option remote-id format user-defined	Configure the value of Remote ID in DHCPv6 relay packets.

ipv6 dhcp relay source	Configure the source interface of a DHCPv6 relay agent.
ipv6 dhcp server	Enable the DHCPv6 Server function on an interface.
ipv6 local pool	Configure a local prefix pool for the PD service of a DHCPv6 server.
option52	Configure the IPv6 address of a Control and Provisioning of Wireless Access Points (CAPWAP) access controller (AC) specified on a DHCPv6 server.
prefix-delegation	Configure prefixes for statically bound addresses on a DHCPv6 server.
prefix-delegation pool	Configure a local prefix pool on a DHCPv6 server.
show ipv6 dhcp	Display the DUID of a DHCPv6 device.
show ipv6 dhcp binding	Display address bindings on a DHCPv6 server.
show ipv6 dhcp conflict	Display conflicted addresses on a DHCPv6 server.
show ipv6 dhcp interface	Display DHCPv6 interfaces.
show ipv6 dhcp pool	Display DHCPv6 address pools.
show ipv6 dhcp relay agent	Display source interfaces on a DHCPv6 relay agent.
show ipv6 dhcp relay destination	Display destination addresses on a DHCPv6 relay agent.
show ipv6 dhcp relay source	Display the source interface definition configuration on a DHCPv6 relay agent.
show ipv6 dhcp relay statistics	Display statistics of different types of packets on a DHCPv6 relay agent.
show ipv6 dhcp server statistics	Displays DHCPv6 server statistics.
show ipv6 local pool	Display local prefix pool configuration and usage on the current device.

1.1 bootfile-url

Function

Run the **bootfile-url** command to configure the boot file Uniform Resource Locator (URL) that a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server assigns to a DHCPv6 client.

Run the **no** form of this command to remove this configuration.

No boot file URL is configured by default.

Syntax

bootfile-url *url-string*

no bootfile-url

Parameter Description

url-string: Boot file URL. The value is a case-sensitive string of 1 to 256 characters.

Command Modes

DHCPv6 address pool configuration mode

Default Level

14

Usage Guidelines

When this command is run on a DHCPv6 address pool multiple times, the last configuration prevails.

Examples

The following example sets the boot file URL in DHCPv6 address pool pool1 to tftp://1000::1/boot.bin.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp pool pool1
Hostname(config-dhcp)# bootfile-url tftp://1000::1/boot.py
```

Notifications

Related Commands

- **show ipv6 dhcp pool**

1.2 clear ipv6 dhcp binding

Function

Run the **clear ipv6 dhcp binding** command to clear bindings on a DHCPv6 server.

Syntax

clear ipv6 dhcp binding [*ipv6-address*]

Parameter Description

ipv6-address: IPv6 address or prefix.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

If the *ipv6-address* parameter is not configured, all bindings on a DHCPv6 server are cleared. If the *ipv6-address* parameter is configured, only bindings of the specified address or prefix are cleared.

Examples

The following example clears all bindings on a DHCPv6 server.

```
Hostname> enable
Hostname# clear ipv6 dhcp binding
```

Notifications

When binding information of the specified address or prefix cannot be found, the following notification will be displayed:

```
Failed to clear DHCPv6 binding x:x:x:x:x:x:x:x, please try again
```

Platform Description

N/A

1.3 clear ipv6 dhcp conflict

Function

Run the **clear ipv6 dhcp conflict** command to clear conflicted addresses on a DHCPv6 server.

Syntax

clear ipv6 dhcp conflict { *ipv6-address* | * }

Parameter Description

ipv6-address: IPv6 address or prefix.

*: All IPv6 addresses or prefixes.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

To clear all conflicted addresses when the *ipv6-address* parameter is not configured, add an asterisk (*) after this command, which represents all IPv6 addresses or prefixes. If the *ipv6-address* parameter is configured, only conflict information of the specified address is cleared.

When a DHCPv6 client detects that the assigned IPv6 address is in conflict, it sends a DECLINE packet to the DHCPv6 server. The DHCPv6 server adds the address to the address conflict queue.

Examples

The following example clears conflicted addresses on a DHCPv6 server.

```
Hostname> enable
Hostname# clear ipv6 dhcp conflict 2008:50::2
```

Notifications

N/A

Platform Description

1.6 dns-server

Function

Run the **dns-server** command to configure the Domain Name System (DNS) server address to be assigned from a DHCPv6 server to a DHCPv6 client.

Run the **no** form of this command to remove this configuration.

No DNS server address is configured by default.

Syntax

dns-server *ipv6-address*

no dns-server *ipv6-address*

Parameter Description

ipv6-address: DNS server address to be assigned to a DHCPv6 client.

Command Modes

DHCPv6 address pool configuration mode

Default Level

14

Usage Guidelines

You can run this command multiple times to create multiple DNS server addresses. New DNS server addresses do not overwrite old one. A maximum of 10 DNS server addresses can be configured.

Examples

The following example sets the DNS server address in DHCPv6 address pool pool1 to **2008:1::1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp pool pool1
Hostname(config-dhcp)# dns-server 2008:1::1
```

Notifications

When the number of configured DNS server addresses exceeds the limit, the following notification will be displayed:

```
Reach dhcpv6 dns limit for each pool, 10.
```

When the configured DNS server address is incorrect, the following notification will be displayed:

```
Configure dhcpv6 dns-server with an invalid unicast ipv6 address.
```

When the DNS server address configuration fails, the following notification will be displayed:

```
Failed to configure DNS address, please try again.
```

Common Errors

N/A

1.7 domain-name

Function

Run the **domain-name** command to configure the domain name to be assigned from a DHCPv6 server to a DHCPv6 client.

Run the **no** form of this command to remove this configuration.

No domain name is configured by default.

Syntax

domain-name *domain*

no domain-name *domain*

Parameter Description

domain: Domain name to be assigned to a DHCPv6 client. The value is a case-sensitive string of 1 to 255 characters.

Command Modes

DHCPv6 address pool configuration mode

Default Level

14

Usage Guidelines

You can run this command multiple times to create multiple domain names. New domain names do not overwrite old ones. A maximum of 10 domain names can be configured.

Examples

The following example sets the domain name in DHCPv6 address pool pool1 to **example.com**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp pool pool1
Hostname(config-dhcp)# domain-name example.com
```

Notifications

When the number of configured domain names exceeds the limit, the following notification will be displayed:

```
Reach dhcpv6 domain name limit for each pool, 10.
```

When domain name configuration fails, the following notification will be displayed:

```
Failed to configure domain name, please try again.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

- **show ipv6 dhcp pool**

1.8 excluded-address

Function

Run the **excluded-address** command to configure excluded network segments on a DHCPv6 server.

Run the **no** form of this command to remove this configuration.

After an address pool is created, no excluded network segment is configured on a DHCPv6 server by default.

Syntax

excluded-address *start-ipv6-address* [*end-ipv6-address*]

no excluded-address *start-ipv6-address* [*end-ipv6-address*]

Parameter Description

start-ipv6-address: Start IPv6 address in an excluded network segment.

end-ipv6-address: End IPv6 address in an excluded network segment. If this parameter is not configured or is the same as the start IPv6 address, a single IPv6 address is excluded.

Command Modes

DHCPv6 address pool configuration mode

Default Level

14

Usage Guidelines

You can run this command multiple times to create multiple excluded network segments.

Before creating an excluded network segment, you need to configure the corresponding identity association non-temporary address (IA_NA) network segment, and the excluded network segment must belong to the IA_NA network segment. After an IA_NA network segment is deleted, excluded network segments belonging to this segment are deleted automatically. After an excluded network segment is created, online entries of users in this network segment are deleted automatically.

Examples

The following example excludes addresses in the network segment from 1000::100 to 1000::200 in DHCPv6 address pool pool1.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# ipv6 dhcp pool pool1
Hostname(dhcp-config)# excluded-address 1000::100 1000::200
```

Notifications

When the number of configured excluded network segments exceeds the limit, the following notification will be displayed:

```
Reach dhcpv6 exclude address limit for each pool, 1000.
```

When a configured excluded network segment does not belong to any IA_NA network segment, the following notification will be displayed:

```
Configure dhcpv6 iana address first before the exclude range.
```

When a configured excluded network segment conflicts with another excluded network segment, the following notification will be displayed:

```
Configure dhcpv6 exclude conflict with other exclude range.
```

When an excluded network segment fails to be configured, the following notification will be displayed:

```
Failed to configure exclude address, please try again.
```

Common Errors

No IA_NA network segment is configured before excluded addresses are configured.

Platform Description

N/A

Related Commands

N/A

1.9 iana-address prefix

Function

Run the **iana-address prefix** command to configure the IA_NA address prefix to be assigned from a DHCPv6 server to a DHCPv6 client.

Run the **no** form of this command to remove this configuration.

No IA_NA address prefix is configured by default.

Syntax

iana-address prefix *ipv6-address/prefix-length* [**lifetime** { *valid-lifetime* | **infinite** } { *preferred-lifetime* | **infinite** } }]

no iana-address prefix

Parameter Description

ipv6-address/prefix-length: IPv6 address or prefix length.

lifetime: Specifies the valid time of an address to be assigned to a DHCPv6 client.

valid-lifetime: Valid time for a DHCPv6 client to use an assigned address, in seconds. The range is from 60 to 4294967295. The default value is **3600**.

preferred-lifetime: Time during which an address is still preferentially assigned to a client, in seconds. The range is from 60 to 4294967295. The default value is **3600**.

infinite: Indicates that an IA_NA address prefix is permanently valid.

Command Modes

DHCPv6 address pool configuration mode

Default Level

14

Usage Guidelines

After an IA_NA address prefix is configured by running this command, a DHCPv6 server can assign an IA_NA address with this prefix to a DHCPv6 client.

When receiving an IA_NA address request from a DHCPv6 client, the DHCPv6 server selects an available address based on the IA_NA address prefix and assigns the address to the client. When the client no longer needs this address, the DHCPv6 server marks this address as available for other clients.

Examples

The following example configures an IA_NA address prefix 2008:50::/64 in DHCPv6 address pool pool1, sets the valid time for a client to use an assigned address with this prefix to 2000s, and sets the time during which the address is still preferentially assigned to the client to 1000s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)#ipv6 dhcp pool pool1
Hostname(config-dhcp)# iana-address prefix 2008:50::/64 lifetime 2000 1000
```

Notifications

When the value of *valid-lifetime* is smaller than that of *preferred-lifetime*, the following notification will be displayed:

```
Preferred lifetime must not exceed valid lifetime.
```

When the number of configured address prefixes exceeds the limit, the following notification will be displayed:

```
iana range number has reached the max 20.
```

1.10 ipv6 dhcp pool

Function

Run the **ipv6 dhcp pool** command to create a DHCPv6 address pool and enter the DHCPv6 address pool configuration mode.

Run the **no** form of this command to remove this configuration.

No DHCPv6 address pool is configured by default.

Syntax

ipv6 dhcp pool *pool-name*

no ipv6 dhcp pool *pool-name*

Parameter Description

pool-name: DHCPv6 address pool name.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to create a DHCPv6 address pool. After configuring this command, you can enter the DHCPv6 address pool configuration mode, so as to configure address pool parameters such as the prefix and DNS server address.

After a DHCPv6 address pool is created, you can run the **ipv6 dhcp server** command on an interface to associate the address pool with the DHCPv6 server on the interface.

Examples

The following example creates a DHCPv6 address pool named **pool1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp pool pool1
Hostname(config-dhcp)#
```

Notifications

When the number of configured address pools exceeds the limit, the following notification will be displayed:

```
Reach dhcpv6 pool limit 256.
```

When address pool configuration fails, the following notification will be displayed:

```
Failed to configure dhcpv6 pool xxx, please try again.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

- **show ipv6 dhcp pool**

1.11 ipv6 dhcp relay destination

Function

Run the **ipv6 dhcp relay destination** command to enable the DHCPv6 Relay function and specify a destination address.

Run the **no** form of this command to disable this feature.

The DHCPv6 Relay function is disabled by default.

Syntax

ipv6 dhcp relay destination [**vrf** *vrf-name*] *ipv6-address* [*interface-type interface-number*]

no ipv6 dhcp relay destination [**vrf** *vrf-name*] *ipv6-address* [*interface-type interface-number*]

Parameter Description

vrf *vrf-name*: Specifies a virtual routing and forwarding (VRF) instance.

ipv6-address: Destination address on a DHCPv6 relay agent.

interface-type interface-number: Type and number of the interface over which packets are routed to the destination address. When the destination address is a multicast address, this parameter is mandatory.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command can be configured only on layer 3 (L3) interfaces.

The total number of destination addresses is 20 at most on all interfaces configured with the DHCPv6 Relay function.

After this function is configured on an interface, all packets received from DHCPv6 clients on this interface are encapsulated and then forwarded to each configured destination address.

Examples

The following example enables the DHCPv6 Relay service on Switch Virtual Interface (SVI) 1 and sets the destination address to **3001::2**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
```

```
Hostname(config-if-VLAN 1)# ipv6 dhcp relay destination 3001::2
```

Notifications

When the configured relay address is a local address, the following notification will be displayed:

```
Cannot relay to this relay agent itself.
```

When the DHCPv6 Relay function is configured on an interface that already works in another mode (DHCPv6 server or client), the following notification will be displayed:

```
Interface is in DHCP xxx mode.
```

When the DHCPv6 Relay function fails to be configured, the following notification will be displayed:

```
Failed to configure DHCPv6 relay, please try again.
```

Common Errors

1.12 ipv6 dhcp relay option interface-id format user-defined

Function

Run the **ipv6 dhcp relay option interface-id format user-defined** command to configure the **Interface ID** option on a DHCPv6 relay agent.

Run the **no** form of this command to remove this configuration.

The interface name is the value of **Interface ID** on a DHCPv6 relay agent by default.

Syntax

ipv6 dhcp relay option interface-id format user-defined *text*

no ipv6 dhcp relay option interface-id format user-defined

Parameter Description

text: Value of user-defined **Interface ID**. The value is a string of 1 to 255 characters.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When customizing the format of an option, you can use keywords described in the following table. The format string behind the keywords can be set to the hexadecimal encapsulation format, ASCII encapsulation format, or hexadecimal and ASCII hybrid encapsulation format.

Table 1-1 User-Defined Option Keywords

Keyword	Name	Format			Description
		ASCII	Hexadecimal	Number of Occupied Hexadecimal Bytes	
hostname	Host name	√	×	-	Example: Hostname
devicename	Device model	√	×	-	Example: S5750C-48GT4XS-H
portname	Interface name	√	×	-	Example: GigabitEthernet 0/1
portsname	Interface name abbreviation	√	×	-	Example: Te0/2.5
porttype	Interface type	√	√	1 B	Example: ● When ASCII is used to represent 1, the padding value is **0x31**. ● When hexadecimal is used to represent 1, the padding value is **0x01**.
sysmac	Interface MAC address	√	√	6 B	Example: ● ASCII: 2222.2222.2222 ● Hexadecimal: 0x22 0x22 0x22 0x22 0x22 0x22
slot	Slot ID	√	√	1 B	Example: ● When ASCII is used to represent 0, the padding value is **0x30**. ● When hexadecimal is used to

Keyword	Name	Format			Description
		ASCII	Hexadecimal	Number of Occupied Hexadecimal Bytes	
					represent 0, he padding value is **0x00**.
port	Port number	√	√	1 B	Example: ● When ASCII is used to represent 2, the padding value is **0x32**. ● When hexadecimal is used to represent 2, the padding value is **0x02**.
svlan	Outer VLAN	√	√	2 B	Example: ● When ASCII is used to represent 5, the padding value is **0x35**. ● When hexadecimal is used to represent 5, the padding value is **0x0005**.
cvlan	Inner VLAN	√	√	2 B	Example: ● When ASCII is used to represent 5, the padding value is **0x35**. ● When hexadecimal is used to represent 5, the padding value is

Keyword	Name	Format			Description
		ASCII	Hexadecimal	Number of Occupied Hexadecimal Bytes	
					0x0005.
length	Length of content following the length keyword	×	√	1 B	Example: When hexadecimal is used to represent 5, the padding value is 0x05.

Note: √ indicates that a keyword supports the corresponding encapsulation format, × indicates that a keyword does not support the corresponding encapsulation format, and - indicates meaningless.

Special characters are described as follows:

- % followed by keywords defined above indicates the format of the keywords. When the percent symbol (%) needs to be contained in the input string, enter %%, which will be converted into a single common percent symbol (%) during parsing.
- The backslash (\) indicates an escape character, and the special character following the backslash (\) indicates the special character itself. For example, \\ indicates the backslash (\) and \" indicates the quotation mark (").
- The double quotation marks ("") indicate that data enclosed is encapsulated in string format. Data without or outside the double quotation marks is encapsulated in hexadecimal format.
- Strings in ASCII format can contain 0 to 9, a to z, A to Z, and the following symbols: !, @, #, $, %, ^, &, *, (), _, +, |, -, =, \, [], {}, ;, :, '", /, ?, ., ,, <>, `.
- For characters %\" in ASCII format, add the prefix (\) in front of the characters. In ASCII format, only keywords and several specific symbols are converted and other data remains unchanged.
- If there is no escape character '%' in front of '%' in configuration commands, the key value in the information field must be added behind. Otherwise, the configuration is incorrect and an error is prompted. If the character '\' needs to be configured, enter "\\".
- For strings in hexadecimal format, digits are encapsulated into the option in hexadecimal notation. When hexadecimal data is used, strings begin with 0X or 0x. When the number of valid characters in the hexadecimal data is an odd, add one 0 to the frontmost. When decimal data is used, the data ranges from 0 to 255 and occupies one byte. You can use spaces to enter multiple pieces of decimal data consecutively.
- Blank characters in hexadecimal notation are ignored.

Examples

The following example sets the value of **Interface ID** to the port name and local host MAC address in ASCII format.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp relay option interface-id format user-defined
"%portname %sysmac"
```

The following example sets the value of **Interface ID** to the local host MAC address in hexadecimal format.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp relay option interface-id format user-defined %sysmac
```

Notifications

When the padding format of a keyword is incorrect (for example, **%portname** can be padded only in ASCII format), the following notification will be displayed:

```
% Format of Keyword unmatched.
```

When a keyword fails to be matched, the following notification will be displayed:

```
% User defined string include bad keyword.
```

When a keyword fails to be identified, the following notification will be displayed:

```
% DHCP6 RELAY could not parse the user defined string.
```

1.13 ipv6 dhcp relay option mac-str-format

Function

Run the **ipv6 dhcp relay option mac-str-format** command to configure the format of the MAC address in the user-defined Option on a DHCPv6 relay agent.

Run the **no** form of this command to remove this configuration.

The default MAC address format is H.H.H.

Syntax

ipv6 dhcp relay option mac-str-format *type*

no ipv6 **dhcp relay option mac**-**str**-**format**

Parameter Description

type: Format of the MAC address string. The value range is from 1 to 3, and the default value is **1**. **1** indicates the H.H.H format, **2** indicates the H-H-H format, and **3** indicates the H:H:H:H:H:H format.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the format of the MAC address in user-defined options.

Examples

The following example sets the format of the MAC address in user-defined options on a DHCPv6 relay agent to H-H-H.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp relay option mac-str-format 2
```

1.14 ipv6 dhcp relay option remote-id enable

Function

Run the **ipv6 dhcp relay option remote-id enable** command to add the **Remote ID** option to DHCPv6 relay packets.

Run the **no** form of this command to remove this configuration.

DHCPv6 relay packets do not carry **Remote-ID** by default.

Syntax

ipv6 dhcp relay option remote-id enable

no ipv6 dhcp relay option remote-id enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Remote ID is used to uniquely identify a DHCPv6 client. Based on the value of **Remote ID**, a DHCPv6 server performs address assignment, parameter configuration, and prefix delegation (PD). The value of **Remote ID** is customized by the vendor. Generally, this option carries the DHCP Unique Identifier (DUID) and name of the access device.

Examples

The following example adds **Remote ID** to DHCPv6 relay packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp relay option remote-id enable
```

1.15 ipv6 dhcp relay option remote-id format user-defined

Function

Run the **ipv6 dhcp relay option remote-id format user-defined** command to configure the value of **Remote ID** in DHCPv6 relay packets.

Run the **no** form of this command to remove this configuration.

The device DUID is specified in **Remote ID** in DHCPv6 relay packets by default.

Syntax

ipv6 dhcp relay option remote-id format user-defined *text*

no ipv6 dhcp relay option remote -id format user-defined

Parameter Description

text: Value of **Remote ID**. The value is a string of 1 to 255 characters.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When customizing the format of an option, you can use keywords described in the following table. The format string behind the keywords can be set to the hexadecimal encapsulation format, ASCII encapsulation format, or hexadecimal and ASCII hybrid encapsulation format.

Table 1-2 User-Defined Option Keywords

Keyword	Name	Format			Description
		ASCII	Hexadecimal	Number of Occupied Hexadecimal Bytes	
hostname	Host name	√	×	-	Example: Hostname
devicename	Device model	√	×	-	Example: S5750C-48GT4XS-H
portname	Interface name	√	×	-	Example: GigabitEthernet 0/1
portsname	Interface name abbreviation	√	×	-	Example: Te0/2.5
porttype	Interface type	√	√	1 B	Example: ● When ASCII is used to represent 1, the padding value is **0x31**. ● When hexadecimal is used to represent 1, the padding value is **0x01**.
sysmac	Interface MAC address	√	√	6 B	Example: ● ASCII: 2222.2222.2222 ● Hexadecimal: 0x22 0x22 0x22 0x22 0x22 0x22
slot	Slot ID	√	√	1 B	Example: ● When ASCII is used to represent 0, the padding value is **0x30**. ● When hexadecimal is used to represent 0, he padding value is **0x00**.
port	Port number	√	√	1 B	Example: ● When ASCII is used to represent 2, the

Keyword	Name	Format			Description
		ASCII	Hexadecimal	Number of Occupied Hexadecimal Bytes	
					padding value is **0x32**. ● When hexadecimal is used to represent 2, the padding value is **0x02**.
svlan	Outer VLAN	√	√	2 B	Example: ● When ASCII is used to represent 5, the padding value is **0x35**. ● When hexadecimal is used to represent 5, the padding value is **0x0005**.
cvlan	Inner VLAN	√	√	2 B	Example: ● When ASCII is used to represent 5, the padding value is **0x35**. ● When hexadecimal is used to represent 5, the padding value is **0x0005**.
length	Length of content following the length keyword	×	√	1 B	Example: When hexadecimal is used to represent 5, the padding value is **0x05**.

Note: √ indicates that a keyword supports the corresponding encapsulation format, × indicates that a keyword does not support the corresponding encapsulation format, and - indicates meaningless.

Special characters are described as follows:

- % followed by keywords defined above indicates the format of the keywords. When the percent symbol (%) needs to be contained in the input string, enter %%, which will be converted into a single common percent symbol (%) during parsing.
- The backslash (\) indicates an escape character, and the special character following the backslash (\) indicates the special character itself. For example, \\ indicates the backslash (\) and \" indicates the quotation mark (").

- The double quotation marks ("") indicate that data enclosed is encapsulated in string format. Data without or outside the double quotation marks is encapsulated in hexadecimal format.
- Strings in ASCII format can contain 0 to 9, a to z, A to Z, and the following symbols: !, @, #, $, %, ^, &, *, (), _, +, |, -, =, \, [], {}, ;, :, '", /, ?, ., ,, <>, `.
- For characters %\" in ASCII format, add the prefix (\) in front of the characters. In ASCII format, only keywords and several specific symbols are converted and other data remains unchanged.
- If there is no escape character '%' in front of '%' in configuration commands, the key value in the information field must be added behind. Otherwise, the configuration is incorrect and an error is prompted. If the character '\' needs to be configured, enter "\\".
- For strings in hexadecimal format, digits are encapsulated into the option in hexadecimal notation. When hexadecimal data is used, strings begin with 0X or 0x. When the number of valid characters in the hexadecimal data is an odd, add one 0 to the frontmost. When decimal data is used, the data ranges from 0 to 255 and occupies one byte. You can use spaces to enter multiple pieces of decimal data consecutively.
- Blank characters in hexadecimal notation are ignored.

Examples

The following example sets the value of **Remote ID** to the device name and local host MAC address in ASCII format.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp relay option remote-id format user-defined
"%devicename %sysmac"
```

The following example sets the value of **Remote ID** to the local host MAC address in hexadecimal format.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp relay option remote-id format user-defined %sysmac
```

Notifications

When the padding format of a keyword is incorrect (for example, **%portname** can be padded only in ASCII format), the following notification will be displayed:

```
% Format of Keyword unmatched.
```

When a keyword fails to be matched, the following notification will be displayed:

```
% User defined string include bad keyword.
```

When a keyword fails to be identified, the following notification will be displayed:

```
% DHCP6 RELAY could not parse the user defined string.
```

1.16 ipv6 dhcp relay source

Function

Run the **ipv6 dhcp relay source** command to configure the source interface of a DHCPv6 relay agent.
Run the **no** form of this command to remove this configuration.
No source interface is configured for a DHCP relay agent by default.

Syntax

ipv6 dhcp relay source { **source-ip-address** | **gateway-address** } { *ipv6-address* | *interface-type interface-number* }

no ipv6 dhcp relay source

Parameter Description

source-ip-address: Sets the source IP address.

gateway-address: Sets the gateway address.

ipv6-address: IPv6 address of the source interface.

interface-type interface-number: Source interface type and number.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

The source interface definition function supports the following types of addresses:

- Source IP address: The source IP address field in DHCPv6 relay packets is changed.
- Gateway address: The source IP address and link address fields in DHCPv6 relay packets are changed.

The source interface definition function can be configured in global configuration mode and interface configuration mode. The source interface definition type in interface configuration mode is prior to that in global configuration mode. In the same configuration mode, the last configured source interface definition type prevails.

Caution

- When the source interface definition parameter uses IPv6 address, it cannot be set to a multicast address, local link address, site address, unconfigured address (with all 0s), or local loopback address.
- When the source interface definition parameter is the interface index, the interface must be an L3 interface. When the specified interface changes to a non-L3 interface, the configuration of the source interface definition function is deleted from this interface.

- When the source interface definition parameter is the interface index, if multiple IPv6 addresses are configured for the specified interface, the minimum global unicast address is used. If no global unicast address is configured for the interface, the current configuration does not take effect and packets are forwarded in default manner.

Examples

The following example enables the source interface definition function on SVI 1, sets the definition type to gateway address, and sets the definition parameter type to IPv6 address.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 1
Hostname(config-if-VLAN 1)# ipv6 dhcp relay source gateway-address 1000::1
```

The following example enables the source interface definition function on all interfaces, sets the definition type to source IP address, and sets the definition parameter type to interface index.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp relay source source-ip-address loopback 0
```

Notifications

When the source interface definition parameter is IPv6 address, but a multicast address, site address, unconfigured address, loopback address, or local link address is configured, the following notification will be displayed:

```
input invalid ipv6 address.
```

When the source interface definition parameter is interface index, but the specified interface is a non-L3 interface, the following notification will be displayed:

```
The specify interface(ifx_id) is not in layer3.
```

1.17 ipv6 dhcp server

Function

Run the **ipv6 dhcp server** command to enable the DHCPv6 Server function on an interface.

Run the **no** form of this command to disable this feature.

The DHCPv6 Server function is disabled by default.

Syntax

ipv6 dhcp server *pool-name* [**rapid-commit**] [**preference** *preference-value*]

no ipv6 dhcp server

Parameter Description

pool-name: DHCPv6 address pool name.

rapid-commit: Allows two-way message exchanges.

preference *preference-value*: Configures the priority of the ADVERTISE message. The range is from 0 to 255, and the default value is **0**.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This function can be configured only on L3 interfaces.

After the **rapid-commit** parameter is configured, a DHCPv6 server can use the two-way message exchange mechanism to assign an address prefix and other configurations to a DHCPv6 client. That is, if the SOLICIT message from a client contains the **Rapid-Commit** option, the DHCPv6 server directly returns a REPLY message.

If **preference** is set to a non-zero value, the ADVERTISE message sent by the DHCPv6 server contains the **Preference** option. The **Preference** option affects DHCPv6 server selection of a client. A larger *preference-value* value indicates a higher priority. If a client receives an ADVERTISE message in which the **Preference** option is set to **255**, the client immediately sends a REQUEST message to the DHCPv6 server to obtain configurations.

The DHCPv6 Server, DHCPv6 Client, and DHCPv6 Relay functions are mutually exclusive, and only one function can be configured on an interface at a time.

Examples

The following example enables the DHCPv6 Server function on GigabitEthernet 0/1 and creates a DHCPv6 address pool named **pool1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 dhcp server pool1
```

Notifications

When the DHCPv6 Server function fails to be enabled, the following notification will be displayed:

```
Failed to start DHCPv6 interface, please try again.
```

When the configured address pool name is too long, the following notification will be displayed:

```
Pool name length should not be larger than 31.
```

When initialization is not completed due to insufficient memory, the following notification will be displayed:

```
Failed to initiate DHCPv6 interface, please try again
```

1.18 ipv6 local pool

Function

Run the **ipv6 local pool** command to configure a local prefix pool for the PD service of a DHCPv6 server.

Run the **no** form of this command to remove this configuration.

No local prefix pool is configured for the PD service of a DHCPv6 server by default.

Syntax

ipv6 local pool *pool-name prefix/prefix-length assigned-length*

no ipv6 local pool *pool-name*

Parameter Description

pool-name: Name of local prefix pool.

prefix/prefix-length: Prefix and prefix length.

assigned-length: Length of the prefix assigned to a DHCPv6 client. The range is from 0 to 128.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to create a local prefix pool. If a DHCPv6 server needs to implement local PD, run the **prefix-delegation pool** command to specify a local prefix pool. Then, the DHCPv6 server assigns prefixes from the specified local prefix pool.

Examples

The following example sets the name of the local prefix pool for PD of a DHCPv6 server to **client-prefix-pool**, sets the prefix to **2001::db8::/64**, and sets the length of prefixes to be assigned to clients to **80**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 local pool client-prefix-pool 2001::db8::/64 80
```

Notifications

When the length of the specified prefix pool name exceeds the limit, the following notification will be displayed:

```
Maximum pool name length is 31.
```

When the length of the specified prefix exceeds the limit, the following notification will be displayed:

```
Prefix length must be in the range [1,128] or [128, 128].
```

When the length of a prefix assigned to a client exceeds the limit (less than the prefix length of the local prefix pool or greater than the address length), the following notification will be displayed:

```
Assign length must be in the range [x,128] or [128,128].
```

When the difference between the length of the specified prefix and that of a prefix assigned to a client exceeds 16 bits, the following notification will be displayed:

```
Assign length minus prefix length must be not more than 16.
```

1.19 option52

Function

Run the **option52** command to configure the IPv6 address of a Control and Provisioning of Wireless Access Points (CAPWAP) access controller (AC) specified on a DHCPv6 server.

Run the **no** form of this command to remove this configuration.

The AC IPv6 address information is not configured by default.

Syntax

option52 *ipv6-address*

no option52 *ipv6-address*

Parameter Description

ipv6-address: IPv6 address of a CAPWAP AC.

Command Modes

DHCPv6 address pool configuration mode

Default Level

14

Usage Guidelines

You can run this command multiple times to specify multiple IPv6 addresses for a CAPWAP AC. A new CAPWAP AC IPv6 address does not overwrite an old one. A maximum of 10 IPv6 addresses can be configured.

Examples

The following example sets the IPv6 address of the CAPWAP AC specified on a DHCPv6 server to **2008:1::1**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp pool pool1
Hostname(config-dhcp)# option52 2008:1::1
```

Notifications

When the number of configured addresses in Option 52 exceeds the limit, the following notification will be displayed:

```
Reach dhcpv6 option52 address limit for each pool, 10.
```

When Option 52 address configuration fails, the following notification will be displayed:

```
Failed to configure option52 address, please try again.
```

Common Errors

Platform Description

N/A

Related Commands

- **show ipv6 dhcp pool**

1.20 prefix-delegation

Function

Run the **prefix-delegation** command to configure prefixes for statically bound addresses on a DHCPv6 server.

Run the **no** form of this command to remove this configuration.

No prefix is configured for a statically bound address on a DHCPv6 server by default.

Syntax

prefix-delegation *ipv6-address/prefix-length client-DUID* [**lifetime** { *valid-lifetime* | **infinite** } { *preferred-lifetime* | **infinite** }]

no prefix-delegation *ipv6-prefix/prefix-length client-DUID* [**lifetime** { *valid-lifetime* | **infinite** } { *preferred-lifetime* | **infinite** }]

Parameter Description

ipv6-address/prefix-length: IPv6 address or prefix length.

client-DUID: DUID of a client.

lifetime: Sets the valid time of an address prefix to be assigned to a client.

valid-lifetime: Valid time of a prefix to be assigned to a client, in seconds. The range is from 60 to 4294967295. The default value is **3600**, that is, 1 hour.

preferred-lifetime: Time during which a prefix is still preferentially assigned to a client, in seconds. The range is from 60 to 4294967295. The default value is **3600**, that is, 1 hour.

infinite: Configures permanent lease.

Command Modes

DHCPv6 address pool configuration mode

Default Level

14

Usage Guidelines

You can run this command to manually configure a prefix list for an IA_PD of a client and specify the valid time of these prefixes.

The *client-DUID* parameter specifies the client to which an address prefix is to be assigned. The address prefix will be assigned to the first IA_PD of the client.

After receiving a REQUEST message for an address prefix from the client, the DHCPv6 server checks whether a static binding is available. If yes, the DHCPv6 server directly returns the static binding. If not, the DHCPv6 server assigns an address prefix from another prefix source.

Examples

The following example sets the address prefix to be assigned to a client (with the DUID of 0003000100d0f82233ac) in DHCPv6 address pool pool1 to **2008:2::/64**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)#ipv6 dhcp pool pool1
Hostname(config-dhcp)# prefix-delegation 2008:2::/64 0003000100d0f82233ac
```

Notifications

When the specified DUID is incorrect, the following notification will be displayed:

```
DUID string length must not be odd number or exceed 128.
```

When the number of configured prefixes for statically bound addresses on a DHCPv6 server exceeds the limit, the following notification will be displayed:

```
Reach dhcpv6 static IAPD binding limit 1024.
```

When prefixes for statically bound addresses fail to be configured, the following notification will be displayed:

```
Failed to configure prefix delegation, please try again.
```

1.21 prefix-delegation pool

Function

Run the **prefix-delegation pool** command to configure a local prefix pool on a DHCPv6 server.

Run the **no** form of this command to remove this configuration.

No local prefix pool is configured for a DHCPv6 server by default.

Syntax

prefix-delegation pool *pool-name* [**lifetime** { *valid-lifetime* | **infinite** } { *preferred-lifetime* | **infinite** }]

no prefix-delegation pool *pool-name*

Parameter Description

pool-name: User-defined name of a local prefix pool.

lifetime: Sets the valid time of a prefix to be assigned to a client.

valid-lifetime: Valid time of a prefix to be assigned to a client, in seconds. The range is from 60 to 4294967295. The default value is **3600**, that is, 1 hour.

preferred-lifetime: Time during which a prefix is still preferentially assigned to a client, in seconds. The range is from 60 to 4294967295. The default value is **3600**, that is, 1 hour.

infinite: Configures permanent lease.

Command Modes

DHCPv6 address pool configuration mode

Default Level

14

Usage Guidelines

This command is used to configure a prefix pool for a DHCPv6 server to assign prefixes to clients. You can run the **ipv6 local pool** command to create a prefix pool.

When receiving a prefix request from a client, the DHCPv6 server selects an available prefix from the prefix pool and assigns the prefix to the client. When the client no longer needs this prefix, the DHCPv6 server reclaims it.

Examples

The following example configures a local prefix pool named **client-prefix-pool** for clients in DHPCv6 address pool pool1, sets the valid time for a client to use an assigned prefix to 2000s, and sets the time during which a prefix is still preferentially assigned to a client to 1000s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp pool pool1
Hostname(config-dhcp)# prefix-delegation pool client-prefix-pool lifetime 2000 1000
```

Notifications

When the value of *valid-lifetime* is smaller than that of *preferred-lifetime*, the following notification will be displayed:

```
Preferred lifetime must not exceed valid lifetime.
```

When prefixes for statically bound addresses fail to be configured, the following notification will be displayed:

```
Failed to configure prefix delegation, please try again.
```

1.23 show ipv6 dhcp binding

Function

Run the **show ipv6 dhcp binding** command to display address bindings on a DHCPv6 server.

Syntax

show ipv6 dhcp binding [*ipv6-address*]

Parameter Description

ipv6-address: IPv6 address or prefix.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If the *ipv6-address* parameter is not configured, all bindings between prefixes and IA_NA addresses dynamically assigned to clients and clients are displayed. If the *ipv6-address* parameter is configured, only bindings of the specified address are displayed.

Examples

The following example displays all address bindings on a DHCPv6 server.

```
Hostname> enable
Hostname# show ipv6 dhcp binding
Client  DUID: 00:03:00:01:00:d0:f8:22:33:ac
  IAPD: iaid 0, T1 1800, T2 2880
  Prefix: 2001:20::/72
  preferred lifetime 3600, valid lifetime 3600
  expires at Jan 1 2008 2:23 (3600 seconds)
```

Table 1-4 Output Fields of the show ipv6 dhcp binding Command

Field	Description
Client DUID	DUID of a client.

IAPD	Bound IA type, which can also be IA_NA. It includes the following information: ● Iaid: IA ID. ● T1: T1 value of the IA. A client needs to send a RENEW message to update the address lease after T1. ● T2: T2 value of the IA. If the update is not complete within T2, the client needs to send another RENEW message.
Prefix	Prefix assigned to a client.
preferred lifetime	Time during which the prefix is still preferentially assigned to a client.
valid lifetime	Valid time of the prefix.
expires at	Time when the prefix expires.

14

Usage Guidelines

This command is used to display the source interfaces and the corresponding link addresses in request packets received by a DHCPv6 relay agent.

Examples

The following example displays all source interfaces and corresponding link addresses on a DHCPv6 relay agent.

```
Hostname> enable
Hostname# show ipv6 dhcp relay agent *
Link local address          l2 interface
---------------
```

Table 1-8 Output Fields of the show ipv6 dhcp relay agent Command

Field	Description
Link local address	Link address
l2 interface	Index of an L2 interface that receives request packets

1.28 show ipv6 dhcp relay destination

Function

Run the **show ipv6 dhcp relay destination** command to display destination addresses on a DHCPv6 relay agent.

Syntax

show ipv6 dhcp relay destination { **all** | *interface-type interface-number* }

Parameter Description

all: Displays all configured destination addresses and interfaces.

interface-type interface-number: Type and number of the interface whose configured destination addresses and interfaces are displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the destination address and interface for forwarding DHCPv6 packets received from clients on an interface with the DHCPv6 Relay service enabled.

Examples

The following example displays the destination addresses of all DHCPv6 relay agents.

```
Hostname> enable
Hostname# show ipv6 dhcp relay destination all
Interface:VLAN 1
Destination address(es)              Output Interface
3001::2
ff02::1:2                           VLAN 2
```

Table 1-9 Output Fields of the show ipv6 dhcp relay destination Command

Field	Description
Interface	Interface on which the DHCPv6 Relay service is enabled
Destination address(es)	Destination address
Output Interface	Outbound interface of packets

1.29 show ipv6 dhcp relay source

Function

Run the **show ipv6 dhcp relay source** command to display the source interface definition configuration on a DHCPv6 relay agent.

Syntax

show ipv6 dhcp relay source

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the source interface definition configuration of the DHCPv6 relay on the current device.

```
Hostname> enable
Hostname#show ipv6 dhcp relay source
Interface-Name         Source-Intf-Type      Source-Intf-Parameter
Global                Source Address        VLAN 10
VLAN 1                Gateway Address       1000::1
GigabitEthernet 0/7     Source Address        3000::1:1
```

Table 1-10 Output Fields of the show ipv6 dhcp relay source Command

Field	Description
Interface-Name	Name of the interface that is configured with the source interface definition function. It is fixed to **Global** in global configuration mode.
Source-Intf-Type	Source interface definition type.
Source-Intf-Parameter	Source interface definition parameter.

1.30 show ipv6 dhcp relay statistics

Function

Run the **show ipv6 dhcp relay statistics** command to display statistics of different types of packets on a DHCPv6 relay agent.

Syntax

show ipv6 dhcp relay statistics

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays statistics of different types of packets on a DHCPv6 relay agent.

```
Hostname> enable
Hostname# show ipv6 dhcp relay statistics
Packets dropped             :  2
   Error                   :  2
   Excess of rate limit     :  0
Packets received            :  28
   SOLICIT                 :  0
   REQUEST                 :  0
   CONFIRM                 :  0
   RENEW                   :  0
   REBIND                  :  0
   RELEASE                 :  0
   DECLINE                 :  0
   INFORMATION-REQUEST      :  14
   RELAY-FORWARD           :  0
   RELAY-REPLY             :  14
Packets sent                :  16
   ADVERTISE               :  0
   RECONFIGURE             :  0
   REPLY                   :  8
   RELAY-FORWARD           :  8
   RELAY-REPLY             :  0
```

Table 1-11 Output Fields of the show ipv6 dhcp relay statistics Command

Field	Description
Packets dropped	Total number of unprocessed packets discarded
Error	Number of error packets discarded
Excess of rate limit	Number of packets discarded due to an insufficient processing capacity of the device
Packets received	Total number of normal DHCPv6 packets received
SOLICIT	Number of SOLICIT packets
REQUEST	Number of REQUEST packets
CONFIRM	Number of CONFIRM packets
RENEW	Number of RENEW packets
REBIND	Number of REBIND packets

Field	Description
RELEASE	Number of RELEASE packets
DECLINE	Number of DECLINE packets
INFORMATION-REQUEST	Number of INFORMATION-REQUEST packets
RELAY-FORWARD	Number of RELAY-FORWARD packets
RELAY-REPLY	Number of RELAY-REPLY packets
Packets sent	Total number of normal DHCPv6 packets sent
ADVERTISE	Number of ADVERTISE packets
RECONFIGURE	Number of RECONFIGURE packets
REPLY	Number of REPLY packets
RELAY-FORWARD	Number of RELAY-FORWARD packets
RELAY-REPLY	Number of RELAY-REPLY packets

1.32 show ipv6 local pool

Function

Run the **show ipv6 local pool** command to display local prefix pool configuration and usage on the current device.

Syntax

show ipv6 local pool [*pool-name*]

Parameter Description

pool-name: Name of the local prefix pool.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display local prefix pool configuration and usage on the current device.

Examples

The following example displays configuration and usage of all local prefix pools.

```
Hostname> enable
Hostname# show ipv6 local pool
Pool               Prefix                  Free          In use
client-prefix-pool   2001:db8::/64            65536          0
```

Table 1-13 Output Fields of the show ipv6 local pool Command

Field	Description
Pool	Name of the local prefix pool
Prefix	Prefix and prefix length
Free	Available prefixes
In use	Prefixes being used

The following example displays the local prefix pool for the address pool client-prefix-pool.

```
Hostname# show ipv6 local pool client-prefix-pool
Prefix is 2001:db8::/64 assign /80 prefix
1 entries in use, 65535 available
Prefix                                              Interface
2001:db8::/80                                        GigabitEthernet 0/0
```

Table 1-14 Output Fields of the show ipv6 local pool Command

Field	Description
Prefix	Assigned prefix and prefix length.
x entries in use	x prefixes are being used.
y available	y prefixes are available.
Interface	Interface over which a prefix is assigned.

1 DHCPv6 Client Commands

Command	Function
clear ipv6 dhcp client	Restart the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Client function on an interface.
ipv6 dhcp client ia	Enable the DHCPv6 Client function on an interface and request an identity association non-temporary address (IA_NA) address.
ipv6 dhcp client pd	Enable the DHCPv6 Client function on an interface and request an address prefix.
show ipv6 dhcp	Display the DHCP Unique Identifier (DUID) of a device.
show ipv6 dhcp interface	Display DHCPv6 interfaces.

1.1 clear ipv6 dhcp client

Function

Run the **clear ipv6 dhcp client** command to restart the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Client function on an interface.

Syntax

clear ipv6 dhcp client *interface-type interface-number*

Parameter Description

interface-type interface-number: Interface type and interface number.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to restart the DHCPv6 Client function on an interface to request configurations from a DHCPv6 server again.

Examples

The following example restarts the DHCPv6 Client service on Switch Virtual Interface (SVI) 1.

```
Hostname> enable
Hostname# clear ipv6 dhcp client vlan 1
```

Notifications

Related Commands

N/A

1.2 ipv6 dhcp client ia

Function

Run the **ipv6 dhcp client ia** command to enable the DHCPv6 Client function on an interface and request an identity association non-temporary address (IA_NA) address.

Run the **no** form of this command to remove this configuration.

The DHCPv6 Client function and IA_NA address requesting are disabled by default.

Syntax

ipv6 dhcp client ia [**rapid-commit**]

no ipv6 dhcp client ia

Parameter Description

rapid-commit: Allows two-message exchange. If this keyword is configured, the SOLICIT message from the client contains the **Rapid-commit** option.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If the DHCPv6 Client function is disabled on an interface, this command is used to enable the DHCPv6 Client function on the interface.

Examples

The following example enables the DHCPv6 Client function on GigabitEthernet 0/1 and requests an IA_NA address.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 dhcp client ia
```

Notifications

When the DHCPv6 Client function fails to be enabled, the following notification will be displayed:

```
Failed to configure DHCPv6 interface, please try again.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

- **show ipv6 dhcp interface**

1.3 ipv6 dhcp client pd

Function

Run the **ipv6 dhcp client pd** command to enable the DHCPv6 Client function on an interface and request an address prefix.

Run the **no** form of this command to remove this configuration.

Address prefix requesting is not configured by default.

Syntax

ipv6 dhcp client pd *prefix-name* [**rapid-commit**]

no ipv6 dhcp client pd

Parameter Description

prefix-name: General IPv6 prefix.

rapid-commit: Allows two-message exchange. If this keyword is configured, the SOLICIT message from the client contains the **Rapid-commit** option.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If the DHCPv6 Client function is disabled on an interface, this command is used to enable the DHCPv6 Client function on the interface.

After this command is executed, the device sends a prefix request to a DHCPv6 server. After receiving the prefix, the client saves the prefix to the general IPv6 prefix pool. In this way, other commands and applications can use this prefix.

Examples

The following example enables the DHCPv6 Client function on GigabitEthernet 0/1 and requests an address prefix.

```
Hostname> enable
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 dhcp client pd pd_name
```

Notifications

When the DHCPv6 Client function fails to be enabled, the following notification will be displayed:

```
Failed to configure DHCPv6 interface, please try again.
```

Common Errors

N/A

Platform Description

N/A

Related Commands

- **show ipv6 dhcp interface**

1.4 show ipv6 dhcp

Function

Run the **show ipv6 dhcp** command to display the DHCP Unique Identifier (DUID) of a device.

Syntax

show ipv6 dhcp

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

The DHCPv6 server, client, and relay on the same device share one DUID.

Examples

The following example displays the DUID of a device.

```
Hostname> enable
Hostname# show ipv6 dhcp
This device's DHCPv6 unique identifier(DUID): 00:03:00:01:00:d0:f8:22:33:b0
```

1.5 show ipv6 dhcp interface

Function

Run the **show ipv6 dhcp interface** command to display DHCPv6 interfaces.

Syntax

show ipv6 dhcp interface [*interface-type interface-number*]

Parameter Description

interface-type interface-number: Interface type and interface number.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If the *interface-type interface-number* parameter is not configured, information about all DHCPv6 interfaces is displayed. If the *interface-type interface-number* parameter is configured, only information about the specified DHCPv6 interface is displayed.

Examples

The following example displays interfaces on a DHCPv6 server.

```
Hostname> enable
Hostname# show ipv6 dhcp interface
VLAN 1 is in server mode
  Server pool: dhcp-pool
  Rapid-Commit: disable
```

Table 1-2 Output Fields of the show ipv6 dhcp interface Command

Field	Description
xxx is in yyy mode	The xxx interface works in yyy mode. The values of yyy include: ● **Client**: The interface works in client mode. ● **Relay**: The interface works in relay mode. ● **Server**: The interface works in server mode.
Server pool	When the DHCPv6 Server function is enabled on an interface, the address pool name of the interface is displayed.
Rapid-Commit	Indicates whether the Rapid-Commit option is enabled. The values include: ● **enable**: Two-way message exchange is enabled. ● **disable**: Two-way message exchange is disabled.

2. The following example displays interfaces on a DHCPv6 client.

```
Hostname> enable
Hostname# show ipv6 dhcp interface
GigabitEthernet 0/1 is in client mode
  Rapid-Commit: disable
```

Table 1-3 Output Fields of the show ipv6 dhcp interface Command

Field	Description
xxx is in yyy mode	The xxx interface works in yyy mode. The values of yyy include: ● **Client**: The interface works in client mode. ● **Relay**: The interface works in relay mode. ● **Server**: The interface works in server mode.
Rapid-Commit	Indicates whether the Rapid-Commit option is enabled. The values include: ● **enable**: Two-way message exchange is enabled. ● **disable**: Two-way message exchange is disabled.

1 DHCPv6 Snooping Commands

Command	Function
clear ipv6 dhcp snooping binding	Clear all dynamic user information in the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Snooping binding database.
clear ipv6 dhcp snooping prefix	Clear all user information in the DHCPv6 Snooping prefix database.
clear ipv6 dhcp snooping statistics	Clear statistics about DHCPv6 packets processed by DHCPv6 Snooping.
ipv6 dhcp snooping	Enable DHCPv6 Snooping globally.
ipv6 dhcp snooping database write-delay	Write all dynamic user information in the DHCPv6 Snooping binding database to a flash memory at a scheduled time.
ipv6 dhcp snooping database write-to-flash	Write dynamic user information in the DHCPv6 Snooping binding database to a flash memory in real time.
ipv6 dhcp snooping information option	Add Option 18 or 37 to DHCPv6 request packets.
ipv6 dhcp snooping information option format remote-id	Set the Remote ID sub-option to a user-defined string or the host name when Option 37 is in extended padding mode.
ipv6 dhcp snooping filter-dhcp-pkt	Configure an interface to filter all DHCPv6 request packets.
ipv6 dhcp snooping link-detection	Clear dynamically bound entries on an interface in linkdown state.
ipv6 dhcp snooping trust	Configure an interface as a DHCPv6 Snooping trusted port.
ipv6 dhcp snooping vlan	Enable DHCPv6 Snooping on a VLAN.
ipv6 dhcp snooping vlan information option change-vlan-to vlan	Change the padded VLAN to a specified VLAN when Option 18 is in extended padding mode.
ipv6 dhcp snooping vlan information option format-type interface-id string	Set the Interface ID to a user-defined string for forwarding when Option 18 is in extended padding mode.

renew ipv6 dhcp snooping database	Import information in a flash memory to the DHCPv6 Snooping binding database.
show ipv6 dhcp snooping	Display DHCPv6 Snooping configurations.
show ipv6 dhcp snooping vlan	Display VLANs to which DHCPv6 Snooping does not take effect.
show ipv6 dhcp snooping binding	Display dynamic user information in the DHCPv6 Snooping binding database.
show ipv6 dhcp snooping prefix	Display user information in the DHCPv6 Snooping prefix database.
show ipv6 dhcp snooping statistics	Display statistics about DHCPv6 packets filtered due to DHCPv6 Snooping.
show ipv6 dhcp snooping packet	Display statistics about packets related to the DHCPv6 Snooping function.

1.1 clear ipv6 dhcp snooping binding

Function

Run the **clear ipv6 dhcp snooping binding** command to clear all dynamic user information in the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Snooping binding database.

Syntax

clear ipv6 dhcp snooping binding [*ipv6-address*] [*mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*]

Parameter Description

ipv6-address: IPv6 address of a user to be deleted.

mac-address: Media access control (MAC) address of a user to be deleted.

vlan *vlan-id*: Specifies the ID of the virtual local area network (VLAN) of a user to be deleted.

interface *interface-type interface-number*: Specifies the interface of a user to be deleted.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

After this command is run, all DHCPv6 users who access an interface with DHCPv6 Source Guard enabled need to re-apply for IPv6 addresses. Otherwise, they cannot access the Internet.

Examples

The following example clears all dynamic user information in the DHCPv6 Snooping binding database.

```
Hostname> enable
Hostname# clear ipv6 dhcp snooping binding
```

1.2 clear ipv6 dhcp snooping prefix

Syntax

Run the **clear ipv6 dhcp snooping prefix** command to clear all user information in the DHCPv6 Snooping prefix database.

Syntax

clear ipv6 dhcp snooping prefix [*ipv6-address*] [*mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*]

Parameter Description

ipv6-address: IPv6 address of a user to be deleted.

mac-address: MAC address of a user to be deleted.

vlan *vlan-id*: Specifies the ID of the VLAN of a user to be deleted.

interface *interface-type interface-number*: Specifies the interface of a user to be deleted.

Command Modes

Privileged EXEC mode

1.5 ipv6 dhcp snooping database write-delay

Function

Run the **ipv6 dhcp snooping database write-delay** command to write all dynamic user information in the DHCPv6 Snooping binding database to a flash memory at a scheduled time.

Run the **no** form of this command to remove this configuration.

The function of writing all dynamic user information in the DHCPv6 Snooping binding database to a flash memory at a scheduled time is not configured by default.

Syntax

ipv6 dhcp snooping database write-delay *time*

no ipv6 dhcp snooping database write-delay

Parameter Description

time: Period for saving database records, in seconds. The value range is from 600 to 86400.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to write dynamic user information in the DHCPv6 Snooping binding database to a flash memory at a scheduled time. This prevents binding information loss after a device restarts, there is no need to re-obtain IPv6 addresses to restore communication.

Note

A high saving frequency reduces the lifespan of the flash memory.

Examples

The following example writes all dynamic user information in the DHCPv6 Snooping binding database to a flash memory every 3600s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp snooping database write-delay 3600
```

Notifications

N/A

Common Errors

The configured period exceeds the limit.

1.7 ipv6 dhcp snooping information option

Function

Run the **ipv6 dhcp snooping information option** command to add Option 18 or 37 to DHCPv6 request packets.

Run the **no** form of this command to remove this configuration.

Option 18 or 37 is not added to DHCPv6 request packets by default.

Syntax

ipv6 dhcp snooping information option [**standard-format**]

no ipv6 dhcp snooping information option [**standard-format**]

Parameter Description

standard-format: Uses the standard padding format for Option 18 or 37.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to add Option 18 or 37 to DHCPv6 request packets, so that a DHCP server can assign addresses based on Option 18 or 37.

When Option 18 or 37 is enabled, the extended padding mode is used by default.

Caution

- Option 18 or 37 for DHCPv6 Snooping and DHCP Relay are mutually exclusive.
- In wireless access scenarios, the **Circuit ID** sub-option is fixed at **0** in both standard padding and extended padding modes of Option 18.

Examples

The following example adds Option 18 or 37 to DHCPv6 request packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp snooping information option
```

1.8 ipv6 dhcp snooping information option format remote-id

Function

Run the **ipv6 dhcp snooping information option format remote-id** command to set the **Remote ID** sub-option to a user-defined string or the host name when Option 37 is in extended padding mode.

Run the **no** form of this command to remove this configuration.

When Option 37 is in extended padding mode, **Remote ID** is not set to a user-defined string or host name by default.

Syntax

ipv6 dhcp snooping information option format remote-id { **hostname** | **string** *ascii-string* }

no ipv6 dhcp snooping information option format remote-id { **hostname** | **string** *ascii-string* }

Parameter Description

hostname: Sets **Remote ID** to the host name.

string *ascii-string*: Sets **Remote ID** to a user-defined string.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When Option 37 is enabled for DHCPv6 packets in extended padding mode, this command is used to customize the content of **Remote ID**.

Examples

The following example sets **Remote ID** to a host name when Option 37 is in extended padding mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp snooping information option format remote-id hostname
```

Notifications

When the value of the *ascii-string* parameter exceeds 63 characters, the following notification will be displayed:

```
% Failed to execute command, because of "Remote-ID string cannot exceed 63 characters".
```

Common Errors

1.9 ipv6 dhcp snooping filter-dhcp-pkt

Function

Run the **ipv6 dhcp snooping filter-dhcp-pkt** command to configure an interface to filter all DHCPv6 request packets.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

No interface is configured to filter all DHCPv6 request packets by default.

Syntax

ipv6 dhcp snooping filter-dhcp-pkt

no ipv6 dhcp snooping filter-dhcp-pkt

default ipv6 dhcp snooping filter-dhcp-pkt

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to reject all DHCPv6 packets on an untrusted port, that is, to forbid all users on this port to apply for addresses via DHCPv6.

This command can be configured only on L2 switching ports, aggregation ports (APs), or encapsulation sub-interfaces.

Examples

The following example configures GigabitEthernet 0/1 to filter all DHCPv6 request packets sent to this interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 dhcp snooping filter-dhcp-pkt
```

Notifications

When this command is configured on a DHCPv6 trusted port, the following notification will be displayed:

```
% Failed to execute command, because of "Security config conflict".
```

When this command is not configured on an L2 switching port, AP, or L2 encapsulation sub-interface, the following notification will be displayed:

```
% Failed to execute command, because of "Configure is not supported on current interface".
```

1.11 ipv6 dhcp snooping trust

Function

Run the **ipv6 dhcp snooping trust** command to configure an interface as a DHCPv6 Snooping trusted port.

Run the **no** form of this command to remove this configuration.

All interfaces are DHCPv6 Snooping untrusted ports by default.

Syntax

ipv6 dhcp snooping trust

no ipv6 dhcp snooping trust

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to configure interfaces connected to legitimate DHCPv6 servers as trusted ports. DHCPv6 response packets received on trusted ports are forwarded normally, while those received on untrusted ports are discarded.

This command can be configured only on L2 switching ports, APs, and L2 encapsulation sub-interfaces.

Caution

Generally, uplink interfaces, that is, interfaces connected to trusted DHCPv6 servers are configured as trusted ports.

Examples

The following example configures GigabitEthernet 0/1 as a DHCPv6 Snooping trusted port.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if)# ipv6 dhcp snooping trust
```

Notifications

When an interface configured with other access security control options is configured as a DHCPv6 Snooping trusted port, the following notification will be displayed:

```
% Failed to execute command, because of "Security config conflict".
```

When this command is not configured on an L2 switching port or AP, the following notification will be displayed:

```
% Failed to execute command, because of "Configure is not supported on current interface".
```

Common Errors

N/A

Platform Description

1.12 ipv6 dhcp snooping vlan

Function

Run the **ipv6 dhcp snooping vlan** command to enable DHCPv6 Snooping on a VLAN.

Run the **no** form of this command to remove this configuration.

After DHCPv6 Snooping is enabled globally, it takes effect to all VLANs by default.

Syntax

ipv6 dhcp snooping vlan { *vlan-range* | *vlan-min* [*vlan-max*] }

no ipv6 dhcp snooping vlan { *vlan-range* | *vlan-min* [*vlan-max*] }

Parameter Description

vlan-range: Range of VLANs in which DHCPv6 Snooping takes effect. The value is a character string, for example 1, 3–5, 7, and 9–11.

vlan-min: Minimum ID of a VLAN to DHCPv6 Snooping takes effect. The value range is from 1 to 4094.

vlan-max: Maximum ID of a VLAN to DHCPv6 Snooping takes effect. The value range is from 1 to 4094.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to enable or disable DHCPv6 Snooping for a specific VLAN. This function takes effect only when DHCPv6 Snooping is enabled globally.

Examples

The following example enables DHCPv6 Snooping for VLAN 1000.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp snooping vlan 1000
```

The following example enables DHCPv6 Snooping for VLAN 1 to VLAN 10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 dhcp snooping vlan 1-10
```

Notifications

When the configured VLAN ID is beyond the range of 1 to 4094, the following notification will be displayed:

```
% Failed to execute command, because of "Not supported vlan range".
```

1.13 ipv6 dhcp snooping vlan information option change-vlan-to vlan

Function

Run the **ipv6 dhcp snooping vlan information option change-vlan-to vlan** command to change the padded VLAN to a specified VLAN when Option 18 is in extended padding mode.

Run the **no** form of this command to remove this configuration.

When Option 18 is in extended padding mode, the padded VLAN is not changed to a specified VLAN by default.

Syntax

ipv6 dhcp snooping vlan *vlan-id* **information option change-vlan-to vlan** *vlan-id*

no ipv6 dhcp snooping vlan *vlan-id* **information option change-vlan-to vlan** *vlan-id*

Parameter Description

vlan-id: VLAN ID. The value range is from 1 to 4094.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When Option 18 is enabled for DHCPv6 packets in extended padding mode, this command is used to change the padded VLAN to a specified VLAN.

Examples

The following example adds Option 18 to DHCPv6 request packets and changes VLAN 4094 in the **Interface ID** sub-option of Option 18 to VLAN 4093.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if)# ipv6 dhcp snooping vlan 4094 information option change-vlan-to
vlan 4093
```

1.14 ipv6 dhcp snooping vlan information option format-type interface-id string

Function

Run the **ipv6 dhcp snooping vlan information option format-type interface-id string** command to set **the Interface ID** to a user-defined string for forwarding when Option 18 is in extended padding mode.

Run the **no** form of this command to remove this configuration.

When Option 18 is in extended padding mode, **Interface ID** is not set to a user-defined string for forwarding by default.

Syntax

ipv6 dhcp snooping vlan *vlan-id* **information option format-type interface-id string** *ascii-string*

no ipv6 dhcp snooping vlan *vlan-id* **information option format-type interface-id string** *ascii-string*

Parameter Description

vlan-id: VLAN of DHCPv6 request packets.

ascii-string: User-defined **Interface ID** content. The value is a string of 3 to 63 bytes in ASCII format.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When DHCPv6 Option 18 is enabled in extended padding mode, this command is used to set **Interface ID** to a user-defined string.

Examples

The following example sets **Interface ID** to a port name when Option 18 is added to DHCPv6 request packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if)# ipv6 dhcp snooping vlan 4094 information option format-type
interface-id string port-name
```

Notifications

When the user-defined character string is not 3 to 63 characters, the following notification is displayed:

```
% Failed to execute command, because of "Interface-ID string must be 3 to 63 characters".
```

Common Errors

Examples

The following example displays DHCPv6 Snooping configurations.

```
Hostname> enable
Hostname# show ipv6 dhcp snooping
DHCPv6 snooping status                 : ENABLE
DHCPv6 snooping database write-delay time : 0 seconds
DHCPv6 snooping binding-delay time       : 0 seconds
DHCPv6 snooping option18/37 status       : DISABLE
DHCPv6 snooping link detection          : DISABLE
Interface               Trusted    Filter DHCPv6
-----------------------    -------    -------------
GigabitEthernet 0/1        YES       DISABLE
```

Table 1-1 Output Fields of the show ipv6 dhcp snooping Command

Field	Description
DHCPv6 snooping status	Indicates whether DHCPv6 snooping is enabled globally
DHCPv6 snooping database write-delay time	Interval for writing data to a flash memory.
DHCPv6 snooping binding-delay time	Delayed time for adding dynamically generated binding entries to the hardware filtering table.
DHCPv6 snooping option 18/37 status	Indicates whether Option 18 or 37 is added to DHCPv6 request packets.
DHCPv6 snooping link detection	Indicates whether dynamically bound entries on a linkdown interface are cleared.
Interface	Interface name
Trusted	Indicates whether an interface is a trusted port.
Filter DHCP	Indicates whether DHCPv6 request packet filtering is configured.

1.18 show ipv6 dhcp snooping binding

Function

Run the **show ipv6 dhcp snooping binding** command to display dynamic user information in the DHCPv6 Snooping binding database.

Syntax

show ipv6 dhcp snooping binding [*ipv6-address*] [*mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*]

Parameter Description

ipv6-address: IPv6 address for which binding information is displayed.

mac-address: MAC address for which binding information is displayed.

vlan *vlan-id*: Specifies the VLAN for which binding information is displayed.

interface *interface-type interface-number*: Specifies the interface for which binding information is displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays dynamic user information in the DHCPv6 Snooping binding database.

```
Hostname> enable
Hostname# show ipv6 dhcp snooping binding
Total number of bindings: 1
NO.   MAC Address        IPv6 Address                              Lease(sec)   VLAN
Interface
1     00d0.f801.0101     2001::10                                  42368        2
GigabitEthernet 0/1
```

Table 1-3 Output Fields of the show ipv6 dhcp snooping binding Command

Field	Description
Total number of bindings	Number of bindings in the DHCPv6 Snooping binding database
No.	Record number
MAC Address	MAC address of a user
IPv6 Address	IPv6 address of a user
Lease(sec)	Lease time of a record
VLAN	VLAN of a user
Interface	Wired access interface of a user

1.20 show ipv6 dhcp snooping statistics

Function

Run the **show ipv6 dhcp snooping statistics** command to display statistics about DHCPv6 packets filtered due to DHCPv6 Snooping.

Syntax

show ipv6 dhcp snooping statistics

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays statistics about DHCPv6 packets filtered due to DHCPv6 Snooping.

```
Hostname> enable
Hostname# show ipv6 dhcp snooping statistics
Packets processed by DHCPv6 snooping = 0
Packets dropped because
Received on untrusted ports        = 0
Relay forward                    = 0
No binding entry                  = 0
Binding fail                     = 0
Unknown packet                    = 0
Unknown output interface           = 0
No enough memory                  = 0
Admin filter DCHPv6 packet         = 0
```

Table 1-5 Output Fields of the show ipv6 dhcp snooping statistics Command

Field	Description
Received on untrusted ports	Server response packets discarded on untrusted ports.
Relay forward	Discarded packets that are relayed once.
No binding entry	When the binding entry of a RELEASE or DECLINE packet does not exist or is incorrect, the packet is discarded.
Binding fail	Packets discarded because entry binding fails. Generally, entry binding fails because hardware resources are insufficient.
Unknown packet	Unknown DHCPv6 packets.
Unknown output interface	Packets sent from unknown outbound interface because the MAC address cannot be found or the interface is not set as a trusted port.
No enough memory	Packets discarded due to insufficient memory resources.
Admin filter-dhcpv6-pkt	DHCPv6 packets filtered due to the administrator configuration, mainly packets filtered after the **ipv6 dhcp snooping filter-dhcp-pkt** command is configured.

1 ND Snooping Commands

Command	Function
clear ipv6 nd snooping prefix	Clear IPv6 prefixes snooped in a virtual local area network (VLAN).
clear ipv6 nd snooping binding	Clear snooped Stateless Address Autoconfiguration (SLACC) users.
clear ipv6 nd snooping packet	Clear Neighbor Discovery (ND) Snooping packet statistics on an interface.
ipv6 nd snooping bind lifetime	Configure the lease of an ND Snooping binding entry.
ipv6 nd snooping bind limit	Configure the capacity for ND Snooping binding entries.
ipv6 nd snooping bind warning-threshold	Configure a capacity alarm threshold for the ND Snooping binding entries.
ipv6 nd snooping check address-resolution	Enable ND guard against address spoofing attacks.
ipv6 nd snooping detect packet	Configure the number of detection packets to be sent and the interval for sending detection packets when conflicted packets are received.
ipv6 nd snooping detect wait	Configure the waiting time for a detection packet response.
ipv6 nd snooping enable	Enable the ND Snooping function to snoop the SLACC process.
ipv6 nd snooping enable vlan	Enable ND Snooping on a VLAN.
ipv6 nd snooping log enable	Enable the function of logging ND Snooping key information.
ipv6 nd snooping log limit	Configure the capacity for ND Snooping key information logs.
ipv6 nd snooping nd-check only	Configure ND Snooping to work only in ND packet validity check mode but not generate binding entries.
ipv6 nd snooping prefix vlan	Configure the prefix for static IPv6 addresses.
ipv6 nd snooping syslog enable	Enable the function of prompting ND Snooping key information.

ipv6 nd snooping syslog frequency	Configure the frequency of ND Snooping key information prompts.
ipv6 nd snooping tentative wait	Configure the waiting time for an address conflict response.
ipv6 nd snooping trust	Configure an interface as an ND Snooping trusted interface.
show ipv6 nd snooping prefix	Display snooped prefixes.
show ipv6 nd snooping binding	Display snooped ND Snooping binding entries.
show ipv6 nd snooping log	Display ND Snooping key information logs recorded in the memory.
show ipv6 nd snooping packet	Display ND Snooping packet statistics on an interface.

1.1 clear ipv6 nd snooping prefix

Function

Run the **clear ipv6 nd snooping prefix** command to clear IPv6 prefixes snooped in a virtual local area network (VLAN).

Syntax

clear ipv6 nd snooping prefix [**vlan** *vlan-id*]

Parameter Description

vlan *vlan-id*: Specifies the VLAN in which the snooped IPv6 prefixes are cleared.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example clears IPv6 prefixes snooped in all VLANs.

```
Hostname> enable
Hostname# clear ipv6 nd snooping prefix
```

Notifications

1.2 clear ipv6 nd snooping binding

Function

Run the **clear ipv6 nd snooping binding** command to clear snooped Stateless Address Autoconfiguration (SLACC) users.

Syntax

clear ipv6 nd snooping binding [**vlan** *vlan-id*]

Parameter Description

vlan *vlan-id*: Specifies the VLAN in which snooped SLACC users are cleared.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example clears SLACC users snooped in all VLANs.

```
Hostname> enable
Hostname# clear ipv6 nd snooping binding
```

Notifications

1.3 clear ipv6 nd snooping packet

Function

Run the **clear ipv6 nd snooping packet** command to clear Neighbor Discovery (ND) Snooping packet statistics on an interface.

Syntax

clear ipv6 nd snooping packet [**interface** *interface-type interface-number*]

Parameter Description

interface-type interface-number: Interface on which the ND Snooping packet statistics are cleared.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used to clear ND Snooping packet statistics on an interface, including the numbers of received, discarded, and forwarded ND packets, the total number of each type of ND packets, and the number of each type of ND packets discarded.

Examples

The following example clears ND Snooping packet statistics on all interfaces.

```
Hostname> enable
Hostname# clear ipv6 nd snooping packet
```

Notifications

1.4 ipv6 nd snooping bind lifetime

Function

Run the **ipv6 nd snooping bind lifetime** command to configure the lease of an ND Snooping binding entry.

Run the **no** form of this command to remove this configuration.

The lease time of an ND Snooping binding entry is 300s by default.

Syntax

ipv6 nd snooping bind lifetime *time*

no ipv6 nd snooping bind lifetime

Parameter Description

time: Lease time of an entry, in seconds. The range is from 5 to 604800.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the lease time for an entry to prevent binding entries from occupying the memory space for a long time.

Examples

The following example sets the lease time of an ND Snooping binding entry to 3600s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping bind lifetime 3600
```

1.5 ipv6 nd snooping bind limit

Function

Run the **ipv6 nd snooping bind limit** command to configure the capacity for ND Snooping binding entries.

Run the **no** form of this command to remove this configuration.

The capacity for binding entries depends on the actual product by default.

Syntax

ipv6 nd snooping bind limit *limit*

no ipv6 nd snooping bind limit

Parameter Description

limit: Capacity for binding entry. The value range is from 7 to 1048576.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the capacity for binding entries. The configured value cannot be less than the current number of binding entries.

Examples

The following example sets the total capacity for binding entries to **1024** and sets that on GigabitEthernet 0/1 to **128**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping bind limit 1024
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd snooping bind limit 128
Hostname(config-if-GigabitEthernet 0/1)# exit
```

Notifications

When the configured capacity value is smaller than the current number of binding entries, the following notification will be displayed:

```
% Failed to execute command, because of "current num more than config maximum".
```

Common Errors

Related Commands

- **ipv6 nd snooping bind warning-threshold**

1.6 ipv6 nd snooping bind warning-threshold

Function

Run the **ipv6 nd snooping bind warning-threshold** command to configure a capacity alarm threshold for the ND Snooping binding entries.

Run the **no** form of this command to remove this configuration.

No capacity alarm threshold is configured for the ND Snooping binding entries by default.

Syntax

ipv6 nd snooping bind warning-threshold *number*

no ipv6 nd snooping bind warning-threshold

Parameter Description

number: Capacity alarm threshold for the binding entries, in percentage (%). The range is from 15 to 100.

Command Modes

Global configuration mode

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to configure a capacity alarm threshold for the binding entries. For example, if *num* is set to **60**, an alarm is triggered when the current number of entries exceeds 60% of the configured capacity and a prompt is displayed when the current number of entries is less than 60% of the configured capacity. When the configuration is canceled, *num* is set to **0**. In this case, no capacity alarm is triggered. When this command is configured on an interface and the capacity for binding entries is not limited on the interface (that is, the *limit* parameter in **ipv6 nd snooping bind limit** is set to **0**), no capacity alarm is triggered.

Examples

The following example sets the capacity alarm threshold for the global binding entries to **60** and sets that on GigabitEthernet 0/1 to **60**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping bind warning-threshold 60
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd snooping bind warning-threshold 60
```

Notifications

When a capacity alarm threshold (for example, 15) is configured for the binding entries and the percentage of the current number of entries to the configured capacity exceeds the configured threshold, the following notification will be displayed:

```
The binding user has exceeded the 15 percent capacity of count limit.
```

1.7 ipv6 nd snooping check address-resolution

Function

Run the **ipv6 nd snooping check address-resolution** command to enable ND guard against address spoofing attacks.

Run the **no** form of this command to disable this feature.

ND guard against address spoofing attacks is disabled by default.

Syntax

ipv6 nd snooping check address-resolution

no ipv6 nd snooping check address-resolution

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When ND guard against address spoofing attacks is enabled, the IPv6 address and Media Access Control (MAC) address fields in neighbor solicitation (NS), neighbor advertisement (NA), and router solicitation (RS) packets received on an interface are checked whether match the binding entries. ND packets that do not match the binding entries are discarded.

Note

The entries for ND guard against address spoofing attacks come from the Source Address Validation Improvements (SAVI) binding table instead of the ND Snooping binding table.

Examples

The following example enables ND guard against address spoofing attacks.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd snooping check address-resolution
```

1.8 ipv6 nd snooping detect packet

Function

Run the **ipv6 nd snooping detect packet** command to configure the number of detection packets to be sent and the interval for sending detection packets when conflicted packets are received.

Run the **no** form of this command to remove this configuration.

Two detection packets are sent at an interval of 250 ms by default.

Syntax

ipv6 nd snooping detect packet *number* **interval** *time*

no ipv6 nd snooping detect packet

Parameter Description

number: Number of detection packets to be sent. The range is from 1 to 10.

time: Interval for sending detection packets, in milliseconds. The range is from 50 to 5000.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the device with ND Snooping enabled receives an NS or NA packet with an address that conflicts with that in a binding entry or the lease of a binding entry expires, the device sends a detection packet to the port recorded in the binding entry. This command is used to set the number of detection packets to be sent and the interval for sending detection packets.

Caution

The interval is only a reference value in ND Snooping for sending packets and may be inaccurate.

Examples

The following example sets the number of detection packets to be sent to **2** and the interval for sending detection packets to **2000**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping detect packet 2 interval 2000
```

1.9 ipv6 nd snooping detect wait

Function

Run the **ipv6 nd snooping detect wait** command to configure the waiting time for a detection packet response.

Run the **no** form of this command to remove this configuration.

The default waiting time for a detection packet response is 500 ms.

Syntax

ipv6 nd snooping detect wait *time*

no ipv6 nd snooping detect wait

Parameter Description

time: Waiting time, in milliseconds. The range is from 50 to 5000. The waiting time is only a reference value in ND Snooping and may be inaccurate.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the waiting time for a detection packet response after the device with ND Snooping enabled sends a detection packet. If no response is received within the waiting time, the device deletes the corresponding entry.

Examples

The following example sets the waiting time for a detection packet response to 2000 ms.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping detect wait 2000
```

1.10 ipv6 nd snooping enable

Function

Run the **ipv6 nd snooping enable** command to enable the ND Snooping function to snoop the SLACC process.

Run the **no** form of this command to disable this feature.

ND Snooping is disabled by default.

Syntax

ipv6 nd snooping enable

no ipv6 nd snooping enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Snooped SLACC user information can be used for ND guard and other security policies.

Examples

The following example enables ND Snooping.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping enable
```

1.11 ipv6 nd snooping enable vlan

Function

Run the **ipv6 nd snooping enable vlan** command to enable ND Snooping on a VLAN.

Run the **no** form of this command to remove this feature.

After ND Snooping is enabled on a device, it takes effect to all VLANs of the device by default.

Syntax

ipv6 nd snooping enable vlan { *vlan-range* | *vlan-id* }

no ipv6 nd snooping enable vlan { *vlan-range* | *vlan-id* }

Parameter Description

vlan-range: Range of VLANs to which ND Snooping takes effect. The value is a character string, for example 1, 3–5, 7, and 9–11.

vlan-id: ID of a VLAN. The range is from 1 to 4096.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

If SLACC snooping is not required in a VLAN, you can run this command to disable ND Snooping on the VLAN.

Examples

The following example disables ND Snooping on VLAN 5 and VLANs 10 to 20.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping enable
Hostname(config)# no ipv6 nd snooping enable vlan 5,10-20
```

1.12 ipv6 nd snooping log enable

Function

Run the **ipv6 nd snooping log enable** command to enable the function of logging ND Snooping key information.

Run the **no** form of this command to disable this feature and clear key information logs in the memory.

The function of logging ND Snooping key information is disabled by default.

Syntax

ipv6 nd snooping log enable

no ipv6 nd snooping log enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After enabling ND guard against address spoofing attacks or RA attacks, you can run this command to enable the function of logging ND Snooping key information. When the device receives packets for address spoofing attacks or RA attacks, information about the attacker is recorded to the memory via attack logs.

Examples

The following example enables the function of logging ND Snooping key information.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping log enable
```

1.13 ipv6 nd snooping log limit

Function

Run the **ipv6 nd snooping log limit** command to configure the capacity for ND Snooping key information logs.

Run the **no** form of this command to remove this configuration.

A maximum of 1000 ND Snooping key information logs can be recorded by default.

Syntax

ipv6 nd snooping log limit *number*

no ipv6 nd snooping log limit *number*

Parameter Description

number: Capacity value. The value range is from 50 to 5000.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the capacity for address spoofing or RA attack logs reaches the upper limit, new attack logs replace the earliest ones.

Examples

The following example sets the capacity for ND Snooping key information logs to **500**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping log limit 500
```

1.14 ipv6 nd snooping nd-check only

Function

Run the **ipv6 nd snooping nd-check only** command to configure ND Snooping to work only in ND packet validity check mode but not generate binding entries.

Run the **no** form of this command to remove this configuration.

ND Snooping is not configured to work only in ND packet validity check mode by default.

Syntax

ipv6 nd snooping nd-check only

no ipv6 nd snooping nd-check only

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command can be configured when ND Snooping entries do not need to be generated but the ND packet validity needs to be checked.

Note

This command takes effect only after ND Snooping is enabled.

Examples

The following example configures ND Snooping to work only in ND packet validity check mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping enable
Hostname(config)# ipv6 nd snooping nd-check only
```

1.15 ipv6 nd snooping prefix vlan

Function

Run the **ipv6 nd snooping prefix vlan** command to configure the prefix for static IPv6 addresses.

Run the **no** form of this command to remove this configuration.

No prefix is configured for static IPv6 addresses by default.

Syntax

ipv6 nd snooping prefix vlan *vlan-id ipv6-address/prefix-length*

no ipv6 nd snooping prefix vlan *vlan-id ipv6-address/prefix-length*

Parameter Description

vlan-id: Access VLAN.

ipv6-address/prefix-length-address/prefix-length: IPv6 address and prefix.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command can be used to configure IPv6 address prefix entries.

Examples

The following example sets the prefix for ND Snooping static IPv6 addresses to 2018:7::/64.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping prefix vlan 1 2018:7::/64

1.16 ipv6 nd snooping syslog enable

Function

Run the **ipv6 nd snooping syslog enable** command to enable the function of prompting ND Snooping key information.

Run the **no** form of this command to disable this feature.

The function of prompting ND Snooping key information is disabled by default.

Syntax

ipv6 nd snooping syslog enable

no ipv6 nd snooping syslog enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After enabling ND guard against address spoofing attacks or RA attacks, you can run this command to enable the function of prompting ND Snooping key information. When the device receives packets of address spoofing attacks or RA attacks, information about the attacker is displayed via system prompts.

Examples

The following example enables the function of prompting ND Snooping key information.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping syslog enable
```

Notifications

```
*Dec 27 20:34:13: %ND_SNP-COLLISION: Receive Address Resolution attack from
host<VLAN=2,port=Gi0/16,MAC=e0db.5594.c026,IPv6=fe80::11da:cb7e:57db:e231> was

1.17 ipv6 nd snooping syslog frequency

Function

Run the **ipv6 nd snooping syslog frequency** command to configure the frequency of ND Snooping key information prompts.

Run the **no** form of this command to remove this configuration.

A maximum of 5 prompts for ND Snooping key information are provided every second by default.

Syntax

ipv6 nd snooping syslog frequency *number*

no ipv6 nd snooping syslog frequency

Parameter Description

number: Frequency of system prompts, in pieces per second. The range is from 1 to 65535.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the frequency of ND Snooping key information prompts, that is, the maximum number of system prompts generated every second. When key information is generated, such as information about address spoofing attacks, RA attacks, capacity threshold alarms, and entry capacity alarms, the system generates corresponding prompt logs. When the number of logs generated every second is greater than the configured frequency, the system displays logs within the frequency range only and discard remaining logs to prevent the screen from frequent refreshing.

Caution

The log limit function is implemented based on the system time, while the log display is implemented based on the user time. Therefore, the number of logs with the same time on the console is [0, 2 x *num*].

Examples

The following example sets the frequency of ND Snooping key information prompts to 200 pieces per second.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping syslog frequency 200
```

1.18 ipv6 nd snooping tentative wait

Function

Run the **ipv6 nd snooping tentative wait** command to configure the waiting time for an address conflict response.

Run the **no** form of this command to remove this configuration.

The default waiting time for an address conflict response is 500 ms.

Syntax

ipv6 nd snooping tentative wait *time*

no ipv6 nd snooping tentative wait

Parameter Description

time: Waiting time, in milliseconds. The range is from 50 to 5000. The waiting time is only a reference value in ND Snooping and may be inaccurate.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the device with ND Snooping enabled receives a DAD_NS packet (for duplicate address check) from a client, the device creates an entry in **TENTATIVE** state. The entry is changed to a formal binding entry after a period of time.

Examples

The following example sets the waiting time for an address conflict response to 2000 ms.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 nd snooping tentative wait 2000
```

1.19 ipv6 nd snooping trust

Function

Run the **ipv6 nd snooping trust** command to configure an interface as an ND Snooping trusted interface.

Run the **no** form of this command to remove this configuration.

All interfaces are ND Snooping untrusted interfaces by default.

Syntax

ipv6 nd snooping trust

no ipv6 nd snooping trust

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

After an interface is configured as an ND Snooping trusted interface, RA and RR packets received on this interface are forwarded, and such packets received on untrusted interfaces are discarded.

This command can be configured only on L2 switching ports, aggregation ports (APs), or encapsulation sub-interfaces.

Note

Generally, uplink interfaces, that is, interfaces connected to trusted gateways are configured as trusted interfaces.

Examples

The following example configures GigabitEthernet 0/1 as an ND Snooping trusted interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 nd snooping trust
```

Command	Function
ip tcp keepalive	Enable the TCP keepalive function.
ip tcp mss	Configure the upper MSS limit for a TCP connection.
ip tcp path-mtu-discovery	Enable the path MTU discovery function of TCP.
ip tcp send-reset	Configure the sending of TCP reset packets upon the receiving of port unreachable messages.
ip tcp synwait-time	Configure the timeout period of SYN packets used for connection establishment.
ip tcp window-size	Configure the TCP window size.
show ipv6 tcp connect	Display the basic information about the current IPv6 TCP connection.
show ipv6 tcp connect statistics	Display the statistics on all the current IPv6 TCP connections.
show ipv6 tcp pmtu	Display the path MTU of an IPv6 TCP connection.
show ipv6 tcp port	Display the usage of the current IPv6 TCP port.
show tcp connect	Display the basic information about the current IPv4 TCP connection.
show tcp connect statistics	Display the statistics on all the current IPv4 TCP connections.
show tcp parameter	Display the information about current TCP parameters.
show tcp pmtu	Display the path MTU of an IPv4 TCP connection.
show tcp port	Display the usage of the current IPv4 TCP port.
show tcp statistics	Display the current TCP statistics of the system.

1.1 ip tcp keepalive

Function

Run the **ip tcp keepalive** command to enable the TCP keepalive function.

Run the **no** form of this command to disable this feature.

Run the **default** form of this command to restore the default configuration.

The TCP keepalive function is disabled by default.

Syntax

ip tcp keepalive [**interval** *interval*] [**times** *times*] [**idle-period** *time*]

no ip tcp keepalive

default ip tcp keepalive

Parameter Description

interval *interval*: Indicates the interval time at which a keepalive packet is transmitted, in seconds. The value range is from 1 to 120. The default value is **75**.

times *times*: Indicates the keepalive packet transmission count. The value range is from 1 to 10, and the default value is **6**.

idle-period *time*: Indicates the idle period, in seconds, that is, the length of time that the peer end does not send a packet to the local end. The value range is from 60 to 1800. The default value is **900**, that is, 15 minutes.

Command Modes

Global configuration mode

Default Level

2

Usage Guidelines

You may enable the keepalive function to check whether the peer end of a TCP connection works normally.

Suppose that the TCP keepalive function is enabled on a device and default interval, transmission count, and idle period settings are used. If no packet is received from the peer within 15 minutes, the device starts sending keepalive packets every 75 seconds for 6 consecutive times. If the device receives no TCP packet from the peer, it considers the TCP connection invalid and automatically releases the TCP connection.

This command is no different to the server and client and applies to all TCP connections.

Examples

The following example enables the TCP keepalive function on a device with the idle period, interval, and transmission count set to 3 minutes, 60 seconds, and 4 respectively.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip tcp keepalive interval 60 times 4 idle-period 180
```

1.2 ip tcp mss

Function

Run the **ip tcp mss** command to configure the upper MSS limit for a TCP connection.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

The calculated value "IPv4/IPv6 MTU – IPv4/IPv6 header length – TCP header length" is used as the upper MSS limit by default.

Syntax

ip tcp mss *max-segment-size*

no ip tcp mss

default ip tcp mss

Parameter Description

max-segment-size: Upper MSS limit. The value range is from 68 to 10000, in bytes.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The MSS refers to the maximum length of data payload in a TCP segment, excluding the TCP option.

This command is used to restrict the MSS limit for TCP connections to be established. The negotiated MSS for a new connection should be smaller than this MSS.

This parameter does not need to be configured by default. Instead, the MSS calculated based on the MTU is used, as shown below:

IPv4 TCP: MSS = IP MTU of the outbound interface corresponding to the peer IP address – IP header size (20 bytes) – TCP header size (20 bytes).

IPv6 TCP: MSS = Path MTU corresponding to the peer IPv6 address – IPv6 header size (40 bytes) – TCP header size (20 bytes).

If a connection supports certain options, the option length after 4-byte alignment should be deducted from the MSS value. For example, 20 bytes need to be deducted if the MD5 option is used because the length of the MD5 option is 18 bytes and the length after alignment is 20 bytes.

If an upper MSS limit is configured, the upper MSS limit that actually takes effect is the MSS calculated based on the MTU or configured MSS, whichever is smaller.

Examples

The following example sets the upper MSS limit of TCP connections to 1,300 bytes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip tcp mss 1300
```

1.3 ip tcp path-mtu-discovery

Function

Run the **ip tcp path-mtu-discovery** command to enable the path MTU discovery function of TCP.

Run the **no** form of this command to disable this feature.

The path MTU discovery function of TCP is disabled by default.

Syntax

ip tcp path-mtu-discovery [**age-timer** *time* | **age-timer infinite**]

no ip tcp path-mtu-discovery

Parameter Description

age-timer *time*: Indicates the interval for a new probe after TCP discovers a path MTU, in minutes. The value range is from 10 to 30. The default value is **10**.

age-timer infinite: Indicates that no probe is performed after TCP discovers a path MTU.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The path MTU discovery function of TCP is implemented according to RFC1191 to improve the network bandwidth utilization. When TCP is applied to bulk transmit chunk data, this function can improve transmission performance greatly.

After discovering the path MTU, TCP can use a larger MSS to probe a new path MTU at intervals. This interval is specified by using the **age-timer** parameter. When the device discovers a path MTU smaller than the MSS negotiated by both ends of a TCP connection, the device tries to probe a larger path MTU at the configured interval described above. The probe process is stopped when the path MTU reaches the MSS or the user turns off the timer. You may use the **age-timer infinite** parameter to turn off this timer.

This command applies to only IPv4 TCP. The path MTU discovery function of IPv6 TCP is enabled permanently and cannot be disabled.

Examples

The following example enables the path MTU discovery function of TCP.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip tcp path-mtu-discovery
```

1.4 ip tcp send-reset

Function

Run the **ip tcp send-reset** command to configure the sending of TCP reset packets upon the receiving of port unreachable messages.

Run the **no** form of this command to remove this configuration.

TCP reset packets are sent upon the receiving of port unreachable messages by default.

Syntax

ip tcp send-reset

no ip tcp send-reset

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

In general, when the TCP module distributes a TCP packet, if the TCP connection, to which the packet belongs, cannot be identified, the local end sends a reset packet to the peer end to terminate the TCP connection. This, however, can also become a target for attackers. A large number of TCP port unreachable messages can impose attacks on the device. You can use this command to prevent the sending of TCP reset packets upon the receiving of port unreachable messages.

This command applies to both IPv4 TCP and IPv6 TCP.

Examples

The following example configures the device not to send TCP reset packets upon the receiving of port unreachable messages.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip tcp send-reset
```

1.5 ip tcp synwait-time

Function

Run the **ip tcp synwait-time** command to configure the timeout period of SYN packets used for connection establishment.

Run the **no** form of this command to restore the default configuration.

The default timeout period of SYN packets used for connection establishment is 20 seconds.

Syntax

ip tcp synwait-time *time*

no ip tcp synwait-time

Parameter Description

time: SYN packet timeout period, in seconds. The value range is from 5 to 300. The default value is **20**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

In case of SYN flooding, shortening SYN timeout period can reduce resource consumption. However, it does not work on continuous SYN flooding.

When a device actively requests to establish a connection with an external device, shortening SYN timeout period can reduces users' waiting time, for example, waiting time in the telnet connection. You may prolong SYN timeout period properly for a poor network.

This command applies to both IPv4 TCP and IPv6 TCP.

Examples

The following example sets the timeout period of SYN packets used for connection establishment to 10 seconds.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip tcp synwait-time 10
```

1.6 ip tcp window-size

Function

Run the **ip tcp window-size** command to configure the TCP window size.

Run the **no** form of this command to restore the default configuration.

The default TCP window size is 65,535 bytes.

Syntax

ip tcp window-size *size*

no ip tcp window-size

Parameter Description

size: Window size, in bytes. The value range is from 128 to 1073725440.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The TCP receive buffer is used to buffer data from the peer. The data will be subsequently read by applications. The TCP window size reflects the size of idle space in the receive buffer. For bulk-data connections, enlarging the window size dramatically promotes TCP transmission performance.

If the window size is greater than 65535 bytes, window enlarging will be enabled automatically.

This command applies to both IPv4 TCP and IPv6 TCP.

Examples

The following example sets the TCP window size to 16,386 bytes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip tcp window-size 16386
```

1.7 show ipv6 tcp connect

Function

Run the **show ipv6 tcp connect** command to display the basic information about the current IPv6 TCP connection.

Syntax

show ipv6 tcp connect [**local-ipv6** *ipv6-address*] [**local-port** *port-number*] [**peer-ipv6** *ipv6-address*] [**peer-port** *port-number*] [**vrf-name** *vrf-name*]

Parameter Description

local-ipv6 *ipv6-address*: Indicates a local IPv6 address.

local-port *port-number*: Indicates a local port. The value range is from 1 to 65535.

peer-ipv6 *ipv6-address*: Indicates a peer IPv6 address. The value range is from 1 to 65535.

peer-port *port-number*: Indicates a peer port.

vrf-name *vrf-name*: Specifies a VRF instance. The value is a VRF instance existing on the device.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If no parameter is configured, the basic information about all IPv6 TCP connections is displayed.

Examples

The following example displays the basic information about the current IPv6 TCP connections.

```
Hostname> enable
Hostname# show ipv6 tcp connect
Number Local Address    Foreign Address        State       Process name
1     :::22           :::0                LISTEN      rg-sshd
2     :::23           :::0                LISTEN      rg-telnetd
3     1000::1:23       1000::2:64201          ESTABLISHED  rg-telnetd
```

The following example displays the basic information about the current IPv6 TCP connection in VRF-IPv6.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# vrf definition vrf-ipv6
Hostname(config-vrf)# address-family ipv6
Hostname(config-vrf-af)# show ipv6 tcp connect vrf-name vrf-ipv6
Number   Local Address   Foreign Address       STATE        Process name     VRF name
1       :::23          :::0                LISTEN       telnetd-main     vrf-ipv6
```

Table 1-1 Output Fields of the show ipv6 tcp connect Command

Field	Description
Number	Serial number.
Local Address	Local address and port number. The number after the last colon is the port number.

Field	Description

Table 1-7 Output Fields of the show tcp parameter Command

Field	Description
Hash table information	Hash table information of TCP connections.
Established hash bucket size	Hash bucket size of TCP connections in established status.
Bind hash bucket size	Hash bucket size of a listening port.
Memory information	Parameter information of Rx and Tx buffers of TCP connections.
Global memory limit	Global memory limit.
low=x	Memory limit of TCP sockets.
pressure=x	Memory alarm level of TCP sockets.
high=x (unit: pages)	Maximum memory usage of TCP sockets. The system will deny allocating sockets when the memory usage exceeds this value.
Per-socket receive buffer size	Size of the socket Rx buffer.
min=x	Minimum size of the socket buffer.
default=x	Default size of the socket buffer.
max=x (unit: bytes)	Maximum size of the socket buffer.
Per-socket send buffer size	Size of the socket Tx buffer.
Current allocated memory	Memory currently used by sockets.
Current memory pressure flag	Whether the current memory usage of sockets exceeds the alarm level.
SYN specific information	Parameter information related to connections and listening on the TCP server side.
Max SYN_RECV sockets per LISTEN socket	Maximum number of SYN connections of the listening socket.
Max SYN retries	Maximum retransmission count of SYN packets.
Max SYN ACK retries	Maximum retransmission count of SYN ACK packets.
Timewait specific information	Parameter information of TCP connections in TIME-WAIT status.
Max timewait sockets	Maximum number of TCP connections in TIME-WAIT status.
Current timewait sockets	Number of current TCP connections in TIME-WAIT status.
Timewait recycle	Quick reclamation of TCP connections in TIME-WAIT status.

Field	Description
Reuse timewait port	Port reuse of TCP connections in TIME-WAIT status.
Keepalive information	Parameter information of the TCP keepalive time.
Keepalive on	Whether the TCP keepalive function is enabled.
Idle period	Idle period of TCP keepalive.
Interval	TCP keepalive interval.
Max probes	TCP keepalive probing count.
MTU probing	Parameter information related to MTU probing.
Enable mtu probing	Whether MTU probing is enabled.
FIN specific information	Parameter information related to closing of TCP connections.
FIN_WAIT_2 timeout	Timeout period in FIN-WAIT-2 status.
Orphan socket information	Parameter information of TCP connections not associated with a specific application.
Max orphans	Maximum number of TCP connections not associated with a specific application.
Max orphan retries	Maximum retransmission count of TCP packets not associated with a specific application.
Current orphans	Number of current TCP connections not associated with a specific application.

1.14 show tcp pmtu

Function

Run the **show tcp pmtu** command to display the path MTU of an IPv4 TCP connection.

Syntax

show tcp pmtu [**local-ip** *ip-address*] [**local-port** *port-number*] [**peer-ip** *ip-address*] [**peer-port** *port-number*] [**vrf-name** *vrf-name*]

Parameter Description

local-ip *ip-address*: Indicates a local IP address.

local-port *port-number*: Indicates a local port. The value range is from 1 to 65535.

peer-ip *ip-address*: Indicates a peer IP address.

peer-port *port-number*: Indicates a peer port. The value range is from 1 to 65535.

vrf-name *vrf-name*: Specifies a VRF instance. The value is a VRF instance existing on the device.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If no parameter is configured, the path MTUs of all IPv4 TCP connections are displayed.

Examples

The following example displays the path MTUs of IPv4 TCP connections.

```
Hostname> enable
Hostname# show tcp pmtu
Number  Local Address          Foreign Address       PMTU
1      192.168.195.212.23     192.168.195.112.13560  1440
```

Table 1-8 Output Fields of the show tcp pmtu Command

Field	Description
Number	Serial number.
Local Address	Local address and port number. The number after the colon is the port number, for example, "23" in "192.168.195.212.23" is a port number.
Foreign Address	Remote address and port number. The number after the colon is the port number, for example, "23" in "192.168.195.212.23" is a port number.
PMTU	Path MTU.

- **show vrf** (IP routing/VRF)

1.15 show tcp port

Function

Run the **show tcp port** command to display the usage of the current IPv4 TCP port.

Syntax

show tcp port [*port-number*]

Parameter Description

port-number: Specified port number. The value range is from 1 to 65535.

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

If no parameter is configured, the usage of all current IPv4 TCP ports is displayed.

Examples

The following example displays the usage of the current IPv4 TCP ports.

```
Hostname> enable
Hostname#show tcp port
TCP connections on port 23:
Number  Local Address Foreign Address    State
1      1.1.1.1:23    1.1.1.2:64571    ESTABLISHED
Total: 1
TCP connections on port 2650:
Number  Local Address Foreign Address    State
Total: 0
```

Table 1-9 Output Fields of the show tcp port Command

Field	Description
Number	Serial number.
Local Address	Local address and port number.
Foreign Address	Remote address and port number.

State	Current status of a TCP connection: ● **CLOSED**: Indicates that the connection is closed. ● **LISTEN**: Indicates the listening status. ● **SYNSENT**: Indicates that the SYN packet is sent, and the connection is in the three-way handshake process. ● **SYNRCVD**: Indicates that the SYN packet is received, and the connection is in the three-way handshake process. ● **ESTABLISHED**: Indicates that the connection is established. ● **FINWAIT1**: Indicates that the FIN packet has been sent from the local end. ● **FINWAIT2**: Indicates that the FIN packet sent from the local end has been acknowledged. ● **CLOSEWAIT**: Indicates that the local end has received the FIN packet from the peer end. ● **LASTACK**: Indicates that the local end has received the FIN packet from the peer end and the local end has sent its own FIN packet. ● **CLOSING**: Indicates that the local end has sent the FIN packet, it has not received the ACK packet, but receives the FIN packet from the peer end. ● **TIMEWAIT**: Indicates that the FIN packet from the local end is acknowledged, and the local end has acknowledged the received FIN packet. ● **NEW_SYN_RECV**: Indicates a new TCP connection request.
Total	Total number of information entries.

1.16 show tcp statistics

Function

Run the **show tcp statistics** command to display the current TCP statistics of the system.

Syntax

show tcp statistics

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

2

Usage Guidelines

This command is used to display the current TCP statistics of the system, including packet receiving information, three-way handshake information, and time-wait connection information.

Examples

The following example displays the current TCP statistics of the system.

```
Hostname> enable
Hostname#show tcp statistics
TCP Packets
  Received: 23243
  Errors  : 0(checksum: 0)
Three way handshake
  Request queue overflow: 0
  Accept backlog full: 0
  Web authentication limit per user: 0
  Failed to alloc memory for request sock: 0
  Failed to create open request child: 0
  SYN ACK retransmits: 0
  Timeouted requests: 0
  Web authentication:
    Limit per user: 0
    SYN ACK retransmission times-users: 0-0,1-0, 2-0,>=3-0
    Handshake fails: 0
Time-wait
  Time-wait bucket table overflow: 0
```

Table 1-10 Output Fields of the show tcp statistics Command

Field	Description
TCP Packets	Statistics on TCP packets received.
Received	Number of TCP packets received.
Errors	Number of TCP error packets received.
Three way handshake	Information about the three-way handshake process.
Request queue overflow	Number of packets discarded due to SYN queue overflow.
Accept backlog full	Number of packets discarded due to Accept queue overflow

Web authentication limit per user	Maximum concurrency of three-way handshake processes supported by a terminal to complete Web-based authentication.
Failed to alloc memory for request sock	Number of memory request failures in the three-way handshake process.
Failed to create open request child	Number of failures to enable subnodes in the three-way handshake process.
SYN ACK retransmits	SYN ACK packet retransmission count.
Timeouted requests	Timeout in the three-way handshake process.
Time-wait	Information about the connection in TIME-WAIT status.
Time-wait bucket table overflow	Overflow statistics of connections in TIME-WAIT status.

1 IP REF Commands

Command	Function
clear ip ref packet statistics	Clear the packet statistics of IPv4 REF.
clear ipv6 ref packet statistics	Clear the packet statistics of IPv6 REF.
hash-disturb	Configure the hash disturbance factor of load balancing.
hash-symmetrical	Enable the load balancing hash disturbance function and configure the hash synchronization factor of load balancing, also known as symmetrical hash.
ip ref algorithm mode	Configure the ECMP hash algorithm mode.
ip ref check	Configure illegitimate destination IP address check of IPv4 REF.
ip ref mgmt-forward	Enable L3 forwarding on the management interface.
ip ref load-balance	Configure the ECMP global load balancing algorithm.
ip ref load-sharing	Configure the load balancing algorithm for IPv4 REF.
ip ref hash-elasticity enable	Enable elastic hash of ECMP load balancing.
ip ref synchronize all	Synchronize IPv4 routes between the hardware and software REF.
ip-ref-load-balance-profile	Rename the enhanced profile and enter the enhanced profile configuration mode of REF load balancing.
ipv4 field	Configure the load balancing mode for IPv4 packets in a specified enhanced profile.
ipv6 field	Configure the load balancing mode for IPv6 packets in the specified enhanced profile.
ipv6 ref load-sharing	Set the load balancing algorithm of IPv6 REF to load balancing based on the source and destination IP addresses.
ipv6 ref synchronize all	Synchronize IPv6 routes between the hardware and software REF.
show ip ref adjacency	Display the adjacency table.

show ip ref exact-route	Display the exact forwarding path of an IP packet.
show ip ref load-balance	Display the configuration of the ECMP load balancing.
show ip ref load-balance-profile	Display the configuration of an enhanced profile.
show ip ref packet statistics	Display the packet statistics of IPv4 REF.
show ip ref resolve-list	Display the information actively resolved by IPv4 REF.
show ip ref route	Display all routing information of the current IPv4 REF.
show ip ref route detail	Display the detailed routing table of a specified IPv4 route prefix.
show ipv6 ref adjacency	Display the adjacency information of IPv6 REF.
show ipv6 ref exact-route	Display the actual forwarding path of an IPv6 packet.
show ipv6 ref packet statistics	Display the packet statistics of IPv6 REF.
show ipv6 ref resolve-list	Display the information actively resolved by IPv6 REF.
show ipv6 ref route	Display routing information of IPv6 REF.
show ipv6 ref route detail	Display the detailed routing table of a specified IPv6 route prefix.

1.3 hash-disturb

Function

Run the **hash-disturb** command to configure the hash disturbance factor of load balancing.

Run the **no** form of this command to disable the load balancing hash disturbance function.

The hash disturbance function of load balancing is disabled by default.

Syntax

hash-disturb *string*

no hash-disturb

Parameter Description

string: Disturbance factor. It is a string of 1 to 16 characters.

Command Modes

Enhanced profile configuration mode of REF load balancing

Default Level

14

Usage Guidelines

Hash disturbance refers that device traffic is balanced using the hash algorithm. For the same stream from two devices of the same type, the same path will be calculated by the load balancing algorithm. When the equal cost multiple path (ECMP) is deployed, the same stream from the two devices may be distributed to the same destination device. This is called hash polarization. The hash disturbance factor is used to affect the load balancing algorithm of the device. Different disturbance factors can be configured on different devices so that different paths are calculated for the same stream.

Examples

The following example configures the hash disturbance factor in enhanced profile configuration mode of REF load balancing.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip-ref-load-balance-profile
Warning: The profile default has been created,  and this command will rename it.
Continue? [Y/N]:Y
Hostname(ref-ip-config-load-balance-profile)# hash-disturb A
```

Notifications

When the ECMP hash disturbance factor fails to be configured, the following notification will be displayed:

```
% Set ecmp hash-disturb failed.
```

Platform Description

N/A

Related Commands

- **show ip ref load-balance-profile**

1.4 hash-symmetrical

Function

Run the **hash-symmetrical** command to enable the load balancing hash disturbance function and configure the hash synchronization factor of load balancing, also known as symmetrical hash.

Run the **no** form of this command to disable the load balancing hash disturbance function.

Hash synchronization is enabled by default.

Hash synchronization is disabled by default.

Syntax

hash-symmetrical { **ipv4** | **ipv6** }

no hash-symmetrical { **ipv4** | **ipv6** }

Parameter Description

ipv4: Enables/Disables load balancing hash synchronization for IPv4 packets.

ipv6: Enables/Disables load balancing hash synchronization for IPv6 packets.

Command Modes

Enhanced profile configuration mode of REF load balancing

Default Level

14

Usage Guidelines

To ensure network security, a firewall cluster is deployed between the internal and external networks for traffic cleaning. This requires that both the uplink and downlink traffic of a session be transmitted to the same device in the firewall cluster for processing. The source and destination IP addresses contained in the uplink and downlink streams of a session are reversed. If a traditional hash algorithm is used, the uplink and downlink streams will be directed to different firewalls, while hash synchronization can ensure that the same path is calculated for the uplink and downlink streams.

When hash synchronization is enabled, the source and destination address-based load balancing modes in an enhanced profile need to be configured symmetrically. For example, if load balancing based on source IP addresses is configured, load balancing based on destination IP addresses needs to be configured at the same time.

Examples

The following example enables load balancing hash synchronization for IPv6 packets in enhanced profile configuration mode of REF load balancing.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip-ref-load-balance-profile
Warning: The profile default has been created,  and this command will rename it.
Continue? [Y/N]:Y
Hostname(ref-ip-config-load-balance-profile)# hash-symmetrical ipv6
```

Notifications

When load balancing hash synchronization fails to be configured for IPv4 packets, the following notification will be displayed:

```
% Set ecmp hash-symmetrical ipv4 failed.
```

When load balancing hash synchronization fails to be configured for IPv6 packets, the following notification will be displayed:

```
% Set ecmp hash-symmetrical ipv6 failed.
```

Common Errors

1.5 ip ref algorithm mode

Function

Run the **ip ref algorithm mode** command to configure the ECMP hash algorithm mode.

Run the **no** form of this command to remove this configuration.

Syntax

ip ref algorithm mode *hash-number*

Parameter Description

hash-number: Number of a hash algorithm mode. The value range is from 0 to 9, and the default value is **0**.

When the value is **0**, the hash algorithm mode is x8+x7+x2+x+1.

When the value is **1**, the hash algorithm mode is x8+x7+x6+x+1.

When the value is **2**, the hash algorithm mode is x8.

When the value is **3**, the hash algorithm mode is x10+x3+1.

When the value is **4**, the hash algorithm mode is x10+x7+1.

When the value is **5**, the hash algorithm mode is x16.

When the value is **6**, the hash algorithm mode is x16+x5+x3+x2+1.

When the value is **7**, the hash algorithm mode is x16+x5+x4+x3+1.

When the value is **8**, the hash algorithm mode is x16+x10+x5+x3+1.

When the value is **9**, the hash algorithm mode is x16+x9+x4+x2+1.

hash-number: Number of a hash algorithm mode. The value range is from 3 to 11, and the default value is **9**.

- When the value is **3**, the hash algorithm mode is 16 bit crc16 using bisync polynomial.
- When the value is **4**, the hash algorithm mode is upper 8 bits of crc16 and 8 bit xor1.
- When the value is **5**, the hash algorithm mode is upper 8 bits of crc16 and 8 bit xor2.
- When the value is **6**, the hash algorithm mode is upper 8 bits of crc16 and 8 bit xor4.
- When the value is **7**, the hash algorithm mode is upper 8 bits of crc16 and 8 bit xor8.
- When the value is **8**, the hash algorithm mode is xor16.
- When the value is **9**, the hash algorithm mode is 16 bit crc16 using the ccitt polynomial.
- When the value is **10**, the hash algorithm mode is 16 LSBs of computed crc32.
- When the value is **11**, the hash algorithm mode is 16 MSBs of computed crc32.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to set an appropriate hash algorithm mode to adapt to different traffic models to achieve the optimal load balancing effect.

Examples

The following example sets the number of the ECMP hash algorithm mode to 3.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip ref algorithm mode 3
```

1.6 ip ref check

Function

Run the **ip ref check** command to configure illegitimate destination IP address check of IPv4 REF.

Run the **no** form of this command to disable this feature.

IPv4 REF does not check illegitimate destination IP addresses by default.

Syntax

ip ref check [**masklen** *mask-length*]

no ip ref check

Parameter Description

masklen *mask-length*: Specifies the IP packet mask length for the illegitimate host address check. The value range is from 1 to 31, and the default value is **24**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

REF can filter out illegitimate class E addresses (excluding 255.255.255.255), addresses with all zeros, and loopback interface addresses (excluding 127.0.0.1), and record the illegitimate destination IP addresses.

Examples

The following example sets the mask length to 20 bits for the illegitimate destination IP address check of IPv4 REF.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip ref check masklen 20
```

1.7 ip ref mgmt-forward

Function

Run the **ip ref mgmt-forward** command to enable L3 forwarding on the management interface.

Run the **no** form of this command to disable this feature.

L3 forwarding is enabled on the management interface by default.

Syntax

ip ref mgmt-forward

no ip ref mgmt-forward

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

If the forwarding function of Ruijie General Operating System (RGOS) is enabled, then L3 forwarding is enabled for both the management interface and other L3 interfaces. If the **no ip ref mgmt-forward** command is run, L3 forwarding can be disabled on the management interface separately without affecting other L3 interfaces. You can run the **ip ref mgmt-forward** command to enable L3 forwarding on the management interface.

If the forwarding function of RGOS is disabled, regardless of whether **no ip ref mgmt-forward** is configured, L3 forwarding is disabled on the management interface and other L3 interfaces.

Examples

The following example disables L3 forwarding on the management interface.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# no ip ref mgmt-forward
```

Notifications

1.8 ip ref load-balance

Function

Run the **ip ref load-balance** command to configure the ECMP global load balancing algorithm.

Run the **no** form of this command to restore the default configuration.

The load is balanced according to an enhanced profile by default.

Syntax

ip ref load-balance { **enhanced profile** *profile-name* | **src-dst-ip** | **src-dst-ip-src-dst-l4port** | **src-ip** }

no ip ref load-balance

Parameter Description

enhanced profile *profile-name*: Performs load balancing based on the packet type field configured in the enhanced profile indicated by *profile-name*.

src-dst-ip: Performs load balancing based on the source and destination IP addresses of incoming packets. Packets with different source and destination IP addresses are evenly distributed among member links, while those with the same source and destination IP addresses are distributed to the same member link.

src-dst-ip-src-dst-l4port: Performs load balancing based on the source IP addresses, destination IP addresses, L4 source port numbers, and L4 destination port numbers of incoming packets.

src-ip: Performs load balancing based on the source IP address of incoming packets. Packets with different source IP addresses are evenly distributed among member links, while those with the same source IP address are distributed to the same member link.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

ECMP differentiates packet flows by using one or several load balancing algorithms based on packet characteristics, such as the source IP address, destination IP address, L4 source port number, and L4

destination port number. It also distributes the same packet flow to the same path for transmission, and different packet flows to equal-cost paths evenly.

For example, in source IP address-based load balancing mode, packets are distributed to different paths based on the source IP addresses of the packets. Packets with different source IP addresses are evenly distributed to equal-cost paths, and packets with the same source IP address are forwarded by the same path.

In an L3 network, you are advised to adopt load balancing based on the source and destination IP addresses of incoming packets.

Examples

The following example configures the ECMP load balancing algorithm based on the source IP address.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip ref load-balance src-ip
```

Notifications

1.9 ip ref load-sharing

Function

Run the **ip ref load-sharing** command to configure the load balancing algorithm for IPv4 REF.

Run the **no** form of this command to restore the default configuration.

The default load balancing algorithm of IPv4 REF is load balancing based on the destination IP addresses of packets.

Syntax

ip ref load-sharing { **original** | **original-only** }

no ip ref load-sharing { **original** | **original-only** }

Parameter Description

original: Sets the load balancing algorithm of IPv4 REF to load balancing based on the source and destination IP addresses.

original-only: Sets the load balancing algorithm of IPv4 REF to load balancing based on the source IP address.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

REF is responsible for data forwarding and supports three load balancing algorithms, that is, load balancing based on the destination IP address, load balancing based on the source IP address, and load balancing based on the source and destination IP addresses. When IP packets are forwarded through multiple paths, if the load balancing based on the destination IP address is set, REF will match the destination IP addresses of the packets with one of the paths for forwarding.

Examples

The following example sets the load balancing algorithm of IPv4 REF to load balancing based on the source and destination IP addresses.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip ref load-sharing original
```

1.10 ip ref hash-elasticity enable

Function

Run the **ip ref hash-elasticity enable** command to enable elastic hash of ECMP load balancing.

Run the **no** form of this command to restore the default configuration.

Elastic hash of ECMP load balancing is disabled by default.

Syntax

ip ref hash-elasticity enable

no ip ref hash-elasticity enable

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

In normal cases, a load balancing cluster interworks with multiple top of rack (ToR) devices via the ECMP, and the ToR devices are required to distribute all packets of a session to the same scheduling server. However, when a server is faulty, all session streams will be reorganized and balanced according to the traditional load balancing mechanism of ToR devices. In this case, packets of the same session may be distributed to two servers. The elastic hash function ensures that, when one link is faulty, traffic on other links is not affected and only the traffic of the faulty link is distributed to other active links, without affecting the traffic of other links. In this way, traffic of a session will only be distributed to the same server.

Examples

The following example enables the elastic hash of ECMP load balancing.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip ref hash-elasticity enable
```

1.11 ip ref synchronize all

Function

Run the **ip ref synchronize all** command to synchronize IPv4 routes between the hardware and software REF.

Syntax

ip ref synchronize all

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used for routing recovery under faulty conditions. If the hardware fails to install routing entries because the number of existing routing entries exceeds the capacity of the routing table, or routing entries are discarded due to insufficient memory, you can use this command to restore the consistency of routing entries between the hardware and software REF after the number of existing entries is reduced to the normal range.

Examples

The following example synchronizes IPv4 routes between the hardware and software REF.

```
Hostname> enable
Hostname# ip ref synchronize all
```

1.12 ip-ref-load-balance-profile

Function

Run the **ip-ref-load-balance-profile** command to rename the enhanced profile and enter the enhanced profile configuration mode of REF load balancing.

Run the **default** form of this command to restore the name of the enhanced profile to **default** and enter the enhanced profile configuration mode of REF load balancing, or restore the default load balancing mode in the enhanced profile.

The default enhanced profile name is **default**.

Syntax

ip-ref-load-balance-profile [*profile-name*]

default ip-ref-load-balance-profile [*profile-name*]

Parameter Description

profile-name: Profile name. It is a string of 1 to 31 characters.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

The device has an enhanced profile named **default**, which cannot be deleted by default.

Run the **ip-ref-load-balance-profile** command (without parameters) to change the profile name to null and enter the enhanced profile configuration mode of REF load balancing.

Run the **ip-ref-load-balance-profile** *profile-name* command (with parameters) to change the profile name to *profile-name* and enter the enhanced profile configuration mode of REF load balancing.

Run the **default ip-ref-load-balance-profile** command (without parameters) to restore the name of the current profile to **default** and enter the enhanced profile configuration mode of REF load balancing.

Run the **default ip-ref-load-balance-profile** *profile-name* command (with parameters) to restore the default load balancing mode for all types of packets in the enhanced profile.

Examples

The following example renames the enhanced profile **rpn**, and enters the enhanced profile configuration mode of REF load balancing.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip-ref-load-balance-profile rpn
Warning: The profile default has been used and this command will rename it. Continue?
[Y/N]:Y
Hostname(ref-ip-config-load-balance-profile)#
```

The following example restores the name of the enhanced profile to **default** and restores the default load balancing mode in the enhanced profile.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# default ip-ref-load-balance-profile
Warning: The profile default has been used and this command will rename it. Continue?

1.13 ipv4 field

Function

Run the **ipv4 field** command to configure the load balancing mode for IPv4 packets in a specified enhanced profile.

Run the **no** form of this command to restore the default configuration.

The load is balanced based on the source IP addresses, destination IP addresses, L4 source port numbers, and L4 destination port numbers of packets by default.

Syntax

ipv4 field [**dst-ip**] [**l4-dst-port**] [**l4-src-port**] [**protocol**] [**src-ip**] [**src-port**]

no ipv4 field

Parameter Description

dst-ip: Performs load balancing based on the destination IP addresses of incoming IPv4 packets.

l4-dst-port: Performs load balancing based on the L4 destination port numbers of incoming IPv4 packets.

l4-src-port: Performs load balancing based on the L4 source port numbers of incoming IPv4 packets.

protocol: Performs load balancing based on the protocol types of incoming IPv4 packets.

src-ip: Performs load balancing based on the source IP addresses of incoming IPv4 packets.

src-port: Performs load balancing based on the source port numbers of incoming IPv4 packets.

Command Modes

Enhanced profile configuration mode of REF load balancing

Default Level

14

Usage Guidelines

ECMP differentiates packet flows by using one or several load balancing modes based on packet characteristics, such as the source IP address, destination IP address, L4 source port number, and L4 destination port number. It also distributes the same packet flow to the same path for transmission, and different packet flows to equal-cost paths evenly.

Run the **default ip-ref-load-balance-profile** *profile-name* command (with parameters) to restore the default load balancing mode for all types of packets in the enhanced profile.

Examples

The following example sets the load balancing mode for IPv4 packets to load balancing based on source IP addresses of incoming IPv4 packets in the enhanced profile named rpn.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip-ref-load-balance-profile rpn
Warning: The profile default has been created,  and this command will rename it.

Run the **ipv6 field** command to configure the load balancing mode for IPv6 packets in the specified enhanced profile.

Run the **no** form of this command to restore the default configuration.

The load is balanced based on the source IP addresses, destination IP addresses, L4 source port numbers, and L4 destination port numbers of packets by default.

Syntax

ipv6 field [**dst-ip**] [**l4-dst-port**] [**l4-src-port**] [**protocol**] [**src-ip**] [**src-port**]

no ipv6 field

Parameter Description

dst-ip: Performs load balancing based on the destination IP addresses of incoming IPv6 packets.

l4-dst-port: Performs load balancing based on the L4 destination port numbers of incoming IPv6 packets.

l4-src-port: Performs load balancing based on the L4 source port numbers of incoming IPv6 packets.

protocol: Performs load balancing based on the protocol types of incoming IPv6 packets.

src-ip: Performs load balancing based on the source IP addresses of incoming IPv6 packets.

src-port: Performs load balancing based on the source port numbers of incoming IPv6 packets.

Command Modes

Enhanced profile configuration mode of REF load balancing

Default Level

14

Usage Guidelines

ECMP differentiates packet flows by using one or several load balancing modes based on packet characteristics, such as the source IP address, destination IP address, L4 source port number, and L4 destination port number. It also distributes the same packet flow to the same path for transmission, and different packet flows to equal-cost paths evenly.

Run the **default ip-ref-load-balance-profile** *profile-name* command (with parameters) to restore the default load balancing mode for all types of packets in the enhanced profile.

Examples

The following example sets the load balancing mode for IPv6 packets to load balancing based on source IP addresses of incoming IPv6 packets in the enhanced profile named rpn.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip-ref-load-balance-profile rpn
Warning: The profile default has been created,  and this command will rename it.
Continue? [Y/N]:Y
Hostname(ref-ip-config-load-balance-profile)# ipv6 field src-ip
```

1.15 ipv6 ref load-sharing

Function

Run the **ipv6 ref load-sharing** command to set the load balancing algorithm of IPv6 REF to load balancing based on the source and destination IP addresses.

Run the **no** form of this command to restore the default configuration.

The default load balancing algorithm of IPv6 REF is load balancing based on the destination IPv6 address.

Syntax

ipv6 ref load-sharing { **original** | **original-only** }

no ipv6 ref load-sharing { **original** | **original-only** }

Parameter Description

original: Sets the load balancing algorithm of IPv6 REF to load balancing based on the source and destination IP addresses.

original-only: Sets the load balancing algorithm of IPv6 REF to load balancing based on the source IP address.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

REF is responsible for data forwarding and supports three load balancing algorithms, that is, load balancing based on the destination IP address, load balancing based on the source IP address, and load balancing based on the source and destination IP addresses. When IP packets are forwarded through multiple paths, if the load balancing based on the destination IP address is set, REF will match the destination IP addresses of the packets with one of the paths for forwarding.

Examples

The following example sets the load balancing algorithm of IPv6 REF to load balancing based on the source and destination IP addresses.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 ref load-sharing original
```

1.16 ipv6 ref synchronize all

Function

Run the **ipv6 ref synchronize all** command to synchronize IPv6 routes between the hardware and software REF.

Syntax

ipv6 ref synchronize all

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

This command is used for routing recovery under faulty conditions. If the hardware fails to install routing entries because the number of existing routing entries exceeds the capacity of the routing table, or routing entries are discarded due to insufficient memory, you can use this command to restore the consistency of routing entries between the hardware and software REF after the number of existing entries is reduced to the normal range.

Examples

The following example synchronizes the IPv6 routes between the hardware and software REF.

```
Hostname> enable
Hostname# ipv6 ref synchronize all
```

1.17 show ip ref adjacency

Function

Run the **show ip ref adjacency** command to display the adjacency table.

Syntax

show ip ref adjacency [**glean** | **local** | *ip-address* | **interface** *interface-type interface-number* | **discard** | **statistics**]

Parameter Description

glean: Indicates glean adjacent nodes.

local: Indicates local adjacent nodes.

ip-address: Adjacency next-hop IP address.

interface *interface-type interface-number*: Specifies the interface type and interface number.

discard: Displays the adjacent nodes that are discarded.

statistics: Displays statistics.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command displays the current adjacency table of IPv4 REF. You can specify parameters to check the glean adjacencies, local adjacencies, adjacency of a specified IP address, adjacencies associated with a specified interface, and all adjacent nodes.

Examples

The following example displays information about all the current adjacent nodes.

```
Hostname> enable
Hostname# show ip ref adjacency
id state     type    rfct chg  ip          interface       linklayer(header data)
1  unresolved mcast   1    0   224.0.0.0
9  resolved   forward 1    0   192.168.50.78   GigabitEthernet 0/0  00 25 64 C5 9D 6A
00 D0 F8 98 76 54 08 00
7  resolved   forward 1    0   192.168.50.200  GigabitEthernet 0/0  00 04 5F 87 69 66
00 D0 F8 98 76 54 08 00
6  unresolved  glean  1    0   0.0.0.0        GigabitEthernet 0/0
4  unresolved  local  3    0   0.0.0.0        Local 1
```

Table 1-1 Output Fields of the show ip ref adjacency Command

Field	Description
id	Adjacency ID.
state	Adjacency status. ● **unresolved**: Indicates unresolved. ● **resolved**: Indicates resolved.

Field	Description
type	Adjacency type. ● **local**: Indicates a local adjacency. ● **forward**: Indicates a forwarding adjacency. ● **discard**: Indicates a discarded adjacency. ● **glean**: Indicates a glean adjacency. ● **mcast**: Indicates a multicast adjacency.
rfct	Number of times that an adjacency is referenced.
chg	Whether an adjacency is in the change chain.
ip	IP address of an adjacency.
interface	Outbound interface.
linklayer(header data)	L2 header.

1.18 show ip ref exact-route

Function

Run the **show ip ref exact-route** command to display the exact forwarding path of an IP packet.

Syntax

show ip ref exact-route [**vrf** *vrf-name*] *source-ip-address destination-ip-address*

Parameter Description

vrf *vrf-name*: Indicates the name of a VRF instance.

source-ip-address: Source IP address of a packet.

destination-ip-address: Destination IP address of a packet.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command displays the forwarding path of a packet whose source and destination IP addresses are specified.

Examples

The following example displays the exact forwarding path of a packet with the source IP address 192.168.217.74 and destination IP address 192.168.13.1.

```
Hostname> enable
Hostname# show ip ref exact-route 192.168.217.74 192.168.13.1
192.168.217.74  --> 192.168.13.1 (vrf global):
id state    type    rfct chg  ip          interface        linklayer(header data)
9  resolved forward 1     0   192.168.17.1  GigabitEthernet 0/0 00 25 64 C5 9D 6A 00

1.19 show ip ref load-balance

Function

Run the **show ip ref load-balance** command to display the configuration of the ECMP load balancing.

Syntax

show ip ref load-balance

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the configuration of the ECMP load balancing.

```
Hostname> enable
Hostname# show ip ref load-balance
  load-balance          : enhanced profile.
  hash-elasticity       : disable.
```

Table 1-3 Output Fields of the show ip ref load-balance Command

Field	Description
load-balance	Type of the configured ECMP load balancing algorithm.
hash-elasticity	• **enable**: Indicates that elastic hash is supported. • **disable**: Indicates that elastic hash is not supported.

1.20 show ip ref load-balance-profile

Function

Run the **show ip ref load-balance-profile** command to display the configuration of an enhanced profile.

Syntax

show ip ref load-balance-profile [*profile-name*]

Parameter Description

profile-name: Profile name.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

If *profile-name* is not specified, information about all enhanced profiles will be displayed.

Examples

The following example displays the enhanced load balancing configuration of the enhanced profile named rpn.

```
Hostname> enable
Hostname# show ip ref load-balance-profile rpn
Load-balance-profile: rpn
Packet   Hash Field:
   IPV4: src-ip dst-ip l4-src-port l4-dst-port
   IPV6: src-ip dst-ip l4-src-port l4-dst-port
```

Table 1-4 Output Fields of the show ip ref load-balance-profile Command

Field	Description
Load-balance-profile	Name of an enhanced profile.
Packet	Packet type. ● **IPv4**: Indicates the load balancing configuration for IPv4 packets in an enhanced profile. ● **IPv6**: Indicates the load balancing configuration for IPv6 packets in an enhanced profile.
Hash Field	Load balancing mode.

Function

Run the **show ip ref packet statistics** command to display the packet statistics of IPv4 REF.

Syntax

show ip ref packet statistics

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays packet statistics of IPv4 REF.

```
Hostname> enable
Hostname# show ip ref packet statistic
IPv4 REF Packet Statistics:
   Flags forward    : 0
   Ip head option   : 68
   Lookup FIB fail  : 0
   Deny forward     : 0
   Invalid adj id   : 0
   Glean adj        : 0
   TTL expiration   : 0
   Don't fragment   : 0
   Ip redirect      : 0
```

```
Redirect p2p    : 0
Forward adj     : 0
Vxlan adj       : 0
Local adj       : 43026
Mcast reserved  : 180
Punt adj        : 0
Cached reserve  : 0
Cached drop     : 0
Cached lost     : 0
Null interface  : 0
Total packets   : 45547
redirect drop   : 0
```

Table 1-5 Output Fields of the show ip ref packet statistics Command

Field	Description
IPv4 REF Packet Statistics	Packet statistics of IPv4 REF.
Flags forward	Number of routed packets.
Ip head option	Number of IP packets with options.
Lookup FIB fail	Number of packets with failed REF routing.
Deny forward	Number of packets that are discarded due to no IP routing.
Invalid adj id	Invalid adjacency index.
Glean adj	Number of packets that match glean adjacencies.
TTL expiration	Number of packets with TTL timeout.
Don't fragment	Number of packets that are discarded because they cannot be fragmented.
Ip redirect	Number of packets that are redirected.
Redirect p2p	Number of packets that are redirected in a point-to-point way.
Forward adj	Number of packets that match forwarding adjacencies.
Vxlan adj	Number of packets that match VXLAN adjacencies.
Local adj	Number of packets that match local adjacencies.
Mcast reserved	Number of packets that are sent by the multicast service to the process.
Punt adj	Number of packets that match Punt adjacencies.
Cached reserve	Number of packets that are sent to the process after cached.
Cached drop	Number of packets that are discarded after cached.
Cached lost	Number of packets that are cached.
Null interface	Number of packets that hit the NULL 0 egress.

Field	Description
Total packets	Total number of packets that are sent to the REF module.
redirect drop	Number of packets that are discarded due to reverse path limited (RPL).

1.23 show ip ref route

Function

Run the **show ip ref route** command to display all routing information of the current IPv4 REF.

Syntax

show ip ref route [**vrf** *vrf-name*] [**default** | *ipv4-address mask* | **statistics**]

Parameter Description

vrf *vrf-name*: Displays routing information of a specified VRF instance.

default: Specifies the default route.

ipv4-address: Destination IP address of a specified route.

mask: Mask of a specified route.

statistics: Displays statistics.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the routing information of the current IPv4 REF. You can specify parameters so that information about the default route, the route of a specified IP/mask, or all routes is displayed.

Examples

The following example displays all routing information of the current IPv4 REF.

```
Hostname> enable
Hostname# show ip ref route
Codes: * - default route
      # - zero route
 ip/mask          weight  path-id     next-hop       interface
 255.255.255.255/32 1      4          0.0.0.0        Local 1
 224.0.0.0/24      1      4          0.0.0.0        Local 1
 192.168.50.0/24    1      6          0.0.0.0        GigabitEthernet 0/0
 192.168.50.200/32  1      7          192.168.50.200  GigabitEthernet 0/0
 192.168.50.122/32  1      4          0.0.0.0        Local 1
 192.168.50.78/32   1      9          192.168.50.78   GigabitEthernet 0/0
```

Table 1-7 Output Fields of the show ip ref route Command

1.24 show ip ref route detail

Function

Run the **show ip ref route detail** command to display the detailed routing table of a specified IPv4 route prefix.

Syntax

show ip ref route detail *ip-address* [**vrf** *vrf-name*]

Parameter Description

ip-address: IP address.

vrf *vrf-name*: Indicates the name of a VRF instance.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the detailed routing table of a specified route prefix.

Examples

The following example displays the detailed routing table of the IPv4 route prefix 100.0.0.0.

```

1.25 show ipv6 ref adjacency

Function

Run the **show ipv6 ref adjacency** command to display the adjacency information of IPv6 REF.

Syntax

show ipv6 ref adjacency [**glean** | **local** | *ipv6-address* | **interface** *interface-type interface-number* | **discard** | **statistics**]

Parameter Description

glean: Displays glean adjacent nodes.

local: Displays local adjacent nodes.

ipv6-address: IPv6 address. After this parameter is configured, adjacency information of a specified address (x:x:x:x::x) will be displayed.

interface *interface-type interface-number*: Specifies the interface type and interface number.

discard: Displays the adjacent nodes that are discarded.

statistics: Displays the statistics on all types of adjacencies.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command displays the current adjacency table of IPv6 REF. You can specify parameters to check glean adjacencies, local adjacencies, adjacency of a specified IP address, adjacencies associated with a specified interface, and all adjacent nodes.

Examples

The following example displays adjacencies of IPv6 REF.

```
Hostname> enable
Hostname# show ipv6 ref adjacency
id    state      type    rfct chg ip    interface          linklayer(header data)
```

```
1    unresolved  glean   1    0   ::    GigabitEthernet 0/0
2    unresolved  local   2    0   ::1   Local 1
```

Table 1-9 Output Fields of the show ipv6 ref adjacency Command

Field	Description
id	ID of an adjacent node.
state	State of an adjacent node.
type	Type of an adjacent node. ● **local**: Indicates a local adjacency. ● **forward**: Indicates a forwarding adjacency. ● **discard**: Indicates a discarded adjacency. ● **glean**: Indicates a glean adjacency. ● **mcast**: Indicates a multicast adjacency.
rfct	Number of times that the route of an adjacent node is referenced.
chg	● **0**: Indicates that an adjacent node is not in the adjacency change chain. ● **1**: Indicates that an adjacent node is in the adjacency change chain.
ip	IPv6 address of an adjacency.
interface	Physical port associated with an adjacent node.
linklayer(header data)	L2 header filling information.

Note

For a distributed device, the **id** column contains two fields: **gid** and **lid**, of which **gid** indicates the global adjacent node ID and **lid** indicates the local adjacent node ID.

1.26 show ipv6 ref exact-route

Function

Run the **show ipv6 ref exact-route** command to display the actual forwarding path of an IPv6 packet.

Syntax

show ipv6 ref exact-route [**vrf** *vrf-name*] *source-ipv6-address destination-ipv6-address*

Parameter Description

vrf *vrf-name*: Indicates the name of a VRF instance.

source-ipv6-address: Source IPv6 address.

destination-ipv6-address: Destination IPv6 address.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the actual forwarding path of a packet with the source address 2001:db8:1::1 and the destination address 3001:db8:2::2.

```
Hostname> enable
Hostname# show ipv6 ref exact-route 2001:db8:1::1 3001:db8:2::2
2001:db8:1::1 --> 3001:db8:2::2 (vrf global):
ID  state      type    rfct chg ip interface           linklayer(header data)
3   unresolve   glean   1    0   :: GigabitEthernet 0/0
```

```

Table 1-11 Output Fields of the show ipv6 ref packet statistics Command

Field	Description
IPv6 REF Packet Statistics	Statistics on packets of IPv6 REF.
Flags forward	Number of routed packets.
Payload big	Number of packets with the actual length smaller than the maximum packet length under load balancing.
Dstaddr multi	Number of packets with the destination addresses being multicast addresses.
Param err	Number of packets with illegitimate parameters (for example, VRF).
Lookup fib fail	Number of packets with failed REF routing.
Null Dstintf	Number of packets with the destination egress being null.

Field	Description
No ipv6 pkt	Number of non-IPv6 packets.
Deny forward	Number of packets that are denied for forwarding.
TTL expirate	Number of packets with abnormal TTL.
Packet too big	Number of packets that are discarded due to too large size.
Address bscope	Number of packets beyond the scope of source address.
Redirect packet	Number of packets that are redirected.
Glean adj	Number of packets that match glean adjacencies.
Forward adj	Number of packets that match forwarding adjacencies.
Local adj	Number of packets that match local adjacencies.
Vxlan adj	Number of packets that match VXLAN adjacencies.
Punt adj	Number of packets that match Punt adjacencies.
Mcast adj	Number of packets that match multicast adjacencies.
Discard adj	Number of packets that match discarded adjacencies.
Cached drop	Number of packets that are discarded after cached.
Cached lost	Number of packets that are cached.
Cached rsvd	Number of packets that are sent to the process after cached.
Current cache pkt	Number of packets that are being cached.
Total packets	Total number of packets

1.28 show ipv6 ref resolve-list

Function

Run the **show ipv6 ref resolve-list** command to display the information actively resolved by IPv6 REF.

Syntax

show ipv6 ref resolve-list

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the information actively resolved by IPv6 REF.

```
Hostname> enable
Hostname# show ipv6 ref resolve-list
IP              State    Flags   Interface
1000::1          unres    1     GigabitEthernet 0/0
```

Table 1-12 Output Fields of the show ipv6 ref resolve-list Command

Field	Description
IP	IPv6 address of an interface.
State	● **unres**: Indicates unresolved. ● **res**: Indicates resolved.
Flags	● **0**: Indicates unrelated to adjacencies. ● **1**: Indicates related to adjacencies.
Interface	Interface name

1.29 show ipv6 ref route

Function

Run the **show ipv6 ref route** command to display routing information of IPv6 REF.

Syntax

show ipv6 ref route [**vrf** *vrf-name*] [**default** | **statistics** | *ipv6-address/prefix-length*]

Parameter Description

vrf *vrf-name*: Indicates the name of a VRF instance.

default: Displays the information of the default route.

statistics: Displays the route statistics.

ipv6-address/prefix-length: Prefix. After this parameter is configured, the routing information of a specified prefix (X:X:X:X::X/<0-128>) is displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display routing information of IPv6 REF. When no VRF parameter is specified, the global routing table is queried; when the VRF parameter is specified, the related VRF routing table is queried.

You can specify parameters to check information about the default route, the route with a specified prefix, or the statistics on all routes.

Examples

The following example displays routing information of IPv6 REF.

```
Hostname> enable
Hostname# show ipv6 ref route
Codes: * - default route
 prefix/len                  weight path_id  next_hop interface
 2001:da8:ffe:2::/64           1       3      ::     GigabitEthernet 0/0
 2001:da8:ffe:2::3/128         1       2      ::1    Local 1
 fe80::/10                   1       6      ::     Null 0
 fe80::21a:a9ff:fe3b:fa41/128   1       2       ::1    Local 1
```

Table 1-13 Output Fields of the show ipv6 ref route Command

Field	Description
prefix/len	IPv6 prefix and prefix length.
weight	Weight value of a route.
path_id	Adjacency index ID.

Field	Description
next_hop	Next-hop address
interface	Name of the interface associated with an adjacent node.

1.30 show ipv6 ref route detail

Function

Run the **show ipv6 ref route detail** command to display the detailed routing table of a specified IPv6 route prefix.

Syntax

show ipv6 ref route detail *ipv6-address* [**vrf** *vrf-name*]

Parameter Description

ipv6-address: IPv6 address.

vrf *vrf-name*: Indicates the name of a VRF instance.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the detailed routing table of a specified route prefix.

Examples

The following example displays the detailed routing table of the IPv6 route prefix 120::.

```
Hostname> enable
Hostname# show ipv6 ref route detail 120::
IPv6 120::/32 vrf:0

```

Table 1-14 Output Fields of the show ipv6 ref route detail Command

Field	Description
ifx	Interface ID.
nh_ip	IP address of the next hop.
pri	Priority of the next hop.
w	Weight value of the next hop.
mac	MAC address of the next hop.
cmd	Adjacency forwarding action.
vid	VLAN ID.
l2_ifx	Physical port number.
sub_port	VXLAN subinterface.
main_vid	Primary VLAN ID.
rt_type	Route type.
rt_own	Network, to which a route belongs.
prefix_type	Prefix type.
nh_id	Resource IP address of the next hop.
ecmp_gid	Resource ID of an ECMP group.
ecmp_ready	Resource readiness identifier of an ECMP group.

Field	Description
nhblk_id	Next-hop block ID.
nhblk_ready	Next-hop resource readiness identifier.
intf_id	RIF resource ID.
phyid	Physical port ID.
vlan	Actual VLAN.
flow_id	Flow classification ID.
adj_id	Adjacency resource ID.
in_adj_id	ID of the resource, to which the inner adjacency belongs.
nhitem_id	ID of the resource, to which the next-hop member belongs.
nh_status	Action flag of the next hop. ● **forward**: Indicates packet forwarding. ● **drop**: Indicates discarding.
unit	ID of the installed chip.
hit	Flow hit identifier.

IP Routing Commands

1 IP Routing Basic Commands

Command	Function
clear ip route	Clear the routing table cache. You can run this command in privileged EXEC mode.
ip recur-route fastswitch-nexthop	Enable fast convergence of recursive routing.
ip recur-route over default-route disable	Configure the function of forbidding recursion to the default route.
ip route arp-to-host delay-time	Configure the delayed redistribution of ARP-to-host route.
ip route arp-to-host interface	Enable ARP-to-host conversion on the specified interface.
ip route arp-to-host tag	Configure the tag attribute of the host route converted by ARP.
ip route notify delete always	Configure direct deletion of the Border Gateway Protocol (BGP) route during graceful restart (GR).
ip routing	Enable the IP routing function of a device.
ipv6 recur-route fastswitch-nexthop	Enable fast convergence of recursive routing.
ipv6 route nd-to-route delay-time	Configure delayed redistribution of the routes converted by neighbor discovery (ND).
ipv6 route nd-to-route interface	Enable ND conversion to a route with fixed-length mask on the specified interface.
ipv6 route nd-to-route tag	Configure the tag attribute of the ND-converted route.
ipv6 route nd-to-route warning-ignore	Configure the function of ignoring warning log of ND conversion to a route of specified length.
ipv6 unicast-routing	Enable the IPv6 routing function of a device.
maximum-paths	Configure the number of equal-cost routes.
show ip route	Display IP routing table information, as well as the equal-cost multi-path routing (ECMP) attribute of routes.
show ip route recursive	Display the recursive information of an IP route.

show ip route static bfd	Display the BFD correlation information of an IP route.
show ip route summary	Display the statistics of a single routing table.
show ip route track-table	Display the track correlation information of an IP route.
show ipv6 route	Display the routing information of an IPv6 route.
show ipv6 route static bfd	Display the BFD correlation information of an IPv6 route.
show ipv6 route summary	Display the statistics of a single IPv6 routing table.
show route-res usage	Display the usage of routing resources.

1.1 clear ip route

Function

Run the **clear ip route** command to clear the routing table cache. You can run this command in privileged EXEC mode.

Syntax

clear ip route [**vrf** *vrf-name*] { ***** | *network* [*mask*] }

Parameter Description

vrf *vrf-name*: Clears the route cache of the specified VRF instance. If virtual routing and forwarding (VRF) is not specified, the command is executed on all VRFs.

*: Clears all the route caches.

network: Network or subnet address for cache clearing.

mask: Network mask. When no mask is specified, the *network* value is used to match the longest route entry in the routing table and clear the cache.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

Clearing route cache will delete the corresponding route, and then trigger relearning of the routing protocol. Note that, if the cache of the whole routing table is cleared, the communication of the entire network will be interrupted temporarily.

Examples

The following example clears the cache of the longest routing table entry matched with 192.168.12.0.

```
Hostname> enable
Hostname# clear ip route 192.168.12.0
```

1.2 ip recur-route fastswitch-nexthop

Function

Run the **ip recur-route fastswitch-nexthop** command to enable fast convergence of recursive routing.

Run the **no** form of this command to disable fast convergence of recursive routing.

Run the **default** form of this command to restore the default configuration.

The fast convergence function of recursive routing is disabled by default.

Syntax

ip recur-route fastswitch-nexthop

no ip recur-route fastswitch-nexthop

default ip recur-route fastswitch-nexthop

Parameter Description

N/A

Command Modes

Global configuration mode

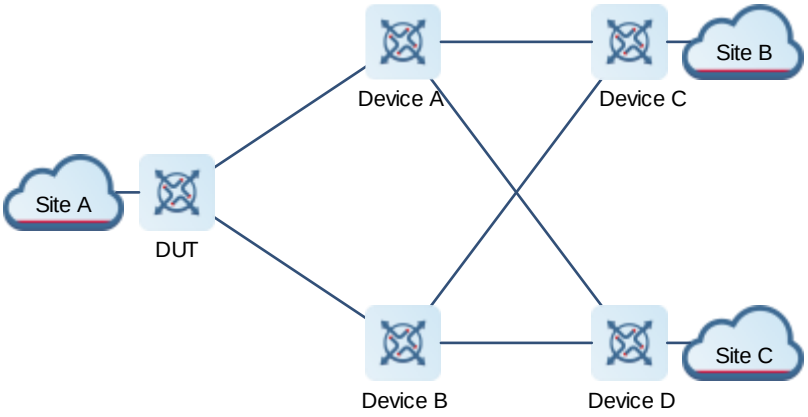
Default Level

14

Usage Guidelines

When link discovery changes or is interrupted, the recursive routing query of dynamic route may converge 2 seconds later. The convergence time is intolerable in some scenarios with high reliability requirements. When the fast convergence function of recursive routing is enabled, the intermediate next hop information will be added to the route sending information. Even if the intermediate link fails, it can be sensed by routing management to shorten the convergence time.

Figure 1-1 Fast Convergence Diagram of IPv4 Recursive Routing



As shown in Figure 1-1, the device under test (DUT) establishes an Intermediate System to Intermediate System (IS-IS) neighbor relationship with Device A and Device B respectively, Device A and Device B establish an IS-IS neighbor relationship with Device C and Device D respectively, and DUT establishes an Internal Border Gateway Protocol (IBGP) neighbor relationship with Device C and Device D respectively. Service sites access the network via External Border Gateway Protocol (EBGP).

In the scenario shown above, BGP routes may be recursed to IS-IS routes. When the link between Device A and Device C is disconnected, the IS-IS route will change and the BGP route that relies on the IS-IS route needs to be re-calculated. Before the calculation result is delivered to the forwarding plane, the BGP traffic from

Site A to Site B still goes through the disconnected link between Device A and Device C, resulting in traffic interruption. Traffic interruption duration = Link down time + Time required by the local IS-IS system to learn route deletion information + Time required by the local NSM system to receive IS-IS routing information + Time required for calculating the BGP route and delivering the result to the forwarding plane + Link switching time. The switching cannot be completed within 1 second.

If the fast convergence function of recursive routing is enabled, the traffic that needs to go through the disconnected link between Device A and Device C can be switched to a normal link within 1 second.

Examples

The following example enables the fast convergence function of recursive routing.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip recur-route fastswitch-nexthop
```

1.3 ip recur-route over default-route disable

Function

Run the **ip recur-route over default-route disable** command to configure the function of forbidding recursion to the default route.

Run the **no** form of this command to disable the function of forbidding recursion to the default route.

Run the **default** form of this command to restore the default configuration.

Recursion to the default route is allowed by default.

Syntax

ip recur-route over default-route disable

no ip recur-route over default-route disable

default ip recur-route over default-route disable

Parameter Description

N/A

Command Modes

Global configuration mode

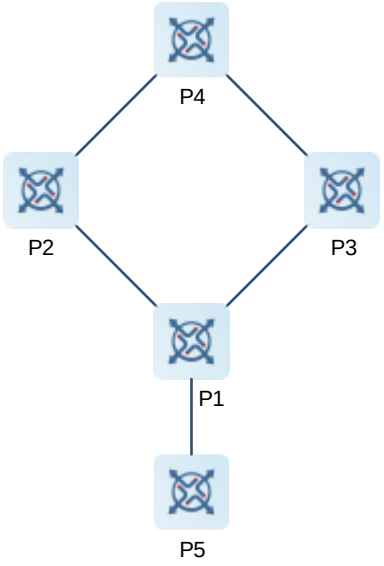
Default Level

14

Usage Guidelines

When you do not want to use the default route for service traffic, you can configure this command to not select the default route egress in recursive routing.

Figure 1-2 Diagram for Forbidding Recursion to Default Route



As shown in Figure 1-2, P1 establishes a non-direct EBGP neighbor relationship with P2 and P3 respectively, service traffic on P1 is balanced and distributed to P4 through P2 and P3. The default route configured on P1 is used to access the Internet through the P1-P5 link egress. When the link between P1 and P2 is faulty, it is expected that service traffic be switched to P3. However, some service traffic is guided to the P1-P5 egress due to the existence of the default route. The P1-P5 egress is not a service egress. As a result, some service traffic is lost and the convergence cannot be completed within 1 second.

With this command, when the link between P1 and P2 is faulty, traffic is completely switched to P3 and is not guided to P5, achieving convergence within 1 second.

Note: When the egress of a default route is not the expected service egress, this command must be configured.

Examples

The following example forbids recursion to the default route.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip recur-route over default-route disable
```

1.4 ip route arp-to-host delay-time

Function

Run the **ip route arp-to-host delay-time** command to configure the delayed redistribution of ARP-to-host route.

Run the **no** form of this command to delete the delayed redistribution of ARP-to-host route.

Run the **default** form of this command to restore the default configuration.

The delayed redistribution function of ARP-to-host route is disabled by default.

Syntax

ip route arp-to-host delay-time *time-number*

no ip route arp-to-host delay-time

default ip route arp-to-host delay-time

Parameter Description

time-number: Delayed redistribution time of ARP-to-host route, in seconds. The value range is from 1 to 1000, and the default value is **0**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To prevent route jitter caused by change to an Address Resolution Protocol (ARP) entry, you can delay conversion of the ARP entry into a route.

Note

After delayed redistribution is configured, redistribution of a route with effective ARP will be delayed according to the specified delay time. For a route with invalid ARP, advertising of the redistribution withdrawal route is not controlled, and the route will be advertised immediately.

Examples

The following example configures delayed redistribution of the ARP-to-host route.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# ip route arp-to-host delay-time 10
```

1.5 ip route arp-to-host interface

Function

Run the **ip route arp-to-host interface** command to enable ARP-to-host conversion on the specified interface.

Run the **no** form of this command to disable ARP-to-host conversion on the specified interface.

Run the **default** form of this command to restore the default configuration.

The ARP-to-host conversion function is disabled on an interface by default.

Syntax

ip route arp-to-host interface *interface-type interface-number*

no ip route arp-to-host interface *interface-type interface-number*

default ip route arp-to-host interface *interface-type interface-number*

Parameter Description

interface-type interface-number: Interface type and interface number.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Note

When configuring this command, make sure that the interface is a Layer-3 interface.

Examples

The following example enables ARP-to-host conversion on the interface of VLAN 40.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# ip route arp-to-host interface vlan 40
```

Notifications

1.6 ip route arp-to-host tag

Function

Run the **ip route arp-to-host tag** command to configure the tag attribute of the host route converted by ARP.

Run the **no** form of this command to delete the tag attribute of the host route converted by ARP.

Run the **default** form of this command to restore the default configuration.

The tag attribute function of the host route is disabled by default.

Syntax

ip route arp-to-host tag *tag-number*

no ip route arp-to-host tag *tag-number*

default ip route arp-to-host tag *tag-number*

Parameter Description

tag-number: Tag attribute value of the host route converted by ARP. The value range is from 1 to 4294967295, and the default value is **0**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the tag attribute value is configured for the host route converted by ARP, the route map can match the tag attribute to implement route control.

Examples

The following example configures the tag attribute of the host route converted by ARP.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# ip route arp-to-host tag 5
```

1.8 ip routing

Function

Run the **ip routing** command to enable the IP routing function of a device.

Run the **no** form of this command to disable the IP routing function.

Run the **default** form of this command to restore the default configuration.

The IP routing function is enabled by default.

Syntax

ip routing

no ip routing

default ip routing

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When a device functions only as a bridge or VoIP gateway, the IP routing and forwarding function of the device is not required. In this case, the IP routing function of the device can be disabled.

After the IP routing function is disabled, the device functions as a common host. The device can send and receive packets but cannot forward packets. All route-related configurations will be deleted except the static route configuration. A large number of static routes may be configured. If a user runs the **no ip routing** command, the configuration of a large number of static routes may be lost. To prevent this situation, the static

route configuration will be hidden temporarily when the **no ip routing** command is run. If the **ip routing** command is run again, the static route configuration can be restored.

Note that if the process or whole system restarts when the **no ip routing** command is run, the static route configuration will not be reserved.

Examples

The following example disables the IP routing function of the device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip routing
```

1.10 ipv6 route nd-to-route delay-time

Function

Run the **ipv6 route nd-to-route delay-time** command to configure delayed redistribution of the routes converted by neighbor discovery (ND).

Run the **no** form of this command to delete delayed redistribution of the routes converted by ND.

Run the **default** form of this command to restore the default configuration.

The delayed redistribution function of the routes converted by ND is disabled by default. The delayed redistribution time is 0 seconds.

Syntax

ipv6 route nd-to-route delay-time

no ipv6 route nd-to-route delay-time

default ipv6 route nd-to-route delay-time

Parameter Description

delay-timetime: Delayed redistribution time of the routes converted by ND, in seconds. The value range is from 1 to 1000.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To prevent route jitter caused by change to an ND entry, you can delay conversion of the ND entry into a route. After delayed redistribution is configured, redistribution of a route with effective ND will be delayed according to the specified delay time. For a route with invalid ND, advertising of the redistribution withdrawal route is not controlled, and the route will be advertised immediately.

Examples

The following example configures redistribution of the routes converted by ND to the protocol module after a delay of 10 seconds.

1.11 ipv6 route nd-to-route interface

Function

Run the **ipv6 route nd-to-route interface** command to enable ND conversion to a route with fixed-length mask on the specified interface.

Run the **no** form of this command to disable ND-to-route conversion on the specified interface.

Run the **default** form of this command to restore the default configuration.

The ND-to-route conversion function is disabled on a specified interface by default.

Syntax

ipv6 route nd-to-route interface *interface-type interface-number* [**ipv6-prefix** *X:X:X:X::X/<0-128>*] [**prefix-len** *masklen*]

no ipv6 route nd-to-route interface *interface-type interface-number* [**ipv6-prefix** *X:X:X:X::X/<0-128>*] [**prefix-len**]

default ipv6 route nd-to-route interface *interface-type interface-number* [**ipv6-prefix** *X:X:X:X::X/<0-128>*] [**prefix-len**]

Parameter Description

interface-type interface-number: Interface name.

X:X:X:X::X/<0-128>: IPv6 network segment. If the ND entries match this network segment, the route is converted according to the mask specified by this network segment. If the network segment does not specify any mask, the default mask is **128**.

masklen: Mask length value of the ND-to-route. If an IPv6 network segment is specified, it is longer than the mask length of configured network segment. If no IPv6 network segment is specified, it is longer than the mask length of IPv6 address on the interface. Otherwise, the configuration fails. The value range is from 0 to 128, and the default value is **128**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Note

When configuring this command, make sure that the interface is a Layer-3 interface.

Parameter configuration rules:

- If neither the IPv6 network segment nor the IPv6 prefix is specified, the ND learned on the interface generates a 128-bit route by default.
- If no IPv6 network segment is specified and only IPv6 prefix is specified, all NDs on the interface generate the specified IPv6 prefix.
- If the IPv6 network segment is specified but no IPv6 prefix is specified, this network segment generates a 128-bit route by default.
- If both the network segment and IPv6 prefix are specified, when ND is learned, the prefix will be checked to find out the network segment it matches, and the configured IPv6 prefix is generated after the specified network segment matched is found.
- If both the network segment and IPv6 prefix are specified and the IPv6 prefix of an unspecified network segment is configured at the same time, a route will be generated according to the IPv6 prefix of the network segment if the network segment is matched, and a route will be generated according to the IPv6 prefix without network segment if the network segment is not matched.
- If you configure the IPv6 address of an interface before configuring the IPv6 prefix for the network segment of this interface address to generate a route with fixed-length mask, a configuration error occurs when the prefix-len is shorter than or equal to the mask of the IPv6 address. In addition, the IPv6 prefix command for the network segment of this interface address fails. For example, if you first configure IPv6 address 10::1/64 on the interface of VLAN 40, and then configure **ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58 prefix-len 60** in global configuration mode, the configuration fails.
- If you configure the IPv6 address of an interface before configuring the IPv6 prefix of an unspecified network segment, a configuration error occurs when the IPv6 prefix length is shorter than or equal to the mask length of any of the IPv6 addresses on the interface. In addition, the IPv6 prefix configuration command for the unspecified network segment fails. For example, if you first configure IPv6 address 10::1/64 on the interface of VLAN 40, and then configure **ipv6 route nd-to-route interface vlan 40 prefix-len 60** in global configuration mode, the configuration fails.
- If you configure the IPv6 prefix of an unspecified network segment before configuring the IPv6 address of this interface, syslog is displayed and the IPv6 prefix configuration of the unspecified network segment is canceled when the mask length of one of the IPv6 addresses is longer than or equal to the IPv6 prefix of the unspecified network segment. For example, if you first configure **ipv6 route nd-to-route interface vlan 40 prefix-len 60** in global configuration mode, and then configure address 10::1/64 on the interface of VLAN 40, syslog alarm is displayed and the configuration **ipv6 route nd-to-route interface vlan 40 prefix-len 60** is deleted.
- If you configure the IPv6 prefix of the specified network segment and then configure the IPv6 address of the corresponding network segment of the interface, syslog is displayed and the IPv6 prefix configuration of the

specified network segment is canceled when the IPv6 address mask of the corresponding network segment is longer than or equal to the IPv6 prefix of the specified network segment. For example, if you first configure **ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58 prefix-len 60** in global configuration mode, and then configure the address 10::1/64 on the interface of VLAN 40, the syslog alarm is displayed and the configuration **ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58 prefix-len 60** is deleted.

- If you configure the IPv6 prefix of an unspecified network segment and the IPv6 prefix of the specified network segment, and then configure the IPv6 address of the interface, please check whether the mask of each IPv6 address is longer than or equal to the IPv6 prefix of the specified/unspecified network segment. If so, syslog is displayed and the IPv6 prefix configuration of the corresponding network segment is canceled. For example, if you first configure **ipv6 route nd-to-route interface vlan 40 prefix-len 62** and **ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58 prefix-len 60** in global configuration mode, and then configure address 10::1/64 on the interface of VLAN 40, the syslog alarm is displayed and two configurations are deleted.

Examples

The following example enables ND-to-route conversion on the specified interface of VLAN 40 so that the ND matching the 10::1/58 network segment is converted to a route with a mask length of 110 bits, the ND matched to the 20::1/56 network segment is converted to a route with a mask length of 128 bits, and the remaining NDs are converted to routes with a mask length of 120 bits.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 route nd-to-route interface vlan 40 prefix-len 120
Hostname(config)# ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58
prefix-len 110
Hostname(config)# ipv6 route nd-to-route interface vlan 40 ipv6-prefix 20::1/56
prefix-len 128
```

1.12 ipv6 route nd-to-route tag

Function

Run the **ipv6 route nd-to-route tag** command to configure the tag attribute of the ND-converted route.

Run the **no** form of this command to delete the tag attribute of the ND-converted route.

Run the **default** form of this command to restore the default configuration.

The tag attribute function of the ND-converted route is disabled by default.

Syntax

ipv6 route nd-to-route tag *tag-number*

no ipv6 route nd-to-route

default ipv6 route nd-to-route tag

Parameter Description

tag-number: Tag attribute value of the ND-converted route. The value range is from 1 to 4294967295, and the default value is **0**.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When the tag attribute value is configured for the host route converted by ND, the route map can match the tag attribute to implement route control.

Examples

The following example sets the tag attribute of the ND-converted route to **5**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 route nd-to-route tag 5
```

1.13 ipv6 route nd-to-route warning-ignore

Function

Run the **ipv6 route nd-to-route warning-ignore** command to configure the function of ignoring warning log of ND conversion to a route of specified length.

Run the **no** form of this command to delete the function of ignoring warning log of ND conversion to a route of specified length.

Run the **default** form of this command to restore the default configuration.

The function of ignoring warning log of ND conversion to a route of specified length is disabled by default.

Syntax

ipv6 route nd-to-route warning-ignore

no ipv6 route nd-to-route warning-ignore

default ipv6 route nd-to-route warning-ignore

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After you configure the function of ignoring warning log of ND conversion to a route of specified length, the alarm that the same PORT ND generates the same network segment route is ignored. If this command is not configured, the warning log that the same Port ND generates the same network segment route is printed (only once). The alarm that different ports generate the same network segment route is not controlled by this command.

Examples

The following example configures the function of ignoring warning log of ND conversion to a route of specified length.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 route nd-to-route warning-ignore
```

1.14 ipv6 unicast-routing

Function

Run the **ipv6 unicast-routing** command to enable the IPv6 routing function of a device.

Run the **no** form of this command to disable the IPv6 routing function.

Run the **default** form of this command to restore the default configuration.

The IPv6 routing function is enabled by default.

Syntax

ipv6 unicast-routing

no ipv6 unicast-routing

default ipv6 unicast-routing

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

When a device functions only as a bridge or VoIP gateway, the IPv6 routing and forwarding function of the device is not required. In this case, the IPv6 routing function of the device can be disabled.

Examples

The following example disables the IPv6 routing function of the device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ipv6 unicast-routing
```

1.15 maximum-paths

Function

Run the **maximum-paths** command to configure the number of equal-cost routes.

Run the **no** form of this command to configure the default number of equal-cost routes.

Run the **default** form of this command to restore the default configuration.

32 equal-cost routes can be configured by default.

Syntax

maximum-paths *path-number*

no maximum-paths

default maximum-paths

Parameter Description

path-number: Number of equal-cost routes. The value range is from 1 to 32.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After the number of equal-cost routes is configured by running the **maximum-paths** command, the number of load-sharing channels in load-sharing mode will not exceed the number of configured equal-cost routes. You can run the **show running config** command to display the number of configured equal-cost routes.

This command is valid for both IPv4 and IPv6 addresses. After this command is configured, the maximum number of equal-cost routes to an IPv4 or IPv6 destination is equal to the configured value.

Examples

The following example sets the maximum number of equal-cost routes to **10**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# maximum-paths 10
```

Related Commands

- **show ip route**

1.16 show ip route

Function

Run the **show ip route** command to display IP routing table information, as well as the equal-cost multi-path routing (ECMP) attribute of routes.

Syntax

show ip route [[**vr**f vrf-name] [**arphost** | **aggregate** | **count** | [**ecmp** | **fast-reroute** | **normal**] [*network* [*mask*]] | *network* [*mask* [**longer-prefix**]] | *route-protocol* [*process-id*] | **weight** | **tag**]

Parameter Description

vrf *vrf-name*: Displays the routing information only of the specified VRF. The routing information of global VRFs is displayed by default.

arphost: Displays the routing information of ARP conversion.

network: Target network to which the routing information is displayed. If no routing information of the target network is matched, the default route will be displayed. All routes are displayed by default.

mask: Mask whose target network routing information is displayed. The route matching the longest matching rule is displayed by default.

longer-prefix: Displays all the detailed routes matched with the specified prefix range.

count: Displays the number of current routes (the ECMP/WCMP route is calculated as one route). The statistics of the number of routes are not displayed by default.

route-protocol: Routing protocol or keywords: **connected**, **static**; to display a specific protocol route, use the following keywords: **bgp**, **isis**, **ospf**, **rip.** All protocols are displayed by default.

process-id: Routing protocol process ID. All the processes are displayed by default.

weight: Displays only routes with non-default weight. The routes of all weights are displayed by default.

normal: Displays normal routes, but not equal-cost routes and fast re-routes. All types of routes are displayed by default.

ecmp: Displays only equal-cost routes. All types of routes are displayed by default.

fast-reroute: Displays the primary/backup route of fast re-route only. All types of routes are displayed by default.

tag: Displays only routes of non-default tag. The routes of all tags are displayed by default.

aggregate: Displays only routes with type set to aggregated route. All types of routes are displayed by default.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

The command can be used to flexibly display the specified routing information according to the options.

The **show ip route** command is used to display the actual table entries that can be used for forwarding. To display the table entries of different attributes, specify the **normal** | **ecmp** | **fast-reroute** parameter.

Examples

The following example displays the IP routing table information, as well as the ECMP attribute of routes.

```
Hostname> enable
Hostname# show ip route
Codes:  C - Connected, L - Local, S - Static
       R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       IA - Inter area, EV - BGP EVPN, A - Arp to host
LA - Local aggregate route
       * - candidate default
Gateway of last resort is no set
S    20.0.0.0/8 is directly connected, VLAN 1
S    22.0.0.0/8 [1/0] via 20.0.0.1
O E2 30.0.0.0/8 [110/20] via 192.1.1.1, 00:00:06, VLAN 1
R    40.0.0.0/8 [120/20] via 192.1.1.2, 00:00:23, VLAN 1

```

Table 1-1 Output Fields of the show ip route Command

Field	Description
O	Indicates the source routing protocol of the route. Value options of the field: **C**: Indicates direct route. **L**: Indicates local route. **S**: Indicates static route. **R**: Indicates RIP route. **B**: Indicates BGP route. **O**: Indicates OSPF route. **I**: Indicates IS-IS route.

Field	Description
E2	Indicates route type. Value options of the field: **E1**: Indicates OSPF external route type 1. **E2**: Indicates OSPF external route type 2. **N1**: Indicates OSPF NSSA external route type 1. **N2**: Indicates OSPF NSSA external route type 2. **SU**: Indicates IS-IS summary route. **L1**: Indicates IS-IS Level-1 route. **L2**: Indicates IS-IS Level-2 route. **IA**: Indicates internal route of routing domain.
20.0.0.0/8	Indicates the network address and mask length of the destination network.
[1/0]	Indicates the management distance/metric.
Via 20.0.0.1	Indicates the next-hop IP address.
00:00:06	Indicates the time to live (TTL) of protocol routing.
VLAN 1	Indicates the next-hop forwarding interface.

The following example displays the information of routing to the target network 30.0.0.0.

```
Hostname> enable
Hostname# show ip route 30.0.0.0
Routing entry for 30.0.0.0/8
Distance 110, metric 20
Routing Descriptor Blocks:
192.1.1.1, 00:01:11 ago, via VLAN 1, generated by OSPF, extern 2
```

Table 1-2 Output Fields of the show ip route 30.0.0.0 Command

Field	Description
Distance	**Indicates the route management distance.**
metric	**Indicates the metric of the route.**
Routing Descriptor Blocks	Displays the next-hop IP address, routing source, update time, interface passed by, source routing protocol, type, BGP community attribute value of routing information.
00:01:11 ago	Indicates the TTL of protocol routing.
extern 2	Indicates the route type of source routing protocol of the route.

The following example displays the number of current routes.

```
Hostname> enable
```

```
Hostname# show ip route count
--- route info ---
the num of active route: 5(include ecmp: 9)
```

Table 1-3 Output Fields of the show ip route count Command

Field	Description
the num of active route	**Indicates the total number of currently active routes.**
include ecmp	**Indicates the number of ECMPs in the total routes.**

The following example displays routes of non-default weight.

```
Hostname> enable
Hostname# show ip route weight
----[distance/metric/weight]----
S    23.0.0.0/8 [1/0/2] via 192.1.1.20
S    172.0.0.0/16 [1/0/4] via 192.0.0.1
```

Table 1-4 Output Fields of the show ip route weight Command

Field	Description
S	**Indicates the source routing protocol of the route.**
distance	**Indicates the route management distance.**
metric	**Indicates the metric of the route.**
weight	**Indicates the weight value of the route.**

The following example displays the primary/backup route of fast re-route to 30.0.0.0.

```
Hostname> enable
Hostname# show ip route fast-reroute 30.0.0.0
Routing entry for 30.0.0.0/8
Distance 110, metric 20
Routing Descriptor Blocks:
[m] 192.1.1.1, 00:01:11 ago, via VLAN 1, generated by OSPF, extern 2
[ba]192.1.1.1, 00:01:11 ago, via VLAN 1, generated by OSPF, extern 2
```

Table 1-5 Output Fields of the show ip route fast-reroute 30.0.0.0 Command

Field	Description
Distance	**Indicates the route management distance.**
metric	**Indicates the metric of the route.**
Routing Descriptor Blocks	Displays the next-hop IP address, routing source, update time, interface passed by, source routing protocol, type, BGP community attribute value of routing information.

Field	Description
[m]	Identifies the primary route.
[ba]	Identifies the backup route.
00:01:11 ago	Indicates the TTL of protocol routing.
extern 2	Indicates the route type of source routing protocol of the route.

The following example displays routes of non-default tag.

```
Hostname# show ip route tag
----[distance/metric/tag]----
S    23.0.0.0/8 [1/0/10] via 192.1.1.20
S    172.0.0.0/16 [1/0/20] via 192.0.0.1
```

Table 1-6 Output Fields of the show ip route tag Command

Field	Description
S	**Indicates the source routing protocol of the route.**
distance	**Indicates the route management distance.**
metric	**Indicates the metric of the route.**
tag	**Indicates the label value of the route.**

The following example displays aggregated routes.

```
Hostname(config)#show ip rou aggregate
LA    20.0.0.0/8 [1/0] via 0.0.0.0, Null 0
LA    21.0.0.0/8 [1/0] via 0.0.0.0, Null 0
```

Table 1-7 Output Fields of the show ip route aggregate Command

Field	Description
LA	Indicates a local aggregated route.

1.17 show ip route recursive

Function

Run the **show ip route recursive** command to display the recursive information of an IP route.

Syntax

show ip route [[**vrf** *vrf-name*] **recursive** *ipv4-network/mask-length*

Parameter Description

vrf *vrf-name*: Displays the routing information only of the specified VRF. The routing information of global VRFs is displayed by default.

network/mask-length: Network address/length of subnet mask.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

You can display the detailed recursive information of an IP route, that is, all the routes that the IP route can be recursed to are listed according to the longest matching principle.

Examples

The following example displays the recursive information of an IP route.

```
Hostname> enable
Hostname# show ip route recursive 50.1.1.1/32
Codes:  C - Connected, L - Local, S - Static
       R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       IA - Inter area, EV - BGP EVPN, * - candidate default
S    50.1.1.1/32 [1/0] via 50.1.3.2
O IA  50.1.1.0/24 [m] via 35.1.10.2, 00:38:26, VLAN 1
S*    0.0.0.0/0 is directly connected, Null 0
```

Table 1-8 Output Fields of the show ip route recursive Command

Field	Description
O	Indicates the source routing protocol of the route. Value options of the field: **C**: Indicates direct route. **L**: Indicates local route. **S**: Indicates static route. **R**: Indicates RIP route. **B**: Indicates BGP route. **O**: Indicates OSPF route. **I**: Indicates IS-IS route.
E2	Indicates route type. Value options of the field: **E1**: Indicates OSPF external route type 1. **E2**: Indicates OSPF external route type 2. **N1**: Indicates OSPF NSSA external route type 1. **N2**: Indicates OSPF NSSA external route type 2. **SU**: Indicates IS-IS summary route. **L1**: Indicates IS-IS Level-1 route. **L2**: Indicates IS-IS Level-2 route. **IA**: Indicates internal route of routing domain.
50.1.1.1/32	Indicates the network address and mask length of the destination network.
[1/0]	Indicates the management distance/metric.
50.1.3.2	Indicates the next-hop IP address.
00:38:26	Indicates the TTL of protocol routing.
VLAN 1	Indicates the next-hop forwarding interface.
Blocks	Displays the next-hop IP address, routing source, update time, interface passed by, source routing protocol, type, BGP community attribute value of routing information.

1.18 show ip route static bfd

Function

Run the **show ip route static bfd** command to display the BFD correlation information of an IP route.

Syntax

show ip route [**vrf** *vrf-name*] **static bfd**

Parameter Description

vrf *vrf-name*: Displays the routing information only of the specified VRF. The routing information of global VRFs is displayed by default.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

You can display the BFD correlation information of an IP route.

Examples

The following example displays the BFD correlation information of an IP route.

```
Hostname> enable
Hostname# show ip route static bfd
S    10.0.0.0/8 via 100.100.100.25, GigabitEthernet 0/3, BFD state is Up
S    20.0.0.0/8 via 200.100.100.25, GigabitEthernet 0/4, BFD state is Admin
```

Table 1-9 Output Fields of the show ip route static bfd Command

Field	Description
S	Indicates static route.
BFD state	Indicates the associated BFD state of static route.

1.19 show ip route summary

Function

Run the **show ip route summary** command to display the statistics of a single routing table.

Run the **show ip route summary all** command to display the statistics of all the routing tables.

Syntax

show ip route [**vrf** *vrf-name*] **summary**

show ip route summary all

Parameter Description

vrf *vrf-name*: Specifies the name of the VRF where this command is executed. If VRF is not specified, the command is executed on all VRFs.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the statistics of routing tables.

Examples

The following example displays the statistics of a single routing table.

```
Hostname> enable
Hostname# show ip route summary
Codes:  NORMAL – Normal route  ECMP – ECMP route  FRR – Fast-Reroute route
   Memory: 2000 bytes
Entries: 22, based on route prefixes
Entries: 29, based on route nexthops
: : :   NORMAL  ECMP    FRR     TOTAL
: Connected   3       0       0       3
: Static      2       1       1       4
: RIP         1       2       1       4
: OSPF        2       1       1       4

Table 1-10 Output Fields of the show ip route summary Command

Field	Description
NORMAL	Indicates the classified entry type. Value options of the field: ● **NORMAL**: Indicates normal routing table entry (non-ECMP or FRR routing). ● **ECMP**: Indicates equal-cost multi-path routing table entry. ● **FRR**: Indicates fast re-route table entry. ● **TOTAL**: Indicates total of table entries of all types.
Memory	Indicates the size of the memory occupied by the current routing table.
Entries: x, based on route prefixes	Indicates the table entries contained in the current routing table (based on the prefix entries of table entries, not next hop entries)

Field	Description
Entries: x, based on route nexthops	Indicates the table entries contained in the current routing table (based on the next hop entries of table entries)
Connected	Indicates the protocol type of the table entry in this line. Value options of the field: **Connected**: Indicates table entries of direct route. **Static**: Indicates table entries of static route. **RIP**: Indicates table entries of RIP route. **OSPF**: Indicates table entries of OSPF route. **ISIS**: Indicates table entries of IS-IS route. **BGP**: Indicates table entries of BGP route. **TOTAL**: Indicates total of table entries in all protocols.
IP routing table count	Indicates the number of routing tables.
Global	Indicates the name of the current routing table. Value options of the field: **Global**: Indicates global (default VRF). **VRF1**: Indicates VRF name. **TOTAL**: Indicates total information of all the VRF routing tables.

1.20 show ip route track-table

Function

Run the **show ip route track-table** command to display the track correlation information of an IP route.

Syntax

show ip route [**vrf** *vrf-name*] **track-table**

Parameter Description

vrf *vrf-name*: Displays the routing information only of the specified VRF. The routing information of global VRFs is displayed by default.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

You can display the track correlation information of an IP route.

Examples

The following example displays the track correlation information of an IP route.

```
Hostname> enable
Hostname# show ip route track-table
ip route 10.0.0.0 255.0.0.0 GigabitEthernet 0/0 track 2 state is [up]
ip route 20.0.0.0 255.0.0.0 GigabitEthernet 0/0 2 track 3 state is [down]
```

Table 1-11 Output Fields of the show ip route track-table Command

Field	Description
track	Indicates the track object index.
state	Indicates the track object state.

1.21 show ipv6 route

Function

Run the **show ipv6 route** command to display the routing information of an IPv6 route.

Syntax

show ipv6 route [[**vrf** *vrf-name*] [[**fast-reroute**] *ipv6-prefix* / *prefix-length* [**longer-prefixes**] | *route-protocol* [*process-id*] | **weight**]]

Parameter Description

vrf *vrf-name*: Specifies the name of the VRF where this command is executed. If VRF is not specified, the command is executed on all VRFs.

fast-reroute: Displays the primary/backup route of fast re-route only. All types of routes are displayed by default.

ipv6-prefix/*prefix-length*: Specified prefix of the IPv6 route to be exactly matched. All the routes are displayed by default.

longer-prefixes: Displays the longest IPv6 route that matches the specified prefix. All the routes are displayed by default.

route-protocol: Routing protocol or keywords: **connected**, **local, static**; to display a specific protocol route, use the following keywords: **bgp**, **isis**, **ospf**, **rip.** The routes of all protocols are displayed by default.

process-id: Routing protocol process ID. The routes of all the processes are displayed by default.

weight: Displays only routes with non-default weight. The routes of all weights are displayed by default.

tag: Displays only routes of non-default tag. The routes of all tags are displayed by default.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the information of IPv6 routing tables.

Examples

The following example displays the routing information of IPv6.

```
Hostname> enable
Hostname# show ipv6 route
IPv6 routing table - Default - 7 entries
Codes:  C - Connected, L - Local, S - Static
       R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       IA - Inter area
C      10::/64  via Loopback 1, directly connected
L      10::1/128  via Loopback 1, local host
S      20::/64 [20/0] via 10::4, Loopback 1C
C      FE80::/10 via Null 0, directly connected
C      FE80::/64  via Loopback 1, directly connected
L      FE80::2D0:F8FF:FE22:33AB/128  via Loopback 1, local host
```

Table 1-12 Output Fields of the show ipv6 route Command

Field	Description
S	Indicates the source routing protocol of the route. Value options of the field: **C**: Indicates direct route. **L**: Indicates local route. **S**: Indicates static route. **R**: Indicates RIP route. **B**: Indicates BGP route. **O**: Indicates OSPF route. **I**: Indicates IS-IS route.

Field	Description
E2	Indicates route type. Value options of the field: **E1**: Indicates OSPF external route type 1. **E2**: Indicates OSPF external route type 2. **N1**: Indicates OSPF NSSA external route type 1. **N2**: Indicates OSPF NSSA external route type 2. **SU**: Indicates IS-IS summary route. **L1**: Indicates IS-IS Level-1 route. **L2**: Indicates IS-IS Level-2 route. **IA**: Indicates internal route of routing domain.
20::/64	Indicates the network address and mask length of the destination network.
[20/0]	Indicates the management distance/metric.
via 10::4	Indicates the next-hop IPv6 address.
Loopback 1	Indicates the next-hop forwarding interface.

1.22 show ipv6 route static bfd

Function

Run the **show ipv6 route static bfd** command to display the BFD correlation information of an IPv6 route.

Syntax

show ipv6 route [**vrf** *vrf-name*] **static bfd**

Parameter Description

vrf *vrf-name*: Displays the routing information of the specified VRF only. The routing information of global VRFs is displayed by default.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

You can display the BFD correlation information of an IPv6 route.

Examples

The following example displays the BFD correlation information of an IPv6 route.

```
Hostname> enable
Hostname# show ip route static bfd
S    25::/64 via 100::25, GigabitEthernet 0/3, BFD state is Up
S    26::/64 via 200::25, GigabitEthernet 0/4, BFD state is Admin
```

Table 1-13 Output Fields of the show ip route static bfd Command

Field	Description
S	Indicates static route.
BFD state	Indicates the associated BFD state of static route.

1.23 show ipv6 route summary

Function

Run the **show ipv6 route summary** command to display the statistics of a single IPv6 routing table.

Run the **show ipv6 route summary all** command to display the statistics of all the IPv6 routing tables.

Syntax

show ipv6 route [**vrf** *vrf-name*] **summary**

show ipv6 **route summary all**

Parameter Description

vrf *vrf-name*: Specifies the name of the VRF where this command is executed. If VRF is not specified, the command is executed on all VRFs.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the statistics of IPv6 routing tables.

Examples

The following example displays the statistics of a single IPv6 routing table.

```
Hostname> enable
Hostname# show ipv6 route summary
IPv6 routing table name is - Default(0) global scope - 5 entries
IPv6 routing table default maximum-paths is 32
Local         2
Connected      3
Static         0
RIP           0
OSPF          0
BGP           0
Total          5
```

The following example displays the statistics of all the IPv6 routing tables.

```
Hostname> enable
Hostname# show ipv6 route summary all
IPv6 routing table count: 2
Total
  Memory: 2000 bytes
  Entries: 20
    Local:2,Connected:2,Static:8,RIP:2,OSPF:2,ISIS:2,BGP:2
Global
  Memory: 1000 bytes
  Entries: 10
Local:1,Connected:1,Static:4,RIP:1,OSPF:1,ISIS:1,BGP:1
VRF1
  Memory: 1000 bytes
  Entries: 10
Local:1,Connected:1,Static:4,RIP:1,OSPF:1,ISIS:1,BGP:1
```

Table 1-14 Output Fields of the show ipv6 route summary Command

Field	Description
Memory	Indicates the size of the memory occupied by the current routing table.
Entries	Indicates the table entries contained in the current routing table (based on the prefix entries of table entries, not next hop entries)

Field	Description
Connected	Indicates the protocol type of the table entry in this line. Value options of the field: **Connected**: Indicates table entries of direct route. **Static**: Indicates table entries of static route. **RIP**: Indicates table entries of RIP route. **OSPF**: Indicates table entries of OSPF route. **ISIS**: Indicates table entries of IS-IS route. **BGP**: Indicates table entries of BGP route. **TOTAL**: Indicates total of table entries in all protocols.
IPv6 routing table count	Indicates the number of routing tables.
Global	Indicates the name of the current routing table. Value options of the field: **Global**: Indicates global (default VRF). **VRF1**: Indicates VRF name. **TOTAL**: Indicates total information of all the VRF routing tables.

1.24 show route-res usage

Function

Run the **show route-res usage** command to display the usage of routing resources.

Syntax

show route-res usage [**all** | **slot** *slot-id*]

Parameter Description

all: Displays the routing information of all the slots.

slot *slot-id*: Specifies the slot for viewing routing resource information.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

The command is used to display the routing resource information of the specified slot.

Examples

The following example displays the usage of routing resources of all the slots.

```
Hostname> enable
Hostname# show route-res usage all
Switch  Slot    Switch Mode Current:
-------------------------------------------------------------------------------
1       0       default

1 Static Route Commands

Command	Function
clear ip route arp scan times	Clear the Address Resolution Protocol (ARP) request transmission count and start counting again.
ip default-gateway	Configure a default gateway.
ip default-network	Configure a default network.
ip fast-reroute static route-map	Enable static fast reroute.
ip route	Configure static route.
ip route scan arp interval	Set the interval for actively sending ARP requests when ARP fails after correlation of static routes with ARP is configured.
ip route scan arp times	Set the times of actively sending ARP requests when ARP fails after correlation of static routes with ARP is configured.
ip route static bfd	Configure correlation of static routes with BFD.
ip route static inter-vrf	Allow static routing across VRFs.
ip static route-limit	Configure the maximum number of static routes.
ipv6 default-gateway	Configure a default gateway on a Layer-2 device.
ipv6 fast-reroute static route-map	Enable static fast reroute.
ipv6 route	Configure IPv6 static route.
ipv6 route static bfd	Configure correlation of static routes with BFD.
ipv6 static route-limit	Configure the maximum number of static routes.
maximum routes	Limit the maximum number of routes in the default VRF.
show ip redirects	Display the default gateway.
show ipv6 redirects	Display the IPv6 default gateway.

1.1 clear ip route arp scan times

Function

Run the **clear ip route arp scan times** command to clear the Address Resolution Protocol (ARP) request transmission count and start counting again.

Syntax

clear ip route arp scan times

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

1

Usage Guidelines

If the configured transmission count of ARP requests is 10 but no ARP reply is received after the ARP request has been sent 10 times, the device no longer sends the ARP request. If you need to continue to send the ARP request, run this command to clear the count so that the device can continue to actively send the ARP request.

Examples

The following example clears the transmission count of ARP request.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip route scan arp times 10
Hostname(config)# exit
Hostname# clear ip route arp scan times
```

1.2 ip default-gateway

Function

Run the **ip default-gateway** command to configure a default gateway.

Run the **no** form of this command to delete the default gateway.

Run the **default** form of this command to restore the default configuration.

No default gateway is configured by default.

Syntax

ip default-gateway *ipv4-address*

no ip default-gateway

default ip default-gateway

Parameter Description

ipv4-address: Default gateway IPv4 address.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

During data interaction, the packet with a destination address not in the local network segment is sent to the default gateway, and the gateway completes the next-step routing, achieving internetworking between the device and other networks.

Examples

The following example configures the default gateway as 192.168.1.1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip default-gateway 192.168.1.1
```

Notifications

Platform Description

This command is supported after the **no ip routing** command is used on devices.

Related Commands

- **show ip redirects**

1.3 ip default-network

Function

Run the **ip default-network** command to configure a default network.

Run the **no** form of this command to delete a default network.

Run the **default** form of this command to restore the default configuration.

The network ID is 0.0.0.0/0 by default.

Syntax

ip default-network *network*

no ip default-network *network*

default ip default-network *network*

Parameter Description

network: Network ID of the default network.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Configuring a default network aims to generate a default route. To generate a default route using the **default-network** command, make sure that the default network is not a directly-connected interface network, but is reachable in the routing table.

The default network always starts with an asterisk (*), indicating that it is a candidate for the default route. If there are direct routes and routes without next hop on the default network, the default route must be a static route.

Examples

The following example configures the default network as 192.168.100.0. Since a static route to the network is configured, the device will automatically generate a default route.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip route 192.168.100.0 255.255.255.0 gigabitethernet 0/1
Hostname(config)# ip default-network 192.168.100.0
```

The following example configures the default network as 200.200.200.0. As long as 200.200.200.0 appears in the routing table, the route becomes a default route.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip default-network 200.200.200.0
```

Related Commands

- **show ip route** (IP Routing Basic)

1.4 ip fast-reroute static route-map

Function

Run the **ip fast-reroute static route-map** command to enable static fast reroute.

Run the **no** form of this command to disable static fast reroute.

Run the **default** form of this command to restore the default configuration.

The static fast reroute function is disabled by default.

Syntax

ip fast-reroute [**vrf** *vrf-name*] **static route-map** *route-map-name*

no ip fast-reroute [**vrf** *vrf-name*] **route-map**

default ip fast-reroute [**vrf** *vrf-name*] **route-map**

Parameter Description

vrf-name: Virtual routing and forwarding (VRF). If no VRF is specified, the command is executed on all VRFs.

route-map-name: Route map of static fast reroute.

static: Generates a backup route for the static route.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Fast reroute sends the primary link route and backup link route at the same time. When the primary link fails, packets can be directly switched to the backup link route for forwarding, reducing service interruption time. For static fast reroute, when the primary next hop fails, the backup next hop, if valid, becomes the primary next hop for forwarding.

To improve the switching performance of fast reroute, bidirectional forwarding detection (BFD) detection can be started for the next hop of primary link. If the interface is Up or Down, to shorten the forwarding interruption time

during fast reroute, you can configure **carrier-delay 0** in interface configuration mode of the primary link egress to achieve the fastest switching performance.

Examples

The following example enables static fast reroute, and sets the backup next hop of all static routes to 192.168.1.2 to forward packets through the Gigabit Ethernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# route-map fast-reroute
Hostname(config-route-map)# set fast-reroute backup-nexthop GigabitEthernet 0/1
192.168.1.2
Hostname(config-route-map)# exit
Hostname(config)# ip fast-reroute static route-map fast-reroute
```

1.5 ip route

Function

Run the **ip route** command to configure static route.

Run the **no** form of this command to delete the configured static route.

Run the **no ip route all** command to delete all the configured static routes.

Run the **default ip route** command to restore the default configuration.

Run the **default ip route all** command to restore the default configuration.

No static route is configured by default.

Syntax

ip route [**vrf** *vrf-name*] *network mask* { *ipv4-address* [**global**] | *interface* [*ipv4-address* [**arp** | **global**] *] } [*distance* | **description** *description-text* | [**disabled** | **enabled**] | [**track** *object-number*] [**permanent**] | **tag** *tag* | **weight** *number*] *

no ip route [**vrf** *vrf-name*] { **all** | *network mask* { *ipv4-address* | *interface* [*ipv4-address*] } [*distance*] }

default ip route [**vrf** *vrf-name*] { **all** | *network mask* { *ipv4-address* | *interface* [*ipv4-address*] } [*distance*] }

Parameter Description

vrf *vrf-name*: Specifies the route VRF, which can be a single-protocol IPv4 VRF or a multi-protocol VRF configured with an IPv4 address family. The VRF is a global VRF by default.

network: Address of the target network.

mask: Mask of the target network.

ipv4-address: Next hop address of the static route. You must specify at least one of *ipv4-address* and *interface*, or both. If *ipv4-address* is not specified, a static direct route is configured.

global: Indicates that the next hop belongs to a global VRF. By default, the VRF of the next hop is the same as the VRF specified by *vrf-name*.

interface: Next-hop egress of the static route. You must specify at least one of *ipv4-address* and *interface*, or both. If *interface* is not specified, a recursive static route is configured. The egress is obtained by the next hop from the routing table.

arp: Creates routes according to ARP entries.

distance: Management distance of the static route. The value range is from 1 to 255, and the default value is **1**.

tag: Tag value of the static route. The value range is from 1 to 4294967295, and the default value is **0**.

permanent: Indicates a permanent route. The static route is not a permanent route by default.

track *object-number*: Indicates correlation with track. *object-number* indicates the ID of the track object. By default, the static route is not correlated with the track function.

weight *number*: Specifies the weight of the static route. The value range is from 1 to 8, and the default value is **1**.

description *description-text*: Specifies the static route description. By default, no description is configured. Here, *description-text* is a string of 1 to 60 characters.

disabled/enabled: Indicates the enable flag of the static route. The flag is **enabled** by default.**all**: Deletes all static routes under the specified VRF.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

In a small network, you can configure IPv4 static routes to implement internetworking.

The management distance of the static route is 1 by default. Setting the management distance allows the routes learned by a dynamic routing protocol to cover static routes. The static route is used only when dynamic routes cannot be learned. Setting the management distance of a static route can implement line backup. In this case, the static route is also called floating route. For example, the management distance of Open Shortest Path First (OSPF) routing protocol is 110, and the management distance of static route can be set to 125. In this way, when the line running OSPF fails, the data traffic can be switched to the line of static route.

The VRF to which the static route belongs can be specified. If it is not specified, the static route will be added to the default VRF. If the specified VRF is a multi-protocol VRF, it must be configured with an IPv4 address family;

otherwise, static route cannot be configured. Deleting the IPv4 address family of a multi-protocol VRF will also delete the IPv4 static route of this VRF.

The default weight of a static route is 1. You can run the **show ip route weight** command to display static routes with non-default weight. The weight parameter **weight** is used to implement the Weighted Cost Multipath (WCMP) function. When load-balancing routes can reach an address, the network device will allocate data traffic according to the weight value of each route. The route with a larger **weight** will share more data packets, and the route with a smaller **weight** will share less data packets. The WCMP limit of the device is 32 generally. When the weight sum of load balancing routes is greater than the limit, the routes beyond the limit will not take effect.

The configuration flag of a static route controls whether the static route is valid. If it is invalid, it will not be used for forwarding. The persistent route is configured to the forwarding table. It will always exist unless it is deleted by the network administrator.

When you want to configure a static route through an Ethernet interface, avoid directly setting the next hop to an interface (such as **ip route 0.0.0.0 0.0.0.0 GigabitEthernet 0/0**) if possible. If the next hop is directly an interface, the device deems that all the unknown target networks are directly connected to the Gigabit Ethernet 0/0 interface. Then, it sends an ARP request to every target host, thus occupying a lot of CPU and memory resources. Therefore, you are not advised to directly point a static route to an Ethernet interface.

Correlation of a static route with a track can be specified. When correlation of a static route with a specified track object is configured and the advertised status of the track object is inactive, the static route does not take effect. If the advertised status of the track object is active, the static route takes effect based on another status. With correlation of a static route with a track object, the third-party status concerned by the track object is mainly used to determine whether the static route takes effect. Correlation of a static route with a track object cannot be used for routes with the permanent attribute.

Correlation of a static route with an ARP object can be specified. When correlation of a static route with an ARP object is configured and the ARP object corresponding to the next hop and egress of the route does not exist, the static route does not take effect. When the ARP object corresponding to the next hop and egress of the route exits, the static route takes effect based on another status. Correlation of a static route with an ARP object cannot be used for routes with the permanent attribute.

Correlation of a static route with a track object cannot be used together with correlation of a static route with an ARP object.

Examples

The following example configures a static route. The next hop to 172.16.100.0/24 is 192.168.12.1, and the management distance is 115.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip route 172.16.100.0 255.255.255.0 192.168.12.1 115
```

The following example configures a static route. The next hop to 172.16.100.0/24 is 192.168.2.1, and data traffic can be forwarded only from the Gigabit Ethernet 0/0 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip route 172.16.100.0 255.255.255.0 GigabitEthernet 0/1
192.168.12.1
```

1.6 ip route scan arp interval

Function

Run the **ip route scan arp interval** command to set the interval for actively sending ARP requests when ARP fails after correlation of static routes with ARP is configured.

Run the **no** form of this command to delete the configured interval for actively sending ARP requests and restore it to the default value.

Run the **default** form of this command to restore the default configuration.

The correlation of static routes with ARP is disabled by default, and the ARP request is sent every 5s.

Syntax

ip route scan arp interval *request-interval*

no ip route scan arp interval

default ip route scan arp interval

Parameter Description

request-interval: Interval for actively sending ARP requests, in seconds. The range is from 5 to 120.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After the correlation of static routes with ARP is configured, when ARP fails due to a link failure or other causes, the device actively sends ARP requests. The transmission interval can be configured. By default, ARP requests are sent at an interval of 5s.

Examples

The following example configures correlation of static routes with ARP. When ARP fails, ARP requests are sent actively at an interval of 10s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip route scan arp interval 10
```

1.7 ip route scan arp times

Function

Run the **ip route scan arp times** command to set the times of actively sending ARP requests when ARP fails after correlation of static routes with ARP is configured.

Run the **no** form of this command to delete the configured times of actively sending ARP requests and restore it to the default value.

Run the **default** form of this command to restore the default configuration.

By default, the correlation of static routes with ARP is disabled, and the ARP request is sent 65,535 times.

Syntax

ip route scan arp times *request-times*

no ip route scan arp times

default ip route scan arp times

Parameter Description

request-times: Times of actively sending ARP requests when the ARP fails. The value range is from 1 to 65535.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After correlation of static routes with ARP is configured, when the ARP fails due to a link failure or other causes, the device actively sends ARP requests and the sending count can be configured. ARP requests are sent 65,535 times by default.

Examples

The following example configures correlation of static routes with ARP. When the ARP fails, the ARP request is actively sent 10 times.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip route scan arp times 10
```

1.8 ip route static bfd

Function

Run the **ip route static bfd** command to configure correlation of static routes with BFD.

Run the **no** form of this command to delete the configured correlation of static routes with BFD.

Run the **default** form of this command to restore the default configuration.

Correlation of static routes with BFD is disabled by default.

Syntax

ip route static bfd [**vrf** *vrf-name*] *interface-type interface-number gateway* [**source** *ipv4-address*]

no ip route static bfd [**vrf** *vrf-name*] *interface-type interface-number gateway* [**source** *ipv4-address*]

default ip route static bfd [**vrf** *vrf-name*] *interface-type interface-number gateway* [**source** *ipv4-address*]

Parameter Description

vrf *vrf-name*: Specifies the name of the VRF to which the static device belongs. The VRF is a global VRF by default.

interface-type interface-number: Interface type and interface number.

gateway: Gateway IP address, which is the neighbor IP address of BFD. If the next hop of the static route is this neighbor, BFD is used to check the connectivity of the forwarding path.

source *ipv4-address*: Specifies the source IP address used for the BFD session. If the neighbor IP address involves multiple hops, this parameter must be configured. By default, the source IP address is not specified.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can use this function to configure correlation of IPv4 static routes with BFD, quickly sensing change to the destination address link. If the Down status of the BFD session is detected, the IPv4 static route is not active and does not participate in packet forwarding. Before configuration, make sure that the BFD session parameters are configured on the interface.

Examples

The following example enables correlation of static routes with BFD and detects the forwarding path to the neighbor 172.16.0.2 via BFD.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no switchport
Hostname(config-if-GigabitEthernet 0/1)# ip address 172.16.0.1 255.255.255.0
Hostname(config-if-GigabitEthernet 0/1)# bfd interval 50 min_rx 50 multiplier 3
Hostname(config-if-GigabitEthernet 0/1)# exit
Hostname(config)# ip route static bfd GigabitEthernet 0/1 172.16.0.2
Hostname(config)# ip route 10.0.0.0 255.0.0.0 GigabitEthernet 0/1 172.16.0.2
```

1.9 ip route static inter-vrf

Function

Run the **ip route static inter-vrf** command to allow static routing across VRFs.

Run the **no** form of this command to disable static routing across VRFs.

Run the **default** form of this command to restore the default configuration.

Static routing across VRFs is allowed by default.

Syntax

ip route static inter-vrf

no ip route static inter-vrf

default ip route static inter-vrf

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

If you configure **no ip route static inter-vrf**, static routing across VRFs will not take effect. If active static routing across VRFs already exists and you configure it again, information similar to the following will be printed, instructing you to delete the static routing across VRFs.

```
*Aug 7 10:58:34: %NSM-ROUTESACROSSVRF: Un-installing route [x.x.x.x/8] from global routing table with outgoing interface x/x.
```

Examples

The following example prohibits static routing across VRFs.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# no ip route static inter-vrf
```

1.10 ip static route-limit

Function

Run the **ip static route-limit** command to configure the maximum number of static routes.

Run the **no** form of this command to configure the default number of routes.

Run the **default** form of this command to restore the default configuration.

The configured maximum number of static routes is 1000 by default.

Syntax

ip static route-limit { *number* | **default-vrf** *number* | **vrf** *vrf-name number* }

no ip static route-limit [**default-vrf**] | [**vrf** *vrf-name*]

default ip static route-limit [**default-vrf**] | [**vrf** *vrf-name*]

Parameter Description

number: Maximum number of all the static routes of a device. The value range is from 1 to 1000000.

default-vrf *number*: Specifies the maximum number of static routes under the default VRF. The value range is from 1 to 10000.

vrf *vrf-name number*: Specifies the maximum number of static routes under the VRF. The value range is from 1 to 10000.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After the maximum number of static routes is configured using **ip static route-limit**, the number of static routes configured will not exceed the maximum number set. You can run the **show running-config** command to display the currently configured maximum number of non-default static routes.

Examples

The following example configures the maximum number of static routes as 9000, the maximum number of static routes of the default VRF as 2000, and the maximum number of static routes of VRF test as 1000.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip static route-limit 9000
Hostname(config)# ip static route-limit default-vrf 2000
Hostname(config)# ip static route-limit vrf test 1000
```

1.11 ipv6 default-gateway

Function

Run the **ipv6 default-gateway** command to configure a default gateway on a Layer-2 device.

Run the **no** form of this command to delete the default gateway.

Run the **default** form of this command to restore the default configuration.

No IPv6 default gateway is configured by default.

Syntax

ipv6 default-gateway *ipv6-address*

no ipv6 default-gateway

default ipv6 default-gateway

Parameter Description

ipv6-address: Default gateway IPv6 address.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

During data interaction, the packet with a destination address not in the local network segment is sent to the default gateway, and the gateway completes the next-step routing, achieving internetworking between the device and other networks. You can run the **show ipv6 redirects** command to display the default gateway configuration.

Examples

The following example configures the default IPv6 gateway as 10::1 on a Layer-2 device.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 default-gateway 10::1
```

1.12 ipv6 fast-reroute static route-map

Function

Run the **ipv6 fast-reroute static route-map** command to enable static fast reroute.

Run the **no** form of this command to disable static fast reroute.

Run the **default** form of this command to restore the default configuration.

The static fast reroute function is disabled by default.

Syntax

ipv6 fast-reroute [**vrf** *vrf-name*] **static route-map** *route-map-name*

no ipv6 fast-reroute [**vrf** *vrf-name*]

default ipv6 fast-reroute [**vrf** *vrf-name*]

Parameter Description

vrf *vrf-name*: Specifies the VRF name. If the VRF name is not specified, the command is executed on all VRFs.

route-map-name: Route map of static fast reroute.

static: Generates a backup route for the static route.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

Fast reroute sends the primary link route and backup link route at the same time. When the primary link fails, packets can be directly switched to the backup link route for forwarding, reducing service interruption time.

To improve the switching performance of fast reroute, BFD detection can be enabled for the next hop of primary link. If the interface is Up or Down, to shorten the forwarding interruption time during fast reroute, you can configure **carrier-delay 0** in interface configuration mode of the primary link egress to achieve the fastest switching performance.

For static fast reroute, when the primary next hop fails, the backup next hop, if valid, becomes the primary next hop for forwarding.

Examples

The following example enables static fast reroute, and sets the backup next hop of all static routes to 2001::1 to forward packets through the Gigabit Ethernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# route-map fast-reroute
Hostname(config-route-map)# set ipv6 fast-reroute backup-interface GigabitEthernet
0/1 backup-nexthop 2001::1
Hostname(config-route-map)# exit
```

```
Hostname(config)# ipv6 fast-reroute static route-map fast-reroute
```

1.13 ipv6 route

Function

Run the **ipv6 route** command to configure IPv6 static route.

Run the **no** form of this command to delete the configured static route.

Run the **no ipv6 route all** command to delete all the configured static routes.

Run the **default ipv6 route** command to restore the default configuration.

Run the **default ipv6 route all** command to restore the default configuration.

The IPv6 static route function is disabled by default.

Syntax

ipv6 route [**vrf** *vrf-name*] *ipv6-prefix* / *prefix-length* { *ipv6-address* [**nexthop-vrf** { *vrf-name1* | **default** }] | *interface* [*ipv6-address* [**nexthop-vrf** { *vrf-name1* | **default** }]] } [*distance*] [**tag** *tag*] [**weight** *number*] [**description** *description-text*]

no ipv6 route [**vrf** *vrf-name*] { **all** | *ipv6-prefix*/*prefix-length* { *ipv6-address* [**nexthop-vrf** { *vrf-name1* | **default** }] | *interface* [*ipv6-address* [**nexthop-vrf** { *vrf-name1* | **default** }]] } [*distance*] }

default ipv6 route [**vrf** *vrf-name*] { **all** | *ipv6-prefix*/*prefix-length* { *ipv6-address* [**nexthop-vrf** { *vrf-name1* | **default** }] | *interface* [*ipv6-address* [**nexthop-vrf** { *vrf-name1* | **default** }]] } [*distance*] }

Parameter Description

vrf *vrf-name*: Specifies the VRF to which the route belongs. This parameter must be a multi-protocol VRF with configured IPv6 address family. The VRF is a global VRF by default.

ipv6-prefix: IPv6 prefix, which must comply with the address representation format specified in RFC4291.

prefix-length: Length of the IPv6 prefix. A slash (/) must be added before the prefix.

ipv6-address: Next hop address of the static route. You must specify at least one of *ipv6-address* and *interface*, or both. If *ipv6-address* is not specified, a static direct route is configured.

interface: Next-hop egress of the static route. You must specify at least one of *ipv6-address* and *interface*, or both. If *interface* is not specified, a recursive static route is configured. The egress is obtained by the next hop from the routing table.

nexthop-vrf *vrf-name1*: Specifies the VRF to which the next hop belongs. This parameter must be a multi-protocol VRF with configured IPv6 address family. By default, the VRF of the next hop is the same as the VRF specified by the VRF name. Here, **nexthop-vrf default** indicates that the VRF of the next hop is a global VRF.

distance: Management distance of the static route. The management distance is 1 by default.

tag *tag*: Specifies the tag value of the static route. The value range is from 1 to 4294967295, and the default value is **0**.

weight *number*: Specifies the weight of the static route, which must be specified when you configure equal-cost routes. When the weights of all equal-cost routes of a route are summed up, the sum cannot exceed the maximum number of equal-cost routes that can be configured for the route. Weighting of equal-cost routes of a route indicates the traffic ratio of these routes. The value range is from 1 to 8, and the default value is **1**.

description *description-text*: Specifies the static route description. By default, no description is configured. Here, *description-text* is a string of 1 to 60 characters.

all: Deletes all static IPv6 routes under the specified VRF.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

On a simple network, you can configure IPv6 static routes to implement internetworking.

Deleting the IPv6 address family of a multi-protocol VRF will also delete the IPv6 static routes in the VRF table or next-hop routes. If the VRF of the interface of an IPv6 static route is inconsistent with the configured VRF of the next hop, this IPv6 static route will not take effect.

The default management distance of static routes is 1. Setting the management distance allows the route learned by the dynamic route to cover the static route. Only when the dynamic route cannot be learned, can the static route be used. Setting the management distance of a static route can implement line backup. In this case, the static route is also called floating route. For example, the management distance of OSPF routing protocol is 110, and the management distance of static route can be set to 125. In this way, when the line running OSPF fails, the data traffic can be switched to the line of static route.

Examples

The following example configures an IPv6 static route. The target network of the traffic is 2001::/64, the next hop is 2002::2, and the management distance is 115.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 route 2001::/64 2002::2 115
```

The following example configures an IPv6 static route. The target network of the traffic is 2001::/64, the next hop is 2002::2, and data traffic can be forwarded only from the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
```

```
Hostname(config)# ipv6 route 2001::/64 GigabitEthernet 0/1 2002::2
```

Function

Run the **ipv6 route static bfd** command to configure correlation of static routes with BFD.

Run the **no** form of this command to delete the configured correlation of static routes with BFD.

Run the **default** form of this command to restore the default configuration.

Correlation of static routes with BFD is disabled by default.

Syntax

ipv6 route static bfd [**vrf** *vrf-name*] *interface-type interface-number gateway* [**source** *ipv6-address*]

no ipv6 route static bfd [**vrf** *vrf-name*] *interface-type interface-number gateway* [**source** *ipv6-address*]

default ipv6 route static bfd [**vrf** *vrf-name*] *interface-type interface-number gateway* [**source** *ipv6-address*]

Parameter Description

vrf *vrf-name*: Specifies the name of the VRF to which the static device belongs. If VRF is not specified, the command is executed on all VRFs.

interface-type interface-number: Interface type and interface number.

gateway: Gateway IP address, which is the neighbor IP address of BFD. If the next hop of the static route is this neighbor, BFD is used to check the connectivity of the forwarding path.

source *ipv6-address*: Specifies the source IP address used for the BFD session. If the neighbor IP address involves multiple hops, this parameter must be configured. By default, the neighbor IP address of the BFD session is a single hop, and the source IP address is not used.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

You can use this function to configure correlation of IPv6 static routes with BFD, quickly sensing change to the destination address link. If the Down status of the BFD session is detected, the IPv6 static route is not active and does not participate in packet forwarding. Before configuration, make sure that the BFD session parameters are configured on the interface.

Examples

The following example enables correlation of static routes with BFD and detects the forwarding path to the neighbor 2001:1::2 via BFD.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if)# no switchport
Hostname(config-if)# ip address 2001:1::1/64

1.15 ipv6 static route-limit

Function

Run the **ipv6 static route-limit** command to configure the maximum number of static routes.

Run the **no** form of this command to configure the default number of routes.

Run the **default** form of this command to restore the default configuration.

The maximum number of static routes is 1000 by default.

Syntax

ipv6 static route-limit { *number* | **default-vrf** *number* | **vrf** *vrf-name number* }

no ipv6 static route-limit [**default-vrf**] | [**vrf** *vrf-name*]

default ipv6 static route-limit [**default-vrf**] | [**vrf** *vrf-name*]

Parameter Description

number: Maximum number of all the static routes of a device. The value range is from 1 to 1000000.

default-vrf *number*: Specifies the maximum number of static routes under the default VRF. The value range is from 1 to 10000.

vrf *vrf-name number*: Specifies the maximum number of static routes under the VRF. The value range is from 1 to 10000.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

After the maximum number of static routes is configured using **ipv6 static route-limit**, the number of static routes configured will not exceed the maximum number set. You can run the **show running config** command to display the currently configured maximum number of non-default static routes.

Examples

The following example configures the maximum number of static routes in global IPv6 mode as 900, the maximum number of static routes of the default VRF as 200, and the maximum number of static routes of VRF test as 100.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 static route-limit 900

1.16 maximum routes

Function

Run the **maximum routes** command to limit the maximum number of routes in the default VRF.

Run the **no** form of this command to cancel limitation to the maximum number of routes in the default VRF.

The maximum number of routes in the default VRF is not limited by default.

Syntax

maximum routes *limit* { *warn-threshold* | **warning-only** }

no maximum routes

Parameter Description

limit: Maximum number of routes. The routes beyond the limit are not written to the core routing table. The value range is from 1 to 4294967295.

warn-threshold: Threshold for printing warning. Warning will be printed when this percentage is reached. The value range is from 1 to 100.

warning-only: Only prints warning and still allows routes to be added to the core routing table when the configured maximum number is reached.

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

This command is used to limit the number of routes running in the default VRF. If you want warning only, use the **warning-only** parameter.

Examples

The following example configures the maximum number of routes under the default VRF as 1000. When the number of routes exceeds 1000*100%, the warning log will be given.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# maximum routes 1000 100

1 RIP Commands

Command	Function
address-family	Enter address family submode to configure the Routing Information Protocol (RIP).
auto-summary	Enable the automatic summarization function of RIP routes.
bfd all-interfaces	Configure link detection through bidirectional forwarding detection (BFD) for all the interfaces of RIP.
default-information originate	Generate a default route in the RIP process.
default-metric	Configure the default metric for RIP.
distance	Configure the management distance of a RIP route.
distribute-list in	Configure and control route update processing to implement route filtering.
distribute-list out	Configure and control route update advertisement to implement route filtering.
enable mib-binding	Bind the management information base (MIB) with a specified RIP instance.
exit-address-family	Exit the address family configuration mode.
fast-reroute	Configure the RIP fast reroute function of a device.
graceful-restart	Configure the graceful restart (GR) function of a device.
ip rip authentication key-chain	Enable RIP authentication and specify the key chain to be used for RIP authentication.
ip rip authentication mode	Configure the mode of RIP authentication.
ip rip authentication text-password	Enable RIP authentication and set the character string of plain text authentication.
ip rip bfd	Configure BFD for link detection on the specified interface.
ip rip default-information	Configure default route advertisement on a RIP interface.

ip rip receive enable	Allow RIP to receive RIP packets on the specified interface.
ip rip receive version	Define the version of RIP packets to be received by RIP on the specified interface.
ip rip send enable	Allow RIP to send RIP packets on the specified interface.
ip rip send supernet-routes	Allow RIP to send supernetting routes on the specified interface.
ip rip send version	Define the version of RIP packets to be sent by RIP on the specified interface.
ip rip split-horizon	Enable the split horizon function of RIP.
ip rip subvlan	Enable the RIP function on a super VLAN.
ip rip summary-address	Configure the RIP route summarization on an interface.
ip rip triggered	Enable the RIP triggered updates function of demand circuits, and configure the retransmission time and retransmission times of the RIP triggered updates.
ip rip v2-broadcast	Allow RIPv2 packets to be broadcast on the specified interface.
neighbor	Configure the IP address of a RIP neighbor.
network	Configure the list of networks to be advertised by the RIP routing process.
offset-list	Increase the metric of a received or sent RIP route.
output-delay	Set the sending delay between RIP update packets.
passive-interface	Prohibit an interface from sending RIP update packets.
redistribute	Redistribute the external routing information.
router rip	Create a RIP routing process and enter routing process configuration mode.
show ip rip	Display the basic information of a RIP routing protocol process.
show ip rip database	Display the route summary in a RIP route database.

show ip rip external	Display the information about external routes redistributed by RIP.
show ip rip interface	Display the information about a RIP interface.
show ip rip peer	Display the information about a RIP neighbor.
timers basic	Adjust the clock of RIP.
validate-update-source	Validate the source address of a received RIP route update packet.
version	Configure the RIP version No. of the entire device.

1.1 address-family

Function

Run the **address-family** command to enter address family submode to configure the Routing Information Protocol (RIP).

Run the **no** form of this command to delete the address family configured with a routing protocol.

The address family of RIP is disabled by default.

Syntax

address-family ipv4 vrf *vrf-name*

no address-family ipv4 vrf *vrf-name*

Parameter Description

vrf *vrf-name*: Specifies the name of the VRF associated with address family configuration submode.

Command Modes

Routing configuration mode

Default Level

14

Usage Guidelines

You can run the **address-family** command to enter address family configuration submode. When the VRF associated with the address family configuration submode is specified for the first time, a RIP instance corresponding to the VRF will be created. In this submode, you can configure the RIP routing information for the related VRF.

To exit address family configuration submode and return to routing process configuration mode, you can run the **exit-address-family** or **exit** command.

Examples

The following example enters the VPN1 address family submode to configure the RIP routing protocol, and create a corresponding RIP instance for the VRF.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ip vrf vpn1
Hostname(config-vrf)# exit
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip vrf forwarding vpn1
Hostname(config-if-GigabitEthernet 0/1)# ip address 192.168.1.1 255.255.255.0
Hostname(config)# router rip
Hostname(config-router)# address-family ipv4 vrf vpn1
Hostname(config-router-af)# network 192.168.1.0
Hostname(config-router-af)# exit-address-family
```

Notifications

When the VRF associated with the address family does not exist, the following notification will be displayed:

```
% VRF vpn1 doesn't exist
```

Common Errors

Platform Description

N/A

Related Commands

router rip

1.2 auto-summary

Function

Run the **auto-summary** command to enable the automatic summarization function of RIP routes.

Run the **no** form of this command to disable the automatic summarization function of RIP routes.

The automatic summarization function of RIP routes is enabled by default.

Syntax

auto-summary

no auto-summary

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

Automatic summarization of RIP routes means that multiple subnet routes are automatically summarized into a classful network route when they cross the boundary of a classful network. For RIPv1 and RIPv2, routes are automatically summarized by default.

If a summarized route exists, subroutes included in the summarized route cannot be seen in the routing table, which reduces the size of the routing table.

Advertising a summarized route is more efficient than advertising individual routes because:

- A summarized route is processed preferentially when RIP looks through the database.
- All subroutes are ignored when RIP looks through the database, which reduces the processing time required.

To learn specific subnet routes, you can disable automatic route summarization. Automatic route summarization can only be disabled using RIPv2. The range of supernetting routes is larger than that of the classful network. Therefore, this command is invalid for supernetting routes.

Examples

The following example disables automatic route summarization of RIPv2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# version 2
Hostname(config-router)# no auto-summary
```

1.3 bfd all-interfaces

Function

Run the **bfd all-interfaces** command to configure link detection through bidirectional forwarding detection (BFD) for all the interfaces of RIP.

Run the **no** form of this command to restore the default configuration.

The BFD function is disabled by default.

Syntax

bfd all-interfaces

no bfd all-interfaces

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

After BFD is enabled on RIP, a BFD session will be set up for the RIP routing information source (that is, the source address of RIP route update packets). Once the BFD neighbor fails, the corresponding RIP route information directly enters the invalid state and is not forwarded.

You can also run the **ip rip bfd** [**disable**] command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the **bfd all-interfaces** command used in routing process configuration mode.

Examples

The following example configures all interfaces running RIP to conduct BFD link detection.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# bfd all-interfaces
```

Notifications

When your peer device also needs to be configured with BFD to prevent route learning from being affected, the following notification will be displayed:

```
% Warning: The BFD for RIP peer shall be enabled, or it would affect the route learning.
```

Common Errors

BFD is not enabled on the interconnected devices at the same time.

Platform Description

N/A

1.4 default-information originate

Function

Run the **default-information originate** command to generate a default route in the RIP process.

Run the **no** form of this command to cancel the generated default route.

There is no default route in the RIP process by default.

Syntax

default-information originate [**always**] [**metric** *metric-value*] [**route-map** *route-map-name*]

no default-information originate [**always**] [**metric**] [**route-map** *route-map-name*]

Parameter Description

always: Enables RIP to generate a default route no matter whether the local router has a default route.

metric *metric-value*: Specifies the initial metric of the default route. The value range is from 1 to 15, and the default value is **1**.

route-map *route-map-name*: Specifies the name of the associated route map. No route map is associated by default.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

If a default route exists in the routing table of a device, RIP does not advertise the default route to external entities by default. You need to run the configuration command **default-information originate** to advertise the default route to neighbors.

If the RIP process can generate a default route using this command, RIP does not learn the default route advertised by the neighbor.

You still need to run the **default-information originate** command to introduce the default route generated by **ip default-network** to RIP.

The parameters are used as follows:

- If the **always** parameter is configured, the RIP routing process advertises a default route to neighbors no matter whether the default route exists, but this default route is not displayed in the local routing table. To check whether the default route is generated, run the **show ip rip database** command to check the RIP routing information database.
- To further control the behavior of advertising the RIP default route, use the **route-map** parameter. For example, run the **set metric** rule to set the metric of the default route.
- You can use the **metric** parameter to set the metric of the advertised default value, but the priority of this configuration is lower than that of the **set metric** rule of the route map. If the **metric** parameter is not configured, the default route uses the default metric configured for RIP.

Examples

The following example generates a default route in the RIP process.

```
Hostname> enable
Hostname# configure terminal
Hostname(config-router)# default-information originate always
```

Notifications

Related Commands

- **show ip rip database**

1.5 default-metric

Function

Run the **default-metric** command to configure the default metric for RIP.

Run the **no** form of this command to restore the default configuration.

By default, the metric of a redistributed route is 1.

Syntax

default-metric *metric-value*

no default-metric

Parameter Description

metric-value: Default metric value. The value range is from 1 to 16. If the value of *metric-value* is equal to or greater than 16, the device determines that this route is unreachable.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command must be used together with the **redistribute** command. When a route is redistributed from another routing protocol process to the RIP route process, the route metric cannot be converted because the metric calculating mechanism is different for each routing protocol. Therefore, in the process of transformation, you need to define the metric of redistributed route in the RIP routing domain. If the metric is not specified during redistribution of a routing protocol process, RIP uses the metric defined by the **default-metric** command. If the metric is specified, the metric defined by the **default-metric** command is overwritten by the specified metric. If this command is not configured, the value of metric is 1 by default.

Examples

The following example uses the RIP to redistribute the route learned by the Open Shortest Path First (OSPF) routing protocol, and sets the initial RIP metric to **3**.

```
Hostname(config)# router rip
Hostname(config-router)# default-metric 3
Hostname(config-router)# redistribute ospf 100
```

Notifications

1.6 distance

Function

Run the **distance** command to configure the management distance of a RIP route.

Run the **no** form of this command to restore the default configuration.

The management distance is **120** by default.

Syntax

distance *distance* [*ipv4-address wildcard*]

no distance [*distance ipv4-address wildcard*]

Parameter Description

distance: Management distance of a RIP route. The value range is an integer from 1 to 255.

ipv4-address: Prefix of the source IP address of the route.

wildcard: IP address comparison bit. Value 0 indicates accurate matching, and 1 indicates that no comparison is performed.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the management distance of a RIP route.

You can run this command to create multiple management distances with source address prefixes. When the source address of a RIP route is within the range of these prefixes, the corresponding management distance will be used; otherwise, the management distance set by RIP will be used for the route.

Examples

The following example configures the management distance of RIP route as 160, and specifies the management distance of the route learned from 192.168.12.1 as **123**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# distance 160
Hostname(config-router)# distance 123 192.168.12.1 0.0.0.0
```

Notifications

When the configured mask is incorrect, the following notification will be displayed:

```
% Invalid mask value
```

Common Errors

The configured mask is incorrect.

Platform Description

N/A

Related Commands

- **show ip rip**

1.7 distribute-list in

Function

Run the **distribute-list in** command to configure and control route update processing to implement route filtering.

Run the **no** form of this command to delete the configured inbound distribution list.

There is no inbound distribution list by default.

Syntax

distribute-list { [*acl-number* | *acl-name*] | **prefix** *prefix-list-name* [**gateway** *prefix-list-name*] | [**gateway** *prefix-list-name*] } **in** [*interface-type interface-number*]

no distribute-list { [*acl-number* | *acl-name*] | **prefix** *prefix-list-name* [**gateway** *prefix-list-name*] | [**gateway** *prefix-list-name*] } **in** [*interface-type interface-number*]

Parameter Description

acl-number: ACL No. Only routes permitted by the access list can be received. The following value ranges are supported.

The value range of IP standard ACL is 1 to 99 or 1300 to 1999; the value range of IP extended ACL is 100 to 199 or 2000 to 2699.

acl-name: ACL name. The value is a case-sensitive string of 1 to 99 characters. Only routes permitted by the access list can be received.

prefix *prefix-list-name*: Uses the prefix list to filter routes.

gateway *prefix-list-name*: Uses the prefix list to filter the route sources.

interface-type interface-number: Specified interface only on which the distribution list is used.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

To refuse receiving some specified routes, you can configure the route distribution control list to process all the received route update packets. If no interface is specified, route update packets received on all interfaces will be processed.

Examples

The following example configures the RIP routing process to control route update processing over the GigabitEthernet 0/1 interface and allows receiving only routes of the 172.16.0.0/16 address segment of ACL 10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# network 200.168.23.0
Hostname(config-router)# distribute-list 10 in GigabitEthernet 0/1
Hostname(config-router)# no auto-summary
Hostname(config)# access-list 10 permit 172.16.0.0 0.0.255.255
```

1.8 distribute-list out

Function

Run the **distribute-list out** command to configure and control route update advertisement to implement route filtering.

Run the **no** form of this command to delete route update advertisement control to implement route filtering.

There is no outbound distribution list by default.

Syntax

distribute-list { [*acl-name* | *acl-number*] | **prefix** *prefix-list-name* } **out** [*interface-type interface-number* | **bgp** | **connected** | **isis** [*area-tag*] | **ospf** *process-id* | **rip** | **static**]

no distribute-list { *acl-name* | *acl-number* | **prefix** *prefix-list-name* } **out** [*interface-type interface-numbe* | **bgp** | **connected** | **isis** [*area-tag*] | **ospf** *process-id* | **rip** | **static**]

Parameter Description

acl-number: ACL No. Only routes permitted by the access list can be sent. The following value ranges are supported.

The value range of IP standard ACL is 1 to 99 or 1300 to 1999; the value range of IP extended ACL is 100 to 199 or 2000 to 2699.

acl-name: ACL name. The value is a case-sensitive string of 1 to 99 characters. Only routes permitted by the access list can be sent.

prefix *prefix-list-name*: Uses the prefix list to filter routes.

interface-type interface-number: Specified interface only to which the route update advertisement control is applicable.

bgp: Applies route update advertisement control only to the routes introduced from Border Gateway Protocol (BGP).

connected: Applies route update advertisement control only to the routes introduced through direct connection.

isis [*area-tag*]: Applies route update advertisement control only to the routes introduced from Intermediate System to Intermediate System (IS-IS). Here, *area-tag* specifies an IS-IS instance.

ospf *process-id*: Applies route update advertisement control only to the routes introduced from OSPF. Here, *process-id* specifies an OSPF instance.

rip: Applies route update advertisement control only to RIP routes.

static: Applies route update advertisement control only to static routes.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

- If this command is configured without any optional parameters, route update advertisement control takes effect on all the interfaces.
- If any interface option is configured, route update advertisement control takes effect on the specified interface only.
- If other routing process parameters are configured, route update advertisement control takes effect on the specified routing processes only.

Examples

The following example configures the RIP routing process to control route update advertisement processing and allows externally advertising only routes of the 192.168.12.0/24 address segment of ACL 10.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# network 200.4.4.0
Hostname(config-router)# network 192.168.12.0
Hostname(config-router)# distribute-list 10 out
Hostname(config-router)# version 2
Hostname(config)# access-list 10 permit 192.168.12.0 0.0.0.255
```

Notifications

When gateway filtering cannot be used for **out** configuration by default, the following notification will be displayed:

```
% Gateway not allowed with OUT in distribute-list cmd
```

Common Errors

1.9 enable mib-binding

Function

Run the **enable mib-binding** command to bind the management information base (MIB) with a specified RIP instance.

Run the **no** form of this command to restore the default binding.

By default, the MIB is bound with the RIP instance of the default VRF.

Syntax

enable mib-binding

no enable mib-binding

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

The RIP MIB does not have RIP instance information. Therefore, you must perform operations only on one instance through SNMP. By default, the RIP MIB is bound with the RIP instance of the default VRF, and all user operations take effect on this instance.

If you wish to perform operations on a specified RIP instance through SNMP, run this command to bind the MIB with the instance.

Examples

The following example configures to bind MIB to the specified RIP instance, and operate the RIP instance with VRF as VPN 1 through SNMP.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# address-family ipv4 vrf vpn1
Hostname(config-router-af)# enable mib-binding
```

1.11 fast-reroute

Function

Run the **fast-reroute** command to configure the RIP fast reroute function of a device.

Run the **no** form of this command to restore the default configuration.

The fast reroute function is disabled by default.

Syntax

fast-reroute route-map *route-map-name*

no fast-reroute

Parameter Description

route-map-name: Route map through which the backup path is specified.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

When the RIP fast reroute function is used, it is recommended that BFD be enabled at the same time so that the device can quickly detect any link failure and therefore shorten the forwarding interruption time. If the interface switches Up/Down, to shorten the forwarding interruption time during RIP fast reroute, you can configure **carrier-delay 0** in interface configuration mode to achieve the fastest switchover speed. If the route map is configured, a backup path can be specified for a matched route through the route map.

Currently, the RIP fast reroute function is subject to the following constraints:

- Only one backup next hop can be generated for one route.
- No backup next hop can be generated for equal-cost multi-path routing (ECMP).

Examples

The following example configures the RIP FRR function of a device and associates it with route map fast-reroute. It configures route map fast-reroute, matches the interface Gigabit Ethernet 0/2, and sets the FRR backup interface to Gigabit Ethernet 0/1 and the backup next hop to 192.168.1.1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# route-map fast-reroute
Hostname(config-route-map)# match interface gigabitEthernet 0/2
Hostname(config-route-map)# set fast-reroute backup-interface GigabitEthernet 0/1
backup-nexthop 192.168.1.1
Hostname(config)# router rip
Hostname(config-router)# fast-reroute route-map fast-reroute
```

Notifications

When the name length of the configured route map exceeds the maximum value, the following notification will be displayed:

```
% Route-map name string length can not exceed 32
```

When the configured route map does not exist, the following notification will be displayed:

```
% route-map name not exist
```

Common Errors

The name length of the configured route map is too long.

The configured route map does not exist.

1.12 graceful-restart

Function

Run the **graceful-restart** command to configure the graceful restart (GR) function of a device.

Run the **no** form of this command to restore the default configuration.

The GR function is enabled by default.

Syntax

graceful-restart [**grace-period** *grace-period*]

no graceful-restart [**grace-period**]

Parameter Description

graceful-restart: Enables the GR function.

grace-period *grace-period*: Specifies the GR period, in seconds. The value range is 1 to 1800. The default value is twice the update time or 60s, whichever is the smaller.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

The GR function is configured based on the RIP process. You can configure different parameters for different RIP processes based on the actual conditions.

The GR period is the maximum time from restart of the RIP process to completion of GR. During this period, the forwarding table before the restart is retained, and the RIP route is restored so as to restore the RIP state before the restart. After the restart period expires, RIP exits the GR state and performs common RIP operations.

The **graceful-restart grace-period** command allows you to explicitly modify the GR period. Note that GR must be completed after the update timer of the RIP route expires and before the invalid timer of the RIP route expires. An inappropriate GR period cannot ensure uninterrupted data forwarding during the GR process. A typical case is as follows: If the GR period is longer than the duration of the invalid timer, GR is not completed when the invalid timer expires. The route is not re-advertised to the neighbor, and forwarding of the route of the neighbor stops after the invalid timer expires, causing interruption of data forwarding on the network. Unless otherwise required, you are not advised to adjust the GR period. If it is necessary to adjust the GR period, ensure that the GR period is longer than the duration of the update timer but shorter than the duration of the invalidity timer based on the configuration of the **timers basic** command.

During the RIP GR process, ensure that the network environment is stable.

Examples

The following example configures the RIP GR function of a device, and sets the GR period parameter to 80s:

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# graceful-restart grace-period 90
```

1.13 ip rip authentication key-chain

Function

Run the **ip rip authentication key-chain** command to enable RIP authentication and specify the key chain to be used for RIP authentication.

Run the **no** form of this command to delete the specified key chain.

No key chain is set by default.

Syntax

ip rip authentication key-chain *name-of-keychain*

no ip rip authentication key-chain

Parameter Description

name-of-keychain: Name of the key chain used for RIP authentication.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If a key chain is already specified in the interface configuration, you need to run the **key chain** command in global configuration mode to define the key chain; otherwise, authentication of RIP packets may fail.

If this command and the **ip rip authentication mode md5** command are configured, message digest 5 (MD5) mode authentication is adopted. If the **ip rip authentication mode** command is not configured, authentication is performed according to the authentication mode specified by the configured **key chain**. MD5 authentication and SM3 authentication are supported at present. Only RIPv2 supports authentication of RIP packets, and RIPv1 does not.

Examples

The following example enables RIP authentication on the GigabitEthernet 0/1 interface and specifies the key chain used for RIP authentication as **ripchainf**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip authentication key-chain ripchain
```

The following example configures the key chain as **ripchain** and the key 1 string as **Hello**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# key chain ripchain
Hostname(config-keychain)# key 1
Hostname(config-keychain-key)# key-string Hello
```

Notifications

N/A

Common Errors

When MD5 authentication is configured, **key-chain** is not configured first.

Platform Description

1.14 ip rip authentication mode

Function

Run the **ip rip authentication mode** command to configure the mode of RIP authentication.

Run the **no** form of this command to restore the default RIP authentication mode.

Plain text authentication mode is used by default.

Syntax

ip rip authentication mode { **text** | **md5** }

no ip rip authentication mode

Parameter Description

text: Indicates that the RIP authentication mode is plain text authentication.

md5: Indicates that the RIP authentication mode is MD5 authentication.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Only RIPv2 supports authentication of RIP packets, and RIPv1 does not.

The RIP authentication modes configured on all devices that need to directly exchange RIP routing information must be the same; otherwise, exchange of RIP packets may fail.

Use plain text or MD5 authentication as instructed below:

- If plain text authentication is used, but the key chain for plain text authentication is not configured or associated, authentication is not performed.
- If MD5 authentication is used, but the key chain is not configured or associated, authentication is not performed either.

Examples

The following example configures the RIP authentication mode of GigabitEthernet 0/1 interface as **MD5**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip authentication mode md5
```

Function

Run the **ip rip authentication text-password** command to enable RIP authentication and set the character string of plain text authentication.

Run the **no** form of this command to delete the character string of plain text authentication.

No character string of plain text authentication is set by default.

Syntax

ip rip authentication text-password [**0** | **7**] *password-string*

no ip rip authentication text-password

Parameter Description

0: Indicates that the key is displayed in plain text.

7: Indicates that the key is displayed in cipher text.

password-string: Character string used for plain text authentication. The length range is 1 to 16 bytes.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command takes effect only in plain text authentication mode. If RIP plain text authentication should be enabled, run this command to configure the key chain for plain text authentication. Alternatively, you can obtain the key chain for plain text authentication by associating the key chain. The key chain obtained using the second method takes precedence over that obtained using the first method.

Only RIPv2 supports authentication of RIP packets, and RIPv1 does not.

Examples

The following example configures the RIP authentication mode of GigabitEthernet 0/1 interface as plain text authentication and sets the character string of plain text authentication to **hello**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip authentication text-password hello
```

Function

Run the **ip rip bfd** command to configure BFD for link detection on the specified interface.

Run the **no** form of this command to delete the BFD configured on the interface.

By default, BFD link detection on an interface is disabled by default.

Syntax

ip rip bfd [**disable**]

no ip rip bfd

Parameter Description

disable: Disables BFD for link detection on a specified interface.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The BFD configured on an interface takes precedence over the **bfd all-interfaces** command used in process configuration mode.

In light of the actual environment, you can run the **ip rip bfd** command to configure BFD for link detection on the specified interface, or run the **bfd all-interfaces** command to configure BFD for link detection on all the interfaces. You can run the **ip rip bfd disable** command to disable BFD for link detection on the specified interface.

Examples

The following example enables BFD for link detection on the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip bfd
```

Notifications

When your peer device also needs to be configured with BFD to prevent route learning from being affected, the following notification will be displayed:

```
% Warning: The BFD for RIP peer shall be enabled, or it would affect the route learning.
```

Common Errors

BFD is not enabled on the interconnected devices at the same time.

Platform Description

1.17 ip rip default-information

Function

Run the **ip rip default-information** command to configure default route advertisement on a RIP interface.

Run the **no** form of this command to cancel default route advertisement on the specified interface.

By default, default route advertisement is disabled on an interface.

Syntax

ip rip default-information { **only** | **originate** } [**metric** *metric-value*]

no ip rip default-information

Parameter Description

only: Indicates that only the default route is advertised.

originate: Indicates that the default route and other routes are advertised.

metric *metric-value*: Specifies the metric of the default route. The value range is from 1 to 15, and the default value is **1**.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

After this command is configured on an interface, a default route is generated and advertised through this interface. If you configure the **ip rip default-information** command for the interface, and the **default-information originate** command for the RIP process, only the default route configured for the interface is advertised.

So far as the **ip rip default-information** command is configured for an interface, RIP does not learn the default route advertised by the neighbor.

Examples

The following example configures default route advertisement on RIP ethernet0/1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip default-information only
```

1.18 ip rip receive enable

Function

Run the **ip rip receive enable** command to allow RIP to receive RIP packets on the specified interface.

Run the **no** form of this command to forbid RIP from receiving RIP packets on the specified interface.

By default, the RIP packet receiving function is enabled on an interface.

Syntax

ip rip receive enable

no ip rip receive enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

To prohibit receiving RIP packets on a specified interface, you can run the **no** form of this command in interface configuration mode. This command takes effect only on the current interface. You can run the **default** form of this command to restore the default setting, that is, allowing the interface to receive RIP packets.

Examples

The following example prohibits receiving of RIP packets on the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no ip rip receive enable
```

1.19 ip rip receive version

Function

Run the **ip rip receive version** command to define the version of RIP packets to be received by RIP on the specified interface.

Run the **no** form of this command to restore the default configuration.

By default, the default behavior depends on the configuration of the **version** command.

Syntax

ip rip receive version [**1**] [**2**]

no ip rip receive version

Parameter Description

version 1: Indicates that only RIPv1 packets are received.

version 2: Indicates that only RIPv2 packets are received.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The configuration result of this command can overwrite the default configuration of the **version** command. This command affects the behavior of receiving RIP packets on the current interface, and the interface is allowed to receive RIPv1 and RIPv2 packets simultaneously. If this command does not contain any parameter, the behavior of receiving RIP packets depends on the configuration of the **version** command.

Examples

The following example allows receiving RIPv1 and RIPv2 packets on the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip receive version 1 2
```

1.21 ip rip send supernet-routes

Function

Run the **ip rip send supernet-routes** command to allow RIP to send supernetting routes on the specified interface.

Run the **no** form of this command to forbid RIP from sending supernetting routes on the specified interface.

By default, the supernetting route sending function is enabled on an interface.

Syntax

ip rip send supernet-routes

no ip rip send supernet-routes

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If a supernetting route is detected when a RIPv1-enabled router monitors RIPv2 route response packets, the router will learn an incorrect route because RIPv1 ignores the subnet mask in the routing information of the packet. In this case, the **no** form of the command must be used to prohibit advertisement of supernetting routes on the related interface. This command takes effect only on the current interface.

The command is effective only when RIPv2 packets are sent on the interface, and is used to control the sending of supernetting routes.

Examples

The following example prohibits RIP from sending RIP supernetting routes on the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no ip rip send supernet-routes
```

1.22 ip rip send version

Function

Run the **ip rip send version** command to define the version of RIP packets to be sent by RIP on the specified interface.

Run the **no** form of this command to restore the default configuration.

By default, the default behavior depends on the configuration of the **version** command.

Syntax

ip rip send version [**1**] [**2**]

no ip rip send version

Parameter Description

1: Indicates that only RIPv1 packets are sent.

2: Indicates that only RIPv2 packets are sent.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The configuration result of this command can overwrite the default configuration of the **version** command. This command affects the behavior of sending RIP packets on the current interface, and the interface can receive RIPv1 and RIPv2 packets simultaneously. If this command does not contain any parameter, the behavior of sending RIP packets depends on the configuration of the version command.

Examples

The following example configures the specific version of RIP packets to be sent by RIP on the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip send version 1 2
```

1.23 ip rip split-horizon

Function

Run the **ip rip split-horizon** command to enable the split horizon function of RIP.

Run the **no** form of this command to disable the split horizon function of RIP.

By default, the split horizon function without poison reverse is enabled.

Syntax

ip rip split-horizon [**poisoned-reverse**]

no ip rip split-horizon [**poisoned-reverse**]

Parameter Description

poisoned-reverse: Enables split horizon with poison reverse.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When multiple devices are connected to an IP broadcast-type network and run the distance vector routing protocols at the same time, you must adopt the split horizon mechanism to avoid the formation of route loop.

For a non-broadcast multi-access network such as frame relay and X.25 network, split horizon may prevent some devices from learning the complete routing information. In this case, you may need to disable split horizon. If an interface is configured with a secondary IP address, the problem of split horizon also needs to be noted.

If the **poisoned-reverse** parameter is configured, the split horizon with poison reverse will be enabled, and the device will still advertise the routing information from the interface that has learned the routing information, but set the metric of the routing information to a value unreachable.

The RIP routing protocol falls into distance vector routing protocols, so the problem of split horizon must be noted in the actual application. If you cannot determine whether split horizon has been enabled on an interface, you can run the **show ip rip** command to make judgment. In addition, the neighbors defined using the **neighbor** command will not be affected by RIP split horizon.

Examples

The following example disables RIP split horizon on the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# no ip rip split-horizon
```

1.24 ip rip subvlan

Function

Run the **ip rip subvlan** command to enable the RIP function on a super VLAN.

Run the **no** form of this command to restore the default configuration.

By default, RIP is disabled on a super VLAN.

Syntax

ip rip subvlan [**all** | *vid*]

no ip rip subvlan

Parameter Description

all: Allows sending packets to all sub VLANs.

vid: Sub VLAN ID. The value range is from 1 to 4094.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

In normal cases, a super VLAN contains multiple sub VLANs. Multicast packets of a super VLAN are replicated once and sent to all of its sub VLANs. In this case, when RIP multicast packets are sent over a super VLAN containing multiple sub VLANs, the RIP multicast packets are replicated multiple times, and the device processing capability is insufficient. As a result, a large number of packets are discarded, causing protocol flapping.

In most scenarios, the RIP function does not need to be enabled on a super VLAN. However, in some scenarios, the RIP function is required on the super VLAN. In this case, you can decide to send multicast packets to a certain sub VLAN or to all sub VLANs as actually needed. Usually, packets need to be sent to only one sub VLAN. In this case, run this command to specify a particular sub VLAN. You must be cautious in configuring packet transmission to all sub VLANs, as the large number of sub VLANs may cause a device processing bottleneck, which will lead to the neighbor flapping.

Examples

The following example enables the RIP function on Super VLAN 300 and allows sending RIP multicast packets to Sub VLAN 2014.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 300
Hostname(config-if-VLAN 300)# ip rip subvlan 1024
```

Notifications

N/A

Common Errors

The function is configured on a non-super VLAN.

The specified sub VLAN on the super VLAN cannot interwork with its neighbors.

1.25 ip rip summary-address

Function

Run the **ip rip summary-address** command to configure the RIP route summarization on an interface.

Run the **no** form of this command to disable RIP route summarization for the specified address or subnet.

By default, RIP route summarization is not configured on an interface.

Syntax

ip rip summary-address *ipv4-address mask*

no ip rip summary-address *ipv4-address mask*

Parameter Description

ipv4-address: IP address to be summarized.

Mask: Subnet mask of the IP address to be summarized.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to manually summarize an address or a subnet under a specified interface. The summary range configured by this command cannot cover supernetting routes, that is, the configured subnet mask length cannot be smaller than the natural mask length of the network.

Examples

The following example disables automatic route summarization of RIPv2. Summarization is configured on the GigabitEthernet 0/1 Interface, and GigabitEthernet 0/1 will advertise the route 172.16.0.0/16 after summarization.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# network 172.16.0.0
Hostname(config-router)# version 2
Hostname(config-router)# no auto-summary
Hostname(config-router)# exit
Hostname(config)# interface gigabitethernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip address 172.16.1.1 255.255.255.0
```

Hostname(config-if-GigabitEthernet 0/1)# ip rip summary-address 172.16.0.0 255.255.0.0Notifications

When the entered mask is wrong and you need to use the correct mask, the following notification will be displayed:

```
RIP: Invalid mask input
```

When the address to be summarized is wrong, for example, 0 address, the following notification will be displayed:

```
% Invalid summary-address value.
```

When the mask to be summarized is not longer than the mask of the main network, the following notification will be displayed:

```
% Summary mask must be greater or equal to major net.
```

1.26 ip rip triggered

Function

Run the **ip rip triggered** command to enable the RIP triggered updates function of demand circuits, and configure the retransmission time and retransmission times of the RIP triggered updates.

Run the **no** form of this command to disable the RIP triggered updates function of demand circuits, and cancel the configured retransmission time and retransmission times of the RIP triggered updates.

The RIP triggered updates function is disabled by default.

Syntax

ip rip triggered [**retransmit-timer** *timer* | **retransmit-count** *count*]

no ip rip triggered [**retransmit-timer** *timer* | **retransmit-count** *count*]

Parameter Description

retransmit-timer *timer*: Configures the interval at which the Update Request or Update Response packet is retransmitted, in seconds. The value range is 1 to 3600, and the default value is **5**.

retransmit-count *count*: Configures the maximum retransmission times of the Update Request or Update Response packet. The default value is **36** times. The value range is from 1 to 3600, and the default value is **36**.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The RIP triggered updates function is the extension of RIP on the wide area network (WAN), and mainly used for demand circuits.

After the RIP triggered updates function is enabled, RIP does not periodically send the route update packets. RIP sends the route update packets to the WAN interface only in one of the following cases:

- A route request packet is received.
- The RIP routing information changes.
- The interface state changes.
- The router is started.

Since the RIP periodical update function is disabled, the acknowledgment and retransmission mechanisms must be used to ensure that the update packets are successfully sent or received on the WAN. You can use the **retransmit-timer** and **retransmit-count** parameters to specify the retransmission interval and maximum retransmission times of the request and update packets.

The triggered updates function can be enabled in either of the following cases:

- The interface has only one neighbor.
- The interface has multiple neighbors but the device interacts with these neighbors in unicast mode.

You are advised to enable this function on the PPP, frame relay, or X.25 link layer protocol.

Precautions for using the triggered updates function:

- It is recommended that split horizon with poison reverse be enabled on the interface configured with the triggered updates function; otherwise, invalid routing information may exist.
- Ensure that this function is enabled on all the routers on the same link; otherwise, this function fails and the routing information cannot be exchanged properly.

- This function cannot be enabled together with the function of correlating RIP with BFD.
- To enable the triggered updates function, make sure that the RIP configurations at both ends of the link are consistent, such as RIP authentication and the RIP protocol version supported by the interface.
- If the triggered updates function is enabled on an interface, source address verification is performed on the packets of this interface no matter whether the source address verification function is enabled using the **validate-update-source** command.

Examples

The following example enables the RIP triggered updates function of demand circuits, and configures the retransmission time as 10s and retransmission times as 18

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip triggered
Hostname(config-if-GigabitEthernet 0/1)# ip rip triggered retransmit-timer 10
Hostname(config-if-GigabitEthernet 0/1)# ip rip triggered retransmit-count 18
```

Notifications

When enabling the RIP triggered updates function may affect route learning, the following notification will be displayed:

```
% Warning: The configurations for Triggered RIP peer shall be same, or it would affect
the route learning.
```

1.27 ip rip v2-broadcast

Function

Run the **ip rip v2-broadcast** command to allow RIPv2 packets to be broadcast on the specified interface.

Run the **no** form of this command to restore the default configuration.

By default, RIPv2 packets are multicast on an interface.

Syntax

ip rip v2-broadcast

no ip rip v2-broadcast

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

When the link or neighbor does not support multicasting, you can configure to broadcast RIPv2 packets.

Examples

The following example allows broadcasting RIPv2 packets on the interface, instead of multicasting.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip rip v2-broadcast
```

1.28 neighbor

Function

Run the **neighbor** command to configure the IP address of a RIP neighbor.

Run the **no** form of this command to delete a neighbor.

No RIP neighbor is configured by default.

Syntax

neighbor *ipv4-address*

no neighbor *ipv4-address*

Parameter Description

ipv4-address: IP address of the neighbor. It should be the address of the network directly connected to the local device.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

By default, RIPv1 uses the IP broadcast address (255.255.255.255) to advertise the routing information, whereas RIPv2 uses the multicast address (224.0.0.9) to advertise the routing information. If you do not want all devices on the broadcast network or non-broadcast multiple access (NBMA) network to receive routing information, configure the related interface as the passive interface using the **passive-interface** command, and specify the neighbors that can receive the routing information. This command does not affect the receiving of RIP packets. After an interface is configured as a passive interface, the interface does not send a request packet even after the device is restarted.

Examples

The following example configures the IP address of a RIP neighbor as 192.168.1.2, and the interface of RIP as passive interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# passive-interface default
Hostname(config-router)# neighbor 192.168.1.2
```

Notifications

When the same configuration already exists, the following notification will be displayed:

```
% Static neighbor configuration exists
```

Common Errors

Related Commands

- **passive-interface**

1.29 network

Function

Run the **network** command to configure the list of networks to be advertised by the RIP routing process.

Run the **no** form of this command to delete the configured network.

No local network is advertised by default.

Syntax

network *network-number* [*wildcard*]

no network *network-number* [*wildcard*]

Parameter Description

network-number: No. of the direct network. This is a natural network No., and all the interfaces with an IP address belonging to the natural network can send and receive RIP packets.

wildcard: IP address comparison bit. Value 0 indicates accurate matching, and 1 indicates that no comparison is performed.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

You can configure the *network-number* and *wildcard* parameters at the same time to enable the interface addresses in the address range to participate in RIP running.

If *wildcard* is not configured, the classful address range is used by default, that is, the device will allow the interfaces whose addresses fall into the classful address range to participate in RIP running.

Only when the interface address is in the network list defined by RIP, can the interface send and receive RIP route update packets.

Examples

The following example configures the networks to be notified by the RIP routing process as 192.168.12.0/24 and 172.16.0.0/24.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# network 192.168.12.0
Hostname(config-router)# network 172.16.0.0 0.0.0.255
```

1.30 offset-list

Function

Run the **offset-list** command to increase the metric of a received or sent RIP route.

Run the **no** form of this command to delete the specified offset list.

No offset list is configured by default.

Syntax

offset-list { *acl-number* | *acl-name* } { **in** | **out** } *offset* [*interface-type interface-number*]

no offset-list { *acl-number* | *acl-name* } { **in** | **out** } *offset* [*interface-type interface-number*]

Parameter Description

acl-number: ACL No. The following value ranges are supported.

The value range of IP standard ACL is 1 to 99 or 1300 to 1999; the value range of IP extended ACL is 100 to 199 or 2000 to 2699.

acl-name: ACL name. The value is a case-sensitive string of 1 to 99 characters.

in: Uses the ACL to modify the metric of a received route.

out: Uses the ACL to modify the metric of a sent route.

offset: Offset of the modified metric. The value range is from 0 to 16.

interface-type: Specified interface where the ACL is used.

Interface-number:-number: Interface number.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

You can use this function to increase the metric of a received or sent RIP route. If a RIP route satisfies both the offset-list of the specified interface and the global offset-list without a specified interface, this RIP route will be increased by the metric of the offset-list of the specified interface.

Examples

The following example increases the metric of the sent RIP route matched with ACL 7 by 7.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# offset-list 7 out 7
```

The following example increases the metric of the RIP route that is matched with ACL 7 and received on GigabitEthernet0/1 by 7.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# offset-list 8 in 7 GigabitEthernet 0/1
```

Notifications

When an interface does not exist or is invalid, the following notification will be displayed:

```
% Interface is invalid.
```

1.31 output-delay

Function

Run the **output-delay** command to set the sending delay between RIP update packets.

Run the **no** form of this command to cancel the sending delay between RIP update packets.

The sending delay between RIP update packets is 0 by default.

Syntax

output-delay *delay*

no output-delay

Parameter Description

delay: Sending delay between packets, in milliseconds. The value range is from 8 to 50.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

Normally, a RIP route update packet is 512 bytes long and can contain 25 routes. If the number of routes to be updated exceeds 25, more than one update packet will be sent as fast as possible.

When a high-speed device sends a lot of update packets to a low-speed device, the low-speed device may not be able to process all update packets in time, causing loss of routing information. In this case, you need to run the **output-delay** command to increase the sending delay between packets on a high-speed device so that a low-speed device can receive and process all update packets.

Examples

The following example changes the sending delay between RIP update packets to 30 ms.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# output-delay 30
```

1.32 passive-interface

Function

Run the **passive-interface** command to prohibit an interface from sending RIP update packets.

Run the **no** form of this command to enable an interface to send RIP update packets.

By default, a RIP-enabled interface is allowed to send and receive RIP update packets normally.

Syntax

passive-interface { **default** | *interface-type interface-num* }

no passive-interface { **default** | *interface-type interface-num* }

Parameter Description

default: Indicates that all interfaces will be configured as passive interfaces.

interface-type interface-num: Interface type and interface number.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

A passive interface suppresses RIP update packets. A passive interface defines the boundary of RIP routing domain to avoid unwanted flooding of RIP packets. If the interface connection device does not run the RIP routing protocol (such as a PC, and Layer-3 device running other routing protocols), you are advised to configure this interface as a passive interface. You can run the **passive-interface default** command to configure all interfaces as passive interfaces, and run the **no passive-interface** *interface-type interface-num* command to configure the specified interface as a non-passive interface.

The passive interface no longer sends RIP route update packets, but can still receive RIP route update packets. In this case, you can run the **neighbor** command on the interface to send route update packets to the specified neighbor.

To fully control whether an interface can send and receive route update packets, you can run the **ip rip send enable** and **ip rip receive enable** commands.

Examples

The following example configures all interfaces as the passive mode, and then sets GigabitEthernet 0/1 to non-passive mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# passive-interface default
Hostname(config-router)# no passive-interface GigabitEthernet 0/1
```

Notifications

When an interface does not exist or is invalid, the following notification will be displayed:

```
% Interface is invalid.
```

Common Errors

1.33 redistribute

Function

Run the **redistribute** command to redistribute the external routing information.

Run the **no** form of this command to cancel redistribution of external routes.

The external routing information is not redistributed to RIP by default.

If OSPF redistribution is configured, the routes of all sub-types of the instance will be redistributed.

If IS-IS redistribution is configured, the routes of Level-2 sub-type of the instance will be redistributed.

In other cases, all routes of this type are redistributed.

Syntax

redistribute { **bgp** | **connected** | **isis** [*area-tag*] [**level-1** | **level-1-2** | **level-2**] | **ospf** *process-id* [**match** { **external** [**1** | **2**] | **internal** | **nssa-external** [**1** | **2**] } *] | **static** } [**metric** *metric-value* | **route-map** *route-map-name*] *

no redistribute { **bgp** | **connected** | **isis** [*area-tag*] [**level-1** | **level-1-2** | **level-2**] | **ospf** *process-id* [**match** { **external** [**1** | **2**] | **internal** | **nssa-external** [**1** | **2**] } *] | **static** } [**metric** | **route-map**] *

Parameter Description

bgp: Redistributes from BGP.

connected: Redistributes from direct routes.

isis *area-tag*: Redistributes from IS-IS. *area-tag* indicates the IS-IS process ID.

l**evel-1** | **level-2** | **level-1-2**: Redistributes IS-IS routes at the specified level.

static: Redistributes from static routes.**match**: Redistributes specific OSPF routes that match the filtering conditions.

external [**1** | **2**]: Redistributes E1, E2, or all external routes.

internal: Redistributes internal routes and inter-area routes.

nssa-external [**1** | **2**]: Redistributes N1, N2, or all external routes of all NSSAs.

metric *metric-value*: Sets the metric of the redistributed route. The value range is from 1 to 16, and the default value is **1**.

route-map *route-map-name*: Associates route map, which is used to set the redistribution filtering rules.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command is used to redistribute external routing information to RIP.

During route redistribution, different routing protocols use different metric measurement methods. For example, RIP measures the metric based on the hop count, and OSPF measures the metric based on the bandwidth. Therefore, the computed metrics cannot be compared with each other. During route redistribution, however, it is necessary to configure a symbolic metric; otherwise, route redistribution fails.

If you configure redistribution of IS-IS routes without specifying the level parameter, only level-2 routes can be redistributed by default. If you specify the **level** parameter during initial configuration of redistribution, routes of the specified level can be redistributed. If both **level 1** and **level 2** are configured, the two levels are combined and saved as **level-1-2**.

If you configure redistribution of OSPF routes without specifying the **match** parameter, OSPF routes of all sub-types can be redistributed by default. The latest setting of the **match** parameter is used as the initial **match** parameter. Only routes that match the sub-types can be redistributed. You can run the **no** form of the command to restore the default value of **match**.

The configuration rules for the **no** form of the **redistribute** command are as follows:

- If some parameters are specified in the **no** form of this command, default values of these parameters will be restored.
- If no parameter is specified in the **no** form of this command, the entire command will be deleted.

For example, if **redistribute isis 112 level-2** is configured, you can run the **no redistribute isis 112 level-2** command to restore the default value of level-2. As **level-2** itself is the default value of the parameter, the

configuration saved is still **redistribute isis 112 level-2** after the preceding **no** form of the command is executed.

To delete the entire command, run the **no redistribute isis 112** command.

Note

The route redistribution command cannot introduce default routes of other protocols to the RIP routing domain. To introduce default routes to the RIP routing domain, run the **default-information originate** command.

Examples

The following example configures static route redistribution to the RIP routing domain.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# redistribute static
```

Related Commands

- **show ip rip database**

1.34 router rip

Function

Run the **router rip** command to create a RIP routing process and enter routing process configuration mode.

Run the **no** form of this command to delete a RIP routing process.

The RIP routing process is disabled by default.

Syntax

router rip

no router rip

Parameter Description

N/A

Command Modes

Global configuration mode

Default Level

14

Usage Guidelines

To create a RIP routing process, you need to define a network No. If a dynamic routing protocol runs on an asynchronous line, **async default routing** needs to be configured on the asynchronous interface.

Examples

The following example creates a RIP routing process and enters routing process configuration mode.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)#
```

Related Commands

- **show ip rip**

1.35 show ip rip

Function

Run the **show ip rip** command to display the basic information of a RIP routing protocol process.

Syntax

show ip rip [**vrf** *vrf-name*]

Parameter Description

vrf *vrf-name*: Specifies the RIP information of the specified VRF.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command can be used to quickly display the three timers, route distribution, route redistribution status, RIP version of interface, RIP interface, network scope, metric, management distance, and other information of a RIP routing protocol process. If VRF is specified, the VRF name and VRF-ID will also be displayed.

Examples

The following example displays the basic information of a RIP routing protocol process.

```
Hostname> enable
Hostname# show ip rip
Routing Protocol is "rip"
Sending updates every 10 seconds
Invalid after 20 seconds, flushed after 10 seconds
Outgoing update filter list for all interface is: not set
Incoming update filter list for all interface is: not set
Default redistribution metric is 2
Redistributing: connected
Default version control: send version 2, receive version 2
Interface            Send  Recv
GigabitEthernet 0/1      2    2
GigabitEthernet 0/2      2    2
Routing for Networks:
192.168.26.0 255.255.255.0
192.168.64.0 255.255.255.0
Distance: (default is 50)
Graceful-restart enabled
 Restart grace period 60 secs
 Current Restart remaining time 16 secs
```

The following example displays the basic information of the corresponding RIP instance of VRF 1.

```
Hostname> enable
Hostname# show ip rip vrf 1
VRF 1  VRF-id:1
Routing Protocol is "rip"
Sending updates every 30 seconds
Invalid after 180 seconds, flushed after 120 seconds
Outgoing update filter list for all interface is: not set
Incoming update filter list for all interface is: not set
Default redistribution metric is 1
Redistributing:
Default version control: send version 1, receive any version
Routing for Networks:
Distance: (default is 120)
Graceful-restart disabled
```

Table 1-1 Output Fields of the show ip rip Command

Field	Description
Sending updates	Indicates the packet update time.
Invalid	Indicates the failure time.
flushed	Indicates the refreshing time.
Outgoing update filter list for all interface	Filters all the output routes.
Incoming update filter list for all interface	Filters all the received routes.
Default redistribution metric	Indicates the default redistribution metric configured.
Redistributing	Indicates the redistributing protocol.
Default version control	Indicates the default RIP protocol version running for the instance.
Routing for Networks:	Indicates the routing network segment externally advertised by RIP.
Distance	Indicates the management distance of an instance.
Graceful-restart	Indicates whether the GR function is enabled.
Restart grace period	Indicates the GR time.
Current Restart remaining time	Indicates the remaining GR time.

1.36 show ip rip database

Function

Run the **show ip rip database** command to display the route summary in a RIP route database.

Syntax

show ip rip database [**vrf** *vrf-name*] [*network-number network-mask*] [**count**]

Parameter Description

vrf *vrf-name*: Specifies the VRF whose RIP routing information is displayed.

network-number: Subnet No. of routing information.

network-mask: Subnet mask. If a network number has been set, you must specific a subnet mask.

count: Displays the routing statistics summary in a RIP database.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

Only when the related subroutes are summarized, will the summarized address item information be displayed in the RIP route database. When the information of the last subroute of the summarized address item information becomes invalid, the summarized address item information will also be deleted from the database.

Examples

The following example displays the route summary in a RIP route database.

```
Hostname> enable
Hostname# show ip rip database
192.168.1.0/24     auto-summary
192.168.1.0/30     directly connected, Loopback 3
192.168.1.8/30     directly connected, GigabitEthernet 0/1
192.168.121.0/24   auto-summary
192.168.121.0/24   redistributed
[1] via 192.168.2.22, GigabitEthernet 0/2
192.168.122.0/24   auto-summary
192.168.122.0/24
[1] via 192.168.4.22, GigabitEthernet 0/1  00:28   permanent
```

The following example displays the summarized address item information of 192.168.121.0/24 in a RIP route database.

```
Hostname> enable
Hostname# show ip rip database 192.168.121.0 255.255.255.0
192.168.121.0/24   redistributed
[1] via 192.168.2.22, GigabitEthernet 0/1
```

The following example displays the statistics summary of each route type in a RIP route database.

```
Hostname> enable
Hostname# show ip rip database count
             All    Valid   Invalid
database       5      5      0
auto-summary    5      5      0
connected      1      1      0
rip           4      4      0
```

Table 1-2 Output Fields of the show ip rip database Command

Field	Description
auto-summary	Indicates the summarized route.
directly connected	Indicates the direct route.
redistributed	Indicates the redistributed route.
database	Indicates the route database of RIP.
All	Indicates the count of all routes.
Valid	Indicates the count of valid routes.
Invalid	Indicates the count of invalid routes.

1.37 show ip rip external

Function

Run the **show ip rip external** command to display the information about external routes redistributed by RIP.

Syntax

show ip rip external [**bgp** | **connected** | **isis** [*process-id*] | **ospf** *process-id* | **static**] [**vrf** *vrf-name*]

Parameter Description

bgp: Displays the redistributed BGP route.

connected: Displays the redistributed direct route.

isis *process-id*: Displays the redistributed IS-IS route. Here, *process-id* indicates the IS-IS process ID.

ospf *process-id*: Displays the redistributed OSPF route. Here, *process-id* indicates the OSPF process ID. The value range is from 1 to 65535.

static: Displays the redistributed static route.

vrf *vrf-name*: Specifies a VRF.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

N/A

Examples

The following example displays the information about external routes redistributed by RIP.

```
Hostname> enable
Hostname# show ip rip external
Protocol connected route:
[connected] 192.100.3.0/24 metric=0
    nhop=0.0.0.0, if=2
 [connected] 192.101.1.0/24 metric=0
    nhop=0.0.0.0, if=3
Protocol static route:
 [static] 10.1.1.1/32 metric=0
    nhop=0.0.0.0, if=4096
 [static] 10.1.2.1/32 metric=0
    nhop=0.0.0.0, if=4096
Protocol ospf 1 route:
 [ospf] 1.1.1.1/32 metric=2
    nhop=192.100.3.2, if=2
 [ospf] 90.1.1.1/32 metric=2
    nhop=192.100.3.2, if=2
```

Table 1-3 Output Fields of the show ip rip external Command

Field	Description
Protocol connected route	Indicates the type of the redistributed route.
connected	Indicates the redistributed route.
metric	Indicates the metric of the redistributed route.
nhop	Indicates the next hop of the redistributed route.
if	Indicates the outbound interface of the redistributed route.

1.38 show ip rip interface

Function

Run the **show ip rip interface** command to display the information about a RIP interface.

Syntax

show ip rip interface [**vrf** *vrf-name*] [*interface-type interface-number*]

Parameter Description

vrf *vrf-name*: Specifies the VRF whose RIP interface is to be displayed.

interface-type interface-number: Interface type and interface number.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the information about a RIP interface. If there is no RIP interface, no information will be displayed.

Examples

The following example displays the information about a RIP interface.

```
Hostname> enable
Hostname# show ip rip interface
GigabitEthernet 0/1 is up, line protocol is up
Routing Protocol: RIP
Receive RIPv2 packets only
Send RIPv2 packets only
Recv RIP packet total: 0
Send RIP packet total: 3
Passive interface: Disabled
Split Horizon with Poisoned Reverse: Enabled
Triggered RIP Enabled:
Retransmit-timer: 5, Retransmit-count: 36
V2 Broadcast: Disabled
Multicast registe: Registed
Interface Summary Rip:
Not Configured
Authentication mode: Text
Authentication key-chain: ripk1
```

```
Authentication text-password: pswdtext
Default-information: only, metric 5
IP interface address:
192.168.64.100/24, next update due in 14 seconds
2.2.1.1/24, next update due in 24 seconds
   neighbor 2.2.1.6, next update due in 3 seconds
   neighbor 2.2.1.77, next update due in 13 seconds
2.2.2.57/24, next update due in 16 seconds
```

The following example displays the information about a RIP interface. If RIP correlation with BFD is enabled, BFD information will be also displayed.

```
Hostname> enable
Hostname#show ip rip interface
GigabitEthernet 0/1 is up, line protocol is up
  Routing Protocol: RIP
    Receive RIPv1 and RIPv2 packets
    Send RIPv1 packets only
    Receive RIP packet: Enabled
    Send RIP packet: Enabled
    Send RIP supernet routes: Enabled
    Recv RIP packet total: 0
    Send RIP packet total: 3
    Passive interface: Disabled
Split Horizon: Enabled
Triggered RIP Disabled
BFD: Enabled
    V2 Broadcast: Disabled
    Multicast registe: Registed
    Interface Summary Rip:
      Not Configured
    IP interface address:
      2.2.2.111/24, next update due in 14 seconds
```

Table 1-4 Output Fields of the show ip rip interface Command

Field	Description
Receive RIPv1 and RIPv2 packets	Indicates the type of packets that can be received by an interface.
Send RIPv1 packets only	Indicates the type of packets that can be sent by an interface.
Receive RIP packet	Indicates whether an interface is allowed to receive packets.
Send RIP packet	Indicates whether an interface is allowed to send packets.
Passive interface	Indicates whether a passive interface is enabled.
Send RIP supernet routes	Indicates whether an interface is allowed to send supernetting routes.
Recv RIP packet total	Indicates the total of packets received by an interface.

Field	Description
Send RIP packet total	Indicates the total of packets sent by an interface.
Split Horizon with Poisoned Reverse	Indicates whether split horizon with poison reverse is enabled.
Triggered RIP	Indicates whether the Triggered function is enabled.
Retransmit-timer	Indicates the time of retransmission.
Retransmit-count	Indicates the retransmission count.
V2 Broadcast	Indicates the V2 broadcast packet.
Multicast register	Indicates whether multicast is registered.
Interface Summary Rip	Indicates whether summarization is enabled on an interface.
Authentication mode	Indicates the authorization mode.
Authentication key-chain	Indicates the key-chain used for authentication.
Authentication text-password	Indicates the authentication character string.
Default-information	Indicates the default metric, default route, and other information.
IP interface address	Indicates the IP address of an interface.
BFD	Indicates whether the BFD function is enabled.

1.39 show ip rip peer

Function

Run the **show ip rip peer** command to display the information about a RIP neighbor.

Syntax

show ip rip peer [*ipv4-address*] [**vrf** *vrf-name*]

Parameter Description

ipv4-address: Address of the specified RIP neighbor.

vrf *vrf-name*: Specifies the VRF whose RIP interface is to be displayed.

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

RIP records the summary information for the information source (the source address of the RIP route update packet) of the learned RIP route to realize convenient monitoring by users. These routing information sources are called RIP neighbor information.

This command is used to display the information about a RIP neighbor. If there is no RIP neighbor, no information will be displayed.

Examples

The following example displays the information about a RIP neighbor.

```
Hostname> enable
Hostname# show ip rip peer
Peer 192.168.3.2:
  Local address: 192.168.3.1
  Input interface: GigabitEthernet 0/2
  Peer version: RIPv1
  Received bad packets: 3
  Received bad routes: 0
  BFD session state up
```

Table 1-5 Output Fields of the show ip rip peer Command

Field	Description
Peer	Indicates the IP address of a neighbor.
Local address	Indicates the local address.
Input interface	Indicates the connected interface.
Peer version	Indicates the RIP version No. of a neighbor.
Received bad packets	Indicates the packets with errors received from a neighbor.
Received bad routes	Indicates the received routes with errors.
BFD session state	Indicates the BFD session state.

1.40 timers basic

Function

Run the **timers basic** command to adjust the clock of RIP.

Run the **no** form of this command to restore the default configuration.

By default, the update timer is 30s, the invalid timer is 180s, the flush timer is 120s, and the holddown timer is 0s.

Syntax

timers basic *update invalid flush* [**holddown** *holddown*]

no timers basic

Parameter Description

update: Interval at which the device sends the route update packet, in seconds. Each time an update packet is received, the invalid timer and flush timer are reset. The value range is from 0 to 2147483647.

invalid: Time after which a route in the routing table becomes invalid because the route is not updated, in seconds. The duration of the invalid timer must be at least three times the duration of the update timer. If no update packet is received before the invalid timer expires, the corresponding route enters the invalid state. If a route update packet is received before the invalid timer expires, the timer is reset. The value range is from 0 to 2147483647.

flush: Route flushing time, in seconds, counted from the time when the RIP route enters the invalid state. When the flush timer expires, the route in the invalid state will be deleted from the routing table. The value range is from 0 to 2147483647.

holddown *holddown*: Specifies the route holddown time, in seconds, counted from the time when the RIP route enters the invalid state. Within the holddown time, the RIP route can only be updated using the routes that come from the same neighbor and have a metric less than 16. The value range is from 0 to 2147483647.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

Adjusting the above timers may reduce the convergence time and failback time of the routing protocol. For routers connected to the same network, values of the three RIP timers must be the same. Generally, you are not advised to modify the RIP timers unless otherwise required.

You can run the **show ip rip** command to display the current parameter settings of RIP timers.

Note

Setting timers to small values on a low-speed link brings risks because a lot of Update packets consume the bandwidth. You can set timers to small values generally on the Ethernet or a 2 Mbps (or above) link to reduce the convergence time of network routes.

Examples

The following example configures to send RIP update packets every 10s. If no update packet is received within 30s, the corresponding route will become invalid and enter the invalid state. After entering the invalid state for more than 90s, the route will be deleted from the routing table.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# timers basic 10 30 90
```

Notifications

N/A

Common Errors

The RIP process update time and other settings are inconsistent on different devices.

1.41 validate-update-source

Function

Run the **validate-update-source** command to validate the source address of a received RIP route update packet.

Run the **no** form of this command to disable source address validation for update packets.

The source address validation function for update packets is enabled by default.

Syntax

validate-update-source

no validate-update-source

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

You can run the command to validate the source address of a RIP route update packet. The purpose is to ensure that the RIP routing process receives only the route update packets coming from the same IP subnet neighbor. Two special cases are as follows:

- After split horizon is disabled on an interface, the RIP routing process will perform source address validation on the update packet no matter whether the **validate-update-source** command is executed in routing process configuration mode.
- For an interface not configured with an IP address, the RIP routing process does not perform source address validation for the update packet no matter whether the **validate-update-source** command is executed in routing process configuration mode.

Examples

The following example disables source address validation of update packets.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# no validate-update-source
```

1.42 version

Function

Run the **version** command to configure the RIP version No. of the entire device.

Run the **no** form of this command to restore the default configuration.

By default, route update packets of RIPv1 and RIPv2 can be received, but only route update packets of RIPv1 are sent.

Syntax

version { **1** | **2** }

no version

Parameter Description

1: Defines the RIP version No. as 1.

2: Defines the RIP version No. as 2.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

You can run the **ip rip receive version** and **ip rip send version** commands to redefine the specific version of RIP packets to be processed by each interface.

Examples

The following example sets the RIP version No. of the entire device to **2**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# version 2
```

Notifications

N/A

Common Errors

The local RIP instance is set to version 1, while the peer sends packets of version 2, leading to a parsing failure.

Platform Description

1 RIPng Commands

Command	Function
clear ipv6 rip	Delete Routing Information Protocol next generation (RIPng) routes.
default-metric	Define the default metric of RIPng when routes are redistributed using other routing protocols.
distance	Configure the management distance of RIPng routes.
distribute-list	Configure and use a prefix list to filter the inbound/outbound update routes.
graceful-restart	Configure the RIPng graceful restart (GR) function of a device.
ipv6 rip default-information	Configure and generate a default IPv6 path to RIPng.
ipv6 rip enable	Enable RIPng on an interface.
ipv6 rip metric-offset	Configure the metric on an interface.
ipv6 rip subvlan	Enable the RIPng function on a super VLAN.
ipv6 router rip	Create a RIPng routing process and enter routing process configuration mode.
passive-interface	Prohibit an interface from sending RIPng update packets.
redistribute	Configure to redistribute the paths of other routing domains to RIPng.
show ipv6 rip	Display the parameters and all the statistics of a RIPng routing protocol process.
show ipv6 rip database	Display the entry information of a RIPng routing table.
split-horizon	Enable the split horizon function of RIPng.
timers	Configure and adjust the timers of RIPng.

1.1 clear ipv6 rip

Function

Run the **clear ipv6 rip** command to delete Routing Information Protocol next generation (RIPng) routes.

Syntax

clear ipv6 rip

Parameter Description

N/A

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

Running this command deletes all the routes sent by RIPng, which may cause service interruption.

Examples

The following command deletes RIPng routes.

```
Hostname> enable
Hostname# clear ipv6 rip
```

Notifications

N/A

Platform Description

N/A

1.2 default-metric

Function

Run the **default-metric** command to define the default metric of RIPng when routes are redistributed using other routing protocols.

Run the **no** form of this command to restore the default configuration.

By default, the metric for route redistribution is 1.

Syntax

default-metric *metric*

no default-metric

Parameter Description

metric-value: Default metric value. The value range is from 1 to 16. If the value of *metric-value* is equal to or greater than 16, the device determines that this route is unreachable.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command must be used together with the **redistribute** command. When a route is redistributed from another routing protocol process to the RIP route process, the route metric cannot be converted because the metric calculating mechanism is different for each routing protocol. Therefore, in the process of transformation, you need to define the metric of redistributed route in the RIP routing domain. If the metric is not specified during redistribution of a routing protocol process, RIP uses the metric defined by the **default-metric** command. If the metric is specified, the metric defined by the **default-metric** command is overwritten by the specified metric. If this command is not configured, the metric value is **1** by default.

Examples

The following example sets the default metric value of RIPng to **3** when OSPF 100 is redistributed.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 router rip
Hostname(config-router)# default-metric 3
Hostname(config-router)# redistribute ospf 100
```

1.3 distance

Function

Run the **distance** command to configure the management distance of RIPng routes.

Run the **no** form of this command to restore the default configuration.

The management distance is **120** by default.

Syntax

distance *distance*

no distance

Parameter Description

distance: Management distance of RIPng routes. The value range is from 1 to 255.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This function is used to set the management distance of RIP routes and change the priority of a device in routing.

Examples

The following example sets the management distance of RIPng routes to **160**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 router rip
Hostname(config)# ipv6 router rip
Hostname(config-router)# distance 160
```

1.4 distribute-list

Function

Run the **distribute-list** command to configure and use a prefix list to filter the inbound/outbound update routes.

Run the **no** form of this command to cancel the corresponding filtering process.

By default, the distribution list is disabled.

Syntax

distribute-list prefix-list *prefix-list-name* { **in** | **out** } [*interface-type interface-number*]

no distribute-list prefix-list *prefix-list-name* { **in** | **out** } [*interface-type interface-number*]

Parameter Description

prefix-list *prefix-list-name*: Specifies the name of the prefix list, which is used to filter routes.

in | **out**: Specifies update routes (received or sent routes) that are filtered.

interface-type interface-number: Interface for which the distribution list will be used.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

To refuse receiving or sending some specified routes, you can configure a route distribution control list to filter all the route update packets. If no interface is specified, route update packets on all interfaces will be filtered.

Examples

The following example configures and uses the prefix list allowpre to filter the update routes received by the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 router rip
Hostname(config)# ipv6 router rip
Hostname(config-router)# distribute-list prefix-list allowpre in GigabitEthernet 0/1
```

1.5 graceful-restart

Function

Run the **graceful-restart** command to configure the RIPng graceful restart (GR) function of a device.

Run the **no** form of this command to restore the default configuration.

The GR function is enabled by default.

Syntax

graceful-restart [**grace-period** *grace-period*]

no graceful-restart [**grace-period**]

Parameter Description

graceful-restart: Enables the GR function.

grace-period *grace-period*: Specifies the GR period, in seconds. The value range is 1 to 1800. The default value is twice the update time or 60s, whichever is the smaller.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

The GR function is configured based on RIPng instances. You can configure different parameters for different RIPng instances based on the actual conditions.

The GR period is the maximum time from restart of the RIPng process to completion of GR. During this period, the forwarding table before the restart is retained, and the RIPng route is restored so as to restore the RIPng state before the restart. After the restart period expires, RIPng exits the GR state and performs common RIPng operations.

The **graceful-restart grace-period** command allows you to explicitly modify the GR period. Note that GR must be completed before the invalid timer of the RIPng route expires. An inappropriate GR period cannot ensure uninterrupted data forwarding during the GR process. A typical case is as follows: If the GR period is longer than the duration of the invalid timer, GR is not completed when the invalid timer expires. The route is not re-advertised to the neighbor, and forwarding of the route of the neighbor stops after the invalid timer expires, causing interruption of data forwarding on the network. Unless otherwise required, you are not advised to adjust the GR period. If it is necessary to adjust the GR period, ensure that the GR period is longer than the duration of the update timer but shorter than the duration of the invalid timer based on the configuration of the **timers** command.

During the RIPng GR process, ensure that the network environment is stable.

Examples

The following example configures the RIPng GR function of a device, and sets the GR period to 90s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 router rip
Hostname(config-router)# graceful-restart grace-period 90
```

1.6 ipv6 rip default-information

Function

Run the **ipv6 rip default-information** command to configure and generate a default IPv6 path to RIPng.

Run the **no** form of this command to delete the default IPv6 path.

By default, default route advertisement is disabled on an interface.

Syntax

ipv6 rip default-information { **only** | **originate** } [**metric** *metric-value*]

no ipv6 rip default-information

Parameter Description

only: Advertises only the IPv6 default route.

originate: Advertises the IPv6 default route and other routes.

metric *metric-value*: Specifies the metric of the default route. The value range is from 1 to 15, and the default value is **1**.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to introduce the default route to an autonomous system (AS) edge device so that other devices in the RIPng domain access other AS domains through this AS edge device by default. In the routing table, a route to the destination network ::/0 is called default route. The default route can be learned from a neighbor device, or sent to a neighbor device. Please configure and distribute the default route according to the actual situation of networking, or specify the cost of the distributed default route.

After this command is configured on the interface, an IPv6 default route is advertised to the external devices through this interface, but the route itself is not added to the route forwarding table or the device and the RIPng route database.

To prevent occurrence of a route loop, once this command is configured on an interface, RIPng refuses to receive the default route updates advertised by neighbors.

Examples

The following example configures to generate a default IPv6 route to RIPng on the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 rip default-information only
```

1.7 ipv6 rip enable

Function

Run the **ipv6 rip enable** command to enable RIPng on an interface.

Run the **no** form of this command to disable RIPng on a specified interface.

By default, an interface is not added to the RIPng process.

Syntax

ipv6 rip enable

no ipv6 rip enable

Parameter Description

N/A

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

This command is used to set an interface participating in the running of RIPng. If RIPng is not running before the command is configured, configuring the command automatically runs the RIPng routing protocol.

Examples

The following example enables RIPng on the GigabitEthernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 rip enable
```

1.8 ipv6 rip metric-offset

Function

Run the **ipv6 rip metric-offset** command to configure the metric on an interface.

Run the **no** form of this command to cancel the corresponding configuration.

By default, the metric on an interface is **1**.

Syntax

ipv6 rip metric-offset *metric*

no ipv6 rip metric-offset

Parameter Description

metric: Metric on an interface. The value range is from 1 to 16.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

Before a route is added to the routing table, the metric of the route must be added with the metric offset set on the interface. You can control the use of a route by setting the interface metric offset.

Examples

The following example sets the metric on the GigabitEthernet 0/1 interface to **5**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ipv6 rip metric-offset 5
```

1.9 ipv6 rip subvlan

Function

Run the **ipv6 rip subvlan** command to enable the RIPng function on a super VLAN.

Run the **no** form of this command to restore the default configuration.

By default, the RIPng function is disabled on a super VLAN.

Syntax

ipv6 rip subvlan [**all** | *vid*]

no ipv6 rip subvlan

Parameter Description

all: Allows sending packets to all sub VLANs.

vid: Sub VLAN ID. The value range is from 1 to 4094.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

In normal cases, a super VLAN contains multiple sub VLANs. Multicast packets of a super VLAN are also sent to its sub VLANs. In this case, when RIP multicast packets are sent over a super VLAN containing multiple sub VLANs, the RIP multicast packets are replicated multiple times, and the device processing capability is insufficient. As a result, a large number of packets are discarded, causing protocol flapping.

In most scenarios, the RIPng function does not need to be enabled on a super VLAN, and it is disabled by default. However, in some scenarios, the RIPng function must be run on the super VLAN, but packets need to

be sent to only one sub VLAN. In this case, you can decide to send multicast packets to a certain sub VLAN or to all sub VLANs as actually needed. You can run this command to specify a particular sub VLAN. You must be cautious when configuring packet transmission to all sub VLANs, as the large number of sub VLANs may cause a device processing bottleneck, which will lead to the neighbor flapping.

Examples

The following example enables the RIPng function on Super VLAN 300 and allows sending packets to Sub VLAN 1024.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface vlan 300
Hostname(config-if-VLAN 300)# ipv6 rip subvlan 1024
```

Notifications

N/A

Common Errors

The function is configured on a non-super VLAN.

The specified sub VLAN on the super VLAN cannot implement interworking with its neighbors.

Related Commands

- **show ipv6 rip**

1.11 passive-interface

Function

Run the **passive-interface** command to prohibit an interface from sending RIPng update packets.

Run the **no** form of this command to re-enable the function of sending RIPng update packets.

By default, a RIPng-enabled interface is allowed to send and receive RIPng update packets normally.

Syntax

passive-interface { **default** | *interface-type interface-num* }

no passive-interface { **default** | *interface-type interface-num* }

Parameter Description

default: Sets all the interfaces to passive mode.

interface-type interface-num: Interface type and interface number.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

A passive interface is set with the boundary of RIPng routing domain. The network segment of the passive interface belongs to the RIPng routing domain, but RIPng packets cannot be sent over the passive interface.

The interface set to a passive interface suppresses RIP update packets. A passive interface defines the boundary of RIP routing domain to avoid unwanted flooding of RIP packets. If the interface connection device does not run the RIP routing protocol (such as a PC and a device running other routing protocols), you are advised to configure this interface as a passive interface.

If RIPng routes need to be exchanged on an interface (such as the device interconnection interface) in the RIPng routing domain, this interface cannot be configured as a passive interface.

Examples

The following example sets all interfaces to passive mode, and enables the function of sending update packets on the Gigabit Ethernet 0/1 interface.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 router rip
Hostname(config-router)# passive-interface default
Hostname(config-router)# no passive-interface GigabitEthernet 0/1
```

Notifications

When the configured interface is invalid or does not exist, the following notification will be displayed:

```
% Interface is invalid.
```

Common Errors

1.12 redistribute

Function

Run the **redistribute** command to configure to redistribute the paths of other routing domains to RIPng.

Run the **no** form of this command to cancel the corresponding redistribution configuration.

The redistribution function is not configured by default. This function redistributes the routes of all subtypes of the specified routing process.

Syntax

redistribute { **bgp** | **connected** | **isis** [*area-tag*] | **ospf** *process-id* | **static** } [**metric** *metric-value* | **route-map** *route-map-name*] *

no redistribute { **bgp** | **connected** | **isis** [*area-tag*] | **ospf** *process-id* | **static** } [**metric** | **route-map**] *

Parameter Description

bgp: Indicates redistribution from BGP.

connected: Indicates redistribution from direct routes.

isis [*area-tag*]: Indicates redistribution from IS-IS. *area-tag* indicates the IS-IS process ID.

ospf *process-id*: Indicates redistribution from OSPF. *process-id* indicates the OSPF process ID. The value range is from 1 to 65535.

static: Indicates redistribution from static routes.

metric *metric-value*: Sets the metric of the route redistributed to the RIPng domain. The value range is from 1 to 16, and the default value is **1**.

route-map *route-map-name*: Indicates the associated route map, which is used to set the redistribution filtering rules.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

RIPng can distribute the routes of other routing protocols in the local routing domain so that the devices in the routing domain can access other routing domains.

During route redistribution, different routing protocols use different metric measurement methods. For example, RIPng measures the metric based on the hop count, and OSPF measures the metric based on the bandwidth. Therefore, the computed metrics cannot be compared with each other. During route redistribution, however, it is necessary to configure a symbolic metric; otherwise, route redistribution fails.

Examples

The following example configures redistributing the static routes satisfying the route map mymap into RIPng.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 router rip
Hostname(config-router)# redistribute static route-map mymap metric 8
```

1.13 show ipv6 rip

Function

Run the **show ipv6 rip** command to display the parameters and all the statistics of a RIPng routing protocol process.

Syntax

show ipv6 rip

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

The command can be used to quickly display the three timers, route distribution, route redistribution status, RIPng version of interface, RIPng interface, network scope, metric, management distance, and other information of a RIPng routing protocol process.

Examples

The following example displays the parameters and all the statistics of a RIPng routing protocol process.

```
Hostname> enable
Hostname# show ipv6 rip
Routing Protocol is "RIPng"
  Sending updates every 10 seconds with +/-50%, next due in 8 seconds
  Timeout after 30 seconds, garbage collect after 60 seconds
  Outgoing update filter list for all interface is:
    distribute-list prefix aa out
  Incoming update filter list for all interface is: not set
  Default redistribution metric is 1
  Distance: 120 (default is 120)  Redistribution:
     Redistributing protocol connected route-map rm
     Redistributing protocol static
     Redistributing protocol ospf 1
  Default version control:  send version 1, receive version 1
```

```
 Interface              Send   Recv
    VLAN 1             1      1
    Loopback 1          1      1
 Routing Information Sources:
    None
```

Table 1-1 Output Fields of the show ipv6 rip Command

Field	Description
Sending update	Indicates the interval for sending update packets.
Sending update	Indicates the failure time.
garbage	Indicates the recovery time.
Outgoing update filter list	Indicates the configured filter table of sent packets.
Incoming update filter	Indicates the configured filter table of received packets.
Default redistribution metric	Indicates the default redistribution metric.
distance	Indicates the management distance.
Redistribution	Indicates the redistribution routing protocol.
Default version control	Indicates the default RIPng version No. received/sent.
Interface	Indicates the interface that joins the RIPng process.

Function

Run the **show ipv6 rip database** command to display the entry information of a RIPng routing table.

Syntax

show ipv6 rip database

Parameter Description

N/A

Command Modes

All modes except the user EXEC mode

Default Level

14

Usage Guidelines

This command is used to display the information of each entry in the RIPng routing table.

Examples

The following example displays the information of each entry in the RIPng routing table.

```
Hostname# show ipv6 rip database
Codes: R - RIPng,C - Connected,S - Static,O - OSPF,B - BGP
sub-codes:n - normal,s - static,d - default,r - redistribute,
         i - interface, a/s - aggregated/suppressed
S(r)   2001:db8:1::/64, metric 1, tag 0
         Loopback 0/::
S(r)   2001:db8:2::/64, metric 1, tag 0
         Loopback 0/::
C(r)   2001:db8:3::/64, metric 1, tag 0
         VLAN 1/::
S(r)   2001:db8:4::/64, metric 1, tag 0
         Null 0/::
C(i)   2001:db8:5::/64, metric 1, tag 0
         Loopback 1/::
S(r)   2001:db8:6::/64, metric 1, tag 0
         Null 0/::
```

Table 1-2 Output Fields of the show ipv6 rip database Command

Field	Description
codes	Indicates the route type and corresponding abbreviation description.
2001:db8:1::	Indicates the corresponding prefix of the route.
metric 1	Indicates the corresponding metric of the route.
VLAN 1/::	Indicates the route interface.

1.15 split-horizon

Function

Run the **split-horizon** command to enable the split horizon function of RIPng.

Run the **split-horizon poisoned-reverse** command to enable split horizon with poison reverse.

Run the **no** form of this command to disable split horizon with poison reverse.

By default, the split horizon function without poison reverse is enabled on an interface.

Syntax

split-horizon

split-horizon poisoned-reverse

no split-horizon poisoned-reverse

Parameter Description

poisoned-reverse: Enables split horizon with poison reverse.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

In update packets, the split horizon function can prevent a device from advertising some routing information from the interface that has learned the routing information. The split horizon with poison reverse advertises some routing information from the interface that has learned the routing information, but sets the corresponding metric value to **16**.

The RIPng routing protocol falls into distance vector routing protocols, so the problem of split horizon must be noted in the actual application. If you cannot determine whether split horizon has been enabled for RIPng, you can run the **show ipv6 rip** command to make judgment.

Examples

The following example disables split horizon of RIPng.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 router rip
Hostname(config-router)# no split-horizon
```

1.16 timers

Function

Run the **timers** command to configure and adjust the timers of RIPng.

Run the **no** form of this command to restore the default configuration.

By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.

Syntax

timers *update invalid flush*

no timers

Parameter Description

update: Route update time, in seconds. The parameter defines the interval at which a device sends route update packets. Each time an update packet is received, the invalid timer and flush timer are reset. The value range is from 0 to 2147483647.

invalid: Route invalid time, in seconds, counted from the last time when a valid update packet is received. The *invalid* parameter defines the time after which a route in the routing table becomes invalid because the route is not updated. The duration of the invalid timer must be at least three times the duration of the update timer. If no update packet is received before the invalid timer expires, the corresponding route enters the invalid state. If a route update packet is received within the time of *invalid*, the timer is reset. The value range is from 0 to 2147483647.

flush: Route flushing time, in seconds, counted from the time when the RIPng route enters the invalid state. When the flush timer expires, the route in the invalid state will be deleted from the routing table. The value range is from 0 to 2147483647.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

Adjusting the above timers may reduce the convergence time and failback time of the routing protocol. For devices connected to the same network, values of the three RIPng timers must be the same. Generally, you are not advised to modify the RIP timers unless otherwise required.

You can run the **show ipv6 rip** command to display the current parameter settings of RIPng timers.

Note

Setting timers to small values on a low-speed link brings risks because a lot of Update packets consume the bandwidth. You can set timers to small values generally on the Ethernet or a 2 Mbps (or above) link to reduce the convergence time of network routes.

Examples

The following example configures to send RIP update packets every 10s. If no update packet is received within 30s, the corresponding route will become invalid and enter the invalid state. After entering the invalid state for more than 90s, the route will be deleted from the routing table.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# ipv6 router rip
Hostname(config-router)# timers 10 30 90
```

Notifications

N/A

Common Errors

Different RIPng timers are configured on different devices. Consequently, routes cannot be learned properly.

Platform Description

N/A

1 OSPFv2 Commands

Command	Function
area	Configure a specified open shortest path first (OSPF) area.
area authentication	Enable OSPF area authentication.
area default-cost	Configure the cost advertised to the default route of a stub area or not-so-stubby area (NSSA).
area filter-list	Configure the filtering conditions of inter-area route learning.
area nssa	Configure an OSPF area as NSSA.
area range	Configure route summarization between OSPF areas.
area stub	Set an OSPF area to a stub or totally stub area.
area sham-link	Configure a sham link.
area virtual-link	Configure an OSPF virtual link.
asbr enable	Enable a device as an ASBR.
auto-cost	Configure the reference value of interface cost.
bfd all-interfaces	Configure link detection through bidirectional forwarding detection (BFD) for all the interfaces running OSPF.
capability opaque	Enable the opaque LSA processing capability.
capability vrf-lite	Forcibly disable the automatic judging function of support to loop detection for OSPF processes.
clear ip ospf process	Clear and restart an OSPF process.
compatible rfc1583	Enable the RFC1583 rules.
default-information originate	Generate a default route to be injected to the OSPF routing domain.
default-metric	Configure the default metric for an OSPF redistributed route.
disable-dn-bit-check	Disable the DN bit loop detection function of LSA.

disable-tag-check	Disable loop detection using the route tag of LSA.
discard-route	Allow adding a discard route to the core routing table.
distance	Configure the management distances corresponding to different types of OSPF routes.
distribute-list in	Configure filtering routes that are calculated based on the received LSA.
distribute-list out	Configure filtering of redistributed routes.
domain-id	Configure the domain ID of an OSPF process.
domain-tag	Configure the VPN route tag of an OSPF process associated with VRF.
enable mib-binding	Bind the MIB to a specified OSPFv2 process.
enable traps	Enable sending of the specified trap message.
extcommunity-type	Configure the Router-ID or Route-Type of an OSPF process associated with VRF.
fast-reroute	Configure the OSPF fast reroute function of a device.
graceful-restart	Enable the OSPF GR capability and set the GR period.
graceful-restart helper	Enable the OSPF GR helper function and configure the relevant topology change detection mode.
ip ospf authentication	Configure the authentication mode of an interface.
ip ospf authentication-key	Configure the plain text authentication key of OSPF.
ip ospf area	Configure an OSPF routing process in which an interface participates.
ip ospf bfd	Configure an OSPF-enabled interface to enable or disable the BFD function.
ip ospf cost	Configure the cost value for an OSPF interface to send a packet.
ip ospf cost-fallback	Configure the cost fallback of an aggregation port (AP).
ip ospf database-filter all out	Prevent an interface from diffusing LSA packets to the outside, that is, LSA update packets are not sent from the interface.

ip ospf dead-interval	Configure the interval for OSPF to determine the failure of a specified interface neighbor.
ip ospf disable all	Prevent a specified interface from generating OSPF packets.
ip ospf fast-reroute protection	Enable the loop-free alternate (LFA) protection mode of a specified interface.
ip ospf fast-reroute no-eligible-backup	Exclude an OSPF interface that cannot be used as a backup interface in the OSPF fast reroute calculation.
ip ospf hello-interval	Configure the interval for OSPF to send hello packets.
ip ospf message-digest-key	Configure a cipher text authentication key of OSPF packets.
ip ospf mtu-ignore	Disable MTU verification when an interface receives database description packets.
ip ospf network	Configure the OSPF network type of an interface.
ip ospf priority	Configure the OSPF priority value of an interface.
ip ospf retransmit-interval	Configure the retransmission interval of LSU packets on an interface.
ip ospf source-check-ignore	Disable the source address verification function for the packets received on a P2P link.
ip ospf subvlan	Enable the OSPF function on a super VLAN.
ip ospf transmit-delay	Configure the delay for an OSPF interface to transmit LSU packets.
ispf enable	Enable the incremental shortest path first (iSPF) feature and run the iSPF algorithm to calculate the network topology.
log-adj-changes	Record the log of adjacency state changes.
max-concurrent-dd	Configure the maximum number of neighbors with which the current OSPF process can concurrently initiate or accept interaction.
max-metric router-lsa	Configure the maximum advertisement metric of an OSPF-enabled device so that other routers will not preferably regard this router as a transmission node in SPF calculation.

neighbor	Configure an OSPF neighbor.
network area	Configure which interfaces will run OSPF and which OSPF area they belong to.
nsr	Configure the current OSPF process to support the non-stop routing (NSR) function.
overflow database	Configure the maximum number of LSAs supported by the current OSPF process.
overflow database external	Configure the maximum number of external LSAs and the waiting time for recovery from the overflow state to the normal state.
overflow memory-lack	Allow the OSPF process to enter the overflow state when the memory is insufficient.
passive-interface	Configure a network interface specified for the local router as a passive interface.
redistribute	Enable the function of redistributing the external routing information.
router ospf	Create an OSPF routing process and enter routing configuration mode of OSPF.
router ospf max-concurrent-dd	Configure the maximum number of neighbors with which all the OSPF routing processes can concurrently initiate or accept interaction.
router-id	Configure the ID of a router.
show ip ospf	Display the summary of an OSPF process.
show ip ospf border-routers	Display the OSPF internal routing table to an ABR/ASBR.
show ip ospf database	Display the information of an OSPF LSDB.
show ip ospf interface	Display the information about an interface associated with an OSPF process.
show ip ospf ispf	Display the times of route computation through iSPF in the OSPF area.
show ip ospf neighbor	Display the neighbor table of an OSPF process.
show ip ospf route	Display an OSPF route.
show ip ospf sham-links	Display the sham link information of an OSPF process.

show ip ospf spf	Display the times of route computation in the OSPF area.
show ip ospf summary-address	Display the summarized route of all the redistributed routes of an OSPF process.
show ip ospf topology	Display the topology information of SPF computation of an OSPF process.
show ip ospf virtual-links	Display the information about a virtual link of an OSPF process.
show running-config router ospf	Display the configuration of an OSPF process.
summary-address	Configure a summarized route for the external routes of the OSPF routing domain.
timers lsa arrival	Configure the delay for receiving a duplicate LSA.
timers pacing lsa-group	Configure a group pacing interval of LSA.
timers pacing lsa-transmit	Configure an interval for sending LSA group and a number of LS-UPD packets in each group.
timers spf	Configure the delay time for SPF computation after an OSPF process receives the topology change information and the time interval between two SPF computations.
timers throttle lsa all	Configure an exponential backoff algorithm of LSA packet generation.
timers throttle route	Configure the delay time for route computation when an OSPF process receives changed inter-area and external LSAs.
timers throttle spf	Configure the delay time for SPF computation, and the minimum interval and maximum interval for two SPF computations after an OSPF process receives the topology change information.
two-way-maintain	Enable the two-way maintenance function of an OSPF process.

1.1 area

Function

Run the **area** command to configure a specified open shortest path first (OSPF) area.

Run the **no** form of this command to delete a specified OSPF area.

No OSPF area is configured by default.

Syntax

area *area-id*

no area *area-id*

Parameter Description

area-id: OSPF area ID. The parameter can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

You can run the **no** form of this command to clear the configuration of a specified OSPF area and delete this area, including the configurations of the area-based commands such as **area authentication**, **area default-cost**, **area filter-list**, and **area nssa**.

You cannot clear the configuration of the OSPF area in the following cases:

- All the configuration of the backbone area needs to be cleared, but there is a virtual link configuration. In this case, the virtual link configuration must be cleared before the backbone area can be deleted.
- There is a corresponding **network area** command in all the areas. In this case, you must clear all the network segment commands that are added to the area before deleting the area.

Examples

The following example deletes the related configuration of OSPF area 2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 2
Hostname(config-router)# no area 2
```

Notifications

When you delete the **area** configuration without deleting the **network** command, the following notification will be displayed.

```
% Error: Area 1 cannot be deleted before its network command is removed
```

Common Errors

You want to delete the **area** configuration without deleting the **network** command.

Platform Description

N/A

1.2 area authentication

Function

Run the **area authentication** command to enable OSPF area authentication.

Run the **no** form of this command to disable OSPF area authentication.

The OSPF area authentication function is disabled by default.

Syntax

area *area-id* **authentication** [**message-digest** | **keychain** *name*]

no area *area-id* **authentication**

Parameter Description

Area-id:-id: ID of the area with OSPF authentication to be enabled. The area ID can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

message-digest: Enables cipher text authentication mode.

keychain *name*: Name of the adopted keychain authentication. If **Keychain** specifies that the authentication type is **SM3**, the key ID value range is from 0 to 255.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

The device supports three authentication types:

- Type 0: No authentication is required. When the **area authentication** command is not used to enable OSPF authentication, the authentication type in OSPF data packets is type 0.
- Type 1: The authentication type is plain text authentication mode. In this mode, the **message-digest** parameter is not contained.
- Type 2: The authentication type is cipher text authentication mode. In this mode, the **message-digest** parameter is contained.

All routers in the same OSPF area must run the same authentication type. If authentication is enabled, the authentication key must be configured on interfaces that are connected to neighbors.

- You can run the **ip ospf authentication-key** command on an interface to configure a plain text authentication key.
- You can run the **ip ospf message-digest-key** command on an interface to configure a cipher text

authentication key.

- If keychain authentication is configured, the key and authentication type configured for keychain are used. Currently, keychain supports plain text authentication, Message-Digest 5 (MD5) authentication, and SM3 authentication.

Examples

The following example configures MD5 authentication for Area 0 (backbone area) of the OSPF routing process, and sets the authentication key for the interface GigabitEthernet 0/1 connected to neighbors to **backbone**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip address 192.168.12.1 255.255.255.0
Hostname(config-if-GigabitEthernet 0/1)# ip ospf message-digest-key 1 md5 backbone
Hostname(config-if-GigabitEthernet 0/1)# exit
Hostname(config)# router ospf 1
Hostname(config-router)# network 192.168.12.0 0.0.0.255 area 0
Hostname(config-router)# area 0 authentication message-digest
```

The following example configures keychain authentication for Area 0 (backbone area) of the OSPF routing process, and sets the keychain name to **ospf**. The configured authentication key for keychain ospf is **hello**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# area 1 authentication keychain ospf
Hostname(config-router)# exit
Hostname(config)# key chain ospf
Hostname(config-keychain)# key 1
Hostname(config-keychain-key)# key-string hello
```

1.3 area default-cost

Function

Run the **area default-cost** command to configure the cost advertised to the default route of a stub area or not-so-stubby area (NSSA).

Run the **no** form of this command to restore the default configuration.

By default, the cost value of a route is 1.

Syntax

area *area-id* **default-cost** *cost*

no area *area-id* **default-cost**

Parameter Description

area-id: ID of a stub area or NSSA. The area ID can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

cost: Cost of the default route injected to the stub area or NSSA. The value range is from 0 to 16777215.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command takes effect only on an area border router (ABR) in a stub area or on an ABR/autonomous system boundary router (ASBR) in an NSSA.

An ABR in a stub area or an ABR/ASBR in an NSSA is allowed to advertise a link-state advertisement (LSA) indicating the default route in the stub or NSSA. You can run the **area default-cost** command to modify the cost of the advertised LSA.

Examples

The following example configures the cost value of the OSPF advertised to a stub area as **50**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.0.0 0.0.255.255 area 0
Hostname(config-router)# network 192.168.12.0 0.0.0.255 area 1
Hostname(config-router)# area 1 stub
Hostname(config-router)# area 1 default-cost 50
```

Notifications

When this command is configured in an area other than the stub area or NSSA, the following notification will be displayed:

```
% The area is neither stub, nor NSSA
```

When this command is configured in a backbone area, the following notification will be displayed:

```
% You can't configure default-cost to backbone
```

Common Errors

This command is configured in an area other than the stub area or NSSA.

This command is configured in a backbone area.

Platform Description

1.4 area filter-list

Function

Run the **area filter-list** command to configure the filtering conditions of inter-area route learning.

Run the **no** form of this command to cancel this configuration.

By default, the filtering conditions of inter-area route learning are not configured.

Syntax

area *area-id* **filter-list** { **access** *acl-number* | **prefix** *prefix-name* } { **in** | **out** }

no area *area-id* **filter-list** { **access** *acl-number* | **prefix** *prefix-name* } { **in** | **out** }

Parameter Description

area-id: Area ID, which can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

access *acl-number*: Associated standard ACL. The value range is from 1 to 99.

prefix *prefix-name*: Name of the associated prefix list. The value is a case-sensitive string of 1 to 99 characters.

in: Filters the routes that are received by the area.

out: Filters the routes that are sent from the area.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command can be configured only on an ABR.

Run this command when it is required to configure filtering conditions for inter-area routes on the ABR.

Examples

The following example configures OSPF Area 1 that is allowed to learn only the inter-area routes within the range of 172.22.0.0/8.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# access-list 1 permit 172.22.0.0 0.255.255.255
Hostname(config)# router ospf 100
Hostname(config-router)# area 1 filter-list access 1 in
```

1.5 area nssa

Function

Run the **area nssa** command to configure an OSPF area as NSSA.

Run the **no** form of this command to delete this configuration.

The NSSA function is disabled by default.

Syntax

area *area-id* **nssa** [**default-information-originate** [**metric** *metric* | **metric-type** *metric-type*] * | **no-redistribution** | **no-summary** | **translator** [**always** | **stability-interval** *stability-interval*] *] *

no area *area-id* **nssa** [**default-information-originate** [**metric** *value* | **metric-type** *type*] * | **no-redistribution** | **no-summary** | **translator** [**always** | **stability-interval**] *] *

Parameter Description

area-id: ID of the NSSA, which can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

default-information-originate: Indicates that a default Type-7 LSA is generated and introduced to the NSSA. This option takes effect only on an NSSA ABR or ASBR.

metric *metric*: Indicates the metric of the generated default LSA. The value range is from 0 to 16777214, and the default value is **1**.

metric-type *metric-type*: Indicates the route type of the generated default LSA. The value is 1 or 2. Here, 1 represents N-1, and 2 represents N-2. The default value is 2.

no-redistribution: When the router is an NSSA ABR and you want to use only the route redistribution command to introduce the routing information into a common area instead of an NSSA, select this option.

no-summary: Prohibits the ABR in the NSSA from sending Summary LSAs (Type-3 LSA).

translator: Indicates that the NSSA ABR is a translator.

always: Indicates that the current NSSA ABR always acts as a translator. The default value is the standby translator.

stability-interval *stability-interval*: Indicates the stability interval after the NSSA ABR is changed from a translator to a non-translator, in seconds. The value range is 0 to 2147483647, and the default value is **40**.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

- The **default-information-originate** parameter is used to generate a default Type-7 LSA. This option is different for the NSSA ABR and ASBR. On ABR, a Type-7 LSA default route is generated regardless of whether there is a default route in the routing table. On ASBR (which is not an ABR at the same time), a Type-7 LSA default route is generated only when there is a default route in the routing table.
- If the **no-redistribution** parameter is configured on the ASBR, other external routes introduced by OSPF through the **redistribute** command cannot be distributed to the NSSA. This parameter is generally used when a router in the NSSA acts both as an ASBR and an ABR. It prevents external routing information from entering the NSSA.
- To further reduce the number of LSAs sent to the NSSA, you can configure the **no-summary** parameter on the ABR to prevent the ABR from sending the Summary LSAs (Type-3 LSA) to the NSSA.
- When the **translator always** parameter is configured, if an NSSA has two or more area border routers (ABRs), the ABR with the largest router ID is selected by default as the translator for converting Type-7 LSAs into Type-5 LSAs. If the current device is expected to be always the translator ABR for converting Type-7 LSAs into Type-5 LSAs, run the **translator always** parameter. In the same NSSA, it is recommended that this parameter be configured on only one ABR.
- When the **stability-interval** parameter is configured, if the translator role of the current device is replaced by another ABR, the conversion capability is retained during the time specified by *stability-interval*. If the router does not become a translator again within the above time, LSAs that are converted from Type 7 to Type 5 will be deleted from the AS after *stability-interval* expires. To prevent a routing loop, LSAs that are converted from Type 7 to Type 5 are deleted from the AS immediately after the current device loses the translator role even if *stability-interval* does not expire.

Examples

The following example sets Area 1 to NSSA.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.0.0 0.0.255.255 area 0
Hostname(config-router)# network 192.168.12.0 0.0.0.255 area 1
Hostname(config-router)# area 1 nssa
```

Notifications

When the backbone area is set to NSSA, the following notification will be displayed:

```
% You can't configure NSSA to backbone
```

Common Errors

The backbone area is set to NSSA.

Platform Description

N/A

Related Commands

- **show ip ospf**
- **area** default-cost

1.6 area range

Function

Run the **area range** command to configure route summarization between OSPF areas.

Run the **no** form of this command to delete this configuration.

By default, no route summarization is configured between OSPF areas.

Syntax

area *area-id* **range** *ipv4-address mask* [**advertise** | **not-advertise**] [**cost** *cost* | **inherit-minimum**]

no area *area-id* **range** *ipv4-address mask* [**cost** | **inherit-minimum**]

Parameter Description

area-id: ID of the OSPF area to which the summarized route will be injected. The parameter can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

ipv4-address mask: Network segment of the summarized route.

advertise: Advertises the summarized route.

not-advertise: Not advertises the summarized route.

cost *cost*: Indicates the metric of the summarized route. The value range is from 0 to 16777215. The default metric of a summarized route is related to compatibility with RFC1583. If the RFC1583 compatibility mode is configured, the default metric is the minimum value of the metric of the summarized route; otherwise, the default metric is the maximum value of the metric of the summarized route. The combination of the **no** prefix and **cost** parameter can restore the default metric of a summarized route, but will not delete route summarization.

inherit-minimum: Sets the minimum value of all the route metrics before summarization to the route metric after summarization.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command can be executed only on the ABR. It is used to combine or summarize multiple routes of an area into one route, and advertise the route to other areas. Combination of the routing information occurs only on the boundary of an area. Although the routers inside the area can learn specific routing information, the routers in other areas can learn only one summarized route. You can set **advertise** or **not-advertise** to determine whether to advertise the summarized route to shield and filter routes. By default, the summarized route is advertised. You can run the **cost** parameter to set the metric of the summarized route.

You can configure route summarization commands for multiple areas. This simplifies routes in the entire OSPF routing domain, and improves the network forwarding performance especially for a large-sized network.

When multiple routes for summarization are configured and have the inclusive relationship with each other, the range of routes to be summarized is determined based on the longest match principle.

Examples

The following example summarizes the routes of OSPF Area 1 into 172.16.16.0/20.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.0.0 0.0.15.255 area 0
Hostname(config-router)# network 172.16.17.0 0.0.15.255 area 1
Hostname(config-router)# area 1 range 172.16.16.0 255.255.240.0
```

Notifications

When the summarized route has been configured for different areas, the following notification will be displayed:

```
% OSPF: This range in different area 1
```

Common Errors

The summarized route has been configured for different areas.

Platform Description

1.7 area stub

Function

Run the **area stub** command to set an OSPF area to a stub or totally stub area.

Run the **no** form of this command to delete this configuration.

The stub area function is disabled by default.

Syntax

area *area-id* **stub** [**no-summary**]

no area *area-id* **stub** [**no-summary**]

Parameter Description

area-id: ID of a stub area. The area ID can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

no-summary: Prohibits the ABR from sending network summary LSAs to the stub. In this case, the stub area can be called a totally stub area. This parameter is configured only when the router is an ABR.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

You must run the **area stub** command on all routers in the OSPF stub area. ABR sends only three kinds of LSAs to the stub area:

- Type 1, router LSA.
- Type 2, network LSA.
- Type 3, network summary LSA.

From the perspective of the routing table, a router in the stub area can learn only the internal routes of the OSPF routing domain, including the internal default route generated by an ABR. A router in the stub area cannot learn external routes of the OSPF routing domain.

To configure a totally stub area, add the **no-summary** keyword when running the **area stub** command on the ABR. A router in the totally stub area can learn only the internal routes of the local area, including the internal default route generated by an ABR.

You can run either the **area stub** or **area default-cost** command to configure an OSPF area as a stub area. If **area stub** is used, you must configure this command on all routers connected to the stub area. If **area default-cost** is used, run this command only on the ABR in the stub area. The **area default-cost** command defines the initial cost of the internal default route.

Examples

The following example sets Area 1 to stub area.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.0.0 0.0.255.255 area 0
Hostname(config-router)# network 192.168.12.0 0.0.0.255 area 1
Hostname(config-router)# area 1 stub
```

Notifications

When you attempt to configure the backbone area as a stub area, the following notification will be displayed:

```
% You can't configure stub to backbone
```

When you attempt to configure an NSSA as a stub area, the following notification will be displayed:

```
% The area is configured as NSSA area already
```

Common Errors

The backbone area is configured as a stub area.

An NSSA is configure as a stub area.

1.8 area sham-link

Function

Run the **area sham-link** command to configure a sham link.

Run the **no** form of this command to delete this configuration.

Run the **default** form of this command to restore the default configuration.

A sham link is disabled by default. No authentication is set for a sham link by default.

Syntax

area *area-id* **sham-link** *source-ipv4-address destination-ipv4-address* [[**authentication** [**keychain** *kechain-name* | **message-digest** | **null**] | **cost** *number* | **dead-interval** *dead-interval* | **hello-interval** *hello-interval* | **retransmit-interval** *retransmit-interval* | **transmit-delay** *transmit-delay*] * | **authentication-key** [**0** | **7**] *key* | **message-digest-key** *key-id* **md5** [**0** | **7**] *key*]

no area *area-id* **sham-link** *source-ipv4-address destination-ipv4-address* [**authentication** | **authentication-key** | **cost** | **dead-interval** | **hello-interval** | **message-digest-key** *key-id* | **retransmit-interval** | **transmit-delay**] *

default area *area-id* **sham-link** *source-ipv4-address destination-ipv4-address* [**authentication** | **authentication-key** | **cost** | **dead-interval** | **hello-interval** | **message-digest-key** *key-id* | **retransmit-interval** | **transmit-delay**] *

Parameter Description

area-id: ID of the OSPF area where the sham link is. The area ID can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

source-ipv4-address: Source address of the sham link.

destination-ipv4-address: Destination address of the sham link.

authentication: Sets the authentication type to plain text authentication.

keychain *keychain-name*: Sets keychain authentication. If **Keychain** specifies that the authentication type is **SM3**, the key ID value range is from 0 to 255.

message-digest: Sets the authentication type to cipher text authentication.

null: Indicates that authentication is disabled.

cost *number*: Indicates the cost value of the OSPF protocol for sending packets on the sham link. The value range is from 0 to 65535, and the default value is **1**.

dead-interval *dead-interval*: Indicates the dead interval of sham link neighbors, in seconds. The value range is 0 to 2147483647, and the default value is **40**.

hello-interval *hello-interval*: Indicates the time interval of sending hello packets on the sham link, in seconds. The value range is 1 to 65535, and the default value is **10**.

retransmit-interval *retransmit-interval*: Indicates the time interval of packets retransmission on the sham link, in seconds. The value range is 0 to 65535, and the default value is **5**.

transmit-delay *transmit-delay*: Indicates the delay of transmitting link state update (LSU) packets on the sham link, in seconds. The value range is 0 to 65535, and the default value is **1**.

authentication-key [**0** | **7**] *key*: Defines the key for OSPF plain text authentication. The key of plain text authentication must be consistent between neighbors.

0: Indicates that the key is displayed in plain text.

7: Indicates that the key is displayed in cipher text.

key: Key value. The value is a string containing 1–8 characters.

message-digest-key *key-id* [**md5**] [**0** | **7**] *key*: Defines the key ID and key for OSPF cipher text authentication. The key ID and key for cipher text authentication must be consistent between neighbors.

key-id: ID of the authentication key. The value range is from 1 to 255.

md5: Uses the MD5 cipher text authentication.

0: Indicates that the key is displayed in plain text.

7: Indicates that the key is displayed in cipher text.

key: Key value. The value is a string containing 1–8 characters.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command takes effect only for the OSPF process associated with VPN routing and forwarding (VRF).

A sham link needs to be configured on two provider edges (PEs) for establishing a sham link at the same time. Only one PE cannot establish a sham link.

The **service password-encryption** command makes the key in the command displayed in a way of encryption.

To establish a sham link between two PEs, you must meet the following configuration conditions:

- The *area-id* value of sham link configured for the two PEs must be consistent.
- The combination of source address and destination address of a sham link configured on one PE must be equal to the combination of destination address and source address of a sham link configured on the other PE.
- The source address used to establish a sham link on the PE must be a 32-bit loopback address, and must be bound to the corresponding VRF instance.

Caution

- Since the OSPF route advertised through a sham link has no VPN label, the route cannot be used for forwarding. Actually packets are still forwarded through the Border Gateway Protocol (BGP) VPNv4 route. Therefore, in the actual configuration, you must ensure that the route advertised through the sham link will also be advertised to the corresponding BGP neighbor through Multiprotocol Extensions for BGP (MP-BGP) in the form of VPNv4 route.
- The source address for establishing the sham link must participate in the BGP VPNv4 route advertisement, but cannot join the calculation of VRF OSPF process.

Examples

The following example configures a sham link in OSPF Area 0, with source address 1.1.1.1 and destination address 2.2.2.2, and sets the metric of the packet sent by OSPF on the sham link to **10**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 10 vrf vpn1
Hostname(config-router)# area 0 sham-link 1.1.1.1 2.2.2.2 cost 10
```

Notifications

N/A

Common Errors

The source address for establishing a sham link joins the calculation of VRF OSPF process.

Only the private route is advertised through the sham link, but the VPNv4 route is not advertised through MP-BGP.

Platform Description

N/A

Related Commands

- **show ip ospf sham-links**

1.9 area virtual-link

Function

Run the **area virtual-link** command to configure an OSPF virtual link.

Run the **no** form of this command to delete this configuration.

No virtual link is configured by default.

Syntax

area *area-id* **virtual-link** *router-id* [**authentication** [**keychain** *kechain-name* | **message-digest** | **null**] | **dead-interval** { *dead-interval* | **minimal hello-multiplier** *multiplier-time* } | **hello-interval** *hello-interval* | **retransmit-interval** *retransmit-interval* | **transmit-delay** *transmit-delay*] * [**authentication-key** [**0** | **7**] *key* | **message-digest-key** *key-id* **md5** [**0** | **7**] *key*]

no area *area-id* **virtual-link** *router-id* [**authentication** | **authentication-key** | **dead-interval** | **hello-interval** | **message-digest-key** *key-id* | **retransmit-interval** | **transmit-delay**] *

Parameter Description

area-id: ID of the OSPF transit area. The parameter can be a decimal integer or an IP address. The value range is from 0 to 4294967295.

router-id: Router ID for the neighbor of the virtual link. The router ID can be displayed using the **show ip ospf** command.

authentication: Sets the authentication type to plain text authentication.

keychain *keychain-name*: Sets keychain authentication. If **Keychain** specifies that the authentication type is **SM3**, the key ID value range is from 0 to 255.

message-digest: Sets the authentication type to cipher text authentication.

null: Indicates that authentication is disabled.

dead-interval *dead-interval*: Indicates the time that the neighbor is declared lost, in seconds. The value range is 0 to 2147483647, and the default value is **40**. The setting of this parameter must be consistent with that on a neighbor.

minimal hello-multiplier *multiplier-time*: Indicates that the fast hello function is enabled to set the dead interval to 1s. Here, *multiplier-time* indicates the number of hello packets sent per second in the fast hello function. The value range is from 3 to 20. The fast hello function is not enabled by default.

hello-interval *hello-interval*: Indicates the time interval for OSPF to send hello packets on the virtual link, in seconds. The value range is 1 to 65535, and the default value is **10**. The setting of this parameter must be consistent with that on a neighbor.

retransmit-interval *retransmit-interval*: Indicates the OSPF LSA retransmission interval, in seconds. The setting of the time interval should take into account the round trip time of packets on the link. The value range is 0 to 65535, and the default value is **5**.

transmit-delay *transmit-delay*: Indicates the delay after which OSPF sends the LSA, in seconds. This value increases the time to live (TTL) of LSA. When the TTL of LSA reaches the fixed time, the LSA will be refreshed. The value range is 0 to 65535, and the default value is **1**.

authentication-key [**0** | **7**] *key*: Defines the key for OSPF plain text authentication. The key of plain text authentication must be consistent between neighbors.

0: Indicates that the key is displayed in plain text.

7: Indicates that the key is displayed in cipher text.

key: Key value. The value is a string containing 1–8 characters.

message-digest-key *key-id* [**md5**] [**0** | **7**] *key*: Defines the key ID and key for OSPF cipher text authentication.

key-id: ID of the authentication key. The value range is from 1 to 255.

md5: Uses the MD5 cipher text authentication.

The **service password-encryption** command makes the key displayed in a way of encryption.

0: Indicates that the key is displayed in plain text.

7: Indicates that the key is displayed in cipher text.

key: Key value. The value is a string containing 1–8 characters.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

In the OSPF routing domain, all the areas must be connected to the backbone area. If the backbone area is disconnected, a virtual link must be configured to connect to the backbone area; otherwise, network communication problems will occur. A virtual link must be created between two ABRs, and the area to which both ABRs belong is the transit area. A stub area or an NSSA area cannot be used as a transit area. A virtual link can also be used to connect other non-backbone areas.

Here, *router-id* is the ID of an OSPF neighbor router. If you are sure about the value of *router-id*, run the **show ip ospf neighbor** command to confirm the value. You can configure the loopback address as the router ID.

The **area virtual-link** command defines only the authentication key of the virtual link. To enable OSPF packet authentication in the areas connected to the virtual link, you must run the **area authentication** command. The **service password-encryption** command makes the key in the command displayed in a way of encryption.

OSPF supports the fast hello function.

- After the OSPF fast hello function is enabled, OSPF finds neighbors and detects neighbor failures faster. You can enable the OSPF fast hello function by specifying the **minimal** and **hello-multiplier** keywords and the *multiplier* parameter. The **minimal** keyword indicates that the dead interval is set to 1s, and **hello-multiplier** indicates the number of hello packets sent per second. In this way, the interval at which the hello packet is sent decreases to less than 1s.
- If the fast hello function is configured for a virtual link, the hello interval field of the hello packet advertised on the virtual link is set to 0, and the hello interval field of the hello packet received on this virtual link is ignored.
- No matter whether the fast hello function is enabled, the dead interval must be consistent and the **hello-multiplier** value can be inconsistent on routers at both ends of the virtual link. Ensure that at least one hello packet can be received within the dead interval.
- Run the **show ip ospf virtual-links** command to monitor the dead interval and the fast hello interval configured for the virtual link.
- The **dead-interval minimal hello-multiplier** and **hello-interval** parameters introduced for the fast hello function cannot be configured simultaneously.

Examples

The following example configures Area 1 as a transit area, and establishes a virtual link with neighbor 2.2.2.2.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.0.0 0.0.15.255 area 0
Hostname(config-router)# network 172.16.17.0 0.0.15.255 area 1
Hostname(config-router)# area 1 virtual-link 2.2.2.2
```

The following example configures Area 1 as a transit area, and establishes a virtual link with neighbor 1.1.1.1. The virtual link connects Area 10 to the backbone area. The virtual link adopts OSPF packet authentication in authentication mode MD5.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.17.0 0.0.15.255 area 1
Hostname(config-router)# network 172.16.252.0 0.0.0.255 area 10
Hostname(config-router)# area 0 authentication message-digest
Hostname(config-router)# area 1 virtual-link 1.1.1.1 message-digest-key 1 md5 hello
```

The following example configures Area 1 as a transit area, establishes a virtual link with neighbor 1.1.1.1, enables the fast hello function on the virtual link, and sets the multiplier to **3**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.17.0 0.0.15.255 area 1
Hostname(config-router)# network 172.16.252.0 0.0.0.255 area 10
Hostname(config-router)# area 1 virtual-link 1.1.1.1 dead-interval minimal
hello-multiplier 3
```

Notifications

When a virtual link is configured in the backbone area, the following notification will be displayed:

```
% You can't configure virtual-link transit to backbone
```

When a virtual link is configured in a stub area or NSSA, the following notification will be displayed:

```
% Area is a stub or nssa so virtual links are not allowed
```

Common Errors

A virtual link is configured in the backbone area.

A virtual link is configured in a stub area or NSSA area.

1.10 asbr enable

Function

Run the **asbr enable** command to enable a device as an ASBR.

Run the **no** form of this command to restore the default value.

ASBR is disabled by default.

Syntax

asbr enable

no asbr enable

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

After the **redistribute** or **default-information** command is executed, the OSPF router automatically becomes an ASBR. If you want the device to become an ASBR without configuring the above command, configure the **asbr enable** command. If the **asbr enable** command is deleted, but the **redistribute** or **default-information** command is still configured, the device is still ASBR**.**

Examples

The following example enables a device as an ASBR.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# asbr enable
```

1.11 auto-cost

Function

Run the **auto-cost** command to configure the reference value of interface cost.

Run the **no** form of this command to restore the default value.

By default, the reference bandwidth value of interface cost calculation is 100 Mbps.

Syntax

auto-cost reference-bandwidth *ref-bw*

no auto-cost reference-bandwidth

Parameter Description

ref-bw: Reference bandwidth value, in mega-bytes per second. The value range is from 1 to 4294967.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

By default, the cost of an OSPF interface is equal to the reference value of the interface bandwidth divided by the actual interface bandwidth. When OSPF is allowed on a link above 100 Mbps, you are advised to increase the *ref-bw* value.

Run the **bandwidth** command to set the interface bandwidth.

The default costs of OSPF interfaces on several typical lines are as follows:

- For the 64 Kbps serial line, the cost is 1562.
- For the E1 line, the cost is 48.
- For the 10 Mbps Ethernet, the cost is 10.
- For the 100 Mbps Ethernet, the cost is 1.

If an interface cost is set using the **ip ospf cost** command, the automatically calculated interface cost will be overwritten.

Examples

The following example configures the reference value of interface bandwidth for the automatically calculated interface cost as 10 Mbps.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.10.0 0.0.0.255 area 0
Hostname(config-router)# auto-cost reference-bandwidth 10
```

Notifications

When the interface cost is changed, the following notification will be displayed:

```
% OSPF: Reference bandwidth is changed.
       Please ensure reference bandwidth is consistent across all routers
```

1.12 bfd all-interfaces

Function

Run the **bfd all-interfaces** command to configure link detection through bidirectional forwarding detection (BFD) for all the interfaces running OSPF.

Run the **no** form of this command to restore the default configuration.

By default, the BFD function is disabled on all the interfaces.

Syntax

bfd all-interfaces

no bfd all-interfaces

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

The OSPF protocol dynamically discovers a neighbor by using hello packets. After BFD is enabled, OSPF establishes a BFD session with a neighbor in the full neighbor relationship to detect the neighbor status through the BFD mechanism. When the BFD neighbor fails, OSFP immediately performs network convergence.

You can also configure the **ip ospf bfd** [**disable**] command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the **bfd all-interfaces** command used in OSPF process configuration mode.

Examples

The following example configures all interfaces running OSPF to conduct BFD link detection.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# bfd all-interfaces
```

Notifications

When the neighbor device also needs to be configured with BFD to prevent route learning from being affected, the following notification will be displayed:

```
% Warning: The BFD for OSPF neighbor shall be enabled, or it would affect the route
learning.
```

Common Errors

BFD is not enabled on the interconnected devices at the same time.

1.14 capability vrf-lite

Function

Run the **capability vrf-lite** command to forcibly disable the automatic judging function of support to loop detection for OSPF processes.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

By default, the automatic judging function of support to loop detection is enabled for the OSPF processes associated with VRF.

Syntax

capability vrf-lite [**auto**]

no capability vrf-lite [**auto**]

default capability vrf-lite [**auto**]

Parameter Description

auto: Automatically judges whether loop detection is supported for the OSPF processes associated with VRF.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command takes effect only for the OSPF process associated with VRF.

By default, support to loop detection and PE-CE OSPF feature is automatically judged for the OSPF processes associated with VRF.

- The **capability vrf-lite** command can be used to forcedly disable the above function.
- The **no capability vrf-lite** command can be used to forcedly enable the above function.
- The **capability vrf-lite auto** command is configured to enable the OSPF process associated with VRF to automatically judge whether the above function is enabled.
- The **capability vrf-lite auto** command is used to restore the default configuration.

Loop detection of OSPF processes aims to prevent possible loop of VPN routes in propagation. When an OSPF process associated with VRF receives LSA, it will process the LSA according to the following principle:

- After the loop detection function is disabled, the OSPF protocol will not check the DN bit (down bit) and VPN route tag in the LSA packet after receiving the LSA packet, and allow the LSA to participate in the calculation of OSPF.
- For type-3, 5 and 7 LSAs, the DN bit is detected. If the received LSA contains a DN bit, the LSA does not participate in OSPF calculation.
- For type-5 and 7 LSAs, the VPN route tag (Domain-tag) is detected. If the VPN route tag of the received LSA is the same as that of the local OSPF process, the LSA does not participate in the OSPF calculation.

The so-called PE-CE OSPF feature converts different OSPF LSAs for advertising to CE according to the BGP extended attribute of route. After the OSPF feature of PE-CE is disabled, different OSPF LSAs are not converted according to BGP attributes.

By default, support to loop detection is automatically judged for the OSPF processes associated with VRF. The purpose of this function is as follows:

In some application scenarios, you may need to disable the loop detection function of VRF OSPF processes. For example, VPN users use MCE devices to exchange VPN routes with PEs. If the OSPF protocol runs between MCEs and PEs to exchange VPN routes, to enable the MCE to learn the VPN route advertised by the PE and advertise it to the downlink VPN site, you need to disable the loop detection function of VRF OSPF processes of the MCE device. For the general MCE scenario, currently the device can automatically judge and disable the loop detection feature of OSPF processes. If the automatic judgment result is incorrect, you need to run the [**no**] **capability vrf-lite** command to forcibly enable or disable the loop detection feature of OSPF processes.

Examples

The following example disables the loop detection capability for OSPF processes.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 10 vrf vpn1
Hostname(config-router)# capability vrf-lite
```

Notifications

If the OSPF process is not bound to VRF, the following notification will be displayed:

```
% The command CAN NOT apply to ospf instance bound to VRF default.
```

1.15 clear ip ospf process

Function

Run the **clear ip ospf process** command to clear and restart an OSPF process.

Syntax

clear ip ospf [*process-id*] **process**

Parameter Description

process-id: OSPF process ID. The value range is from 1 to 65535. When this parameter is specified, the specified OSPF process will be cleared and reset. When this parameter is not specified, all the running OSPF processes will be cleared and reset.

Command Modes

Privileged EXEC mode

Default Level

14

Usage Guidelines

Resetting the whole OSPF process will reestablish all the neighbors, which has a great impact on the entire protocol.

When running this command, you need to make confirmation.

Examples

The following example clears and resets OSPF Process 1.

```
Hostname> enable
Hostname# clear ip ospf 1 process
Reset OSPF process! [yes/no]:
```

Notifications

When an OSPF process not existing is reset, the following notification will be displayed:

```
%OSPF: No router process 1
```

Platform Description

1.16 compatible rfc1583

Function

Run the **compatible rfc1583** command to enable the RFC1583 rules.

Run the **no** form of this command to disable the RFC1583 rules.

The RFC1583 rules are enabled by default.

Syntax

compatible rfc1583

no compatible rfc1583

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

When multiple paths reach the same external destination of AS, the optimum path must be determined. This command determines to run the priority rule used in the RFC1583 rules.

Examples

The following example configures the RFC1583 rules to determine the optimum route.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# no compatible rfc1583
```

1.17 default-information originate

Function

Run the **default-information originate** command to generate a default route to be injected to the OSPF routing domain.

Run the **no** form of this command to disable the default route.

No default route is generated by default.

Syntax

default-information originate [**always** | **metric** *metric* | **metric-type** *type* | **route-map** *map-name*] *

no default-information originate [**always** | **metric** | **metric-type** | **route-map**] *

Parameter Description

always: Enables OSPF to generate a default route no matter whether the local router has a default route.

metric *metric*: Indicates the initial metric of the default route. The value range is from 0 to 16777214, and the default value is **1**.

metric-type *type*: Indicates the type of the default route. The default value is 2. OSPF external routes are classified into two types. Type 1: The metric varies with routers. Type 2: The metric is the same for all the routers. Type 1 external routes are more trustworthy than Type 2 external routes.

route-map *map-name*: Indicates the name of the associated route map. No route map is associated by default.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

After the **redistribute** or **default-information** command is executed, the OSPF router automatically becomes an ASBR. The ASBR, however, does not automatically generate or advertise a default route to all routers in the OSPF routing domain. To enable the ASBR to generate a default route, configure the **default-information originate** command.

If the **always** parameter is specified, the OSPF routing process advertises an external default route to neighbors regardless of whether a default route exists. This default route, however, is not displayed on the local router. To confirm whether a default route is generated, run the **show ip ospf database** command to display the OSPF link state database (LSDB). The external link with ID 0.0.0.0 describes the default route. On an OSPF neighbor, you can run the **show ip route** command to see the default route.

The metric of the external default route can be set only by running the **default-information originate** command, instead of the **default-metric** command.

OSPF has two types of external routes. The metric of the Type-1 external route changes, but the metric of the Type-2 external route is fixed. If two parallel paths to the same destination have the same route metric, the priority of the Type 1 route is higher than that of the Type 2 route. Therefore, the **show ip route** command displays only the Type 1 route.

This command generates a default route of Type-5 LSA, which will not be flooded to the NSSA. If you want to generate a default route in the NSSA, run the **area nssa default-information-originate** command.

A router in the stub area cannot generate an external default route.

The metric value range configured for the associated route map is 0 to 16777214. If the value exceeds this range, routes cannot be introduced.

Examples

The following example configures an external default route for the OSPF routing domain with type set to **1** and metric set to **50**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.24.0 0.0.0.255 area 0
Hostname(config-router)# default-information originate always metric 50 metric-type
1
```

1.18 default-metric

Function

Run the **default-metric** command to configure the default metric for an OSPF redistributed route.

Run the **no** form of this command to restore the default configuration.

By default, the metric of a redistributed route is 20.

Syntax

default-metric *metric*

no default-metric

Parameter Description

metric: Default metric of the OSPF redistributed route. The value range is from 1 to 16777214.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

The **default-metric** command must be used together with the **redistribute** command to modify the initial metrics of all redistributed routes.

Setting the **default-metric** command does not take effect on the external routes that are configured and injected to the OSPF routing domain using the **default-information originate** command.

Examples

The following example sets the default metric value of an OSPF redistributed route to **50**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router rip
Hostname(config-router)# network 192.168.12.0
Hostname(config-router)# version 2
Hostname(config-router)# exit
Hostname(config)# router ospf 1
Hostname(config-router)# network 172.16.10.0 0.0.0.255 area 0
Hostname(config-router)# default-metric 50
Hostname(config-router)# redistribute rip subnets
```

1.19 disable-dn-bit-check

Function

Run the **disable-dn-bit-check** command to disable the DN bit loop detection function of LSA.

Run the **no** form of this command to enable the function.

Run the **default** form of this command to restore the default configuration.

The DN bit loop detection function of LSA is enabled by default.

Syntax

disable-dn-bit-check [**summary** | **ase** | **nssa**]

no disable-dn-bit-check [**summary** | **ase** | **nssa**]

default disable-dn-bit-check [**summary** | **ase** | **nssa**]

Parameter Description

summary: Disables DN bit check of the summary LSA.

ase: Disables DN bit check of the AS-External LSA.

nssa: Disables DN bit check of the NSSA LSA.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

In the CE dual-homing scenario of L3VPN, loop is avoided by suppressing the route computation of DN bit between PEs. However, in a specific scenario, PEs may be allowed to learn routes from each other without generating any loops. In this case, check of the DN bit can be cancelled using this command.

When a PE device is connected to an MCE device, the MCE device needs to calculate the route advertised by the PE and the DN bit will not be checked.

Type-3, Type-5, and Type-7 LSAs of OSPF can all carry a DN bit.

Examples

The following example disables loop detection using the DN bit of summary LSA under the VRF OSPF process VPN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 10 vrf vpn1
Hostname(config-router)# disable-dn-bit-check summary
```

1.20 disable-tag-check

Function

Run the **disable-tag-check** command to disable loop detection using the route tag of LSA.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

The loop detection function using the route tag of LSA is enabled by default.

Syntax

disable-tag-check

no disable-tag-check

default disable-tag-check

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

In the CE dual-homing scenario of L3VPN, when the LSA route tag received by a PE is the same as its route tag, the route is not calculated, thus avoiding loop.

In a specific scenario, PEs are allowed to learn routes from each other without generating any loops. In this case, you can configure different route tags for multiple PEs, or configure to disable route tag check.

When a PE device is connected to an MCE device, the MCE device needs to calculate the route advertised by the PE and the route tag will not be checked.

Type-5 and Type-7 LSAs of OSPF can carry a route tag.

Examples

The following example disables loop detection using the route tag of LSA under the VRF OSPF process VPN 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 10 vrf vpn1
Hostname(config-router)# disable-tag-check
```

1.21 discard-route

Function

Run the **discard-route** command to allow adding a discard route to the core routing table.

Run the **no** form of this command to remove this configuration.

The discard route adding function is enabled by default.

Syntax

discard-route { **internal** | **external** }

no discard-route { **internal** | **external** }

Parameter Description

internal: Allows adding the inter-area route summarization command, namely, the discard route generated by the **area range** command.

external: Allows adding the external route summarization command, namely, the discard route generated by the **summary-address** command.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

During route summarization, the range after summarization may exceed the actual network scope in the routing table. If the data is sent to a network beyond the summarization range, a routing loop may be formed and the router processing load may increase. To prevent these problems, a discard route must be added to the routing table on the ABR or ASBR. This route is automatically generated, and is not advertised.

Examples

The following example prohibits adding a discard route to the core routing table.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# no discard-route internal
```

1.22 distance

Function

Run the **distance** command to configure the management distances corresponding to different types of OSPF routes.

Run the **no** form of this command to restore the default configuration.

By default, the management distance is **110** for all the OSPF routes.

Syntax

distance { *distance* [**route-map** *map-name*] | **ospf** { [**intra-area** *distance* [**route-map** *map-name*]] [**inter-area** *distance* [**route-map** *map-name*]] [**external** *distance* [**route-map** *map-name*]] } }

no distance [**ospf**]

Parameter Description

distance: Management distance of a route. The value range is from 1 to 255.

intra-area *distance*: Indicates the management distance of an intra-area route. The value range is from 1 to 255.

inter-area *distance*: Indicates the management distance of an inter-area route. The value range is from 1 to 255.

external *distance*: Indicates the management distance of an external route. The value range is from 1 to 255.

route-map *map-name*: Indicates the name of the associated route map. No route map is associated by default.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

To compare the priorities of routes generated by different OSPF processes, you need to run this command to specify the management distances corresponding to different types of OSPF routes.

The management distance allows different routing protocols to compare route priorities. A smaller management distance indicates a higher route priority.

If the management distance of a route entry is set to 255, the route entry is not trustworthy and does not participate in packet forwarding.

Configure the **route-map** parameter and set a management distance for the specific route through a policy. If **route-map** is configured with **set distance**, then:

- For a matched route, the management distance is set by the **set distance** command.
- For an unmatched route, the management distance is set by the **distance** command.

Examples

The following example sets the management distance of an OSPF external route to **160**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# distance ospf external 160
```

1.23 distribute-list in

Function

Run the **distribute-list in** command to configure filtering routes that are calculated based on the received LSA.

Run the **no** form of this command to remove this configuration.

By default, the filtering function of the routes calculated based on the received LSA is disabled, that is, all these routes get past.

Syntax

istribute-list { *acl-name* | *acl-number* | **gateway** *prefix-list-name* | **prefix** *prefix-list-name* [**gateway** *prefix-list-name*] | **route-map** *route-map-name* } **in** [*interface-type interface-number*]

no distribute-list { *acl-name* | *acl-number* | **gateway** *prefix-list-name* | **prefix** *prefix-list-name* [**gateway** *prefix-list-name*] | **route-map** *route-map-name* } **in** [*interface-type interface-number*]

Parameter Description

acl-name: ACL name. The value is a case-sensitive string of 1 to 99 characters.

acl-number: ACL No. The following value ranges are supported. The value range of IP standard ACL is 1 to 99 or 1300 to 1999; the value range of IP extended ACL is 100 to 199 or 2000 to 2699.

gateway *prefix-list-name*: Uses the gateway for filtering.

prefix *prefix-list-name*: Uses a prefix list for filtering.

route-map *route-map-name*: Uses a route map for filtering.

interface-type interface-number: interface for which LSA routes are filtered.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This function filters the routes that are computed based on received LSAs. Only the routes meeting the filtering conditions can be forwarded. The command does not affect the LSDB or the routing tables of neighbors. The ACL, prefix list, and route map filtering rules are mutually exclusive in the configuration. In other words, if an ACL is used for filtering routes of a specified interface, prefix list or router map cannot be configured for filtering routes of the same interface.

The route map used in this command supports the following **match** commands:

- **match interface**
- **match ip address**
- **match ip address prefix-list**
- **match ip next-hop**
- **match ip next-hop prefix-list**
- **match metric**
- **match route-type**
- **match tag**

Caution

Filtering routes by running the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type-3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black hole routes are generated. In this case, you can run the **area filter-list** or **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black hole routes.

Examples

The following example configures ACL 3 to filter the routes received by GigabitEthernet 0/1 and calculated based on the received LSA.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# access-list 3 permit 172.16.0.0 0.0.127.255
Hostname(config)# router ospf 25
Hostname(config-router)# distribute-list 3 in GigabitEthernet 0/1
```

Related Commands

- **show ip route** (route management)

1.24 distribute-list out

Function

Run the **distribute-list out** command to configure filtering of redistributed routes.

Run the **no** form of this command to disable filtering of redistributed routes.

By default, the filtering function of redistributed routes is disabled, that is, all the redistributed routes get past.

Syntax

distribute-list { *acl-number* | *acl-name* | **prefix** *prefix-list-name* } **out** [**arp-host** | **bgp** | **connected** | **isis** [*area-tag*] | **ospf** *process-id* | **rip** | **static**]

no distribute-list { *acl-number* | *acl-name* | **prefix** *prefix-list-name* } **out** [**arp-host** | **bgp** | **connected** | **isis** [*area-tag*] | **ospf** *process-id* | **rip** | **static**]

Parameter Description

acl-number: ACL No. The following value ranges are supported. The value range of IP standard ACL is 1 to 99 or 1300 to 1999; the value range of IP extended ACL is 100 to 199 or 2000 to 2699.

acl-name: ACL name. The value is a case-sensitive string of 1 to 99 characters.

prefix *prefix-list-name*: Uses a prefix list for filtering.

arp-host: Filters host routes converted by Address Resolution Protocol (ARP).

bgp: Filters BGP routes.

connected: Filters direct routes.

isis [*area-tag*]: Filters IS-IS routes.

ospf *process-id*: Filters OSPF routes.

rip: Filters RIP routes.

static: Filters static routes.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

The **distribute-list out** command is similar to the **redistribute route-map** command, and is used to filter routes that are redistributed from other protocols to OSPF. The **distribute-list out** command itself does not redistribute routes, and is generally used together with the **redistribute** command. The ACL and prefix list filtering rules are mutually exclusive in the configuration. In other words, if an ACL is used for filtering routes coming from a certain source, the prefix list cannot be configured to filter the same routes.

Examples

The following example filters the redistributed static routes according to the prefix list jjj.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# redistribute static subnets
Hostname(config-router)# distribute-list prefix jjj out static
```

Notifications

When the **gateway** parameter is carried for filtering of redistributed routes, the following notification will be displayed:

```
% Gateway not allowed with OUT in distribute-list cmd
```

1.25 domain-id

Function

Run the **domain-id** command to configure the domain ID of an OSPF process.

Run the **no** form of this command to remove this configuration.

Run the **default** form of this command to restore the default configuration.

By default, the domain ID value of an OSPF process is **null**, and the type value is **0005**.

Syntax

domain-id { *ipv4-address* [**secondary**] | **null** | **type** { **0005** | **0105** | **0205** | **8005** } **value** *hex-value* [**secondary**] }

no domain-id [*ipv4-address* [**secondary**] | **null** | **type** { **0005** | **0105** | **0205** | **8005** } **value** *hex-value* [**secondary**]]

default domain-id

Parameter Description

ipv4-address: IPv4 address as the domain ID.

secondary: Uses the configured domain ID as a secondary identifier.

null: Indicates that the OSPF process has no domain ID.

type { **0005** | **0105** | **0205** | **8005** }: Sets the domain ID type of an OSPF process. Its value can be one of the following four types: 0x0005, 0x0105, 0x0205, and 0x8005. The default value is 0x0005.

value *hex-value*: Sets the domain ID value of an OSPF process, a hexadecimal value indicating a 6-byte number.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command takes effect only on the OSPF process associated with VRF.

If an OSPF process is configured with a domain ID, when an OSPF route is redistributed to BGP and becomes a VPN route, the domain ID will be redistributed to BGP together, and finally will be advertised to other PEs as one part of the extcommunity attribute in the VPN route.

You can run the **domain-id secondary** command to configure multiple domain IDs of an OSPF process. However, there can be only one primary domain ID, and the remaining ones are secondary domain IDs. When the OSPF route is converted to a VPN route for advertising, the corresponding extcommunity attribute will carry the primary domain ID information only.

In general, the OSPF protocol runs between the PE and CE for VPN route interaction. After the PE receives a VPN route and redistributes it to the OSPF process, the route will be advertised to the VPN site as a Type-5 LSA. However, for different sites belonging to the same OSPF domain, the route should be advertised as a Type-3 LSA. Therefore, the same domain ID can be configured for the corresponding VRF OSPF process on the PE so as to advertise the route within the domain as a Type-3 LSA.

The domain IDs of different VRF OSPF processes on the same PE do not influence each other, and can be configured the same or different. However, the VRF OSPF processes that belong to the same VPN must be configured with the same domain ID to ensure the correctness of route advertising.

Examples

The following example configures the domain ID type under VRF OSPF process VPN 1 as 0005 and the domain ID value as 000000000001.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 10 vrf vpn1
Hostname(config-router)# domain-id type 0005 value 000000000001
```

1.26 domain-tag

Function

Run the **domain-tag** command to configure the VPN route tag of an OSPF process associated with VRF.

Run the **no** form of this command to restore the default value.

Run the **default** form of this command to restore the default configuration.

By default, the default value of a VRF OSPF process is the AS number of the local BGP protocol.

Syntax

domain-tag *tag*

no domain-tag

default domain-tag

Parameter Description

tag: VPN route tag value of an OSPF process. The value range is from 1 to 4294967295.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command takes effect only for the OSPF process associated with VRF and BGP redistributed routes.

If a VPN site is connected to multiple PEs, the VPN route will be learned from the PE through MP-BGP. If the route is advertised to the VPN site through a Type- 5 or Type-7 LSA, it may be learned and advertised by other PEs connected to the VPN site, which may cause a loop. To prevent loops, the VRF OSPF processes connected to the same VPN site on the PEs are configured with the same VPN route tag. When a VRF OSPF process sends a Type-5 or Type-7 LSA to a VPN site, the VPN route tag information will also be attached to the LSA. When other PE sites receive such a Type-5 or Type-7 LSA, if they detect that the VPN route tag in the LSA is consistent with that of the local OSPF process, the LSA will not participate in the OSPF computation.

Generally, the OSPF processes belonging to the same VPN site are configured with the same VPN route tag value.

The VPN route tag occupies four bytes in an OSPF packet. If a VRF OSPF process is not configured with this command, when the OSPF process advertises a Type-5 or Type-7 LSA, the first two bytes of the VPN route tag

are set to 0xD000 by default, and the last two bytes are the AS number of the local BGP. For example, if the AS number of the local BGP is 1, the hexadecimal form of the VPN route tag is: 0xD0000001.

Examples

The following example configures the route tag of the OSPF process VPN1 associated with VRF as **10**.

```
Hostname(config)# router ospf 10 vrf vpn1
Hostname(config-router)# domain-tag 10
```

1.27 enable mib-binding

Function

Run the **enable mib-binding** command to bind the MIB to a specified OSPFv2 process.

Run the **no** form of this command to restore the default binding.

By default, the MIB is bound to the OSPFv2 process with the minimum process ID.

Syntax

enable mib-binding

no enable mib-binding

Parameter Description

N/A

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

The OSPFv2 MIB does not have the OSPFv2 process information. Therefore, you must perform operations on a single OSPFv2 process through SNMP.

If you wish to perform operations on a specified OSPFv2 through SNMP, run this command to bind the MIB with the process.

Examples

The following example configures to bind the MIB to the specified OSPFv2 process 100.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 100
Hostname(config-router)# enable mib-binding
```

1.28 enable traps

Function

Run the **enable traps** command to enable sending of the specified trap message.

Run the **no** form of this command to disable sending of the specified trap message.

The trap message sending function is disabled by default.

Syntax

enable traps [**error** [**IfAuthFailure** | **IfConfigError** | **IfRxBadPacket** | **VirtIfAuthFailure** | **VirtIfConfigError** | **VirtIfRxBadPacket**] | **lsa** [**LsdbApproachOverflow** | **LsdbOverflow** | **MaxAgeLsa** | **OriginateLsa**] | **retransmit** [**IfTxRetransmit** | **VirtIfTxRetransmit**] | **state-change** [**IfStateChange** | **NbrRestartHelperStatusChange** | **NbrStateChange** | **NssaTranslatorStatusChange** | **RestartStatusChange** | **VirtIfStateChange** | **VirtNbrRestartHelperStatusChange** | **VirtNbrStateChange**]]

no enable traps [**error** [**IfAuthFailure** | **IfConfigError** | **IfRxBadPacket** | **VirtIfAuthFailure** | **VirtIfConfigError** | **VirtIfRxBadPacket**] | **lsa** [**LsdbApproachOverflow** | **LsdbOverflow** | **MaxAgeLsa** | **OriginateLsa**] | **retransmit** [**IfTxRetransmit** | **VirtIfTxRetransmit**] | **state-change** [**IfStateChange** | **NbrRestartHelperStatusChange** | **NbrStateChange** | **NssaTranslatorStatusChange** | **RestartStatusChange** | **VirtIfStateChange** | **VirtNbrRestartHelperStatusChange** | **VirtNbrStateChange**]]

Parameter Description

error: Configures all the trap switches related to Error. This parameter can also configure the following specific error trap switches:

IfAuthFailure: Indicates interface authentication error.

IfConfigError: Indicates interface parameter configuration error.

IfRxBadPacket: Indicates that the interface receives an error packet.

VirtIfAuthFailure: Indicates virtual interface authentication error.

VirtIfConfigError: Indicates virtual interface parameter configuration error.

VirtIfRxBadPacket: Indicates that the virtual interface receives an error packet.

lsa: Configures all the trap switches related to LSA. This parameter can also configure the following specific LSA trap switches:

LsdbApproachOverflow: Indicates that the number of external LSAs has reached 90% of the upper limit.

LsdbOverflow: Indicates that the number of external LSAs has reached the upper limit.

MaxAgeLsa: Indicates that the LSA aging timer expires.

OriginateLsa: Indicates that a new LSA is generated.

retransmit: Configures all the trap switches related to Retransmit. This parameter can also configure the following specific retransmit trap switches:

IfTxRetransmit: Indicates that a packet is retransmitted on the interface.

VirtIfTxRetransmit: Indicates that a packet is retransmitted on the virtual interface.

state-change: Configures all the trap switches related to State-change. This parameter can also configure the following specific state-change trap switches:

IfStateChange: Indicates that the interface state changes.

NbrRestartHelperStatusChange: Indicates that the status of the neighbor GR process changes.

NbrStateChange: Indicates that the neighbor state changes.

NssaTranslatorStatusChange: Indicates that the NSSA translator state changes.

RestartStatusChange: Indicates that the GR status of the local device changes.

VirtIfStateChange: Indicates that the virtual interface state changes.

VirtNbrRestartHelperStatusChange: Indicates that the status of the virtual neighbor GR process changes.

VirtNbrStateChange: Indicates that the virtual neighbor state changes.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

Currently the OSPFv2 process supports sending of 16 kinds of trap messages, which are classified into four types.

The function configured by this command is restricted by the **snmp-server** command. You can must configure the **snmp-server enable traps ospf** command and then the **enable traps** command before the corresponding OSPF trap message can be correctly sent out.

This command is not restricted by the MIB bound to the process. The trap switch can be enabled concurrently for different processes.

Examples

The following example enables sending of the specified trap message.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 100
Hostname(config-router)# enable traps
```

1.29 extcommunity-type

Function

Run the **extcommunity-type** command to configure the Router-ID or Route-Type of an OSPF process associated with VRF.

Run the **no** form of this command to restore the default type value.

Run the **defaulttype** form of this command to restore the default configuration.

By default, the type of Router-ID is 0107, and the type of Route-Type is 0306.

Syntax

extcommunity-type { **router-id** { **0107** | **8001** } | **route-type** { **0306** | **8000** } } *

no extcommunity-type { **router-id** | **route-type** } *

default extcommunity-type { **router-id** | **route-type** } *

Parameter Description

router-id { **0107** | **8001** }: Sets the Router-ID of an OSPF process. Its value is **0107** or **8001**.

route-type { **0306** | **8000** }: Sets the Router-Type of an OSPF process. Its value is **0306** or **8000**.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command takes effect only for the OSPF process associated with VRF, but is invalid for the global VRF instance configuration.

When an OSPF route of VRF forms a VPN route, the Router-ID information of the OSPF process will also be carried in the extcommunity attribute of the VPN route. You can run the **extcommunity-type router-id** command to specify the value of the type field in the extcommunity attribute as **0x0107** or **0x8001**.

When an OSPF route of VRF forms a VPN route, the Route-Type information of the OSPF process will also be carried in the extcommunity attribute of the VPN route. You can run the **extcommunity-type roue-type** command to specify the value of the type field in the extcommunity attribute as **0x0306** or **0x8000**.

Examples

The following example configures the Router-ID of the OSPF process VPN1 associated with VRF as **8001**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 10 vrf vpn1
Hostname(config-router)# extcommunity-type router-id 8001
```

1.30 fast-reroute

Function

Run the **fast-reroute** command to configure the OSPF fast reroute function of a device.

Run the **no** form of this command to restore the default configuration.

The fast reroute function is disabled by default.

Syntax

fast-reroute { **lfa** [**downstream-paths**] | **route-map** *route-map-name* }

no fast-reroute { **lfa** [**downstream-paths**] | **route-map**] }

Parameter Description

lfa: Enables computation of the loop-free backup path.

downstream-paths: Enables computation of the downstream path.

route-map *route-map-name*: Specifies a backup path through the route map.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

If the **lfa** parameter is configured, computation of the loop-free backup path is enabled. Now, you can run the interface mode command to specify the path protection mode of the interface.

It is recommended that automatic computation of LFA for the backup path be disabled if any of the following cases exists on the network:

- Virtual links exist.
- Alternative ABRs exist.
- An ASBR is also an ABR.
- Multiple ABSRs advertise the same external route.

If both **lfa** and **downstream-paths** are configured, computation of the downstream path is enabled.

If **route-map** is configured, a backup path can be specified for a matched route through the route map.

When the OSPF fast reroute function is used, it is recommended that BFD be enabled at the same time, so that the device can quickly detect any link failure and therefore shorten the forwarding interruption time. If the interface is up or down, to shorten the forwarding interruption time during OSPF fast reroute, you can configure **carrier-delay 0** on a Layer-3 interface to achieve the fastest switchover speed.

Note

- Currently, the OSPF fast reroute function is subject to the following constraints:
- Only one backup next hop can be generated for one route.
- No backup next hop can be generated for equal-cost multi-path routing (ECMP).

Examples

The following example configures the FRR function of OSPF process 1 and associates it with fast-reroute of the route map.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# route-map fast-reroute
Hostname(config-route-map)# match ip address 1
Hostname(config-route-map)# set fast-reroute backup-interface GigabitEthernet 0/1
backup-nexthop 192.168.1.2
Hostname(config)# router ospf 1
Hostname(config-router)# fast-reroute route-map fast-reroute
```

Notifications

When the route map name exceeds 32 characters, the following notification will be displayed:

```
% Route-map name string length can not exceed 32
```

Common Errors

1.31 graceful-restart

Function

Run the **graceful-restart** command to enable the OSPF GR capability and set the GR period.

Run the **no** form of this command to disable the OSPF GR capability or restore the default value of the GR period.

The OSPF GR capability is enabled by default.

Syntax

graceful-restart [**grace-period** *grace-period* | **inconsistent-lsa-checking**]

no graceful-restart [*grace-period*]

Parameter Description

grace-period *grace-period*: Sets the GR period, in seconds, which is the maximum time from occurrence of an OSPF failure to restart of OSPF and completion of the OSPF GR. The value range is 1 to 1800, and the default value is **120**.

inconsistent-lsa-checking: Enables topology change detection. If any topology change is detected, OSPF exits the GR process to complete convergence.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

When a GR-enabled device is restarted on the control plane, data forwarding can be guided on the forwarding plane. In addition, actions such as neighbor relationship re-forming and route computation performed on the control plane do not affect functions of the forwarding plane. In this way, service interruption caused by route flapping can be avoided, thus enhancing reliability of the entire network.

The GR function is configured based on the OSPF process. You can configure different parameters for different OSPF processes based on the actual conditions.

This command is used to configure the GR restarter capability of a device. The grace period is the maximum time of the entire GR process, during which link state is rebuilt so that the original state of the OSPF process is restored. After the GR period expires, OSPF exits the GR state and performs common OSPF operations.

Run the **graceful-restart** command to set the GR period to 120s. The **graceful-restart grace-period** command allows you to modify the GR period explicitly.

If the Fast Hello function is enabled, the GR function cannot be enabled.

The precondition for successful execution of GR and uninterrupted forwarding is that the topology remains stable. If the topology changes, OSPF quickly converges without waiting for further execution of GR, thus avoiding long-time forwarding black-hole.

- Disabling topology detection: If OSPF cannot converge in time when the topology changes during the hot standby process, forwarding black-hole may appear in a long time.
- Configuring topology detection: Forwarding may be interrupted when topology detection is enabled, but the interruption time is far shorter than that when topology detection is disabled.

In most cases, it is recommended that topology detection be enabled. In special scenarios, topology detection can be disabled if the topology changes after the hot standby process, but it can be ensured that the forwarding black-hole will not appear in a long time. This can minimize the forwarding interruption time during the hot standby process.

Examples

The following example enables the OSPF restarter capability and sets the GR period to 60s.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# graceful-restart grace-period 60
```

1.32 graceful-restart helper

Function

Run the **graceful-restart helper** command to enable the OSPF GR helper function and configure the relevant topology change detection mode.

Run the **no** form of this command to remove this configuration.

The GR helper capability is enabled by default. After the GR helper is enabled on the device, LSA changes are not checked.

Syntax

graceful-restart helper { **disable** | **strict-lsa-checking** | **internal-lsa-checking** }

no graceful-restart helper { **disable** | **strict-lsa-checking** | **internal-lsa-checking** }

Parameter Description

disable: Prohibits a device from acting as a GR helper for another device.

strict-lsa-checking: Indicates that changes in Type-1 to Type-5 and Type-7 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as a GR helper.

internal-lsa-checking: Indicates that changes in Type-1 to Type-3 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as a GR helper.

Command Modes

Routing process configuration mode

Default Level

14

Usage Guidelines

This command is used to configure the GR helper capability of a device. When a neighbor device implements GR, it sends a Grace-LSA to notify all neighbor devices. If the GR helper function is configured on the local device, the local device becomes the GR helper on receiving the Grace-LSA, and helps the neighbor to complete GR. The **disable** option indicates that the GR helper is not provided for any device that implements GR.

After a device becomes a GR helper, the network changes are not detected by default. If any change takes place on the network, the network topology converges after GR is completed. If you wish that network changes can be quickly detected during the GR process, you can configure **strict-lsa-checking** to check Type 1 to 5 and Type 7 LSAs that indicate the network information or configure **internal-lsa-checking** to check Type 1 to 3 LSAs that indicate internal routes of the AS domain. When the network scale is large, it is recommended that you disable the LSA checking options (strict-lsa-checking and internal-lsa-checking) because regional network changes may trigger termination of GR and consequently reduce the convergence of the entire network.

Examples

The following example disables the OSPF GR helper function and configures the relevant topology change detection mode as **strict-lsa-checking**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# router ospf 1
Hostname(config-router)# graceful-restart helper disable
Hostname(config-router)# no graceful-restart helper disable
Hostname(config-router)# graceful-restart Helper strict-lsa-checking
```

1.33 ip ospf authentication

Function

Run the **ip ospf authentication** command to configure the authentication mode of an interface.

Run the **no** form of this command to restore the default authentication mode.

By default, no authentication mode is set on an interface. In this case, the authentication type of the related area is used on the interface.

Syntax

ip ospf authentication [**message-digest** | **null** | **keychain** *kc-name*]

no ip ospf authentication

Parameter Description

message-digest: Indicates that MD5 encryption authentication is enabled on the current interface.

null: Indicates that authentication is disabled.

keychain *kc-name*: Indicates that keychain authentication is configured. If **Keychain** specifies that the authentication type is **SM3**, the key ID value range is from 0 to 255.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

If the **ip ospf authentication** command does not contain any option, plain text authentication is enabled. If you run the **no** form of this command to restore the default authentication mode, whether authentication is enabled is determined by the authentication type that is configured in the area to which the interface belongs. If the authentication type is set to **null**, authentication is disabled forcibly. When authentication is configured for both an interface and the area to which the interface belongs, the authentication type configured for the interface is used preferentially.

If keychain authentication is configured, the key and authentication type configured for keychain are used. Currently, keychain supports plain text authentication, MD5 authentication, and SM3 authentication.

Examples

The following example configures the OSPF authentication type of GigabitEthernet 0/1 interface as MD5 authentication.

```
Hostname> enable
```

```
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip address 172.16.1.1 255.255.255.0
Hostname(config-if-GigabitEthernet 0/1)# ip ospf authentication message-digest
```

The following example configures the OSPF authentication type of the GigabitEthernet 0/1 interface as keychain authentication and the key chain as hello.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip ospf authentication keychain ospf
Hostname(config-if-GigabitEthernet 0/1)# exit
Hostname(config)# key chain ospf
Hostname(config-keychain)# key 1
Hostname(config-keychain-key)# key-string hello
```

1.34 ip ospf authentication-key

Function

Run the **ip ospf authentication-key** command to configure the plain text authentication key of OSPF.

Run the **no** form of this command to delete the plain text authentication key.

The authentication key is disabled by default.

Syntax

ip ospf authentication-key [**0** | **7**] *key*

no ip ospf authentication-key

Parameter Description

0: Indicates that the key is displayed in plain text.

7: Indicates that the key is displayed in cipher text.

key: The key, a string of up to eight characters.

Command Modes

Interface configuration mode

Default Level

14

Usage Guidelines

The key configured by the **ip ospf authentication-key** command is inserted to the headers of all OSPF packets. If the keys are inconsistent, two directly connected devices cannot set up the OSPF neighbor relationship and therefore cannot exchange the routing information.

Different keys can be configured for different interfaces, but all routers connected to the same physical network segment must be configured with the same key.

You can enable or disable authentication in an OSPF area by running the **area authentication** command.

You can enable authentication on an individual interface by running **ip ospf authentication** in interface configuration mode. When authentication is configured for both an interface and the area to which the interface belongs, the authentication type configured for the interface is used preferentially.

Examples

The following example configures the OSPF authentication mode of the GigabitEthernet 0/1 interface as **ospfauth**.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip address 172.16.1.1 255.255.255.0
Hostname(config-if-GigabitEthernet 0/1)# ip ospf authentication-key ospfauth
```

Usage Guidelines

Running this command will add all IP addresses on the interface to the OSPF process.

You can also add an interface to OSPF process using the **network** command on the instance. If two commands are run at the same time, the configuration on the interface takes effect first.

Examples

The following example enables the GigabitEthernet 0/1 interface to participate in Area 0 of OSPF Routing Process 1.

```
Hostname> enable
Hostname# configure terminal
Hostname(config)# interface GigabitEthernet 0/1
Hostname(config-if-GigabitEthernet 0/1)# ip address 172.16.1.1 255.255.255.0
Hostname(config-if-GigabitEthernet 0/1)# ip ospf 1 area 0
```
